**Background:** The Antibody Mediated Prevention (AMP) studies provided proof-of-concept for broadly neutralizing antibodies (bnAbs) to possibly prevent HIV-1 trans-

mission. Timing HIV acquisition aids in the interpretation of clinical trials of HIV prevention modalities, especially in trials like AMP, where the antibody interventions have time-varying antibody concentrations. The day of diagnosable infection (DDI) can be estimated using diagnostic test data, as well as using methodologies that evaluate the diversification of the within-host HIV quasispecies using sequencing-based methodologies.

**Methods:** We applied the HIV time-estimating pipeline that was recently employed in the AMP trials to samples collected from 41 study participants drawn from the FRESH and RV217 cohorts. These cohorts were selected due to their frequent sample schedule, which resulted in a narrow window between the participants' last negative and first positive HIV-1 RNA detection dates (2-7 days, median 4 days). These early diagnoses minimized the window of uncertainty for the true time of RNA detection. One to three samples per participant from later timepoints were used to represent HIV acquisition scenarios from AMP's monthly sampling schedule. Bias of modelled DDI estimates was compared to the true date of first detectable RNA, the Root Mean Square Error (RMSE) describes variability in these estimates across participants.

**Results:** Sequence-based estimation of the DDI yielded reasonably accurate and precise estimates for both antibody-negative samples (bias 4 days, RMSE 8 days) and samples collected up to 5 weeks post acquisition (bias 0-5 days, RMSE 6-8 days), but not samples collected after 5 weeks post acquisition (bias 15 days, RMSE 20 days). Overall, the HIV time estimation approach using diagnostic data performed well (bias 0, RMSE 6 days) and integrating sequence-based estimates with diagnostic-based estimates yielded bias -1, RMSE 6 days.

**Conclusions:** This study emphasizes the importance of monthly HIV testing in future HIV antibody-mediated prevention trials. Data suggest monthly sampling is needed both for acquisition time estimation and to characterize the initial founding virus population prior to diversification. In these samples the diversification from founding virus occurred 4-6 weeks post-DDI. This diversification may obscure the founding strain(s) and negatively impact power to detect acquisition sieve effects.

## THPEC260

Faith-engaged community posts expand HIV case finding, treatment and viral suppression among men in Zambia in the context of COVID-19, April 2018 – March 2022

G. Makangila<sup>1</sup>, S. Hillis<sup>2</sup>, A. Medley<sup>3</sup>, L. Mbulo<sup>4</sup>, M. Mumba<sup>4</sup>, T. Aholou<sup>3</sup>, J. Nel<sup>5</sup>, K. Mweebo<sup>4</sup>, A. Mwila<sup>4</sup>, K. Nkwemu<sup>4</sup>

<sup>1</sup>Circle of Hope, Executive Director, Lusaka, Zambia,

<sup>2</sup>Bureau of Global Health Security and Diplomacy, GHSD - PEPFAR, Washington, DC, United States, <sup>3</sup>Centers for Disease Control and Prevention, Center for Global Health, Atlanta, United States, <sup>4</sup>Centers for Disease Control and Prevention, Prevention Branch, Lusaka, Zambia, <sup>5</sup>Centers for Disease Control and Prevention, DGHT, Lusaka, Zambia

**Background:** HIV testing and treatment coverage among men remains suboptimal in Zambia because they are less likely to access facilities. To address this gap, Circle of Hope (CoH), a local faith-based organization, developed the community post (CP) model. CPs are staffed by a multi-disciplinary team offering a range of services including HIV testing, anti-retroviral treatment (ART), and viral load testing.

We summarize the effect of these CPs on HIV case finding, ART initiation, and viral load suppression among men.

**Methods:** Routine indicators reported to PEPFAR by Zambia CoH were analyzed for the two years prior to the COVID-19 pandemic (April 2018-March 2020) and for the first two pandemic years (April 2020-March 2022).

Indicators include the number of HIV tests conducted and positive results received (both overall and for index testing), the number of people living with HIV (PLHIV) initiated on ART, the percent of PLHIV on ART retained at 12 months, and the percent of ART clients with a documented suppressed viral load (<1000 copies/mL).

**Results:** Between April 2018 and March 2022, the number of CPs increased from 9 to 38. The male proportion of these key indicators also increased: the number of men tested (45% to 47%,  $p<.00001$ ), the number of men diagnosed (37% to 42%,  $p<.00001$ ), and the number of men living with HIV initiated on ART (41% to 45%,  $p<.0001$ ). The number of men receiving ART at the CPs increased from 3,320 (38% of all PLHIV) to 13,580 (43%,  $p<.000001$ ). Retention at 12 months and viral load suppression among men also increased over this period (from 94% to 97% and 95% to 96%, respectively).

Over 6,000 men were diagnosed through index testing services over the four-year period, with percent positivity increasing from 56% in April 2018 to 62% in March 2022 ( $p<.005$ ).

**Conclusions:** The COH model was successful at identifying men living with HIV, enrolling and retaining men in HIV treatment services, and assisting them to achieve and maintain viral suppression even during the COVID-19 pandemic. Expanding this community-based model may

therefore help close HIV testing and treatment gaps among men and advance HIV epidemic control in Zambia and beyond.

## THPEC261

Dynamic trends in first-time HIV testing and positivity among key populations: a three-year records in Bangkok and Pattaya

S. Unkarnkamol<sup>1</sup>, S. Sumalu<sup>1</sup>, P. Sopanri<sup>1</sup>, N. Klaitin<sup>1</sup>, P. Leksiri<sup>1</sup>, J. Saratai<sup>1</sup>, P. Muhammatsalae<sup>1</sup>, C. Phaengnongyang<sup>1</sup>, S. Janyam<sup>1</sup>

<sup>1</sup>Service Workers In Group Foundation, Bangkok, Thailand

**Background:** Early HIV testing is essential for prevention and treatment efforts, particularly among key populations. This analysis examines data from SWING clinics in Bangkok and Pattaya to understand trends in first-time HIV testing and the associated positivity rates, reflecting on the broader global challenge of engaging at-risk groups in early testing.

**Methods:** We analyzed HIV testing records from 2021 to 2023 at SWING clinics, focusing on first-time testers across demographics, including age, key populations (MSM, MSW, FSW, TG, TGSW), and nationality. Trends and positivity rates were assessed to identify changes over time and disparities among groups.

**Results:** The number of first-time HIV testers at SWING clinics in Bangkok has shown an upward trend from 1,275 in 2021 to 2,470 in 2023. Similarly, Pattaya experienced an increase from 523 first-time testers in 2021 to 2,684 in 2023. However, the proportion of new HIV positive cases among these first-time testers has been declining, from 8.5% in 2021 to 7.3% in 2023 in Bangkok, and from 9.6% in 2021 to 2.3% in 2023 in Pattaya.

This downward trend is consistent across all age groups, nationalities, and key population subgroups. Notably, MSM and individuals under 24 years of age had higher rates of positivity, but these have decreased significantly over the years, with a marked reduction in Pattaya's youth population. Non-Thais demonstrated a consistently higher positivity rate than their Thai counterparts, indicating specific vulnerabilities.

Characteristics	Total number of HIV testers			% of first-time testers among the total			% of HIV positive among the first-time		
	2021	2022	2023	2021	2022	2023	2021	2022	2023
<b>Bangkok</b>									
Age group									
<18	5,486	6,617	11,817	13.8	12.5	10.8	9.3	8.7	7.6
≥18	3,869	2,311	5,454	50.0	58.6	54.8	7.2	7.3	7.1
Key Populations

TGSW	247	411	551	17.8	18.7	1.8	11.3	15.9	0.0
Nationality									
Thai	3,817	4,719	7,811	17.2	16.5	22.4	8.0	7.4	5.0
Non-Thai	110	396	459	30.0	21.4	35.9	45.5	14.3	8.2
Total	3,927	5,115	8,270	17.0	18.7	31.6	9.0	9.9	5.9

**Conclusions:** While the program successfully increased overall HIV testing uptake, the data suggests a need for enhanced outreach to higher-risk groups. Particularly, first-time testers, including younger and non-Thai key populations, show a significant proportion of HIV positivity, underscoring the importance of targeting these at-risk groups in future testing and prevention strategies.

## THPEC262

Feasibility, acceptability and effectiveness of a nationwide, web application-guided, home-based HIV and syphilis self-screening program in Thailand

N. Salvadori<sup>1</sup>, S. Piyarat<sup>1</sup>, S. Chairahaeng<sup>1</sup>, T. Ponsuntikul<sup>1</sup>, A. Kaewbundit<sup>1</sup>, S. Chalermpanmetagul<sup>1</sup>, W. Khamduang<sup>1</sup>, N. Ngo-Giang-Huong<sup>2</sup>, S. Pornprasert<sup>1</sup>, S. Ongwadee<sup>3</sup>, G. Jourdain<sup>1</sup>

<sup>1</sup>Chiang Mai University, Chiang Mai, Thailand, <sup>2</sup>French National Research Institute for Sustainable Development (IRD), Chiang Mai, Thailand, <sup>3</sup>Ministry of Public Health, Nonthaburi, Thailand

**Background:** Expanding HIV screening is needed to reduce the number of untreated people living with HIV and identify at-risk individuals. We assessed the feasibility, acceptability and effectiveness of a nationwide, web application-guided, home-based HIV and syphilis self-screening program.

**Methods:** Individuals aged ≥15 and residing in Thailand could order a Bioline™ HIV/Syphilis Duo kit on the project website, prompting immediate shipment by post. Participants used their smartphone to scan the kit's QR code, access a web-based application providing step-by-step self-screening video instructions until results interpretation, and photograph the test cassette for later verification by a health professional. Regardless of the results, they could make an appointment for counseling online and/or present at a health facility for confirmation and referral. Those with an HIV negative result reporting high-risk behaviors were advised on and given practical information for getting PrEP. The program was promoted through social media.

**Results:** Between 28 September and 31 December 2023, 1,030 eligible users from 72 of the 77 provinces in Thailand ordered a kit. Kits were shipped within a median of 2 days after order (IQR: 1-3) (shipment median cost: USD 0.89). Of the 1,030 participants, 642 entered the web-based application within a median of 4 days after order (IQR: 4-6) and 455 uploaded a picture of the cassette. Of them, 259 (57%) were born female and median age was 24 years (IQR: 21-29). 21 participants correctly interpreted a positive HIV test, including 17 previously unaware (Table).

Of the 443 participants who completed the satisfaction survey, 436 (98%) reported being satisfied with the shipment and 441 (>99%) with the self-screening process.

	HIV	Syphilis
Screening results interpretable on the picture and valid	423/455 (93%)	423/455 (93%)
Negative screening results correctly interpreted by participants	387/388 (>99%)	375/379 (99%)
Positive screening results correctly interpreted by participants	21/35 (60%)	34/44 (77%)
Participants previously unaware of their status	17/1,030 (1.7%)	23/1,030 (2.2%)

**Conclusions:** Many participants did not report their results. However, at least 1.7% discovered that they were living with HIV and 2.2% with syphilis. This strategy offers an additional tool for case finding, with comparable effectiveness to screening clinics but at much lower cost.

## THPEC263

Integrated HIV testing program for female sex workers and their male clients: a community coverage approach to reach men who purchase sex beyond the "regular partners"

A. Mulopo<sup>1</sup>, P. Mabanza<sup>1</sup>, Y. Matumona<sup>1</sup>, D. Ngoie<sup>1</sup>, J. Kakesa<sup>1</sup>, G. Ilunga<sup>1</sup>, F. Mbuta<sup>1</sup>, V. Ranebennur<sup>2</sup>, J. Mandala<sup>3</sup>, A. Lambert<sup>3</sup>

<sup>1</sup>FHI360 DRC, Lubumbashi, Congo, the Democratic Republic of the, <sup>2</sup>FHI360 India, Bombay, India, <sup>3</sup>FHI360, Washington, United States

**Background:** Sex work is associated with a higher HIV risk of HIV acquisition for both the sex worker and the partner in the Democratic Republic of the Congo (DRC). Many strategies have been developed to reach subgroups of female sex workers (FSW) for HIV prevention, testing, and treatment support, while the strategies for reaching men who purchase sex (MWPS), as part of the general population, have relied heavily on the use of index testing among FSWs.

However, many of the MWPS identified via index testing strategies are those that are easier to contact such as long-term regular clients, boyfriends, or husbands, thus programs may be missing the more "occasional" MWPS. We describe activities aimed at reaching "occasional" MWPS who are males in and around FSW hotspots without any link with any index testing activities

**Methods:** The DRC PEPFAR/USAID-funded Meeting Targets and Maintaining Epidemic Control (EpiC) project developed a community strategy for FSW hotspot testing, prioritizing extensive testing for men in and around the hotspot. We compared data from October 2022 to September 2023 on case finding rates (CFR) among FSW and their MWPS clients. The analysis differentiated between those reached through index testing and the community coverage approach.

**Results:** Between October 2022 and September 2023, 324 and 1,615 new HIV-positive MWPS were identified through index testing and the community testing model, respec-

tively. CFR were comparable for both populations with-in index testing 24.8% (324/983) among MWPS and 24% (281/888) among FSW. Within the community coverage model, we found a CFR of 6.1% (1615/24862) among MWPS and 5.04% (1221/23024) among FSWs.

	Community HIV screen/test				Index HIV screening/test			
	HTS neg	HIVST neg	HIV positive HTS	Case Finding rate (%)	HTS neg	HIVST neg	HIV positive HTS	Case Finding rate (%)
FSW	21,983	1041	1221	5.04	888	0	281	24
MWPS	24074	788	1615	6.10	983	0	324	24.8

**Conclusions:** Through our FSW/MWPS community coverage strategy, we identified not only a very high HIV CFR among MWPS compared to the adult general population prevalence, but also a strategy to reach the "elusive" hard-to-reach "once-off" or occasional clients of FSWs often missing from traditional index testing.

Additionally employing community coverage testing with MWPS provides us with large numbers of HIV-positive men in which to continue index testing to reach more intimate sexual partners and children.

Feasibility and acceptability of nurse-initiated GeneXpert birth HIV and maternal viral load testing as a task shifting approach: mixed methods study among mothers and nurses in Tanzania

D. Pamba<sup>1</sup>, A. Lwilla<sup>2</sup>, W. Olomi<sup>2</sup>, K. Elsbernd<sup>3,4</sup>, I. Sabi<sup>2</sup>, S. Boniface<sup>2</sup>, N. Ntinginya<sup>2</sup>, T. Mbunda<sup>5</sup>, A. Kroidl<sup>3,6</sup>

<sup>1</sup>National Institute for Medical Research-Mbeya Medical Research Center (NIMR-MMRC), HIV and Reproductive Health, Mbeya, Tanzania, the United Republic of, <sup>2</sup>National Institute for Medical Research-Mbeya Medical Research Center (NIMR-MMRC), TB and Emerging Diseases, Mbeya, Tanzania, the United Republic of, <sup>3</sup>University of Munich, Division of Infectious Diseases and Tropical Medicine, Munich, Germany, <sup>4</sup>Institute for Information processing, Biometry, and Epidemiology, Munich, Germany, <sup>5</sup>Management and Development for Health, Dar Es Salaam, Tanzania, the United Republic of, <sup>6</sup>German Center for Infection Research (DZIF), Munich, Germany

**Background:** In Tanzania, centralized infant HIV testing at 6 weeks is associated with long result turnaround times, low rates of infant ART initiation, and poor retention in HIV care. A cluster-randomized trial was conducted in Tanzania and Mozambique to establish the clinical impact of point-of-care early infant HIV diagnosis (POC-HEID) at birth and 4-8 weeks, linked with nurse-supported immediate ART initiation in neonates diagnosed with HIV versus standard of care 4-8 week testing only.

This study assessed whether the intervention was acceptable by nurses and clients and feasible within programmatic settings in Tanzania.

**Methods:** This was a convergent mixed methods study conducted in four regions from November, 2021 to February, 2023. We purposively sampled nurses and mothers living with HIV at the end of trial participation. Questionnaires were administered to 35 nurses and in-depth interviews were conducted with 13 mothers. Descriptive and thematic analysis were applied.

**Results:** The majority (60%) of the nurses were working at district hospitals and 74% in the reproductive and child health department. On average, nurses strongly agreed that trainings provided were sufficient. All nurses stated that handling GeneXpert machines was easy, although 69% sometimes experienced invalid test results. A majority (69%) disagreed that the intervention added work burden. Furthermore, 20% reported that immediate ART initiation for neonates was complicated. All nurses recommended national scale-up of birth POC-HEID. Mothers were knowledgeable about the intervention. They expressed positive attitudes on early receipt of results and immediate infant ART initiation. However, they were concerned for their neonates about painful blood pricking. Due to non-disclosure, some mothers faced difficulties in providing ART or prophylaxis to neonates.

**Conclusions:** Our findings demonstrate that birth POC-HEID coupled with immediate infant ART initiation is feasible to be implemented by nurses and is acceptable to clients in Tanzania. However, enhanced counseling and disclosure support is important if adherence to neonatal ART is to be maintained at home.

## THPEC265

[Pediatric active case finding a missing piece of the puzzle: case of seven districts in Zimbabwe, 2023](#)

N. Ndlovu<sup>1</sup>

<sup>1</sup>Bantwana Zimbabwe, HIV and Health, Bulawayo, Zimbabwe

**Background:** Nationally and globally there has been great strides in improving testing, treatment, and the prevention of mother to child transmission program options for children living with HIV, yet only 65% of the children living with HIV (Global HIV statistics) have been identified for linkage to treatment. The Orphans and vulnerable children program have been uniquely placed in the community to access the "well" children in the community.

**Description:** A community who complements the efforts of the clinical partner in all health facilities in seven districts. All children under the age of two were followed up on using the community health workers list to ascertain their HIV status; this includes infants exposed to HIV who did not show any symptoms. Additionally, the program

collaborated with the health facilities that maintained a list of all HIV-positive infants without a final outcomes, and home visits were carried out in conjunction with the clinical partner to test children that were not tested.

**Lessons learned:** During the exercise, 743 infants and children were monitored; 413 of them had a known HIV negative for HIV, 196 had a recent HIV negative test, 11 tested HIV positive, and 123 are still being followed up as they relocated and the contacts they had provided were not going through. All the eleven children were linked to care and are responding well on treatment. The outcomes and yield were aided by team work. Numerous social protection issues were found and forwarded to the social development department.

**Conclusions/Next steps:** The initial stage of the continuum of paediatric care and treatment is the identification and diagnosis of HIV infection in children. In spite of this, many HIV exposed infants and children are never offered the opportunity to have an HIV diagnostic test. To come together and change things, several players must work together in a collaborative effort. Other approaches are necessary to identify the well-asymptomatic HIV positive children in the community; index case testing needs to be complemented by other novel strategies.

## THPEC266

[Integrating point-of-care recency testing into routine index testing does not increase HIV positivity among traced contacts in Lusaka, Zambia: a prospective cohort study](#)

M. Herce<sup>1,2</sup>, C. Mwila<sup>1</sup>, J. Pry<sup>1,3</sup>, M. Moono<sup>1</sup>, C. Frimpong<sup>1</sup>, H. Kapesa<sup>1</sup>, M. Nanyangwe<sup>1</sup>, L. Phiri<sup>1</sup>, R. Ngandu<sup>1</sup>, P. Sakanya<sup>1</sup>, S. Mwansa<sup>1</sup>, T. Phiri<sup>1</sup>, M. Hachiwa<sup>1</sup>, P. Maritim<sup>1</sup>, M. Arons<sup>4</sup>, T. Aholou<sup>4</sup>, T. Savory<sup>1</sup>, S. Iyer<sup>1</sup>

<sup>1</sup>Centre for Infectious Disease Research in Zambia (CIDRZ), Lusaka, Zambia, <sup>2</sup>University of North Carolina at Chapel Hill, Institute for Global Health and Infectious Diseases, Chapel Hill, United States, <sup>3</sup>University of California at Davis, Department of Public Health, Davis, United States, <sup>4</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Global Health Center, Atlanta, United States

**Background:** Evidence-based strategies to improve index testing efficiency are lacking. To optimize routine index testing in Zambia, we piloted integration of HIV recency testing into CDC/PEPFAR-supported index testing. Here, we report the effects of such "recency-focused" index testing on key performance indicators along the index testing cascade.

**Methods:** We enrolled a prospective cohort of consecutive adults ≥18 years who tested HIV-positive at two health facilities in Lusaka, Zambia and consented for routine HIV index testing. Participants underwent rapid testing for recent infection (RTRI) at the point-of-care and laborato-

ry-based viral load testing according to the national recent infection testing algorithm (RITA). We returned RITA results to participants and offered those with RITA-recent HIV an additional round of partner elicitation, assisted partner notification, contact tracing and testing after the clinic completed routine index services. We collected data on index testing indicators and compared them using descriptive statistics.

**Results:** Between 20 May 2021–10 March 2022, we screened 393 people newly diagnosed with HIV, of whom 344 (88%) were eligible, 322 (94%) consented, 321 (99%) enrolled, and 4 (1%) were excluded. Of those enrolled, the majority (n/N=200/317, 63.1%) were female with median age 30 years (interquartile range (IQR): 25–37 years). Contact elicitation ratios varied by RITA status (Table).

	RITA Long-term Participants (N=297)	RITA Recent Participants (N=20)			
	Initial Contact Elicitation n (%)	Initial Contact Elicitation n (%)	Contact Re-elicitation n (%)	Total Contact Elicitation n (%)	
Contact Status					
Reported contacts (Elicitation ratio)	479 (1.72)	39 (1.95)	14 (0.70)	53 (2.65)	
Contact tracing failed	74 (15.4)	3 (7.7)	3 (21.4)	6 (11.3)	
Contacts already known to be HIV-positive	165 (34.4)	16 (41.0)	3 (21.4)	19 (35.8)	
Contacts tested	240 (50.1)	20 (51.3)	8 (57.1)	28 (52.8)	
Contacts testing HIV-negative	173 (72.1)	14 (70.0)	6 (75.0)	20 (71.4)	
Contacts testing HIV-positive	67 (27.9)	6 (30.0)	2 (25.0)	8 (28.6)	

Table. Index testing cascade metrics for study participants classified as RITA Long-term versus RITA Recent (N=317).

No statistically significant difference was seen in the proportion of new HIV cases identified among contacts of participants with RITA-recent HIV (n/N=8/28, 28.6%), compared to contacts of participants with long-term HIV (n/N=67/240, 27.9%) (p-value= 0.942).

**Conclusions:** While it was feasible to integrate POC recency testing into routine index testing, it did not improve index testing efficiency as measured by the change in HIV positivity among contacts traced and tested through the national program. Although our study was limited by small numbers of recent infections, our results do not support the routine use of individual-level recency testing as a strategy to improve HIV index testing efficiency.

**Background:** In 2022, there were 1,833 new HIV diagnoses in Canada, a 24.9% increase from 2021, and 1 in 10 people living with HIV remain undiagnosed. This study examines the effectiveness of the *I'm Ready* program that uses a smartphone app (iOS/Android) to provide access to HIV self-testing (HIVST) to reach the undiagnosed, first-time testers and key populations across Canada.

**Methods:** *I'm Ready*, Test app launched in June 2021 after licensure of HIVST in Canada in November 2020. Participants anonymously request up to three free HIVST, which are delivered where someone lives or picked-up at one of 90+ participating community organizations.

Canadian residents participate by downloading the app, create an anonymous profile, and complete short surveys before and after self-testing. Participant characteristics and key variables including sexual risk behaviour and first-time testers were summarized using descriptive statistics.

**Results:** By December 2023, a total of 14,071 participants enrolled in *I'm Ready*, from which 7,888 (56%) ordered a self-test kit. Of those who reported, 62% (n=7,350) identified with at least one key population and 84% (n=8,176) indicated high-risk sexual behaviour. For testing behaviour, 37% (n=3,662) were first-time testers and 32% (n=3,162) had last tested more than 1 year ago.

First-time testers were significantly more likely to:

- Live in small/rural communities (OR=1.5, p<0.01);
- Be from the Atlantic provinces (OR=1.4, p<0.01);
- Identify as sexual minorities (OR=2.2, p<0.01); and
- Be ≤24 years old (OR=2.66, p<0.01).

There was a total of 29 positive test results submitted (3,361 or 43% of participants submitted a test result) for an overall positive testing rate of 0.86% (29/3,361). Of these new positives, 63% identified as being from a key population and 74% were first time testers or last tested >1 year ago.

**Conclusions:** Using a smartphone app like *I'm Ready* is a critical technology component needed to effectively distribute HIV self-testing kits to support reaching people who are undiagnosed and 1<sup>st</sup> time testers, especially key populations and those who are underserved, as well as

people who are younger, who identify as sexual minorities, and who live in small/rural communities and in the Atlantic provinces in Canada.

## THPEC268

Identifying and linking the missing children, adolescents and young people: experiences from the HIV testing services optimization efforts in Uganda

G. Taasi<sup>1</sup>, C. Katusiime<sup>1</sup>, M. Lyazi<sup>2</sup>, R. Kizito<sup>2</sup>, M. Lubega<sup>2</sup>, L. Kabunga<sup>2</sup>, J. Batusa<sup>2</sup>, D. Adoo<sup>1</sup>

<sup>1</sup>Ministry of Health, Kampala, Uganda, <sup>2</sup>Clinton Health Access Initiative, Kampala, Uganda

**Background:** HIV Testing Services (HTS) programs are operating within increasingly complex environments with more limited resources and declining number of people living with HIV identified. The Uganda HTS program is considering how to effectively manage declining testing yields as more people living with HIV (PLHIV) are on treatment, plateauing donor resources dedicated to testing, disparities in testing coverage among different population groups and challenges with linkage, retention and re-engagement in care. Children, adolescents and young people living with HIV have been sub-optimally identified in Uganda.

Significant efforts have been directed towards identifying the missing children, adolescents and young people by implementing innovative and iteratively revised HTS approaches to reach them.

**Methods:** MOH developed a national HTS optimization plan that was implemented in the period October 2021 to September 2023. The interventions prioritized for identification of the missing children and adolescents included the scale up of innovative HTS strategies including HIV Self-Testing (HIVST) and other targeted approaches such as Index Testing including Assisted Partner Notification with testing of biological children and Social Network Testing. Systematic screening of children and adolescents at Outpatient department (OPD) and other facility entry points was also implemented.

**Results:** A total of 5,892,705 children, adolescents and young people aged 0 to 24 years were offered HTS during the reference period, with 77,707 (1.3%) testing positive and 72,201 (93%) linked to care. Of those tested, 517,118 were aged 0 to 9 years, 2,113,583 aged 10 to 19 years and 3,262,004 aged 20 to 24 years. The highest positivity rate was realized among the 0-to-9-year aged children (2.0%). Majority of the clients were tested in the facilities (80.5%). Higher yield (1.6%) reported in community compared to facility testing (1.25%). Total of 557,828 HIVST kits were distributed with 5,303 (~1%) reporting a positive HIVST.

**Conclusions:** Implementation of innovative case finding strategies among children, adolescents and young people is highly feasible. Scale up of targeted community

based approaches can lead to higher identification rates for PLHIV. Integration of HIVST into HTS can lead to significant number of PLHIV identifications among children, adolescents and young people.

## Cascades of HIV care and treatment

"It's not the virus that kills you, it's the community": Stigma and HIV care engagement among sex workers, sexually diverse men, and transgender women living with HIV in Jamaica

C. Logie<sup>1</sup>, L. Gittings<sup>2</sup>, D. Kinitz<sup>3</sup>, P. Shuper<sup>4</sup>, P. Newman<sup>1</sup>, S. Baral<sup>5</sup>, P. Lalor<sup>6</sup>, K. Levermore<sup>6</sup>

<sup>1</sup>University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, <sup>2</sup>Western University, London, Canada, <sup>3</sup>Stanford University, Stanford, United States,

<sup>4</sup>Centre for Addiction and Mental Health, Toronto, Canada, <sup>5</sup>John Hopkins University, Baltimore, United States,

<sup>6</sup>Jamaica AIDS Support for Life, Kingston, Jamaica

**Background:** In Jamaica, sex workers (SW), men who have sex with men (MSM), and transgender women experience criminalization and are overrepresented in the HIV pandemic, yet their experiences of living with HIV are understudied.

To address this gap, we explored experiences of stigma and linkages with the HIV care cascade among cisgender women SW, MSM, and transgender women living with HIV in Jamaica.

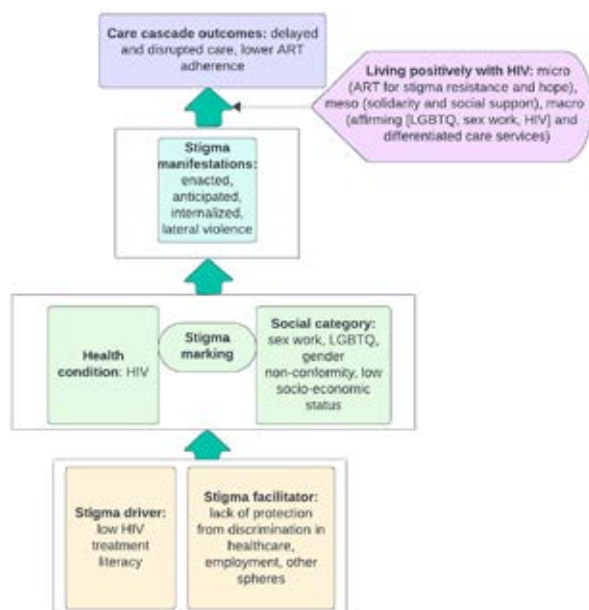

**Methods:** This community-based qualitative study involved n=9 focus groups (FG), n=1 FG per population (SW, MSM, and trans women living with HIV) in each of three sites: Kingston, St. Ann, and Montego Bay. We also conducted n=10 key informant (KI) interviews.

We applied thematic analysis informed by the Health Stigma and Discrimination (HSD) Framework, a cross-cutting framework that examines stigma drivers and facilitators, marking, manifestations, and outcomes.

**Results:** FG participants (n=67) included SW (n=18), MSM (n=28), and trans women (n=21); we interviewed n=10 KI (n=5 cisgender women, n=5 cisgender men). Participant narratives revealed low HIV treatment literacy as a stigma driver, notably misinformation about ART benefits and HIV acquisition risks. Stigma facilitators included a lack of legal protection from discrimination. Stigma marking targeted health (HIV) and intersecting identities (sex work, LGBTQ identities, gender non-conformity).

Stigma manifestations included enacted stigma in communities and families, and internalized stigma—including lateral violence. HIV care cascade impacts included reduced/delayed HIV care engagement and ART adherence

challenges. Participants also discussed strategies to live positively with HIV, including: ART adherence as stigma resistance; social support and solidarity; and accessing affirming institutional support.

**Conclusions:** Findings underscore the role of multi-faceted intersectional stigma processes in shaping the lived experiences of key populations living with HIV in ways that constrain access to resources, social support, and ultimately to HIV outcomes. In addition to addressing intersecting stigma, future research and programing can bolster multi-level stigma-resistance strategies for living positively with HIV.

## THPEC270

### Predicting retention in care before and after the COVID-19 pandemic among people with HIV (PWH)

M. Bogart<sup>1</sup>, G. Germain<sup>2</sup>, A. Urosevic<sup>2</sup>, M. Mahendran<sup>2</sup>, F. Laliberté<sup>2</sup>, M.S. Duh<sup>3</sup>

<sup>1</sup>Gilead Sciences, Inc., Foster City, United States, <sup>2</sup>Groupe d'Analyse, Ltée, Montréal, Canada, <sup>3</sup>Analysis Group, Inc., Boston, United States

**Background:** Poor retention in care is associated with worse HIV-related outcomes. We examined the impact of the COVID-19 pandemic on retention in care and identified predictors of falling out of care among PWH in the U.S.

**Methods:** Retrospective data from the IQVIA PharMetrics® Plus database were assessed to compare retention in care in the 12-month period before and after the COVID-19 pandemic (index date: March 1, 2020), using odds ratios estimated from logistic regression models. A LASSO model was developed using cross-validation to identify predictors of falling out of care during the post-pandemic period.

**Results:** Overall, 19,782 PWH were included (median age 51 years, 81% male). Most HIV-related medical claims closest to the index date arose from primary care (50%) or infectious disease specialists (28%). A significant decrease in the likelihood of retention in care was observed post-versus pre-pandemic using three metrics: HIV-related healthcare visits (-35%), laboratory testing (-45%) and antiretroviral therapy (ART) adherence (-10%) (all  $P < 0.001$ ; Table). Using ART adherence, 14,011 PWH were retained in care pre-pandemic and selected for LASSO model development (c-statistic: 0.70); of these, 15% fell out of care during the post-pandemic period. Predictors of falling out of care included younger age, female sex, insurance plan type, use of antidiabetic medications,  $\geq 1$  pre-pandemic CD4 count test,  $\geq 1$  pre-pandemic HIV-related emergency department visit, cardiac arrhythmias and addictive disorders (Figure).

Retention in care metric	Pre-pandemic period retention in care, n (%) N=19,782	Post-pandemic period retention in care, n (%) N=19,782	Reduction (%)	Odds ratio* (95% CI)	P value*
HIV-related healthcare visits <sup>†</sup>	13,335 (67.4)	11,308 (57.2)	35	0.65 (0.62, 0.67)	<0.001
Laboratory testing <sup>‡</sup>	14,284 (72.2)	11,638 (58.8)	45	0.55 (0.53, 0.57)	<0.001
ART use during the HIV identification period <sup>§</sup>	18,941 (95.7)	18,941 (95.7)	–	–	–
ART adherence <sup>¶</sup>	14,011 (74.0)	13,637 (72.0)	10	0.90 (0.88, 0.93)	<0.001

\*Odds ratios, 95% confidence intervals and P values were calculated from generalized estimating equation logistic regression models; <sup>†</sup>Participants with  $\geq 2$  HIV-related outpatient visits  $\geq 90$  days apart within the 12-month period; <sup>‡</sup>Participants with  $\geq 2$  CD4 count or viral load tests  $\geq 90$  days apart within the 12-month period; <sup>§</sup>6-month HIV identification period (September 1, 2018, to March 1, 2019); <sup>¶</sup>Participants with proportion of days covered by ART (i.e., total number of days with medication on hand)  $\geq 0.9$  within the 12-month period  
ART, antiretroviral therapy; PWH, people with HIV

Table. Retention in care among PWH in the pre- vs. post-pandemic period.

\*Odds ratios, confidence intervals and P values were calculated from a regular logistic regression (i.e., unpenalized) using all covariates selected by the LASSO logistic model. <sup>†</sup>Age, sex and insurance plan type were assessed on index date; all other demographics were assessed during the 12-month pre-pandemic period, not including the index date  
DSM-V, Diagnostic and Statistical Manual of Mental Disorders, 5th Edition; HRU, healthcare resource utilization; PPO, preferred provider organization

Figure. Odds ratios\* of LASSO predictors significantly associated with falling out of care in the post-pandemic period.

**Conclusions:** The COVID-19 pandemic significantly affected retention in care in PWH. Predictors from the LASSO model advance our understanding of retention in care and could be used to identify and engage PWH at risk of falling out of care in clinical practice.

## THPEC271

### The influence of community-based interventions on multi-month dispensing of ART in children and adolescents living with HIV

A. Exavery<sup>1</sup>, J. Charles<sup>1</sup>, E. Kuhlik<sup>2</sup>, R. Fovo<sup>1</sup>, A. Ally<sup>1</sup>, R. Msey<sup>1</sup>, T. Mbwambo<sup>1</sup>, C. Shao<sup>1</sup>, A. Barankena<sup>1</sup>, L. Kikoyo<sup>1</sup>

<sup>1</sup>Pact Tanzania, Dar es Salaam, Tanzania, the United Republic of; <sup>2</sup>Pact Inc., Washington DC, United States

**Background:** Multi-month dispensing (MMD) is a vital strategy for differentiated service delivery (DSD) to enhance care and treatment outcomes of people living with HIV. However, MMD coverage in children and adolescents living with HIV (CALHIV) is limited.

This study examines the association between interventions provided by the community based ACHIEVE project on MMD coverage in CALHIV receiving ART in Tanzania.

**Methods:** Data from 43,668 CALHIV aged 0-17 years who were beneficiaries of the ACHIEVE project as of 31 July 2023 was used. MMD, a clinical characteristic of the CALHIV obtained from health facilities, was the outcome variable in three categories: not on MMD, MMD 3-5 months, and MMD 6+ months.

Data analysis involved cross tabulations and multivariable mixed-effects ordinal logistic regression model to identify how different interventions of the ACHIEVE project influenced MMD in the CALHIV.

**Results:** The analysis included CALHIV aged 10.5 years on average, 52.3% of whom were female. Their MMD status as of 31 July 2023 was 31.3%, 11.2%, and 57.5% for not on MMD, 3-5 months, and 6+ months, respectively.

After adjusting for several characteristics, the likelihood of CALHIV to be on MMD was positively influenced by the ACHIEVE project interventions, including longer duration in the project (6-11 months: aOR = 3.65, 95% CI 2.85-4.69; 12+ months: aOR = 3.73, 95% CI 2.91-4.79), provision of ART calendar (aOR = 1.61, 95% CI 1.47-1.77, caregiver participation in savings groups (aOR = 1.23, 95% CI 1.13-1.34), teen club attendance (aOR = 2.57, 95% CI 2.32-2.84), and provision of health insurance (aOR = 1.25 95% CI 1.16-1.35).

**Conclusions:** The findings reveal a significant, positive association between interventions provided by the ACHIEVE project and the likelihood of CALHIV to be on MMD. This highlights the potential role of community-based programs in DSD for improving MMD utilization.

## THPEC272

### Integration of traditional healers with local health facility service delivery

M. Chabane<sup>1</sup>, J. Pienaar<sup>1</sup>

<sup>1</sup>Aurum Institute, Johannesburg, South Africa

**Background:** The uptake of ART among MSM in SA is complicated by the need for some clients to undertake traditional remedies before attempting to initiate ART. These clients strongly believe in traditional medicine and seek care from traditional healers. Traditional medicine is by no means an alternative practice in South Africa, with an estimated 72% of the Black African population in South Africa relying on this form of medicine. This proportion of clients consults with traditional healers before accessing public health services.

**Description:** To address prevention and treatment gaps the uMgungundlovu POP INN team engaged with traditional healers in the local areas and invited them to the clinic for discussions about HIV prevention, treatment, and care from December 2020. During the period of October 2022-September 2023 uMgungundlovu found 198 HIV positive cases, however, 169 cases were linked to care using same-day ART initiation. Eleven traditional healers in the uMsunduzi sub-district were invited to the clinic to begin collaborative efforts.

The aim of the collaboration was to establish and build a strong working relationship with traditional healers that will educate and empower them about HIV/AIDS and other related diseases.

**Lessons learned:** Traditional healers were trained in HIV testing services, treatment, and care. Four traditional healers with HIV knowledge have since been integrated with the POP INN clinics and provide HTS, condom distribution, and referrals between their practices and the clinics. The collaboration has assisted in the retention of clients and re-initiating of lost clients. Training the traditional healers on HTS has provided a strong referral system, this has expanded to the eThekweni site where two additional traditional healers have been integrated and trained. Engaging with communities and traditional healers through Mpowerment groups resulted in 23 clients reached and provided with prevention packed (PrEP).

**Conclusions/Next steps:** Collaboration with traditional healers at Aurum POP INN uMgungundlovu continues to grow and expand to the provision of PrEP consultations and referrals from the traditional healers to the facility. The traditional healers' premises will also be used as 'pick up points' for the clients to reduce and mitigate transport costs, reduce institutional stigma, and bridge the gap between culture and mainstream medicine.

## THPEC273

"It is beyond anonymity": reasons why PLHIV continue to opt for ART services from a distant location compared to place of residence, Andhra Pradesh

R. Allam<sup>1</sup>, P.K. Ragi<sup>2</sup>, N. Chava<sup>2</sup>, R. Ganti<sup>2</sup>, J.K. Kurada<sup>2</sup>, V. Yeldandi<sup>2</sup>, R. Prasad<sup>2</sup>, K. Prasad<sup>3</sup>, M. Nyendak<sup>1</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention (CDC), DGHT, New Delhi, India, <sup>2</sup>Society for Health Allied Research & Education India (SHARE INDIA), Hyderabad, India,

<sup>3</sup>Andhra Pradesh State AIDS Control Society, Vijayawada, India

**Background:** Andhra Pradesh (AP) State AIDS Control Society rolled out several 'Differentiated Service Delivery Models' including multi-month dispensation (MMD), rapid antiretroviral therapy (ART) initiation, and decentralized ART in the community, reducing interruption in treatment (IIT) rates from 4.1% to 1.5% during September 2020-2022.

**Methods:** To further prevent IIT, we identified 20,761 of 213,375 people living with HIV (PLHIV) travelling >50 kilometers (kms) to access ART and sought to decentralize ART closer (<50kms) to their residence. During November 2022-April 2023, staff from 53 ART centers, contacted PLHIV traveling >50 kms either telephonically or in-person during pill pick-up, and systematically provided options on the benefits of decentralized ART services, and recorded responses in routine program tools.

We calculated the proportion of PLHIV who opted for decentralized care closer to their residence and odds ratio (OR) to determine if gender, current age, and ART duration were associated with acceptance of decentralized care.

**Results:** We contacted 18,047/20,161(90%) of eligible PLHIV and 8,336(46%) agreed to care closer to their residence. Reasons for not opting for closer care included benefit of availing other interdepartmental-health services in the current location (n=3,675; 38%), proximity to workplace (n=1,275; 13%), ART staff familiarity (n=1,011; 10%), while 28% (n=2,744) cited anonymity and 6% noted self-perceived stigma (n=535) (Figure-1).

Figure 1. Reasons why PLHIV prefer Antiretroviral Therapy access from a distant location of more than 50 kilometres, Andhra Pradesh - 2023.

Those who decided to receive ART closer to their residence were more likely to be on ART for <3 years (n=2,007; 54%) [OR:1.47, 95% CI:1.37-1.58] and female gender (n=4,481; 48%) [OR:1.15, 95% CI:0.08-1.22] compared to those on ART for >3 years (n=6,329; 44%) and male and transgender [3,836 (44%); 19 (43%)].

**Conclusions:** Slightly less than half of PLHIV opted for closer ART care when offered, although women and PLHIV on ART less than 3 years preferred this option. Reasons for not accepting closer ART care included desire to access co-located health services and anonymity.

## THPEC274

Successes and persistent gaps in achieving UNAIDS 95-95-95 target for sexually exploited minors and female sex workers, men who inject drugs, and men who have sex with men in Vietnam

B.H. Duc<sup>1</sup>, P.T.T. Huong<sup>1</sup>, P.D. Manh<sup>1</sup>, D.T. Lo<sup>1</sup>, N.T.T. Ha<sup>2</sup>, H.T.T. Ha<sup>2</sup>, K.V. Nghia<sup>3</sup>, T.P. Hau<sup>3</sup>, N.D. Phuc<sup>3</sup>, N.C. Quoc<sup>4</sup>, N.H. Minh<sup>4</sup>, A. Mirzazadeh<sup>5</sup>, W. McFarland<sup>5</sup>, D.C. Thanh<sup>4</sup>

<sup>1</sup>Vietnam Administration of HIV/AIDS Control, Ministry of Health, Ha Noi, Viet Nam, <sup>2</sup>National Institute of Hygiene and Epidemiology, Ha Noi, Viet Nam, <sup>3</sup>Pasteur Institute of Ho Chi Minh City, Ho Chi Minh city, Viet Nam, <sup>4</sup>US. CDC Vietnam, Division of HIV and TB, Ha Noi, Viet Nam, <sup>5</sup>Institute for Global Health Sciences, University of California San Francisco, Epidemiology and Biostatistics, San Francisco, United States

**Background:** The HIV epidemic in Vietnam is concentrated among key populations (KP) including people who inject drugs (PWID), sexually exploited minors (SEM) and female sex workers (FSW), and men who have sex with men (MSM). We characterize progress toward UNAIDS 95-95-95 targets in these populations.

**Methods:** We analyzed data from the National Sentinel Surveillance Plus Behavior which used venue-based (where KP gathering) sampling. Surveys were conducted with male-PWID (20 provinces, 2019), SEM/FSW (13 provinces, 2018 and 2020) and MSM (11 provinces, 2018 and 2020). We measured UNAIDS 95-95-95 targets with the 1<sup>st</sup> 95 as HIV status awareness among participants self-reported HIV-positive or viral load [VL]<200 copies/ml if reported HIV negative/unknown); 2<sup>nd</sup> 95 as being on ART self-reported or VL<200 copies/ml if denying ART use); and 3<sup>rd</sup> 95 as being virally suppressed (VL<1000 copies/ml). National level analysis was adjusted for the clustering effect.

**Results:** The UNAIDS 95-95-95 estimates are shown in Figure 1. Notably, for SEM/FSW the 1<sup>st</sup> 95 estimate increased significantly from 33.3% (95% CI 20.4-49.4) in 2018 to 79.8% (95% CI 59.2-91.5) in 2020.

For MSM the 1<sup>st</sup> 95 estimate decreased from 53.9% (95% CI 43.5-64.0) in 2018 to 45.1% (95% CI 35.0-55.5) in 2020. The 2<sup>nd</sup> 95 and 3<sup>rd</sup> 95 estimates were above 95% for SEM/FSW,

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

and for MSM, in 2020. For male PWID, the 1<sup>st</sup> 95 estimate was 89.9% (95% CI 85.9-92.8), the 2<sup>nd</sup> 95 was 96.4% (95% CI 93.5-98.1), and the 3<sup>rd</sup> 95 was 94.6% (95% CI 91.9-96.5) in 2019.

Figure 1. HIV care continuum cascades among key populations in Vietnam, 2018 - 2020.

**Conclusions:** Although these results suggest the 2<sup>nd</sup> and 3<sup>rd</sup> 95 targets are being achieved for three KP, our study revealed significant gaps in meeting the 1<sup>st</sup> 95 target, especially among MSM. Much improvement in the 1<sup>st</sup> 95 target for SEM/FSW are noted. Efforts are needed to prioritize HIV case finding in provinces where the gaps are.

## THPEC275

The impact of 2014 military conflict in Donbas Region and the Autonomous Republic of Crimea on 95-95-95 HIV cascade among people who inject drugs receiving opioid agonist treatment in Ukraine

A. Meteliuk<sup>1</sup>

<sup>1</sup>Alliance for Public Health, TPSM, Kyiv, Ukraine

**Background:** Opioid agonist therapies (OAT) for people who inject drugs (PWID) have been available in Ukraine since 2004 with 1,868 PWID receiving OAT in Donbass Region and the Autonomous Republic [AR] of the Crimea with over 30% of whom lived with HIV before the onset of Russian invasion of Ukraine in 2014.

This study assessed the effect of 2014 military conflict on 95-95-95 HIV cascade among people on OAT living with HIV residing and receiving treatment in areas affected by the conflict.

**Methods:** Data from the Ukrainian national registry of people on OAT containing 1,868 PWID receiving OAT as of January 2014 in conflict areas (Donbass and AR of the Crimea) were analyzed. Logistic regressions were conducted to compare the 95-95-95 HIV cascade indicators among people on OAT living with HIV referred from government-controlled areas (GCA) and non-government-controlled areas (non-GCAs) as of the end of 2021.

**Results:** Total number of people on OAT living with HIV affected by the 2014 military conflict was 674, among whom 528 were referred from GCAs compared to 146 patients from non-GCAs. The majority of them were male (over 80%), in 35-44 years old age category (74%) with less than 14 years of drug use experience before OAT initiation (62%)

and receiving high dosing of methadone as their OAT drug (96%) mostly take-home from OAT site (72%). As for the 95-95-95 HIV cascade, all HIV-positive OAT patients (n=674) were aware of their HIV status, however only 53% of those referred from non-GCAs were on ART compared to 83% among those referred from GCAs ( $p<0.00001$ ) with 37% and 59% being virally suppressed among HIV-positive patients referred from non-GCAs and GCAs respectively ( $p=0.0021$ ).

**Conclusions:** This study provides critical insight into how conflict and displacement affect people OAT living with HIV. OAT program in AR of the Crimea was shut down. Few patients were successfully referred from non-GCAs to treatment sites in GCAs, and the 95-95-95 HIV cascade indicators are significantly lower in those from non-GCAs. Given the obtain results it is crucial to retain people on OAT living with HIV given the on-going russian full-scale invasion of Ukraine.

## THPEC276

Finding missed opportunities across the PMTCT cascade to improve interventions to reduce the transmission of HIV among Infants in Mozambique DOD-supported facilities

L. Nhambi<sup>1,1</sup>, L. Macaringue<sup>2</sup>, C. Santos<sup>2</sup>, C. Machalela<sup>2</sup>, A. Viegas<sup>1</sup>, M. Strachan<sup>2</sup>, S. Kelbert<sup>2</sup>, S. Massangaie<sup>3,3</sup>, O. Tuzine<sup>4</sup>, L. Joaquim<sup>4</sup>

<sup>1</sup>Jhpiego, M&E, Maputo, Mozambique, <sup>2</sup>Jhpiego, DOD Project, Maputo, Mozambique, <sup>3</sup>FADM, Departamento de Saúde Militar, Maputo, Mozambique, <sup>4</sup>FADM, Direção de Saúde Militar, Maputo, Mozambique

**Background:** In Mozambique, mother-to-child transmission (MTCT) of HIV has reduced from 12% in 2022 to 10% in 2023. As part of the U.S. Department of Defense-funded program, Jhpiego works with the Forças Armadas de Defesa de Mozambique (FADM) to implement a comprehensive HIV program, which includes the elimination of MTCT. The purpose of this study was to identify missed opportunities in preventing MTCT.

**Methods:** This is a retrospective descriptive analysis of missed opportunities across the PMTCT cascade leading to HIV vertical transmission, using data from October 2022 to September 2023. De-identified data on HIV status, antiretroviral therapy (ART), viral load suppression (VLS), antenatal care (ANC) visits of mothers, and early infant diagnosis (EID) were extracted from monthly programmatic reports.

**Results:** From October 2022 to September 2023, 1094 HIV-exposed infants (HEI) were expected based in proxy measure HIV positive woman but only 889 (81%) were identified across nine sites. 99.5% (n=885) EID PCR DNA samples were collected; of those identified, 3% (n=29) were diagnosed with HIV and 86% (n=25) started ART. Of the 29 infants diagnosed with HIV, 51% (n=15) were <2

months of age and 49% (14) were aged 2-9 months. A total of 67.9% (19/28) of the pregnant mothers attended ANC visits in FADM-supported sites and the remaining 32.1% (9/28) were followed up at other MOH health facilities. About 42% (8/19) of pregnant mothers were already on ART at the start of their pregnancy; 53% (10/19) were newly diagnosed as HIV-positive and 90% (10/11) started ART. About 36% (10/28) had VLS (< 1000 copies/ml), 14% (4/28) had unsuppressed VL, and 50% (14/28) had no VL testing requested. Of the 29 infants diagnosed with HIV, 65.5% (19) were identified through EID testing. The remaining 34.5% (9) had interrupted follow-up in MoH sites and were identified in routine screening at the Expanded Vaccination Program.

**Conclusions:** This initial analysis reveals missed opportunities across various PMTCT cascade stages, including VL monitor, retention of HIV-infected pregnant and breast-feeding women on ART, insufficiently monitoring HIV-exposed children and inconsistent PCR collection impacting MTCT. Additionally, conduct thorough studies at each stage for detailed insights into targeted interventions.

## THPEC277

### Factors associated with repeat treatment interruption among men in Malawi: findings from two randomized control trials

K.T. Balakasi<sup>1</sup>, M. Thorp<sup>2</sup>, I. Robson<sup>1,2</sup>, M. Mphande<sup>1</sup>, C. Lemani<sup>1</sup>, A. Choko<sup>1,3</sup>, S. Phiri<sup>1,3</sup>, R. Hoffman<sup>2</sup>, T.J. Coates<sup>2</sup>, K. Dovel<sup>1,2</sup>

<sup>1</sup>Partners in Hope, Implementation Science, Lilongwe, Malawi, <sup>2</sup>University of California, Los Angeles, David Geffen School of Medicine, Los Angeles, United States, <sup>3</sup>Kamuzu University of Health Sciences, School of Global and Public Health, Blantyre, Malawi

**Background:** Men living with HIV (MLHIV), especially those who have already experienced treatment interruption (TI) of antiretroviral therapy, need additional support to reinitiate and to avoid repeat TI. We assessed factors associated with repeat TI among men with a history of TI in Malawi.

**Methods:** We used data from the IDEAL and ENGAGE trials conducted in 28 facilities in eight districts of Malawi (ClinicalTrials.gov#NCT04858243; #NCT05137210). Trials aimed to assess impact of male-specific interventions on retention. Eligible participants were: MLHIV ≥15-years; living within facility catchment area; not in care at time of enrolment (never initiated, missed initial refill after initiation, or ≥28 days late for a refill appointment). This secondary analysis only includes men who (re)initiated ART during the trial. Our primary outcome of interest was repeat TI during the trial period (≥28-days late for a refill appointment), measured through validated medical chart data. We identified factors associated with repeat TI using mixed effects logistic regression.

**Results:** The trials enrolled 1309 men; we included 1190 (91%) men who re-initiated ART in this analysis. Among those included, 42% (498/1190) experienced repeat TI during the 6-month trials period (Table).

Variable	Total % (n=1190)	Retained in care % (n=692)	Had a repeat TI % (n=498)	aOR <sup>a</sup> (95% CI)
Younger age (<40 years) <sup>1</sup>	52.6 (626)	46.2 (320)	61.5 (306)	1.92 (1.51-2.44)***
Unmarried (single or not in a steady relationship)	30.3 (361)	27.2 (188)	34.7 (173)	1.43 (1.11-1.85)***
Not owning a productive asset <sup>2</sup>	66.5 (791)	62.7 (434)	71.7 (357)	1.57 (1.22-2.03)***
Perceived stigma from status disclosure	80.9 (963)	81.2 (562)	80.5 (401)	1.01 (0.75-1.37)
Disclosed status to anyone	92.2 (1097)	92.9 (643)	91.2 (454)	0.80 (0.52-1.25)
Mobility (spent >30 nights away from home)	8.3 (99)	5.1 (35)	12.9 (64)	2.76 (1.77-4.31)***
Hazardous alcohol consumption <sup>3</sup>	28.6 (340)	25.4 (176)	32.9 (164)	1.38 (1.06-1.78)**

<sup>1</sup>Reference group is men aged 40+ years

<sup>2</sup>Includes a bicycle, motorcycle, car or oxcart

<sup>3</sup>Consuming more than 4 drinks on the last drinking episode

\*p<0.1, \*\*p<0.05, \*\*\*p<0.01

<sup>a</sup>Adjusting for trial arm and health facility

Table: Factors associated with repeat treatment interruption.

Men had a median age of 39-years (IQR 32-46), 30% were unmarried and 67% did not own any productive assets (bicycle, motorcycle, car or oxcart); during trial period 8% were mobile (spent >30 nights away from home) and 29% had hazardous alcohol use. Mobility increased the odds of repeat TI three-fold (aOR 2.76; 95%CI 1.77-4.32). Younger age (<40-years) (aOR 1.93, 95%CI 1.52-2.45), being unmarried (aOR 1.43, 95%CI 1.11-1.85), not owning a productive asset (aOR 1.57, 95%CI 1.22-2.03) and hazardous alcohol use (aOR 1.38; 95%CI 1.06-1.78) were significantly associated with repeat TI.

**Conclusions:** Mobility, younger age and not owning productive assets were strongly associated with TI in this population. Interventions tailored to these sub-populations are needed.

## THPEC278

From being labeled 'vectors of HIV' to strategic partners: the case of female sex-workers at the center of HIV programming and interventions using community-led strategies in Kampala and Wakiso, Uganda

R.M. Kyomukama<sup>1</sup>, M. Simiyu<sup>2</sup>

<sup>1</sup>Alliance of Women Advocating for Change (AWAC), Programs, Kampala, Uganda, <sup>2</sup>Alliance of Women Advocating for Change (AWAC), Kampala, Uganda

**Background:** Female sex workers (FSWs) face stigma and discrimination being labeled as vectors of HIV which excludes their efforts and affects their agency in the fight against HIV. The Alliance of Women Advocating for Change (AWAC), a Female sex worker-led organization, designed a 3 years program dubbed 'Leveraging FSW structures and strength in HIV care and prevention' that placed FSW at the center of HIV programing, enhance their agency and address negative connotations to FSW as vectors of HIV but rather key partners in the fight against HIV in Uganda.

**Description:** Thirty (30) grassroots female sex-workers were engaged in Community Client-led ART delivery, Peer Outreaches, Community Health and Livelihoods Enhancement Groups (CHLEGs) and Door-to-door testing modalities to enhance ART services, PrEP uptake and awareness on PEP and other HIV related services in Kampala and Wakiso districts, Uganda between Oct 2020 to Sept 2023.

**Lessons learned:** In 3yrs, 30 grassroots FSWs extended services to fellow FSWs including; 10910 initiated on PrEP, 572 initiated on ART, 482 received ART Refills, 5679 received PrEP refills, 127 were reached with Viral Load bleeding, 149 received Intense Adherence Counseling, 3200 received GBV Services (Counseling and Treatment), 89 FSWs using and injecting drugs were reached with one time use needles and syringes to curb new incidences and 94 FSWs living with HIV were screened for Cervical cancer. More so, 500 children (218M, 282F) of FSWs were identified and tested for HIV, of whom 22 (8M, 14F) were tested positive and initiated ART. Overall, FSWs structures, leaders and the FSW fraternity became more strengthened and actively engaged in the fight against HIV in Kampala and Wakiso districts in Uganda.

**Conclusions/Next steps:** FSWs are better reached by FSWs and this has increased their uptake of HIV services in Kampala and Wakiso, Uganda. This program gave evidence that FSW are key partners working at the center of HIV programming, leveraging on their structures, agency and efforts to fight against HIV hence controlling new incidences and increasing adherence thus contributing to U=U. Future programming should be deliberate at creating spaces and platforms to amplify the role of FSW at the center of the fight against HIV.

## THPEC279

Strategic interventions for reducing dropped cases from ARV treatment cascade (LFU) and tracked for HIV care management: a case study from Uttar Pradesh, India

H. Agarwal<sup>1</sup>, R. Dua<sup>2</sup>, R. Huidrom<sup>2</sup>, P. Kumar<sup>2</sup>, F. Khan<sup>1</sup>, B. Singh Kushwaha<sup>3</sup>, R. Singh<sup>4</sup>, R.K. Singh<sup>5</sup>

<sup>1</sup>India HIV/AIDS Alliance, Program, Delhi, India, <sup>2</sup>India HIV/AIDS Alliance, Senior Program Management, Delhi, India, <sup>3</sup>National AIDS Control Organization, Ministry of Health, National care, support and treatment -program, Delhi, India, <sup>4</sup>National AIDS Control Organization India, National care, support and treatment -program, Delhi, India, <sup>5</sup>India HIV/AIDS Alliance, Strategic information department, Delhi, India

**Background:** "Lost To Follow-Up" (LFU) in HIV care refers to diagnosed individuals missing scheduled counselling and treatment, complicating tracking due to factors like fake identities and migrations. Stigma contributes to LFU risks, complicating clinical studies. Identifying and controlling LFU factors is challenging, with outreach vital for nuanced insights. IHAA's care program, since 2013, spans 310 centers nationwide, serving 1.9 million PLHIV.

In Uttar Pradesh, densely populated and facing migration challenges, Vihaan identified 1,87,229 LFU cases, tracing back 140,695 at a 75% success rate. Despite progress, significant efforts are needed for re-engagement. VAAPSHI LFU Drive (Jan. 2023 to Feb. 2023) aimed to minimize LFU cases in UP.

**Description:** The strategy included meticulous planning, data collection, segregation, weekly tracking, utilising virtual platforms for coordination and outreach mapping, and collaboration with stakeholders. The roadmap of activities undertaken is given in the flowchart.

**Lessons learned:** The success of the initiatives hinged on strengthened outreach through team training, consistent follow-up via phone calls and home visits, and identification of limited treatment awareness among clients. Challenges, such as inadequate contact information, underscored the need for innovative locating methods. During the VAAPSHI LFU Drive, 9853 line lists were received, with an impressive 87% contact rate.

Of these, 3756 clients (44%) were successfully brought back into the care system, while 870 (10%) were reported deceased, and 706 (8.2%) opted out.

**Conclusions/Next steps:** The strategic initiatives implemented in the drive yielded valuable insights, emphasizing the need for ongoing improvements in HIV care. The following conclusions and recommendations emerged:

- Strengthen collaboration between ART Centres and CSCs for positive client engagement.
- Enhance literacy programs for improved understanding of treatment regimens.
- Innovate locating methods using technology-driven or community-centric approaches.
- Tailor interventions for clients agreeing to visit ART Centres for successful retention.
- Implement a robust state-level monitoring mechanism for ongoing data validation and adaptive strategies.

## THPEC280

Closing the viral load suppression gap among pediatric clients in Southern Nigeria: a retrospective study

D. Zekeri<sup>1</sup>, O. Ogungbade<sup>2</sup>, O. Majekodunmi<sup>1</sup>, M. Ikpeme<sup>1</sup>, C. Umeh<sup>1</sup>, B. Ochonye<sup>1</sup>, S. Ohimor<sup>1</sup>, D. Ogundehin<sup>3</sup>, O. Igboelina<sup>3</sup>, N. Ajayi<sup>4</sup>, B. Airiagbonbu<sup>1</sup>, O. Kanu-Oji<sup>5</sup>  
<sup>1</sup>Heartland Alliance Limited by Guarantee (HALG), Programs, Ikeja, Nigeria, <sup>2</sup>West Africa Center for Public Health and Development (WACPHD), Strategic Information, Ikeja, Nigeria, <sup>3</sup>United State Agency for International Development, Programs, Abuja, Nigeria, <sup>4</sup>Pathfinder International, Programs, Ikeja, Nigeria, <sup>5</sup>Heartland Alliance Limited by Guarantee (HALG), Strategic Information, Ikeja, Nigeria

**Background:** Sub-Saharan Africa has experienced a scale-up of antiretroviral therapy (ART) resulting in the improvement of the survival of children living with HIV. Viral Load (VL) monitoring is critical to HIV patient health management, and when suppressed to an undetectable level, helps in the reduction of HIV transmission. Suppressed VL is a critical component of the 95:95:95 paradigm and Children and Adolescent Living with HIVs (CALHIV) has lagged behind the Adults Living with HIV (ALHIV) in suppression rates. The study aims to showcase a program's effort to improve viral suppression in CALHIV on the Accelerating the Control of HIV Epidemic (ACE)- Cluster 6, a USAID-funded project in Southern Nigeria within a period of one year.

**Methods:** This retrospective cohort study used electronic medical record data of all pediatric clients (children < 15 years) with VL results  $\geq 1000$  cp/ml as of December 2022 living with HIV and who received HIV care at the ninety-five (95) USAID-supported sites on the project from February 2022 till August 2023. The analysis was done using STATA 13.

**Results:** From the 3314 pediatric clients actively on ART as of December 2022; 2747, clients had their VL done (83%) and 2423 clients were virally suppressed (88%). There were

324 (M: 154 F: 170), 22% virally unsuppressed clients identified out of which 164 (M: 88 F: 79), 51% were previously inactive on ART and were all tracked. After a period of nine months of Enhanced Adherence Counseling (EAC), Home Visits, Operation Triple Zero (OTZ) Club meetings, and Drug Therapeutic Committee interventions; 314 out of the 324 (97%) were virally suppressed. All the 10 (3%) the virally unsuppressed clients were inactive on ART during the nine months.

**Conclusions:** Scaling up routine VL monitoring for infants and children in resource-constrained areas like Nigeria is essential to achieve viral suppression. The importance of EAC, Home visits, OTZ cannot be overemphasized for a better overall health outcome as shown in the study. Based on UNAIDS 95-95-95 goals, it is important that programmes focus more on the needs of the pediatrics and young adults through peer support and EAC for better outcomes.

## THPEC281

Community-based HIV care accelerates viral suppression in gold-mining sites in Mali: ANRS 12392 – Sanu Gundo

F. Cavarero<sup>1</sup>, A. Kamissoko<sup>2</sup>, F. Traore<sup>2</sup>, G. Maradan<sup>1</sup>, M. Anou Guindo<sup>2</sup>, F. Diallo<sup>2</sup>, Z. Diarra<sup>2</sup>, M. Mora<sup>1</sup>, M. Bourrelly<sup>1,3</sup>, M. Cissé<sup>2</sup>, B. Dembélé Keita<sup>2</sup>, B. Spire<sup>1</sup>, M. Fiorentino<sup>1</sup>, L. Sagaon-Teyssier<sup>1</sup>

<sup>1</sup>Aix Marseille Univ, Inserm, IRD, SESSTIM, Sciences Economiques & Sociales de la Santé & Traitement de l'Information Médicale, ISSPAM, Marseille, France, <sup>2</sup>ARCAD Santé PLUS, Centre Intégré de Recherche, de Soins et d'Action Communautaire (CIRSAC), Bamako, Mali, <sup>3</sup>Coalition Plus, Community-Based Research Laboratory, Pantin, France

**Background:** In Mali, informal gold mining sites (IGMS) are characterized by circular migration, convergence of key populations, geographic isolation, and the absence of health services. There is an important potential risk of acquisition and dissemination of HIV.

This study aimed to assess the impact of a proximity community-based HIV care compared with services delivered by the public sector on linkage-to-care, retention, and viral suppression among HIV-positive people diagnosed in two IGMS.

**Methods:** ARCAD Santé PLUS in Mali, offered community-based medical consultations including HIV testing in two IGMS. Adults newly tested/confirmed positive for HIV in Kofoulatié were offered with the community-based HIV care (intervention group) and those in Diassa were referred to the public sector, as recommended by the national guidelines (control group). Sociobehavioral and clinical data were collected quarterly for 12 months, along with dried blood spots at M0, M6, and M12 (2020-2022). The intervention's impact was assessed by comparing

between groups the percentages of linkage to care at M3, viral suppression (<200 cp/mL) at M6, and retention in care at M12 (using logistic regressions), and the mean viral loads at M6 (using Wilcoxon test). To account for confounding factors, we adjusted our analysis using propensity scores.

**Results:** Out of the 9774 individuals offered an HIV test, 170 tested positive and were enrolled (56 men; 41 female sex workers; 73 female non-sex workers). The linkage to care at M3 was 86% (IC95: 80-91), and retention in care at M12 was 93% (88-96), with no observed difference between groups. At M6 (n=79), the intervention group exhibited significantly lower mean viral loads (42,325 cp/mL vs. 5,986 cp/mL;  $p=0.039$ ) compared to the control group, along with higher proportions of viral suppression (73% vs. 44%, Odds Ratio 4.05 [95% CI: 1.52-11.8],  $p=0.007$ ). No significant differences between the groups were observed at M0 ( $p=0.2$ ).

**Conclusions:** The community-based HIV care intervention had a faster effect in decreasing viral loads after 6 months, compared with public services. Implementing on-site community-based HIV testing and care is a promising strategy for controlling HIV epidemics within and emanating from remote areas that convey mobile, vulnerable, and at-risk populations for HIV.

## THPEC282

### Food insecurity and longitudinal HIV care continuum outcomes among people with HIV entering HIV care in Cameroon

A. Parcesepe<sup>1</sup>, L. Filiatreau<sup>2</sup>, P.V. Ebasone<sup>3</sup>, A. Dzudie<sup>3</sup>, M. Wainberg<sup>4</sup>, M. Yotebieng<sup>5</sup>, K. Anastos<sup>5</sup>, R. Ajeh<sup>3</sup>, D. Nash<sup>6</sup>  
<sup>1</sup>University of North Carolina at Chapel Hill, Chapel Hill, United States, <sup>2</sup>Washington University in St Louis, St Louis, United States, <sup>3</sup>Clinical Research Education Networking and Consultancy, Yaounde, Cameroon, <sup>4</sup>Columbia University and New York State Psychiatric Institute, New York, United States, <sup>5</sup>Albert Einstein College of Medicine, Bronx, United States, <sup>6</sup>City University of New York, New York, United States

**Background:** Food insecurity has been associated with suboptimal health outcomes, including among people with HIV (PWH). The impact of food insecurity on outcomes across the HIV care continuum remains poorly understood. Multi-state analytic methods can advance our understanding of how individuals experiencing food insecurity engage with HIV care over time.

**Methods:** Data were collected from 426 PWH aged 21 or older entering HIV care at 3 clinics in Cameroon between June 2019 and March 2020. HIV clinic data were extracted for all participants through January 1, 2022. Food insecurity was measured using the Household Hunger Scale. The proportion of individuals and time spent in six mutually exclusive and exhaustive HIV care states was estimated: linked to clinic; engaged at clinic, prescribed ART; disen-

gaged from clinic; re-engaged at clinic; known death; known transfer out. Estimates were compared for those with versus without food insecurity at baseline using differences.

**Results:** Overall, 417 PWH contributed 819.4 person-years of follow-up. A total of 28% of participants reported moderate or severe food insecurity at enrollment into HIV care. Individuals with (vs without) moderate or severe food insecurity were more likely to have a documented transfer out two years following HIV care engagement [Figure; 18.6% (95% CI 13.3%, 23.5%) versus 8.9% (95% CI 6.4%, 11.2%); percent difference=9.7%]. The difference in the total time spent on treatment and engaged (or re-engaged) in HIV care at their original clinic among those with (vs without) food security was 22.1 days.

Figure. HIV care outcomes among PWH in Cameroon, stratified by food insecurity.

**Conclusions:** Food insecurity was associated with suboptimal HIV care outcomes in the first two years of HIV care among this cohort of PWH in Cameroon. These findings underscore the importance of addressing the material needs of PWH and support integration of food assistance and economic empowerment interventions into HIV care.

## THPEC283

### New indicators to measure non retention and re-engagement in HIV care in England

V. Martin<sup>1</sup>, K. Okumu-Camerra<sup>1</sup>, C. Chau<sup>1</sup>, A. Brown<sup>1</sup>  
<sup>1</sup>Uk Health Security Agency Uk Health Security Agency, London, United Kingdom

**Background:** Regular HIV care consultations are key to reducing ill health and to ensure HIV remains undetectable thereby preventing onward transmission. British guidelines advise people with HIV to access care annually. We describe the characteristics of people living with HIV who did not attend HIV care within 15 months of their last appointment and who re-attended after a care gap.

**Methods:** All adults (≥15 years) reported through HIV and AIDS reporting system (HARS) seen for HIV care between 2019-2022 in England were included. Non retention in care was defined as not attending any UK clinic within 15 months of last attendance (including virtual/phone consultations). Successful re-engagement was defined as attending in care after a 15-month gap including a viral load (VL) was <200 copies/mL within 6 months of re-attendance. Clinic follow-up was used to exclude those who emigrated.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Results:** Among 86,161 adults seen for care between October 2019 and September 2020, 6,392 (7.4%) were not retained by end of 2021. Both the number (and proportion) not retained in HIV care increased in from 4,669 (6%) in 2019 to 6,819 (7%) in 2020 and decreased to 6,390 (7%) in 2022. Younger people (16% for people aged 15-34 years) were more likely to not be retained compared to older groups (12%), and people born abroad (8%) compared with those born in England (5%).

Among the 6,392 not retained in care by end of 2021, 3,203 (50.1%) re-attended care by end of 2022. Of these 1,658 (52%) had VL <200 copies/mL at that re-attendance suggesting receipt of ART outside specialist HIV care or was not recorded; excluding these individuals reduces non-retention to 5.5% (4,734) by end 2021.

Of the 1,545 with no evidence of viral suppression at subsequent re-attendance, 964 (62.4%) had VL<200 copies within 6 months of re-attendance and were classed as successfully re-engaged.

**Conclusions:** Around 5% of people with diagnosed HIV are not retained in care annually, half of whom successfully re-engage up to a year later. A higher proportion of younger people and those born abroad were not retained. These new indicators can evaluate interventions to improve engagement in care.

## THPEC284

Rates of recent prior antiretroviral therapy exposure among treatment initiators in South Africa

M. Benade<sup>1,2,3</sup>, M. Maskew<sup>2</sup>, V. Ntjikelane<sup>2</sup>, N. Ngcobo<sup>2</sup>, L. Sande<sup>2</sup>, S. Rosen<sup>1,2</sup>

<sup>1</sup>Boston University School of Public Health, Department of Global Health, Boston, United States, <sup>2</sup>University of Witwatersrand, Health Economics and Epidemiology Research Office, Johannesburg, South Africa, <sup>3</sup>Amsterdam University Medical Center, Department of Medical Microbiology, Amsterdam, Netherlands, the

**Background:** The era of universal treatment for HIV has seen high rates of both disengagement from antiretroviral therapy (ART) programs and re-engagement after interruptions, with modeled rates of non-naïve initiators >50% in many places. Most re-engagers are reluctant to admit prior antiretroviral exposure, and non-self-reported data on the proportion of re-initiators are scarce. We conducted ART metabolite testing to assess the proportion of people who present for initiation with evidence of recent ART use.

**Methods:** We enrolled clients who reported newly initiating ART or re-initiating ART after an interruption >90 days at three facilities in Mpumalanga, KwaZulu-Natal, and Gauteng provinces in South Africa and collected individual characteristics, self-reported previous treatment experience, reasons for stopping treatment, and service

delivery preferences. Dried blood specimens (5 x 50mm) dried blood spots on a Whatman 903 Protein saver card) from venous blood samples were collected during routine ART initiation. Liquid chromatography tandem mass spectrometry was performed to measure for metabolites of tenofovir diphosphate (TDF), which are typically detectable for approximately 90 days, allowing detection of prior use for up to 3 months.

**Results:** We enrolled 89 participants (median age 32.5, 62% female), of whom 16 (18%) self-reported previously taking ART but with a current interruption >3 months. Test results indicated that 18 (20%) participants had detectable metabolites of TDF in their specimens.

Among these 18, 17% had a level consistent with regularly taking 4-6 doses per week, 44% 2-3 doses per week, and 38% <2 doses per week. Of those with detectable TDF metabolites, only 4 reported ever previously using ART. Gender, age, and location were not associated with a detectable metabolite result.

**Conclusions:** At 3 clinics in 3 provinces of South Africa, one of five initiators who self-reported being ART naïve or in an interruption >3 months did have evidence of recent (<90 days) TDF use.

This is a lower proportion than anticipated based on modeled estimates, possibly due to self-selection out of the study, but it is still a substantial minority. Future work should explore reasons for reluctance to disclose prior ART use, how to identify re-engagers at initiation, and interventions needed to support re-engagers.

## THPEC285

A case-based management approach to strengthen the follow-up of HIV-exposed infants in Tanzania

R. van de Ven<sup>1</sup>, C. Nnko<sup>1</sup>, A. Temu<sup>1</sup>, F. Lyimo<sup>1</sup>, S. Kimambo<sup>1</sup>, M. Nyamhagatta<sup>2</sup>, M. Msangi<sup>2</sup>, M. Bateganya<sup>3</sup>

<sup>1</sup>Elizabeth Glaser Pediatric AIDS Foundation, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Ministry of Health, Reproductive and Child Health Section - PMTCT Unit, Dodoma, Tanzania, the United Republic of, <sup>3</sup>United States Agency for International Development, Dar es Salaam, Tanzania, the United Republic of

**Background:** The success of prevention of mother-to-child transmission of HIV (PMTCT) programs relies on the ability to monitor the full cascade until the final outcome of HIV-exposed infants (HEIs). In Tanzania, the mother-child cohort register was introduced to enhance follow-up, but it is still paper-based. Through its successive USAID-funded projects in Tanzania, the Elizabeth Glaser Pediatric AIDS Foundation established a case-based management (CBM) approach in 2019 to strengthen follow-up of HEIs. The CBM approach includes on-site mentorship, an electronic dashboard to visualize PMTCT cascade data, virtu-

Author Index

al data review meetings, and service provider WhatsApp communication groups. This study evaluates the progress made to date.

**Methods:** A retrospective analysis was conducted on the annual PMTCT cohorts at 472 health facilities in five supported regions, documenting the final outcome status of HEIs at 18 months of age. Data were extracted from the national mother-child cohort registers and care and treatment databases from October 2016 - September 2023.

**Results:** Overall, the annual number of HEIs dropped from 5,433 in 2017 to 4,696 in 2023, and the percentage of HEIs with a documented final outcome status increased from 61% (3,288/5,433) to 91% (4,290/4,696). The number of HEIs with a confirmed positive HIV test dropped from 196 to 80, with the positivity among those tested dropping from 6.1% in 2017 to 1.9% in 2023. Out of the 406 HEIs (9%) in 2023 with unknown status, 55% were recorded as transfer-out and no final outcome was captured in the system. See figure showing the annual trend.

Figure. Trend in proportion of HIV exposed infants with final outcome status.

**Conclusions:** The intensified CBM approach improved the follow-up of HEIs. We recommend scaling up the CBM model that includes the use of digital health tools to enable timely and complete monitoring of mother-baby pairs across all service delivery points and facilities to further close the MTCT cascade gaps.

## THPEC286

### Inequalities in access to treatment and viral suppression among vulnerable people living with HIV/AIDS (PLWH) in Brazil

A.R. Pascom<sup>1</sup>, T. Benoliel<sup>1</sup>, A. Krummenauer<sup>1</sup>, I. Ornelas<sup>1</sup>, N. Veras<sup>1</sup>, R. Oliveira<sup>1</sup>, A. Kalichman<sup>1</sup>, M.C. Gianna<sup>1</sup>, R. Hallal<sup>1</sup>, T. Alencar<sup>1</sup>, D. Barreira<sup>1</sup>

<sup>1</sup>Ministry of Health, Department of HIV/AIDS, TB, HV and STI, Brasília, Brazil

**Background:** Brazil has made significant improvements in its HIV/AIDS care cascade over the past decade. This study aims to demonstrate the inequalities in access to treatment and viral suppression among vulnerable PLWH in the country.

**Methods:** We analyzed programmatic data from all PLWH in Brazil who were linked to health care, i.e., had at least one antiretroviral prescription and/or conducted at least one viral load (VL) or CD4 test during the study year. We estimated the proportion of linked PLWH who were on treatment and achieved suppression (VL<50copies/mL) after six months of treatment according to age group, race/skin color, schooling, and exposure category. Statistical differences were verified using Chi-square tests.

**Results:** In 2022, 842,000 PLWH were linked to the Brazilian public healthcare system. Significant differences were observed across all analyzed variables (p-value<0.001). Among those with higher schooling (12+ years), 90% were on treatment and 84% were virally suppressed, compared to 85% and 74% respectively among those with up to seven years. These indicators increased with age: 81% were on treatment and 54% were suppressed among PLWH aged 5-8yo, and 90% and 82% for those aged 50+yo. Higher vulnerability was observed among indigenous PLWH (84% were on ART; 70% were suppressed), followed by black/brown individuals (86% and 75%, respectively). In 2021, among 781 PLWH linked, we observed that women who used injectable drugs exhibited the poorest indicators (86% on treatment and 77% suppressed), compared to men who have sex with men (92% and 89%, respectively).

**Conclusions:** Our study revealed that, despite improvements in the 95-95-95 goals in Brazil, national advancements were not evident among the most vulnerable populations. In addition to stigma and discrimination, the lack of essential rights such as food, education, housing, and sanitation represents a significant barrier to improving the health of this population.

To overcome these obstacles, implementing intersectoral interventions is essential. Therefore, under the coordination of the Ministry of Health, the Brazilian Government launched the National Program for the Elimination of Socially Determined Diseases. This program, which brought together fourteen other Ministries, is promising in fully enacting health policies for the entire population, leaving no one behind.

## THPEC287

### Rates of first post-onset-of-the-pandemic (pop) HIV care visits and utilization of telehealth at a large academic medical center: study findings from North Carolina

V. Yelverton<sup>1</sup>, J. Ostermann<sup>2,3,4</sup>, M.E. Yarrington<sup>1</sup>, A.K. Weinhold<sup>5,3</sup>, N. Natafagi<sup>2</sup>, B. Olatosi<sup>2,4</sup>, S. Weissman<sup>6,4,7</sup>, N.M. Thielman<sup>1,3</sup>

<sup>1</sup>Duke University, Division of Infectious Diseases, Durham, United States, <sup>2</sup>University of South Carolina, Health Services Policy and Management, Columbia, United States, <sup>3</sup>Duke University, Duke Global Health Institute, Durham, United States, <sup>4</sup>University of South Carolina, South Carolina SmartState Center for Healthcare Quality (CHQ), Columbia, United States, <sup>5</sup>Duke University, Center for Health Policy and Inequalities Research, Durham, United States, <sup>6</sup>University of South Carolina, Department of Internal Medicine, Columbia, United States, <sup>7</sup>Prisma Health, Columbia, United States

**Background:** Telehealth was used to maintain HIV care continuity during the COVID-19 pandemic in the United States.

We assessed secular trends in rates of first post-onset-of-the-pandemic HIV care visits and telehealth use among people living with HIV (PWH) receiving care from a large university-based HIV clinic in North Carolina (NC).

**Methods:** First post-onset-of-the-pandemic (pop) HIV care visits describe the first individual HIV care visit per person following the onset of the COVID-19 pandemic, including people new to the clinic and established clients (henceforth: first pop visits).

Aggregated electronic health record (EHR) data from the Duke University Infectious Disease clinic in NC were extracted using Epic's SlicerDicer tool to graphically assess temporal patterns of engagement in HIV care and the utilization of telehealth between March 2020 and March 2023. Monthly rates of first pop visits were calculated as the proportion of PWH who had their first HIV care visit during each month from March 16, 2020.

**Results:** EHR data from 2,623 PWH who received care between January 2019 and March 2023 were extracted. Most PWH had a first pop visit (94%) between March 16, 2020 and March 31, 2023. Rates of first pop visits were highest between March and August 2020; thereafter the cumulative trend flattened (Figure 1).

The proportion of telehealth among first pop visits peaked with 88% telehealth visits in April 2020. Telehealth use decreased thereafter before showing a second peak in the first half of 2021.

**Conclusions:** Telehealth accounted for a high proportion of first pop visits at the beginning of the pandemic and bridged in-person HIV care interruptions. The observed second peak in telehealth use for HIV care first pop visits suggests that telehealth could help to mitigate care interruptions among PWH.

Notes: Figure 1 shows the cumulative proportion of PWH who had a first post-onset-of-the-pandemic (pop) visit (blue) and the proportion of PWH with telehealth first pop visits among monthly visit rates (red) after the onset of the COVID-19 pandemic in mid-March 2020. Q1-4 refer to the end-of-the-quarter cumulative proportion of PWH who had first pop visits (blue) or quarterly averages of telehealth rates among those PWH (red) across months of the quarter of the respective calendar year. Abbreviations: PWH People living with HIV; pop post-onset-of-the-pandemic.

Figure 1. Engagement in first post-onset-of-the-pandemic (pop) HIV care visits and utilization of telehealth.

### Longitudinal HIV care continuum outcomes among people living with HIV newly enrolling in HIV care in Kwazulu-Natal, South Africa: a multistate analysis

F. Musiello<sup>1</sup>, L. Filiatreau<sup>2</sup>, A. Mody<sup>2</sup>, B. Chibi<sup>1</sup>, A.K. Keter<sup>1,3,4</sup>, K. Sikombe<sup>5,6</sup>, C. Iwuji<sup>7,8</sup>, Z. Essack<sup>1,9</sup>, C. Groenewald<sup>1</sup>, A. Sharma<sup>5,10</sup>, K. Sausi<sup>1</sup>, E. Geng<sup>2</sup>, A. Van Heerden<sup>1,11</sup>

<sup>1</sup>Human Sciences Research Council, Centre for Community Based Research, Sweetwaters, Pietermaritzburg, South Africa, <sup>2</sup>Washington University in St. Louis, Department of Medicine, St. Louis, United States, <sup>3</sup>Institute of Tropical Medicine, Clinical Sciences, HIV/TB Unit, Antwerp, Belgium, <sup>4</sup>Gent University, Department of Applied Mathematics, Computer Science and Statistics, Gent, Belgium, <sup>5</sup>Centre for Infectious Disease Research in Zambia, Lusaka, Zambia, <sup>6</sup>London School of Hygiene and Tropical Medicine, Department of Public Health, Environments, and Society, London, United Kingdom, <sup>7</sup>University of Sussex, Department of Global Health and Infection, Brighton and Sussex, United Kingdom, <sup>8</sup>Africa Health Research Institute, Durban, South Africa, <sup>9</sup>University of KwaZulu-Natal, South African Research Ethics Training Initiative (SARETI), Pietermaritzburg, South Africa, <sup>10</sup>University of Washington, Global Health Department, Seattle, United States, <sup>11</sup>University of the Witwatersrand, SAMRC/WITS Developmental Pathways for Health Research Unit, Johannesburg, South Africa

**Background:** Cyclical engagement and disengagement of people living with HIV across the HIV care continuum remains a persistent public health challenge. This study aims to provide new insights into longitudinal care dynamics, offering essential knowledge for tailored interventions in a region of South Africa with high prevalence.

**Methods:** We extracted electronic health records for individuals aged 16+ who initiated HIV care at six public healthcare clinics in Kwazulu-Natal between March 2021-March 2023. We categorized individuals into nine

mutually exclusive and exhaustive HIV care states related to antiretroviral therapy (ART) initiation, retention, transfers, and mortality from the time of enrolment until database closure. We used multistate models to estimate the proportion of individuals in each care state over time and the restricted mean time spent in each state, accounting for transitions in and out of non-absorbing clinical states and competing events over time.

**Results:** 3833 individuals were included (60.6% female, median age 32 [IQR 26-39]). 95.5% initiated ART the same day they enrolled in care. At 12 and 24 months after enrollment, 69.6% and 62.6% (50.9% continuously retained [95% CI: 48.9, 53.2]; 11.7% re-engaged [95% CI: 9.9-13.7], Figure) of individuals were in care, respectively. At 6- and 24-months after enrollment, 16.0% and 19.9% were lost and 6.7% and 16.2% had transferred, respectively. After loss from care, 25.8% and 34.2% were re-engaged at 6- and 12-months following disengagement, respectively. The restricted mean time spent in care across the first 24 months was 540 days.

**Conclusions:** Although same-day ART initiation was high, a large proportion of people living with HIV cycle in and out of care over time, with loss from care increasing over time and just a small proportion returning to care. Interventions that promote sustained engagement and return to care are urgently needed to improve later-stage care cascade outcomes.

## THPEC289

Reach 95-95-95 using the monthly analysis and reporting approach of HIV program indicators by health districts in Senegal: district approach

C.B.D. Gueye<sup>1</sup>, A. Sagna<sup>1</sup>, D. Niang<sup>1</sup>, C.T. Koulibaly<sup>1</sup>, S. Thiam<sup>1</sup>  
<sup>1</sup>Executive Secretariat of the National Council for the Fight against AIDS, Monitoring, Evaluation and Research Unit, Dakar, Senegal

**Background:** In Senegal, the HIV epidemic is concentrated with a prevalence of 0.5%. The location-based and population-based approach presents the AIDS epidemic as the sum of several interconnected local epidemics, within which key populations and certain regions are more affected. The South and South-East regions have prevalences varying from 0.9 to 1.5%. They border coun-

tries where the HIV epidemic is generalized. Key populations have prevalences ranging from 5.2% to 27.6%. In 2021, the HIV program implemented the district approach which allows the calculation and analysis of cascades in order to monitor progress towards 3X95 of the country's 79 districts.

**Description:** This approach based on priority populations and their locations aims to prioritize districts through scores based on 7 areas and 11 performance criteria from program indicators. It identifies problem districts and GAPS to be filled to improve their performance. Achieving 3\*95 at the district level posed a problem due to poor completeness and timeliness of the routine data transmitted. The national and district targets resulting from the Spectrum estimates were never achieved because the providers did not master the methods of calculating and analyzing the cascades, in addition to the lack of coordination and regular analysis of the data. To support this strategy, a monthly reporting and cascade analysis process is put in place.

**Lessons learned:** This approach made it possible to analyze the cascade of districts with a level of disaggregation by age and sex. The data is collected using the waterfall generation tool. The cascades are analyzed, the gaps identified and an improvement plan is developed and implemented by the district. At the end of 2022, 41,560 PLHIV are estimated in Senegal, 36,714 know their serological status (88%), 33,423 are on ARV (91%) and 30,144 have achieved viral suppression (90%). Of the 79 districts in the country, almost half reached the first 95. More than 2/3 reached the second and third 95.

**Conclusions/Next steps:** This approach with targeted cascade analysis was able to set clear and achievable objectives and help improve district performance. It enabled regular monitoring of the program towards achieving 3\*95. It has greatly improved the quality of district data.

## THPEC290

Transition to paediatric Dolutegravir: a before and after study of virologic suppression rate among paediatric treatment cohort in Rivers State, Nigeria

G. Owghonda<sup>1</sup>, I. Aaron Wali<sup>2</sup>, U. Edewor<sup>1</sup>, U. Korfii<sup>1</sup>, A. Ndubuisi<sup>1</sup>, C. Eze<sup>1</sup>, A. Ore<sup>1</sup>

<sup>1</sup>Rivers State Ministry of Health, Public Health, Port Harcourt, Nigeria, <sup>2</sup>Rivers State University, Community Medicine, Port Harcourt, Nigeria

**Background:** The virologic suppression rate in children with HIV is suboptimal, and their progression to AIDS is faster, posing an over 80% risk of death within five years without effective treatment. Dolutegravir (DTG) exhibits superiority over protease inhibitor-based regimens, especially lopinavir/ritonavir (LPV/r), with lower treatment

failure risk in infants and young children. This study aims to compare viral suppression rates in children with HIV (CLHIV) weighing under 20kg transitioning from LPV/r to a paediatric Dolutegravir (pDTG)-based regimen.

**Methods:** A quasi-experimental study conducted in Rivers State Nigeria among CLHIV on treatment - ART (less than 20kg at the time of regimen transition and initially on LPV/r based regimen ) and transitioned to pDTG-based regimen between October 2021 and February 2022. Descriptive statistics using counts and proportions for categorical variables and means and standard deviations for continuous variables. Test of association using McNamar Chi-square. P-value 0.05.

**Results:** There was a total of 744 CLHIV in the cohort of study; out of which 377 (50.7%) were females while 367 (49.3%) were males. The mean age before and after the transition to pDTG were 4 years and 5 years respectively. Before the transition to pDTG, 88.2% (656) of children were virally suppressed. After the cohort was transitioned to pDTG, viral suppression increased to 90.2% (671). The disaggregated percentage of viral load suppression after transition to pDTG showed that the undetectable viral load among the suppressed cohort was 99.7%, while before transition to pDTG, it was 84%. 52 of the total CLHIV that were suppressed before the transition to pDTG became unsuppressed after the transition to pDTG while 67 of the total CLHIV that was unsuppressed before transitioning to pDTG became suppressed after transitioning to pDTG but these proportions were not statistically significant (p-value = 0.167).

**Conclusions:** Transition to pDTG improved viral load suppression by 2.04% (not statistically significant). However, CLHIV with undetectable viral load increased significantly following the use of DTG-based ART. Though pDTG seems to have some advantage over LPV/r in achieving undetectable viral load in suppressed, further studies may be necessary to explore other essential factors that may be operational in achieving viral suppression in CLHIV.

## Monitoring the spread, impact and prevention of new or resurgent pathogens

### THPEC291

Emerging challenges: prevalence and associations of sexually transmitted infections in individuals with Mpox - Insights from a Major Brazilian referral health service

M. Secco Torres da Silva<sup>1</sup>, T. Silva Torres<sup>1</sup>, C. Coutinho<sup>1</sup>, E. Moreira Jalil<sup>1</sup>, M. Oliveira Bastos<sup>1</sup>, A. Echeverría-Guevara<sup>1</sup>, C. Yanavich<sup>1</sup>, E. Mesquita Peixoto<sup>1</sup>, P. da Silva Martins<sup>1</sup>, M. Braga Mesquita<sup>1</sup>, R. Ismério Moreira<sup>1</sup>, F. Cristina Serrão Lessa<sup>1</sup>, E. Portela Nunes<sup>1</sup>, B. Hoagland<sup>1</sup>, S. Wagner Cardoso<sup>1</sup>, V. Gonçalves Veloso<sup>1</sup>, B. Grinsztejn<sup>1</sup>, INI-Fiocruz Mpox Study Group

<sup>1</sup>Instituto Nacional de Infectologia Evandro Chagas, Fiocruz, Rio de Janeiro, Brazil

**Background:** Mpox remains an important emerging concern, increasingly associated with sexual transmission, particularly in conjunction with bacterial sexually transmitted infections (bSTIs).

We aimed to describe the prevalence of each/any concurrent bSTIs diagnosis and associated factors among participants with mpox, assessed at a prominent Brazilian referral health service.

**Methods:** Prospective cohort that enrolled 554 participants aged 18+ years with confirmed mpox (detectable MPXV DNA by real-time PCR) between June 2022-January 2024 in Rio de Janeiro, Brazil. For this cross-sectional analysis, we included only participants who performed any bSTI testing at baseline.

We offered testing for chlamydia/gonorrhea (real-time PCR detection in anorectal swab) and syphilis (active diagnosis if VDRL>1/8). The baseline prevalence of each/any concurrent bSTI was calculated, and sociodemographic, clinical and behavioral characteristics were assessed based on any concurrent bSTI diagnosis (yes/no). Qualitative variables were compared using Chi-squared/Fisher's test, while quantitative variables were assessed using Wilcoxon rank-sum test.

**Results:** Among 554 participants (83% tested for at least one bSTI at baseline), 91% were cisgender men, 61% Black/Pardo, and 58% had primary schooling or less.

Median age was 33 years (IQR:28-39). Prevalence of any bSTI was 38%; the most common was primary syphilis (24%), followed by anorectal chlamydia (10%) and gonorrhea (9%).

Compared to those with no bSTI, a higher proportion of participants with any concurrent bSTI tested positive for HIV (68% vs 44%, p<0.01) and for HCV (10% vs 5%, p=0.04), reported anal sex in the last 30 days (83% vs 72%, p=0.03), reported any bSTI in the previous year (50% vs 22%, p<0.01), presented clinical symptoms of proctitis (32% vs

21%,  $p < 0.01$ ), and had detectable MPXV PCR in rectal swabs (77% vs 66%,  $p = 0.02$ ). Household mpox transmission was less frequent in individuals with any concurrent bSTI (4% vs 9%,  $p = 0.05$ ), and we found no differences regarding sociodemographic characteristics.

**Conclusions:** We identified a high prevalence of concurrent bSTIs among persons diagnosed with mpox. Additional anorectal STIs might represent higher odds of acquiring HIV.

This study emphasizes the importance of integrating mpox evaluation into a comprehensive sexual health approach, providing an opportunity for expanded screening, treatment, and prevention strategies for HIV/STI.

## THPEC292

Increasing COVID-19 vaccine coverage among art clients through a comprehensive vaccination intervention in Kasungu district, Malawi

M. Chivwara<sup>1</sup>, C. Saini<sup>2</sup>, R. Khunga<sup>3</sup>, E. Makwakwa<sup>2</sup>, H. Kanise<sup>3</sup>, J. Njala<sup>1</sup>, D. Smith<sup>3</sup>, S. Phiri<sup>1</sup>, C. Moucheraud<sup>4</sup>, E. Chikuse<sup>1</sup>, R. Hoffman<sup>5</sup>, J. van Oosterhout<sup>3</sup>

<sup>1</sup>Partners in Hope, Programs, Lilongwe, Malawi, <sup>2</sup>Partners in Hope, Programs, Kasungu, Malawi, <sup>3</sup>University of California Los Angeles, Department of Medicine, David Geffen School of Medicine, Lilongwe, Malawi, <sup>4</sup>New York University, Department of Public Health Policy and Management, School of Global Public Health, New York, United States, <sup>5</sup>University of California Los Angeles, Department of Medicine, David Geffen School of Medicine, Los Angeles, United States

**Background:** By early 2023, Malawi had registered nearly 90,000 confirmed COVID-19 cases with 2,700 deaths. Vaccination started in 2021 and persons living with HIV (PLHIV) were a priority group. Kasungu, a rural district in central Malawi, has around 20,000 people alive on ART. Despite evidence that vaccination reduces COVID-19 severity in PLHIV, vaccination coverage among ART clients in Kasungu district remained low. Several factors, including misconceptions and vaccine hesitancy, initial vaccine shortages, lack of vaccination service accessibility and vaccinators at ART clinics contributed to this.

To address these challenges, a multi-pronged COVID-19 vaccination intervention took place from April-September 2023 at 12 ART clinics in Kasungu district.

**Description:** Partners in Hope (PIH), a Malawian, non-governmental organization, supports HIV services in Kasungu district with PEPFAR/USAID funding. PIH developed a comprehensive COVID-19 enhanced vaccination intervention that addressed both demand- and supply-side constraints. We trained HIV service providers to vaccinate and lay cadre staff to screen for vaccination eligibility. We procured dedicated cooler boxes to allow vaccine availability in ART consultation rooms. Based on PIH research that indicated the importance of vaccine safety messag-

es from trusted sources to address vaccine hesitancy, we implemented intensive awareness campaigns at facility and community level, using new, locally appropriate information materials. PIH involved previously vaccinated ART clients, health care workers, and local leadership to share their favorable vaccination experience in frequent health education sessions.

Monitoring of vaccination progress informed bi-weekly health facility-level performance reviews. After six months, full vaccination coverage among ART clients in Kasungu district had increased from 4,386/14,048 (31%) to 8,581/14,157 (61%), much higher than in the general population (around 3%).

**Lessons learned:** Formative local research to understand barriers to vaccine uptake was critical to address vaccine hesitancy as part of our intervention. Overcoming infrastructure and human resource capacity challenges, intensive health facility-based monitoring and evaluation, and strong collaboration with key stakeholders, including ART clients, policy makers and local community leadership, led to success of a district-based COVID-19 vaccination campaign.

**Conclusions/Next steps:** This approach can be scaled-up for PLHIV and others at high risk of COVID-19 and can be used to address other vaccine-preventable disease threats.

## THPEC293

Low prevalence and incidence of hepatitis C virus infection among individuals using PrEP in the Dutch national PrEP program between 2019-2022

K. Hage<sup>1,2,3</sup>, A. Boyd<sup>1,4</sup>, E. Op de Coul<sup>5</sup>, D. Sarink<sup>5</sup>, E. Hoornenborg<sup>1,2,6,7</sup>, M. Prins<sup>1,2,3,7</sup>

<sup>1</sup>Public Health Service of Amsterdam, Infectious Diseases, Research and Prevention, Amsterdam, Netherlands, the, <sup>2</sup>Amsterdam Institute for Infection and Immunity, Infectious Diseases, Amsterdam, Netherlands, the, <sup>3</sup>Amsterdam UMC, University of Amsterdam, Infectious Diseases, Amsterdam, Netherlands, the, <sup>4</sup>stichting hiv monitoring, Amsterdam, Netherlands, the, <sup>5</sup>Centre of Infectious Disease Control, Epidemiology and Surveillance, National Institute for Public Health and the Environment (RIVM), Bilthoven, Netherlands, the, <sup>6</sup>Amsterdam UMC, University of Amsterdam, Internal Medicine, Amsterdam, Netherlands, the, <sup>7</sup>Amsterdam Public Health Research Institute (APH), Amsterdam, Netherlands, the

**Background:** Studies have shown that men who have sex with men (MSM), particularly those using pre-exposure prophylaxis (PrEP), are at increased risk of sexually-acquired hepatitis C virus (HCV) infection.

We evaluated HCV prevalence and incidence, along with their associated determinants, in a cohort of PrEP using individuals in the Netherlands.

**Methods:** In 2019, the Netherlands launched a five-year national PrEP program that offers PrEP to eligible individuals. We used prospectively-collected data from individuals registered in this program between 2019-2022. Individuals generally underwent annual testing for HCV antibodies, and additional HCV-RNA testing was conducted when antibodies were detected.

We calculated HCV prevalence at first PrEP visit in the program and overall incidence rate (IR) per 100 person-years (PYs) during follow-up. Univariable logistic and Poisson regression models were used to identify determinants associated with prevalent or incident HCV-infection, respectively.

All determinants were self-reported, except for sexually transmitted infection (STI) diagnosis, and referred to the six months preceding the visit.

**Results:** Among 10,563 individuals that were included, HCV antibodies were prevalent in 66 (0.6%) individuals and was associated with PrEP use within 12 months before the first visit in the national PrEP program [odds ratio (OR)=3.03, 95% confidence interval (CI)=1.79-5.13], receptive condomless anal sex (CAS) (OR=2.73, 95%CI=1.25-5.98), chemsex or group sex, STI diagnosis at visit (OR=2.37, 95%CI=1.29-4.37), and injecting drug use (IDU) (OR=6.61, 95%CI=2.35-18.61). Among 9,851 individuals with 17,150 person-years (PY) of follow-up, 64 incident HCV-infections [IR=0.37 per 100 PY, 95%CI=0.29-0.48] were identified. All were primary incident infections.

Factors associated with incident HCV-infection were receptive CAS [incidence rate ratio (IRR)=2.59, 95%CI=1.12-6.02], chemsex or group sex (IRR=1.83, 95%CI=1.01-3.30), STI diagnosis at visit (IRR=1.96, 95%CI=1.07-3.60) and IDU (IRR=6.15, 95%CI=2.20-17.18).

**Conclusions:** Prevalence and incidence of HCV were low among individuals in the Dutch PrEP program, likely reflecting early HCV testing advice for MSM using PrEP from 2017 onwards, the high uptake of effective DAA treatment for acute and chronic HCV infections, and widened access to PrEP. Instead of annual HCV testing, behaviorally driven testing for HCV could be considered.

## Monitoring and population-level interventions for non-HIV outcomes

### THPEC294

Exploring colon cancer screening in people living with HIV at an urban community health center

A. Radix<sup>1,2</sup>, A. Cantor<sup>2</sup>, E. Blanchard<sup>3</sup>, R. Vail<sup>2</sup>, U. Belkind<sup>2</sup>

<sup>1</sup>Columbia University Mailman School of Public Health, Department of Epidemiology, New York, United States,

<sup>2</sup>Callen-Lorde Community Health Center, Department of Medicine, New York, United States, <sup>3</sup>Callen-Lorde Community Health Center, Department of Nursing, New York, United States

**Background:** In 2023, over half of people living with HIV in the USA were age 50+, and at risk for age-related malignancies. Ensuring quality care requires following established guidelines for routine healthcare maintenance, in addition to optimizing HIV care and viral suppression. Callen-Lorde, a NYC-based community health center, is dedicated to providing care to the LGBTQ communities and people living with HIV.

Our robust quality management group ensures that clients receive high-quality, culturally competent, and appropriate care throughout the life course.

**Description:** As part of an ongoing project to monitor colon cancer screening (CCS) utilization, we aimed to ensure that no communities were underserved by a clinic-wide initiative that includes mailing home-based Fecal Immunochemical Test (FIT) kits, in-house fecal occult blood test (FOBT), and providing referrals and reminders for colonoscopy. We utilized the electronic health record (EHR) to assess CCS among individuals living with HIV aged 50+. Disparities were evaluated by race, ethnicity, gender identity, housing status, and viral load suppression.

**Lessons learned:** We served 1,519 individuals living with HIV aged 50+ in December 2023, of whom 1,494 were eligible for routine CCS (ages 50-75). This group is racially and ethnically diverse; Black (n=372, 27.5%), White (n=558, 41.2%), Hispanic/Latinx (n=355, 26.2%), Asian (n=29, 2.1%), and multiracial individuals (n=36, 2.5%). The majority are cisgender men (1246, 83.7%) and transgender women (168, 11.3%). Viral suppression was high at 94.3%. Overall, only 510 (34.1%) had a documented CCS. This did not significantly differ by race, ethnicity, birth-sex, gender identity, or housing status. Clients with a last viral load  $\geq 200$  copies/mL were less likely to have undergone CCS (18.8% vs. 35.1%;  $p=.002$ ). Potential barriers to CCS include low client knowledge/awareness, provider-related (including time constraints, prioritization of HIV care over preventive care and incomplete EHR documentation), and structural, e.g., cost, transportation, appointment scheduling and insurance-related issues.

**Conclusions/Next steps:** We learned that despite high levels of engagement in HIV care and viral suppression, CCS rates were suboptimal and below the Healthy People 2030 target of 74.4%. A targeted campaign (ColonCARE+) is underway to address barriers and improve adherence to routine CCS. We plan ongoing monitoring to measure the impact of these interventions.

## THPEC295

The impact of the COVID-19 pandemic on depression and panic among people living with HIV in the U.S.

**Background:** The COVID-19 pandemic and subsequent impacts of shelter-in-place have impacted the mental health of vulnerable populations.

This study examines changes in depression and panic symptoms following the shelter-in-place mandate in March 2020 among people living with HIV (PLWH) across the U.S.

**Methods:** We assessed depression (measured by the Patient Health Questionnaire [PHQ-9]) and panic disorder symptoms (measured by the Panic Disorder Severity Scale [PDSS]) in response to COVID-19 between March 2018 and 2022. Data were collected among PLWH enrolled in the Center for AIDS Research Network of Integrated Clinical Systems (CNICS), which follows participants in 8 HIV clinics across the U.S. We fit interrupted time series (ITS) mod-

els to examine changes in the probability of moderate or severe depression and panic over time, adjusted for age, race, sex, geographic region, and HIV viral load.

**Results:** Overall, 7,121 PLWH completed questionnaires in this timeframe (total of 19,873 assessments); the median age was 51-years (Interquartile range [IQR]= 39-58), and 20% were female. There were significant increases in moderate/severe depression symptoms over time ( $p=.001$ , **Figure 1A**), and in panic symptoms ( $p<.001$ , **Figure 1B**) in the two years following onset of COVID-19 compared to the period two years prior. After COVID-19, participants were more likely to report moderate/severe depression symptoms if they had an HIV viral load  $>200$  copies/mL ( $p=.032$ ), and were more likely to report moderate/severe panic symptoms if they were homeless ( $p=.011$ ).

Figure 1.

**Conclusions:** Findings demonstrate the detrimental impact of COVID-19 on the mental health of PLWH during a time when access to mental health services was further limited. Results underscore the need for increased access to integrated mental health and HIV care services in the U.S. In the context of lingering mental health impacts of the pandemic, targeted mental health interventions integrated within HIV care may lead to improved mental health outcomes among PLWH.

## THPEC296

Social-behavioral predictors of blood pressure profiles in a longitudinal cohort of people living with HIV and cardiometabolic disorders

A. Conroy<sup>1</sup>, J. Bidwell<sup>2</sup>, R. Butterfield<sup>1</sup>, A. Ruark<sup>3</sup>, S. Weiser<sup>1</sup>, T. Neillands<sup>1</sup>, J. Jere<sup>4</sup>, N. Mulauzi<sup>5</sup>, J. Mkandawire<sup>5</sup>  
<sup>1</sup>University of California San Francisco, Department of Medicine, San Francisco, United States, <sup>2</sup>University of California Davis, School of Nursing, Davis, United States, <sup>3</sup>Wheaton College, Biological and Health Sciences, Wheaton, United States, <sup>4</sup>University of California Berkeley, Berkeley, United States, <sup>5</sup>Invest in Knowledge, Zomba, Malawi

**Background:** Cardiometabolic disorders (CMDs) are rising among people living with HIV in sub-Saharan Africa, signaling an impending public health crisis. Uncontrolled hypertension is a key target for public health intervention, as it is a major, yet largely modifiable, risk factor for premature cardiometabolic diseases. To inform future interventions, we leveraged longitudinal data from the

*Healthy Hearts* couples cohort study in Malawi to identify blood pressure (BP) profiles and test for associations with modifiable, socio-behavioral factors.

**Methods:** Couples having at least one partner living with HIV and hypertension/diabetes completed quarterly visits consisting of a survey and clinical assessment. Using systolic (SBP) and diastolic (DBP) blood pressure readings from three visits, we used latent class analysis to identify BP profiles among those with CMD and HIV.

Multinomial logistic regression was used to examine associations between BP profiles and baseline social-behavioral factors at the individual, dyadic, and social-structural levels (e.g., correct CMD knowledge, medication adherence; partner support for CMD, couple illness communication; access to care, food insecurity). Models controlled for demographics.

**Results:** Participants (N=120) were gender-balanced (53% male), 52 years on average, and had low education (75%). The best fitting model was a three-profile model (entropy=0.90, posterior probabilities all >0.95, LMRT  $p=0.03$ , PBLRT <0.001). Profiles were characterized as Normal BP (24% of sample; SBP 114-120, DBP 74-79), Elevated BP (53%; SBP 138-148, DBP 86-92), and Highly-elevated BP (23%; SBP 166-174, DBP 104-111).

The odds of being in the Highly-elevated BP profile (compared to Normal BP) was associated with higher partner support ( $B=0.43$ ,  $p=0.01$ ) and higher illness communication ( $B=1.26$ ;  $p=0.03$ ). The odds of being in the Elevated BP profile was associated with lower adherence to anti-hypertensive medication ( $B=-2.24$ ;  $p=0.03$ ) and higher CMD knowledge ( $B=0.23$ ;  $p=0.02$ ). No other factors were associated.

**Conclusions:** Relationship dynamics were associated with elevated BP over other factors, suggesting the importance of close relationships in BP management.

Participants in elevated BP profiles reported better communication, partner support, and CMD knowledge, perhaps due to more severe disease and greater exposure to health education.

Good adherence reduced the risk for elevated BP. CMD interventions should consider involving partners early on to manage BP, and provide adherence support.

## THPEC297

### Syndemic Health/Sexual risks on predicting depression among urban refugee youths: a Latent Class Analysis

Z. Admassu<sup>1</sup>, S.S. Chen<sup>1</sup>, C. Logie<sup>1</sup>, M. Okumu<sup>2</sup>, F. MacKenzie<sup>1</sup>, R. Hakiza<sup>3</sup>, B. Katisi<sup>3</sup>, P. Kyambadde<sup>4</sup>

<sup>1</sup>University of Toronto, Social work, Toronto, Canada,

<sup>2</sup>University of Illinois, School of Social Work, Urbana, United States, <sup>3</sup>Young African Refugees for Integral Development, Kampala, Uganda, <sup>4</sup>Most at Risk Population Initiative (MARPI), Kampala, Uganda

**Background:** Widespread social and health disparities experienced by refugee youth warrant urgent attention. Social ecological factors (e.g., violence, sexual relationship power, and food/water insecurity) that are closely associated with HIV vulnerability may also contribute to depression. Despite well-established direct relationships, the synergistic effect of these contextual factors on refugee youth depression remains unclear.

Using latent class analysis (LCA), this study aims to examine the patterns of health/sexual risks among urban refugee youths in Kampala, Uganda, and to explore their associations with depression.

**Methods:** A longitudinal survey was implemented with urban refugee youths living in informal settlements in Kampala (N=282). Respondents' social determinants of health (SDOH) risk was evaluated based on responses to six indicators: violence experience (physical/sexual), water insecurity, food insecurity, alcohol misuse, transactional sex, and multiple sexual partners; depression risk was assessed by Patient-Health-Questionnaire-9 at baseline (Wave-3). LCA identified groups characterized by distinctive patterns of SDOH risk.

Adjusting for age and gender, we conducted multivariate logistic regression to explore the relationship between classes of SDOH risk and depression, and whether the identified differences in SDOH risk persisted over time (Wave-4) in predicting depression.

**Results:** Differences in SDOH risk were best described by 3 classes: low-risk (Class-1;  $n = 69$ , 24.5%), medium-risk (Class-2;  $n=185$ , 65.6%), and high-risk (Class-3;  $n=28$ , 9.9%). Both Class-2 and Class-3 were characterized by high food/water insecurity and problematic alcohol use, while Class-3 also demonstrated high partner sexual violence, having multiple sexual partners, and engaging in transactional sex. Class-2 (adjusted odds ratio [aOR]: 2.24; 95% confidence interval [CI]: 1.07, 4.71;  $p=0.033$ ) and Class-3 (aOR: 5.12; 95% CI: 1.71, 15.30;  $p=0.004$ ) showed a higher likelihood of depression than Class-1. Subgroup differences persisted over time. Class-3 presented higher odds of depression at Wave-4 (aOR: 9.46; 95% CI: 3.08, 29.09;  $p<0.001$ ) compared to Class-1.

**Conclusions:** Social determinants of health, including poverty indicators and sexual health risks, are associated with depression among refugee youth.

These findings extend our understanding of syndemics in refugees' sexual and mental health domains. Mental health interventions should consider multicomponent programs, and a comprehensive approach is recommended when examining mental health concerns and needs among youth refugees.

## THPEC298

Community-based monitoring and improving access to mental health services for people living with and vulnerable to HIV in EECA countries

A. Petrova<sup>1</sup>, S. Golovin<sup>2</sup>, N. Sidorenko<sup>1</sup>

<sup>1</sup>Peer partners EECA NGO, Bishkek, Kyrgyzstan,

<sup>2</sup>ITPC - International Treatment Preparedness Coalition of Eastern Europe and Central Asia, Tbilisi, Georgia

**Background:** According to EACS, depression prevalence reaches 40% among people living with HIV. Studies have shown that the risk of death from suicide for people with HIV is 100 times higher than the average population. Depression impacts HIV treatment adherence. Mental health is a priority when it comes to improving the life quality of people living with and vulnerable to HIV. Our project aims to improve access to mental health services for people living with and vulnerable to HIV by raising mental health awareness, training peer counselors about depression screening, monitoring accessibility and availability of mental health services, and developing recommendations to improve mental healthcare access in Eastern Europe and Central Asia.

**Description:** The project includes:

- Establishing a working group on HIV and mental health consisting of sex workers, people using drugs, men having sex with men, transgender people, and people living with HIV;
- Developing a manual for HIV peer counselors focused on depression screening and referral to mental health services;
- Workshops for peer counselors from each key population focused on depression screening and referral to mental health services;
- Monitoring access to mental health services.

**Lessons learned:** 80 key population representatives took part in the workshops; over 100 people received copies of the manual; 522 people from 10 countries took part in the monitoring survey. Preliminary results show that 53% of the respondents never received mental health counseling from their clinicians; 60% never sought mental health services. Key barriers to mental healthcare included stigma and discrimination (19.2%), financial constraints (18.9%), and mistrust in mental health professionals (18%).

**Conclusions/Next steps:** The key recommendations are to raise awareness of EECA clinicians about the need to monitor and manage mental health issues in people living with and vulnerable to HIV, build the capacity of

mental health providers in HIV-related issues, and raise awareness of people living with and vulnerable to HIV about mental health and access to services.

Future steps include in-depth data analysis, recommendations for improving access to mental health services for people living with and vulnerable to HIV in EECA; expanding the monitoring system; training for HIV peer counselors on mental health issues.

## THPEC299

Positive Outcomes-11: a short version of the Positive Outcomes patient reported outcome measure to assess health and wellbeing among people living with HIV

A. Pelchen-Matthews<sup>1</sup>, R. Harding<sup>2</sup>, C. Smith<sup>1</sup>, A. Aghaizu<sup>3</sup>, F. Nakagawa<sup>1</sup>, C. Kelly<sup>3</sup>, A. Rodger<sup>1</sup>, M. Kall<sup>3</sup>, A. Sparrowhawk<sup>4</sup>, E. Hamlyn<sup>5</sup>, A. Clarke<sup>6</sup>, J. Sewell<sup>1</sup>, H. Kitt<sup>3</sup>, C. Humphreys<sup>3</sup>, F. Lampe<sup>1</sup>, The Positive Voices 2022 Study Team

<sup>1</sup>University College London, Institute for Global Health, London, United Kingdom, <sup>2</sup>King's College London, Cicely Saunders Institute of Palliative Care, Policy & Rehabilitation, London, United Kingdom, <sup>3</sup>UK Health Security Agency, London, United Kingdom, <sup>4</sup>Terrence Higgins Trust, London, United Kingdom, <sup>5</sup>Kings College Hospital NHS Foundation Trust, London, United Kingdom, <sup>6</sup>Royal Sussex County Hospital, Brighton & Sussex Medical School, Brighton, United Kingdom

**Background:** Positive Outcomes (PO) is a multi-dimensional measure of wellbeing for people with HIV. It was included as an optional, additional questionnaire in the Positive Voices 2022 (PV2022) UK survey.

We aimed to identify a shorter version of PO for research and assess the association of original and shorter versions with other health and wellbeing measures.

**Methods:** PO assesses wellbeing over the previous four weeks with 20 questions in four domains (physical, emotional, social and sexual wellbeing), with answers scored 0 to 4 (higher scores reflecting poorer outcomes). We used exploratory factor analysis (EFA) to identify latent factors and define a shorter version.

We analysed associations of the full and short versions with other health and wellbeing measures using total scores and a cut-point defining the top quartile with poorest wellbeing.

**Results:** Altogether 897 (19.5%) individuals completed the optional PO questionnaire in PV2022: 695 (77.5%) men, 190 (21.2%) women, median age 53 years (IQR 44-59), 673 (75.0%) white and 137 (15.3%) black ethnicity, and median time since diagnosis 15 years (IQR 10-20). EFA identified two factors, with the first of 11 questions (pain, stomach/bowel problems, memory/concentration, sleep, usual activities, anxiety, depression, feeling good, feeling at peace, money worries, and social support) providing a reliable mea-

sure of physical, emotional, and socioeconomic wellbeing (Cronbach alpha=0.89). Total scores of PO and the shorter PO-11 correlated well with the EQ-5D-5L index ( $R^2$  0.41 and 0.50, respectively), PHQ-9 depression ( $R^2$  0.66 and 0.72), and GAD-7 anxiety ( $R^2$  0.56 and 0.60). Participants with PO or PO-11 scores in the top quartile had a high prevalence of chronic health conditions and mental health symptoms, lower quality of life, and greater financial hardship (Figure).

**Conclusions:** The short PO-11 provides a statistically valid measure of wellbeing that may be useful as a research or screening tool among people with HIV.

## THPEC300

### Maternal sexually transmitted infections and congenital anomalies among newborns in the United States

W. Cao<sup>1</sup>, C. Li<sup>2,3,4</sup>, F. Sun<sup>1</sup>, Y. Shi<sup>1</sup>, Y. Ji<sup>1</sup>, H. Lin<sup>1</sup>, M. Ni<sup>1</sup>, S. Sun<sup>5</sup>, C. Chang<sup>1</sup>

<sup>1</sup>Peking University, Beijing, China, <sup>2</sup>Chengdu Women's and Children's Central Hospital, Chengdu, China, <sup>3</sup>Chengdu Jintang County Maternal and Child Health Hospital, Chengdu, China, <sup>4</sup>Chengdu Xinjin District Maternal and Child Health Care Hospital, Chengdu, China, <sup>5</sup>Capital Medical University, Beijing, China

**Background:** Maternal sexually transmitted infections (STIs) might be associated with increased risk of congenital anomalies in newborns, yet the available evidence remains limited and less comprehensive. We aimed to estimate the association between maternal STIs (including chlamydia, gonorrhea, and syphilis) and the risk of cause-specific congenital anomalies among live singleton births in contiguous United States (US).

**Methods:** We included data from 14,602,822 live singleton births occurring from 2016 to 2019 across 525 counties in the US. We used logistic regression to estimate the association between each maternal sexually transmitted infections and the risk of total congenital anomalies and diagnostic categories after adjusting for socio-demographic and pregnancy-related factors. We conducted subgroup analyses to identify potential susceptible subpopulations.

**Results:** A total of 41,755 congenital anomalies (2.9 per 1000 births) were documented during the study period. Chlamydia infection was associated with increased risk of total congenital anomalies (odds ratio [OR] of 1.20 [95% CI: 1.12, 1.28]), cleft lip with or without cleft palate (OR: 1.26 [95% CI: 1.08, 1.47]), Down syndrome (OR: 1.64 [95% CI: 1.27, 2.13]), and hypospadias (OR: 1.26 [95% CI: 1.08, 1.47]). Syphilis infection was associated with a higher risk of omphalocele (OR: 2.87 [95% CI: 1.28, 6.46]).

These associations were homogeneous across subgroups defined by maternal age, maternal education, pre-pregnancy BMI, and infant sex, with the exception of maternal race and ethnicity. However, we found no evidence for the association between gonorrhea infection and congenital anomalies.

**Conclusions:** Among live singleton births in the US, chlamydia and syphilis infection may be associated with an increased risk of congenital anomalies. Further studies are recommended to elucidate the underlying pathophysiological mechanisms for the association between maternal STIs and neonate congenital birth anomalies.

## Methodology to support epidemiological studies

#### Using electronic health record data to establish HIV case surveillance in Zimbabwe: de-duplication using active machine learning

S. Chaputsira<sup>1</sup>, K. Milligan<sup>2,3</sup>, T. Butso<sup>1</sup>, F. Lee<sup>2</sup>, J. Dzangare<sup>4</sup>, M. Muzamhindo<sup>5</sup>, R. Gongora<sup>6</sup>, T.H. Dinh<sup>2</sup>  
<sup>1</sup>Zimbabwe Technical Assistance, Training & Education Center for Health, Harare, Zimbabwe, <sup>2</sup>US Centers for Disease Control and Prevention/Global Health Center, Division of Global HIV and Tuberculosis, Atlanta, United States, <sup>3</sup>Peraton Inc., Reston, United States, <sup>4</sup>Zimbabwe Ministry of Health and Child Care, AIDS and TB Unit, Harare, Zimbabwe, <sup>5</sup>US Centers for Disease Control and Prevention/Global Health Center, Division of Global HIV and Tuberculosis, Harare, Zimbabwe, <sup>6</sup>Zimbabwe Ministry of Health and Child Care, Harare, Zimbabwe

**Background:** Establishing national HIV case surveillance (NCS), a longitudinal individual-level dataset from the time of being diagnosed with HIV throughout the continuum of care using existing health records from multiple sources is an important public health activity.

A probabilistic matching algorithm deduplicating client records across facilities and data sources based on the similarity of demographic information has been used to establish the NCS in Zimbabwe. We described the training, evaluation, and outcomes of this algorithm.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author

**Methods:** An active learning-based deduplication algorithm from the Python Pandas-dedupe package was used. A subset of client demographic data, abstracted from the national client registry, including clients' first and last name, sex, and date-of-birth, was used for model training and evaluation. A random selection of 2,000 records from one clinic with the highest and another with the lowest client volume within each of 10 provinces formed the model validation dataset of 40,000 records; these were manually checked for duplicates to provide ground-truth labels. The evaluated model was then run on the full dataset of 1,048,575 individual-level records from national data warehouse (NDW) with HIV-positive status. Predicted duplicates were tabulated by North and South region.

**Results:** Of 120,000 records were used to train the model, 1,500 were manually labeled in the active learning process. The accuracy of the algorithm on the validation set was 95% and the F1 score was 0.77 (Table-1). The matching/deduplication process reduced the number of records from 1,048,575 to 904,152 records of unique individuals (14%). 77,617 duplicates were within the North region, 42,845 were within the South, 5,401 were across North-South, and 78,059 were not duplicates.

Number of records	True positives	True negatives	False positives	False negatives	Accuracy	F-1 score*	Precision	Sensitivity
40,000	2,701	31,899	791	853	0.95	0.77	0.77	0.76

The sum of True positive, True negative, False positive, and False negative equals the number of predicted individuals based on the model and may not equal the number of records since one person could have ≥ one records.

\*F1-score =  $2 * (\text{precision} * \text{sensitivity}) / (\text{precision} + \text{sensitivity})$

*Table 1. Evaluation of the Matching and De-duplication Algorithm Used in Zimbabwe's HIV Case Surveillance on the Validation Dataset*

**Conclusions:** Zimbabwe has demonstrated that establishing NCS using individual-level data from the NDW with similar demographic information is doable. Choosing an appropriate matching algorithm and process underpinned the successes.

We found additional deduplicates across different sub-national levels suggesting that matching process at the national level might improve quality of the CS data. Routine training and evaluations of the matching algorithm including attributes are important to consistently generating reliable CS data.

## THPEC302

### Using Geographical Information System in a spatiotemporal analysis of HIV epidemic in Senegal

C.T. Koulibaly<sup>1</sup>, S. Thiam<sup>2</sup>, C.B. Dieye<sup>1</sup>, A. Sagna<sup>1</sup>, D. Niang<sup>1</sup>, C.T. Ndour<sup>3</sup>

<sup>1</sup>National AIDS Fighting Council of Senegal, Monitoring and Evaluation, Dakar, Senegal, <sup>2</sup>National AIDS Fighting Council of Senegal, Dakar, Senegal, <sup>3</sup>Ministry of Health, AIDS Fighting Division of Senegal, Dakar, Senegal

**Background:** Public health and location are intimately related. Although Geographical Information Systems can increase understanding of spatial variance of the HIV epidemic; its application in Sub-Saharan Africa is restricted. The HIV pandemic is affected by strong spatiotemporal variation in Senegal.

Using spatial analysis tools support by the national database, this study is aimed at examining the spatiotemporal trends of HIV epidemic (HIV Population and HIV related deaths) in Senegal from 2013 to 2022.

**Methods:** The first step in this study was to "georeference" all HIV treatment sites in Senegal using their GPS coordinates. The second step consisted of assigning each site its attributes (HIV population and deaths) from 2013 to 2022. The "Inverse Distance Weighting" and "Trend Analysis" tools of ArcGIS 10.1's software were used to generate continuous surfaces of the HIV epidemic from point data. These interpolation techniques determine values by a weighted combination of a set of sample points.

**Results:** Our study produced a modeling revealing wide spatio-temporal variation of HIV population and deaths from 2013 to 2022 in Senegal. The areas of greatest HIV concentration were located in Dakar (31%) and in the southern regions (Kolda, Sédhiou and Ziguinchor), polarizing together (25% of the total PLWHIV of the national database). A significant increase has been also noticed along the national road network stretching from (Thies, Mbour, Fatick, Kaolack, Kaffrine, Tambacounda and Kédougou), which now accounts for 28% of the national database. Although HIV-related deaths have seriously declined, it is much more concentrated in the regions of Kolda (2.9%), Sédhiou (4.37%), Ziguinchor (2.15%), Kédougou (3.24%), Tambacounda (2.36%), Fatick (2.54%) and Kaffrine (3.35%), with rates greater than the national average (2.09%) in 2022.

**Conclusions:** Our research provides evidence of strong geographic clustering of HIV population and deaths in the South and Trans-boundary regions of Senegal. Intervention strategies should be therefore more emphasized in improving access to HIV services especially in those hotspot areas. The study also suggests a deeper spatial analysis of the HIV epidemic in the trans-boundary areas of Senegal.

## THPEC303

### Population size estimation of men who have sex with men including transgender women in ten provinces of Vietnam in 2023: results from a three-source capture-recapture study

K.V. Nghia<sup>1</sup>, L.Q. Thu<sup>1</sup>, L.N. Tu<sup>1</sup>, N.V.N. Thanh<sup>1</sup>, N.D. Phuc<sup>1</sup>, N.H. Minh<sup>2</sup>, N.C. Quoc<sup>2</sup>, B.H. Duc<sup>3</sup>, D.T. Lo<sup>3</sup>, P.D. Manh<sup>3</sup>, H.L.L. Ngoc<sup>4</sup>, N.T.T. Ha<sup>4</sup>, T.P. Hau<sup>1</sup>, N.V. Thuong<sup>1</sup>, D.C. Thanh<sup>2</sup>  
<sup>1</sup>Pasteur Institute of Ho Chi Minh City, Ho Chi Minh city, Viet Nam, <sup>2</sup>US. CDC Vietnam, Division of HIV and TB, Ha Noi, Viet Nam, <sup>3</sup>Vietnam Administration of HIV/AIDS Control, Ministry of Health, Ha Noi, Viet Nam, <sup>4</sup>National Institute of Hygiene and Epidemiology, Ha Noi, Viet Nam

**Background:** In Vietnam, estimated HIV prevalence among men who have sex with men (MSM) have increased in recent years. Estimating the population size of MSM is essential for improving inputs into epidemiological models and to provide data for focused HIV prevention interventions.

**Methods:** In 2023, we implemented a three-source capture-recapture study (Source 1: dating app user count, source 2: distributing unique objects, and source 3: respondent-driven sampling survey) to estimate MSM population sizes in 10 Vietnam provinces. Eligible participants were assigned male at birth, aged 18 years and older, had anal sex with another man in the past 12 months, and lived/worked in the province for at least three months. Bayesian Latent Class Modeling was used for analysis.

**Results:** Prior and updated MSM size estimates by province are shown in Table 1.

Region	Province	Estimate	95% CI	Prevalence of MSM among general male population (%; 95%CI)	Prior estimate and prevalence of MSM among general male population (%; 95%CI)
North	Thai Nguyen	2,200	2,100 - 2,300	0.65 (0.62-0.69)	3,100 (0.95)
	Hai Phong	6,400	4,800 - 8,500	1.27 (0.95-1.68)	4,700 (0.95)
	Ha Noi	50,300	44,400 - 53,700	2.27 (2.00-2.42)	33,600 (1.81)
	Total	58,900	51,300 - 64,500	1.93 (1.68-2.11)	41,500 (1.42)
South	Long An	12,100	10,900 - 13,300	2.51 (2.26-2.76)	4,600 (0.97)
	Kien Giang	13,700	12,300 - 15,500	2.81 (2.51-3.16)	4,800 (0.97)
	An Giang	18,200	14,100 - 21,000	3.94 (3.06-4.55)	4,800 (0.97)
	Can Tho	20,100	17,000 - 22,700	5.64 (4.77-6.38)	4,200 (1.19)
	Ba Ria-Vung Tau	7,900	7,100 - 8,900	2.54 (2.29-2.85)	3,100 (0.97)
	Ho Chi Minh City	105,900	94,400 - 129,300	3.77 (3.36-4.61)	55,000 (2.04)
	Binh Duong	27,200	22,100 - 33,500	2.84 (2.31-3.50)	8,000 (0.97)
	Total	205,100	177,900 - 244,200	3.50 (3.03-4.16)	84,500 (1.49)
Overall		264,000	229,30 - 308,700	2.96 (2.57-3.46)	126,000 (1.46)

Table 1. Population size estimation of men who have sex with men using three sources capture-recapture method, Vietnam 2023.

We estimate 264,000 (95%CI: 229,000-309,000) MSM, corresponding to 2.96% (95%CI: 2.57-3.46) of adult male population, in the 10 provinces. The percentage of MSM among adult males ranges from 0.65% (95%CI: 0.62-0.69) in Thai Nguyen to 5.64% (95%CI: 4.77-6.38) in Can Tho. The percentage is higher in the South (3.50, 95%CI: 3.03-4.16) compared to the North (1.93, 95%CI: 1.68-2.21). Current estimates in 9 provinces are higher than estimates from 2019.

**Conclusions:** MSM size estimates show substantial increase from prior MSM two-source capture-recapture estimates in Vietnam, especially in the South where HIV prevalence increasing, may reflect social evolution and culture differences toward homosexuality between regions. These findings will be extrapolated for a national MSM size estimate, as inputs for people living with HIV estimates, and for HIV prevention programming.

Applying the Health Belief Model in determining the association between knowledge, perception, and willingness towards HIV testing among women of childbearing age (WOCBA) in Iloilo City, Philippines

R. Olete<sup>1,2,3</sup>, S. Flores<sup>3</sup>, J.M.P. Oyco<sup>3</sup>

<sup>1</sup>National Cheng Kung University, Department of Public Health, Tainan, Taiwan, Province of China, <sup>2</sup>Sustained Health Initiatives of the Philippines, Mandaluyong City, Philippines, the, <sup>3</sup>Gabay sa Pulang Laso Inc., Antipolo City, Philippines, the

**Background:** The rate of new HIV cases in Filipino pregnant women has increased steadily from 2010-2020, though the proportion remains low. DOH guidelines emphasize HIV testing for women of childbearing age (WOCBA), but their willingness for testing remains under-explored.

This study uses the Health Belief Model to explore the association between knowledge, perception, and willingness to undergo HIV testing among WOCBA in Iloilo City.

**Methods:** A cross-sectional online survey was conducted between February 19 and March 1, 2023. Using the HBM, the questionnaire was divided into:

1. HIV-related knowledge (20-item true/false),
2. Perceptions of susceptibility, severity, benefits, and barriers towards HIV and HIV testing using a 5-point Likert scale (1-strongly disagree; 5-strongly disagree), and
3. Willingness to HIV testing measured by an 10-point rating scale (0- not willing; 9-very willing) and tested for internal consistency (Cronbach's alpha=0.84).

Descriptive statistics with composite scoring of Likert scales, and multivariable regression analysis was used in analyzing the data.

**Results:** The 300 WOCBA were mainly from low-to-poor income earners (93.7%), had a median age of 29 (IQR=25-33), and reported a mean gravidity of 2.5 pregnancies (SD=1.6). Almost half never had an HIV test during their pregnancy (46.3%) but reported a high willingness to get an HIV test (mean=7.4; SD=2.9). Their average HIV-related knowledge scored 14.9 (SD=2.12) while the composite scores revealed that the WOCBA had low perception towards barriers of HIV testing and HIV-related severity/threats (mean=1.36; SD=0.60, and mean=3.06; SD=1.20, respectively), moderate perception towards susceptibility to HIV (mean=3.40; SD=0.30), and had higher perception towards the benefit of HIV testing (mean=4.64;SD=0.41). The regression analysis revealed that the willingness to

HIV testing among WOCBA were positively associated to their HIV-related knowledge ( $\alpha$ OR=1.21, 95%CI=1.02-1.43,  $p=0.025$ ) but negatively associated to perceived barriers to HIV testing ( $\alpha$ OR=0.42, 95%CI=0.24-0.71,  $p=0.001$ ) and WOCBA's gravidity ( $\alpha$ OR=0.78, 95%CI=0.63-0.95,  $p=0.014$ ).

**Conclusions:** In conclusion, WOCBA in Iloilo City demonstrated a generally high willingness to undergo HIV testing, emphasizing the need for accessible HIV education and screening, particularly among those with fewer pregnancies. Addressing perceived barriers is crucial for ensuring universal coverage of HIV prevention efforts.

This study contributes valuable insights for public health strategies aimed at promoting HIV testing among WOCBA, fostering a foundation for targeted interventions.

### THPED305

Applying a design-thinking approach for male-friendly ART services: lessons learnt from Blantyre, Malawi

A. Berner-Rodoreda<sup>1</sup>, E. Ngwira<sup>2</sup>, B. Chione<sup>3</sup>, T. Bärnighausen<sup>1</sup>, F. Neuhann<sup>1</sup>

<sup>1</sup>Heidelberg Institute of Global Health, Heidelberg, Germany, <sup>2</sup>Lilongwe University of Agriculture and Natural Resources, Lilongwe, Malawi, <sup>3</sup>Lighthouse Trust, Blantyre, Malawi

**Background:** Design-thinking emerged from marketing and is characterized by collaborating with users in the design of products. It follows different stages of developing a product or service: empathizing, defining the problem, ideating, prototyping and testing the product or service. In Global Health, it has been used to model services and products with users, based on their needs.

As men's utilization of health- and HIV-facilities lags behind women's, we used this approach to design male-friendly HIV delivery services in Malawi.

**Description:** We empathized through in-depth interviews ( $n=72$ ) with men on ART in Blantyre, Malawi, men in surrounding communities, and local stakeholders, by familiarizing ourselves with men's health facility issues. This enabled us to define the problem and categorize ideas for ideal male HIV services emerging from the interviews. Together with the Lighthouse Trust, we purposively selected ideas in early 2022 based on best fits for solving the identified problems and conducted a total of 4 workshops with male clients and men in surrounding communities in October/November 2022.

Participating men prototyped models by using a variety of materials (e.g., colorful paper, stickers, pens, cardboard, modelling clay). In 2 deliberative workshops with all stakeholder groups, participants developed implementable HIV service-delivery models. Workshops were audio-recorded transcribed, and analyzed using thematic and discourse analysis deal male HIV services emerging from interviews.

**Lessons learned:** We present methodological and practical challenges faced in implementing the design-thinking process in Malawi.

While the workshops were all successfully conducted, challenges in the prototyping workshops included sampling, choice of venue, tight time-frames, usage of materials and group dynamics as well as recording and transcribing pair work; in the deliberative workshops, an additional challenge was mixing people of various educational levels including health care workers and clients.

**Conclusions/Next steps:** The participatory approach of design-thinking works in a resource-limited setting and can be recommended for other projects. Participants enjoy the method and develop interesting models, but attention should be paid to the selection process of participants, group dynamics and the challenge of recording group work in a confined space. Also, a longer time-frame for conducting these creative and deliberative workshops will help produce implementable models.

## THPED306

**By youth, for youth: a community-based participatory research approach to mental health assessment among youth with HIV in India**

S. Sannigrahi<sup>1</sup>, B. Seenappa<sup>2</sup>, P. Laxmikanth<sup>2</sup>, S. Reddy<sup>2</sup>, K. Filian<sup>1</sup>, M.B. Raj<sup>2</sup>, L. Ganapathi<sup>3</sup>, A. Shet<sup>1</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Department of International Health, Baltimore, United States, <sup>2</sup>RISHI Foundation, Bengaluru, India,

<sup>3</sup>Massachusetts General Hospital, Harvard Medical School, Division of Pediatric Global Health, Boston, United States

**Background:** Youth with HIV (YWHIV) confront distinct mental health challenges necessitating interventions informed by their lived experiences. Failure to do so, as evidence suggests, can perpetuate a self-reinforcing cycle of misaligned and ineffective support, further exacerbating existing vulnerabilities.

This study addresses this gap by employing a community-based participatory research (CBPR) approach, empowering YWHIV to actively co-create and implement a culturally responsive mental health assessment program.

**Description:** Six youth investigators (YIs) aged 18-24, born with HIV and residing in the southern Indian states of Karnataka and Tamil Nadu, underwent certification in human subjects' protection and survey administration techniques. YIs actively shaped the research process by culturally adapting standardized assessments (PHQ-9, GAD-7) through iterative discussions with experts, drawing on their own perspectives.

After a 2-day training incorporating pedagogy, role-play, and debate, YIs assessed 206 YWHIV peers across urban and rural settings, prioritizing rapport, authenticity, and ethical conduct. On-site professional counselors ensured well-being for YIs and participants, offering timely guid-

ance, referrals, and crisis intervention. Following each assessment, YIs documented their experiences and reflections in surveys and written essays.

**Lessons learned:** Continuous feedback mechanisms and debriefing sessions improved YI training by addressing concerns about tool understanding, trust-building, and sensitive topics. YI Involvement improved the research process by optimizing tools, combating stigma, and facilitating reliable data collection. Fuller participation and fewer refusals were observed. YIs created a safe space for participants to express emotions openly, leading to candid conversations and stronger social connections. Beyond data collection, the YIs' participation significantly boosted their own knowledge, self-confidence, and research skills.

**Conclusions/Next steps:** This study serves as an illustrative model of CBPR in mental health research among YWHIV, highlighting the importance of feedback, supportive supervision, and youth engagement in fostering an impactful research environment.

The next phase of this research will continue collaboration with YWHIV to develop peer-led interventions that can enhance the delivery of mental health services within the community.

## THPED307

**Breaking stigma and saving lives: the revolutionary impact of CyberRwanda's digital HIV awareness, testing, and prevention campaign**

A. Uwera<sup>1</sup>

<sup>1</sup>Youth Development Labs (YLabs), Design, Kigali, Rwanda

**Background:** CyberRwanda addresses Rwanda's high rates of unplanned teen pregnancies and HIV transmissions by providing access to adolescent health information and services. The self-care digital platform, targeting young people aged 12-19, is implemented by Y Labs in collaboration with the Society for Family Health - Rwanda, guided by the Ministry of Health and Rwanda Biomedical Center.

**Description:** A Randomized Control Trial (RCT) involving 6,000 students in CyberRwanda-implemented schools spanned 2021-2023. The study, with baseline, midline, and end-line assessments, aimed to determine if CyberRwanda could enhance modern contraceptive use, delay child-bearing initiation, and increase HIV testing and prevention among adolescents.

**Lessons learned:** The evaluation results highlighted significant improvements in HIV awareness and testing among participants engaged with CyberRwanda. Notably, the number of participants reporting ever testing for HIV increased progressively over the study period: 2323 (38.2%) at baseline, 2810 (48.7%) at midline, and 2863 (51.6%) at end-line. Additionally, individuals reporting condom use as an HIV prevention method was as follow: 685

Oral  
abstracts

Poster  
exhibition

Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

(39.8%) at baseline, 877 (50.9%) at midline, and 596 (40.4%) at end-line. Although a slight decline was observed at the end-line, the overall trajectory reflects a growing awareness of condom use for HIV prevention during the study period.

Furthermore, a positive behavioural shift was noted in CyberRwanda's implementation. Strategies to dispel myths and reduce HIV stigma led to youth openly discussing HIV-related topics in school clubs. Research findings revealed a notable change, with increased willingness to engage in conversations and share personal experiences—a positive shift in attitudes and perceptions surrounding the topic.

**Conclusions/Next steps:** In summary, CyberRwanda is a pivotal digital tool that imparts knowledge and triggers positive behavioural shifts among young people, ultimately contributing to increased HIV awareness and reduced stigma. As the project advances towards national-scale implementation, it aims to strengthen these behavioural transformations further, making significant strides in adolescent health and HIV prevention efforts across Rwanda.

## THPED308

Information-Motivation-Behavior (IMB) theory-based intervention to address high-risk AIDS behaviors among men who have sex with men: a systematic review and meta-analysis

Y. Krishnamoorthy<sup>1</sup>, M.G. Majella<sup>1</sup>, D. Govindan<sup>2</sup>

<sup>1</sup>PROPUL Evidence, Evidence Synthesis Unit, Chennai, India,

<sup>2</sup>ESIC Medical College and Hospital, Community Medicine, Chennai, India

**Background:** This study aims to evaluate the effectiveness of Information-Motivation-Behavioral Skills (IMB) model-based interventions in reducing high-risk behaviors for AIDS among men who have sex with men (MSM). Despite extensive health initiatives, MSM continue to exhibit high rates of HIV/STIs and risky behaviors. Previous interventions using the IMB model have shown varied outcomes.

This review systematically aggregates existing evidence to determine the efficacy of the model in addressing the unique health challenges faced by MSM population.

**Methods:** This meta-analysis focused on randomized controlled trials (RCTs) conducted amongst MSM to test interventions that utilized the IMB model as a theoretical framework, compared against placebo, control/standard care. Comprehensive searches were done in the following databases: Scopus, Embase, Cochrane trials library, PubMed Central, Medline, ScienceDirect and Google Scholar and trial registries like Clinicaltrials.gov till December 2022. Risk of bias assessment was done using Cochrane Risk of bias 2 (RoB2) tool. Meta-analysis was carried out using random-effects model with inverse

variance technique. With 95% confidence intervals (CIs), pooled standardised mean differences/mean difference (SMD/MD), and/or risk ratios (RR) were reported. Methodological guidance and reporting were taken from PRISMA 2020 checklist.

**Results:** In total, 10 RCTs were included. Half of the studies had higher risk of bias. The pooled SMD for HIV-related knowledge was -0.08 (95%CI: -1.48 to 1.32), for HIV-related motivation was 0.20 (95%CI: -0.27 to 0.67), for HIV-related behavioural skills was 0.32 (95%CI: -0.23 to 0.87), for condom usage was 2.72 (95%CI: -0.75 to 6.19), for number of sexual partners was 0.22 (95%CI: -0.13 to 0.57). The pooled RR for unprotected anal intercourse (UAI) was 0.83 (95%CI: 0.73-0.94), HIV positivity was 1.04 (95%CI: 0.45-2.38). Sensitivity analysis revealed that none of the outcomes differed significantly in terms of the degree or direction of the link.

**Conclusions:** Intervention based on IMB model has better effectiveness compared to standard care in reducing the number of MSM people having UAI. However, it did not have any impact on any of the other HIV risk reduction behaviours. This review also supports the need for more RCTs on intervention containing both e-component and interaction component based on IMB model for HIV risk reduction behaviour.

## THPED309

Application of the Information-Motivation-Behavioural Skills model to ART adherence in recently diagnosed People Living with HIV – preliminary results

L.T. Dube<sup>1</sup>, L. Knight<sup>2,1</sup>

<sup>1</sup>University of the Western Cape, School of Public Health, Cape Town, South Africa, <sup>2</sup>University of Cape Town, School of Public Health, Cape Town, South Africa

**Background:** The success of any anti-retroviral therapy (ART) program depends on adequate adherence. High adherence rates ≥95% are required in order to achieve positive virologic suppression, increased CD4 count and fewer hospitalisations. The Information-Motivation-Behavioural Skills (IMB) model is a behavioural theory model used to assess adherence and provides a simple explanation for complex health behaviours.

This paper aims to describe ART-related information, motivation and behavioural skills among people living with HIV (PLWH), as well as adherence to ART.

**Methods:** Baseline data on ART-related information, motivation, behavioural skills and adherence was collected within a randomised controlled trial with 316 PLWH in 12 sub-districts in Cape Town, South Africa, from May 2021 to May 2022. The data was analysed using SPSS (version 28) for descriptive statistics. Chi-squared test of independence was used to assess the relationship between the model constructs and demographic characteristics (age, gender and level of education), as well as adherence.

**Results:** 85.4% of PLWH self-reported as adherent to ART, based on four day recall. High ART-related information was reported, with 78.5% of PLWH scoring above 60%. ART-related personal motivation was low ( $M=2.04$  on a 1-5 scale,  $SD=0.89$ ), ART-related social motivation was high ( $M=3.74$  on a 1-5 scale,  $SD=0.55$ ), household social support was high ( $M=72.5$  on a 0-100 scale,  $SD=25.12$ ) and ART-related behavioural skills were high ( $M=4.13$  on a 1-5 scale,  $SD=0.53$ ). There was no statistically significant relationship between each of the model constructs and age, gender and level of education.

Adherence was significantly related to household support and behavioural skills ( $p=0.01$  and  $p=0.01$ , respectively), but not to information or motivation.

**Conclusions:** The results underscore the need to enhance personal motivation in order to improve adherence. Behavioural skills are important in promoting adherence, in agreement with the IMB model. Household-based social support has also emerged as an important contributor to adherence.

The use of theory-based models to understand factors that influence ART adherence directly and indirectly helps to optimize adherence for PLWH. Use of these models acknowledges the need for a comprehensive approach to effect behaviour change.

## Social and behavioural aspects and approaches to HIV and living with HIV

Getting to the Heart of Stigma: lessons learned from stakeholder engagement workshops to inform the development of stigma reduction toolkits

A. Cloete<sup>1</sup>, N. Mbandazayo<sup>2</sup>, T. Madondo<sup>3</sup>, P. Ramothwalo<sup>4</sup>, N. Zungu<sup>2</sup>

<sup>1</sup>the Human Sciences Research Council, Public Health, Societies and Belonging, Cape Town, South Africa, <sup>2</sup>the Human Sciences Research Council, Public Health, Societies and Belonging, Pretoria, South Africa, <sup>3</sup>Izinga Life and Leadership Institute, Pretoria, South Africa, <sup>4</sup>South African National AIDS Council (SANAC), Pretoria, South Africa

**Background:** The Getting to the Heart of Stigma study explored factors facilitating HIV-related stigma, its manifestations in various institutions, and the outcomes for affected populations in KwaZulu-Natal, Mpumalanga, and the Free State provinces in South Africa.

The researchers involved in the study aimed to use the findings to inform action. Out of this grew the idea of developing stigma reduction toolkits to address intersectional stigma using the research findings.

**Description:** The research team conceptualized two workshops to interrogate, validate, and translate the evidence of the Getting to the Heart of Stigma study into action toolkits that can be used for advocacy. Stakeholders from civil society were invited to attend two workshops. A participatory co-learning dissemination approach that included dialogue throughout all the sessions was adopted. This approach allowed participants to share their experiences of stigma within their communities, places of work, healthcare facilities, schools, or homes.

**Lessons learned:** The research team learned the significance of stakeholders involved in co-creating knowledge for action. A participatory approach to validating the study findings and developing evidence-based guidelines is critical for creating a contextually nuanced stigma response relevant to key and vulnerable populations' needs.

The research team also learned that dissemination is not a once-off event but involves and should include several stakeholder engagements.

**Conclusions/Next steps:** The next steps will include collaborating with the South African National AIDS Council (SANAC) to explore pathways to reduce stigma as well as partner with civil society organizations to implement a feasibility and accessibility study.

This phase will be followed by rolling out the adapted toolkits and assessing the impact thereof on reducing intersectional stigma experienced by people living with HIV.

### THPED311

"Lean On Me Support Group" transforms lives: a success story in Baringo County, Kenya

S. Muniya<sup>1</sup>, S. Ajuoga<sup>2</sup>, C. Kiprop<sup>2</sup>, E. Chepsoi<sup>2</sup>

<sup>1</sup>GoldStar Kenya, Community Support Department, Nakuru, Kenya, <sup>2</sup>USAID Tujenge Jamii, Nakuru, Kenya

**Background:** Baringo County, is known for its picturesque landscapes, grappled with high rates of alcoholism and HIV/AIDS. Recognizing the intricate connection between these two health issues, local health authorities partnered with community leaders to establish the "Lean On Me Support Group." The group targeted individuals facing the dual burden of chronic alcoholism and the need for consistent adherence to ARV drugs.

In the year 2022-2023 we analyzed 39 out of 70 persons living with HIV and seeking ARVs health services at Marigat Sub County Hospital who were struggling with Alcoholism that negatively affected their treatment outcomes.

**Description:** The support group adopted a holistic approach to address the physical, mental, and social aspects of its members' lives. Regular counseling sessions were provided to help individuals cope with the challenges of both alcoholism and living with HIV/AIDS. Also Peer Support Mentorship, Education, Awareness and Community Integration.

**Lessons learned:** Members of the Lean On Me Support Group reported a significant improvement in their adherence to ARV medications. The group's emphasis on education and peer support contributed to better understanding and commitment to treatment plans, Hence Viral Load Suppression rate improved from 13/39 (33%) in August 2022 to 36/39 (92%) in May 2023. Also Reduction in Alcohol Consumption, Enhanced Mental Well-being and Community Transformation through this support group.

**Conclusions/Next steps:** The "Lean On Me Support Group" in Baringo County stands as a beacon of hope, showcasing the transformative power of community-based interventions. By addressing the unique challenges faced by individuals dealing with chronic alcoholism and HIV/AIDS simultaneously, this initiative has not only improved treatment outcomes but has also contributed to a positive shift in community attitudes. The success of this support group serves as a model for similar interventions in regions facing similar health challenges, demonstrating that a holistic and community-driven approach can make a lasting impact on individuals' lives.

## THPED312

### Sexual violence, antiretroviral adherence, and viral suppression among reproductive age women in African population-based surveys

L. Schrubbe<sup>1</sup>, H. Stöckl<sup>2</sup>, A. Hatcher<sup>3</sup>, C. Calvert<sup>4</sup>

<sup>1</sup>London School of Hygiene and Tropical Medicine, Faculty of Epidemiology and Population Health, London, United Kingdom, <sup>2</sup>Ludwig-Maximilians-University, Institute for Medical Information Processing, Biometry and Epidemiology, Munich, Germany, <sup>3</sup>University of North Carolina at Chapel Hill, Department of Health Behavior, Chapel Hill, United States, <sup>4</sup>University of Edinburgh, Centre for Global Health, Usher Institute, Edinburgh, United Kingdom

**Background:** Women living with HIV (WLH) face challenges in antiretroviral therapy (ART) adherence and achieving viral suppression despite expanded access to ART. Using data from Population-Based HIV Impact Assessment (PHIA) surveys, we have previously shown sexual violence against women (VAW) is an important risk factor for poor ART adherence.

Here we examined the association of sexual VAW with viral suppression, and explored the extent to which this is moderated by ART adherence.

**Methods:** A pooled, weighted, secondary analysis was conducted among WLH on ART, age 15-49, from PHIA cross-sectional surveys (2015-2018) from nine sub-Saharan African countries. We explored the distribution of WLH by self-reported exposure to VAW, and by viral suppression and self-reported ART adherence status ( $\leq 1$  missed day in past 30 days). Logistic regression was used to exam-

ine the association between lifetime sexual violence and unsuppressed viral load ( $\geq 1000$  copies/mL), after adjusting for key confounders.

**Results:** Among 5,038 WLH, the prevalence of VAW was 15.2% (95%CI:13.3-17.1%), the prevalence of suboptimal ART adherence was 19.8% (95%CI:18.1-21.5%), and the prevalence of unsuppressed viral load was 13.6% (95%CI:12.0-15.2%). Women with a history of VAW were more likely to be virally suppressed and report suboptimal ART adherence than women who did not report VAW (24.6% versus 14.4%) (Figure).

There was no evidence for an association between VAW and unsuppressed viral load ( $\alpha\text{OR}$ :0.98, 95%CI:0.62-1.48).

Figure.

**Conclusions:** We found evidence for an association between sexual violence and ART adherence, but not viral suppression. A substantial proportion of women were virally suppressed yet reported suboptimal ART adherence, and this was particularly notable in women who experienced sexual violence.

Future population-based studies should consider biomarker measures for ART adherence, such as hair sample concentrations, as self-report measures may be subject to bias. Future research is needed to further investigate the relationship between VAW and ART adherence and viral suppression.

## THPED313

### Health stigma & discrimination experienced by adolescents living with HIV and comorbid depression in Malawi

M. Faidas<sup>1,2</sup>, M. Stockton<sup>3,2</sup>, N. Bhushan<sup>4</sup>, H. Hedrick<sup>5</sup>, B. Gaynes<sup>6</sup>, HEADS-UP Study Group

<sup>1</sup>University of North Carolina, School of Medicine, Chapel Hill, United States, <sup>2</sup>UNC Project-Malawi, Lilongwe, Malawi,

<sup>3</sup>University of Pennsylvania, Psychiatry, Philadelphia, United States, <sup>4</sup>RTI International, Durham, United States,

<sup>5</sup>University of North Carolina at Greensboro, Psychology, Greensboro, United States, <sup>6</sup>University of North Carolina, Psychiatry, Chapel Hill, United States

**Background:** Among 65,000 adolescents living with HIV (ALWH) in Malawi, nearly 19% also suffer from depression. HIV stigma is a major contributor to depression and adversely impacts engagement with HIV care, particularly adherence to antiretroviral therapy (ART). ALWH in Malawi experience HIV stigma as stereotyping, social exclusion, low social support, and abuse; and these experiences are associated with poor mental health. Despite recognition of the deleterious effects of HIV stigma in this population, we have limited knowledge of how stigma is experienced by ALWH.

In this analysis, we use the Health Stigma and Discrimination framework to describe stigma faced by depressed ALWH in Malawi, and its impact on health and social well-being.

**Methods:** As part of our formative work adapting a counseling intervention, the Friendship Bench (FB), for ALWH, we recruited 25 ALWH from adolescent ART clinics in Lilongwe from January to April 2023. Adolescents aged 13-19 with a prior HIV diagnosis and a positive depression screen on the Beck Depression Inventory-II were eligible for the study. We also recruited 4 caregivers of ALWH, and 10 individuals involved in a prior study adapting the FB for perinatal women living with HIV.

We conducted in-depth interviews, focus group discussions, and social support mapping sessions. Data was analyzed via deductive and inductive coding, and thematic analysis.

**Results:** Analyses identified the major drivers of HIV stigma as fear of HIV transmission, and stereotyping ALWH as weak and unable to achieve dreams. The most common manifestations of HIV stigma were gossip, mockery, and physical and social distancing. Internalized stigma manifested as worthlessness and shame.

Decreased adherence to ART was a commonly cited outcome of HIV stigma. Broader impacts of HIV stigma include social exclusion, substance use, poor mental health, and suicidality.

**Conclusions:** This study is the first to specifically describe the stigma and discrimination faced by depressed ALWH in Malawi. It verifies our prior knowledge that stigma is a significant barrier to healthcare and adversely impacts

quality of life. Further studies are needed to understand the intersectional stigma of HIV and depression, explore resiliency factors amongst ALWH, and develop interventions to address stigma across multiple socioecological levels.

## THPED314

### Intersectional impact of the COVID pandemic on multiple forms of HIV-related stigma and discrimination: findings from a UK sample (n=653)

M. Pantelic<sup>1,2</sup>, K. Martin<sup>1,3</sup>, M. Tweed<sup>4</sup>, C. Fitzpatrick<sup>3</sup>, E. Nixon<sup>3</sup>, W. Spice<sup>5</sup>, M. Jones<sup>6</sup>, M. Darking<sup>7</sup>, J. Whetham<sup>1,3</sup>, J. Vera<sup>1,3</sup>

<sup>1</sup>University of Sussex, Brighton and Sussex Medical School, Falmer, United Kingdom, <sup>2</sup>University of Oxford, Department of Social Policy and Intervention, Oxford, United Kingdom,

<sup>3</sup>Brighton and Sussex University Hospitals, Brighton, United Kingdom, <sup>4</sup>Terrence Higgins Trust, Brighton, United Kingdom, <sup>5</sup>Western Sussex University Hospitals, Worthing, United Kingdom, <sup>6</sup>East Sussex Healthcare NHS Trust, Eastbourne, United Kingdom, <sup>7</sup>University of Brighton, School of Humanities and Social Science, Falmer, United Kingdom

**Background:** This study examined the intersectional impact of the COVID pandemic on stigma and discrimination experienced by people living with HIV (PLWH) in the UK.

**Methods:** A co-produced survey was circulated to all HIV service users (> age 18) in Sussex, UK during the first lockdown. Multiple logistic regressions and marginal effects models examined socio-demographic predictors of enacted stigma, internalised stigma, disclosure concerns, and data security concerns.

**Results:** Out of 653 respondents, the majority identified as male (n=522, 80.6%) and gay (n=451, 69.8%), representative of PLWH in Sussex. Respondents from ethnic minority backgrounds comprised 16.9% of the sample (n=109). 44 (6.8%) PLWH reported more frequent experiences of enacted HIV stigma since the start of COVID; 211 (32.6%) reported heightened internalised stigma; 273 (42.1%) heightened worries about HIV disclosure; and 285 (44.0%) heightened worries about data security. Younger PLWH (aged 20-39) were more likely to experience enacted stigma than 40-59 year-olds (AOR: .36, 95% CI: .16-.85) and PLWH over 60 (AOR: .24 (.08-.73), as well as internalised stigma (AOR: .53, 95% CI: .33-.86 for 40-59 year-olds; AOR: .25, 95% CI: .14-.46 for PLWH aged 60+).

Compared to men living with HIV, more women living with HIV (WLWH) experienced internalised stigma (AOR: 2.39, 95% CI: 1.13-5.05) and data security concerns (AOR: 2.51, 95% CI: 1.21-5.21).

Compared to white PLWH, ethnic minority respondents were more likely to have data security concerns (AOR: 3.24, 95% CI: 1.84-5.70). Gay PLWH were less likely (AOR: .49, 95%

AIDS 2024

CI: .26-.93) to have concerns about HIV status disclosure than heterosexual PLWH. The marginal effect model findings indicated that, of all demographic groups, minority ethnic WLWH were most likely to report heightened concerns about data security (80.5%, three times more likely than white men).

Young WLWH were most likely to report worsening internalised stigma since the start of the pandemic (66.4%, four times more likely than older men).

**Conclusions:** Early responses to COVID inadvertently heightened multiple forms of HIV-related stigma and discrimination, with women, ethnic minority and young PLWH being disproportionately affected.

Future health emergency responses and HIV service changes must prioritise the needs of marginalised communities and PLWH with intersecting vulnerabilities.

### THPED315

*"I live my own life": HIV-related stigma coping strategies in older adults living with HIV in a suburban community in Northern Thailand: a qualitative study*

L. Aupibul<sup>1</sup>, R. Thammalangka<sup>1</sup>, S. Muangjai<sup>2</sup>, S. Masurin<sup>1</sup>, P. Threeyakul<sup>2</sup>, A. Srita<sup>1</sup>, A. Tangmungkongvorakul<sup>1</sup>

<sup>1</sup>Chiang Mai University, Research Institute for Health Sciences, Chiang Mai, Thailand, <sup>2</sup>Fang Hospital, Chiang Mai, Thailand

**Background:** Despite a longer life expectancy on antiretroviral treatment (ART), HIV-related stigma remained a public health challenge affecting people living with HIV (PLHIV) globally.

We explored the experiences of long-term HIV survivors to learn about their HIV-related stigma coping strategies.

**Methods:** A qualitative study was conducted from March-July 2023. We performed semi-structured interviews with 31 older adults living with HIV(OALHIV) aged ≥50 years who attended HIV clinic care at Fang Hospital, Chiang Mai, Thailand. The transcribed audiotapes were reviewed, hand-coded, and categorized using thematic analysis.

**Results:** The median age of study participants was 60 years(IQR 56-64); 90% received ART for >10 years, 65% were female. Their stigmatized experiences included social rejection, employment discrimination, and public ridicule. Several themes about stigma coping strategies emerged.

- Limiting social relationships. After being discriminated against, many OALHIV were still hired daily to earn a living. However, they limited other socialization outside working hours to avoid untoward situations.
- Refraining from specific situations to avoid ostracism. They attended community activities but avoided getting involved in sensitive areas like food preparation.

- Relying on informal social support from family members. The supportive persons included a partner or spouse in an old or new family, children, grandchildren, siblings, nephews, or nieces. Support could be financial, meals, or encouraging words.
- Non-disclosure of HIV status and social isolation. Some OALHIV reported living alone and not telling anyone about their HIV. They received only formal support from healthcare providers, not from other villagers.
- Preemptive disclosure of HIV status and educating others. Many female OALHIV reported their social disclosure involuntarily after the death of their husband or their illnesses or voluntarily by direct conversation. While most joined peer support groups, some were trained and became counselors, educators, or case managers in their villages before the availability of ART. In ART era, they also helped with adherence counseling in the clinic. Moreover, some had roles in voluntary HIV counseling and testing and sexual education in public schools. All community contributions allowed them to feel worth living.

**Conclusions:** A better understanding of stigma coping strategies will enable healthcare providers to counsel and design stigma reduction interventions that most fit their life context.

### THPED316

*Mitigating the impact of Covid 19 on women living with HIV: addressing mental and psycho social impact of Covid 19 amongst women living with HIV in Eswatini*

A.Z. Nyatsi<sup>1,2</sup>, T.T. Mazorodze<sup>3</sup>, G.Y. Dlamini<sup>2</sup>

<sup>1</sup>Positive Women Together in Action (PwTA), Psychosocial Services, Manzini, Eswatini, <sup>2</sup>Positive Women Together in Action (PwTA), Psychosocial Services, Mankayane, Eswatini, <sup>3</sup>Positive Women Together in Action, Psychosocial Services, Mankayane, Eswatini

**Background:** Covid was first detected in Wuhan China in December 2019. World Health Organization (WHO) declared the epidemic a Public Health Emergency on 30<sup>th</sup> January 2020, and a pandemic on 11<sup>th</sup> March 2020.

The first case in Eswatini was diagnosed on 14<sup>th</sup> March 2020. Women living with HIV were severely impacted by the pandemic, some had covid themselves and faced discrimination, others lost family, friends and breadwinners. Some lost livelihoods as companies and borders closed for informal cross border business people.

Accessing services was also a problem due to lockdown. This resulted to psychological and mental health consequences such as depression, insomnia and post traumatic stress (PTSD) hence the need for mental health interventions for women living with HIV.

The pandemic happened at a time where there was po-

political unrest and people were shot, lost limbs and buildings were burnt making the trauma worse.

**Description: Method:** The project provided emotional comfort for those who were emotionally overwhelmed and disoriented. This was done through Training workshops for women living with HIV on Psychological First Aid and resilience so they provide a community supported model for peer women living with HIV.

Conducted one day debriefing sessions for 900 for women living with HIV in support groups from 30 support groups and linkages to nearest health centres for mental health services.

**Lessons learned:** The impact is long term and there is need to scale up psychological and mental wellness interventions. There is need for training of more community cadres on psychological first aid to build capacity of PLHIV on mental health issues and screen for mental health disorders. There is need for a comprehensive study on the impact of COVID-19 on mental health, focusing on women living with HIV and TB survivors.

The dual burden of chronic diseases coupled with the psychological trauma caused by the pandemic, has led to an increased need for psychological support.

**Conclusions/Next steps:** Strengthening Mental Health Resilience for women living with HIV demonstrated the importance of providing targeted mental health support for women living with HIV during a crises.

The project's success highlights the need for continued mental health education and resources for vulnerable populations.

## THPED317

### Fostering resilience: a psychosocial support program for women living with HIV in rural Ghana

A.-H.S. Inusah<sup>1</sup>, A. Ziblim<sup>2</sup>, N. Seidu<sup>2</sup>

<sup>1</sup>Upper East Regional Hospital, Internal Medicine, Bolgatanga, Ghana, <sup>2</sup>Inclusive Health for Africa, Programmes, Tamale, Ghana

**Background:** Studies show that as many as half of people living with HIV (PLHIV) have one or two psychiatric disorders and these individuals are less likely to achieve viral suppression than those without mental illness. Studies also assert that psychosocial support interventions have shown promising outcomes viral suppression and breaking stigmas.

In Ghana, not only are Women Living with HIV (WLHIV) often stigmatized due to sociocultural sentiments, mental health support for them is limited. This program aimed to address psychosocial needs, reduce stigma, and empower WLHIV.

The support group aims to establish safe spaces as well as disseminate crucial information about HIV, treatment options, and healthy living while fostering a sense of community to reduce isolation and combat stigma for WLHIV.

The program also strives to empower participants by building self-esteem, confidence, and resilience, offering opportunities for skill development in communication, problem-solving, and self-advocacy.

**Description:** Conducted at the Antiretroviral Clinic of the Upper East Regional Hospital, in the Upper East Region of Ghana (Ghana's second poorest region nationwide). This project was led by the hospital management in collaboration with the Internal Medicine department and spanned from November 2022 to November 2023. Fifty-two WLHIV participated, engaging in weekly 1-2 hour sessions for a minimum of 24 weeks. The initiative started with individual support sessions before transitioning to a group format.

**Lessons learned:** Among the 52 participants, 88% reported enhanced empowerment and knowledge about HIV services, 92% reported improved mental health, and 73% identified mental health support as crucial for ARV medication adherence. A total of 18 referrals were made for psychiatric conditions, and 13 for medical complications.

**Lessons learned:** Tailored support is crucial due to diverse participant needs, and psychosocial support positively impacts medication adherence and overall health. Cultural sensitivity is essential, and ongoing education is vital to keep participants informed about advancements in HIV treatment and care.

**Conclusions/Next steps:** The programme addresses psychosocial needs of WLHIV and demonstrates the significance of culturally sensitive and tailored support in enhancing mental health and overall well-being. The program's success highlights the importance of integrating mental health support into HIV care models.

## THPED318

### Creative communications on the benefits of U=U: using audience insights and evidence to generate demand for HIV prevention and treatment services among MSM and other key populations in Central America

A. Cabrera<sup>1</sup>, S. Lungo<sup>2</sup>, C. Palma<sup>1</sup>

<sup>1</sup>Pan American Social Marketing Organization (PASMO), Guatemala City, Guatemala, <sup>2</sup>Pan American Social Marketing Organization, Guatemala City, Guatemala

**Background:** In Guatemala, El Salvador, Honduras, Nicaragua, and Panama 77% of men who have sex with men (MSM) age 18 and above who participated in a 2021 online survey indicated that the consequences of an HIV positive diagnosis were the main reason for not getting tested for HIV.

**Description:** In November 2022, the Pan American Social Marketing Organization (PASMO), under USAID's Prevention Services against HIV project, conducted a participative co-development and co-design "Empathy, Insights, Prototyping" (EIP) workshop in Guatemala with MSM, pro-

gram staff, the communications and marketing team, and its Advertising Agency to explore and prototype communications around undetectable = untransmittable (U=U) to address barriers among key populations, especially MSM, to HIV testing services (HTS). PASMO collected the input from the online study and audience insights from the workshop to develop a creative brief that would guide a social and behavior change communications (SBCC) campaign to communicate the benefits of U=U within the context of HTS uptake and reduced HIV-related stigma.

**Lessons learned:** PASMO and its Advertising Agency carried out creative processes to decode and translate U=U for target audiences with a clear call to action to know one's HIV status, producing a campaign concept and logo "continua con tu vida". The campaign uses imagery, colors, and messages that transmit hope, and the opportunity to continue with your life knowing as there is modern and effective treatment for HIV that can lead to undetectability and non-transmission to partners.

**Conclusions/Next steps:** In 2024, under a new locally-implemented HIV Prevention, Care, and Treatment project with USAID funds, PASMO will complete the validation the campaign materials and messages with target audiences, especially MSM and people living with HIV, prior to its launch and will develop a comprehensive media plan to reach primary and secondary audiences at various levels. In parallel, and as part of a broader SBCC strategy, PASMO will integrate the campaign's U=U messaging to training and educational materials for healthcare providers and their clients to transmit the benefits of U=U along the HIV continuum of care to increase HTS uptake and treatment adherence and thus contribute to the global 95-95-95 goals in Central America.

## THPED319

**When good isn't good enough: exploring how HIV providers conceptualize patient-provider interactions with people living with HIV who use drugs using a harm reduction framework**

S.L. Creasy<sup>1</sup>, J.E. Egan<sup>1</sup>, S. Krier<sup>2</sup>, J. Townsend<sup>3</sup>, M. Hawk<sup>1</sup>, E.S. Kay<sup>3</sup>

<sup>1</sup>University of Pittsburgh School of Public Health, Department of Behavioral and Community Health Sciences, Pittsburgh, United States, <sup>2</sup>University of Pittsburgh School of Public Health, Department of Infectious Diseases and Microbiology, Pittsburgh, United States, <sup>3</sup>University of Alabama at Birmingham School of Nursing, Birmingham, United States

**Background:** In addition to structural interventions like syringe services and Naloxone distribution, harm reduction (HR) is also a *relational* approach to care encompassing principles such as patient autonomy and pragmatism that can be implemented in healthcare teams

to improve outcomes for people living with HIV (PLWH) who use drugs. Evidence suggests that using a relational HR framework to operationalize care for PLWH who use drugs may improve the patient-provider relationship, thus positively impacting HIV outcomes.

We previously found that attitudes towards people who use drugs are negatively associated with acceptance of HR; however, little is known about how HIV providers conceptualize the patient-provider relationship with PLWH who use drugs.

**Methods:** We interviewed providers (n=23) working at three HIV clinics in the United States to assess their interactions with patients. Providers included anyone who had worked at their respective clinic for ≥ 1 year and who had face-to-face contact with patients (e.g., front desk staff, research coordinators, nurses, physicians, and social workers). Data were coded thematically via Dedoose.

**Results:** While HIV providers described both positive and negative interactions with patients, we found some providers conceptualize positive interactions as being antithetical to HR. Examples of how providers described positive interactions in line with HR principles: when patients appear comfortable with and trusting of their provider, conversations that are easy or pleasant, when patients feel heard by their provider, and when providers feel they are responsive to patient needs.

However, other providers described positive interactions counter to the HR principle of autonomy, describing "positive" or "good" interactions as those in which patients are compliant of what providers ask of them, or make provider-directed behavioral changes.

**Conclusions:** Our findings reflect the current lack of relational HR practice among some providers. Provider descriptions of positive interactions in line with relational HR in their conceptualization of patient-provider interactions with PLWH who use drugs have potential to guide efforts in increasing acceptability of HR in HIV care.

Given evidence showing HR improves outcomes for those who use drugs, our findings suggest missed opportunities to incorporate relational HR principles into the patient-provider relationship in HIV primary care settings.

## Adam's Love We Care: a multifaceted eHealth intervention for early linkage to HIV treatment and optimizing retention in care among Thai HIV-positive MSM

C. Nitpolprasert<sup>1,2</sup>, S. Pinyakorn<sup>3,4</sup>, T. Anand<sup>1</sup>, P. Reiss<sup>2</sup>, J. Ananworanich<sup>2</sup>, H.L. Peay<sup>5</sup>

<sup>1</sup>Adam's Love Global Foundation for MSM and Transgender Health (ALGO), Bangkok, Thailand,

<sup>2</sup>Department of Global Health, Amsterdam University Medical Centers, University of Amsterdam, and Amsterdam Institute for Global Health and Development, Amsterdam, Netherlands, the, <sup>3</sup>Military HIV Research Program, Walter Reed Army Institute of Research, Silver Spring, MD, United States, <sup>4</sup>Henry M. Jackson Foundation for the Advancement of Military Medicine, Bethesda, MD, United States, <sup>5</sup>Center for Newborn Screening, Ethics, and Disability Studies, RTI International, Research Triangle Park, NC, United States

**Background:** We developed Adam's Love We Care, a multifaceted eHealth intervention aimed at optimizing early linkage to care, antiretroviral therapy (ART) adherence and retention in care among Thai men who have sex with men (MSM) living with HIV.

**Methods:** Between April 2017 and June 2022, a 12-month pilot intervention study was conducted. Key intervention components included:

1. Interactive website,
2. Individualized eCounseling,
3. HIV educational video sessions,
4. Online-to-offline (O2O) ART linkage referrals,
5. Daily electronic ART reminders personalized for content, timing and delivery,
6. Clinic notifications sent 15, 7 and three days prior to the visit.

Follow-up surveys were conducted at 3, 6, 9, and 12 months. Random effect model was used to assess the effect of the intervention on ART adherence.

**Results:** Of 118 Thai HIV-positive MSM enrolled, 87.3% self-identified as gay, 11.9% as bisexual and 0.8% as transgender women, with median age 26 (IQR 23-30.75) years, majority (58.5%) located in Bangkok, and most (87.2%) with a monthly income <1,000 USD. Median time between online referral and actual ART linkage was 2 [IQR 1-7] days. Following ART linkage, 16 participants dropped out, and the remaining 102 underwent Adam's Love intervention. Over half (56.9%) preferred to receive two-way daily ART reminders via LINE app, while 43.1% preferred SMS. Most (89.2%) opted for discreet reminders such as Good Morning/Night, Greetings, and Adam's Alert.

The mean number of individualized eCounseling sessions was 4.28 (SD 2.49). The online HIV educational video sessions engaged 79 MSM who attended a median of 4 [IQR 1-4] unique video sessions. Clinic visit reminders yielded a total of 407 visits (median 4 [3-5.25] visits/participant).

Participants who completed all four video sessions had a higher mean adherence score than those who did not receive video intervention (89.8 vs 75.1, 95% CI: 3.42 – 26.0,  $p=0.011$ ). After receiving the multifaceted eHealth intervention, self-reported ART adherence significantly improved at month 9 and month 12 ( $p=0.012$ ).

**Conclusions:** Our eHealth study intervention shows promise in ensuring linkage to care and short-term retention on ART among newly diagnosed MSM. The intervention is novel and highly scalable to address the HIV care needs of vulnerable populations.

## THPED321

## Changing provider behavior to make 'U=U' a motivator for treatment adherence in Zambia

L. Kawanga<sup>1</sup>, A. Ndhlovu<sup>1</sup>, M. McKay<sup>2</sup>, N. Castle<sup>2</sup>, J. Posner<sup>2</sup>

<sup>1</sup>JSI/USAID DISCOVER-Health, Lusaka, Zambia,

<sup>2</sup>JSI, Arlington, United States

**Background:** There is overwhelming evidence supporting undetectable=untransmittable (U=U). However, there is a general gap in the use of U=U in HIV prevention and management. The USAID DISCOVER-Health project, implemented by JSI, integrated U=U into their work with providers to change how this cadre shares messages on prevention and manages client treatment.

The goal was to change provider behavior to improve the use of PrEP in discordant couples and adherence to ART by tapping into client motivation mechanisms.

**Description:** The DISCOVER-Health project supported providers in Zambia's Copperbelt and Central provinces to routinely use U=U in messaging and to differentiate counseling based on motivational drivers of discordant couples, suppressed and unsuppressed clients.

Partners living with HIV were counseled that within the first six months of beginning and adhering to ART they were likely to achieve U=U.

Partners not living with HIV were counseled to start PrEP at the same time that their partner began ART (six months before achieving U=U). Among unsuppressed clients, messaging focused on the benefits of attaining U=U. Among suppressed clients, messaging focused on remaining undetectable.

**Lessons learned:** While U=U is part of national guidelines, provider behavior change efforts to enshrine it into their way of working, making U=U an organizational norm, was critical to comprehensive and consistent transferrence to clients. U=U messaging during discordant couples counseling proved effective in motivating partners living with HIV to adhere to treatment; viral load test coverage increased from 83% (Oct-Dec 2021) to 94% (Jul-Sep 2023) and viral suppression increased from 96% (Oct-Dec 2021) to 98% (Jul-Sep 2023). The rate of PrEP continuity after six months was also higher among discordant couples that

received U=U counseling versus other populations. Sharing this impact with providers reinforced the organizational norm to default to U=U counseling.

**Conclusions/Next steps:** Using U=U in messaging during client counseling is effective in improving access to services and continuity of HIV prevention and treatment methods. Provider behavior change, with a focus on organizational norms, to support tailoring of U=U messaging to client motivations and needs during all counseling visits can be an efficient and effective way to achieve national viral suppression and HIV prevention goals.

## THPED322

### Determinants of HIV status disclosure to sexual partners among young adults living with HIV at the Academic Model Providing Access to Healthcare

J. Wachira<sup>1</sup>, T. Njoroge<sup>1</sup>, B. Gakinya<sup>2</sup>, J. Aluoch<sup>3</sup>

<sup>1</sup>Moi University College of Health Sciences, Mental Health and Behavioural Sciences, Eldoret, Kenya, <sup>2</sup>Moi University, Mental Health and Behavioural Sciences, Eldoret, Kenya, <sup>3</sup>AMPATH, Pediatrics Research, Eldoret, Kenya

**Background:** Young adults living with HIV (YALWH) are a vulnerable population globally, and especially in Sub-Saharan Africa where the vast majority of YALWH reside. YALWH's desire to fulfil their sexual and reproductive needs put them at risk of transmitting HIV to their sexual partners. Non-disclosure of their HIV status to sexual partners increases this risk.

A deeper understanding of the process of YALWH's disclosure of HIV status to sexual partners will be critical to developing interventions aimed at preventing new transmissions.

**Methods:** A cross-sectional mixed methods study was carried out among a representative sample of YALWH (aged 15-24 years) at the Academic Model for Providing Access to Healthcare (AMPATH)-Rafiki clinic in Western Kenya between September and December 2023. Prevalence of HIV status disclosure to sexual partners was determined through a baseline survey of all participants. A sample of 257 those in sexual relationships participated in 4 focused group discussions to identify the barriers and facilitators to HIV disclosure, and to assess experiences and outcomes related to disclosure.

Analysis was completed using SPSS version 21 for proportions and thematically coded using N-VIVO software.

**Results:** Among 257 YALWH ages 15-24 median age 19 years, (53.6%female) disclosure to any person was 71.5%, only 36.6% had disclosed their status to sexual partners. YALWH reported difficulties and unwillingness to disclose their HIV status to sexual partners, despite being aware of the risk of transmission. The reasons and motivation for disclosure included fear of partners finding out by themselves, guilty conscious, relationship status and need for

support. Challenges experienced included too much anxiety, insufficient knowledge to disclose and inability to handle emotional reactions post-disclosure and not being in control of the relationship.

**Conclusions:** Current data shows an increase in number of new transmissions among young adults occasioned by casual sex and non-disclosure of HIV status. Only a small proportion of YALWH have disclosed their HIV status to their sexual partners.

Findings suggest an urgent need for interventions to support disclosure of HIV status to sexual partners to reduce the number of new transmissions among the young adult population.

## THPED323

### An intervention to reduce discrimination, stigma, and sexual violence among men who have sex with men in South Africa; findings from a serial cross-sectional study

J. Gao<sup>1</sup>, A. Marr<sup>2</sup>, A. Mirzazadeh<sup>2,1</sup>, A. Scheffler<sup>1</sup>, J. Kornak<sup>1</sup>, S. Kegeles<sup>2</sup>

<sup>1</sup>University of California, San Francisco, Department of Epidemiology and Biostatistics, San Francisco, United States, <sup>2</sup>University of California, San Francisco/Institute for Global Health Sciences, San Francisco, United States

**Background:** In many countries, men who have sex with men (MSM) are frequent victims of discrimination, stigma, and sexual violence. Our study aimed to evaluate the impact of a community-based intervention aimed at reducing discrimination, stigma, and sexual violence among MSM in South Africa.

**Methods:** We analyzed baseline and post-intervention data collected in the Mpumalanga Men's Study. It included data from three cross-sectional surveys conducted in 2013 (pre-intervention baseline measurement), 2014 (post-intervention measurement 1), and 2015 (post-intervention measurement 2) in Gert Sibande district.

Eligible participants were MSM over 18 years old who reported anal/oral sexual activity with a man in the previous 6 months. Respondent-driven sampling was utilized for recruitment. The intervention launched in April 2013 and included several components implemented by community volunteers such as small-group workshops, informal and formal outreach, and community gatherings. The intervention was a systematic adaptation of the Mpowerment Project. In each survey, discrimination, stigma, and sexual violence were measured by Likert scales and WHO VAW Instrument. The intervention continued throughout assessment phases.

We assessed the changes in the study outcomes by comparing baseline with the two post-intervention measures. We performed analysis of these (binary) outcomes while accounting for confounding effects of several covariates using logistic regression models.

**Results:** A total of 307 MSM at baseline, 326 in 2014, and 311 in 2015 were enrolled in the study. Discrimination was reported by 52.1% at baseline, 30.3% in 2014, and 11.6% in 2015. Any type of stigma was reported by 14.7% at baseline, 2.1% in 2014, and 1.3% in 2015.

Sexual violence was reported by 47.9% at baseline, 11.7% in 2014, and 1.9% in 2015. In the covariate adjusted logistic regression analyses, significant reductions compared to baseline levels were observed in 2014 and 2015 for discrimination (Adj. OR = 0.49 and 0.17), stigma (Adj. OR = 0.13 and 0.11), and sexual violence (Adj. OR = 0.12 and 0.03), all with  $p < 0.001$ .

**Conclusions:** Our findings suggested that the high prevalence of discrimination, stigma, and sexual violence experienced by MSM in an African setting has substantially reduced over time which may have resulted from a multi-component community-based intervention.

## THPED324

Changing the conversation about HIV: using visually striking artwork and real stories in a co-designed public campaign to reduce HIV stigma in Queensland, Australia

A. Finch<sup>1</sup>, M. Warner<sup>1</sup>, N. Deane<sup>2</sup>

<sup>1</sup>Queensland Positive People, East Brisbane, Australia,

<sup>2</sup>Wonderkarma, West End, Australia

**Background:** In Australia, HIV is rarely discussed positively in the media. The resulting lack of visibility, awareness, and contemporary knowledge of HIV, leaves misconceptions, prejudices, and discrimination to dominate. Sadly, research indicates HIV stigma is still present amongst mainstream Australians. QPP created a targeted campaign to reduce HIV stigma, by introducing everyday people living with HIV (PLHIV), through vibrant imagery, video, and concise storytelling, encouraging self-education and exploration through [www.qpp.org.au/hi](http://www.qpp.org.au/hi).

**Description:** Informed with lived experience from both QPP and creative agency Wonderkarma, we harnessed co-design paired with an extensive brief including research and region-specific data to develop campaign concepts. These were presented to focus groups of PLHIV from our national network, and 'stigmatisers' via market research. An Australia-wide transparent and inclusive search for 'Campaign Ambassadors' was used, with support available to ensure psychological safety and well-being of all applicants. The final creative messaging encouraged media companies to donate additional media. Beginning during IAS2023, the campaign was presented on TV, radio, newsprint, social and outdoor media for 2 weeks throughout Brisbane and further afield.

**Lessons learned:** Post-campaign analysis revealed that 67% of people found the campaign effective in changing opinions around HIV stigma. 83% said the creative made them feel that PLHIV should not be discriminated against.

84% now believe that you can live a long and happy life with HIV after seeing the ad. And 84% now understand that HIV affects people from many different backgrounds. \$976,134 AUD of media and agency costs were donated, on top of an \$25,447 AUD investment, allowing the campaign to inform over 1,551,125 people and drove over 30,000 visits to the QPP website.

The key to success was using co-design, market research, agency expertise, and most importantly, the lived experience of PLHIV to hero in the campaign. Donated investment illustrated the importance of buy-in by media to maximise impact.

**Conclusions/Next steps:** The campaign was effective in communicating that HIV affects all types of people who shouldn't be discriminated against. Next is to use data and developed content with the aim of securing funding for nationwide release in collaboration with our partner organisations.

## THPED325

Building resilience through peer mentorship among adolescents and young adults with perinatal HIV: the impact of the I'mpossible Fellowship intervention in India

M.B. Raj<sup>1</sup>, S. Sannigrahi<sup>2</sup>, S. R<sup>1</sup>, B. Seenappa<sup>1</sup>, L. Reddy<sup>1</sup>, A. Sharma<sup>3</sup>, S.K. Sk<sup>4</sup>, S. Solomon<sup>5</sup>, L. Ganapathi<sup>3</sup>, A. Shet<sup>2</sup>

<sup>1</sup>Rishi Foundation, Programs, Bengaluru, India, <sup>2</sup>Johns Hopkins Bloomberg School of Public Health, Department of International Health, Baltimore, United States, <sup>3</sup>Harvard Medical School, Division of Pediatric Global Health, Boston, United States, <sup>4</sup>YRG CARE, Chennai, India, <sup>5</sup>Johns Hopkins School of Medicine, Department of Infectious Disease, Baltimore, United States

**Background:** While peer-led mentorship models show encouraging results of improved adherence and viral suppression among youth with HIV, such studies are rare in Asia.

This study evaluates the I'mPossible Fellowship (IF), a peer-led intervention in southern India empowering adolescents and young adults with HIV through a comprehensive approach supporting their health, educational and psychosocial needs.

**Methods:** The IF intervention was implemented among 220 adolescents and young adults with perinatal HIV (AYAWH) in Karnataka state in 2021 (general population baseline of 64% viral suppression and 50% school cessation rate). The intervention, delivered by 10 older AYAWH ('fellows') who were each matched with 25 younger peers, consisted of mentorship support regarding health, education and livelihood via mobile phones and support group meetings.

After one year of IF intervention, 216 peers (4 were not reachable or declined consent) were surveyed on socio-demographic, educational and treatment status,

and were administered the Child and Youth Resilience Measurement (CYRM). Determinants of low resilience were identified using multivariable logistic regression.

**Results:** Mean age was 19y (range 9-25y), 65% identified as male, 43% lived in group homes, and 50% were double orphans. All were on ART for a mean of 9.6y, recent median CD4 was 700 cells/ $\mu$ l (IQR 550-855), and 91% were virally suppressed (VL<150). Among 33% who discontinued high school, 7% re-entered the educational system.

Total median CYRM resilience score was high at 74 (IQR 69-78, max 85). In multivariate regression, correlates of low resilience (CYRM score  $\leq$ 25 percentile) were loss of both parents (aOR 3.34, 95%CI: 1.59-7.01), school cessation (aOR 2.38, 95%CI: 1.08-5.24), and inability to discuss problems at ART center (aOR 3.26, 95%CI: 1.52-6.97).

**Conclusions:** Initial analysis of the I'mPossible intervention indicated success in treatment outcomes, educational retention and resilience. Among those with lower resilience scores despite high levels of viral suppression, additional support to address parental loss and maintain educational trajectories is needed. Immediate next steps include tailoring the intervention for the most vulnerable AYAWH.

## THPED326

Health or income? How men living with HIV in Malawi experience and navigate decisions between income generation and ART refills

M. Ramesh<sup>1</sup>, K. Balakasi<sup>2</sup>, J. Hubbard<sup>3</sup>, M. Thorp<sup>3</sup>, L. Kamtsendero<sup>2</sup>, M. Sanena<sup>2</sup>, S. Phiri<sup>2</sup>, M. Cornell<sup>4</sup>, T. Coates<sup>3</sup>, K. Holland<sup>1</sup>, A. Choko<sup>2</sup>, K. Dovel<sup>3,2</sup>

<sup>1</sup>University of California, Los Angeles David Geffen School of Medicine, Los Angeles, United States,

<sup>2</sup>Partners in Hope, Lilongwe, Malawi, <sup>3</sup>University of California, Los Angeles, Division of Infectious Disease, Los Angeles, United States, <sup>4</sup>University of Cape Town, Centre for Infectious Disease Epidemiology, Cape Town, South Africa

**Background:** People living with HIV who live in extreme poverty often face challenging trade-offs between accessing care and meeting economic needs. We explored how accessing HIV care impacts economic security among Malawian men, where over two-thirds of the population live in extreme poverty (<\$1.90/day).

**Methods:** We conducted a mixed-methods, secondary analysis on data from the IDEAL and ENGAGE trials, which examined the impact of person-centered care interventions on ART initiation and retention among men (ClinicalTrials.gov#NCT04858243; #NCT05137210).

Eligibility criteria included: male;  $\geq$ 15 years; and not engaged in HIV care at enrollment. We conducted baseline and endline surveys (4-6 months after enrollment) on socioeconomic factors and their experiences with the interventions. We also conducted three rounds of in-depth

interviews 4-6 months after enrollment with a random sample of participants, stratified by ART initiation and retention outcomes and self-reported client mobility.

**Results:** We conducted 1,309 baseline surveys, 1,206 end-line surveys, and 99 in-depth interviews. 1,017 men had complete socioeconomic data. 91% attended ART appointments during the study period. Median age was 39 years (IQR:31-46), 39% (399/1,017) had informal employment reliant on piecework, 55% (559/1,017) lived in extreme poverty, and 59% (596/1,017) had no financial savings. Most men reliant on piecework lost income when they attended ART appointments, since they could not seek or be recruited for work.

Pieceworkers and men without savings who lost income described experiencing food insecurity for their family, with nearly half their families "going hungry" that night. However, most men chose attending ART refills over income generation because HIV treatment was considered critical to sustaining health and earning potential.

Participants with formal employment or their own businesses described strategies to remain engaged in HIV care while generating income, such as obtaining permission to pick up refills from supervisors and coordinating staffing replacements. However, these strategies were not options for those participating in piecework.

**Conclusions:** Men living with HIV in Malawi often balanced the desire to prioritize ART refills with their daily needs due to extreme poverty. Interventions offering differentiated service delivery models with multi-month dispensing or shorter facility visits for clients, are urgently needed to minimize economic vulnerability among this population.

## THPED327

An arts-based narrative enquiry: naming HIV to children - young people and parents share the stories that matter to inform future practice

K. Warburton<sup>1</sup>

<sup>1</sup>University of Central Lancashire, School of Nursing and Midwifery, Preston, United Kingdom

**Background:** Children living with HIV are likely to have acquired HIV from their mother in pregnancy, at birth or through breastfeeding (perinatally acquired). Children are not routinely told they are HIV positive. Stigma, fear and guilt are barriers echoed by parents and professionals. This must be balanced by the child's right to know. This qualitative study used arts-based narrative inquiry to explore the stories of young people who have experienced the process of being told they are HIV positive and parents whose child is aware of their HIV diagnosis.

**Methods:** Sixteen young people and ten parents were recruited via voluntary sector organisations in the UK. Participants shared their experiences in one of four focus groups. Young People were living with perinatally ac-

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

quired HIV and aged between 15 and 21. 11 participants in the young people's groups and 2 participants in the parent's group were born in the UK.

Participants used arts to create something of their choice giving participants a voice which enabled people to share their stories. The focus group discussions were recorded. Reflexive thematic analysis was used to analyse the data.

**Results:** Creative pieces made by participants included masks and boxes illustrating the experiences of stigma and self-stigma highlighting the need to hide HIV.

Young people reported HIV was named between ages 8-13. Most participants were told at home.

The way in which parents find out about their HIV matters. Parents experienced feelings of fear and guilt before naming and report relief and calm once their child had HIV named. Young people highlighted parents feelings and emotions as barriers to HIV naming and drivers of self-stigma.

The language used and heard when talking to children about HIV plays a role in negative emotions, self-stigma and stigma.

Secrecy within the family home exacerbates self-stigma. Participants reported experiencing stigma which resulted in challenges in sharing their diagnosis, negative experiences in schools and difficulty adhering to medication.

**Conclusions:** There is a clear consensus that HIV must be named to children at a younger age. Parents and professionals require appropriate support on this journey. Public education is urgently required to reduce stigma.

## THPED328

### Barriers in accessing HIV related healthcare by transgender women in Surat, Gujarat - Learnings from a Student Study Project

S. Sharma<sup>1,2</sup>, S. Rawat<sup>1</sup>, A. Dange<sup>1</sup>

<sup>1</sup>The Humsafar Trust, Research, Mumbai, India, <sup>2</sup>Indian Institute of Public Health, Public Health, Gandhinagar, India

**Background:** Transgender communities have been subjected to discrimination, stigma and violence leading to exclusion from mainstream employment and towards high-risk sex work. Persistent stigma in healthcare settings further affects their access to healthcare and health-seeking behaviour.

This study explored the barriers in accessing HIV healthcare services by persons living with HIV (PLHIV) who were transgender women (TGW) in Surat, India from the perspective of both the providers and the community.

**Methods:** Semi-structured telephonic interviews as part of the dissertation were conducted with 10 HIV positive TGW and 8 providers (4 doctors, 4 counsellors) over a period of 2 months (February 2020- March 2020) along with

field observation. Study participants were recruited by snowball sampling. Interviews were thematically analyzed.

**Results:** Themes that emerged were societal, structural and beneficiary-provider interactions. Societal barriers included discrimination based on their gender presentation and stigma associated from their perceived status of "sacred mother" contracting "such" disease.

The fear of community isolation upon disclosure and the impact of Guru further posed a barrier in their healthcare access. Those living with biological families initially struggled to disclose their HIV status but found more support after revealing it, unlike those living within community.

Providers recognized that transwomen avoided disclosing HIV statuses to their community or private healthcare providers due to perceived insensitivity. Structural barriers included inconvenient timings, unorganized navigation, long waiting queues, and a lack of privacy during counselling sessions.

Providers focus on processes and documentation sometimes delayed services, acting as access barrier. The TGW also shared that while the counsellor interaction aided their access, interaction with doctors posed challenges. Most providers reported of insufficient training to provide medical consultation specific to TGW.

**Conclusions:** Achieving the end of HIV by 2030 possess challenges of stigma associated with gender identity, HIV status in healthcare setting and within community especially with respect to TGW. The study highlights the need for gender sensitivity and inclusivity trainings for healthcare providers and medical colleges with focus on transgender health.

Additionally, TG community gatekeepers should be made aware of community stigma and its' impact to foster greater support to their PLHIV community members.

### Substance use and HIV treatment adherence in a treatment support trial among female sex workers living with HIV in eThekweni, South Africa

L. Shipp<sup>1</sup>, C. Comins<sup>1</sup>, M. Mcingana<sup>2</sup>, J.G. Rosen<sup>3</sup>,

J.R. Knox<sup>4</sup>, K. Rucinski<sup>3</sup>, J. Steingo<sup>2</sup>, S. Makama<sup>5</sup>,

D.R. Phetlhu<sup>6</sup>, H. Hausler<sup>2,7</sup>, S. Baral<sup>1</sup>, S. Schwartz<sup>1</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology, Baltimore, United States, <sup>2</sup>TB HIV Care, Cape Town, South Africa, <sup>3</sup>Johns Hopkins Bloomberg School of Public Health, Department of International Health, Baltimore, United States, <sup>4</sup>Columbia University, HIV Center for Clinical and Behavioral Studies, New York, United States, <sup>5</sup>TB HIV Care, Durban, South Africa, <sup>6</sup>Sefako Makgatho Health Sciences University, Department of Nursing Science, Ga-Rankuwa, South Africa, <sup>7</sup>University of Pretoria, Department of Family Medicine, Pretoria, South Africa

**Background:** Substance use and dependency has been associated with suboptimal HIV care outcomes among people living with HIV. We qualitatively assessed the impact of substance use on HIV treatment outcomes among female sex workers (FSW) living with HIV and receiving services from TB HIV Care via the Siyaphambili trial in eThekweni, South Africa.

**Methods:** From March 2021 to January 2022, we purposively sampled for in-depth interviews among FSW (n=36) from Siyaphambili, a randomized trial of adaptive HIV treatment support strategies, and service providers (n=12) including case managers and nurses.

Participants described experiences with and perceptions of Siyaphambili's HIV treatment support strategies, decentralized treatment provision (DTP) and individualized case management (ICM). The COM-B model was used to assess participant capability, opportunity, and motivation to engage with DTP and ICM strategies and adhere to ART in the context of substance use.

**Results:** Both FSW and strategy implementors identified substance use as a key barrier to consistent engagement in and adherence to HIV treatment (Figure). Case managers identified substance use as a challenge to FSW participants completing sessions, hindering ICM implementation. ICM support for reducing substance use primarily comprised referrals to external rehabilitation services and ART adherence counseling.

Many FSW reported substance use as a barrier to ART adherence, often going days without taking ART during periods of heavy substance use. FSW reported operating in sex work venues managed by drug dealers, which contributed to ongoing drug use and limited intervention opportunities.

FSW receiving the DTP intervention emphasized its importance for retention in care when unable to travel to the clinic while under the influence of substances.

Figure. COM-B Model describing substance use-related barriers and facilitators to ART adherence and intervention engagement among female sex workers living with HIV and participating in the Siyaphambili trial in eThekweni, South Africa.

**Conclusions:** Substance use remains a major barrier to sustained engagement in ART among people living with HIV in South Africa.

Comprehensive harm reduction and substance use dependency services may be central to optimizing HIV treatment outcomes in South Africa.

## THPED330

### #HelpNowHUB: a model of collaborative resilience and innovation in global HIV response amidst the war emergency in Ukraine

A. Aghajanyan<sup>1</sup>, V. Brodskaya<sup>1</sup>, J. Golub<sup>1</sup>, I. Gavrylova<sup>2</sup>

<sup>1</sup>Alliance Consultancy LLC, Kyiv, Ukraine, <sup>2</sup>Alliance for Public Health, Kyiv, Ukraine

**Background:** In direct response to Russian war on Ukraine, in early March 2022, Alliance for Public Health launched #HelpNow Service, innovative initiative addressing the distinctive needs of Persons Living with HIV and Key Populations affected by the war in Ukraine. With support of more than 50 regional, and national organizations during weeks of operation Service transformed into comprehensive HelpNowHUB.

Operating over 20 months, #HelpNowHUB with support of local organisations was providing vital services in more than 50 countries and 200 cities to Ukrainian refugees seeking treatment and prevention services.

**Description:** #HelpNowHUB introduced comprehensive approach by combining information provision, virtual case-management, and social/humanitarian support. The key functions of HUB and integrated Services - Information, Navigation, Coordination.

By integrating digital technology with high-level medical professionals at Help24, we not only strengthened the response capacity but also facilitated convenient communication and collaboration between clients and doctors. The inclusion of community-led peer support, robust referral systems, and client algorithms streamlined access to necessary services for refugees in host countries.

**Lessons learned:** #HelpNowHUB provided 37,000 crucial services, highlighting the significance of collaborative resilience, impactful service delivery, humanitarian innovation, and community empowerment.

The HUB's unique approach and support from host organizations facilitated uninterrupted access to vital HIV prevention and care services for Ukrainian refugees.

Key lessons include the importance of adaptable, swift, and responsive humanitarian aid models, promoting self-reliance, and emphasizing global solidarity during crises.

Figure.

**Conclusions/Next steps:** The #HelpNowHUB journey underscores crucial lessons for emergency responses, emphasizing the need for prompt action, collaboration, adaptability, and sustained support in addressing global humanitarian crises, particularly for underserved populations. It showcases the transformative power of empathy in action, demonstrating the profound impact of united efforts in alleviating suffering and fostering hope. In conclusion, #HelpNowHUB serves as a beacon, illustrating the genuine impact of collective action, innovation, and unwavering commitment on individuals and communities facing adversity.

## THPED331

Interventions for stigma reduction in HIV treatment and prevention designed to enhance antiretroviral uptake and adherence: a systematic review

A.M. Dhir<sup>1</sup>, A. Singh<sup>2</sup>, S.S. Solomon<sup>3</sup>, J.E. Farley<sup>1</sup>

<sup>1</sup>Johns Hopkins University School of Nursing, Center for Infectious Disease and Nursing Innovation (CIDNI), Baltimore, United States; <sup>2</sup>Johns Hopkins University School of Medicine, Medicine, Baltimore, United States; <sup>3</sup>Johns Hopkins University School of Medicine, Baltimore, United States

**Background:** HIV-related stigma poses a threat to antiretroviral therapy (ART) and pre-exposure prophylaxis (PrEP) adherence. Some interventions have been implemented to mitigate this stigma. We conducted a system-

atic review to evaluate the effectiveness of such interventions in reducing HIV-related stigma and improving adherence to ART/PrEP.

**Methods:** We followed PRISMA guidelines to include randomized controlled trials and quasi-experimental studies published between January 2013 and June 2023 after searching MEDLINE, Embase, Scopus, Web of Science, CINAHL, and PsycINFO databases.

Participants include people living with HIV on ART or vulnerable populations using PrEP. Interventions include those targeting stigma reduction. Outcomes include uptake/adherence to ART/PrEP. We used Cochrane Collaboration's risk of bias tools for quality assurance. We used narrative data synthesis due to heterogeneity across studies. We registered this systematic review with PROSPERO (CRD42023455610).

**Results:** We analyzed eight randomized controlled trials (RCTs) featuring population diversity in gender, age, ethnicity (Hispanic/Latino, Indigenous, Black), and geography (Asia, Africa, and North America). The effectiveness of interventions in stigma reduction and medication adherence varied widely. Seven interventions aimed to improve adherence to ART, while one focused on PrEP adherence. Two cognitive behavioral therapy (CBT)-based interventions reduced HIV stigma (~ 78.7% variance) and boosted ART adherence (~ 50.3% variance), while the other two lacked statistical significance (Cohen's d = 0.30). An empowerment intervention (1.3 units stigma-reduction in stigma for 1 unit increase in ART adherence) and a youth peer mentoring intervention (OR 0.63, 95% CI: 0.35-1.13) achieved both goals effectively.

Conversely, a single-session educational-film intervention failed to demonstrate effectiveness (p=.78). PrEP-focused intervention (motivational interviewing called "jump-start") significantly reduced stigma and improved PrEP adherence (37%, effect size 0.10).

**Conclusions:** Interventions incorporating cognitive behavioral therapy, peer support, and motivational interviewing demonstrate the potential to reduce HIV-related stigma and enhance ART/PrEP adherence.

Multicenter RCTs with larger populations, harmonized study designs, and standardized outcomes are required to validate these findings in diverse contexts.

## THPED333

"They care about us": assessment of telemedicine by people with HIV using this strategy in the public health system of Buenos Aires city

T. Kierszenowicz<sup>1</sup>, M. Bullo<sup>2</sup>, M.C. Acosta<sup>2</sup>, M.J. Rolon<sup>3</sup>, M. Cabrini<sup>3</sup>, D. Cecchini<sup>4</sup>, C.G. Rodriguez<sup>4</sup>, P.G. Scapellato<sup>5</sup>, E. Bottaro<sup>5</sup>, M. Losso<sup>2</sup>, M. Kundro<sup>2</sup>

<sup>1</sup>The National Scientific and Technical Research Council, Buenos Aires, Argentina, <sup>2</sup>Hospital J.M. Ramos Mejía, Buenos Aires, Argentina, <sup>3</sup>Hospital Dr. Juan A. Fernández, Buenos Aires, Argentina, <sup>4</sup>Hospital Dr. Cosme Argerich, Buenos Aires, Argentina, <sup>5</sup>Hospital Donación F. Santojanni, Buenos Aires, Argentina

**Background:** From October-2020 to September-2022, we conducted an implementation study to offer telemedicine(TM) across four HIV units of public hospitals in Buenos Aires. We implemented TM to provide a continuum of care to people living with HIV(PLHIV) while exploring their perceptions of its benefits. TM visits were conducted through phone or video calls. The study started during the COVID-19 outbreak and continued until complete flexibilization came through.

**Methods:** This work analyzes PLHIV's perceptions of telemedicine to understand opportunities for the implementation of this strategy for HIV-care. We prospectively collected qualitative data through virtual open-ended interviews with PLHIV users of telemedicine. Interviewees were identified considering gender, age, hospital unit, and years from diagnosis. Sample size was determined by theoretical saturation according to baseline analytical axis: care trajectories, hospital unit valuation, and opportunities for telemedicine. Interviews were conducted through Zoom® and manually recorded. Rather than a statistical analysis, we favored an ethnographic approach to interviews, focusing on both the diversity and the common experiences. Analysis was done using Atlas.ti®.

**Results:** 39 PLHIV were invited to interviews. 100% agreed and participated. 41%(16) were cisgender women, 2.5%(1) were transgender women, and 56.5%(22) were cisgender men. 51%(20) had up to 10 years since diagnosis. Telemedicine was positively rated by all interviewees. Different arguments were pointed out, such as avoiding commuting to hospitals and reducing consultation time. While some interviewees highly valued the fact of receiving a medical checkup, other PLHIV associated teleconsultations as a way to obtain care in a hostile setting triggered by the COVID-19 outbreak. These valuations were observed mainly in those interviewees who referred to having built a close relationship with their doctors over time. They positively rated the initiative lead by hospitals units to establish a contact in an isolated circumstance.

**Conclusions:** This study sheds light on the affective dimension of HIV-care that goes beyond common medical priorities focused on individual viral load suppression and is not ordinarily quantified by health systems. Rather than

a way of having medical checkups, telemedicine was considered a form of feeling cared for and an opportunity to maintain the personal relationships built over time between PLHIV and doctors.

## THPED334

Adaptation and acceptability of an internalized stigma reduction intervention for women living with HIV in Tanzania

R. Mtei<sup>1</sup>, M. Kilongo<sup>1</sup>, D. Kisamo<sup>1</sup>, L. Kajula<sup>1</sup>, W. Pan<sup>2</sup>, M. V. Relf<sup>2</sup>, L. Nyblade<sup>3</sup>

<sup>1</sup>Muhimbili University of Health and Allied Sciences, Psychiatry and Mental Health, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Duke University, School of Nursing, Durham, United States, <sup>3</sup>Research Triangle Institute International, Stigma and Discrimination, Washington, United States

**Background:** There is growing evidence that internalized HIV stigma negatively impacts the health and well-being of people living with HIV and undermines HIV care, ART adherence and viral load suppression, yet evidence-based interventions to address internalized stigma reduction are limited, particularly in low-and-middle-income countries. In response, we adapted and tested for acceptability in Tanzania the *Maybe Someday: Voices of Women Living with HIV* (WLWH) intervention, developed in the United States.

**Methods:** A 4-stage iterative cultural and linguistic adaptation of the intervention through: translation, synthesis, back translation, and expert committee review before filming in Swahili. Five WLWH actresses chose and read the monologues that they felt represented their life experiences. Acceptability was assessed through mixed methods. 58 WLWH, purposively sampled on geography (urban, semi-urban, and rural) and age (18-24/25+) watched the five monologues comprising the intervention. After viewing each monologue, participants completed a questionnaire and participated in a focus group discussion (FGD). Acceptability was assessed qualitatively through the FGDs and measured quantitatively with a 12-item Swahili Narrative Transportation & Realism Scale (NTRS) (alpha = 0.89).

**Results:** A five-session set of videos, the *Labda Siku Moja: Sauti za Wanawake Wanaoishi na VVU intervention* (Table 1) was identified to be acceptable among WLW in Tanzania urban, semi-urban and rural areas and across ages. Agreement with each of the 12 NTRS items was high across all 5 stories, with 8/12 items above 90% agreement, 3 between 74-82% and one at 56% with no systemic differences in total scores over the 5 stories by geography or age. FGD discussions highlighted resonance of the videos with participants lives and recommendations to create similar videos for other groups living with HIV and share the videos as way to reduce community stigma.

Session # & Story Title	Conceptual Elements of Story
1. Keeping it a Secret	Societal stigma and fear of negative consequences of disclosure; deciding to disclose or not
2. Protecting my Children	Decision-making (how/when) related to disclosing to children
3. Telling my Friends	Decision-making (how/when) related to disclosing to friends; fear of possible effects of disclosure with friends; sense of hope and relief after telling friends
4. I'm not a Bad Person	Stereotypes & perceived community stigma; assumptions about WLWH (sex worker, person who uses drugs, promiscuous); intersectional stigma; being judged
5. Planting a Garden	Intimate relationships (concealment/ disclosure issues); externally enacted stigma with disclosure to sexual partners

**Conclusions:** Internalized stigma-reduction interventions can be successfully adapted from one context (US) to another (Tanzania) and should be further tested for impact on retention in care, and ART adherence.

## THPED335

Healthcare provider stigma as a barrier to HIV care engagement for women who exchange sex and use substances (WESUS) in Kazakhstan in Project Orleu

M. Darisheva<sup>1</sup>, V. Frye<sup>2</sup>, T. McCrimmon<sup>3</sup>, A. Terlikbayeva<sup>1</sup>, S. Primbetova<sup>1</sup>, N. Zholnerova<sup>4</sup>, E. Grigorichuk<sup>5</sup>, K. Alipova<sup>1</sup>, D. Gryazev<sup>1</sup>, P. Gulyaev<sup>1</sup>, D. Bekishev<sup>1</sup>, Z. Mussina<sup>6</sup>, L. Starbird<sup>7</sup>, A. Davis<sup>2</sup>, B. West<sup>2</sup>

<sup>1</sup>Global Health Research Center of Central Asia, Almaty, Kazakhstan, <sup>2</sup>Columbia University, School of Social Work, New York, United States, <sup>3</sup>Columbia University, School of Public Health, New York, United States, <sup>4</sup>NGO "Amelia", Taldykorgan, Kazakhstan, <sup>5</sup>NGO "Community Friends", Almaty, Kazakhstan, <sup>6</sup>Kazakh Scientific Center of Dermatology and Infectious Diseases, Almaty, Kazakhstan, <sup>7</sup>University of Pennsylvania, Penn Nursing, Philadelphia, United States

**Background:** Kazakhstan remains one of the few countries in Eastern Europe/Central Asia (EECA) region where HIV incidence and mortality continue to increase, and where there exists a large overlap between sex work and substance use. Women who exchange sex and/or use substances (WESUS) are a highly-stigmatized population with significant unmet health needs. Healthcare provider (HCP)-enacted stigma is a major barrier to HIV prevention/care continuum engagement.

We present data on how stigma related to drug use or sex work act as barriers to healthcare access for WESUS.

**Methods:** Project Orleu is a multilevel, intersectional anti-stigma intervention. Between October 2023 - January 2024, we recruited 124 WESUS from 14 regions of Kazakhstan. Participants completed online survey, focused on sociodemographics, sexual behavior, substance use, access to health services, stigma and medical mistrust. To

inform intervention development, we conducted 5 focus group discussions with 4-6 WESUS each (N=22), where we asked about their stigma experiences in clinics.

**Results:** In surveys, participants described poor access to services: 40% couldn't receive necessary health services in past 6 months, 74% had gone without medical care because of high costs, and 37% had been treated poorly by HCPs because of their sex work and/or drug use.

Additionally, 44% of participants said HCPs do not take medical complaints of WESUS seriously. In focus groups, participants stated that WESUSs' "rights are still violated in polyclinics", and described feelings of social exclusion in their interactions with HCPs ("We have borders between us... no matter how they smile at us...we are still in our place").

Participants expressed a desire to be treated with understanding and acceptance by HCPs: ("[Doctors] should have an understanding of the job, who they work for"; "We have to be accepted as we are").

**Conclusions:** Results show limited access to health services and significant medical mistrust among WESUS. Stigmatizing experiences within clinics contributed to these outcomes, highlighting the need for interventions focused on stigma reduction for HCP.

Community-led interventions designed in collaboration with WESUS are likely to have the greatest impact on reducing stigma and increasing engagement in HIV services for WESUS in Kazakhstan.

## THPED336

Community-led mobilization and tailored demand creation for increased HIV service uptake among key populations: the CHILL project

C.E. Metuge<sup>1</sup>, S. Mabouna<sup>1</sup>, S. Fogue Tiozang<sup>1</sup>, G. Fako<sup>1</sup>, A. Zeh Meka<sup>1</sup>, M. Tokam<sup>1</sup>, A. Boupdia<sup>1</sup>, Z. Zeh Akiy<sup>2</sup>, J. Tchofa<sup>2</sup>  
<sup>1</sup>Care and Health Program, Yaounde, Cameroon, <sup>2</sup>USAID, Yaounde, Cameroon

**Background:** In Cameroon, despite progress in the fight against HIV among key populations (KP), stigma and discrimination continue to be barriers to HIV service access even at community level. PEPFAR introduced through CHP the community based CHILL project to scale up access to tailored HIV service delivery for KPs.

**Description:** From October 2022 to September 2023, CHP with partner Community Based Organizations (CBOs) employed a variety of community led mobilization and demand creation strategies:

1. CHP trained and supported peer leaders for in-person and virtual mobilization, using the QuickRes application, social media, SMS, and phone calls.
2. FSW CBOs focused on educational talks, sensitization at hotspots, and drop-in-center (DIC) social events. MSM and TG CBOs mobilized for HIV services through "grins", "chill-ins," "Pride Campaigns," and cinema pro-

abstracts

Author  
Index

jections. The CBOs also extended their sensitization efforts into drug use hotspots, known as "tèrres" to mobilize PWIDs.

3. Peers facilitated Social and Behavioral Change, providing HIV/STI screenings, PrEP, and GBV identification. They connected clients to DICs for medical consultations, family planning, mental health, ART support and VL sample collection.

**Lessons learned:** A total of 130,090 KPs (72,033 FSW, 53,276 MSM, 3,403 PWID and 1,378 TG) HIV prevention services (SBCC, condoms, lubricants) of which 2,905 were reached virtually. Of the 130,090 KPs reached, 89,314 were eligible for HIV testing and 41% (36,619) were tested for HIV through conventional HIV testing with over 45% being in the 25-35 age group, while 22,034 received HIV self test kits.

Additionally, 2,933 KPs were tested positive for HIV (positivity rate = 8%) and up to 96.7% (2,838) started ART. Index case testing accounted for 33% (984) of case finding. Among the KPs who tested HIV negative, 4,429 were initiated on PrEP.

Of the other HIV related services, 5,552 clients were diagnosed with an STI and 5,090 (91%) received treatment; 22,292 reported to have suffered a form of GBV (sexual, economic, physical, emotional) and 1,378 received the minimum package of GBV services.

**Conclusions/Next steps:** The CHILL project in Cameroon has significantly succeeded in expanding access to HIV services for KPs while breaking the barriers of stigma and discrimination through community mobilization and demand creation approaches.

## THPED337

City-specific disparities in self-reported antiretroviral therapy (ART) adherence, viral suppression, and psychosocial and institutional factors among transgender women living with HIV in India

A. Kumar<sup>1</sup>, W. Lodge II<sup>2</sup>, J. Chaudary<sup>3</sup>, S. Rawat<sup>4</sup>, M. Agénor<sup>5</sup>, A. Dange<sup>3</sup>, V. R. Anand<sup>3</sup>, D. Operario<sup>6</sup>, M. J. Mimiaga<sup>7</sup>, K. B. Biello<sup>6</sup>

<sup>1</sup>The Humsafar Trust, Research Department, Delhi, India, <sup>2</sup>Brown University School of Public Health, Department of Behavioral and Social Health Sciences, RI, United States, <sup>3</sup>The Humsafar Trust, Research Department, Maharashtra, India, <sup>4</sup>The Humsafar Trust, Research, Maharashtra, India, <sup>5</sup>University School of Public Health, Department of Behavioral and Social Health Sciences, RI, United States, <sup>6</sup>Brown University School of Public Health, Center for Health Promotion and Health Equity, RI, United States, <sup>7</sup>The Fenway Institute, MA, Boston, United States

**Background:** This study focuses on city-specific variations in India's ART adherence and viral load suppression and the psychosocial and institutional barriers encoun-

tered by TGW living with HIV to emphasize the need for state-specific targeted interventions to improve ART adherence.

**Methods:** We assessed self-reported ART adherence (>90%) and viral suppression (<1000 copies/ml, as per Indian Government guidelines) among 150 TGW living with HIV in Mumbai (n=75) and New Delhi (n=75) in August-November 2023 using participants' ART booklets. Recruitment was conducted by trained community recruiters via community networks. Additionally, we evaluated psychosocial and institutional barriers (such as mental health, substance use, stigma, and gender-affirming care) faced by TGW living with HIV. Bivariate and multivariable logistical regression analyses were employed to analyze city variation.

**Results:** Among our participant (n=150), 63% adhered to ART (≥90%) and viral suppression (<1000 copies/ml, as per Indian Government cut-out) was 96%. However, there were significant variations across the cities in bivariate logistical regression analysis, with participants in New Delhi less likely to adhere to ART (OR: 0.35, [CI 95%: 0.17,0.69], p=0.003). Even after adjusting for age, age, transgender identity (e.g., Hijra, Kinnar, Jogti), education, and caste, optimal ART adherence (≥90%) remains statistically significant. In the multivariate analysis of potential psychosocial and institutional barriers, we found that participants in New Delhi were significantly more likely to use drugs at least once in the past (aOR: 2.95, [CI 95%: 1.12, 8.48], p=0.03) and experience TGW stigma (aOR: 3.22, [CI 95%: 1.30,8.44], p=0.01) compared to participants in Mumbai.

**Conclusions:** This study is the first to highlight self-reported ART adherence and viral suppression among exclusively transgender women living with HIV in the urban settings of Mumbai and New Delhi. Despite the government's provision of free ART, substantial challenges persist in achieving optimal ART adherence.

The findings emphasize the need for targeted interventions tailored to the unique contexts of each state, particularly cities where transgender women might face higher rates of substance use and experience stigma.

Further research is needed to understand the pathways to suboptimal ART adherence and the role played by psychosocial and institutional barriers.

## THPED338

### Adherence support counseling in beneficiaries of ARV care and treatment

F. Boene<sup>1</sup>, E. Paunde<sup>1</sup>, I. Gaspar<sup>1</sup>, O. Tiberi<sup>1</sup>, E. Filipe<sup>1</sup>, E. Tembe<sup>1</sup>, A. Couto<sup>1</sup>

<sup>1</sup>Ministry of Health, National STI-HIV/AIDS Control Program, Maputo, Mozambique

**Background:** In Mozambique, around 2.4 million people live with HIV and the prevalence is 12.5% among adults. One of the integral services for treatment and care is Adherence Support Counseling, which helps to reduce the negative impact of HIV, support in accepting the diagnosis, treatment, and management of risk factors for adherence.

With the adoption of Test and Start in 2016, Adherence Support Counseling began to be offered by all ART care and treatment providers including Doctors, Nurses, Psychologists, and Lay Counselors.

**Description:** The purpose of adherence support counseling is to ensure that clients are retained, achieve viral suppression, and improve their quality of life. During the sessions, beneficiaries receive counseling to support adherence, assessing risk factors, emotional and social support, provided by the provider offering the clinical consultation. The adherence monitoring indicator is evaluated quarterly, where, of the 2,017,624 beneficiaries 15+ and 114,735 beneficiaries aged 0-14 active on ART, 1,203,963 (61%) of 15+ and 69,656 (63%) of 0-14 years, had follow-up adherence, numbers which have never been achieved before the involvement of all providers.

The achievement should also consider that the some of the differentiated service models contribute to beneficiaries not attending appointments every quarter.

**Lessons learned:** The expansion of psychosocial support to all providers showed that it is possible to capitalize on existing human resources, training them and responding to concerns related to frequent loss of follow-up of users on antiretroviral treatment, keeping them in care and improving their quality of life.

**Conclusions/Next steps:** Next steps: In 2024, training is planned to reinforce the quality of adherence support counseling offered to users, including the identification and training of new providers in health units.

Finally, a data reporting mechanism must be created that covers all users who received counseling to monitor adherence.

## THPED339

### Migration is associated with increased HIV vulnerability among young transgender women in Lima, Peru

A. Perez-Brumer<sup>1,2</sup>, D. Apedaile<sup>1</sup>, D.F. Leon<sup>2</sup>, L. Huerta<sup>3</sup>, S. Leon<sup>4</sup>, K. Konda<sup>2,5</sup>, S. Reisner<sup>6,7,8,9</sup>, A. Silva-Santisteban<sup>2</sup>

<sup>1</sup>Dalla School of Public Health, University of Toronto, Toronto, Canada, <sup>2</sup>Center for Interdisciplinary Research in Sexuality, AIDS and Society, Universidad Peruana Cayetano Heredia, Lima, Peru, <sup>3</sup>Féminas, Lima, Peru, <sup>4</sup>Escuela Profesional de Tecnología Médica, Universidad Privada San Juan Bautista, Lima, Peru, <sup>5</sup>Department of Population and Public Health Sciences, Keck School of Medicine, University of Southern California, Los Angeles, United States, <sup>6</sup>Division of Endocrinology, Diabetes, and Hypertension, Brigham and Women's Hospital, Boston, Boston, United States, <sup>7</sup>Department of Medicine, Harvard Medical School, Boston, United States, <sup>8</sup>Department of Epidemiology, Harvard T.H. Chan School of Public Health, Boston, United States, <sup>9</sup>The Fenway Institute, Fenway Health, Boston, United States

**Background:** Latin America has made little progress in reducing new HIV infections and is currently facing its largest recorded mass migration. Transgender women (TW) in Latin America continue to be disproportionately impacted by HIV in need of early prevention efforts, yet there is limited information on HIV vulnerabilities and migration among this population. This research examines the association between migration, HIV, and related vulnerabilities among young TW.

**Methods:** Between February-July 2022, a cross-sectional survey was conducted with 211 young TW ages 16-24 in Lima, Peru accompanied by laboratory testing for HIV and STIs (syphilis, chlamydia, gonorrhea). Bivariate tests ( $\chi^2$ ) compared HIV and STI prevalence, and related vulnerabilities, between migrants and non-migrants. Poisson regression models estimated adjusted prevalence ratios (aPR) and 95% confidence intervals (95% CI) for the association between time in Lima (non-migrant, 0-1 years, 2-5 years,  $\geq 6$  years) and HIV vulnerabilities (condom use, sex work).

**Results:** Of 204 young TW reporting migration status, 110 were migrants to Lima (54%); 45% arrived in Lima  $\leq 5$  years ago. Most migrants were Peruvian (70% from Peruvian Jungle regions); 14% were from Venezuela. HIV sero-prevalence was 44% among migrants and 39% in non-migrants ( $p=0.67$ ).

Compared to non-migrants, migrants had a higher prevalence of laboratory-confirmed lifetime syphilis (65% vs 41%;  $p<0.01$ ) and small but non-significant increase in the prevalence of recent (chlamydia and gonorrhea) (33% vs 28%;  $p=0.62$ ). Migrants reported worse access to health-care with 29% reporting no medical insurance compared to 12% of non-migrants ( $p<0.01$ ). Among migrants, 78% reported ever engaging in sex work compared to 55% of

non-migrants ( $p<0.01$ ); migrants were also more likely to report daily sex work (42% vs 8%;  $p<0.01$ ) and violent victimization from clients (23% vs 6%;  $p<0.01$ ). Migrants who arrived in Lima 0-1 years ago were 1.54 times more likely to report past 6-month condomless anal sex compared to non-migrants (95% CI=1.02-2.32).

**Conclusions:** Young TW have high HIV and STI prevalence, and for migrants, intersectional HIV vulnerabilities extend through resettlement. Scale-up of HIV prevention and care for young TW is urgently needed; migrants require immediate and ongoing support through integrated health and social services in urban centres post-migration.

Pius<sup>4</sup>, O. Oyelaran<sup>4</sup>, R. Goldstein<sup>4</sup>, O. Onyedini<sup>1</sup>, A. Adegboye<sup>1</sup>, A. Eyo<sup>1</sup>  
<sup>1</sup>Excellence Community Education Welfare Scheme (ECEWS), Uyo, Nigeria, <sup>2</sup>Achieving Health Nigeria Initiative, Uyo, Nigeria, <sup>3</sup>Family Health International (FHI360), Abuja, Nigeria, <sup>4</sup>Office of HIV/AIDS and TB, United States Agency for International Development, Abuja, Nigeria, <sup>5</sup>Office of HIV/AIDS, United States Agency for International Development (USAID), Washington DC, United States, <sup>6</sup>National AIDS, Sexually Transmitted Infections Control and Hepatitis Programme (NASCP), Federal Ministry of Health, Abuja, Nigeria, <sup>7</sup>National Agency for the Control of AIDS (NACA), Abuja, Nigeria

**Background:** Adolescents and young persons (AYP) face several barriers to accessing HIV testing services (HTS). In September 2022, the PEPFAR/USAID-funded ECEWS ACE-5 project allocated 60% of its HIV Self-Testing (HIVST) kits to AYP, which were then distributed by peer AYPs. This study assessed the effect of this strategy on the uptake of HIVST among AYPs in Southern Nigeria.

**Methods:** This was a retrospective cross-sectional study using HIVST distribution data from the District Health Information System of 155 health facilities in Akwa Ibom and Cross River States. HIVST kits were distributed through various facility/community-based channels. During the intervention, the HIVST allocated to AYPs was separated from those for other sub-populations at these channels and peer AYPs were primarily responsible for the distribution. The age and sex of recipients, and the number of kits distributed were extracted. Proportions of all HIVST kits distributed to AYP (10-24 years) were compared

15 months before (P1: July 2021-September 2022) and 15 months after commencing the intervention (P2: October 2022-December 2023) using Mann-Whitney U-test.

**Results:** Of the 94,369 HIVST kits distributed over the 30-month period, 52.1% (49,166) were distributed to males and 37.7% ( $n=35,595$ ) to AYP. Of those distributed to AYP, 36% (12,803) were distributed to those aged 15-19 years and 55.8% (19,865) to those aged 20-24 years.

The proportion of HIVST distributed to AYP increased from 22.9% (10,996/48,113) in P1 to 53.2% (24,599/46,256) in P2 ( $p=0.034$ ) (Figure 1).

This increase occurred across all age bands (10-14 years: 1.7% [803/48,113] vs 4.6% [2,124/46,256]  $p=0.034$ ; 15-19 years: 5.7% [2,733/48,113] vs 21.8% [10,070/46,256]  $p<0.001$ ; 20-24 years 15.5% [7,460/48,113] vs 26.8% [12,405/46,246] [ $p=0.002$ ]).

**Conclusions:** Strategic resource allocation improved HIVST distribution among AYP in this setting. Programs looking to expand the use of HIVST among AYP could consider this approach.

## THPED341

Initiation and cessation patterns of opioids and stimulants among female sex workers living with HIV in South Africa: a time-to-event analysis

C.G. Schluth<sup>1</sup>, J.G. Rosen<sup>2</sup>, M. Mcingana<sup>3</sup>, K. Rucinski<sup>2</sup>, J. Knox<sup>4</sup>, C. Comins<sup>1</sup>, J. Steingo<sup>3</sup>, L. Shipp<sup>2</sup>, S. Makama<sup>5</sup>, D. Phetlhu<sup>6</sup>, H. Hausler<sup>3,7</sup>, S. Baral<sup>1</sup>, S. Schwartz<sup>1</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology, Baltimore, United States,

<sup>2</sup>Johns Hopkins Bloomberg School of Public Health, Department of International Health, Baltimore, United States, <sup>3</sup>TB HIV Care, Cape Town, South Africa, <sup>4</sup>Columbia University, HIV Center for Clinical and Behavioral Studies, New York, United States, <sup>5</sup>TB HIV Care, Key Populations Programme, Durban, South Africa, <sup>6</sup>Sefako Makgatho Health Sciences University, Department of Nursing Science, Ga-Rankuwa, South Africa, <sup>7</sup>University of Toronto, Department of Medicine, Division of Infectious Diseases, Toronto, Canada

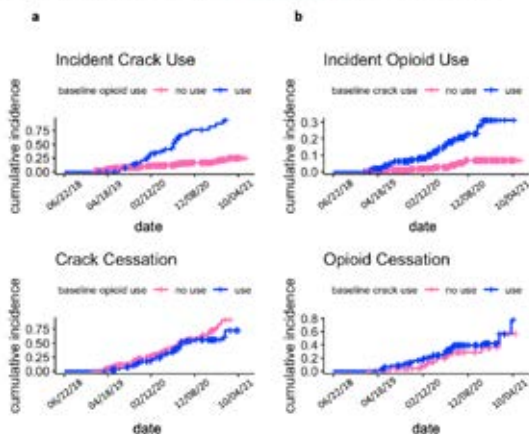

**Background:** Female sex workers (FSW) in South Africa are disproportionately impacted by HIV and substance use disorders. Substance use has been associated with poor

HIV treatment outcomes, necessitating exploration of polysubstance use patterns and predictors among FSW living with HIV.

**Methods:** Data on substance use and relevant covariates were obtained for 777 FSW randomized to the *Siyaphambili* HIV treatment strategies trial implemented through TB HIV Care. FSW were screened for recent marijuana, opioid (heroin and whoonga), crack, and hazardous alcohol use at enrollment and semi-annually from June 2018-January 2022. Individuals were assessed for substance use initiation/cessation after enrollment. Kaplan-Meier plots visualize polysubstance trends in incidence and cessation. Cox proportional hazards models assessed baseline substance use as predictors of initiation and cessation of other substances and adjusted for age, education, homelessness, sex work venue type, and lifetime physical and sexual violence. Calendar time was used as the time metric.

**Results:** Substance use incidence/cessation trends are shown (Figure). Opioid use at baseline was a predictor of crack initiation (aHR=6.86, 95% CI: 3.87-12.19); similarly, crack use at baseline was a predictor of opioid initiation (aHR=4.09, 95% CI: 1.83-9.15). Age was a negative predictor of crack initiation (aHR=0.92, 95% CI: 0.88-0.96) and a predictor of opioid cessation (aHR=1.18, 95% CI: 1.10-1.26) and crack cessation (aHR=1.04, 95% CI: 1.00-1.09). Primarily conducting sex work at an outdoor venue was a predictor of crack initiation (aHR=1.90, 95% CI: 1.01-3.57).

**Figure 1a)** Cumulative incidence of crack initiation and cessation by opioid use status at baseline among FSW living with HIV and participating in the *Siyaphambili* trial in Durban, South Africa; **b)** Cumulative incidence of opioid initiation and cessation by crack use status at baseline among FSW living with HIV and participating in the *Siyaphambili* trial in Durban, South Africa

**Conclusions:** Opioid use was a strong predictor of initiating crack and vice versa, suggesting that concurrent opioid and stimulant use is common among FSW. These findings highlight a need for multipronged substance use interventions for FSW that integrate harm reduction approaches to opioid and stimulant use.

Further investigation into these complex polysubstance use patterns and HIV treatment outcomes could inform HIV care delivery strategies tailored to FSW's preferences and needs.

## THPED342

### The impact of stigma on women's adherence to oral pre-exposure prophylaxis (prep) during the pregnancy and breastfeeding period in Lilongwe, Malawi: a qualitative analysis

T. Phanga<sup>1</sup>, A. M. Young<sup>2</sup>, F. Saidi<sup>1</sup>, A. Bula<sup>1</sup>, J. Tseka<sup>1</sup>, P. Mmodzi<sup>1</sup>, C. Baluwa<sup>1</sup>, L. D. Pearce<sup>3</sup>, S. Maman<sup>4</sup>, C. E. Golin<sup>4</sup>, W. Mutale<sup>5</sup>, B. H. Chi<sup>6</sup>, L. M. Hill<sup>4</sup>

<sup>1</sup>University of North Carolina Project, Lilongwe, Malawi,

<sup>2</sup>University of North Carolina at Chapel Hill, Department of Maternal and Child Health, North Carolina, United States,

<sup>3</sup>University of North Carolina at Chapel Hill, Department of Sociology, North Carolina, United States, <sup>4</sup>University of North Carolina at Chapel Hill, Department of Health Behavior, North Carolina, United States, <sup>5</sup>University of Zambia School of Public Health, Department of Health Policy, Lusaka, Zambia, <sup>6</sup>University of North Carolina at Chapel Hill, Department of Obstetrics and Gynecology, School of Medicine, North Carolina, United States

**Background:** Women experience elevated HIV risk during pregnancy and breastfeeding, particularly in sub-Saharan Africa (SSA). PrEP is effective in preventing HIV infection during this critical period, yet adherence to oral PrEP remains low among this population. We sought to understand the barriers pregnant and breastfeeding women taking PrEP face and how it affects their adherence.

**Methods:** We conducted a qualitative study to understand the sources and types of stigma that pregnant and breastfeeding women using oral PrEP experienced, and how stigma affected their adherence to PrEP. We purposively recruited participants from a PrEP clinical trial in Lilongwe, Malawi including: 30 HIV-negative pregnant women using PrEP, 5 HIV-negative Pregnant women that declined PrEP, and 10 health care workers (HCWs) i.e. counsellors and clinician working with women accessing PrEP. All participants completed an individual in-depth interview in Chichewa. We followed a thematic approach to analyze the interview data.

**Results:** Both women and HCWs reported anticipated stigma as one of the barrier to oral PrEP adherence. Women taking PrEP expressed concerns that people might think PrEP is the same as ART for HIV treatment. They feared being perceived as promiscuous when taking PrEP by their partners/family. Three women feared disclosing the reason they were eligible for PrEP to their partners/family e.g. resent sexually transmitted infection. As a result, many did not disclose to their partners/family they were taking PrEP which had a direct impact on adherence causing some women to temporarily or permanently discontinue PrEP whenever the risk of discovery became high. Women reported leaving PrEP at home when they travelled or when going to the hospital for delivery. Women also reported having challenges with drug storage and taking PrEP secretly at home. Leading to extended periods of missed doses.

**Conclusions:** Women reported anticipated PrEP stigma, which they related to barriers to PrEP use. Strategies at both the facility and community levels to clarify the difference between PrEP and ART may mitigate anticipated stigma. Strategies to support family disclosure and involving male partners in PrEP use may enable families to better support the women's PrEP use. Evidence-based strategies to reduce PrEP-related stigma are urgently needed.

### THPED343

Effects of life instability on later psychosocial syndemic problems and HIV adherence in PLWH in care in South Florida

S. Safren<sup>1</sup>, N. Kirakosian<sup>1</sup>, Y. Chen<sup>1</sup>, B. Bharat<sup>1</sup>, E. Weinstein<sup>1</sup>

<sup>1</sup>University of Miami, Miami, United States

**Background:** South Florida is a sociodemographically diverse region with one of the worst HIV epidemics in the U.S. People living with HIV (PLWH) in this setting are impacted by significant structural life instability and psychosocial syndemic problems that interfere with adherence to HIV treatment.

The present study sought to examine the impact of life instability on psychosocial syndemic problems, and in turn, HIV-related care outcomes (i.e., ART adherence, log RNA viral load) over time among South Florida PLWH.

**Methods:** Standard measures of patient reported outcomes were collected from 241 PLWH (51% men, 48% women, 1% non-binary/transgender; 76.3% Black, 22.4% Latino, 2.9% non-Latino White; age M=51.1 years) receiving care at a public clinic in Miami at two time points (M=22 months apart). HIV RNA viral load was extracted from medical records.

The additive index of structural life instability included unemployment, low educational attainment, incarceration history, immigrant status, housing instability, and lack of significant other.

Psychosocial syndemic count included depression, anxiety, trauma, intimate partner violence, and problematic substance use. Regression analyses were employed.

**Results:** Participants reported an average 2.23 life instability factors and 3.05 psychosocial syndemic problems, with only 2.9% reporting neither (no gender differences). At follow up, average self-reported adherence was 95.0% for men and 91.2% for women ( $p<.05$ ) with 12.4% having detectable ( $>200$ ) HIV (no gender differences). Each additional indicator of life-instability at baseline was associated with a 0.22 increase in syndemic count at follow-up (CI: 0.06, 3.87,  $p=.008$ ).

Further, each additional psychosocial problem at follow-up was associated with a 1.32 percentage point decrease in self-reported adherence (CI: -2.6, -0.02,  $p=.046$ ) covarying life-instability and gender.

Adherence was, in turn, associated with log HIV RNA viral load, covarying life instability and psychosocial syndemic problems ( $b=-.035$ , CI: -0.04, -0.03,  $p<.001$ ).

**Conclusions:** Results suggest a temporal relationship between baseline life instability and psychosocial problems, which is associated with difficulties in adhering to ART treatment in PLWH in South Florida, a region with significant HIV inequities. Interventions that address individual psychosocial problems and the structural disparities that drive them may help curb the epidemic in high burden U.S. domestic HIV "hot spots".

### THPED344

Impact of case management on children living with HIV under Chibefwe Catchment Area in Zambia

B. Ng'andu<sup>1</sup>, C. Mukelabai<sup>2</sup>, C. Mizinga<sup>2</sup>, P. Musamba<sup>2</sup>

<sup>1</sup>Project Concern Zambia, Programs, Lusaka, Zambia,

<sup>2</sup>Project Concern Zambia, Strategic Information Department, Lusaka, Zambia

**Background:** Project Concern Zambia (PCZ), through the USAID Empowered Children and Adolescent Program (ECAP)II, has been implementing the OVC Case Management Program to support government efforts in reaching the UNAIDS 95-95-95 goal. The program is aimed at contributing to HIV epidemic control through HIV case finding and household-based HIV treatment and care support along the continuum of care. Since 2020, USAID ECAPII has been implementing case management around Chibefwe catchment area in Mkushi through Community Case Workers (CCW).

**Description:** Implemented through community case management, individuals testing HIV+ through community HIV testing services (HTS) are promptly initiated on ART. Efforts extend to tracing and re-engaging clients experiencing treatment interruption (ITT). Monthly home visits target households with children living with HIV (C/ALHIV), ensuring adherence support. CCW utilize program screening tools to identify C/ALHIV facing treatment adherence challenges, focusing on personalized services. Services provided encompass referrals to health facilities when identified challenges necessitate clinical intervention.

USAID ECAPII collaborates with health facility personnel, streamlining viral load sample collection within clients' homes for comprehensive, person-centered care.

**Lessons learned:** Community-based case management has notably improved HIV/AIDS services in Chibefwe. Since the program's inception, the number C/ALHIV on ART has risen from 179 to 223 in 2024. CCW support played a vital role by tracing those not on treatment, addressing ITT, and aiding newly diagnosed individuals to access treatment services. Viral Load (VL) suppression improved from 67% to 99% owing to adherence support and time-

ly home-based VL sample collection. The unsuppressed C/ALHIV count reduced from 29 to 3 over the 3-year period. This success underscores the program's efficacy in enhancing healthcare provision, minimizing disruptions, reducing long queues/waiting time and prioritizing person-centered services.

**Conclusions/Next steps:** PCZ's community-led approach, led by CCW in the Chibefwe catchment area under USAID's ECAP II, has contributed to the UNAIDS 95-95-95 goals. This initiative significantly contributed to the increase in ART enrollment by addressing treatment delays and interruptions through community-led support. The collaborative efforts, including viral load sample collection at clients' homes, resulted in a rise in viral suppression from 67% to 99% over the 3-year period, reducing virally unsuppressed C/ALHIV from 29 to 3.

## THPED345

Trust in 'Undetectable=Untransmittable' (U=U) is associated with lower self-stigma and greater sexual satisfaction in people living with HIV in the UK

R. Palich<sup>1</sup>, M. Kall<sup>2</sup>, J. Sewell<sup>1</sup>, C. Smith<sup>2</sup>,

A. Pelchen-Matthews<sup>1</sup>, A. Aghaizu<sup>2</sup>, V. Delpech<sup>2</sup>,

A. Sparrowhawk<sup>3</sup>, V. Martin<sup>2</sup>, M. Brady<sup>4</sup>, L. Jennings<sup>5</sup>,

C. Kelly<sup>2</sup>, F. Nakagawa<sup>1</sup>, F. Lampe<sup>1</sup>, A. Rodger<sup>1</sup>,

PV2022 Study Group

<sup>1</sup>University College London, London, United Kingdom,

<sup>2</sup>UK Health Security Agency, London, United Kingdom,

<sup>3</sup>Terrence Higgins Trust, London, United Kingdom, <sup>4</sup>Kings College Hospital NHS Foundation Trust, London, United Kingdom, <sup>5</sup>North Bristol NHS Trust, Bristol, United Kingdom

**Background:** Having confidence in the U=U message may enhance well-being in people with HIV. We assessed levels of trust in U=U in people with HIV in the UK, and association with self-stigma and sexual satisfaction.

**Methods:** Positive Voices 2022 is the largest UK national survey of people with HIV. Participants self-completed a confidential questionnaire on socio-demographic, health and lifestyle factors.

We defined:

- Trust in U=U as a response of 'yes strongly believe' to the statement: "A person on HIV treatment with undetectable viral load cannot pass on HIV through sex",
- HIV-related self-stigma as a response of 'strongly agree' or 'agree' to the statement: "I have poor self-esteem because of my HIV status", and;
- Sexual satisfaction (among those reporting sex in the past three months) as a response of 'very' or 'mostly' to the question: "In general, how physically pleasurable have you found your sexual relationships over the last three months?"

We assessed factors associated with trust in U=U, and associations of trust in U=U with HIV-related self-stigma

and sexual satisfaction, using logistic regressions, adjusted for: demographic group; age; time since starting ART.

**Results:** 4607 people participated: 2488 (54%) MSM, 1121 (24%) women, 585 (13%) heterosexual men; 1120 (24%) Black ethnicity; median (IQR) age 52 years (43-60), 99% on ART with duration 13 years (8-18). 4375 (95%) participants reported knowing their last viral load, with 4205 (96%) reporting it as undetectable. 4221/4525 (93%) had heard of the U=U message; 2931/4535 (65%) trusted U=U.

Heterosexual women and men, older participants, those with lower education, greater financial hardship and unmet need about treatment advice were less likely to trust in U=U. People who trusted U=U were less likely to report HIV-related self-stigma (adjusted OR 0.52, 95%CI 0.44-0.60,  $p<0.0001$ ) and more likely to report sexual satisfaction (adjusted OR 1.66, 95%CI 1.34-2.05,  $p<0.0001$ ).

**Conclusions:** A third of people with HIV in the UK had a lack of trust in U=U, despite good awareness of the message. Lack of trust in U=U was associated with HIV-related self-stigma, and lack of sexual satisfaction.

Strategies to improve trust in the U=U message should be prioritised.

## THPED346

Empowering Youth: PrEP4U campaign as an innovative intervention in HIV prevention and demand generation for HIV services

<sup>6</sup>My Home Clinic, Ho Chi Minh City, Viet Nam, <sup>7</sup>United

States Agency for International Development

(USAID), Hanoi, Viet Nam, <sup>8</sup>Vietnam Administration

of HIV/AIDS Control, Vietnam Ministry of Health, Hanoi,

Viet Nam

**Background:** HIV infections in Vietnam are increasing among young people, including students. To achieve Vietnam's goal of HIV epidemic control by 2030, it is imperative that uptake of pre-exposure prophylaxis (PrEP) be scaled up via joint efforts from HIV service delivery partners. Co-designed by USAID/PATH STEPS, Vietnam's Ministry of Health, the Ministry of Education, and youth leaders, the national PrEP4U campaign (where "U" stands for both "you" and "university") uses a suite of edutainment ("educational entertainment") activities at universities and high schools to enhance student knowledge about SRH and safer sex, and encourage the use of HIV and STI testing, PrEP for HIV prevention, and other SRH services.

**Description:** PrEP4U campaign employs diverse approaches such as talk shows, interactive edutainment games, integration with other sex-ed programs at schools, and booth exhibitions where students can interact with staff from community-based primary care clinics and receive HIV testing, PrEP counseling, and referrals for other services. The campaign also runs across online platforms and leverages a network of PrEP4U Ambassadors and a PrEP4U Facebook page blending informative and humorous content derived by youth to motivate viewers to seek PrEP/SRH information and services.

**Lessons learned:** In 2023, STEPS and partners integrated digital innovations in the PrEP4U campaign, such as:

1. An online registration platform to effectively link individuals to free STI testing and HIV services at Glink clinic;
2. An online Virtual Reality (VR) gallery showing SRH information; and,
3. An online survey to evaluate SRH knowledge levels of students.

From March 2022 to –September 2023, PrEP4U campaign hosted 44 offline events and reached more than 11,000 students, distributed 1,445 HIV self-test kits and enrolled 804 individuals on PrEP. The PrEP4U Facebook page has become a hub of trustworthy SRH and PrEP information for students, supporting the campaign to garner over 2.4 million views across-platform since its launch in May 2022.

**Conclusions/Next steps:** Youth-focused PrEP/SRH campaigns with targeted edutainment activities centered around principles of choice, equity, and people-centeredness ensures that PrEP and sex-ed knowledge resonated with different youth segments to achieve Vietnam's twin goals of ending AIDS and ensuring universal health coverage by 2030.

## THPED347

Understanding risk behaviors among HIV+ women during conflict: insights from post-invasion Ukraine - a qualitative study

H. Skipalska<sup>1</sup>, T. Castillo<sup>2</sup>, A. Saienko<sup>1</sup>, D. Ompad<sup>3</sup>, L. Goldsamt<sup>3</sup>

<sup>1</sup>Ukrainian Foundation for Public Health, Kyiv, Ukraine,

<sup>2</sup>HealthRight International, New York, United States, <sup>3</sup>New York University, School of Global Public Health, New York, United States

**Background:** The war in Ukraine has given rise to a distinctive and concerning increase in HIV among women. In the aftermath of the full-scale invasion in Ukraine, the upheaval significantly complicated the landscape for those managing HIV care. Our research aimed to identify and comprehend the risk behaviors among HIV-positive women in the context of active conflict and displacement in Ukraine. This study seeks to shed light on the factors contributing to the increased prevalence of HIV among women during conflict.

**Methods:** In June and July 2023, we conducted in-depth interviews with 30 HIV-positive women (18 years+) in Kyiv, Uzhhorod, and Lviv, who learned of their status during wartime. Each person received services through our day programs. Employing a narrative analysis approach, our interview protocol explored several themes, including reactions to HIV diagnosis, relationships, misconceptions about HIV transmission, social support structures broken during wartime, and the intricacies of disclosure.

**Results:** Strained relationships emerged as a primary theme, with revelations about high-risk behaviors and trust issues influencing emotional landscapes. Respondents expressed challenging preconceived notions about HIV transmission and personal vulnerability. Narratives focused on introspection, stigma, and, in some instances, suicidal ideation. Misconceptions about HIV transmission were amplified in emergency situations. Fears of contagion added complexity to the experiences of individuals living with HIV. Heightened isolation and resource constraints were reported by a significant portion of the group. Fear of stigma and discrimination led many respondents to conceal their HIV status, underscoring additional layers of challenges faced by individuals navigating both an HIV diagnosis and wartime conditions.

**Conclusions:** This research provides crucial insights into the nuanced experiences of women with HIV during war and displacement, emphasizing the vital role of social support structures. It highlights the urgent need for targeted education and awareness campaigns to address internal struggles and external barriers to disclosure in emergency situations.

The findings underscore the importance of implementing strategies to strengthen support systems, dispel misconceptions about HIV transmission, and proactively address the unique needs of individuals in challenging circumstances, contributing significantly to the well-being of women living with HIV.

## THPED348

Employing differentiated peer-led social behavior change communication channels to promote condom utilization for HIV prevention

P. Anyumiza<sup>1</sup>, F. Kabasuga<sup>2</sup>, R. Babirye<sup>2</sup>, P. Nakamya<sup>2</sup>, B. Epoku<sup>3</sup>, F. Engwau<sup>4</sup>, H. Balidawa<sup>3</sup>, R. Mutumba<sup>3</sup>, R. Kindyomunda<sup>4</sup>, P. Mudiope<sup>3</sup>, S. Taratwebirwe<sup>3</sup>

<sup>1</sup>Program for Accessible Health Communication and Education, Kampala, Uganda, <sup>2</sup>Program for accessible Health Communication and Education, Kampala, Uganda, <sup>3</sup>Uganda Ministry of Health, Kampala, Uganda,

<sup>4</sup>United Nations Population Fund, Kampala, Uganda

**Background:** The 2020/21-2024/25 National Strategic Plan (NSP) for HIV and AIDS prioritizes condoms as a cost-effective intervention, aiming for a 90% usage rate during high-risk encounters. Uganda Population-Based HIV Im-

pact Assessment (UPHIA) exposed gaps in condom use among the population. In response, the Program for Accessible Health Communication and Education (PACE) executed the Differentiated Condom Demand Generation and Last-Mile Distribution challenge from March to December 2023, targeting Adolescents and Young Persons (AYPs) and Key Populations in Kampala, Busia, and Yumbe districts. The goal was to overcome barriers to condom use and enhance accessibility.

**Description:** PACE, in collaboration with the Ministry of Health, held localized co-creation sessions addressing barriers such as stigma, access issues, myths, high costs, and resistance. Stakeholders actively contributed to innovative solutions, shaping the differentiated peer-led Social Behavioral Change Communication (SBCC) Campaign, "Get it on, stay safe." After audience segmentation, Kampala focused on 15-30-year-olds, Yumbe targeted refugees aged 15-30, and Busia reached individuals aged 15-30 and sex workers aged 15-45. Seventy Condom Champions (Peers), trained to utilize interpersonal communication, reached 11,723 individuals, including those without smartphones. A social media campaigns further engaged 631,865 individuals.

Condom Champions facilitated last-mile delivery of 1,895,618 male condoms at 1,645 GIS-mapped points and providing real-time reporting using a smartphone application. Collaborations with the private sector, including beer delivery tracks, delivered condoms to 56 establishments.

**Lessons learned:** The analysis of 883 endline survey responses yielded valuable insights, indicating that 70% of participants expressed satisfaction with the availability of condoms. Establishing collaborations with the private sector emerged as a sustainable approach to ensuring a consistent supply of condoms. Additionally, the active involvement of peers in co-designing activities proved instrumental in tailoring condom messages to the audience, thereby effectively communicating the importance of condom use.

**Conclusions/Next steps:** The initiative emphasized differentiated, equitable, and people-centered condom programs. Recommendations include expanding the Peer-Led Differentiated Condom Demand Generation campaign, involving Civil Society Organizations (CSOs) for sustainable delivery, and leveraging social media extensively for condom messaging. The findings underscore the importance of continuous efforts to address persistent barriers and promote positive sexual health behaviors among target populations.

## THPED349

### Enhancing HIV treatment adherence through behavioral interventions: addressing stigma, discrimination and human rights violations in healthcare settings

N. Tshuman<sup>1</sup>, T. Ndlovu<sup>1</sup>, S. Ntamo<sup>2</sup>, T. Mpitso<sup>3</sup>

<sup>1</sup>Best Health Solutions, Public Health, Johannesburg, South Africa, <sup>2</sup>Women Believes Connections, Advocacy Officer, Bloemfontein, South Africa, <sup>3</sup>Free State Provincial Government, Office of the Premier, Provincial Council on AIDS Secretariat, Bloemfontein, South Africa

**Background:** In the Mangaung, Batho location, substantial progress has been made in reducing the burden of HIV, TB, and STIs. Despite these achievements, negative behaviors exhibited by some healthcare workers persist, leading to stigmatization and treatment default among individuals seeking healthcare services. Such behaviors result in treatment interruptions, escalating the risk of illness. The abstract outlines a comprehensive program aimed at addressing these challenges through scalable behavioral interventions.

**Description:** The program, conducted over a specified period in the Mangaung, Batho location, targeted healthcare facilities. It involved engaging healthcare workers to mitigate barriers related to stigma, discrimination, and human rights violations. A patient respondent mechanism was employed, creating a safe space for identified patients to share their experiences, focusing on retention to care, treatment adherence, and the associated risks of non-adherence. Linkage officers played a crucial role in understanding clinical experiences, facilitating smoother interventions.

**Lessons learned:** Findings from the program underscore the significance of behavioral interventions in enhancing HIV treatment adherence. Lessons learned include the identification of root causes of negative behaviors, the importance of patient narratives in addressing healthcare worker attitudes, and the role of family members and community engagement in facilitating interventions for treatment default.

**Conclusions/Next steps:** The outcomes of this program have broader implications for HIV prevention and treatment strategies. Addressing social and behavioral factors, such as stigma and discrimination, is crucial for the success of advanced interventions like long-acting extended delivery antiretrovirals.

The findings emphasize the need for deploying interventions at multiple levels, including structural changes in healthcare settings. As the program continues, further research and evaluation will refine strategies and contribute to the ongoing development of effective, socially informed HIV response efforts.

Bridging knowledge gaps, shifting attitudes, and enhancing processes: tailored interventions for effective HIV disclosure to adolescents

A. Ronan<sup>1</sup>, L. Gittings<sup>2</sup>, N. Nokuzola<sup>2</sup>, C. Mutambo<sup>3</sup>, G. Puri<sup>4</sup>, B. Engelsmann<sup>3</sup>, L. Hatane<sup>3</sup>

<sup>1</sup>Agnes Ronan, Programmes and Knowledge Management, Cape Town, South Africa, <sup>2</sup>Western University, School of Health Studies, Faculty of Health Sciences, Ontario, Canada, <sup>3</sup>Paediatric Adolescent Treatment Africa (PATA), Cape Town, South Africa, <sup>4</sup>Paediatric Adolescent Treatment Africa (PATA), Inhambane, Mozambique

**Background:** Incomplete disclosure to adolescents can have far consequences such as poor adherence to ART, increased morbidity, onward transmission, emotional challenges, and conflicts with caregivers including educators. Despite the availability of comprehensive ALHIV-focused disclosure guidelines, toolkits, and checklists, significant gaps persist in their effective implementation.

**Methods:** A participatory study was conducted in 2023 involving 519 frontline health care providers at 19 sites in 12 high HIV burden African countries, including eSwatini, Kenya, Malawi, South Africa, Tanzania, Uganda, Zambia, Cameroon, Ethiopia, Nigeria, Angola and Zimbabwe. Using participatory methods, participants undertook a preference ranking exercise to identify and rank the main barriers to effective disclosure to adolescents. Thematic analysis was used to categorise the barriers identified.

**Results:** Key barriers to effective HIV disclosure include lack of developmentally appropriate tools, insufficient skills to clearly explain HIV, and limited knowledge of the legal framework. Attitudinal barriers include caregiver reluctance, fear of stigma, and concerns about emotional distress during disclosure.

Process-related challenges include anxiety about post-disclosure support, inadequate facilities for maintaining confidentiality, and time constraints in busy health facilities.

**Conclusions:** To improve effective HIV disclosure among adolescents, multifaceted interventions are needed to address attitudinal challenges and overcome procedural limitations. Addressing these challenges requires tailored interventions that foster a more supportive environment for adolescents, caregivers and health care providers. Support for adolescents and their caregivers through culturally and age-appropriate resources and literacy materials, and reduction of stigma and fear through awareness campaigns are key. Practices can be improved by strengthening post-disclosure support, investing in facility infrastructure for confidentiality, and addressing time constraints through strategic interventions.

Comprehensive and ongoing training for health care providers is essential. This should be coupled with supportive tools and resources. Finally, and importantly, supporting providers to build emotional resilience is critical. These

multifaceted approaches can create a supportive and informed environment for adolescents and caregivers during the HIV disclosure process, promoting better outcomes.

## THPED351

PLHIV community facilitators leading in Healthcare

J. Patrick<sup>1</sup>, A. Williams<sup>1</sup>, K. Fagan<sup>1</sup>

<sup>1</sup>The Jamaican Network of Seropositives, Kingston, Jamaica

**Background:** The JN+ Community Facilitators Deployment Programme (CFDP) is a peer-to-peer PLHIV support programme with contact points across this continuum of care. The CFDP is community-led and engages PLHIV outreach workers as peer facilitators who support other PLHIV in accessing care and treatment services and also provide support by helping their peers to identify and overcome barriers that are and may affect their adherence to medication and staying in care.

The CFDP since 2017 has grown to streamline its goals and expectations of the peer workers. Facilitators provide knowledge and sensitization to their peers to support the prevention of loss to follow-up and promote ART adherence towards viral suppression.

**Description:** The CFDP engages empowered and virally suppressed PLHIV who can motivate and offer peer support to other PLHIV with treatment adherence challenges, high risk, with detectable and high viral load levels and who may have been previously lost to follow-up. A Community Facilitator (CF) is a PLHIV who works with these PLHIV peers (clients), has satisfied the selection requirements and has demonstrated a willingness to work with nominated and consenting HIV-positive peers. As such, both parties are willing to disclose their HIV-positive status.

**Lessons learned:** The CFDP has increased PHDP knowledge and outcomes among PLHIV. 87% of peers reported that their CF supported their learning and knowledge on the topic. 70% included self-care, sexual risk management and, stigma and discrimination. 91% of peers/clients indicated they feel more motivated to take care of their health and wellness. From 2019 to 2022, the CFDP worked with 1096 peers/clients and at the end of 2022, [767], 68% were retained in care and had achieved viral suppression which was higher than the national average of 50%. and 48% respectively.

**Conclusions/Next steps:** The CFDP has built the knowledge and capacity of CF/peers and client/ peers but has empowered their ability and that of their peers to journey to viral suppression through adherence to ART and retention in care.

The programme's success can be attributed to the active involvement of PLHIV. Engaging the community in treat-

ment planning, monitoring and evaluation has also enhanced the programme's strategic alignment with the National HIV/STI Strategic Plan.

## THPED352

### The Cookie Jar: utilization of social media platforms to accelerate access to HIV prevention services in Botswana

T.L. Molete<sup>1</sup>, G. Makwinja<sup>2</sup>

<sup>1</sup>Tebelopele Wellness Center, Social Marketing Officer, Gaborone, Botswana, <sup>2</sup>Tebelopele Wellness Center, Executive Director, Gaborone, Botswana

**Background:** The Fifth Botswana AIDS Impact Survey 2021 (BAIS V) report indicates that Botswana exceeded all UN-AIDS 95-95-95 targets at 95%, 98%, and 98% among adults (15-64 years) living with HIV. The survey also indicates that gaps still exist among PLHIV 15-24 years, 84.5% were aware of their status, 98.5% people are on Antiretroviral Therapy, and 91.6% of people on ART achieved VLS. Tebelopele Wellness Centers (TWC) as a community-based facilities and DREAMS initiative a clinical partner faces difficulties reaching AGYW with HIV prevention services and reduce their vulnerability to acquire HIV due to factors including low PrEP awareness and poor perception of HIV vulnerability.

**Description:** To identify and reach AGYW at risk and refer them for HIV prevention services, TWC combined the use of social media and peer-led mobilization, acknowledging the significance of social media in AGYW daily lives. Established in 2017, the Cookie Jar Facebook Group is a closed, safe space for girls and young women (ages 15 to 24) to discuss issues that affect their lives, health and well-being. It is overseen by AGYW' Health Care Educators (content creators) who work in the facility. Depending on the girl's need, content creators frequently share targeted HIV prevention messages, peer-led talks, referral directories, pathways and mobilize AGYWs who have unprotected sex.

**Lessons learned:** As of September 2023, a total of 1 788 AGYW are active on the group. 820 AGYW were referred for DREAMS screening, out of the 420 AGYWs that tested for HIV, 49 AGYWs living with HIV were enrolled on antiretroviral therapy, 76 for contraceptive mix, 161 for PrEP, 108 for STI Screening and Treatment and 16 for post GBV services. All referrals initiated from the online platform were directed to TWC. The health care educators were able to provide a warm handover process to their referred services. This comprehensive approach ensured a seamless layering of services, and all referrals were successfully completed. We ought to scale up the implementation of Facebook group across Botswana to reach more AGYWs.

**Conclusions/Next steps:** Social media platforms play a significant role in AGYW daily lives and should be utilized to accelerate targeted HIV prevention services.

## THPED353

### People-centred approaches: Community Facilitators' Deployment Programme

A. Davis<sup>1</sup>, R. Plummer<sup>1</sup>, O. Gayle<sup>1</sup>, D. Mitchell<sup>1</sup>

<sup>1</sup>Jamaican Network of Seropositives, Kingston, Jamaica

**Background:** The JN+ Community Facilitators Deployment Programme (CFDP) is a peer-to-peer PLHIV support programme that promotes retention in care among PLHIV.

Community Facilitators are trained PLHIV who work with treatment sites across Jamaica, providing mentorship and support to peers to promote adherence and retention in care by mentoring peers to improve adherence and overall health.

**Description:** Since 2017, The Community Facilitators Deployment Programme has supported 18 HIV treatment sites across the island of Jamaica. Trained Community Facilitators utilise a Positive Health, Dignity and Prevention (PHDP) approach for empowering and promoting Leadership among Persons Living with HIV through Treatment Literacy and stigma and discrimination-reducing interventions. For inclusion in the CFDP, both parties are willing to disclose their HIV-positive status and establish a two-party confidential line of communication.

The programme is managed through a simplified approach comprising treatment site supervision which recommends and assigns peers to Community Facilitators, adhering to onboarding and recruitment protocols. This is complemented by administrative and programmatic oversight from a remote secretarial supervisor who reviews peer assignment and conducts check-ins with CFs.

**Lessons learned:** The Community Facilitator's Deployment Programme significantly contributes to retention in care. From 2019 to 2022, the programme engaged and served 1096 PLHIV, with 767 (70%) becoming retained in care - 50% above Jamaica's national average. Support from Community Facilitators also resulted in 519 of their PLHIV peers achieving viral suppression.

Ensuring the programme's integration within national budgetary allocations is essential for sustainability; continued resource mobilisation and support from technical partners will also aid in securing access to global expertise, best practices, and meeting funding gaps.

**Conclusions/Next steps:** The CFDP supports the strategic direction and priorities of the Government and its national HIV programme across multiple entry points within the HIV Care Continuum. Promising practices and innovations have emerged from the implementation of nuanced and creative strategies across the island's four regional health authorities. It also works to support all the target outcomes identified and highlighted by Jamaica's current National Integrated Strategic Plan for Sexual and Reproductive Health (SRH) & HIV.

### Testing outcomes of HIV exposed infants (HEI) in Botswana

R. Faatse<sup>1</sup>, D. Tlagae - Gaseitsiwe<sup>1</sup>, K. Katse<sup>1</sup>, N. Tumelo<sup>1</sup>, B. Adera<sup>2</sup>, M. Matshaba<sup>3,4</sup>

<sup>1</sup>Global Communities, Gaborone, Botswana, <sup>2</sup>Global Communities, Silver Spring, United States, <sup>3</sup>Botswana-Baylor Children's Clinical Centre of Excellence, Gaborone, Botswana, <sup>4</sup>Baylor College of Medicine, Department of Pediatrics, Houston, United States

**Background:** In Botswana, over 20% of women of child-bearing age are living with HIV. Between 2014 and 2018, reported rates of mother to child transmission of HIV in Botswana ranged from 1.4-4.8%. Published paediatric data of 2020 indicated that Botswana did not reach the WHO 95-95-95 goals for 0-14 year olds. Early Infant Diagnosis (EID) is critical in achieving these goals by 2025. Global Communities in collaboration with Botswana-Baylor Children's Clinical Centre of Excellence (BBCCOE) sought to ascertain the HIV testing service uptake for HIV Exposed Infants (HEI) and explored barriers and enablers for testing and care.

**Methods:** In 2020 to 2021, Global Communities and BBCCOE conducted cross-sectional and retrospective cohort study. Data sources included interviews with HEI caregivers, clinic data, maternal medical history, physical examinations of the children, and HIV testing for children who met criteria but did not get tested. Uptake of HEI testing at 6 weeks and 18 months of age, as well as the HIV status of the children was reviewed.

Clinical and demographic data, including patient age, medical history, medications, and laboratory results were collected from the paper birth registers at the hospitals and captured into an electronic medical record. Data analysis was performed using SPSS version 16.0.

**Results:** Findings show that 97.1% of all children in the study received at least one test before the study visit. However, 2.4% of the HEI were deceased by the time of our study with 72.7% of them having not received an HIV test and 2% tested positive. Long distances to health facilities, limited transport money, stigma and discrimination, non disclosure, and multiple caregiving were cited by mothers living with HIV and other caregivers as barriers at community/family level. Health care workers reported limited resources for follow up.

**Conclusions:** Perspectives of mothers living with HIV on the barriers and facilitators for testing among HEI is critical. Policy efforts, health systems strengthening at community level, and consistent PMTCT health education to mothers living with HIV can promote uptake of HEI testing. A multi-level approach is needed to address barriers to HEI testing uptake.

## THPED355

### Perceptions of Long-Acting and Extended Delivery (LAED) HIV treatment regimens among South African youth living with HIV

T. Ritchwood<sup>1</sup>, M. Atujuna<sup>2</sup>

<sup>1</sup>Wake Forest University School of Medicine, Winston-Salem, United States, <sup>2</sup>University of Cape Town, Desmond Tutu Health Foundation, Cape Town, South Africa

**Background:** Compared to children and adults, adolescents living with HIV (ALWH) have poor engagement in HIV care, frequently struggling with treatment adherence and experiencing elevated viremia. Long-Acting and Extended Delivery (LAED) HIV treatment regimens offer great promise in reducing the burden associated with HIV care management. Yet, there are lingering questions about end-user needs and how best to promote LAED among ALWH. Research exploring youth's challenges with HIV treatment adherence, along with perceptions of HIV cure and participation in related research, could inform LAED product development, testing, and promotion strategies. Therefore, this study leverages data on ALWH's perceptions of participating in HIV cure research to inform the global rollout of LAED regimens.

**Methods:** We conducted semi-structured, in-depth interviews with 20 ALWH (aged 13-19 years) in Cape Town, South Africa. Data were analyzed using inductive and deductive approaches to content analyses. Interviews inquired about ALWH's: challenges with treatment adherence, perception of the potential impact of an HIV cure on their lives, views concerning participating in HIV cure research, and delivery modality preferences (e.g., pills or injections, or implants).

**Results:** Most participants associated an HIV cure with relief from the burden of living with HIV care, including daily medications, frequent doctor's visits, and stigma within HIV clinics. While most reported interest in participating in HIV cure research, some expressed concerns, such as the unknown impact of the experimental medications on their bodies or not wanting to be the first trial subjects. Concerning treatment modality, preferences for a pill was most common followed by injections.

**Conclusions:** HIV cure-related research seeking to elucidate barriers and facilitators to adolescent willingness to engage in clinical trial research, along with their preferences regarding treatment modality, can be leveraged to anticipate and address challenges that this population may face with LAED promotion and uptake. Our findings suggest a need for increased attention to educating youth about the importance of LAED research, and its relevance to their lives and futures. However, research is needed to identify and evaluate tools aimed at assisting youth with making informed decisions about their healthcare, including the appropriateness of switching to LAED regimens.

## THPED356

### Paving the way for long acting injectable ARV's in Botswana: a rapid assessment

P. Masire<sup>1</sup>, M. Modisaotsile<sup>1</sup>, L. Busang<sup>1</sup>, M. Keakantse<sup>1</sup>, V. Mochawacha<sup>1</sup>, K. Seipone<sup>1</sup>

<sup>1</sup>African Comprehensive HIV/AIDS Partnership, Gaborone, Botswana

**Background:** Long-acting Injectable ARV (LAI) treatment provides an exciting opportunity to shift treatment paradigms if appropriately contextualized. This Rapid Assessment was an opportunity to identify existing resources and opportunities for the proposed intervention that will bolster the planning and uptake of LAI. This Rapid Assessment sought to develop foundational knowledge regarding the policy and operational environment around LAI's, target populations and assess facility readiness for, and develop recommendations to support effective uptake for LAIs in Botswana.

**Description:** In this rapid assessment we:

- Mapped the healthcare system, client flows and client populations in the clinical cascade,
- Identified relevant stakeholders to engage in designing, building and executing innovate Care Delivery Models,
- Evaluated facility readiness, and;
- Provided recommendations on target populations.

Twenty-nine Key Informant Interviews and 7 Focus Group Discussions were conducted at both National level and across 8 selected District with experts from Ministry of Health, Civil Society, PLHIV, local government and private institutions. Five Key Informant Interviews were further conducted among key stakeholders from the private sector across 3 districts. Twenty-nine public facilities and 6 private facilities were assessed for both client and facility level characteristics and readiness.

**Lessons learned:** This rapid assessment was intended as an initial step in developing recommendations to support effective uptake of LAIs in Botswana. Key findings were:

- Establish A national coordinating mechanism to maximize the effectiveness of LAI implementation and align with national strategies,
- Involve representatives from all key populations to participate at all levels of planning and implementation,
- Strengthening routinely collected data for HIV by revising data tools to include key populations disaggregation and aligning M&E systems, as well as leveraging innovative technologies such as real time tracking systems,
- Tailoring demand creation and service delivery for the unique considerations of each high-risk group,
- Prioritizing Public Private Partnership models,

f. Leveraging the existing vaccine cold chain infrastructure to align with LAI distribution

**Conclusions/Next steps:** The Rapid Assessment provided a deeper understanding of the current key health system and population contexts, as well as assessment of facilities for readiness to upscale LAI adoption in Botswana, in an effort to achieve epidemic control.

## THPED357

### Sex workers' engagement with mutual aid both on-the-ground and online: exploring access to grassroots support networks among a community-based cohort in Vancouver, Canada (2020-2022)

J. Pearson<sup>1,2</sup>, A. Krüsi<sup>1,2</sup>, K. Shannon<sup>1,2</sup>, C. Zhou<sup>2</sup>, E. Luba<sup>2</sup>, S. Goldenberg<sup>3,2,1</sup>

<sup>1</sup>University of British Columbia, Department of Medicine, Vancouver, Canada, <sup>2</sup>Centre for Gender and Sexual Health Equity, Vancouver, Canada, <sup>3</sup>San Diego State University, Division of Epidemiology and Biostatistics, School of Public Health, San Diego, United States

**Background:** Community empowerment has been identified as a key driver of sex workers' (SWs) health, including HIV/STI prevention. We know little about SWs' uptake of 'mutual aid', a model for grassroots support based on principles of direct action and solidarity, especially relating to increased digital/online facilitation of both sex work and mutual aid.

We aimed to measure recent (last six months) engagement of "digital" and "on-the-ground" mutual aid, and their associations with occupational conditions and access to structural supports (e.g., health/social services) among SWs in Vancouver, Canada.

**Methods:** Prospective data (2020-2022) were drawn from a community-based cohort of SWs, operated by experiential and community-based staff. We used novel measures to assess digital (e.g., sharing 'bad date' lists online) and on-the-ground (e.g., safety checks, providing harm reduction supplies) mutual aid, and multivariable explanatory models with generalized estimating equations (GEE) to examine correlates of uptake over two years.

**Results:** Analyses included 290 sex workers, of whom 53.8% were Indigenous and 5.6% non-Indigenous people of colour. 10% identified as gender minorities (vs. cis women). At baseline, 16.8% were living with HIV, and 3.8% were STI seropositive (chlamydia/gonorrhea/syphilis). 57% engaged with any mutual aid over 2-years, which was higher for on-the-ground (45.7%) compared to digital (34.7%). In multivariable analysis (figure 1), SWs facing recent physical/sexual violence and those accessing sex work-specific services had higher uptake of mutual aid, particularly on-the-ground; whereas SWs experiencing incarceration and recent unstable housing had lower uptake of digital mutual aid.

Figure 1. Adjusted odds ratios (AORs) and 95% Confidence Intervals (CIs) of factors correlated with recent mutual aid among women sex workers in Metro Vancouver, Canada, AESHA, March 2020 - March 2022 [n=290].

**Conclusions:** This study presents some of the first data on SWs' uptake of mutual aid. Building on existing community empowerment models, structural interventions to scale-up both "on-the-ground" and "digital" mutual aid models for SWs are recommended as part of HIV/STI and violence prevention strategies for SWs, alongside broader interventions towards full decriminalization of sex work, safe housing, and universal internet access.

## THPED358

The influence of perceived neighborhood disorder on Health-related decisions among people living with HIV: a qualitative study

L. Kimaru<sup>1</sup>, P. Magrath<sup>1</sup>, C. Hu<sup>2</sup>, S. Nangalingam<sup>3</sup>, E. Connick<sup>4</sup>, K. Ernst<sup>2</sup>, J. Ehiri<sup>1</sup>

<sup>1</sup>University of Arizona, Department of Health Promotion Sciences, Tucson, United States, <sup>2</sup>University of Arizona, Department of Epidemiology and Biostatistics, Tucson, United States, <sup>3</sup>El Río Special Immunology Associates, Tucson, United States, <sup>4</sup>University of Arizona, Division of Infectious Diseases, Tucson, United States

**Background:** This qualitative study explores the impact of perceived neighborhood disorder on health-related decisions among people living with HIV. Recognizing the crucial role environmental factors play in health behaviors, the research seeks to bridge a gap in understanding how neighborhood dynamics affect individuals with HIV.

**Methods:** A qualitative research design with interpretive qualitative analysis. The interview guide and analysis were guided by the theoretical frameworks of Broken Windows Theory and Social Cognitive Theory, enabling a comprehensive exploration of the intersection between environmental perceptions and healthcare behaviors. Data were collected through telephonic in-depth interviews with 18 participants attending two HIV clinics in Southern Arizona from June 2022 to February 2023. Interviews were analyzed using the Dedoose software 9.0.17 and narratives were enriched using data triangulation from a validated scale to measure perceived neighborhood disorder.

**Results:** This study indicates that the degree of perceived neighborhood disorder impacts individuals' sense of control, which in turn influences their HIV care-seeking decisions and preferences for care characteristics. Perception of lower degrees of neighborhood disorder correlates with a strong sense of control and a preference for specialized care. As the perception of neighborhood disorder increases, there's a shift toward care settings that balance specialized services with a supportive community environment. A higher perception of neighborhood disorder leads to prioritized care settings that provide a sense of community, support, and discretion, reflecting adaptations to a compromised sense of control.

**Conclusions:** The findings of this research underscore the influence of perceived neighborhood disorder on health-related decisions, emphasizing the role of health-care environments in mitigating this impact. For chronic disease management, such as with HIV, the development of healthcare settings that reinforce patient autonomy and control, alongside community efforts to diminish signs of disorder, is crucial.

## THPED359

Individual, household and community factors affecting ART adherence

L. Campbell<sup>1</sup>, C. Masquillier<sup>1</sup>, L. Knight<sup>2</sup>, E. Wouters<sup>1</sup>

<sup>1</sup>University of Antwerp, Antwerpen, Belgium, <sup>2</sup>University of Cape Town, Cape Town, South Africa

**Background:** Antiretroviral therapy (ART) adherence is crucial for health outcomes of people living with HIV (PLWH). Individuals' adherence is impacted by a complex interplay of individual, community, and household factors, with the household gaining increasing recognition as a significant factor.

This article focuses on the influence of household factors on ART adherence among people living with HIV who have recently initiated ART in Cape Town.

**Methods:** Baseline data for a cluster-randomized control trial were collected from 316 PLWH in 12 districts in Cape Town between 6<sup>th</sup> May 2021 and 22<sup>nd</sup> May 2022. Zero-inflated Poisson models, with cluster-adjusted standard errors, were used to analyse the association between individual, household, and community factors and two measures of ART adherence; self-rated ART adherence, and the number of days that all pills were missed in the last 4 days.

**Results:** At the household-level, psychological and emotional violence increased poor self-rated ART adherence by a factor of 1.40 (p=0.04). Higher levels of household support were linked to lower rates of poor self-rated adherence (exp. coeff. 0.80, p<0.001) and decreased the number of days when pills were missed by a factor of 0.65 (p=0.001). A one-point increase in household asset index scores increased the expected number of days where pills

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

were missed by a factor of 1.32 ( $p=0.021$ ). At the individual-level, male gender and reinitiating ART were associated with poorer self-rated ART adherence: participants re-initiating ART were 1.43 times more likely to rate their ART adherence poorly (adj. exp. coeff: 1.43,  $p<0.001$ ) and male participants reported 1.37 ( $p<0.001$ ) times worse ART adherence. Higher education levels reduced missed pill days by a factor of 0.28 ( $p<0.001$ ), and each point increase in HIV knowledge reduced missed pill days by a factor of 0.32 ( $p<0.001$ ). At the community level, higher levels of stigma increased poor self-rated adherence by a factor of 1.20 ( $p=0.02$ ).

**Conclusions:** Household, individual and community factors play an important role in ART adherence. To improve ART adherence, proximal and distal factors must be considered, particularly in addressing gender-based disparities, promoting health literacy, reducing stigma, tackling violence, and enhancing household support.

## THPED360

The endorsement of stereotypes, prejudicial beliefs, and microaggressions toward people living with HIV: an opportunity for growth and discussion

L. Eaton<sup>1</sup>, A. Cole<sup>2</sup>, M. Kalichman<sup>2</sup>, S. Kalichman<sup>3</sup>, R. Watson<sup>1</sup>

<sup>1</sup>University of Connecticut, Human Development and Family Sciences, Storrs, United States, <sup>2</sup>Perceptions Programs, Inc, Willimantic, United States, <sup>3</sup>University of Connecticut, Psychological Sciences, Storrs, United States

**Background:** Considerable efforts in HIV prevention and treatment sciences have been focused on understanding the experiences of people who have been stigmatized. What is less understood, however, are the beliefs and perspectives of individuals who hold stigmatizing beliefs towards individuals living with HIV. Further, stigma interventions have primarily focused on coping with mistreatment, leaving out opportunity for directly addressing negative beliefs. Working with individuals who hold negative beliefs must be a key piece of our efforts to eliminate stigma.

**Methods:** Data were collected among individuals who reported identifying as Black/African American, anal sex with a man in the past year, substance use or depression, male sex at birth, and interest in or current use of PrEP. Data were collected among participants residing in the southeastern United States between 2021-2023 ( $N=287$ ). Participants completed survey assessments that included items on prejudice (3-items), stereotypes (3-items), and microaggressions (5-items) towards people living with HIV.

**Results:** Prejudicial beliefs (e.g., People who are living with HIV make me feel nervous) were reported among approximately 10% of the sample for each item. Stereotypes (e.g., Most people living with HIV have acted carelessly) were

reported among approximately 15% of the sample for each item. Endorsement of microaggressions were more frequently reported and with higher variability across items. For example, 48.7% of the sampled agree with "I would have hesitations about having sex with someone who was living with HIV", 67.7% agreed with "Laws that require people who are living with HIV to disclose their HIV status are important to have," and 24.7% agree with "People living with HIV should limit their sex partners to other people living with HIV".

**Conclusions:** It is promising that a large percentage of the sample disagreed with prejudicial and stereotypical beliefs towards individuals living with HIV. However, a small percentage of participants did endorse these beliefs and the percent who reported microaggressions towards individuals living with HIV was considerably higher. Findings may have important implications for U=U messaging, which supports treatment and sustained undetectable viral load as an effective form of HIV prevention. Beliefs appear to persist, however, that may undermine this form of prevention.

## THPED361

Synergy among multiple stigmas in predicting psychosocial conditions and condomless anal sex among transgender women in India: findings from a longitudinal S3 (stigma, syndemics and sex) cohort study

V. Chakrapani<sup>1</sup>, A. Sebastian<sup>2</sup>, R. Nelson<sup>1</sup>, M. Shanmugam<sup>1</sup>, J. Kaur<sup>3</sup>, A.C. Tsai<sup>4</sup>, A. Scheim<sup>5</sup>, P.A. Newman<sup>6</sup>, S. Rawat<sup>7</sup>, A. Jaya<sup>8</sup>

<sup>1</sup>Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, <sup>2</sup>National Institute of Advanced Studies (NIAS), Bengaluru, India, <sup>3</sup>Postgraduate Institute of Medical Education and Research (PGIMER), Chandigarh, India, <sup>4</sup>Massachusetts General Hospital and Harvard Medical School, Boston, United States, <sup>5</sup>Drexel University, Philadelphia, United States, <sup>6</sup>University of Toronto, Toronto, Canada, <sup>7</sup>The Humsafar Trust, Mumbai, India, <sup>8</sup>Sahodaran, Chennai, India

**Background:** Limited research in India has assessed the potential synergy among multiple stigmas faced by TGW in contributing to psychosocial conditions and condomless anal sex (CAS). We explored these associations, informed by syndemic theory and intersectionality framework.

**Methods:** We used three-wave data (November 2020 to March 2022: ~ every 6 months) from a cohort study of 500 TGW recruited through community-based organizations implementing HIV prevention interventions in Chennai and Mumbai. CAS was defined as "never" using condoms during anal sex with male non-primary partners during the past 2 months. Using generalized linear modelling approaches (Stata-16), we modeled CAS (wave-3)

and psychosocial binary outcomes (wave-2 depression [PHQ-9], anxiety [GAD-2], internalized transprejudice, and heavy alcohol use [AUDIT-C]) as a function of interactions between 3 types of stigma scores (wave-1): perceived HIV stigma, sex work stigma and transgender identity stigma.

**Results:** Participants' mean age at baseline was 27.5 (SD=5.6) years and 4.9% self-reported as HIV positive. We estimated a high prevalence of outcome and mediators: CAS (81.2%), internalized transprejudice (46.2%), anxiety (37.9%), problematic alcohol use (15.3%), and depression (14.8%).

**Synergy in the production of CAS:** All three stigmas significantly predicted CAS: HIV stigma (OR=1.67, 95% CI 1.36 to 2.05,  $p<.001$ ), sex work stigma (OR=1.18, 95% CI 1.11 to 1.24,  $p<.001$ ), and internalized transprejudice (3.13, 95% CI 1.15 to 8.52,  $p=.02$ ), with a significant interaction between sex work stigma and HIV stigma (OR=1.02, 95% CI 1.01 to 1.04,  $p=.005$ ).

**Synergy in the production of psychosocial conditions:** Transgender identity stigma (OR=1.11, 95% CI 1.06 to 1.16,  $p<.001$ ) and sex work stigma (OR = 1.03, 95% CI 1.001 to 1.07,  $p=.04$ ) and their interaction term (OR=1.006, 95% CI 1.001 to 1.01,  $p=.03$ ) significantly predicted anxiety. Sex work stigma significantly predicted internalized transprejudice (OR=1.02, 95% CI 1.001 to 1.04,  $p=.03$ ), and there was a significant interaction between sex work stigma and transgender identity stigma in predicting internalized transprejudice (OR=1.003, 95% CI 1.01 to 1.006,  $p=.04$ ).

**Conclusions:** Synergistic interactions between stigmas were identified in their associations with psychosocial conditions (anxiety, internalized transprejudice) and CAS. Multi-level and syndemic theory-based interventions are needed to eliminate intersecting/multiple stigmas and promote mental health and safer sex.

"I got two vaccines. I don't want a third:"  
COVID-19 vaccine skepticism and fatigue among  
Black and Latino MSM at-risk or living with HIV in  
California and New York

J. Egbunikeokye<sup>1</sup>, M. Wharton<sup>2</sup>, W. Bagby<sup>1</sup>, A. Rivas<sup>1†</sup>,  
N. Wilson<sup>1</sup>, O. Harris<sup>1</sup>

<sup>1</sup>University of California, San Francisco, Community Health  
Systems, San Francisco, United States, <sup>2</sup>University of  
Rochester, School of Nursing, Rochester, United States

**Background:** Black and Latino sexual minority men (BLSMM) have been disproportionately impacted by viral outbreaks such as COVID-19, Mpox and HIV/AIDS, yet they have continuously been negligibly reflected in vaccine uptake. Previous studies have examined medical mistrust as a reason for low vaccine uptake among marginalized and minoritized populations. However, few studies have explored vaccine skepticism, hesitancy, fatigue, and

acceptance among BLSMM living with or at-risk for HIV. Therefore, the purpose of this study is to explore COVID-19 vaccine skepticism, hesitancy, fatigue, and acceptance among BLSMM at-risk for or living with HIV.

**Methods:** In this qualitative descriptive study, we utilized in-depth, individual, semi-structured interviews as the primary source for data collection. Data were collected between August 2021 and December 2022 from 41 adult participants in California and New York. Interviews were recorded, transcribed verbatim, and analyzed using thematic content analysis.

**Results:** Participants ranged in age from 19-65 years. The majority described their gender as male (93%) with the remaining identifying as 'other.' Black participants comprised majority of the sample (73%), with Latinos accounted for 25%. Participants narratives revealed that COVID-19 vaccine skepticism was fueled by persistent distrust in government, medical and public health institutions.

Vaccine skepticism was also fueled by the politicization of the vaccine development, vaccine dissemination and lack of representation of people of color in leadership positions within the medical field. Vaccine fatigue, seen as exhaustion or inertia of vaccines, was observed among participants—leading many to forgo further protection from vaccine boosters.

Fatigue also appeared as a result of the frequency of various types of vaccinations (i.e., COVID-19, Mpox, flu, HPV, etc.) since the onset of the pandemic.

Additionally, participants suggested that their experience with side-effects and COVID-19 infection experience after vaccination, resulted in exhaustion to receiving any further vaccine COVID-19 boosters or for other infectious diseases.

**Conclusions:** These findings suggest vaccine skepticism, fatigue, and acceptance are complexed issues are influencing vaccine decision-making among BLSMM living with or at-risk for HIV. An understanding of these issues can further inform future implementation strategies for vaccines and new biomedical HIV prevention and treatment modalities such as long-acting injectables among BLSMM in the U.S.

## THPED363

### Streaming ahead or a top-down trickle? Gender-transformative social norms change through our movements: lessons learned from the STREAM Network

L.W. Njenga<sup>1</sup>, E. Bajenja<sup>2</sup>, A. Welbourn<sup>3</sup>, J. Alesi<sup>4</sup>

<sup>1</sup>STREAM Network/Positive Young Women Voices, Nairobi, Kenya, <sup>2</sup>STREAM Network/CFAR, Kampala, Uganda, <sup>3</sup>STREAM Network/Salamander Trust, London, United Kingdom, <sup>4</sup>STREAM Network Uganda, Kampala, Uganda

**Background:** Global evidence states that: 25% of all women experience violence (VAW); VAW increases women's HIV acquisition by 1.5%; VAW restricts women's access to SRH services; and that violence against children (VAC) can also lead to adult experience or perpetration of violence. So violence and HIV can have reciprocal life-long links. Global evidence also demonstrates that national-level VAW-reduction efforts only succeed where independent women's rights networks thrive. However HIV policies have largely been siloed, bio-medical, and individualistic, focused on ending women's 'dropouts' and 'adherence failures'; not on supportive society-wide, social-norms change. Therefore we created the STREAM Network, to scale an evidence-based, community-led, holistic, gender-transformative social-norms change-programme, Stepping Stones: to reduce VAW and advance SRHR, through networks/movements.

**Description:** Forty-two East and Southern African long-term male (11) and female (14) Stepping Stones trainers and women living with HIV from there, plus Argentina, Cameroon and India (19), (aged 25-79), gathered in September 2023 to create the international STREAM Network. (STREAM = Stepping Stones Trainers Engaged with Activist Movements). In 2024, team members developed national-specific STREAM Network strategic plans. Each national team seeks to train women and men living with HIV as Stepping Stones facilitators, to run programmes within their own networks and communities: to reduce violence against women and children (VAWC), promote community-wide trauma-aware support for people living with HIV, and uphold their SRHR.

**Lessons learned:** Combining lived experiences of women living with HIV with gendered social-norms-change trainers' skills, across genders, generations, status and borders, creates inspiring new opportunities for shared learning and lasting transformation. Everyone committed to this long-term gendered, rights-based, cross-generational learning process, to support networks of women living with HIV to achieve holistic SRHR for themselves, partners and children. However, national STREAM teams face ongoing challenges through current HIV policy focuses. Top-down, quick-fix, individualistic, bio-medical models inhibit lasting real world movement-led processes: so VAWC and HIV stigma remain rife.

**Conclusions/Next steps:** Long-term, gendered, society-wide, movement-led social norms change is key to effective, ethical and sustainable HIV responses. The STREAM Network will continue to advocate for this, based on the clear global evidence-base of what works to reduce VAW.

## THPED364

### Empowering pastoralist women through climate-smart HIV/AIDS intervention: lessons from the "Afya ya Mama, Afya ya Jami/Afya Timiza" project in Samburu, Kenya

F. Lalakipian<sup>1,1</sup>

<sup>1</sup>Regis University, Development Practice, Denver, United States

**Background:** According to (UNAIDS, 2022), HIV prevalence in Samburu County is at 5.6% which is higher than the country's at 4.5%. Study Show that 80% of people affected by climate change are women. The "Afya ya Mama, Afya ya Jami" (Mother's Health, Community Health) project, launched in 2020, aimed to improve access to HIV/AIDS information and services for Samburu women and girls facing heightened vulnerability due to climate change. The project partnered with local women's groups and health facilities to implement a multi-pronged approach.

**Description:** The project spanned three years in five Samburu villages, targeting women and girls aged 15-45. Activities included:

- Mobile outreach clinics: Bringing HIV testing, counselling, and treatment closer to nomadic communities.
- Community health education: Utilizing traditional communication channels and peer educators to raise awareness about HIV/AIDS, sexual health, and climate change resilience.
- Income-generating initiatives: Empowering women economically through drought-resistant farming techniques and micro-business training.
- Gender equality workshops: Promoting women's participation in decision-making regarding healthcare and community resource management.

#### Lessons learned:

- Mobile outreach clinics: Significantly increased HIV testing rates among pastoralist women (30% increase in project villages vs. 15% in control villages) and reduced stigma surrounding HIV/AIDS by 25%.
- Community education: Traditional storytelling and peer support groups facilitated open discussions about sexual health and HIV prevention, leading to increased condom use and family planning practices.
- Income generation: Diversified livelihoods and improved food security reduced women's dependence on husbands, fostering greater agency in healthcare decisions.

E-posters

Late-breaker abstracts

Author Index

- Gender equality workshops: Enhanced women's leadership in community resource management, leading to improved water security and sanitation infrastructure, which further decreased HIV transmission risk.

**Conclusions/Next steps:** Afya ya Mama, Afya ya Jami/ Afya Timiza" demonstrates that integrating climate change adaptation and gender empowerment into HIV/ AIDS interventions can significantly improve health outcomes for marginalized communities. Replicating this model in other settings, with cultural adaptations, and scaling up with support from government and NGOs can create lasting impact.

Future research should focus on long-term sustainability and measuring the project's impact on mother-to-child HIV transmission and adolescent girls' sexual health.

### THPED365

Association of structural racism and other social determinants of health with HIV late presentation: a county-level analysis in Southern United States

F. Shi<sup>1</sup>, J. Zhang<sup>2</sup>, S. Chen<sup>2</sup>, X. Yang<sup>1</sup>, Z. Li<sup>2</sup>, S. Weissman<sup>2</sup>, B. Olatosi<sup>2</sup>, X. Li<sup>1</sup>

<sup>1</sup>University of South Carolina, Health Promotion, Education, and Behavior, Columbia, United States, <sup>2</sup>University of South Carolina, Columbia, United States

**Background:** HIV late presentation with advanced disease (LPWA) decreases the life expectancy of people with HIV (PWH) and increases the risk of onward HIV transmission. Racial residential segregation, as one prominent manifestation of structural racism in the United States (US), may impact HIV LPWA via neighborhood differences in access to economic, medical, political, and environmental resources.

Understanding the association of residential segregation and other social determinants of health (SDOH) with HIV LPWA could help improve population-level HIV outcomes above individually based behavior and biomedical factors.

**Methods:** We created a county-level aggregate dataset for analysis by linking South Carolina (SC) statewide HIV diagnosis data and publicly available social contextual data (i.e., the American Community Survey and County-health rankings).

All adult PWH diagnosed from 2012 to 2019 in SC were included in the current study. Individual-level LPWA was defined as having an AIDS diagnosis within three months of initial HIV diagnosis. Linear mixed models were employed to explore potential risk factors of county-level 5-year average percentage of LPWA.

**Results:** Around 30% of new HIV diagnoses were LPWA in SC, and the mean delay time from HIV infection to initial diagnosis for people with LPWA was around 13 years. Counties with more racial residential segregation had a

higher percentage of LPWA (Adjusted beta = 5.079, 95% CI: 0.268-9.889). Regarding other SDOH, the increased percentage of LPWA was associated with fewer Ryan White centers per 100,000 population (Adjusted beta = -0.006, 95% CI: -0.011~-0.001) and higher percentages of population with less than high school education (Adjusted beta = 0.008, 95% CI: 0~0.015).

**Conclusions:** Reducing disparities in LPWA requires multifaceted interventions addressing multiple dimensions of SDOH. Targeted interventions are needed for counties with more Black residential segregation, fewer Ryan White centers, and higher percentages of the population with less than high school education.

### THPED366

Social determinants of health on HIV Pre-Exposure Prophylaxis (PrEP)-to-need ratio in the nationwide United States: a county-level analysis

F. Shi<sup>1</sup>, T. Mi<sup>2</sup>, X. Li<sup>1</sup>, X. Yang<sup>1</sup>

<sup>1</sup>University of South Carolina, Health Promotion, Education and Behavior, Columbia, United States,

<sup>2</sup>University of South Carolina, Columbia, United States

**Background:** Despite the promising efficacy of pre-exposure prophylaxis (PrEP) in preventing HIV, its coverage exhibits geographical disparities, and social determinants of health contribute to existing inequalities. This study aims to investigate county-level variability in PrEP utilization across dimensions of structural racism, providing insights for targeted interventions to enhance PrEP uptake in the US.

**Methods:** The 2013-2022 nationwide county-level PrEP-to-Need Ratio (PNR), defined as the ratio of PrEP users to new HIV diagnoses, was sourced from AIDSVu. Sociodemographic and healthcare factors at the county level were derived from publicly available datasets and calculated into indices of social determinants of health (SDoH), including the Black-to-White unemployed ratio, Black-to-White poverty ratio, dissimilarity index, and isolation index. Linear mixed effect regression was employed to identify associations between SDoH and PNR on a nationwide scale and within different geographic regions of the US.

**Results:** The study involved 912 counties with an average PNR of 5.71. Nationally, PNR was significantly associated with higher Black-to-White poverty ratio ( $\beta=0.80$ , 95% CI [0.45, 1.14]), smaller dissimilarity index ( $\beta=-0.31$ , 95% CI [-0.59, -0.03]), and smaller isolation index ( $\beta=-0.75$ , 95% CI [-1.04, -0.46]).

Regionally, Black-to-White poverty ratio was positively associated with PNR in the Northeast ( $\beta=1.63$ , 95% CI [0.44, 2.84]) and South ( $\beta=0.67$ , 95% CI [0.29, 1.05]), indicating the potential impact of targeted programs, such as PrEP-DAP, to assist individuals facing financial barriers in accessing PrEP medications for HIV prevention.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

Dissimilarity index was negatively related to PNR in the Northeast ( $\beta = -2.47$ , 95% CI  $[-3.81, -1.20]$ ) and West ( $\beta = -1.03$ , 95% CI  $[-1.90, -0.17]$ ), while isolation index was solely associated with lower PNR in the South ( $\beta = -0.90$ , 95% CI  $[-1.20, -0.61]$ ), highlighting the impact of racial segregation on potential disparities in access to and utilization of preventive measures against HIV.

**Conclusions:** County-level SDoH play a crucial role in understanding the challenges of scaling up PrEP coverage. The findings underscore the importance of tailored strategies across different regions and provide valuable insights for future interventions to optimize PrEP implementation.

By prioritizing interventions that address SDoH related to racial segregation, public health initiatives can work towards ensuring widespread and equitable distribution of HIV prevention efforts across diverse communities.

## THPED367

Tackling the triple threat in Kenya: evidence on the association between potential protective factors and HIV risk, violence victimisation, and early pregnancy among adolescent girls and young women

B. Maughan-Brown<sup>1</sup>, B. Banounin<sup>2</sup>, M. Little<sup>3</sup>, E. Toska<sup>4</sup>, L. Hertzog<sup>5</sup>, L. Cluver<sup>3</sup>

<sup>1</sup>University of Cape Town, Southern Africa Labour and Development Research Unit, Cape Town, South Africa, <sup>2</sup>UNFPA WCARO, Dakar, Senegal, <sup>3</sup>University of Oxford, Department of Social Policy & Intervention, Oxford, United Kingdom, <sup>4</sup>University of Cape Town, Centre for Social Science Research, Cape Town, South Africa, <sup>5</sup>Curtin University, School of Population Health, Perth, Australia

**Background:** High incidence of HIV, gender-based violence and adolescent pregnancy among adolescent girls and young women (AGYW) in Kenya – referred to as the ‘triple threat’ – require urgent intervention. Interventions with positive impacts on multiple components will accelerate improved outcomes and be more cost-effective. Based on INSPIRE strategies, we evaluated the association between three factors – positive gender norms, good parental support and food security – that are hypothesized to improve multiple outcomes and HIV-risk behaviours, violence victimisation, and early pregnancy.

**Methods:** Nationally representative data among AGYW 13–24 ( $n=1344$ ) from the 2018–19 Kenya Violence Against Children Survey (VACS) was used in multivariable logistic regression analyses (weighted and controlling for socio-demographic covariates), with Westfall–Young stepdown adjusted  $p$ -values to account for multiple hypothesis testing. Gender norms measured gender attitudes around sex and attitudes to intimate partner violence (IPV). Parental support captured communication and closeness with parent(s); and parents’ or caregivers’ knowledge of

key aspects of the participant’s life. Food security was defined as no day (past month) that the household went without food.

**Results:** Low proportions of AGYW reported positive gender norms (22%), parental support (28%) and food security (22%). Positive gender norms was associated with lower prevalence of IPV (adjusted odds-ratio (aOR): 0.35,  $p<0.01$ ) and adolescent pregnancy (aOR: 0.61,  $p<0.05$ ). Parental support was associated with lower prevalence of IPV (aOR: 0.52,  $p<0.05$ ), sexual violence (aOR: 0.46,  $p<0.05$ ), and child marriage (aOR: 0.45,  $p<0.05$ ). Food security was associated with lower prevalence of adolescent pregnancy (aOR: 0.54,  $p<0.05$ ) and child marriage (aOR: 0.40,  $p<0.01$ ). Combined, positive gender norms, parental support and food security (i.e., all three factors compared to none) were associated with a 82% lower prevalence of IPV, 72% lower prevalence of sexual violence, 67% lower prevalence of adolescent pregnancy, and 86% lower prevalence of child marriage.

**Conclusions:** The findings indicate that interventions that improve gender norms, good parenting and food security may help to reduce violence victimisation, adolescent pregnancy, and other HIV-risk factors. Moreover, improving each protective factor may have positive impacts on multiple outcomes, and combined effects are greater than individual effects, suggesting the possibility for high impact, cost-effective, multicomponent interventions.

## THPED368

Community versus facility-based services to improve the screening of active HCV in Cambodia: a cluster randomized controlled trial

D. Khuon<sup>1</sup>, S. Neth<sup>1</sup>, O. Segeral<sup>1,2</sup>, S. Saint<sup>1</sup>, L. Meyer<sup>3</sup>, L. Saganon Teyssier<sup>4</sup>, C.I. Phoeung<sup>1</sup>, C. Chhay<sup>1</sup>, K. Heang<sup>1</sup>, S. Mam<sup>1</sup>, J.-C. Duclos-Vallee<sup>3,5</sup>, V. Saphonn<sup>1</sup>

<sup>1</sup>University of Health Sciences, Phnom Penh, Cambodia, <sup>2</sup>Geneva University Hospital, HIV Unit, Geneva, Switzerland, <sup>3</sup>Paris Saclay University, Paris, France, <sup>4</sup>Aix Marseille University, Marseille, France, <sup>5</sup>DHU Hepatitov Hôpital Paul Brousse, Villejuif/Frafra, France

**Background:** Despite testing interventions among high-risk groups for active Hepatitis C virus (HCV) cases seems to be effective to diagnose cases and increase treatment uptake, new strategies using community-based approaches are needed to reach people far away from healthcare facilities.

This study aims to compare the effectiveness of community-based to facility-based intervention to improve HCV testing uptake among Cambodians aged more than 40 years.

**Methods:** This is a two-arm cluster-randomized controlled trial conducted in 40 villages from 2 provinces which were divided into 8 clusters. Facility-based intervention, in which HCV testing was performed in primary

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

health centers after information provided by Community Health Workers (CHWs), was compared to community-based intervention, where HCV rapid test (RDT) using finger stick capillary whole blood was directly performed by CHWs at the participants' home after consent. The primary outcome, HCV RDT testing uptake, was compared between the two groups using multivariate logistic regression.

**Results:** A total of 7692 participants, 3861 facility-based and 3831 community-based, were enrolled between April and July 2022. The median age was 55 years (IQR: 47-65); one-third (30.32%) were between 50-59 years. The majority were female (57.72%), married (76.74%), did not generate income (48.56%), and were farmers (51.28%). Of those, 249 (3.24%) ever tested for HCV, and 103 (1.34%) had  $\geq 1$  household member diagnosed and treated for HCV. After adjusting for covariates, community-based group had higher odd of HCV RDT testing uptake compared to facility-based group (OR=1.61, 95%CI:1.28-2.04). Factors associated with HCV RDT testing uptake include higher income participants compared to those earned  $\leq 80,000$  Riels/month ( $>300,000$ -1,500,000: OR=1.54, 95%CI:1.05-2.26;  $>1,500,000$ -1,800,000: OR=2.40, 95%CI:1.30-4.43;  $>1,800,000$ : OR=0.27, 95%CI:0.13-0.59). Ever tested for HCV participants had higher uptake compared to those who never tested (OR=16.14, 95%CI:8.69-29.94); sellers had lower uptake compared to government officers (OR:0.59, 95%CI:0.37-0.92); and subjects perceived worse health status at the interview time had lower uptake compared to those perceived very good health (Good: OR:0.08, 95%CI:0.03-0.19; Moderate: OR:0.22, 95%CI:0.08-0.56; Bad: OR:0.004, 95%CI:0.0004-0.04).

**Conclusions:** Community-based intervention could be effective to increase HCV testing uptake in high-risk populations. Cost-effectiveness analysis will be conducted for a better understanding after weighing the costs.

## THPED369

### Community-led response in humanitarian settings. Addressing the needs of PLHIV and key populations in Ukraine

G. Dovbakh<sup>1</sup>, A. Volgina<sup>2</sup>, Y. Yoursky<sup>3</sup>, S. Plecas<sup>4</sup>, Y. Kononchuk<sup>1</sup>, S. Moroz<sup>5</sup>, R. Drozd<sup>6</sup>, O. Belyaeva<sup>7</sup>, O. Dymaretsky<sup>8</sup>, D. Ocheret<sup>9</sup>

<sup>1</sup>Eurasian Harm Reduction Association (EHRA), Vilnius, Lithuania, <sup>2</sup>GNP+ – Global Network of People Living with HIV, Amsterdam, Netherlands, the, <sup>3</sup>ECOM – Eurasian Coalition on Health, Rights, Gender and Sexual Diversity, Tallinn, Estonia, <sup>4</sup>Sex Workers' Rights Advocacy Network (SWAN), Budapest, Hungary, <sup>5</sup>Eurasian Women's Network on AIDS (EWNA), Tbilisi, Georgia, <sup>6</sup>CO «Light of Hope», Poltava, Ukraine, <sup>7</sup>Eurasian Network of People who Use Drugs (ENPUD), Dnipro, Ukraine, <sup>8</sup>All-Ukrainian Union of People with Drug Addiction "VOLNA", Kyiv, Ukraine, <sup>9</sup>UNAIDS, Community Engagement Advisor, Geneva, Switzerland

**Background:** HIV-related stigma and criminalization of same sex behaviors, drug use, sex work, and HIV transmission create barriers to life-saving services in humanitarian settings. There are gaps in knowledge among humanitarian sector stakeholders of the needs of PLHIV, sex workers, LGBTI communities and people who use drugs, as well as political barriers to making these needs a priority in the context of increased competition for diminishing resources.

The full-scale Russian war against Ukraine highlighted the urgency of technical support for community-led organizations (CLOs) in Ukraine and border countries to adapt to humanitarian settings and lead in humanitarian responses for their communities.

**Description:** Since the first months of the full-scale war, GNP+, ECOM, EHRA, and SWAN, with UNAIDS support, have been coordinating the efforts of local CLOs to strengthen their capacities of documenting and addressing barriers that PLHIV and KPs face in access to health and humanitarian services; building partnership with humanitarian sectors; addressing humanitarian needs of PLHIV and KPs; and resource mobilization.

**Lessons learned:** This collaboration resulted in a wide range of positive effects on sustainability of CLOs in the war times, new partnerships, CLOs' documentation and research capacities, and sound advocacy with country and EU-level partners. CLOs, previously dependent on international donors, started reaching out to private donors, crypto-philanthropy and crowdfunding platforms, with tangible results. CLOs started shelters that, beyond accommodation and food, provided opportunities for re-adaptation for KP war refugees. Staff of shelters and frontline organizations built skills of systematically addressing needs of GBV survivors in the war context. With limited additional funding, CLM tools were adapted to track the needs of KP/PLHIV refugees and help restore access to HIV services in foreign health systems. Digital

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

security skills and access to technology can be rapidly enhanced for KPs. Horizontal connections between CLOs are a precondition for these effects.

**Conclusions/Next steps:** To address the needs of PLHIV and key populations in humanitarian settings, communities themselves need to get access to decision-making platforms and obtain funding to adapt HIV service delivery, CLM, and communication and advocacy strategies to rapidly changing context in conflict and post-conflict zones and neighboring countries and regions.

## THPED370

Lifetime trauma and severity of depressive symptoms among adults Ugandans living with HIV and community controls

A. Ezeamama<sup>1</sup>, D. Hassan<sup>1</sup>, S.K. Zalwango<sup>2</sup>, A. Sikorskii<sup>1</sup>, J.E. Awadu<sup>1</sup>, C. Abbo<sup>3</sup>, B. Giordani<sup>4</sup>

<sup>1</sup>Michigan State University, Psychiatry, East Lansing, United States, <sup>2</sup>Kampala Capital City Authority, Directorate of HIV Services, Kampala, Uganda, <sup>3</sup>Makerere University, School of Medicine, Kampala, Uganda, <sup>4</sup>University of Michigan, Neurology, Nursing & Social Work, Ann Arbor, United States

**Background:** The types of traumas experienced by adults living with HIV (ALWH) and their contributions to mental and physical health outcomes are under-appreciated in African adults. Hence, we investigate the frequency and types of traumas, quantify the relationship of trauma to depression, and determine the extent to which this relationship varies by HIV status.

**Methods:** Adults (n=1054) – including 696 ALWH and 348 controls, were enrolled as part of three cohort studies implemented between March 2017 and January 2024 in Kampala Uganda. The sum of lifetime traumatic experiences and the respective types of trauma experienced was quantified per the Stressful Life Events Screening Questionnaire. Depressive symptoms were measured per the Hopkins Symptoms Check List.

Multivariable linear regression models quantified risk differences (RD) and corresponding 95% confidence intervals (95% CI) for the cross-sectional relationship of traumatic experiences to depression with adjustment for cohort, age, sex, years of education and HIV status.

**Results:** An average of 2.2 (SD=2.3) traumatic events were reported with ALWH (mean=2.7, SD=2.4) endorsing more trauma than HIV-unaffected controls (mean=1.9, SD=2.1). Traumatic events endorsed at ≥20% in the sample included experiences of: life-threatening illness (45%), physical abuse (as adult/child, 31.4%), unnatural death of a loved one (29%), life-threatening accident (22%) and miscarriage of a wanted pregnancy (20.5%). Child or adult sexual abuse was endorsed at 10%. Per unit increment in lifetime trauma, depressive symptoms increased by 1.7 (95%CI: 1.3, 2.2) units rising to 6.8 units higher (95%CI: 4.6, 9.0) for persons with ≥ four vs. zero traumatic events.

Most forms of trauma were independently associated with higher depressive symptoms in multivariable analyses without evidence of variation in this relationship by HIV status. Emotional abuse (RD = 4.2, 95%CI: 1.5, 6.2), physical abuse (RD = 4.7, 95%CI: 1.4, 7.6), life-threatening illnesses including HIV (RD=4.2, 95%CI: 3.0, 5.4) and history of sexual assault (RD=3.3, 95%CI: 1.0, 5.7) were types of traumas most strongly associated with depression in this sample.

**Conclusions:** Trauma is a modifiable determinant of depression in Ugandan adults regardless of HIV status. Routine screening of traumatic events by health providers will support trauma-informed holistic management of high-risk individuals including connection to mental health services, when indicated.

## THPED371

Tackling GBV and HIV as twin epidemics: understanding vulnerabilities and examining promising models to improve quality of care for women and high-risk populations

D. Cherian<sup>1</sup>, N. Zafar<sup>1</sup>

<sup>1</sup>IMA World Health/Corus International, Washington DC, United States

**Background:** The Tushinde Ujeuri project in Eastern DRC strengthened Community-Based Prevention and Response to Sexual and Gender-Based violence (SGBV), including the Quality of and Access to Holistic Care for Survivors among LGBTIQ+ Individuals.

**Description:** Tushinde (November 2017- October 2023) was implemented through local partners in five Health Zones in the North and South Kivu Provinces of the DRC. The integrated prevention and response activities focused on psychosocial, medical, legal, advocacy, and socio-economic activities.

**Lessons learned:** Tushinde served a total of 26,438 Gender-Based Violence (GBV) survivors with medical and psychosocial care, exceeding the life-of-project goal of 22,516. Approximately 82% of survivors served were female, and 85% were 18 years or older. In the 5 targeted health zones, 33.14% of incidents reported were SGBV-related cases (rape, sexual assault, and forced marriage), 66.86% were other GBV-related cases including physical assault, denial of resource or opportunity, and 35.2% were cases of emotional abuse.

Mental healthcare was the most accessed service, reaching 8,157 survivors. Community-based lay counselors led confidential one-on-one counseling, and therapeutic group exercises to rebuild the confidence and trust of survivors. 18,049 survivors were screened for clinical eligibility for Cognitive Processing Therapy (CPT- intensive 12-week program). Of this 4,724 were found eligible and 2,197 completed the CPT cycle for survivors suffering from PTSD and for whom basic psychosocial care was insufficient. Through Tushinde 23,959 (target 16,086) survivors recov-

Oral

Index

ered with psychosocial support, 7,473 survivors accessed lawyers led legal assistance supported by teams of locally recruited and trained paralegals stationed at each of the five Tushinde Social Centers, 904 Village savings and loans associations were created, enrolling 732 survivors, joined by an additional 24,468 community members to initiate small and medium-sized businesses for financial autonomy; an extremely popular program intervention.

**Conclusions/Next steps:** Studies suggest that women and girls who experience GBV are 1.5 times more likely to acquire HIV. Access to comprehensive and integrated GBV services is integral to mitigating the risks HIV poses, specifically for women and the most vulnerable. Tackling GBV and HIV as twin epidemics should be an integral programming model to mitigate the cause and consequence of HIV, and to strengthen prevention, treatment, adherence, and retention.

## THPED372

Addressing disparities: a systematic review of the TB/HIV co-infection care for migrants, refugees, and Internally Displaced Persons (IDPs) in Africa

D. Shomuyiwa<sup>1</sup>, N.S. George<sup>2</sup>

<sup>1</sup>University of Lagos, Faculty of Pharmacy, Lagos, Nigeria,

<sup>2</sup>University of Sheffield, Sheffield, United Kingdom

**Background:** In 2022, the World Health Organization (WHO) reported that TB remains a leading cause of death among people living with HIV, and over 25% of TB deaths occurred in Africa. The intersection of TB and HIV in the context of migrants, refugees, and internally displaced persons (IDPs) is a critical global health concern, compounded by unique challenges such as displacement, resource limitations, and social marginalisation. The study aimed to investigate the access to HIV and TB co-infection care among migrants, refugees, and IDPs in Africa.

**Methods:** We systematically searched Scopus, PubMed, and Web of Science databases for studies on TB/HIV co-infection care among migrants, refugees, and IDPs in Africa. Inclusion criteria covered English peer-reviewed articles and grey literature from 2013 to 2023.

Keywords encompassed "TB/HIV co-infection," "migrants," "refugees," "internally displaced persons," "healthcare access," "barriers," "facilitators," and "Africa."

**Results:** Eight (8) studies with a total sample size of 2260 were included in the review. The review revealed the heightened severity of TB within migrant, refugee, and displaced populations, attributing it to suboptimal living conditions, compromised health and nutritional statuses, overcrowding, and inadequate access to TB care and prevention. Notably, there is a dearth of aggregated data on HIV/TB testing rates, particularly for refugees and migrants. Challenges encompass discrimination, disruptions in care during travel or transition to host countries,

fear of deportation, social repercussions of HIV status disclosure, stigma, and language barriers. Co-infection risk factors, including drug and alcohol misuse, casual treatment, and the potential creation of drug-resistant TB reservoirs, further exacerbate the issue. Economic evaluations for refugee- and migrant-specific HIV interventions in these co-infections are lacking, hindering the formulation of targeted, cost-effective strategies.

**Conclusions:** The study illuminates the multifaceted challenges faced by migrants, refugees, and IDPs concerning TB/HIV co-infection care in Africa. Addressing these disparities necessitates a comprehensive approach, encompassing holistic care management, policy improvements, cross-border collaboration, and targeted interventions. The findings underscore the urgency of establishing robust healthcare systems that account for the unique needs of mobile and migrant populations to effectively combat the TB/HIV co-infection burden in Africa.

HSS, Kano, Nigeria, <sup>4</sup>Georgetown Global Health Nigeria

Ltd, HSS, Dutse, Nigeria, <sup>5</sup>Georgetown Global Health

Nigeria Ltd, HSS, Bauchi, Nigeria

**Background:** Incidence Command System (ICS) is a typical set up where different case management teams (CMTs) at facilities led by ART Coordinator who is the incidence commander. Team comprises of a Data Entry Clerk, Treatment Supporter, Phlebotomist, Counsellor Tester and ART Nurse. The ICS was introduced to lower persistent rise in number of unsuppressed clients due to poor adherence despite enhanced adherence counselling (EAC), use of DTG and multi-month scripting to clients. Each CMT was assigned ≤1000 clients of suppressed and unsuppressed to increase engagement based on client's agreement (physical/virtual) within weeks in addition to monthly EAC.

**Methods:** Retrospective clinical chart reviews of 54,201 total samples collected by October 2022 was compared against 75,166 total Samples collected by September 2023 to measure the impact of ICS on Viral Load suppression.

**Results:** ICS implementation showed excellent improvement on viral load suppression among ACE-2 clients from 92% to 97%. Most significant in children from 31% to 94%. Urban based facilities produce better suppression than those in rural places which could be because tertiary centers were urban based. PHCs improved after ICS from 81% to 95%. The gender did not show difference between the male or female but spiked to 97% after ICS. States with significant improvement after ICS were Jigawa and Kano state from 91% in both to 97% and 96% respectively.

Variable	Before				After			
	Samples Collected	Received result	Virally suppressed	% Virally suppressed	Samples Collected	Received result	Virally suppressed	% Virally suppressed
ACE-2 (Kano, Bauchi, Jigawa)	54,201	43,031	39,764	92(%)	75,166	50,369	48,674	97(%)
Kano State	30,746	23,791	21,639	91 (%)	41,428	25,562	24,629	96 (%)
Bauchi State	15,682	12,798	12,279	96 (%)	21,593	17,501	16,981	97 (%)
Jigawa State	7,773	6,442	5,846	91 (%)	12,145	7,306	7,064	97 (%)
Primary Facility	528	399	363	81 (%)	1,033	474	452	95 (%)
Secondary Facility	38,340	29,551	27,065	92 (%)	53,219	34,422	33,279	97 (%)
Tertiary Facility	15,333	13,081	12,336	95 (%)	20,914	15,473	14,943	97 (%)

Table 1.

Variable	Before				After			
	Samples Collected	Received result	Virally suppressed	% Virally suppressed	Samples Collected	Received result	Virally suppressed	% Virally suppressed
Age								
Children (<19 years)	2,380	1,935	606	31 (%)	3,738	2,484	2,342	94 (%)
Adult (≥19 years)	51,821	41,096	39,158	93 (%)	71,428	47,885	46,332	97 (%)
Male	18,229	14,365	13,279	92 (%)	29,890	17,077	16,509	97 (%)
Female	35,972	28,666	26,485	92 (%)	45,276	33,292	32,165	97 (%)
Site								
Rural	17,466	13,316	12,026	90 (%)	28,682	15,008	14,417	96 (%)
Urban	36,735	29,715	27,738	93 (%)	46,484	35,361	34,257	97 (%)

Table 2.

**Conclusions:** ICS brings clients closer to service providers, leading to improved care at individual level according to client's need. This can be used to solve poor Viral Load suppression among pediatric age groups.

## THPED374

### High satisfaction with point-of-care Chlamydia and Gonorrhoea testing in community-led clinics among clients and key population lay providers in Thailand

S. Thongsuksangcharoen<sup>1</sup>, N. Thammajarak<sup>1</sup>, P. Mingkwanrungruang<sup>1</sup>, S. Suriwong<sup>1</sup>, W. Tasomboon<sup>1</sup>, A. Phunkron<sup>2</sup>, T. Sangpasert<sup>3</sup>, T. Pasansai<sup>4</sup>, N. Thanmarak<sup>5</sup>, S. Mills<sup>6</sup>, N. Phanuphak<sup>1</sup>, R.A. Ramautarsing<sup>1</sup>

<sup>1</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>2</sup>Service Workers In Group Foundation, Bangkok, Thailand, <sup>3</sup>Rainbow Sky Association of Thailand, Bangkok, Thailand, <sup>4</sup>Mplus Foundation, Chiang Mai, Thailand, <sup>5</sup>Service Workers In Group Foundation, Chonburi, Thailand, <sup>6</sup>FHI 360, Bangkok, Thailand

**Background:** *Chlamydia trachomatis* (CT) and *Neisseria gonorrhoeae* (NG) are prevalent sexually transmitted infections (STIs) in Thailand, particularly among men who have sex with men and transgender women. To increase STI testing access, we implemented point-of-care (POC) CT/NG testing in community-led clinics as part of a study. Counseling and testing were delivered by trained key population lay providers.

We assessed satisfaction with POC CT/NG testing among clients and laboratory staff.

**Methods:** The study was conducted between August 2019-September 2021 across four community-led clinics in Thailand. Individuals at high risk of HIV and STIs were invited to complete a survey assessing Cepheid Xpert CT/NG testing satisfaction at baseline and subsequently every three months.

Laboratory staff were asked to complete surveys at month (M) 1, and subsequently every 6 months. Responses of "satisfied" or "very satisfied" were grouped as "satisfied," and "agreed" or "strongly agreed" as "agreed". Data from follow-up visits were compared with baseline using a Two-sample test of proportions.

**Results:** Client participants included 1,696 men who have sex with men and 194 transgender women, median age was 29 (interquartile range 23 - 34) years. The survey was completed 5,975 times (M0: n=1,890, M3: n=1,297, M6: n=1,128, M9: n=956, M12: n=704). From baseline to M12 participant satisfaction with waiting times for results increased (95.64% to 98.01%, p<0.01), preference for testing at community-led clinics over hospitals increased (96.08% to 99.57%, p<0.001), and willingness to pay for testing at these clinics increased (79.79% to 84.66%, p<0.05). Among six lay providers surveyed, 83.34% were satisfied with training at M1, and all were satisfied with testing procedures and time efficiency. At M1 50% agreed that POC NG/CT testing was suitable for community-led clinics. This increased to 100% at M12.

**Conclusions:** Clients and laboratory staff were exceedingly satisfied with POC CT/NG testing delivered in community-led clinics by key population lay providers. Cli-

ents overwhelmingly preferred community-led clinics as testing locations, and a majority were willing to pay for POC CT/NG testing in this setting. Scale-up of this service delivery approach across Thailand could increase access to STI testing and improve health outcomes among key populations.

### THPED375

Peer-led support for improving oral pre-exposure prophylaxis uptake and adherence: perceptions and preferences of adolescent girls and young women in Kampala, Uganda

Y. Mayanja<sup>1,2</sup>, I. Kayesu<sup>1</sup>, Z. Nabalwany<sup>1</sup>, L. Mujumbusi<sup>1</sup>, K. Mugisha<sup>3</sup>, B. Kikaire<sup>4,5</sup>, E. Ruzagira<sup>1,6</sup>, A.M. Ekström<sup>2,7</sup>, K. Kosidou<sup>2,8</sup>

<sup>1</sup>MRC/UVRI and LSHTM Uganda Research Unit, Entebbe, Uganda, <sup>2</sup>Karolinska Institute, Department of Global Public Health, Stockholm, Sweden, <sup>3</sup>AIDS Information Centre, Kampala, Uganda, <sup>4</sup>Uganda Virus Research Institute, Entebbe, Uganda, <sup>5</sup>Makerere University, Kampala, Uganda, <sup>6</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>7</sup>South General Hospital, Department of Infectious Diseases, Stockholm, Sweden, <sup>8</sup>Centre for Epidemiology and Community Medicine, Region Stockholm, Stockholm, Sweden

**Background:** Uptake and adherence to oral pre-exposure prophylaxis (PrEP) among adolescent girls and young women (AGYW) in Eastern and Southern Africa remains low. While peer support interventions have improved HIV treatment outcomes among young people living with HIV, their potential for improving oral PrEP use among AGYW at high risk for HIV is unknown.

**Methods:** Between January-July 2023, a qualitative study was conducted among 14-24year old AGYW in Kampala, Uganda to explore their perceptions of peer support for oral PrEP and preferences regarding peer leaders. The study was nested within a randomised controlled trial (RCT) aiming to assess the effect of peer support on oral PrEP uptake and adherence. RCT participants were recruited from urban slums and frequently reported paid sex. They were enrolled at the AIDS Information Centre-Kampala and randomly assigned to health worker counselling (control) vs health worker counselling plus peer support (intervention).

Before intervention implementation, in-depth interviews were conducted with 36 AGYW purposively selected by: study group (intervention, control), age group (14-19, 20-24) and PrEP use (yes, no). Data were analysed thematically using Nvivo Version 14.0.

**Results:** AGYW generally expressed positive views toward peer support, primarily stating that learning from peers with whom they share experiences would increase their confidence in PrEP. Frequent concerns were about confidentiality, misinformation, and lack of cooperation. Ma-

jority of AGYW preferred peer leaders who were living with HIV. Some mentioned that the experience of living with HIV gave peer leaders an edge to educate about HIV prevention while others pointed out that cautionary tales from peer leaders living with HIV would encourage PrEP use among HIV negative AGYW. AGYW showed equal preference for both male and female peer leaders.

Female peer leaders were thought to understand female challenges better, thus encouraging open discussions while males were perceived to have leadership qualities and would equip AGYW with skills to handle male clients.

**Conclusions:** AGYW are supportive of peer support for improving oral PrEP use. Peer support through male peer leaders and peer leaders living with HIV, working within existing HIV prevention and treatment structures may enhance oral PrEP use thereby improving HIV prevention among AGYW.

### THPED376

Developing resilient and sustainable national HIV Testing Services (HTS) programmes through a Community Advisory Board (CAB): a joint cross-country regional approach

D. Mumba<sup>1</sup>, M. Ginivan<sup>1</sup>, G. Chipendo<sup>1</sup>, L. Simao<sup>1</sup>

<sup>1</sup>Clinton Health Access Initiative, Infectious Disease - Global HIV Access Program, Boston, United States

**Background:** Eastern and Southern Africa remain heavily impacted by HIV. Key gaps and opportunities within the HTS space illustrate the need for greater community engagement to inform policy and implementation. Disparities in testing coverage indicate that services are not effectively meeting the needs of at-risk populations. To support effective, person-centred testing and linkage services, there must be avenues for direct and meaningful community engagement.

Community Advisory Boards (CABs) in the treatment space have successfully bridged disconnects between communities and national programs, informing global and national HIV policies and implementation. There is an opportunity to apply this approach to HTS.

**Description:** With support from the Bill and Melinda Gates Foundation, CHAI established a cross-country HTS CAB with members from Malawi, Zambia, and Zimbabwe. Recruitment in Uganda was delayed by the recently enacted anti-LGBTQ legislation but is planned for January 2024. Members were selected from diverse community networks.

Selection included knowledge and personal experience with HTS and most critically, desire and ability to elevate diverse community perspectives to drive HTS policy. CHAI formally launched the CAB in July 2023, supporting CAB members to independently set priorities for CAB activities and empowering them with a strong technical foundation in HIV.

**Lessons learned:** Though the HTS CAB may be nascent, its establishment has provided critical insights into HTS programming gaps and informed new HTS policy. Active participation in HTS and other related technical working groups keeps the members abreast of new developments in HTS and provides them with an advocacy platform. The joint regional approach enables CABs to leverage each other's expertise, share knowledge and replicate best practices. This creates a feedback loop of continuous learning and capacity building in turn strengthening the relevance and contribution of the CABs to national HTS programmes.

**Conclusions/Next steps:** The HTS CAB provides a promising opportunity for Ministries of Health to strengthen the active participation of community members in HIV programming and encourage broader community consultation, participation and engagement in HTS policy development, programme design, and implementation and demand generation. Further monitoring and ongoing support to this work will be critical to better define best practices and understand the impact on HTS programs.

## THPED377

### HEalth Record Optimization for Identifying Candidates for HIV Pre-Exposure Prophylaxis (HEROIC-PrEP): a stakeholder-informed approach to model development and implementation

M. Clement<sup>1,2</sup>, J. Thomas<sup>3,4</sup>, C. Kelsey<sup>1</sup>, T. Jagneaux<sup>1,5</sup>, C. O'Neal<sup>1,5</sup>, S. Lim<sup>1,2</sup>, S. Widman<sup>3,6</sup>, J. Marcus<sup>7</sup>, N.L. Okeke<sup>3</sup>

<sup>1</sup>Louisiana State University Health Sciences Center - New Orleans, New Orleans, United States, <sup>2</sup>University Medical Center - New Orleans, New Orleans, United States, <sup>3</sup>Duke University School of Medicine, Durham, United States, <sup>4</sup>Duke Department of Population Health Sciences, Durham, United States, <sup>5</sup>Our Lady of the Lake Health, Baton Rouge, United States, <sup>6</sup>Duke Office of Clinical Research, Durham, United States, <sup>7</sup>Harvard Medical School, Department of Population Medicine, Boston, United States

**Background:** Electronic health record (EHR)-based models to identify individuals who may benefit from PrEP outperform traditional risk scores and may alleviate challenges associated with PrEP initiation at both the client- and provider-levels. However, pre-implementation work is critical to ensure algorithms are optimized for the local context and that their implementation is acceptable and useful to clients and providers.

**Methods:** To inform implementation of EHR-based models within large health systems in New Orleans and Baton Rouge, Louisiana, we held focus group discussions (FGDs) with local community advocates, and conducted in-depth interviews (IDIs) with emergency department, primary care, and infectious diseases/HIV-trained clinicians. We asked about their perspectives on HIV epidemiology and PrEP uptake, suggestions on variables to improve

model performance, perceptions of the model, and insights on optimizing model implementation. FGDs and IDIs were audio-recorded and analyzed using thematic analysis.

**Results:** Between January and March 2023, FGDs were conducted with 18 community advocates, and IDIs with 12 clinicians (Table).

	Landscape of HIV and PrEP in the Community	Variables to Input into EHR Model	Perceptions of the EHR Model	Strategies to Optimize Model Implementation
Community Advocates	"I think it's a lot of miseducation as well around PrEP. And I say this because I have experience testing in the local jail and I always ask the question, 'Have you heard of PrEP?' Or I'll start to explain PrEP and they'll be like, 'Oh yeah, yeah, I saw that. That's the gay commercial. I don't need that.' Most people think it's geared toward a certain group of people and it's not. And a lot of them would say, 'Well, what do I need to take that for, I don't have HIV.' You know, it is just a miseducation, I think. And like she said it was rolled out totally geared toward one group of people when it should have been opened up to this is for everybody." - Baton Rouge Focus Group	"I was just agreeing with number of pregnancies because a lot of women are not using birth control and they're not only not using birth control, nine times out of ten of course they're not using condoms because they're pregnant. So, I would say pregnancies as well." - New Orleans Focus Group  "I don't know how you would put it in, but women engaged in unprotected sex because of trauma. So trauma includes rape, sexual assault, sex trafficking, all of that." - Baton Rouge Focus Group	"I just think a risk calculator can be misconstrued. It can be taken the wrong way... Because now in my mind, and I don't know what it's going to look like, and it could actually just be part of a conversation or just the input in the computer. But right now I see back to the future and I see inputting all this data in, you're coming up with us with this is what's going on with you now. And I think depending on who's giving that information, everybody's not going to receive that well. Because if you're a regular nurse office assistant behind the window and, I don't relate to you, and you just like, 'Okay, this is what's going on with you because this is what the computer shows.' I'm going to be highly offended because you don't know what's going on with me." - New Orleans Focus Group	"And that's what I'm saying about how doctors have to have bedside manners. And also, when individuals have HIV or they may even be at risk that they don't have that compassion. Because automatically it's the assumption that they dirty, they deserve it.... Oh yeah, they shouldn't have been using drugs or whatever'... There's no empathy behind medical practice. And I think that there needs to be some type of empathy. And so that means we have to also educate them on how to be compassionate." - New Orleans Focus Group  "And I think that the biggest responsibility lies in the doctor's ability to interview their patient in a way that motivates them to talk. And that is the biggest thing. And I think the way to change that narrative is to educate and train the doctors and physicians in how to motivationally interview their patients and get them to open up." - Baton Rouge Focus Group
Clinicians	"I think in certain circles, I think probably in white gay men you're seeing maybe a more palpable effect on transmission. But I think uptake remains so low outside of that group that I think there's hardly a deflection in the trajectory of the epidemic." - HIV/ Infectious Disease Provider, New Orleans	"I think any of the opiates just because even if it's not a route that can be associated with IV transmission, it may be defining a higher risk behavior in the population. And so I, we've taken care of patients who were having sex for money to have money to buy their pill drugs. And so is there an associated risk for it? So I would probably include just either the general testing for all toxicology tests or specifically maybe include some of the other opiates." - Primary Care Provider, Baton Rouge	"People are worried about their friends and family knowing their business. So a stranger knowing their business is going to be explosive." - HIV/ Infectious Disease Provider, New Orleans  "Oh, I think that's fabulous actually, because the people calling would clearly be trained and probably even more so than some of the providers in the clinic who had acute setting to answer all of those questions particularly and access the resources. So, I mean, I think that would be the ideal situation." - Primary Care Provider, New Orleans	"People, they're already sitting there waiting [in the ER]. So, if some additional person wants to come in and talk to them about this, that or whatever, social work, whatever the issue is, people are generally really receptive to it... because you have a captive audience." - ER Provider, New Orleans  "I think it would be enhanced if there was some education to the providers as far as how effective the medications actually are, because... I didn't realize how truly effective they were. So I think that educating the providers and then putting them in the chart, so it's easier to do, I think would help." - Emergency Medicine Provider, New Orleans

Table. Illustrative Quotes from Community Advocates and Clinicians.

Oral abstracts

Author Index

Community advocates and clinicians reported that HIV most significantly impacts Black communities. Community advocates did not believe that PrEP had reduced local HIV incidence, primarily due to lack of inclusive marketing. Clinicians noted that improving PrEP uptake would require better access to education, PrEP providers, and affordable medication.

Community advocates suggested adding sexual assault history and number of pregnancies to the model; clinicians suggested adding hepatitis B, more STI treatment modalities, incarceration, opiate use, sexual assault history, unintended pregnancies, and number of pregnancies.

Community advocates believed that local populations would have a range of reactions to the model, including skepticism, and suggested that conveying model output in a respectful and compassionate manner would be critical to successful implementation.

Providers voiced concerns about creating a greater workload and favored task-shifting patient discussions to trusted social workers or community health workers. Both community advocates and clinicians believed that provider education would be needed.

**Conclusions:** Although evidence supports the use of EHR-based models to identify PrEP candidates, local stakeholders can provide unique insight into improving model performance and implementation.

## THPED378

### Empowering communities through the 'Ticket to Work' program: a revolving fund approach to HIV prevention and vocational training

S. Sih Ndowah<sup>1</sup>, K. Suleman<sup>2</sup>, M. Salim<sup>3</sup>, M. Larrisa<sup>4</sup>, P. Aisha<sup>4</sup>, R. Fornuy<sup>3</sup>

<sup>1</sup>University of Buea, Journalism, Buea, Cameroon, <sup>2</sup>ICAD Center of Excellence, Computer Science, Dschang, Cameroon, <sup>3</sup>ICAD Center of Excellence, Advocacy, Dschang, Cameroon, <sup>4</sup>ICAD Center of Excellence, Marketing and Outreach, Dschang, Cameroon

**Background:** The program's primary purpose is twofold: to provide accessible vocational training and to foster HIV prevention within key populations. By utilizing a revolving fund mechanism, it ensures that individuals, particularly those affected by HIV/AIDS, have the opportunity to acquire valuable vocational skills, enhancing their employability and self-sufficiency. Simultaneously, it addresses the social determinants of HIV vulnerability, promotes awareness, and reduces stigma.

**Description:** The "Ticket to Work" program, spanning 2023 to 2028, operates in diverse urban, rural, and peri-urban settings across regions and countries. It employs a collaborative structure involving governmental health agencies, NGOs, and local CBOs, with regional task forces established. Key populations, including MSM, sex workers,

transgender individuals, and people who inject drugs, are actively engaged. Activities encompass community mobilization, education, behavioral interventions, HIV testing, advocacy, community-led initiatives, and research. The program's holistic approach combines vocational training and HIV prevention, empowering communities, and reducing stigma while enhancing employability and income generation.

**Lessons learned:** Key findings from the "Ticket to Work" program include increased vocational skills and employability among participants, higher rates of HIV testing, and reduced HIV-related stigma within communities. Lessons learned emphasize the power of community ownership, tailored interventions, and the sustainability of revolving funds for vocational training. Best practices include holistic approaches, community-led initiatives, and data-driven adaptations.

These outcomes underscore the effectiveness of community-driven, integrated approaches to vocational training and HIV prevention, with potential for broader application in addressing HIV/AIDS challenges.

**Conclusions/Next steps:** The findings and outcomes of the "Ticket to Work" program hold immense significance for HIV prevention, treatment, care, and support. They demonstrate the potential for holistic, community-driven approaches to create lasting change in the context of HIV/AIDS. Increased vocational skills empower individuals to break the cycle of vulnerability, while reduced stigma enhances access to healthcare. The program's success highlights the importance of community engagement and tailored interventions.

Future implications include the need for scaling up such initiatives to reach more communities and regions, fostering policy changes that support integrated approaches, and sustaining efforts to maximize impact on affected communities and HIV prevention strategies.

## THPED379

### Comparative benefits of adopting open-designed Community's methodologies in HIV community led monitoring programs: a case study of Rivers State, Nigeria

J. Aseme<sup>1</sup>, D. Vena<sup>2</sup>

<sup>1</sup>Greater Women Initiative for Health and Right, Programs for Social Works and Community Development, Port-Harcourt, Nigeria, <sup>2</sup>Greater Women Initiative for Health and Right, Programs for Public Health, Port-Harcourt, Nigeria

**Background:** This study was conducted in Rivers State, Nigeria, on the benefits of open-designed methodologies in HIV community-led monitoring (CLM) programs. The study scope focuses on enhancing effectiveness, inclusivity, and viability to CLM processes, with the primary objective of reviewing past CLM methodologies (tools, data

collection processes, and triangulation methods), piloting and test-running new open-designed techniques of CLM such as, Setting the Levels (STL) process and community-designed Kobo Collect for future adoption.

**Description:** The open-designed method of CLM is a collaborative and inclusive approach involving diverse communities in designing HIV CLM processes to harness collective intelligence, explore diverse perspectives and increase user satisfaction and acceptance.

The study covered 13 PEPFAR-supported key and general facilities from July 2022 to October 2023. The studied population selected through random sampling comprised 869 key populations, 1216 general populations, and 30 service providers.

For comparison, the 2021 PEPFAR CLM program in the State served as a case study to critique the existing CLM methodology. To achieve this, the communities collaboratively adapted STL tool to local context and accountability forums held to explore community and service providers' perspectives on healthcare.

**Lessons learned:** The study exposed the limitations of the previous CLM methodology to be closed-ended and highlighted the benefits of an open-designed approach. This method allowed for a more comprehensive understanding of local challenges, fostering community engagement by addressing long-ignored issues.

Respondents expressed increased trust in sharing sensitive information, and the adaptive nature of the approach identified timely intervention trends. Triangulating data with service providers improved the clarity of CLM findings.

The key learning from these findings is that incorporating this mechanism in HIV CLM is recommended for enhancing information depth, quality, and promoting community ownership.

**Conclusions/Next steps:** In conclusion, this study highlighted the transformative potential of adopting an open, community-centered approach to HIV CLM as study findings revealed the limitations of closed-ended CLM methods and showcased the benefits of community owned open-designed approaches which calls for a holistic reevaluation of existing strategies.

Therefore, learning from this method and implementing it in CLM will significantly contribute to the effectiveness and sustainability of HIV prevention, treatment, care, and support efforts.

## THPED380

### HPTN 094: engaging key community stakeholders in preparation for mobile clinics providing integrated health services (medication for opioid use disorder and HIV treatment/prevention services) for people who inject drugs (PWID)

M. Albano<sup>1</sup>, J. Harris<sup>1</sup>, C. Blades<sup>2</sup>, A. Davis<sup>3</sup>, J. Lucas<sup>1</sup>, S. Alvarado<sup>1</sup>, J. Yeager<sup>4</sup>, S. Edwards<sup>5</sup>, P. Andrew<sup>1</sup>, N. El-Bassel<sup>6</sup>, S. Shoptaw<sup>7</sup>

<sup>1</sup>FHI 360, Science Facilitation, Durham, United States,

<sup>2</sup>University of California Los Angeles, Center for Behavioral and Addiction Medicine, Los Angeles, United States,

<sup>3</sup>University of Pennsylvania, Prevention Clinical Trials Unit, Philadelphia, United States, <sup>4</sup>University of Texas

Health Science Center at Houston, School of Biomedical Informatics, Houston, United States, <sup>5</sup>Columbia University, Bronx Prevention Center, Bronx, United States, <sup>6</sup>Columbia University, School of Social Work, New York, United States, <sup>7</sup>University of California Los Angeles, Department of Family

Medicine, Los Angeles, United States

**Background:** The drug overdose crisis remains a public health problem in the U.S. with 112,127 drug overdose deaths estimated during the 12-month period ending in August 2023 a nearly 50% increase in the last 5 years. Factors including access to care, poverty, mental health disorders, and poly-substance use increase HIV transmission/acquisition risk and other health issues in PWID. HPTN 094 aims to address the intertwined public health crises of opioid use disorder (OUD) and HIV among PWID by determining the efficacy of utilizing mobile health units to provide integrated health services [medication for OUD (MOUD) and HIV treatment/prevention medication].

**Description:** Staff training and community engagement activities began 6 months prior to study launch. Each clinical research site (CRS) (Houston, Los Angeles, New York City, Philadelphia, and Washington, D.C.) held local stakeholder engagement consultations to facilitate information exchange and encourage dialogue with advocates, healthcare providers, and PWID. Consultation attendees (n=126) were provided overviews of the PWID opioid and HIV epidemic in the U.S. and locally, and descriptions of HPTN 094 research methodology. Participants provided guidance/feedback on study implementation plans, educational materials, and recruitment materials. Multiple cultural responsiveness trainings for CRS staff (n=64) focused on experiential learning and reflexive thinking to mitigate cultural insensitivity and unintended micro-aggressions.

**Lessons learned:** Consultation feedback resulted in recruitment material alterations to address diversity concerns and to ensure PWID de-stigmatization. Updated recruitment material images reflected diversity indicative of participating communities to encourage inclusivity. Modifications to recruitment, retention and adherence plans included multi-pronged low-cost approaches

utilizing community-based organizations, PWID social networks, web-based outreach, and traditional media. Stakeholder engagement during pre-implementation activities resulted CRS community advisory board (CAB) creation. CABs served as a consistent resource throughout study implementation.

Adjustments assisted in achieving a 2:1 screening to enrollment ratio. Cultural competency training enhanced staffs' capacity to engage PWID and address health/racial disparities resulting in effective dialogue between participants and CRS staff.

**Conclusions/Next steps:** Better than expected screening to enrollment ratios were attributable in part to proactive interactions with local stakeholders, including PWID. Involving affected communities in problem-solving without judgement and stigma is a critical strategy for partnership building to advance HIV prevention among highly impacted populations.

## THPED381

**Harnessing the power of peers: empowering Kenyan youth to combat HIV and AIDS, teenage pregnancy, and gender-based violence**

D. Maina<sup>1</sup>, J. Musimbi<sup>1</sup>, I. Gomba<sup>2</sup>, C. Mugambi<sup>1</sup>

<sup>1</sup>National Syndemic Diseases Control Council, Coordination and Support, Nairobi, Kenya, <sup>2</sup>National Syndemic Diseases Control Council, Policy, Monitoring & Research, Nairobi, Kenya

**Background:** Kenya's Adolescents and Young People face a critical crossroads. Despite contributing to the country's highest proportion of new HIV acquisitions (41%), they also hold immense potential for shaping a healthier future. However, they remain entangled in a complex web of challenges – HIV and AIDS, teenage pregnancy, and gender-based violence – fueled by a combination of behavioral, structural, and service delivery obstacles.

Leveraging the critical window of autonomy during adolescence, the Maisha Youth Movement, a national youth-led and youth-serving organization in all 47 counties, implements innovative peer-to-peer engagement strategies to empower young people with information, resources, and tools to make informed decisions about their health and well-being.

**Description:** Since its inception in 2017, Maisha Youth has advocated for better sexual health practices by adolescents and young people. In the 2022/23 financial year, over 3.2 million AYP were reached through dynamic peer-to-peer engagement strategies: advocacy, digital media forums and cocurricular activities tailor-made to resonate with the diverse learning styles and preferences of young people. To assess impact, both qualitative and quantitative measures were tracked, including knowledge increase, service utilization, and youth leadership development.

**Lessons learned:** Maisha Youth's journey has unearthed invaluable lessons, highlighting the potential and challenges of peer-to-peer engagement in the Kenyan context:

1. Peer-to-peer interventions have been met with enthusiasm by young people, who value safe spaces to learn and be heard, fostering trust and open communication.
2. Awareness campaigns and positive portrayal of people living with HIV and youth utilizing condoms have contributed to a more positive perception of HIV prevention strategies.
3. Negative peer influence and misinformation through digital media platforms pose persistent challenges, necessitating continuous efforts to equip youth with critical thinking skills and media literacy.

**Conclusions/Next steps:** Maisha Youth is committed to expanding its peer-to-peer interventions across Kenya through strengthening partnerships and collaborations, advocating for supportive policies and empowering young people.

### Next steps:

- i. Strengthen partnerships within the government, NGOs, and community-based organizations.
- ii. Advocate for policies and programs that support youth-led initiatives.
- iii. Integrate peer-to-peer approaches to broaden HIV prevention and treatment efforts among young people.
- iv. Share best practices and lessons learned with other organizations globally.

## THPED382

**Facilitators and barriers to the enrolment and retention of female sex workers in a sexual health cohort (ANRS 12381 PRINCESSE) in San-Pedro, Côte d'Ivoire**

K.E.A. Kissi<sup>1,2</sup>, R.-M. Dedocoton<sup>1,2</sup>, M. Nouaman<sup>2,1</sup>, M. Plazy<sup>3,4,5,6</sup>, P. Coffie<sup>2,1</sup>, A. Agoua<sup>7</sup>, J. Larmarange<sup>8,9,10,11</sup>, V. Becquet<sup>12</sup>

<sup>1</sup>Université Félix Houphouët-Boigny, Abidjan, Côte d'Ivoire, <sup>2</sup>Programme PAC-CI, Abidjan, Côte d'Ivoire, <sup>3</sup>University of Bordeaux, Bordeaux, France, <sup>4</sup>INSERM UMR 1219, Bordeaux, Côte d'Ivoire, <sup>5</sup>IRD EMR 273, Bordeaux, France, <sup>6</sup>Bordeaux Population Health Research Center, Bordeaux, France, <sup>7</sup>ONG Aprosam, San Pedro, Côte d'Ivoire, <sup>8</sup>Ceped, Paris, France, <sup>9</sup>Université Paris Cité, Paris, France, <sup>10</sup>IRD, Paris, France, <sup>11</sup>Inserm, Paris, France, <sup>12</sup>Ined, Aubervilliers, France

**Background:** The PRINCESSE project (11/2019-06/2023) implemented a sexual and reproductive health care package for female sex workers (FSWs) in the San Pedro area of Côte d'Ivoire. The package was offered through a mobile clinic operating on prostitution sites. A total of 489 wom-

en were included, but retention was low, with less than one-third attending quarterly visits. This analysis examines the factors that enable or hinder the adherence and retention of FSWs

**Methods:** A qualitative study, conducted between May 2022 and November 2023, involved 16 biographical interviews with participants, three individual interviews with non-participating FSWs, 10 interviews with participants who were lost to follow-up, and three focus groups. The analysis focuses on the FSWs' perceptions of the benefits and constraints associated with their participation.

**Results:** FSWs reported that the mobile clinic's presence on prostitution sites, the peer educators' advanced strategies, and the site managers' involvement in community mobilization facilitated their commitment to the PRINCESSE program.

Additionally, the welcoming attitudes and skills of the care staff, the distribution of free condoms and lubricating gel, and the provision of free care and medication were reported to facilitate their retention in follow-up.

However, some participants found certain aspects of the care provision burdensome, which limited their program adherence. These included concerns about excessive blood sampling and rumours of blood resale, the mobile clinic being located too far away and exposed to indiscretions, visits being deemed excessively long, and challenges related to the high mobility of FSW participants.

Delays in the transmission of medical analysis results, incomplete coverage of expressed needs by the care offer, and insufficient quantities of condoms and lubricants hindered the retention of many participants.

**Conclusions:** A paradox has arisen. Although the program was perceived to have benefits, it was deemed insufficient to meet the needs of FSWs and was seen as burdensome. Additionally, operational challenges have undermined participants' confidence in the long term. However, the project was able to rely on its team, including caregivers and peer educators, which proved to be an essential factor in keeping FSWs engaged due to the close ties and trust established..

## THPED383

### Early sexual debut in South Africa: comparing results from national population-based HIV surveys in 2017 and 2022

S. Ramlagan<sup>1</sup>, M. Mazinu<sup>2</sup>, Y. Shean<sup>3</sup>

<sup>1</sup>Human Sciences Research Council, Public Health, Societies and Belongings, Pretoria, South Africa, <sup>2</sup>South Africa Medical Research Council, Biostatistics, Cape Town, South Africa, <sup>3</sup>Human Sciences Research Council, Public Health, Societies and Belongings, Cape Town, South Africa

**Background:** Research suggests that individuals engaging in their first sexual experience before turning 15 years old heightened risks to their sexual and reproductive health, HIV risk as well as negative emotional consequences. We investigated early sexual debut in South Africa in 2017 and 2022 as well as its demographic determinants.

**Methods:** Analysis was based on data collected from two national household-based surveys in South Africa conducted in 2017, and 2022. Both national surveys utilized a multi-staged, stratified cluster design to select 1000 census enumeration areas (EAs) and then 15 households per EA. All people in the selected household who slept there the night before were invited to participate.

Data was weighted and benchmarked against the 2022 census. The analysis focused on adolescents and young adults aged 15–24 years. Proportions and 95% confidence intervals were calculated using STATA 18.0. A z-test for two proportions was used to test for association and comparison of estimated proportions in categorical variables.

**Results:** Early sexual debut has been reported by 11.2% of youth aged 15–24 years in 2022, with 15.7% males and, 6.6% females reporting early sexual debut. The overall 2022 proportion decreased from 13% in 2017. In both survey years, youth in urban areas reported higher rates of early sexual debut (14.3% in 2017 and 12.1% in 2022) than those residing in rural informal (tribal) (10.9% in 2017 and 9.7% in 2022) and rural formal (farm) (10.0% in 2017 and 9.2% in 2022) areas.

In 2022, youth in the Western Cape reported the highest proportion of early sexual debut (16.3%) whereas youth living in Mpumalanga reported the lowest proportion (5.4%). A statistically significant ( $p < 0.05$ ) decrease was seen in Mpumalanga province between 2017 (13.3%) and 2022 (5.4%).

**Conclusions:** The observed overall decline in the proportion of those engaged in early sexual debut in 2022, although not significant when compared to the 2017 survey results, is an encouraging finding. The findings though suggest further research in Mpumalanga province into best practices to reduce early sexual debut as well as a need for strengthening prevention strategies and effective strategies to significantly reduce early sexual debut.

Training community health providers to provide HIV research education to households: evaluation of the impact

B. Dajo<sup>1</sup>, Z. Kwen<sup>2</sup>, E. Bukusi<sup>3</sup>, C. Makokha<sup>1</sup>

<sup>1</sup>Kenya Medical Research Institute, Research, Kisumu, Kenya, <sup>2</sup>Kenya Medical Research Institute, Social Science, Kisumu, Kenya, <sup>3</sup>Kenya Medical Research Institute, Social Science, Nairobi, Kenya

**Background:** Mistrust of HIV biomedical research processes due to inadequate knowledge can undermine community participation. Enhancing research literacy in communities can reduce mistrust and enhance meaningful engagement and research participation. We sought to determine the impact of training community health promoters (CHPs) to provide HIV research education.

**Methods:** This study employed a stepped wedge design, providing training to 42 (CHPs) from three fishing landing communities on the content and techniques of educating households under their jurisdiction to enhance their research literacy. The CHPs were trained for 4 days utilizing a combination of the CARES Fellowship Training Program and Brody's model of research literacy curriculum and were then deployed to educate households in their jurisdiction in stages. Four households out of 100 assigned to each CHP (N=152) were randomly selected for assessment of the impact of education on research literacy using a 12-item medical researcher trust scale. Data was collected at baseline and after the health education intervention period of approximately 3 months in each community. The 12 items on the trust scale were scored on a 5-point scale ranging from 1 strongly disagree to 5 strongly agree with negatively worded statements reverse-coded with a higher score equating to higher trust.

**Results:** The baseline median overall medical researcher's trust score was 38 which increased to 44 after 3 communities received the education ( $p < 0.01$ ). Further, the Kruskal Wallis test showed that there was a significant difference in the median medical researcher trust score between the first community that received research literacy education from CHPs (median = 44; N = 53) compared to those that were yet to receive the education (median = 38; N = 96)  $X^2 = 25.9$ ;  $p < 0.01$ ). A similar trend was seen when the first two communities received the intervention (median = 45; N = 76) compared to the third community (median = 34; N = 65)  $X^2 = 43.6$ ;  $p < 0.01$ .

**Conclusions:** Training CHPs to give health research literacy education was successful in increasing community research trust, as measured by the medical researchers' trust scale. It is necessary to assess the retention of research literacy gained over time.

## THPED385

Impact of tightening DREAMS eligibility criteria on program enrollment in Zimbabwe

T. Bhatasara<sup>1</sup>, A. Sheets<sup>2</sup>, M. Munjoma<sup>3</sup>, S. Miner<sup>1,4</sup>

<sup>1</sup>United States Agency for International Development, Harare, Zimbabwe, <sup>2</sup>Population Services International, Harare, Zimbabwe, <sup>3</sup>Population Services for Health, Harare, Zimbabwe, <sup>4</sup>International Business & Technical Consultants, Inc., Vienna, United States

**Background:** DREAMS provides adolescent girls and young women (AGYW) at risk of HIV with layered HIV prevention services. As Zimbabwe experiences declining HIV incidence among AGYW (by 82% between 2010 and 2022), this abstract examines the impact of tightening eligibility criteria on DREAMS enrollment.

**Description:** In Zimbabwe, AGYW are eligible for DREAMS if they meet any criteria related to alcohol use, orphanhood, school attendance, experience of violence, or sexual history and behavior. Since October 2020, DREAMS has screened 557,864 AGYW, of whom 98% were eligible, as follows: 51% met one eligibility criterion; 31% met two, and 16% met three or more. Of those who met only one criterion; 58% screened in on the basis of school drop out risk alone, and 23% on irregular condom use alone. Combined, these individuals represent 43% of AGYW eligible for DREAMS since 2020.

While 98% eligibility ensured population coverage of HIV prevention services among AGYW, it limited time and resources dedicated to most-at-risk AGYW. Given declining HIV incidence, in October 2023 DREAMS adopted stricter eligibility criteria to better target resources. School drop out risk and lack of condom use with a marital or cohabitating partner will no longer be considered eligibility factors for DREAMS.

**Lessons learned:** Researchers applied historical DREAMS screening data and marriage rates among AGYW from the 2015 Zimbabwe Demographic and Health Survey to estimate the impact of these changes. DREAMS eligibility is expected to drop from 98% to 60% among all AGYW, and from 99% to 44% among 10-14 year olds. This trend is already emerging in preliminary data from 11,027 AGYW, with overall eligibility dropping to 71%, and to 46% among AGYW 10-14 years old. DREAMS will therefore experience a large decrease in enrollment, permitting more resources to be allocated to service delivery for most-at-risk AGYW, including expansion to new geographies.

**Conclusions/Next steps:** Given declining HIV incidence among AGYW, tightening DREAMS eligibility criteria is an effective way to target program resources toward most-at-risk AGYW. DREAMS programs should monitor population-level outcomes among AGYW ensuring that lower program enrollment does not increase STIs, HIV, or adolescent pregnancies.

## THPED386

Evaluation of a culturally responsive and community-based social media campaign to facilitate HIV testing and PrEP uptake among Latino/x men who have sex in men in Washington State

J.J. Lee<sup>1</sup>, J. Aguirre<sup>2</sup>, M. Zuniga<sup>2</sup>, Y. Cruz<sup>2</sup>, D. Huh<sup>1</sup>,

E.R. Orellana<sup>1</sup>, J. Li Verdugo<sup>1</sup>, S.M. Graham<sup>3</sup>

<sup>1</sup>University of Washington, School of Social Work, Seattle, United States, <sup>2</sup>Entre Hermanos, Seattle, United States,

<sup>3</sup>University of Washington, Global Health and Medicine, Seattle, United States

**Background:** Hispanic/Latino/x men who have sex with men (MSM) in the United States are disproportionately affected by HIV due to structural and social determinants such as language, immigration status, discrimination, and stigma. We harnessed the widespread use of technology and social media and developed a culturally relevant social media campaign in partnership with a community-based organization, Entre Hermanos, in Washington State, and examined its impact on engaging Latinx MSM and shaping HIV prevention behaviors.

**Methods:** Tailored and community-informed social media content was posted on Instagram and Facebook over a 2-month period between January and March 2023 in Washington State. We examined the reach of the campaign using social media data analytics from Facebook and Instagram. Surveys were conducted that assessed self-reported HIV testing and pre-exposure prophylaxis (PrEP) use with Latino/x MSM clients at Entre Hermanos both prior to and following the campaign. Latino/x MSM clients who engaged in services at Entre Hermanos following campaign initiation were also compared to a matched sample of clients from the prior year.

**Results:** The most popular social media post reached a total of 13,425 people in our audience and had a post engagement of 285 users during the 2-month campaign period. A total of 59 Latino/x MSM received services at Entre Hermanos during and 1-month following the campaign and completed the survey—this was a 26% increase in the number of unique Latinx MSM who engaged in services following the campaign compared with a matched calendar period in the prior year. Exposure to the campaign was associated with a small, statistically significant increase in the likelihood of HIV testing ( $d = .04$ ,  $p = .025$ ,  $N = 277$ ), but not on the likelihood of PrEP use.

**Conclusions:** This study underscores the potential of culturally tailored social media campaigns to address HIV-related disparities among Latino/x MSM in the United States.

Further research and ongoing collaboration with community-based organizations will be essential to refine strategies that not only increase HIV testing but also address behavioral determinants that influence the uptake of HIV prevention among Latino/x MSM.

## THPED387

Cultural humility model in HIV prevention can whittle down incidences in Botswana: the case of age, gender relations, religious and cultural values among 15 to 24 ages

E. Ditsheko<sup>1</sup>

<sup>1</sup>Southern Illinois University, School of Journalism and Advertising, Carbondale, United States

**Background:** More than 70% of Botswana's youth population is familiar with mass-mediated HIV-prevention slogans promoting AIDS drugs as a preventative, but forsake them due to lifestyles by lead roles in the commercials, the findings show.

**Methods:** Funded by the Botswana National AIDS and Health Promotions Agency between April and August 2022, a mixed-method study unearthed sobering results concerning the PrEP and U = U campaigns. Close to 250 male and female students aged between 15 and 24 across 20 pilot sites for PrEP participated in the study. It was hosted on Qualtrics. The hypothesis was to determine the rising HIV incidences against the accessibility to HIV prevention information to test how awareness influences safer sexual choices to stop the spread of the virus. Raw data was imported into SPSS for analysis and interpretation.

**Results:** The unintended outcome of biased advertising campaigns is the indifference the adolescents continue to display in their behaviours increasing the rates of new HIV acquisition in Botswana. The young people scored a 92% rate of awareness and knowledge about preventing HIV. However, "Media Exposure on HIV Prevention Slogans" is not the same as empowering oneself with strategies to apply during intercourse. Still, 72% of the respondents stated that they are not mirrored in drug commercials, therefore, ads are targeting a different demographic. Moreover, 66% decried a lack of cultural sensitivity while another 72% said ads did not respect their religious beliefs.

**Conclusions:** Unless African scientists, medical anthropologists, and health communication scholars pay attention to the dominant cultural and religious realities of Africa to prevent HIV, the grand goal of eliminating AIDS by 2030 as envisioned in the third United Nations Sustainable Development Goal is likely to fail badly in sub-Saharan Africa. The conclusion, therefore, is that the communication strategies should go to the heart of the matter by recognizing the cultural contexts of Botswana. Campaigns must resonate with their beliefs, practices, nuances, and behavioural communication strategies that target homogenous audiences with specific messages rather than a general tone targeting heterogeneous groups, evidence from the study recommends rather strongly.

Baseline survey on self-stigma among Adolescent Girls and Young Women (AGYW) living with HIV and its impact on access to HIV & Sexual Reproductive Health & Rights services in Uganda

D. Namutamba<sup>1</sup>, L. Mworeko<sup>2</sup>

<sup>1</sup>International Community of Women Living with HIV Eastern Africa, Programmes, Kampala, Uganda,

<sup>2</sup>International Community of Women Living with HIV/AIDS - Ea, Administration, Kampala, Uganda

**Background:** Self-stigma among people living with and affected by HIV is a global public health threat that hampers the use of healthcare services, and adherence to life-saving Antiretroviral Treatment (ART), including HIV prevention methods. Available studies don't give information on self-stigma prevalence among AGYW living with HIV to foster evidence-based advocacy and programming.

The International Community of Women Living with HIV Eastern Africa (ICWEA) conducted a Baseline survey on self-stigma among AGYW Living with HIV and its impact on access to HIV and SRHR in Uganda to contribute to new knowledge in the HIV response in the EA region by providing new dimensions and lessons for achieving the 90x90x90 UNAIDS targets and the Sustainable Development Goals (SDGs).

**Methods:** The baseline adopted quantitative and highly participatory qualitative research approaches. Focus group discussions were held with AGYW aged 10 -19 years who were enrolled or not on ART, both in and out-of-school, in support groups and those that did not belong to any support group. Key informant interviews were held with health workers and anti-stigma champions. A total of 86 individual respondents participated. ICWEA reviewed programme and policy documents on self-stigma both at program, national and international levels.

Data was analysed in STATA and frequency tables, measures of central tendency and charts generated to show frequency and percentages of variables.

**Results:** The survey revealed that 94% of the respondents were aware of self-stigma, how it presents and its existence among AGYW. The teenagers were the most affected at 61% and young women at 56% while those that had never been married were at 54%. 57% of the respondents revealed having ever refused to seek care and treatment and engage with society opportunities due to self-stigma. 16% had not yet enrolled for treatment and said they were not psychologically ready. 35% of the AGYWs respondents indicated that they had undergone some form of discrimination due to their HIV status.

**Conclusions:** The baseline provided evidence for ICWEA and implemented a project dubbed Building Resilience among AGYW to fight self-stigma among AGYW in Uganda and in Burundi May 2021-May 2023 and was a benchmark that tracked its progress.

## THPED389

An urgent need for gender equality and meaningful participation of women in all their diversity in Global Fund processes: a multifaceted global consultation on the Grant Cycle 7

Á. León Cáceres<sup>1</sup>, K. Dunaway<sup>2</sup>, B. Formin<sup>1</sup>, S. Brion<sup>2</sup>

<sup>1</sup>Women4GlobalFund, Arusha, Tanzania, the United

Republic of, <sup>2</sup>International Community of Women Living with HIV (ICW), Nairobi, Kenya

**Background:** Women and girls in all of their diversity face difficulties in engaging effectively in decision-making processes related to HIV, TB, and Malaria responses. Gender equality is stated as key in the Global Fund's current Strategy; promoting its integration across all programs. However, results from the previous allocation cycle indicate concerning realities about the realisation and prioritisation of gender equality; resulting in persistent inequalities that limit women and girls' access to comprehensive healthcare and knowledge.

**Methods:** In 2023, we conducted a multifaceted global consultation directed to women in all their diversity, specially women living with HIV or at most risk of, including an online multi-country survey that aimed to explore women's engagement and challenges in participating in GC7 processes. 81 responses were collected and comprehensively analysed using descriptive statistics and thematic coding, spanning 23 countries across distinct regions: South Asia, the Caribbean, Latin America, East Africa, South Africa, Central Africa, and West Africa.

**Results:** Our findings indicate a disparity in involvement at various stages: 46.9% of the participants indicated being not as involved as they wanted to be, while 27.1% encountered challenges in actively participating. Only 18.5% felt very involved in country-level dialogues, and merely 6% were part of proposal writing teams. Particularly striking is the limited participation of women in CCMs; 75% of them were not CCM members, highlighting a clear representation gap. We found that more than a half of respondents had either not heard of a gender assessment or stated that no gender assessment had been conducted during the process. Several concerns and challenges were identified: prevailing lack of clarity and transparency around decision-making procedures, accessibility and language constraints, restricted connectivity, and financial limitation and non-remunerated work. Of noteworthy concern is the insufficient representation of indigenous women in country dialogues.

**Conclusions:** Advocacy for increased participation of women and girls was identified as an overarching challenge, compounded by difficulties in effectively promoting gender-transformative programmes within the GC7 process. Clear and transparent decision-making procedures, enhanced accessibility for all, and broader representation across all stages of engagement are essential to ensure meaningful participation of women in all their diversity.

## THPED390

### Sexual health and social engagement among Australian bi+ men: findings from a national survey on sexuality, community experience and network engagement

B. Bushby<sup>1</sup>, B.R. Bavinton<sup>1</sup>, M. Holt<sup>2</sup>, H.T.H. Wong<sup>2,3</sup>,  
S. Spencer<sup>4</sup>, C. Newman<sup>2</sup>, C. Chan<sup>1</sup>

<sup>1</sup>The Kirby Institute, UNSW, Sydney, Australia, <sup>2</sup>Centre for Social Research in Health, UNSW, Sydney, Australia, <sup>3</sup>Sydney Nursing School, Faculty of Medicine and Health, University of Sydney, Sydney, Australia, <sup>4</sup>National Association of People with HIV Australia, Sydney, Australia

**Background:** Bi+ (bisexual, pansexual and other multi-gender attracted) men have often been grouped with gay men in HIV prevention. This approach can mask key differences in HIV prevention needs between bi+ men and gay men by conflating them as one group.

We examined characteristics of bi+ men compared with gay men from a national cross-sectional study on social connection and HIV prevention.

**Methods:** Participants were recruited across Australia through social media and mailing lists to complete an online survey between November 2022 and January 2023. Analyses were restricted to participants who were men (cis or trans) and identified as either bi+ or gay. Demographic characteristics and sexual health outcomes were compared using chi-square and t-tests.

**Results:** 915 responses were included (bi+ men=30.9%, gay men=69.1%). 86.4% of bi+ men and 79.3% of gay men were born in Australia and most participants were cisgender (bi+=96.6%, gay=99.4%). Among bi+ men, 1.8% were HIV-positive, 71.7% were HIV-negative and 26.5% were untested/unknown, compared to 8.2%, 80.2% and 11.6% of gay men ( $p<0.001$ ).

Among non-HIV-positive participants ( $n=858$ ), bi+ men were less likely to have ever taken PrEP (23.0% versus 50.5%,  $p<0.001$ ). Bi+ men were also less likely than gay men to have: condomless anal intercourse with casual male partners (58.0% versus 68.5%,  $p<0.001$ ); tested for HIV in the last 12 months (51.9% versus 66.1%,  $p<0.001$ ); received comprehensive STI testing (22.3% versus 48.4%,  $p<0.001$ ); and received information about sexual health from healthcare providers (47.4% versus 64.7%,  $p<0.001$ ) or from community-based organisations (14.1% versus 31.7%,  $p<0.001$ ).

Compared to gay men, bi+ men reported less social engagement (Mean=2.24, SD=1.27 versus Mean=3.32, SD=1.61,  $p<0.001$ ) and LGBTQ+ people (Mean=2.60, SD=1.43 versus Mean=3.50, SD=1.57,  $p<0.001$ ), however were more likely to receive social support from other bi+ men (Mean=4.52, SD=5.36 versus Mean=2.64, SD=4.22,  $p<0.001$ ).

**Conclusions:** Key differences in PrEP use, HIV/STI testing, community engagement, social support, and sources of sexual health information have implications for engaging bi+ men in HIV and sexual healthcare.

Further research is needed to understand HIV and sexual health needs within bi+ communities to develop tailored bi+ specific interventions to reach higher-risk bi+ men in testing and prevention.

## THPED391

### Gender-based violence (GBV) among women in Botswana: an ongoing threat to HIV epidemic control achievements

R. Kereng<sup>1</sup>, W. Dikobe<sup>1</sup>, D. Kemiso<sup>1</sup>, M. Mhatasediba<sup>2</sup>,  
V. Ranebennur<sup>3</sup>, C. Akolo<sup>4</sup>

<sup>1</sup>FHI360, Prevention Care and Treatment Services, Gaborone, Botswana, <sup>2</sup>Botswana GBV Prevention and Support Centre, Counselling Services, Gaborone, Botswana, <sup>3</sup>FHI360, Strategic Information, New Delhi, India, <sup>4</sup>FHI360, HIV Department, Gaborone, Botswana

**Background:** GBV among women in Botswana remains a pressing public health concern, potentially jeopardizing the country's strides in reaching epidemic control. We determined case rate of self-reported emotional/physical, and sexual violence, association with self-reported HIV risk among females receiving post-GBV care and psychosocial support at Botswana GBV Prevention and Support Centre (BGBVC) using data from PEPFAR/USAID-funded Meeting Targets and Maintaining Epidemic Control (EpiC) project GBV database.

**Methods:** EpiC conducted a retrospective analysis of program data collected between October 2022 through September 2023 at BGBVC. For this analysis, main exposures of interest investigated were emotional/physical violence, and sexual violence. A composite exposure variable comprising the presence of any violence was generated. Outcome of interest was HIV risk defined by inconsistent condom use, discordant partner, index client and having multiple concurrent partners. Control variables included age, education, employment and relationship status. Multivariable logistic regression models were used to compute adjusted odds ratios (aOR) and 95% confidence intervals (CI) for associations between main exposures and outcomes of interest while adjusting for control variables all analysis were conducted using Stata v15.

**Results:** Out of 920 women screened for GBV, 707 (76.9%) reported emotional/physical violence, and 120 (13.0%) reported sexual violence. Among 820 women reporting both frequency of abuse and experience of violence, 176 (21.5%) reported occurrence daily, and 358 (43.7%) weekly. Among those who screened for GBV, 151 (16.6%) were classified as high risk for HIV. Women who reported sexual or emotional/physical violence were more likely to be classified as high risk for HIV acquisition compared to those who did not report GBV; 147 (17.9%) vs 4 (4.4%); [aOR=6.0; 95%CI (2.1-17.0);  $p=0.001$ ]. Single women were more likely to be classified as high risk compared to those in cohabiting relationships [aOR=2.6; 95%CI (1.3-4.9);  $p=0.002$ . Women

aged 50years and above compared to under 20 years were less likely to be classified as high risk for HIV acquisition [ $\alpha$ OR=0.08; 95%CI (0.009-0.76);  $p=0.03$ ]

**Conclusions:** Considering the last mile of epidemic control in Botswana, scale up of targeted interventions and prevention methods for addressing both GBV and HIV risk remains critical for sustaining achievements made in reduction of HIV incidence in Botswana.

## THPED392

### CLM as part of national monitoring: the case of Zimbabwe

W. Chikanya<sup>1</sup>, D.D. Tobaiwa<sup>2</sup>, T. Chakanyuka<sup>3</sup>

<sup>1</sup>Zimbabwe Community Health Intervention Research Project, Health, Harare, Zimbabwe, <sup>2</sup>Jointed Hands Welfare Organisation, Health, Gweru, Zimbabwe, <sup>3</sup>Zimbabwe National Network of People Living with HIV (ZNNP+), Health, Harare, Zimbabwe

**Background:** Community-led monitoring (CLM) is an essential social accountability mechanism used by communities and CSOs to monitor the quality and accessibility of health care services. Zimbabwe is implementing CLM to address structural, and client centric healthcare challenges that have been left unaddressed for many years. Health services are often not designed to respond to the needs of communities, who have limited direct feedback on the experiences of communities and other social accountability opportunities including how health services could be improved.

**Description:** Zimbabwe started implementing community led monitoring in 2010 with ACT piloting it in five districts and later expanding to 32 PEPFAR supported districts. The CLM models in Zimbabwe are varied and funded by several different donors, including PEPFAR, Global Fund, and One Impact.

The country has a national steering committee which receives advocacy data from these models and programs and uses the data to inform policy decisions and to track the progress of CLM activities in the country.

**Lessons learned:** Some of the noticeable changes that have been recorded since the inception of CLM in Zimbabwe include an improvement in availability of commodities in some hard to reach areas up to 60% improvement, community satisfaction (82% of sex workers satisfied with services) and trust in health services and community participation and access to health services (91% of sex workers reported access), better and more reliable health service delivery systems in certain communities, improved relationships between health staff and the communities they serve, and empowerment of communities to demand better health services from providers.

There is also an improved feedback system and resolution of facility/community issues and readily available community feedback on health services.

The buy-in from government of Zimbabwe is a huge achievement as it is crucial for the long-term sustainability of CLM.

**Conclusions/Next steps:** CLM is a proven platform to gather qualitative and quantitative data and with-it availability, accessibility, acceptability, affordability, appropriateness, equity, and quality of the services is measured. Advocacy with service providers and decision makers is less emotional and social accountability is achieved.

## THPED393

### HIV risk perception, trust and PrEP adherence among participants in an HIV prevention trial: a qualitative longitudinal study, South Africa

R.S. Chimukuche<sup>1,2</sup>, L. Shandu<sup>1</sup>, P. Khanyile<sup>1</sup>, S. Zulu<sup>1</sup>, N. Singh<sup>3</sup>, Z. Gaffoor<sup>3</sup>, R. Kawuma<sup>4</sup>, S. McCormack<sup>5</sup>, J. Seeley<sup>1,4,6</sup>, PrEPVacc Study Group

<sup>1</sup>Africa Health Research Institute, Social Sciences Core, Durban, South Africa, <sup>2</sup>University College London, Division of Infection & Immunity, London, United Kingdom, <sup>3</sup>South African Medical Research Council, HIV and Other Infectious Diseases Research Unit, Durban, South Africa, <sup>4</sup>MRC/UVRI and LSHTM Uganda Research Unit, Social Science, Entebbe, Uganda, <sup>5</sup>University College London, MRC Clinical Trials Unit, London, United Kingdom, <sup>6</sup>London School of Tropical Hygiene and Medicine, Department of Global Health and Development, London, United Kingdom

**Background:** Effective HIV prevention requires efficient adherence to prevention and treatment methods. Adhering to a method requires a level of assurance or trust that the method is indeed effective. This analysis evaluated trust in relation to HIV risk perception and adherence to pre-exposure prophylaxis (PrEP) among clinical trial participants.

**Methods:** We conducted longitudinal in-depth interviews between February 2022 and October 2023. Thirty participants, ten percent of the overall clinical trial participants were purposively selected, to include equal numbers from those randomised on TAF/ FTC (Descovy) and TDF/FTC (Truvada) different age groups (18-40 years), gender and socio-economic characteristics. All participants came from an area with high HIV prevalence in urban KwaZulu-Natal, South Africa. Twenty-five participants completed three interviews assessing PrEP adherence and facilitators/barriers to persistence. Data analysis was conducted using the trust, confidence and cooperation (TCC) framework to understand the correlation between trust and HIV risk perception and changes in health behaviours.

**Results:** Trust significantly influenced individual perceptions of HIV risk and played a crucial role in influencing behaviours and decisions related to sexual health. Regular and ongoing PrEP adherence counselling, interaction and discussion opportunities during scheduled and unscheduled study visits with study staff, provided ongoing

support, addressed concerns, and reinforced the value of PrEP as an effective HIV preventive measure. Participants' trust in the clinical trial health care providers together with proven effectiveness of daily oral PrEP facilitated consistent PrEP adherence and heightened participants' introspection regarding their past risks. However, this assurance in the efficacy of PrEP also led participants to feel protected and, as a result, trust they were protected and take part in high-risk sexual behaviour such as condomless sex and sex with multiple casual partners.

**Conclusions:** Our analysis showed the interplay between trust in PrEP, perceived HIV risk and PrEP adherence within a HIV prevention clinical trial. The results showed that continuous active interaction with clinical staff played a pivotal role in influencing individuals' choices to embrace PrEP as an HIV preventative measure.

Our findings can highlight the importance of sustained engagement and trust-building in the development and implementation of HIV prevention strategies.

## THPED394

How community mobilizers leading a demand creation strategy is increasing voluntary medical male circumcision uptake in Zambia

M. Mulungushi<sup>1</sup>, B. Lunkamba<sup>1</sup>, C. Sichikwenkwe<sup>1</sup>, J. Kashitala<sup>1</sup>, M. Nyumbu<sup>1</sup>, M. Musonda<sup>2</sup>, A. Ndhlovu<sup>1</sup>

<sup>1</sup>JSI Research and Training Institute Inc (JSI), Clinical Services, Lusaka, Zambia, <sup>2</sup>USAID ZAMBIA, Lusaka, Zambia

**Background:** Community mobilizers play a critical role in positively influencing decision-making in health matters among men. With circumcision saturation rates estimated at 66% in the priority age group 15-29 years old in urban settings in Zambia, it has become increasingly difficult to reach eligible uncircumcised males. The US-AID DISCOVER-Health project, implemented by JSI, regular community mobilizers were recruited and trained to engage priority male population, learn their insights about voluntary medical male circumcision (VMMC) for increased uptake.

**Description:** The project recruited thirty community mobilisers between October 2021 to September 2022 to increase VMMC uptake; selection was based on age being within target population of 15-29 years, experience in advocacy, peer influence and commitment to promote VMMC. They received training for two days, focused on mobilization skills, interpersonal communication and accurate information on HIV and VMMC. Health records of all men who received VMMC services in 6 health facilities were reviewed and socio-demographic information on the client intake form was extracted to evaluate the impact of community mobilisers.

**Lessons learned:** Table below summarizes variables analyzed. We found that community mobilisers referrals were significantly higher across all age groups compared

to other sources of information. The higher percentage among 15-29 priority age may be attributed to engagement of mobilisers from that age group, to knowledge/skills acquired and identified safe spaces or settings where they hold meetings to educate people.

Community mobilizers are a trusted source of health information in communities and have strategic partnerships with community members serving as a link between the community and health facilities.

**Conclusions/Next steps:** Community mobilisers have an important role in public health programs, such as VMMC, in resource-limited settings. Their ability to provide accurate information during one-on-one and private counselling has proved successful in service uptake saturation.

Particularly men, appreciate receiving discrete health information from trusted and respected familiar figures.

## THPED395

Leveraging digital gamification strategies for communicating next-generation HIV vaccine science to communities living in a high-risk environment in India

S. ul Hadi<sup>1</sup>, K. Goyal<sup>2</sup>, D.L. Bose<sup>1</sup>, K. Seth<sup>1</sup>, F. Gonsalves<sup>3</sup>, P. Sandbhor<sup>3</sup>, T. Aurora<sup>3</sup>, A. Kumar<sup>3</sup>, P. Saha<sup>1</sup>, J. Mukherjee<sup>3</sup>

<sup>1</sup>IAVI, Gurugram, India, <sup>2</sup>DCT Mindlinks, Delhi, India,

<sup>3</sup>Quicksand, Delhi, India

**Background:** Community participation in HIV biomedical research is largely driven by altruism and a desire to contribute to the discovery of new HIV prevention technologies (Hanass-Hancock 2021). To enable truly informed and sustainable participation, it is important for HIV vaccine studies to explain their scientific rationale to communities in an easy-to-understand manner.

To address this unmet need, IAVI partnered with Quicksand to develop a suite of digital games that explain HIV vaccine concepts such as viral diversity, latency, conserved epitopes and broadly neutralizing antibodies (bNAbs) to affected communities.

Author Index

**Description:** Through 5 co-creation workshops between scientists and key population representatives in New Delhi in 2021, we identified the key HIV vaccine concepts and messages our communities were most interested in. We also identified culturally appropriate and relevant examples to explain each concept, resulting in the storyline and characters for the 'Village Invasion' game. The game has 7 levels that sequentially introduce players to:

- a) an "island village" representing the human body;
- b) an HIV "super-invader" that rapidly mutates and attacks the immunity "sentinels" protecting the village;
- c) antiviral "shields" that prevent the super-invader from replicating but sometimes develop resistance;
- d) conserved elements (epitopes) on the super-invader's body that do not change despite mutations and disguises; and,
- e) a "super-sentinel" that has the ability to neutralize the super-invader by targeting its conserved epitopes. Post-game discussions enabled players to link game metaphors with HIV science.

**Lessons learned:** The co-creation workshops helped clarify that:

- 1) digital games were played most effectively when guided by peer-facilitators;
- 2) nesting smaller games explaining different concepts within a larger meta-game to introduce the story and characters was useful;
- 3) framing the meta-game as an adventure and quest motivated players to complete all levels;
- 4) leveraging a mixture of puzzle and skill-based games was helpful in demystifying science;
- 5) earning rewards after each level sustained player motivation; and,
- 6) post-game discussions effectively leveraged community self-knowledge and collaborative exploration to decode game metaphors and link them with HIV science.

**Conclusions/Next steps:** Digital storytelling and gamification represent a potentially high-impact strategy to make science communication clearer, more relevant, culturally-rooted and relatable for end-user communities.

## THPED396

### Factors associated with common mental disorders among adults living with HIV in the Western Cape, South Africa

A. Delport<sup>1</sup>, H. Tabana<sup>2</sup>, E. Wouters<sup>3</sup>, L. Knight<sup>4,2</sup>

<sup>1</sup>University of the Western Cape, Department of Psychology, Bellville, South Africa, <sup>2</sup>University of the Western Cape, Bellville, South Africa, <sup>3</sup>University of Antwerp, Antwerp, Belgium, <sup>4</sup>University of Cape Town, Cape Town, South Africa

**Background:** It is crucial to understand the psychological factors that impact achieving viral suppression for people living with HIV (PLWH). This study therefore examined the relationship between depression, anxiety, and their coexistence, collectively referred to as common mental disorders (CMDs), among PLWH while controlling for inter-related factors at the individual, household, and community level.

**Methods:** This study used baseline data collected from 315 PLWH enrolled in 12 clinics in the Sinako cluster-randomised controlled trial in Cape Town, South Africa. Three 4-block hierarchical regressions were conducted on depression, anxiety, and CMDs across the levels of the individual, household, and community.

**Results:** Anxiety:

Gender was negatively associated with generalised anxiety scores ( $\beta = -0.153$ ,  $p = 0.008$ ), with men reporting lower symptoms of general anxiety. Initiating ART for the first time was associated with higher symptoms of general anxiety ( $\beta = 0.156$ ,  $p = 0.015$ ). Higher levels of perceived household social support were associated with lower symptoms of general anxiety ( $\beta = -0.194$ ,  $p < 0.001$ ).

Depression:

The inclusion of social support variables led to the most significant increase in explanatory power ( $\Delta R^2 = .083$ ,  $p < .001$ ), with higher levels of family cohesion ( $\beta = -.154$ ,  $p = .005$ ) and higher scores on perceived household social support ( $\beta = -.256$ ,  $p < .001$ ) associated with lower symptoms of depression. Initiating ART for the first time was also associated with higher symptoms of depression ( $\beta = 1.316$ ,  $p = .012$ ).

Common mental disorders:

Gender was an important factor, with females reporting higher scores of CMDs ( $\beta = -.136$ ,  $p = .018$ ), while initiating ART for the first time was also associated with higher CMD scores ( $\beta = .201$ ,  $p = .002$ ). Perceived household social support was negatively associated with CMD scores ( $\beta = -.175$ ,  $p < .001$ ).

**Conclusions:** It is vital to consider CMDs in the design and implementation of future interventions aimed at improving HIV outcomes in resource-limited settings.

## THPED397

### Using FRAME to adapt an evidence-based HIV-prevention intervention for Zambian adolescent girls and young women

T. Kanguya<sup>1</sup>, G. Sissoko<sup>2</sup>, A. Sharma<sup>1</sup>, C. Bolton<sup>3</sup>, G. Donenberg<sup>2</sup>

<sup>1</sup>Centre For Infectious Disease Research In Zambia, Lusaka, Zambia, <sup>2</sup>University of Illinois at Chicago, Chicago, United States, <sup>3</sup>University of Alabama at Birmingham, Alabama, United States

**Background:** Zambia faces significant challenges in HIV prevention among adolescent girls and young women (AGYW). They have a 3.3% HIV prevalence and are four times more likely to acquire HIV than their male counterparts. Interventions to reduce HIV acquisition among Zambian AGYW require planned adaptations to improve fit within the local context. One evidence-based program – IMARA -- developed in the United States and adapted for South African AGYW has demonstrated significant reductions in STI incidence and mental health distress among AGYW and strong implementation outcomes (e.g., feasibility, acceptability, fidelity).

We describe using the Framework for Reporting Adaptations and Modifications-Expanded (FRAME) to carefully document modifications to IMARA for Zambian AGYW at the pre-implementation phase.

**Description:** The study is a 2-arm hybrid effectiveness-implementation trial comparing ZAIMARA (IMARA adapted for Zambia) to a health promotion program on AGYW STI/HIV outcomes, sexual behavior, HIV testing, and PrEP uptake. Consistent with the FRAME, we recorded planned and proactive pre-implementation adaptations to the curriculum and implementation strategies.

Extensive feedback from local researchers and two community advisory boards (adolescent and adult board) that informed adaptations to IMARA's content and implementation strategies, and we detailed the "When," "Who," "What," "How," "Why," "Goal," and "Reasons" of each modification. Content changes reflected local cultural, social, and gender norms, and modifications to implementation strategies represented the need for capacity building and workforce strengthening.

**Lessons learned:** The FRAME-led adaptation process revealed key insights. FRAME was instrumental in structuring the adaptation process, allowing for a clear rationale and documentation of each modification. It highlighted the challenges retaining core elements while substituting some scenarios in the modules to best fit the local context.

FRAME offered a rigorous approach to capture the active involvement of community stakeholders and other drivers of the adaptation (e.g., sociopolitical, organizational/setting). The FRAME permitted evaluating adjustments through theater testing and iterative revisions to ensure cultural and contextual relevance.

**Conclusions/Next steps:** FRAME is a useful tool to document the adaptation of interventions and implementation strategies. Applications of FRAME across studies will strengthen the science of adaptation and reveal modifications that improve uptake of evidence-based interventions.

## THPED398

### Boosting community-based screening and referrals for HIV testing using digital applications: a first 95 game changer for young people?

K. Choga<sup>1</sup>, P. Charashika<sup>1</sup>, K. Takarinda<sup>1</sup>, K. Masiye<sup>1,2</sup>, I. Nhiringi<sup>1</sup>, L. Gale<sup>2</sup>, S. Moore<sup>2</sup>, K. Webb<sup>1</sup>

<sup>1</sup>Organisation of Public Health Interventions and Development, Harare, Zimbabwe, <sup>2</sup>Avert, London, United Kingdom

**Background:** Young people are at increased risk of HIV and other STIs and yet are the least likely to uptake HIV testing services (HTS) at health facilities. The Boost digital application for community health workers (CHWs) includes age-appropriate HIV test screening algorithms and referrals for 10-24-year olds.

Our objective was to describe the outcomes of community-based HIV test screenings and impact upon health service uptake among young people.

**Methods:** We conducted a mixed-method evaluation of guideline concordant HIV test screening outcomes and referrals by CHWs among young people (YP) 10-24yrs using the Boost digital application. Facility HIV testing data were abstracted from routine data to explore changes in testing. Focus group discussions (FGDs) were conducted with CHWs to explore acceptability and feasibility of digital screening and referrals and analyzed thematically.

Figure. Routine HIV testing versus boost screenings.

**Results:** From February to December 2023 a total of 102 587 YP10-24yrs were screened using the Boost App, with 49% (n=50,351) screening 'positive' for need for HIV testing. There was a 16% increase in the number of YP HIV tested at health facilities and a 5.3% increase in HIV self-test kit distribution as compared to the same period prior to use of the Boost App., HIV test yield among 10-24-year-olds was 3% with a total of 2,127 YP newly diagnosed with HIV and initiated on treatment. There were significant differences between age- and sex-disaggregated groups with

regards to the screening questions triggering need for HIV testing. CHWs value the use of digital decision aides for providing accurate health information, screening, and referrals for young people.

**Conclusions:** Digital tools are feasible, acceptable, and effective methods for identifying YP in need of HIV testing. Screening outcomes highlight the importance of differentiated strategies by age band and sex.

## THPED399

Strategies to improve enrolment and retention of male participants with a low likelihood of HIV acquisition in an HIV prevention study. Harare-Zimbabwe

E.S. Magada<sup>1</sup>, C. Chasakara<sup>1</sup>, P. Mukwekwerere<sup>1</sup>, T. Tauya<sup>1</sup>, W. Samaneka<sup>1</sup>, F. Muhlanga<sup>1</sup>, T. Murefu<sup>1</sup>

<sup>1</sup>University of Zimbabwe - Clinical Trials Research Centre (UZ-CTRC), Harare, Zimbabwe

**Background:** Cisgender male participation in HIV prevention studies in Africa is crucial for the development and implementation of effective interventions. We evaluated our male recruitment approach for the HVTN140/HPTN 101 phase 1 clinical trial of a monoclonal antibody combination in adults with low likelihood of acquiring HIV, implemented at 3 sites in Zimbabwe.

**Description:** After trial closure, personnel from the 3 sites met to outline recruitment and retention strategies used, quantify outcomes, and reflect on best practices. Recruitment strategies included:

1. *Trial ambassadors:* We conducted 10 meetings where we trained participants enrolled in another HIV prevention clinical trial, Community Advisory Board Members (CAB), community health workers and male-focused group representatives to promote the trial in their communities;
2. *Targeted social networks for peer referral:* Former participants posted trial information materials through their University WhatsApp groups;
3. *Snowballing* by enrolled participants.

Participant retention strategies included:

1. A *participant-friendly environment* by providing free Wi-Fi, private working space, and extended clinic hours to accommodate work and academic schedules; and,
2. *Courtesy calls*, approximately 3 in-person visits and several telephone calls per participant.

**Lessons learned:** Of the 36 participants screened, 21 were male: 5 (24%) came from trial ambassadors, 6 (29%) from social networks, and 10 (48%) through snowballing. Male screening to enrolment ratio was 2:1 (12 enrolled). All enrolled males completed scheduled visits until trial exit. Snowballing appeared most efficient, generating 9/20 (45%) males screened.

On reflection, site personnel considered all the strategies to be effective. A distinct advantage of snowballing was that current participants can share their lived experienc-

es with interested peers, which could build trust in the research process and directly answer questions about what to expect from the trial. Using targeted social networks required less involvement of study personnel than training trial ambassadors and it has got a wider reach, however, both approaches serve to raise research literacy among study communities which could benefit future recruitment efforts.

**Conclusions/Next steps:** Future studies among males in this setting should use a multiple approaches. As observed, snowballing contributed most male participants, whilst the initial potential participants came through targeted social networks and trained ambassadors, CAB and appropriate male forums.

## THPED400

'I want someone that looks like me': factors to consider when implementing a community-based medication adherence support for aging individuals with HIV in western Kenya

J. Kiplagat<sup>1,2</sup>, V. Naanyu<sup>3</sup>, K. Wools-Kaloustian<sup>4</sup>

<sup>1</sup>Moi University, College of Health Sciences, Department of Epidemiology and Medical Statistics, Eldoret, Kenya,

<sup>2</sup>Academic Model Providing Access to Healthcare, Research, Eldoret, Kenya, <sup>3</sup>Moi University, School of Arts and Social Science, Eldoret, Kenya, <sup>4</sup>Indiana University, School of Medicine, Department of Medicine, Indianapolis, United States

**Background:** Access to antiretroviral therapy (ART) has significantly enhanced both the lifespan and well-being of individuals with HIV. Nevertheless, as people grow older, they frequently confront the intricate interaction of multiple health conditions, leading to the need for multiple medications and heightened challenges in adhering to medication regimens. Community-based adherence programs customized to individual patients hold promise in addressing these adherence challenges and improving medication adherence in this population.

**Methods:** In this qualitative investigation, a total of 27 healthcare providers (HCPs), 28 community health volunteers (CHVs), 29 community members, and 56 older adults living with HIV (OALWH) at AMPATH participated. Through in-depth interviews and focus group discussions, the study delved into the factors that support or impede CHVs in providing medication adherence support to OALWH. All interactions were recorded and transcribed for analysis, with NVivo software employed for coding. Subsequent thematic analysis aimed to identify facilitators and barriers that impact the successful implementation of such a community-based medication adherence program.

**Results:** Perceived obstacles to the successful implementation of the program encompassed concerns about disclosure and potential increased stigma, the cost and

accessibility of non-communicable disease (NCD) medications, heightened workload for CHVs, limited medication literacy among CHVs, complex medication regimens, transportation challenges for CHVs, and a healthcare system characterized by compartmentalization, leading to inconsistent communication with healthcare client.

Notwithstanding these challenges, participants identified several factors that they perceived as facilitators to program implementation, including collaborative efforts between HCPs and CHVs, trust between CHVs and OALWH, empowerment of clients, affordability of medication through health insurance, supportive supervision for CHVs, psychological support for clients, provision of equipment for routine monitoring of blood pressure and blood sugars, and the utilization of pill boxes.

**Conclusions:** Despite obstacles like stigma and medication challenges, collaborative efforts, trust, client empowerment, health insurance, and supportive measures emerged as crucial facilitators for successful implementation of a CHV-led community-based medication adherence support program for OALWH.

## THPED401

Ethical engagement of AGYW in Global Fund GC7 process: AGYW perspectives from Eswatini, Lesotho, Malawi, Mozambique, and Zimbabwe

C.R.N. Bonzo<sup>1</sup>

<sup>1</sup>University of Cape Town, Social Sciences, Cape Town, South Africa

**Background:** Adolescent girls and young women (AGYW) in Southern Africa continue to face disproportionate risk of HIV acquisition, despite significant progress in understanding and responding to the developmental, biological, structural, and behavioral risks they face.

The HER Voice Fund initiative focuses on investing in the capabilities of AGYW leaders and AGYW-led organizations serving AGYW in their diversity to participate in national policy and planning processes.

**Description:** HER Voice Ambassadors (HVAs) led a process of ethical engagement, towards the development of AGYW priorities for inclusion in Global Fund Cycle 7 (GC7) country funding requests. HVAs led meaningful engagement processes with approximately 250 AGYW aged 15-24 years across 5 countries. HVA analyzed epidemiological trends from recent population-based household surveys, the AGYW-only population size estimation tool (NAOMI), service facilitators and barriers from qualitative and field research client referral data to facilities.

Consultations included diverse AGYW; pregnant and young mothers, those living with HIV, disabilities, and key populations. Participatory methodology was used with vignettes, role-playing activities, and World Café. Consultations resulted in collaborative priorities that were

amplified by AGYW leaders in national planning processes, aiming to influence the GC7 funding request in each country.

**Lessons learned:** AGYWs were well-equipped, demonstrated leadership during Country Coordinating Mechanism (CCM) -led national country dialogues and in development of National HIV/AIDS Health Strategic Plans. Select common themes emerging from HVA-led country consultations included: re-positioning and re-packaging PrEP to address myths; inclusion of HIVST to enhance community-level PrEP initiation; and improved use of data on hotspots to enable sharpened condom programming and distribution. The level of commitment to power-sharing from CCMs varied by country, resulting in some AGYW being excluded from critical consultations and decision-making processes, and in other countries AGYWs were included in the national consultation and proposal development process.

**Conclusions/Next steps:** Meaningful engagement and inclusive decision making cannot be undertaken without a commitment to capacity strengthening and power sharing between adult policy-makers and AGYW. When AGYW feel agency in and ownership over processes that affect them, they are more likely to remain engaged. There is need to strengthen inclusive decision-making processes that extend beyond the GC7 funding request to end AIDS by 2030.

## THPED402

Breaking down sociocultural barriers through education, and awareness strategies amongst young men, to increase access to services by GBV survivors and shift attitudes and behaviors that perpetuate GBV

R.R. Monnaatlala<sup>1</sup>, J. Thabeng<sup>2</sup>

<sup>1</sup>Tebelopele Wellness Center, Health, Gaborone, Botswana,

<sup>2</sup>Tebelopele Wellness Center, Gaborone, Botswana

**Background:** Research has proven that GBV and HIV/AIDS are both major public health concerns in Botswana. Over two thirds of women in Botswana (67%) have experienced some form of gender based violence in their lifetime including partner and non-partner violence. To deconstruct ideologies that men are unable to open up and express themselves as perpetrators of GBV and because most GBV strategies have been focused on GBV survivors, mostly women, strategies meant to increase men's capacity to prevent and respond to Gender Base Violence (GBV) were implemented through the Tebelopele Wellness Center Men's Clinic.

**Description:** A campaign was implemented in Molepolole, Kweneng East District, Botswana, to provide education, awareness, and access to support services for men, for a period of 12 months. Through the integration into comprehensive clinical post GBV care services, i.e. provision of

Oral abstracts

Poster exhibition

E-posters

counselling, HIV Testing Services, PrEP, and STI screening and treatment, platforms for addressing socioeconomic issues were developed. Men got access to support services through social and behavior change strategies, i.e. anonymous venting chat box, ultimate bonfire Facebook page, social football clubs and talk shops where ideologies and misconceptions were deconstructed.

**Lessons learned:** A total of 1028 men were reached with GBV messaging through various platforms: men's conference, bootcamps, soccer tournaments, outreach activities and one-on-one sessions. Of those screened for GBV, 29% reported to being GBV survivors and of these, 79% reported emotional violence, 17% reported having experienced physical violence and 4% were sexually violated. 20% of the identified GBV survivors were provided with pre-exposure prophylaxis. Planning with collaborating partners ensured that all aspects of reaching men are addressed but more emphasis on resource support from the collaborative partners is needed to ensure the client's medical and support needs are met.

**Conclusions/Next steps:** In conclusion, by integrating awareness campaigns, provision of SRH services, empathy building talk shops and providing support services, there's a higher likelihood of breaking down sociocultural barriers, fostering attitudinal shifts, and creating an environment where GBV survivors can access the support they need. Collaboration amongst different stakeholders can go a long way in reducing incidences of GBV.

## THPED403

Leveraging gains from behavior change communication to improve PrEP acceptance amongst Adolescent Girls and Young Women (AGYW)

T. Dlamini<sup>1</sup>, H. Nxumalo<sup>1</sup>, M. Maseko<sup>2</sup>

<sup>1</sup>World Vision Eswatini, Programs, Mbabane, Eswatini,

<sup>2</sup>World Vision Eswatini, Strategic Information, Mbabane, Eswatini

**Background:** In Eswatini HIV high incidence rates continue soar high at 1.7% amongst females and 1% among men annually. PrEP uptake remains low with the country recording 40% uptake among eligible clients offered. World Vision Eswatini through USAID/PEPFAR funding implements a project aimed at eliminating new infections amongst AGYW aged 15-24. The project is implemented at six (6) constituencies across the country. Over the years the project has sought different approaches to improving interest and subsequently uptake of PrEP amongst its beneficiaries and their sexual partners as another recommended HIV preventative measure.

In this paper the project describes and shares lessons on how the introduction and employment of the services of PrEP ambassadors can positively improve PrEP uptake at communities.

**Description:** The project defines a PrEP ambassador as an expert client who is actively enrolled and is adhering to PrEP treatment and as such deemed to have firsthand knowledge to share on the dynamics of PrEP uptake including risks and benefits. Their responsibility is to exemplify PrEP among their peers through deciphering own experiences of PrEP to educate, clear myths and misconceptions and facilitate accompanied referrals if need be, for improved uptake and retention.

Following counterproductive efforts to mobilize AGYW for PrEP in the first year of implementation, PrEP ambassadors were introduced in the second year, leading to a drastic increase in initiations and retention when compare to the first year. PrEP initiations stood at 28%, 71% and 94% against each year's annual targets for FY21, FY22 and FY23 respectively.

**Lessons learned:** PrEP ambassadors work to educate, clear myths and misconceptions on PrEP for improved access and retention among AGYW. Effectively executed, behavior change communication can positively contribute towards influencing attitudes and health seeking behaviors among adolescent girls and young women.

**Conclusions/Next steps:** The project will look into expanding the scope of PrEP Ambassadors beyond HIV testing and PrEP initiations to integrate other services such as Family planning and ASRH which are as equally important in curbing the spread of HIV.

The project will also use these results to advocate for a similar structure in the Ministry of Health through health care facilities for sustainability.

## THPED404

Implementation of voluntary medical male circumcision mobile outreach in remote closed communities: lessons learned from South Sudan

A. Changjowk<sup>1</sup>, H. Awongo<sup>1</sup>, A. Lasu<sup>2</sup>, P. Komakech<sup>1</sup>, J.E. Woja<sup>3</sup>, M. Moi<sup>4</sup>, R. Dillon<sup>5</sup>, L. Courtney<sup>2</sup>

<sup>1</sup>RTI, Juba, South Sudan, <sup>2</sup>RTI, Washington, DC, United States, <sup>3</sup>South Sudan People's Defense Force, Juba, South Sudan, <sup>4</sup>US DoD HIV/AIDS Prevention Program, Juba, South Sudan, <sup>5</sup>US DoD HIV/AIDS Prevention Program, San Diego, United States

**Background:** Access to healthcare in remote, rural settings is a challenge worldwide, particularly in countries with limited infrastructure, and pockets of distant closed communities such as South Sudan. Low literacy in these isolated populations due to limited education access, coupled with limited healthcare, employment options, and other resource limitations exacerbate existing inequities. Since 2006 the HIV Secretariat of the South Sudan People's Defense Force (SSPDF) has offered quality HIV services for SSPDF troops, their family members, and the surrounding communities. In 2018, as part of a comprehensive HIV/AIDS service initiative, the HIV Secretariat be-

gan offering voluntary medical male circumcision (VMMC) services to male troops, their family members, and the surrounding communities. In 2022 VMMC services were expanded including mobile VMMC service delivery to reach remote communities within South Sudan.

**Description:** SSPDF's HIV Secretariate implemented mobile outreach programs in three remote, isolated communities within a 3-hour drive or boat ride from the largest town. A roving team of clinicians was trained to provide services in non-clinical settings. Successful VMMC were completed on approximately 500 clients during each 10-day outreach event. The largest group of clients were aged 15-17 (n=585, 39%), with 531 clients aged 18-21 (35.4%). Clients reported traveling up to 45 km for mobile VMMC services, with 51% traveling over 9 km.

**Lessons learned:** We share lessons learned for successful considerations for implementing mobile VMMC. We documented lessons learned based on factors including site characteristics, service delivery methods used, staff selected, and demand creation methods. Site proximity to schools in-session provided successful recruitment opportunities. Radio programs attracted clients from wide distances. We observed high demand from clients for VMMC services despite barriers of distance and community stigma from cultural norms.

**Conclusions/Next steps:** Provision of healthcare services such as mobile VMMC in areas with limited access to healthcare, low literacy rates, stigma, and sparse populations is a viable approach to reduce health inequities. We will contribute to the public health literature by providing practical guidance for policymakers, healthcare professionals, and organizations involved in designing and implementing VMMC outreach strategies tailored to the unique dynamics of remote and closed communities.

## Key populations and other vulnerable populations: Behavioural, social and cultural issues and contexts

### THPED405

Reinitiating sex work among young men who have sex with men and transgender women who exchange sex in Bangkok, Thailand: substance use, social support, and PrEP use

J.P. Ngo<sup>1</sup>, B.W. Weir<sup>1,2</sup>, A.L. Wirtz<sup>1</sup>, T. Chemnasiri<sup>3,4</sup>, A. Warapornmongkhokul<sup>3,4</sup>, D. Linjongrat<sup>5</sup>, S. Janyam<sup>6</sup>, P. Sirivongrangson<sup>7</sup>, B. Chua-Intra<sup>7</sup>, A.C. Hickey<sup>3,4</sup>, C. Beyrer<sup>1</sup>, Combination Prevention Effectiveness (COPE) Study Team  
<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Center for Public Health and Human Rights, Department of Epidemiology, Baltimore, United States, <sup>2</sup>Johns Hopkins Bloomberg School of Public Health, Department of Health, Behavior & Society, Baltimore, United States, <sup>3</sup>U.S. Centers for Disease Control and Prevention, Division of HIV Prevention, Atlanta, United States, <sup>4</sup>Thailand Ministry of Public Health-U.S. Centers for Disease Control and Prevention Collaboration, Nonthaburi, Thailand, <sup>5</sup>Rainbow Sky Association of Thailand (RSAT), Bangkok, Thailand, <sup>6</sup>Service Workers in Group Foundation (SWING), Bangkok & Pattaya, Thailand, <sup>7</sup>Thailand Ministry of Public Health, Department of Disease Control, Nonthaburi, Thailand

**Background:** In Bangkok, HIV incidence is estimated at 11.1 per 100 person-years (95% CI:6.7-17.4) among young men who have sex with men (MSM) and transgender women (TGW) who exchange sex. Among a cohort of young (18-26) MSM and TGW in Bangkok who have exchanged sex in the past year, we examine reinitiation of sex work and outcomes related to sexual behavior, substance use, mental health, PrEP use and other HIV prevention outcomes.

**Methods:** In the COPE study (2017-2020), participants were offered PrEP at baseline assessment and could start or stop PrEP throughout study participation. Analytic sample included 679 participants (1537 follow-up (months 3, 6, and 9 assessments) observations) across three Bangkok sites who reported no sex work in the last 30 days at previous assessment. Each factor was regressed on reinitiation of sex work and its lagged values using logistic regression with fixed effects for study sites and cluster-robust standard errors for participants.

**Results:** Of 679 participants who reported no sex work at previous assessment, 141 (20.8%) reinitiated sex work at their next assessment.

Participants reinitiating sex work were more likely to report having drug use in last 3 months, alcohol or drug use during anal sex in last 7 days, outreach encounters in last 3 months, PrEP discussions and emotional and financial support from young MSM and TGW who sell sex, and PrEP use.

**AIDS 2024**

FIGURE The relationship between sex work initiation and individual behaviors, mental health, and community support outcomes among young Thai men who have sex with men and transgender women aged 15-25 years in Bangkok who reported sex work in the last 32 days of the previous assessment (36 = 578; observations = 1937)

Model is adjusted for the lagged values of the dependent variable, study sites, and with cluster-adjusted standard errors for participants  
 \*Drug use: marijuana, cocaine, methamphetamine, ecstasy, psychotropic substances, heroin, heroin, or Viagra

**Conclusions:** Timely and low-barrier access to occupational PrEP is essential given the dynamic nature of sex work among young Thai MSM and TGW. High prevalence of hazardous alcohol use and the association of drug use with reinitiation of sex work suggest the need for combination services for HIV prevention and substance use. Findings suggest leveraging sex-work-related networks and social support could be instrumental in increasing PrEP awareness and use among young Thai MSM and TGW during sex work transitions.

## THPED406

### Association between substance use and PrEP adherence among AGYW enrolled in an HIV prevention study (HPTN 082) in Southern Africa

K. Hlaleli<sup>1</sup>, R.P. Choudhury<sup>2</sup>, N.M. Mgodi<sup>1</sup>, B. Siziba<sup>1</sup>, P.L. Anderson<sup>3</sup>, S. Delany-Moretlwe<sup>4</sup>, T.R. Ndzhukule<sup>5</sup>, S. Hosek<sup>6</sup>

<sup>1</sup>University of Zimbabwe Faculty of Medicine and Health Sciences, Clinical Trials Research Centre, Harare, Zimbabwe, <sup>2</sup>HPTN SDMC\_Statistical Center for HIV/AIDS Research & Prevention (SCHARP), Fred Hutchinson Cancer Research Center (FHCRC, Fred Hutch), Seattle, Washington, United States, <sup>3</sup>University of Colorado Anschutz Medical Campus, Denver Colorado, United States, <sup>4</sup>Wits Reproductive Health and HIV Institute (Wits RHI), Johannesburg, South Africa, <sup>5</sup>Desmond Tutu Health Foundation, Cape Town, South Africa, <sup>6</sup>HIV Prevention Trials Network, University of Illinois, Chicago, United States

**Background:** Adolescent girls and young women (AGYW) in sub-Saharan Africa are at substantial risk of HIV acquisition and would benefit from oral pre-exposure prophylaxis (PrEP) for HIV prevention. Substance use (SU), including hazardous drinking (HD), may result in poor adherence and diminish PrEP effectiveness. The effect of SU on PrEP adherence in AGYW within the African context has not been extensively studied. We sought to determine the prevalence of SU and its association with PrEP adherence in AGYW enrolled in HPTN 082 study.

**Methods:** HPTN 082 enrolled healthy, HIV-negative, sexually active young women (16-25 years) from Harare, Zimbabwe, Cape Town, and Johannesburg, South Africa

between October 2016, and October 2018. Participants were offered oral PrEP and could choose to accept or decline its use. Data on HD was collected using the concise AUDIT-C questionnaire. HD was defined as having an AUDIT-C score  $\geq 3$ . The frequency of use of different illicit substances was collected using the abridged ASSIST questionnaire, with responses scored between 0 (never used a substance) and 4 (daily use of substance). SU was categorized as either low (score= 0), moderate (score=1-10), or high (score $\geq 10$ ). Tenofovir-diphosphate (TFV-DP) concentrations in dried blood spots at weeks 13, 26 and 52 were used to measure PrEP adherence, with poor adherence being TFV-DP concentration  $< 700$  fmol/punch. Repeated measure multinomial regression modelling was used to determine associations between SU and HD vs PrEP adherence.

**Results:** Of the 451 participants enrolled, 427 (94.7%) accepted PrEP. Overall, the prevalence of HD and SU at baseline was 37% and 24% respectively. HD was highest in Cape Town (53%), while SU was highest in Johannesburg (31%). Injection drug use was similar across sites (1%). Cannabis (7%) and sedatives (6%) were the most used substances. HD and SU decreased with continued study participation. After adjusting for site, HD and moderate SU were associated with increasing odds of poor PrEP adherence ( $\alpha$ OR=1.80, 95%CI=1.27-2.58) and ( $\alpha$ OR=1.58, 95%CI=1.11-2.25).

**Conclusions:** SU and HD were high in this study and were associated with poor PrEP adherence. There is a need to integrate HD and SU screening in PrEP initiation and adherence programs for adolescents in Africa.

## THPED407

### Impact of photovoice intervention on trans and gender diverse people affected by HIV and stigma in the border region of Nepal

S. Sharma<sup>1</sup>, M. Dhakal<sup>1</sup>, S. Banik<sup>2</sup>, E.C. Wilson<sup>3</sup>  
<sup>1</sup>Blue Diamond Society, Kathmandu, Nepal, <sup>2</sup>Baldwin Wallace University, Berea, United States, <sup>3</sup>San Francisco Department of Public Health, San Francisco, United States

**Background:** Trans women in low resource settings make up the largest proportion of trans women globally and are underserved in the HIV response. In 2019, we found that 11.3% of trans women in Nepal had HIV. Anti-trans and HIV stigma were a primary driver of low ART adherence and low HIV care engagement.

We implemented a Photovoice intervention to improve social support to mitigate the effects of stigma on trans women in Nepal.

**Methods:** Two 3-day Photovoice workshops were conducted with trans women in the Terai highways district region of Nepal along the India-Nepal border. Workshops were held in August and December 2023. Pre intervention surveys were conducted to assess HIV status, stigma, and social support.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

Post intervention surveys and qualitative data were collected to assess the impact of the intervention on social support among participants.

**Results:** Most of the 15 participants were between the ages of 30-39 years old (57%), identified as hijra (90%), were very low income (100%) and relied on blessings from their religious work as hijra (57%) and from sex work (57%) for income. Most (93%) participants were living with HIV at enrollment, and 62% said their viral load was undetectable. Most reported that their families were embarrassed by them (71%), that they deserved misfortune because they are trans (42%) and that it was normal for trans women to have HIV (50%).

Post intervention, almost all trans women reported they reached out to their community more for support because of participating in the Photovoice intervention (92%) and felt supported by new friends made at the workshops (78.6%). Most reported they felt they could share their happy or sad moments with friends they made as part of the intervention (86%).

**Conclusions:** Photovoice was an effective method for improving social support and building support networks among trans women at the southern border region of Nepal. Internalized stigma among trans women in the border region of Nepal remained high. Interventions are needed to address external stigma from society to improve the quality of life of trans women in Nepal and to improve their HIV viral suppression.

## THPED408

Exploring differentiated HIV service delivery for men who have sex with men in Africa: a Kenyan qualitative study

E. Mwore<sup>1</sup>, J. Walimbwa<sup>1</sup>, S. Tabbu<sup>2</sup>, J. Zech<sup>3</sup>

<sup>1</sup>Ishtar MSM Health and Wellness Center, Research, Nairobi, Kenya, <sup>2</sup>Kenya Youth Development and Education Support Association (Kydesa), Research, Nakuru, Kenya, <sup>3</sup>ICAP at Columbia University, Research, New York, United States

**Background:** This research study presents the findings of a qualitative study conducted in Kenya, assessing the applicability and acceptability of differentiated HIV service delivery models among men who have sex with men (MSM). The study aims to elucidate the unique challenges faced by this population and identify strategies to enhance HIV care through tailored service delivery.

**Methods:** In-depth interviews and focus group discussions were conducted with MSM individuals and healthcare providers in diverse settings across Kenya. A qualitative approach allowed for an in-depth exploration of participants' experiences, preferences, and perceptions related to current HIV service delivery models.

**Results:** Preliminary analysis revealed distinct challenges faced by MSM in accessing and engaging with conventional HIV services, highlighting the need for a more

nuanced approach. Participants expressed a preference for differentiated service delivery models that account for the socio-cultural contexts and stigmatization faced by the MSM community. Factors influencing acceptability included confidentiality, cultural sensitivity, and the integration of comprehensive healthcare services.

The findings underscore the importance of tailoring HIV services to the specific needs of MSM in Kenya. Differentiated service delivery models, such as decentralized testing, community-based outreach, and integration with mental health support, emerged as viable solutions. The study advocates for the incorporation of these insights into national HIV programs to ensure inclusivity and effectiveness.

**Conclusions:** This qualitative study contributes valuable insights into the applicability and acceptability of differentiated HIV service delivery among MSM in Kenya. The results emphasize the need for a more targeted and culturally sensitive approach to address the unique challenges faced by this population.

Integrating these findings into policy and practice has the potential to enhance the impact of HIV services and foster a more inclusive and responsive healthcare environment for MSM in Kenya.

## THPED409

Prevalence and correlates of intimate partner violence among PrEP users in pre-war Ukraine

J.I. Steinert<sup>1</sup>, N. Lunchenkov<sup>2</sup>, P. Mounchid<sup>2</sup>, C. Hong<sup>3</sup>

<sup>1</sup>Technische Universität München, TUM School of Social Sciences and Technology, München, Germany, <sup>2</sup>Technische Universität München, München, Germany, <sup>3</sup>UCLA, Los Angeles, United States

**Background:** Intimate partner violence (IPV) has been identified as a serious public health threat, however, most research has focused on affected women rather than men. This study assesses the prevalence and correlates of IPV in a sample of gay, bisexual and other men who have sex with men enrolled in a pre-exposure prophylaxis (PrEP) programme in Ukraine.

**Methods:** 1176 men completed an online survey, which was distributed via PrEP case managers between January and February 2022, shortly before Russia's violent attack on Ukraine. The survey was filled out anonymously, capturing possible experiences of economic, emotional, physical and sexual IPV.

We conducted a multivariable logistic regression to assess which COVID-19-related stressors and different sexual and substance use behaviours were associated with an elevated IPV risk.

**Results:** IPV experiences were highly prevalent with 39% of respondents having experienced at least one form of violence in the past six months. Specifically, 27% reported experiences of emotional IPV, and the prevalence of physical

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

and economic IPV was at 10% and 8%, respectively. In addition, 8% of respondents reported having been raped by a sexual partner in the past six months. The risk of physical and sexual IPV was significantly elevated among men who disclosed having had sex while on drugs or drunk and among men who had participated in sex parties.

Furthermore, men who faced greater psychological pressures because of the COVID-19 pandemic were at a significantly higher risk of experiencing physical and economic IPV. Men who reported having faced negative financial consequences due to the pandemic were more vulnerable to emotional and sexual IPV.

**Conclusions:** The study highlights high levels of risk and adversity faced by men who have sex with men in Ukraine. While IPV already frequently occurred during the COVID-19 pandemic, vulnerability may further be exacerbated during the ongoing war. Providing multi-layered and LGBT-sensitive support for PrEP users in Ukraine, including IPV prevention efforts, remains a pressing policy task.

## THPED410

Preference for long-acting HIV prevention methods among transgender women at greatest risk for HIV acquisition in eastern and southern United States: findings from the LITE cohort

E. Cooney<sup>1</sup>, S. Reisner<sup>2</sup>, M. Stevenson<sup>3</sup>, R. Aguayo-Romero<sup>4</sup>, T. Poteat<sup>5</sup>, K. Mayer<sup>6,7</sup>, C. Beyrer<sup>8</sup>, A. Radix<sup>9</sup>, J. Schneider<sup>10</sup>, A. Wawrzyniak<sup>11</sup>, C. Brown<sup>12</sup>, L. Ragone<sup>12</sup>, V. Vannappagari<sup>12</sup>, A. Wirtz<sup>3,1</sup>, American Cohort to Study HIV Acquisition Among Transgender Women (LITE) Study Group

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, International Health, Baltimore, United States,

<sup>2</sup>University of Michigan, Epidemiology, Ann Arbor, United States, <sup>3</sup>Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States,

<sup>4</sup>Whitman-Walker Institute, Washington, DC, United States, <sup>5</sup>Duke University School of Nursing, Division of Healthcare in Adult Populations, Durham, United States,

<sup>6</sup>The Fenway Institute, Boston, United States, <sup>7</sup>Harvard Medical School, Boston, United States, <sup>8</sup>Duke Global Health Institute, Durham, United States, <sup>9</sup>Callen-Lorde Community Health Center, New York, United States,

<sup>10</sup>Emory University School of Medicine, Department of Medicine, Atlanta, United States, <sup>11</sup>University of Miami Miller School of Medicine, Department of Psychiatry and Behavioral Sciences, Miami, United States, <sup>12</sup>ViiV Healthcare, Durham, United States

**Background:** Despite FDA-approval of two highly efficacious PrEP modalities for transgender women in the United States (daily oral pills; DOP and long-acting injectable; LAI), HIV incidence among transgender women remains high and continues to disproportionately impact young, Black, and Latina transgender women and those in the South. Prior research has identified multi-level barriers to

optimal PrEP use among transgender women, but data on preferred PrEP modalities among this population are limited.

**Methods:** Transgender women without HIV enrolled in The LITE Cohort were asked about PrEP modality preferences as part of their 24-month survey. Using the paired comparison method, we summarized ranked preferences based on an exhaustive set of 10 head-to-head comparisons of 5 PrEP modalities (DOP, LAI, implantable device, topical gel, and intravenous antibodies).

We conducted sensitivity analyses to determine if ranked preferences differed by race, ethnicity, age, geography, or PrEP indication based on CDC guidelines.

**Results:** Between April 2020 and August 2022, 786 transgender women from across the eastern and southern United States completed a 24-month survey. Twenty percent identified as Black, 16% as Latina, 52% were aged 18-29 years old, 47% resided in the South, 34% had a PrEP indication, and 15% were currently using PrEP at the time of the survey. The most preferred modality was the implant (ranked first among 45% of respondents), followed by DOP (21%), LAI (19%), gel (10%), and intravenous antibodies (4%). The implant was ranked highest among Latina transgender women (36%), young adult transgender women (41%), those living in the South (47%), and those with current PrEP indications (45%) while LAI was the top ranked modality among Black transgender women (30%). In a head-to-head comparison restricted to currently available modalities, LAI was preferred over DOP (58% vs 42%). LAI was preferred over DOP regardless of race, ethnicity, geography, age, or PrEP indication.

**Conclusions:** Our findings suggest high interest in implants for HIV prevention, underscoring the importance of ongoing research on implantable drug delivery devices for ARVs. The consistent preference for LAI over DOP among transgender women at highest risk for HIV acquisition highlights the importance of improving access to this modality for equitable PrEP uptake.

## THPED411

AGYW perspectives on PEP and PrEP: online platforms and telemedicine adoption in South Africa

R.T. De Koker<sup>1</sup>, Y. Naidoo<sup>2</sup>, V. Timmerman<sup>3</sup>

<sup>1</sup>Stellenbosch University, Africa Centre for HIV/AIDS Management, Stellenbosch, South Africa, <sup>2</sup>HIVSA, Johannesburg, South Africa, <sup>3</sup>University of Cape Town, Cape Town, South Africa

**Background:** The integration of technology in healthcare, particularly telemedicine and online platforms, is transforming the delivery of health services. This shift is crucial for Adolescent Girls and Young Women (AGYW), given their unique healthcare needs, especially in sexual and reproductive health (SRH).

The study focuses on AGYW's perspectives on these technologies in the context of HIV/AIDS, aiming to align healthcare solutions with their dynamic relationship with technology.

**Methods:** Employing a quantitative research approach, the study investigates AGYW's knowledge, attitudes, and behaviors regarding HIV/AIDS, with a focus on their willingness to adopt telemedicine and online platforms. Using a 5-point Likert scale, electronic surveys are distributed to the entire AGYW population aged 18 to 25, ensuring a cross-sectional snapshot of prevalent factors. The total population sampling strategy reaches 218,279 subscribers of a targeted online magazine, facilitating a diverse and representative sample. A validated structured questionnaire is used, ensuring ethical considerations like informed consent, confidentiality, and voluntary participation. Quantitative data, collected through Likert scale responses, is analyzed using SPSS, employing descriptive and inferential statistics, including ANOVA.

**Results:** Initial findings reveal that 93% of respondents are aware of their HIV status, with 1% reporting multiple sexual partners. Notably, 78% express interest in purchasing HIV self-test kits online, and 57% desire broader online health services. Regarding PrEP, 67% are aware, 17% have initiated PrEP, and 46% are open to online PrEP services. Financially, 60% are willing to spend up to ZAR500 (USD27) for online health services.

**Conclusions:** The study's findings demonstrate a high level of awareness and openness among AGYW toward incorporating online platforms into their healthcare routines. The interest in HIV self-test kits, PrEP, and broader online health services underscores the potential of digital platforms to address reproductive health needs effectively.

The study contributes substantively to the discourse on digital health strategies, emphasizing the importance of aligning interventions with the preferences and priorities of AGYW in South Africa.

Further analysis will refine these insights, guiding the development of targeted interventions in the dynamic landscape of reproductive healthcare.

## THPED412

### Exploring the heterogeneity of psychosocial factors that may influence the acceptability of Pre-exposure Prophylaxis (PrEP) among Men who have Sex with Men (MSM) in the United Kingdom: latent profile analysis

A. Gifford<sup>1</sup>, R. Jaspal<sup>2</sup>, B. Jones<sup>1</sup>, D. McDermott<sup>1</sup>

<sup>1</sup>Nottingham Trent University, Psychology, Nottingham, United Kingdom, <sup>2</sup>University of Brighton, PVC Office, Brighton, United Kingdom

**Background:** Pre-Exposure Prophylaxis (PrEP) is medication used to prevent the spread of Human Immunodeficiency Virus (HIV). At-risk populations including Men who Have Sex with Men (MSM) are eligible for PrEP for free in the UK. However, HIV surveillance reports indicate stagnated uptake of the drug, alongside increasing rates of HIV infection.

This study aimed to establish latent classes of PrEP and Non-PrEP Users to establish heterogeneous profiles of MSM, based on PrEP acceptability and other psychosocial factors.

**Methods:** 500 MSM participated in an online cross-sectional, psychometric study between June and September in 2023. Latent Profile Analysis was used to discern profiles of MSM based on PrEP acceptability, various psychosocial variables (e.g., trust in science) and behavioural factors (e.g., propensity for condomless sex).

Follow-up ANOVAs then helped to help reduce the defining of spurious classes, that is, to measure distinct group differences between the identified profiles.

**Results:** Four latent profiles of MSM were established by examining Akaike Information Criterion (AIC), Bayesian information criterion (BIC) and Entropy levels. Profiles were then qualitatively defined with the use of theory (e.g., Identity Process Theory), recent literature, and patterns of item means.

The resulting labels were as follows:

1. PrEP Ambivalent,
2. PrEP Accepting,
3. PrEP Hesitant and,
4. PrEP Rejecting. ANOVA (with Bonferroni correction) established significant group differences across each profile, strengthening the typological assumptions of latent groups.

**Conclusions:** This novel study highlights current profiles of MSM and their acceptability of PrEP. It quantifies differences across psychosocial factors, such as LGTBQ+ connectedness, perceived risk of HIV and, condom self-efficacy that may increase or decrease PrEP uptake and use.

To the authors' knowledge, this had yet to be done within this specific population (i.e., UK-based MSM). As such, the use of clustering techniques to establish vulnerabilities to specific PrEP-barriers can now help develop targeted public health interventions. More specifically, a focus on the 'PrEP hesitant' group shows the most in-need of PrEP

counselling to establish effective HIV prevention strategies; especially with the high prevalence of condomless sex reported in this group.

Overall, this may ameliorate the uptake of PrEP, helping combat the global HIV epidemic.

## THPED413

**Social cohesion, social support, and network size are linked to reduced psychological distress among transgender women in São Paulo, Brazil**

N. Prata Menezes<sup>1</sup>, A.R. Mocello<sup>1</sup>, G. Saggese<sup>2,3</sup>, J.L. Gomez<sup>2,3</sup>, C.A. da Silva Santos<sup>2</sup>, M. Wanzeller<sup>2</sup>, J. Sevelius<sup>4</sup>, M.A. Veras<sup>3,2</sup>, S. Lippman<sup>1</sup>

<sup>1</sup>University of California, San Francisco, Center for AIDS Prevention Studies, San Francisco, United States, <sup>2</sup>Faculdade de Ciências Médicas da Santa Casa de São Paulo, Departamento de Saúde Coletiva, São Paulo, Brazil, <sup>3</sup>Núcleo de Pesquisa em Direitos Humanos e Saúde da População LGBT+ (NUDHES), São Paulo, Brazil, <sup>4</sup>Columbia University, Department of Psychiatry, New York, United States

**Background:** Empirical evidence highlights the importance of social connections on mental health. Less understood are differential effects based on social connection typology, particularly among populations with multi-level vulnerabilities to HIV acquisition.

We investigated links between three measures of social connection (social cohesion, social support, friendship network size) and psychological distress among transgender women (TGW) in São Paulo, Brazil.

**Methods:** We conducted secondary analysis of baseline data from a randomized controlled trial (ClinicalTrials.gov NCT04114955) assessing efficacy of a peer-led intervention to improve HIV testing, increase PrEP uptake, and reduce internalized stigma among Brazilian TGW (N=392, 2020-2024). Eligible participants were ≥18 years old; assigned 'male' sex at birth and identified as female or transgender; residing in São Paulo; and not living with HIV. Interviewer-administered questionnaires captured participant demographics, sexual behavior, psychosocial well-being, healthcare utilization, and substance use.

We measured psychological distress as a continuous outcome using the Kessler Psychological Distress Scale (K10). Social cohesion was measured using six questions on transgender community identity and strength of community-level relationships (alpha=0.82). Social support, or support from other transgender persons, was measured using seven questions on emotional, informational, tangible, and appraisal support (alpha=0.86).

Personal network size was determined using participants' self-reported log number of transgender friends. Linear regressions evaluated associations between psychological distress and social cohesion, social support, and network size, separately. Models adjusted for age, race/eth-

nicity, income, unstable housing, accessing healthcare in past year (gender-affirming and HIV testing), drug use in prior year, and recent alcohol consumption (Alcohol Use Disorder Identification Test), given associations with the outcome ( $P<0.20$ ).

**Results:** Overall, median age was 32 (IQR 25-40), and 25% were Black. Median K10 score was 28 (IQR 22-34), indicating high prevalence of moderate to severe psychological distress. TGW reporting higher mean social cohesion experienced less psychological distress (beta=-3.27; 95%CI: -4.79;1.75). Similarly, less distress was reported by those with higher mean social support (beta=-2.22; 95%CI: -3.12;-1.27) and more transgender friends (beta=-2.08; 95%CI: -3.41;-0.74).

**Conclusions:** Our findings elucidate associations between social connections and lower psychological distress among TGW in Brazil. Peer-led approaches offering personalized support could anchor interventions to promote positive HIV and mental health outcomes.

## THPED414

**Ethical complexities in HIV testing among African, Caribbean, and Black Migrant communities in Canada: Ubuntu-Pamoja Study**

R. Souleymanov<sup>1</sup>

<sup>1</sup>University of Manitoba, Social Work, Winnipeg, Canada

**Background:** Existing research on ethical issues in HIV testing, such as perceptions of consent, privacy, and management of HIV-related data and biosamples among African, Caribbean, and Black (ACB) migrant populations in Canada, is scarce.

The study aimed to explore these ethical complexities in community-based HIV testing within the ACB communities in Canada.

**Methods:** A total of 33 ACB migrant individuals (mean age: 34; 20 self-identified as women, 13 as men, 25 self-identified as heterosexual, and 8 as LGBTQIA+) were recruited through flyers, peer networks, and social media. One-hour individual, semi-structured interviews were conducted, focusing on participants' perspectives and experiences with HIV testing, including access challenges, to understand the factors that affect HIV testing utilization. Participants were compensated \$40 for their time. Iterative inductive data analysis was applied to the data using MAXQDA.

**Results:** Participants expressed significant concerns about the collection, sharing, and use of HIV data from healthcare encounters, revealing mistrust towards institutions like police, child welfare, and immigration accessing their health information. Their worries centred on the handling of biological samples, data misuse, HIV criminalization, deportations, and challenging consent, privacy, and bodily autonomy principles. While open to contributing to medical research, they unanimously demanded greater

transparency, informed consent, and control over the secondary use of their health data. Participants emphasized informed consent, the need for clear communication on sample use, and ethical considerations like compensation for sample use in future research.

**Conclusions:** To our knowledge, this is the first study to explore the ethical issues in community-based HIV testing among Black, African, and Caribbean migrants in Canada. The study underscores the need for culturally sensitive approaches in HIV testing and ethical governance in healthcare for ACB communities. It highlights the importance of prioritizing participant empowerment, ensuring transparency, practicing informed consent, and implementing robust data security measures to balance effective HIV information management with the protection of individual rights. A comprehensive, decolonizing, and anti-racist strategy is crucial for transforming HIV testing and healthcare into an equitable and just system.

## THPED415

Incorporating mental health strategies for sustaining progress in HIV/STI epidemic control

S. Mugo<sup>1</sup>, N.M. Silas<sup>2</sup>, J. Mutegei<sup>3</sup>

<sup>1</sup>Blissful Minds Kenya, Mental Health, Chuka, Kenya,

<sup>2</sup>Empowering Marginalized Communities, Key Population, Meru, Kenya, <sup>3</sup>Men in Action Supporting Men, Key Population, Meru, Kenya

**Background:** Kenya has achieved significant advancements in the advocacy and delivery of comprehensive HIV combined prevention services to the Key Population. However, In early 2023, there was a very hostile environment for the Key population and LGBTQ community which led to a 60% decline in individuals receiving HIV/STI services at the safe space.

**Description:** In response to this crisis, through our "Come We Share" activities, referred to as "Spaces of Grace," we reached out to 95 organizational leaders, peer educators, and paralegals. During these sessions, individuals engaged in open dialogues, sharing personal narratives that addressed challenges related to sexuality, mental health, HIV concerns, Hostile environment, the impact of punitive laws, and the navigation of cultural practices and norms. These discussions were facilitated by psychologists, and necessary interventions were offered. Shockingly, the initiative unveiled that 95% of participants grappled with mental health challenges, with 90 (95%) having anxiety, 45 (47%) having depression symptoms, and 23 (25%) having PTSD. All participants were experiencing activist burnout. They reported increased fear and anxiety about leading the HIV and advocacy activities as it exposed them to the general communities. 42 (42%) Participants reported to have experienced violence in the period. Some had run away from home and others were in self-isolation as they feared for their lives. Critical

questions arose, with many wondering the worthiness of their efforts, and questioning the long-term impact and systemic changes that could be achieved.

Others expressed uncertainties about the sustainability of their advocacy efforts. Others expressed concerns about the lack of substantial investments to support them in emergencies.

**Lessons learned:** The initiative uncovered the profound impact of HIV programming and the hostile environment on the mental well-being of key advocates and community leaders.

In addition, it brought to light the current programming model has neglected the well-being of these pivotal activists, who serve as the backbone of HIV prevention and advocacy programs.

**Conclusions/Next steps:** Future steps involve sustained efforts to reformulate program structures, prioritizing the mental health of these key individuals, as their well-being directly influences the sustainability and impact of HIV initiatives within the Key Population in Kenya.

## THPED416

Factors associated with prediction of sex for hypothetical on-demand PrEP use among young men who have sex with men in the United States

B. Stamp<sup>1</sup>, K. Powers<sup>1</sup>, K. Horvath<sup>2</sup>, Z. Soberano<sup>3</sup>,

S. Hosek<sup>4</sup>, J. Stocks<sup>3</sup>, M. Rosso<sup>3</sup>, L. Hightow-Weidman<sup>3</sup>

<sup>1</sup>University of North Carolina at Chapel Hill, Gillings School of Global Public Health, Department of Epidemiology, Chapel Hill, United States, <sup>2</sup>San Diego State University, Department of Psychology, San Diego, United States, <sup>3</sup>Florida State University, Institute on Digital Health and Innovation, College of Nursing, Tallahassee, United States, <sup>4</sup>Stroger Hospital of Cook County, Department of Psychiatry, Chicago, United States

**Background:** Factors associated with accurate prediction of sex - which is critical for successful on-demand pre-exposure prophylaxis (PrEP) use - among young men who have sex with men (YMSM) in the United States (US) are not well understood.

**Methods:** We followed 120 YMSM (ages 16-24) in the US from April through June 2021 for eight weeks with digital daily surveys assessing their perceived probability of anal sex in the next 24 hours (0-100%), actual engagement in anal sex in the prior 24 hours, and timing of advance knowledge that an actualized anal sex encounter was going to occur ( $\leq 2$  vs.  $> 2$  hours before the encounter). We used generalized linear mixed models to estimate concordance statistics (c-statistics) between predicted probabilities of sex and actual sexual encounters, with stratification by baseline sociodemographic, mental health, and cognitive factors, including executive functioning and impulsiveness. We compared groups using a chi-square test with  $\alpha=0.05$ .

Additionally, we used generalized estimating equations to estimate unadjusted risk ratios (RRs) for the association between each factor and the risk of an *unpredicted spontaneous encounter*, defined as an encounter for which the prior-day predicted probability of sex was <50% and advance knowledge was ≤2 hours before the encounter, and therefore unlikely to have been protected by on-demand PrEP use.

**Results:** Overall concordance between prediction of and actualization of sex was high (c-statistic=0.87, 95% CI=0.85, 0.88), but persons with executive functioning in the lowest (vs. highest) quartile and impulsiveness in the highest (vs. lowest) quartile had decreased predictive abilities ( $p=0.003$  and  $p=0.004$ , respectively). Risk of an unpredicted spontaneous encounter was higher in Black vs. white participants (RR=1.63, 95% CI=1.38, 1.92) and those experiencing vs. not experiencing depressive symptoms (RR=1.34, 95% CI=1.09, 1.64).

**Conclusions:** On-demand PrEP may be especially challenging for some YMSM, potentially placing them at increased risk of HIV acquisition. Those with depression, impulsivity, or executive function challenges may particularly benefit from interventions that address their mental health and developmental needs. Ultimately, tailored approaches that account for both individual dosing preferences and factors associated with prediction challenges may help to optimize selection of, adherence to, and protection by on-demand PrEP among US YMSM.

## THPED417

Considerations for the inclusion of adolescents in a gonorrhea treatment trial: experiences from the Zoliflodacin study in Cape Town, South Africa

K. Gill<sup>1</sup>, K. De Gouveia<sup>2</sup>, A. Madikida<sup>2</sup>, M. Duyver<sup>2</sup>, K. Mahlangu<sup>2</sup>, T. Nkosi<sup>2</sup>, L.-G. Bekker<sup>2,1</sup>

<sup>1</sup>University of Cape Town, Institute of Infectious Diseases and Molecular Medicine, Cape Town, South Africa,

<sup>2</sup>Desmond Tutu Health Foundation, Cape Town, South Africa

**Background:** Despite the high prevalence of sexually transmitted infections in adolescents globally, they are often excluded from clinical research. The possible consequence of ethical and regulatory guidance designed to protect children is delayed access to potentially lifesaving interventions.

We sought to demonstrate that older adolescents (16- and 17-year-olds) could be safely enrolled in a phase 3 clinical trial and parental proxy consent safely waived.

**Description:** The Zoliflodacin study (NCT03959527) was a pivotal phase 3 trial evaluating the efficacy and safety of a single, oral, dose of zoliflodacin compared to a combination of a single intramuscular dose of ceftriaxone and a single oral dose of azithromycin in the treatment of patients with uncomplicated gonorrhoea. We reviewed

scientific literature and advocacy calls to include adolescents in adult clinical trials. We consulted with key stakeholders including youth advisers, legal experts, ethicists, trial investigators, the ethics committee, and community advocates before and during trial execution, and identified priority actions to facilitate the inclusion of adolescents without the need for parental consent.

**Lessons learned:** Specific actions to promote the inclusion of adolescents include:

1. Early engagement with community stakeholders and parents, with written documentation of consultations,
2. Dialogue with the adolescent community advisory board on how best to engage adolescents and ensure consent forms were age-appropriate,
3. Consultation with legal experts, ethicists and the ethics committee to draft a robust and detailed ethical justification for the waiver of proxy parental consent,
4. Engaging with regulatory authorities and implementing a protocol requirement for test of cure and standard of care for treatment failure,
5. Implementing enhanced protection measures to mitigate risk including frequent follow-ups, encouraging involvement of a trusted adult and conducting the research in an adolescent-friendly space,
6. Providing the ethics committee with frequent progress reports for minor participants.

**Conclusions/Next steps:** Early and robust stakeholder engagement can facilitate the inclusion of adolescents in phase 3 studies. The Zoliflodacin study was the first treatment study in South Africa to have been granted a waiver of parental consent for older adolescents and will hopefully result in further engagement around the inclusion of adolescents in treatment and prevention clinical trials in South Africa.

## THPED418

Navigating oral PrEP patterns of use: a qualitative longitudinal study of gay, bisexual and queer men's everyday use of non-daily PrEP in Canada

E. Daroya<sup>1</sup>, A. Wells<sup>2</sup>, M. Gaspar<sup>1</sup>, J. Sinno<sup>1</sup>, M. Hull<sup>3</sup>, N.J. Lachowsky<sup>2</sup>, D.H.S. Tan<sup>4</sup>, D. Grace<sup>1</sup>

<sup>1</sup>University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, <sup>2</sup>University of Victoria, School of Public Health and Social Policy, Victoria, Canada, <sup>3</sup>University of British Columbia, Vancouver, Canada, <sup>4</sup>St. Michael's Hospital, Toronto, Canada

**Background:** The Canadian HIV pre-exposure prophylaxis (PrEP) guidelines recommend both daily and on-demand dosing for gay, bisexual, and queer men (GBQM), meeting additional risk criteria. Despite this recommendation, a paucity of research has focused on GBQM's experiences and perspectives on alternative PrEP use patterns beyond daily intake.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

We aimed to investigate how GBQM in Canada implemented non-daily PrEP use and the contextual factors influencing decisions to pause, resume, or discontinue PrEP.

**Methods:** As part of PRIMP, a mixed-methods implementation science study, we conducted annual qualitative interviews with former and current PrEP users from Ontario ( $n=18$ ) and British Columbia ( $n=20$ ), Canada, between 2020-2022. A total of 107 interviews were completed across three rounds. Interviews were transcribed verbatim and coded in NVivo using reflexive thematic analysis.

**Results:** We identified two overall non-daily PrEP use patterns: periodic PrEP and on-demand PrEP. Many participants described periodic PrEP involving brief interruptions of a few weeks or months, returning to daily PrEP during heightened sexual activity. Others followed the standard 2-1-1 on-demand PrEP schedule. Several participants reported complete discontinuation with no future plans for PrEP use unless social and sexual situations change significantly. During the COVID-19 pandemic, participants used PrEP periodically, pausing when sexual activities decreased and restarting daily when sexual activities resumed. Others took breaks due to relationship changes or sexual inactivity, restarting PrEP use one week ahead in anticipation of future sexual experiences.

On-demand PrEP was adopted by those experiencing side effects, while some used it to save costs. Some men stopped PrEP use for a sustained period due to becoming monogamous, losing health insurance, experiencing side effects, and low perceived HIV risk. Most participants expressed concerns regarding limited information about non-daily PrEP use, resorting to online sources or relying on insights from peers for guidance.

**Conclusions:** PrEP users adapted non-daily use to evolving contexts, deciding on periodic, on-demand, or discontinuation based on anticipated risk and sexual behaviours. Such adaptive PrEP-taking patterns suggest GBQM's capacity to correctly identify their own seasons of risk. PrEP clinical counselling should include discussions on strategies to discontinue and resume PrEP appropriately for all PrEP users, including alternative risk reduction strategies.

## THPED419

### Acceptability of long-acting injectable (LAI) pre-exposure prophylaxis (PrEP) among key populations in Malaysia

S.C.S. Chong<sup>1</sup>, I. Azwa<sup>2</sup>, S.H. Lim<sup>2</sup>, M.H. Cheah<sup>2</sup>, J. Pang<sup>2</sup>

<sup>1</sup>La Trobe University, Department of Public Health, Bundoora, Australia, <sup>2</sup>University of Malaya, Faculty of Medicine, Kuala Lumpur, Malaysia

**Background:** The Malaysian Drug Control Authority, in 2023, approved Apretude (Cabotegravir) a long-acting injectable pre-exposure prophylaxis as an additional option for HIV prevention. Potential LAI-PrEP users' per-

spectives are necessary to inform the roll-out of LAI-PrEP and efforts to support compliance. This study aimed to determine the acceptability of LAI-PrEP, specifically the facilitators and impediments to uptake that may be experienced by vulnerable key populations at high-risk of acquiring HIV.

**Methods:** This qualitative study commenced in August 2023. Purposive sampling was used to recruit participants. Advertisements were placed at HIV-related community-based organisations which directed potential participants to the researchers. Semi-structured interviews were conducted in-person or via online platforms, in English and Malay languages, with men-who-have-sex-with-men (MSM), transgender women and female sex workers. Interviews duration were 45-60 minutes, audio-recorded, and transcribed via a transcription service. Data was analysed using iterative thematic analysis. NVIVO 12 was used for data coding, from which themes were developed.

**Results:** Participants were MSM ( $n=15$ ), transgender women ( $n=10$ ) of which five were sex workers, cisgender female sex workers ( $n=2$ ) aged between 24-52 years. They identified as Malay ( $n=14$ ), Chinese ( $n=6$ ), Indian ( $n=3$ ) and other ( $n=4$ ) ethnicity reflecting the Malaysian ethnic population distribution. Most participants reported high interest in LAI-PrEP specifying no daily pill regimen, likely improved adherence, privacy (injectable viewed as discreet), and bi-monthly doses as conducive for uptake and persistence. Concurrently, they raised concerns related to LAI-PrEP potential side effects, interaction with gender affirming hormones (among transgender women) and fear of needles.

Participants would prefer LAI-PrEP providers that administer non-judgemental services, employ peer workers/navigators, ensure health data confidentiality and privacy, are centrally located, and offer short waiting time. LAI-PrEP dose frequency at two-, three- or four-month intervals were favoured by participants. Many participants prefer self-administration of LAI-PrEP.

LAI-PrEP unaffordability was cited as a main deterrent to uptake. Unless injectables are provided at no-cost through government hospitals/health clinics or priced similarly to oral PrEP, participants will not use LAI-PrEP.

**Conclusions:** The outcomes will contribute evidence to inform planning by government and community stakeholders to develop strategies, build HIV-related workforce capacity and prepare key populations for the provision of LA-PrEP.

Pre-exposure prophylaxis uptake among Black/African American men who have sex with men in Midwestern, United States: a systematic review

O. Adeagbo<sup>1</sup>, O. Badru<sup>1</sup>, P. Addo<sup>2</sup>, A. Hawkins<sup>1</sup>, M. Brown<sup>2</sup>, X. Li<sup>3</sup>, R. Afifi<sup>1</sup>

<sup>1</sup>University of Iowa College of Public Health, Community and Behavioral Health, Iowa City, United States, <sup>2</sup>Arnold School of Public Health, University of South Carolina, Epidemiology, Columbia, United States, <sup>3</sup>Arnold School of Public Health, University of South Carolina, Health Promotion, Education and Behavior, Columbia, United States

**Background:** Black/African American men who have sex with other men (BMSM) are disproportionately affected by HIV, experience significant disparities in HIV incidence and prevalence, and face significant barriers to accessing HIV treatment and care services, including pre-exposure prophylaxis (PrEP). This review examined patterns of, and barriers and facilitators to PrEP uptake among BMSM in the Midwest, United States.

**Methods:** Five databases (CINAHL Plus, PUBMED, PsychINFO, SCOPUS, and Web of Science) were searched in March 2023. We included studies that focused on BMSM in the Midwestern states; only empirical studies (either quantitative or qualitative or both) were considered. The barriers and facilitators were thematically analyzed and structured under the Capability, Opportunity, Motivation and Behavior (COM-B) model.

**Results:** We screened 850 articles, and 24 (quantitative: 14; qualitative: 8; mixed methods: 2) met our eligibility criteria. Most (n=16) of the studies were conducted in Chicago. PrEP uptake ranged from 3.0% to 62.8%, and most studies (n=11) reported a prevalence of less than 15%. We identified themes related to physical capability and opportunity, psychological capability, social opportunity, reflective and automatic motivation for PrEP uptake. The barriers include lack of PrEP awareness, inadequate PrEP access, PrEP stigma, side effects, PrEP preference, socioeconomic status, medical insurance and support, partner trust, lack of trust in the health system, and precautions with sexual partners. The identified PrEP facilitators included a positive perception of PrEP as an effective HIV prevention method, friends influence, experience with dating men living with HIV, safety, phobia for HIV, disdain for condoms, and power and personal autonomy.

**Conclusions:** In the Midwest, BMSM PrEP uptake is generally low, and identified barriers increase the risk of acquiring HIV. Multimodal and multilevel strategies are needed to improve PrEP uptake among BMSM especially in the Midwest, including knowledge improvement and adequate funding to provide free PrEP.

## THPED421

"Like a testimony": PrEP promotional messaging preferences to reduce stigma and improve trust among gay, bisexual, and other men who have sex with men in the Southeastern United States

R.M. Gravett<sup>1</sup>, G. McCollum<sup>1</sup>, J.D. Tucker<sup>2,3,4</sup>, L.T. Matthews<sup>1</sup>, B. Van Der Pol<sup>1</sup>, J. Marrazzo<sup>5</sup>, L. Elope<sup>1</sup>

<sup>1</sup>University of Alabama at Birmingham, Division of Infectious Diseases, Department of Medicine, Heersink School of Medicine, Birmingham, United States, <sup>2</sup>University of North Carolina at Chapel Hill, Institute for Global Health and Infectious Diseases, Chapel Hill, United States, <sup>3</sup>London School of Hygiene and Tropical Medicine, Clinical Research Department, Faculty of Infectious and Tropical Diseases, London, United Kingdom, <sup>4</sup>Southern Medical University, Dermatology Hospital, Guangzhou, China, <sup>5</sup>National Institutes of Health, National Institute of Allergy and Infectious Diseases, Bethesda, United States

**Background:** In the Southeastern US, PrEP uptake among gay, bisexual, and other men who have sex with men (GBM) significantly lags behind the national standard with tremendous racial and ethnic disparities. Many GBM feel uncomfortable accessing PrEP due to anticipated stigma or healthcare provider mistrust, and targeted ads to this community may lead to perceived stigma. We explored the PrEP messaging preferences of GBM in the Southeast to inform PrEP promotions for increased uptake.

**Methods:** We interviewed self-reported HIV-negative cisgender GBM, 18 years and older, purposively sampled from community venues, word-of-mouth, and online recruitment. Using an exploratory interview guide, grounded in the Andersen Healthcare Utilization Model, we explored how stigma, medical mistrust, media use, and digital access influences preferences for PrEP promotional content and delivery to affect PrEP access. Two coders (one with similar lived experiences to improve reflexivity) inductively and deductively coded interview transcripts. We assembled subcodes and codes into construct-based categories to operationalize thematic analysis.

**Results:** Forty GBM (68% Black, median age 28 years) completed interviews. Emerging themes primarily mapped to predisposing factors and enabling resources. Highlighted themes include:

1. *The role of diverse and relatable identities in messaging.* Participants suggested that promotions should present many different identities and presentations; most participants felt only one identity represented (e.g., Black, gay men) is stigmatizing and reduces awareness among other identity groups. Relatability improves the promotion trustworthiness;
2. *Preferred content for PrEP promotion.* Content should emphasize personal experiences through a gain-frame perspective as "success stories;"
3. *PrEP promotional platforms.* GBM preferred varied delivery platforms with concise and "eye catching" content.

Themes	Subthemes	Exemplar Quotes	Construct
The role of diverse and relatable identities in messaging.	Diversity reduces stigma from a singular identity presented.	"Oversaturating the type messaging I think only further perpetuates stigma."	Predisposing Factors
		"Most of them are honestly and truly set around Black, gay men, so it just seems like you get this disease from a Black, gay man."	
		"If the commercial is just focused on queer people, it's gonna always have the backlash or the stigmatization of it just being a queer illness instead of being like everybody's illness."	
Preferred content for PrEP promotion	Relatability increases the appeal and response to promotion.	"Start by saying, 'hey, this is not just for men who sleep with men. This is for all people,' right? I think if we use that type of language, it can start to deconstruct and de-stigmatizing everything that's attached to this field...Once you change that, we'll change the whole paradigm of the purpose of PrEP."	Enabling Resources
	PrEP promotions should be for anyone at risk for acquiring HIV.	"I do think that those commercials are more focused on the LGBT community, and it should be more focused on everyone." "I think it could be used or should be used for anyone having unprotected sex, whether that's gay, straight, female, White, Black, Hispanic, all age groups."	Predisposing Factors
	Personal anecdotes and experiences as success stories will increase action through gain-frame perspectives.	"Maybe giving somebody's story in the ad...that might actually get people interested." "Just telling about my personal experience...more so like a testimony." "This is how PrEP works for me."	Enabling Resources
PrEP promotional design and platforms	Content should focus on access, effectiveness, and safety.	"It's like it's secret. Like everything - it's not secret, but it's not advertised for people to actually go get help or go seek it." "I've never seen an ad discuss where to get [PrEP]. It just say, 'call your doctor.'"	Need
	Promotions should be "concise and clear" and "eye catching."	"Just knowing how much the risk is reduced. I don't know anyone that wouldn't wanna take that." "I like short and to-the-point commercials." "One of those flyers that just was made. Like, it's not fun, it's not bold, it's not trying to reach out. It's just there."	Enabling Resources
	Media access is common, and digital promotion is preferred.	"For me, I think that [digital promotion] is the most effective...I am gonna be on my phone pretty much all day."	Enabling Resources

Table 1. Themes, subthemes, and quotes mapped to constructs in the Andersen Healthcare Utilization Model.

**Conclusions:** Current PrEP promotions must evolve to better reach Southern GBM. Diverse representation with lived experiences delivered in concise and attractive PrEP promotions would reduce stigma and foster relatability and trust. These findings highlight the need for nuanced PrEP promotion that reaches communities in greatest need for PrEP uptake.

## THPED422

### Opportunities for an integrated continuum of HIV prevention and care among transgender and gender-diverse people in Puerto Rico

C.E. Rodriguez-Diaz<sup>1</sup>, Y. Santiago-Rivera<sup>2</sup>, A. Lint<sup>3</sup>, A. Figueroa<sup>3</sup>

<sup>1</sup>Boston University School of Public Health, Community Health Sciences, Boston, United States, <sup>2</sup>George Washington University, Milken Institute School of Public Health, Washington, United States, <sup>3</sup>Arianna's Center, Miami, United States

**Background:** In Puerto Rico (PR), HIV continues to disproportionately affect sexual and gender minorities, and transgender and gender-diverse (GD) people experience the worst outcomes. To end the HIV epidemic in these groups, it is necessary to provide an integrated approach to primary and secondary prevention.

This study aimed to assess HIV prevention and care outcomes among transgender and GD individuals in PR.

**Methods:** Data were analyzed from 126 participants from a transgender and GD community-centered assessment conducted in 2020. Participants provided information about sociodemographic characteristics, sexual risk practices, history of sexually transmitted infections (STIs), and engagement with primary and secondary HIV prevention services.

**Results:** Despite having nearly three-quarters of the participants (65%) reporting having completed a degree beyond high school, low income (88% earning under the poverty level) was common. Most of the sample (90%) were HIV-negative. Over a quarter (26%) have been diagnosed with an STI in their lifetime. Over a quarter of the sample (39%) reported engaging in sex work, and this group also represented 62.7% of those with HIV.

Regarding HIV primary prevention services, trans women exhibited robust HIV and STI testing rates (e.g., 38% of the sample tested for HIV more than once a year), while testing among trans men was less frequent (14% once a year). While PrEP awareness was high (91%), use was low (14%). Interest in PrEP was moderate (21%), and awareness of U=U (73%) and access to gender-affirming care (69%) were high. Among those with HIV (6.8%), all were engaged in ART, and all achieved viral suppression.

**Conclusions:** Findings from this analysis provide insights on current primary and secondary HIV prevention engagement among trans and GD people in PR and can be leveraged to support integrated HIV prevention efforts to meet the specific needs of minoritized gender-diverse individuals.

The success of engaging people with HIV in care can support strategies to improve primary prevention services and practices in these groups.

### Somos Youth Community Center

E. Alcides<sup>1</sup>, I.D. Marquez<sup>1</sup>, M.A. Barriga Talero<sup>2</sup>

<sup>1</sup>Red Somos Corporation, Cundinamarca, Bogotá, Colombia, <sup>2</sup>Red Somos Corporation, Bogotá, Colombia

**Background:** The project "Somos Youth Community Center" SYCC aims to be the first youth center in Bogota and Soacha, Colombia, focused on human, sexual and reproductive rights oriented to vulnerable LGBTIQ+ population between 14 and 24 years old, with the objective of having a contribution to increase knowledge, HIV diagnosis and prevention services.

**Description:** The SYCC was built under the strategy of combined HIV prevention from an intersectional approach that recognizes the diversity of cultural, sexual, gender and nationality identities of young people. It also proposed to interconnect in one place -with a community-based model- educational, artistic or cultural spaces, cyber-educator type platforms and the use of communicative messages developed by them.

In addition, it prioritizes its attention to men who have sex with men MSM; trans women; Cis women, transgender men and male sex workers; and men who use psychoactive substances.

**Lessons learned:** The creation of the SYCC arises from the findings of the work developed by the community-based organization Red Somos since 2007 in Bogota and Soacha. Throughout its trajectory, it has shown that sexuality is approached from institutional settings where fear of its consequences is inculcated (unwanted pregnancies, STIs and STDs) and its approach is based on the reductionism of sexuality, prejudice and individual moral character. Likewise, the attention provided by district health workers creates barriers to access to contraceptive methods and counseling on sexual and reproductive health.

**Conclusions/Next steps:** In the work carried out in its first year of operation, the SYCC has implemented actions that can contribute to the current Colombian health system, such as the need and importance of working with communities from a model that integrates the participation of peers or community peer agents, since the relationship of communities tends to have greater assertiveness and effectiveness when the community identifies a person with whom they share a certain degree of equality or similarity. This action has allowed the development and integration of adolescents and young people to safe spaces to address their sexuality and self-care.

## THPED424

### What are the enablers and barriers to oral PrEP uptake and continuity among key and vulnerable populations? Results from an assessment in Eswatini

B. Sithole<sup>1</sup>, N. Dlamini<sup>1</sup>, M. Matsebula<sup>1</sup>, V. Dlamini<sup>1</sup>, F. Masango<sup>1</sup>, C. Akolo<sup>2</sup>, H. Mahler<sup>2</sup>, V. Ranebennur<sup>2</sup>, S. Matse<sup>3</sup>

<sup>1</sup>FHI 360, EpiC, Mbabane, Eswatini, <sup>2</sup>FHI 360, EpiC, Washington DC, United States, <sup>3</sup>Ministry of Health, Eswatini AIDS Programme, Mbabane, Eswatini

**Background:** Eswatini introduced daily oral pre-exposure prophylaxis (PrEP) in 2016 and event-driven (ED) PrEP in 2021. Despite concerted efforts, uptake remains low among people at substantial risk. The PEPFAR/US-AID-funded Meeting Targets and Maintaining Epidemic Control (EpiC) project conducted a PrEP assessment to provide insights into enablers and barriers for PrEP uptake among key populations (KP) in Eswatini.

**Methods:** We interviewed 346 KP and priority populations (PP) receiving services in EpiC project. Semi-structured interview guide was used for in-depth interviews (IDI) among 122 clients who started and continued with PrEP for more than three months while interview schedule was used among 224 who refused PrEP or dropped within three months. Interviews (20-30 minutes) were conducted with consenting clients by trained EpiC nurses.

Quantitative data was analyzed in an Excel file while qualitative was grouped into themes. Ethics clearance was received from FHI 360 and Eswatini National Health Research Review Board.

**Results:** Top PrEP uptake barriers included: pill burden; lack of time for refills; stigma associated with PrEP and ART; and dislike of PrEP-branded packages (Table 1).

Notably, pill burden was reported less among MSM. Key enablers for PrEP uptake/continuity included: easy access to PrEP; refill reminders from health providers; and self-reminders from clients (Table 2).

**Conclusions:** The PrEP assessment provided information on enablers and barriers to PrEP uptake and continuity within EpiC program. KP generally had more challenges in PrEP uptake compared to PP. Programs should analyze distinct issues on uptake for different sub-populations, addressing them based on feedback from the recipients of care.

## THPED425

### Stigma reduction and mental health promotion for sexual and gender minorities at risk of/living with HIV in Nigeria: implementation lessons

A. Fernandez Eromhonselé<sup>1</sup>, J. Pulerwitz<sup>2</sup>, W. Tun<sup>2</sup>,

A. Gottert<sup>2</sup>, A. Adedimeji<sup>3</sup>

<sup>1</sup>Consulant, Durham, United States, <sup>2</sup>Population Council, Washington, DC, United States, <sup>3</sup>Albert Einstein College of Medicine, Philadelphia, United States

**Background:** High levels of stigma are experienced by sexual and gender minorities (SGMs) – including in Nigeria, where same-sex behavior is criminalized – yet there are few if any evidence-based interventions for SGMs that address stigma and related mental health concerns in Nigeria (or across Africa). We derived lessons from the development and implementation of a novel stigma reduction intervention for SGMs in Nigeria.

**Description:** The program took place in Lagos, Nigeria (April–September 2022). It drew upon cognitive behavioral therapy principles, and consisted of four workshops addressing intersectional and internalized stigma, mental health, and HIV in a small group setting ( $n=10$ –12 participants). Sessions were facilitated by community health workers (CHEWs) at an SGM-friendly community-based organization (CBO). 185 sexual minority men (SMM) and 55 transgender women (TGW) participated in the program. Complementing the RCT-based evaluation (reported on elsewhere), focus group discussions with CHEWs ( $n=5$ ), and in-depth interviews with TGW ( $n=12$ ), SMM ( $n=12$ ), and program staff ( $n=3$ ) were conducted.

**Lessons learned:** After consultation with community members and topical experts, an HIV status neutral program was recommended and implemented, with self-identified SMM and TGW included in separate groups. The program was successful in recruiting from the SGM community even in this highly challenging environment, and almost all participants attended all four sessions. Participants reported appreciating the program's identity-affirming messages, and how HIV prevention/treatment was not the only topic addressed but was instead woven into the program as an important aspect of self-care. As reported, program satisfaction was also due to the welcoming and safe CBO environment and positive rapport with the CHEWs.

Program staff and participants indicated that the sessions led to increased resilient coping mechanisms to confront stigma, self-blame, and depression, and provided an environment where participants could give and receive social support.

**Conclusions/Next steps:** The intervention was highly regarded by participants and well attended, suggesting feasibility / acceptability of the novel program. Feedback suggests that the approaches used represent important directions for HIV programming, including: centering mental health and wellbeing in an HIV status neutral

program; group-based stigma reduction programming to facilitate shared resiliency / support; and basing programs out of locally credible, experienced CBOs.

## THPED426

### Elevating HIV case identification in men who have sex with men and transgender people through Peer-Driven Interventions: insights from Cambodia

S. Tuot<sup>1,2</sup>, S. Eang<sup>3</sup>, P.S. Seng<sup>3</sup>, D. Saman<sup>3</sup>, S. Tep<sup>4</sup>, V. Kem<sup>5</sup>, C. Phorn<sup>3</sup>, S. Oeur<sup>3</sup>, S.C. Choub<sup>3</sup>, S. Yi<sup>1,6</sup>

<sup>1</sup>KHANA, KHANA Center for Population Health Research, Phnom Penh, Cambodia, <sup>2</sup>The University of Tokyo, Department of Community and Global Health, Tokyo, Japan, <sup>3</sup>KHANA, Phnom Penh, Cambodia, <sup>4</sup>National Center for HIV/AIDS, Dermatology and STD, Phnom Penh, Cambodia, <sup>5</sup>Men Health Cambodia, Phnom Penh, Cambodia, <sup>6</sup>National University of Singapore, Singapore, Singapore

**Background:** In Cambodia, despite commendable achievements in HIV treatment adherence and viral load suppression, 9% of people living with HIV remain unaware of their status. To address this gap, the HIV response program requires heightened innovation and a targeted approach, mainly focusing on higher-risk key populations such as men who have sex with men (MSM) and transgender people (TG). Introducing Peer-Driven Intervention Plus (PDI+) has emerged as a strategic initiative to enhance the identification of new cases among MSM and TG in Cambodia.

**Description:** PDI+ employs an incentive-driven, peer-centered, and snowball approach, where individuals (seeds) are equipped with coupons to recruit peers within their networks for risk screening and HIV testing services at designated hotspots. Implemented by the Khmer HIV/AIDS NGO Alliance (KHANA), a prominent non-governmental organization in Cambodia, and its partners, PDI+ was executed in eight provinces from 2021–2023. Eligible participants at high HIV risk were incentivized with USD 2.50 for confidential HIV/Syphilis testing and an additional USD 2.50 for each recruit. Seeds received five coupons, valid for two weeks, to facilitate the recruitment of five participants, with one coupon per recruiter.

**Lessons learned:** Between 2021 and 2023, seeds/recruiters successfully enlisted 4,380 participants (3,408 MSM and 972 TG) for PDI+ program eligibility screening and HIV risk assessment. Of the 4,181 participants (3,258 MSM and 923 TG) who underwent HIV testing, 273 (6.5%) received positive results, with 171 (5.2%) identified as MSM and 102 (11.1%) as TG. All individuals diagnosed with HIV were promptly enrolled in ART clinics for necessary care and management.

**Conclusions/Next steps:** This intervention program substantiates the effectiveness of peer-driven network interventions as a viable method for HIV case detection. The

PDI+ approach has demonstrated superiority over traditional methods, enabling increased accessibility and recruitment of hard-to-reach populations. Moving forward, we recommend further expanding and integrating PDI+ initiatives into existing HIV response programs, tailoring outreach strategies for sustained engagement, and fostering collaborations to enhance the scalability and impact of peer-driven interventions in HIV detection and prevention efforts.

## THPED427

Developing and implementing a tailored mental health assessment tool for sex workers: insights from SWING clinics in Bangkok and Pattaya

A. Somwaeng<sup>1</sup>, D. Phuengsamran<sup>2</sup>, S. Janyam<sup>1</sup>,  
C. Phaengnongyang<sup>1</sup>, S. Sukthongsa<sup>1</sup>, D. Srikrongthong<sup>1</sup>,  
V. Suwong<sup>1</sup>, T. Wongsing<sup>1</sup>, N. Jantasook<sup>1</sup>,  
K. Chalermkrittikorn<sup>1</sup>, A. Thepbinkarn<sup>1</sup>, K. Hiek Thy<sup>1</sup>,  
S. Pomboribut<sup>1</sup>, K. Kaeosri<sup>1</sup>

<sup>1</sup>Service Workers In Group Foundation, Bangkok, Thailand,

<sup>2</sup>Institute for Population and Social Research, Mahidol University, Nakorn Pathom, Thailand

**Background:** This research, conducted by the Service Workers In Group Foundation (SWING), aims to develop a mental health self-assessment tool specifically for sex workers. Since 2022, SWING's clinics in Bangkok and Pattaya have utilized the 2Q Depression Screen alongside the PHQ-9 to identify depression among the clients. However, among 7,823 screenings, five cases of depression were flagged, with one identified as moderate. This project emphasizes the need for specialized, stigma-free mental health resources for sex workers, addressing unique challenges and promoting well-being.

**Methods:** The development of SWING's mental health self-assessment tool combined the Stress Test Questionnaire (ST-5) and the PHQ-9, with additional elements addressing specific experiences of sex workers. This included concerns related to mental well-being, sexual health, and the impacts of COVID-19. A survey of 200 sex workers, aged 18 or older, in Bangkok and Pattaya focused on factors such as workplace safety, experiences of violence, alcohol consumption during work, family obligations, and readiness for unexpected events like pandemics, ensuring the tool's relevance to this group.

**Results:** The self-assessment tool indicated that 20% of participants had minimal to moderate depression, a rate higher than what was previously identified in clinic settings. Significant factors impacting depression levels encompassed workplace type, alcohol consumption, self-rated health status, chronic disease, experiences of physical abuse, instances of clients removing condoms, and overall stress levels. This highlights the multifaceted and intricate nature of the mental health challenges encountered by the participants.

Characteristics	Patient Health Questionnaire (PHQ-9)						Pearson Chi-square (p-value < 0.05)
	No to minimal depression (0-4 scores) (n=147)		Mild to Moderate Depression (7 - 27 scores) (n=53)		Total (N=200)		
	n	%	n	%	n	%

No stress (0 points)	33	22.45%	0	0.00%	33	100.0	
Mild Stress (1-4 points)	121	81.55%	8	15.09%	129	100.0	
Moderate to Very High Stress (5-15 points)	6	4.08%	30	56.60%	36	100.0	

**Conclusions:** This study highlights the necessity of mental health support for sex workers. Incorporating PHQ-9 and ST-5, along with considerations unique to sex workers, the revised self-assessment tool is set to be implemented in SWING clinics. This will enhance the overall well-being and resilience of sex workers, addressing their specific mental health needs and contributing to more effective HIV prevention and treatment strategies.

## THPED428

Putting people (Migrants) first in India to reach the goal of 95:95:95

M. Kumar<sup>1</sup>, V.S. Prasad<sup>2</sup>, E. Michael<sup>3</sup>, S. Dwivedi<sup>4</sup>, L.H. Mojica<sup>5</sup>

<sup>1</sup>AIDS Health Care Foundation - India, New Delhi, India,

<sup>2</sup>Country Program Director - AIDS Health Care Foundation

- India, New Delhi, India, <sup>3</sup>Director of Operations &

Partnerships - AIDS Health Care Foundation - India, New

Delhi, India, <sup>4</sup>Prevention Program Manager- AIDS Health

Care Foundation - India, New Delhi, India, <sup>5</sup>Chief Financial

Officer - AIDS Healthcare Foundation, Finance, Los Angeles, United States

**Background:** AIDS Healthcare Foundation - India implements HIV community based rapid HIV testing across nine states. The objective of the program is early detection in the semi urban and rural areas where there is suboptimal or nil HIV services and link them to treatment and to compliment the efforts of National Program in reaching 95-95-95.

**Description:** This operational study considered two source migration states (Uttar Pradesh & Bihar) from where male migrants would travel to destination States for employment. The Community based rapid HIV testing data (gender disaggregated) of two years 2022 & 2023 was analysed. The objective of the study was to compare the HIV sero positivity of two years between men and women and to revisit the risk profile of the newly identified cases.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Lessons learned:** A total of 1,36,929 migrants were tested in Uttar Pradesh (4 Districts) and Bihar (3 Districts) from 2022 to 2023 where 1,517 HIV cases were detected. The results showed that the HIV sero positivity in these states among men and women was 1.64% and 1.11% respectively. Based on this evidence a quick profile of the newly identified men and women was analysed, revealing that these women were wives/partners of male migrants who returned from destination States.

Most Men (73%) and women (87%) have children and are between 10 – 22 years old. 93% of women had completed primary education and 78% men had completed high school. They had seemingly low knowledge about HIV during the initial risk assessment and counselling. Women (100%) were housewives and did not have any employment and was solely dependent on their husband (male migrants) for living. 92% of all identified HIV positives were linked to the Government ART centre for treatment and follow-up.

**Conclusions/Next steps:** The study recommends increased access to HIV prevention, testing and treatment services to be made available at source migrant states. The study reiterates that migrant workers are responsible for ruralization of HIV epidemic. It is long overdue where HIV program is strategized putting people first and focus on ensuring HIV services in semi urban and rural locations.

## THPED429

### Epidemiological study on the prevalence of HIV and sexually transmitted diseases among men who have sex with men in five regions of the Russian Federation

D. Korenev<sup>1,2</sup>, K. Barskiy<sup>1,2</sup>, A. Petrov<sup>1</sup>, E. Poilova<sup>3</sup>

<sup>1</sup>Fund for Prevention of Socially Significant Diseases "Steps", Moscow, Russian Federation, the, <sup>2</sup>Autonomous Non-Profit Organization "Public Health", Moscow, Russian Federation, the, <sup>3</sup>Saint Petersburg Center for Control of AIDS and Infectious Diseases, Saint Petersburg, Russian Federation, the

**Background:** Considering the substantial stigma in Russia related to MSM, there is a paucity of relevant data regarding the group's size and prevalence. Legislation criminalizing the LGBT+ group has resulted in a lack of epidemiological control over the community placing MSM in an uncertain circumstance. Significant portions of diseases with atypically localized STIs are caused by the lack of guidelines for the collection of samples from extra genital loci, like the rectum and oropharynx.

**Methods:** In 2021/2022, the Steps Foundation and the Central Research Institute of Epidemiology carried out a bio behavioral study on a cohort of MSM. The study geographical region was Voronezh, St. Petersburg, Leningrad region, Moscow and Moscow region. In samples taken

from three loci (oropharynx, rectum, urethra), PCR investigations were done for the following STIs: N.gonorrhoeae, C.trachomatis, M.genitalium, T.vaginalis, T.pallidum, HSVI and HSVII. Serum ELISA for HIV, hepatitis B/C, syphilis (rapid testing) was also taken. A questionnaire on behavioral aspects was also obtained from the participants.

**Results:** 644 subjects participated in the research. 15% of all participants had both male and female partners. Only 34% of respondents use condoms on a regular basis times. 20% of respondents reported using chemsex or psychoactive substances. HIV positive status was present in 23.4% of individuals. 215 individuals (33.4%) had STIs detected. 325 STIs were identified with 166(51%) detected in the rectum, 104(32%) in the oral cavity, and 55(17%) in the urethra. Among those with HIV, 80% had experienced a STI in the past. 4% of participants who were HIV-negative and 16% of those who were HIV-positive had three loci that were detected simultaneously. Substance abuse and HIV status are risk factors that more than double the likelihood of contracting a STI.

**Conclusions:** Our study reveals that the three main predictors of STIs among MSM are substance use, HIV status and number of sexual partners per year. It is our assessment that collection of samples from atypical loci be introduced into the diagnostic criteria in Russian Federation. Community-based studies with health institutions participation have shown unique results.

Further research is needed on the prevalence of sexually transmitted diseases and HIV among MSM.

in AIDS (CERIA), Department of Medicine, Kuala Lumpur,  
Malaysia, <sup>2</sup>University of Malaya, Department of Medicine,  
Kuala Lumpur, Malaysia, <sup>3</sup>University of Delaware,  
Department of Human Development and Family Sciences,  
Newark, United States, <sup>4</sup>University of Connecticut,  
Department of Educational Psychology, Connecticut,  
United States, <sup>5</sup>New York University Grossman School of  
Medicine, Department of Population Health Epidemiology,  
New York, United States, <sup>6</sup>New York University, Center for  
Drug Use and HIV/HCV Research, New York, United  
States, <sup>7</sup>Community Health Center, Inc., Center for Key  
Populations, Middletown Connecticut, United States, <sup>8</sup>Yale  
University, Yale School of Public Health, New Haven, United  
States, <sup>9</sup>Yale School of Medicine, Department of Internal  
Medicine, New Haven, United States

**Background:** Key populations and people with HIV (PWH) in Malaysia experience adversities, including pathologization, stigmatization of intersectional identities, and resource restriction, resulting in deleterious well-being outcomes. While individuals employ varying strategies in response to stressors, research exploring factors contributing to their resilience is scarce. Using Photovoice, we explored the challenges key populations and PWH in Malaysia experience and the repertoire of resilience resources they employ.

**Methods:** From October to November 2021, individuals across Malaysia aged 18 and above who self-identified as members of key populations, i.e., men who have sex with men (MSM), transgender women (TGW), female sex workers (FSW), people who inject drugs (PWID), and people with HIV (PWH) participated in an online Photovoice project. Participants submitted photographs with captions responding to prompts about their challenges, sources of happiness and sadness, and personal priorities. We employed Rapid Qualitative Inquiry to identify themes across the data.

**Results:** Thirty-four participants took part, including 12 (35.3%) MSM, 7 (20.6%) TGW, 7 (20.6%) FSW, 6 (17.6%) PWID and 8 (23.5%) PWH. We grouped the emerging challenges from the data into three domains:

1. Intrapersonal: management of concealable stigmatized identities; perceived stigma, i.e., assessment of beliefs about prejudice, stereotypes, and discrimination among others; securing subsistence resources (e.g., food, safety, access to transportation, and employment); and death-related cognitions and grief;

2. Interpersonal: enacted stigma, i.e., experiences of stereotypes, prejudice, and discrimination; and navigating complexities of relationships with friends, family, and partners; and lastly,

3. Structural stigma (e.g., absence of legal protection and restriction of resources).

The resilience resources that emerged were creative expression and celebration of self-identities; engaging in prosocial actions (e.g., volunteering, making someone smile, donation); spirituality, religious values, and drawing strength from nature; social support; self-care (e.g., exercise, good food, practicing gratitude); and the role of time as a promotive factor in developing resilience, i.e., quality time dedicated to health promotion and relationships as a buffer against stress and illness.

**Conclusions:** The study identified stressors experienced by key populations and PWH in Malaysia and resilience resources employed, offering insights into the need for strength-based approaches to bolster access to HIV care and cultivate stigma-resistant communities.

## THPED431

The HIV status of peer recruiters and their  
recruits in a social network strategy promoting  
HIV testing among people who inject drugs  
(PWID) in Kazakhstan

T. McCrimmon<sup>1</sup>, T. Hunt<sup>2</sup>, L. Gilbert<sup>2</sup>, E. Wu<sup>2</sup>,  
M. Chang<sup>2</sup>, M. Darisheva<sup>3</sup>, A. Terlikbayeva<sup>3</sup>,  
S. Primbetova<sup>3</sup>, N. El-Bassel<sup>2</sup>

<sup>1</sup>Columbia University Mailman School of Public Health,  
New York, United States, <sup>2</sup>Columbia University School  
of Social Work, New York, United States, <sup>3</sup>Global Health  
Research Center of Central Asia, Almaty, Kazakhstan

**Background:** Information and support shared through social networks can encourage HIV testing among marginalized populations. The social network strategy (SNS) is a peer-driven recruitment approach that was demonstrated to be effective in increasing HIV testing among people who inject drugs (PWID) in Kazakhstan.

We investigate how a peer recruiters' own HIV status and substance use history is associated with the HIV status of PWID that they recruited through an SNS program.

**Methods:** Between August 2017 and February 2020, we implemented a SNS program as part of a multicomponent HIV testing and linkage-to-care intervention at needle-syringe programs (NSPs) across three Kazakhstani cities. NSP staff trained peer recruiters to refer their network associates (recruits) to the NSP for rapid HIV testing. We collected data from 250 peer recruiters during their training and 6,218 PWID recruits who came for HIV testing at the NSP. Measures included: gender, age (both), self-reported HIV status and substance use history (peer recruiters), rapid HIV test outcome and whether each reactive case was newly-identified (recruits).

We used logistic regression to examine associations between:

1. Recruit's rapid test results and their peer recruiter's HIV status, and
2. Whether a recruit was newly-diagnosed and their peer recruiter's HIV status.

Models were adjusted for recruit's age, gender, and peer recruiter's current substance use.

**Results:** Of 250 peer recruiters, 38 (15.2%) reported living with HIV, and 47.6% reported current substance use. Among 6,218 recruits,  $n=256$  (4.2%) had a positive rapid test for HIV; over half ( $n=135$ , 52.9%) of these were newly-identified. In adjusted logistic regression models, having an HIV-positive peer recruiter was significantly associated with a recruit's increased odds of both a positive HIV test result ( $aOR=1.87$ , 95% CI=1.33-2.62) and of being a newly-identified case of HIV ( $aOR=1.95$ , 95% CI=1.05-3.70). There were no significant associations based on a recruiter's current substance use.

**Conclusions:** Findings affirm the importance of including people living with HIV in outreach efforts and programming for PWID and other marginalized groups. Strategies which leverage the social networks and experiences of peer recruiters living with HIV may be particularly useful in reaching those unaware of their status.

## THPED432

HIV combination prevention approaches that have contributed to reduction of acquiring HIV among the GBMSM enrolled in MPEG amid the insecurity environment for the LGBTQ community in Kiambu County, Kenya

P. Mwaura<sup>1</sup>, A. Kadenge<sup>2</sup>, R. Inyang'ala<sup>3,4</sup>

<sup>1</sup>Mt Kenya University, Thika, Kenya, <sup>2</sup>Ergerton University, Eldoret, Kenya, <sup>3</sup>Nairobi University, Nairobi, Kenya, <sup>4</sup>UON, Nairobi, Kenya

**Background:** Mambo Leo Peers Empowerment Group is an LGBTI community led organization that works with Men who have Sex with Men /Male Sex Workers (MSM/MSWs) other Bisexual and Gay men in Kiambu county providing comprehensive HIV prevention, care and treatment, structural and behavioral interventions. MPEG partnered with PEPFAR/CDC funded Dhibiti to upscale HIV prevention and care & treatment interventions to MSM/MSW between 2022 and 2023 in Kiambu County. The approach of the interventions were aligned to UNAIDS 95-95-95 targets. This case finding paper attempts to discuss how HIV prevention interventions contributed to reduction in acquiring HIV among the cohort of MSM/MSW under MPEG.

**Methods:** MPEG had a cohort of 1956MSM by the end of the project in September 2022. The Cohort had received HIV prevention interventions for at least two years, including ; Condom and lubricants, health education, PrEP and

PEP services, adherence interventions for the PLHIVs, HTS and STI management. During the period, MPEG deployed the following strategies Targeted HIV testing among those with unknown status, conducted community outreaches and static models of services, Voluntary Partner Referrals (VPR), Social Networks Strategies (SNS), individualized tracking of the non-testers and reaching them with HTS, distribution of HIVST kits and online mobilization and referral for HTS.

**Results:** In the 2021, 1555MSM were reached with services including HTS with a HIV positivity of 4.7% among those tested (1154), compared to 2% from 1956 MSM tested in 2023.

**Conclusions:** Offering friendly comprehensive HIV prevention combination decreases the rates of acquiring HIV among the MSM/MSWs

## THPED433

Impact of GBV on access and utilization of HIV prevention, treatment and care services among transwomen in Greater Kampala Metropolitan Area (GKMA), Uganda

D. Ssentamu<sup>1</sup>, N. Muyanga<sup>2</sup>, M. Martine<sup>3</sup>

<sup>1</sup>Makerere University, Department of Mass Communication, Kampala, Uganda, <sup>2</sup>Makerere University, School of Public Health, Kampala, Uganda, <sup>3</sup>Makerere University, Education, Kampala, Uganda

**Background:** Transwomen, defined as individuals who were born male but identify as female are still disproportionately affected by Gender-based violence (GBV) including physical, sexual, and emotional violence due to their gender identity and they are 13% times at risk of HIV. This study was premised on Levesque's conceptual framework to explore impact of GBV on access and utilization of HIV prevention, treatment and care services among transwomen in greater Kampala metropolitan area (GKMA), Uganda.

**Methods:** This study was conducted in the GKMA. A cross-sectional study design utilizing participatory qualitative approaches was used to obtain data from trans women aged 18 years and above using focus group discussions, in-depth interviews and key informant interviews were used to obtain data from the purposively selected respondents and we used respective guides after

Author Index

obtaining informed consent to discuss. 20 IDIs, 6 FGDs and 10 KIs were conducted. Discussions were digitally recorded, transcribed verbatim, codes developed, Nvivo was used for coding transcripts and analysis was done based on the study objectives.

**Results:** 60 trans women participated in the study from the districts of Mukono, Kampala and Wakiso. 56 were aged between 18 and 28 years and 36 depended on sex work as source of income. Results showed that GBV has a great impact access to and utilization of HIV prevention, care and treatment services among trans women. Respondents reported having limited chances of having their HIV/AIDS health care need to be met due to GBV. Inaccessibility at the healthcare facility, unacceptability by patients and some healthcare providers, Social disconnection from family and friends and abuse by sexual partners resulted in delayed health seeking, shunning away from the facilities without accessing services, limited their ability to decide to seek HIV services, poor adherence to ART and inability to express their SRH issues that would require thorough examination to receive meaningful medication. Sexual violence survivor miss HIV prevention services like PEP. These experiences breed fear, stigma among trans women, mistrust in the health care system and inability to engage health care providers.

**Conclusions:** Trans inclusive policies on GBV and HIV control and evidence-based interventions are needed to improve HIV outcome.

**Methods:** A mixed methods study was conducted in May 2023 in Bulawayo and Harare among AGYW aged 15-24 years. We interviewed 230 AGYW in the cross-sectional survey and 48 AGYW across 4 Focus Group Discussions (FGDs). Quantitative data were collected in Kobo and analyzed using STATA 17 and logistic regression modeling and difference between proportions were used for analyses. Qualitative data were collected from four focus group discussions (FGDs), tape-recorded, and thematically analyzed using De-DOSE.

**Results:** DSA prevalence was 34% (95% CI: 28 – 40) among AGYW with over 50% reporting abusing drugs at least once a week. AGYW abusing drugs were 4.9 times (95% CI: 2.3 -10.5 (odds ratios)) more likely to report an unmet need for HIV testing and sexual and reproductive health (family planning, STI, and cancer screening) (SRH) services compared to AGYW not abusing drugs.

Further, AGYW abusing drugs had higher STI prevalence (44.9% (95% CI: 32.9 – 57.4)) compared to just 4.2 % among non-users (95% CI: 0.9 – 11.9%). In the qualitative analyses, occurrences of risky sexual behaviors (condomless sex, orgies, and sex while intoxicated) were reported mostly by drug users compared to non-users.

**Conclusions:** The study showed significantly higher risky behavior among AGYW abusing drugs including a much higher risk of STI acquisition, coupled with high unmet need for HIV and SRH services. It is therefore imperative to strengthen programs that reduce DSA and improve access to health care services in this key sub-population.

## THPED434

Drug and substance abuse threaten gains in HIV and sexual and reproductive health programming among Adolescent Girls and Young Women (AGYW): evidence from Zimbabwe

M. Munjoma<sup>1</sup>, B. Choi<sup>2</sup>, J. Mavudze<sup>1</sup>, N. Kunaka<sup>1</sup>, M. Dhodho<sup>1</sup>, N. Nhando<sup>1</sup>, K. Chatora<sup>1</sup>, T. Moga<sup>1</sup>, B. Mutede<sup>1</sup>, S. Leuschner<sup>3</sup>, N. Taruberekera<sup>1</sup>

<sup>1</sup>Population Solutions for Health, Harare, Zimbabwe,

<sup>2</sup>Princeton University, New Jersey, United States,

<sup>3</sup>Population Services International, Harare, Zimbabwe

**Background:** Drug and substance abuse (DSA) continues to be on the increase in Africa and Zimbabwe is not spared from the scourge. In Zimbabwe, adult HIV prevalence among drug users is reportedly higher at about 20% compared to 13% in the general population. As HIV incidence remains disproportionately high among Adolescent Girls and Young Women (AGYW), UNICEF reported a drug abuse prevalence of 41% in this sub-population in 2023. Population Solutions for Health (PSH) in collaboration with the Swedish International Development Cooperation Agency (SIDA) and the Ministry of Health and Childcare (MoHCC) conducted a study to assess the effect of drug and substance abuse among AGYW on access to HIV and sexual and reproductive health services.

## THPED435

Opportunity for differentiated service delivery to improve PrEP retention among MSM in Kenya

J. Walimbwa<sup>1</sup>, S. Tabbu<sup>2</sup>, P. Irungu<sup>3</sup>, J.M. Zech<sup>4</sup>

<sup>1</sup>Ishara, Nairobi, Kenya, <sup>2</sup>Kenya Youth Development and Education Support Association (Kydesa), Nakuru, Kenya,

<sup>3</sup>Health Options for Young Men on HIV/AIDS/STI (HOYMAS), Nairobi, Kenya, <sup>4</sup>ICAP at Columbia University, New York, United States

**Background:** In Kenya, although high PrEP acceptance has been reported among men who have sex with men (MSM), uptake and retention remain low. Improving access to PrEP is critical to ensure targets of reducing HIV transmission are met. Differentiated service delivery (DSD) models offer a client-centered approach, aiming to streamline HIV services without overburdening the healthcare system.

We conducted a cross-sectional study to assess perceptions of PrEP service delivery and explore perspectives on DSD for MSM enrolled in PrEP care in Kenya.

**Methods:** The study was conducted in three counties in Kenya: Kisumu, Nairobi and Mombasa from July 2020 to July 2021. A questionnaire was conducted among 300 MSM accessing HIV services at drop-in centers (130 ART

and 170 PrEP); selected via consecutive sampling. Data was entered into Excel, cleaned, and analyzed descriptively using SPSS.

**Results:** Of the 170 PrEP clients interviewed, 81% identified as MSM and 19% as male sex workers; mean age: 25.4 years (SD 3.7). Almost half (43%) had been on PrEP for <1 year, 49% for 1-3 years, and 6% >3 years with most (82%) receiving quarterly HIV testing. PrEP was mostly collected monthly (72%) with some clients collecting quarterly (16%). Sixty-five (38%) clients reported missing at least one PrEP appointment within the last year; reasons for missing PrEP appointments included travelling (31%), transportation costs (29%), and forgetting (18%). Factors making PrEP refill a good experience included MSM-friendly clinics (64%), quick refill visits (51%), assured client confidentiality (47%), attentive providers (43%), support groups (17%), and short distance to clinic (15%). Respondents were interested in a variety of DSD models and services: spaced-out appointments (69%), set appointments (54%), fast track window (37%), facility-based peer support groups (37%), community drug distribution points (26%), and community-based peer support groups (13%).

**Conclusions:** MSM receiving PrEP services want friendly, confidential, and quick refill visits. MSM PrEP clients are interested in DSD models at both facility and community levels, with appointment spacing being the most acceptable model. HIV prevention programs should modify PrEP service delivery for MSM by implementing DSD to tailor refill to fit individual needs and remove barriers to access and retention.

## THPED436

Exploring the relationship between comprehensive sexual health prevention measures and the intent to use long-acting PrEP among MSM

A. Adriaque Lozano<sup>1</sup>, J. Kolstee<sup>1</sup>, H. Wang<sup>1</sup>,  
H. Zimmermann<sup>1</sup>, M. Schroeder<sup>2</sup>, A. Appliah<sup>3</sup>, C. Brown<sup>2,3</sup>,  
A. Milinkovic<sup>4</sup>, K. Jonas<sup>1</sup>

<sup>1</sup>Maastricht University, Psychology and Neuroscience, Maastricht, Netherlands, the, <sup>2</sup>ViiV Healthcare Ltd, Brentford, United Kingdom, <sup>3</sup>Chelsea and Westminster Hospital, London, United Kingdom, <sup>4</sup>ViiV Healthcare Ltd, Munich, Germany

**Background:** Men who have sex with men (MSM) have been encouraged to engage in health behaviors to help prevent the spread of a range of sexually transmitted infections (STIs) and adapt to evolving pathogens. Long-Acting Pre-Exposure Prophylaxis (LA-PrEP) is emerging as a promising solution to unmet HIV prevention needs among MSM.

This analysis investigates whether MSM actively engaging in comprehensive sexual health prevention measures (comprehensive protectors) are more inclined to intend to use LA-PrEP use.

**Methods:** Data from the PROTECT survey was utilized to identify and assess comprehensive protectors (CP) among MSM in France, Germany, United Kingdom, Italy and Spain (EU5). To identify comprehensive protectors among MSM, logistic regression was employed, using the intention to take LA-PrEP as the endpoint, with having received various vaccines (Hep A/B, Mpox, COVID, ME, and HPV) as independent variables. Descriptive analyses compared CP with the rest of MSM to reveal distinct characteristics. Subsequently, a regression analysis explored socio-demographic variables associated with being a CP.

**Results:** The results showed that only elective sexual-health-related vaccines played a role in greater intention to take LA-PrEP, including Mpox (aOR 1.62; 1.46-1.79;  $p < .0001$  6.21E-21), HPV (aOR 1.38; 1.23-1.54;  $p < .0001$ ). Thus, in our analysis CP are defined as MSM who vaccinate against Mpox and HPV over and above Hep A/B. CP compared to the rest of our sample were more likely to have a master's degree ( $n=578$ , 40.9) and reported higher sexualized substance use ( $n=463$ , 32.8%).

Notably, CP demonstrated higher rates of frequent STI testing ( $n=1084$ , 76.7%) and current PrEP use ( $n=1146$ , 81.1%). The United Kingdom had the highest number of CP, followed by France, Italy, Germany, and Spain ( $p < 0.0005$ ). Our multivariate model demonstrated that CP were also more inclined to report higher intention to take LA-PrEP (aOR 1.79; 1.01-1.38,  $p=0.04$ ).

**Conclusions:** These findings highlight the proactive stance on preventive health CP can have, evidenced not only by vaccination against other STIs but by higher rates of STI testing and interest in LA-PrEP. Comprehensive protectors could be a target, among a range of population targets, for the uptake of LA-PrEP when it becomes available in Europe.

## THPED437

Unveiling lived realities on trans youth inclusion in healthcare and navigating trans youth leadership in the Asia-Pacific

L.B. Villar<sup>1</sup>

<sup>1</sup>Youth LEAD, Bangkok, Thailand

**Background:** In the Asia-Pacific region, existing research on trans inclusion in healthcare including access to HIV services is limited and focus on the experiences of trans adults. As such, more efforts must be taken to recognise the realities and intersectionalities of young trans people in accessing healthcare, and to enable young trans people to take up leadership roles to address their community's needs.

**Description:** Funded by the Robert Carr Fund, this project, implemented by Youth LEAD, includes conducting a study on trans youth inclusion in healthcare, developing and piloting a trans youth healthcare manual for healthcare providers, and providing small grants for trans-

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

and youth-led organizations to increase the capacity of young trans people in the Asia-Pacific region. The project duration is for three years from 2022 to 2024, implemented across the Asia-Pacific specifically in India, Indonesia, Nepal, Mongolia, Philippines, and Thailand. The target population for the project is all young key populations, with specific attention to young trans people.

**Lessons learned:** The study found that mental health and health literacy should be included in trans healthcare and HIV programs and that a primary target for such interventions should be young adults, with peer-to-peer networks as the recommended pathway for information dissemination and service delivery. Both study and pilot training for the Trans Youth Healthcare Module recommends educating the healthcare workforce as a whole, including supporting roles; considering country-specific guidelines for trans youth; and engaging the trans community to improve the quality of care.

Small grants were used to conduct trans rights awareness workshops and trans youth consultations leading to the identification of priorities, needs, and opportunities for the young trans community and the development of organizational documents and guidelines on trans youth engagement.

**Conclusions/Next steps:** The Trans Youth Healthcare Training Module will be integrated into Youth LEAD's Regional Healthcare Worker Sensitisation Training Manual for YKPs that has existing buy-in from health ministries and will be continuously promoted moving forward.

Small grants remain an essential form of financial support for trans- and youth-led organizations, but consistent core funding support is necessary to realize capacity building goals. Without appropriate funding allocation, skills gained have minimum impact.

## THPED438

### Healthcare and service provider perspectives on uptake and use of pre-exposure prophylaxis in young Australians

S. Warzywoda<sup>1,2</sup>, A. Dyda<sup>1</sup>, L. Fitzgerald<sup>1</sup>, A.B. Mullens<sup>3</sup>, J.A. Fowler<sup>1</sup>, L. Coffey<sup>4</sup>, E. Sargent<sup>4</sup>, R. Muscolino<sup>5</sup>, C. Pickard<sup>6</sup>, J.A. Dean<sup>1,7</sup>

<sup>1</sup>The University of Queensland, School of Public Health, Brisbane, Australia, <sup>2</sup>University of New South Wales, Kirby Institute, Sydney, Australia, <sup>3</sup>University of Southern Queensland, School of Psychology and Wellbeing, Centre for Health Research, Institute for Resilient Regions, Ipswich, Australia, <sup>4</sup>Queensland Positive People, Brisbane, Australia, <sup>5</sup>Queensland Council for LGBT Health, Brisbane, Australia, <sup>6</sup>Open Doors Youth Service, Brisbane, Australia, <sup>7</sup>The University of Queensland, Poche Centre for Indigenous Health, Brisbane, Australia

**Background:** The Australian Pharmaceutical Benefits Scheme (PBS) expanded in 2021 allowing access to HIV pre-exposure prophylaxis (PrEP) for young people <18 years. Healthcare providers (e.g. general practitioners, HIV specialists, Nurses) and service providers (e.g. HIV support organisations), are important for PrEP awareness, education, access, and provision under the PBS. This study aimed to investigate provider experiences, and perceptions about PrEP uptake and use for young people aged <24 years in Australia.

**Methods:** An online cross-sectional survey of healthcare/service providers across Australia was conducted between February-November 2023. Survey data, including participant demographic, healthcare provider perceptions on sexual health behaviours, HIV prevention and PrEP use in young people (<24 years), were analysed using Stata Statistical Software:Release 17. Descriptive and inferential analyses were conducted to investigate provider experiences and perspectives.

**Results:** The final sample consisted of 122 healthcare/service providers, 40.2% (49/122) were nurses, 18.0% (22/122) general practitioners and 11.5% (14/122) HIV community educators/support officers. Over half reported currently having HIV clients/caseload (59.8%, 73/122) and 45.1% (55/122) were eligible PrEP prescribers in Australia. Providers with a HIV caseload were significantly more likely than non-caseload providers to initiate conversations about PrEP with young people of all ages but how often conversation were initiated decreased with client age for all providers-18-24-year-olds (84.93% vs 79.49%, p<0.001), 16-17-year-olds (57.53% vs 41.03%, p<0.001) and <16-years-olds (17.81% vs 10.26%, p<0.001). Only 38.2% (21) of the 55 prescribers indicated that they were aware of the PBS changes for <18-year-olds, 47.6% (10/21) of these prescribers indicated changed prescribing habits and 42.9% (9/21) reported their PrEP conversations with young people had changed following PBS changes, but only 1 provider (1/21) indicated the uptake of PrEP had increased.

**Conclusions:** Our study highlights low awareness of the 2021 PBS lifting of restrictions, limiting use of PrEP to >18-years. This combined with the reported lack of practice change and low rates of PrEP prescribing may be placing young people at risk. Greater community and provider awareness of PBS changes, increased prescriber and other healthcare/service provider training and universal sexual education in schools were identified as pivotal strategies to promote PrEP uptake and adherence for young people.

## THPED439

### Innovate and engage: Nudgeathons in action for PrEP provision among gay men and other men who have sex with men in South Africa

S. Bokolo<sup>1</sup>, P. Mistri<sup>1</sup>, C. Govathson<sup>1</sup>, L. Vezzi<sup>1</sup>, N. Ndlovu<sup>1</sup>, J. Miot<sup>2</sup>, C. Chetty-Makkan<sup>1</sup>, J. Pienaar<sup>3</sup>, B. Maughan-Brown<sup>4</sup>, H. Thirumurthy<sup>5</sup>, S. Pascoe<sup>1</sup>, A. Bittenheim<sup>6</sup>, L. Long<sup>2</sup>

<sup>1</sup>Health Economics and Epidemiology Research Office, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, <sup>2</sup>Boston University School of Public Health, Department of Global Health, Boston, United States, <sup>3</sup>Aurum Institute, Johannesburg, South Africa, <sup>4</sup>Southern Africa Labour and Development Research Unit, University of Cape Town, Cape Town, South Africa, <sup>5</sup>University of Pennsylvania, Department of Medical Ethics and Health Policy, Perelman School of Medicine, Philadelphia, United States, <sup>6</sup>University of Pennsylvania, Department of Family and Community Health, School of Nursing, Philadelphia, United States

**Background:** Improving the performance of HIV programs requires collaboration and innovation to design interventions that align with client needs. Nudgeathons are events in which novel, behaviourally informed solutions to a particular problem can be rapidly crowdsourced. Given their limited use in the HIV response, the Indlela nudge unit hosted its inaugural nudgeathon in March 2023 to identify potential ways to increase uptake and persistence of oral PrEP among gay men and other men who have sex with men (MSM).

**Description:** We conducted a 2-day nudgeathon in Johannesburg and designed activities that followed elements of Indlela's NUDGE framework for identifying behavioural solutions:

1. Narrow the behavioural problem,
2. Understand the context,
3. Discover insights about barriers to the behaviour,
4. Generate solutions and
5. Evaluate the solutions.

A person-centred approach to crafting interventions was adopted, which leveraged several behavioural science tools; including user journey maps to understand the context; the COM-B (Capability, Opportunity, Motivation-Behaviour) model to identify behavioural barriers; and the EAST (Easy, Attractive, Social, Timely) framework to generate behaviourally informed ideas.

**Lessons learned:** The nudgeathon included a diverse group of 25 participants, including behavioural scientists and health service providers. Over 2-days, 600 ideas for promoting sustained PrEP use were identified. Through an iterative process of refinement and selection, participants and an adjudication panel identified three promising ideas:

1. Packaging to improve engagement in event-driven (ED) PrEP;
2. Mobile PrEP delivery; and,
3. Simplifying PrEP access at health clinics.

Subsequently, one participating organisation implemented a variation on the strategy to promote ED PrEP and integrated this into its existing MSM program. PrEP starter packs including an HIV self-test and first dose of ED-PrEP were distributed at nightclubs, multiple pride and community events across 2 provinces with a formal evaluation pending.

#### Conclusions/Next steps:

Nudgeathons are a promising way to apply behavioural insights to challenges in HIV prevention and generate solutions to those challenges that can be rapidly integrated into health programs and evaluated.

## THPED440

### Practicing rights-based approaches - an effective tool for increasing meaningful involvement of PWIDs and spouses of HIV-positive PWIDs to access project-specific harm reduction services

S. Shah<sup>1</sup>, R. Khan<sup>2</sup>

<sup>1</sup>Bridge Consultants Foundation, Executive Director, Karachi, Pakistan, <sup>2</sup>Bridge Consultants Foundation, Program Management, Karachi, Pakistan

**Background:** A predominant mode of HIV transmission in Pakistan is injecting drug use. 48.70% HIV prevalence rate among PWIDs was documented in Karachi as reported in the Integrated Biological and Behavioral Surveillance in Pakistan 2016-17. Criminal labeling, severe stigma and discrimination, unfriendly behaviors by healthcare providers, no free-of-cost detox and rehabilitation facilities in government healthcare settings, limited HIV treatment centers and their short timings, violation, and abusive behaviors towards PWIDs by law enforcement agencies are the main constraints to remain PWIDs keeping distance from the limited healthcare services.

**Description:** A team of trained staff applied rights-based approaches to engage people who inject drugs (PWIDs) and their spouses during the implementation of a service delivery project focusing on HIV harm reduction. Through outreach model interventions of needle syringe exchange program, HIV testing and counseling, care and support

for PLHIVs, and spouse prevention programs were carried on in the three towns of Karachi and the entire district of Sanghar. All the relevant staff members practiced stigma and discrimination-free right-based approaches to engage the target groups not only for the services but linkages with the referral networks.

The data shows the effectiveness of rights-based approaches, during 2021-2023, a total of 260,725 contacts with 2,350 PWIDs and 8,400 contacts with 296 spouses of HIV-positive PWIDs were established for the service delivery. 3,698 HTC services to PWIDs and 968 to the spouses were offered while 200 PWIDs and 14 spouses were identified as HIV positive, the HIV incidence rate was 5.41% among PWIDs and 1.02% among the spouses of HIV-positive PWIDs. 193 (90.19%) HIV-positive clients including all 14 spouses were registered with HIV treatment centers for the treatment.

307 clients were linked with the referral network for advanced medical care, and 207 PWIDs were linked with a 45-day ART adherence program. A total of 3 spouses were linked with the PPTCT center.

**Lessons learned:** Rights-based approaches help clients understand their rights and responsibilities and participate in improving their quality of life, leading to increased trust between staff and clients and improved access to available services.

**Conclusions/Next steps:** Service delivery will be stigma and discrimination-free to enhance client involvement and benefit.

## THPED441

### Addressing HIV/AIDS and chemsex harm reduction challenges: lessons learned from Taiwan's therapeutic communities

P. Huang<sup>1</sup>, C.-W. Li<sup>2</sup>, S.W.-W. Ku<sup>3</sup>, C. Strong<sup>4</sup>

<sup>1</sup>National Taiwan University, Taipei, Taiwan, Province of China, <sup>2</sup>National Cheng Kung University/Center for Infection Control and Department of Internal Medicine, Tainan, Taiwan, Province of China, <sup>3</sup>Division of Infectious Diseases, Department of Medicine, Taipei City Hospital Renai Branch, Taipei, Taiwan, Province of China, <sup>4</sup>National Cheng Kung University/Department of Public Health, College of Medicine, Tainan, Taiwan, Province of China

**Background:** Taiwan has made significant progress in combatting AIDS, but the syndemic of HIV/AIDS and chemsex among MSM remains a concern for frontline healthcare providers. Since 2017, the Taiwanese government has allocated over US \$500 million to implement the New Generation Anti-Drug strategies, establishing "therapeutic communities" (TCs). These TCs integrate HIV care systems and harm reduction services, showcasing the integration of chemsex healthcare and HIV services into the daily lives of the community.

**Description:** Within TCs, residential treatment facilities adopt a "living together within a residential community" approach to deliver health services. Since 2017, six TCs have emerged in Taiwan to provide harm reduction services to key populations. While existing literature has examined TCs' capacity to deliver services and enhance residents' mental stability, limited attention has been given to how TCs implement HIV sciences in their daily operations. Based on qualitative fieldwork conducted in three Taiwan TCs, this study reported how bottom-up community living and cultural interventions can shape the knowledge and well-being of key populations in the syndemic context of HIV and chemsex.

**Lessons learned:** Between 2022 and 2023, interviews were conducted with six TC health practitioners (including executives and social workers) and twelve residents across three TCs. Evaluation of programs in these TCs revealed variations in how they engage with HIV sciences, employing biomedical, psychological, and spiritual approaches. TCs crafted narratives aligned with their organizational missions, interpreting "chemsex harm" differently, ranging from withdrawal and harm reduction to recovery. Most programs underscored the importance of self-efficacy while implicitly discouraging group dynamics. TCs employing biomedical and spiritual approaches tended to overlook the influence of sexual identities, resulting in harm reduction discourses that oversimplified the diversity of sexual identities among MSM. Romantic relationships were perceived as potential barriers to group cohesion. Despite benefiting from TCs' services, some MSM residents reported difficulties in achieving full recovery within a cohabiting, controlled community setting.

**Conclusions/Next steps:** Taiwan's TCs hold promise in addressing HIV/AIDS and chemsex, emphasizing the significance of "learning from the community." However, challenges related to navigating sexual identity and relationships persist. Ongoing adaptation is essential to better support key populations and further enhance the effectiveness of TC programs.

## THPED442

Seeking sexual partners through digital platforms, a window of accelerated HIV vulnerability among female sex workers(FSW) in south western Uganda

F. Lukabwe<sup>1</sup>, E. Tumwesige<sup>1</sup>, P. Nabimanya<sup>1</sup>, K. Ondenge<sup>2</sup>, P. Saha<sup>3</sup>, Y. Wangui Machira<sup>2</sup>, J. Mukherjee<sup>4</sup>, S.u. Hadi<sup>5</sup>, N. Kyegombe<sup>1</sup>, R. Kawuma<sup>1</sup>

<sup>1</sup>MRC/UVRI and LSHTM Uganda Research, Social Aspects of Health Across the Life-Course Programme, Entebbe, Uganda, <sup>2</sup>International Aids Vaccine Initiative, Social Behavioral Sciences, Nairobi, Kenya, <sup>3</sup>International Aids Vaccine Initiative, Research and Development, Gurugram, India, <sup>4</sup>International Aids Vaccine Initiative, Access, Research and Development, Gurugram, India, <sup>5</sup>International Aids Vaccine Initiative, Research and Development, Delhi, India

**Background:** Digital platforms have become increasingly common avenues for meeting sexual partners. Sex workers of ages between 18 to 30 are turning to online platforms such as WhatsApp, Facebook to seek sexual partners because of the increased availability of smart phones. We set out to assess the risky behaviors associated with digital platforms and how they increase vulnerability among female sex workers.

**Methods:** The DigiTapp study was conducted in Uganda, South Africa and India to understand digitally driven risk networks in Key populations. We conducted 12 in-depth interviews and 6 focus group discussions from March through to May 2023 with sex workers of ages between 24-40 years in Lukaya a town known for high HIV prevalence. The interviews were carefully transcribed and subjected to thorough thematic analysis.

**Results:** Although majority of sex workers appeared to rely on feature phones to connect to their regular clients and to new ones through referrals, our analysis indicated that a growing number of sex workers are aware of and use online platforms such as WhatsApp, Facebook, TikTok for seeking sexual partners. The increasing adoption of digital channels among sex workers was attributed to various advantages that included the ability to connect with a larger pool of potential clients, privacy and increased earning potential as digital partners are recognized for offering higher compensation. Digital channels also facilitated risky behaviors such as coercion into sex, sexual violence, unprotected sex, limited opportunity for HIV testing and meeting relatively more sexual partners which could increase HIV transmission.

**Conclusions:** While digital platforms offer increased accessibility to potential partners, they also exposed women to greater risks that heightened their vulnerability to HIV transmission. There is need for targeted interventions, comprehensive sexual education and technology informed public health strategies to mitigate the evolving challenges faced by at-risk women in the digital era.

## THPED443

Harm reduction comprehensive package implementation in Ukrainian prisons under the martial law

D. Shevchenko<sup>1</sup>, S. Vasyliiev<sup>2</sup>, Y. Khaniukov<sup>3</sup>, Y. Kaniuka<sup>4</sup>  
<sup>1</sup>FREE ZONE, Kyiv, Ukraine, <sup>2</sup>Head of the Public Institution, Health Center of the State Criminal Executive Service of Ukraine, Kyiv, Ukraine, <sup>3</sup>Chief Specialist in Project Management and International Cooperation of the Public Health Center of the Ministry of Health of Ukraine, Kyiv, Ukraine, <sup>4</sup>Specialist in Project Management and International Cooperation of the Public Health Center of the Ministry of Health of Ukraine, Kyiv, Ukraine

**Background:** In Ukraine, injection drug use is widespread among prisoners. Limited access to sterile injecting equipment in prisons is one of the main reasons why HIV prevalence in prisons is 10 times higher than in the civilian sector. Although syringe exchange programs have been implemented in the civilian sector for 25 years, no such services were provided in prisons until 2023.

**Description:** During 2021-2023, changes were made to the law, granting every prisoner the right to carry syringes. The survey, conducted with the FREE LIFE digital app confirmed the urgent need for this. Medical and non-medical staff from 2 prisons underwent special training. A training module for outreach workers of the syringe exchange program (SEP) in prisons has been developed.

Following the training, 13 peer consultants are currently involved in SEP. In each block of 2 Ukrainian prisons, an outreach peer worker provides sterile syringes and needles, as well as counseling on harm reduction and overdose prevention, if needed. The medical staff of the correctional facilities is also involved in the SEP, facilitating the collection and disposal of used needles and syringes. Thus every prisoner can get a syringe visiting the medical unit.

**Lessons learned:** In 2023, 13 outreach workers provided more than 10,000 comprehensive service packages consisting of syringe exchange, safe use/harm reduction services/overdose-preventing counseling, and forming adherence to HIV and HCV treatment. More than 500 prisoners who inject drugs received services. The syringe exchange program increased the number of prisoners involved in preventive and treatment programs, namely, HIV and HCV testing and treatment, and participation in harm reduction programs. The syringe exchange program catalyzed more active implementation of harm reduction programs in Ukrainian prisons.

**Conclusions/Next steps:** The next step is the implementation of SEP in one more prison with the further spread of this practice to a larger number of correctional facilities in Ukraine.

Furthermore, a transition from donor to budgetary financing for a comprehensive service package is planned.

### Promoting inclusivity to the last mile: Reaching the Deaf and Hard of Hearing

L.A. Adundo<sup>1</sup>, A. Huebner<sup>2</sup>, B. Nyang'or<sup>1</sup>, R. Mwanyuma<sup>1</sup>, J. Maruti<sup>1</sup>, M. Owili<sup>1</sup>

<sup>1</sup>United States Peace Corps, Programming and Training, Kisumu, Kenya, <sup>2</sup>United States Peace Corp, Office of Global Health and HIV, Washington DC, Kenya

**Background:** In 1992, Peace Corps Kenya (PC-K) initiated the education for the deaf sector in response to the Ministry of Education's focus on education for children with special needs. Peace Corps Volunteers (PCVs) and their counterparts, with technical support from staff, have work in primary schools for the deaf, providing technical assistance to teachers, collaborate with health PCVs to facilitate behavior change communication strategies using Kenya Sign Language (KSL) in HIV/AIDS awareness and prevention efforts. PC-K also collaborates with the Ministries of Health, local administration, community-based organizations, schools and health facilities.

The objective is to identify support for DHH in accessing HIV/AIDS prevention messages through traditional HIV/AIDS prevention communication campaigns, EBI facilitation, social and mainstream media message in KSL, entertainment education through KSL videos, and Internet- and computer-based media technologies.

**Description:** PC-K trains DHH and hearing teachers from schools for the deaf in EBIs and other HIV prevention curriculum facilitation trainings to equip them as TOTs and resources for training the DHH.

Through this program, 26 TOTs in the communities have reached 1450 DHH. PCVs support counterparts to design and create learning resources translated from the curriculums using locally available materials and relevant signs for key HIV prevention messages PC-K has continued to engage with organizations supporting translation of learning resources to seek funds to improve the health literacy for DHH.

**Lessons learned:** Reaching the DHH with HIV/AIDS prevention messages faces many obstacles, lack of translated resources, evidence-based curriculum, educational videos and posters, and advert notices in mainstream media and billboards, inadequate number of signing HIV/AIDS prevention curriculum facilitators posing a significant communication barrier leading to inequality of accessing health information for health literacy thereby denying them the right to make informed health decisions.

**Conclusions/Next steps:** Translated HIV/AIDS prevention educational resources, serve as self-directed powerful learning tools for DHH not privileged to benefit from in-person education. Improving the health literacy of DHH will aid them in making proper informed health decisions enhancing their quality of life. Increased community engagement to create awareness in reducing stigma

and discrimination, continued advocacy for funding programs and innovations in technology that improve information access, will promote inclusivity and equity.

## THPED445

### Chain of Life: emergency IT decisions for displaced PLIVs and other vulnerable groups

O. Danilova<sup>1</sup>, O. Yarovenko<sup>1</sup>

<sup>1</sup>CO 100 PERCENT LIFE, Analytical Unit, Kyiv, Ukraine

**Background:** Since the beginning of the war CO 100 PERCENT LIFE started emergency actions for displaced people. Chain of Life is a CO "100 PERCENT LIFE" initiative that currently operates several shelters in Rivne, Chernivtsy and Ivano-Frankivsk oblasts, that are designed to provide shelter to people who suffer from domestic violence, discrimination and military aggression by the Russian army, for representatives of the PLHIV community, representatives of communities vulnerable to HIV, and internally displaced persons.

**Description:** Shelter services provided include:

1. Temporary shelter for up to 3-6 months for representatives of key HIV-vulnerable communities affected by military aggression,
2. Social support to ensure round-the-clock social support of clients,
3. Social support to clients of the shelter, regarding obtaining medical and legal assistance, as well as obtaining state social guarantees and services,
4. Psychological support to clients of the shelter and members of their families with whom they are staying in the shelter;
5. Humanitarian aid to residents (food and hygiene kits). There is also a transport service for moving people. For better linkage of these services, a digital customer relationship management tool (CRM) has been deployed for 5 shelters in Lviv, Ivano-Frankivsk, Chernivtsi, Rivne, and Kyiv region, 20 licenses were distributed, and training for users was conducted. Functionalities of accounting, shelter accounting, and statements for exchanging client needs are fully working.

**Lessons learned:** In the conditions of war, implemented activities require urgent actions and changes. Our general conclusion is that in the current conditions in which Ukraine and its citizens, NGOs and government institutions are, it is necessary to react quickly, to be ready for unforeseen risks that arise, and to be flexible in these conditions, unpredictable issues arise out of control and long-term planning is not possible

**Conclusions/Next steps:** More shelters need to be connected to the chain, more training should be done for specialists involved in CRM data circulation, it is easier to use the IT system instead of calling and directly interfering with other parties. Extremely important to input correct data in time.

## THPED446

### Mechanism of economic and relationship stressors in mental health and substance use problems and suggestions for targeted interventions: qualitative feedback from adults living with HIV in Lesotho

G.H. Yoon<sup>1</sup>, N.E. Johnson<sup>1</sup>, N. Tschumi<sup>1</sup>, I. Falgas Bague<sup>2</sup>, M. Mokhu<sup>3</sup>, M. Mokebe<sup>3</sup>, P. Mahlatsi<sup>3</sup>, L.D. Malebanye<sup>1,3</sup>, A. Van Heerden<sup>4</sup>, N.D. Labhardt<sup>1</sup>, J.M. Belus<sup>1</sup>

<sup>1</sup>University Hospital Basel, Clinical Research, Basel, Switzerland, <sup>2</sup>Swiss Tropical and Public Health Institute, Department of Epidemiology & Public Health, Allschwil, Switzerland, <sup>3</sup>SolidarMed Lesotho, Butha Buthe, Lesotho, <sup>4</sup>Human Sciences Research Council, Sweetwaters, South Africa

**Background:** About a fifth of adults in Lesotho live with HIV. People with HIV (PWH) are vulnerable to mental health and substances use (MH/SU) problems. Recent population-level data in Lesotho reveal that only a small proportion of individuals with MH/SU problems recognize the need to access MH/SU services. We examined local perceptions, needs, and drivers of MH/SU problems to understand this treatment gap.

**Methods:** We recruited adult PWH with past year history of mild depressive symptoms or risky alcohol consumption from November to December 2022 in the Butha-Buthe and Mokhotlong districts of Lesotho. Semi-structured individual interviews were conducted with 28 individuals in Sesotho (local language) and translated and transcribed to English. Thematic analysis was conducted by two coders, with 30% of transcripts double coded.

**Results:** Participants were mostly female (83%), had a median age of 44 (IQR 38-55), and living in Butha Buthe (77%).

As presented in the figure, participants' perceived drivers of MH/SU issues in their community were a result of economic hardship and difficulties with close relationships. Trying to solve these complex issues without agency and/or tangible resources as lead community members to

feeling helpless. Persistent helplessness then escalates to MH/SU problems, which go untreated and further reduce the likelihood that individuals can improve their economic state or interpersonal relationships.

Participants suggested strategies that could ameliorate the cycle of MH/SU problems and address the unmet need of MH/SU in their community, which fell into three main categories: economic empowerment, MH/ SU counseling and public education to raise awareness about harmful behaviors and their consequences, and social/ recreational activities as a source of community support and healthy activities.

**Conclusions:** To target the drivers of MH/SU issues among PWH in Lesotho, economic empowerment and addressing interpersonal relationships should be integrated into differentiated service delivery models to address the MH/ SU needs.

## THPED447

### Empowering key populations through community-led intervention: lessons and future directions of HIV self-testing integration for enhanced access and sustainability in Ghana

D.T. Nartey<sup>1</sup>, Y.A. Abdul Rahman<sup>1</sup>, E. Adiibokah<sup>1</sup>, H. Tagoe<sup>1</sup>, T.A. Azugnue<sup>1</sup>, Z.D. Issifu<sup>1</sup>, N. Akorli<sup>2</sup>, H. Nagai<sup>1</sup>

<sup>1</sup>JSI, Strategic Information, Takoradi, Ghana, <sup>2</sup>Ghana Health Service, Western Regional Health Directorate, Sekondi, Ghana

**Background:** HIV testing is the first step within the cascade for comprehensive service provision encouraging all persons to test and know their HIV status, and access treatment and care to ensure that HIV is no more a public health threat by 2030. However, Key Populations (KPs) in Ghana such as Female Sex Workers (FSWs) and Men who have Sex with Men (MSM) continue to face challenges accessing HIV testing. These barriers include stigma and discrimination, criminalization, fear of confidentiality breach, violence, harassment, mental health, and limited access to healthcare.

The inclusion of HIV self-testing is an alternative HIV testing program that affords KPs intervention in improving access to testing.

**Description:** The Care Continuum Project collaboration with Ghana Health Service and Civil Society Organizations (CSOs) led by KPs trained staff across the three PEPFAR regions in October 2022 on HIV self-testing. The training focused on guidelines and integration of HIV self-testing. KP community volunteers incorporated self-testing messaging in HIV prevention, treatment, and care support to peers. We leveraged the existing healthy living platform providing confidential online services through phone counseling. This enhances KP's access to information and follow-up care and support, especially for those opting for unassisted testing.

The platform facilitates reports of reactive cases, connecting them to healthcare professionals for confirmatory tests based on the national testing algorithm.

**Lessons learned:** The community-centered approach not only disseminated crucial information but also provided a supportive network, thereby breaking down barriers related to stigma and discrimination. The proportion of FSWs accessing HIV self-testing almost quadrupled from 7% (314/3481) in 2022 to 26% (1666/6342) in 2023. Similarly, uptake of HIV self-testing among MSM also increased from 4% (122/2943) in 2022 to 20% (952/4673) in 2023. The distribution of HIV self-test kits also improved testing of contacts elicited from KPs index clients whose sexual contacts preferred HIV self-test.

**Conclusions/Next steps:** The integration of HIV self-testing into the Project's strategy effectively addressed the multifaceted barriers faced by FSWs and MSM in accessing traditional HIV testing services. Tailored interventions for KPs highlight the value of community engagement through planning, implementation, evaluation, and integration HIV self-testing into the healthcare system.

## THPED448

Exploring risky sexual behavior and associated outcomes amongst 15–19-year-old learners in beyond zero supported schools through the Global Fund grant: a multi-sub-district analysis

S. Mofu<sup>1</sup>, S.L. Masiko<sup>2</sup>

<sup>1</sup>Beyond Zero, Adolescents and Young People, East London, South Africa, <sup>2</sup>Beyond Zero, Strategic Information, East London, South Africa

**Background:** Despite global efforts to curb the spread of HIV/AIDS and promote sexual health, learners aged 15–19 continue to engage in risky sexual behaviours, posing significant challenges to public health. This study focuses on Beyond Zero Supported Schools in five diverse sub-districts i.e. Nelson Mandela Bay-C, Nyandeni, Dhlabeng, Setsoto and Fetakgomo-Tubatse Sub-Districts.

The study aims to analyse relevant information on risky sexual behaviour and associated outcomes among the target group.

**Methods:** This study employs an analysis of programmatic data from Global Fund Supported initiatives to explore the risky sexual behavior and associated outcomes among learners aged 15–19 in Beyond Zero Supported Schools across five distinct sub-districts during the period of 01 April 2022 – 31 March 2023.

**Results:** Between April 1, 2022, and March 31, 2023, 51,082 girls and 22,333 boys aged 15–19 were enrolled in the program. A significant portion of both genders reported being sexually active, with disparities in condom use and a notable incidence of transactional sex. Disturbingly, 544 girls reported receiving money or goods in exchange for sex, highlighting vulnerability to exploitation. Moreover,

2,664 girls and 10 boys reported having a sexual partner five or more years older, emphasizing the need to address power imbalances. In addition, 38% of girls and 43% of boys who are sexually active reported inconsistent use of condoms during sexual activities.

Demographic Information		Sample Size	Risky Sexual Behavior among learners aged 15–19 years reported during risk assessment conducted at enrolment						Outcomes		
Age group	Gender	Learners Enrolled in the Programme	Sexually active	Age Disparate Relationships	Transactional Sex	Multiple Sexual Partners	Inconsistent Condom Use	Teenage Pregnancy	HIV Prevalence	STI Prevalence	
15–19	Female	51082	24170 (47%)	2664 (5.2%)	544 (1.06%)	1460 (2.85%)	9142 (38%)	3212 (6.3%)	203 (0.4%)	2554 (5%)	
15–19	Male	22333	11742 (53%)	10 (0.04%)	0 (0%)	1081 (4.84%)	5022 (43%)	0 (0%)	60 (0.3%)	893 (4%)	

**Conclusions:** This abstract highlight the importance of tailoring sexual health interventions to the specific needs and challenges within each sub-district, promoting a targeted and effective approach to address risky sexual behavior among 15–19-year-old learners in Beyond Zero Supported Schools. The research contributes valuable insights to the ongoing efforts to enhance comprehensive sexuality education and learner support in schools, ultimately aiming to reduce the incidence of risky sexual behaviors and improve overall well-being among the youth. The collaborative efforts of educators, policymakers, and community stakeholders are essential in creating an environment that fosters responsible sexual behavior and ensures the well-being of learners in this critical phase of their lives.

## THPED449

Strategic approach in reaching "hard-to-reach" female sex workers (FSW) virtually

R. Rani<sup>1</sup>, A. Kapoor<sup>1</sup>, M. Sivasubramian<sup>2</sup>, J. Singh<sup>2</sup>, S. Rawat<sup>2</sup>

<sup>1</sup>The Humsafar Trust, Social Work, New Delhi, India, <sup>2</sup>The Humsafar Trust, Social Work, Mumbai, India

**Background:** India poses challenges in reaching out to female sex workers (FSWs) despite increase in clients accessing sex workers virtually. Many sex workers do not prefer to be labeled and hence are not reached out through traditional ways of outreach. The network operators/ gatekeepers/ pimps are main access points to the sex work negotiation and deal-making as this provides safety to the FSWs

During the negotiations and dealing, the brokers make deals on the money, time, and venue with no discussion of safe sex practice. Hence FSWs are often left out of the ambit of existing HIV intervention programs and are vulnerable to HIV/ STIs.

**Description:** NETREACH is a pan-India virtual intervention program implemented by The Humsafar Trust, using platforms such as dating apps, private chatrooms, web-

site and social media profiles such as whatsapp, Instagram and Facebook- it was found that these profiles are operated by the gatekeepers/ brokers. This increased the challenge in directly understanding situations faced by of the FSWs through virtual modes.

Developing rapport, sensitising gatekeepers/operators, building trust by arranging condoms and offering health services leads to discreetly meeting the FSWs in gatekeepers presence.

FSWs discuss cervical cancer, HIV- STI, medicines and other health-based services. Arranging mobile health van increases possibility of testing immediately.

**Lessons learned:** Operators and FSWs showed limited knowledge of safe sex, HIV- STI and need for medicines in crises making FSWs vulnerable to infections. Additionally, fear of disclosing sexual encounters lowered the chances of FSWs seeking healthcare.

Many FSWs in semi-urban and rural areas shared no knowledge of testing centres.

FSWs shared that the timeslots and locations were inconvenient to get tested at Government based centres.

**Conclusions/Next steps:** New strategies need to be designed to reach and address concerns of FSW and their gatekeepers. The new program needs to have options for community-based testing, HIV self-test or mobile van availability to enable the FSWs to get tested at their convenience. The testing centre needs to include confidential and sensitised counseling for sex worker community alongwith convenient timeslots.

Additionally, a bouquet of health services to be offered such as breast cancer, cervical cancer while discussing HIV and STI.

## THPED450

Impact of close relationship between site's community team and community-based peers on retention of women at high- risk for HIV in clinical trial studies at Baylor-Uganda Clinical Research Site

R. Nabukenya<sup>1,2</sup>, F. Nakiyingi<sup>3</sup>, C. Ssuuna<sup>4</sup>, S. Kabs Kesande<sup>2</sup>, B. Nantume<sup>2</sup>, V. Korutaro<sup>2</sup>, M. Montevalli<sup>5</sup>, A. Kekitiinwa<sup>2</sup>, P. Nahirya Ntege<sup>2</sup>

<sup>1</sup>Baylor College of Medicine Children's Foundation-Uganda CRS# 31798, Research, Kampala, Uganda, <sup>2</sup>Baylor College of Medicine Children's Foundation Uganda, Research, Kampala, Uganda, <sup>3</sup>Baylor College of Medicine Children's, Research, Kampala, Uganda, <sup>4</sup>Baylor College of Children's Foundation Uganda, Research, Kampala, Uganda, <sup>5</sup>Johns Hopkins University, School of Medicine, Baltimore, United States

**Background:** Baylor Uganda CRS conducts HIV prevention studies to evaluate the safety and efficacy of PrEP products in reducing HIV transmission among high-risk women. Various strategies were employed to ensure safe par-

ticipation throughout the trial. We share our experience in ensuring participant retention throughout the study life cycle, including the COVID lockdown period.

**Description:** The Baylor Uganda CRS community team closely collaborated with community-based peers from the early phase of the study's implementation. The site's community team engaged with stakeholders and community-based organizations that serve high-risk women. These organizations connected them with their community-based peers, who trained the sites' community team on how to respectfully engage potential participants. Meanwhile, the site's community team trained them on informed and voluntary participation. The peers also conducted group sensitization and mobilization activities within their hotspots.

Once participants were recruited, the team carefully documented their location and phone contacts for reminder calls and regularly reviewed this information for accuracy. Each participant was also connected with a peer who helped locate them when needed. Home visits were conducted upon permission granted by the participant and the peers helped establish trust during these visits. These visits were ideal for mapping, sick visits pickups, follow-up, and health education.

The site also employed the peer support model in their clinic. Selected peers supported check-in/checkout procedures and provided guidance on creating comfortable environments with a cozy waiting area for participants, including Meet-the-Peer Corner and Children's Corner to offer opportunities for connection and community building. During lockdowns, staff and participants were transported following a schedule, participants contacted a day before and visits were expedited. Field peers contacted participants to address any issues.

**Lessons learned:** Up to 90% of participants (pregnant and non-pregnant women) were retained. Some of the challenges encountered by participants were economic mobility, exodus, change of phone numbers, lack of disclosure, and locating limitations by the recruitment peers. However, peers bridged the gap and provided valuable feedback to the team.

**Conclusions/Next steps:** A multifaceted approach to participant retention encompassing enhanced communication with enrolled participants and bridging the gap between the study team and participants, results in better retention rates in HIV prevention research studies.

"Seducing" fishermen to test for HIV: a qualitative study of social network-central promoter experiences with encouraging social network members to test for HIV

P. Olugo<sup>1</sup>, S. Gutin<sup>2</sup>, J. Lewis-Kulzer<sup>3</sup>, H. Nishimura<sup>4</sup>, Z. Kwenda<sup>5</sup>, K. Agot<sup>1</sup>, B. Ayieko<sup>1</sup>, L. Oluoch<sup>1</sup>, D. Angawa<sup>1</sup>, H. Thirumurthy<sup>6</sup>, C. Camlin<sup>3,4</sup>

<sup>1</sup>Impact Research and Development Organization, Research, Kisumu, Kenya, <sup>2</sup>University of California, Community Health Systems, School of Nursing, San Francisco, United States, <sup>3</sup>University of California, Obstetrics, Gynecology and Reproductive Sciences, San Francisco, United States, <sup>4</sup>University of California, Medicine, Division of Prevention Science, San Francisco, United States, <sup>5</sup>Kenya Medical Research Institute, Centre for Microbiology Research, Kisumu, Kenya, <sup>6</sup>University of Pennsylvania, Center for Health Incentives and Behavioral Economics, Philadelphia, United States

**Background:** Fishermen, a priority population in Kenya's HIV response, experience low HIV awareness and limited engagement in prevention and treatment. To address sub-optimal HIV testing among them, we conducted a cluster randomized control Owete trial (NCT04772469) engaging highly central fishermen in their social networks as HIV testing promoters.

This abstract reports on a qualitative study of promoter experiences with HIV self-test (HIVST) kit distribution at 3-month follow-up.

**Methods:** Network-central promoters from both control and intervention arms from three beach communities in Siaya County, Kenya were trained on HIV literacy and testing. Intervention arm promoters received extra training on distributing HIVST kits and transportation vouchers for confirmatory testing at local public clinics. Control arm promoters received HIV test vouchers for redemption at local public clinics. Thirty in-depth interviews (IDIs) were conducted at three months, purposively sampling promoters based on age (<35 and ≥35 years) and beach community. The in-depth interviews were audio-recorded, transcribed/ translated into English. Through an iterative process, a codebook was developed, transcripts were inductively coded, and a framework analysis was conducted to identify themes.

**Results:** Promoters reported positive experiences with HIVST and voucher distribution. Most experienced no challenges with HIVST distribution, educating cluster members, providing HIVST instructions, interpreting results, or encouraging linkage to treatment. Using a one-on-one approach at homes, promoters explained HIVST kits patiently. Some described the importance of introducing the topic slowly to "seduce" cluster members to test. Instruction on HIVST or voucher use was considered "easy." Promoters facilitated the normalization of HIV testing and engagement in treatment by encouraging

testing and dispelling fears of positive results. Control promoters faced challenges, including appearing empty-handed with only testing vouchers, men preferring HIVST kits over facility testing, and some questioning the efficacy of HIVST.

**Conclusions:** Network central promoters consistently reported positive experiences with HIVST distribution and promoting linkage to prevention and care services in their social networks. Social network approaches are a promising method for increasing HIVST uptake and normalizing testing among hard-to-reach fishermen.

## THPED452

Factors associated with condom use among men who engage in online transactional sex in Canada

T. Hedrich<sup>1,2</sup>, J. Castro Avila<sup>3</sup>, R. Diagne<sup>4</sup>, G. Daunais-Laurin<sup>5</sup>, J. Grail<sup>5</sup>, E. Benoit Tessier<sup>5</sup>, A. Gauthier<sup>5</sup>, R. Delabre<sup>3</sup>, A. Dumont Blais<sup>5</sup>, D. Rojas Castro<sup>3,6</sup>

<sup>1</sup>Coalition des Organismes Communautaires Québécois de Lutte contre le Sida (COCQ-SIDA), Montreal, Canada, <sup>2</sup>Université du Québec à Montréal (UQAM), École de Travail Social, Montreal, Canada, <sup>3</sup>Coalition PLUS, Laboratoire de Recherche Communautaire, Pantin, France, <sup>4</sup>Coalition PLUS, Laboratoire de Recherche Communautaire, Dakar, Senegal, <sup>5</sup>RÉZO, Montreal, Canada, <sup>6</sup>Université Aix-Marseille, Inserm, IRD, SESSTIM, Sciences Économiques & Sociales de la Santé & Traitement de l'Information Médicale, ISSPAM, Marseille, France

**Background:** Men who engage in online transactional sex (OTS; i.e. exchanging sexual services for money, goods or services via the Internet) remain underrepresented in studies and interventions targeting key populations.

This study aims to identify the factors associated with condom use among this population to assess the prevention of HIV and other STBBIs for this population.

**Methods:** ANRS-SEXTRA is a cross-sectional community-based research study conducted in eight countries on men (cis and trans) and trans women offering OTS. In Canada, data on men were collected via an online questionnaire (August 2021-May 2022). Although trans women were included in the study population, no respondents identified as such.

In addition to sociodemographic questions and questions about their experience in OTS, the participants were asked about how often they used condoms during anal or vaginal intercourse with their clients, with response options including never, sometimes, or always. Multivariate ordinal regression was employed to identify the factors associated with condom use frequency.

**Results:** The analysis included 89 participants, 19 of whom were living with HIV (18/19 undetectable). Of the participants, 33.7% reported never using condoms, 33.7% reported sometimes using them, and 32.6% reported always using them. 61.8% reported that their clients requested

not to use condoms or paid them more not to use them. 12.4% responded that OTS was seen as an obligation rather than a chosen activity. Multivariate analysis indicated that condom use was less frequent among individuals whose clients requested no condom use (OR[95%-CI]: 0.14[0.05-0.37]) and among people living with HIV (OR[95%CI]: 0.15[0.04-0.54]). Conversely, condom use was more frequent among those who perceived OTS as an obligation (OR[95%CI]: 6.28[1.29-30.6]).

**Conclusions:** This study contributes to the limited research on the needs, practices and access to prevention and care of men involved in OTS. The frequency of condom use was affected by external constraints, such as client demands, and feeling that OTS was an obligation. People living with HIV tend to use condoms less frequently, which may suggest less concern about other STBBIs and a good appropriation of the U=U message. The results will be used to adapt prevention campaigns for men engaging in OTS.

## THPED453

Expanded strategy to reach out to key populations in virtual spaces: connecting through a virtual network under community system strengthening (CSS) in India

V. Kurne<sup>1</sup>, S. Rajan<sup>2</sup>, S. Bhavsar<sup>3</sup>, S. Agarwal<sup>1</sup>, S. Pandey<sup>1</sup>, M. Sivasubramanian<sup>4</sup>, S. Shekhar<sup>1</sup>, U. Das<sup>1</sup>

<sup>1</sup>Hindustan Latex Family Planning Promotion Trust, HIV & TB, Noida, India, <sup>2</sup>National AIDS Control Organisation, HIV, Delhi, India, <sup>3</sup>National AIDS Control Organization, HIV, Delhi, India, <sup>4</sup>The Humsafar Trust, HIV, Mumbai, India

**Background:** Evolving patterns of interaction, such as virtual informal groups and dating apps (Grindr, Tinder, etc), among at-risk populations (FSW, MSM, TG/H, and PWID), have created an ideal environment for the acquisition of HIV, and STIs. The Community Championship (CC) initiative under CSS has established a robust network of community representatives within localities. Through their social networking efforts (Expanded community outreach), which involves engaging with members in virtual groups, dating apps, etc., these representatives share crucial information, assess risks, and facilitate access to HIV-related services provided by the national program.

As per the India HIV Estimates 2022, the HIV prevalence among the general population is 0.20% whereas among the high-risk groups, it is 1.85% (FSW), 3.26% (MSM), 3.78% (TG) and 9.03% (IDUs).

**Description:** The Community Champions (CCs) serve as a vital link between the community and the National Programme to facilitate enhanced outreach to the unreached or hidden population. Under the CSS, key populations were involved and nominations for CCs were received. These individuals were capacitated on 6 capacity building modules on strengthening community partici-

pation. These CCs have established connections with fellow community members in virtual spaces disseminated essential information on the prevention and control of HIV and STIs and facilitated their access to service provisions.

**Lessons learned:** In the initial phase, 43 Community Champions were engaged as 'NETREACH Peers' for virtual outreach. Through this outreach, they screened 2509 KPs for HIV and identified 11 positive cases. Of them, 7 were linked with ART services within 6 months. Proactive engagement by CCs in disseminating information, assessing risks, and facilitating connections to essential services proved to be a successful strategy highlighting the importance of expanded outreach in virtual space.

**Conclusions/Next steps:** The engagement of community representatives through the Community Championship initiative under CSS effectively addresses evolving patterns of interaction within at-risk populations on virtual spaces. The approach's ongoing success depends on sustaining and expanding the Community Resource Pool. Leveraging a network of 4250 trained CCs from key populations, PLHIV, and Youth from KP is crucial to reach out to the unreached virtual population.

## THPED454

Culture as healing: addressing gaps in the 95/95/95 targets among Indigenous people living with HIV in British Columbia, Canada

S. Elliott<sup>1</sup>, R. Baltzer-Turje<sup>1</sup>, P. Smith<sup>1</sup>, C. Barton<sup>1</sup>, S. Vasquez<sup>1</sup>, K.J. Clark<sup>1</sup>, N. Basri<sup>1</sup>, P. McDougall<sup>1</sup>

<sup>1</sup>Dr. Peter Centre, Vancouver, Canada

**Background:** In Canada, Indigenous people are 2.7 times more likely to be diagnosed with HIV. Additionally, Indigenous people face significantly worse outcomes at every level of the province of British Columbia's 95-95-95 targets on HIV diagnosis, treatment, and viral suppression. As a result, increasing engagement in HIV/AIDS prevention and treatment among Indigenous people through improving the cultural safety of health care services, is key in Canada's HIV response, and a key gap to be addressed in the progress made toward provincial and national HIV/AIDS targets.

**Description:** The Dr. Peter Centre (DPC) launched services in 2022 to address these unique challenges faced by Indigenous people living with HIV. Approximately 30-40% of the Centre's 350+ Day Health participants self-identify as Indigenous. The program, led by Indigenous staff consisting of a Facilitator, Elders, Cultural Workers, and Knowledge Keepers, integrates ceremony, cultural and artistic activities, traditional medicines, and practices into health care services.

The program hosts cultural gatherings, art and music activities, culture-inspired food programs, storytelling sessions, and counselling services.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Lessons learned:** The program has yielded encouraging outcomes. Program evaluation indicates participants appreciate reconnecting with their culture, fostering a sense of welcomeness and engagement within the DPC and the broader community. Success is attributed to incorporating the voices of Indigenous participants into program design, ensuring Indigenous-led and run programming while educating non-Indigenous staff and leadership. Through a lens of reconciliation, staff are learning to see the value and beauty of Indigenous culture and ceremony. The DPC aims to create a more inclusive healthcare environment nationally by elevating Indigenous voices and fostering collaboration.

Efforts also involve decolonizing spaces and services and enhancing Indigenous representation at all levels within the organization.

**Conclusions/Next steps:** The DPC's healing and reconciliation work, centered around this program, aims to provide essential services while addressing systemic issues contributing to health disparities among Indigenous populations.

The program seeks to scale up best practices for other non-Indigenous frontline organizations, offering culturally relevant initiatives to meet the population's specific needs. This includes guidance on reducing barriers to health care services, increasing access to culturally relevant spaces, and supporting health care organizations to effectively assist their Indigenous clients.

## THPED455

HIV information dissemination for HIV service uptake: a case of PrEP up take among adolescent girls and young women in sex work in hard to reach areas of Uganda

N. Proscovia<sup>1</sup>, Sex Workers

<sup>1</sup>WONETHA, Programs, Kampala, Uganda

**Background:** In Uganda, HIV Prevalence among Female sex workers (FSW) is 37% and FSW account for 18% of the new infections in the country. Pre-exposure prophylaxis (PrEP) is the only female controlled strategy that can be used to reduce infections and transmissions. Studies indicate high acceptability of PrEP by sex workers but their willingness to take it is low. Lack of appropriate information is one of the reasons for low uptake of PrEP. WONETHA received funding from Viiv to reduce the incidence of HIV infection and HIV/AIDS related morbidity and mortality among adolescent girls and young women selling sex in Uganda in line with the UNAIDS 95-95-95 targets for epidemic control.

**Description:** From the base line assessment carried out, 20% of the AGYW were taking PrEP, 40% knew about PrEP but were not taking PrEP while the 60% were ignorant about the PrEP. WONETHA embarked on deliberate sensitization of the AGYW on the benefits of using PrEP.

WONETHA, in collaboration with health workers from public health facilities mobilize, sensitize and test AGYW in sex work in their hotspots. Those with HIV negative results are given more information and encouraged to enroll for PrEP and followed up for timely refill of PrEP to ensure adherence.

### Lessons learned:

- During the Programme intervention of one year, PrEP uptake among AGYW in sex work increased from 20% to 50% due to the information given during the outreaches.
- Fears and myths around PrEP that hindered PrEP uptake among AGYW are addressed through giving correct information.
- New science in Prevention and Treatment need to be communicated to the grass root population who are the targeted beneficiaries.
- Stigma around PrEP due to its resemblance to ART affected the uptake of PrEP.
- Continuous sensitization is critical to keep AGYW on treatment and while motivating others to enroll on PrEP.

### Conclusions/Next steps:

- Appropriate information and addressing myths around PrEP lead to increased uptake of PrEP among AGYW selling sex.
- Peer encouragement and support improves adherence to PrEP and yield positive outcomes of PrEP.
- Information about the new science of injectable PrEP and its availability should be scaled up to address the stigma related to the PrEP Tab.

## THPED456

The hidden epidemic: the impact of discrimination and internalized homonegativity on depression in Brazilian young men and non-binary individuals who have sex with men

C. M. Jalil<sup>1</sup>, E. M. Jalil<sup>1</sup>, C. Coutinho<sup>1</sup>, M. Ramos<sup>1</sup>, B. Hoagland<sup>1</sup>, S. W. Cardoso<sup>1</sup>, R. Scarparo<sup>1</sup>, V. G. Veloso<sup>1</sup>, E. C. Wilson<sup>2</sup>, W. McFarland<sup>2</sup>, B. Grinsztejn<sup>1</sup>, T. S. Torres<sup>1</sup>, the Conectad@s Study Team

<sup>1</sup>Oswaldo Cruz Foundation (Fiocruz), Evandro Chagas National Institute of Infectious Diseases (INI), Rio de Janeiro, Brazil, <sup>2</sup>San Francisco Department of Public Health, Center for Public Health Research, San Francisco, United States

**Background:** HIV rates are rising among Latin American youth. Discrimination against the LGBT community poses a risk for sexual and gender minority youth, potentially leading to internalized homonegativity, depression and risky sexual behavior. We assessed the prevalence of HIV, discrimination, depression and internalized homonegativity. We also examined the association between discrim-

ination and internalized homonegativity with depression among young men and non-binary individuals who have sex with men (YMSM) (18-24 years) in Brazil.

**Methods:** We used baseline data from the Conectad@ study, which employed respondent-driven sampling to recruit YMSM between November 2021-October 2022 in Rio de Janeiro, Brazil. Depression was measured by the Patient Health Questionnaire (PHQ-9; scores range:0-27); scores equal to or higher than 10 were indicative of depression. We used Portuguese-validated scales to measure discrimination (18-item Explicit Discrimination Scale [EDS], scores range:0-54) and internalized homonegativity (7-item Internalized Homonegativity Scale [IHS], scores range:0-42); higher scores represented higher measures. Logistic regression models were used to examine associations with depression.

**Results:** Of 409 participants (90.5% cis-MSM, 7.3% NB, 2.2% trans-MSM), 70.6% were Black/Pardo, 60.4% had secondary education or lower, and 71.0% a monthly per capita income equal to USD230 or less. Median age was 21 years (IQR:20-23). Forty participants (9.8%) tested positive for HIV (20 were newly diagnosed with HIV).

Overall, 97.1% of participants reported discrimination, 27.6% reported physical violence due to their sexual orientation, and 35.0% reported healthcare avoidance due to fear of discrimination. Depression occurred in 210 (51.3%) participants. Those with depression had higher scores of discrimination (10.8 [SD8.0] vs. 7.3 [SD5.8]) and internalized homonegativity (8.1 [SD5.8] vs. 6.5 [SD4.6]) compared to those without. In adjusted models, YMSM with depression had increased odds of discrimination (aOR1.07 [95%CI:1.04-1.12];  $p<0.001$ ) and internalized homonegativity (aOR1.06 [95%CI:1.01-1.10];  $p=0.01$ ).

**Conclusions:** Our sample had high HIV prevalence, with most YMSM reporting discrimination. Nearly one third faced violence related to sexual orientation, and depression was linked to discrimination and internalized homonegativity.

Our data emphasizes the need for an HIV response for YMSM addressing both physical and mental health, aligning with anti-discrimination and anti-homophobia efforts.

## THPED457

### Sociodemographics and psychosocial characteristics of female sex workers enrolled in "MAS por nosotras" cohort in Buenos Aires, Argentina

V. Zalazar<sup>1</sup>, I. Aristegui<sup>1</sup>, M. Loutfy<sup>2</sup>, E. Esandi<sup>1</sup>, Z. Ortiz<sup>1</sup>, V. Fink<sup>1</sup>, G. Miernes<sup>1</sup>, A. Nava<sup>1</sup>, M.C. Trejo<sup>1</sup>, R. Acuña<sup>1</sup>, N.F. Cardozo<sup>1,3</sup>, A. Exner<sup>1</sup>, M. Romero<sup>3</sup>, G. Orellano<sup>4</sup>, A. Duran<sup>5</sup>, M.I. Figueroa<sup>1</sup>, P. Cahn<sup>1</sup>, S. Walmsley<sup>2</sup>

<sup>1</sup>Fundacion Huesped, Research department, Buenos Aires, Argentina, <sup>2</sup>University Health Network, Toronto, Canada,

<sup>3</sup>Asociación de Travestis, Transexuales y Transgénero de Argentina, Buenos Aires, Argentina, <sup>4</sup>Sindicato de Trabajadorxs Sexuales de Argentina, Buenos Aires,

Argentina, <sup>5</sup>Coordination of Sexual Health, HIV and Sexually Transmitted Infections of the Ministry of Health of Buenos Aires, Buenos Aires, Argentina

**Background:** "MAS por Nosotras" is an ongoing prospective cohort study aiming to evaluate the sexual and reproductive health of cisgender (CGW) and transgender (TGW) female sex workers (FSW) and the feasibility of implementing a comprehensive healthcare package in Argentina. This work describes baseline psychosocial characteristics of the participants.

**Methods:** Consenting FSW attended an NGO healthcare service and completed questionnaires at baseline to assess: Food Security (Module of the Canadian Community Health Survey), Sex Work-related Stigma (adapted version of Grosso's Scale, 4 dimensions: Experienced and Perceived Stigma in a Healthcare Setting, Stigma from Family and Friends, and Stigma from Police); Posttraumatic Stress Disorder (PCL-5), Depression (CES-D), alcohol use (AUDIT), and Substance Use (DAST-10), Condom Use (while using substances and in the last sexual intercourse). Repeated measures X<sup>2</sup> and ANOVA were used to analyze differences between TGW and CGW.

**Results:** Between June-December 2023, 116 FSW were enrolled, 61 (52.6%) TGW and 55 (47.6%) CGW. The median age was 33.5 years (IQR= 26.8-44.3). Regarding education, 42.2% attained secondary school or higher (TGW:40.7%; CGW:44%). For most of them (91%) sex work was the main source of income (TGW:94.9%, CGW:86.5%). Only 28.9% perceived they had enough food and the kind they wanted (TGW:30.8%, CGW:27%). Most FSW (71.7%) reported using protection in the last sexual intercourse (TGW:75.9%; CGW: 66.7%). Overall, TGW showed higher alcohol use than CGW ( $p<0.001$ ), and higher frequency of substances and alcohol use before and during sexual intercourse ( $p=0.002$ ). No significant differences were found between TGW and CGW in the Food Security scale, Sex Work related Stigma and its dimensions, CES-D, PCL-5 and DAST-10.

**Conclusions:** Psychosocial health determinants were similar for CGW and TGW and are likely related to the conditions of sex work. TGW reported higher alcohol use. This highlights the need for a common approach to improve

AIDS 2024

the living and health conditions of FWS, complemented by targeted interventions on the differential risks faced by TGW. These results highlight the need of considering other moderating variables beyond gender identity and will be used to design the comprehensive healthcare package for this population.

## THPED458

Examining experiences of African American men who have sex with men (MSM) with medical providers and the healthcare system

C. Mahaffey<sup>1</sup>, R. Jeremiah<sup>2</sup>, R. Hubach<sup>1</sup>

<sup>1</sup>Purdue University, Public Health, West Lafayette, United States, <sup>2</sup>University of Illinois Chicago, Nursing, Chicago, United States

**Background:** African American MSM comprise the largest portion of new HIV diagnoses in the U.S. (39%). Trends show that HIV incidence is different across age groups among African American MSM; decreasing among younger groups while older groups are experiencing higher rates. Barriers such as homophobia, stigma, provider bias and discrimination, and medical mistrust affect their use of healthcare services and prevention tools including as PrEP; placing this population at greater risk for exposure to HIV. However, there is a dearth of research that examines differences in experiences with healthcare providers within African American MSM when considering age. The purpose of this study was to understand how experiences with medical providers and the U.S. healthcare system differ across age groups of African American MSM.

**Methods:** This was a qualitative study consisting of one-on-one, semi-structured interviews with 28 African American MSM, ages 21 to 57, from 01.01.2018 to 31.12.2020. Interviews assessed knowledge and perceptions of PrEP and experiences seeking healthcare. Through an interpretive (postmodern) approach, guided by the socio-ecological model, we performed inductive content analysis of transcribed interviews using Dedoose. Participant interviews were divided into three age groups: 20-29 years, 30-39 years, and ages 40 and older. Participants were recruited from often-understudied areas in Southwestern, Midwestern, and Southern U.S.

**Results:** Findings among African American MSM, 20-29 years, revealed themes of fear and anxiety around receiving HIV test results, stigma from medical providers, and holding a sense of shame, especially living in conservative states. Among those aged 30-39 years, men sought health care for specific issues rather than general preventative care. In addition, these men held race and gender preferences for their provider. Among those aged 40 and older, men were content and did not seek care unless there was a personal experience of a significant health scare. Across age groups, participants held similar PrEP perceptions.

**Conclusions:** In this study, the sexual health care needs of African American MSM differed by age group. Recognizing and incorporating these differences in tailored HIV prevention approaches could contribute to an uptake in PrEP use and a significant reduction in the disparity in HIV diagnosis and risk among African American MSM.

## THPED459

Out in health: sexual orientation disclosure to healthcare providers among gay, bisexual and other men who have sex with men in New Zealand

T.B. Swinburn<sup>1,2</sup>, P. Saxton<sup>1</sup>, M. Lyndon<sup>3</sup>

<sup>1</sup>University of Auckland, Social and Community Health, Auckland, New Zealand, <sup>2</sup>University of Auckland, Medical School, Auckland, New Zealand, <sup>3</sup>University of Auckland, Centre for Medical and Health Science Education, Auckland, New Zealand

**Background:** Gay, bisexual, and other men who have sex with men (GBMSM) in New Zealand (NZ) are disproportionately impacted by HIV and other STIs. Biomedical innovations such as PrEP offer new prevention tools, but these are only accessible through clinical interactions. Consequently, opportunities to prevent HIV transmission hinge on GBMSM disclosing their sexuality (disclosure) and feeling comfortable discussing sexuality (comfort) with healthcare providers (HCPs).

Prior international scholarship has investigated the role of sexuality disclosure with HIV prevention/testing, but the role of comfort is less clear. We examined these associations for the first time.

**Methods:** Data were analysed from HIV-negative GBMSM participating in the 2022 Sex and Prevention of Transmission Study, NZ's national, cross-sectional HIV bio-behavioural surveillance programme. Four 'healthcare outness' profiles were constructed based on GBMSM's sexuality disclosure and comfort discussing sexuality with HCPs: comfortable disclosers, uncomfortable disclosers, comfortable non-disclosers, and uncomfortable non-disclosers.

Frequency cross-tabulation was used to describe the profiles by sociodemographic and sexual behaviour characteristics, and logistic regression to explore associations with HIV testing/prevention outcomes.

**Results:** Overall, 2115 participants were eligible. Healthcare outness profiles varied by age, ethnicity, sexual identity, and sexual behaviours. Any degree of discomfort or non-disclosure was associated with significantly lower odds of recent HIV testing in adjusted analyses. Uncomfortable disclosers were 0.51 times (95% CI 0.28, 0.95), comfortable non-disclosers 0.25 times (0.13, 0.49), and uncomfortable non-disclosers 0.22 times (0.13, 0.36) less likely, respectively, to have tested recently for HIV compared with comfortable disclosers. Recent PrEP use showed a gradient: 35% of comfortable disclosers had

recently used PrEP, compared with 30% of uncomfortable disclosers, 10% of comfortable non-disclosers, and 7% of uncomfortable non-disclosers. Any degree of non-disclosure was associated with significantly lower odds of recent PrEP use.

**Conclusions:** In the biomedical prevention era, many GBMSM still face barriers to HIV prevention/testing, even in progressive high-income countries. Differentiated service delivery that centralises GBMSM's identities and sexual health needs can be achieved by improving HCPs' cultural competence and cultural safety, and providing alternative HIV prevention/testing access points, including at-home self-testing. GBMSM's ability to communicate about sexuality and sexual health is key to eliminating HIV transmission by 2030.

## THPED460

Substance use discrimination in healthcare and HIV status disclosure among people with HIV who inject drugs in St. Petersburg, Russia

A. Wong<sup>1</sup>, M. Vetrova<sup>2</sup>, D. Antonova<sup>3</sup>, K. Hook<sup>4</sup>, M. Alkhadro<sup>5</sup>, V. Truong<sup>6</sup>, N. Gnatienko<sup>6</sup>, A. Michals<sup>7</sup>, E. Sisson<sup>7</sup>, O. Toussova<sup>8</sup>, E. Blokhina<sup>2</sup>, D. Cheng<sup>7</sup>, W. Shan<sup>7</sup>, J. Samet<sup>6</sup>, K. Lunze<sup>6</sup>

<sup>1</sup>Boston Medical Center, General Internal Medicine, Boston, United States, <sup>2</sup>First Pavlov State Medical University of St. Petersburg, St. Petersburg, Russian Federation, the, <sup>3</sup>St. Petersburg Humanitarian Action Charitable Fund Programs, Global Fund to Fight AIDS, Tuberculosis and Malaria Project, St. Petersburg, Russian Federation, the, <sup>4</sup>Harvard T.H. Chan School of Public Health, Department of Epidemiology, Boston, United States, <sup>5</sup>Cairo University, Faculty of Medicine Kasr Al-Ainy, Cairo, Egypt, <sup>6</sup>Boston University School of Medicine, Boston Medical Center, Department of Medicine, Boston, United States, <sup>7</sup>Boston University School of Public Health, Department of Biostatistics, Boston, United States, <sup>8</sup>First Pavlov State Medical University of St. Petersburg, Department of General and Clinical Psychology, St. Petersburg, Russian Federation, the

**Background:** HIV status disclosure is an important HIV preventive strategy but, historically, has been less prevalent in Russia. People with HIV and substance use disclosure experience intersectional stigma and discrimination related to both substance use and HIV, but the link between discrimination experiences for substance use and HIV disclosure has not yet been explored.

This analysis investigated the intersectional relation of substance use-related discrimination in healthcare, stigma and current HIV status disclosure rates in an HIV key population.

**Methods:** This cross-sectional analysis involved 225 people with HIV who injected drugs and are in substance use treatment in St. Petersburg, Russia. We assessed perceived

discrimination in healthcare for substance use (frequency, total score from 7 - 35), HIV stigma score, substance use stigma score, intersectional stigma (both scores high) and HIV disclosure to either some or all friends, family, or people they live with. Logistic regression analyses examined the relationship between the independent variables—high perceived discrimination, HIV and substance use stigma—and the outcome HIV disclosure.

**Results:** Most participants (74%) disclosed their HIV status to all or some in their social network (family, friend, or person they live with). Complete nondisclosure was uncommon. Perceived discrimination in healthcare occurred commonly (score 17/35) and was not associated with HIV disclosure (AOR 1.44, 95%CI 0.69-3.00, n=223). About 1/3 (31.7%) had high intersectional stigma, and neither high HIV nor substance use stigma or intersectional stigma were associated with HIV disclosure (AOR .71, 95% CI 0.33-1.55, n=208; AOR .98, 95% CI 0.44-2.20, n=198; AOR 0.66, 95% 0.27-1.59, n=189).

**Conclusions:** Among people with HIV and substance use in Russia, HIV disclosure, specifically selective disclosure, seems to have become a widely used strategy but seemed unrelated to high HIV stigma. Discrimination for substance use is still a common experience in this HIV key population, but seemed unrelated with HIV disclosure. Discrimination's harmful effects call for interventions in Russia's healthcare environment.

## THPED461

Empowering Appalachia: a comprehensive community-driven initiative addressing syndemic challenges through vaccination advocacy and HIV/HCV testing

L. Storrow<sup>1</sup>, A.T. Young<sup>1</sup>, M. Reynolds<sup>2</sup>, L. John<sup>1</sup>

<sup>1</sup>Community Education Group, Lost River, United States,

<sup>2</sup>West Virginia University, Morgantown, United States

**Background:** The Community Education Group (CEG) initiated a comprehensive program, funded by the Centers for Disease Control and Prevention, to address declining vaccination rates and combat syndemic challenges in the Appalachian region, particularly in West Virginia.

The program aimed to promote COVID and influenza vaccine uptake while advocating for HIV and HCV testing among rural Appalachians.

**Description:** CEG, in collaboration with strategic partners and supported by the Appalachian Partnership Fund (APF), implemented initiatives across 13 states, focusing on New York, North Carolina, Maryland, Pennsylvania, Tennessee, Virginia, and West Virginia. The program involved 18 grantees, serving over 16,870 clients over a one year period. The activities included administering more than 476 COVID-19 vaccinations, conducting 811 COVID-19 tests (with 37 self-reported positives), performing 2024 HIV tests (resulting in 13 positives), conducting 884 HCV tests

(with 107 positives), administering 1046 influenza vaccinations, and providing 62 MPOX vaccinations. Both in-person and virtual outreach events exceeding 200 occurred during the reporting period.

**Lessons learned:** The outcomes highlighted the effectiveness of collaborative efforts in addressing health disparities. The initiative successfully facilitated widespread testing, vaccination, and outreach, contributing to the identification of positive cases.

"The support of CEG helped us get the tests needed for HCV and HIV testing among educational materials. We were able to leverage the dollars with other agencies to bring as much as possible to the communities we serve..." The testimonial reflects the program's impact, emphasizing the leverage of funds and the importance of community engagement in enhancing healthcare access.

**Conclusions/Next steps:** The findings underscore the significance of community-driven interventions in improving vaccination rates and addressing health crises. Lessons learned emphasize the need for continued collaboration, resource leveraging, and community involvement. The success of the program provides insights into addressing not only vaccination challenges but broader health issues, such as HIV and HCV, in underserved regions. The implications to extend to future initiatives, emphasizing the importance of tailored, community-focused approaches in public health responses.

## THPED462

### Reasons for Pre exposure prophylaxis discontinuation among Female Sex Workers in Gaborone, Botswana

N. Monnapula<sup>1</sup>, N. Hishamu<sup>2</sup>, K. Francis<sup>2</sup>, M. Madile<sup>3</sup>, W. Dikobe<sup>3</sup>

<sup>1</sup>Nkaikela Youth Group, Programmes, Tlokweng, Botswana,

<sup>2</sup>Nkaikela Youth Group, Programmes, Gaborone,

Botswana, <sup>3</sup>FHI 360, Programmes, Gaborone, Botswana

**Background:** Female Sex Workers (FSW) have a relatively high prevalence of HIV at 42.8% as compared to female general population at 26.2% in Botswana. Oral pre exposure prophylaxis (PrEP) has been found to be effective in reducing the chance of acquiring HIV when taken as prescribed. PrEP continuation is a challenge globally yet little is known about the reasons for discontinuation among FSW. To improve PrEP continuation, Nkaikela Youth group (NYG) followed up FSW enrolled on PrEP and documented the reasons for discontinuation.

**Description:** Overall, (NYG), a non-governmental organization mobilised and enrolled 610 FSW from October 2022 to September 2023 in Gaborone. FSW were given information on PrEP including benefits and side effects by the peer outreach workers (POWs) and the nurses. All FSW were followed up through telephone and reminded of subsequent appointments by NYG care officer 5 to 2 days prior

to the appointment. FSW who missed the appointment were documented on excel. Three attempts of follow up were made to understand the reasons.

**Lessons learned:** NYG enrolled FSW of the following age groups: 18-19 (8%), 20-24 (34%), 25-29 (25%), 30-35 (16%), 35-39 (10%), 40-44 (5%) and 45-49(1%). Of the 610, 366 (60%) discontinued PrEP. Reasons for discontinuation varied with majority 236 FSW reporting side effects (feeling nauseas, vomiting and diarrhoea), no longer at risk, FSW were told they can just stop PrEP by POWs, pill fatigue, no reason to take PrEP while not sick, just stop without a reason, not having transport money, no one to look after the children, influence from the family to stop. Other reasons were service provision related like closed drop in centre and unsuitable appointment dates. Twenty eight FSW were untraceable.

**Conclusions/Next steps:** The reasons cited by FSW offers an opportunity to strengthen PrEP programming. The components which needs strengthening include, PrEP education and empowerment, training for POWs on the importance of PrEP, integrated social services to cater for children, adherence support, advocacy for provision of other PrEP methods, including PrEP injectable and PrEP ring.

### Knowledge, attitudes, and perceptions of gender-based violence health services: improving support for sexual and reproductive health rights among adolescents and young persons affected by HIV in Nigeria during COVID-19 pandemic

O. Eghaghe<sup>1</sup>

<sup>1</sup>College of Medicine, University of Lagos, Community Health and Primary Care, Idi-Araba, Nigeria

**Background:** The World Health Organization (WHO) underscores the significance of addressing gender-based violence (GBV) as a public health concern, emphasizing the essential role of quality healthcare services for survivors, particularly during crises such as disease outbreaks. Healthcare providers are crucial in delivering life-saving care, especially for adolescents, young individuals, and other vulnerable groups. In Nigeria, statistics reveal that 48% of individuals aged 15-29 have encountered gender-based violence, with a mere 3% seeking GBV health services in the aftermath of such violence.

The study aimed:

1. To determine the knowledge of gender-based violence among adolescents and young persons affected by HIV,

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

2. To determine their Attitudes, and perceptions of GBV health service quality, and;
3. To assess the comprehensive access to GBV services.

**Methods:** The study was a descriptive cross-sectional study design that involved 422 participants selected using the simple random sampling method in Nigeria. Data were collected using interviewer-administered paper-based questionnaires to determine the knowledge of GBV, attitude, and perception of GBV health services and assess comprehensive access to GBV services.

Analyses were performed using IBM SPSS version 27. The bivariate analysis identified factors correlated with knowledge and attitude of GBV health services.

**Results:** Out of 422 study participants, more than three quarters (90.3%) had good knowledge of how GBV is defined and what constitutes gender-based violence, 55.7% strongly agree that there are GBV health services offered, while 18.5% have access to GBV services. Additionally, 129 participants (30.6% of total participants) reported that covid-19 pandemic is linked with gender-based violence cases. The study indicated that despite High knowledge of GBV, there is limited knowledge of GBV health services and utilization of GBV health services remained low. Age, gender, population group, sexual identity, place of residence, and educational level, Marital status, Ethnicity, religious belief, Employment status are significantly associated with knowledge, Attitude, and access to GBV services.

**Conclusions:** Coordinated actions need to be strengthened to reach Adolescents and Young Persons who remain unaware of GBV. Improving GBV service quality, bettering interventions aimed at reducing GBV among Adolescents and Young persons in Nigeria, and scaling up integrated service models, such as GBV one-stop centers.

## THPED464

Revolutionizing sexual health education for Indonesian adolescent Girls through insights into knowledge and behaviors

R.A. Setyani<sup>1</sup>, A. Probandari<sup>1</sup>, E.P. Pamungkasari<sup>1</sup>

<sup>1</sup>Universitas Sebelas Maret, Public Health, Surakarta, Indonesia

**Background:** Adolescent girls in Indonesia face a three-fold higher risk of HIV transmission compared to their male counterparts. Various obstacles hinder their access to comprehensive sexual health education, including societal, economic disparities, limited educational and healthcare access, discrimination, and violence.

This qualitative study delves into the sexual health behaviors and literacy of Indonesian adolescent girls, exploring the potential of technology to enhance sexual and reproductive health outcomes in this demographic.

**Methods:** Twenty-four adolescent girls aged 15-17, enrolled in the EKSTRIM mHealth program, participated in four focus group discussions (FGDs). The participants

were randomly selected from four secondary schools involved in the EKSTRIM randomized clinical trial (N = 480). FGDs, conducted in the local language, were audio-recorded, transcribed verbatim, and translated. Translated transcripts were managed and coded using NVivo. Key themes that emerged included Influences for Sex/Relationships, HIV Knowledge, and Sources of Sexual Health Information.

**Results:** Participants identified common influences for engaging in sexual activity, including the pursuit of resource security, limited communication with parents, and peer influences. Knowledge gaps were evident, with participants seeking information on preventing unplanned pregnancies and HIV, endorsing sexual health myths, and highlighting barriers to accessing sexual health information.

**Conclusions:** The study revealed noticeable inconsistencies and limited access to basic sexual health knowledge, heightening the risks of adverse sexual and reproductive health outcomes among adolescent girls.

Culturally appropriate interventions are essential to address these challenges and advance the sexual and reproductive health needs of Indonesian adolescent girls.

## THPED465

From intimacy to uncertainty: a qualitative study of women living with HIV/AIDS in Indian Kashmir concerning the impact of HIV on their sexual well-being and partner relationships

J. Rashid<sup>1</sup>, S. Jan<sup>1</sup>, S. Manzoor<sup>1</sup>

<sup>1</sup>University of Kashmir, Srinagar, India

**Background:** This paper studies the intricate dynamics of intimate relationships among women living with HIV/AIDS, focusing on the profound impact of stigma and discrimination. Despite a wealth of data on the influence of marital quality on individual health and well-being, there is a notable gap in the literature regarding the effects of HIV/AIDS on intimate partner bonds, especially in diverse cultural contexts like Indian Kashmir.

**Methods:** This study, conducted in Indian Kashmir in 2020-21, investigates the experiences of 21 women living with HIV. Using Interpretative Phenomenological Analysis (IPA), the research treats participants' self-accounts as context-specific stories rather than universal truths. The goal is to uncover the meanings within these narratives, recognizing their contextual nature. IPA allows for a thorough exploration of individual experiences, presenting results through thematic and sub-thematic structures with qualitative illustrations.

This approach provides a nuanced understanding of how HIV, intimate relationships, and stigma interact within the cultural and social context of Indian Kashmir.

**Results:** The findings reveal that the stigma associated with HIV/AIDS significantly influences personal and sexual relationships, creating a web of challenges for WLHA. Par-

ticipants share narratives of betrayal, fear, and emotional turmoil, highlighting the impact of HIV on decision-making processes within relationships.

Stigma-driven distancing, emotional, sexual physical, is evident among those affected, with some participants experiencing rejection and subtle forms of discrimination from their close ties.

**Conclusions:** In patriarchal societies like Indian Kashmir, societal expectations of women to remain submissive and compliant compound the challenges faced by those living with HIV/AIDS.

The study underscores the intricate web of relationships affected by the diagnosis, particularly within personal intimate partnerships. Emotional and physical distancing from partners perceived as the source of infection becomes a coping mechanism, manifested in decisions such as separating beds and reevaluating sexual intimacy. The narratives reveal the complex interplay between fear, economic dependence, and societal expectations, which often lead participants to navigate their relationships delicately. Instances of abuse from in-laws and the cold treatment from siblings underscore the social repercussions of an HIV diagnosis. The sense of belongingness drives some participants to keep their HIV-positive status a secret, fearing rejection and isolation.

## THPED466

**Tailoring individual HIV testing and counseling for emerging adult (aged 18 to 24) men in relationships with other men: enhancing sexual risk reduction through increased relationship skills**

T. Starks<sup>1</sup>, G. Robles<sup>2</sup>, T. Dellucci<sup>3</sup>, D. Cain<sup>1</sup>, K. Kyre<sup>1</sup>,

A. Outlaw<sup>4</sup>, T. Lovejoy<sup>5</sup>, S. Naar<sup>6</sup>, S. Feldstein Ewing<sup>7</sup>

<sup>1</sup>Hunter College, CUNY, Psychology, New York, United States,

<sup>2</sup>Rutgers University, New Brunswick, United States,

<sup>3</sup>Indiana University School of Medicine, Indianapolis, United States,

<sup>4</sup>Wayne State University, Detroit, United States,

<sup>5</sup>Oregon Health and Science University, Portland, United States,

<sup>6</sup>Florida State University, Tallahassee, United States,

<sup>7</sup>University of Rhode Island, Providence, United States

**Background:** Sexual minority men (SMM) account for most new HIV cases in the US, with older adolescent and emerging adults at the highest risk. Those in relationships face unique HIV prevention challenges. Existing dyadic sexual HIV transmission risk interventions for male couples often encounter implementation challenges and engaging younger SMM early in relationships may be particularly difficult.

The purpose of the current study was to evaluate the feasibility and estimate the potential effect size associated with the use of *We Test* – a behavioral health intervention tailored for younger SMM in relationships. The intervention comprises two adjunct modules – video-based communication skills training as well as communication

goal setting and planning – delivered in conjunction with routine HIV testing and counseling in individual or dyadic formats.

**Methods:** A sample of 69 SMM aged 17 to 24 were recruited online. Following baseline assessment, youth were randomized to receive either the experimental, *We Test*, intervention or routine HIV testing (the control condition). At all assessments, youth reported sexual behavior as well as communication skills, communal coping, and relationship power.

**Results:** While differences were not statistically significant, the odds of CAS with casual partners were approximately 61.5% lower in the *We Test* condition compared to control ( $OR=0.385$ ,  $p=.203$ ) at 3 month follow-up. Results further suggested the intervention was associated with improvements of moderate size (Cohen's  $d = .50$  to  $.80$ ) in communication skills, communal coping, and relationship power.

**Conclusions:** Findings suggest *We Test* can be feasibly delivered in an online, remote format to participants in the US. An intervention such as *We Test* provides an opportunity for youth to practice communication skills specifically relevant to navigating sexual interactions with a partner. Findings suggest these interpersonal skills may be plausible mediators leading to sexual HIV risk reduction. Skill building is done in the context of a current relationship, such skills might generalize to interactions with future relationship partners and to sexual partners outside the context of a relationship. Such an intervention may be particularly relevant for SMM during late adolescence and emerging adulthood -- periods where peer and dating relationships are increasingly salient.

## THPED467

**Experiences of daily discrimination among sexual minority men of color in Raleigh-Durham, North Carolina**

D. Michael Craven<sup>1</sup>, F. Soto<sup>2</sup>, J. Quimbo<sup>1</sup>, K.S.K. Piang<sup>1</sup>,

A.M. Dennis<sup>1</sup>, B. Skaathun<sup>2</sup>

<sup>1</sup>University of North Carolina at Chapel Hill, Institute for Global Health and Infectious Diseases, Chapel Hill, United States,

<sup>2</sup>University of California San Diego, Department of Medicine, San Diego, United States

**Background:** In the United States, it has been shown that sexually minority men (SMM), especially people of color (PoC), may have an increased vulnerability to HIV due to discrimination. Better understanding how discrimination may impact PoC SMM engagement in HIV prevention services is a critical public health concern. The linkages between HIV vulnerability, psychosocial factors and discrimination among PoC SMM are not well described in the literature. We assessed the associations between perceived discrimination, psychosocial factors, and HIV status among PoC SMM.

**Methods:** Data are from an observational study of adult persons of color assigned male at birth having sex with other persons assigned male at birth recruited from clinics, social media, dating apps, and social venues in the Raleigh-Durham area. Discrimination was measured with the Everyday Discrimination Scale (short version), summed by situation. A multivariable logistic regression was used to assess the association between perceived discrimination, psychosocial factors, and HIV status.

**Results:** Of 94 SMM participants, 58.5% were living with HIV (PLWH), 86.5% experienced at least one type discrimination in the past year, 7.5% were non-gay/bisexual/queer identified, 9.7% were gender diverse, 71% were Black/African-American, 22% were Latinx, mean age 33. In the multivariable logistic regression, PLWH and Latinx participants had lower odds of experiencing discrimination compared with HIV-negative and non-Latinx counterparts (OR 0.67; 95% CI 0.49-0.91) and (OR 0.30; 95% CI 0.23-9.26), respectively. Sexual orientation was marginally significant, with those not identifying as gay/bisexual/queer having higher odds of experiencing discrimination (OR 1.68; 95% CI 0.09-3.05) than gay/bisexual/queer identified.

**Conclusions:** In our sample of predominately Black/African-American SMM, PLWH and Latinx persons experienced less discrimination than people living without HIV and non-Latinx persons. Interestingly, those who did not outwardly identify as gay/bisexual/queer experienced slightly more discrimination. These results highlight the importance of elucidating how discrimination may impact HIV vulnerability and prevention as well as HIV-associated psychosocial factors among PoC SMM.

Future studies should investigate the role of race, ethnicity, self-reported sexual orientation, and other psychosocial factors in SMM's experience of discrimination. These next steps may help inform health policy strategies to mitigate discrimination and increase HIV prevention efforts.

## THPED468

### No Means No: lessons learned implementing the sexual violence prevention curriculum for girls aged 10-14 years in Matabeleland North Province, Zimbabwe

P. Ntini<sup>1</sup>, L. Sibanda<sup>1</sup>, R. Mashapa<sup>1</sup>, G. Gonese<sup>2</sup>, T. Mharadze<sup>3</sup>, J. Mandisarisa<sup>4</sup>, P. Mungwari<sup>5</sup>, F. Mpofu<sup>1</sup>, R. Makunike<sup>12</sup>, S. Wiktor<sup>11</sup>

<sup>1</sup>Zim-TTECH, DREAMS, Bulawayo, Zimbabwe, <sup>2</sup>Zim-TTECH, DREAMS, Harare, Zimbabwe, <sup>3</sup>Center for Disease Control and Prevention, Harare, Zimbabwe, <sup>4</sup>Centre for Disease Control and Prevention, Harare, Zimbabwe, <sup>5</sup>No Means No Worldwide, NMN, Johannesburg, South Africa, <sup>6</sup>Ministry of Health and Child Care, DREAMS and KP, Harare, Zimbabwe, <sup>7</sup>National AIDS Council, DREAMS, Harare, Zimbabwe, <sup>8</sup>International Training and Education Center for Health (I-TECH) University of Washington, Washington, United States, <sup>9</sup>No Means No World wide, San Francisco, United States, <sup>10</sup>International Training and Education Center for Health (I-TECH) University of Washington, Washington DC, Zimbabwe, <sup>11</sup>International Training and Education Center for Health (I-TECH) University of Washington, Washington DC, United States, <sup>12</sup>Zim-TTECH, Harare, Zimbabwe

**Background:** Adolescent girls (AG) aged 10-14 years are disproportionately affected by sexual violence compared to their male counterparts, a risk factor for acquiring HIV. As part of the determined resilient empowered AIDS-free mentored safe (DREAMS) program in Matabeleland North Province, Zim-TTECH delivers a sexual violence prevention curriculum for AG.

**Description:** The "No Means No" (NMN) curriculum equips AG with mental, verbal, and physical skills to prevent sexual assault and escape potential perpetrators. The curriculum employs participatory methods that include demonstrations and practice of self-defense skills. From October 2020 to October 2023 NMN was implemented in school and community settings in the four DREAMS districts in Matabeleland North.

The program certified 60 Instructors selected from the communities where NMN was implemented, these were supported and supervised by 12 lead trainers. During this program, 17,360 enrolled AGs were trained in the NMN curriculum by certified instructors.

**Lessons learned:** 17,360 AG (69% of DREAMS enrolled AG) completed NMN sessions, and AGs readily accepted NMN sessions as part of ongoing DREAMS activities. The adaptation of the curriculum to the Zimbabwean context included revising language to reflect local terms and language. School-based delivery supported attendance in after-class sessions while continuous monitoring and support were key to ensure standardization and fidelity in implementation. Stakeholders noted the relevance of NMN to older girls while caregivers and boys outcried for

a similar program for boys who felt left out. NMN sessions created a safe and acceptable platform for AG to disclose experiencing violence; 17 AG reported experiences of being sexually violated. Instructors immediately linked survivors to clinical and social protection services.

**Conclusions/Next steps:** There is a need to expand the delivery of sexual prevention sessions to older AGYW as well as boys for a broader impact. Further research is needed to understand how to customize NMN sessions for Zimbabwe. Instructors need thorough training in first-line GBV response and close collaboration with government line ministries to ensure timely response to GBV cases.

## THPED469

### Redefining HIV prevention efforts for AGYW through the engagement of their male sexual partners

J. Kelly<sup>1</sup>, S. Perera<sup>1</sup>, P. Nyamukondiwa<sup>1</sup>, J. Ferguson<sup>1</sup>, B. Maughan-Brown<sup>1,2</sup>, M. Mchenga<sup>1</sup>, R. Yates<sup>1</sup>, D. Sekgobela<sup>1</sup>, N. Langwenya<sup>3</sup>, E. Toska<sup>1,3</sup>

<sup>1</sup>University of Cape Town, Centre for Social Science Research, Cape Town, South Africa, <sup>2</sup>University of Cape Town, Southern Africa Labour and Development Research Unit, Cape Town, South Africa, <sup>3</sup>University of Oxford, Department of Social Policy and Intervention, Oxford, United Kingdom

**Background:** While increased access to HIV prevention and treatment services have contributed to substantial reductions in HIV prevalence among adolescent girls and young women (AGYW) in sub-Saharan Africa, new infections continue to persist at a high rate especially in the context of sexual relationships between AGYW and their male partners, often characterized by power disparities and gender imbalances.

We explored factors which increase the risk of HIV acquisition among male sexual partners of AGYW as well as their engagement and utilisation of HIV-related services.

**Methods:** We followed an integrated review design which included a scoping review of qualitative and quantitative data, and secondary analysis of existing quantitative datasets, focused on five countries with particularly high rates of HIV: Kenya, Eswatini, Lesotho, Mozambique and Cameroon. Datasets were drawn from LePHIA, UNAIDS NAOMI spectrum and the Demographic and Health Survey.

For the scoping review, literature searches were conducted on Ebscohost, ScienceDirect and Google Scholar and titles, abstracts, full texts and reference lists were screened, generating 39 relevant articles for inclusion.

**Results:** Patterns of sexual behaviour among male partners of AGYW include early sexual debut, multiple and concurrent relationships, substantial age differences in relationships and low voluntary medical male circumcision rates, all of which increase the risk of acquiring HIV

among this population. Greater male engagement in HIV care and prevention efforts is therefore an important measure that could address this issue. However, barriers to engagement in HIV interventions faced by male partners of AGYW include financial constraints, disruption of work commitments, and the potential impact an HIV positive status may have on community social status.

**Conclusions:** Interventions to improve the engagement of male partners of AGYW in HIV interventions may include the integration of HIV couples testing and counselling into reproductive health and other related services, increasing the availability and accessibility of testing, and through awareness campaigns using a multi-pronged approach including through healthcare providers, traditional healers, chemists, at workplaces, and using social media.

However, further research among male partners of AGYW is required to fully understand what the most effective approach to improving their engagement might be in different contexts in this region.

### Addressing gender dynamics in HIV prevention, treatment and care services uptake among men in our community: the case of North West

D. Macana<sup>1</sup>, C. Moyo<sup>2</sup>, M. Malahlela<sup>3</sup>, T.M. Ndhlovu<sup>2</sup>, S. Moyo<sup>2</sup>, N. Tshuma<sup>2</sup>

<sup>1</sup>Excellent2030 Projects, Community Based Organisation, North West, South Africa, <sup>2</sup>Best Health Solutions, Consultancy, Johannesburg, South Africa, <sup>3</sup>Civil Society Forum, NGO Sector, Johannesburg, South Africa

**Background:** The study investigates the complexities of gender dynamics influencing men's engagement with HIV services and information in our community. Masculine norms and behaviors intersect with lifestyle factors, creating barriers such as self-sufficiency, emotional control, and rigid gender roles that contribute to hesitations and delays in seeking HIV prevention, treatment and care services.

The study aims to understand the multifaceted challenges men face, incorporating individual, social, economic, and cultural factors that impact HIV service utilization.

**Description:** Employing a qualitative approach, this research delves into the nuanced reasons behind men's hesitation to seek HIV prevention, treatment and care services. The study utilizes in-depth interviews and focus group discussions to capture the voices and experiences of men in our community. Key thematic areas explored include self-sufficiency, risk-taking behaviors, gender roles, stigma, cultural pressures, economic considerations, and environmental factors contributing to delays in seeking HIV services. Brings an understanding of the sociocultural and economic contexts influencing men's health-seeking behaviors.

**Lessons learned:** The study reveals a complex interplay of masculine norms, lifestyle choices, and societal expectations shaping men's reluctance to engage with HIV services. Specific findings highlight the influence of toxic masculinity, cultural pressures, and economic considerations as significant factors impacting men's health behaviors.

Additionally, occupational exposures, social and community stigma, and perceptions of healthcare services contribute to the hesitancy among men to access HIV services promptly. It underscores the need for targeted interventions that challenge toxic masculinity, address cultural pressures, and create supportive healthcare environments conducive to men seeking HIV services. Lessons also highlight the importance of community awareness campaigns to counter stigma and challenge gender norms hindering health-seeking behaviors.

**Conclusions/Next steps:** There is need for development of tailored health promotion initiatives aimed at reshaping masculine norms. Interventions should target both individual and societal levels, fostering environments where men feel empowered to prioritize their health. Culturally sensitive HIV services and awareness campaigns, coupled with workplace interventions, are crucial to overcoming economic barriers and occupational exposures.

Collaborative efforts between healthcare providers, community leaders, and policymakers are recommended to implement effective strategies that address the multifaceted challenges hindering men's prompt engagement with HIV services.

sexual agreements, and main partner gender identity were measured. Bivariate comparisons were conducted by relationship status and sexual agreement. The odds of condomless anal sex (CAS) with casual cis male partners was predicted from relationship characteristics and substance use.

**Results:** A total of 2240 TM respondents completed the survey. Most indicated their sexual identity as queer (46.4%), followed by bisexual (28.7%) and gay (23.1%). Fifteen percent were currently on PrEP. A majority of the sample was single (58.6%). Among those in a relationship, 85.7% reported having a non-monogamous sexual agreement. A majority reported heavy drinking (57.4%) and cannabis use (65.4%). Overall illicit drug use was 14.6%. Engaging in CAS with casual cis male partners (35.4%) was associated with heavy drinking and illicit drug use, but not cannabis. Having a monogamous sexual agreement was associated with not currently on PrEP, lower cannabis use, and having a cis male or trans male main partner. There were no differences in the occurrence of CAS with casual cis male partners regardless of whether you were single or had a monogamous (presumably breaking your agreement) or a non-monogamous sexual agreement.

**Conclusions:** TM with a monogamous sexual agreement are just as likely to have CAS with casual cis male partners but were less likely to currently be on PrEP. Sexual agreements may impact PrEP uptake and sustainment and should be considered in HIV prevention interventions for partnered TM.

## THPED471

Sexual agreements, substance use, and HIV sexual transmission behaviors among transgender men in the United States

D. Cain<sup>1</sup>, D. Brusche<sup>1</sup>, T.J. Starks<sup>1,2</sup>

<sup>1</sup>Hunter College- City University of New York, New York, United States, <sup>2</sup>Graduate Center of City University of New York, Doctoral Program in Health Psychology and Clinical Science, New York, United States

**Background:** Transgender men (TM), especially those who have sex with cis men, are at elevated risk for acquiring HIV. Little attention has been given to understanding how relationship factors impact HIV transmission risk behaviors (TRB) among TM. The goal of this study was to examine substance use and relationship correlates of HIV TRB among a sample of TM in the United States.

**Methods:** Secondary data analysis was conducted on data obtained from a large screening survey (November 2017- March 2020) intended to determine eligibility for various research studies. Recruitment occurred through social media and geosocial sexual networking apps mostly used by sexual minority men. Socio-demographics, substance use, sexual behavior, PrEP use, relationship status,

## Sexualities and sexual cultures: Meanings, identities, norms and communities

Addressing sexualized drug use in Sri Lanka: designing and developing a targeted Chemsex intervention package for men who have sex with men and transgender people

P. Narayanan<sup>1</sup>, J. Oorloff<sup>2</sup>, A. Abher<sup>3</sup>, M. Kusen<sup>4</sup>, S. Williams<sup>5</sup>, F. Young<sup>1</sup>, H. Vu<sup>6</sup>, L. Bradley<sup>1</sup>, N. Suwandi<sup>3</sup>, R. Siriwardana<sup>2</sup>, P.C. Loh<sup>4</sup>

<sup>1</sup>Health Equity Matters, Sydney, Australia, <sup>2</sup>Family Planning Association of Sri Lanka, Colombo, Sri Lanka, <sup>3</sup>APCOM Foundation, Bangkok, Thailand, <sup>4</sup>Health Equity Matters, Bangkok, Thailand, <sup>5</sup>Mainline Foundation, Amsterdam, Netherlands, the, <sup>6</sup>SCDI, Hanoi, Viet Nam

**Background:** The prevalence of Chemsex, (sexualized drug use), is increasing in Asia, particularly among men who have sex with men and transgender communities. Studies show an increase in drug use within sexualized

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

settings, with a clear connection to unsafe sex and increased risk of HIV transmission. Most Chemsex intervention packages and models have targeted high-income/Western countries. The Sustainability of HIV Services for Key Populations in Asia (SKPA-2) program is developing a tailored program to address Chemsex among men who have sex with men and transgender people.

**Description:** Through assessments and field visits, a training program has been crafted for key-population community members, outreach workers, and healthcare providers. This program is adapted from Mainline's Harm Reduction School initiative. Using this customized training, an intervention strategy covering prevention, treatment, sexual health, and PrEP was developed. Crucially, individuals engaged in Chemsex actively contributed to the strategy, ensuring its relevance and effectiveness.

#### Lessons learned:

- Transgender persons have distinct experiences and needs for Chemsex harm reduction compared with men who have sex with men, including the need for specialized topics covering gender reassignment surgery, and Chemsex risks among transgender sex workers post-surgery.
- The Chemsex intervention package requires specific content to address misinformation among community members and healthcare providers related to PrEP use and drug interactions.
- Chemsex intervention programs must be contextualized to the external environment in a country and understand the issues driving sexualized drug use among certain communities, (such as criminalization of homosexuality), and the impacts of the current economic crisis in Sri Lanka.
- Virtual interventions can be tailored based on the available platforms used by the communities, (e.g., Grindr).
- Intervention packages should include activities to increase access to PrEP, including reducing PrEP provider bias, eliminating misinformation, and strengthening linkages to other community-led HIV programmatic strategies and initiatives.

**Conclusions/Next steps:** The SKPA-2 program Chemsex intervention package provides a unique example from Asia that can be adapted for other countries facing high levels of stigma. This program helps to build on the emerging literature on how to utilize harm reduction approaches to respond to sexualized drug use in a contextually appropriate way.

## THPED473

### Sex work and digital technologies in CEECA

L. Connors<sup>1</sup>, T. Janushev<sup>1</sup>, S. Plecas<sup>1</sup>

<sup>1</sup>SWAN, Budapest, Hungary

**Background:** As internet and technology use throughout the CEECA region increases, how have sex-workers been impacted? Whilst the internet, mobile apps, and online payment platforms reshape the industry, offering opportunities for broader clientele, efficient management, financial security, and improved safety, the digital shift also exposes sex-workers to surveillance, harassment, and bias. This briefing paper explores the complex relationship between sex-work and digital technology in CEECA, aiming to unveil digital inequalities, safety concerns, and security issues.

**Methods:** A total of 47 Members of SWAN were invited to respond to a survey of 49 questions in English or Russian. Additionally, in-depth interviews were conducted with representatives of five SWAN member organisations: Ameliya (Kazakhstan), Legalife (Ukraine), Sex Work Polska (Poland), STAR-STAR (North Macedonia), and Tais Plus (Kyrgyzstan). The research findings were supplemented by desk-based research using available resources on sex-work, feminism, digital technologies, cybersecurity, and data protection.

**Results:** Sex-workers as a highly stigmatised group, face increased threats to their anonymity as digital technologies including social media, online sex-work platforms and AI, are adopted, with drastic and sometimes violent real-world consequences. A significant digital divide results from disparities in internet access and digital literacy. Repressive laws, like anti-pornography and anti-LGBTQ laws, further impact sex-workers' internet use: Anti-LGBTQ measures in Russia and Poland worsen the situation, legal restrictions in Ukraine create a hostile environment, and targeted attacks from abolitionist radical feminists contribute to further challenges. Legalized sex-work in some countries, while restricted, pushes some toward online services, yet digital inequalities pose risks for sex workers with limited internet access.

**Conclusions:** Online platforms must minimize data collection, avoiding the need for sex-workers' passports and IDs, and their design should consider marginalized communities, prioritize user experience, and simplify interfaces. Governments should decriminalize sex-work, repeal harmful laws, protect marginalized communities in data laws, and avoid jeopardizing encryption. A human rights-based approach and engagement with sex-workers in policy processes are vital. Funders should support sex-worker-led digital projects and relax documentation requirements. Service providers should refrain from identity verification, prioritize anonymity, secure data, consider the digital divide, and collaborate with sex-worker organizations in digital service planning.

## THPED474

### Queering Africa: a feminist approach to analysing the socioeconomic and health vulnerabilities

E. Lamontagne<sup>1,2</sup>, Q. Abdool Karim<sup>3,4,5</sup>,

M. Oluwátóyín Fóláyan<sup>6,7</sup>, The Working Group on Vulnerable Women and Girls in Nigeria and South Africa

<sup>1</sup>UNAIDS, Equitable Financing, Johannesburg, South Africa, <sup>2</sup>Aix-Marseille University, CNRS, EHESS, Centrale Marseille, Aix-Marseille School of Economics, Marseille, France, <sup>3</sup>University of KwaZulu-Natal, Centre for the AIDS Programme of Research in South Africa (CAPRISA), Nelson R Mandela School of Medicine, Durban, South Africa, <sup>4</sup>University of KwaZulu-Natal, Department of Psychology, School of Applied Human Sciences, Durban, South Africa, <sup>5</sup>Columbia University, Mailman School of Public Health, New York, United States, <sup>6</sup>Obafemi Awolowo University, Department of Child Dental Health, Ile-Ife, Nigeria, <sup>7</sup>Nigeria Institute of Medical Research, Yaba, Nigeria

**Background:** In Africa, queer women face compounded inequality and discrimination due to their gender and their sexual identities. These inequalities and discrimination increase their vulnerability to HIV infection through gender-based violence and 'corrective' rape.

We compare the socioeconomic and health vulnerabilities of queer women and transgender individuals to that of straight ciswomen in Nigeria and South Africa during the COVID-19 pandemic, focusing on the risk for HIV infection.

**Methods:** We used data from individual surveys among 7497 women and girls in Nigeria and South Africa. We analysed the macrosocial vulnerability status, physical and mental health, and the socioeconomic situation within and between the two countries. We also considered emotional, economic, physical, and sexual violence.

We applied a socioecological approach to study the differences in vulnerability status at the individual, interpersonal, and geospatial levels and analysed these vulnerabilities using the recent feminist lens for social change regarding gender inequality, such as sexual harassment and rape culture.

**Limitations:** The sample in this survey was purposefully selected to represent vulnerable groups using non-probability sampling methods. and there are socio-demographic and economic differences between Nigeria and South Africa. Comparisons to the general population should be done cautiously.

**Results:** Most respondents were straight ciswomen (74%), 17% queer women, and 9% transgender people. We found that queer women and transgender individuals experienced greater disruptions in accessing HIV ( $\chi^2(2, n=7051)=176.8, p\text{-value}<0.000$ ) and sexual and reproductive health services ( $\chi^2(2, n=6966)=56.8, p\text{-value}<0.000$ ) compared to straight ciswomen. Queer wom-

en also reported higher rates of depression and anxiety ( $\chi^2(6, n=6596)=84.9, p\text{-value}<0.000$ ), suicidal ideation ( $\chi^2(2, n=7164)=22.4, p\text{-value}<0.000$ ), gender-based violence ( $\chi^2(6, n=6722)=188.9, p\text{-value}<0.000$ ), and unplanned pregnancies following a rape than their straight cis-women counterparts ( $\chi^2(6, n=518)=22.3, p\text{-value}=0.001$ ).

The majority (74%) did not report this violence due to embarrassment, lack of knowledge or distrust in the system ( $\chi^2(12, n=1890)=29.5, p\text{-value}=0.0031$ ).

**Conclusions:** We showed that women and girls, in all their diversity, face socioeconomic and health vulnerabilities. Moreover, queer women and transgender individuals in Nigeria and South Africa experienced increased vulnerabilities during the COVID-19 pandemic and are victims of more sexual and gender-based violence, which may increase their risk of HIV infection.

Policymakers and advocates need a bold feminist approach to achieve more inclusive, equitable, and responsive systems of support and care.

## THPED475

### Role of Adolescent Boys, Young Men (ABYM) and Male Sexual Partners (MSP) in prevention of Gender Based Violence (GBV) amongst Adolescent Girls and Young Women (AGYW) in Homa Bay County

M. Muia<sup>1</sup>, V. Ochieng<sup>2</sup>, O. Madiang<sup>1</sup>

<sup>1</sup>National Organization of Peer Educators (NOPE), Programs, Nairobi, Kenya, <sup>2</sup>USAID Nuru Ya Mtoto DREAMS/OVC, Homa Bay, Kenya

**Background:** Gender based violence increase risk of acquiring HIV and unplanned pregnancies among AGYW. NOPE/USAID Nuru Ya Mtoto Project implements the DREAMS project in Homa Bay County. This project aims to empower AGYW to violence prevention with the involvement of male sexual partners and the community.

The integrated approach aims to motivate participation resulting to policy generation and adoption of interventions that favor reduction of new HIV infections among the AGYW. The Project considers ABYM and MSP a critical resource instrumental in reducing gender based related violence among AGYW.

**Description:** The ABYM and the MSP are involved in the DREAMS Project implementation from planning, execution, feedback stages. The MSPs are mobilized through the partner AGYW enrolled in the program for the Start Awareness Support Action (SASA) sessions.

This community mobilization approach is dictated by the MSP characterization outlined as per the program policy. During the MSP sessions, discussions around physical and sexual violence dominate, toxic masculinity attributes associated with men as well as negotiation skills attached to sexuality are disseminated, all these are anticipated to eliminate physical violence. HIV testing services (HTS) are offered during MSP sessions.

**Lessons learned:** This approach has enhanced interventions that culminate in reduction of intimate partner violence (IPV) thus creating a safer environment for the ABYM, MSP and the AGYW. SASA interventions conducted in partnership with key community stakeholders contributed to the changing of community norms and adapting a culture that promotes healthy behaviors. Community gate keepers as change agents for SASA sessions helps fast track norms change. Consent to sex and knowing partner status is key in dealing with sexual violence, HIV testing services (HTS) are offered during MSP sessions.

**Conclusions/Next steps:** The proactive involvement ABYM and the MSP served as a strategic approach to prevent GBV among AGYW. Engaging ABYM and MSP in discussions, sensitization, and advocacy, the project aimed to reduce toxic masculinity, promote healthy relationships, and create a safer environment for AGYW. This comprehensive strategy, including SASA interventions, community engagement, and youth center initiatives contributed to fostering a cultural shift and ultimately reducing instances of GBV in the community.

## Implementation science and scale up of HIV testing

### THPEE476

Tracking outcomes of indeterminate HIV rapid  
test results and impact on HIV case identification  
in five SPHLS-supported regions of Cameroon  
(NWR, SWR, Littoral, South and West regions)

A. Ernest Forku<sup>1</sup>, T. Katayi Edouard<sup>2</sup>, T. Pius Muffih<sup>3</sup>,  
M. Emmanuel Fai<sup>4</sup>, M.K. Eveline<sup>5</sup>, N. Mirabel Mbueh<sup>6</sup>,  
T. Samuel<sup>6</sup>, M. Stephen<sup>7</sup>, V. Catherine<sup>8</sup>, K. Emmanuel<sup>9</sup>,  
M. Johnson<sup>10</sup>

<sup>1</sup>Cameroon Baptist Convention Health Board  
(CBCCHB), Laboratories, Bafoussam, Cameroon,

<sup>2</sup>Cameroon Baptist Convention Health Board (CBCCHB),  
Clinical Research and HIV Care, Yaounde, Cameroon,

<sup>3</sup>Cameroon Baptist Convention Health Board, Health  
Services, Yaounde, Cameroon, <sup>4</sup>Cameroon Baptist  
Convention Health Board, Laboratories, Yaounde,  
Cameroon, <sup>5</sup>Cameroon Baptist Convention Health Board,  
Clinical Services, Buea, Cameroon, <sup>6</sup>Cameroon Baptist  
Convention Health Board, Laboratories, Bamenda,  
Cameroon, <sup>7</sup>Cameroon Baptist Convention Health  
Board, Laboratories, Ebolowa, Cameroon, <sup>8</sup>Cameroon  
Baptist Convention Health Board, Laboratories, Douala,  
Cameroon, <sup>9</sup>Cameroon Baptist Convention Health Board,  
Laboratories, Buea, Cameroon, <sup>10</sup>Cameroon Baptist  
Convention Health Board, Health Services, Bamenda,  
Cameroon

**Background:** Individuals with HIV infection who are not  
aware of their HIV status are responsible for a dispro-  
portionate number of new HIV infections. HIV diagnosis  
in Cameroon is done using a series and combination of  
rapid test kits applied in a serial algorithm. This diagnos-  
tic strategy gives room for a category of results known as  
"indeterminates"; which require further investigations for  
a final HIV testing outcome.

This study aimed to determine the rate of occurrence and  
impact of the tracking outcomes of these indeterminate  
cases on HIV case identification in Cameroon. This will  
inform national decision-makers and HIV/AIDS program  
implementers on key priority intervention areas to speed  
up progress towards HIV epidemic control.

**Description:** A hospital-based study involving the ex-  
ploitation of HIV testing and counselling (HTC) records of  
clients with indeterminate HIV rapid test results from Oc-  
tober 1<sup>st</sup>, 2022 to September 30<sup>th</sup>, 2023.

Data for this study were extracted from national HIV test-  
ing registers and/or electronic medical records in use on-  
site. Data collected was entered into Excel, cleaned and  
analyzed using IBM SPSS, Version 25.

**Lessons learned:** A total of 564,777 HIV rapid tests were  
done in the 208 SPHLS-supported sites, including military  
facilities for 1 year (October 1<sup>st</sup>, 2022 to September 30<sup>th</sup>  
2023. Out of this number, 1912 indeterminate HIV rapid  
test results were registered giving an Indeterminate Rate  
of 0.34%. Of the 1912 participants with indeterminate test  
results reviewed, 294(15.4%) did a follow-up test (either re-  
peated RDT in 3 to 4 weeks or did ELISA according to the  
national guidelines) and over 1618 (84.6%) did not do any  
follow-up test (were lost to follow-up). Of those who did a  
follow-up test, 271 (92.2%) turned out HIV negative while 17  
(5.8%) were confirmed HIV positive and 6 (2.0%) remained  
indeterminate after the follow-up investigations.

**Conclusions/Next steps:** There is a need for the Camer-  
oon national guidelines and HIV surveillance programs to  
develop a protocol for reporting and tracking individuals  
with indeterminate HIV rapid test results to ascertain  
their final HIV testing outcome. This category of clients  
may constitute niches for further HIV propagation in our  
communities hence slowing progress towards HIV epi-  
demic control in Cameroon.

### THPEE477

Enhancing accessibility of HIV testing in Uganda:  
statistical analysis of an app-based, personalized,  
unsupervised HIV self-testing program

A. Humayiya<sup>1</sup>

<sup>1</sup>Kampala International University, Mbarara, Uganda

**Background:** In Uganda, where access to HIV testing  
remains a crucial challenge, we implemented and as-  
sessed the impact of an app-based, personalized, oral  
HIV self-testing (HIVST) program facilitated by healthcare  
workers. The study aimed to address the scarcity of data  
on digital unsupervised HIVST initiatives in the region.

**Description:** Conducting a quasirandomized study  
(n=3095), we targeted consenting adults with undiag-  
nosed HIV infections in diverse settings, including town-  
ship clinics. Participants in the HIVST arm (n=1535) were  
given the option of an offsite, unsupervised digital HIVST  
program (n=962) or an onsite, clinic-based, supervised  
digital HIVST program (n=573) with 24/7 linkage services.  
Propensity score analyses were employed to compare  
outcomes with conventional HIV testing (ConvHT) arm  
participants (n=1560) randomly recruited from geograph-  
ically separated clinics. The participants in both arms  
were predominantly young, female, and with a month-  
ly income below 3000 Ugandan shillings. The majority  
chose unsupervised HIVST, reporting behaviors indicative  
of higher HIV risk.

**Lessons learned:** Our flexible and personalized app-  
based HIVST program, administered by healthcare work-  
ers, demonstrated high linkage rates unsupervised HIVST  
(99.7%) and supervised HIVST (99.8%) compared to Con-  
vHT (98.5%). The overall new HIV infection rate was 9%,

Oral  
abstracts

Author Index

with supervised HIVST at 10.9%, unsupervised HIVST at 7.6%, and ConvHT at 6.79%. Notably, test referrals significantly increased in the HIVST group (16.7%) compared to ConvHT (3.1%).

**Conclusions/Next steps:** The findings underscore the success of our approach in linking nearly all HIV self-testers, detecting new infections, and augmenting referrals for self-testing. Our program holds promise for expanding HIV testing accessibility and addressing unique behavioral factors influencing testing choices. The results have broader relevance for digital HIVST initiatives globally, emphasizing the need for personalized and healthcare worker-supported strategies to enhance testing outcomes. Future steps should focus on scaling up such programs to contribute significantly to HIV prevention, treatment, and care in resource-constrained settings like Uganda.

## THPEE478

### Implementing a national HIV self-testing delivery service: lessons from Australia

B. Newham<sup>1</sup>, A. Cogle<sup>1</sup>, M. Warner<sup>2</sup>, L. Coffey<sup>2</sup>

<sup>1</sup>National Association of People with HIV Australia, Sydney, Australia, <sup>2</sup>Queensland Positive People (QPP), Brisbane, Australia

**Background:** In Australia there remain significant barriers to regular HIV testing which were significantly exacerbated by COVID-19, reducing access to both primary health care and specialist sexual health.

HIV self-testing has remained under-utilised in Australia since regulatory approval in 2021. HIVTest.au was developed to raise awareness and increase uptake of HIV self-testing throughout Australia.

**Description:** HIVTest.au is Australia's first national HIV self-testing kit delivery service. It offers a year's worth of HIV self-testing kits delivered, at no cost, to anyone in Australia. The pilot allocated 12,000 tests over a 12-month period.

Although the project was open to all Australian residents, targeted platforms were created to specifically target priority populations such as gay, bi+ and queer men, Asian communities, Latinx Communities, Women, and Aboriginal and Torres Strait Islander communities. Ordering platforms and materials were also provided in languages other than English, including Thai, Vietnamese, Spanish, Chinese and Portuguese.

In developing the project, special focus was given to consultation to people with HIV from priority populations to inform project design to reduce access barriers. We made ordering kits low friction, prioritised photographs of community members, and allow community members to assess their own need for HIV testing.

**Lessons learned:** HIVtest.au demonstrated a high level of demand for HIV self-testing throughout Australia, exhausting the initial allocation of kits within the first 6

months of the project launch. This exceeded expectations. Despite being open to all Australian residents, there was consistent demand from priority populations. Of those who completed the post order survey, a vast majority of project clients identified as either gay or bisexual men, and over 40% being born in a country other than Australia.

Over 30% had not tested for HIV in the last 2 years, with over 17% having never tested for HIV.

**Conclusions/Next steps:** The high demand for HIV self-testing within the project has highlighted the need for the ongoing availability for HIV self-testing within the testing landscape in Australia. Funding has been sought to expand the project over the next four years.

## THPEE479

### Qualitative evaluation of implementation outcomes from a pilot study of integrating Point-of-Care Rapid Testing for recent Infection into HIV index testing in Lusaka, Zambia

P. Maritim<sup>1</sup>, C. Mwila<sup>2</sup>, J.M. Pry<sup>2,3</sup>, M. Moono<sup>2</sup>, C. Frimpong<sup>2</sup>, M. Nanyangwe<sup>2</sup>, L. Phiri<sup>2</sup>, R. Ngandu<sup>2</sup>, P. Sakanya<sup>2</sup>, S. Mwansa<sup>2</sup>, T. Phiri<sup>2</sup>, M. Hachiwa<sup>2</sup>, T. Savory<sup>2</sup>, C. Bolton<sup>2,4</sup>, M. Herce<sup>2,5</sup>, S.S. Iyer<sup>2</sup>

<sup>1</sup>School of Public Health, University of Zambia, Lusaka, Zambia, <sup>2</sup>Centre for Infectious Disease Research in Zambia (CIDRZ), Lusaka, Zambia, <sup>3</sup>School of Medicine, University of California, Davis, United States, <sup>4</sup>School of Medicine, University of Alabama, Birmingham, United States, <sup>5</sup>Institute for Global Health and Infectious Diseases, University of North Carolina, Chapel Hill, United States

**Background:** HIV rapid tests for recent infection (RTRI) can differentiate recent from long-term infection, and help HIV programs deliver prevention services more efficiently. To improve HIV index testing (IT) efficiency, we piloted integration of point-of-care (POC) RTRI testing into routine IT services. Here, we qualitatively examine pilot acceptability and feasibility.

**Methods:** We conducted 24 in-depth interviews with adults ≥18 years who: were newly diagnosed people living with HIV (PLWH) identified between 20 May 2021–10 March 2022 at two health facilities in Lusaka, Zambia; consented for routine IT; and either accepted (n=20) or declined (n=4) pilot participation. Additionally, four focus group discussions (FGD) were conducted with healthcare workers (HCWs). Thematic analysis was conducted using Proctor's Implementation Outcomes Framework.

**Results: Acceptability:** Participants felt that recency testing helped them build a timeline of the circumstances surrounding their HIV infection, identify potential contacts and facilitate disclosure to contacts for index services: "...that (recency status) will help me to say 'maybe it is from what happened that day'" (Recently HIV infected, Male, Age 22). Providers perceived the pilot as helpful in

identifying recent infections within communities and informing programmatic action through IT and offering of antiretroviral therapy and combination prevention: "So if it's a recent infection, you even know that there are contacts for that person at high risk. So index has to be intensified" (HCW, FGD4, Female).

**Feasibility:** POC RTRI was thought to add to HCW workload due to longer processes and additional blood sample collection. PLWH refusing a POC RTRI felt that it would have no bearing on the services they would subsequently receive. Integrating POC RTRI into IT was impacted by limited logistical support for contact tracing, provider competency on IT delivery and RTRI result interpretation, and inadequate facility space for private service delivery.

**Conclusions:** Integrating POC RTRI into IT was generally perceived as acceptable and feasible though there were negative responses towards delivery within existing implementation structures. POC RTRI has the potential to improve the quality of client counselling and public health surveillance. Feasibility was contingent on a well-functioning IT program and continued investments in safe and ethical IT.

## THPEE480

### Adapting HIV testing in wartime Ukraine: continuous evolution of differentiated service delivery models for key and priority populations

D. Shevchuk<sup>1</sup>, O. Vynogradova<sup>1</sup>, O. Petrash<sup>2</sup>, Y. Zelinskyi<sup>3</sup>  
<sup>1</sup>FHI360, Kyiv, Ukraine, <sup>2</sup>Pact Inc, Kyiv, Ukraine, <sup>3</sup>USAID/PEPFAR Community Action for HIV Control Project, Kyiv, Ukraine

**Background:** The war in Ukraine is characterized by ongoing shelling, infrastructure and commodity destruction, injury and death, security concerns, internal displacement, and migration. To sustain case finding among key and priority populations (KP/PP), innovative and adaptive approaches tailored to the context and changing client needs, are crucial.

**Description:** From October 2022 to December 2023, the PEPFAR funded Community Action for HIV Control project, implemented by Pact, FHI360 and AFEW, supported 22 local NGOs in 15 regions, including frontline areas, to design and implement HIV-case finding initiatives tailored to the specific needs of KP/PP through approximately 60 differentiated service delivery (DSD) models.

Each DSD model is comprised of a detailed description of activities and services, specifying the frequency, hotspots, service providers necessary to identify new HIV cases within specific KP/PP. These models undergo quarterly revisions based on results and experiences gained during implementation, ensuring continuous improvement to better reach KP/PP representatives.

**Lessons learned:** From October 2022 to December 2023, 64,993 KP/PP individuals were engaged in HIV testing delivered through the DSD models. Among them, 1,492 were

diagnosed with HIV, with 1,393 linked to ARV treatment.

We conducted a qualitative assessment of the DSD model implementation, through 43 independent interviews with lay providers and project coordinators involved in DSD models implementation. Those interviewed identified several advantages of the DSD approach including a systematic and clear algorithm for working with KP/PP, flexibility to incorporate features specific to these groups, comprehensive consideration of their needs, and the provision of enhanced services.

Furthermore, the quarterly review and revision process allowed for adjustments and adaptations to factors including contextual factors like war and migration, thereby reducing interruption of services.

**Conclusions/Next steps:** In navigating the challenging wartime environment, the implementation of DSD models has proven to be an effective and adaptable strategy for sustaining HIV case finding. The project recommends dissemination of best practices and lessons learned, scaling up adaptable approaches to other regions, ongoing monitoring and evaluation to further refine and optimize DSD models, and integration of additional services such as humanitarian aid screenings on non-communicable diseases, gender-based violence, and mental health services to enhance the reach and impact of DSD models.

## THPEE481

### Advancing maternal and child health: the impact of the new HIV/syphilis program in Liberia

B.M.F Gibson<sup>1</sup>, J. Flomo<sup>2</sup>, M. Odo<sup>3</sup>, A. Forleh<sup>4</sup>, W. Cole<sup>5</sup>, D. Dunbar<sup>6</sup>, W. Fassah<sup>4</sup>, M. Tobii<sup>3</sup>, G. Bondo<sup>7</sup>, M. Aliou<sup>8</sup>, S. Sow<sup>9</sup>, S. Conteh<sup>10</sup>

<sup>1</sup>National AIDS Control Program, Liberia, PMTCT, Monrovia, Liberia, <sup>2</sup>National AIDS Control Program, Liberia, Program Manager, Sinkor, Liberia, <sup>3</sup>NACP, Liberia, Consultant for HIV Program, Sinkor, Liberia, <sup>4</sup>NACP, Liberia, PMTCT, Monrovia, Liberia, <sup>5</sup>Liberia Network of People Living with HIV, President, Mother Mentor, Monrovia, Liberia, <sup>6</sup>Redemption Hospital, ART Clinic, Monrovia, Liberia, <sup>7</sup>NACP, Liberia, PMTCT, Sinkor, Liberia, <sup>8</sup>National AIDS Control Program, Liberia, Monitoring and Evaluation Unit, Monrovia, Liberia, <sup>9</sup>National AIDS Control Program, Liberia, HIV Care and Treatment Unit, Monrovia, Liberia, <sup>10</sup>NACP, Liberia, Laboratory, Sinkor, Liberia

**Background:** Liberia, like many other sub-Saharan African countries, has faced the dual challenge of maternal HIV and syphilis, posing significant threats to maternal and child health. In 2022, Liberia expanded the existing HIV program for pregnant women to comprehensively screen and manage both HIV and syphilis. We present the results of this initiative implemented across the country.

**Methods:** A training curriculum based on WHO recommendations for HIV and syphilis testing was developed and employed for the Training of Trainers (TOT) session

and subsequent national rollout. The TOT covered 124 county staff nationwide and extended to 563 healthcare facilities. Demand-creation meetings were held in the catchment areas of most healthcare facilities to raise awareness and encourage participation. Data were collected from healthcare facilities and analyzed to assess the program's impact on screening rates and positive case identification.

**Results:** Between January and December 2021, a total of 182,775 pregnant women were tested for HIV, with 1,846 positive identified before the launch of the HIV/Syphilis program. Routine syphilis testing was not included as part of the standard prenatal testing for pregnant women before the launch of the HIV/ Syphilis program. At the end of 2022 (January-December), a total of 1,652 pregnant women tested positive for syphilis, while 1,878 tested positive for HIV and received treatment.

Age Group	ANC First Visit	Tested for Syphilis	Tested Positive for Syphilis	Tested for HIV	Tested Positive for HIV
10 - 14 yrs.	1,666	914	21	1,286	23
15 - 19 yrs.	52,397	27,529	362	47,893	214
20 - 24 yrs.	58,449	32,702	460	54,490	569
25+ yrs.	86,052	50,654	809	83,998	1,072
Total	198,564	111,799	1,652	187,667	1,878
Total treated for Syphilis with Benzathine Penicillin					
Total on ART	1901				

Table. Pregnant women tested for Syphilis and HIV (January 1-December 30, 2022).

Discrepancies in the HIV and syphilis tests can be attributed to stock out of commodities and untimely requests.

**Conclusions:** The introduction of the Maternal HIV/Syphilis Program in 2022 marked a significant stride in fortifying maternal and child health outcomes. The program has yielded increased testing rates and positive case identification for both HIV and Syphilis for pregnant women across all age groups. Efforts are needed for further scale-up and to address issues related to stock out of commodities.

## THPEE482

### Sexual and reproductive health knowledge and attitudes: a comparative study of eight open-source large language models

A. van Heerden<sup>1</sup>

<sup>1</sup>Human Sciences Research Council, Center for Community Based Research, Pietermaritzburg, South Africa

**Background:** With the growing integration of Large Language Models (LLMs) in various domains, their application in sexual and reproductive health (SRH) services necessitates an understanding of their knowledge and attitudes in this area. This study evaluates the proficiency of LLMs in SRH knowledge and their perspectives on human sexuality.

**Methods:** We assessed over 200 SRH-related questions sourced from the WHO, Gender Role Beliefs Scale, and the Sexuality Attitudes and Beliefs Survey. These included knowledge-based questions (e.g., relating to HIV) and belief statements (e.g., regarding one-night stands), categorized into three domains. Eight open-source LLMs were evaluated, focusing on their ability to handle questions not readily available online, enhancing the test's rigor.

The prompt used was: "Answer the following questions to the best of your ability. ONLY give one of the answer options provided."

**Results:** Response accuracy for all models on knowledge-based questions was 70.1% (s.d. 15.2%). The best-performing model was openai/gpt-4-1106-preview (88.2%), and the poorest meta-llama/llama-2-70b-chat (46.1%). Models differed in their willingness to discuss topics about sex, abortion, and gender identity (e.g. "It is possible to become infected with HIV/AIDS by engaging in unprotected sexual intercourse with someone just once?"). The Kruskal-Wallis H test indicated a notable difference in the accuracy of the models ( $H = 79.28$ ,  $p < 0.001$ ). Subsequent post-hoc analysis identified several pairs of LLMs with statistically significant differences in performance.

Notable contrasts were observed between 'mixtral-8x7b-instruct' and 'claude-2' ( $p < 0.01$ ) and 'gpt-4-1106-preview' and 'llama-2-70b-chat' ( $p < 0.01$ ).

Conversely, some pairs, such as 'mixtral-8x7b-instruct' and 'gpt-4-1106-preview', showed no significant performance difference ( $p = 0.83$ ). Many models, prioritizing caution, chose not to respond to belief questions (43.1%). Among responders, 46.6% held overall liberal views on transgender people, sexual norms, and HIV stigma.

Responses were most conservative on sexual norms (20.6%) and most liberal regarding transgender people (53.8%), with only 5.4% conservative towards this group.

**Conclusions:** These results underscore the diverse capabilities of current LLMs in their knowledge of SRH and their unwillingness to talk about sensitive topics.

Careful consideration and evaluation should be given to model choice when preparing to integrate LLMs into SRH services.

**THPEE483****Geospatial clustering for recent HIV transmissions: an underutilized approach to optimizing targeted case identification in Chipata district of Eastern Province, Zambia**

G.I. Kibombwe<sup>1</sup>, M. Goma<sup>1</sup>, T. Malebe<sup>1</sup>, P. Mutale<sup>1</sup>,  
C. Kasambwe<sup>2</sup>, E. Oladele<sup>3</sup>, J. Msofe<sup>4</sup>, H. Satti<sup>5</sup>,  
D. Carpenter<sup>5</sup>, N. Persaud<sup>6</sup>, L. Nyau<sup>7</sup>, C. Lushinga<sup>7</sup>,  
M. Ngámbe<sup>8</sup>, O. Chabikuli<sup>9,10</sup>

<sup>1</sup>FHI 360, Technical, Lusaka, Zambia, <sup>2</sup>Eastern Province Health Office, Strategic Information, Chipata, Zambia,

<sup>3</sup>FHI 360, Program Management, Lusaka, Zambia, <sup>4</sup>FHI 360, Strategic Information, Pretoria, South Africa, <sup>5</sup>FHI 360, Technical, Durham, United States, <sup>6</sup>FHI 360, Strategic Information, Durham, United States, <sup>7</sup>Eastern Province Health Office, Technical, Chipata, Zambia, <sup>8</sup>Eastern Province Health Office, Program Management, Chipata, Zambia, <sup>9</sup>FHI 360, Program Management, Pretoria, South Africa, <sup>10</sup>Howard University, Public Health Program, Graduate School, Washington, United States

**Background:** In 2019, Zambia piloted a phased rollout of recency testing surveillance for new HIV transmissions. After three years, Eastern province began implementing recency testing in 35 health facilities in November 2022. Through recency, the Ministry of Health aimed to characterize incidence, identify demographic and geographic hot spots to facilitate targeted index testing, and effectively break the cycle of HIV transmission. To optimize targeted case finding and implement tailored interventions, integration of geographic information system (GIS) and spatial analysis techniques becomes crucial.

We analyzed program data for distribution of recent HIV transmissions and geographic clusters for a one-year period in Chipata district of Eastern province.

**Description:** We extracted one-year routine program data on recent HIV transmissions from the electronic laboratory information management system (LIMS) from November 2022 to November 2023. Shape files, layered maps, and analysis of spatial distribution of recent HIV transmissions were conducted using ArcGIS v10.15 and Satscan v9.4 software. To identify statistically significant spatial clusters of recent transmissions (acquired within past 12 months), spatial scan statistic was applied within a discrete Poisson model. Clusters were defined as geographical areas with a disproportionate excess in recent HIV transmission compared to the surrounding areas. Additionally, computation of associated relative risks with respective level of significance was done.

**Lessons learned:** Out of 1,143 new HIV-positive samples analyzed, 17% (199) were recent HIV transmissions. Spatial scan analysis showed a notable excess of recent HIV prevalence by geography of service coverage in four of the 16 facilities that recorded at least one recent transmission. With an observed-to-expected ratio of 2.6, the total of 77 observed cases within the cluster significantly exceeded

the expected 30 cases. Consequently, individuals living within this cluster were 5.5 times more likely to acquire new HIV transmission compared to those living outside of the cluster (RR = 5.5,  $p < 0.001$ ).

**Conclusions/Next steps:** The integration of geographic information system (GIS) and spatial analysis techniques is important for enhancing understanding of localized HIV transmission dynamics. To be effective in breaking the cycle of transmission and attaining epidemic control, we recommend implementing these techniques at household level to enhance targeted index testing efforts.

**THPEE484****Identifying patient-level characteristics impacting routine, opt-out, HIV screening at the Jackson Memorial Hospital Emergency Department in Miami, USA**

D. Escudero<sup>1,2</sup>, N. Maldonado Rueda<sup>3</sup>, M. Bahamon<sup>4</sup>,  
G. Gallo Rodriguez<sup>4</sup>, C. Amelia<sup>4</sup>, D. Hercz<sup>4</sup>, P. Panakos<sup>4</sup>,  
R. Clay<sup>5</sup>, L. Lee<sup>4</sup>

<sup>1</sup>Vanderbilt University Medical Center, Epidemiology, Nashville, United States, <sup>2</sup>Harvard T.H. Chan School of Public Health, Epidemiology, Boston, United States,

<sup>3</sup>Vanderbilt University Medical Center, Nashville, United States, <sup>4</sup>Jackson Memorial Hospital, Miami, United States,

<sup>5</sup>Mount Sinai Medical Center, New York, United States

**Background:** As the first step in an initiative to implement improvements in Jackson Memorial Hospital Emergency Department's (ED's) routine, opt-out, HIV screening program, we sought to identify patient-level characteristics affecting screening and linkage to care processes.

**Methods:** We examined electronic health records (EHRs) for 392,861 Jackson Memorial Hospital ED visits (2017-2021) and linkage-to-care records for 2,263 ED patients during this same time-period with an HIV positive test (previously or newly diagnosed HIV infection). We determined the proportion of patients:

1. Designated at ED triage as HIV screening eligible (also did not "opt-out") and
2. Linked-to-care if HIV-positive.

We constructed multivariable logistic regression models to identify patient-level factors that suggest discrepancies in HIV screening and linkage to care processes. Adjusted odds ratios (aORs) and corresponding 95% confidence intervals were estimated.

**Results:** Out of 392,861 patient ED visits, 209,257 (53.3%) were designated as HIV screening eligible. Out of 2,263 persons with an HIV positive test, 228 patients (10.1%) were newly diagnosed, including 28 cases of acute HIV infection. Of these 228 patients newly diagnosed, 177 (77.6%) were linked to care through a public-private partnership with the Miami-Dade Department of Health. Patients more likely to be designated as HIV screening eligible were women (aOR=1.15; 1.14-1.17), Hispanics (aOR=1.17; 1.16-

1.20) and those presenting with pregnancy ( $\alpha\text{OR}=2.17$ ; 2.04-2.31), and pelvic pain ( $\alpha\text{OR}=2.42$ , 2.26-2.60). Asian/Pacific Islanders ( $\alpha\text{OR}=0.86$ , 0.78-0.96) and those presenting with Covid-19 ( $\alpha\text{OR}=0.34$ , 0.32-0.36) trauma ( $\alpha\text{OR}=0.03$ ; 0.02-0.04) and assault ( $\alpha\text{OR}=0.58$ , 0.53-0.63) were less likely to be designated as HIV screening eligible. Hispanics were more likely to be linked to care ( $\alpha\text{OR}=3.33$ ; 1.20-9.29). We did not find evidence that sex or race were correlated to linkage-to-care status.

**Conclusions:** Although HIV screening at this ED in the highest HIV incidence community in the United States was meant to be universal, there were patient-level factors that appear to have influenced designation of HIV screening eligibility. Linkage-to-care, however, did not appear to be influenced by these same factors, with the exception of Hispanics, who were more likely to be linked-to-care.

These findings indicate processes that require interventions to ensure that all ED patients have opportunities for HIV screening.

## THPEE485

### Initiating self-care pathway for accessing HIV services in Cambodia through online reservation app

M. Ngo<sup>1</sup>, V. Ouk<sup>2</sup>, S. Tep<sup>3</sup>, S. Seng<sup>4</sup>, K. So<sup>5</sup>, A. Len<sup>6</sup>, M.U. Thong<sup>7</sup>, S. Chaudhary<sup>8</sup>

<sup>1</sup>Family Health International (FHI 360), Social Behavior Change, Phnom Penh, Cambodia, <sup>2</sup>NCHADS, Phnom Penh, Cambodia, <sup>3</sup>NCHADS, Behavior Change Communication, Phnom Penh, Cambodia, <sup>4</sup>FHI 360, EpiC Cambodia, Phnom Penh, Cambodia, <sup>5</sup>FHI 360, Prevention, Phnom Penh, Cambodia, <sup>6</sup>FHI 360, Strategic Information EpiC, Phnom Penh, Cambodia, <sup>7</sup>FHI 360, Prevention EpiC, Phnom Penh, Cambodia, <sup>8</sup>FHI 360 India, Online EpiC, New Delhi, India

**Background:** HIV control among key populations (KPs) requires that all know their HIV status, start antiretroviral therapy (ART), and reach viral suppression if acquired or start and effectively use pre-exposure prophylaxis (PrEP) if at risk. This requires incorporating modalities that reach key populations who are not being reached face-to-face. In Cambodia, 67.5% of the population is online, offering another opportunity to engage target audiences. The online reservation app (ORA), developed by FHI 360, allows users to assess their own risk, needs and book services across a range of partner providers via smartphone or computer.

Digital Report 2023: <https://datareportal.com/reports/digital-2023-cambodia>

**Description:** To reach key populations online, the National Center for HIV/AIDS, Dermatology and STD (NCHADS) adapted ORA, renamed "TohTest", offering a self-care pathway online, that is particularly good for hidden KPs to conduct a self-risk assessment and engage with HIV

services. The app links target audiences to nearby HIV services, making an appointment without filling forms or getting a referral, often a barrier with young KPs.

**Lessons learned:** 1,839 appointments were made from April 2020 to October 2023 at 18 clinics and CBO sites in seven provinces; 1,179 arrived; 869 tested for HIV; 49(6%) confirmed HIV positive; 46(94%) initiated ART. 454 were tested for sexually transmitted infections (STIs) and 85(19%) were screened positive and treated; 485(59%) HIV-negative KPs initiated PrEP (see testing cascade below). Case detection via TohTest was three times the rate of face-to-face outreach testing by community-based organizations (CBOs) and PrEP initiation five times higher than among those reached face-to-face.

**Conclusions/Next steps:** TohTest contributed to HIV case finding among hard-to-reach KPs and linked high-risk HIV-negative KPs to PrEP. NCHADS will upgrade the app making it friendly for mobile users and linked to more KP-friendly clinics, and CBO PrEP sites. NCHADS will work closely with CBO partners promoting to target audiences.

## THPEE486

### Experiences and reporting of physical and sexual violence among key populations in Unguja, Zanzibar, 2023

A. Khamis<sup>1</sup>, M. Mtoro<sup>2</sup>, J. Ndayongje<sup>2</sup>, M. Khamis<sup>3</sup>, G. Mgomella<sup>4</sup>, S.E. Porter<sup>4</sup>, C. Said<sup>5</sup>, A. Kailembo<sup>4</sup>, S. Welty<sup>5</sup>, P. Khamis<sup>3</sup>, M. Dahoma<sup>3</sup>

<sup>1</sup>Ministry of Health, Zanzibar, Tanzania, the United Republic of, <sup>2</sup>Global Programs, Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>Zanzibar Integrated HIV, Hepatitis, TB, and Leprosy Programme, Zanzibar, Tanzania, the United Republic of, <sup>4</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Dar es Salaam, Tanzania, the United Republic of, <sup>5</sup>University of California, San Francisco, San Francisco, CA, United States

**Background:** Key populations (KPs) are at heightened vulnerability to physical and sexual violence due to their engagement in illicit and criminalized behaviors. Data on violence prevalence and reporting among KP in Unguja remains scarce, inhibiting development of targeted services. We report experiences of physical and sexual violence among female sex workers (18+ years, FSW)/sexually

exploited children (SEC) (girls <18 years old who are given money or goods for sex), men who have sex with men (MSM), and people who inject drugs (PWID) in a bio-behavioral survey conducted in Unguja, Zanzibar, in 2023.

**Methods:** We used respondent-driven sampling (RDS) to recruit individuals aged  $\geq 15$  years who lived in Unguja for  $\geq 3$  months and were FSW/SEC (exchanged sexual intercourse for money in the prior month), PWID (injected drugs in the past 3 months), or MSM (had sex with men in the past 3 months). Physical and sexual violence in the prior 12 months and subsequent reporting to authorities were assessed through interviewer-administered questionnaires. We produced weighted estimates reported as percentages with 95% confidence intervals (95%CI).

**Results:** We recruited 598 FSW/SEC, 485 MSM, and 455 PWID. High levels of physical violence in the past 12 months were reported among FSW/SEC (30.7% (95%CI: 26.4-34.9)), MSM (22.7% (95%CI: 18.6-26.8)), and PWID (52.2% (95%CI: 47.6-56.7)). Of those physically abused, few reported to an authority: 17.9% (95%CI: 11.2-24.4) of FSW/SEC, 13.5% (95%CI: 5.3-21.0) of MSM, and 16.3% (95%CI: 12.1-20.3) of PWID. Past-year sexual violence was also common though higher among FSW/SEC 22.9% (95%CI: 19.0-26.9) versus MSM (12.2% (95%CI: 8.9-15.5)) and PWID (4.9% (95%CI: 3.0-6.7)). Very few sexually-abused participants reported to an authority: 14.9% (95%CI: 7.3-22.4) of FSW/SEC, 1.1% (95%CI: 0.6-1.3) of MSM, and none of PWID. The most common reason for not reporting to an authority was feeling ashamed or embarrassed among FSW/SEC (12.5% (95%CI: 7.9-16.9)), MSM (55.5% (95%CI: 41.2-70.4)), and PWID (47.0% (95%CI: 30.5-64.5)).

**Conclusions:** Physical and sexual violence are common among KPs in Unguja. Interventions to remove barriers that prevent KPs from safely reporting violence and to facilitate linkage to existing health, legal, and social services could increase uptake of important services following experiences of violence among KPs.

## THPEE487

### Role of social media outreach program in engaging key populations for HIV services: findings from a mixed-method study in Myanmar

M.M. Thet<sup>1</sup>, N.H. Oo<sup>2</sup>, E.M. Soe<sup>3</sup>, H.K. Ko<sup>2</sup>

<sup>1</sup>Population Services International Myanmar, Strategic Information Division, Yangon, Myanmar, <sup>2</sup>Lan Pya Kyel Association, Yangon, Myanmar, <sup>3</sup>Population Services International Myanmar, Program Management Division, Yangon, Myanmar

**Background:** Taking advantage of a digital technology leapfrog experience in Myanmar, Population Services International Myanmar and its local partner Lan Pya Kyel (LPK) invested in a dedicated social media team to respond to private messages on social media platforms (on Facebook, Line, Bee-talk, GRINDR, and Viber), hotline

calls, and offer online referral to LPK clinics. LPK also managed content towards key populations (KP) through Facebook pages, private Facebook groups, and Instagram accounts. Two online channels, Social Network Outreach and Social Profile Outreach, are being used to engage KPs to refer HIV testing services since February 2022.

The study aimed to evaluate the performance of the two online channels compared to that of traditional physical outreach channel after one year implementation.

**Methods:** A mixed-method approach was applied. LPK clinics data were extracted, and individual qualitative interviews were conducted with 15 online channel clients and 8 staff who were involved in online channel management. HIV testing, positive yield, confirmation and linkage to ART treatment were compared against traditional physical outreach and two online channels through descriptive analysis and chi-square tests. Thematic analysis was done to generate key findings from qualitative data.

**Results:** A total of 5,165 clients enrolled into the program through online channels and 16,458 through physical channel for HIV testing. Positive yields were 13.9% for on-line and 6.6% for physical channels respectively. Confirmation of HIV were 97.9% and 93.4% among HIV positive patients. Among them, linkage to ART treatment were 63.9% and 76.8%. The results were statistically significant with  $p < 0.001$ .

Qualitative data revealed that there were benefits of using online channels such as less time consuming, higher confidentiality, faster response from providers, easier access to providers, able to reach more hidden populations, greater number of clients and those from wider geographic areas.

However, operational challenges were reported such as under-staffing, needing detail explanation when sharing information by providers, requiring training and internet connectivity problems.

**Conclusions:** The study highlighted that engagement of KPs through online channels proved to be a potential avenue for reaching hidden populations, linking them to HIV care and services but it was important to ensure that operational challenges are addressed properly.

### National Community Link Program: using a community-based model for low-barrier access to HIV self-testing to reach first-time testers and key populations in Canada

K. McBain<sup>1</sup>, R. Anthonyraj<sup>1</sup>, I. Fakhrajani<sup>1</sup>, M. Kisikaw Piyesis<sup>2</sup>, A. McLeod<sup>3</sup>, J. Jollimore<sup>4</sup>, W. Tharao<sup>5</sup>, J. Bajgai<sup>6</sup>, S. Rourke<sup>1,7</sup>

<sup>1</sup>St. Michael's Hospital, MAP Centre for Urban Health Solutions, Toronto, Canada, <sup>2</sup>Communities, Alliances & Networks (CAAN), Fort Qu'Appelle, Canada, <sup>3</sup>Spirit Consultants of Manitoba, Winnipeg, Canada, <sup>4</sup>Canadian AIDS Treatment Information Exchange (CATIE), Toronto, Canada, <sup>5</sup>Women's Health in Women's Hands, Toronto, Canada, <sup>6</sup>Pacific AIDS Network, Vancouver, Canada, <sup>7</sup>University of Toronto, Department of Psychiatry, Toronto, Canada

**Background:** In November 2022, the Public Health Agency of Canada funded a national HIV self-testing program to reach those who are undiagnosed and help them "know their status" to get access to appropriate prevention and treatment. The program distributed 200,000 free HIV self-tests across the past year through frontline, community-based and harm reduction organizations, including community health centers, mobile distribution units, shelters, pharmacies, and public health units to reach first-time testers and key populations most impacted by HIV.

**Methods:** The Community Link Program (responsible for 55% of the overall kit distribution) partnered with 347 agencies, with support workers providing individuals with access to up to 5 kits. Participants completed an anonymous demographic survey to evaluate the effectiveness of the program in reaching first-time testers and underserved populations. Chi-squared tests (significance with  $p < 0.01$ ) were conducted to examine the demographic characteristics of first-time testers compared to people with previous testing experiences.

**Results:** Over the past year, 26,281 HIV self-tests were distributed to 9,292 people. Overall, 46% were first-time testers, and 43% of those who received multiple kits agreed to share with personal and social networks.

First-time testers were significantly younger with 77% <20 years, compared with 51% >20 years, and from diverse gender groups and sexual identities, including 47% of cisgender men, 52% of cisgender women, 46% of transgender and non-binary participants, 57% of heterosexual, and 59-63% of lesbian, asexual and questioning participants, compared with 30% of gay and 44% of bisexual participants.

Among key populations, 68% of African, Caribbean and Black participants, 57% of women, 50% of Indigenous people and 53% of people who inject drugs were first-time testers, compared with 34% of participants who identify as gay, bisexual, and men who have sex with men. The

Prairies (55%) and Quebec (80%) had higher first-time testers compared with Ontario (40%) and British Columbia (42%).

**Conclusions:** Community-based distribution of HIV self-testing kits is effective in meeting people where they are, and reaching first-time testers, particularly those who are younger, women, identify as heterosexual or with a sexual minority group, from key populations, and in previously underserved geographic regions in Canada.

## THPEE489

### The role of artificial intelligence (AI) in improving confidence and trust in private-sector telemedicine models for HIV pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP) delivery

R. Mendonca<sup>1</sup>, D. Rech<sup>1</sup>, S. Frade<sup>1</sup>, S. Morris<sup>1</sup>, S. Smedinghoff<sup>1</sup>, A. Ibrahim<sup>1</sup>, K.F. Ortblad<sup>2</sup>, D. Were<sup>3</sup>

<sup>1</sup>Audere, Seattle, United States, <sup>2</sup>Fred Hutchinson Cancer Centre, Seattle, United States, <sup>3</sup>JHPIEGO, Nairobi, Kenya

**Background:** To address challenges in accessing PrEP in Kenya, an online model for PrEP and PEP delivery was created. This model utilized MYDAWA, a private online pharmacy, to establish a virtual care pathway. The pathway incorporated computer vision-based AI as a decision support tool for remote clinicians providing PrEP/PEP services. The AI facilitated efficient audits of clinical outcomes and commodities within the private sector channel, ensuring trusted, timely, stigma-free care at reduced costs.

**Description:** The ePrEP Kenya Pilot, an 18-month prospective study in Nairobi and Mombasa, evaluated online PrEP and PEP services. Clients purchased HIV self-testing kits and uploaded test result images through the MYDAWA app or website to determine eligibility for PrEP/PEP. HealthPulse AI, integrated with MYDAWA apps and the website, assesses image quality in real-time, providing a high-quality image and AI interpretation to clinicians for decision-making. Clinicians consider AI interpretation, client results, and self-tester interpretation before counseling, prescribing PrEP/PEP, or care referral.

**Lessons learned:** From October 2023 to January 2024, HealthPulse AI supported 1929 clinical encounters for PrEP and PEP access with uploaded HIV self-test photos, successfully identifying all 11 positive cases, including 6 faint positives (0.5% of total encounters).

Clinicians missed three faint positives, interpreting them as negative, and three others were not interpreted. AI disagreement analysis (average of 5 disagreements per month) prompted corrective actions in all 6 cases during regular audits, impacting follow up with clients incorrectly prescribed PrEP for confirmatory testing.

The analysis informed supervisor monitoring, leading to additional training. Clinicians increasingly relied on the

AI, especially for true positives, providing confidence in interpreting faint lines on presumptive negative results for PrEP/PEP prescription or referral to care.

**Conclusions/Next steps:** In low HIV incidence settings like Kenya, accurate identification of new cases of people living with HIV is crucial for achieving the 95/95/95 targets. Integrating HealthPulse AI into telehealth enhances care quality, reduces errors, and improves the identification of positive cases. It also provides fail-safe measures, including regulatory audits. In private sector telemedicine models, incorporating AI for PrEP/PEP delivery allows for diversified healthcare by ensuring increased reliability, reduced stigma, and improved accessibility to expanded public health services.

## Implementation science and scale up of prevention

### THPEE490

**Sustaining impact: a comprehensive assessment of the National Medical Male Circumcision Programme in South Africa**

M.I. Khan<sup>1</sup>, L. Mulenga<sup>1</sup>, G. Mvuma<sup>1</sup>, A. Kwarteng<sup>1</sup>, N. Burger<sup>1</sup>, D. Loykisoonlal<sup>2</sup>

<sup>1</sup>Genesis Analytics, Health Practice, Johannesburg, South Africa, <sup>2</sup>National Department of Health, Pretoria, South Africa

**Background:** The South African Government has made significant progress in HIV prevention through the implementation of the MMC programme. To ensure the programme's sustainability, the government implemented the MMC Strategy and Implementation Plan 2020-2024, focused on strengthening programme areas of leadership and advocacy, governance and coordination, service delivery, communication and demand generation, M&E and operational research and domestic resourcing. The sustainability assessment aimed to evaluate the programme's strengths, weaknesses, opportunities, and threats, while also piloting the Sustainability Assessment tool for future improvements.

**Methods:** The sustainability assessment is an Excel-based tool with 36 indicators across six programme domains and was undertaken in 11 selected districts located in Kwa-Zulu Natal, Gauteng and Mpumalanga. The tool informs the National MMC Sustainability Scorecard, which allows for evaluating programmatic alignment within a sustainability framework.

Scoring is indicated in the table below and informed by literature review and a portfolio of evidence provided by key informants responsible for delivering the VMMC programme.

Score	Definition
3	Document review and in-person engagement reveal that all requirements are in place to fully meet the definition of sustainability. There are no risks related to sustainability.
2	Document review and in-person engagement reveal several vulnerabilities that pose moderate risks to the sustainability of the programme.
1	Document review and in-person engagement reveals many major vulnerabilities that pose substantial risks to the sustainability of the programme.

**Results:** The assessment revealed an average score of 2 out of 3 across all programme areas at the national, provincial, and district levels, indicating several vulnerabilities posing moderate risks to sustainability. The provincial level score for service delivery indicated major vulnerabilities that posed substantial sustainability risks.

Programme areas	National	Provincial	District
I. Leadership and Advocacy	2	2	2
II. Governance and Coordination	2	2	2
III. Service Delivery	2	1	2
IV. Communication and Demand Generation	2	2	2
V. M&E and Operational Research	2	2	2
VI. Domestic Resourcing	2	2	2

**Conclusions:** While policies, strategies, and operational plans are in place, filtering down implementation of these plans to provincial and district levels is required. The sustainability assessment has assisted in identifying areas for improvement embedded in the programmatic areas and informing targeted action plans to enhance sustainability of the MMC programme. By leveraging strengths and addressing service delivery challenges, the impact of the programme on HIV prevention and men's health can be enhanced.

The assessment tool and Sustainability Scorecard will undergo further iterations to adapt to emerging needs and ensure the programme's long-term sustainability.

### THPEE491

**Perspectives on integrating HIV Pre-Exposure Prophylaxis and psychiatric care: a qualitative study of psychiatrists in the U.S. ending the HIV epidemic priority jurisdictions**

mented healthcare system. Psychiatrists serve as primary physicians for many PLWMI and may be their only point of contact with the healthcare system.

Thus, engaging psychiatrists as prescribers of pre-exposure prophylaxis (PrEP) for HIV prevention may be an important intervention to scale-up PrEP prescription for PLWMI, a key population in domestic and international HIV prevention policy agendas.

**Methods:** Within a larger study, 30 psychiatrists completed a 60-minute interview following a survey about PrEP prescription within psychiatric practice. Mean years in practice was 13.9 and 20.0% practiced primarily in inpatient psychiatry (63.3% in outpatient), and all in the U.S. *Ending the HIV Epidemic* priority jurisdictions. Interviews were transcribed verbatim, checked for accuracy, and thematically analyzed by a team of three researchers.

**Results:** Of the interviewed psychiatrists, 56.5% indicated interest in future PrEP prescription, and 20.0% indicated they had already done so. Psychiatrists identified several benefits to prescribing PrEP including increasing accessibility for patients and having a unique therapeutic relationship that could promote comfort discussing sexual health.

Concurrently, psychiatrists noted several barriers to PrEP implementation in their practice including limited knowledge, concerns about liability for practicing outside the 'normal' scope-of-practice, the information burden of staying up-to-date with PrEP developments, and appointment time constraints. Interviewees also highlighted the centrality of multi-level medical education interventions (eg. medical school, graduate medical education, continuing medical education) to increase PrEP knowledge among psychiatrists. Interviewees cited the need for clinical support resources, either through consultation with experts at their institution or via a national physician network (eg. hotline).

Finally, psychiatrists were overall supportive of prescribing long-acting injectable (LAI) PrEP citing the benefit of an existing clinical workflow to administer LAI antipsychotics and improved adherence.

**Conclusions:** In this qualitative study, psychiatrists were generally interested in prescribing PrEP for PLWMI. Psychiatrists indicated both facilitating and prohibiting factors regarding PrEP prescription and specific PrEP training needs to facilitate prescription in psychiatric practice. Considering the well-documented vulnerability to HIV among PLWMI, integration of PrEP prescription into existing psychiatric care should be pursued.

## THPEE492

### Integrating strengths from various sources through a digital health platform: an online-to-offline service model for HIV pre-exposure prophylaxis (PrEP)

Y. Gu<sup>1</sup>, Y. Luo<sup>1</sup>, Y. Lu<sup>2</sup>, G. Meng<sup>2</sup>, L. Sun<sup>2</sup>, Y. Cai<sup>1</sup>, Z. Han<sup>1</sup>

<sup>1</sup>Guangzhou Center for Disease Control and Prevention, Guangzhou, China, <sup>2</sup>Lingnan Partners Community Support Center, Guangzhou, China

**Background:** Over the last decade, global evidence has shown PrEP's high efficacy, reducing HIV acquisition risk by over 90% in MSM. China approved TDF/FTC for PrEP in 2020. However, PrEP services, primarily in HIV ART hospitals, face low utilization due to complex clinic procedures and limited LGBT friendliness.

In Guangzhou, a prominent city in China, the proportion of MSM seeking PrEP services in 2022 was merely 4.9% compared to PEP cases in these HIV ART hospitals, emphasizing the need for convenient, LGBT-friendly, and complementary services.

**Description:** The HIV digital health platform ("Chabei"), developed by our team, serves as a central hub connecting organizations to create an online-offline PrEP service model. Initially, LGBT community-based organizations (CBOs) provide online/offline MSM-friendly consultation and assessments. Guangzhou center for disease control and prevention, in collaboration with third-party testing facilities, conducts offline testing for HIV, HBV/HCV/STIs, and creatinine. Physicians familiar with ART medicines review, prescribe, and facilitate the delivery of PrEP medications to MSM through online medical platforms. Subsequent follow-up is managed by CBOs. The HIV digital health platform acts as a unified portal for online/offline services, integrating processes and data from different organizations to enhance efficiency, user experience, and data flow.

Consultation, assessment, testing, and follow-up services are provided free of charge, with MSM responsible only for medication costs.

**Lessons learned:** Launched in Guangzhou in December 2021, our model provided PrEP consultations for 920 MSM by June 2023. Of them, 223 underwent pre-medication testing. 4 with positive HIV antibodies were unsuitable, and 6 with positive HBV antigen were referred. 27 had abnormal creatinine levels, but none precluded PrEP. Ultimately, 207 MSM initiated PrEP, 3.6 times more than all HIV ART hospitals in Guangzhou. 99.5% percent opted for event-driven PrEP, with 50.7% in follow-up. No HIV seroconversions occurred.

**Conclusions/Next steps:** Our model integrates strengths from various sources through the HIV digital health platform, combining online convenience with standardized, safe, and MSM-friendly procedures. It serves as a distinctive complement to HIV ART hospitals. The model enhances the applicability of PrEP and holds potential for

adaptation in other Chinese cities. Subsequent stages will explore streamlined processes and adaptable follow-ups in line with WHO guidelines.

## THPEE493

### A mixed methods evaluation of pharmacists' preparedness to provide long-acting injectable HIV pre-exposure prophylaxis in California

L.A. Hunter<sup>1</sup>, R.M. Beltran<sup>2</sup>, L.J. Packel<sup>1</sup>, L. De Martini<sup>3</sup>, I.W. Holloway<sup>2</sup>, B.J. Dong<sup>4</sup>, J. Lam<sup>5</sup>, A. Miyashita Ochoa<sup>2</sup>, S.I. McCoy<sup>1</sup>

<sup>1</sup>University of California, Berkeley School of Public Health, Berkeley, United States, <sup>2</sup>University of California, Los Angeles Luskin School of Public Affairs, Los Angeles, United States, <sup>3</sup>California Society of Health-System Pharmacists, Sacramento, United States, <sup>4</sup>University of California, San Francisco School of Pharmacy, San Francisco, United States, <sup>5</sup>Chapman University School of Pharmacy, Irvine, United States

**Background:** Pre-exposure prophylaxis (PrEP) uptake remains low among people who could benefit, and recently developed alternatives to daily oral PrEP, such as long-acting injectable PrEP (LAI-PrEP), may facilitate uptake. In 2019, California passed Senate Bill 159, which enabled pharmacists to furnish or prescribe up to 60 days of oral PrEP without an outside provider's prescription. Using a mixed methods approach, we evaluated the potential for pharmacist provision of LAI-PrEP in California pharmacies.

**Methods:** In 2022–2023, we conducted an online cross-sectional survey of California pharmacists and pharmacy students (n=919) and in-depth interviews with pharmacists (n=30), both of which included modules assessing attitudes about PrEP provision. Log-binomial regression was used to estimate prevalence ratios (PRs) comparing survey participants' willingness to provide LAI-PrEP by pharmacy- and individual-level characteristics. Qualitative interview data were analyzed via Rapid Qualitative Analysis to identify factors that may affect pharmacists' provision of LAI-PrEP.

**Results:** Many survey participants reported that their pharmacy provides vaccinations or other injections (68%) and/or has private spaces available for consultation (48%). Half of survey participants (53%) indicated that they would be willing to administer LAI-PrEP via gluteal injection in their pharmacy (if provided with training, compensation, and a private room).

Willingness was higher among participants who worked in pharmacies that already provided vaccinations or other injections (56% vs. 46%; PR: 1.2; 95% confidence interval [CI]: 1.0–1.4) and/or oral PrEP under Senate Bill 159 (65% vs. 51%; PR: 1.3; 95% CI: 1.1–1.5) than among participants whose pharmacies did not. Interviewed participants reported individual, organizational, and structural barriers

to LAI-PrEP provision including the need for increased training, staffing, and time to implement LAI-PrEP within current pharmacy workflows; a private room for gluteal injections; better medication access; and a more streamlined regulatory process that would allow for equitable payment for LAI-PrEP services.

Still, many interviewed participants considered LAI-PrEP provision to be within their scope of practice and feasible with existing or improved pharmacy infrastructure.

**Conclusions:** Pharmacies offer a promising setting for increased LAI-PrEP access, particularly among persons at risk for HIV. However, pharmacists may require additional training and favorable policy changes to make implementation feasible.

## THPEE494

### Potential effects of community-based mentor mothers on HIV viral load suppression and vertical HIV transmission rates in Southern Karamoja, Uganda

S. Ssentongo<sup>1</sup>, B. Bakashaba<sup>1</sup>, B. Oryokot<sup>1</sup>, R. Opito<sup>1</sup>, S. Alwedo<sup>1</sup>, M. Yunus<sup>1</sup>, B. Etukoit<sup>1</sup>, A. Munina<sup>1</sup>, D. Idipo<sup>2</sup>, K. Mugisha<sup>1</sup>, G. Namazzi<sup>3</sup>

<sup>1</sup>The AIDS Support Organization, Kampala, Uganda,

<sup>2</sup>Ministry of Health AIDS Control Program, Kampala, Uganda, <sup>3</sup>US Centers for Disease Control and Prevention, Global Health Center, Division of Global HIV and TB, Kampala, Uganda

**Background:** Uganda has made notable progress in reducing mother-to-child HIV transmission (MTCT) from over 20% in 2000 to 2.8% in 2021. However, pregnant and breastfeeding women (PBFW) living with HIV still face barriers in accessing HIV-related services. In the remote Southern Karamoja sub-region, long distances to health facilities, insecurity, food scarcity, and HIV stigma limit access to HIV care and treatment services contributing to high infant positivity.

We describe the effect of community-based mentor mothers (MMs) on viral load (VL) suppression among PBFW living with HIV and infant positivity during the intervention period as compared to the preintervention period in Napak, Amudat, Nakapiripiti, and Nabilatuk districts of Southern Karamoja, North-Eastern Uganda.

**Description:** In April 2021, with support from the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) through the U.S. Centers for Disease Control and Prevention (CDC), 21 MMs were trained at 21 HIV clinics in Southern Karamoja. We assigned 5–10 PBFW living with HIV from the study clinics to receive support from one community-based MM. The MMs role included educating PBFW on timely antenatal care attendance, providing antiretroviral therapy (ART) adherence counseling, linking mother-baby pairs to care, supporting community VL collection, delivering ART to homes, and connecting mothers to community sup-

port groups. MMs submitted monthly reports and routine program data were collected to estimate HIV infant positivity and VL suppression over time.

**Lessons learned:** Between; April 2021-December 2022 (intervention period), community-based MMs supported 250 HIV-exposed infants (HEIs) to receive their first PCR test, resulting in 0.8% (2/250) infant positivity. From January-March 2021 (pre-intervention period), 34 HEIs were tested resulting in 8.8% (3/34) infant positivity; from April-December 2021, 115 HEIs were tested resulting in 1.7% (2/115) infant positivity, and from January-December 2022, 135 HEIs were tested resulting in 0% (0/135) infant positivity. Among PBFW living with HIV, VL suppression (<1,000 copies/ml) improved from 89% to 100%, and 12-month retention improved from 80% to 100% during the intervention period.

**Conclusions/Next steps:** Support from MMs improved VL suppression, retention, and infant positivity decreased among PBFW living with HIV, and further engagement of MMs could prove beneficial in achieving the elimination of MTCT.

## THPEE495

### Acceptability of a peer PrEP referral model among Kenyan adolescent girls and young women

M. McGowan<sup>1</sup>, N. Wairimu<sup>2</sup>, A.M. Reedy<sup>3</sup>, P. Mogere<sup>2</sup>, C. Culquichicon<sup>3</sup>, I. Njeru<sup>2</sup>, R.C. Malen<sup>3</sup>, S.D. Roche<sup>3</sup>, A. Jahn<sup>1</sup>, T. Bärnighausen<sup>1,4,5</sup>, K. Ngure<sup>6</sup>, K.F. Ortblad<sup>3</sup>

<sup>1</sup>Heidelberg University, Heidelberg Institute of Global Health, Heidelberg, Germany, <sup>2</sup>Kenya Medical Research Institute, Partners in Health and Research Development, Thika, Kenya, <sup>3</sup>Fred Hutchinson Cancer Research Center, Public Health Sciences Division, Seattle, United States, <sup>4</sup>Harvard Center for Population and Development Studies, Cambridge, United States, <sup>5</sup>Africa Health Research Institute, KwaZulu-Natal, South Africa, <sup>6</sup>Jomo Kenyatta University of Agriculture and Technology, School of Public Health, Nairobi, Kenya

**Background:** While the uptake of daily oral HIV pre-exposure prophylaxis (PrEP) remains low among African adolescent girls and young women (AGYW), those who do initiate PrEP in this region often do so through informal (i.e., word-of-mouth) referral. Thus, we sought to understand the acceptability of a formalized peer PrEP referral pathway for AGYW supported with the distribution of HIV self-test (HIVST) kits.

**Methods:** We conducted a pilot study in central Kenya testing a peer-based PrEP referral model supported with HIVST (CT.gov: NCT04982250). AGYW (≥16-24 years) who had been using PrEP for ≥3 months (i.e., "peer providers") were trained to facilitate conversations with peers ("peer clients") about HIV prevention, deliver HIVST kits to peers, and support peers' linkage to clinic-based PrEP services (if desired). One month following training, we followed-up

with peer providers and peer clients to assess their perceived acceptability delivering or receiving the intervention. To assess acceptability, we developed 10 statements (with 5-point Likert scales) that measured different component constructs (e.g., affective attitude, burden) of the Theoretical Framework of Acceptability (TFA) and analyzed these descriptively.

**Results:** From March to October 2022, 16 peer providers were trained and delivered the intervention to 55 peer clients of whom all peer providers and 30 clients completed surveys one month later. Peer providers' and clients' median ages were 23 years (IQR 21-24) and 21 years (IQR 19-22), respectively. Half (8/16) of peer providers and 73% (22/30) of clients reported casual sexual partners.

At study completion, >80% or more of peer providers and clients "agreed" or "completely agreed" with 9 of 10 TFA statements. However, the statements assessing intervention burden (*It was hard to deliver the intervention*) was found acceptable to only 75% (12/16) of peer providers and the statement assessing intervention opportunity costs (*The intervention interfered with my other priorities*) was found acceptable to 50% (15/30) peer clients.

**Conclusions:** In this pilot, AGYW found that delivering or receiving peer referrals to PrEP services with the support of HIVST was highly acceptable post-intervention.

Future peer-delivered HIV prevention interventions should be designed around perceived burden and opportunity costs to maximize HIVST uptake and PrEP initiation.

## THPEE496

### Utilizing HIV clinic infrastructure for the delivery of chronic disease and adolescent and youth friendly services: lessons from western Kenya

A. Chory<sup>1,2</sup>, I. Marete<sup>3</sup>, L. Embleton<sup>1,2</sup>, C. Ronoh<sup>4</sup>, W.-J. Wu<sup>1,2</sup>, F. Jaguga<sup>3</sup>, B. McCoy<sup>1,2,5</sup>, W. Aruasa<sup>4</sup>, S. Kimaiyo<sup>5</sup>, R. Vreeman<sup>1,2</sup>, E. Apondi<sup>4,5</sup>

<sup>1</sup>Icahn School of Medicine at Mount Sinai, New York City, United States, <sup>2</sup>Arnhold Institute for Global Health, New York, United States, <sup>3</sup>Moi University College of Health Sciences, Eldoret, Kenya, <sup>4</sup>Moi Teaching and Referral Hospital, Eldoret, Kenya, <sup>5</sup>Academic Model Providing Access to Healthcare (AMPATH), Eldoret, Kenya

**Background:** With the advent of ART, children living with HIV are growing into adolescence, a period associated with complex care needs, ranging from preventive services to chronic disease management. For adolescents in HIV care, there is an opportunity to deliver comprehensive adolescent and youth friendly services (AYFS) in a familiar setting with trusted providers. Adapting existing HIV infrastructure to provide chronic disease and AYFS globally should be prioritized.

**Description:** The Moi Teaching and Referral Hospital's Rafiki Centre for Excellence in Adolescent Health provides HIV care to adolescents living with HIV (ALWH) in western

Kenya. As adolescents mature, they have increasingly broader needs related to sexual and reproductive health (SRH), mental health, chronic diseases, substance use, and psychosocial stressors like violence, food insecurity, and street-connectedness.

Through discussions with the Ministries of Health and Education, youth, clinicians, researchers and public health experts - key programmatic priorities were established. The Rafiki Centre aims to become a "one-stop shop" providing SRH, mental health, chronic disease management, HIV prevention/treatment services, and life skills training for all adolescents, regardless of HIV status, at no cost by leveraging existing HIV infrastructure for the provision of chronic disease and AYFS.

**Lessons learned:** It is critical to prepare the next generation of health care workers—from peer navigators to fellowship-trained clinicians - to address adolescent-specific health needs. Adolescent Medicine is not currently a clinical specialty in Kenya; challenges remain in building multi-disciplinary teams that provide adolescent-specific care and creating health systems for adolescents to access comprehensive health services. HIV-related stigma continues to pose a threat to care delivery for adolescents, as Rafiki is known as an HIV clinic.

Additionally, intersectional stigma related to sexuality and street-connectedness increases vulnerability and reduces support for services. We identified needs for expanding services, re-branding the clinic, and improving community outreach and sensitization.

**Conclusions/Next steps:** In the global push to integrate chronic disease care delivery with HIV infrastructure, integrating AYFS should be strongly considered. Interventions to train health care workers are needed to strengthen workforce capacity to deliver AYFS and HIV stigma reduction strategies, particularly around community perception of the facility, may be needed to attract HIV-uninfected youth to services.

## THPEE497

### The role of private sector engagement in scaling up and sustaining access to pre-exposure prophylaxis (PrEP) in Vietnam

B. Vu<sup>1</sup>, K. Green<sup>1</sup>, L. Tran<sup>1</sup>, P. Phan<sup>1</sup>, C. Pham<sup>1</sup>, A. Tran<sup>1</sup>, D. Nguyen<sup>2</sup>, A. Doan<sup>2</sup>, T. Ngo<sup>2</sup>, T. Tran<sup>1</sup>, P. Tran<sup>3</sup>, V. Nguyen<sup>3</sup>, B. Nguyen<sup>1</sup>, T. Phan<sup>3</sup>, H. Nguyen<sup>1</sup>, H. Phan<sup>4</sup>, L. Doan<sup>4</sup>

<sup>1</sup>PATH, Hanoi, Viet Nam, <sup>2</sup>USAID, Hanoi, Viet Nam, <sup>3</sup>PATH, Ho Chi Minh City, Viet Nam, <sup>4</sup>Vietnam Administration of HIV/AIDS Control (VAAC), Ministry of Health, Hanoi, Viet Nam

**Background:** To achieve UNAIDS prevention targets by 2030, accelerating PrEP scale-up is crucial. PrEP was introduced in Vietnam in 2017 and is now available in 210 clinics across 29 provinces. The private sector accounts for one-fifth of these clinics, serving approximately 50%

of clients. We assessed the impact of private sector engagement in scaling up PrEP in Vietnam through the USAID/PATH Healthy Markets (HM) and STEPS projects, supported by the U.S. President's Emergency Plan for AIDS Relief (PEPFAR).

**Description:** We engaged 23 public outpatient clinics and 17 private KP-led clinics offering free or commercial oral PrEP. Using data from the national HMed PrEP system, we assessed PrEP initiation, retention, return, and dropout rates in Hanoi, Ho Chi Minh City, and Dong Nai. We also identified factors associated with PrEP continuation.

**Lessons learned:** Between October 2017 and September 2023, we enrolled 32,064 individuals in PrEP, of which private clinics accounted for 80.1%, while public clinics made up 19.9%. The majority of PrEP initiations were at private clinics, ranging from 71.2% to 95.9% annually. Private clinic clients represented a longer median duration of PrEP use (268 days) compared to public clinics (148 days). The HIV sero-conversion rate among PrEP users was lower in private clinics (0.03%) compared to public clinics (0.13%). Multiple linear regression analysis indicated that longer PrEP continuation was associated with being enrolled in private sector services (Coef = 116; 95%CI: 108-123; P<0.001), enrollment in tele PrEP (Coef = 92; 95%CI: 60-125; P<0.001), paying for PrEP/commercial PrEP (Coef = 84; 95%CI: 75-93; P<0.001), and among transgender women (Coef = 49; 95%CI: 32-65; P<0.001).

**Conclusions/Next steps:** Engaging the private sector in PrEP delivery is critical for accelerating PrEP scale-up and sustainability in Vietnam. Private clinics have played a pivotal role in initiating and retaining individuals on PrEP, ensuring its effective utilization. These findings highlight the importance of continued private sector engagement in achieving the Vietnam's 2030 goal of ending AIDS.

## THPEE498

### Scale up of pre-exposure prophylaxis (PrEP) in facility-based HIV prevention services in El Salvador

N. Farach<sup>1</sup>, A. Carrillo<sup>2</sup>, C. Castaneda<sup>3</sup>, T. Rivera<sup>4</sup>, A. Morales<sup>5</sup>, O. Villalobos<sup>5</sup>, C. Galindo<sup>6</sup>, J. Franks<sup>7</sup>, R. Mendizabal-Burastero<sup>6</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention, Central America office, Tegucigalpa, Honduras, <sup>2</sup>Ministry of Health of El Salvador, San Salvador, El Salvador, <sup>3</sup>U.S. Centers for Disease Control and Prevention, Central America office, San Salvador, El Salvador, <sup>4</sup>ICAP Central America, Tegucigalpa, Honduras, <sup>5</sup>ICAP Central America, San Salvador, El Salvador, <sup>6</sup>ICAP Central America, Guatemala City, Guatemala, <sup>7</sup>ICAP, New York, United States

**Background:** Key populations carry the highest HIV burden in El Salvador. The Ministry of Health (MoH) provides a tailored HIV prevention package for key populations through the STI Sentinel Surveillance strategy, known as

VICITS by its Spanish acronym. In 2015, the World Health Organization recommended the integration of PrEP into existing prevention services as an additional HIV prevention alternative.

**Description:** Following the launch of PrEP guidelines in December 2021, El Salvador received a donation of PrEP medication from the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) to jumpstart service delivery. In collaboration with PEPFAR, the MoH developed a plan to ensure an enabling environment for PrEP introduction and scale up at VICITS facilities. The plan included a site-specific needs assessment, health care worker training plans, integration of a PrEP module into the country's SIS health information system, community outreach and engagement, demand creation, and considerations for the sustainability of PrEP services through domestic funding. Health care worker trainings included both clinical as well as lay workers, including peer promoters and educators. PrEP dispensation began in one VICITS facility in San Salvador in September 2022. In 2023, the MoH expanded PrEP to 11 additional VICITS sites. By September 2023, 1,135 people had started PrEP, reaching 129% of the target of PrEP initiations for that year. Out of these, 94% were men who have sex with men and 6% transgender women. In the same period, 303 people discontinued PrEP, including 3 seroconversions, all of them in the window period.

**Lessons learned:** The integration of PrEP into existing HIV prevention packages allowed El Salvador to quickly expand PrEP while assuring sustainability based on domestic funding for staff, medication, and supplies.

**Conclusions/Next steps:** The El Salvador MoH will expand PrEP to 12 additional facilities in 2024 and introduce a status neutral testing service approach to assure people who test negative and could benefit from PrEP are provided pathways to this service. El Salvador's fostering of an enabling environment for PrEP within its public health and clinical infrastructure is a model for other countries intending to rapidly scale-up this service.

## THPEE499

Geospatial location-allocation analysis reveals three distribution locations to maximize HIV prevention service reach for persons who inject drugs in Ciudad Juárez, Mexico

N. Ludwig-Barron<sup>1</sup>, J. Lechuga<sup>2</sup>, J. Salazar<sup>1</sup>, M.E. Ramos Rodríguez<sup>3</sup>, S. Villalobos Alavez<sup>3</sup>, L. Rodríguez García<sup>1</sup>, M.Á. Jácome Santos<sup>3</sup>, J. Saucedo<sup>1</sup>

<sup>1</sup>University of California, San Francisco, Medicine, San Francisco, United States, <sup>2</sup>Hunter College City University of New York, Psychology, New York, United States, <sup>3</sup>Programa Compañeros, Juárez, Mexico

**Background:** Ciudad Juárez (Juárez), Mexico sits along a major binational, drug-trafficking route, with limited HIV prevention services for the >10,000 persons who inject

drugs (PWID), of whom 11% are living with HIV and >80% are living with hepatitis C. Programa Compañeros, the region's sole harm reduction organization, delivers safe injection equipment directly to PWID via mobile vans. Using location-allocation analysis (LAA), we aimed to identify three locations to maximize their mobile HIV prevention service delivery.

**Methods:** From June to September 2023, we recruited PWID who injected in the previous month, ≥18 years old, living in Juárez and Spanish-speaking to complete an HIV environmental, cross-sectional survey with questions on: a. Shared injection equipment (previous year) and; b. Up to four locations where they last shared using Google Maps to capture latitude and longitude coordinates. Data were analyzed in ArcGIS Pro 3.1.

We pre-specified three locations and a travel radius of 2.5 km (approx. 30- 40-minute walk) to maximize service reach. Results include descriptive statistics, a heat map indicating high-density sharing, and the LAA.

**Results:** Of the 149 participants, 103 (69.1%) shared injection equipment within the last year and provided a total of 142 coordinates. Participants were mostly male (86.4%), with a median age of 45 years and <9<sup>th</sup> grade education (71.8%). All participants injected heroin, averaging 5.2 injections per day.

Figure 1 indicates high-density equipment-sharing locations, with the majority of coordinates (82%) in Northern Juárez. LAA yielded two locations in North Juárez and one in South Juárez that maximize outreach to PWID communities with the greatest need for HIV prevention services.

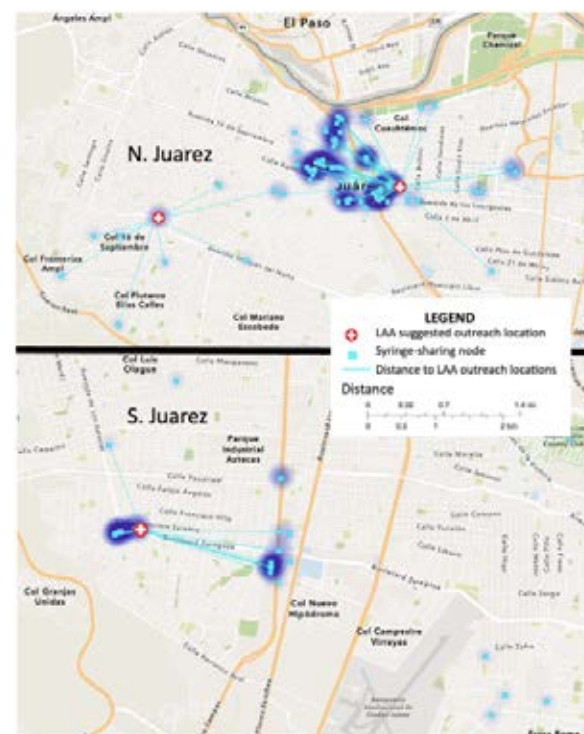

Figure 1. Location-allocation analysis identifies two locations in Metro Ciudad Juárez and one location in South Juárez to maximize HIV prevention services for PWID.

**Conclusions:** LAA was useful in suggesting three locations that maximize HIV prevention services to PWID within Juárez, Mexico, revealing one location in South Juárez that was previously unknown. Geospatial data analysis was useful in maximizing HIV prevention outreach services.

## THPEE500

### Developing an implementation plan for pharmacy-based PrEP service delivery model in Malaysia: findings from a collaborative stakeholder consultation

Y.N. Gan<sup>1,2</sup>, R. Ahmad Zaki<sup>1,3</sup>, S.K. Syed Razif<sup>4</sup>, M. Ahmad Nizaruddin<sup>5</sup>, R. Rajasuriar<sup>4,6</sup>, S. Basri<sup>4,7</sup>, A. Yap<sup>8</sup>, S.H. Lim<sup>1,4</sup>, F. Altice<sup>4,9,10,11</sup>, I. Azwa<sup>4,7</sup>

<sup>1</sup>Universiti Malaya, Department of Social & Preventive Medicine, Kuala Lumpur, Malaysia, <sup>2</sup>Ministry of Health Malaysia, Malaysian Health Technology Assessment Section (MaHTAS), Putrajaya, Malaysia, <sup>3</sup>Universiti Malaya, Centre for Epidemiology and Evidence-Based Practice (CEBP), Kuala Lumpur, Malaysia, <sup>4</sup>Universiti Malaya, Centre of Excellence for Research in AIDS (CERiA), Kuala Lumpur, Malaysia, <sup>5</sup>University of Cyberjaya, Faculty of Pharmacy, Department of Community & Pharmacy Practice, Cyberjaya, Malaysia, <sup>6</sup>Universiti Malaya, Department of Medicine, Kuala Lumpur, Malaysia, <sup>7</sup>Universiti Malaya, Infectious Diseases Unit, Department of Medicine, Kuala Lumpur, Malaysia, <sup>8</sup>The Red Clinic, Petaling Jaya, Malaysia, <sup>9</sup>Yale School of Medicine, Section of Infectious Diseases, Department of Internal Medicine, New Haven, United States, <sup>10</sup>Yale School of Public Health, Department of Epidemiology of Microbial Diseases, New Haven, United States, <sup>11</sup>Yale University, Center for Interdisciplinary Research on AIDS (CIRA), New Haven, United States

**Background:** In Malaysia, despite the availability of HIV pre-exposure prophylaxis (PrEP) in primary and tertiary health centres, uptake remains low, with only 18% of men who have sex with men ever having taken PrEP. To address this issue, we explored the feasibility of leveraging the existing accessible community pharmacies to provide demedicalised service delivery and increase PrEP uptake through a collaborative stakeholder consultation.

**Description:** In April 2023, a one-day meeting was conducted in Kuala Lumpur with 31 stakeholders from community pharmacies, professional medical and pharmacy societies, telemedicine provider, non-governmental organizations (NGOs) and scientists working in the field of HIV and implementation research. Through a comprehensive review of formative qualitative study findings on barriers and concerns with key populations, PrEP prescribers, and community pharmacists, the stakeholders identified solutions to overcome barriers and concerns related to com-

ponents of pharmacy-based PrEP service delivery. These included promotional activities, HIV testing, pharmacist assessment and counselling, physician prescribing, dispensing and follow up. Key discussion points were summarized.

**Lessons learned:** Key recommendations encompassed the provision of private consultation room, affordable PrEP price points, availability of protocol for pharmacy-based PrEP service, digitalised checklist-based assessment, use of HIV self-testing, collaboration with NGOs, PrEP prescribers, and laboratory providers, and ensuring strict confidentiality of client information.

Identified training needs for community pharmacists included PrEP education, eligibility criteria for PrEP initiation and continuation, referral protocols and scenario-based learning. Necessary competencies included knowledge on HIV and sexually transmitted infections (STIs), risk behaviour assessment, professional behaviour, and using person-centred language.

Six implementation sites were selected, each with specific preparation needs including availability of HIV self-test kits, PrEP medication, PrEP leaflets, trained pharmacists, subscription to telemedicine service, and partnering PrEP clinic within 10km for referrals. Implementation plan for pharmacy-based PrEP service was finalised.

**Conclusions/Next steps:** Stakeholders were supportive and enthusiastic about the pharmacy-based PrEP service delivery model as an alternative access to PrEP in the Klang Valley, Malaysia. Future research is essential to evaluate the sustainability of this novel implementation strategy to increase PrEP uptake in Malaysia and other similar settings. Streamlining the approach to be simplified, person-centered, and demedicalised will be pivotal for successful implementation.

## THPEE501

### Preferences for the provision of oral and injectable PrEP among MSM and transgender persons who discontinued oral PrEP in Europe

H. Zimmermann<sup>1</sup>, H. Wang<sup>1</sup>, J. Kolstee<sup>1</sup>, A. Adriaque Lozano<sup>1</sup>, M. Schroeder<sup>2</sup>, A. Appiah<sup>2</sup>, C. Brown<sup>3</sup>, J. Scherzer<sup>4</sup>, K. Jonas<sup>1</sup>

<sup>1</sup>Maastricht University, Work and Social Psychology, Maastricht, Netherlands, the, <sup>2</sup>ViiV Healthcare Ltd, Brentford, United Kingdom, <sup>3</sup>ViiV Healthcare Ltd, Durham, United States, <sup>4</sup>ViiV Healthcare Ltd, Munich, Germany

**Background:** Oral PrEP can substantially reduce HIV infections, but provider barriers can lead to discontinuation. Long-acting injectable PrEP (LA-PrEP) may address unmet needs. We identify characteristics of discontinued users and explore their past oral PrEP-provider and preferred provider of oral and LA-PrEP, and whether mismatch between past and preferred oral PrEP-provider is associated with intention and preference for LA-PrEP.

**Methods:** We conducted the online cross-sectional PROTECT survey among men who-have-sex-with-men, trans\* and non-binary individuals in 20 European countries from October-December 2023.

We used logistic regression for high intention to use LA-PrEP and multinomial regression for preference for oral PrEP, LA-PrEP or mixed use among discontinued users, adjusted for PrEP-reimbursement (i.e., countries where PrEP is fully, partly or not reimbursed).

**Results:** We included 13,317 participants; 6,413 were PrEP-naïve, 5,998 current and 906 discontinued oral PrEP-users. Median age was 40 years (IQR=32-49) and most participants resided in countries where PrEP was fully or partly reimbursed (79.4%). Discontinued users were more often younger, a migrant or financially struggling than PrEP-naïve or current users ( $p<0.001$ ).

Furthermore, discontinued users (18.5%) resided more often than current users (12.4%), but less often than PrEP-naïve participants (28.6%), in countries without PrEP-reimbursement ( $p<0.001$ ).

Both discontinued and current users most often accessed oral PrEP from sexual health clinics (32.0%; 34.6%) and medical specialists (23.5%; 28.8%), but discontinued users accessed PrEP more often informally (11.6%; 0.7%) but less often from general practitioners (18.2%; 27.5%;  $p<0.001$ ).

Among discontinued users, preferred oral and LA-PrEP providers were most often GPs (32.3%; 31.0%), sexual health clinics (27.6%; 38.2%) and medical specialists (11.7%; 16.3%), but almost half (49.8%) preferred a different provider for oral than for LA-PrEP. 57.6% also reported a mismatch between past and preferred oral PrEP-provider, which was more common if PrEP is not fully reimbursed in their country ( $p<0.001$ ). This mismatch was not associated with LA-PrEP intention ( $aOR=1.05$ ; 95%CI=0.76-1.46), but was associated with preferring oral over LA-PrEP ( $aOR=0.57$ ; 95%CI=0.41-0.79).

**Conclusions:** The infrastructure for provision of PrEP is highly relevant and needs to be considered, given new modalities. A mismatch of preferred access pathways may result in discontinuation, inhibit re-uptake and may also inhibit uptake of new modalities.

## THPEE502

Creating the time and space for meaningful discussions on HIV prevention and Sexual and Reproductive Health and Rights (SRHR) among adolescent girls and young women in Angola

E. Waya<sup>1</sup>

<sup>1</sup>ADPP Angola, Partnership Team, Luanda, Angola

**Background:** Angola has a relatively low HIV prevalence (2%) for the region. Adolescent girls and young women (AGYW) comprise an estimated 25% of the people who have recently acquired HIV, with a three-fold higher risk than that of young men. With 65% of the Angolan popu-

lation under 24 and limited access to Sexual and Reproductive Health and Rights (SRHR) targeted prevention for AGYW is critical.

**Description:** ADPP Angola, a local NGO, has implemented "Bancadas" (UNDP, GF/UNFPA) for in- and out-of-school AGYW aged 10-24 since 2018. *Bancadas* is a community-based, AGYW-led movement focused on HIV prevention and SRHR. Concentrated in urban and suburban areas where prevalence is highest, weekly activist-led *Bancadas* sessions— which take place in informal, accessible settings and include lessons, storytelling, music and role models— provide comprehensive sexuality education, including HIV prevention, and offer safe spaces for SRHR discussions.

**Lessons learned:** In 2023, Bancadas reached 47,343 AGYW, approximately one third per age group: 10-14, 15-19, and 20-24 years old. 12% were young mothers. In 2023, 21,915 girls successfully completed the program, participating in over 70% of sessions and demonstrating correct knowledge of HIV/SRHR messages, outperforming the national average of 32.5% message awareness.

All participants were risk screened and 22,662 (82%) tested for HIV; 81 (0.4%) tested positive and 81 (100%) initiated Antiretroviral Therapy. Program data from 2018-2021 identified a 2.3% positivity rate (309/13,331) in a group comprising a 3-2 ratio of in-school to out-of-school AGYW highlighting the need to target both groups. Key lessons learned is that it takes time to build the confidence of AGYW: a full-year of Bancadas allows AGYW to acquire knowledge on HIV prevention, explore their own doubts, support each other, and become peer educators in their communities.

**Conclusions/Next steps:** Employing a "people-to-people" approach involving young activists, peer educators, and *Bancadas* participants is a relatively low-cost option to engage the broader community in discussions addressing HIV prevention, SRHR, stigma and discrimination. As more AGYW graduate and carry their messages to the community, ADPP will also monitor changes in message awareness within the broader community. Further study on the experience of male-only and mixed Bancadas is required to spearhead an inclusive, transformative movement.

Conversations with providers explaining CAB LA ease of use and their right to choose enabled decision-making. PSPs outlined convenience of injections, not having to remember to take PrEP every day, decreased adherence stress, and not worrying about HIV as key reasons for choosing/switching to CAB LA (Table 1). Most PSPs (74%) reported having no CAB LA concerns; 17% with concerns cited side effects and injection pain/soreness.

**Conclusions:** Provider conversations coupled with lifestyle benefits influenced decisions of MSM and TGM to adopt CAB LA. Equipping providers with effective PrEP discussion strategies is crucial for supporting PrEP uptake.

## THPEE505

Interim results from an online pre-exposure prophylaxis (PrEP) pilot for men and women in Gauteng province, South Africa

T. Nyamuzihwa<sup>1</sup>, A. Tembo<sup>1</sup>, E. Edem<sup>1</sup>, M. Mkansi<sup>1</sup>, A. Mkhize<sup>1</sup>, C. Phahla<sup>1</sup>, T. Wonderlik<sup>1</sup>, N. Martyn<sup>1</sup>, L. Makola<sup>1</sup>, T. Guramatunhu<sup>2</sup>, M. Motsoari<sup>2</sup>, F. Venter<sup>1</sup>

<sup>1</sup>Ezintsha, Research, Johannesburg, South Africa, <sup>2</sup>King Online, Johannesburg, South Africa

**Background:** The World Health Organisation recommends differentiated service delivery to increase PrEP coverage. The growth of online health and wellness retailers and increasing acceptance of online health services in South Africa such as virtual doctor consultations and e-scripting presents an opportunity to provide PrEP services online.

This project aims to pilot an online PrEP model for adult men and women.

**Methods:** In July 2023, King Online, an online vending company with a history of providing sexual wellness products launched an end to end PrEP platform to customers for 13 months. Men and women ≥18 years residing in Gauteng province accessing their website are provided information on the "PrEP page." Those that sign up for PrEP, receive an HIV self-test and complete an online form to report their HIV results, schedule a once-off nurse visit (for baseline laboratory investigations) and doctor virtual consult for PrEP scripting- all performed after client's consent. PrEP refills are supported by HIV self-testing, self-collection of dry blood spot samples (for confirmation of HIV status), doctor telephonic consultations and courier delivery of PrEP. Project data was analysed using STATA/SE 18.0

**Results:** To date, a total of 53 customers have initiated PrEP, with 22 (42%) returning at month one and 5 (9%) at month 4. A total of 79% (42) are new PrEP initiations, 64% (34) are male, 74% (39) are black and the mean age is 32 years. Most (40/53, 75%) participants do not have a steady sexual partner and 79% (42) have tertiary education with 85% (45) earning more than the national minimum wage. At screening, 34 participants (64%) reported condomless sex.

Figure 1. Chart depicting the online PrEP initiation cascade.

**Conclusions:** Preliminary results suggest that online PrEP is feasible, acceptable and that HIV self-testing can support maintenance on PrEP. Next steps are streamlining the model based on user experiences for larger scale implementation.

## THPEE506

High reach and adoption of secondary DREAMS services among AGYW in Zambia: a country-wide RE-AIM assessment of DREAMS implementation 2016-2022

C. Baumhart<sup>1,2</sup>, B. Lindsay<sup>1,2</sup>, L.K. Mwango<sup>3</sup>, T. Lascko<sup>1,2</sup>, C. Muleya<sup>4</sup>, A. Mwila<sup>4</sup>, C.W. Claassen<sup>1,2,5</sup>

<sup>1</sup>University of Maryland Baltimore (UMB), Center for International Health Education and Biosecurity (Ciheb), Baltimore, United States, <sup>2</sup>University of Maryland Baltimore (UMB), Institute of Human Virology (IHV), Baltimore, United States, <sup>3</sup>Ciheb Zambia, Lusaka, Zambia, <sup>4</sup>Centers for Disease Control and Prevention (CDC), Division of Global HIV and TB, Lusaka, Zambia, <sup>5</sup>Maryland Global Initiatives Corporation Zambia, Lusaka, Zambia

**Background:** In Zambia, the DREAMS initiative was implemented primarily as an HIV prevention intervention among adolescent girls and young women (AGYW). DREAMS has also contributed to the holistic development and wellbeing of AGYW through secondary services, such as socioeconomic support and family planning. These additional DREAMS services extend beyond primary services to provide sustained support and address the multifaceted challenges faced by AGYW. We assessed the reach and adoption of secondary services among AGYW in 14 districts in Zambia.

**Methods:** We conducted a multi-year, country-wide assessment of DREAMS program implementation from 2016 to 2022 in 14 Zambian districts using the Reach, Effectiveness, Adoption, Implementation, and Maintenance (RE-AIM) implementation science framework. Data were collated from all DREAMS implementing partners since DREAMS inception in Zambia in 2016. We used aggregate and line-listed client-level data to quantitatively analyze the reach and adoption of secondary DREAMS services among AGYW across all the programs. Data were analyzed using R-Studio.

**Results:** Of 1,091,641 AGYW who were enrolled in DREAMS, 565,378 (51.8%, 95% CI:51.7-51.9%) were documented as having received at least one secondary service. Second-

ary services engagement was lowest in the earliest years of DREAMS implementation and reached 72.1% by FY2021. By district, uptake of any secondary service ranged from 36.1% in Lusaka to 84.3% in Mongu.

Without considering eligibility due to age differences, engagement in secondary services was highest in the 20-24 age group with 79.8% (95% CI:79.7-79.9%) of AGYW engaging in a secondary service, 57.6% (95% CI:57.5-57.8%) of AGYW aged 15-19 engaging, and 21.3% (95% CI:21.2-21.4%) of AGYW aged 10-14 engaging. Socioeconomic support services were the most commonly accessed with 29.6% participation, while biomedical services, including condom distribution, family planning, and HIV testing, followed with 27.2%, 11.2%, and 9.6% participation, respectively.

Overall, 2,328 (2.2%) of 104,859 AGYW accessing HIV testing services tested positive for HIV.

**Conclusions:** The DREAMS programs across Zambia successfully reached over one million AGYW over the years, and 52% of AGYW enrolled in DREAMS received secondary services, especially older AGYW aged 15-24. DREAMS appears to be highly effective at reaching at-risk AGYW with multifaceted services in sub-Saharan African countries such as Zambia.

## THPEE507

**Integrating PrEP delivery in public family planning clinics increases PrEP screening and uptake: results from a large stepped-wedge, cluster-randomized trial in Kenya**

K. K.Mugwanya<sup>1,2</sup>, D. Matemo<sup>3</sup>, A. Meisner<sup>4</sup>, C. Wandera<sup>3</sup>, T. Schaafsma<sup>1</sup>, A. Lee<sup>1</sup>, J.F. Morton<sup>1</sup>, K. Beima-Sofie<sup>1</sup>, B.J. Weiner<sup>1</sup>, J. Kinuthia<sup>3,1</sup>, FP Plus Project Team

<sup>1</sup>University of Washington, Global Health, Seattle, United States, <sup>2</sup>University of Washington, Epidemiology, Seattle, United States, <sup>3</sup>Kenyatta National Hospital, Research & Programs, Nairobi, Kenya, <sup>4</sup>University of Washington, Fred Hutchinson Cancer Center, Seattle, United States

**Background:** Young African women account for a disproportionate number of new HIV infections and are a priority population for pre-exposure prophylaxis (PrEP).

**Methods:** Between March 2021 and December 2023 in collaboration with Kisumu County Department of Health (KDOH), we conducted a stepped-wedge, cluster-randomized trial to integrate systematic screening for HIV risk and oral PrEP provision at 12 family planning (FP) clinics in Kisumu, Kenya (ClinicalTrials.gov: NCT04666792).

The intervention included facility-based health provider training, technical assistance (TA) to coach and mentor providers, and joint supervision with KDOH to audit and provide feedback. PrEP provision and follow-up was conducted by existing FP staff. Women could be screened both before and during intervention but were counted only once towards PrEP initiation. We compared out-

comes during pre-intervention vs intervention periods using modified Poisson generalized estimating equations models, adjusted for time effects and clustering by clinic.

**Results:** Overall, 25,456 women without HIV were seen, with 7,058 encounters pre-intervention and 19,240 during the intervention. Median age was 27 (IQR 23-31) years. Women were using injectable (42%), implant (23%), and oral pills (25%) for contraception. The number and proportion of women screened for PrEP substantially increased from 212 (3%) in 7,386 women-encounters pre-intervention to 19,561 (92%) from 21,343 women-encounters during the intervention period (RR: 20.5, 95%CI 3.5-120; p<0.001). PrEP initiation among women eligible for PrEP substantially improved from 3% (4/119) pre-intervention to 41% (983/2,426) during intervention (RR: 52.8, 95%CI 2.9-967; p=0.008). PrEP initiations continued in the maintenance period (12 months after intensive TA stopped), resulting in 1,415 total PrEP initiations. Overall, 43% refilled at least once and the mean proportion of days covered by PrEP was 53% through 3 months and 36% through 6 months post-initiation.

Thematic analysis of TA reports identified provider attitude, workload, frequent staff transfers, and requirement to complete multiple data registers as important facility barriers to integration. Health talks and using HIV testing counselors to conduct risk assessment emerged as facilitators.

**Conclusions:** We observed high PrEP screening and uptake and reasonable coverage. Integration of PrEP services within African FP clinics is feasible and has tremendous potential to improve PrEP access for African women.

## THPEE508

**Innovative syringe-needle distribution in Dhaka: integrating secondary channels for enhanced accessibility and cost-efficiency**

M.S. Alam<sup>1</sup>, R. Khan<sup>1</sup>, S. Islam<sup>1</sup>

<sup>1</sup>Save the Children, HIV/AIDS, Dhaka, Bangladesh

**Background:** Bangladesh has pioneered harm reduction program in South Asia, yet gaps remain in syringe-needle (SN) distribution, particularly in Dhaka. Traditional outreach by Peer Outreach Workers (POWs) is limited by their availability and mobility, resulting in People Who Inject Drugs (PWID) facing difficulties in accessing necessary services. Peer Outreach Workers (POWs) are not on field 24 hours. Besides, POW roams around the spots approximately two-square Kilometers area, so PWID can't find POW sometimes when necessary. This highlighted the need for a revised approach in SN distribution to bridge these service gaps.

**Description:** Under the Global Fund NFM3-grant in 2023, an innovative model was introduced in Dhaka, incorporating thirty-five depot holders (26 pharmacies, 9 rag-

pickers) and five syringe vending machines at strategic locations. This dual approach operates alongside conventional outreach. Depot holders distribute syringes during POWs' off-hours, receiving a nominal incentive for their participation.

Additionally, vending machines provide 24/7 access to syringes. Efforts to ensure safe disposal, including drop-boxes and training for both depot holders and PWID, were implemented, with the PWID network playing a crucial role in monitoring and supporting this initiative.

#### Lessons learned:

- Syringe distribution per PWID increased from 265 to 315 units annually.
- Monthly reach to mother-listed PWID increased significantly from 67% to 93%.
- Approximately 75% of syringes distributed through depots were safely collected in drop-boxes.
- Local leaders and elites became active advocate of harm reduction program since they were engaged in the whole process (planning, implementation and monitoring).
- The cost of syringe distribution through secondary channels is significantly lower (USD 0.02 per syringe) compared to traditional methods (USD 0.10 per syringe).

**Conclusions/Next steps:** The secondary distribution channels, encompassing both depots and vending machines, have proven to be a highly effective and cost-efficient method to bridge the service gap in hard-to-reach PWID populations. This model not only enhances accessibility but also demonstrates potential for global replication. While drop-out of POW remains a challenge, ongoing training and capacity building of new POWs can mitigate this issue, ensuring the sustainability and effectiveness of the program.

## THPEE509

Results and cost of baseline serum creatinine testing among key and vulnerable populations: analysis of routine oral PrEP program data in Tanzania

E. Herman<sup>1</sup>, B. Ogbwang<sup>1</sup>, D. Boyee<sup>1</sup>, B. Sage<sup>1</sup>, J. Abel<sup>1</sup>, G. Massawe<sup>1</sup>, J. Ngweshemi<sup>1</sup>, A. John<sup>1</sup>, D. Carpenter<sup>2</sup>, C. Akolo<sup>2</sup>

<sup>1</sup>FHI-360, Dar Es Salaam, Tanzania, the United Republic of,

<sup>2</sup>FHI-360, Washtong DC, United States

**Background:** WHO recommended Pre-exposure Prophylaxis (PrEP) as a preventive measure against HIV for individuals who are at substantial risk of acquiring HIV. The PEPFAR/USAID-funded Meeting Targets and Maintaining Epidemic Control (EpiC) project collaborates with the Ministry of Health to scale-up HIV prevention services, including oral PrEP among key and vulnerable populations (KVP). Tanzanian National guidelines mandate serum cre-

atinine clearance (CC) before PrEP initiation. We present results of baseline CC among KVP initiated on PrEP and associated cost implications.

**Description:** Prior to PrEP initiation a healthcare provider takes blood sample for serum creatinine testing and offers one month of PrEP. Samples are taken to health facilities with result turnaround time of 2 weeks. Individual client data, including estimated CC were recorded in national PrEP client card and entered in DHIS2 database. We analyzed CC results from routine program data between October 2022 and September 2023, disaggregated by age and sex. We calculate average unit cost for creatinine testing, excluding costs for sample collection, human resources, and transportation.

**Lessons learned:** 22,572 individuals initiated oral PrEP, of whom 95% were 15-39 years. Among those initiated, 93.3% (21067/22572) were tested for serum creatinine, 99.3% (20,911/21067) had CC of above 60ml/min and 156 (0.7%) had CC below 60ml/min. There is no statistical significant difference by age for those with CC below 60ml/min; 0.8% (111/13452) among <30-year-olds, 0.6% (41/6349) among 30-39 year-olds and 0.4% (4/996) among 40+ years (p=0.217). The proportion of women with CC <60ml/min was higher than men (0.8 vs 0.3, p= 0.004). 10% of those with CC <60ml/min had history of medical conditions, including diabetes, hypertension, and kidney disease and none of those with CC above 60ml/min reported any medical condition. The estimated total cost was USD 77,706 with an actual serum creatinine test averaged USD 5.8 (interquartile range ~3.9 – 7.5 USD) per individual.

**Conclusions/Next steps:** Majority of client-initiated PrEP had normal baseline CC. To improve access, Tanzania should consider adapting WHO recommendation that removes requirement for mandatory baseline CC for PrEP initiation. Given few individuals with abnormal results, there is an opportunity to save costs, facilitate efficient resource allocation, and promote efforts to improve PrEP continuation and monitoring.

## THPEE510

The use of incentives: a demand creation strategy in COVID-19 vaccine-hesitant communities

L. Mbata<sup>1</sup>, S. Sotshongaye<sup>1</sup>, E. Zwane<sup>1</sup>, J. Pienaar<sup>1</sup>  
<sup>1</sup>Aurum Institute, Johannesburg, South Africa

**Background:** The success of demand creation strategies for health services is dependent on the communities where they are being implemented. We use different strategies to promote demand, educate communities on health programs and services and correcting myths and misinformation. The COVID-19 vaccine program experienced vaccine-hesitancy at various points in its implementation, and it was important we implement new strategies such as the use of nominal incentives which has been proven to be an effective tool to drive demand.

**Description:** We used Geographical Information System (GIS) report to identify areas that have low vaccine-up-take. In the identified areas we conducted community mapping and screening and developed mass vaccination campaigns and introduced the use of incentives, social media, and radio as part of the demand creation strategies. Community mapping exercise enabled us to customize incentives according to the community needs and we created incentive packages as informed by the communities.

**Lessons learned:** Targeted mapping allowed us to identify areas with low vaccine uptake, the contribution made towards overall vaccinations went from 522 doses in Jul 2023 to 18 598 in Sep 2023 in the Tshwane region. The introduction of incentives improved the daily vaccination rate from vaccinating under 100 to over 700 in the Tshwane district. With the strategies implemented were able to map the area according to the needs of the area, package incentives according to the district preference and managed to give over 120k vaccination doses.

Our incentive was below \$5 and included store vouchers, food vouchers, airtime vouchers and food packages and marketing material (t-shirts and lanyards). Food vouchers were the most preferred of the incentives. We embedded a customer satisfaction survey within the project, and customer feedback was used to improve service delivery.

**Conclusions/Next steps:** Tailoring demand creation strategies to community needs is vital. For COVID-19 vaccine uptake, GIS-driven targeting and nominal incentives, especially food vouchers, significantly increased vaccinations, emphasizing the importance of community-driven approaches. This is especially important for community-driven programs with high hesitancy and these strategies have the potential to improve community engagement in similar programs such as HIV prevention, influenza and .

## THPEE511

### Condom use after PrEP initiation among adolescents: findings from the PrEP1519 cohort

P. de Almeida Silva<sup>1</sup>, B. Leite<sup>2</sup>, D. Zeballos<sup>2</sup>, P. Caires<sup>2</sup>, A. Grangeiro<sup>3</sup>, D. Greco<sup>4</sup>, I. Dourado<sup>2</sup>, L. Magno<sup>1</sup>

<sup>1</sup>Universidade do Estado da Bahia, Departamento de Ciências da Vida, Salvador, Brazil, <sup>2</sup>Universidade Federal da Bahia, Instituto de Saúde Coletiva, Salvador, Brazil,

<sup>3</sup>Universidade de São Paulo, São Paulo, Brazil, <sup>4</sup>Universidade Federal de Minas Gerais, Belo Horizonte, Brazil

**Background:** Daily oral PrEP proves highly effective for HIV prevention. However, there are concerns about potential decreases or interruptions in condom use among adolescents upon initiating PrEP. We aimed to analyze anticipation of condom use following PrEP initiation among adolescent men who have sex with men (AMSM) and transgender women (ATGW).

**Methods:** PrEP1519 constituted a demonstration cohort study of daily oral PrEP among AMSM/ATGW aged 15-19 years, in three Brazilian cities. A cross-sectional analysis was conducted including adolescents who initiated PrEP between April-2019-March-2023.

The study assessed three outcomes after PrEP initiation:

1. The anticipation of reduced condom use during receptive anal intercourse (RAI),
2. The anticipation of reduced condom use during insertive anal intercourse (IAI), and;
3. The anticipation of condomless sex.

Logistic regression was employed to estimate adjusted odds ratios (aOR) and 95% confidence intervals (95%CI) of the association between condom use in the 3 months before PrEP initiation and the outcomes.

**Results:** 1,219 adolescents initiated PrEP. 74.2% were 18-19 years old, 71.8% identified as black/brown, 91.0% were MSM, 82.0% lived with parents/family members and 60.1% reported condomless anal sex in the 3 months before PrEP use.

After PrEP initiation 31.8% anticipated reducing condom use during RAI, 32.9% during IAI and 11.0% anticipated condomless sex. Adolescents reporting inconsistent condom use during RAI and IAI before had 2.92 and 2.98 times higher odds of anticipating reduced condom use after PrEP initiation, respectively.

Those reporting inconsistent condom use during anal sex before had 3.01 times greater odds of anticipating condomless sex after PrEP initiation (Table 1).

Study Variables	aOR	95%CI
<b>Outcome 1: The anticipation of reduced condom use during RAI* after PrEP initiation</b>		
Condom use during RAI in the 3 months before PrEP initiation		
Consistent condom use	Reference	
No sexual partner	1.44	0.90 - 2.27
Inconsistent condom use	2.92	2.16 - 3.96
<b>Outcome 2: The anticipation of reduced condom use during IAI** after PrEP initiation</b>		
Condom use during IAI in the 3 months before PrEP initiation		
Consistent condom use	Reference	
No sexual partner	1.06	0.60 - 1.86
Inconsistent condom use	2.98	2.03 - 4.43
<b>Outcome 3: The anticipation of condomless sex after PrEP initiation***</b>		
Condom use during anal sex in the 3 months before PrEP initiation		
Consistent condom use	Reference	
No sexual partner	1.60	0.71 - 3.63
Inconsistent condom use	3.01	1.76 - 5.14

RAI = Receptive Anal Intercourse; IAI = Insertive Anal Intercourse; aOR = adjusted Odds Ratio; 95%CI = 95% Confidence Interval  
 \*Adjusted for study population and housing situation. AIC: 11.82; BIC: 1.306; Hosmer-Lemeshow test (0.918); LR test (p-value) 1.000  
 \*\*Adjusted for condom use in the first sex and fear of HIV. AIC: 929; BIC: 965; Hosmer-Lemeshow test (0.965); LR test (p-value) 0.136  
 \*\*\*Adjusted for age. AIC: 758; BIC: 778; Hosmer-Lemeshow test 0.920

Table 1. Association between condom use in the 3 months before PrEP initiation and the outcomes. PrEP1519 cohort.

**Conclusions:** The anticipation of reducing or interrupting condom use after PrEP initiation was more prevalent among adolescents with a history of inconsistent condom use.

These findings underscore the importance of timely PrEP initiation, serving as a crucial element in the comprehensive prevention of HIV risk.

## THPEE512

Strategies to achieve the elimination of HIV horizontal transmission in the Municipality of São Paulo (MSP)

M.C. Abbate<sup>1</sup>, C.M. Matos<sup>1</sup>, R.F. Camargo<sup>1</sup>, S.F.M. Rodrigues<sup>1</sup>, A.Q. Silva<sup>1</sup>

<sup>1</sup>STI/AIDS Coordination of the City of São Paulo, São Paulo, Brazil

**Background:** Over the past six years, the MSP has steadily reduced new HIV acquisition by employing strategies to enhance vulnerable populations access to diagnosis, treatment, and prevention methods for HIV and sexually transmitted acquisition (STIs). However, to eliminate horizontal HIV transmission, given the epidemiological scenario, it is crucial for the Unified Health System (SUS) to implement public policies that reach various population groups, especially those are not accessing the available health services.

**Description:** An innovative strategy was establishing a health unit "Estação Prevenção Jorge Beloqui", within a busy metro station. It operates from Tuesday to Saturday, from 5pm to 11pm, a time when conventional units conclude their services. This allows access for individuals who cannot take time off from their daytime responsibilities or who engage in nighttime work/study, attend parties, etc. The unit features a compact structure with three consultation rooms, a reception area, and a sample collection room. It provides HIV pre or post-exposure prophylaxis (PrEP/PEP), rapid testing, and preventive insumes. Individuals with a reagent HIV test collect exams, a teleconsultation, and are referred to Specialized Services-IST/AIDS for follow-up.

**Lessons learned:** From June to December/2023, a total of 3905 appointments were conducted, dispensed 2451 PrEP, 713 PEP, 39 new cases of HIV diagnosed, and 702 HIV tests. The increase in appointments was gradual, starting with 291 and reaching 750 people/month. Black people age 19-34 make up more than half of the cases, 90% self-identifying as males who have had sex with men. These numbers underscore the importance of eliminating barriers to access the SUS.

**Conclusions/Next steps:** This service is strategically located and offers extended hours, which makes HIV prevention, diagnosis and treatment more accessible to the population, a critical factor in preventing new acquisition. At the same time, remote access to PrEP/PEP was initiated through the e-SAUDE application, allowing teleconsultations and digital PrEP/PEP prescriptions, which can be obtained at the "Prevention Station" or at a 24-hour health unit. As a result, the municipality recorded a reduction in new HIV cases for six consecutive years, with a drop of 46% in this period. Thus, we hope to soon eliminate horizontal transmission of HIV in MSP.

## THPEE513

Structured group-based community model facilitates oral PrEP continuation among key and vulnerable populations in Dar es Salaam, Tanzania

B. Manzi<sup>1</sup>, B. Ogowang<sup>1</sup>, J. Ng'weshemi<sup>1</sup>, C. Mbise<sup>1</sup>, A. Massawe<sup>1</sup>, E. Herman<sup>1</sup>, D. Carpenter<sup>2</sup>, C.F. Walker<sup>2</sup>, D. Boyee<sup>1</sup>, C. Akolo<sup>2</sup>

<sup>1</sup>FHI 360, Dar es salaam, Tanzania, the United Republic of,

<sup>2</sup>FHI 360, Washington DC, United States

**Background:** Globally, oral pre-exposure prophylaxis (PrEP) programs show challenges with continuation. In Dar es Salaam, EpiC, community-based program funded by the PEPFAR/USAID, in collaboration with the government of Tanzania supports PrEP use among key and vulnerable populations (KVP), including adolescent girls and young women (AGYW), female sex workers (FSW), and men who have sex with men (MSM).

A structured group-based community model (SGBCM) was introduced to support PrEP refill among KVP. We compared SGBCM outcomes to a non-structured group-based community model (NSGBCM).

**Description:** In SGBCM, support groups of 5-7 clients are formed for mutual assistance in PrEP adherence. Monthly group refills are scheduled by the group lead and health-care worker based on differentiated person-centered care, with reminders and close follow-ups. Partners implementing NSGBCM lacked comprehensive follow-ups and reminders for refills/rescheduling.

We conducted a retrospective analysis of refills within SGBCM and NSGBCM for clients initiated from October 2022 - June 2023 to understand patterns of PrEP continuation in the first, second-, and third-months post-PrEP initiation. The chi-square test determined the statistical significance of the observed difference in PrEP refills.

**Lessons learned:** 4,790 clients-initiated PrEP (3,933 under SGBCM, 857 under NSGBCM). Within SGBCM, 62.4% were FSWs, 23.7% MSM, and 13.4% AGYW. For NSGBCM, 54.0% FSWs, 21.5% MSM, and 24.5% AGYW ( $p < 0.001$ ). Within SGBCM, 83% (3,255/3,933) refilled one-month post-initiation, 75% (2,937/3,933) second month, and 65% (2,553/3,933) third month. In the NSGBCM, 28% (243/857) refilled one-month post-initiation, 13% (111/857) second month, and 9% (73/857) third month.

Compared to NSGBCM, the odds of SGBCM returning for at least one refill were 12.1 times greater, 19.8 for both second and third refills ( $p < 0.001$ ). This demonstrates strong evidence that refill rates are better within SGBCM compared to NSGBCM ( $p < 0.001$  for each visit).

Service sites	First refill			Second refill			Third refill		
	FSW	MSM	AGYW	FSW	MSM	AGYW	FSW	MSM	AGYW
NSGBCM	ref	ref	ref	ref	ref	ref	ref	ref	ref
SGBCM	13.7	8.6	11.1	12.0	29.8	22.9	14.9	18.8	15.9
OR (95% CI)	10.0 (7.0-14.1)*	7.5 (5.6-10.1)*	12.3 (8.4-18.1)*	10.5 (7.5-14.6)*	18.3 (13.2-25.4)*	18.3 (13.2-25.4)*	11.3 (8.2-15.4)*	11.3 (8.2-15.4)*	11.3 (8.2-15.4)*

**Conclusions/Next steps:** Differentiated service delivery involving SGBCM improves PrEP continuation and could be included as an effective strategy in community programs.

## THPEE514

### Uptake of HIV pre-exposure prophylaxis at private pharmacies in Kenya: early findings from a cluster randomized controlled trial

S.D. Roche<sup>1</sup>, V. Omollo<sup>2</sup>, T. Kareithi<sup>3</sup>, P. Ong'wen<sup>4</sup>, L. Juma<sup>2</sup>, C. Kiptinness<sup>3</sup>, P. Otieno<sup>2</sup>, G. Rota<sup>2</sup>, M. Anyona<sup>4</sup>, P. Banerjee<sup>1</sup>, M. Asewe<sup>2</sup>, B. Rono<sup>2</sup>, E. Gichuru<sup>3</sup>, K. Harkey<sup>1</sup>, R. Malen<sup>1</sup>, J. Odoyo<sup>2</sup>, D. Were<sup>4</sup>, E.A. Bukusi<sup>2,5</sup>, K. Ngure<sup>3,6</sup>, K.F. Ortblad<sup>1</sup>, Pharm PrEP cRCT Team

<sup>1</sup>Fred Hutchinson Cancer Center, Public Health Sciences, Seattle, United States, <sup>2</sup>Kenya Medical Research Institute, Kisumu, Kenya, <sup>3</sup>Partners in Health and Research Development, Thika, Kenya, <sup>4</sup>Jhpiego, Nairobi, Kenya, <sup>5</sup>University of Washington, Seattle, United States, <sup>6</sup>Jomo Kenyatta University of Agriculture and Technology, Nairobi, Kenya

**Background:** Recent pilot studies of pharmacy-based PrEP delivery in Kenya observed high rates of uptake and continuation, including among populations not commonly reached by public clinics.

To understand the potential value-add of allowing private pharmacies to initiate and manage clients on PrEP (the intervention) compared to the current standard of care (screening and referral to clinic-based PrEP services, the control), we are conducting a randomized controlled trial (cRCT).

We report early findings on PrEP uptake at intervention arm pharmacies.

**Methods:** As part of the Pharm PrEP cRCT, trained pharmacy providers at 45 private pharmacies in Central and Western Kenya are offering PrEP initiation and refill services. Eligible clients are age 16+ and self-report: unknown or negative HIV status, 1+ recent (past 6 months) behavior associated with risk of HIV acquisition, and no contraindicated medical conditions. Enrollees undergo HIV testing and, if eligible, are dispensed a 30-day PrEP supply.

The details of each PrEP visit (e.g., dispensing) and client demographics are documented by pharmacy providers in an electronic medical record. We analyzed these data using descriptive statistics.

**Results:** From July 2023 to mid-January 2024, 447 clients were enrolled and initiated PrEP at 45 intervention pharmacies. PrEP uptake was higher in Western Kenya, which accounted for 78% (347/447) of enrollments.

About half (56%, 252/447) of enrollees were female, median age was 27 (IQR 23-33), and 56% (251/447) were unmarried. Similar to prior pilot studies, most (93%, 415/447) did not self-identify as belonging to a key population. The most commonly reported HIV risk behaviors were incon-

sistent condom use (79%, 356/447), multiple sex partners (62%, 277/447), and having 1+ sex partner(s) of unknown HIV status (59%, 264/447).

**Conclusions:** Data from the first 6 months of this cRCT provides further evidence that private pharmacies in Kenya, especially those in high HIV burden areas, reach individuals who could benefit from PrEP and that pharmacy clients are willing to initiate PrEP at these locations.

Estimates of the effect different models of pharmacy-delivered PrEP services have on clinical outcomes, and how these models compare with pharmacy referral to PrEP services at public clinics in Kenya, are forthcoming.

## THPEE515

### PrEP and more! Comprehensive HIV pre-exposure prophylaxis (PrEP) care to improve uptake and effective use among adolescent girls and young women (AGYW) in western Kenya

M. Owiti<sup>1</sup>, R. Muinde<sup>1</sup>, O. Madiang<sup>1</sup>, D. Canagasabay<sup>2</sup>, J. Thoya<sup>1</sup>

<sup>1</sup>PATH, Kisumu, Kenya, <sup>2</sup>PATH, Nairobi, United States

**Background:** 15% and 36% of new HIV diagnoses in Kenya were among adolescents aged 10-19 years and young people aged 15-24 years, respectively (2022). In 2020, PrEP uptake rate among adolescent girls and young women aged 15-24 in Kenya was estimated to be around 16%. This indicates that a relatively small proportion of eligible adolescents are currently accessing PrEP necessitating strategies to enhance PrEP uptake and use among this group. PATH implemented a comprehensive PrEP care package and assessed its impact on PrEP uptake and effective use among AGYW in western Kenya.

**Description:** Following a risk assessment-based PrEP eligibility screening, eligible AGYW were counseled by a healthcare provider and initiated on PrEP following clinical evaluation. Enrolled AGYW received a comprehensive suite of services for effective PrEP use, including pairing with a PrEP Ambassador, support group enrollment, SMS appointment reminders, community/home-based PrEP distribution, adherence counseling, and socioeconomic support (for AGYW with financial need). PrEP services were integrated into multiple facility-based entry points, enabling provision of one-stop shop services for other healthcare needs, including antenatal (ANC), family planning, and screening and treatment of sexually transmitted infections (STI). 140 healthcare providers and 42 PrEP Ambassadors were trained on the approach, including referrals for additional care needs. This comprehensive PrEP care package was introduced in 2020 across three counties in western Kenya.

**Lessons learned:** Among 1,002 AGYW screened and eligible for PrEP, 915 were initiated and 595 continued PrEP between October 2022–June 2023 with no reported seroconversions, indicating strong adherence. AGYW active-

ly using PrEP increased from 438 (December 2022) to 595 (September 2023). Month-1 and Month-3 PrEP continuation also increased from 58% (858/1,426) to 92% (761/821) and 51% (735/1,426) to 89% (731/821), respectively, between October 2021–June 2022 and October 2022–September 2023.

Clients accessed other health services, including 389 initiating FP services, 147 receiving post-violence care, 27 accessing ANC services, and 12 receiving STI treatment from October 2022–September 2023.

**Conclusions/Next steps:** This comprehensive PrEP care package led to improved PrEP uptake and continued effective use among AGYW and should be scaled up as an effective strategy for enhancing HIV and other health outcomes among AGYW in Kenya.

## THPEE516

**FastPrEP: evaluating factors associated with PrEP initiation from community-based mobile clinics compared to fixed-site primary health facilities in adolescents and young people in Cape Town, South Africa**

E. Rousseau<sup>1</sup>, K. Lebelo<sup>1</sup>, N. Mathola<sup>1</sup>, P. Macdonald<sup>1</sup>, O. Vanto<sup>1</sup>, P. Fuzile<sup>1</sup>, P. Smith<sup>1</sup>, T. Woxie<sup>1</sup>, L. Fynn<sup>1</sup>, M. Wallace<sup>1</sup>, D. Davey<sup>2,3</sup>, L.-G. Bekker<sup>1</sup>

<sup>1</sup>University of Cape Town, Desmond Tutu HIV Centre, Cape Town, South Africa, <sup>2</sup>University of Cape Town, School of Public Health, Cape Town, South Africa, <sup>3</sup>University of California, School of Medicine, Los Angeles, United States

**Background:** Effective HIV prevention will require implementing and evaluating pre-exposure prophylaxis (PrEP) service delivery options that can engage large populations of adolescents and young people (AYP) with diverse characteristics.

**Methods:** FastPrEP is an ongoing implementation science project in Cape Town, South Africa, evaluating uptake and effectiveness of a youth-focused, decentralized district-wide PrEP program. Oral PrEP is offered to AYP, aged 15 to 29 years, as part of an integrated sexual and reproductive health (SRH) service from four community-based mobile clinics and 12 primary health facilities.

Descriptive statistics and logistic regression models (adjusted for age and gender) explored the factors associated with AYP's PrEP initiation from mobile clinics and fixed-site primary health facilities.

**Results:** Between August 2022 and December 2023, 9940 AYP (mean age 24 years) initiated oral PrEP. Majority were adolescent and young women (63%, n=6247) of which 3% (n=182) were pregnant. Of the 3693 men starting PrEP, 5% (n=177) identified as men who have sex with men. Most AYP were unmarried (95%) with 22% reporting multiple concurrent sex partners. Most AYP (81%) initiated PrEP from mobile clinics compared to primary health facilities. Factors significantly associated with initiating PrEP at mobile

clinics included being male (OR 1.7; 95%CI:1.53-1.9), having casual sex partners (aOR 1.7; 95%CI:1.34-2.12), presence of STI symptoms (aOR 1.5; 95%CI:1.14-2.03), and displaying hazardous alcohol consumption (AUDIT-C score; aOR 1.5; 95%CI:1.25-1.85). PrEP initiation at mobile clinics was associated with mild depression/anxiety (PHQ4 scores; aOR 1.5; 95%CI:1.18-1.8), however people with moderate depression/anxiety were less likely to access mobiles compared to primary health facilities (aOR 0.7; 95%CI:0.53-0.84). Pregnant women were less likely to initiate PrEP at mobile clinics compared to primary health facilities. No significant difference in age, relationship status, or number of sex partners was observed between people starting PrEP at mobile compared to health facilities.

**Conclusions:** Tailored, integrated mobile SRH services, including PrEP, attracted men and young people who had factors associated with higher risk for HIV acquisition. Pregnant women however chose to access PrEP from traditional healthcare facilities, possibly primarily accessing antenatal care.

Further integration of mental health (depression and anxiety) and substance misuse support for AYP in mobile services are also indicated by these data.

## THPEE517

**The impact of demedicalizing PrEP in Mozambique, 2023**

J. Seleme<sup>1</sup>, I. Sathane<sup>1</sup>, O. Tiberi<sup>1</sup>, V. Mega<sup>1</sup>, H. Magaia<sup>1</sup>, M. Da Cunha<sup>1</sup>, M. Pereira<sup>2</sup>, A. Couto<sup>1</sup>

<sup>1</sup>Ministry of Health of Mozambique, Department of Public Health, Maputo, Mozambique, <sup>2</sup>Maputo City Health Services, Public Health Department, Maputo, Mozambique

**Background:** Mozambique has the third highest number of new HIV acquisitions globally. To maximize HIV combination prevention efforts, Mozambique piloted pre-exposure prophylaxis (PrEP) in 2017; national expansion began in 2021. In 2022, new WHO guidelines recommended the demedicalizing PrEP, which no longer restricted PrEP to the clinical setting. Subsequently, in 2023 Mozambique wrote an addendum to National Guidelines aimed to increase PrEP uptake.

**Description:** The revised National PrEP guidelines expanded the eligibility criteria of specific key and vulnerable populations (key populations, high-risk men, pregnant and lactating women, and adolescents and young women) to also include anyone who desires PrEP; these were classified as "other population." In addition, multi-month dispensing was introduced offering 1-, 3- or 6-months PrEP dispensing during the first clinical visit depending on client's needs. Community PrEP provision was facilitated through mobile clinics.

**Lessons learned:** Demedicalizing PrEP demonstrated increasing PrEP uptake. In 2022, 99,961 people had initiated PrEP compared to 2023's 178,239, general PrEP uptake in-

creased 78%. This increase was verified in all subpopulations, majorly in adolescent and young population (51%) and KP (29%).

Additionally, unrestricting PrEP to all populations allowed for a rapid PrEP uptake by 'other population' increasing from 247 in April to 7,709 in December 2023. The effort to differentiate, simplify, and demedicalize PrEP delivery including reducing frequency of clinical visits and the burden on the health facility empower health providers with more opportunities to offer PrEP.

**Conclusions/Next steps:** A people-centered approach for PrEP provision must be adopted which embraces the diversity of client populations and empowers them to make informed decisions about their prevention methods. An evaluation of acceptability of new PrEP options will be rolled out in 2024 to better inform further updates of PrEP guidelines.

Finally, a national PrEP campaign will be rolled out to promote PrEP services and increase client literacy and demand creation. Focusing Client diverse needs is key to maximize its uptake and consequently impact in the reduction of HIV acquisitions.

## THPEE518

So you want to offer injectable PrEP: findings from four sexual health clinics in the US

K. Meyers<sup>1,2</sup>, B. Lane<sup>1</sup>, C. Wolfer<sup>3</sup>, A. De Roche<sup>3</sup>, C. Carnevale<sup>4</sup>, S.A. Golub<sup>3</sup>

<sup>1</sup>Columbia University Irving Medical Center, Aaron Diamond AIDS Research Center, New York, United States,

<sup>2</sup>Columbia University Irving Medical, Division of Infectious Diseases, Department of Medicine, New York, United States,

<sup>3</sup>Hunter College of the City University of New York, New York, United States, <sup>4</sup>New York Presbyterian Hospital, New York, United States

**Background:** Injectable cabotegravir (cab-LA) is an evidenced based biomedical intervention clinically proven to reduce the risk of HIV transmission; however, little is known about how early adopting clinics are integrating injectable PrEP into their programs.

**Methods:** Between 1/2023 and 1/2024 we conducted Rapid Assessment Procedure-Informed Clinical Ethnography with four US-based sexual health clinics. Through synthesis of data collected by organizational assessments, site visits, interviews, and document review, we identified three key factors clinics may consider when planning for cab-LA introduction into existing oral PrEP services.

**Results:** First, while all four clinics follow national guidance to discuss oral PrEP with all sexually-active individuals, the high cost and complexity of coverage investigation of cab-LA precludes widespread discussion and same-day starts. Providers report feeling disappointed to return to restrictive rather than permissive stances on injectable PrEP eligibility.

Second, all clinics described the intensity and complexity of (1) education and counseling for cab-LA and (2) follow up protocols, as significantly higher than for oral PrEP.

Education and counseling messages include the need to maintain timely injections and importance of remaining engaged in care after discontinuation.

All clinics report that this results in: (1) longer visits and, in many cases, multiple visits, before initiation; (2) more time spent reaching out to clients to ensure they return for timely injections; and (3) in two out of four clinics, higher program costs due to transportation subsidies to support timely injections.

Third, three out of four clinics integrated clinical pharmacists into their PrEP teams to facilitate investigation of coverage and tracking clients for follow up. The fourth developed partnerships with external pharmacies. Medical directors reported that pharmacy support was essential for growth and sustainment of cab-LA services.

**Conclusions:** Initiating and sustaining individuals safely on cab-LA requires increased time per visit, extensive human resources, and funding. The high cost of cab-LA, complexity of navigating coverage in the US healthcare system, and the critical importance of keeping individuals who discontinue injections engaged in care, suggests that cab-LA is unlikely to result in increased population coverage of PrEP unless navigating access is simplified and cost of the medication reduced.

## THPEE519

Developing an instrument to assess the fidelity of a PrEP shared decision-making intervention for pregnant women in Malawi

A. Benson<sup>1</sup>, C. Sulpizio<sup>1</sup>, F. Saidi<sup>2</sup>, T. Phanga<sup>3</sup>, M. Tsidy<sup>2</sup>, A. Young<sup>1</sup>, B. Chi<sup>3</sup>, S. Maman<sup>1</sup>, C. Golin<sup>1</sup>, L. Pearce<sup>4</sup>, L. Hill<sup>1</sup>

<sup>1</sup>University of North Carolina, Gillings School of Global Public Health, Chapel Hill, United States, <sup>2</sup>UNC Project Malawi, Lilongwe, Malawi, <sup>3</sup>University of North Carolina, School of Medicine, Chapel Hill, United States, <sup>4</sup>University of North Carolina, Department of Sociology, Chapel Hill, United States

**Background:** Pre-exposure prophylaxis (PrEP) presents an opportunity to significantly lower HIV risk during the perinatal period, but strategies to support informed decision-making among differing PrEP options are needed. The MyChoice intervention aims to promote user fit and PrEP adherence through shared decision-making (SDM). For counselor-delivered interventions like SDM, evaluating and promoting fidelity is critical to ensure construct validity of the intervention tested. Yet, limited guidance exists for the development of fidelity assessments—particularly in the SDM context.

**Description:** We developed a 29-item fidelity assessment instrument for the MyChoice intervention which measures both quality and completion of key intervention goals.

The tool incorporates OPTION-5, a validated scale for evaluating client involvement in health decision-making, and qualitative memoing. It is supplemented by a scoring codebook and training manual to enhance inter-rater reliability. The development process began with a literature review, followed by identifying feasible assessment strategies and defining core intervention components. These elements were iteratively drafted into observable checklist items. Content experts were consulted to better understand OPTION-5 scoring, which was adopted for the instrument. The tool was piloted using transcripts of practice counseling sessions, and further revisions were made to clarify language, differentially scale items, and refine scoring guidelines.

**Lessons learned:** In ongoing piloting, we have found the instrument to be user-friendly and appropriate to capture the intended intervention content and quality of delivery. Creating fidelity assessment measures specific to the intervention context requires an iterative and adaptable approach. Translating abstract goals into observable instrument measures often involves a loss of nuance—which can be balanced by incorporating qualitative components, carefully training scorers, and fostering a collaborative review process. Beta testing highlighted the importance of considering data format when establishing clear rubrics.

**Conclusions/Next steps:** Detailed documentation and transparent reporting of fidelity are essential for improving the quality and rigor of public health interventions. The fidelity assessment instrument will be used to assess pilot interviews with MyChoice, help train new counselors as a job aid, and iteratively improve the intervention for use in diverse settings. Continued checklist modifications will enhance fidelity and may be used to help prepare future interventions.

## THPEE520

### Achieving optimized delivery of voluntary medical male circumcision (VMMC) services using a locally-led approach for engaging communities in Tanzania

M. Makokha<sup>1</sup>, P. Massawe<sup>1</sup>, H. Chaula<sup>1</sup>, M. Luponya<sup>1</sup>, N. Rweyemamu<sup>1</sup>, K. Haroun<sup>2</sup>, P. Mkwama<sup>2</sup>, S. Mmbando<sup>3</sup>, A. Christensen<sup>4</sup>, Z. Mwandi<sup>5</sup>, K. Curran<sup>6</sup>, N. Fida<sup>7</sup>, Y. Mlaw<sup>7</sup>, I. Udo<sup>7</sup>, V. Kiggundu<sup>8</sup>

<sup>1</sup>Jhpiego, Reaching Impact, Saturation, and Epidemic Control (RISE) Project, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>President's Office Regional Administration and Local Government (PORALG), Iringa Regional Secretariat, Iringa, Tanzania, the United Republic of, <sup>3</sup>Tanzania Ministry of Health (MOH), National AIDS, STIs and Hepatitis Control Programme (NASHCoP), Dodoma, Tanzania, the United Republic of, <sup>4</sup>Jhpiego, Country Office, Dar es Salaam, Tanzania, the United Republic of, <sup>5</sup>Jhpiego, RISE, Nairobi, Kenya, <sup>6</sup>Jhpiego, RISE, Baltimore, MD, United States, <sup>7</sup>U.S. Agency for International Development (USAID), Health Office, Dar es Salaam, Tanzania, the United Republic of, <sup>8</sup>USAID, Office of HIV/AIDS, Washington, DC, United States

**Background:** The lack of local male circumcision prevalence (MCP) data in Tanzania hinders the rational allocation of project investments to optimize VMMC service delivery. The Reaching Impact, Saturation and Epidemic Control (RISE) Project funded by the President's Emergency Plan for AIDS Relief (PEPFAR) and the U.S. Agency for International Development (USAID) piloted a tool to estimate local MCP through social mapping using local intelligence (SOMALI).

**Description:** The SOMALI tool aims to:

- Identify areas of unmet need for VMMC,
- Quantify the size of need in selected localities, and;
- Customize services to match contextual factors.

SOMALI leverages intimate knowledge of localities that local leaders have in Tanzania given the centrality of villages in devolved government. The SOMALI tool uses Kobo Toolbox to consolidate self-reported MCP estimates from multiple local leaders from one village to produce reliable findings (on a scale of 1-10 how many adult men in your locality are probably circumcised?).

The primary output is a village dashboard showing unmet need for VMMC based on averaging local MCP estimates. RISE piloted the tool in Iringa Region from April to May 2023 involving 51 local leaders.

**Lessons learned:** Outreach services accompanying SOMALI pilot aimed to perform 358 circumcisions during 14 days of dedicated services covering 11 villages. This plan was modelled on preceding outreaches in Iringa Region. Data collected in pilot sites estimated unmet need to be 40% among men aged 15 years and older (8,155). The pilot performed 382 circumcisions (107% of target) in 10 days (71% of duration) covering 5 villages, 60% coverage.

Six villages were inaccessible because of ongoing rains. The SOMALI tool supported timely and efficient target achievement. Local MCP feedback was effective for microplanning and targeted service delivery.

**Conclusions/Next steps:** SOMALI can be a game-changer in locally-led needs assessment and microplanning. RISE used data from the pilot to plan later outreaches in the same villages. This approach can be useful for other interventions that integrate community health promotion and service delivery. RISE will test the predictive value of the SOMALI tool in localities assumed to have saturated and compare uptake of VMMC services in test and non-test sites.

## THPEE521

Providing a complete digital experience to the user: HIV prevention interventions in Central America

O.S. Lungo Galvez de Lopez<sup>1</sup>, A. Cabrera<sup>1</sup>

<sup>1</sup>Pan American Social Marketing Organization (PASMO), Guatemala, Guatemala

**Background:** Under the HIV Prevention, Care, and Treatment project implemented by the Pan American Social Marketing Organization (PASMO) with funds from the United States Agency for International Development (USAID), PASMO works to reach hidden and difficult access key populations (KP), especially men who have sex with men (MSM), to know their HIV status and link them to care; therefore, online outreach has been key. From October 2022 to September 2023, 58% of all at-risk KPs reached by the project were reached through PASMO's 20+ online outreach team of "cyber-educators". Stigma remains relevant with 72% of MSM surveyed in 2021 indicating the "fear of confidentiality loss / someone finding out they were taking an HIV test" as the main barrier to getting tested.

**Description:** PASMO's user centered digital approach provides confidential, anonymous, and quality prevention and care services, ensuring follow-up to user's journey until they are linked to treatment. Cyber-educators use audience segmentation profiles, analysis of behavioral studies and social media use to reach at-risk users more effectively while leveraging social media tools to generate demand for HIV prevention services. PASMO also implements highly segmented online demand generation campaigns and uses chatbot technology for 24/7 access to prevention information and referrals to prevention services with a virtual voucher that can be redeemed at private sector partner labs and clinics or Telemedicine options. Finally, both cyber-educators and health providers continuously update their knowledge through an e-learning training platform.

**Lessons learned:** In 2023, half of all new HIV cases identified by PASMO originated from online outreach efforts under the digital user experience approach and young KPs

have been highly receptive to digital technologies such as the chatbot and proven to be frequent user of social media tools where cyber-educators and creative online demand generation efforts can reach them.

**Conclusions/Next steps:** PASMO is expanding its digital user experience to include STI testing and treatment, and PrEP services with follow-up and tracking along the HIV cascade, including linkage to care and treatment services. In-depth audience understanding is key to effectively reach target populations; the digital world changes fast and we need to adapt prevention and treatment interventions accordingly.

## THPEE522

Fostering adaptive leadership in PrEP engagement: advancing implementation science for ending the HIV epidemic among people who identify as Black MSM

C. Watson<sup>1,2</sup>, M. Andrasik<sup>3</sup>, S. Fields<sup>2</sup>, D. Wheeler<sup>2</sup>

<sup>1</sup>Morgan State University, Center for Urban Equity, Baltimore, United States, <sup>2</sup>HIV Prevention Trials Network, Black Caucus, Durham, United States, <sup>3</sup>HIV Vaccine Trials Network, Seattle, United States

**Background:** In the realm of Implementation Science, understanding the dynamics between individuals and healthcare providers in Pre-Exposure Prophylaxis (PrEP) engagement among People who Identify as Black and Men who have Sex with Men (MSM) is crucial. Leveraging a secondary analysis of HPTN-073 qualitative research data, this study investigates the adaptive leadership framework within these interactions, emphasizing the social and cultural factors influencing PrEP uptake.

The objective is to contribute insights to advance Implementation Science strategies for effectively ending the HIV epidemic, particularly within the community of People who Identify as Black and MSM.

**Methods:** Employing an interpretive phenomenological approach, the study utilizes qualitative data from the HPTN-073 study, which recruited 226 HIV-uninfected individuals who Identify as Black and MSM across three U.S. cities. Qualitative interviews and focus groups (involving a subset of participants, n = 30) facilitate exploration of experiences with PrEP and services received. Coordinated Management of Meaning (CMM) within an interpretive framework aligns with the objective of understanding adaptive behaviors within culturally competent spaces, contributing to the implementation of effective strategies.

**Results:** The secondary analysis reveals that individuals who Identify as Black and MSM, despite reported barriers, exhibit adaptive behaviors in embracing PrEP. Culturally competent spaces and comprehensive care coordination emerge as crucial facilitators, underscoring the importance of these factors in shaping the narrative

of PrEP engagement. Results are presented with clarity, highlighting the significance of social and cultural nuances in interactions within the context of Implementation Science.

**Conclusions:** The study's conclusions, supported by the results, underscore the potential of culturally informed care and comprehensive coordination in shaping adaptive behaviors for PrEP uptake. Positioned within the framework of Implementation Science, this research contributes significantly by providing insights into adaptive behaviors among People who Identify as Black and MSM, offering a nuanced understanding of dynamics.

The integration of cultural competence and care coordination as key components adds a unique dimension to the discourse on ending the HIV epidemic.

These findings offer actionable insights for the implementation of targeted interventions and improved prevention strategies.

## THPEE523

Sex workers' leadership in overcoming PrEP continuation barriers in Kilifi county – a case study of ICRH-Kenya's Hotspot Community Group

S. Mwangi<sup>1</sup>, M. Aside<sup>1</sup>, D. Muchiri<sup>1</sup>, L. Baya<sup>1</sup>, B. Mwari<sup>1</sup>

<sup>1</sup>International Centre for Reproductive Health-Kenya, HIV, Mombasa, Kenya

**Background:** Despite the proven efficacy of pre-exposure prophylaxis (PrEP) in reducing HIV transmission among high-risk individuals, low continuation rates remain a significant challenge. While PrEP holds immense potential in ending the HIV epidemic, its effectiveness hinges on successful integration with community-centered approaches. In Kilifi County, Kenya, PrEP continuation at the ICRHK Mtwapa Drop-In Centre (DICE) between October 2022 and June 2023 was alarmingly low, with only 17% of clients continuing at month 3 and a mere 4% at month 6.

This highlighted the need for innovative, community-driven interventions to overcome these barriers and ensure equitable access to PrEP for all sex workers.

**Methods:** Recognizing low PrEP continuation among sex workers at Mtwapa DICE, FSWs took charge by forming voluntary, hotspot-based community PrEP groups. Capped at 20 members, these groups met on shared refill dates, offering peer support, health education (focused on PrEP), comprehensive clinical services (STI treatment, TB screening, etc.), and tailored counseling. Absent members were encouraged to rejoin, and all received consistent advice and the next meeting venue, fostering peer-driven learning and sustained PrEP use. This proactive approach aimed to scale up and retain FSWs on PrEP, empowering them to lead the fight against HIV.

**Results:** Between July and December 2023, six hotspot-based FSW community PrEP groups blossomed, empowering 131 sex workers to overcome barriers and achieve

remarkable PrEP continuation rates. With 89% and 76% continuation at months one and three, respectively, these groups showcase the power of peer support. Sex workers have become champions, raising awareness, reminding each other about refills, and demystifying myths surrounding PrEP and HIV. This community-driven initiative proves that empowering sex workers can lead to a sustainable fight against HIV.

**Conclusions:** Community taking central role in HIV prevention and response is critical in ending HIV pandemic. They have solutions to address barriers in HIV prevention through the invaluable innovation, passion and insight which have proven pivotal in getting the world to the point where there is a clear path to end AIDS as a public health threat.

## Implementation science and scale up of treatment

## THPEE524

What tools do we have for Ending the HIV/AIDS Epidemic (EHE) in the USA? A review of the potential population impact of structural, biomedical and implementation interventions across EHE pillars

M. Piske<sup>1</sup>, B.C. Guerra-Alejos<sup>1</sup>, B. Enns<sup>1</sup>, M. Medina<sup>2</sup>, B. Nosyk<sup>2</sup>, The Localized Economic Modeling group

<sup>1</sup>University of British Columbia, Vancouver, Canada, <sup>2</sup>Simon Fraser University, Burnaby, Canada

**Background:** The United States (US) Ending the HIV Epidemic (EHE) initiative is challenged by structural and implementation barriers to care delivery and access (e.g. policies, financial, geographic). Though interventions to address these barriers are well-studied, their potential impact – their effectiveness and scalability within their given target population – have not been estimated systematically. This review identified structural, biomedical and implementation interventions to support each of the EHE pillars and estimated their potential population-level impact.

**Methods:** We conducted a targeted literature review of articles with established effectiveness data from studies conducted in the US focused on HIV prevention, diagnosis, treatment and response (EHE pillars) published as of September 2023. We searched interventions included in the US Centers for Disease Control and Prevention HIV Compendium and Response Evidence Brief, publicly available EHE jurisdictional plans and the peer-reviewed literature. An intervention's potential population impact was determined as the product of its trial-based effectiveness and reach and estimates of its scalability, accounting for structural barriers in access.

**Results:** A total of 73 interventions of 395 identified had evidence on effectiveness and met inclusion criteria. Pre-exposure prophylaxis (PrEP) interventions ranged in population-level impact from a 1.2% (95% Confidence Interval: 0.6%, 2.5%) increase in PrEP uptake through low-threshold mobile clinics with syringe services, to a 191% (106%, 270%) increase in PrEP uptake through county-wide expansion of PrEP across settings for outbreak response (implementation intervention). HIV testing interventions ranged in impact from a 10% (9%, 13%) increase in testing through personalized testing recommendations, to a 206% (94%, 374%) increase in testing through state-wide expansion of partner services and syringe service authorization (structural intervention).

Antiretroviral treatment interventions ranged in impact from a 1.2% (1.0%, 1.4%) increase in viral suppression through HIV specialist telehealth services in Veterans Affairs primary care clinics, to a 164% (142%, 194%) increase through app-based care linkage with tailored education and virtual support (implementation intervention).

**Conclusions:** Maximizing the impact of evidence-based interventions to end the US HIV epidemic will require tailored efforts to overcome structural barriers (financial, geographic and legal) and implementation barriers (awareness among providers, stigma, medical mistrust and health literacy in individuals) in each of the EHE's target jurisdictions.

## THPEE525

### Acceptability of point-of-care viral load monitoring among children and young people living with HIV in East Africa: a qualitative study

I.M. Sumari-de Boer<sup>1,2,3</sup>, P.C. Msoka<sup>1,3,4</sup>, R. Akello<sup>5</sup>, J. Berchmans<sup>6,7</sup>, N. Iraguha<sup>8</sup>, P. Madiaga<sup>9</sup>, A.E. Mtenga<sup>1,10</sup>, L. Mujumbusi<sup>11,12</sup>, C. Mukwano<sup>13</sup>, E. Wanyama<sup>13</sup>, R. Reis<sup>3</sup>  
<sup>1</sup>Kilimanjaro Clinical Research Institute, Clinical Trials, Moshi, Tanzania, the United Republic of, <sup>2</sup>Kilimanjaro Christian Medical University College, Moshi, Tanzania, the United Republic of, <sup>3</sup>Amsterdam Institute for Global Health and Development, Amsterdam, Netherlands, the, <sup>4</sup>Amsterdam Institute for Social Science Research, Amsterdam, Netherlands, the, <sup>5</sup>National Institute for Medical Research-(NIMR-Muhimbili), Dar es Salaam, Tanzania, the United Republic of, <sup>6</sup>University of Rwanda, Directorate of Research and Innovation, College of Medicine and Health Sciences, Kigali, Rwanda, <sup>7</sup>Karolinska Institutet, Department of Global Public Health, Stockholm, Sweden, <sup>8</sup>University of Rwanda, College of Medicine and Health Sciences, Kigali, Rwanda, <sup>9</sup>Kenya Medical Research Institute, Kisumu, Kenya, <sup>10</sup>Nelson Mandela African Institution of Science and Technology, Arusha, Tanzania, the United Republic of, <sup>11</sup>Medical Research Council/Uganda Virus Research Institute, Kampala, Uganda, <sup>12</sup>London School of Hygiene and Tropical Medicine, Uganda Research Unit, Kampala, Uganda, <sup>13</sup>Uganda Virus Research Institute, Entebbe, Uganda

**Background:** Point-of-Care (POC) Viral Load (VL) monitoring is currently being implemented in several countries to overcome bottlenecks of centralized monitoring of VL, such as long turn-around times, loss of samples and results and filing backlogs. Though POC-VL monitoring may overcome those bottlenecks, the acceptability of POC-VL monitoring may be hindered by challenges experienced by end-users. Our study aims to investigate the acceptability of point-of-care viral load monitoring among children with their caretakers and young people living with HIV in East Africa (EA).

**Methods:** We conducted a qualitative study among participants in the intervention arm of the EAPOC-VL cluster randomized trial that investigates the effectiveness of POC-VL monitoring on viral load suppression (The EAPOC-VL Project) in East Africa. Children and young people living with HIV who recently had a VL test using POC and their caretakers and treatment supporters were interviewed using in-depth interviews and focus group discussions. Data was analyzed deductively using the Sekhon Framework comprising seven constructs of acceptability of an intervention: affective attitude, perceived effectiveness, perceived burden, ethicality, self-efficacy, intervention coherence and opportunity costs.

**Results:** Preliminary analyses show that POC-VL monitoring, in general, is acceptable. The affective attitude was mostly positive as most liked to get results quickly, though

some said this rapidity rather caused anxiety. Perceived effectiveness was positive as the majority reported adhering better to medication after being given the results. Intervention coherence was high as participants understood that POC-VL monitoring gives quick results. On the other hand, there was a perceived burden due to waiting for results at the health facility on the day of testing. Further, there were opportunity costs such as missing school (and school lunch), homework, or other important functions like birthdays.

**Conclusions:** POC-VL monitoring was considered acceptable. Quantification of these results through a cross-sectional survey would provide a more precise understanding of the magnitude of the mentioned factors. Though perceived burden and opportunity costs could be lowered by implementing strategies to overcome the long wait at the health facility, such as by giving back results and counselling by phone.

## THPEE526

Lessons learned during cohort monitoring of HIV-exposed infants: improving documentation of final outcome at 24 months of age

C. Shava<sup>1</sup>, E. Mwiinga<sup>1</sup>, J. Chansa<sup>1</sup>, E. Kaemba<sup>1</sup>, F. Lipita<sup>1</sup>, F. Kunda<sup>1</sup>, A. Mumba<sup>1</sup>, M. Chitambo<sup>1</sup>, M. Mukumba<sup>1</sup>, O. Luneta<sup>1</sup>, D. Mwansa-Zulu<sup>1</sup>, X. Bean<sup>2</sup>, P. Juarez<sup>2</sup>, S. Chirwa<sup>2</sup>, P. Matthews-Juarez<sup>2</sup>

<sup>1</sup>Meharry Medical College Global Health and HIV Clinical Services, Clinical, Lusaka, Zambia, <sup>2</sup>Meharry Medical College, Nashville, United States

**Background:** Systematic retention and follow-up of HIV-exposed infants (HEI) is critical to enable documenting their final outcome (FO) at 24 months. This was conducted in the PEPFAR-supported program: Leveraging Health Service Equity through supporting the health care needs of mothers and their HEI.

The aim was to contribute to elimination of Mother-To-Child Transmission of HIV through a person-centered approach using their "One-Stop" Differentiated Service Delivery model.

**Description:** This initiative has been conducted in the Maternal and Child Health Units (MCH) of four high volume, Level-one Hospitals in Lusaka from October 2022 to date. A person-centered team including medical, pharmacy, data, support personnel and mentor mothers are embedded in MCH and provide care and treatment for pregnant and breast-feeding women living with HIV and their children under 2-years-old. HEI receive prophylaxis, growth monitoring, testing and treatment. Pairing of mother-baby appointments is done prioritizing the baby's testing schedule.

Phone call reminders for appointments are made. Mentor mothers provide psychosocial support for newly diagnosed mothers and conduct physical tracking in the com-

munity for clients with missed appointments. Infants who transfer out are tracked to ensure that they are connected to care. Data for birth cohorts of HEI born between October 2020 and September 2021 were reviewed using MCH paper registers and the electronic health record system SmartCare.

**Lessons learned:** Data for 2,386 HEI were reviewed (51% females). Having a dedicated team with proactive follow-up led to increased documentation of FO at 24 months with 2,287 (96%) having a documented FO. This is inclusive of 170 (7.1%) who transferred out but whose final status was documented due to follow up. 42 (1.8%) infants died (all had a previous negative result) and 45 (1.9%) infants seroconverted.

Having a proactive team, pairing of mother and baby appointments, psychosocial support and community tracking led to increased retention. EID cohort monitoring data for fiscal year 2021 is presented below.

Birth Cohort	Cohort size [D]	HIV Infected	HIV Uninfected	Died	Unknown FO (IIT)	Cohort with FO [N]	PMTCT_FO (N/D) x100
FY2021	2386	45	2200	42	99	2287	96%

Table 1. EID Cohort Monitoring for Four Hospitals in Lusaka District, Zambia

**Conclusions/Next steps:** Deliberate and coordinated HEI cohort monitoring increases care, retention and documentation of final outcome at 24 months.

## THPEE527

Facilitating safe disclosure of key population identities to optimize HIV differentiated service delivery in Harare, Zimbabwe in Harare, 2022-2023

C. Hera<sup>1</sup>, P. Moyo<sup>1</sup>, C. Muchemwa<sup>1</sup>, S. Nyakuwa<sup>1</sup>, J. Murungu<sup>1</sup>, I. Mahaka<sup>1</sup>, B. Mushangwe<sup>2</sup>, G. Gonesse<sup>2</sup>, B. Makunike<sup>2</sup>, T. Sola<sup>3</sup>, T. Mharadze<sup>4</sup>, R. Malaba<sup>4</sup>, H.J. Cham<sup>4</sup>, K. Thomson<sup>5</sup>, S. Wiktor<sup>5</sup>, E. Chidovi<sup>2</sup>

<sup>1</sup>Pangaea Zimbabwe, Harare, Zimbabwe, <sup>2</sup>Zim-TTECH, Harare, Zimbabwe, <sup>3</sup>MoHCC, Harare, Zimbabwe, <sup>4</sup>CDC, Harare, Zimbabwe, <sup>5</sup>I-TECH University of Washington, Seattle, United States

**Background:** In Zimbabwe, criminalization of key populations (KPs) (female sex workers, men who have sex with men, people who inject drugs, and transgender persons) results in non-disclosure of KP status in health service settings. Pangaea Zimbabwe (PZ) under the Zimbabwe Partnership to Accelerate AIDS Control (ZimPAAC) consortium supported a KP Program in 21 public health facilities in Harare and conducted a KP reclassification exercise to identify hidden KPs among persons seeking health services. The objective of the program was to facilitate safe disclosure of KP status and optimize Differentiated Service Delivery (DSD) Models for HIV care and treatment.

**Description:** Clients on antiretroviral therapy, self-administered KP Classification tool between October 1, 2022, and September 30, 2023, at their scheduled clinical visits. Trained KP-peer community facilitators (CFs) distributed the paper-based tool and offered in-person assistance to clients during health talks and while in service waiting queues. Where clients could neither read nor write, the CFs helped administer the tool.

**Lessons learned:** Over the 12-month period, 33,284 clients (47% of all clients on ART) were screened, of whom 3,335 (9.2%) self-identified as KP and were then classified in the clinic records as KP, offered KP friendly services, linked to CFs in their area and to other support services. 48 (1.44%) clients with unsuppressed viral load (VL) were identified and linked to enhanced adherence counselling, and 518 (15.53%) with missing VL results were linked VL monitoring programmes. The KP screening questions were also useful for identifying and tailoring services for KPs newly enrolled onto ART.

**Conclusions/Next steps:** The process showed that most KPs were already engaged in care but had not been identified as KPs and were therefore receiving non-tailored services. A similar gap may exist amongst clients seeking HIV prevention services. Differentiated, client centered KP services within public sector health settings requires person specific tools administered in a confidential, non-judgmental manner to elicit sensitive information that is crucial for care. We recommend further exploration of the experiences leading to non-disclosure of KP status and establish linkages to other services.

## THPEE528

### Using technology for HIV prevention and treatment adherence in West Nile, Uganda

H. Kayonga<sup>1</sup>, M. Senyonga Kirwana<sup>2</sup>,  
J. Nalwoga Martha<sup>3,3</sup>

<sup>1</sup>African Network of SRHR Alliances, Regional Youth Coordinator, Kampala, Uganda, <sup>2</sup>Global Fund Uganda Country Coordinating Mechanism, Youth Country Representative, Kampala, Uganda, <sup>3</sup>United Nations Association of Uganda, Community Engagement, Wakiso, Uganda

**Background:** In Uganda, HIV/AIDS remains a public health challenge with approximately 1.4million people living with it. This has sparked prevention and treatment adherence being critical components of the national response. Our abstract presents the **Strengthening Covid-19 Response (SCR)** project that utilized technology to enhance prevention efforts and improve treatment adherence among Young People in 3 districts of west Nile: Arua, Terego and Adjumani.

**Description:** This project happened between January and November 2022 in the three districts. It employed a multi-faceted approach leveraging various technological

tools such as **Airtel SMS** reminders, **Sauti Plus** mobile application embedded with telemedicine services such as **Refill myART** to reach individuals at risk of HIV and those already living with the virus. Partnerships were established between local health authorities, health centres, community-based organizations, and telecom companies to implement and evaluate the interventions.

**Lessons learned:** Using technology for HIV prevention and treatment adherence in Uganda has shown promising results. The project's success can be attributed to the convenience offered by technology, particularly in reaching marginalized populations who face barriers to accessing traditional healthcare services.

The use of **Sauti plus** application and Airtel SMS reminders provided continuous support and information, empowering individuals to take control of their health and make informed decisions.

**Refill myART** telemedicine service bridged the geographical gap ensuring that individuals in remote areas had access to healthcare professionals for counselling and treatment support.

SMS reminders increased condom use by 30% among young people and facilitated a 25% increase in regular HIV testing.

**Sauti plus** application was downloaded by over 10,000 individuals, with 79.8% reporting increased knowledge on HIV prevention methods. Treatment adherence rates among individuals using **Refill myART** improved by 12.4% compared to those who received standard care.

**Conclusions/Next steps:** This project demonstrates the effectiveness of using technology for HIV prevention and treatment adherence in Uganda. The integration of technology into the national HIV response can significantly enhance efforts to reduce new HIV infections and improve the 95-95-95 HIV clinical cascade health outcomes. Scaling up these interventions and ensuring equitable access to technology will also be crucial for achieving the U=U goal and an AIDS-free Uganda by 2030.

Favorable retention in care outcomes among persons receiving ART via a decentralized pharmacy dispensation differentiated service delivery model in Mozambique: a retrospective cohort study in Mozambique

C. De Schacht<sup>1</sup>, C. Belo<sup>1</sup>, C. Cabsela<sup>1</sup>, M. Efigenia<sup>2</sup>, I. Libombo<sup>3</sup>, J. Tique<sup>1</sup>, J. Matsimbe<sup>4</sup>, M. Ynusse<sup>4</sup>, C.W. Wester<sup>5,6</sup>, G. Amorim<sup>7</sup>

<sup>1</sup>Friends in Global Health, Maputo, Mozambique,

<sup>2</sup>Provincial Health Directorate, Quelimane, Mozambique,

<sup>3</sup>Central de Medicamentos e Artigos Médicos, Maputo, Mozambique,

<sup>4</sup>Friends in Global Health, Quelimane, Mozambique,

<sup>5</sup>Vanderbilt University Medical Center (VUMC), Department of Medicine, Division of Infectious

Diseases, Nashville, United States, <sup>6</sup>Vanderbilt Institute for Global Health (VIGH), Nashville, United States, <sup>7</sup>Vanderbilt

University Medical Center (VUMC), Department of Biostatistics, Nashville, United States

**Background:** As one of the differentiated service delivery models in Mozambique, clinically stable persons with HIV (PWH) can receive antiretroviral therapy (ART) at Ministry of Health-approved public or private pharmacies outside of health facilities (HF). This decentralized ART distribution model (DADM) initiated in Zambézia Province in July 2021.

The objective of this evaluation was to assess the model's effect on retention in care, compared to HF-based ART dispensation.

**Methods:** A retrospective cohort study with a 3:1 (propensity score) matched population ( $\geq 15$  years of age; matched on time on ART, sex and HF) eligible for the DADM (i.e., adherent to ART) and receiving 3-month dispensation was done at three urban HF linked to seven public/private pharmacies in the capital Quelimane.

Individual-level data were extracted from the electronic medical record database from July 2021-March 2023. PWH were considered retained in care at 12 months if they had at least one ART pick-up within 121-180 days after eligibility to the DADM.

Conditional logistic regression analysis estimated the effect on retention in care (adjusted for age and sex), and Cox regression analysis estimated hazard ratio (HR) of loss to follow-up.

**Results:** Matched data included 2968 adults, 41.6% female, median age 30 years (IQR 25-39). Overall, 12-month retention in care rate was 81.9% (88.4% at public/private pharmacies, versus 79.7% at HF).

Adjusted analysis showed that PWH receiving ART at private/public pharmacies were about twice as likely to be retained at 12 months (adjusted Odds Ratio [aOR]: 1.95 [95%CI:1.51-2.52]; p-value<0.001) and have approximately 70% reduced risk of being lost to follow-up (HR: 0.27 [95%CI:0.19-0.39]; p-value<0.001), compared to those obtaining ART at HF (Figure).

Figure 1. Cumulative hazard of being lost to follow-up, comparing those with pharmacy pick-up (green) versus not (pink).

**Conclusions:** PWH receiving ART via a DADM had improved retention in care rates compared to the standard HF-based dispensation approach, highlighting the importance of public-private partnerships in contributing to improvement of HIV outcomes.

## THPEE530

Thailand's first comprehensive integrated prevention and treatment for HIV, TB, and STI in Bangkok Metropolitan Administration's Primary Health Clinic

R. Luengwattana<sup>1</sup>, T. Palakawong Na Ayuthaya<sup>2</sup>, C. Brukesawan<sup>2</sup>, C. Nandavisa<sup>1</sup>, S. Pattharasikarin<sup>2</sup>, S. Khongjaroensakun<sup>2</sup>, V. Poomlek<sup>2</sup>, P. Panutat<sup>2</sup>, K. Lerdtripthop<sup>3</sup>, P. Chaiphosri<sup>3</sup>, R. Lolekha<sup>1</sup>, N. Isarankura Na Ayuthaya<sup>3</sup>, S. Northbrook<sup>1</sup>, S. Sunthornchart<sup>3</sup>

<sup>1</sup>Division of Global HIV and TB, U.S. Centers for Disease Control and Prevention, Nonthaburi, Thailand, <sup>2</sup>Public Health Center 28, Health Department, Bangkok Metropolitan Administration, Bangkok, Thailand, <sup>3</sup>Health Department, Bangkok Metropolitan Administration, Bangkok, Thailand

**Background:** In 2017, the Bangkok Metropolitan Administration Health Department's Public Health Center 28 (PHC28) implemented an integrated primary care model for people living with HIV (PLHIV). This patient-centered approach integrates comprehensive and coordinated care for sexually transmitted infections (STI), tuberculosis (TB), and HIV services.

**Description:** A "status-neutral" approach ensures care regardless of HIV status and enables tailored counseling, treatment, and support based on individual results. HIV-positive individuals receive immediate opportunistic infections (OI) screening, including point of care se-

rum cryptococcus antigen screening, chest X-ray and antiretroviral therapy (ART) initiation, bypassing lengthy laboratory turnaround times, potential ART delays and minimizing patient disengagement. Those who test HIV negative benefit from preventive education and regular HIV/STI screenings. Services also include pre-/post-exposure prophylaxis (PrEP/PEP), STI treatment, OI treatment, and referral for complex cases.

**Lessons learned:** Bangkok Smart Monitoring System and HIV-Info Hub data shows that between 2021 and 2022:

**1. Client Growth:** Increased in PLHIV under care (3,880 to 4,763), PrEP clients (2,314 to 2,868), PEP clients (289 to 377), and STI treatments (189 to 217).

**2. Exceeding National Average:** Achieved ART coverage of 94.2% and 96.8% (vs. national coverage of 91.0% and 90.2%), respectively; 100% and 100% same-day/rapid ART initiation for eligible PLHIV (vs. 36.2% and 39.7%), lower all-cause mortality of 1.0% and 0.5% (vs. 3.0% and 2.6%), and higher proportion of undetectable viral load of 97.1% and 95.5% (vs. 92.9% and 93.2%).

**3. High Engagement and TB Cure Rates:** Minimal patient loss one year after ART initiation (3.5% and 0.3%) and 100% TB cure rates in PLHIV for both years.

Figure. Public health center 28's HIV prevention and treatment flow.

**Conclusions/Next steps:** Enhancing Thailand's public health, PHC28's integrated care for PLHIV provides a model for primary health clinics, streamlining diagnosis and treatment and demonstrating the impact of patient-centered care on PLHIV, aligning with HIV epidemic control goals.

## THPEE531

Innovating interactive SMS for training health workers in provision of all-inclusive HIV services for most at risk groups. This is after the signing of the anti- gay law in Uganda

A. Bagarukayo<sup>1,2</sup>, B. Kemigisa<sup>3,4</sup>, A. Nanyonjo<sup>4</sup>, L.S. Namara<sup>5</sup>, F. Nabaweesi<sup>1</sup>, M. Ssemakula<sup>1</sup>

<sup>1</sup>Youth Space Uganda, Kyegegwa, Uganda, <sup>2</sup>Center for Domestic Violence Prevention, Kampala, Uganda,

<sup>3</sup>PillPower Uganda, Hoima, Uganda, <sup>4</sup>DFCU Bank, Kampala, Uganda, <sup>5</sup>Infectious Diseases Institute, Kampala, Uganda

**Background:** In May 2023, Uganda signed the anti- homosexuality law, The law criminalizes MSM with life imprisonment and death penalty for those convicted, it also prohibits health care practitioners from providing HIV prevention, treatment, and care services for MSM. As a result, the health workers are living in fear and have refrained from providing these services to the suspected MSM.

Youth Space Uganda is a Community AIDS Organization that innovates approaches to mass trainings for low resource constrained communities responded to this need. YS believes in the provision of equitable services for all without discrimination so the organization piloted an interactive SMS training for health workers. SMS training was a viable option because it has a massive reach, uses any basic phone and is user- friendly.

**Description:** YS piloted a 3-week course, Enhancing Access to Safe and Equitable HIV Services for Key Populations. The modules included; HIV prevention approaches, HIV stigma and discrimination and Creating Friendly Environments. It was piloted among 180 health workers in Wakiso District. The participants received Module content thrice a week and SMS quizzes at the end of every module. The quizzes were in the form of multiple-choice questions. Health workers responded to the questions through a toll-free platform that instantly provided feedback on whether the response was right or wrong.

**Lessons learned:** 78% ( 81M, 59F ) of the health workers enrolled to the course and responded to the SMS quiz questions, 81% submitted the correct response. This was above the 60% pass mark for the award of certificates. Challenges that hindered responses included busy work schedules, poor network coverage, and lack of battery power. The high percentage of responses in general, and specifically the high percentage of correct responses, shows that SMS is effective as a mass training approach for health workers in low resource settings. The teaching method was also very effective as an emergency / immediate intervention after signing of the anti gay bill. It didn't require mass gathering of health workers who were already living in fear.

**Conclusions/Next steps:** YS has scaled up the SMS training to 3 more districts and plans for a wider coverage.

Focused site support to improve viral load coverage among people living with HIV on treatment: lessons learned from Zimbabwe during program implementation in 2022 through to 2023

M. Mhangara<sup>1</sup>, S. Mukungunugwa<sup>1</sup>, T. Tapera<sup>1</sup>, K. Nyathi<sup>2</sup>, T. Nyamundaya<sup>2</sup>

<sup>1</sup>USAID, Health, Population and Nutrition, Harare, Zimbabwe, <sup>2</sup>Zimbabwe Health Intervention, Harare, Zimbabwe

**Background:** Of Zimbabwe's 1.28 million people living with HIV (PLHIV), 94% receive antiretroviral therapy (ART) and of these, 95% are virally suppressed according to UNAIDS' 2022 HIV estimates. Despite this high viral load suppression, viral load coverage (VLC) is suboptimal nationally at 73% (against a national target of 85%) and is variable across geographies and populations. Using Manicaland province as a case study, this abstract demonstrates how focused site support improved VLC.

**Description:** To improve VLC, USAID Zimbabwe supported clinic laboratory interface quality improvement (QI) initiatives at sites from October 2021 to March 2022. The QI teams focused on clinical and laboratory processes and systems: client flow, viral load sample transportation and results flow, and use of data to improve VLC and to ensure quality services.

Teams documented their QI plans, activities, and outputs in "QI corner" with annotated run charts and held multidisciplinary monthly team meetings to review progress and learning for continuous adaptation.

**Lessons learned:** PEPFAR/Zimbabwe program data showed that the five districts supported by USAID in Manicaland province achieved an increase from 66% VLC in June 2022 to 82% in September 2023. The program's efforts were associated with a notable increase by more than 20% of VLC in two districts; the other three districts registered increases in VLC of more than 9% during the same period (Figure 1).

Figure 1. Improved viral load coverage and suppression trends across PEPFAR supported districts in Manicaland.

**Conclusions/Next steps:** Viral load monitoring is key to ending HIV/AIDS as a public health threat by 2030. Zimbabwe, through the Manicaland case study, has demon-

strated the feasibility and importance of clinical laboratory interface QI initiatives to increase VLC. Additional efforts should be tailored to support these initiatives across all sites offering ART for continuous VLC improvement.

## THPEE533

Care in motion: supporting antiretroviral treatment continuation for Nepalese seasonal migrants in India

S.K. Paudel<sup>1</sup>, A.B. Rai<sup>2</sup>, D.R. Joshi<sup>1</sup>, A.P. Poudyal<sup>2</sup>, U. Shrestha<sup>3</sup>

<sup>1</sup>AIDS Healthcare Foundation (AHF) Nepal, Program and Management, Lalitpur, Nepal, <sup>2</sup>AIDS Healthcare Foundation (AHF) Nepal, Monitoring and Evaluation, Lalitpur, Nepal, <sup>3</sup>AIDS Healthcare Foundation (AHF) Nepal, Clinical Mentoring and Medical Advisory, Lalitpur, Nepal

**Background:** Nepalese workers are relocating as seasonal migrants to India for unskilled labor, leveraging open cross-border mobility. However, those Nepalese people living with HIV (PLHIV) face challenges in obtaining antiretroviral (ARVs) medications; often rely on family and friends to send the ARVs to India from Nepal. Practical solutions are needed to minimize treatment interruption in these populations.

**Description:** AIDS Healthcare Foundation (AHF) Nepal supports facilities that encompass 31% of the total 23,293 PLHIV on antiretroviral treatment (ART) in Nepal; of those, 7% are seasonal migrants in different States of India. Most (80%) are males, 68% are 31-50 years old, 55% receive antiretrovirals as multi-month dispensing in Nepal, and 80% rely on family members to get their medications and send them to India.

Leadership from Nepal's Bheri Hospital ART center and AHF Nepal visited the Uttar Pradesh State AIDS Control Society (UPSAC) in India to establish collaborations with local ART services and support Nepalese PLHIV in seasonal migration. The consensus was to provide workplace ID documents; toll-free telephone numbers; outreach workers for their health needs; and establish cross-reference between ART centers in Nepal and those operating under UPSAC.

Annual meetings including representatives from both countries and other stakeholders were recommended to further improve the system. Nepalese PLHIV who are seasonal migrants in Uttar Pradesh are now easily getting their antiretrovirals, and 98% of this population achieved viral suppression. Similar collaborations are underway in Maharashtra and Himanchal State in India.

**Lessons learned:** PLHIV need treatment and support regardless of where they might be. State-level and non-governmental stakeholders can collaborate in the provision of continued care to displaced populations; moreover, their model of care can be expanded to other States.

**Conclusions/Next steps:** The integrated action combining multilateral governmental and non-governmental institutions can support the implementation of creative solutions to mitigate the barriers for HIV care across State borders.

<sup>1</sup>Uganda Peoples Defense Forces (UPDF), Directorate of HIV/AIDS, Kampala, Uganda, <sup>2</sup>DoD-Uganda University Research Co., LLC Project, University Research Co., LLC, Kampala, Uganda, <sup>3</sup>University Research Co., LLC, Chevy Chase, United States, <sup>4</sup>Department of Defense, U.S. Embassy Kampala, Uganda, Kampala, Uganda, <sup>5</sup>Infectious Diseases Institute, Makerere University, College of Health Sciences, Kampala, Uganda

**Background:** Extension for Community Healthcare Outcomes (ECHO) model has gained prominence for its innovative approach to knowledge dissemination and collaborative learning within healthcare settings. In August 2021, the Ugandan military health services established the ECHO program to strengthen the capacity of health workers in HIV care. The ECHO program entails biweekly virtual sessions that include a short didactic and case presentations.

Sessions focus on areas of HIV care such as treatment optimization for complex cases and death audits and include discussion. This evaluation aimed to assess the Uganda military ECHO program's impact.

**Methods:** A survey was conducted with a random sample of ECHO participants. Data were also collated from feedback after sessions. The survey encompassed demographics, equipment issues, moderation, changes in knowledge and practice after sessions, and challenges. Data were analyzed to determine participation and learner reactions to these sessions, challenges and learning outcomes.

The analysis used the Kirkpatrick Model of evaluating training and learning programs. Only the first three levels of Reaction, Learning, and Behavior were assessed.

**Results:** Overall, 38 participants (30 from ECHO sites and 8 who joined remotely) provided responses. Of these, 79% were male with most being counsellors (32%), clinicians (24%) and nurses (13%).

Attendance by personal devices (mobile phones) was 50% and 45% attended using site level conferencing facilities. Learners' indicated universal agreement that session objectives were clear, sessions were relevant, and that content experts were knowledgeable.

Several respondents indicated that the content was at times too complex. 63% of participants reported sessions changed their medical practice and empowered them to make better decisions on complex cases. While 87% reported having consistent functionality of ECHO equipment, challenges were reported by 15% regarding connectivity and 15% regarding difficulties in equipment operation. Currently 521 military health workers are registered with ECHO; average attendance is 90 persons per session.

**Conclusions:** This assessment shows the ECHO program is acceptable, feasible and improves self-reported knowledge and practices among health workers in Ugandan military health facilities. Increasing ECHO program gains will require targeted interventions to improve participation and address internet connectivity. Research is needed to identify barriers to regular participation among registered health workers.

## THPEE535

### "Decongesting health facilities, reducing stigma, transport costs and client waiting time": stakeholder experiences of using medical drones to deliver anti-retroviral therapy in fisherfolk communities of Kalangala Islands

J.L. N. Ssemata<sup>1</sup>, E. Nakibuuka<sup>1</sup>, J. Beinomugisha<sup>1</sup>, A. Bwanika Naggirinya<sup>1</sup>, P. Ssesaazi<sup>1</sup>, R. Parkes-Rotanshi<sup>1,2</sup>  
<sup>1</sup>Infectious Diseases Institute, Academy for Health Innovations, Kampala, Uganda, <sup>2</sup>University of Cambridge, Public Health, Cambridge, United Kingdom

**Background:** To achieve the UNAIDS 95:95:95 target, People Living with HIV (PLHIV) need to be engaged throughout the HIV care continuum and have life-long retention in care. Differentiated Service Delivery (DSD) models can address barriers related to accessibility of care, however there are unanticipated challenges of Anti-retroviral (ART) delivery in remote and hard to reach areas. In the islands of Kalangala district with the highest HIV prevalence (18%) in Uganda, ART delivery involves risky boat journeys. To achieve the UNAIDS targets, we must adopt technologies and strategies that strengthen health systems to improve transport in hard to reach areas. We piloted and evaluated the use of medical drones to deliver ART refills to clients in Kalangala.

**Methods:** In October 2022, we conducted five focus group discussions (FGDs) (n=33) following a semi structured interview guide including Female living with HIV (7), Male living with HIV (7), mixed male and female living with HIV (6), Health Care Workers (6) and People not living with HIV (7) on 4 landing sites (Kusu, Buwunge, Kaazi and Bufumira). The FGDs were audio recorded, transcribed verbatim and translated into English. Data was categorized using Nvivo into themes and sub-themes by 2 social scientists and analyzed using a content-thematic approach.

**Results:** The average participant age was 34 years and 19 out of 33 were female. All healthcare workers reported improved client adherence and retention in care. They agreed that the health facilities have become decongested with reduced work load. Majority of participants mentioned experiencing reduced stigma, transport costs and waiting time. Both healthcare workers and clients were happy about the medical drones delivering other medical supplies like blood especially in emergencies. They agree that it's use is convenient, promotes privacy, is timely and has enabled capacity building for peer support workers. All reported reduced water transport risks and cost saving. However, a few showed concern regarding client- healthcare worker interaction, poor network and limited drone capacity.

**Conclusions:** Medical drones can decongest health facilities and ensure consistency of refills at landing sites with resultant increase in client adherence and retention in care.

### THPEE536

Results of the SAIA-Scale trial: scaling up the systems analysis and improvement approach for PMTCT in Mozambique (NCT0342513)

K.H. Ásbjörnsdóttir<sup>1</sup>, S. Gimbel<sup>2</sup>, J. Coutinho<sup>3</sup>, J. Crocker<sup>4</sup>, A. Dinis<sup>5</sup>, C. Hazim<sup>5</sup>, M. Cruz<sup>3</sup>, M. Agostinho<sup>3</sup>, F. Amaral<sup>3</sup>, I. Ramiro<sup>3</sup>, K. Sherr<sup>5</sup>

<sup>1</sup>University of Iceland, Center of Public Health Sciences, Reykjavik, Iceland, <sup>2</sup>University of Washington, Family and Child Nursing, Seattle, United States, <sup>3</sup>Comité para Saúde de Moçambique, Maputo, Mozambique, <sup>4</sup>Emory University, Rollins School of Public Health, Atlanta, United States, <sup>5</sup>University of Washington, Global Health, Seattle, United States

**Background:** Since the introduction of Option B+ in Mozambique, HIV testing and ART initiation in antenatal care have drastically improved and currently exceed 90%. However, later steps of the PMTCT cascade have lagged behind, with early infant diagnosis (EID) estimated at 75% in 2022 and maternal loss to follow-up, particularly postpartum, remaining high. Low-cost interventions to improve cascade outcomes are urgently needed. The Systems Analysis and Improvement Approach (SAIA) is a multi-component implementation strategy made up of three systems engineering tools: cascade analysis, process mapping and continuous quality improvement, that engages frontline healthcare providers in data-driven quality improvement of multistep care cascades. SAIA enables providers to identify service bottlenecks or cascade drop-offs within their facilities and tailor micro-interventions to improve them.

**Methods:** SAIA-Scale was a stepped-wedge trial scaling up SAIA through the Mozambican public healthcare system. SAIA-Scale was implemented at 36 PMTCT facilities

across all 12 districts of Manica Province from 2018-2021. Districts were randomized to three waves, 12 months apart, and received a 12-month intensive phase during which District Nurse Supervisors (DNS) were trained and supported by study nurses to implement SAIA, followed by a maintenance phase implemented solely by the DNS. Each health facility conducted monthly SAIA meetings to review PMTCT data and propose and test micro-interventions to improve service delivery.

Individual-level cascade outcomes were abstracted from PMTCT service registries, and effectiveness was assessed using generalized estimating equations with Poisson family and clustering by facility. Exposure was the facility's study phase at the client's first visit (pre-intervention, intensive, maintenance), and analyses were adjusted for calendar year.

**Results:** Early infant diagnosis (EID) increased 15% during the intensive phase of SAIA (95% confidence interval 1.08-1.22,  $p < 0.001$ ), and 9% during the maintenance phase (1.00-1.19,  $p = 0.03$ ) compared to pre-intervention. PCR testing at any age increased 5.5% during the intensive phase (1.00-1.11,  $p = 0.05$ ). There was no association between study phase and mother-to-child transmission, either early or overall.

**Conclusions:** Use of SAIA was associated with a substantial increase in EID, which was maintained during the less-supported phase of the trial. These results demonstrate that SAIA can be successfully scaled up and implemented using existing management structures and personnel.

### THPEE537

Can financial incentives enhance the effectiveness of community-based tracing to re-engage people who have disengaged from HIV care? A randomized study in Tanzania

J.L. Kadota<sup>1</sup>, M. Mlowe<sup>2</sup>, H. Maila<sup>2</sup>, B. Joseph<sup>2</sup>, L.J. Packel<sup>1</sup>, N. Ulenga<sup>3</sup>, W.H. Dow<sup>4</sup>, P.F. Njau<sup>5</sup>, A. Sabasaba<sup>2</sup>, S.I. McCoy<sup>1</sup>

<sup>1</sup>University of California Berkeley, School of Public Health, Division of Epidemiology, Berkeley, United States, <sup>2</sup>Health for a Prosperous Nation (HPON), Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>Management and Development for Health, Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>University of California Berkeley, School of Public Health, Division of Health Policy and Management, Berkeley, United States, <sup>5</sup>Ministry of Health, Dodoma, Tanzania, the United Republic of

**Background:** In 2022, Tanzania was one of five sub-Saharan African countries to achieve UNAIDS '95-95-95' targets. Nevertheless, the 'missing 5%' of the 2<sup>nd</sup> and 3<sup>rd</sup> targets - people living with HIV (PLHIV) who are out-of-care and/or unsuppressed - may be difficult to reach yet play an outsized role in ongoing HIV transmission.

**Methods:** We conducted a cluster randomized trial in Lake Zone, Tanzania to assess the effectiveness of *Rudi Kundi*, a program which adds a modest financial incentive (~\$10USD) to standard counseling/referral by home-based care providers (HBC) to encourage out-of-care PLHIV to return to care. From July 2022–October 2023, 32 health facility catchment areas were randomized 1:1 to usual HBC tracing/counseling, or the same model plus the offer of a financial incentive (half provided at enrollment, half upon return). Outcomes were return to care within 90 days, time to return, reasons for return, and 6-month care status.

**Results:** Among 567 PLHIV (61% female, average age 36.9 years, out-of-care mean 121 days), 239/250 (95.6%) in the comparison and 314/317 (99.1%) in the intervention group returned within 90 days (risk difference=3.5 percentage points, 95% CI: 0.9-6.0); return time did not differ between groups ( $p=0.45$ ; combined=3.3 days). At baseline, 34% ( $n=190$ ) indicated transportation costs as their main barrier. The most common return reason was the decision that "returning to HIV care was the best choice for me" ( $n=198/310$ , 64%), with no evidence of coercion. Only 3% of intervention participants indicated the cash was their main motivation for return. 6 month in-care status did not differ between arms and included 343/406 PLHIV (84.5%).

**Conclusions:** Reengagement in HIV care was surprisingly high in both arms after HBC intervention. The offer of the incentive demonstrated modest additional benefit over usual services. Among both groups, personal motivation and HBC encouragement were primary motivators for return. Additional data are needed to explain unusually high return rates in the comparison group. 6-month viral load suppression (primary outcome) will reveal whether high return rates translate to improved clinical outcomes.

	Intervention (n=186)	Comparison (n=124)	Overall (n=310)
I decided that returning to HIV care was the best decision for me	126 (67.7%)	72 (58.1%)	198 (63.9%)
I was encouraged by the HBC home visit and counseling to return to HIV care/I learned how to return to care (I got the information and resources needed to return)	32 (17.2%)	33 (26.6%)	65 (21.0%)
Felt that I was in poor health/other health related reasons	22 (11.8%)	14 (11.3%)	36 (11.6%)
Other reason (including "Receipt of cash from this study", intervention participants only: n=6/186, 3.2%)	6 (3.2%)	4 (3.2%)	10 (3.2%)

*Table. Self-reported most important reason for return to HIV care among a sample of study participants who completed their endline survey (n=310).*

# Effect of differentiated models of service delivery for HIV treatment on healthcare worker time spent with ART clients: retrospective cohort and time and motion analysis

N. Lekodeba<sup>1</sup>, V. Ntjikelane<sup>1</sup>, O. Mokgethi<sup>1</sup>, M. Benade<sup>1,2,3</sup>,  
L. Sande<sup>1</sup>, I. Mokhele<sup>1</sup>, N. Ngcobo<sup>1</sup>, K. Shumba<sup>2</sup>,  
L. Jamieson<sup>1</sup>, A. Huber<sup>1</sup>, S. Pascoe<sup>1</sup>, S. Rosen<sup>1,3</sup>

<sup>1</sup>Health Economics and Epidemiology Research Office,  
Faculty of Health Sciences, University of the Witwatersrand,  
Johannesburg, South Africa, <sup>2</sup>Amsterdam University  
Medical Center, Department of Medical Microbiology,  
Amsterdam, Netherlands, the, <sup>3</sup>Boston University School  
of Public Health, Department of Global Health, Boston,  
United States

**Background:** Differentiated service delivery (DSD) models for HIV treatment can reduce the frequency of interactions between clients and the healthcare system without harming health outcomes. This reduction in healthcare interactions is hypothesized to reduce the overall amount of time providers spend with ART clients enrolled in DSD models.

We measured the average number of interactions per ART client and the average time providers spend with ART clients per year in the context of DSD scale-up in South Africa.

**Methods:** From 09/2022-11/2023, we conducted a time and motion study with providers and a retrospective record review of ART clients at primary healthcare clinics (n=18) in South Africa. The number of healthcare interactions and average time spent by provider by type of healthcare interaction were recorded per client per year, stratified by the client's ART delivery model (remaining in conventional care but eligible for DSD compared to 2 DSD models: facility pickup points, external pickup points).

**Results:** 635 ART clients' (75.3% female, median age 41) were enrolled. Nurses (n=72) and pharmacy assistants (n=3) were observed for 143 working days. Clients had an average of 1.2 full clinic visits/year in both DSD models, compared to 1.9 for those eligible for DSD but enrolled in conventional care.

Compared to those eligible for DSD but enrolled in conventional care, clients using facility pickup points and external pickup points had 1.4 and 2.2 fewer average healthcare interactions per year, respectively, and both used 71% less provider time per client per year.

	Initial pilot phase (2016)		Extended pilot phase (2017)		Conventional, possible for 2018		Conventional, possible for 2018	
	Interactions per client	Positive client impact per client (€)	Interactions per client	Positive client impact per client (€)	Interactions per client	Positive client impact per client (€)	Interactions per client	Positive client impact per client (€)
First client visits	1.07		1.07		1.73		1.92	
Second client visits (involvement in decision making)	0.2	32.2 (20.0)	0.2	35.5 (20.0)	0.2	33.0 (20.0)	0.2	36.0 (20.0)
Education (all visits)	0.2	26.25	0.2	26.75	0.2	26.1	0.2	26.1
Information (all visits)	0.1	25.75	0.1	26.0	0.1	25.8	0.1	25.8
Information + education (all visits)	0.1	25.75	0.1	26.0	0.1	25.8	0.1	25.8
Information + education (all visits) (2017 only)	0.2	32.00	0.2	32.50	0.2	32.00	0.2	32.00
Access to care/management only	0.1	31.24	0.1	31.99	0.1	31.6	0.1	31.6
Total	2.58	104.75	2.58	105.75	3.45	109.51	3.76	110.21

**Conclusions:** ART clients enrolled in DSD models had fewer healthcare interactions and required less provider time compared to those in conventional care. The shift of ART clients who are eligible for DSD models from conventional care into DSD models can reduce annual provider time by more than 70% per client, reducing pressure on the healthcare workforce.

Facilities with quality improvement projects in Côte d'Ivoire show better outcomes for pediatric viral load suppression in children and adolescents with HIV

E. MacLachlan<sup>1</sup>, C. Gnogoué<sup>2</sup>, N. Krou Danho<sup>2</sup>, M. Van Osdale<sup>1</sup>, E. Leunkeu Koffi<sup>2</sup>, S. Ehouman<sup>2</sup>, A. Diokouri Lognon<sup>2</sup>, L. Kouamé<sup>2</sup>, M. Samba<sup>3</sup>, E. Ehui<sup>4</sup>, J. Ngulefac<sup>5</sup>, J. Perlman<sup>5</sup>, C. Feldacker<sup>1</sup>, N. Abiola<sup>2</sup>

<sup>1</sup>University of Washington, Department of Global Health, International Training and Education Center for Health (I-TECH), Seattle, United States, <sup>2</sup>International Training and Education Center for Health (I-TECH) Côte d'Ivoire, Abidjan, Côte d'Ivoire, <sup>3</sup>General Directorate of Health and Public Hygiene (DGSH), Abidjan, Côte d'Ivoire, <sup>4</sup>National AIDS Control Program (PNLS), Abidjan, Côte d'Ivoire, <sup>5</sup>US Department of Health and Human Services, Health Resources and Services Administration (HRSA), Rockville, United States

**Background:** Since 2021, I-TECH and the Ivorian Ministry of Health (MoH) have collaborated on the Quality Improvement Solutions for Sustained Epidemic Control (QISSEC) project, funded by HRSA, to strengthen provider capacity in quality improvement (QI) for HIV service delivery. I-TECH QI coaches support facility QI teams to implement QI projects, including those that improve pediatric viral load suppression (VLS).

**Description:** Among all 2022 QI projects in 80 facilities, 7 focused on pediatric VLS. Over 9 cumulative months of data collection, pediatric VLS rates in those 7 QI sites were compared to the average across PEPFAR sites using linear regression models. The QI interventions used and key lessons learned for improving pediatric VLS were explored qualitatively to determine shared themes.

**Lessons learned:** The 7 sites followed 350 HIV-infected children and adolescents and the QI projects involved 69 with unsuppressed VL. During the QI intervention period, the monthly number of children with VLS increased from 0 to 36 children after the 6th month (36/69, 52%); 48 children (48/69, 70%) were suppressed at 9 months. VLS rate in the 7 sites increased from 81% to 89%, higher than pediatric VLS at PEPFAR-sites (86%), p-value < 0.0001. The qualitative analysis showed that reminder phone calls to caregivers every week (often daily or multiple times per week), treatment adherence education with parents using ART educational image 'boxes' and scheduling home

visits to children's homes when needed were influential. Additional interventions included directly observed therapy, 'motivations' provided to children who achieved viral suppression, support groups, providing after-hours laboratory services for viral load blood draws, disclosure counseling, and revisions to the clinic flow process for child and adolescent clients.

**Conclusions/Next steps:** Implementing focused, facility-based QI interventions can improve VLS in children and adolescents. Multiple touchpoints with parents/caregivers created an atmosphere of trust and good will while external monitoring of child ARV drug taking (such as home visits, working with social services for complex cases and utilizing community counselors) showed promise. Client and caregiver education using visual tools helped improve pill-taking autonomy, especially for adolescents. A similar mixed methods approach to analysis of other QI interventions could help determine QI collective impact.

## THPEE541

Enhancing re-engagement management in South Africa's HIV Treatment Program through a differentiated approach with algorithmic guidance

L.C. Malala<sup>1</sup>, M.R. Manganye<sup>1</sup>, L. Seshoka<sup>1</sup>, M. Ntloana<sup>1</sup>, J. Wessels<sup>2</sup>, T. Chidarikire<sup>3</sup>, R. Fritz<sup>1</sup>, P.N. Khoza<sup>1</sup>, L. Wilkinson<sup>4,5</sup>  
<sup>1</sup>National Department of Health, Pretoria, South Africa, <sup>2</sup>No Affiliation, Pretoria, South Africa, <sup>3</sup>World Health Organization, HIV Prevention, Pretoria, South Africa, <sup>4</sup>International AIDS Society, International AIDS Society, Johannesburg, South Africa, <sup>5</sup>University of Cape Town, Centre for Infectious Epidemiology and Research, Cape Town, South Africa

**Background:** With the maturation of South Africa's HIV treatment programme, individuals returning to antiretroviral treatment (ART) care now exceed new initiations. In 2023, the South African National Department of Health (NDoH) updated its national ART guidance. As part of this update, a combined clinical and service delivery re-engagement management algorithm was developed. We describe the process, factors considered, and the resulting approved algorithm that was included in the national ART and Service Delivery guidelines.

**Description:** National technical working groups (TWGs) for HIV focusing on clinical and service delivery, considered clinical factors and the time since a missed scheduled appointment to differentiate management of ROC re-engaging in HIV care. Clinical factors considered were clinical presentation at re-engagement, an elevated viral load before disengagement, current tuberculosis diagnosis, identification of advanced HIV disease, and treatment regimen. Service delivery factors focused on alleviating ROC burden at re-engagement. The final approved algorithm is presented as Figure 1.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

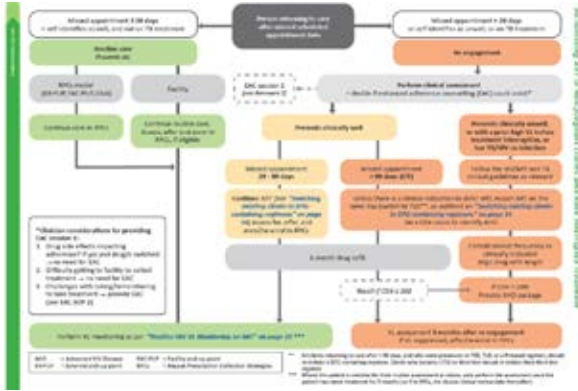

Author  
Index

Figure 1: South Africa 2023 ART guidelines re-engagement management algorithm

**Lessons learned:** Effective management at re-engagement necessitates a differentiated, client-centered approach that considers both clinical and service delivery needs. Previous initiatives, such as the national welcome-back campaign and the standard operating procedure from 2020, did not change healthcare providers approaches to supporting ROC returning to care. The joint consideration of clinical and service delivery aspects, coupled with the prominent placement of the algorithm in the revised short-form version of the ART clinical guidelines, may improve healthcare worker uptake and implementation.

**Conclusions/Next steps:** Provincial training of the revised guidelines, has been completed, including a specific section on re-engagement. An online training module is available through the Knowledge Hub.

Future steps involve integrating the updated re-engagement algorithm into the national welcome-back package, offering support to provinces for incorporation into their context specific re-engagement models (e.g. 'Kwa-Zulu Natal's "Operation Vuyo"), along with providing supporting job aides.

## THPEE542

Long-term health outcomes of people living with HIV who were enrolled in decentralized distribution of antiretrovirals through private pharmacies in three provinces of Mozambique

J. Saturnino<sup>1</sup>, J. Moiane<sup>1</sup>, J. Alexandre<sup>1</sup>, B. Punguane<sup>2</sup>, M. Prieto<sup>1</sup>

<sup>1</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique, Maputo, Mozambique, <sup>2</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique/Abt Associates, Maputo, Mozambique

**Background:** The increasing number of people living with HIV (PLHIV) receiving antiretroviral treatment (ART) requires innovative approaches to make services more convenient for clients while reducing the workload on health systems. In June 2020, Mozambique rolled out its national model for decentralized delivery of ART through private

pharmacies (DD), consisting of networks of public health facilities linked to private pharmacies, which clients can select based on convenience or preference and receive three-months drug refills. USAID-funded Efficiencies for Clinical HIV Outcomes (ECHO) project analyzed the long-term health outcomes of PLHIV who were enrolled in DD in three provinces of Mozambique.

**Methods:** This is a quantitative cross-sectional study of PLHIV enrolled in DD from January to March 2022. Eligibility criteria included: age  $\geq 10$  years old, on ART for  $\geq 6$  months, with a viral load (VL)  $< 1,000$  copies/ml, have no current illness, and not be on cotrimoxazole and/or tuberculosis prophylaxis (excluding pregnant/breastfeeding women). Data was collected from electronic medical records and the ART dispensation electronic system from 9 health facilities and 20 private pharmacies in three provinces. All individuals were followed until October 2023 to assess their VL coverage, VL suppression (defined as VL  $< 1,000$  copies/ml) and retention in care after  $\geq 18$  months of enrollment in DD. Descriptive statistics were used to characterize the study sample and determine long-term health outcomes.

**Results:** 1,773 PLHIV enrolled in DD were included, of whom 61% (1,089/1,773) were female. The median age was 41 years [interquartile range (IQR): 35–48 years], and median time on ART was 95 months (IQR: 71–135 months). By the end of October 2023, only 48% (845/1,773) of individuals were still enrolled in DD, of whom 96% (808/845) had a VL test result, and 98% (795/808) were found to be virally suppressed. Among the individuals who dropped DD, 94% (867/919) were enrolled in other differentiated service delivery models, of whom 66% (582/867) were enrolled in six-month dispensing (6MMD).

**Conclusions:** PLHIV enrolled in DD can achieve successful long-term health outcomes as evidenced by high rates of VL suppression. However, once more convenient frequency dispensing models were available, clients dropped DD.

### Key-population-led health providers increased access to same-day antiretroviral therapy (SD-ART): results from seven provinces in Thailand

P. Phoopisutthisak<sup>1</sup>, S. Janyam<sup>2</sup>, P. Patpeerapong<sup>3</sup>, S. Sittikarn<sup>4</sup>, A. Wongsas<sup>5</sup>, S. Mills<sup>6</sup>, K. Sirisup<sup>6</sup>, P. Rattakittvijun Na Nakorn<sup>7</sup>

<sup>1</sup>Rainbow Sky Association of Thailand, Hatyai, Thailand,

<sup>2</sup>Service Workers in Group Foundation, Bangkok, Thailand,

<sup>3</sup>Mplus Foundation, Chiangmai, Thailand, <sup>4</sup>Caremat

Foundation, Chiangmai, Thailand, <sup>5</sup>Institute of HIV

Research and Innovation, Bangkok, Thailand, <sup>6</sup>FHI 360, EpiC

Thailand, Bangkok, Thailand, <sup>7</sup>United States Agency for

International Development, Bangkok, Thailand

**Background:** Same-day antiretroviral therapy (Initiating ART on the same day of HIV diagnosis) ensures immediate access to lifesaving drugs and reduces loss to follow-up following HIV diagnosis.

We report here how SD-ART was initiated and scaled among community-based key-population-led health service (KPLHS) providers in seven provinces in Thailand serving predominantly men who have sex with men (MSM) and transgender (trans) women.

**Description:** KPLHS providers Rainbow Sky Association of Thailand, SWING, MPLUS, and Caremat operate 11 clinics in seven provinces of Thailand and have collaborative relationships with provincial government hospitals. In 2022, these KPLHS providers decided to pilot SD-ART per the national guidelines. Obstacles included legal challenges to keeping antiretrovirals (ARVs) at the community clinic, lack of consensus among provincial stakeholders on the need for SD-ART, and treatment delays caused by time needed to determine the appropriate insurance scheme for clients.

**Lessons learned:** The figure shows the number of days from diagnosis to ART initiation from October 2022 through September 2023.

Figure. ART initiation duration at KPLHS clinics.

During October 2022 – September 2023, 33.4% (n= 543 / 1,625) of clients diagnosed with HIV at KPLHS providers-initiated ART on the day of diagnosis, increasing from 18.3% (n=262 / 1,435) from October 2021 – September 2022. Since providers in each province managed SD-ART in unique

environments with different challenges, results varied in terms of the percentage of HIV-positive clients initiated on SD-ART, ranging from 6.45% to 52.02%. KPLHS partners worked with government stakeholders and provincial hospitals to address these obstacles, enabling the 11 KPLHS clinics to initiate and scale up SD-ART.

**Conclusions/Next steps:** Our results show that community-based KPLHS providers can be capacitated to successfully offer SD-ART to newly diagnosed people with HIV from MSM and trans communities, giving them immediate access to ARVs from partner hospitals.

Foundation (AHF), Nepal, Clinical Mentoring and Medical

Advisory Department, Lalitpur, Nepal, <sup>5</sup>AIDS Healthcare

Foundation (AHF), Nepal, Administration and Finance

Department, Lalitpur, Nepal

**Background:** Introduced in 2016, Nepal's Health Insurance scheme is a social protection initiative designed to provide citizens with quality healthcare services without imposing financial burdens, ultimately aiming to reduce the predominant out-of-pocket expenditures for health services.

**Description:** In 2019, the Nepalese government implemented a free registration scheme for Health insurance targeted at People Living with HIV (PLHIV) and their families. However, due to concerns about stigma and discrimination associated with the requirement to register at local ward offices and mandatory disclosure of HIV status, only 21% of PLHIVs were registered by 2021 at the 16 ART centers in collaboration with the AIDS Healthcare Foundation (AHF) Nepal.

Currently, AHF Nepal collaborative centers encompass currently 58% of the total 23,293 PLHIVs receiving antiretroviral treatment (ART) in Nepal.

Recognizing this challenge, AHF Nepal coordinated with the Health Insurance Board to streamline the registration process within ART centers, assisted by Peer Educators. This collaborative effort resulted in a significant increase in enrollment, reaching 53% in 2022 and further rising to 85% in 2023.

**Lessons learned:** Merely offering a free health insurance scheme has proven insufficient to effectively cover the PLHIV community within the program. The importance of considering the prevailing social context is evident. ART

centers, where all PLHIVs have already disclosed their HIV status, provide a more comfortable environment for registration of health insurance. Therefore, integrating this intervention into a comprehensive package for PLHIVs at ART centers has proven more successful.

**Conclusions/Next steps:** The implementation of a free health insurance scheme achieves maximum enrollment among PLHIVs when seamlessly integrated into a comprehensive package at ART centers.

## THPEE545

Outcomes of interventions to support documented retention for clients on antiretroviral treatment at select sites in four South African provinces, 21 August 2023–1 October 2023

J. Murphy<sup>1</sup>, H. Paulin<sup>1</sup>, G. Fox<sup>1</sup>, M. Ndlovu<sup>1</sup>, T. Molapo<sup>2</sup>, P.N. Khoza<sup>2</sup>, R. Chisango<sup>1</sup>, R. Machava<sup>1</sup>, M. Mberi<sup>1</sup>, M.D. Makapela<sup>1</sup>, G. Mona<sup>1</sup>, A. Ochieng<sup>1</sup>, R. Joseph<sup>1</sup>, M. Manganye<sup>2</sup>, K. Mitruka<sup>1</sup>

<sup>1</sup>Centers for Disease Control and Prevention (CDC), Division of Global HIV and TB, Pretoria, South Africa, Pretoria, South Africa, <sup>2</sup>South African National Department of Health (NDoH), Pretoria, South Africa

**Background:** In South Africa, the President's Emergency Plan for AIDS Relief (PEPFAR)-Centers for Disease Control and Prevention (CDC) supports HIV services at approximately 1,300 antiretroviral treatment (ART) sites in 12 districts within four provinces, through four District Support Partners (DSPs). Over FY23, challenges were observed in achieving the desired quarterly programmatic growth in the number of people on ART needed to make progress toward epidemic control. Data capturing of rendered HIV services was found to be a common, ongoing site-level barrier to improving program growth. To address this gap, a standard operating procedure (SOP) was developed and implemented at select sites to improve the quality of data on missed appointments and interruptions in treatment.

**Description:** The SOP was implemented at 363 non-hospital ART sites during 21 August, 2023 –1 October, 2023. Sites were selected based on having: the greatest number of people on ART and lowest absolute growth of people on ART, and/or, the greatest number of missed appointments and smallest number returned to treatment. The SOP called for weekly triangulation of data on clinic encounter, medication pick-up, and laboratory services to ensure completeness of clinical records and to facilitate confirmation of lost-to-follow-up (LTFU) (>90 days since last ART pick-up). DSPs systematically corrected and monitored, weekly, the number of records that were misclassified as missed appointments and confirmed LTFU.

**Lessons learned:** Across 363 sites, the weekly average of missed appointments was 108,458 (102,734 –117,458) (Table 1); across the 6-weeks, 35,858 (33%) files were found to be

clients active in care who were misclassified as having missed appointments. Timely corrections of these coincided with a weekly decline of misclassifications, from 7% to 4% of missed appointments. On average, 0.64% of total missed appointment were confirmed to be lost-to-follow-up (LTFU). At the end of 7 weeks, 4,191 clients were confirmed as LTFU.

**Conclusions/Next steps:** Implementation of the SOP at selected sites improved the quality of data on missed appointments and LTFU, allowing for more efficient use of resources to support clients with true missed appointments and provided a more accurate picture of program growth. These findings support the investment in improving data quality to support HIV programming.

## THPEE546

Experiences of health care workers in providing HIV and STI testing and linkage to care to MSM in a digital HIV prevention trial

N.M. Shaikh<sup>1</sup>, J. Chaudary<sup>1</sup>, S. Rawat<sup>2</sup>, A. Dange<sup>2</sup>, N. Mutyala<sup>2</sup>, R. Chawadi<sup>1</sup>, V. Anand<sup>1</sup>, V.V. Patel<sup>3</sup>

<sup>1</sup>The Humsafar Trust, Research Department, Mumbai, India, <sup>2</sup>The Humsafar Trust, Mumbai, India, <sup>3</sup>Albert Einstein College of Medicine/Montefiore Health System, Bronx, United States

**Background:** On account of perceived stigma about sexuality and behaviour, men having sex with men (MSM) in India continue facing challenges in accessing care pertaining to HIV testing and treatment which requires peer support. We present lessons learned from linking MSM testing positive for HIV/Syphilis to care as part of a digital HIV prevention randomised control trial.

**Description:** The study was conducted in Mumbai and Thane, 1005 MSM received health messages through WhatsApp.

All participants were provided three free testing options for HIV and syphilis:

1. Private lab,
2. LGBTQ+ community-based organization, and;
3. Home-delivered/self-pick-up HIV self-test kit.

The study had three health-care-workers (HCWs) accessible via WhatsApp, audio/video calls. HCWs maintained weekly-logs of participant interactions and followed up with those who tested positive, providing referrals to care and support services. 30 participants opting for testing at private lab and 7 opted for home-based HIV self-screening kits, were followed up within 24-and 48-hours. Incentives (~USD \$1.50) were provided for sharing test kit result picture.

Results showed that among the 30 testing at private labs, one was reactive for HIV, six for syphilis, and two for both HIV and syphilis. Among the seven participants using home-based testing, six screened negative, and one screened positive.

Challenges encountered included denial of positive results, avoidance of calls/messages, and the mental struggle of coping with a positive diagnosis.

**Lessons learned:** Multiple follow-ups were required for individuals with positive test result. However, a gap of a day between each follow-up provided space for the individuals to process their test result. imperative to have a mental health counsellor on board if participants feel anxious after testing positive. Sensitization of the private labs regarding disseminating the test report and providing an enabling environment to test can ease the process and make it less stigmatizing. HCWs need to have knowledge about HIV, HIV programmes and treatment. A pre-recorded HIV counselling video can be shared with participants on a webpage or message providing information on positive living and U=U.

**Conclusions/Next steps:** Participants in digital/online HIV prevention implementation programs require multiple follow-ups and support with linkage-to-care by HCWs. Additionally, mental-health support/counselling accessible in-person and virtually are required.

## THPEE547

Client satisfaction with HIV treatment services in Bunyoro region in Uganda: a cross-sectional study

A. Ndawula<sup>1</sup>, K. Onekalit<sup>1</sup>, P. Nagiisi<sup>1</sup>, P. Kiiza<sup>1</sup>, S. Rogers<sup>1</sup>, B. Nsangi<sup>1</sup>

<sup>1</sup>Baylor College of Medicine Children's Foundation-Uganda, Kampala, Uganda

**Background:** Clients attend health facilities with a certain level of expectations of the quality of care provided which influence their satisfaction. Client satisfaction influences retention and adherence to antiretroviral treatment (ART) and viral suppression. We used facility client satisfaction surveys to understand the level of satisfaction of people living with HIV (PLHIV) in care.

**Methods:** Cross-sectional exit interviews were conducted on PLHIV at 39 ART clinics in October 2023 as part of routine quality improvement. Data were collected on clients' level of satisfaction with facility staff attitudes, communication with clients, privacy and confidentiality, client involvement in their care, waiting time, cleanliness of environment and if they would refer a relative to the same facility for care. Data were collected using OpenData Kit (ODK) and analyzed using STATA 14.0. Client satisfaction was measured using frequencies and percentages.

**Results:** Of the 718 clients who participated, 71% were women; only 15% were employed; average duration on ART was 73.5 months; the average distance from home to facility was 8.5 km; and 89% (641) travelled less than 11 km to reach the facility. Eighty-one percent reported involvement in decisions about their own care; 91% were served in a respectful manner; 89% and 83% were pro-

vided adequate information about their condition and medication respectively; and 82% reported adequate privacy. Additionally, 82% felt their medical information had never been shared with unauthorized persons; only 28% felt they spent longer at facility than they should have; and 71% reported spending only one hour or less at the facility. Forty-three percent, 28%, 16% and 11% reported long waiting time at triage, prior to seeing a clinician, sample collection for investigations and ART dispensing respectively. Eighty-seven percent of clients would refer a close relative to receive care at their ART clinic. Respectful treatment of clients scored the highest (96%) while waiting time scored lowest (71%).

**Conclusions:** Dissatisfaction with waiting time underscores the importance of enrolling PLHIV into differentiated service delivery models and streamlining client flow in ART clinics. Quality improvement methods should be used to improve client waiting time while decongesting clinics through multi-month dispensing for ART and community drug distribution models.

## THPEE548

Achieving 95-95-95 targets in prison and other closed settings: a comprehensive approach to HIV prevention, testing and treatment in India

H. Sharma<sup>1</sup>, S. Rajan<sup>2</sup>, M. Mistry<sup>1</sup>, S. Bhavsar<sup>2</sup>, P. Patra<sup>2</sup>, R. Shukla<sup>2</sup>, R. Gamit<sup>3</sup>, M. Dabi<sup>3</sup>, K. Singh<sup>4</sup>, M. Malviya<sup>4</sup>, R. Singh<sup>5</sup>, P. Sharma<sup>5</sup>, D. Kemparaju<sup>6</sup>, A. Soni<sup>7</sup>, S. Singh<sup>7</sup>, V. Kumar<sup>1</sup>, M. Kumar<sup>8</sup>, T. Sampath<sup>9</sup>, M. Nair<sup>10</sup>, N. Kanse<sup>11</sup>, M. Sangam<sup>12</sup>, B. Jaya Prakash<sup>13</sup>, G. Gupta<sup>1</sup>, S. Jha<sup>1</sup>, M. Doddamane<sup>1</sup>, J. Srivastava<sup>1</sup>, A. Hazra<sup>1</sup>, A. Lahiri<sup>1</sup>, S.S. Raghavan<sup>1</sup>

<sup>1</sup>SAATHII, Delhi, India, <sup>2</sup>National AIDS Control Organisation, Delhi, India, <sup>3</sup>GSNP+, Surat, India, <sup>4</sup>LEPRA, Bhopal, India, <sup>5</sup>NCPI+, Chandigarh, India, <sup>6</sup>SYVM, Bengaluru, India, <sup>7</sup>UPNP+, Lucknow, India, <sup>8</sup>SAATHII, Jaipur, India, <sup>9</sup>SAATHII, Chennai, India, <sup>10</sup>SAATHII, Thiruvananthapuram, India, <sup>11</sup>SAATHII, Mumbai, India, <sup>12</sup>SAATHII, Hyderabad, India, <sup>13</sup>SAATHII, Vijaywada, India

**Background:** To address the high HIV prevalence (2.1%) in prisoners, the National AIDS Control Organization (NACO) in collaboration with Ministries of Home Affairs (MHA) and Women and Child Development (WCD) and SAATHII scaled-up HIV prevention and treatment services across India. Lack of well-trained HCP, onsite confirmatory testing and treatment, and post-release follow-up hampered 95-95-95 targets.

The objective is to describe interventions that helped overcome barriers to HIV testing and treatment initiation, continuation and adherence among prisoners.

**Description:** SAATHII, with funding from GFATM, implemented the program in 23 states and UTs covering 952 prisons and 474 OCS. The interventions included training prison officials and healthcare providers, identifying and

training Prison Peer Volunteers (PPV), facilitating inter-departmental coordination and linkages to community-led care and support services, and designing recording and reporting systems. Between April 2021 and September 2023, the program screened 19,41,837 inmates and diagnosed 9,165 HIV-positive individuals, 96% of whom were initiated on ART. The majority were men (98%) and pre-trial detainees (97%), 82% were 18–35 years old, and 51% were PWID. HIV screening increased from 25% in March 2021 to 67% by September 2023, and ART initiation from 79% to 96% and the average time between confirmation and ART initiation reduced from 22 to 10 days.

**Lessons learned:** NACO, MHA, and WCD shared ownership, strong national policies, operational and technical guidelines, and seamless inter-departmental collaboration enabled HIV screening to be integrated into prison health services. Fortnightly screening camps reached the unreached. Sample transportation, escorting prisoners to treatment facilities, ART doctor visits to high-load prisons, and drug dispensing inside prisons accelerated timely diagnosis and treatment initiation. Trained PPVs and HCPs motivated prisoners to test, comply with treatment, and adopt prevention measures, while parole officers assisted in obtaining correct addresses for post-release follow-up. Community health workers helped with post-release psychosocial support, facility visit and medication compliance, and linkage to harm reduction services.

**Conclusions/Next steps:** Universal access to HIV services for prisoners requires strengthening prison health services, developing comprehensive national policies and guidelines, strong interdepartmental coordination, and partnership with community-based services. HIV prevention, post-release follow-up, and spouse/partner testing remain challenging.

## THPEE549

### Preferences for service delivery among adult clients in the first six months on antiretroviral therapy in Zambia

A. Morgan<sup>1</sup>, A. Kamanga<sup>2</sup>, T. Makwalu<sup>2</sup>, P. Haimbe<sup>2</sup>, P. Lumano-Mulenga<sup>3</sup>, H. Shakwelele<sup>2</sup>, L. Sande<sup>4</sup>, M. Maskew<sup>4</sup>, V. Ntjikelane<sup>4</sup>, N. Scott<sup>1</sup>, M. Benade<sup>1</sup>, S. Rosen<sup>1</sup>

<sup>1</sup>Boston University School of Public Health, Department of Global Health, Boston, United States, <sup>2</sup>Clinton Health Access Initiative, Lusaka, Zambia, <sup>3</sup>Ministry of Health, Lusaka, Zambia, <sup>4</sup>University of the Witwatersrand, Health Economics and Epidemiology Research Office, Johannesburg, South Africa

**Background:** To improve engagement in HIV care, antiretroviral therapy (ART) service delivery should be responsive to recipients of care (clients). Clients in the first six months of treatment (the early treatment period) are at increased risk of disengagement from care. Initial differentiated service delivery frameworks deliberately excluded

these clients and other high-risk populations, and they were offered little choice in service delivery. We assessed preferences for service delivery among clients in the early treatment period.

**Methods:** We surveyed adult ( $\geq 18$ ) clients who were starting, restarting, or on ART for  $\leq 6$  months at 12 facilities in Zambia from 9/2022–6/2023. We collected and analyzed quantitative survey data on preferences for HIV care. A subset of these clients participated in 15 focus group discussions (FGD) between 8/2023 and 9/2023.

**Results:** We enrolled 771 adults (67% female, median age 32). At enrollment, 29% were initiating for the first time, 5% were re-initiating after previous disengagement, and 65% had been on ART for 0–6 months. 53% of clients on treatment for 0–6 months preferred 6-month visit scheduling, compared to 41% of new initiates and 33% of re-engagers: re-engagers more often preferred 3-monthly visits (40%). FGD participants reported varying preferences for visit scheduling. 6-month dispensing was favored by female respondents (57%) more than male respondents (48%). 30% of participants indicated a preference for external (community) medication pick-up points. FGD participants expressed their desire to receive HIV services at the health facility: community-based services made many fearful of involuntary disclosure and stigma. Most participants (87%) had not been offered any choices of service delivery locations or dispensing durations. Work obligations and lack of transport and food posed barriers to clinic visits. Long waiting times, confusing client flow, and other facility attributes were cited as barriers to remaining in care. FGD participants expressed the importance of strong, empathetic, personal counseling to navigate and overcome barriers.

**Conclusions:** To improve service delivery during the early treatment period, it is critical to understand clients' preferences. We found that some preferences differ among clients and that choice is rarely offered. Models of care for the early treatment period should account for varying contexts and preferences.

<sup>1</sup>Clinton Health Access Initiative, Infectious Diseases, Abuja, Nigeria, <sup>2</sup>Clinton Health Access Initiative, Boston, United States, <sup>3</sup>Clinton Health Access Initiative, Abuja, Nigeria, <sup>4</sup>Federal Ministry of Health, National AIDS, Viral Hepatitis and STI Control Programme, Abuja, Nigeria, <sup>5</sup>U.S. Department of Defense, Abuja, Nigeria, <sup>6</sup>National Agency for Food & Drug Administration & Control, Abuja, Nigeria, <sup>7</sup>Jos University Teaching Hospital, Jos, Nigeria, <sup>8</sup>Federal Medical Center Makurdi, Makurdi, Nigeria, <sup>9</sup>University of Calabar Teaching Hospital, Nigeria, Calabar, Nigeria, <sup>10</sup>Primary Health Centre Base, Uyo, Uyo, Nigeria, <sup>11</sup>Lagos University Teaching Hospital, Lagos, Nigeria, <sup>12</sup>Sokoto Specialist Hospital Sokoto, Sokoto, Nigeria, <sup>13</sup>Military Hospital Port Harcourt, Port Harcourt, Nigeria, <sup>14</sup>Global Health Supply Chain – Procurement and Supply Management, Abuja, Nigeria, <sup>15</sup>United States Agency for International Development, Abuja, Nigeria, <sup>16</sup>Ahmadu Bello University Teaching Hospital, Zaria, Zaria, Nigeria

**Background:** Prior to 2020, access to DTG was limited among children due to the unavailability of a suitable pediatric formulation despite evidence of safety and efficacy among adult population. A generic formulation of DTG10mg (pDTG) was approved in 2020, and Nigeria was an early adopter country. The country commenced a phased transition of eligible children from LPV/r-based to the pDTG-based regimen in 2021.

This study reports the clinical outcomes of children initiated on pDTG in the first phase of implementation and lessons to inform the national scale-up.

**Methods:** The study was conducted in 7 selected ART sites among children living with HIV (CLHIV) weighing > 3kg to <20kg initiated/transitioned to pDTG and their caregivers. Enrolment period was September 2021 to January 2022, with a 12 month follow-up period for participants. The experience of CLHIV/caregiver was assessed using a structured questionnaire at months 1, 6, and 12 post-initiation, and clinical outcomes (anthropometric measurements, side effects, viral load, random blood sugar (RBS), and lipid profile) were measured at initiation and months 6 and 12 post-initiation. The anthropometric data was analyzed using STATA Zanthro package, and other data were analyzed using SAS 9.4.

**Results:** A total of 180 CLHIV were enrolled in the study. The mean age was 4.7 years (SD 2.2), 53% were female, and 98% were treatment-experienced. Among study participants with baseline BMI for age results, 13% were wasted/severely wasted, and this percentage reduced to 5% at month 12. Also, 26% were either overweight or obese at baseline, and this increased to 33% at month 12. The commonest side effects reported at month 12 were increased appetite (23%) and hyperactivity (10%).

The percentage of participants who had viral load results <50 copies/ml increased from 66% at baseline to 90% at month 12, and the mean RBS result decreased from 4.9mmol/l to 4.6mmol/l. There were no documented cases of hyperglycemia.

**Conclusions:** We conclude that pDTG is safe and efficacious and has the potential to reduce morbidity and mortality among children living with HIV in Nigeria. The drug can be scaled up with minimal concerns around safety, however, ongoing pharmacovigilance is advised in line with national recommendations.

## THPEE551

### Exploring the effect of differentiated service delivery on missed clinic visits for HIV treatment in South Africa: a cross sectional survey

N.O. Mokgethi<sup>1</sup>, I. Mokhele<sup>1</sup>, A. Huber<sup>1</sup>, V. Ntjikelane<sup>1</sup>, S. Pascoe<sup>1</sup>, S. Rosen<sup>2</sup>

<sup>1</sup>Health Economics and Epidemiology Research Office, Johannesburg, South Africa, <sup>2</sup>Boston University School of Public Health, 2. Department of Global Health, Boston, United States

**Background:** Missed clinic visits for antiretroviral therapy (ART) clients are linked to interruptions in treatment, virologic failure, and undiagnosed and unmanaged comorbid conditions. Differentiated service delivery (DSD) models aim to address barriers to regular clinic attendance by providing flexibility in the duration and location of medication collection.

**Methods:** From 9/2022-4/2023 we surveyed adult (≥18) ART clients attending routine visits at 18 primary clinics in three districts in South Africa, stratified by model of service delivery: conventional care, eligible for DSD (conventional-eligible); conventional care, not eligible for DSD (conventional-not eligible); facility-based models (fac-pup); and external pick-up points (ex-pup). We estimated proportions of participants with self-reported missed visits ≥7 days in the past 12 months by model of care, the reasons for missed visits, and whether they also missed medication doses, noting that each model required different numbers and timing of routine visits to maintain full engagement.

**Results:** 724 clients were interviewed (76% female; median age 39 years; DSD status: 26% conventional-eligible, 27% conventional-not eligible, 22% fac-pup, 28% ex-pup).

Overall, 14% (102/724) reported missing a scheduled visit ≤12 months (50% (51/102) conventional-not eligible; 14% (14/102) conventional-eligible, 18% (18/102) fac-pup, and 19% (19/102) ex-pup). 86% of those who missed visits still had ART medication on hand and indicated that they experienced no actual dosing interruptions. Reasons for missed visits varied (Figure).

In conventional care, primary reasons for missing a visit were mobility, scheduling issues, and lack of support/assistance. In DSD models, primary reasons were work-related constraints and mobility, particularly for clients in external PuPs.

**Conclusions:** ART clients continue to face challenges that impact clinic visit attendance, specifically SOC client who have more frequent scheduled appointments, but late visits do not necessarily indicate missed medication doses. Earlier enrolment in lower intensity DSD to alleviate the burden of frequent appointments may improve continuous engagement.

## THPEE552

Access to advanced HIV disease interventions and testing outcomes among new and failing clients living with HIV: observational lessons from Uganda

A. Nuwagira<sup>1</sup>, R. Kirungi<sup>1</sup>, V. Nabitaka<sup>1</sup>, L. Kabunga<sup>1</sup>, J. Batusa<sup>1</sup>, W. Eigege<sup>2</sup>, I. Amamilo<sup>2</sup>, J. Conroy<sup>2</sup>, C. Amole<sup>2</sup>, P. M. Namuwenge<sup>3</sup>, V. Kasone<sup>4</sup>, J. Kyokushaba<sup>4</sup>

<sup>1</sup>Clinton Health Access Initiative, HIV Care and Treatment, Kampala, Uganda, <sup>2</sup>Clinton Health Access Initiative, Boston, United States, <sup>3</sup>Ministry of Health, AHD/TB Program, Kampala, Uganda, <sup>4</sup>National Health Laboratory and Diagnostic Services, Kampala, Uganda

**Background:** The Ugandan HIV treatment guidelines recommend the Advanced HIV Disease (AHD) package of care (PoC) for all new clients diagnosed with HIV and those failing on their antiretroviral treatment (ART).

This study compares access to some components of the AHD PoC and the testing outcomes between newly diagnosed people living with HIV (PLHIV) and existing clients who are failing their ART.

**Description:** The Uganda Ministry of Health (MOH) with support from partners rolled out the AHD PoC in 2021 after completing healthcare worker training and delivery of commodities to health facilities. Interventions included CD4 testing to identify AHD clients; screening for opportunistic infections (OIs); prophylaxis and treatment for OIs; and rapid ART initiation. After two years of implementation, we abstracted and compared data from DHIS2 on AHD service uptake among new clients and those failing their ART from January to December 2023 to identify and address any gaps along the AHD cascade in these two client populations.

**Lessons learned:** Access to CD4+ testing was higher (84%) among the new clients compared to the failing clients (57.3%). While access to TB-LAM testing was also better among the new clients with AHD compared to the failing clients, a greater proportion of the failing clients received CrAg testing. On testing outcomes, AHD prevalence and TB-LAM positivity among new clients is marginally higher than the failing clients. However, blood CrAg positivity was slightly higher among failing clients than new clients. The prevalence of OIs is comparable between new clients and failing clients, hence optimizing AHD interventions among failing clients presents a huge opportunity to save more lives from AHD-associated OIs.

**Conclusions/Next steps:** Deprioritizing AHD services among failing clients results in missed opportunities to identify and manage life-threatening OIs. Country programs need to ensure equitable access to AHD interventions among failing clients to further reduce AIDS morbidity and mortality.

## THPEE553

Progress beyond projects – building a sustainable HIV response while improving continuity of treatment for people living with HIV in Maharashtra and Telangana in India

S. Kaur<sup>1</sup>, D.J. Srivastava<sup>2</sup>, M. Srivastava<sup>3</sup>, V. Stapleton<sup>4</sup>

<sup>1</sup>USAID, Health Office, HIV, Delhi, India, <sup>2</sup>USAID, HO, HIV, Delhi, India, <sup>3</sup>USAID, Office of HIV/AIDS, Washington DC, United States, <sup>4</sup>USAID, HO, Delhi, India

**Background:** The USAID PEPFAR provides direct service delivery for the HIV continuum of care in seven districts within two high burden states of India - Maharashtra and Telangana, through an Implementation partner. Through human resource support, treatment interven-

tions support sustainable solutions for ensuring people living with HIV, retain in care and are tracked through last mile indicators. The emphasis is also on quality aspects of treatment in addition to implementing site-specific innovations based on a differentiated care model that is client-centered. To progress towards a sustainable model, a human resource optimization exercise was conducted from 2020 – 2023 while monitoring the impact on the continuum of care for PLHIV.

**Methods:** A three-pronged approach to quantify and measure direct and indirect sustainable treatment activities were conducted under the project which included:

1. Cohort analysis,
2. Effort index to see down-sizing and withdrawal of HR at facilities, based on the ART Preparedness phase, intensive and long term retention phases, without compromising on maximum continuity of treatment results, and;
3. Validating the success of the health facility through community lead monitoring.

**Results:** From year 1 to year 3 of the project implementation, human resource intense sites optimized and reduced their staff by one-third. With this optimization, a continuous cohort analysis showed the number of clients on treatment increased from 97, 905 to 1,20,276, interruptions in treatment decreased (6% to 2%), and retention on treatment increased (approx. 80% to 94%) and a significant improvement in RTT. Community lead monitoring data was also correlated and validated improve treatment outcomes

**Conclusions:** This analysis underlines the project's enhanced efficiency, demonstrating that a more streamlined human resource approach does not compromise the quality or impact of care.

The success is attributed to client-centred interventions that address both clinical and programmatic needs creating progress towards sustainability beyond project timelines.

World AIDS day (1 December) in 2019, Right To Care has supported its scale up across USAID supported Districts in South Africa.

**Methods:** Viral suppression (defined as <50 copies/ml) analysis was made in a cross-section of clients on ART as of 23<sup>rd</sup> January 2024, in Ehlanzeni District, a rural district in South Africa. Included were ART clients who had been on treatment for ≥ 6months, have formal viral load result available and have been receiving treatment at same facility since initiation, as a proxy for high chance of adherence and clients' socio-economic stability.

Descriptive analyses were done and multivariate logistic regression models explored associations with promptness in medicine parcels collection.

**Results:** Of the 197,626 eligible clients, 91% and 9% were on TLD and non-TLD regimens respectively and 78% attained viral suppression at <50 copies/ml. Clients on TLD regimen were almost twice more likely to attain viral suppression compared to clients on non-TLD regimens (aOR 1.75; CI 1.69- 1.81). Females were 1.5 times more likely to attain viral suppression compared to males (aOR 1.49; CI 1.45- 1.52). Clients 10 to 14 years, 20 to 24 years, and 25+ years were more likely to attain viral suppression compared to children 0 to 9 years (aOR 1.25; CI 1.09- 1.43); (aOR 1.53; CI 1.37- 1.71); and (aOR 2.38; CI 2.15- 2.64) respectively. There was no statistically significant difference observed among clients 15 to 19 year (p-value=0.943).

Similarly, specifically among the 180143 eligible clients on TLD regimen, female gender (P value = 0.000) and older age groups > 9 years (P value = 0.000) were associated with viral suppression on TLD.

**Conclusions:** TLD regimen appears more effective for virologic suppression attainment compared to non-TLD regimen. There is need for more research to understand the drivers of sub-optimal virologic suppression among males and children and appropriate interventions instituted.

## THPEE554

Are clients on TLD faring better? A comparison of virologic suppression of a cross-section of clients on TLD regimen in Rural South Africa versus those on non-TLD regimens

<sup>1</sup>Amref Health Africa Tanzania, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Amref Health Africa, Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>Christian Social Services Commission, Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>Ministry of Health, PMTCT unit, Dodoma, Tanzania, the United Republic of, <sup>5</sup>Ministry of Health, National AIDS, STIs and Hepatitis Control Program, Dodoma, Tanzania, the United Republic of

**Background:** Tanzania has attained HIV testing coverage in ANC, with 97% of pregnant women knowing their HIV status in 2022, and 98% in 2023. Despite the remarkable progress made in terms of ART provision to pregnant women living with HIV there are still significant number of new HIV infections occurring in children. Important concerns have surfaced about suboptimal uptake and retention into ART. For example UNAIDS estimated that the MTCT was at 6.7% in 2022 against the national target of reaching less than 5% in 2023. Peer-based strategies using mentor mothers have been effective for improving maternal and infant uptake and retention. To attain the goal of elimination of new HIV infection, Amref used a strategy of peer model (mentor mothers) with aims at reducing HIV transmission from mother to child through improved retention and follow up to ART.

**Description:** The intervention is implemented in a total of 10 regions in 330 Facilities which are non PEPFAR supported. Mentor mothers were trained to encourage follow up and provide peer support and counselling to pregnant and breastfeeding women on ART to continue with the service and reduce stigma and discrimination as they are afraid of being judged or they fail to disclose their HIV status to their male partners.

**Lessons learned:** From January-September 2023, total of 127,189 (109%) pregnant women tested and know their HIV status. Additionally, 125,451 pregnant women were newly tested for HIV at their 1<sup>st</sup> ANC visit and 1,060 were tested HIV positive which is equal to 0.8% of positivity rate, 99% were linked to care, treatment, and support services. There were 1,738 pregnant women who were known HIV-positive and were on ART. To ensure retention a total of 1,839 women from 88 groups are continuously supported and linked to psychosocial support groups and income-generating activities (PSAG) through support from mentor mothers.

**Conclusions/Next steps:** Peer mothers model is a feasible strategy for increasing uptake and retention for HIV services. It is a community-based strategy which have the

potential to fill a critical gap in the quality and continuum of care for mothers living with HIV and can be scaled to all ANC/PMTCT sites.

## THPEE556

### Peer navigation intervention to link out-of-care older people with HIV to care during the war in Ukraine

Y. Rozanova<sup>1,2</sup>, I. Zaviryukha<sup>3</sup>, K. Dumchev<sup>3</sup>, S. Shenoi<sup>4</sup>, A. Deac<sup>5</sup>, O. Zeziulin<sup>3</sup>

<sup>1</sup>Julia Rozanova, IoPPN, London, United Kingdom,

<sup>2</sup>Yulia Rozanova, Yale AIDS Program, New Haven, United States, <sup>3</sup>European Institute on Public Health Policy, Kyiv, Ukraine, <sup>4</sup>Yale University, AIDS Program, New Haven, United States, <sup>5</sup>King's College London, IoPPN, London, United Kingdom

**Background:** In Ukraine, <30% of older people with HIV (OPWH) over 50 years are linked to ART within 6 months of diagnosis, with substantial proportions dropping out-of-care (OOC). During the ongoing war, HIV services linkage is especially threatened by economic, emotional, and social hardship as OPWH mostly stay in place but (younger) caregivers who had supported their HIV care may flee abroad or become internally displaced. Peer Navigation (PN) feasibility and effectiveness has never been explored in humanitarian settings with this population.

**Methods:** From Feb-Dec 2023, we conducted a pilot 2-arm trial with 94 OOC OPWH (37 newly diagnosed OPWH and 57 previously dropped out-of-care), with 63 participants randomized to 12-week PROST (Peer-Run Optimal Support for Treatment) PN intervention and 31 to Control group. Currently, the 3-month follow-up is ongoing.

The primary outcome is ART linkage within 30 days, and the secondary outcome is ART retention at 6 months. Participants were surveyed at baseline and data analyses used R Statistical Software (v4.3.1; R Core Team 2023).

**Results:** 55.3% of participants were women. At baseline, 41.5% lived alone, 43% had monthly income below \$150 USD, 40% had mild to severe depressive symptoms, 32% had mild to severe anxiety, and 10% had addiction history. Female gender and living alone were not significant predictors of mental health symptoms, but addiction history was significantly ( $p=0.001$ ) associated with higher anxiety symptoms and lower purpose in life scores. To date, 59 PROST participants initiated ART compared to 15 Control participants (but 3-month follow-ups continue).

**Conclusions:** Preliminary findings indicate that PN PROST may be more effective than usual care in linking OOC OPWH to ART in Ukraine despite the war and humanitarian crisis creating further barriers to care besides OPWH poor mental health and low resources.

Yet, OPWH with addiction history appear to be the most at-risk for poor mental health and need more effort for HIV care linkage. Qualitative interviews with OPWH and

peer navigators will examine PROST implementation lessons in preparation for a full-scale RCT to examine the full PROST effects on linking OOC OPWH with and without addiction history to care during the crisis.

## THPEE557

Treatment outcomes of community versus facility managed ART patients in 17 Nigerian States - Comparative analysis of clients commenced on ART in the 1<sup>st</sup> year of surge implementation

A. Idemudia<sup>1</sup>, D. Onime<sup>1</sup>, C. Obiora-Okafo<sup>1</sup>, K. Kakanfo<sup>1</sup>, U. Akpan<sup>2</sup>, O. Toyo<sup>2</sup>, O. Asaolu<sup>1</sup>, B. Oyawola<sup>1</sup>, C. Nwadike<sup>1</sup>, B. Onimode<sup>1</sup>, B. Pius<sup>1</sup>, P. Gado<sup>1</sup>, T. Idaboh<sup>1</sup>, A. Kalaiwo<sup>1</sup>, A. Raji<sup>3</sup>, B. Kagniniwa<sup>3</sup>, E. James<sup>1</sup>, J. Pius<sup>1</sup>, A. Bashorun<sup>4</sup>, O. Oyelaran<sup>1</sup>, R. Goldstein<sup>1</sup>

<sup>1</sup>USAID Nigeria, Abuja, Nigeria, <sup>2</sup>ECEWS, Uyo, Nigeria, <sup>3</sup>USAID, Washington, United States, <sup>4</sup>National HIV/AIDS and STI Control Program, Federal Ministry of Health, Abuja, Nigeria

**Background:** According to the Nigeria HIV/AIDS Indicator and Impact Survey (NAIIS 2018), the national HIV prevalence among adults is 1.3%, translating to about 1.8 million people living with HIV.

In a bid to address the high unmet need, the USAID supported the Nigerian government to conduct surge activities including the formation of Community ART Management (CAM) teams.

This study aimed to compare the treatment outcomes of patients managed in community-based settings versus those in healthcare facilities across 17 USAID supported states in Nigeria.

**Methods:** A Retrospective Cohort analysis of data for clients initiated on HIV/AIDS treatment in USAID supported facilities within the 1<sup>st</sup> year of the surge implementation (April 2019 – March 2020). The clients were categorized into two groups based on their treatment management setting: community-managed and facility-managed. Treatment outcomes at the end of December 2023, including retention in care and viral suppression (less than 1000 copies per ml) were assessed and compared between the two groups.

**Results:** 133,920 clients (F: 64%; M: 36%) started ART in the cohort months with 45% receiving community-managed ART and 55% receiving facility-managed ART. Findings show that viral load suppression rates were comparable between the two groups, with 98% in the community-managed group and 97% in the facility. There was also no significant difference in the viral suppression between males and females, as well as across the age-groups among both cohort groups.

About 88% of those managed in the community were retained in care, with no significant difference in the retention rates between males and females. Among the facility-managed group, the retention rate was 40%, with

females having a significantly higher retention rate. The lowest retention rate in both groups was found among those 0-4 years of age (73% & 13% respectively). The result of the Paired sample T-test was for retention was 3.13 (P-value = 0.016), while for viral suppression it was found to be 17.66 (P-value of 0.04).

**Conclusions:** The findings suggest that community-managed ART can yield comparable and even better treatment outcomes to facility-managed ART. However, further studies are required to understand the contextual factors influencing these outcomes and to inform program design.

## Global and national financing, economic evaluation and sustainability

## THPEE558

Provision of free STI treatment critical for increasing HIV testing rates in men who have sex with men in Ghana

J. Martin<sup>1</sup>, S. Owiredo Hanson<sup>2</sup>, S. Elliot Owusu<sup>2</sup>

<sup>1</sup>Center for Popular Education and Human Rights, Ghana (CEPEHRG), Programs, Peer Educator, Accra, Ghana,

<sup>2</sup>Center for Popular Education and Human Rights, Ghana (CEPEHRG), Programs Coordinator, Accra, Ghana,

<sup>3</sup>Maritime Life Precious Foundation, Programs, Kumasi, Ghana

**Background:** In Ghana, screening of sexually transmitted diseases (STD) among men who have sex with men (MSM) often ends with the provision of prescription without the actual attainment of treatment due to lack of funds by KP Implementers to support them coupled with the high cost of STI drugs. Financial concerns are often the significant barrier for MSM, leading to delayed or neglected STD treatment, subsequently increasing the risk of HIV transmission.

This abstract reports on the uptake of STD services as well as HIV testing service uptake (HTS) as a result of providing MSM with free STD treatment.

**Description:** Upon seeing the high STI treatment completion rates, CEPEHRG realigned its project budget to cater for free STD treatment for MSM. The free medication was made available at Community Drop-in-Centers (DIC) and sensitized facilities to easy access. Peer educators informed MSM about the availability of free STI drugs at the DIC and health facilities and referred them for STI screening and treatment services.

**Lessons learned:** Trends from the programmatic data show that uptake of STD screening and HIV testing increased after the provision of free STD treatment. Between December 2022 and January 2023, 235 MSM were

referred for STD services and 148 received STD services (62% completion rate). After the implementation of free STD treatment, between Feb and March 2023, a total of 231 MSMs were referred and all of them received STD services (100% completion rate).

Consequently, the number of MSM receiving HTS also increased from 405 (December 2022 –January 2023) to 583 (February–March 2023) – an increase of 43.9% over the period.

**Conclusions/Next steps:** The provision of free STD treatment for MSM is feasible hence the government of Ghana should consider that as a strategy to increase HIV testing rates among this population. By addressing the financial barriers associated with STD treatment, health systems can also foster a more proactive approach to HIV prevention, ultimately contributing to the reduction of HIV incidence within the MSM community.

We therefore advocate for policy changes and public health initiatives aimed at integrating free STD medication into comprehensive HIV prevention programs, acknowledging the interconnectedness of these health issues.

## THPEE559

Looking to the future: do we have the funding and pipeline to meet the needs of people living with HIV in low- and middle-income countries?

A. Hynen<sup>1</sup>, V. Chowdhary<sup>1</sup>, A. Ankomah<sup>1</sup>, H. Bhatia<sup>1</sup>, C. Ventola<sup>1</sup>, L. Keir<sup>1</sup>

<sup>1</sup>Policy Cures Research, Science and Policy Advisory, Sydney, Australia

**Background:** Two-thirds of the 39 million people living with HIV (PLWH) are in Africa. To put people first, products to prevent, treat and diagnose HIV must meet the needs of those most affected. To determine whether the products in development address low- and middle-income country (LMIC) needs and if there is sustainable funding for such research and development (R&D), we examined the R&D investment landscape and assessed pipeline candidates against available R&D priorities.

**Methods:** Restricted to LMIC-focused R&D (excluding commercially-driven R&D), funding data from public, private and philanthropic sectors was collected through the G-FINDER survey (2007–2022). Candidates were identified from public data-sources including clinical trial databases (2015–2023). The Portfolio-to-Impact (P2I) tool predicted product launches. Analysis was performed in Microsoft Excel.

**Results:** Sixteen years of investment totalled \$24b, contrastingly, COVID-19 R&D totalled \$17b in three years. LMIC-based organisations received \$4.5b but only disbursed \$0.2b (noting low LMIC survey participation) – both funding flows decreasing over time. LMIC-led R&D is reliant on high-income country (HIC) public funding (who provided

\$19b), making it vulnerable to HIC priorities, compromising LMIC-focused R&D. R&D is concentrated on vaccines – \$13b and 56 candidates. Novel technologies generating broadly neutralising antibodies show promising results but require two doses, impacting delivery and LMIC-suitability. With no launches expected before 2040, other prevention alternatives are needed.

Biologics comprise 21% of the pipeline yet received 1.6% of funding (\$0.4b). Most biologics are monoclonal antibodies (17) (eight meet WHO prevention priorities) with 13 combinations undergoing trials – five are subcutaneous injections, enabling access.

Modelling predicts two launches by 2040 so PLWH could benefit from these sooner than vaccines, but these will likely require frequent and trained administration.

Modelling predicts six diagnostics this year: cheap oral and urine-based point-of-care tests for at-home testing, and battery-powered viral load and early infant diagnostics. Three meet WHO R&D priorities, closing product gaps for PLWH.

**Conclusions:** With an expanding pipeline, increased and sustained investment from a stronger LMIC funder base is needed to prioritise and progress LMIC-suitable candidates that address current product gaps.

This will decrease reliance on HICs, creating a robust LMIC R&D ecosystem that provides more options for PLWH in LMICs.

## THPEE560

Trends in HIV prevention investments at The Global Fund: a comprehensive analysis

A. Frangioni<sup>1</sup>, S. McLean<sup>1</sup>

<sup>1</sup>The Global Fund to Fight AIDS, Tuberculosis and Malaria, Geneva, Switzerland

**Background:** Increased availability of life-saving treatment and declines in new infections have transformed the HIV epidemic in many countries from an emergency to a chronic care paradigm. However, key and priority populations continue to face persistently high risk of HIV acquisition, especially in sub-Saharan Africa. Primary HIV prevention efforts remain insufficient, hindered by social, economic and gender inequalities, legal barriers, and widespread stigma.

Further, HIV prevention progress has continued to lag because of financial constraints and the financial pressure of sustaining HIV treatment programmes.

In 2017, The Global Fund to Fight AIDS, Tuberculosis and Malaria (The Global Fund) joined the Global HIV Prevention Coalition (GPC) to support global efforts in accelerating HIV prevention, to respond to the prevention financial crisis and to promote the prioritization of HIV prevention investments. Consequently, the Global Fund Strategy 2023–2028 identified HIV prevention and equitable access to innovation among its top priorities.

**Methods:** This study presents a novel comprehensive analysis of Global Fund HIV prevention investments over the past three Grant Cycles (GC4 to GC6), covering nine years from 2015 to 2023. Drawing on data available as of December 2023, the study investigates the trends in HIV prevention investments both as absolute values and as proportion of the total HIV/AIDS allocation, disaggregating HIV prevention budgets across prevention interventions.

The study identifies and addresses challenges in the definition of HIV prevention and thus the categorization of investments to ensure comparability across Global Fund funding cycles.

**Results:** The analysis finds an overall increase in HIV prevention investments of 19%, from 737 million USD to 874 million USD (GC5 vs GC6). The analysis also finds increases in funding for high-impact interventions, such as a 38% increase in funding for condom and lubricant programs (GC5 vs GC6) and a 98% increase in funding for Pre-Exposure Prophylaxis (PrEP) programs (GC5 vs GC6).

**Conclusions:** The increase in HIV prevention funding at the Global Fund, coupled with a strategic emphasis on high-impact interventions, signals a collective commitment to address global HIV prevention targets. This increase has created opportunities for the financing of HIV prevention in a context of reducing donor resources and increasing HIV prevention need.

## THPEE561

Costing HIV services provided by community-based organizations and social enterprises (CBOs/SEs) via social contracting (SC) in Vietnam

D.T. Nguyen<sup>1</sup>, A.C.T. Nguyen<sup>2</sup>, H. Nguyen<sup>1</sup>, H. Nguyen<sup>1</sup>, H.H. Kieu<sup>3</sup>, A.T. Duong<sup>4</sup>, S. Insanally<sup>5</sup>, A. Wadsworth<sup>5</sup>

<sup>1</sup>Abt Associates, Hanoi, Viet Nam, <sup>2</sup>USAID, Hanoi, Viet Nam,

<sup>3</sup>Promedi Vietnam Consulting Company Limited, Hanoi, Viet Nam, <sup>4</sup>Vietnam Administration for HIV/AIDS Control, Ha Noi, Viet Nam, <sup>5</sup>Abt Associates, Rockville, MD, United States

**Background:** Vietnam's Ministry of Health (MOH) is implementing a SC pilot with CBOs/SEs to deliver HIV services (January 2022–December 2024). As CBOs/SEs are currently not authorized to provide health services using the government budget, the pilot is financed by donors. USAID's Local Health Systems Sustainability Project (LHSS) supported the MOH to cost the HIV service packages delivered by CBOs/SEs as part of the pilot. The costing follows national budget rules and cost norms to inform future up-scaling of SC with government budget.

**Description:** A time-driven activity-based approach was used to cost four service packages providing: harm reduction commodities, community testing and referral for confirmation testing, linkage to ART and linkage to PrEP.

LHSS conducted the costing from November 2021 to January 2022. The costing process includes five steps from:

1. Reviewing the technical procedures for selected HIV service packages,
2. Applying the government cost norms, regulations and unit prices to determine line-item costs,
3. Developing costing framework with detailed cost components to estimate unit costs,
4. Calculating total cost based on the selection of service packages and targets and, finally;
5. Validating and vetting results with key stakeholders (MOH, Ministry of Finance, provincial authorities, and CBOs/SEs).

Cost components include human resources, travel, supplies and equipment, maintenance, capacity strengthening, management fees, margin profit and value-added tax.

Cost ranges were calculated for the four packages across urban and rural/remote areas, following government regulations on regional minimum salaries applying for enterprises and travel allowance differences across regions.

**Lessons learned:** Applying government cost norms and regulations in conducting the costing increases the likelihood that SC scale-up can be achieved and sustained with government funding. Grounding the SC costing within the government's framework also ensured that the costing approach received buy-in from stakeholders, which is essential to successful implementation and expansion of the pilot.

**Conclusions/Next steps:** The costing results are currently being used in eight provinces participating in the pilot and costing of packages is an important step for implementation. At the end of the pilot, the government will evaluate and review the results to inform the development of the legal framework for expanding SC nation-wide.

## THPEE562

A model of social contracting advocacy for sustainable financing for community-led HIV response in Indonesia

A. Nugroho<sup>1,2</sup>, H. T. Anick<sup>3</sup>, S. Sawitri<sup>3</sup>, E. Widen<sup>1</sup>

<sup>1</sup>UNAIDS Indonesia, Jakarta, Indonesia, <sup>2</sup>Lambung Mangkurat University, School of Public Health, Faculty of Medicine & Health Science, Banjarbaru, Indonesia, <sup>3</sup>Konsil LSM Indonesia, Jakarta, Indonesia

**Background:** Community involvement in HIV response is key to program success. However, relying solely on donor funding could jeopardize the HIV community-led responses' sustainability. Therefore, it is imperative to seek out local funding for HIV-related community-led programs. The current Indonesian government procurement policy allows social contracting to fund community-led initiatives. Nevertheless, the 2021 mapping of 10 cities showed that

civil society organizations (CSOs) and government entities are still unprepared for social contracting. This program's overarching goal is to strengthen HIV CSOs' capacity to lobby their local government to include social contracting in its HIV response.

**Description:** In 2023, UNAIDS Indonesia and a technical partner supported the pilot social contracting initiative in six cities in Indonesia: Jakarta, Semarang, Bandung, Yogyakarta, Medan, and Denpasar.

TA efforts include:

1. Identifying HIV CSO champions and building the city's HIV CSO alliance as an advocacy platform; and,
2. Creating CSO advocacy documents. This includes assistance in developing program proposals and CSO profiles;
3. Mapping the potential government entities that are targeted for partnership.
4. Socializing social contracting by sharing learning from prior partnerships;
5. Assisting CSOs in lobbying and hearings with local government.

**Lessons learned:** By the end of 2023, four cities (Denpasar, Semarang, Bandung, and Medan) out of the six pilot cities had successfully established partnerships with social contracting between HIV CSOs and local governments for funding in 2024.

Lessons learned include:

1. CSOs must comprehend HIV community-led program gaps and offer partnerships to local governments based on their expertise.
2. CSOs must build an organizational profile that accurately demonstrates their competency and track record as accountable and transparent agencies.
3. Establishing trust between the government and CSOs is crucial.

Hence, the process that promotes the establishment of trust plays a crucial role in advocating for social contracting.

**Conclusions/Next steps:** Our pilot demonstrates that social contracting partnerships between local governments and CSOs for community-led HIV response in Indonesia are feasible. Adopting good practices gained from this project to broaden the scope of social contracting advocacy is the next step of action.

Additionally, advocacy for national policies that encourage the accelerated adoption of social contracting on a nationwide scale is needed.

## Costing, cost effectiveness and affordability

### THPEE564

#### Budget impact analysis of including Dolutegravir in the social health insurance benefit package in Viet Nam

D. Thi Nguyen<sup>1</sup>, M.N.T. Nguyen<sup>2</sup>, C.T.T. Nguyen<sup>3</sup>, D.A. Nguyen<sup>4</sup>, T. Snow<sup>5</sup>, A. Wadsworth<sup>5</sup>

<sup>1</sup>Abt Associates, Hanoi, Viet Nam, <sup>2</sup>Abt Associates, Ha Noi, Viet Nam, <sup>3</sup>Ha Noi University of Pharmacy, Ha Noi, Viet Nam, <sup>4</sup>USAID, Hanoi, Viet Nam, <sup>5</sup>Abt Associates, Rockville, MD, United States

**Background:** In Vietnam, Tenofovir, Lamivudine, Dolutegravir (TLD) fixed-dose combination (FDC), has been used since 2021 as the first line of treatment for adults and children aged ten and over. Certain PLHIV groups - including vulnerable populations - cannot use this regimen due to age and health complications, requiring instead a single-use Dolutegravir (DTG) tablet. Procurement of this product is currently entirely financed by donors. Including it on the social health insurance (SHI) drug list would expand access to domestically financed ARVs in Vietnam. USAID's Local Health System Sustainability Project (LHSS) conducted a budget impact analysis in late 2023 to assess the financial impact of adding single-dose DTG to SHI.

**Methods:** The analysis estimated the annual cost of procuring single dose DTG over five years using population-based models focused on two target populations:

1. Those ten and older who cannot use FDC, and;
2. Those under ten weighing at least three kilograms.

LHSS used parameters like target population disaggregated by those with and without Tuberculosis (TB), dosing based on weight and age, and unit cost of a DTG bottle. These concluded the cost per patient, per year in each sub-group.

**Results:** For PLHIV under 10 with and without TB, annual DTG costs average \$53.80 and \$34.40 respectively, less than the average annual costs of \$30.60 and \$19.60 for PLHIV aged 10 and older, with and without TB. Assuming DTG procurement is fully covered by the SHI fund, the annual estimated cost to procure the product ranges from \$512,961 to \$558,564 over five years (2024-2028). Based on the estimated costs for SHI-funded health examinations and treatment in 2023, the budget impact of including single-dose DTG on the SHI drug list accounts for less than 0.015% of total SHI expenditure.

**Conclusions:** Single-dose DTG is crucial for treating HIV in pediatric and vulnerable patients and would have limited financial impact on the SHI fund. Since Vietnam has already included TLD in the SHI benefit package, single-dose DTG should also be included to enable full transition to optimal DTG-based regimens - especially for pediatric and marginalized patients.

### Cost-effectiveness of using conditional economic incentives to improve adherence to pre-exposure prophylaxis among male sex workers

C. Chivardi<sup>1</sup>, F. Alarid Escudero<sup>2</sup>, M. Wilson-Barthes<sup>3</sup>, A. Zamudio-Sosa<sup>4</sup>, M. Gandhi<sup>5</sup>, K. H. Mayer<sup>6</sup>, D. Operario<sup>7</sup>, O. Galárraga<sup>8</sup>

<sup>1</sup>University of York, Centre for Health Economics, York, United Kingdom, <sup>2</sup>Stanford University School of Medicine, Health Policy, California, United States, <sup>3</sup>Brown University School of Public Health, Providence, United States, <sup>4</sup>National Autonomous University of Mexico, Mexico city, Mexico, <sup>5</sup>University of California San Francisco, Department of Medicine, San Francisco, United States, <sup>6</sup>The Fenway Institute, Boston, United States, <sup>7</sup>Emory University, Rollins School of Public Health, Atlanta, United States, <sup>8</sup>Brown University School of Public Health, Department of Health Services, Policy and Practice, Providence, United States

**Background:** Conditional economic incentives can improve medication-taking behaviors among populations living with or at risk for HIV. However, no studies have estimated the cost-effectiveness of incentive-based programs that aim to improve pre-exposure prophylaxis (PrEP) adherence among male sex workers (MSWs), a population with one of the highest HIV acquisition risks.

**Methods:** We conducted an economic evaluation of the PrEP Seguro pilot trial in Mexico City. The trial randomized n=110 MSWs to the incentive intervention or standard care. Intervention participants received tiered incentives based on a biomarker of PrEP adherence measured via scalp hair analysis at three study visits over 6 months. The incentive intervention led to an overall 28.7% increase in scalp hair PrEP concentration levels consistent with increased adherence (p=0.05).

The present evaluation used a micro-costing approach from the health system perspective to calculate the cost and quality-adjusted life years (QALYs) per patient in each trial arm. QALYs were based on the number of HIV infections averted through sufficiently high PrEP adherence (Tenofovir concentration >0.011 ng/mg corresponding to  $\geq 5$  doses per week). Incremental cost-effectiveness ratios (ICERs) were in the form cost per QALY gained due to the intervention. Probabilistic sensitivity analysis explored uncertainty in ICER estimates.

**Results:** The mean total cost per patient was \$166.68 in the control group and \$175.3 in the incentive group. The percent of patients adherent to PrEP was 62% for the control group and 78% for the incentive group over the follow up period. After 6 months, the average QALYs gained were 10.26 (min, max: 8.39, 12.12) and 8.13 (min, max: 6.65, 9.61) among incentive and control patients, respectively. The 6-month ICER was \$5.93/QALY gained by the intervention, which was highly cost-effective at a willingness-to-pay threshold of <1 Mexico's 2020 GDP per capita (US\$8,655).

**Conclusions:** Administering incentives conditional on objective PrEP adherence was highly cost-effective for increasing adherence among MSWs in this pilot trial. Combining behavioral economics approaches with antiretroviral-based HIV prevention may offer health and fiscal benefits to the health systems because of reductions in HIV incidence.

Future fully-powered implementation trials can determine the potential cost-savings of scaling up incentives for PrEP adherence.

## Health systems, health systems strengthening and partnerships

## THPEE566

### Implementation and evaluation of a pilot training to Improve clinical competency and delivery of HIV and sexual health services to transgender persons in the Caribbean

A. Radix<sup>1,2</sup>, K. Placide<sup>3</sup>, D. Daphness<sup>4</sup>, R. Greene<sup>5</sup>, U. Belkind<sup>1</sup>  
<sup>1</sup>Callen-Lorde Community Health Center, Medicine, New York, United States, <sup>2</sup>Columbia University Mailman School of Public Health, Department of Epidemiology, New York, United States, <sup>3</sup>Eastern Caribbean Alliance for Diversity and Equality, Castries, Saint Lucia, <sup>4</sup>Eastern Caribbean Alliance for Diversity and Equity, Georgetown, Guyana, <sup>5</sup>Transwave, Kingston, Jamaica

**Background:** The Caribbean ranks as the second-most affected region globally in terms of HIV prevalence. Significant disparities exist among transgender individuals, with HIV prevalence exceeding 25% among transgender women. Transgender people in the region face numerous obstacles to accessing HIV prevention, treatment, and care services, including healthcare-related stigma, a shortage of informed healthcare providers, limited availability of gender-affirming care, and legislative and cultural barriers hindering equitable healthcare access.

**Description:** The Eastern Caribbean Alliance for Diversity and Equality (ECADE), comprising 31 organizations across twenty-two territories in the Eastern Caribbean, is dedicated to advocating for human rights, equality, justice, and respect for LGBTQ+ individuals. In July 2023, ECADE initiated a pilot training program aimed at enhancing the knowledge, skills, and attitudes of healthcare workers and improving delivery of healthcare services to transgender persons.

A comprehensive two-day training was held in Jamaica, attended by twenty-eight participants from nine countries, and encompassed ten modules and four interactive activities. Topics included cultural competency, legal and ethical considerations, gender-affirming care, sexual and

reproductive health, and best practices for HIV prevention, care and treatment. Pre and Post-training surveys indicated a significant increase (35.9%,  $p=0.013$ ) in mean medical knowledge scores among participants, including physicians, nurses, and program coordinators.

**Lessons learned:** While the Caribbean shares commonalities, the region exhibits significant sociocultural, economic, religious, and linguistic diversity. As such, the training had to be tailored to accommodate the unique experiences of participants and the transgender communities they serve. Most providers had not received any training in transgender health and additional time was required for foundational work, including terminology, communication skills, and understanding intersectionality. Incorporating interactive learning methods such as real-life scenarios, interactive exercises, tabletop activities, role plays, and case-based vignettes were preferred by participants over didactic content. The active involvement of transgender community members in organizing the pilot, providing feedback and participating in teaching proved integral to the training's success.

**Conclusions/Next steps:** The pilot training successfully enhanced the knowledge and skills of participants. Looking ahead, further adaptations will be made to facilitate expansion of this training initiative to additional countries and territories in the Caribbean, fostering a more inclusive and responsive healthcare environment for transgender individuals.

## THPEE567

### Acceptability of task shifting and sharing interventions to improve the mental health of people living with HIV with exposure to violence-related trauma

C. Kokubun<sup>1</sup>, C. Ellison<sup>1</sup>, V. Guardado-Menjivar<sup>2</sup>, B. Druss<sup>3,1</sup>, B. Woods-Jaeger<sup>1</sup>, A. Kalokhe<sup>4,5</sup>, J. Sales<sup>1</sup>

<sup>1</sup>Emory University Rollins School of Public Health, Department of Behavioral, Social, and Health Education Sciences, Atlanta, United States, <sup>2</sup>Emory University Rollins School of Public Health, Department of Epidemiology, Atlanta, United States, <sup>3</sup>Emory University Rollins School of Public Health, Department of Health Policy and Management, Atlanta, United States, <sup>4</sup>Emory University School of Medicine, Division of Infectious Diseases, Atlanta, United States, <sup>5</sup>Emory University Rollins School of Public Health, Hubert Department of Global Health, Atlanta, United States

**Background:** People living with HIV (PLWH) are vulnerable to violence-related exposures (i.e., intimate partner violence, adverse childhood experiences, and community-based violence) and experience disproportionately high rates of trauma compared to the general population. Comorbidity of HIV and mental disorders, often stemming from violence/trauma, necessitates prioritization and provision of mental health and psychosocial support (MHPSS) services. Task shifting and sharing can increase the capacity of health care organizations to address client needs while reducing burden on mental health care providers.

**Methods:** As part of a multi-phase, mixed methods study to investigate the acceptability and feasibility of implementing violence screenings and violence-related support services at Ryan White-funded HIV clinics (RWCs) in the southeastern U.S., we conducted six mixed-gender focus group discussions with PLWH who had experienced violence to assess acceptability of MHPSS interventions (i.e., professionally-delivered cognitive behavior therapy [CBT], Psychological First Aid [PFA]/Mental Health First Aid [MHFA], peer mentorship/navigation, and peer support groups).

We also explored the acceptability of non-specialist health care workers (HCWs) and lay health workers (LHWs; i.e., community health workers and peers) as MHPSS service providers. Two facilitators co-led discussions that were audio-recorded, transcribed, and coded for in-depth analysis using MAXQDA 2022 (VERBI GmbH).

**Results:** Non-specialist HCWs and LHWs were considered acceptable as MHPSS service providers, even for CBT, so long as they were adequately trained, knowledgeable of available resources, and conscientious of client concerns (e.g., maintaining privacy and confidentiality, behaving in a professional and compassionate manner, and respecting personal boundaries). Participants highly valued lived experience/relatability in service delivery/providers, sometimes over educational degrees. Peer support groups and peer mentorship/navigation were the most preferred of all MHPSS interventions, followed by CBT and PFA/MHFA. Peers were considered important sources of social support by participants, who emphasized the need to increase general awareness of peer support services at RWCs and availability of on-site and virtual options.

**Conclusions:** Our findings indicate that task shifting/sharing of MHPSS services is considered acceptable to PLWH who have been exposed to violence-related trauma and that peer support interventions are preferred. RWCs should consider implementing or expanding this approach to MHPSS service delivery and promote on-site/virtual availability to better support clientele.

### Midpoint reflections on USAID's HIV/AIDS local partner transition efforts

E.C. Raulfs-Wang<sup>1</sup>, D. Kalie<sup>1</sup>, C. Knight<sup>1</sup>, L. Avery<sup>2</sup>, L. White<sup>3</sup>, L. Bonanno<sup>1</sup>, J. Porter<sup>4</sup>, K. Hoeflich<sup>5</sup>, C. Irwin<sup>1</sup>, C. Nikola<sup>6</sup>, A. Paul<sup>7</sup>, M. Hijazi<sup>8</sup>, C. Cavanaugh<sup>9</sup>

<sup>1</sup>United States Agency for International Development (USAID), Bureau for Global Health, Office of HIV/AIDS, DC, United States, <sup>2</sup>United States Agency for International Development (USAID), Guatemala City, Guatemala, <sup>3</sup>Independent Scholar, Denver, United States, <sup>4</sup>United States Agency for International Development (USAID), Pretoria, South Africa, <sup>5</sup>United States Agency for International Development (USAID), Bureau for Inclusive Growth, Partnerships, and Innovation, Local, Faith, and Transformative Partnerships Hub, DC, United States, <sup>6</sup>United States Agency for International Development (USAID), Bureau for Management, Office of Acquisition and Assistance, DC, United States, <sup>7</sup>Independent Scholar, Washington, United States, <sup>8</sup>United States Agency for International Development (USAID), Bureau for Global Health, Office of Health Systems, DC, United States, <sup>9</sup>The Palladium Group, Washington, United States

**Background:** In 2018 and 2021, respectively, leadership among the President's Emergency Plan for AIDS Relief (PEPFAR) and the United States Agency for International Development (USAID) announced ambitious goals to increase funding of its programs directly through local organizations.

USAID reflects on the efforts to localize its PEPFAR-funded HIV portfolio and how that aided efforts for localization across the Agency.

**Description:** Between 2018 and 2021, USAID's HIV program increased its annual funding to local partners from \$452 to \$797 million, a 76% increase. This represents 55% of USAID's HIV program going directly to local organizations. USAID's investments in local capacity building have improved partner capacity to manage funding, and simultaneously strengthened local health networks, increasing opportunities for sustainable HIV responses.

These lessons on transitioning programs reflect what worked well in the initial stages for HIV programs, largely addressing internal agency barriers.

**Lessons learned:** Five key factors facilitated localization of the USAID HIV portfolio:

1. Intentional planning, as USAID Missions developed strategic approaches grounded in local reality, and created localization plans and risk analyses to understand risks, vulnerabilities, and approaches to risk management;
2. Systems for tracking, to help the program monitor progress, performance, and course-correct as needed;
3. Investment in capacity, to prepare the most capable subrecipients for direct funding, and increase USAID staff positions to manage more local awards;

4. Change in standard business processes, through internal processes and increased direct engagement with local partners; and,

5. Strong consistent leadership, across all levels within the Agency, to establish ambitious targets and ensure teams were equipped with tools and support.

**Conclusions/Next steps:** Four years into the efforts to localize USAID/PEPFAR programs, USAID identifies five factors that supported a substantial shift in funding and programming to local organizations, while still allowing for delivery of quality programs at scale.

These efforts helped USAID's HIV programs increase the number and diversity of local partners, which could provide a model for similar transition efforts. While the first phase of the transition focused on improving how USAID made awards to local organizations, the next phase will focus on how USAID works with and implements through local partners.

## THPEE569

### Assessing the Impact of Climate Change on Life expectancy in high HIV burden countries in Africa

M. Reid<sup>1</sup>, V. Whittaker<sup>1</sup>, S. Silva<sup>2</sup>

<sup>1</sup>University of California, San Francisco, Institute for Global Health Sciences, San Francisco, United States, <sup>2</sup>Harvard University, Boston, United States

**Background:** Without a dramatic change in multilateral strategies, climate change will be the greatest transboundary threat to health in sub-Saharan Africa (SSA). There is a pressing need to estimate the potential scale of climate-related deaths in high HIV-burden countries in SSA so as to inform climate adaptation and mitigation strategies. Consideration of these strategies is critical to HIV sustainability planning.

**Methods:** We sought to determine the excess mortality from climate-related health effects between now and 2050 in 20 PEPFAR-supported countries in sub-Saharan Africa (SSA), assuming a business-as-usual (BAU) climate trajectory of > 2.5 C degrees rise in global temperature by 2100. We used the excess mortality risk due to a 1°C increase in regional temperatures estimated by others to calculate the excess deaths due to global warming at ten-year increments between now and 2050 in these 20 countries.

We converted the excess deaths to corresponding life expectancy losses by eliminating regional temperature increases as a cause. We assumed that the excess mortality risks remain constant between 2022 and 2050 and are age invariant.

**Results:** A BAU climate trajectory will result in 31005 excess annual deaths in 2030, 45030 excess annual deaths in 2040, and 64152 excess annual deaths in 2050 across the 20 PEPFAR-supported countries in SSA. This excess mortality will account for 0.48% of the projected 29.12 million pos-

sible deaths in these countries during between now and 2050. By 2050, the greatest absolute increase in excess annual deaths will occur in Nigeria (21205 excess deaths), followed by South Africa (4546 excess deaths).

Across all 20 countries, estimated life expectancy will decline by 1.8 years in 2050, relative to 2023 levels, in the BAU scenario.

**Conclusions:** Climate-related health impacts will increase substantially in the coming twenty years with a deleterious impact on life expectancy in PEPFAR-supported countries in SSA.

Our findings highlight the urgent need for health-specific adaptation strategies and bold mitigation policies, to ensure that hard-won HIV gains are not undermined by climate-related health threats. Moreover, as countries embark on developing 'HIV sustainability roadmaps' it is critical that they address the increasing threat posed by adverse climate-related health outcomes.

## THPEE570

Predicting the Global Health Security Index (GHSI) in 80 Low-and-Middle Income Countries, Implementing and not Implementing U.S. President's Emergency Plan for AIDS Relief (PEPFAR) Programs

M. Dessie<sup>1</sup>, C. Nichols<sup>1</sup>, G. Siberry<sup>1</sup>, C. Holtzman<sup>1</sup>, C. Zambrana-Torrel<sup>2</sup>

<sup>1</sup>United States Agency for International Development, OHA, Washington, United States, <sup>2</sup>United States Agency for International Development, Emerging Threats Division, Washington, United States

**Background:** Since 2003, PEPFAR has invested over \$100 billion in the global HIV response in over 50 countries, preventing 25 million deaths. While PEPFAR-supported systems are leveraged for outbreak response (e.g., COVID-19, Ebola, mpox), there is limited research examining PEPFAR's impact on global health security.

We investigated the relationship between PEPFAR investments and other development factors on the Global Health Security Index (GHSI). We also evaluated the association between these factors and GHSI categories in 80 low- and middle-income countries using 2021 data.

**Methods:** We analyzed national economic and health data from the World Bank, World Health Organization, PEPFAR, and the GHSI. A multiple-linear regression model was selected among seven models trained and evaluated using a cross-validation technique with K-folds=10. A stepwise regression and regularization were employed for variable selection. We fit the final model with the selected variables and GHSI category response variables.

**Results:** Our analysis showed significant positive associations with high overall GHSI scores and gross domestic product per capita ( $\beta = 0.0268$ , p-value=0.002), government effectiveness (4.6570, p-value=<0.001), net official

development assistance received (NODAR) (0.0099, p-value=0.016) and being a PEPFAR-supported host country (4.4549, p-value=<0.001). These factors showed varied levels of association with specific subcategories of the GHSI. Government effectiveness (4.9929, p-value=0.017), NODAR (0.0341, p-value=<0.001), and PEPFAR support (8.4534, p-value=<0.001) were significantly associated with the GHSI-Detection and Reporting sub-category. Government effectiveness (4.3740, p-value=0.023), NODAR (0.0168, p-value=0.049), and PEPFAR support (5.3370, p-value=0.018) were significantly associated with the GHSI-health sector robustness sub-category.

**Conclusions:** Global health security preparedness measured by a country's GHSI score can be predicted by government effectiveness, PEPFAR support, and other development assistance received.

These significant findings suggest that PEPFAR's investments extend beyond the HIV/AIDS sector and support strengthening public health services and systems, which lay the foundation for global health security.

Further research is needed to better understand the impacts of PEPFAR investments on global health security.

## THPEE571

Public-private partnerships for the delivery of oral HIV pre- and post-exposure prophylaxis: lessons learned from an implementation study in Kenya

M. Anyona<sup>1</sup>, G. Rota<sup>2</sup>, S. Roche<sup>3</sup>, D. Were<sup>1</sup>, P. Ong'wen<sup>1</sup>, P. Gathii<sup>1</sup>, T. Kareithi<sup>4</sup>, K. Ngure<sup>5</sup>, E. Bukusi<sup>6,2</sup>, K. Ortblad<sup>3</sup>, V. Omollo<sup>2</sup>, PharmPrEP cRCT Team

<sup>1</sup>Jhpiego, PharmPrEP, Nairobi, Kenya, <sup>2</sup>Kenya Medical Research Institute, Kisumu, Kenya, <sup>3</sup>Fred Hutchinson Cancer Center, Seattle, United States, <sup>4</sup>Partners in Health and Research Development, Thika, Kenya, <sup>5</sup>Jomo Kenyatta University of Agriculture and Technology, Nairobi, Kenya, <sup>6</sup>University of Washington, Seattle, United States

**Background:** Countries in sub-Saharan Africa are exploring ways to leverage the private sector as part of broader efforts to increase long-term sustainability of their HIV response in the midst of decreasing external support. One possibility is to allow a portion of publicly procured HIV commodities to be delivered to private sector entities.

As part of a cluster-randomized controlled trial (cRCT) of private pharmacy-based pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP) delivery, we developed a novel system for pharmacies to access and account for PrEP/PEP drugs and HIV test kits procured by National AIDS & STIs Control Program (NASCO); an entity responsible for HIV programming in Kenya's Ministry of Health (MOH).

**Description:** Launched in July 2023, the Pharm PrEP cRCT is delivering PrEP/PEP services via 60 private pharmacies in central and western Kenya. To enable study pharmacies access commodities from Kenya's Medical Supplies

Authority, each is linked to a public health clinic for commodity requests and submit monthly reports on PrEP, PEP, and HIV test consumption; information needed for Kenya's health information system. To facilitate compliance with required MOH reporting, study pharmacies use an electronic point-of-sales system that tracks the use and dispensation of HIV test kits and PrEP/PEP drugs respectively.

**Lessons learned:** Support from NASCOP and counties was instrumental to the implementation of this model over the past 6 months. County and sub-county pharmacists and medical laboratory coordinators helped to establish good working relationships with study pharmacies; ensuring linked clinics fulfill commodity requests and eliciting support from other counties during periods of intermittent commodity stockouts. Continuous on-job training has helped pharmacy providers gain proficiency in the electronic point-of-sales system and to prepare, proofread, and submit required MOH reports in a timely manner.

On a few occasions, technical issues with the point-of-sales system and/or staff turn-over has led to late submission of consumption reports and thus resulted in delays in receipt of commodities at the private pharmacies, signaling areas for improvement.

**Conclusions/Next steps:** This public-private partnership model has a potential to enable private pharmacies to access quality-assured HIV commodities from government stock. Future research should explore long-term sustainability of using this model at scale.

## THPEE573

[A preliminary analysis of the feasibility, appropriateness, efficacy and adoption of a trauma-informed PrEP intervention for clinical staff in Baltimore, Maryland](#)

T. Willie<sup>1</sup>, D. Knight<sup>2</sup>, S. Schmalzle<sup>3</sup>, M. Dhir<sup>4</sup>, P. Ryscavage<sup>3</sup>, J. Jones<sup>5</sup>, S. Ruhs<sup>6</sup>, Y. Eskinazi<sup>6</sup>, S. Rives<sup>5</sup>, T. Williamson<sup>6</sup>, A. Shah<sup>1</sup>, S. Baral<sup>7</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Mental Health, Baltimore, United States, <sup>2</sup>Johns Hopkins Bloomberg School of Public Health, International Health, Baltimore, United States, <sup>3</sup>University of Maryland School of Medicine, Baltimore, United States, <sup>4</sup>Johns Hopkins School of Nursing, Baltimore, United States, <sup>5</sup>Johns Hopkins School of Medicine, Baltimore, United States, <sup>6</sup>Chase Brexton Health Care, Baltimore, United States, <sup>7</sup>Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States

**Background:** Intimate partner violence (IPV) and HIV are mutually-reinforcing epidemics affecting U.S. Black cisgender women, yet few studies have implemented and evaluated trauma-informed interventions in healthcare settings to reduce the impact of these epidemics. This

study assesses the preliminary feasibility, appropriateness, efficacy, and adoption of a trauma-informed HIV pre-exposure prophylaxis (PrEP) Implementation Toolkit for clinical staff in Baltimore, Maryland.

**Methods:** A multiphase, hybrid effectiveness-implementation type 2 study was conducted between January 2022 and October 2023 with Black cisgender women and clinical staff involved in HIV services in Baltimore, Maryland, United States.

Phase 1 included semi-structured interviews with 20 Black cisgender women and 18 clinical staff. Qualitative data was thematically analyzed and guided by the Consolidated Framework for Implementation Research.

Phase 2 included executing a trauma-informed PrEP implementation Toolkit in a randomized stepped-wedge design across four centers in two-month intervals.

The Toolkit comprised four trainings and a clinic protocol. Preliminary effectiveness of the Toolkit was tested among 60 staff using pre-post surveys and GEE assessed staff changes in feasibility, appropriateness, and efficacy from pre- to post-Toolkit.

**Results:** In Phase 1, qualitative themes described several barriers and recommendations for the Toolkit's implementation: obtaining staff buy-in; building capacity to address IPV; and ensuring compatibility of Toolkit within clinics.

In Phase 2, significant changes were observed in staff outcomes: increases in self-efficacy to discuss PrEP with Black women clients experiencing IPV (OR=4.31 (2.10, 8.93)); and increases in screening Black women clients' sexual history, especially women experiencing IPV (OR=5.22 (2.80, 9.87)).

There were also significant increases in implementation outcomes: feasibility (OR=1.95 (1.07, 3.78) and appropriateness (OR=1.35 (1.02, 3.07) to screen for IPV and refer Black women clients to community resources.

**Conclusions:** Trauma-informed PrEP implementation programs addressing IPV and safety planning are useful, feasible, and appropriate resources for clinical staff serving Black women. This study has implications for the implementation of this program in other U.S. priority jurisdictions with high incidence of HIV among Black cisgender women.

## THPEE574

Using Geographic Information Systems (GIS) to manage disparate datasets and support decision-making for the Central Chronic Medicines Dispensing and Distribution programme (CCMDD) in South Africa

S. Meiring<sup>1</sup>, P. Roberts<sup>1</sup>, J. Botha<sup>1</sup>, M. Pillay<sup>1</sup>, M. Munsamy<sup>2</sup>

<sup>1</sup>Project Last Mile, Pretoria, South Africa, <sup>2</sup>Government of South Africa, National Department of Health, Pretoria, South Africa

**Background:** The Central Chronic Medicines Dispensing and Distribution (CCMDD) programme is a South African initiative that aims to improve access to chronic medication by allowing PLHIV to pick up medicines, including ART, at convenient retail locations as an alternative to their public health clinic. Since 2016, Project Last Mile (PLM) has partnered with South Africa's National Department of Health (NDoH) to support the expansion of CCMDD, utilizing data from multiple sources and in different structures and formats, which need to be merged and analysed to inform the evolution of the programme. PLM has deployed GIS as a key approach to data management and strategic decision making.

**Description:** A Geographic Information System (GIS) is a system that creates, consolidates, manages, analyses, and visualizes multiple data types and allows for individual data points to be assigned to a geography. PLM has geo-classified programme-related datasets, including data from public health facilities, medication pick-up points, private healthcare facilities, and national and local datasets containing demographic, administrative and HIV-burden information, using a GIS system. The consolidated GIS dataset has been continually updated and analysed to inform the development of the CCMDD programme.

**Lessons learned:** GIS has enabled PLM to generate insights such as identifying areas of high burden and gaps in health coverage. Presenting the GIS analysis visually offers spatial context that has made it easier to analyse, interpret, and communicate results to a wide audience. The use of GIS has helped to focus planning efforts by identifying where interventions are required. For example, it was found that some high burden public health facilities in rural provinces had no pick-up-points within a 5km radius of a health facility and required innovative solutions, such as containers or smart lockers, for medicine collection.

**Conclusions/Next steps:** GIS as a mechanism for consolidating data from multiple sources has been successfully implemented for CCMDD and has provided many benefits for the programme. For NDoH and PLM in South Africa, GIS has enabled the analysis of multiple datasets and used GIS's spatial insights and data visualization capabilities to support programme decision making. This has contributed to the rapid strengthening and expansion of the programme.

## THPEE575

Comprehensive and structured capacity assessment is crucial for community-based organization capacity building and nuclear for community system strengthening

T.N.N. Nguyen<sup>1</sup>, R. Frescas<sup>1</sup>, L.T. Nguyen<sup>1</sup>, N.T. Truong<sup>1</sup>,

T.M. Ngo<sup>2</sup>, P.T.M. Le<sup>1</sup>, G.T.C. Pham<sup>1</sup>, H.V. Nguyen<sup>3</sup>, D.M. Levitt<sup>3</sup>

<sup>1</sup>LIFE Centre, Ho Chi Minh, Viet Nam, <sup>2</sup>USAID Vietnam, Hanoi, Viet Nam, <sup>3</sup>FHI 360 Vietnam, Ho Chi Minh, Viet Nam

**Background:** Communities play an important role in Vietnam's response to HIV/AIDS, especially towards the first and second 95 targets. Strengthening the capacity of community-based organizations (CBOs) and key population-led social enterprises (SEs) in a structured and strategic manner ensures they can continue to serve the community effectively and sustainably.

**Description:** Community Organizational Sustainability Assessment (COSA) is an organizational capacity assessment tool developed by LIFE Centre under a USAID-supported project. COSA has 5-point scale assessing 6 domains: HIV-related services; other health related services; governance, administration and operations; financial management and sustainability; monitoring, evaluation and learning; and communications.

The second domain particularly set benchmarks for growing the organization's knowledge and skills beyond HIV to better meet key populations' health care needs, and lay foundations for their fee-based service delivery towards financial sustainability.

During March and April 2022, 25 CBOs/SEs completed the initial COSA (20 supported by LIFE and 5 by FHI 360 Vietnam). LIFE Centre then facilitated a planning process to develop specific recommendations for technical assistance, and empowered the organizations to prioritize those recommended interventions based on need.

A follow-up assessment was conducted with 20 CBOs/SEs by LIFE during October-December 2023 to assess areas of improvement and identify areas not yet supported according to plan.

The recommendations were grouped and customized for clusters of organizations of similar capacity building needs and plan of growth. COSA aggregated results were also shared with USAID partners and health service providers for strengthening coordination and linkages among services and program implementing partners.

**Lessons learned:** COSA enables the CBOs/SEs, who are the key drivers of the community system, to realize their gaps and needs across the board. It helps establish benchmarks before initiating capacity-building efforts. The capacity-building initiatives can then be customized to address the identified weaknesses and enhance organizational strengths.

The follow-up assessments (6 and 12 months) allow LIFE and the organizations to track improvements and adjust strategies as needed.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Conclusions/Next steps:** COSA helps objectively assess impact of capacity building over time. Once CBOs/SEs are trained on COSA, they can conduct periodical assessment on their own to update needs and developing skills to generate resources to ensure sustained growth.

## THPEE576

### Impact of Incident Command System on HIV/AIDs epidemic control: lessons from ACE-2 Project in Northern Nigeria

I. Gobir<sup>1</sup>, A. Salihi<sup>1</sup>, B. Zubayr<sup>1</sup>, A. Adamu<sup>1</sup>, M. Niyang<sup>1</sup>, J. Shallangwa<sup>1</sup>, M. Adeoye<sup>1</sup>, D. Ogundehin<sup>2</sup>, K. Olatunbosun<sup>2</sup>, C. Obiora-Okafor<sup>2</sup>, A. Idemudia<sup>2</sup>, C. Nwadike<sup>2</sup>, K. Kakanfo<sup>2</sup>, B. Pius<sup>2</sup>, B. Onimode<sup>2</sup>, A. Raji<sup>3</sup>, B. Ayowola<sup>2</sup>, B. Kagniniwai<sup>3</sup>, O. Asaolu<sup>2</sup>, A. Bashorun<sup>4</sup>, A. Gambo<sup>5</sup>, D. Onime<sup>2</sup>, J. Pius<sup>2</sup>, O. Oyelaran<sup>2</sup>, R. Goldstein<sup>2</sup>

<sup>1</sup>Georgetown Global Health Nigeria, Abuja, Nigeria,

<sup>2</sup>Office of HIV/AIDS and TB, United States Agency for International Development (USAID), Abuja, Nigeria,

<sup>3</sup>Office of HIV/AIDS, United States Agency for International Development (USAID), Washington DC, United States,

<sup>4</sup>National AIDS, Sexually Transmitted Infections Control and Hepatitis Programme (NASCP), Federal Ministry of Health, Abuja, Nigeria, <sup>5</sup>National Agency for the Control of AIDS (NACA), Abuja, Nigeria

**Background:** Over the past two decades, Nigeria has benefited from substantial U.S. Government investments in health systems, aiming to achieve HIV/AIDS epidemic control by 2030. Vital to this objective is the elimination of acquisition of HIV and the sustenance of gains in prevention, treatment, and viral load (VL) suppression initiatives. The Accelerating Control of the HIV Epidemic in Nigeria (ACE-2) project implemented in Jigawa and Kano states faced suboptimal VL suppression.

To address this, Incident Command System (ICS) was adopted, leveraging the cohort for index case testing (ICT) to enhance clinical outcomes and elevate treatment saturation in the states.

**Description:** The ICS led by the health facility's antiretroviral therapy (ART) coordinator, serving as the incident commander for various case management teams (CMTs). ACE2 activated 64 CMTs in Kano and 20 in Jigawa from October 2022 to September 2023, each composed of a data entry clerk, treatment supporter, phlebotomist, counselor tester, and ART nurse.

Emphasizing individualized client-centered designs, the teams closely follow cohorts of clients, with increased service interactions through phone calls and WhatsApp chats aligned with national HIV treatment guidelines. Treatment supporters manage an average of 100 clients employing reminders and support especially for poorly suppressed clients. The counselor tester employs an index case testing (ICT) approach for people living with HIV, while the phlebotomist collects samples as needed.

Data entry is electronic handled by the DEC and the ART Nurse provides essential clinical services during physical visits.

**Lessons learned:** The ICS approach contributed to client case finding through ICT in the year with a yield of 9.3% despite a prevalence of <0.6% in the ACE-2 supported states. The VL suppression rate improved from 91%, to 96% in Kano and 90% to 97% in Jigawa.

**Conclusions/Next steps:** Tailoring individualized strategies for clients, irrespective of VL suppression management, demands a hybrid of physical and virtual support. The Incident Command System (ICS) facilitated monitoring, enhanced adherence, and boosts VL suppression rates, contributing to improved treatment outcomes and HIV case identification.

## THPEE577

### Utilizing continuous quality improvement to enhance the quality of recent HIV-1 infection surveillance: insights and lessons from Uganda

T. Agaba<sup>1</sup>, R. Kiranda<sup>1</sup>, C. Katusiime<sup>2</sup>, W. Bikokye<sup>3</sup>, F. Namimb<sup>4</sup>, L. Buback<sup>5</sup>, E. Muhanguzi<sup>5</sup>, R. Merai<sup>5</sup>, R. King<sup>5</sup>  
<sup>1</sup>Global Programs for Research and Training, Kampala, Uganda, <sup>2</sup>Ministry of Health, Uganda, Aids Control Program, Kampala, Uganda, <sup>3</sup>United States Agency for International Development, Kampala, Uganda, <sup>4</sup>Infectious Diseases Institute, Kampala, Uganda, <sup>5</sup>University of California, San Francisco, San Francisco, United States

**Background:** In efforts to control the HIV epidemic by 2025, the Uganda Ministry of Health and partners launched Recent HIV-1 Infection Surveillance (RIS) to identify potential signals of HIV acquisition to inform targeted prevention interventions. RIS integrates the Rapid Test for Recent Infection (RTRI) into routine HIV testing for those newly diagnosed and above 15 years old, identifying potential recent HIV acquisition.

To ensure the availability of high-quality data, a continuous quality improvement (CQI) approach was implemented across 15 regions of Uganda.

**Description:** We reviewed CQI data from 15 regions between the years 2020 and 2022. Health facility staff were trained on the RIS protocol, procedures, and CQI methods. One month post-training, baseline assessments were conducted to identify gaps for components scoring below 80%. Using a Plan Do Study Act (PDSA) model, we analyzed gaps, developed interventions, measured improvement and effectiveness in follow-up assessments. Both assessments used a standard checklist with six quality components. including staff, procedures, source data, physical facility, recruitment, and site supplies. A real-time performance scorecard, checklist, and action plan matrix were captured electronically using Open Data Kit on tablets. This data was then transmitted on the RIS dashboard for immediate access and descriptive analysis.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Lessons learned:** Our CQI approach led to improvements in all six assessed components. Five coded interventions accounted for more than 80% of all interventions and these included: improvement of staff mentorship in procedures (31.9%), provision of staff refresher training (16.5%), provision of training certificates (13.4%), procurement of recency supplies (8.2%) and enrolling staff in recency training (8.2%). Participant recruitment and physical facility components performed lowest at baseline with median scores of 79.7% and 80.0% yet, their scores improved to 86% and 100% respectively at follow-up. This highlights the efficacy of targeting underperforming health facilities for enhancement through data-driven CQI strategies.

**Conclusions/Next steps:** Using context-specific interventions generated by health facility staff, CQI effectively bridged disparities between current performance and expected standards. Despite an already overburdened public health system, our CQI activities facilitated the availability of quality data for use by RIS stakeholders in Uganda.

Lessons in resilience: the role of a quality improvement collaborative focused on improving HIV care retention in New Orleans, Louisiana (NOLA) during and following Hurricane Ida

E. Arnold<sup>1</sup>, S. Fuller<sup>1</sup>, L. Fidelak<sup>2</sup>, J. Xavier<sup>1</sup>, B. Agins<sup>1</sup>, W. Steward<sup>1</sup>, G. Rebchook<sup>1</sup>, K. Koester<sup>1</sup>

<sup>1</sup>University of California San Francisco, Medicine, San Francisco, United States, <sup>2</sup>Johns Hopkins University, Baltimore, United States

**Background:** In the United States, climate-related events, including hurricanes, are becoming more intense and frequent, presenting challenges to the HIV-related health care system affecting facilities, staff, and people living with HIV (PLWH). Fostering professional connections and leveraging quality improvement collaboratives (QIC) s may enable the system to adapt to climate events by promoting retention and re-engagement in care despite intense climate-related disruptions. We present a case study of a QIC that was in place when Hurricane Ida hit New Orleans in August 2021.

**Methods:** This case study included key informant interviews with providers, health department staff, and capacity building specialists involved in the QIC (n=9) as well as extensive fieldnotes documented during four 2-day learning sessions in 2021-2022, each attended by 20-25 QIC participants. Learning sessions focused on improving emergency preparedness and responding to Hurricane Ida. Transcripts and fieldnotes were coded and analyzed thematically.

**Results:** Immediate disruptions during the storm included loss of physical buildings, relocating clients to other states and parts of the state, loss of power, and

homelessness. Providers faced difficulties helping clients gain access to antiretroviral therapy and other essential medications, especially at pharmacies across state lines following evacuation or relocation. Enablers of provider success in re-engagement included QIC participation, using existing networks and messaging apps that facilitated reconnecting with clients and medication access, while mitigating feelings of isolation and anxiety as they assisted clients with navigating the hurricane disruptions.

Following the hurricane, QIC learning sessions involved sharing of emergency preparedness plans, developing client-oriented materials tailored for those living with HIV, and integrating hurricane planning into routine clinical care, strategies which informants felt could improve engagement in care following future climate-related disruptions.

**Conclusions:** The HIV health care system is particularly vulnerable to the impact of climate change. Creating emergency preparedness plans, particularly tailored for PLWH, and proactive strategies to maintain treatment access for displaced people constitute important steps in creating resilient and responsive systems. QICs offer an important vehicle for health care providers and staff to share resources, link healthcare providers with the public health system, and communicate during and following climate events, supporting the achievement of better HIV-related health outcomes.

## THPEE579

Enhancing private sector's role in providing comprehensive person-centered care and HIV treatment services to people in need

V.M. Nguyen<sup>1</sup>, A.K. Tran<sup>1</sup>, B.N. Vu<sup>1</sup>, K. Green<sup>1</sup>, P.T. Phan<sup>1</sup>, T.T. Tran<sup>1</sup>, L.K. Tran<sup>1</sup>, K.Q. Do<sup>2</sup>, T.M. Le<sup>3</sup>, D. Nguyen<sup>4</sup>, T. Ngo<sup>4</sup>, A. Doan<sup>4</sup>, H. Phan<sup>5</sup>, L. Doan<sup>5</sup>

<sup>1</sup>PATH, Hanoi, Viet Nam, <sup>2</sup>Galant Clinic, Ho Chi Minh City, Viet Nam, <sup>3</sup>Glink Clinic, Ho Chi Minh City, Viet Nam, <sup>4</sup>United States Agency for International Development (USAID), Hanoi, Viet Nam, <sup>5</sup>Vietnam Administration of HIV/AIDS Control, Vietnam Ministry of Health, Hanoi, Viet Nam

**Background:** With strong understanding of their clients, private clinics play a vital role in delivering HIV services to key populations (KPs) by offering a wide range of HIV-related services in accommodative ways, including confidentiality, flexible working hours, and continuously improving to meet the needs of targeted clients. To strengthen private sector engagement in providing comprehensive person-centered care and HIV treatment services, the USAID/PATH Support for Technical Excellence and Private Sector Sustainability in Vietnam (STEPS) project delivered a complete package of technical training and continuous quality improvement (CQI) to two private clinics, named Glink and Galant in Ho Chi Minh City, Vietnam.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Description:** Since 2022, STEPS has been providing technical assistance to private clinics in delivering comprehensive healthcare for ART clients including same day antiretroviral therapy (ART), HIV viral load testing, prophylaxis and treatment for opportunistic infections; as well as providing other client centered services such as screening and linkage to mental health, non-communicable diseases such as dyslipidemia, diabetes, hypertension etc.

In addition, STEPS provides training and tools for CQI to clinics by regularly collecting client feedback on service delivery, and offering solutions to address areas that need improvement.

**Lessons learned:** From October 2022 to September 2023, 1,518 clients received ART at Glink and Galant clinics (commercial clients: 731; clients with Social Health Insurance (SHI): 787) out of which 509 were new clients. Most clients were men who have sex with me (MSM) (94.5%) with an average age of 27 years.

In terms of socio-economic status, the majority of clients had a college or higher education level (57%), were currently employed (82.2%) and were office workers (44.2%). As of 2023, treatment effectiveness was very high with viral suppression of 99.8%, much higher than the national rate of 96%, and the treatment retention rate of ARV clients is at 85.3%.

**Conclusions/Next steps:** Private clinic participation in providing comprehensive ART services contributes an important role to diversify choices to meet the needs of clients. Besides ensuring treatment according to standard care, holistic health care needs are comprehensively being taken care of as an integral part for such populations.

## THPEE580

Integrating quality improvement methodologies in improving index testing positivity yield in 19 selected sites in Southern province Zambia

M. Changu Nzala<sup>1</sup>, R. Lungwebungu<sup>1</sup>

<sup>1</sup>Ministry of Health, Health, Choma, Zambia

**Background:** As the proportions of people living with HIV(PLHIV) who do not know their HIV status decrease, reaching the remaining few who are asymptomatic and not in contact with the health care system becomes a critical challenge. Therefore, reaching the first 90 of the UNAIDS 90-90-90 targets will require effective and efficient HIV testing approaches. Index testing model has demonstrated an increase in identification of HIV positive cases among children and adults and linkage into care and treatment services.

**Methods:** A baseline assessment was conducted and found the index positivity yield of 14% in September 2020. Following a baseline assessment, a root cause analysis was conducted to establish the magnitude of the problem.

The root causes were found to be:

1. Non appointment of an Index Champion,
2. Incomplete locator information for the elicited contacts for easy follow-ups,
3. Inadequate knowledge and counselling skills on safety and ethical index testing,
4. Inconsistent departmental data review meetings.

To address the route cases facilities enrolled into QI project with following intervention:

1. Provided integrated ART outreach service and engaged community partner (DAPP) in making follow ups,
2. Provided TORs and oriented facility index champion on the Job Aids,
3. Involved Facility/ART in charges in index testing services to enhance supervision,
4. Built capacity in counsellors and other providers in Ethical & Safe Index Testing through trainings and onsite mentorship,
5. Holding data review meetings, daily, weekly and monthly.

**Results:** The index positivity yield improved from 14% in September 2020 to 25% by end of the first quarter and increased to 36% by end of second quarter with a further increase to 48% by the end of the third quarter and further improved to 57% by the end of FY21.

Furthermore, it was observed the average (12 months) index positivity yield and contribution was 29% and 55% respectively. It was also observed that Index reduced untargeted testing by 1.1% by the end of quarter one and by 4.8% by the end of the second quarter.

**Conclusions:** Application of quality improvement methodologies remains pivotal in index positivity yield improvement and achieving the first 95%.

## THPEE581

Self-reflection and peer learning are key to improving HIV prevention capacity and prioritization in the West and Central African region

M. Emmanuel<sup>1</sup>, B. Gbehi<sup>2</sup>, K. Mangold<sup>3</sup>, T. Ofem<sup>4</sup>, L. Lunika<sup>5</sup>, T. Ahner-Mchaffie<sup>6</sup>, J. Vandelanotte<sup>7</sup>, R. Mhlanga-Gunda<sup>8</sup>, C. Masuku<sup>9</sup>

<sup>1</sup>Genesis Analytics, Health Practice, Lagos, Nigeria, <sup>2</sup>Genesis Analytics, Abidjan, Côte d'Ivoire, <sup>3</sup>Genesis Analytics, Health Practice, Johannesburg, South Africa, <sup>4</sup>Genesis Analytics, Health Practice, Abuja, Nigeria, <sup>5</sup>Genesis Analytics, Health Practice, Nairobi, Kenya, <sup>6</sup>Bixal, Virginia, United States, <sup>7</sup>Bixal, Brussels, Belgium, <sup>8</sup>Adesim Developments, Harare, Zimbabwe, <sup>9</sup>Adesim Developments, Johannesburg, South Africa

**Background:** The South-to-South HIV Prevention Learning Network (SSLN) was established in response to the request from the Global NAC Directors Forum for a learning platform on HIV prevention. The learning network oper-

ates in 15 sub-Saharan African countries, covering the five HIV prevention pillars. Country champions, nominated through the National AIDS council, assess their prevention programs using a HIV Prevention Self-Assessment Tool (PSAT). Analysis of this tool informs a customized learning agenda. With the support of the SSLN, country champions participate in different learning activities.

This study explores the effectiveness of SSLN activities, country-specific experiences, successes, and key lessons learned from West and Central African (WCA) country champions in Côte d'Ivoire, Ghana, Nigeria and the Republic of Congo during the programme's mid-term evaluation.

**Methods:** Data was collected by external evaluators from May-September 2023 using a mixed method approach: an online survey for all champions and key informant interviews (KII) in Ghana and Nigeria. From the WCA region, a total of 86 champions participated in the survey and 18 champions in the KII.

Survey data was exported to Stata for cleaning and analysis, and then presented in frequencies and percentages. KII data was transcribed and analysed using NVivo software for thematic content analysis. Common themes, trends, and challenges were identified, integrating sub-themes into broader themes.

**Results:** Respondents from WCA reported improved capacity in HIV prevention since joining the network, and that the SSLN refocused their attention to prevention. The PSAT was regarded as helpful in identifying programme gaps in a structured and systematic way. Participation in the network provided opportunities to connect with colleagues in similar roles across different countries. Respondents expressed motivation to excel upon witnessing progress in countries with similar contexts. The network's collaboration with governments was regarded as influential and supportive for sustainability. Learning visits were preferred over virtual activities. Respondents believed documenting best practices and frequent meetings for action plan review would benefit their countries.

**Conclusions:** These findings demonstrate the significance of networking, social capital, and leveraging competencies to improve HIV prevention programmes in the West and Central African Region. Feedback from the respondents will be considered for improved programme implementation.

### Growth of Glink Academy: first key-population (KP) led peer-to-peer capacity building program in Vietnam for HIV awareness and service uptake

T. Tran<sup>1</sup>, T. Tran<sup>1</sup>, T.M. Phan<sup>1</sup>, H.T. Nguyen<sup>1</sup>, P.H. Vu<sup>1</sup>, K. Green<sup>1</sup>, T.M. Le<sup>2</sup>, T.L.V. Tran<sup>2</sup>, T. Ngo<sup>3</sup>, D. Nguyen<sup>3</sup>, A.H. Doan<sup>3</sup>, M.T. Udugama<sup>1</sup>, H. Phan<sup>4</sup>, L. Doan<sup>4</sup>

<sup>1</sup>PATH, Hanoi, Viet Nam, <sup>2</sup>Glink Academy, Ho Chi Minh City, Viet Nam, <sup>3</sup>United States Agency for International Development (USAID), Hanoi, Viet Nam, <sup>4</sup>Vietnam Administration of HIV/AIDS Control, Vietnam Ministry of Health, Hanoi, Viet Nam

**Background:** Business start-up and growth, especially in the field of HIV, is a challenge for early-stage LGBTQI+ led organizations in Vietnam. Glink Academy, initiated by Glink key population (KP)-led social enterprise (SE), with 12 years of operating experience in the HIV KP-led clinic chain and community, and USAID/PATH STEPS project, provides a comprehensive peer-to-peer capacity building program to support the establishment and sustainable growth of KP-led SEs and clinics.

**Description:** Since its inception in 2022, Glink Academy, with support from USAID/PATH STEPS, has grown as an incubator for social enterprises by providing a comprehensive and need-based peer-to-peer capacity-building program. The program offers diverse activities which includes: thematic training; individual mentoring and coaching; resources and tools for start-up development; an e-learning platform; Business Innovation Talks (BITs); Digital Marketing Forums (DMF); and an innovation grant for KP-led SEs and clinics. Glink Academy's capacity building program takes a human-centered approach, through selection of innovative, useful, and practical topics requested by the community, unique case studies, and lessons learned from the HIV field.

**Lessons learned:** Glink Academy continues to drive the growth of a sustainable network of KP-led businesses that provide high-quality HIV services, and have successfully delivered series of activities that expand impact and innovation within the KP community including but not limited to: 3 trainings on business development, demand generation, and marketing and communications; 10 BITs connecting social impact businesses with speakers and experts; 8 DMFs on digital campaigns to effectively reach target populations; incubated 3 SEs with innovative business models in HIV, of which, one is TG-led clinic and working towards its mission of healthcare promotion for TG communities; and developed an e-learning platform with learning material on social entrepreneurship, legal matters, health service delivery, organizational management, sustainable growth; and a mentoring and coaching program.

**Conclusions/Next steps:** Glink Academy exemplifies a transformative LGBTQI+ led model for peer learning and incubation. Further advancement of its peer-to-peer ca-

capacity building efforts will help diversify and expand a network of community-friendly health social enterprises in Vietnam that are positioned to deliver high-quality, inclusive health services for the LGBTQI+ community creating greater HIV awareness and service uptake.

## THPEE583

Finishing HIV: a social network program to encourage HIV service use by Latinos who self-identify as gay, straight, or bisexual

M. Kanamori<sup>1</sup>, E. Rodriguez<sup>1</sup>, L. Craker<sup>1</sup>, C.H. Shrader<sup>2</sup>, A. Johnson<sup>1</sup>, J. Buch<sup>3</sup>, K. Self<sup>4</sup>, S. Fallon<sup>3</sup>

<sup>1</sup>University of Miami Miller School of Medicine, Public Health Sciences, Miami, United States, <sup>2</sup>Arizona State University, Department of Nursing, Tempe, United States, <sup>3</sup>Latinos Salud, Miami, United States, <sup>4</sup>University of Miami, School of Education and Human Development - Educational and Psychological Studies, Miami, United States

**Background:** Latino MSM (LMSM) have the highest HIV incidence in Miami-Dade (Miami); a county that ranks amongst the highest HIV incidence in the US. Non-gay identified (NGI) LMSM have lower HIV prevention knowledge than gay-identified LMSM. Latino cultural values (e.g., *Machismo*) may contribute to Latinos' reluctance to identify as gay and increase HIV-risk behaviors. Most HIV prevention programs focus on gay-identified LMSM, *FINISHING HIV (FHIV)* fills this gap.

**Description:** *FHIV* uses implementation science to promote services from Latinos Salud, our community partner, through 4 networks:

Social Networks for gay-identified LMSM. Outreach Specialists, HIV Testing Counselors, and Peer Educators provide HIV education.

Park Network for non-gay identified LMSM. Peer Educators conduct outreach to increase HIV prevention awareness.

Pharmacy Network for all Latino men. HIV prevention information was disseminated by CVS Health (a national pharmacy corporation).

Community Radio Network for all Latino men. Radio soap operas promote HIV prevention programs. *FHIV's* logic model explicates the determinants, strategies, mechanisms, and outcome measures (Figure 1).

**Lessons learned:** We learned how to effectively reach all LMSM. Approaches included sport bags containing HIV prevention information (800 bags distributed at 132 community events; i.e., movie nights and yoga).

It is important to partner with pharmacy companies to select venues with appropriate infrastructure, client demographics, and provided services. Seven CVS locations delivered PrEP information using innovative in-store strategies; 14,000+ PrEP flyers were distributed.

With a community radio station, we developed radio soap operas, formatted to mimic soccer commentary, a popular Latino sport. Five PrEP soap operas were broadcast

twice daily. Radio *ADICTIVA* has 270,000+ monthly listeners furthering *FHIV's* reach. Geographic analyses confirmed reach throughout Miami. 12-month EHE Outcomes: Diagnose. Testing N=9,612, Diagnosed N=191. Treat. 100% linked to care. Prevent. PrEP clients N=1,581, condoms distributed N=322,000, education sessions N=4,517.

The *FHIV* logic model incorporates two implementation science frameworks: The Consolidated Framework for Implementation Research (CFIR) and the Reach Effectiveness Adoption Implementation and Maintenance (RE-AIM). <sup>1</sup>CFIR scoring: strongly agree = 2, agree = 1, neither agree nor disagree = 0, disagree = -1, and strongly disagree = -2. The closer the score to 2 the more positive answers for the questions within each subconstruct. Findings are based on 20 interviews with community partners. <sup>2</sup>These mechanisms are based on the Social Contagion Theory.

Figure 1. Finishing HIV logic model.

**Conclusions/Next steps:** This year, we will launch a hybrid-1-implementation-effectiveness RCT of *FHIV*.

## THPEE584

Caring for young carers: co-conceptualising, implementing and adapting psychosocial and clinical support for young PrEP peer navigators in semi-urban Western Cape, South Africa

C. Coakley<sup>1,2</sup>, E. Rousseau<sup>1</sup>, O. Vanto<sup>1</sup>, N. Mathola<sup>1</sup>, P. Fuzile<sup>1</sup>, L.-G. Bekker<sup>1</sup>

<sup>1</sup>University of Cape Town, Desmond Tutu HIV Centre, Department of Medicine, Cape Town, South Africa,

<sup>2</sup>University of Cape Town, Centre for Social Science Research, Cape Town, South Africa

**Background:** Peer-supported PrEP services offer a tailored solution for young people, building knowledge, agency and addressing barriers to PrEP use, including PrEP stigma, unfriendly service provision and complex intimate relationship dynamics. Peer-supported services enable PrEP initiation and continued use by creating a customised, non-stigmatising setting to receive ongoing education and refills.

We describe an initiative to support peer navigators (PNs) which is part of a study "FAST-PrEP": scaling differentiated PrEP provision for 15-29 year olds in Klipfontein and Mitchell's Plain, Western Cape, South Africa.

**Description:** FAST-PrEP has 32 PNs working across 12 health facilities and 4 mobile clinics. PNs are trained to welcome young clients, provide relatable, non-judgmental psychosocial support, accurate health information, and navigate adolescents through PrEP and other health services. PNs also coordinate with clinic staff on record-keeping and client follow-up.

A framework for clinical and psychosocial support, refined with PNs to align with their specific clinical settings and work experience with adolescents, was used in bi-monthly, debriefing and mentorship sessions.

**Lessons learned:** Themes from the semi-structured sessions included:

1. Motivation to serve – PNs consider their "responsibility to educate adolescents" an important task and meaningful job that serves their community;
2. Fragmentation in care – prospective PrEP users recruited by PNs face multiple barriers in completing the PrEP cascade at facilities, including limited and noncontinuous testing, counselling and prescribing services;
3. Tension with established medical hierarchy – PNs perceive a low level of respect for the contributions PNs make to optimising clinic flow and integrating HIV and SRH services;
4. Mental burden – PNs experience social anxiety, face rejection from prospective PrEP users, and secondary trauma risk from responding to emergency referrals outside of the scope of their role.

**Conclusions/Next steps:** Peer workers can be considered "experience-based experts" that can shape design of PrEP programming but need continuous training, routine supportive supervision, and psychosocial support. Findings from this collaborative work with PNs indicated the need for a co-designed, structured training and psychosocial support plan, as well as a strengthened supportive supervision and integration process at health facilities. This will create a shared framework for PNs, and clinical supervisors to ensure ongoing well-being and effectiveness of PNs.

## THPEE585

### Utilization of digital tools to enhance TB screening in communities for a lasting impact

P. Chimungu<sup>1</sup>, K. Takarinda<sup>1</sup>, E. Dhodho<sup>1</sup>,  
P.T. Chimberengwa<sup>2</sup>, S. Page-Mtongwiza<sup>2</sup>, T.T. Chinyanga<sup>2</sup>,  
I. Nhiringi<sup>2</sup>, T. Bepe<sup>2</sup>

<sup>1</sup>Organization of Public Health Interventions and Development (OPHID), Strategic Information and Evaluation, Harare, Zimbabwe, <sup>2</sup>Organization of Public Health Interventions and Development (OPHID), Programs, Harare, Zimbabwe

**Background:** Zimbabwe faces a significant challenge in managing tuberculosis (TB), particularly among people living with HIV (PLHIV). In 2020, an estimated 29,000 TB cases with an incidence rate of 181.3 per 100,000 people were reported. The TB mortality rate (excluding HIV) increased, while the rate among HIV-positive individuals slightly decreased.

Discrepancies between notified and estimated cases highlight suboptimal treatment coverage, emphasizing the need for enhanced case detection.

**Description:** The Target Accelerated Sustainability Quality of Care program, an ongoing initiative within the Organization for Public Health Interventions and Development (OPHID), has significantly transformed the approach to TB screening among HIV clients by moving from a paper-based system to a digital platform across 15 districts. Community Outreach Agents (COAs) efficiently collect and input screening data into the Open data Kit (ODK) during outreach programs. Each client undergoes a thorough TB screening process. Those responding affirmatively to screening questions are identified as presumptive TB cases, triggering a seamless referral process to designated facilities, health posts, or alternative service delivery points.

This structured approach ensures timely interventions for individuals at risk of TB within the HIV clients. Routine programme data were collected from January to December 2023 using ODK. Data were analyzed descriptively using STATA 15.

**Lessons learned:** A total of 125,750 HIV clients were screened for TB in the community, of whom, 86,337 (68.7%) were female and overall median age was 43 years (IQR 34–51 years). Of these, 9163 (7%) were presumptive TB cases and were referred to the health facilities for further TB diagnosis. Of the remaining 116,587 excluded TB symptoms, 11,131 were linked to the facility for TPT initiation which translated to community contribution of 18% of 60,812 annual TPT initiations.

**Conclusions/Next steps:** This study demonstrated that the integration of digital tools for TB screening among HIV clients can significantly streamline the identification and referral process for TB in community settings. However, it also points out the need for better linkage to care for clients after they are screened. The tools have demonstrated the potential for enhancing TB control within HIV service delivery. Future research should evaluate the long-term impact and cost-effectiveness of digital screening interventions.

## THPEE586

Lessons learned from integrating GBV response services into HIV prevention care and treatment in four CDC supported provinces of Zambia

C. Muleya<sup>1</sup>, C. Nsomfu<sup>2</sup>, K. Watala<sup>3</sup>, M. Luhana<sup>4</sup>, M. Phiri<sup>5</sup>, O. Chituwo<sup>5</sup>, A. Mwila<sup>1</sup>, B. Kaliki<sup>1</sup>, L. Denhard<sup>6</sup>

<sup>1</sup>US Centers for Disease Control and Prevention, Division of Global HIV and TB, Lusaka, Zambia, <sup>2</sup>Ministry of Health, Western, Mongu, Zambia, <sup>3</sup>Ministry of Health, Southern Province, Choma, Zambia, <sup>4</sup>Ministry of Health, Eastern, Chipata, Zambia, <sup>5</sup>Ministry of Health, Lusaka Province, Lusaka, Zambia, <sup>6</sup>US Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, Zambia

**Background:** Gender-based violence (GBV) is a driver of the HIV epidemic globally and in Zambia, particularly among adolescent girls and young women aged 10-24 (AGYW). In 2023, 29.5% of post-violence service provision in Zambia were in response to sexual violence, and 69.9% of these cases were among AGYW.

The U.S. Centers for Disease Control and Prevention (CDC) through its partners has been supporting public health facilities in Eastern, Southern, Lusaka, and Western provinces of Zambia in offering the post-violence care as part of HIV Prevention intervention. We gathered lessons learned from 3 years of scale up of the GBV minimum package.

**Description:** Between October 2020 and September 2023, we scaled up post GBV care services in public health facilities from 116 to 551 (375% increase). The scale up also included capacity building of health care providers as first line responders to GBV disclosure. The scale up of the GBV services in health facilities improved access due to reduced distance to the nearest health facility and capacity building of health care providers improved the GBV services offered to the survivors.

**Lessons learned:**

Figure 1.

In 2023, the total number of post-rape care services offered increased from 3527 in 2021 to 7473 in 2023 (111.9% increase). The post-rape care services among AGYW specif-

ically increased from 2,447 in 2021 to 5,114 in 2023 (109.0% increase). AGYW completing post-exposure prophylaxis increased from 1,109 in FY21 to 2,713 in FY23 (144.6% increase).

**Conclusions/Next steps:** Scaling up of GBV service points closer to survivors is key to increasing access to the services and improved outcomes.

Despite these positive strides, however, PEP completion rates remain low. Further analysis is needed to determine the challenges in PEP completion rates as the scale-up process continue.

## THPEE587

The drivers of gender-based violence in rural settings and its implications in achieving HIV epidemic control, North Central, Nigeria

Bashorun<sup>9</sup>, B. Oyawola<sup>6</sup>, B. Kagniniwai<sup>8</sup>, A. Gambo<sup>10</sup>, E. James<sup>6</sup>, O. Onime<sup>6</sup>, R. Goldstein<sup>6</sup>, W. Okafor<sup>1</sup>, D. Abu Sambe<sup>11</sup>

<sup>1</sup>Center for Clinical Care and Clinical Research Nigeria and Johns Hopkins Program for International Education in Gynecology and Obstetrics (Jhpiego), Abuja, Nigeria, <sup>2</sup>Center for Clinical Care and Clinical Research Nigeria, Abuja, Nigeria, <sup>3</sup>Johns Hopkins Program for International Education in Gynecology and Obstetrics (Jhpiego), Program, Abuja, Nigeria, <sup>4</sup>Center for Clinical Care and Clinical Research Nigeria, Kwara, Nigeria, <sup>5</sup>Center for Clinical Care and Clinical Research Nigeria and Johns Hopkins Program for International Education in Gynecology and Obstetrics (Jhpiego), Strategic Information, Kwara, Nigeria, <sup>6</sup>Office of HIV/AIDS and TB, United States Agency for International Development (USAID), Abuja, Nigeria, <sup>7</sup>Center for Clinical Care and Clinical Research Nigeria, Technical, Minna, Nigeria, <sup>8</sup>Office of HIV/AIDS and TB, United States Agency for International Development (USAID), Washington DC, United States, <sup>9</sup>National HIV/AIDS and STI Control Program, Abuja, Nigeria, <sup>10</sup>National Agency for the Control of AIDS, Abuja, Nigeria, <sup>11</sup>Johns Hopkins Program for International Education in Gynecology and Obstetrics (Jhpiego), Abuja, Nigeria

**Background:** Gender based violence (GBV) is a global public health problem, an act of violence/abuse perpetrated against a person's will that usually results in physical, sexual, or emotional/psychological harm. Global statistics shows 35% of women have experienced physical, emotional, or sexual GBV. 38% of murders of women are committed by the intimate partner.

The purpose of the study is to highlight the drivers of GBV in rural settings and its implications to achieving HIV epidemic control.

**Methods:** This is a mixed method retrospective study. We reviewed the hospital records of 2,000 clients randomly selected from 60 public hospitals in Kwara and Niger States (23 in Kwara and 37 in Niger) who had received gender-based services; including routine enquiry/GBV screening, GBV prevention and post GBV services in the community from October 2022 - September 2023. We analyzed the data with statistical tables/formula.

**Results:** From the 2,000 (F1,300; M 700) records reviewed, 778 (F509; M269) clients corresponding to 39% experienced different forms of GBV. 751 (F511; M 240) clients experienced physical/emotional violence, while 28 (F25; M 3) clients experienced sexual violence.

Out of 778 GBV survivors, 25%(195) had only basic or primary education as their highest educational qualification, 33% (257) were unemployed or do menial jobs, 8% (62) got married early before 25years of age, and 11% (86) were in polygamous marriages/family.

In total, 77% (599) out of 788 survivors (p-value <0.05) have one of these characteristics; illiteracy/low literacy levels, low socio-economic status/poverty, early marriage, and being in polygamous marriage/family.

**Conclusions:** Illiteracy/low literacy levels, low socio-economic status/poverty, early marriage, and being in polygamous marriage/family were the major drivers of GBV in rural community settings in North Central Nigeria. GBV (especially different forms of sexual violence) are among the drivers of the HIV epidemic.

It is important and timely to design GBV interventions which will focus in both urban and rural communities and hard-to-reach areas, this is a crucial step in the journey to achieve HIV epidemic control.

Further research is needed to shed light on the use of technology, digital application/software to enhance GBV prevention interventions and post GBV management.

of 2022, signifying a 29% increase from 7,920 in quarter four of 2021 [1]. We aimed to investigate the place of the Coaching Boys into Men (CBIM) initiative in addressing the root causes of gender based violence and HIV in Zambia's Kapiri Mposhi District.

1.<https://www.afrobarometer.org/publication/ad685-zambians-see-gender-based-violence-as-a-top-priority-though-many-consider-domestic-violence-a-private-matter>

**Methods:** Between October 2023 and December 2023, the USAID Controlling HIV Epidemic for Key and Underserved Populations (CHEKUP II) implemented by JSH, Implemented the Coaching Boys Into Men (CBIM) unified approach in fighting gender-based violence and HIV in Kapiri Mposhi District. CBIM aims to prevent sexual and gender-based violence in schools and communities. The Activity identified male coaches in schools to lead boys aged 10-14 into a series of 15-minute 13-card series. Focus group discussions were incorporated into sports with conversations around GBV, HIV and mental health. Desk reviews, pre and post session surveys were used.

**Results:** 19 coaches in 10 schools were trained and lead boys in a 13- card series. Out of a quarterly target of 282, 505 boys aged 10-14 were trained and graduated, representing 177% achievement. 101 boys were screened for mental health, of which 66 received Psychological First Aid, and 35 enrolled in sessions. According to a post-session survey, services enhanced the boys' coping mechanisms with them adopting equitable non-violence attitudes.

**Conclusions:** When boys and young men are 'caught young' with the knowledge of how to challenge harmful gender norms and promote healthy relationships, sustainable HIV and gender-based violence prevention outcomes are assured. The paper recommends the exploration of more all-encompassing approaches to the HIV response and the fight against GBV.

## THPEE588

Engaging boys in DREAMS programming for a safer tomorrow: a model for Coaching Boys Into Men (CBIM) in Kapiri Mposhi District, Central Zambia

K. Kasonde<sup>1</sup>, L. Chingumbe<sup>1</sup>, C. Kaonga<sup>1</sup>, J. Banda<sup>1</sup>

<sup>1</sup>John Snow Health, Technical, Lusaka, Zambia

**Background:** Historically, there has been a greater emphasis on programs tailored for adolescent girls than those for adolescent boys. This trend continues to pose a strain on gains in HIV prevention among adolescents. With epidemic control efforts increasingly shifting towards addressing structural barriers as a way to sustain current gains and an understanding of the intersection between sexual gender based violence and HIV transmission, there is an increasing need of including boys and men in GBV and HIV programs. The Zambia Police Victim Support Unit recorded 10,241 GBV cases in quarter four

## THPEE589

Effectiveness of the use of an evidence-based curriculum in the reduction of sexual violence among adolescent girls at risk of HIV infection in Kano State, North-West, Nigeria

L. Mohammed<sup>1</sup>, H. Nuhu Dikko<sup>1</sup>, F. Mairiga<sup>2</sup>, K. Eruchalu<sup>1</sup>, I. Pious<sup>1</sup>, A. Abubakar<sup>3</sup>, A. Agweye<sup>4</sup>

<sup>1</sup>Society for Family Health, Nigeria, Programs, Abuja, Nigeria, <sup>2</sup>Save the Children International, Programs, Abuja, Nigeria, <sup>3</sup>American International Health Alliance, Programs, Abuja, Nigeria, <sup>4</sup>United States Agency for International Development, Programs, Abuja, Nigeria

**Background:** Sexual violence against adolescent girls and young women (AGYW) increases their risk of HIV infection. In parts of the sub-Saharan Africa, sexual violence among adolescents is as high as 24% (pediatrics). The No Means No Worldwide reported that nearly half of sexual violence

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

is against girls aged 15 and younger. This study evaluated the effectiveness of an evidence-based curriculum (No Means No) that teaches empowerment self-defense skills for adolescent girls in preventing sexual violence in Kano Municipal Council, Tarauni, Fagge, Ungogo and Nassarawa LGAs of Kano State, Nigeria.

**Methods:** We conducted an orphaned and vulnerable children vulnerability assessment to identify adolescents at risk of HIV infection. The intervention collected data from the Sexual Assault Referral Centre, Kano State to identify communities with high cases of sexual violence. We taught the adolescent girls (N = 8,955) the skills to prevent sexual violence for 11 months.

We sampled 71 training cohorts of adolescent girls (n = 4,622) aged 9-17 to measure the knowledge gained and change in attitude through pre/post-test and focused-group discussions.

We measured behavioral outcome using anonymous beneficiary disclosure data from the total size of the population. We established a network referral system to provide post-GBV care to the survivors of sexual violence.

**Results:** The average increase in immediate knowledge on how to prevent sexual violence was 76% (pre-test 44%, post-test 78%); while the average change in attitude on gender and socialization was 68% with (pre-test 42%, post-test 71%). At baseline, adolescents had 65.5% rate of awareness about the occurrence of sexual violence in their communities.

After 11 months of intervention, 70 adolescents disclosed sexual assault against them and used the skills to prevent it. Sampled caregivers n = 12 representing 100% of the sample size, reported the effectiveness of this intervention on their children. 55 adolescent girls voluntarily conducted peer education for their peers in their communities.

**Conclusions:** The adolescent girls prevented sexual violence in these LGAs by using these skills. The intervention should be adapted by the Federal Government of Nigeria for implementation in secondary schools across the country to improve impact.

# Integration of HIV services with other health and support services

## THPEE590

**DOTS PLUS: a promising approach to increasing adherence to tuberculosis, drug resistant tuberculosis and antiretroviral HIV treatment in Mozambique**

A. Abdula<sup>1</sup>, H. Hallstrom<sup>1</sup>, A. Mugunhe<sup>1</sup>, A. Baptista<sup>1</sup>, P. Nota<sup>2</sup>, U. Jantar<sup>3</sup>, P. Zindoga<sup>4</sup>

<sup>1</sup>ADPP, LTBR, Maputo, Mozambique, <sup>2</sup>ADPP, LTBR, Quelimane, Mozambique, <sup>3</sup>DPS, PNCT, Quelimane, Mozambique, <sup>4</sup>USAID, TB, Maputo, Mozambique

**Background:** According to WHO Global Tuberculosis (TB) Report (2023), Mozambique is extremely high burden for TB, drug resistant TB (DR-TB) and HIV-associated TB, where over 75% of estimated DR-TB cases remain undetected and one-third of people with DR-TB also live with HIV. Addressing barriers to (DR-) TB diagnosis and treatment adherence is a national priority for reducing morbidity and mortality. Since 2019, ADPP Mozambique, a local NGO, has implemented a holistic, client-centered approach through the enhanced Direct Observation Treatment Strategy (DOTS) PLUS model.

**Description:** ADPP Mozambique, funded by USAID, leads implementation of the Local TB Response project in four provinces, in partnership with FHI360, Comusanas, Kupulumusana and DIMAGI.

The model, DOTS PLUS, comprises direct observation of (DR-) TB treatment **plus** psychosocial and financial support (for nutrition, transport, and other costs), and provision of pill boxes. DOTS PLUS support services include medication monitoring, regularly scheduled visits, drug home deliveries, client escort for clinic visits, contact investigation plus TPT for eligible contacts.

**Lessons learned:** From May 2020 to September 2023, the project diagnosed 85,904 people with TB and 743 people with DR-TB (53% of all new TB diagnoses and 39% of new DR-TB diagnoses in the 50 target districts); 291,649 contacts of people with TB were screened for TB and HIV resulting in 1898 people diagnosed with TB (1715 DS TB and 183 DR-TB) and 394 (23%) people with TB also diagnosed with HIV. A total of 73,570 people were initiated on TPT and all people with concomitant HIV started on ART.

In total, DOTS PLUS support was provided to 1,219 people with DR-TB achieving 99% adherence to TB and ART (for those with concomitant HIV), 79% treatment success, 7% death, 4% not evaluated and 2% lost to follow up. These results compare positively to previous results of 52% treatment success and 21% of mortality.

**Conclusions/Next steps:** Providing DOTS PLUS for people with TB, DR-TB and concomitant HIV has demonstrated both scalability and good outcomes in the Mozambican context. Providing wraparound care and communi-

ty-based follow-up support improves (DR-) TB case finding and treatment success, HIV-TB integration and TPT uptake reducing morbidity and mortality.

## THPEE591

The facilitators and barriers to the access of mental health services and support for people living with HIV in China: a qualitative study from a client's perspective

L. Zhencheng<sup>1</sup>, H. Hongyan<sup>1</sup>, S. Yijia<sup>2</sup>, W. Dan<sup>1</sup>

<sup>1</sup>Nanjing Medical University, Department of Social Medicine and Health Education, Nanjing, China, <sup>2</sup>The University of Hong Kong, Hong Kong, Hong Kong, SAR of China

**Background:** People living with HIV (PLHIV) in China face significant mental health burdens, including depression, anxiety, and suicidal tendencies. The mental health needs of PLHIV remain unmet due to the fragmented nature of the Chinese healthcare system. Mental health screening and treatment are lacking in the HIV clinic, and mental healthcare providers lack expertise in HIV care. This dual service gap contributes to fragmentation in the HIV care cascade.

The aim of this study was to explore the factors that influence access to mental health services from the perspective of PLHIV in China.

**Methods:** This qualitative research, through online in-depth semi-structured interviews, was conducted with 21 PLHIV nationwide in China between November 2023 and January 2024. The interviews explored participants' understandings and experiences of mental health coping, help-seeking, and related social and health services, as well as perceived facilitators and barriers to accessing service. Data was coded in NVivo 14 employing the Anderson service utilization model.

**Results:** 21 PLHIV, mostly identifying as men who have sex with men (MSM), were recruited with various educational backgrounds and ages ranging from 25 to 49. Half of the participants have experience in coping with and accessing services when confronted with mental health challenges. The key barriers encompassed deficient mental healthcare infrastructure at the contextual level, and limited access and privacy concerns at the individual level. Stigma and discrimination associated with HIV and strained doctor-client relationships were identified as barriers at the health behavior level.

The key facilitators involved CBO-led care linkage at the contextual level. At the individual level, facilitators included awareness and destigmatization of mental healthcare, knowledge and economic capital, and social support from peers, CDC workers, and relatives.

Streamlined healthcare logistics were identified at the health behavior level. Designated hospitals were preferred for PLHIV due to privacy protection, culture adaptation, and empathy of service providers.

**Conclusions:** Our findings underscore the importance of addressing disparities in access and healthcare information, ensuring privacy protection, fostering cultural competence among healthcare providers, and establishing an inclusive environment within the mental healthcare setting. Future research should consider the provider's perspective on the barriers and facilitators in service delivery in China.

## THPEE592

Nature of PEPFAR's above-site health system investments in 52 countries: PEPFAR led, PEPFAR supported integration, or partner country led?

A. Verani<sup>1</sup>, C. Griffin<sup>1</sup>, S. Ally<sup>1</sup>, M. Bartee<sup>1</sup>

<sup>1</sup>U.S. State Department, Bureau of Global Health Security and Diplomacy, PEPFAR, Washington DC, United States

**Background:** The United States President's Emergency Plan for AIDS Relief (PEPFAR) has invested in health systems above the site of service delivery. PEPFAR's Five-year Strategy states, "it will be critical to integrate large parts of the PEPFAR HIV programmatic effort more effectively into country-led programs and systems." A new indicator tracks integration of PEPFAR above-site activities into partner country systems.

**Methods:** We quantified above-site health systems investments according to a new measure in the PEPFAR Planning for Above-Site Investments Tool (PASIT) as part of the Country/Regional Operational Plan process for investments from October 2024 to September 2026. The Nature of Health Systems Investment measure includes three mutually exclusive response options for each above-site health system investment planned: 1. PEPFAR led (defined as "investment not integrated into health system"), 2. PEPFAR supported integration (defined as "jointly managed investment dependent on PEPFAR and host country support"), 3. Partner country led (defined as "host country ownership and management, PEPFAR enhances system"). PEPFAR country teams categorized each above-site health systems activity into one of the three options. We describe these activities by country, by World Bank income group (Low, Lower Middle, Upper Middle, High), and by region (Africa, Asia, Americas, Europe).

**Results:** Of 1,574 above-site health system investments planned by PEPFAR and partners across 52 countries, 18% were PEPFAR led, 49% were PEPFAR supported integration, and 33% were partner country led. The percentage of above-site health systems investments that were partner country led increased by each income group level (i.e., Low 30% to Lower Middle 33% to Upper Middle 37% to Upper 50%), yet the percentage of PEPFAR led activities was relatively constant across income groups (i.e., 15-20%). The corresponding proportions for PEPFAR led, PEPFAR supported integration and partner country led varied considerably by region.

Author Index

**Conclusions:** The percentage of above site health systems activities that were partner country led increased by income groups, which may indicate a relationship between partner country economic capacity and its leadership of these activities. Most activities were PEPFAR supported integration. Integration into partner country health systems may promote HIV response sustainability.

## THPEE593

**Mainstreaming HIV/AIDS prevention services within government health systems: a critical measure for sustaining interventions for PWID's in Bangladesh**

S.M.A.A. Reza<sup>1</sup>

<sup>1</sup>Varendra University, Master of Public Health, Rajshahi, Bangladesh

**Background:** HIV intervention was NGO driven program from the beginning of the HIV from different funding streams but funds was winding up day by day and government is taking over the development project like HIV. The HIV prevention program is a major project undertaken by the Bangladesh government and a major target of the SDGs 3.3 From that point of view, the government is determined to fulfill this responsibility. Global fund is in transition phase and integration to the Government facilities of the KP services.

**Description:** APOSH emerged as a Shelf-Help Group of ex-drug users in Bangladesh in 1999. APOSH has been implementing Demand & HR intervention for PWID since 2004 through different projects. Currently, APOSH serves around 4564 PWIDs.

In 2022 APOSH started a comprehensive HIV prevention and treatment services in five Government hospital with National AIDS/STD Control (NASC) & SCI. Government Hospital provided space; NASC & SCI provided all TA support & APOSH is implementing this program. At present, in 5 Govt service center total 1807 PWID are provided the comprehensive package: last six months 1028 HIV testing, 62 STI, 75 Abscess management, 555 General Health service, 812 Health Screening, 246038 S/N distribution and 35650 Condoms distribution. Supplementary services medical consultations were also provided. PWID were referred to government services for all clinical services, TB care & drug dependence counseling.

**Lessons learned:** The project spends \$ 200 taka per month per service center/\$ 2400 per year/5 Services center, total \$ 12000 In one year these five service centers, to run this program by renting a house outside, but now no money is being spent. Now all utility cost is borne by the Hospital authorities.

**Conclusions/Next steps:** KP intervention which will be implemented by the APOSH from the hospitals. KPs are stigmatized in our society and their behavior may not be similar to general people. Thus, they deserve separate attention from the service providers.

Moreover, integration of this program to government hospitals is making it possible to provide all services under one umbrella. It is cost effective and sustainable as well. This is a unique and innovative HIV Program in Bangladesh.

## THPEE594

**Transformative impact: scaling OST services leads to substantial decline in HIV prevalence among PWID in Dhaka, Bangladesh**

M.-U. Rashid<sup>1</sup>, C.A.A. Asif<sup>2</sup>, S. Rahman<sup>1</sup>, A.J. Shilpy<sup>1</sup>

<sup>1</sup>CARE Bangladesh, Health and Nutrition, Dhaka, Bangladesh, <sup>2</sup>Save the Children in Bangladesh, Health and Nutrition Sector, Dhaka, Bangladesh

**Background:** CARE Bangladesh has spearheaded the PWID intervention since 1998, continuing through the Global Fund from 2008. Notably, HIV cases peaked from 2016-2018, reaching 27.3% prevalence among PWID in Dhaka City in 2016. The intervention saw significant growth in 2018 when CARE and Save the Children rapidly scaled up OST services across 11 centers by 2023, benefiting 2,750 PWID, including 550 HIV-positive individuals.

This strategic scale-up contributed to a remarkable decline in HIV prevalence among PWID in Dhaka, reaching 5.1% as per IBBS 2021, showcasing the program's substantial success in HIV prevention.

**Description:** Adhering to the global commitment of 95-95-95, the PWID intervention aims to annually engage 95% of the listed PWID in HIV Testing Services (HTS). The data from 2016 to 2023 provides valuable insights into HIV testing and treatment trends. The number of HIV tests conducted annually has remained relatively stable, fluctuating between approximately 7,000 and 14,000 tests. Notably, the number of HIV-positive cases peaked in 2018 at 176, followed by a decrease in subsequent years.

Despite the variations in the number of positive cases, the HIV identification rate has generally declined from 2.5% in 2018 to 0.3% in 2022 and 2023.

This suggests a positive trend in controlling and identifying HIV cases within the tested population. Concurrently, the number of clients receiving Opioid Substitution Therapy (OST) in Dhaka has shown a consistent increase, reaching 2,150 in 2023. This growth in OST clients underscores the importance of comprehensive healthcare strategies, including both HIV testing and substance abuse treatment, in addressing public health challenges.

**Lessons learned:** The majority of hard-core People Who Inject Drugs (PWIDs) are consistently participating in Opioid Substitution Therapy (OST) and maintaining regular contact with the Psycho-social Counselor.

Consequently, the likelihood of needle syringe sharing has been significantly reduced, leading to a declining trend in HIV transmission. This underscores the noteworthy impact of the OST program on the PWID community.

**Conclusions/Next steps:** OST proves to be an effective and successful initiative in preventing the transmission of HIV. This service plays a crucial role in halting the spread of HIV among individuals who inject drugs.

## THPEE595

**Bridging the gap: integrating mental health screening into routine HIV care at Anti-Retroviral Treatment Center in Delhi, India**

S. Anuradha<sup>1</sup>, M. Goyal<sup>2</sup>, S. Singh<sup>2</sup>, S. Kataria<sup>3</sup>

<sup>1</sup>Maulana Azad Medical College, Department of Medicine, Delhi, India, <sup>2</sup>UW International Training and Educational Center for Health (ITECH-India), Delhi, India, <sup>3</sup>ART Center, Lok Nayak Hospital, Delhi, India

**Background:** People living with HIV (PLHIV) bear a disproportionate burden of mental health conditions. Worldwide, PLHIV frequently encounter mental health challenges at an elevated rate compared to the general population. These mental health conditions can significantly affect adherence to HIV treatment and retention in care. To address this concern, we integrated a mental health screening initiative at the Anti-Retroviral Treatment (ART) center in Delhi.

This approach involves collaboration between lay healthcare workers and clinicians, aiming to seamlessly integrate mental health services into the routine care provided at the ARTCs.

**Description:** This ongoing initiative involves systematically screening all adult PLHIV aged  $\geq 18$  years during their routine visits. A screening protocol, following current national guidelines, was established, and the staff at the ART center received specialized training to screen and identify mental health conditions.

The trained lay healthcare workers conducted initial screenings using a designated mental health screening tool, specifically Patient Health Questionnaire-2 (PHQ-2). Subsequently, individuals identified as positive for PHQ-2 underwent a comprehensive screening using PHQ-9. Those testing positive on PHQ-9 are referred to trained clinical mental health experts for further assessment, diagnosis, and treatment.

Depending on the results, ART clients identified with mild disorders received counseling from ARTC counselors, those with moderate disorders were referred to psychologists for counseling, and individuals with moderate to severe disorders were linked with the Department of Psychiatry for initiation of treatment.

**Lessons learned:** During the initial three-month implementation phase (November-2023 to January-2024), healthcare staff at ARTC screened 1500 PLHIV for mental health. Among those screened, 11.7% (171/1500) identified positive on the PHQ-2 and underwent the PHQ-9 assessment. On the PHQ-9, 87.7% (150/171) were identified as likely to have mild to severe mental health conditions.

Among these, 64.7% (97/150) individuals received individual counseling at the ARTC, while 35.3% (53/150) with suspected moderate to severe mental health condition were referred to psychiatrists for further evaluation and management.

**Conclusions/Next steps:** Routine screening of PLHIV for mental health helps to proactively identify and manage PLHIV with co-morbidities. The integration of mental health services into HIV care through a task-sharing approach is a feasible strategy that could increase access to mental health services among PLHIV.

## THPEE596

**Screening for mental health disorders among vulnerable people living with HIV: lessons learned from 11 demonstration facilities in Tanzania can inform broader integration**

J. Songoro<sup>1</sup>, B. Silvan<sup>2</sup>, R. Shigi<sup>3</sup>, C. Genge<sup>4</sup>, C. Lenz<sup>5</sup>, F. Haraka<sup>6</sup>, R. Van de Ven<sup>1</sup>, S. Kimambo<sup>1</sup>, M. Bateganya<sup>7</sup>

<sup>1</sup>EGPAF, Care and Treatment, Dar Es Salaam, Tanzania, the United Republic of, <sup>2</sup>Ministry of Health, Care and Treatment, NASHCOP, Dodoma, Tanzania, the United Republic of, <sup>3</sup>EGPAF, Care and Treatment, Arusha, Tanzania, the United Republic of, <sup>4</sup>EGPAF, Care and Treatment, Dodoma, Tanzania, the United Republic of, <sup>5</sup>EGPAF, Care and Treatment, Washington DC, United States, <sup>6</sup>EGPAF, Research, Dar Es Salaam, Tanzania, the United Republic of, <sup>7</sup>USAID, TB/HIV, Dar Es Salaam, Tanzania, the United Republic of

**Background:** Integrating mental health screening within existing HIV programming is a global priority given the high risk of mental health disorders among people living with HIV (PLHIV). Mental health screening in Tanzania is not routinely done as recommended by the World Health Organization. The Elizabeth Glaser Pediatric AIDS Foundation, through the USAID-funded Afya Yangu Northern project, integrated mental health screening in 11 HIV clinics in Tanzania.

**Description:** Eleven HIV clinics were selected from 472 project-supported sites to serve as demonstration sites. Mental health screening tools for HIV care providers were adapted from existing national mental health diagnostic tools. Recording and reporting tools were developed, as well as referrals pathways.

We screened for symptoms and signs of anxiety, depression, post-traumatic stress disorders (PTSD), psychosis, drug use, and dementia. Screening was prioritized for vulnerable PLHIV—namely, those with a high viral load, newly initiated on antiretroviral therapy (ART), returned to treatment (RTT), pregnant and breastfeeding women (PBFW), and gender-based violence survivors.

Patient-level data were abstracted from routine clinic registers for the period of April 2023 to September 2023. Data analyzed included the proportions of individuals

Oral

Late-breaker abstracts

Author Index

screened, disaggregated by sex; proportion with symptoms suggestive of mental health disorders; and proportions referred to mental illness care clinics.

**Lessons learned:** Among 2,129 vulnerable PLHIV 1,974 (88%) were screened for mental health disorders. Those screened included 1500 (80%) women, 749 (40%) PBFW, and 642 (34%) PLHIV newly initiated on ART. At least one symptom suggestive of a mental health disorder was identified in 769 (41%) individuals screened with 364 (47%) requiring referral to mental health providers.

These individuals were escorted to the mental health clinics and completed referrals for diagnosis and treatment were confirmed by mental health providers. Depression and anxiety were the most frequently reported disorders at 33% (254/769) and 28% (216/769) respectively.

**Conclusions/Next steps:** Integrated mental screening targeting vulnerable cohorts of PLHIV is feasible in routine care. Without screening, serious mental disorders could be missed. For full integration, systems are needed to ensure HIV providers are equipped with skills to manage common mental health disorders and refer those with serious illness.

## THPEE597

The effectiveness and impact of point-of-care diagnosis on improving TB case finding among people living with HIV (PLHIV); a strategic intervention for optimizing TB/HIV collaboration

E. Ajayi<sup>1</sup>, A. Agbaje<sup>2</sup>, C. Mensah<sup>3</sup>, P. Dakum<sup>2</sup>, F. Adole<sup>4</sup>, S. Odunjo<sup>5</sup>, F. Odiaka<sup>4</sup>, T. Famodu<sup>4</sup>, O. Daniel<sup>6</sup>, R. Eneogu<sup>7</sup>, D. Nongo<sup>7</sup>

<sup>1</sup>Institute of Human Virology, Program (Prevention, Treatment and Care), Abeokuta, Nigeria, <sup>2</sup>Institute of Human Virology, Program, Abuja, Nigeria, <sup>3</sup>Institute of Human Virology, Program/Administrative, Abuja, Nigeria, <sup>4</sup>Institute of Human Virology, Program/Strategic Information, Abeokuta, Nigeria, <sup>5</sup>Society for Family Health, Program/Community Mobilization, Abeokuta, Nigeria, <sup>6</sup>Institute of Human Virology, Program, Lagos, Nigeria, <sup>7</sup>United State Agency for International Development-Nigeria, Program, Abuja, Nigeria

**Background:** HIV and Tuberculosis are the world's two most deadly diseases and TB is the leading cause of death among people living with HIV (PLHIV). In addition to early access to ART, high quality TB screening, and prompt TB testing are critical interventions to ensure that people with HIV receive timely treatment for TB disease thereby preventing mortality and improving their quality of life.

**Description:** This study was conducted in a facility with the highest burden of TB/HIV co-infection in Ogun state, Nigeria. As part of effective TB/HIV collaboration, active TB screening takes place at ART clinic while HIV testing and counselling is also done for all TB presumptive cases identified from OPD screening activity. HIV positive clients

with CD4 count less than 200 (Advanced HIV disease) are tested with LF-LAM while other HIV positive clients are evaluated with GeneXpert or Chest X-ray appropriately.

**Lessons learned:** With LF-LAM point-of-care TB diagnosis, the facility recorded the highest TB/HIV co-infection case finding in Quarter 4, 2021 with an overall documented statewide incidence rate of 10% in 2021 compared with the 8% of 2020. A downward trend in the case finding began from Quarter 1, 2022 when the stock of LF-LAM test kit started declining and then nosedived in Quarter 3 and 4 of 2022 due to stock-out of LF-LAM test kit in the country.

Table 1.0 Means of Diagnosis

Quarter	GeneXpert	LF LAM	CXR	Total Diagnosed
Q4 2021	12(44%)	12(44%)	3(11%)	27
Q1 2022	5(28%)	11(61%)	2(11%)	18
Q2 2022	7(41%)	7(41%)	3(18%)	17
Q3 2022	3(33%)	1(11%)	5(56%)	9
Q4 2022	4(40%)	0(0%)	6(60%)	10

Table 2.0 CD4 Status.

Quarter	Sub Total	New FX CD4 Count		Sub Total	Old FX CD4 Count		Sum Total
		>200	<200		>200	<200	
Q4 2021	20	11 (52%)	9 (42%)	7	0 (100%)	27	
Q1 2022	14	5 (36%)	9 (64%)	4	0 (100%)	18	
Q2 2022	14	9 (64%)	5 (36%)	3	0 (100%)	17	
Q3 2022	9	3 (33%)	6 (67%)	0	-	9	
Q4 2022	10	4 (40%)	6 (60%)	0	-	10	
Total	67	32 (48%)	35 (52%)	14	0 (100%)	81	

**Conclusions/Next steps:** LF-LAM point-of-care TB diagnosis is effective at improving TB case detection among PLHIV and comparatively more sensitive than GeneXpert and CXR in TB diagnosis particularly among patients with advanced HIV disease because of the paucibacillary TB disease.

It is therefore recommended that policy should support resource mobilization for adequate supply of LF-LAM test kits to national TB program which can positively impact on finding all missing TB cases among PLHIV, consequently promoting prompt TB treatment and reducing TB-related mortality.

## THPEE598

### The integration of a mental health referral system within adolescent HIV clinics

D.W.S. Chow<sup>1</sup>, D. Dow<sup>2</sup>, P. Pronyk<sup>3</sup>, R. Mgimba<sup>4</sup>, W. Elimwaria<sup>5</sup>, R. Ndaki<sup>6</sup>, A. Ambokile<sup>7</sup>

<sup>1</sup>Duke-NUS Medical School, MD Programme, Singapore, Singapore, <sup>2</sup>Duke University, Paediatrics Infectious Diseases, Durham, United States, <sup>3</sup>Duke-NUS Medical School, Department of Infectious Disease, Singapore, Singapore, <sup>4</sup>Baylor College of Medicine Tanzania, Mbeya, Tanzania, the United Republic of, <sup>5</sup>Baylor College of Medicine Tanzania, Mwanza, Tanzania, the United Republic of, <sup>6</sup>Ifakara Health Institute, Ifakara, Tanzania, the United Republic of, <sup>7</sup>Kilimanjaro Christian Medical Centre, Mental Health Department, Kilimanjaro, Tanzania, the United Republic of

**Background:** Mental health screening in HIV clinics is rare, especially in resource-limited settings. This is in part due to the lack of referral systems. This study evaluates the feasibility of integrating a mental health referral pathway for young people living with HIV (YPLWH) who screen positive for symptoms across four unique clinical settings in Tanzania.

**Methods:** As part of Sauti ya Vijana (SYV), a peer-led mental health intervention for YPLWH, we developed an integrated referral pathway within adolescent HIV clinics. At each study visit, youth responded to interviewer-guided mental health screening tools using the REDCap Mobile app. Automatic referral alerts were sent to the study team if: a score of  $\geq 10$  on the Patient Health Questionnaire-9 or General Anxiety Disorder-7 is met, any instance of sexual abuse, self-harm, or suicidal ideation is reported, or by an interviewer specified concern. Site-specific referral flowcharts were developed based on site-specific manpower and facilities. Referrals were documented in the study logbook, entered into REDCap, and analysed for incidence, attendance, and outcome.

**Results:** To date, 52 (15%) of the 351 enrolled youth generated 63 alerts (Figure 1).

Figure 1. Number of youth referrals by study visit timepoint.

Seventy-one percent attended their referral appointment, of which 76% reported resolution of their mental health distress, with 62% after a single visit. Referred YPLWH saw a trained counsellor (68%), and the remaining

saw psychologists (14%), psychiatrists (14%) and the clinic physician (5%). Challenges included undocumented outcomes (15%), refusal (2%) and non-attendance (12%) of referrals, particularly in one clinic, which relies on referrals to an external mental health department, unlike the other three clinics with on-site referral services.

**Conclusions:** Despite barriers such as stigma, logistics, and financial limitations, many YPLWH improved after a single referral visit for mental health distress.

The study demonstrated the feasibility and benefits of integrating a mental health referral pathway within the existing adolescent HIV clinic structure.

## THPEE599

### Implementation determinants for PrEP among peripregnant women who use drugs and have a history of incarceration in the U.S.

K. Nowotny<sup>1</sup>, K. Culbertson<sup>2,1</sup>, D. Estes<sup>2</sup>, T. Chueng<sup>1</sup>, K. Ciraldo<sup>1</sup>, E. Suarez<sup>1</sup>, J. Younts<sup>3,4</sup>, M. McKenna<sup>1</sup>

<sup>1</sup>University of Miami, Coral Gables, United States, <sup>2</sup>LEAP for Ladies, Miami, United States, <sup>3</sup>Justice Impact Alliance, Washington DC, United States, <sup>4</sup>Florida Justice Center, Fort Lauderdale, United States

**Background:** This study addresses the syndemic of drug use, incarceration, reproductive health, and HIV risk among women of reproductive age. We conducted a community-engaged, mixed-methods research study to identify the implementation barriers and facilitators to implementing PrEP and understand the multilevel barriers to HIV risk reduction during reentry from the perspective of peripregnant women who use drugs and have a history of incarceration living in Miami-Dade County, a priority county for ending the HIV epidemic in the U.S.

**Methods:** During 2023 we conducted semi-structured qualitative interviews and brief surveys with 34 peripregnant women who use drugs and have a history of incarceration and semi-structured qualitative interviews with 11 providers working in the areas of HIV or reentry services. The research was funded by the NIH Ending the HIV Epidemic initiative (3P30MH116867-04S2) and was approved by the University of Miami Human Subjects Review Board. Qualitative interviews were transcribed verbatim and were analyzed using a general inductive approach and team-based thematic coding in NVivo.

**Results:** Individual-level determinants described by women include not being familiar with PrEP, concerns about taking medications during pregnancy, and not perceiving themselves as having risk for HIV acquisition. Most women expressed preference for LAI PrEP versus daily oral medication. Women did not have a regular reproductive health provider and when they experienced pregnancy it was difficult to find appropriate services. Women reported that when they did receive reproductive health care, their provider did not discuss PrEP with them. Women

seemed supportive of integrating reproductive health services into harm reduction programs. Data from both women and providers indicate a fragmented service system: HIV providers had very little knowledge of the complex legal challenges that women in our study reported, and reentry providers had very low knowledge about, but high interest in, HIV/PrEP services.

**Conclusions:** Supportive and non-stigmatizing reproductive health should be part of reentry and harm reduction/drug treatment services in combination with HIV prevention/PrEP for women of reproductive age who use drugs. Given the high level of coercive system involvement (family services, police, etc.), which complicates healthcare treatment for women, a medical legal partnership model may be effective for this client population.

## THPEE600

### USAID/PEPFAR contributions to dual HIV and syphilis elimination efforts in pregnant persons in eight countries

A. Vrazo<sup>1</sup>, J. Firth<sup>2</sup>, M. Hartig<sup>1</sup>, M. Newman Owiredi<sup>3</sup>, M. Barr-DiChiara<sup>4</sup>, J. Rowley<sup>5</sup>, V. Wong<sup>2</sup>, E. Manfredini<sup>1</sup>, D. Patel<sup>1</sup>, E. Takang<sup>6</sup>, T. Okegbe<sup>1</sup>

<sup>1</sup>GHTASC, Credence Management Solutions LLC, supporting USAID Office of HIV/AIDS, Prevention Care and Treatment Division, Washington, United States, <sup>2</sup>USAID Office of HIV/AIDS, Prevention Care and Treatment Division, Washington, United States, <sup>3</sup>World Health Organization, Treatment and Care Unit, Global HIV, Hepatitis and STIs Programmes, Geneva, Switzerland, <sup>4</sup>World Health Organization, Testing Prevention and Populations Unit, Global HIV, Hepatitis and STIs Programmes, Geneva, Switzerland, <sup>5</sup>World Health Organization, Strategic Information Analysis and Use Unit, Global HIV, Hepatitis and STIs Programmes, Geneva, Switzerland, <sup>6</sup>U.S. Department of State, Public Health Systems Unit, Bureau of Global Health Security and Diplomacy/PEPFAR, Washington, United States

**Background:** Elimination of vertical transmission of HIV and syphilis is a global priority and has been validated in several countries. Multiple stakeholders support inclusion of HIV and syphilis testing at the first antenatal care (ANC1) visit, in alignment with World Health Organization (WHO) guidance, and some PEPFAR-funded programs have procured syphilis testing and treatment commodities.

This analysis quantifies PEPFAR's testing and commodity contributions to dual elimination efforts in eight countries that report syphilis in pregnancy data to WHO.

**Methods:** We reviewed routine data from eight USAID/PEPFAR-supported countries (Haiti, DRC, Kenya, Lesotho, Nigeria, Tanzania, Uganda, Zimbabwe) including: 1) HIV testing coverage at ANC1 in Fiscal Year 2022 (FY22, USAID/PEPFAR), 2) procurements of syphilis rapid test kits (RTKs),

HIV/syphilis RTKs, and Benzathine Penicillin G (BPG) (FY20-22, PEPFAR), and 3) national syphilis testing coverage, seropositivity, and treatment coverage in pregnancy in calendar year 2022 (WHO Global Health Observatory data). Data on accessibility of quality-assured BPG for syphilis treatment and congenital syphilis case estimates were too limited to include.

**Results:** HIV testing coverage at ANC1 averaged 96% (range: 83-100%), while syphilis testing coverage in pregnancy averaged 67% (range: 21-96%). The average syphilis positivity among ANC attendees was 2.3% (range: 0.59-8.03%), and an average of 72% (range: 17-100%) of ANC attendees with a reactive syphilis test received treatment. In FY20-22, Nigeria, Uganda, and Zimbabwe procured dual HIV/syphilis RTKs, Uganda and Haiti procured syphilis RTKs, and Nigeria, Uganda, and Haiti procured BPG using PEPFAR funds.

**Conclusions:** USAID/PEPFAR strongly supports global goals to eliminate vertical transmission of HIV and syphilis. The stark differences in testing coverage for syphilis and HIV in pregnancy may be attributable to gaps in necessary commodities and service delivery approaches for syphilis. Additionally, poor treatment coverage in some settings, limited availability of high-quality data on syphilis treatment coverage, partner follow-up, congenital syphilis rates, and syphilis commodity procurements across procurement agents warrants further attention.

Multi-stakeholder efforts are needed to develop integrated approaches to service delivery and procurement to ensure that platforms created to prevent vertical HIV transmission are adequately leveraged to support elimination of vertical transmission of syphilis, and expanded to include triple elimination of hepatitis B.

## THPEE601

### Breaking barriers to integration of HIV and mental health services delivery in Kenya

E. Munene<sup>1</sup>, J. Ngari<sup>1</sup>

<sup>1</sup>Health Rights Advocacy Forum (HERAF), Nairobi, Kenya

**Background:** Mental health conditions increase the risk of HIV infection, and PLWH have increased risk of mental health conditions and low adherence to HIV treatment, increase risk behaviours, and HIV prevention.

The purpose was to strengthen integration of mental health and HIV services delivery in Kenya in order to promote early detection and management of comorbidity of HIV and mental health conditions.

**Description:** Conducted baseline survey, targeted key influencers of HIV and mental health at community, health facilities and policy levels, increased their awareness of HIV and mental health comorbidity and WHO quality rights. Further, improved attitude and practices in services provision. Advocated for legal, policy, planning and budgetary reforms, and conducted end line survey.

**Lessons learned:** Both HIV and mental health conditions were associated with multiple stigma leading to discrimination and social exclusions. However, HIV services delivery systems were advanced and provided platform to promote mental health interventions. HIV services providers and support groups were trained on Problem Management Plus (PM+) and Mental Health Gap (mhGAP). This sustained access to HIV and mental health services for 1,331 clients, establishment of 17 psychosocial support groups, and mobilisation of 18 champions.

Factors determining HIV and mental health were multi-sectoral, hence interventions adopted a multi-sectoral approach. Incorporated HIV and mental health in all facets of the economy including justice system. This enabled women, teen mothers, PLWHA and PWDs with mental health conditions facing abuse, disinheritance and abandoned to access justice with support of *probono* lawyers. Universal health coverage successes require targeted legal, policy, planning and investments. While HIV programmes have sound and progressive laws, policies and investment plans, mental health was incapacitated. Rigorous advocacy led to amendments to mental health law, policy, establishment of coordination structures and integrated costed mental health plans provided opportunities for joint HIV and mental health planning, facility and outreach services delivery.

**Conclusions/Next steps:** Integration of mental health to HIV services is challenged by lack of understanding of mental health, and relationships between HIV and mental health. Nonetheless, creating awareness, capacity building, working with gatekeepers, health providers, policy makers and stakeholders is crucial for successes on integration of HIV and mental health services delivery.

## THPEE602

### Integration of HIV services with primary health care in Africa: a comprehensive review of costs and cost-effectiveness

I.K. Seninde<sup>1,2</sup>, C. Schütte<sup>1</sup>, E. Smith<sup>1</sup>

<sup>1</sup>Genesis Analytics, Health Practice, Johannesburg, South Africa, <sup>2</sup>University of the Witwatersrand, School of Economics and Finance, Johannesburg, South Africa

**Background:** The integration of HIV services with primary health care (PHC) has gained significant attention in recent years, as a strategy to enhance the delivery of comprehensive care for individuals living with HIV. This review aimed to assess existing literature about costs and cost-effectiveness of integrating HIV services in PHC, to identify gaps in understanding pathways to integration, and the resulting economic implications of HIV integration in PHC.

**Methods:** A literature search was conducted in PubMed and the National Health Service - Economic Evaluation database, from 01 January 2012 to March 30, 2023. Out of

90 studies, 19 studies (including 1 systematic review) were included, with 10 estimating cost-effectiveness and 9 focusing on costing for integration. An exploratory analysis of costing methods, components, and the economic impact of integrating HIV services in PHC, was undertaken.

**Results:** Most studies were implemented in Kenya (n=7) and South Africa (n=5), with additional studies in Zambia, Malawi and Uganda. Integrated services included non-communicable diseases, family planning, and Sexual and Reproductive Health (SRH).

Findings suggest that integrating HIV services reduces unit costs and is associated with cost-effectiveness. However, its impact non-major cost drivers, such as personnel and medical supplies, remained inadequately addressed and examples from integration beyond facility-level pilot programs are limited.

**Conclusions:** This review underscores that integration of HIV services with other health services is largely associated with cost-savings and cost-effectiveness, but evidence from interventions beyond pilot studies remains limited. In addition, pathways of how integration unfolds and impacts on costs are not well-documented or illustrated, specifically at the health system level. Developing a framework for these pathways is crucial for understanding integration and its impact on unit and total costs. Further research is essential to explore these pathways and assess the long-term costs and cost-effectiveness of HIV integration in PHC at all levels of the health system.

### Implementation of screening for hazardous alcohol use to address mental health among key populations in three Zambian provinces

A.O. Adebayo<sup>1,2</sup>, L.K. Mwango<sup>3</sup>, T. Lascko<sup>4,5</sup>, C. Baumhart<sup>5,4</sup>, P. Olowski<sup>2</sup>, E. Silomba<sup>3</sup>, J. Chipukuma<sup>3</sup>, O. Chituwo<sup>6</sup>, C.W. Claassen<sup>2,4,5</sup>

<sup>1</sup>UMB-Maryland Global Initiatives Corporation (MGIC), Strategic Information and Evaluation, Lusaka, Zambia, <sup>2</sup>Maryland Global Initiatives Corporation, Lusaka, Zambia, <sup>3</sup>Ciheb Zambia, Lusaka, Zambia, <sup>4</sup>Center for International Health, Education, and Biosecurity, University of Maryland School of Medicine, Baltimore MD, United States, <sup>5</sup>Institute of Human Virology, University of Maryland School of Medicine, Baltimore MD, United States, <sup>6</sup>U.S. Centres for Disease Control and Prevention, Division of Global HIV and TB, Lusaka, Zambia

**Background:** In sub-Saharan Africa individuals from marginalized or vulnerable key populations (KPs) with limited access to healthcare often face increased risk of engaging in hazardous drinking behaviors. Addressing hazardous alcohol use among KPs requires equitable mental health (MH) services integrated into safe spaces to provide support and reduce harm. The Community Impact to Reach Key and Underserved Individuals for Treatment and Support (CIRKITS) project integrated MH and alcohol use screening into KP safe spaces in Southern, Western, and Eastern provinces of Zambia.

**Methods:** From October 2022 through June 2023, healthcare workers at KP safe spaces were trained to administer the Cutting down, Annoyance by criticism, Guilty feeling, and Eye-openers (CAGE) questionnaire. The CAGE tool consists of four standardized questions to screen for hazardous alcohol use to identify individuals with problematic drinking behaviors.

A "yes" response to two or more questions indicates that further assessment for alcohol-related problems may be warranted. All KP clients accessing HIV services at the safe spaces were offered MH screening, including CAGE. All clients who consented were screened and data documented.

KP clients were categorized with hazardous use and non-hazardous use; clients at risk for hazardous use were referred to services at the health facility. Data were analyzed using R Studio.

**Results:** Using CAGE, 236 KP were screened for hazardous alcohol use, with 172 (73%) categorized as hazardous alcohol users. When disaggregated by age, 81% of KPs aged 17-24 years and 70% of KPs over 25 years had hazardous alcohol use. A higher proportion of KPs aged 17-24 exhibited hazardous behaviors around their alcohol use. Among KPs with hazardous alcohol use, 80 (47%) were men who have sex with men, 64 (37%) were female sex workers, 19% (11) were people who inject drugs, and 9 (5%) were people who are transgender.

**Conclusions:** In Zambia, about three quarters of KPs screened reported hazardous alcohol use. The integration of screening services is the first step to providing additional care and support to KPs, but further services need to be implemented to provide critical mental health services to vulnerable populations.

## THPEE604

### Who is the grim reaper: a descriptive retrospective review on causes of mortality amongst PLHIV in 4 counties in Kenya

A. Kahiga<sup>1</sup>, M. Kitheka<sup>1</sup>, S. Bii<sup>2</sup>, D. Juma<sup>1</sup>

<sup>1</sup>USAID Tujenge Jamii, Nakuru, Kenya, <sup>2</sup>USAID Kenya, East Africa, Nairobi, Kenya

**Background:** Despite significant advances in HIV treatment, mortality remains high among PLHIV in Kenya, with advanced HIV disease (AHD) as the leading cause. In Kenya, approximately 28,200 people living with HIV (PLHIV) died in 2017, a 48 % decline compared to 53,900 in 2010. Among children <15 years, the deaths were estimated at 4,300 in 2017 down from 10,200 in 2010, a 58% decline. This review was done to analyze the causes of death with the aim to strengthen the health system to address preventable causes of death.

**Description:** USAID Tujenge Jamii is an HIV project supporting 60,150 clients on ART in 189 clinics as of 31st October 2023. The project developed a customized open data kit (ODK) collection tool to collect data for any client reported as died across the 189 sites in 4 counties in Kenya. Health care providers were sensitized on monthly data collection of all the mortalities from October 2022 to September 2023. The cause of death was based on verbal autopsy as reported by the next of kin or the health care workers post data review. Data was reviewed and disaggregated by cause of death, geographical area, age, and sex.

**Lessons learned:** From the treatment cohort of 59,849, the crude death rate was 1.06% for Clients aged above 15 years (Male=1.4%, Female=0.9%), and 0.9% for children aged below 15 years (Male=0.9%; Females=0.4%). Of these, 30% (194) were classified as WHO stage 3 and 4, while Stage 1 and 2 were 55% and 15% respectively. Among the Females, the highest causes of death were TB 53(14.9%) and Cancers 49(13.8%), while in males was TB 56(21.5%) and cancers 20 (7.7%). 25% children died of TB.

**Conclusions/Next steps:** TB and cancer remain the highest contributors of death in adults with HIV in this region and efforts to intensify TBHIV and NCDs integration within HIV services need to be prioritized, even as quality of care is strengthened. It's imperative to continually review the causes of mortality and use the data to inform early detection and avert early deaths though more integrated programming, especially for TB and HIV as program managers.

## THPEE605

### Integrated and user-centered care model for pregnant adolescents with HIV in the Dominican Republic

C. Valdez<sup>1</sup>, E. Barillas<sup>2</sup>, M. Thormann<sup>3</sup>, M. Jimenez<sup>3</sup>, R. Santos<sup>4</sup>, M. Encarnacion<sup>4</sup>, S. Menendez<sup>5</sup>

<sup>1</sup>GIS Grupo Consultor - UNICEF Project, Santo Domingo, Dominican Republic, the, <sup>2</sup>GIS Grupo Consultor - UNICEF Project, Washington, United States, <sup>3</sup>Ministry of Health, DIGECITSS, Santo Domingo, Dominican Republic, the, <sup>4</sup>Servicio Nacional de Salud, Redes, Santo Domingo, Dominican Republic, the, <sup>5</sup>UNICEF, Santo Domingo, Dominican Republic, the

**Background:** According to PAHO, in 2022 the adolescent fertility rate in the Dominican Republic was 97 births per 1,000 women between the ages of 15 and 19, significantly higher than the average for Latin America. As of December 2023, the National Health Service (NHS) reported 76 HIV pregnant adolescents in the health facility network. Pregnant adolescents with HIV are cared for in adult units and do not have access to differentiated care to avoid stigma, discrimination, confidentiality, and clinical care appropriate to their needs. The NHS and the MoH's DIGECITSS, with the support of UNICEF and GIS Grupo Consultor, designed and implemented a user-centered model of care for pregnant adolescents to increase health care demand and adherence to treatment, and contributed to the reduction of mother-to-child transmission of HIV.

**Methods:** A baseline study was conducted in 12 Specialized Adolescents Units (SAU) reporting the highest incidence of HIV in pregnant adolescents.

The study focused on the conditions to organize the provision of HIV care services in the SAU:

- Availability of physical space;
- Personnel trained in adolescent care, STIs, and HIV;
- Conditions to offer a comprehensive package, including counseling focused on adolescent health, HIV rapid tests, CD4, viral load, TB screening, ARVs, and syphilis treatment.

**Results:** To close the gaps identified in the baseline study 12 SAUs were conditioned and habilitated to provide HIV services and 223 health personnel were trained in adolescent care, pre and post HIV test counseling, HIV, syphilis treatment, and adherence to treatment strategies. From May to December 2023, 3,247 pregnant adolescents attended these improved SAUs and were provided with HIV tests and same-day results. Out of all the adolescents tested, 37 were HIV positive, and 25 (68%) of those received ARVs and counseling on the same day as the diagnosis.

**Conclusions:** HIV and pregnancy care of adolescents in adult health facilities was identified as a barrier to health care demand, adherence to treatment, and the reduction of mother-to-child transmission of HIV. The improvement of SAUs to provide these services proved to be an effective strategy to increase demand, diagnosis, and early treatment of HIV in pregnant adolescents.

## THPEE606

### Unraveling the intersection of HIV and hepatitis C among males who inject drugs

V.T. Msolomba<sup>1</sup>, M. Majam<sup>2</sup>, K. Hatzold<sup>3</sup>

<sup>1</sup>Ezinstha, Medical Technologies, Johannesburg, South Africa, <sup>2</sup>Ezintsha, Medical Technologies, Johannesburg, South Africa, <sup>3</sup>Population Services International, HIV and TB Programs, Cape Town, South Africa

**Background:** The co-infection of Human Immunodeficiency Virus (HIV) and Hepatitis C Virus (HCV) poses a significant public health concern, particularly within the demographic of males who inject drugs (MWID).

This intersection of viral infections presents complex challenges, as individuals engaging in injection drug use are at heightened risk for acquiring both HIV and HCV.

**Methods:** In one model, we provided Hepatitis C Virus self-tests (both oral-fluid and blood-based) during HIV service visits. In the other model, community-based HCV self-testing (HCVST) was conducted through outreach efforts. This comprehensive approach aims to understand the intricate relationship between HIV and HCV among males who inject drugs.

By offering HCV self-tests in different key populations, we aim to gain insights into their acceptance and the feasibility of self-testing. Individuals who tested positive for HCV on the self-test were given the option for confirmatory testing.

Those confirmed positive for HCV on polymerase chain reaction (PCR) were eligible to receive free Direct Acting Antivirals as part of the study.

**Results:** From June 2023 to December 2023, a total of 1058 males who inject drugs participated in the study. Out of these, 874 (82.6%) tested positive on the HCV self-test. Among the positive results, 754 individuals (71.3%) were confirmed positive through PCR testing. For those who visited the sites for HIV services, 274 had undergone HIV testing. Among them, 84 (30.7%) tested positive, while 190 (69.3%) tested negative.

The study found that 1005 participants (95%) admitted to injecting multiple times a day, and a significant number, 1032 (97.5%), had never been tested for Hepatitis C before. Notably, 90% of the participants expressed a willingness to conduct future self-tests using an HCV self-test.

**Conclusions:** Ultimately, our findings underscore the need for comprehensive public health strategies that address the specific challenges faced by men who inject drugs, promoting both awareness and accessibility to testing services for HIV and Hepatitis C. The integration of HCVST into existing HIV services represents a step forward in advancing public health initiatives that target key populations and contribute to the control of these epidemics.

## THPEE607

Integrating peer-led mental health interventions into adolescent Sexual and Reproductive Health (SRH) services: design perspectives from adolescent mental health service providers and researchers

M. Wallace<sup>1</sup>, K. Bagg<sup>1</sup>, E. Rousseau<sup>1</sup>, L.-G. Bekker<sup>1</sup>

<sup>1</sup>Desmond Tutu HIV Centre, Institute of Infectious Diseases and Molecular Medicine, University of Cape Town, Cape Town, South Africa

**Background:** The importance of including mental health interventions in combination with HIV prevention and treatment is increasingly recognized. Mental health and illness are known to impact behaviours related to HIV prevention and treatment outcomes, with poor mental health identified as a barrier to PrEP uptake and persistence. As SRH and HIV services for adolescents become more differentiated, establishing optimal ways to intervene to address mental health issues within service delivery platforms is key.

**Methods:** As part of a larger implementation science project (FastPrEP), scaling PrEP through a hub and spokes model offering multiple ways for young people to access PrEP, formative qualitative research was conducted to explore adolescent mental health provider and researcher perspectives on how best to integrate a mental health intervention into this model. Ten in-depth interviews were conducted with participants who were purposively recruited, exploring recommended intervention content, structure and operationalization. Interviews were coded using Nvivo 14 and analysed using thematic analysis.

**Results:** Participants acknowledged that despite numerous environmental drivers of mental illness, intervening at the individual level remains important for developing ability and skills to respond to external stressors.

Key recommended intervention components included building problem-solving and interpersonal skills, and developing emotional regulation, in combination with stress management and alcohol and drug education.

For sufficient dosage, most recommended a minimum of 4 to 7 intervention sessions, and favored group intervention sessions (of 6 to 8 adolescents), noting the value of opportunities for young people to learn from and build connections with their peers. Some however recommended inclusion of an initial one-to-one session to establish individual concerns.

Suggestions for delivery included leveraging the differentiated service delivery platform of FastPrEP to offer multiple venues and varying levels of intervention to suit adolescent needs. Key concerns included adequate training and ongoing support for peer facilitators and ensuring safe spaces for sessions.

**Conclusions:** Expert input indicates the value of peer-led group mental health interventions for adolescents that offer choice and variety in delivery location and level of

intervention to meet diverse and fluctuating adolescent mental health needs. Input from adolescents will be vital to further inform intervention development.

## Innovations in data collection, monitoring and evaluation

### THPEE608

Developing an international Quality of Care (QoC) benchmark for strengthening Community Led Monitoring systems

M. Kusen<sup>1</sup>, L. Stackpool-Moore<sup>2</sup>, A. Aher<sup>3</sup>, P. Loh<sup>1</sup>, C. Zebadi<sup>4</sup>, A. Karawita<sup>5</sup>, D. Perera<sup>6</sup>, T. Gyeltshen<sup>7</sup>, T. Dendup<sup>8</sup>, N. Galsanjamts<sup>4</sup>, M. Merrigan<sup>9</sup>, M. Poonkasetwattana<sup>3</sup>, F. Young<sup>9</sup>

<sup>1</sup>Health Equity Matters, Bangkok, Thailand, <sup>2</sup>WATIPA, Sydney, Australia, <sup>3</sup>APCOM Foundation, Bangkok, Thailand, <sup>4</sup>Youth For Health Centre Mongolia, Ulaanbaatar, Mongolia, <sup>5</sup>Ministry of Health, Colombo, Sri Lanka, <sup>6</sup>Family Planning Association of Sri Lanka, Colombo, Sri Lanka, <sup>7</sup>Pride Bhutan, Thimpu, Bhutan, <sup>8</sup>Save the Children, Thimpu, Bhutan, <sup>9</sup>Health Equity Matters, Brisbane, Australia

**Background:** Community Led Monitoring (CLM) is a process whereby service users or local communities gather, analyze, and use information to support quality improvements of HIV services to increase uptake and retention of HIV services and improve health outcomes for key populations. A key component of CLM success is ensuring that data are used for decision-making and that feedback from communities of people living with HIV and other key populations improves HIV outcomes. Currently, there are no universally established minimum standards to assess CLM feedback mechanisms.

**Description:** The Sustainability of HIV Services for Key Populations in Southeast Asia (SKPA-2) program has reviewed CLM tools, technical briefs, and case studies to develop a quality of care (QoC) benchmark framework. The framework covers design, implementation, and monitoring and evaluation (M&E) stages of CLM, with sub-criteria developed under each phase. These include community leadership, data security, referral mapping and verification, duty of care, and links to advocacy. The tool aims to ensure CLM is fed back to all relevant stakeholders. We used the criteria to assess CLM initiatives in Bhutan, Mongolia, and Sri Lanka. For each country and category, scores between one and four were generated to assess strengths and gaps.

**Lessons learned:** The CLM QoC benchmark identified strengths and weaknesses of CLM systems to ensure they remain strong and responsive to key populations and that client feedback could be analyzed and actioned.

- Community leadership and confidentiality (including data security and mapping of referral service providers for serious incidents) were well documented across each country.
- Gaps were identified in documenting verified referral networks to ensure survivor centered services, and lack of duty of care among implementors.
- Engagement in advocacy for improving services, and ongoing M&E and refinement, was found to be weak or not well documented, indicating the need for increased attention to problem resolution and case management.

**Conclusions/Next steps:** SKPA-2's QoC CLM benchmark tool provides a set of standards that programs can use for self-assessment to identify strengths and areas requiring improvement. This will ensure that CLM is community-led, catalyzes actions, and supports progress to ending AIDS by 2030.

## THPEE609

Enhancing key communities' power in HIV advocacy in CECCA by equipping them with tools and knowledge in community-led monitoring

I. Gordon<sup>1</sup>

<sup>1</sup>N/A, N/A, Lithuania

**Background:** Community-led monitoring (CLM) is increasingly recognized in the Central and Eastern Europe and Central Asia (CECCA) region as a crucial tool for identifying and addressing gaps in HIV services. Despite its importance, community groups often hesitate to engage in CLM due to perceived complexities, costs, and uncertain advocacy effects. This situation significantly reduces the community's ability to use data to influence HIV programs.

This project aims to develop a practical compendium and web tool to empower community groups to be involved in CLM by simplifying the process and demonstrating its effectiveness.

**Description:** The project involves creating a comprehensive, yet accessible compendium, coupled with an interactive web tool. The compendium presents key practices and concepts of CLM, essential steps in the monitoring cycle, and a catalog of 19 CLM methods. These are explained in a manner suitable for diverse community groups. The web tool, designed for groups familiar with their monitoring objectives but unsure about the best methods, guides users in selecting appropriate CLM methods based on their specific questions, advocacy goals, and available resources. The project focuses on ten common areas for CLM, including accessibility, service quality, human rights violations, stigma, and medicine availability.

**Lessons learned:** The implementation of these tools has underlined the importance of user-friendly resources for community groups. It showed that with the right tools,

these groups are more likely to engage in effective monitoring, improving their capacity for evidence-based information collection and advocacy in HIV response.

The initiative also highlighted the need for further capacity building and knowledge among communities, promoting the use of scientifically proven research methods within CLM.

**Conclusions/Next steps:** This project underscores the significance of promoting scientifically proven research methods for use in CLM for community groups in the CECCA region, facilitating their active participation in shaping the HIV response through CLM and advocacy.

The next phase involves the widespread dissemination of the compendium and web tool, along with the evaluation of their impact on enhancing community-led monitoring initiatives.

Feedback from users will be crucial in refining these resources, ensuring their continued relevance and effectiveness in supporting community-led HIV response and advocacy efforts.

## THPEE610

Electronic systems for services in HIV prevention among key populations and care and support for PLHIV programs

A. Hubashova<sup>1</sup>, I. Zahorovskyi<sup>2</sup>

<sup>1</sup>State Institution Public Health Center of the MOH of Ukraine, Department of HIV Infection Management and Prevention, Kyiv, Ukraine, <sup>2</sup>State Institution Public Health Center of the MOH of Ukraine, Department of Information Technologies, Kyiv, Ukraine

**Background:** Since 2019, State Institution Public Health Center of the MOH of Ukraine (PHC) has been successfully implementing HIV prevention and care and support for PLHIV state programs in Ukraine. Considering the WHO key recommendations, the negative impact of Russia's invasion of Ukraine and the high risk of losing data on paper/electronic carriers without a comprehensive information protection system, PHC launched a project on single national system of comprehensive monitoring of public health services provision.

**Description:** In February 2023, PHC received the property rights to the DATACHECK.GOV computer program on care and support services for PLHIV by All-Ukrainian Network of PLWH (current name – Information and Analytical System "Service Management in the Field of Combating Socially Dangerous Diseases", short name – Public Health). During March-August 2023, PHC technically adapted and refined the system according to the state program needs, and piloted it in 4 Ukrainian regions.

On September 1, 2023, PHC officially launched the system, and 100% of care and support services for PLHIV in Ukraine (state budget) are currently accounted for in Public Health.

The project allowed to improve data accounting, optimize the reports submission and acceptance, and increased the quality of M&E of services. Public Health is:

- recipients and services provided database since the state program beginning;
- an effective audit system: indicators of program implementation, limits of paid services, verification of the contract conditions fulfillment;
- automatic program reports construction;
- mobile application for providers to record work information with the possibility of telephone verification of services by recipients.

**Lessons learned:** Starting the system allowed to:

- carry out at the national level high-quality collection, processing, monitoring and protection of data on state program;
- analyze the quality of service provision using different statistical information about services;
- monitor violations of the service provision algorithm by provider, promptly respond to them;
- reduce the PHC monitors workload by automating some operational processes.

**Conclusions/Next steps:** In 2024, PHC plans to develop and launch HIV prevention services module among key populations, which will allow, among other impacts, to identify risk groups and individuals, take proactive measures to prevent diseases, provide individual recommendations for health preservation, adapt state programs for changes in public health.

number of days that they tracked in a week over 12 weeks of the intervention period. We used latent trajectory analysis to identify clusters of individuals who shared similar trajectories in medication tracker engagement over 12 weeks. Once trajectories were estimated, we examined whether trajectories were associated with the intervention outcome; PrEP adherence at week 13 was defined as TFV-dp $\geq 1,000$  fmol/punch (reflection of taking  $\geq 4$  doses/week).

**Results:** We identified three trajectories: a "high consistent" profile (n=63; 38.7%), a "consistent" profile (n=51; 31.3%), and a "declining" profile (n=49; 30.1%). Among participants who provided dried blood spots to test for TFV-DP at week 13 (n=103), 77.7% achieved PrEP adherence. Moreover, there was a significant association between tracker engagement trajectories and PrEP adherence (p=0.017), indicating higher rates of PrEP adherence among participants in the "high consistent" profile (90.1%) compared to those in the "consistent" profile (63.6%) and "declining" profile (74.1%).

Trajectories of medication tracker engagement in P3 (PrEPared, Protected, emPowered) intervention app to improve PrEP adherence

S.K. Choi<sup>1</sup>, K. Muessig<sup>2</sup>, C. Rainer<sup>2</sup>, K. Claude<sup>2</sup>, M. Rosso<sup>2</sup>, L. Hightow-Weidman<sup>2</sup>

<sup>1</sup>University of Pennsylvania, School of Nursing, Philadelphia, United States, <sup>2</sup>Florida State University, College of Nursing, Tallahassee, United States

**Background:** Despite the importance of adherence to pre-exposure prophylaxis (PrEP) in HIV prevention, there are limited evidence-based digital health interventions (DHIs) to promote and sustain PrEP adherence. Therefore, this study explores the efficacy of P3 (PrEPared, Protected, emPowered), a novel, theory-based mobile app that utilizes game mechanics and social networking features to improve PrEP adherence among young men who have sex with men (YMSM) and young transgender women who have sex with men (YTWMSM).

**Methods:** Intervention arm (P3 and P3+ arms) participants (n=163; mean age=21.43) had access to a medication tracker where participants could track whether or not they took their PrEP medication. We explored participants' medication tracker engagement by counting the

**Conclusions:** Our findings highlight the potential for DHIs that utilize medication trackers to improve PrEP adherence among YMSM and YTWMSM. Understanding participant engagement profiles and app components that facilitate engagement is critical for the design and implementation of DHIs to address the HIV epidemic.

## THPEE612

ShoutLink: leveraging technology to improve layering of behavioral and biomedical HIV prevention services among adolescent girls and young women in South Africa

C. Wendler<sup>1</sup>, T. Mabande<sup>1</sup>, D. Van Zyl<sup>2</sup>, J. Cockburn<sup>2</sup>, D. Mankgane<sup>2</sup>, W. Taylor<sup>1</sup>, R. Makiwa<sup>1</sup>, N. Mtshali<sup>1</sup>

<sup>1</sup>Shout-It-Now, Kirstenhof, Cape Town, South Africa,

<sup>2</sup>Community Media Trust, Cape Town, South Africa

**Background:** Shout-It-Now (Shout) is a community-based PEPFAR CDC DREAMS partner providing combination behavioral and biomedical HIV prevention services to adolescent girls and young women (AGYW) in two South African provinces. DREAMS aims to fortify vulnerable AGYW with multiple layers of behavioral and biomedical protections, which are often delivered by multiple partners. Like many other NGOs who refer clients to partners for

additive services, Shout experienced challenges tracking service provision by its largest partner, Community Media Trust (CMT), and other service providers due to organizations' separate data systems and different client engagement priorities. These challenges created a barrier to collaboration and to delivering comprehensive services to AGYW.

**Description:** To improve implementation, monitoring and reporting of layering, as well as promote a continuously supported journey for clients; Shout developed *ShoutLink*, an app that tracks each client's referral and service access data across multiple service providers. *ShoutLink* is designed to follow AGYW longitudinally as they access behavioral and/or biomedical services from different organizations, as well as track their enrollment, attendance, vulnerability assessments and graduation from behavioral programs. *ShoutLink* is integrated with Shout's electronic client management system which allows for transparent, real-time monitoring and reporting of DREAMS layering and enables more timely programmatic decision making for resources to be allocated and make real-time program improvements. This also provides clients with a seamless experience as they are layered between the behavioral programs and biomedical services without having to repeat their details or feel that they're being referred to a different, unknown service provider.

**Lessons learned:** The fit-for-purpose *ShoutLink* app significantly improved the delivery of comprehensive, layered HIV prevention services to vulnerable AGYW between two separate organizations (see table).

Indicator	COP21 Layering (pre-ShoutLink)	COP22 Layering (using ShoutLink)	% Increase in Layering
Number of 15 – 19 year olds who graduated at least one program AND had an HIV test	23,720	33,579	41.6%
Number of 15 – 19 year olds who graduated at least one program AND accessed PrEP	12,948	22,750	75.7%
Number of 15 – 19 year olds who graduated at least one program AND accessed contraception	5,091	8,630	69.5%
Number of 15 – 19 year olds who graduated at least one program AND had a reported GBV case	1,970	4,587	132.8%
Number of 20 – 24 year olds who graduated at least one program AND had an HIV test	16,474	27,141	64.8%
Number of 20 – 24 year olds who graduated at least one program AND accessed PrEP	8,751	17,395	98.8%
Number of 20 – 24 year olds who graduated at least one program AND accessed contraception	5,200	10,274	97.6%
Number of 20 – 24 year olds who graduated at least one program AND had a reported GBV case	988	3,115	215.3%

**Conclusions/Next steps:** Shout is offering *ShoutLink* to other providers to support interoperable linkage and referrals of clients across a range of services, while simultaneously providing real-time data for monitoring, program improvement and reporting.

## THPEE613

### Result of the application of the PDSA assessment cycles in Health Facilities to ensure compliance with national standards for the provision of HIV in Mozambique

Y. Paulo<sup>1</sup>, O. Munguambe<sup>1</sup>, I. Gaspar<sup>1</sup>, O. Tiberi<sup>1</sup>, A. Couto<sup>1</sup>

<sup>1</sup>MoH Mozambique, STI HIV National Program, Maputo, Mozambique

**Background:** The HIV Response Acceleration Plan (2013/17) and the Test & Start approach (2016) have increased the demand for ART and the challenge of ensuring quality of care has arisen. The Quality Improvement (QI) guideline was developed to balance the demand for ART and the supply of services within standards with the aim of raising quality levels in service provision through interventions for HIV viral suppression.

**Description:** The QI Directorate provides for the creation of provincial and district structures, which monitor implementation through implementation reports and technical support visits.

Evaluations are carried out using the PDSA model, which combines efforts to make changes that lead to better results for clients, professional development and system performance; in each cycle, indicators are selected taking into account national priorities.

The activities during the cycle are monitored through: clinical services management committee meetings (weekly); intensive monitoring (monthly); mid-term evaluation (mid-cycle).

Providers benefit from clinical mentoring and, in each cycle, there is an exchange of experiences between the health units/districts and the provinces, and also to recognize the health units with the best performance.

**Lessons learned:** Although the categories of indicators have varied over the years, some have stood out positively since the beginning of the evaluation shown below in the graphic:

Figure. The performance trend of the indicators in the Quality Improvement Assessment cycles.

The organizational structure (bellow) at all levels has made it possible to consolidate this activity and maintain an upward trend in the performance of the indicators:

**Conclusions/Next steps:** This approaches has driven the improvement of the quality of care in HIV services for the control of the epidemic.

## THPEE614

Novel questions to broaden the understanding of injection risk behaviours among people who inject drugs in Unguja, Zanzibar, 2023

M. Mtoro<sup>1</sup>, A. Jahzumi<sup>2</sup>, I. Maulid<sup>2</sup>, F. Faki<sup>2</sup>, I. Mohammed<sup>2</sup>, S. Porter<sup>3</sup>, G. Mgomella<sup>3</sup>, H. Solomon<sup>4</sup>, A. Kailembo<sup>3</sup>, M. Dahoma<sup>2</sup>, C. Said<sup>5</sup>

<sup>1</sup>Global Programs, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Zanzibar Integrated HIV, Hepatitis, TB, and Leprosy Programme, Unguja, Tanzania, the United Republic of, <sup>3</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States, <sup>5</sup>University of California, San Francisco, United States

**Background:** Sharing needles or syringes put people who inject drugs (PWID) at increased risk of hepatitis C virus (HCV) and HIV acquisition. Questions about sharing needles or syringes are a standard part of collecting information on HCV and HIV risk among PWID.

We report findings from a biobehavioural survey that included novel questions about needle or syringe sharing conducted among PWID in Unguja Island, Zanzibar, in 2023.

**Methods:** We recruited people aged  $\geq 15$  years who lived in Unguja for  $\geq 3$  months and injected drugs in the past 3 months using respondent driven sampling. Participant information was collected through an interviewer-administered questionnaire. Questions pre-tested through key informant discussions probed different forms of needle or syringe sharing. We asked whether they ever shared a needle or syringe. We also asked whether they ever left their needle somewhere and returned to use it later and

whether they thought someone else may have used it in the interim. We also asked whether they ever injected with a needle that they found which was not theirs. We produced weighted estimates, reported as percentages with 95% confidence intervals (95%CI).

**Results:** Among 455 PWID, 43.5% (200/455; 95%CI: 38.2-48.8) ever shared a needle. Of PWID, 31.6% (141/432; 95%CI: 28.5-34.6) had ever found a needle somewhere that was not theirs and used it to inject drugs; of those, 9.3% (13/141; 95%CI: 4.9-13.6) reported never sharing a needle. Of PWID, 67.7% (278/432; 95%CI: 63.2-72.3) had ever left their needle somewhere and returned to use it later, of whom 20.9% (60/278; 95%CI: 15.7-26.1) believed someone else used their needle in their absence, and among those, 20.9% (11/60; 95%CI: 10.5-31.5) reported never sharing a needle.

**Conclusions:** The findings suggest that there are varied understandings of what it means to share a needle or syringe and that many PWID do not report all means of sharing needles or syringes, such as leaving a needle and returning to it.

Introducing new survey questions about different forms of needle or syringe sharing, including indirect sharing, may provide more accurate information about risk behaviors. Key populations stakeholders can play a critical role in developing these questions.

## THPEE615

Enhancing viral load coverage: the impact of a customized electronic medical records system in UPDF health facilities for people living with HIV in Uganda

A. Tumusiime<sup>1</sup>, B. Lutimba<sup>1</sup>, T. Rwegyema<sup>1</sup>, A. Wasukira<sup>2</sup>, E. Asiimwe<sup>2</sup>, E. Turesson<sup>3</sup>, H. Tibihenda<sup>4</sup>, J. Nyati Akao<sup>4</sup>

<sup>1</sup>DoD-Uganda University Research Co., LLC Project, Kampala, Uganda, <sup>2</sup>Uganda Peoples Defense Forces (UPDF), Kampala, Uganda, <sup>3</sup>University Research Co., LLC, Washington DC, United States, <sup>4</sup>U.S. Embassy Kampala, Department of Defense, Kampala, Uganda

**Background:** By September 2020, 20,444 people living with HIV (PLHIV) were active in care at Uganda People's Defense Forces (UPDF) Military health facilities across the country, yet the viral load coverage lagged at 72% compared to the national average of 94%. The University Research Co., LLC Department of Defense HIV and AIDS Prevention Program (DHAPP) initiated the use of Uganda's Electronic Medical Record (EMR) in 2020 in the military to streamline client management, real-time data capture, and viral load tracking. The UPDF-EMR is integrated with the national Uganda-EMR with a customized camouflage background, strategically designed for enhanced ownership by military personnel.

Feedback on the functionality and areas of improvement on some concepts was given to the system developers by the end users for improvement in subsequent versions.

**Description:** The methodology involved leveraging EMR-generated line lists to identify clients overdue for viral load tests, appointments, and those returning for both. Clients were promptly contacted, given appointments for viral load sample collection, and offered other aligned services. Monthly viral load test data were downloaded from the national dashboard and compared with the health facilities' EMR records to ensure all clients had been monitored for viral load. A retrospective analysis, utilizing DATIM datasets from September 2019 to September 2023, assessed progress in viral load coverage and suppression. Data queries addressed quality issues, and trend analysis illuminated changes over the four-year period.

**Lessons learned:** Viral load coverage showed a consistent increase from 72% in FY19 to 94% in FY22, followed by a slight decrease to 90% in FY23. This upward trajectory aligns with the introduction and consistent use of UPDF\_EMV for viral load tracking by the health workers. EMR generated line lists enabled health workers to track and promptly contact all clients due for or missing a viral load testing appointment.

**Conclusions/Next steps:** The Uganda\_EMV has emerged as a transformative tool in managing HIV care. The UPDF\_EMV, through its accurate and consistent application in client management, significantly enhances viral load coverage and retention for PLHIV in Uganda's military health facilities.

This success underscores the pivotal role of electronic medical records systems in advancing HIV care and outcomes.

## THPEE616

Implementation of a data review intervention to mitigate data leakages in the South African VMMC programme: a case study on Gert Sibande district

A. Ismail<sup>1</sup>, G.J. Mvuma<sup>1</sup>, T. Mashinini<sup>1</sup>, L. Mulenga<sup>1</sup>, D. Loykissoonlal<sup>2</sup>, A. Kwarteng<sup>1</sup>

<sup>1</sup>Genesis Analytics, Health Practice, Johannesburg, South Africa, <sup>2</sup>National Department of Health, Voluntary Medical Male Circumcision, Tshwane, South Africa

**Background:** In South Africa, adolescent boys and men, aged 10 and above, have access to Voluntary Medical Male Circumcision (VMMC) services. These services are provided by service delivery partners (SDPs) funded by the government and PEPFAR. Data on VMMC services rendered is submitted to the Department of Health (DOH) hubs based in facilities and sub-districts, where DOH staff capture the data into the District Health Information System (DHIS). This data capturing process has been identified as being susceptible to data loss.

To combat this issue, MMC SUSTAIN, in its role as a technical assistance partner, has implemented systematic data review protocols to enhance data accuracy and integrity.

**Description:** From June to October 2021, data review was conducted to ensure complete data capture on DHIS. The review process followed five steps:

1. Collating service delivery data from the SDPs via an excel based data collection tool,
2. Extracting and comparing DHIS data to detect variances between the two data sources,
3. Joint review sessions with DOH and SDPs,
4. Sourcing outstanding data from SDPs for entry into DHIS,
5. Validating captured data through retrospective DHIS analysis.

These efforts were aimed at bolstering the data's completeness and validity.

**Lessons learned:** The intervention led to the recovery of 21,380 VMMC records previously unreported, markedly improving data completeness and accuracy as reflected in the table below:

Data Element	Jun-21	Jul-21	Aug-21	Sep-21	Oct-21	Total
VMMC data before review	3019	8224	1399	1899	3176	17717
VMMC data after review	7904	13543	7136	6954	3560	39097
VMMC data recovered	4885	5319	5737	5055	384	21380

Overall, routine reviews cultivated better compliance with data management protocols among partners, and the introduction of pre- and post-verification protocols enhanced the quality of data in the DHIS.

**Conclusions/Next steps:** The institutionalisation of the district led data review processes fostered a sense of ownership which is crucial for the sustainability of VMMC programmes and is pivotal to informed decision-making in HIV prevention strategies. The success of this intervention underscores the effectiveness of ongoing data verification in maintaining data integrity within the DHIS.

### Virtual mapping of key populations: lessons learned from MSM and opportunities for expanding to FSW and TG in Nigeria

J. I. Ejembil<sup>1</sup>, K. Green<sup>2</sup>, C. Ejekam<sup>3</sup>, A. Udoete<sup>4</sup>,  
J. Ariri-Edafe<sup>5</sup>, S. Oladayo<sup>6</sup>, A. Adesina<sup>7</sup>

<sup>1</sup>West African Centre for Public Health and Development, IT/Health Informatics, Gwarinpa, Nigeria, <sup>2</sup>West African Centre for Public Health and Development, Country Director, Gwarinpa, Nigeria, <sup>3</sup>West African Centre for Public Health and Development, Program, Gwarinpa, Nigeria, <sup>4</sup>West African Centre for Public Health and Development, GIS, Gwarinpa, Nigeria, <sup>5</sup>West African Centre for Public Health and Development, Admin/HR, Gwarinpa, Nigeria, <sup>6</sup>West African Centre for Public Health and Development, M&E, Gwarinpa, Nigeria, <sup>7</sup>West African Centre for Public Health and Development, M&E/Analyst, Gwarinpa, Nigeria

**Background:** Accurate data on key populations (KP), including female sex workers (FSW), men who have sex with men (MSM), and transgender people (TG), is crucial for effective public health interventions. The Key Population Size Estimation (KPSE 2023) in Nigeria employed novel methods for virtual mapping (VM) of MSM, leading a more precise population size estimates.

The objectives were to estimate the number of MSM who operate virtually and to understand the extent of overlap between virtual sites and physical locations. The aim is to expand this approach to other Typologies for accuracy and comprehensiveness of KP size estimates in Nigeria.

**Methods:** The VM approach used in the KPSE 2023 in Nigeria involved a sequential listing of virtual sites uses three stages: listing of virtual sites, profiling and size estimating MSM on those sites, and sampling MSM quantitative interviews with a sample of MSM selected from these sites. The method employed Virtual Mappers who moved from LGA to LGA, observed each site and app virtually during peak days and times, estimated the number of MSM using the various sites in the LGA, and generated estimates for MSM in the state by LGA.

**Results:** The VM of MSM in the KPSE 2023 in Nigeria revealed that 18% of MSM only operate virtually, with 54% aware of programs for MSM and 35% in contact with a peer educator. On average, MSM own profiles on 2 different virtual platforms. The mean age of virtual MSM is 28 years, with 61% having tertiary education. Virtual MSM are active during various times of the day, with 49% in the evening and 64% at night.

The findings provide valuable insights into MSM who operate in virtual spaces, which can inform targeted for KP interventions and programs.

**Conclusions:** The VM of MSM in the KPSE 2023 provides valuable insights into the MSM who operate in virtual spaces. The method used in the KPSE2023 can be expanded to cover FSW and TG to enhance the accuracy and

comprehensiveness of population size estimates for KP in Nigeria. The findings highlight the potential impact of VM on future mapping for targeted KP interventions and programs.

## THPEE618

### Monitoring and evaluation (M&E) of wartime adaptations in an HIV program in Ukraine: shifting from disease-centric to person-centric

K. Krasnikova<sup>1</sup>, I. Shvab<sup>1</sup>, M.J. Wright<sup>2</sup>

<sup>1</sup>Pact Inc, Kyiv, Ukraine, <sup>2</sup>Pact Inc, Washington DC, United States

**Background:** Community Action for HIV Control - USAID/PEPFAR-funded project implemented by Pact Ukraine focuses on HIV prevention, testing, and linkage to care among key populations (KP) through implementation of innovative approaches and strengthening the capacity of local organizations. In the face of war, "putting people first" has become an innate motto for the project, with its M&E system being no exception.

**Description:** Due to the war, priorities in services for KPs have shifted, and to fulfill the project's objectives, it became necessary to develop differentiated service delivery (DSD) models, taking into account the provision of immediate needs for KPs. Adapting approaches to implement M&E for the development of effective DSD models has become an urgent task. To tailor approaches for engaging with KPs in dynamic circumstances, a range of adaptive measures to enhance M&E were introduced. These included studying the regional landscape concerning KPs needs, monitoring the availability of services, visualizing real-time data on rendered services, etc. These lead to project scope shifted from HIV only (disease-centric) to inclusion of emergency services (person-centric), making some objectives being irrelevant.

**Lessons learned:** While operating amidst conflict and chaos, CAHC and its local partners continue to tackle service delivery obstacles through highly collaborative, person-centered adaptations and innovations in data collection, reporting and quality assurance. The adaptation of M&E approaches created an opportunity to customize project activities and deliver HIV-related services to KPs whose priorities have shifted towards basic needs.

Due to these strategies and despite the dynamic and complex operating environment, CAHC delivered emergency support services to 81,332 people (70.8% male, 29.2% female) between 1 April 2022 – 1 January 2024. Among them tested 65,589 individuals, of them 1,604 were confirmed newly positive; of them 1,499 (93.5%) were enrolled on ART.

**Conclusions/Next steps:** For HIV programs operating in conflict, timely and accurate data is especially critical to enable programmatic decision making. As evidenced by the project, enhanced collaboration, innovation and

collective feedback from KPs can enable successful M&E in even the most challenging contexts; and amidst war integrate innovative needs and methods into services provision. Complex adaptive M&E system can customize project activities and further implement them in challenging times.

## THPEE619

### Enhanced engagement for individuals with interrupted HIV treatment through person-centered empathetic communication ("Uzwelo/Empathy"): a quasi-experimental study

E. Dhodho<sup>1</sup>, K. Takarinda<sup>1</sup>, K. Masiye<sup>1</sup>, K. Webb<sup>2</sup>, P.T. Chimberengwa<sup>3</sup>, S.P. Mtongwiza<sup>3</sup>

<sup>1</sup>Organization for Public Health Interventions and Development, Strategic Information Evaluation and Learning, Harare, Zimbabwe, <sup>2</sup>Organization for Public Health Interventions and Development, Incubators and Implementation Science, Harare, Zimbabwe,

<sup>3</sup>Organization for Public Health Interventions and Development, Programs, Harare, Zimbabwe

**Background:** Person-centered approaches are essential for sustained engagement in HIV care and crucial for achieving viral suppression among individuals living with HIV. The Uzwelo approach, embodying empathy and the Ubuntu philosophy in the clinic-client-next of kin interaction, was developed to optimize the re-engagement of individuals with interrupted HIV treatment within Zimbabwe's HIV Program.

**Methods:** This quasi-experimental study employed a pre/post-test design in Chitungwiza City, Zimbabwe. It aimed to evaluate the re-engagement rates of individuals identified as having interrupted their HIV treatment, defined as a delay of more than 28 days from their scheduled HIV care appointment. A simple random sample of 202 individuals was selected in April 2023 from a pool of 1,100. The study compared the Uzwelo approach, incorporating empathetic emotional attunement and respectful interactions into the phone tracing, with the standard-of-care method. Quantitative data were analyzed using the T-test for paired proportions, while qualitative questions were employed to explore underlying reasons for treatment interruption.

**Results:** The Uzwelo approach significantly increased successful re-engagements, with 148 out of 202 individuals (73%;  $p < 0.01$ ) reached, compared to 91 (45%;  $p < 0.01$ ) with standard phone calls.

Furthermore, 101 individuals (50%;  $p < 0.01$ ) were re-engaged using Uzwelo, versus 48 (24%;  $p < 0.01$ ) with the standard phone call method. Stratification by demographic characteristics showed increased re-engagement rates across different groups with Uzwelo, notably among those on Antiretroviral Therapy (ART) for more than one year, with an increase from 24% to 50% ( $p < 0.01$ ).

Qualitative findings indicated that individuals and their Next of Kin felt more valued and integral to the care process under Uzwelo.

**Conclusions:** The Uzwelo model, emphasizing empathetic communication within the context of the Ubuntu philosophy, markedly enhances the re-engagement of individuals with interrupted HIV treatment.

This approach offers a promising model for patient-centered engagement in culturally sensitive settings and underscores the importance of considering individuals' emotional and social needs in HIV care.

## THPEE620

### Putting people first: developing a minimum practice standard for person-centered care based on ART client and provider perspectives

J. Posner<sup>1</sup>, H. Tagoe<sup>2</sup>, H. Nagai<sup>2</sup>, C. Madevo-Matson<sup>3</sup>, A. Casella<sup>3</sup>

<sup>1</sup>JSI, Washington DC, United States, <sup>2</sup>JSI, Accra, Ghana,

<sup>3</sup>JSI, Boston, United States

**Background:** Person-centered care (PCC) in HIV services aims to improve client experiences, service accessibility, treatment adherence and outcomes. For PCC to be effectively and sustainably practiced, providers and clients must work together with clients' priorities at the forefront.

**Methods:** JSI conducted a mixed-methods study in May 2023 piloting the PCC assessment tool (PCC-AT), which measures health facility PCC service delivery, in five facilities in Ghana's Western region. PCC-AT implementation was followed by focus group discussions with antiretroviral treatment (ART) providers (n=37) and interviews with ART clients (n=20) to assess PCC-AT feasibility and content validity.

While evaluating results, similarities and differences in client and health staff perspectives were identified and examined.

**Results:** Clients reported treatment concerns that providers were often unaware of (e.g. fear of delayed/lost viral load results).

Most ART providers assumed clients prefer not to receive digital outreach (e.g. appointment reminders, adherence check-ins) due to fears of unintentional disclosure; however, many clients indicated such outreach as helpful. Both clients and ART providers noted gaps in systems to collect client preferences (e.g. space on medical visit forms to select when/where to receive services).

While most facilities reported having some client feedback mechanism (e.g. hotlines, drop-boxes), clients were often unaware or lacked confidence in confidentiality to provide feedback. ART providers emphasized that QI approaches and tools, such as the PCC-AT, support identification of priorities that enable consistent PCC implementation.

AIDS 2024

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Figure 1. Proposed PCC minimum practice standard.

**Conclusions:** Findings elucidated the need for a PCC minimum practice standard, for which the study team proposes five components (Figure 1).

Together with the PCC-AT, the PCC minimum practice standard provides a framework against which HIV services can be upheld and evaluated. This systematic approach holds potential to further providers' ability to provide care that is responsive to and aligned with clients' needs and expectations.

## THPEE621

Using routine data quality improvement through triple tally verification to enhance viral load coverage in CDC-supported regions of Zambia

M. Mumba<sup>1</sup>, L. Mbulo<sup>1</sup>, B. Kaliki<sup>1</sup>, B. Muyunda<sup>1</sup>

<sup>1</sup>United States's Centers for Disease Control and Prevention (CDC Zambia), Monitoring and Evaluation, Lusaka, Zambia

**Background:** Improvement in viral load (VL) testing for individuals on antiretroviral therapy (ART) leads to enhanced quality of treatment delivery and adherence services. Viral load suppression (VLS) among people living with HIV (PLHIV) significantly reduces the risk of secondary transmission of HIV. In 2021, the viral load coverage (VLC) for Zambia plateaued at 76%.

We aimed to demonstrate the impact of implementing strict data quality improvement processes on VLC in the US Centers for Disease Control and Prevention (CDC)-supported regions of Zambia.

**Description:** Between August and September 2022, CDC Zambia implemented a Triple tally verification process (TTV) of VL data from the health facility records, the hubs (Regional coordinating health laboratory centers) and laboratory data system.

The process ensured all samples at facility level were well documented and transported to the hubs where they were recorded in the data intensive system and application (DISA) and eventually transported to the polymerase chain reaction (PCR) laboratory and reviewing the submission of results trail back to the facility. CDC provided technical assistance and monitoring through weekly meetings and on-site visits. Data were obtained from data for accountability, transparency, and impact monitoring (DATIM) system

**Lessons learned:** VLC increased by 8 % in all the CDC supported regions within four weeks. By region, VLC significantly jumped between 2022 quarter three to quarter

four in Lusaka Province from 82% to 91%; Eastern Province 76% to 88%; Southern Province 77% to 85%; Western Province 76% to 85% (Figure 1.0).

Figure 1.0: Viral load suppression and coverage by province in the CDC supported provinces, 2022.

**Conclusions/Next steps:** The TTV process revealed gaps in the VL sample and results documentation at all levels. The emphasis on reviewing records from the three critical VL client recording systems proved to be an effective approach to address program, systemic and data quality gaps, thereby improving the VLC. Scaling up the TTV process to all regions has the potential to improve VL coverage countrywide.

## THPEE622

SIDAINfo: an electronic medical record (EMR) system tailored to provide solutions for HIV care and data management in Burundi

E. Mugiraneza<sup>1</sup>, S. Bisore<sup>1</sup>, A. Kavungerwa<sup>2</sup>, A. Ndayizeye<sup>3</sup>, A. Nkuzimana<sup>1</sup>, V. Nitereka<sup>1</sup>, E.P. Maburuki<sup>1</sup>, H. Mbanze<sup>3</sup>

<sup>1</sup>Research & Training Institute, Inc., Information System, Bujumbura, Burundi, <sup>2</sup>USAID/PEPFAR Burundi, Health Strategic Information, Bujumbura, Burundi, <sup>3</sup>PNLS/IST, HIV Program, Bujumbura, Burundi

**Background:** HIV care is inherently complex and involves multifaceted treatment and monitoring regimens for people living with HIV (PLHIV). In Burundi, this complexity includes challenges related to the manual maintenance of paper-based medical records, which leads to errors, loss of information, and delays in record retrieval, directly impacting the efficiency and efficacy of client health care.

Additionally, exchanging data between the siloed systems of healthcare facilities and laboratories has been a challenge, causing delays in diagnosis, treatment change, and viral load (VL) monitoring.

**Description:** Developed through a partnership between the Burundian government and USAID/PEPFAR, SIDAINfo is a local EMR solution designed to address these challenges that has been deployed in over 400 facilities currently covering more than 80% of the PLHIV cohort in Burundi. It features a unique biometric identification (UID) for PLHIV, a real-time lab module for VL and early infant diagnosis (EID), recent infection tracking, and a prevention of mother to child transmission (PMTCT) module for supporting

effective care for mothers and children. The system facilitates antiretroviral therapy (ART) monitoring, targeted support identification, pharmacy management, and critical data reporting. SIDAInfo interoperates with the national District Health Information System (DHIS2) and laboratory information system, reducing siloed medical records and promoting evidence-based healthcare decisions.

**Lessons learned:** SIDAInfo's special features, such as quick alerts by SMS to clients for ART refills and transmission of crucial lab results including VL and EID/PCR to healthcare providers and PLHIV, enhanced client adherence and follow-up. The system has significantly reduced VL turnaround times from 11-35 days to 7-10 days, and the incidence of missed appointments has decreased dramatically. The integration of UID-facilitated clients' deduplication and accurate tracking and the management of their data is crucial for intervention planning and resource allocation, while also allowing PLHIV to seamlessly receive care at different health facilities. By limiting client visits to hospitals, discrimination is mitigated, expenses are reduced, and inclusion for mobile and key populations is improved.

**Conclusions/Next steps:** The implementation of SIDAInfo, complemented by other innovative strategies, has helped Burundi accelerate and sustain progress towards the UNAIDS (95-95-95) goals. As of September 2023, the achievement rate stands at 93-99-95.

## THPEE623

Integrating machine learning models in EMR systems to deliver targeted client-centric HIV testing services in Nigeria

A. Mishra<sup>1</sup>, I. Kamber<sup>1</sup>, M. Adegbite<sup>2</sup>, I. Abah<sup>2</sup>, V. Ajor<sup>2</sup>,

C. Okafor<sup>2</sup>, J. Friedmann<sup>3</sup>, E. Ondura<sup>2</sup>, O. Ogorry<sup>2</sup>

<sup>1</sup>Palladium Group, Washington DC, United States,

<sup>2</sup>Palladium Group, Abuja, Nigeria, <sup>3</sup>Palladium Group, Nairobi, Kenya

**Background:** To meet its UNAIDS 95-95-95 targets, Nigeria must improve HIV case-finding; recent UNAIDS progress reports indicate that less than 90% of people living with HIV (PLHIV) know their HIV status. Machine learning (ML) can leverage client and contextual data from electronic medical record (EMR) systems to identify clients at high risk of acquiring HIV and maximize testing yield.

**Methods:** We built and deployed ML model for HIV testing services (HTS) and integrated them with LAMISPlus—the open-source, modular EMR system for USAID implementing partners (IPs)—to generate real-time risk scores at service points even without internet connectivity. The models predict the risk of acquiring HIV based on prediction scores after screening questions and client sociodemographic information. We trained three models (XGBoost, logistic, and random forest) on 264,178 client records captured by

the HTS modules of LAMISPlus at 15 key population testing sites across six states from 2021 to 2023. Predictive variables included clients' social, health, and sexual behavior history and location-specific prevalence of risk factors. We evaluated the models on their ability to identify positive test cases (precision-recall). Final model was converted from R to PMML for compatibility with LAMISPlus, which allows models to run real-time in offline settings.

**Results:** The XGBoost model performed better than logistic and random forest models, with an AUCPR of 0.79. The HTS model identified most of the positive cases in a fraction of total tests: 57% of all positive cases were concentrated in the top 8.1% of the highest risk scores.

	Highest Risk (≥0.75)	High Risk (≥0.50)	Medium Risk (≥0.25)	Low Risk (≥0.05)
Total tested	4620	6085	9184	28326
# Positives	4432	5357	6499	8493
# Negatives	188	728	2685	19833
Sensitivity Rate	47.5%	57.4%	70%	91%
Positivity Rate	96%	88%	71%	30%

**Conclusions:** Implementation of ML models improved HTS yield by identifying more HIV-positive clients while minimizing test numbers. High-risk clients who test negative for HIV are referred to prevention services. By enabling IPs to run these predictive models in real-time at point-of-service, these models allow Nigeria to continue its progress toward epidemic control efficiently and proactively.

## THPEE624

Promoting data integrity: a milestone towards improving early infant diagnosis and mother- to-child HIV elimination in Ethiopia

B. Seid<sup>1</sup>, M. Desta<sup>2</sup>, G. Bantayehu<sup>1</sup>, B. Ahmed<sup>2</sup>, Z. Melaku<sup>2</sup>,

D. Habte<sup>1</sup>, A. Mekonnen<sup>1</sup>, A. Mahmoud<sup>2</sup>, M. Ahmed<sup>1</sup>,

Z. Abebe<sup>3</sup>, F. Negash<sup>3</sup>, S. Ghosh<sup>4</sup>

<sup>1</sup>CDC-Ethiopia, DGHT, Addis Ababa, Ethiopia, <sup>2</sup>ICAP Ethiopia, Addis Ababa, Ethiopia, <sup>3</sup>Ministry of Health -Ethiopia, Addis Ababa, Ethiopia, <sup>4</sup>U.S. Centers for Disease Control and Prevention, Division of HIV and Tuberculosis, Atlanta, United States

**Background:** Since 2001, Ethiopia's Ministry of Health (MOH), with support from the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) program implemented a comprehensive prevention of mother-to-child transmission (PMTCT) and early infant diagnosis (EID) program across over 2,865 health facilities. However, inconsistent practices have led to poor data quality, and hindered program improvement.

We implemented data quality improvement (DQI) activities to ensure high-quality patient data for effective program management and monitoring.

**Description:** We compared client charts and clinic registers of PMTCT ART data from 139 select high volume health facilities representing 56% of PMTCT ART clients reported nationally that offer PMTCT services. Data were analyzed for completeness, validity, consistency, and verification. Twelve data elements were assessed for both PMTCT ART and the mother-baby cohort register. Additionally, nine reportable indicators were examined for data verification between registers and MOH (DHIS2).

**Lessons learned:** Data completeness was assessed for 2420 and 2191 unique records of mothers with HIV and HIV-exposed infants (HEI), respectively, in service delivery from July 2022 to June 2023. Of the 12 data elements reviewed for record completeness, both the maternal & HEI charts showed higher percentages of completed and valid data than the respective registers. Data completeness was higher in charts (92%) than registers (87%), with syphilis test (69.3%) and viral load (52.8%) data being the least complete (Table).

Data consistency between charts and registers was below 90%, with tuberculosis preventive treatment (TPT) start date (74%) and infant enrollment (78%) having the lowest consistency. Data verification between registers and DHIS2 suggested under-reporting of pregnant women on ART (18%) and HEI receiving cotrimoxazole (21%).

Data element	Completeness	Chart	Register
1 Age (n=2,420)		99.90%	99.70%
2 Date of entry to PMTCT (n=2,417)		96.20%	99.20%
3 Syphilis test result (n=2,306)		69.30%	81.40%
4 Date ART initiated (n=2,318)		97.90%	94.10%
5 ART Regimen at last visit (n=2,319)		99.10%	98.00%
6 TB Screening (n=2,318)		97.30%	88.50%
7 TPT Start date (n=2,393)		89.50%	75.50%
8 Latest Viral Load result (n=2,308)		71.80%	52.80%
9 Date of infant enrolment (n=2,191)		89.10%	90.60%
10 Date infant received ARV prophylaxis (n=2,185)		90.20%	89.10%
11 Result of DNA PCR for infants (n=2,085)		80.00%	86.10%
12 Cotrimoxazole treatment started (n=2,151)		90.40%	91.90%

**Conclusions/Next steps:** Major data quality issues identified, including under-reporting and inconsistencies, leading to inaccurate estimation of mother-to-child transmission rates and children living with HIV. This assessment may help inform future interventions to improve data quality and increase program effectiveness.

## THPEE625

Impact of community-led monitoring on the uptake of ART refills in Gauteng, South Africa.

M. Ntini<sup>1</sup>

<sup>1</sup>Treatment Action Campaign, Policy, Communication and Research, Johannesburg, South Africa

**Background:** ART retention is a public health challenge in South Africa and threatens efforts to ending HIV/AIDS epidemic as a public health threat by 2030. These challenges are attributed to but not limited to healthcare provider's attitude, HIV medication stockouts and missing files. The provision of friendly and welcoming services has been documented as an intervention that supports long-term ART retention.

Data collected through community-led monitoring (Ritshidze project) implemented by the People Living with HIV (PLHIV) sector aimed at improving services at public health facilities indicated trends of progress on ART refills in Gauteng, South Africa.

**Description:** Community-led monitoring is a system of community-developed and community-owned data collection and monitoring at the site of service delivery that leads to the implementation of solutions to respond to the evidence that communities have collected. As part of the Ritshidze's interventions, routine data collection in Gauteng among people living with HIV has indicated an improvement in ART refill as friendly and welcoming services are advocated for which have highlighted progress with 3 – 6 months ART refill with 29% in 2020, 38% in 2021, 46% in 2022 and lastly 56% in 2023.

**Lessons learned:** CLM participatory approaches increase leadership among the community and being involved in all the phases of the project ensures that the community takes ownership of the data and interventions resulting from the project.

Data collected between 2020 and 2023 indicate an increase of 27% of 3-6 months ART refill among surveyed PLHIV.

An important lesson learnt through the Ritshidze project is the value of cooperation between the community and stakeholders. The project allowed coordination and collaboration among multi-sectoral stakeholders which avoided duplication of effort, provided an opportunity for resource mobilisation and sustainability.

**Conclusions/Next steps:** CLM enables communities to hold duty bearers accountable and demand friendly and welcoming services. This has led to the progress made to the 3 – 6 ART refills and ultimately overall improvement in ART retention. The initiatives implemented through community-led monitoring improves availability, accessibility and good quality of HIV services for PLHIV. Ritshidze project implementation has offered an opportunity in ending HIV/AIDS epidemic as a public health threat.

**THPEE626****Improving data quality for HIV implementation in Akwa Ibom, Nigeria: adaptation of the Ottawa Hospital Innovation Framework**

E. Aloro<sup>1</sup>, I. Elechi<sup>1</sup>, K.-A. Ukpomg<sup>1</sup>, I. Olajide<sup>1</sup>, N. Ibah<sup>1</sup>, C. Anikpo<sup>1</sup>, A. Otanwa<sup>2</sup>, B. Gana<sup>3</sup>, O. <sup>1</sup>Achieving Health Nigeria Initiative (AHNI), Uyo, Nigeria,

<sup>2</sup>Family Health International (FHI360), Uyo, Nigeria,

<sup>3</sup>Excellence Community Education Welfare Scheme

(ECEWS), Uyo, Nigeria, <sup>4</sup>Office of HIV/AIDS and TB, United States Agency for International Development (USAID), Abuja, Nigeria, <sup>5</sup>Office of HIV/AIDS, United States Agency for International Development (USAID), Washington DC, United States, <sup>6</sup>National AIDS, Sexually Transmitted Infections Control and Hepatitis Programme (NASCP), Federal Ministry of Health, Abuja, Nigeria, <sup>7</sup>National Agency for the Control of AIDS (NACA), Abuja, Nigeria

**Background:** Data quality is essential for effective monitoring and evaluation of HIV programs, but many health facilities in Nigeria face challenges in reporting quality data. The PEPFAR/USAID-funded Accelerating Control of the HIV Epidemic in Nigeria Project adopted The Ottawa Hospital Innovation Framework, a five-step simplified quality improvement approach, to improve data quality standards. This study reports the outcome of this intervention.

**Description:** To define the problem, Data Quality Assessment (DQA) was conducted for July-September 2022, in October 2022 at 25 high-volume health facilities in Akwa Ibom State, Nigeria. Data availability, integrity, consistency, and validity were assessed using a program-adopted Data Verification/Validation Tool, with a benchmark score of 95-105% as passed.

Root-cause analyses by the project quality improvement team for scores outside the benchmark revealed that gaps in data quality were due to low staff capacity a high staff attrition rate, new staff hires with limited experience, poor collaboration between government and project staff, and stock-out of data capturing tools.

A health systems strengthening intervention to improve data quality included implementing corrective actions from the DQA, central daily/monthly gap profiling with feedback for immediate corrections, structured monthly capacity building sessions, team building efforts, peer-to-peer learning, use of bi-monthly tools inventory reporting systems, and site-supportive supervisory visits. Data validity, the most failed DQA domain, was monitored weekly using a resilience dashboard.

To evaluate the intervention, another DQA was conducted for January-March 2023, in April 2023, and the mean number of domains passed per site was compared pre- and post-intervention using t-test.

**Lessons learned:** Overall, 69% (69/100) domains were passed at baseline DQA (data availability: 84% (21/25), integrity: 56% (14/25), consistency: 88% (22/25), validity 48% (12/25)). Post-intervention, the domain pass rate was 85% (85/100), with better scores in 3 domains: data integrity: 72%, consistency: 100%, and validity: 84%. Data availability remained at 84%. The mean number of domains passed per site improved from  $2.76 \pm 1.26$  to  $3.4 \pm 0.81$  ( $p=0.054$ ).

**Conclusions/Next steps:** A simplified quality improvement approach focused on improving data quality using evidence-based strategies, led to improvement in data validity of the HIV implementation program. However, strategies to address data availability can be further strengthened and implemented.

**THPEE627****Using the National reporting system to harness data for informed action: eradicating parallel partner systems for efficient HIV data management in Lesotho**

H. Motsoasele<sup>1</sup>

<sup>1</sup>National AIDS Commission-Lesotho, Strategic Information, Maseru, Lesotho

**Background:** The National AIDS Commission in Lesotho has made significant contributions to streamlining national information systems as part of the HIV response, and these are highlighted in this abstract. The main objective of the program is to do away with parallel reporting systems in order to promote a unified and effective method of gathering and reporting HIV data. Development Partners have for a long time highlighted that there is fragmented reporting on the Implementing Partners efforts to end AIDS in Lesotho. It has always been a challenge to consolidate the efforts of civil society organizations at the national level. With financial resources from the Global Fund, Efforts were made to set up an National reporting system that would be used by Partners to report on their contribution in the National HIV response. The developed system is called the Lesotho Output Monitoring System for HIV and AIDS.

**Description:** The roll-out of the Lesotho Output Monitoring System for HIV and AIDS (LOMSHA) is a national project and it aims to strategically optimize national information systems. In order to establish an effective monitoring and evaluation system for the HIV response, LOMSHA promotes collaboration among important players that include CSOs. With an emphasis on eliminating redundant procedures and guaranteeing accuracy in HIV-related data, the project highlights the significance of standardized reporting by Implementing Partners.

**Lessons learned:** One of the lessons learnt highlights the difficulty the National AIDS Commission to report on the progress made in the HIV response in Lesotho.

The research emphasizes the value of standardized reporting, collaborating with stakeholders for greater impact, and elevating data from program level to national level through an integrated reporting system that is easy to use.

**Conclusions/Next steps:** The existence of LOMSHA shows the possibility of an effective M&E system for the HIV response in Lesotho. The project aims to improve data accuracy and allocate resources more efficiently by ending parallel partner systems. In this era of the expanding digital health sphere, the National AIDS Commission continues to advocate for one system for an effective and efficient HIV response.

## THPEE628

Utility of integrated data repositories to estimate mortality for patients on antiretroviral therapy (ART) in Botswana 2010-2023

A.T. Ketlogetswe<sup>1</sup>, B. Kaisara<sup>2</sup>, M.D. Seretse<sup>1</sup>, B.P. Tlhaloganyang<sup>3</sup>, K. Bagapi<sup>1</sup>, C. Serumola<sup>1</sup>, P. Tema<sup>2</sup>, K. Sebina<sup>3</sup>, P. Lekone<sup>1</sup>, T.-H. Dinh<sup>4</sup>

<sup>1</sup>Center of Disease Control and Prevention, Strategic Information, Gaborone, Botswana, <sup>2</sup>Ministry of Health, Monitoring and Evaluation, Gaborone, Botswana, <sup>3</sup>Botswana University of Maryland Health Initiative, Strategic Information, Gaborone, Botswana, <sup>4</sup>Center of Disease Control and Prevention, Epidemiology and Surveillance, Atlanta, United States

**Background:** Data repositories from electronic medical records (EMRs) and other systems improve program capacity to track health outcomes, including mortality and lost to follow up (LTFU). The Botswana EMRs are not currently linked to Births and Deaths Registry System (BDRS); mortality data may be incomplete. To assess the value added by linking systems, we compared outcomes for patients on ART using EMR data and integrated EMR and BDRS data.

**Methods:** Data were extracted from the national data repository with individual-level data from multiple public health facilities EMRs and merged with data from BDRS using identifiers. Analysis was done with and without BDRS data. A cohort of people on ART in the repository as of 31 December 2010 was used. Survival analysis methods using STATA 16 censoring on 31 October 2023 was conducted using person months. The study outcome was mortality and survival rates for both EMR data and integrated EMR and BDRS data.

**Results:** As of 31 December 2010, 73,841 people were on ART; 62.1% women. During follow-up, 9,508 (12.9%) deaths were recorded, of which 3990 (42.3%) were marked LTFU using EMR alone. More than half 2065 (51.6%) of the pa-

tients who were marked as LTFU using EMR alone were women while men were 1925(48.3%). Survival probability at the end of follow-up was 0.91 (95%CI 0.90-0.92) using EMR; 0.85 (95%CI 0.84-0.86) for integrated EMR and BDRS data. Incidence of mortality per 100, 000 person-months using EMR data was 55 deaths (95%CI 54-57); 96 deaths (95% CI 94-98) using EMR and BDRS data. Incidence of mortality per 100,000 person-months among women was 46 (95%CI 44-48) using EMR and 79 (95% CI 77-81) using EMR and BDRS data. Among men it was 72 (95% CI 69-75) using EMR and 125 (95%CI 121-128) from EMR and BDRS data.

**Conclusions:** We found EMR data underestimated deaths and overestimated survival, compared to integrated EMR and BDRS data. Use of EMR data alone could misrepresent the success of the program. Implementing interoperability between EMR and BDRS data will be key to strengthen HIV mortality surveillance, leading to improved outcome documentation for persons on ART.

## THPEE629

Impact of revitalizing medicines and therapeutics committees on antibiotics prescription rates at outpatient departments: a three-year analysis of eight Uganda Catholic medical bureau hospitals

H. Suubi<sup>1</sup>, L. Ocen<sup>1</sup>, R. Kasyaba<sup>1</sup>, S. Najjingo<sup>1</sup>, R. Tamale<sup>1</sup>, R. Tamale<sup>1</sup>

<sup>1</sup>Uganda Episcopal Conference, Uganda Catholic Medical Bureau, Kampala, Uganda

**Background:** Antimicrobial resistance is a key global health concern, with high antibiotic prescription rates as one of its major drivers. The study assesses the impact of revitalizing medicines and therapeutics committees (MTCs) in eight Uganda Catholic Medical Bureau (UCMB) hospitals on the outpatient department (OPD) antibiotics prescription rates. These hospitals serve many people living with HIV (PLHIV) who receive antibiotics for the treatment of opportunistic infections.

**Description:** The UCMB has been conducting annual drug prescription surveys across 33 Catholic-founded hospitals in Uganda since 2004; the results are presented in an annual assembly to determine targeted improvement interventions for poorly performing hospitals. A common theme at the consistently poorly performing hospitals reporting high antibiotics prescription rates was the absence of active MTCs. Starting March 2021, UCMB provided technical and financial support for the revitalization of MTCs at the eight consistently poorly performing hospitals. MTCs were charged with reductions in OPD antibiotics prescription rates, among other duties.

**Lessons learned:** Within a year following the revitalization of MTCs, a significant positive impact on OPD antibiotics prescription rates was observed across the eight hospitals. Rates dropped from 36% pre-intervention in 2020 to 28% in 2022 and 26% in 2023.

These improvements were sustained over three years post-intervention following both random spot checks and subsequent annual surveys.

**Conclusions/Next steps:** Revitalization of MTCs in UCMB hospitals contributed to a swift and sustained positive impact on antibiotics prescription rates, leaning towards the World Health Organization-recommended <25%. The PLHIV receiving antibiotics as part of their care are, therefore, beneficiaries of this intervention, with the added benefit of contributing to wider antibiotic stewardship efforts.

#### THPEF630

##### The relationship between anti-LGBTQ+ legislation and HIV prevention among young sexual and gender minorities in the United States

N.K. Kelly<sup>1</sup>, S. Ranapurwala<sup>1</sup>, B.W. Pence<sup>1</sup>, L.B. Hightow-Weidman<sup>2</sup>, A.L. French<sup>3,4</sup>, S. Hosek<sup>4</sup>, A.E. Pettifor<sup>1</sup>

<sup>1</sup>University of North Carolina at Chapel Hill, Department of Epidemiology, Chapel Hill, United States, <sup>2</sup>Florida State University, College of Nursing, Institute on Digital Health and Innovation, Tallahassee, United States, <sup>3</sup>University of Illinois at Chicago, Division of Infectious Diseases, Chicago, United States, <sup>4</sup>University of Illinois Chicago, Center for Dissemination & Implementation Science, Chicago, United States

**Background:** In the United States (US), many states have recently passed anti-LGBTQ+ legislation targeting young sexual and gender minorities (YSGM). YSGM also face an increased risk of HIV acquisition, yet it remains unknown how anti-LGBTQ+ policies influence HIV dynamics.

We therefore examined the longitudinal associations of state- and local-level policy climate with HIV prevention outcomes among a national sample of YSGM.

**Methods:** The Keeping it LITE-1 cohort prospectively enrolled 3,330 HIV negative YSGM ages 13-34 throughout the US from 2017-2022. Online surveys collected information every 6 months on 3 self-reported HIV prevention measures (current PrEP use (yes/no), past week PrEP adherence (yes/no), HIV/STI testing in the past 6 months (yes/no)). LITE-1 geolocation was linked with publicly available state-level LGBTQ+ policy data and county-level election data.

Multivariable generalized estimating equations estimated the single and joint longitudinal associations for 2 different exposures [state-level LGBTQ+ policy climate (more discriminatory vs. less discriminatory) and county-level political majority (Democratic/swing vs. Republican)] with each HIV prevention outcome.

**Results:** Among YSGM living in a state with more discriminatory laws, residing in a Democratic/swing county was associated with a 6-percentage point increase in PrEP use compared to a Republican county (PD: 0.06; 95% CI: 0.02, 0.09). Among YSGM in Republican counties, living in a state with less discriminatory laws was associated with a 5-percentage point increase in PrEP use compared to those in a more discriminatory state (0.05; 95% CI: -0.02, 0.11). Residing

in both a Democratic/swing county and a state with less discriminatory laws, relative to living in both a Republican county and a state with more discriminatory laws, was associated with a 10-percentage point increase in PrEP use (PD: 0.10, 95% CI: 0.06, 0.14) and a 5-percentage point increase in HIV/STI testing (PD: 0.05, 95% CI: 0.00, 0.09).

**Conclusions:** More progressive state and local LGBTQ+ policies were each associated with increased PrEP use, and together, doubled the magnitude of this association. PrEP is greatly underutilized among American youth, and these findings provide preliminary evidence that state and local-level anti-LGBTQ+ policies may be exacerbating this gap.

Future studies should examine the effects of specific legislation to pinpoint areas of intervention and protect YSGM.

#### THPEF631

##### Navigating legal and political challenges: a spotlight on trans people living with HIV

M. Romero<sup>1,2</sup>

<sup>1</sup>Center of Documentation and Trans Situation of Latin America and the Caribbean (CEDOSTALC), Buenos Aires, Argentina, <sup>2</sup>Latinamerican and the Caribbean Network of Trans People (REDLACTRANS), Buenos Aires, Argentina

**Background:** Within the context of Track F in the RedLac-Trans network, CeDoSTALC 2023 delves into the unique challenges faced by trans people living with HIV in accessing healthcare services. The persisting inequalities and politicization of health, exacerbated by events such as Mpox and the COVID-19 pandemic, underscore the urgency of addressing the intersections of politics, governance, law, policy, and human rights.

This research aims to shed light on the specific barriers faced by transgender individuals, focusing on the legal and political factors that hinder their access to HIV testing, prevention, treatment, care, and support.

**Description:** The study meticulously examines the political and legal dimensions affecting trans people within the realm of HIV. It scrutinizes laws and policies related to reproductive rights, bodily autonomy, and integrity, particularly coercive practices like sterilization and abortion. Special attention is given to legislation concerning HIV transmission, exposure, and non-disclosure, and the ensuing implications on various aspects of trans people's lives, such as travel, employment, work, and residency permits. The study explores the nuanced challenges trans people face in accessing healthcare services and the role of legal frameworks in perpetuating or dismantling these barriers.

**Lessons learned:** The research illuminates critical lessons regarding the intricate interplay of political and legal factors affecting trans people living with HIV. It emphasizes the need for targeted, rights-based approaches in policymaking and law enforcement to dismantle discrim-

inatory barriers. The lessons learned underscore the significance of fostering legal environments that safeguard the human rights and healthcare access of transgender individuals, acknowledging the unique intersectionality of their experiences.

**Conclusions/Next steps:** Moving forward, the study advocates for proactive interventions tailored to the needs of trans people living with HIV. Recommendations include the creation of supportive legal environments, ensuring gender-affirming healthcare policies, and addressing discriminatory law enforcement practices.

Future research should focus on evolving challenges specific to transgender communities, fostering collaboration between policymakers, legal experts, healthcare providers, and transgender advocacy groups.

By addressing these specific challenges, we can work towards a more inclusive and accessible healthcare landscape for transgender individuals living with HIV.

## THPEF632

### Global trends in HIV criminalisation

E. Bernard<sup>1</sup>, S. Beaumont<sup>1</sup>, E. Hatt<sup>1</sup>

<sup>1</sup>HIV Justice Network, Amsterdam, Netherlands, the

**Background:** HIV criminalisation describes the unjust application of criminal law to people living with HIV based on HIV-positive status, either via HIV-specific criminal statutes or general criminal or similar laws. Such state-sponsored stigma and discrimination within the criminal legal system is a barrier to universal access to HIV prevention, testing, treatment and care, and a human rights issue of global concern.

**Methods:** An audit of laws and cases included in the HIV Justice Network's Global HIV Criminalisation Database focusing on 2022-24. We define 'recent' as reported cases of the application of HIV-specific (i.e. singling out people with HIV and/or treating HIV as a separate element) or non-HIV-specific (a wide range of general laws applied to allegations of HIV non-disclosure, potential or perceived exposure, or transmission) criminal laws since Jan 1st 2019. Abstract data to 15th January 2024; final presentation will include data to June 30th.

**Results:** Following a COVID-19 era decline in reported HIV-related prosecutions, we documented 86 cases in 18 countries in 2023 (compared to 49 cases in 16 countries in 2022). Most case reports were from the EECA region, North America and Western Europe.

However, Sub-Saharan Africa has the greatest number of HIV-specific laws (30 countries). Since 2022, repeal or reform succeeded in eight jurisdictions in four countries (Belize, Mexico, United States, and Zimbabwe); and positive court rulings took place in a further four countries (Ireland, Lesotho, South Korea and Taiwan). However, 2023 saw Latvia apply its 2013 HIV-specific criminal law for the first time, and the death penalty for 'aggravated

homosexuality' was included in Uganda's anti-LGBT law, adding to an already draconian HIV-related legal environment.

**Conclusions:** Despite the high number of HIV-specific criminal laws (104 jurisdictions in 85 countries) these laws have only recently been applied in 33 jurisdictions in 17 countries. Non-HIV-specific criminal laws have recently been applied in 26 countries.

These data suggest that the global movement to limit or end HIV criminalisation is succeeding, although the pace is currently too slow to achieve the UN target of fewer than 10% of countries with punitive laws and policies that negatively impact the HIV response, requiring further focus and funding.

## THPEF633

### Communities dismantling barriers: the Make Medicines Affordable (MMA) consortium's patent opposition experience for affordable access to medicines

M. Ahmar<sup>1</sup>, S. Kondratyuk<sup>1</sup>, D. Peeler<sup>1</sup>, O. Mellouk<sup>1</sup>

<sup>1</sup>International Treatment Preparedness Coalition, Johannesburg, South Africa

**Background:** Abusive patents on medicines may prevent or delay market entry of cost-effective generics leading to high prices and limited access. Patent oppositions (POs) are legal and administrative procedures aiming to prevent the granting of such patents.

The Make Medicines Affordable (MMA) consortium constituted of civil society (CS) and community organizations from 17 low and middle-income countries (LMICs) is leading patent opposition work in Eastern Europe and Central Asia, Latin America, North Africa, and South East Asia.

**Description:** Since 2019, the MMA consortium has filed 104 challenges on patents and patent applications on medicines. Selection and prioritization of medicines are informed in consultations with local community representatives and health officials. Opposition cases are prepared by multidisciplinary teams of local community representatives, lawyers and chemists.

Of the 104 POs filed by MMA partners, 39 covered 13 HIV treatment; 15 were filed on HCV; 25 were filed on 7 COVID-19, and 25 were filed on 8 TB medicines. 33 of 104 oppositions filed had a positive outcome: patent application rejected or withdrawn. The successful POs yielded resulting in significant savings in health budgets, which allowed expansion of treatment coverage. 12 oppositions have failed and the rest is still under procedure.

**Lessons learned:** The MMA experience demonstrates that, despite the complex technical aspect of POs, local communities and civil society organizations are able to file successful cases. Capacity building, technical support and follow-up, communication, and advocacy are key elements for success.

Thanks to the Patent Opposition Academies capacity has been built in countries where such capacity didn't exist and first ever oppositions have been filed.

**Conclusions/Next steps:** Patent challenges processes are technical and lengthy, requiring time for preparation, support, follow-up, communication, and advocacy - yet they achieve major results. PO are one of the most accessible options for improving affordability of, and access to medicines. The successful POs yielded resulting in significant savings in health budgets, which allowed price reductions and expansion of treatment coverage.

### Continuity of key population service delivery in the community drop-in centers amidst anti-homosexuality act 2023 enactment in Uganda

G. Pande<sup>1</sup>, P. Kyambadde<sup>1</sup>, P. Mudioppe<sup>1</sup>, H. Kadama<sup>1</sup>, H. Balidawa<sup>1</sup>, M. Kimbugwe<sup>2</sup>, R. Lisimbo<sup>3</sup>, J. Egessa<sup>4</sup>, J. Katesi<sup>4</sup>, S. Mugerwa<sup>5</sup>, P. Kina;wa<sup>6</sup>, M. Nakimuli<sup>6</sup>, C. Ngobi<sup>7</sup>, E. Kamakune<sup>4</sup>, I. Mulungi<sup>4</sup>

<sup>1</sup>Ministry of Health, Uganda, AIDS Control Program, Kampala, Uganda, <sup>2</sup>Spectrum Uganda Initiative, Kampala, Community, Kampala, Uganda, <sup>3</sup>Uganda Key Population Consortium, Director, Kampala, Uganda, <sup>4</sup>The AIDS Support Organization, Service Delivery, Kampala, Uganda, <sup>5</sup>Uganda AIDS Commission, Prevention, Kampala, Uganda, <sup>6</sup>Most AT Risk Population Initiative (MARPI), Programs, Kampala, Uganda, <sup>7</sup>The AIDS Support Organization, Service delivery, Kampala, Uganda

**Background:** Ministry of Health has adopted innovations and efficient strategies such as the community DIC for delivering HIV/AIDS services that are client centered. The Anti-Homosexuality Act assented to by the President on 26th May 2023, has affected service delivery in community DICs. It is with this background therefore, that the Ministry of Health conducted an assessment in the community drop-in-centre to find out the current status of service delivery for key population and inform its adaptation strategy.

**Methods:** This cross-sectional study was conducted in all community DICs in July 2023. We targeted 74 DICs as informed by the Ministry of Health DIC assessment report done in June 2022 and any other community DIC as reported by regional Implementing Partners, Community Based Organization (CBO), districts and Civil Society Organizations (CSOs).

Data collection was conducted using a standard tool, the activity started with a preparatory meeting involving the national technical staff during which the team familiarized itself with the assessment tools and terms of reference for the activity.

**Results:** Out of the 74 DICs previously documented as functional by MoH a year prior to this assessment, only 64 were found to be operational. Majority, 85.9% (55/64)

of the DICs noted that the turn up of clients had declined during the AHA law 2023 Period. About 45% (29/64) had experienced safety and security concerns since March 2023(AHA 2023 period). Of those who experienced safety and security incidences, more than 55.1% (16/29) noted that they had media outing, 44.8% (13/29) experienced physical assault and eviction from premises by the landlord, 37.9% (11/29) had been raided by police or local authority and 34.5% (10/29) reported to have been chased away from the community. Of those that experienced incidents 65.5% (19/29) reported targeting transgender, 58.6% (17/29) reported targeting MSM.

**Conclusions:** The enactment and commencement of enforcement of the Anti-Homosexuality Act, 2023 has and continues to affect service delivery in the community DICs. Ministry of Health should follow up the DICs especially those which had closed, to establish circumstances leading to closure and support accordingly.

## THPEF635

### The relevance of gender to potential or perceived HIV 'exposure' charges in HIV criminalisation cases

S. Beaumont<sup>1</sup>, E. Bernard<sup>1</sup>, A. Symington<sup>1</sup>

<sup>1</sup>HIV Justice Network, Amsterdam, Netherlands, the

**Background:** HIV criminalisation is a global phenomenon with a significant impact on public health and human rights. "Protecting women" has been a common argument in favour of HIV criminalisation. However, studies have shown that women are more vulnerable to prosecution because they are often the first to discover their HIV status through prenatal screening, and disclosing their HIV status or negotiating safer sex can be challenging due to power imbalances. This audit aims to identify the relevance of gender to HIV criminalisation cases.

**Methods:** An audit of all cases of HIV criminalisation documented in the HIV Justice Network's Global HIV Criminalisation Database from January 2006 to December 2023, involving cisgender women and heterosexual cisgender men defendants. Database entries are based on media monitoring, information provided by representatives of civil society organisations and legal records, where available.

**Results:** Of 723 HIV criminalisation cases, 227 defendants were women and 496 heterosexual men. Of 227 women's cases, 146 were for potential or perceived HIV 'exposure' (64%) and 81 for alleged transmission (36%) in the context of alleged HIV non-disclosure. In contrast, of 496 cases against heterosexual men, 175 were for 'exposure' (35%) and 321 for alleged transmission (65%).

Women defendants comprised only 31% of all HIV criminalisation cases but represented 45% of all potential or perceived HIV 'exposure' cases. 20% (30/146) of these were for acts that do not transmit HIV, such as spitting or biting. The defendants in 18% (27/146) of the 'exposure'

cases were identified as sex workers, usually arrested before any sexual act. Proportionally, twice as many women were charged for HIV 'exposure' compared to heterosexual men, regardless of actual risks of transmission.

**Conclusions:** Our data show that women are disproportionately facing HIV 'exposure' charges, rather than being accused of transmitting HIV. Although there may be biological factors involved (from a transmission science perspective), there may also be potential gender bias from law enforcement and the criminal legal system.

Further research is essential to identify the causes of this phenomenon and assess potential gender bias in sentencing. This understanding is pivotal for fostering equitable legal systems and effective public health strategies.

## THPEF636

Welcome to Aotearoa New Zealand!

Successful advocacy to remove HIV-related travel restrictions attracts migrants living with HIV

B.M. Hollingshead<sup>1,2</sup>, M. Fisher<sup>3</sup>, S. McAllister<sup>4</sup>, S. Saini<sup>1</sup>, C. Leakey<sup>1,5</sup>, R. Olin German<sup>1,6</sup>, J. Bruning<sup>7</sup>, J. Rich<sup>1</sup>

<sup>1</sup>Burnett Foundation Aotearoa, Auckland, New Zealand,

<sup>2</sup>Australian Research Centre in Sex, Health and Society,

La Trobe University, Melbourne, Australia, <sup>3</sup>Body Positive

Inc., Auckland, New Zealand, <sup>4</sup>University of Otago, AIDS

Epidemiology Group, Dunedin, New Zealand, <sup>5</sup>University

of Auckland, Auckland, New Zealand, <sup>6</sup>GNP+, Amsterdam,

Netherlands, the, <sup>7</sup>Positive Women Inc., Auckland, New

Zealand

**Background:** In 2017, legislative change making HIV a notifiable disease also allowed all people living with HIV in New Zealand (NZ) access to free antiretroviral treatment, regardless of visa status. However, HIV was specifically listed by Immigration NZ as a medical condition deemed to impose significant costs and/or demands on New Zealand's health services, resulting in people living with HIV automatically considered to not meet an 'acceptable standard of health' for migration.

Most work or residence visas were therefore declined, and the country was one of 48 countries with HIV-specific travel restrictions.

**Description:** Burnett Foundation Aotearoa partnered with other community organisations, clinicians, and researchers to advocate to government to remove this automatic exclusion of people living with HIV, arguing blanket restrictions were stigmatising, advances in treatment enabled people living with HIV to lead long and fulfilling lives, well-controlled HIV was not a public health risk, and the availability of generic antiretroviral medication had significantly decreased costs.

We were invited to work with the Ministry of Health and Immigration NZ to inform these policy changes, and HIV-specific rules were removed in October 2021.

**Lessons learned:** In the context of U=U and generic medication, relatively simple, small but specific policy changes can have significant outcomes for communities. Since the legislative change in 2021, we have seen an increase in migration queries and the number of overseas-diagnosed people living with HIV migrating to NZ, leading to greater demand for services.

The true impact of the legislative changes, however, are likely impacted by an overall increase in migration to NZ, and therefore requires monitoring.

**Conclusions/Next steps:** Since the removal of HIV-travel exclusions, higher numbers of people living with HIV are migrating to NZ. Open immigration is important for all people living with HIV, especially when immediate safety is at risk, and this policy change allows people living with HIV to have their human right to move freely be upheld without discrimination.

Ongoing medical inadmissibility persists with mandatory HIV testing and a cost threshold on medical conditions in place satisfied only through the provision of generic medications, limiting choice and best medical outcomes, and therefore ongoing advocacy is required.

## THPEF637

Who suffers the most – receives the least protection: recent data on sexual violence against women from vulnerable groups and sex workers in the EECA region

V. Kalyniuk<sup>1</sup>, F. Gulova<sup>2</sup>, N. Semchuk<sup>1</sup>, T. Fomina<sup>3</sup>, B. Chalgynchieva<sup>4</sup>

<sup>1</sup>Alliance for Public Health, Kyiv, Ukraine, <sup>2</sup>Equal

Opportunities, Dushanbe, Tajikistan, <sup>3</sup>AO Iniciativa Pozitiva,

Chisinau, Moldova, the Republic of, <sup>4</sup>Soros Foundation

Kyrgyzstan, Bishkek, Kyrgyzstan

**Background:** Although sex work is decriminalized in some countries in the EECA region, it remains a cause for unwarranted persecution and pressure from the police.

There is limited data and documented evidence regarding the actual situation of sex workers' rights in the region.

For the years 2022-2023, a total of **2k+ complaints were recorded in Moldova, Georgia, Ukraine, Kyrgyzstan, Tajikistan, and Uzbekistan** from sex workers, who experienced rights violations, discrimination, legal barriers, or violence.

**Methods:** To **monitor human rights violations and discrimination**, as well as to **track responses and assistance to victims**, NGOs and CBOs in the EECA region use the online **tool REAct**.

REAct agents (activists and paralegals) document appeals from KPs and provide support. The use of a unified tool enables **regional analysis of collected statistical data**.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

## Results:

The chart shows that **women from KPs, especially sex workers, are particularly vulnerable to sexual violence**. Although the number of cases of sexual violence is small compared to the total number of sex work-related incidents, this is because the **topic of sexual violence is either taboo or has become so widespread that many survivors prefer to remain silent**.

The number of cases of **sexual violence by police** is almost equal to the number of cases when **the victim filed a police report**. This indicates that the **police do not provide adequate protection**, and may even be the source of violence. The smallest bar represents **cases of sexual violence that reached the court** and the court gave an adequate judgment. This paltry number emphasizes how few sexual violence cases reach court. This is because the **process of proving sexual violence for survivors is extremely difficult**, exhausting, time-consuming, and traumatizing.

**Conclusions:** The states should **reduce legal barriers to access to justice** and **decriminalize sex work** to protect women from the violation of their rights and discrimination.

## THPEF638

Understanding the complexity of legal frameworks that shape access to HIV-related information and services

L. Ferguson<sup>1</sup>, M. Anderson<sup>1</sup>

<sup>1</sup>University of Southern California, Institute on Inequalities in Global Health, Los Angeles, United States

**Background:** Laws provide the framework for implementing HIV-related policies, programmes, and services. They can promote good HIV outcomes and fulfillment of human rights; they may also limit achievement of these goals.

**Methods:** Using data collected under SDG Indicator 5.6.2, we analyzed the existence of HIV-related laws from 153 countries, any restrictions therein based on age, sex, marital status or third-party authorization requirements and any contradictions from plural legal systems. We combined this with Policy Lab data on the existence of other relevant laws in these countries.

**Results:** Of the 153 countries, only four (2.6%) reported having no legal guarantee for voluntary HIV counselling and testing; the same four were also the only countries to report having no legal guarantee for HIV treatment and care services. Only one country (0.7%) reported having no legal guarantee for the protection of confidentiality for people living with HIV. While few restrictions were reported, 6-7% of countries reported the existence of a plural legal system that might impede effective implementation of these laws. 107 countries (70%) report having a law, regulation or policy making sexuality education mandatory within the school curriculum. While 139 report having a law that guarantees access to contraceptive services, 40% of these report one or more associated restrictions. Overall, 95 countries (62%) report having legal guarantees for HIV testing, treatment, and confidentiality that contain no restrictions or contradictions caused by a plural legal system. Of these, 22 (23%) have laws that criminalize non-intentional HIV exposure/transmission, and there are reports of recent arrests/prosecutions; 27% (n=26) have laws that criminalize consensual same-sex acts, and there are reports of recent prosecutions.

Only 15 of the 153 countries report having all of the studied supportive HIV-related laws in place with no restrictions or contradictions, and also do not criminalize HIV exposure/transmission or consensual same-sex activity, whether in law or practice.

**Conclusions:** Much work is still needed to strengthen HIV-related legal environments. Looking across different databases can create a fuller understanding of the many different laws affecting HIV-related outcomes to promote a supportive legal environment for achieving HIV-related targets and supporting people to access relevant services.

## THPEF639

### The ABCs of HIV law reform in Latin America and the Caribbean: case studies on HIV (de) criminalisation in Argentina, Belize and Colombia

E. Hatt<sup>1</sup>, S. Varguez<sup>1</sup>, E. Bernard<sup>1</sup>, A. Symington<sup>1</sup>

<sup>1</sup>HIV Justice Network, Amsterdam, Netherlands, the

**Background:** In the past five years, Argentina, Belize and Colombia made changes to their HIV laws. Due to the diversity of their motivations for reform and advocacy strategies, analysing the processes in these three countries together provides a broad perspective on the realities, challenges and opportunities to repeal punitive laws in Latin America and the Caribbean.

**Methods:** In August 2023, we conducted in-depth interviews with key stakeholders in each country to understand the legislative and political landscapes, reform drivers, repeal processes, and the impacts of legislative changes. We undertook additional research into the history of HIV criminalisation in each country, analysed the impact of these reforms on the respective criminalisation landscapes, and noted appropriate follow up activities, including training and awareness raising, to ensure the potentials of these reforms are maximised.

**Results:** Key lessons learned are:

- Civil society strength, and the arguments and advocacy tactics employed, are key to successful legislative reform.
- The importance of high-level champions for the success of reform cannot be overstated.
- Support from and dialogue with international civil society can also be influential, helping to add weight to arguments for reform, and enabling cross-learning about successful advocacy strategies.
- Human rights-based litigation can be a legitimate and successful route to reform especially if strong rights protections exist in national constitutions.
- Regardless of domestic constitutional protections, introducing scientific evidence and relevant international jurisprudence to legal arguments adds authority and increases the likelihood of success.
- Public awareness of law reform is often limited, hence the need for effective awareness-raising campaigns to maximise the positive impacts of reform.

**Conclusions:** Collectively, these studies provide a snapshot of how reform of HIV laws can be achieved. While the motivation and process in each country was, and always is, a product of factors unique to the local context and cannot be replicated exactly, these case studies demonstrate that reform of HIV laws can be accomplished, whether through the legislature or the courts, when the power of advocates including activists, lawyers, and politicians is effectively leveraged. These studies also highlight the vital importance of centering latest scientific evidence and appeals to human rights protections in reform campaigns.

## THPEF640

### Do abortion laws influence hiv risk among young females in uganda?

P. Nakayenze<sup>1</sup>, J. Kawuki<sup>2</sup>

<sup>1</sup>Family Rescue Initiative Uganda, Legal and Human Rights, Kampala, Uganda, <sup>2</sup>Ultra Medical Hospital, Public Health, Kampala., Uganda

**Background:** There is an intersection between abortion laws and HIV risk. Except in extremely rare cases where a mother's health could be in danger, rape, incest, or fetal deformity, Ugandan law forbids abortion. These policies on abortion are interpreted inconsistently by law enforcement, health workers and the judicial system, which makes it difficult for women and the medical community to understand when abortion is permitted. Uganda's young female population has been most impacted by this situation. We conducted a study on understanding of abortion laws and link between access to safe abortions and HIV risk among young girls' resident in two military bases in Uganda and health workers.

**Methods:** This was a qualitative study that conducted key informant interviews among adolescent girls and young women and health workers in 2 public health facilities in Uganda. Thematic analysis was done to identify key themes regarding knowledge levels about abortion laws, where young girls seek abortion services, link between HIV and abortion, type of methods and knowledge and attitudes of health workers about abortion and those who seek these services.

**Results:** A total of 6 young women and 5 health workers were interviewed. Two young women reported threats of arrest at mention of abortion when they asked for the services. All women reported being aware of colleagues who had accessed abortion services, all of which had been from unlicensed clinics or through use of foreign sharp objects to induce abortions. The young women reported no HIV related information or services were offered in these abortion clinics. The women did worry about contracting HIV from these unlicensed clinics. All health workers reported reluctance to manage or deal with legal abortions.

**Conclusions:** A culture of stigma and discrimination surrounding abortion is prevalent among young women and health workers in Uganda. This creates an environment that increases HIV risk and prevents early seeking of HIV services. Public awareness and training of health workers about abortion laws in Uganda is needed. Legal aid for these young women should be made available.

### Challenging coercion and misplaced punishment: HIV and infant feeding choices

A. Symington<sup>1</sup>, S. Beaumont<sup>1</sup>

<sup>1</sup>HIV Justice Network, Amsterdam, Netherlands, the

**Background:** While mothers living with HIV in many countries are advised to breastfeed their infants for best health outcomes, some women living with HIV have faced disapproval, child protection intervention, and even prosecution for breastfeeding an infant. Punitive approaches to breast/chestfeeding by people living with HIV are inconsistent with current scientific information regarding HIV transmission and fundamental principles of human rights and criminal law.

**Description:** To help protect the rights of people living with HIV, the HIV Justice Network (HJN) monitors and engages in legal cases against people living with HIV for infant feeding. HJN searches English-language legal databases and media reports, and consults with the HIV Justice Worldwide Coalition to identify cases. HJN documents cases in our Global HIV Criminalisation Database and offers technical legal assistance to local defence lawyers and HIV organisations.

**Lessons learned:** HJN's monitoring reveals that women living with HIV continue to experience surveillance and judgement with respect to their infant feeding choices. Medical guidance about HIV and infant feeding varies between countries. Clinicians could help their patients avoid prosecution by ensuring they receive accurate and comprehensive information regarding their legal obligations and infant feeding options. Legal interventions have been threatened recently against two women in Latin America who voiced their intention to breastfeed. Coercing parents' infant feeding decisions with the threat of child protection or criminal intervention is a violation of their human rights and a misuse of punitive responses.

**Conclusions/Next steps:** Science supports that the best outcomes for a mother and a child result from proper medical care, access to treatment and openness. The law should too. Our findings indicate that authoritative, up-to-date guidance is urgently needed from international and national health agencies regarding HIV and breast/chestfeeding. Parents must be empowered with accurate information about the benefits and risks of different modes of infant feeding. Guidance should clearly indicate that criminal prosecution and/or child protection intervention are unjustified.

## THPEF642

### Preventing overly broad criminalisation of HIV exposure, non-disclosure and transmission through multi-sector collaboration on education initiatives

A. Stratigos<sup>1</sup>, S. Greenbank<sup>2</sup>, M. Warner<sup>3</sup>, A. Fryer<sup>2</sup>

<sup>1</sup>HIV/AIDS Legal Centre (HALC), Surry Hills, Australia,

<sup>2</sup>Queensland Department of Health, HIV Public Health Team, Brisbane, Australia, <sup>3</sup>Queensland Positive People, Brisbane, Australia

**Background:** It has long been best practice for criminalisation of HIV transmission, exposure, and non-disclosure to only occur in a "worst case scenario" where transmission has occurred and where intent can be proven to the relevant criminal law standard. In the Australian state of Queensland (QLD), peer representative bodies, lawyers, law enforcement and health policy experts have collaborated to develop educational materials and forums to prevent an overly broad application of legislation criminalising PLHIV for transmission, exposure and non-disclosure offences.

Instead, this initiative promotes the use of existing public health interventions where more appropriate.

**Description:** In the lead up to IAS 2023, Brisbane (capital of QLD) joined the Fast Track Cities network to end HIV transmission by 2030. HIV sector organisations noted that this couldn't be achieved without removing barriers to HIV testing and treatment, including removal of HIV criminalisation offences.

While HIV sector organisations continue to advocate for legislative reform, a ground up approach was also taken. Steps were taken to promote education of law enforcement personnel (police and prosecution) to prevent overly broad criminalisation of PLHIV.

**Lessons learned:** Achieving legislative reform can be a lengthy process, as a stop-gap, engagement with grassroots and frontline organisations to work within existing legislative frameworks can achieve favourable results. HIV sector organisations found that when provided with appropriate materials law enforcement agencies were highly supportive of a best practice human rights approach and engaged favourably with training and education initiatives.

Law enforcement personnel reported that they were unaware of public health interventions and had previously seen criminalisation as the only option where PLHIV are seen to be placing others at risk of HIV.

**Conclusions/Next steps:** Through successful collaboration: Queensland Positive People, the QLD Health Department, the HIV/AIDS Legal Centre (HALC), the Director of Public Prosecutions and QLD Police, are planning on launching training seminars and materials in the first half of 2024. This education will bring greater awareness to the existing public health interventions and reduce overly broad application of criminal laws; the outcomes

ultimately being reduced stigma and discrimination towards PLHIV and removal of one of the barriers to HIV testing and treatment.

## THPEF643

### Empathetic law enforcement training: fostering support for sex worker rights and public health

S. Janyam<sup>1</sup>, C. Phaengnongyang<sup>1</sup>

<sup>1</sup>Service Workers In Group Foundation, Bangkok, Thailand

**Background:** In Thailand, sex work is governed by laws, particularly the Prevention and Suppression of Prostitution Act, B.E. 2539 (1996), and the Act on Entertainment Places, B.E. 2509 (1966), which criminalize various aspects of sex work, including solicitation in public areas, association with sex establishments, and advertising for sex work.

Recent years have witnessed police conducting often violent raids on sex establishments, while reports of widespread corruption and official involvement in prostitution add to the challenges faced by sex workers in Thailand. In this context, police cadet internships hold potential for safeguarding sex workers' rights and well-being through education and awareness.

**Description:** Since 2007, the Service Workers In Group Foundation (SWING) has annually enrolled 5-10 cadets in a specialized Police Cadets Internship Course. This program features interactive sessions, field experiences, and direct engagement with sex workers, emphasizing human rights, public health in sex work, and sex workers' rights and health. A central focus is the discussion how police enforcement of these laws can potentially violate the rights of sex workers.

**Lessons learned:** The emphasis on potential law enforcement misuses had a profound impact. Graduates of this internship program with SWING have formed an alliance, providing assistance when sex workers are arrested under these laws.

This collective effort contributes to the overall well-being of sex worker communities, underscoring the crucial role of empathetic law enforcement training in advancing rights and public health.

**Conclusions/Next steps:** Moving forward, it is crucial to expand and replicate this model in other law enforcement training contexts to promote greater understanding and support for sex workers.

Additionally, ongoing monitoring of long-term outcomes and the incorporation of these lessons into broader policies and initiatives will be essential for creating lasting positive impacts on HIV prevention, treatment, care, and support efforts within sex worker communities.

## THPEF644

### Legal barriers and facilitators to HIV service access for men who have sex with men in Uganda

G. Tumusinze<sup>1</sup>, Z. Nampewo<sup>2</sup>, D. Kasozi<sup>1</sup>, G. Musinguzi<sup>1</sup>, S.T. Alamo<sup>3</sup>, C. Ajulong<sup>3</sup>, P. Kyambadde<sup>4</sup>, M. Baluku<sup>3</sup>, A.C. Awor<sup>3</sup>, J. Musinguzi<sup>4</sup>, N. Musoba<sup>5</sup>, G. Pande<sup>4</sup>, D. Byamukama<sup>5</sup>, E. Mwebaza<sup>6</sup>, A. Jjuuko<sup>6</sup>, A.G. Fitzmaurice<sup>3</sup>, R. Wanyenze<sup>1</sup>

<sup>1</sup>Makerere University School of Public Health, Disease Control and Environmental Health, Kampala, Uganda,

<sup>2</sup>Makerere University School of Law, Human Rights and Peace Center (HURIPEC), Kampala, Uganda, <sup>3</sup>US Centers for Disease Control and Prevention, Global Health Center, Division of Global HIV&TB, Kampala, Uganda, <sup>4</sup>Ministry of Health, Kampala, Uganda, <sup>5</sup>Uganda AIDS Commission, Kampala, Uganda, <sup>6</sup>Human Rights Advocacy and Promotion Forum (HRAFP), Kampala, Uganda

**Background:** Uganda faces significant challenges managing the HIV epidemic, particularly among MSM. Legal and societal environments can facilitate or hinder HIV service uptake, so we assessed legal barriers and facilitators affecting access to HIV services among MSM in Uganda.

**Methods:** This cross-sectional study was conducted in 15 randomly selected districts in five regions of Uganda during January and February 2022 using desk reviews of existing laws and policies, two consultative workshops, 56 key informant interviews, and 16 focus group discussions. We engaged diverse stakeholders, including healthcare workers, MSM, key-population-led civil society organizations (KP-led CSOs), legal professionals, and government officials, to gauge the impacts of laws, policies, and societal attitudes on MSM's access to HIV services. Data were analyzed using the thematic approach with Atlas.ti software.

**Results:** MSM reported barriers to accessing health and HIV services, justice services, and basic ethical rights, such as lack of privacy, autonomy, and confidentiality. They reported being subjected to police brutality and viewed as criminals, resulting in fear and mistrust impeding their ability to seek HIV services. Legal barriers included criminalizing same-sex relationships under the Penal Code Act cap 120 in Sections 145-6. The absence of anti-discrimination protections for LGBTI populations further marginal-

AIDS 2024

Author Index

izes MSM. Individual barriers (e.g., being unaware of legal rights) render MSM unable to defend themselves when violated. Facilitators of service access included Uganda's ratification of international and regional human rights treaties, ensuring rights to health and justice, laying the foundations for advocacy, and promoting non-discrimination. KP-led CSOs facilitate MSM service access through free legal services and training.

**Conclusions:** Laws, policies, and behaviors that violate the basic human rights of MSM in Uganda hinder access to essential HIV services, aggravating the HIV epidemic's challenges in the country. This highlights the need for legal reforms and shifts in societal attitudes towards MSM. Alongside advocating for legal reforms, confidentiality, and privacy, key actors might prioritize awareness of human rights and bolster access to health and justice services.

More support in legal assistance and human rights education of KPs and service providers could foster an inclusive, unprejudiced, equitable, and just environment.

## THPEF645

### Increasing access to affordable generic medicines through patent opposition academies

S. Kondratyuk<sup>1</sup>, G. Chaves<sup>2</sup>, K. Bhardwaj<sup>3</sup>, D. Peeler<sup>4</sup>, M. Ahmar<sup>4</sup>, O. Mellouk<sup>5</sup>

<sup>1</sup>ITPC, Kyiv, Ukraine, <sup>2</sup>ITPC MMA Consultant, Rio-de-Janeiro, Brazil, <sup>3</sup>Independent Consultant, New Delhi, India, <sup>4</sup>ITPC, Johannesburg, South Africa, <sup>5</sup>ITPC, Marrakesh, Morocco

**Background:** The removal of intellectual property (IP) barriers has been instrumental in providing access to cost-effective generic medicines, fostering competition among manufacturers and significantly reducing prices. Since 2001, the price for a year of HIV treatment has plummeted from \$ US 10,439 to under \$60, enabling dramatic scale up, from 0.6 million people to 30 million people.

Despite these advancements, certain middle-income countries (MICs) continue to face challenges in accessing affordable generic antiretrovirals and other essential medicines due to lingering IP barriers.

Civil society organizations (CSOs) play a pivotal role in overcoming these challenges by utilizing Trade-Related Aspects of Intellectual Property Rights (TRIPS) flexibilities, particularly through patent oppositions (POs). However, POs are intricate processes that demand a diverse range of expertise.

**Description:** International experts can provide support and guidance for POs, but local expertise is needed for national results. To prepare local CSOs for case filing, the Make Medicines Affordable consortium, working in 17 low- and middle-income countries (LMIC), established Patent Opposition Academies (POAs), aiming to train local lawyers, scientists and CSOs together on the legal and technical aspects of POs.

During 2019-2021, 89 lawyers, chemists, scientists and CS representatives from 17 LMIC have benefitted from three regional POAs, which provided practical training and joint capacity-building. Pre- and post-training questionnaires found a 56% increase of knowledge among POA participants. After the POAs, CS groups, lawyers, chemists and scientists worked together in Armenia, Belarus, El Salvador, Georgia, Guatemala, Honduras, Kazakhstan, Kyrgyzstan, Moldova and Morocco to file and argue the first-ever CSO-led patent oppositions in those countries in 2020-2023.

Since 2015, members of the MMA consortium has filed 103 patent oppositions on ARVs, direct-acting antivirals for hepatitis C virus, and treatment for tuberculosis (TB) and COVID-19; their work has yielded projected savings of US \$901 million.

**Lessons learned:** POAs are a vital steppingstone towards country-specific PO strategies. Participation of mentors from local NGOs enhanced POAs, through sharing their experience, and building the connection between the MMA campaign and participants.

**Conclusions/Next steps:** POAs are effective; they have increased the number of patent oppositions filed by CSO participants.

## THPEF646

### Bodily autonomy and integrity amidst anti-rights protests

D. Gatsha<sup>1</sup>

<sup>1</sup>Success Capital Organisation, Gaborone, Botswana

**Background:** Public protests against the legal instrumentalisation of Botswana's decriminalisation of same-sex intercourse reflected other anti-rights movements across Africa. This occurred 2 years after the Court of Appeal and 4 years after the High Court decriminalised same sex intercourse. This was further fuelled by public discourse on key populations, including sex workers who are part of the LGBTI community.

Harmful gender norms, digital phobia and gender based violence have exasperated efforts to remove human rights barriers to the HIV response. Success Capital Organisation and its partners, working at a grassroots level - adopted intersectional feminist approaches to activism, health promotion, community referral services and improving the human rights situation for LGBTI through a Bodily Autonomy and Integrity (BAI) project.

**Description:** The BAI project, supported by the AIDS Rights Alliance for Southern Africa and in partnership with the Botswana Network on Ethics, Law and HIV/AIDS, spent over two years across rural Botswana educating and providing community health referral services to key populations through an intersectional lens; health promotion on HIV and SRHR, documentary screening, community dialogues, public theatre, poetry and engaging policy

makers at city, district and national levels. It advanced the rights of LGBTI and Sex Workers, including those with disabilities, from ethnic minority, indigenous, rural and impoverished communities. It engaged communities in spaces of recreation, public malls, informal trading and even public transportation.

**Lessons learned:** Key populations are resilient and creative through their struggles. Socioeconomic conditions such as Botswana's ranking as the 4th most unequal per Gini coefficient in the world is reflected in lived experiences of LGBT and sex workers. Consent, non-physical forms of violence (digital, financial, psychological) are not deemed forms of violence and marital rape is not outlawed. This only highlights the structural and societal inequities.

**Conclusions/Next steps:** There are knowledge gaps on HIV underpinned by harmful gender norms, stigma, discrimination, variant forms of violence and a lack of political will to prioritise HIV within SRHR, UHC and SDG discourse.

Further polarised by anti-rights elements influencing political, religious, traditional leadership. It reflects the decreased investments in HIV literacy, socio-behavioral change and human rights. BAI 2.0 has been started to address these challenges.

## THPEF647

Advanced HIV policy dashboard: results from tracking policy adoption of WHO cryptococcal meningitis recommendations in national guidelines in sub-Saharan Africa

M. Kavanagh<sup>1</sup>, A. Sharma<sup>1</sup>, V. Srivatsan<sup>1</sup>, A. Banda<sup>1</sup>, S. Lynch<sup>1</sup>, J. Lee<sup>2</sup>

<sup>1</sup>Center for Global Health Policy and Politics, O'Neill Institute for National and Global Health Law, Georgetown University, Washington DC, United States, <sup>2</sup>Drugs for Neglected Diseases Initiative, Geneva, Switzerland

**Background:** Cryptococcal meningitis (CM), an opportunistic infection caused by the *Cryptococcus* fungi, accounts for 15% of global HIV-related deaths. Despite progress in biomedical interventions to prevent and manage CM, mortality rates remain high: an estimated 3 out of 4 PLWHA with CM died in 2021. The HIV Policy Lab's Advanced HIV Disease (AHD) Dashboard:

(<https://www.advancedhiv.org/>) tracks policy alignment between national guidelines and WHO recommendations on CM.

**Methods:** The AHD Dashboard, a collaboration between the Drugs for Neglected Diseases initiative and HIV Policy Lab, compares CM-related national policies with the 2022 WHO Guidelines for the diagnosis, prevention, and management of cryptococcal disease in adults, adolescents, and children with HIV. We track 13 policy indicators related to AHD and CM in Eastern and Southern Africa (ESA) and

Western and Central Africa (WCA). Relevant documents for these countries were found via desktop reviews or document repositories of HIV Policy Lab ([www.hivpolicy-lab.org](http://www.hivpolicy-lab.org)).

**Results:** Relevant guidelines were found for 35/46 countries. Overall, we found that policy alignment was better in ESA than in WCA.

ESA: Relevant guidelines were found for 17/21 countries. Zambia, Mozambique, and Kenya adopted 11/13 policies while South Africa, Rwanda, and Malawi adopted 7 policies. 16 countries require baseline CD4 testing but 5 lack guidelines on CD4 testing for those reentering ARV care. All countries in ESA have adopted point-of-care rapid cryptococcal antigen (CrAg) test as a screening tool.

Only 4 countries have adopted the WHO-recommended liposomal amphotericin B (LAmB)-based induction regimen for the treatment of CM for PLHIV. In the essential medicines lists, LAmB is least adopted, with only Mozambique including LAmB for CM.

WCA: Relevant guidelines were found for 18/25 countries. Among them, 15 have adopted baseline CD4 testing for people entering care, but only 3 countries require it for people reentering HIV care. 7 countries have adopted CrAg test as screening tool. Pre-emptive and prophylactic fluconazole therapy is adopted by only 6 and 5 countries, respectively. Only DRC has adopted the LAmB-based induction therapy.

**Conclusions:** The AHD dashboard is a tool to identify areas for policy reform to align with WHO CM-related recommendations.

## Political drivers and policy contexts of HIV

### THPEF648

Empowering people living with HIV: the Village Banking project to reduce poverty and stimulate socio-economic growth in Mumias, Kenya

M. Barracchia<sup>1</sup>, E. Wetoyi<sup>1</sup>, P. Mbone<sup>1</sup>, J. Sospeter<sup>1</sup>, A. Akinyi<sup>1</sup>  
<sup>1</sup>Western Organization for People Living with HIV, Mumias, Kenya

**Background:** In 2014, the Western Organization for People Living with HIV (WOPLAH) in Mumias, Kenya, implemented the Village Banking project to address challenges linked with both living with HIV and experiencing poverty. This ongoing initiative aimed to alleviate vulnerabilities, enhance income opportunities, and establish socio-financial safety, offering group-level soft loans and fostering sustainable entrepreneurship. The Village Banking empowered people living with HIV, enabling them to invest loan capital and generate income for basic needs—food,

transportation costs for antiretroviral collection, school fees, and caring for orphans and children. This economic strategy addressed financial hardships, stigma, financial illiteracy, and gender disparities, promoting holistic well-being.

**Description:** The Village Banking initiative, spanning 2014 to 2024 across 36 villages, trained people living with HIV in financial literacy, microfinancing, and entrepreneurship. Initially providing 600 USD per member for business activation, leaders established community support groups, allocating funds through low-interest loans and developing communal projects. The Village Banking followed five phases: training leaders, business plan development, project implementation, loan repayment, and impact analysis. Monitoring and evaluations were conducted with the Ministry of Health, the Gender and Social Officers, NASCOP, CABDA, group leaders, and partner organizations.

**Lessons learned:** From 2014 to 2024 the project trained 90 leaders previously living in poverty, impacting and enhancing the socio-economic situation of their families and communities, supporting a total of 4570 people living with HIV, including 3000 women, 1,270 men, and 300 children. The Village Banking improved financial stability and social inclusion, diminished HIV-related stigma, and reduced gender disparity by 80% at the household and community level. An initial SWOT analysis, annual evaluations, and participatory approaches were employed for impact measurement and documentation. Best practices included the development and sustainable use of 30 training manuals and consistent monitoring mechanisms.

**Conclusions/Next steps:** The Village Banking addressed the financial challenges faced by individuals living with HIV in Mumias, Kenya, underscoring the importance of establishing a community-driven culture centered on financial empowerment and sustainable lending. This approach reduces inequities and alleviates vulnerabilities, contributing to the holistic wellbeing of people living with HIV. WOPLAH aims to expand the Village Bank to further contribute to poverty reduction, social inclusion, and community resilience.

## THPEF649

### Assessing the landscape of community-led HIV responses in the 7th Global Fund grant-making cycle

R. Hirve<sup>1</sup>, D. Ocheret<sup>1</sup>, L. Sprague<sup>1</sup>, K. Mienies<sup>2</sup>

<sup>1</sup>UNAIDS, Equality and Rights for All, Geneva, Switzerland,

<sup>2</sup>The Global Fund, Community Rights and Gender, Geneva, Switzerland

**Background:** For over four decades, community-led organizations (CLOs) have been essential in the HIV response, formally recognized by the adoption of the specific 30-80-60 targets by UN Member States in 2021, a global call to scale up their work. The 2023-2028 Global Fund Strategy, aligned with the Global AIDS Strategy, underscores community engagement and leadership. Current WHO guidelines recommend HIV services led by and for each key population (KP).

This research examines the impact of these new targets and guidelines in the 7th Global Fund grant-making cycle (GC7), particularly focusing on key-population- and people living with HIV (PLHIV)-led responses.

**Methods:** We selected funding requests from 13 countries across 4 regions, based on submission window and eligibility for UNAIDS Technical Support Mechanism.

We extracted and synthesized information on engagement of networks of:

- KPs as HIV service providers,
- PLHIV, from diverse gender and age groups, in differentiated service delivery,
- PLHIV and KP in community-led data for advocacy,
- across communities in community systems strengthening.

**Results:** Provisional findings suggest that the majority of countries have adopted UNAIDS and the Global Fund CLO terminology and indicate to increase KPs and PLHIV engagement in service provision and human rights interventions. However, few have explicit plans for achieving 30-80-60 targets specifically. While community members are often engaged in service delivery, they are often engaged as individuals rather than as contracted CLOs. Few funding requests specify a role for networks of young people and women living with HIV in implementation arrangements for treatment and human rights efforts or in community systems strengthening.

Additionally, despite major investments in community-driven data, including community-led monitoring, few funding requests used this data for prioritization of interventions.

**Conclusions:** Global targets and guidelines worked to create more visibility and agreement on language supporting CLOs. However, limited engagement of KPs and PLHIV in their diversity as implementing partners of GC7 programmes weakens long-term effectiveness and sustainability not only of community systems, but also of health responses in general. Bridging these gaps is im-

perative for reaching the end of AIDS, as a public health threat, through recognition of and funding for CLOs as legitimate partners.

## THPEF650

### Reframing the AIDS activist agenda for a new era: participatory development of a global AIDS advocacy Agenda for 2030 and beyond

M.A. Torres<sup>1</sup>, K. Morrison<sup>1</sup>, M. O'Connor<sup>1</sup>

<sup>1</sup>International Council of AIDS Service Organizations (ICASO), Toronto, Canada

**Background:** Since the beginning of the AIDS pandemic, community and civil society activism has been the engine of the AIDS response. Advocacy has been indispensable for ensuring political commitments and resources so that individuals living with HIV have access to affordable life-saving medication, comprehensive services, and non-discriminatory legal frameworks. Recent developments threaten the sustainability and safety of ongoing activism around HIV and its social determinants. This participatory assessment sought to test the hypothesis that the lack of robust civil society engagement and oversight is critical to explaining why the global AIDS response is faltering, particularly regarding stagnating financial resources, and determining if it is time to reformulate AIDS advocacy agendas.

**Methods:** Between September and December 2023, a team of community researchers undertook a desk review, key informant interviews with global advocates (n=50), an online survey in four languages (n=206) of community advocates around the world, and a verification meeting of results in a satellite meeting at ICASA with a focus on advocacy needs for east and southern Africa.

**Results:** The abovementioned methods consulted more than 500 community advocates and key global community networks and agencies. It resulted in a consensus that it is indeed time to revisit advocacy agendas. Key findings included the need to better integrate HIV into related health and social issues while addressing the specific needs of populations affected by HIV; better access to services requires a strategic focus on structural impediments to the response; communities need to be at the center of the response through strategic investment in outreach systems, community-led monitoring and systematic evidence, and meaningful community participation in priority setting.

The process highlighted the need to highlight communities' contributions to UHC, vigorously addressing resistance to human rights for all and building responses from the ground up.

**Conclusions:** The study noted the need to work collaboratively. In early 2024, the study will continue the consultation process across regions and within local communities and explore common advocacy priorities with

SRHR (sexual and reproductive health and rights), social justice, and other health concerns, including TB and NCDs (non-communicable diseases).

## THPEF651

### Community advocacy to decriminalise HIV in NSW, Australia

L. Watson<sup>1</sup>, B. Mackie<sup>1</sup>, R. Evans<sup>2</sup>

<sup>1</sup>ACON, Surry Hills, Australia, <sup>2</sup>University of Technology Sydney, Sydney, Australia

**Background:** In December 2023, the Australian Government released the report of the National HIV Taskforce. It recommends the Australian Government engage with state and territory governments to promote the use of current HIV science in the creation and implementation of law and policy, and identify how laws and policy are contributing to stigma, which undermines the public health response and impacts negatively on the community, especially people living with HIV.

**Description:** In NSW, an Australian jurisdiction, there are several laws that do not apply current HIV science, and contribute to stigma and undermining the public health response to HIV. This presentation examines the ways community organisations can collaborate and leverage the recommendations of the National HIV taskforce to advocate for change in NSW. It outlines the current legal situation in NSW, the work achieved following the release of the National HIV Taskforce report to date, and the opportunities ahead to ensure NSW's laws are evidence-based and not further stigmatising people living with HIV.

**Lessons learned:** ACON, a community organisation with almost 40 years of history in HIV advocacy, has always leveraged the strength of its partnerships to achieve positive change in the HIV sector, including in law and policymaking. The current advocacy work applies the lessons of the last 40 years, including working with partners and careful negotiations with the NSW government to advocate for changes to the Public Health Act, the Crimes Act, and the repeal of the Mandatory Disease Testing Act. It is a challenging environment in which to seek legislative change, but this paper also outlines the work being done to minimise the harm of these laws, should advocacy for their repeal or amendment be unsuccessful.

**Conclusions/Next steps:** NSW has been a world leader in the HIV response for decades, in large part due to strong partnerships between community, researchers, and government that created a robust, well-funded and evidence-based public health response to HIV. As we find ourselves on the brink of virtual elimination of HIV, our legislative framework stands in the way. This presentation concludes with recommendations for continued community advocacy in NSW to end HIV stigma alongside virtual elimination.

Community monitors advancing quality of HIV care: lessons learned from introducing the secret client methodology in Ukraine

I. Gryshayeva<sup>1</sup>, O. Voskresenska<sup>2</sup>, A. Bondarenko<sup>3</sup>, V. Kurpita<sup>4</sup>, C. Todd<sup>3</sup>, L. Hetman<sup>4</sup>, A. Radetskyi<sup>5</sup>, A. Zhuk<sup>5</sup>, I. Tereshchuk<sup>5</sup>, L. Shevchenko<sup>5</sup>, N. Abdulkadyrova<sup>5</sup>, O. Negovska<sup>5</sup>, O. Kvitkovskii<sup>5</sup>, O. Sorokin<sup>5</sup>, O. Piven<sup>5</sup>, V. Malikov<sup>5</sup>, V. Parkhomenko<sup>5</sup>, V. Melentii<sup>5</sup>, Y. Stemkovska<sup>5</sup>, Y. Kniaziuk<sup>5</sup>, Y. Kogan<sup>5</sup>, Y. Nizhnichenko<sup>5</sup>, I. Kuzmenko<sup>5</sup>

<sup>1</sup>Pact, Kyiv, Ukraine, <sup>2</sup>AFFW - Ukraine, Kyiv, Ukraine, <sup>3</sup>Pact, Washington DC, United States, <sup>4</sup>Centre for Public Health of the MOH of Ukraine (CPH), Kyiv, Ukraine, <sup>5</sup>USAID/PEPFAR Community Action for HIV Control Project, Kyiv, Ukraine

**Background:** Community-led monitoring (CLM) has successfully documented HIV services availability since the beginning of the Russian invasion and may be advanced to assess quality. The secret client method, where a trained observer poses as a patient, has been used in research to evaluate service quality. We applied this methodology to CLM in Ukraine to identify barriers to and strengths of HIV service quality within the context of armed conflict.

**Description:** Between August and October 2023, the US-AID/PEPFAR-funded Community Action for HIV Control project identified and trained interested community representatives/monitors on the secret client method, which includes care standards, in 12 Ukrainian regions and Kyiv city. Trained key population representatives visited 24 public health facilities, seeking HIV testing services (HTS) using the secret client approach. Findings were shared with the Ministry of Health's Centre for Public Health to determine responsive quality improvement measures.

**Lessons learned:** Twenty-four HTS secret client visits were conducted. Five were incomplete as three secret clients did not have physician referrals, creating a service barrier. A further two facilities did not provide HTS despite national facility services list. Positive findings among 19 completed visits included rare experiences of stigma (1 visit); pre-test information sessions (10 visits); clients received test results (18 visits), and no wait required to see a provider (7 visits). All secret clients reported a friendly atmosphere and ability to ask the provider questions. Challenges included difficulty or inability to schedule services in advance; absence of post-test counseling for more than half of visits; partner testing was rarely offered (2 visits); and some clients noted lack of confidentiality during testing. One theme influencing HTS availability was limited provider confidence in rapid test results. Secret client information also allowed verification of routine monitoring data. Results were shared with regional CPH representatives and responsive actions included provider refresher training in HTS, updating the HTS facility list for testing not requiring physician referrals, and restoring HTS in facilities where previously unavailable.

**Conclusions/Next steps:** The secret client approach provided important findings to improve the quality of HTS and other services. This model will be refined and expanded to evaluate services provided by NGOs

## THPEF653

Reporting on a two-day plenary session to develop an HIV strategy to achieve UNAIDS 95-95-95 targets in Saskatoon, Saskatchewan, Canada

C. Spence<sup>1</sup>, M. Zetti<sup>1</sup>, E. Morin<sup>2</sup>, L. Kiesman<sup>3</sup>, B. Wudel<sup>4</sup>, L. Clatney<sup>5</sup>, K. Roberts<sup>6</sup>, C. Ugolini<sup>4</sup>, A. Hrabowy<sup>7</sup>, D.J. Sutherland<sup>8</sup>, S. Naytowhow<sup>3</sup>  
<sup>1</sup>University of Saskatchewan, Medicine, Saskatoon, Canada, <sup>2</sup>Cambiar Consulting, Saskatoon, Canada, <sup>3</sup>Westside Community Clinic, Saskatoon, Canada, <sup>4</sup>Saskatchewan Health Authority, Saskatoon, Canada, <sup>5</sup>Saskatoon Community Clinic, Saskatoon, Canada, <sup>6</sup>Sanctum Care Group, Saskatoon, Canada, <sup>7</sup>Saskatoon Tribal Council, Saskatoon, Canada, <sup>8</sup>Wellness Wheel Clinic, Regina, Canada

**Background:** Saskatoon, Saskatchewan is facing concurrent and compounding epidemics including HIV, syphilis, homeless, mental health, and opioid addiction. Saskatoon's infection rates are 13x the national average, and UNAIDS 95-95-95 target outcomes at 61-61-42 (2022) - the highest per capita in Canada. Two programs provide the bulk of HIV care to those accessing care in Saskatoon - the Positive Living Program (acute care) and the Westside Saskatoon Community Clinic (community-based care), with UNAIDS outcomes of 51-45-31 and 70-75-50, respectively. In 2022, a group of care providers commissioned an independent HIV program evaluation to identify care gaps and barriers.

Following the evaluation's findings, a two-day strategic plenary session was undertaken with all provider stakeholders to establish a renewed HIV strategy, identifying actionable steps to improve care towards the UNAIDS 95-95-95 targets.

**Description:** Findings from the independent program evaluation were circulated to the advisory committee and served as the foundation informing the two-day strategy planning process with all relevant care, and community service provider stakeholders, including the Saskatchewan Health Authority and the Government of Saskatchewan. The sessions were structured to review the evaluation's findings, hear from people with lived experience, and establish a strategy for HIV care in Saskatoon. To achieve 95-95-95 targets, key components required for each step along the care cascade were collectively articulated, collated and prioritized. The event used a hybrid model to facilitate participation.

**Lessons learned:** The two-day event was received positively by attendees (n=45). Participant feedback validated evaluation findings, and established a common vision

and action plan. The event highlighted political and administrative barriers (resistance) that interfered with the evaluation and subsequent strategy's progress.

**Conclusions/Next steps:** The two-day event established actionable and broader next steps with short, mid, and long-term timelines. Progress is ongoing to achieve identified milestones and mobilize necessary resources.

A final report and strategy are expected in the summer of 2024. Paramount to the success of the report recommendations and strategy is the support and investment from the health authority and provincial government, including the shared commitment to address rising HIV infection rates in Saskatchewan and achieve the UNAIDS targets in a critically timely manner.

## Human rights and responses to HIV

### THPEF654

People living with HIV as subjects of special constitutional protection: a human rights perspective of the Constitutional Court of Peru

R. Diaz Giunta<sup>1</sup>

<sup>1</sup>ODM Organización Democrática Mundial por el Desarrollo, Lima, Peru

**Background:** In Peru, prejudice & discrimination are factors that have contributed to a historic neglect by the Ministry of Health's authorities regarding their duty to provide medical treatment to people living with HIV. Sometimes, people living with HIV from low-income households had their health negatively impacted by the indolence of those authorities who would justify the suspension of antiretroviral treatments due to budgetary issues. Ever since 2004, the Constitutional Court has adopted resolutions that protected the right to health of people living with HIV, and have deemed them subjects of special constitutional protection. Their landmarks decisions across the years have also shaped public policy and legislation.

**Description:** The Constitutional Court of Peru has guaranteed protection of the human rights of people living with HIV. For example, in the case 02945-2003-PA/TC, it ruled that investment in HIV is not restricted to access of treatment, but also there must be greater focus on information about HIV, prevention campaigns and sexual education programs. Plus, in the case 04749-2009-PA/TC, it established that people living with HIV qualify for a special pension even if they are receiving access to antiretrovirals. Also, through the case 0298-2020-PA/TC, it ruled that not even the context of the COVID-19 pandemic justifies any delays in the access to antiretrovirals, because that situation violates the right to health.

**Lessons learned:** The public budget in Peru for treatment and prevention of HIV has increased in more than 60% due to precedents of the Constitutional Court and the pathway they have set for the protection of people living with HIV, as subjects of special constitutional protection.

**Conclusions/Next steps:** The existence of a breach or suspension of the existing obligations that Peru has towards guaranteeing people the access to HIV treatment does indeed affect their health. Thus, this situation constitutes the violation of their right to health.

As subjects of special constitutional protection, and in accordance with the precedents of the Constitutional Court, the Government needs to take affirmative action to ensure the rights of people living with HIV are protected, and that they receive their treatments and medicines with adequate conditions of quality, opportunity, acceptability and accessibility.

### THPEF655

Recognition of sex work as a formal source of employment in Costa Rica

N. Ordóñez Ugalde<sup>1</sup>

<sup>1</sup>Asociación La Sala, San José, Costa Rica

**Background:** Sex workers in Costa Rica face pervasive discrimination and violence, despite the absence of legal prohibition on sex work. Reports from the Latin American and Caribbean Network of Sex Workers RedTraSex highlight this issue, revealing gaps in the protection promised by existing anti-discrimination laws.

Costa Rican La Sala Association contends that regulating sex work as any other profession would enhance protection and diminish stigma.

**Description:** In collaboration with the First National Meeting of Sex Workers in 2023, La Sala undertook several initiatives. We devised an advocacy strategy to integrate sex work into all labor laws, sought the Ministry of Education's acknowledgment of justified absences for sex work-related reasons, as well as the commitment to implement community-led educational programs for security forces, and successfully lobbied the Social Security Fund for self-employment coverage.

Contacts with the National Institute for Women and the Ministry of Public Security aimed to mitigate police harassment, resulting in an official apology from the Ministry of Security.

Coordination with the National Insurance Institute is ongoing for occupational risk policies, while efforts to be included in the Minimum Wage Decree were hampered by legal obstacles, prompting La Sala to appeal to the Constitutional Court.

The culmination of these efforts is the official recognition of sex work as legitimate employment in Costa Rica. This landmark achievement signifies broader entitlements

for sex workers, including physical security, non-discrimination, social security, maternity leave, and benefits for sickness and occupational accidents.

**Lessons learned:** This milestone is the product of more than 30 years of non-stop advocacy.

The support of the Regional Network RedTraSex has been crucial.

Progress would not be sustainable without the unity nationwide of Costa Rica's sex worker community.

**Conclusions/Next steps:** La Sala recognizes that challenges persist and anticipates further strides in securing rights and protections for sex workers. The acknowledgment and legal safeguarding of sex work in Costa Rica represent a significant achievement, setting the stage for continued advocacy and reform in the ongoing pursuit of comprehensive rights for sex workers in the country.

## THPEF656

"I was called 'bencong' while arranging my BPJS" – Forging a community-led intersectional justice approach to health and social security for elderly transgender women in Indonesia

A. Wolter<sup>1</sup>, B. Hegarty<sup>2</sup>, I. Susetyo<sup>1</sup>, L. Sugiharto<sup>3</sup>, R. Mallay<sup>4</sup>, J. Kaunang<sup>5</sup>, A. Wardhana<sup>5</sup>

<sup>1</sup>Perkumpulan Suara Kita, Jakarta, Indonesia, <sup>2</sup>Kirby Institute, UNSW Sydney, Sydney, Australia, <sup>3</sup>Yayasan Srikindi Sejati, Jakarta, Indonesia, <sup>4</sup>Waria Crisis Centre, Yogyakarta, Indonesia, <sup>5</sup>Indonesia AIDS Coalition, Jakarta, Indonesia

**Background:** In Indonesia, elderly transgender women face sociostructural barriers that impede their access to essential health and social services. Despite the existence of universal health coverage and social protection programs designed to serve the poor and elderly, these marginalized individuals continued to be excluded. This study aims to

1. Investigate specific barriers that elderly transgender women face in accessing health and social security programs and;
- 2.) Capture the intersecting challenges that come from being trans, poor, and elderly.

### Description:

This mixed-methods study utilized a participatory rapid ethnographic approach to examine barriers to health and social security programs for elderly trans women (n=48), using knowledge and insights from trans communities and government representatives (n=5). The research was operationalized by trained community researchers (n=12) and conducted across five Indonesian cities.

**Lessons learned:** The findings revealed how elderly trans women live at the intersections of being trans, poor, and elderly, resulting in difficulty accessing government support (e.g., health insurance and financial aid). Barriers to services include discrimination based on gender identity

and expression (e.g., being prohibited from appearing feminine when accessing services or being socially excluded from financial assistance programs), bureaucratic registration requirements, sole recognition of traditional nuclear family structure (especially in the context of Program Keluarga Harapan; Indonesia's first conditional cash transfer program), and lack of access to information and technology. Community support, particularly from transgender NGO workers, played a critical role in bridging trans communities with government services, often determining participants' ability to receive support.

**Conclusions/Next steps:** Government policy structures related to "identity" and "family" do not fully align with the lived experiences of elderly transgender women, who often find themselves excluded in Indonesian sociostructural systems.

This study calls for systemic reforms to address barriers to health and social security programs, proposing a justice-centered approach by broadening community involvement to ensure no one is left behind.

## THPEF657

Impact of the Anti-Homosexuality Act 2023 on access to HIV services and comprehensive Sexual Reproductive Health and Rights among men who have sex with men and transgender women in Uganda

C. Ssenabulya<sup>1</sup>, H. Mukiibi<sup>2</sup>, G. Miir<sup>3</sup>

<sup>1</sup>Children of the Sun Foundation Uganda Limited, Kampala, Uganda, <sup>2</sup>Children of the Sun Foundation Uganda Limited, Kampala, Uganda, <sup>3</sup>Makerere University, Kampala, Uganda

**Background:** The study investigates the consequences of Uganda's Anti-Homosexuality Act 2023 (AHA 2023) on the access to HIV services and sexual reproductive health rights for MSM, gay, bisexual, and transgender women. It aims to test the hypothesis that the implementation of AHA 2023 has significantly hindered healthcare access for these communities.

The research seeks a comprehensive understanding of the impact, providing recommendations to address the adverse effects on access to crucial healthcare services for MSM and transgender women in Uganda.

**Methods:** A three-month study was conducted from September to November 2023 in urban and rural areas across central, eastern, western, and northern regions of Uganda explored the impact of the Anti-Homosexuality Act 2023 (AHA 2023) on MSM, gay, bisexual, and transgender women aged 18 and above. The mixed-methods approach involved qualitative methods including 32 in-depth interviews, 10 focus group discussions, and participant observations, providing nuanced insights into challenges faced. Quantitative data analysis included a retrospective examination of 14 healthcare records, 9 health

reports, and statistical databases related to HIV service utilization of both public and private health centers. The integration of both data types yielded a comprehensive understanding, guiding the development of recommendations.

**Results:** The Anti-Homosexuality Act 2023 in Uganda severely impacted the accessibility of HIV services and Sexual Reproductive Health Rights for MSM, gay, bisexual, and transgender women, with a pronounced decline among those aged 18-25. The Act led to reduced availability of services like counseling and STI screening due to closures of key population organizations and drop-in centers, driven by fear of persecution. Increased stigma, discrimination, and mental health concerns, including anxiety and depression, affected all age groups due to home evictions, job loss, raids, arrests, and attacks. Trust between healthcare providers and patients in public health centers declined, hindering non-discriminatory care.

**Conclusions:** The study highlights the necessity for the targeted HIV prevention initiatives, enhancing access to treatment, comprehensive sexual reproductive Health programs, reduction of stigma and discrimination, mental health integration and policy advocacy for inclusivity for MSM, gay, bisexual and transgender women in Uganda.

## THPEF658

Exposing the false dichotomy between human rights and family values: UNESCO shares lessons for countering the anti-rights movement

S. Séguéy<sup>1</sup>, A. Singh<sup>1</sup>

<sup>1</sup>UNESCO, Education Sector, Paris, France

**Background:** Comprehensive sexuality education (CSE) is a flashpoint for anti-rights actors as it represents a hotly contested intersection of young people, sex, reproductive health, sexual rights, gender and power. While opposition is not new, its improved coordination and resources have halted or reversed CSE implementation in some countries. UNESCO, with other UN agencies, is working on building support, examining CSE resistance and backlash, and strategizing tools and approaches to manage and mitigate their harmful impact on CSE policy and programmes.

**Description:** Since 2020, UNESCO is mapping counter-movements against CSE and strategies of response; analysing the media landscape and documenting case studies in 5 sub-Saharan African countries about the surge of externally motivated CSE polarisation and government, CSO and UN response; implementing values-based communications; providing information and technical briefings for national delegations to the UN in Geneva and New York alongside side events at UN meetings; and demonstrating solidarity on CSE through the Global Partnership Forum on CSE with joint research, advocacy, and sharing.

**Lessons learned:** The anti-rights movement uses tactics of confusion, re-framing, disinformation; targets existing fears and makes emotional appeals to families, faith leaders and governments; disseminates pseudo-science and discredits sexual rights actors. The nexus between anti-rights actors and conservative governments is exemplified through policy actions such as adoption of anti-homosexuality bills.

While rights actors have engaged in evidence-based advocacy, it is time to use values-based messaging and take control of the narrative – not only for CSE, but for SRHR as a whole – with a need to focus on shared values and create a positive vision for change, rather than only highlighting the negative consequences of lack of sexual rights and CSE.

**Conclusions/Next steps:** CSE is a key prevention tool for HIV. While the anti-rights movement has targeted CSE, their underlying narrative is against all sexual rights and gender equality, thus affecting any gains made on HIV prevention or reduction of stigma and discrimination. Exposing their tactics while building cross-movement solidarity among SRHR actors is essential to ensure that we retain control over the narrative, build community and stakeholder support, and continue to positively influence policies, legislation and programmes for better sexual rights for all.

## THPEF659

Assessment in 11 cities for the development of a PLHIV, especially WLHIV, and key populations gender-based violence module for field officers

I. Widjaja<sup>1</sup>, A.A. Riyadi<sup>1</sup>

<sup>1</sup>Indonesia AIDS Coalition, Program, South Jakarta, Indonesia

**Background:** Indonesia's HIV epidemic has reached 543,100 people since 1987, with a high loss to follow-up and death rate. Only 62% of People Living with HIV (PLHIV) know their status, 21% are on treatment, and 1.5% have achieved viral suppression. Challenges include a lack of solid healthcare client relationships, which was caused by stigma, discrimination, and healthcare burden. Gender-Based Violence (GBV) is a significant issue in the HIV response program. Capacity building for field workers can help address GBV during the outreach and mentoring process.

**Description:** The study used a qualitative approach with the Participatory Action Research (PAR) method to assess community engagement in the implementation of the Indonesia AIDS Coalition (IAC)'s Human Rights Program. The research methodology, action dimension, and participation dimension were the three main pillars. The study was conducted in 11 districts from March to May 2022, focusing on community need analysis, problem-solving, and solutions as the basis of transformative actions.

## Lessons learned:

1. The vulnerability of Women Living with HIV (WLHIV) and key populations includes local customs that affect them.
2. Survivors of GBV within the HIV community (PLHIV, WLHIV, and Key Populations) often do not have access to justice, which causes them to lose confidence in law enforcement.
3. The HIV community experiences challenges when accessing GBV services.
4. Situations related to the referral system for GBV service providers in the HIV community. In general, not all key population groups and field officers know of the referral mechanism.
5. There exists a need for capacity building for field officers to respond to GBV issues in the HIV community.

**Conclusions/Next steps:** The assessment indicates a need for increased awareness about GBV among law enforcement officers, particularly in relation to the amendment of the Legal Aid Law. This can be achieved through advocacy to the Ministry of Law and Human Rights. For certain regions, such as Bali, Papua, and West Papua, it is necessary to sensitize traditional and religious leaders because of the strong influence of customs and religions in the area. Lastly, training modules should be differentiated for each key population group, a special session on self-acceptance added, and guidelines or referral systems.

## THPEF660

### Assessing the gender-responsiveness of HIV services in South Africa: a new facility checklist and indicator for Global AIDS monitoring

A. Stangl<sup>1</sup>, T. Pliakas<sup>2,3</sup>, G. Hoddinott<sup>4,5</sup>, L. Viljoen<sup>4</sup>, Z. Kavalieratos<sup>4</sup>, V. Bendaud<sup>6</sup>

<sup>1</sup>US Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States, <sup>2</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>3</sup>Impact Epilysis, Thessaloniki, Greece, <sup>4</sup>University of Stellenbosch, Department of Paediatrics and Child Health, Cape Town, South Africa, <sup>5</sup>The University of Sydney, Sydney, Australia, School of Public Health, Faculty of Medicine and Health, Sydney, Australia, <sup>6</sup>Joint United Nations Programme on HIV/AIDS, Data for Impact Practice, Geneva, Switzerland

**Background:** Gender inequality stands in the way of global goals to end AIDS by 2030. Women and girls are disproportionately affected by HIV globally, particularly in sub-Saharan Africa where they represent ~64% of people living with HIV. Gender-diverse populations (GDP) are also at higher risk of HIV infection. Intensifying efforts to ensure that HIV services are gender-responsive (designed to address differing needs of men/women, boys/girls, and GDP) is therefore critical.

**Methods:** The new indicator was calculated based on responses to a checklist completed by health facility managers in South Africa. The initial checklist was developed based on literature review. Face validity was established with input from an advisory group composed of community, academia, multi-laterals, and implementers. The checklist was piloted in 18 health facilities (13 urban, 1 semi-urban, 4 rural) in Western Cape Province, South Africa between June-August 2022. Exploratory factor analysis and consultation with technical experts were used to reduce the number of items included. Reliability was assessed using Cronbach's alpha.

**Results:** The final checklist consists of 43-items and two sections: (1) general information on the health facility, and (2) gender-responsiveness of HIV services, which is divided into 7 sub-sections. All sub-sections demonstrated very good reliability (Cronbach's alpha range: 0.75-0.95). Health facilities are considered gender-responsive if they receive a score between 75 and 100 on the checklist. Half of the facilities in the pilot had a score over 91, with scores ranging from 39 and 100.

**Conclusions:** The new indicator and checklist address a critical gap that will help monitor progress towards the 2021 Political Declaration target of "<10% of women, girls, people living with HIV and key populations experience gender inequality and violence", and the sub-target of ">90% of HIV services are gender-responsive by 2025," and identify where intervention is needed to increase the gender-responsiveness of HIV services.

Gender-responsiveness sub-section scores across 18 health facilities in South Africa, 2022	No. of items	Max Score	Mean (SD)	Range	Median
Training for all healthcare staff	7	14	11.9 (2.60)	7-14	13.5
Training for al health facility staff	4	8	6.9 (1.95)	0-8	8
Policy and feedback mechanisms	6	12	9.6 (3.03)	0-12	11
HIV prevention services	5	10	8.7 (1.78)	4-10	10
HIV treatment services	5	10	8.6 (2.73)	0-10	10
HIV care and support services	5	10	8.3 (2.70)	0-10	10
Sexual and reproductive health services	5	10	8.8 (1.93)	4-10	10
Overall score, adjusted to 100	37	100	85.0 (17.07)	39.2-100	91.2
Percentage of health facilities providing gender-responsive HIV services	No. facilities 18	No. scored > 75 12	No. scored >75/No. facilities 66.7%		

## THPEF661

### 'Women's right to health in detention':

United Nations Committee Observations since the adoption of the Bangkok Rules with focus on HIV/AIDS

S. Fleißner<sup>1</sup>, U.-B. Klankwarth<sup>1</sup>, H. Stöver<sup>1</sup>, M.-C. van Hout<sup>2</sup>

<sup>1</sup>Frankfurt University of Applied Sciences / Institute of Addiction Research, Frankfurt, Germany, <sup>2</sup>Liverpool John Moores University / Public Health Institute, Liverpool, United Kingdom

**Background:** Approximately 11.7 million people are detained globally, with an observed rise in the female prison population in recent years. A range of human rights treaties, and non-binding minimum standards of care (2016 Standard Minimum Rules for the Treatment of Prisoners (the Mandela Rules), 2010 Rules for the Treatment of Women Prisoners and Non-custodial Measures for Women Offenders (the Bangkok Rules)) protect the rights of prisoners. States however have discretion in defining humane treatment and adequate medical care in detention settings, also in regard to Aids/HIV-treatment.

**Methods:** We scrutinized all United Nations Committee on the Elimination of Discrimination against Women and Committee against Torture Concluding Observations published between 2010 and 2021, and provide a global illustration of violations of women's health rights in detention settings with a focus on HIV. We identified four Bangkok Rules which are directly related to HIV/AIDS.

**Results:** Human rights violations identified in the Concluding Observations reflect 39 countries. HIV/Aids was mentioned in four reports (e.g. "violence faced by women living with HIV/AIDS").

For 21 countries the reports are very general in their findings with statements as "access to adequate health facilities". It therefore seems reasonable to assume that the treatment of HIV/AIDS is only possible to a limited extent, if at all. However, the actual situation is not clear from these reports.

**Conclusions:** Our investigation raises general questions around the continued lack of resourcing of female detention settings and gender-responsive healthcare programming, the lack of data and advocacy on behalf of detained women, and the lack of routine scrutiny of the unique health rights assurances of women within independent monitoring and inspection in detention settings all over the world. There is especially limited information about HIV/AIDS, even as four of the Bangkok Rules (Rule 6, 14, 17 and 34) explicitly refer to HIV/AIDS.

## THPEF662

By partnering with the CDC and various organizations, work towards creating an equitable medical pathway, known as the "green channel," for transgender sex workers living with HIV

S. Liu<sup>1</sup>, Y. Liu<sup>2</sup>

<sup>1</sup>Star Language Empowerment Center, Guangzhou, China, <sup>2</sup>Asia Pacific Network of Queer Sex Workers, Shenzhen, China

**Background:** This abstract encapsulates the comprehensive program designed to address HIV prevention and care among transgender sex workers. The overarching purpose is to bridge critical healthcare gaps by establishing a tailored approach that focuses on the unique needs of this vulnerable population. The program's scope encompasses a multi-faceted strategy, incorporating prevention, treatment, care, and support initiatives.

**Description:** This initiative is based in the city of Guangzhou, where the primary objective is to establish a streamlined and inclusive healthcare pathway, often referred to as the "green channel," for transgender individuals. Operating within Guangzhou, the program aims to address the specific healthcare needs of the transgender sex workers community. This includes developing and implementing measures to eliminate barriers and ensure equitable access to medical services. The initiative involves close collaboration with local healthcare facilities, community organizations, and governmental bodies to create a supportive environment and navigate the complexities of establishing a green channel tailored to the unique requirements of transgender individuals in Guangzhou. Through targeted activities and interventions, the program seeks to promote awareness, reduce stigma, and facilitate a more inclusive healthcare system for the transgender population in the city.

**Lessons learned:** The program has yielded valuable insights and outcomes. Increased engagement with healthcare services resulted in higher rates of HIV testing and early detection. Outreach efforts led to improved community trust and increased knowledge about safe practices. However, challenges persist, including persistent stigma and discrimination. The program's successes highlight the importance of tailored interventions and community involvement. Lessons learned include the need for ongoing anti-stigma campaigns, continuous training for healthcare providers, and sustained community empowerment.

**Conclusions/Next steps:** The findings underscore the significance of targeted HIV interventions for transgender sex workers. The program has demonstrated tangible improvements in prevention and care outcomes. Moving forward, sustained efforts are required to address the remaining challenges and expand the program's reach. The results have broader implications for HIV initiatives, emphasizing the need for inclusivity, cultural competence,

and ongoing community engagement in public health interventions. The program serves as a model for future endeavors, providing valuable insights for the design and implementation of effective and inclusive HIV prevention and care strategies.

## THPEF663

**Untold realities: human rights perspective on the intersecting challenges faced by orphaned women living with HIV**

P. Pokhrel<sup>1</sup>

<sup>1</sup>National Association of PLHIV in Nepal, Chitwan Plus, Chitwan, Nepal

**Background:** The personal narratives shared by young adult girls living with HIV by birth, as discussed within a Chitwan Plus organized sharing circle in Nepal, expose an alarming reality from a human rights perspective characterized by pervasive stigma and discrimination. Seven orphaned young women, aged between 16 and 26, offered unfiltered accounts of their lives, emphasizing the intersectionality of gender, HIV status, and orphanhood, all against the backdrop of alarming experiences of ravishment and abuse.

**Description:** These narratives unveil a profound societal stigma that casts a pervasive shadow over the lives of these young women. Their courageous testimonies shed light on the compounded discrimination they endure, underscoring the intersectional nature of their challenges. The convergence of gender, HIV status, and orphanhood collectively contributes to a hostile environment, leading to their unjust judgment and exclusion.

**Lessons learned:** The particular concern are the testimonies that illuminate the harsh reality of women facing sexual violence and abuse, driven by individuals exploiting vulnerabilities arising from their HIV status and orphaned backgrounds. The absence of adequate social protection mechanisms exacerbates their vulnerability, subjecting them to exploitation and further human rights violations. The sharing circle emerged as a platform for these survivors to advocate urgently for robust social safety nets, essential to shielding women from predatory actions fueled by their HIV status and orphanhood.

The narratives underscore the pressing need for societal education to challenge deeply ingrained prejudices. Stigma not only permeates interpersonal relationships but also infiltrates cultural practices and norms, amplifying the discrimination faced by these individuals.

**Conclusions/Next steps:** The sharing circle thus serves as a powerful call to action, urging society to dismantle the entrenched stereotypes that perpetuate discrimination against women living with HIV from a human rights perspective. The testimonies of these young adult girls portray a painful reality shaped by the intersectionality of gender, HIV status, and orphanhood, highlighting the

immediate need for comprehensive human rights interventions. These should address stigma, bridge social protection gaps, and combat gender-based violence.

By amplifying these voices, the sharing circle becomes a potent catalyst for human rights-driven change, compelling society to confront and eliminate discriminatory forces.

## THPEF664

**Transformative approaches at the intersection: strengthening community led SGBV redress initiatives for enhanced access to HIV services among Adolescent Girls and Young Women (AGYW) in the Bukedi sub-region**

A. Kyagera Nairuba<sup>1</sup>

<sup>1</sup>Center for Human Rights, University of Pretoria, Pretoria, South Africa

**Background:** This abstract presents a groundbreaking initiative titled "Strengthened Community-Led Redress Initiative for SGBV," implemented by the SRHR Alliance Uganda with a focus on addressing structural barriers to access HIV services among adolescent girls and young women in the Bukedi Sub-region.

The project, spanning from February 2021 to June 2022, aimed to enhance community-led response systems for survivors of Sexual and Gender-Based Violence (SGBV) and contribute to the broader discourse on the intersection of politics, governance, law, policy, and human rights in the context of HIV services.

**Description:** Operating in Tororo, Busia, and Butaleja districts, the project employed a comprehensive approach, integrating community-based interventions, legal aid services, and innovative strategies such as "Community Response Agents" (CRAs). These CRAs played a pivotal role in identifying and supporting survivors, building community awareness, and fostering collaboration with local government leaders. The project sought to create a functional toll-free center, provide legal aid services, and apply a Gender Transformative Approach for comprehensive protection. Key activities included training sessions, legal aid provision, mentorship programs, community dialogues, and media campaigns, benefiting a total of 17,360 individuals.

**Lessons learned:** The findings of the project revealed significant advancements in the establishment of a functional formal and informal community SGBV response system. The increased awareness and capacity of existing systems demonstrated a positive impact on survivors' access to justice. The utilization of CRAs proved to be an effective strategy in bridging the gap between survivors and available support services. The project also highlighted the importance of addressing societal normalization and discriminatory informal systems as barriers to justice for adolescent girls and young women.

**Conclusions/Next steps:** The "Strengthened Community-Led Redress Initiative for SGBV" yields pivotal implications for HIV prevention, treatment, and care. Successfully establishing functional SGBV response systems offers a model for integrating community-led initiatives into the broader HIV services framework. Emphasizing a Gender Transformative Approach, the project highlights the need for comprehensive protection and advocacy against systemic barriers.

To sustain and scale-up such initiatives, ongoing collaboration among community organizations, government entities, and international stakeholders is essential, ensuring enduring impacts on human rights, gender equality, and access to essential health services.

## THPEF665

Breaking Down Barriers: integrating access to justice programming with HIV/TB prevention and care in 5 countries

M. McLemore<sup>1</sup>, M. Golichenko<sup>2</sup>, N. Sun<sup>3</sup>, A. Bolotbayeva<sup>4</sup>, R. Ningsih<sup>5</sup>, C. Narcisse<sup>6</sup>, C. Aquino<sup>7</sup>, D. Lohman<sup>8</sup>, J. Mabilat<sup>9</sup>, P. Chibatamoto<sup>10</sup>, J. Amon<sup>11</sup>

<sup>1</sup>Consultant, Jacksonville, United States, <sup>2</sup>HIV Legal Network, Toronto, Canada, <sup>3</sup>Consultant, Durham, United States, <sup>4</sup>Consultant, Bishkek, Kyrgyzstan, <sup>5</sup>Consultant, Jakarta, Indonesia, <sup>6</sup>Consultant, Kingston, Jamaica, <sup>7</sup>Center for Health Solutions and Innovations Philippines, Manila, Philippines, the, <sup>8</sup>Consultant, New York, United States, <sup>9</sup>Consultant, Frankfurt, Germany, <sup>10</sup>Consultant, Gaborone, Botswana, <sup>11</sup>Drexel University, Office of Global Health, Philadelphia, United States

**Background:** The Global Fund's 2023-2028 Strategy recognizes that ending the HIV, TB and malaria epidemics requires scaling-up programs to remove human rights-related barriers to health services. Aligned with this goal, the "Breaking Down Barriers" (BDB) initiative has funded programs to address structural barriers to HIV, TB and malaria services in 20 countries, including support to community-led paralegals and other interventions for increasing access to justice.

**Description:** Progress assessments were conducted in 2023 and key themes were identified across national contexts. Access to justice programming took a step forward in multiple countries due to combining community-led legal literacy and services with delivery of HIV/TB prevention and treatment.

**Lessons learned:** In Kyrgyzstan, Indonesia, Jamaica, the Philippines and the Democratic Republic of the Congo, paralegals, peer educators and case managers trained in legal literacy were strategically integrated into HIV prevention, treatment and care services. In Kyrgyzstan, community-led paralegals and peers worked with people who use drugs to build legal literacy and skills to counter police disruption of harm reduction and opioid substitution

programs. In the Democratic Republic of the Congo, peer educators, paralegals, 'Mother Mentors' and service providers played key roles in expanding legal literacy and promoting conflict resolution and redress for key populations and those experiencing gender-based violence. In Indonesia, HIV peer educators, outreach workers and paralegals from the sex worker community provided training in legal literacy, human rights documentation and mediation that aided resolution of human rights violations perpetrated by clients, the police and intimate partners. In the Philippines, HIV case managers were trained to assist clients to resolve discrimination cases in education, health and family settings. In Jamaica, peer "legal focal points" from a leading HIV service provider trained clients in legal literacy and responded promptly to clients experiencing discrimination, gender-based violence and other human rights issues.

**Conclusions/Next steps:** Access to justice programs, when strategically integrated with HIV prevention and treatment services, can strengthen the capacity of key populations to challenge discrimination, gender-based violence, police harassment and other human rights-related barriers to HIV and TB services.

## THPEF666

Equality and equal access to health for PLHIV and key population

J. Kiti<sup>1</sup>

<sup>1</sup>HAPA Kenya, Advocacy, Mombasa, Kenya

**Background:** HAPA-Kenya is a key population-led community-based organization in Mombasa with a mission to provide comprehensive health services to sexual and gender minorities through community health outreaches, support groups, community drop-in-centers and virtual health support. HAPA Kenya was founded in 2011 as a support group for and by gay men living with HIV. HAPA Kenya is supported through The Global Fund to provide HIV, TB, STI and SRHR prevention and treatment service to the MSM, MSW and Transgender communities in Mombasa, Taita Taveta and Kwale counties. The program currently reaches 3,022 MSM in Mombasa County, 140 of whom are PLHIV.

The program uses a peer outreach model to mobilize and organize the community for health services including supporting home-based care, community dispensing strategies and psychosocial support.

**Description:** During anti-LGBTIQ campaigns in 2023, the care and treatment program were identified as the most vulnerable to interruption by the temporary closure of drop-in-centres and suspensions of community health outreaches. The program focused on supporting peer navigators to deliver door-to-door treatment and support, provide psychosocial first aid and support emergency response activities. The peer navigators offered a

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

1-week virtual training covering community dispensing models, violence mapping and response, basic counseling skills and referral for health services and SGBV.

**Lessons learned:** Despite the hostile anti-LGBTI climate, the treatment program continued to support 140 KPLHIV clients in care in 2023, with monthly appointments being above 95%. To support this the program trained an additional 11 peer navigators bringing the number to 18 and this offered support to organise support groups outside DICE, door to door visits and referrals and linkage. In total 104 teleconsultations and door-to-door visits were conducted over the year, reaching to 50 individual KPLHIV. The peer navigators were supported through daily debriefing sessions during the high-tension period and monthly psychological supervision by the program counsellor.

**Conclusions/Next steps:** Peer navigation for Key population is effective in addressing the complexities of delivering HIV care and treatment services among men who have sex with men and male sex workers in the volatile anti-LGBTIQ climate. Effective person-centered interventions for KPLHIV requires intentional involvement of community members in strategy making and execution.

## THPEF667

The well-being of sexual and gender diverse people around the world: the intersecting roles of HIV, homophobia and economic precarity

E. Lamontagne<sup>1,2</sup>, V. Leroy<sup>3</sup>, S. Howell<sup>4</sup>, S. Boyer<sup>3</sup>, B. Ventelou<sup>2</sup>

<sup>1</sup>UNAIDS, Equitable Financing, Johannesburg, South Africa,

<sup>2</sup>Aix-Marseille University, CNRS, EHESS, Centrale Marseille, Aix-Marseille School of Economics, Marseille, France,

<sup>3</sup>Aix-Marseille University, Inserm, IRD, SESSTIM, Sciences Economiques & Sociales de la Santé & Traitement de l'Information Médicale, ISSPAM, Marseille, France, <sup>4</sup>LGBT+ Foundation, San Francisco, United States

**Background:** Little is known about the interactions between economic vulnerability, the different dimensions of homophobic stigma and discrimination and their roles on the well-being of lesbian, gay, bisexual, transgender, questioning, and sexual and gender diverse people (LGBTQ+) in low- and middle-income countries. This study aimed to fill this gap by investigating determinants of well-being among LGBTQ+

**Methods:** We used data from the Global LGBTQ+ Happiness survey among 115,000 participants in 195 countries. We applied a socioecological approach to study three levels of homophobic stigma and discrimination: family, local community and institutional (legislation). We estimated the association between well-being, HIV status, the different dimensions of homophobia, and income levels (to address economic heterogeneity) using a multi-level model. Dominance analysis identified the strongest predictor of well-being loss.

**Results:** HIV status highly correlates with the well-being of LGBTQ+ after controlling for homophobia. Compared to those who are HIV-negative, participants living with HIV reported a smaller-than-expected reduction in their well-being. Alternatively, we found that participants unaware of their HIV status reported the largest negative association with their well-being (Table 1).

	N (%)	Coefficient	P> z	[95% conf. interval]	
HIV-Negative	49 595 (62.7)	(Base)			
HIV-Positive	8 609 (10.9)	-0.092	0.000	-0.136	-0.047
Don't want to answer	3 186 (4.0)	0.124	0.000	0.055	0.192
I don't know	17 715 (22.4)	-0.160	0.000	-0.194	-0.125

Table 1: Well-being: Association per HIV status.

The impact of homophobia on well-being varied across socioeconomic statuses, with economically deprived LGBTQ+ reporting the greatest well-being losses attributable to the three homophobia levels. Predictors of well-being loss were greatest from homophobia at the family level(71%), followed by institutional(15%) and inter-personal(14%). LGBTQ+ in the Middle East and North Africa faced the worst impacts, followed by Eastern Europe and Central Asia.

**Conclusions:** Our results highlighted the negative and consistent impact of heterosexist stigma and discrimination, particularly at household level, on LGBTQ+ well-being, with stronger impact among lower-income people.

Considering the association between well-being and preventive health behaviour, public health and HIV measures should dedicate more importance to addressing homophobic stigma and discrimination, focusing on the lowest socioeconomic strata of society.

These new findings have important implications for HIV testing initiatives among LGBTQ+, stressing the need to better account for subjective well-being and, by extension, mental health as a potential determinant of HIV testing intentions.

## THPEF668

Assessing HIV/TB-related stigma against community HIV/TB volunteers and its impact on early HIV/TB case detection in Ghana: evidence from Global Fund NFM 3 Project, Ghana

R.S. Adzesi<sup>1</sup>, J. Amoah-Larbi<sup>2</sup>, A. Tsiboe<sup>3</sup>

<sup>1</sup>University of Ghana, Statistics, Accra, Ghana, <sup>2</sup>Ghana National TB Voice Network, Accra, Ghana, <sup>3</sup>Keba Africa, Accra, Ghana

**Background:** Traditionally, health facilities passively identify HIV/TB cases when people who are unwell reported to the health facility for medical screening. In order to find cases that might not be identified in the health facility when people who are unwell fail to report to the medical facility for medical checkup and to prevent commu-

nity transmission of HIV/TB, Ghana with the support of the Global Fund has implemented the community HIV/TB case findings and treatment under the Community System Strengthening project of the Global Fund New Funding Model II and III.

This initiative was to make HIV/TB services available to all Ghanaians through a well-coordinated community HIV/TB intervention. The main aim of this study is to assess HIV/TB-related stigma against community HIV/TB volunteers and its impacts on HIVTB case detection in Ghana.

**Methods:** A mixed-methods cross-sectional design was employed. A total of 191 volunteers were sampled using systematic random sampling and surveyed using a validated stigma scale. In-depth interviews were also conducted to get in-depth understanding on the type of stigma faced by HIV/TB community volunteers. The data was statistically analysed using principal component factor analysis, bivariate analysis and multivariate analysis.

**Results:** The result revealed that perceived community stigma was the common form of stigma faced by community HIV/TB volunteers in Ghana. The chi-squared analysis revealed that stigma did not differ significantly by gender (chi-squared = 0.7711, 0.3799). The estimated HIV/TB-related stigma incidence rate of Ghana was 60%. The logistics regression revealed that region and education significantly influenced HIV/TB-related stigma against community HIV/TB volunteers in Ghana.

The analysis further revealed that HIV/TB-related stigma delayed HIV/TB diagnosis, reduced screening/adherence, and lowered detection rates. HIV/TB-related stigma against volunteers undermines case detection in Ghana.

**Conclusions:** Community-specific education is needed to address misconceptions fueling HIV/TB-related stigma against community HIV/TB volunteers in Ghana. Protective policies for volunteers could help optimize their contributions to ending the spread of HIV/TB transmission in Ghana.

It is therefore, recommended that Ghana AIDS Commission, must as a matter of necessity operationalise the HIV/TB workplace policy to help protect community HIV/TB volunteers from stigma and discrimination.

## THPEF669

### Disparities in quality of care among trans men and trans women in South Africa: findings from Ritshidze's community led-monitoring

O.J. Oladipo<sup>1</sup>, N. Rambau<sup>1</sup>, S. Luthando<sup>1</sup>, N. Damane<sup>1</sup>, L. Rutter<sup>2</sup>, S. Senn<sup>3</sup>, E. Lankiewicz<sup>3</sup>, S. Tshabalala<sup>4</sup>

<sup>1</sup>Ritshidze Community-led Monitoring Programme, Johannesburg, South Africa, <sup>2</sup>Health GAP, Johannesburg, South Africa, <sup>3</sup>amfAR, The Foundation for AIDS Research, Washington, DC, United States, <sup>4</sup>Treatment Action Campaign, Johannesburg, South Africa

**Background:** Trans people bear disproportionate HIV burdens and face stigma and discrimination within healthcare systems. Historically, the HIV response has often inappropriately grouped trans women with men who have sex with men or treated trans populations as homogenous despite growing evidence of health disparities within the diverse groups that exist under the trans umbrella. Few data on trans people within the South African public healthcare system exist, and disaggregated information on trans men and women in this context is even scarcer.

**Methods:** In South Africa, the Ritshidze Community-Led Monitoring Programme recruited trans people to complete a cross-sectional survey via a community-based snowball sampling method across 7 provinces from July – September, 2023. Descriptive statistics, Pearson's  $\chi^2$ , and independent samples t-tests ( $\alpha = 0.05$ ) were calculated to identify significant differences in quality of care between trans men and women.

Additionally, purposive sampling was used to identify respondents for participation in qualitative in-depth interviews (IDIs), which were transcribed and coded.

**Results:** 255 trans men and 708 trans women were included in the quantitative analysis of public facility users. A greater proportion of trans women indicated facility staff were always friendly than trans men ( $n = 263, 37.15\%$  vs.  $n = 63, 24.71\%$ ;  $p < 0.0001$ ). A higher percentage of trans women stated facility staff respected their confidentiality ( $n = 287, 40.54\%$  vs.  $n = 78, 30.59\%$ ,  $p < 0.01$ ) or gender identity ( $n = 240, 33.90\%$  vs.  $n = 59, 23.14\%$ ;  $< 0.0001$ ) relative to trans men. In IDIs, trans men and women reported medical professionals use incorrect pronouns or names; several respondents also mentioned that they felt uncomfortable and there was no privacy at clinics.

**Conclusions:** Trans people report poor quality of care at public facilities, and trans men and women report different experiences in quality of care. Interventions aimed at improving care must be cognizant of the diversity of experiences across trans populations. LGBTQ provider representation, further training/education and expanding the availability of gender-neutral spaces (e.g., toilets) represent areas of particular importance to trans people.

### Structural drivers of HIV among AGYW in Lesotho: new findings from the Violence Against Children Surveys

E. Toska<sup>1,2</sup>, J.O. Baruwa<sup>1</sup>, B. Eltigani<sup>2</sup>, R. Yates<sup>2</sup>,  
P. Nyamukondiwa<sup>1</sup>, M. Mchenga<sup>1</sup>, B. Maughan-Brown<sup>1</sup>,  
L. Cluver<sup>2,1</sup>

<sup>1</sup>University of Cape Town, Centre for Social Science  
Research, Cape Town, South Africa, <sup>2</sup>University of Oxford,  
Department of Social Policy and Intervention, Oxford,  
United Kingdom

**Background:** Adolescent Girls and Young Women (AGYW) in the Kingdom of Lesotho are at high risk of HIV exposure and acquisition. Addressing their unique needs requires an understanding of the structural drivers that result in HIV exposure. Both early motherhood and marriage may increase the risk of HIV among AGYW.

We analyze the Violence Against Children Survey (VACS), a large nationally representative dataset, to investigate effects of adolescent motherhood and early marriage on AGYW HIV risk.

**Methods:** N=7101 13-24-year-olds participated in the 2018 Lesotho VACS: assessing violence experiences, sexual health outcomes and service access. We assessed whether early marriage moderated effects of early motherhood on four HIV risks (condomless sex, transactional sex, age-disparate sex and multiple sexual partners) and a composite high-risk sex outcome (self-reported condomless sex and any other of the three sexual risks). Covariates included age, early sexual debut, violence exposure, education, poverty, and drought. Multivariable covariate-adjusted generalized linear model regressions were used, with an interaction term for early motherhood and marriage.

Marginal effects were calculated to model predicted probabilities of reporting HIV risk for four groups of AGYW:

1. Married & mothers,
2. Married only,
3. Mothers only,
4. Neither.

**Results:** In multivariable analyses, higher HIV sexual risk was associated with early motherhood (Relative risk ratio [RRR]=1.61, 95%CI 1.31--1.97, p<0.001) and marriage (RRR=1.94, 95%CI 1.54--2.45, p<0.001). Early marriage moderated the effect of motherhood on HIV risk for all outcomes (p<0.001).

AGYW mothers were at higher risk of HIV exposure than non-mothers (27% vs 17%), but early marriage was associated with a greater increase in risk of HIV exposure especially among non-mothers (31% vs 4%; Figure 1).

**Conclusions:** Addressing early marriage and motherhood - two structural drivers of HIV exposure among AGYW - is critical to reaching our HIV targets. HIV prevention programming must be tailored to the needs and experiences of married and mothering AGYW in Lesotho.

Figure 1. Predicted probabilities of HIV exposure among AGYW (13-24 years) in Lesotho.

## THPEF671

### Lessons from crisis prevention and response mechanism in enhancing KVP programming in Tanzania from 2020 to 2023

M. Mutongore<sup>1</sup>, C. Peter<sup>1</sup>, M. Mhando<sup>1</sup>, Z. Mansoor<sup>1</sup>

<sup>1</sup>Key and Vulnerable Population Forum, Tanzania, Dar es Salaam, Tanzania, the United Republic of

**Background:** In Tanzania, the size estimate for the FSW is 155,450 and their HIV prevalence is 26%. The MSM population is estimated at 49,000 with HIV prevalence at 25%. The PWID population is estimated at 30,000 with an HIV prevalence estimated at 36%. People who use drugs (PWUD) is estimated at 300,000.

Currently, these Key Population groups are criminalized. Hence, they are inherently vulnerable to police interference, harassment and eventually being arrested. They are also in danger of facing violence and rejection from their families and communities.

**Description:** With funding support from PEPFAR, KVP Forum and PEPFAR IPs formed the crisis prevention and response teams (CPRTs) to respond to counter human rights incidents facing KPs. The activities covered 144 hotspots in Dar es Salaam and Morogoro regions. Through the technical support and capacity building provided by FHI 360, training was conducted on paralegals, documentation and how to conduct hospital referrals. The CPRTs were made up of 80 members with members being KPs themselves. These teams engaged KPs' families, health care providers, local government leaders, and police stations and bailed KPs at court level.

**Lessons learned:** CPRTs have significantly contributed to enhancing legal literacy and rights awareness among KPs. Most families, law enforcers and community influential leaders were visited by the CPRTs and have been sensitized on the significance of KVP programming to reduce stigma and discrimination and other structural barriers to reduce overall HIV impact among KVPs. The CPRTs have also built allies with the legal fraternity, human rights groups, activists, and organizations that support crisis response.

Generally, the CPRTs have supported approximately 5,734 KPs, of which 2,641 were FSW, 1,650 PWUDs and 1,404 MSM and 39 Transgender.

**Conclusions/Next steps:** Crisis Prevention and Response Mechanism needs be integrated urgently into national KVP programming, as it comprehensively responds to persisting structural barriers affecting the uptake of existing HIV and other related services among KVPs.

In light to that, KVP Forum will continue mobilizing resources from PEPFAR, Global Fund and potential donors to sustain existing CPRTs as well as scale up the initiative to other regions, especially those with KVP programming.

## THPEF672

### Adolescent girls and young women living with HIV experiences in access to health facilities in Lesotho 2023

M. Fako<sup>1</sup>

<sup>1</sup>Bacha Re Bacha, Maseru, Lesotho

**Background:** Adolescent girls and young women (AGYW) in Lesotho continue to have an unacceptably high risk of HIV because of structural and societal injustices that make AGYW vulnerable to acquire HIV. Bacha Re Bacha (BRB) in Lesotho is implementing Community-Led Monitoring (CLM) of health service quality to allow AGYW to have a voice to the services they are given. BRB is one of the first CLM projects implemented by AGYW, with data collection tools designed specifically to capture the priorities of this population.

**Description:** BRB is implementing both quantitative and qualitative systematic data collection about service delivery among AGYW in six districts of Lesotho with the support from Global Fund. The programme is in its first year of implementation. BRB engaged AGYW and trained them as data monitors and district coordinators.

The team uses client, facility manager, and observation surveys, as well as in-depth interviews to gather data. After data collection, AGYW monitors analyse the data to identify problems and suggest solutions.

A facility interface meeting is held to discuss the identified problems, solutions and tabulate timeframes to the identified solutions. Other issues are taken to the district level and then national level if not solved at the facility level.

**Lessons learned:** 9566 AGYW were interviewed. These data demonstrate AGYW living with HIV do not feel comfortable going to health facilities as they are separated from other health service users, resulting in discrimination and revealing their HIV status to others.

When AGYW miss their check-up appointments, service providers are not friendly and helpful when they go back to the facilities.

For some, viral load results are not explained to them. For young breast feeding mothers, long wait times at facilities are a clear barrier to care.

**Conclusions/Next steps:** Issues of unfriendly staff were solved at the facility level and other issues solved at the district level with the district health management team. AGYW-led CLM offers novel insights into the specific challenges this population faces in HIV services, and leads to targeted solutions.

## THPEF673

### Improving HIV treatment cascade indicators through increased paralegal support: the experience of the Tiberius project in the EECA region

Y. Kononchuk<sup>1</sup>

<sup>1</sup>Eurasian Harm Reduction Association (EHRA), Vilnius, Lithuania

**Background:** Despite substantial evidence supporting paralegal services in improving HIV treatment access, the EECA region lacks an established practice of integrating legal support as part of the HIV treatment cascade. Legal barriers, along with internal and external stigma, continue to hinder vulnerable groups from accessing and continuing HIV prevention and treatment services. Between 2019 and 2022, the Eurasian Harm Reduction Association (EHRA), supported by the Elton John AIDS Foundation, executed the TIBERIUS project in Georgia, Kazakhstan, and Moldova.

Aiming to aid the most vulnerable in EECA, the project offered peer-based legal services and strengthened the capabilities of lawyers and paralegals to assist these communities in navigating legal obstacles to HIV care.

**Description:** Of the 2814 individuals seeking assistance for legal barriers to HIV services, 1538 (55%) gained access to state services. The success rate varied, from 44% in Georgia to 75% in Moldova. Before TIBERIUS, integrating legal support within HIV treatment strategies was uncommon.

This initiative led the way in incorporating legal aid, prompting organizations to address legal, discriminatory, and stigmatizing issues in accessing ART services. EHRA and its partners also documented human rights issues and legal barriers, lobbying for systemic changes to decrease HIV risks in key populations. The project was effective in merging paralegal services with harm reduction and treatment efforts, markedly enhancing HIV treatment access.

**Lessons learned:** The project successfully defined paralegals' roles in linking clients with justice and human rights, addressing stigma and overcoming barriers. It emphasized the synergy between prevention, treatment, and paralegal services, underscoring the need to combat stigma and discrimination.

In Kazakhstan, it identified and addressed systematic service barriers, fostering legislative changes and enhanced dialog between activists and government.

Enhanced paralegal skills improved case management and advocacy, empowering clients to assert their human rights.

**Conclusions/Next steps:** The project demonstrated the crucial role of paralegal services in enhancing HIV treatment access, seamlessly integrating with prevention and treatment efforts.

It highlighted the inadequacy of available services without addressing stigma and discrimination, underscoring the need for donor support in extending these services beyond HIV care.

This approach significantly benefited vulnerable communities, suggesting its regular adoption in outreach and service cycles globally.

## THPEF674

Efforts to advance human rights of sex workers: evidence from the on-line community-based human rights monitoring and response programme in Ukraine

N. Semchuk<sup>1</sup>, O. Pashchuk<sup>1</sup>

<sup>1</sup>ICF "Alliance for Public Health", Monitoring and Evaluation, Kyiv, Ukraine

**Background:** Criminalization of sex work, stigma and discrimination from both state and non-state actors impede sex workers from accessing and uptaking HIV and other health services and undermine the HIV prevention response.

With the aim of monitoring and responding to human rights violations of key populations, ICF "Alliance for Public Health" in 2019 launched the REAct (*Rights-Evidence-Action*) system.

**Methods:** REAct is an on-line community-based human rights monitoring and response programme. System allows to document cases of human rights-related barriers that key populations experience in accessing HIV and other health-related services, as well as to respond to cases identified.

System has been implemented in Ukraine by 101 community-based organizations in 19 regions out of 24. About 10,000 cases of human rights violations among key vulnerable to HIV and TB populations were registered in total.

**Results:** Since 2019, 662 cases of human rights violations against sex workers were registered. In 98% of cases appeals were made by woman and in 2% by man. 95% of all registered cases had signs of stigma and discrimination due to sex work. The perpetrators of sex workers rights most frequently were police officers (40%) and most cases involved emotional abuse (91%).

**Conclusions:** REAct provides an evidence for further planning and designing of interventions aiming to eliminate human rights related barriers while accessing HIV prevention and other services, reforming law enforcement practices, as well as strengthening the legal and policy

environment. Furthermore, documenting cases of human rights violations is crucial in amplifying community voices and supporting community empowerment.

REAct cases of rights violations of sex workers by perpetrators (Ukraine, since 2019)

Types of human rights violations of sex workers and key types of incidents registered in REAct (Ukraine, since 2019)

## THPEF675

Gender equality in Funding Requests to the Global Fund: what's the current situation, what's coming up, and how can UNAIDS support?

C. Lourenço Tach<sup>1</sup>, A. Patkar<sup>1</sup>, E. Bell<sup>1</sup>, F. Hale<sup>1</sup>, UNAIDS Gender Team

<sup>1</sup>UNAIDS, Gender Team, Geneva, Switzerland

**Background:** The Global Fund to Fight AIDS, Tuberculosis and Malaria (GF) has a new GF Gender Equality Strategy, to scale up comprehensive programmes and approaches to remove gender related barriers across the portfolio, and initiate a partnership-wide focus on supporting gender transformative programming.

**Description:** In Grant Cycle 7 (2023), the UNAIDS Gender Team conducted a review of 10 Funding Requests (FRs), to the GF for the period 2023-2025 on how they currently support a gender transformative approach, with the aim of informing UNAIDS guidance to countries and the Global Fund.

The review was based on our ten elements of a gender-transformative approach.

**Lessons learned:** There were some good examples of FRs that consider gender. However, there were recurring issues across different FRs. There was a lack of:

- sex and gender disaggregation of groups such as people who use drugs (groups that can include more than one gender).
- actions for women living with HIV beyond prevention of vertical transmission.
- focus on the specific issues of trans women (who tend to be included with men who have sex with men).
- HIV prevention interventions that go beyond biomedical prevention and ensure the rights of those involved, including those who test positive.
- interventions for and inclusive of adolescent girls living with HIV.
- mention of the specific needs of different groups in treatment modules.
- work on preventing GBV - most interventions on violence focus on post-violence care.
- focus on how gender inequality intersects with stigma and discrimination against women and girls (eg abuse in SRH and maternity services).
- articulation of comprehensive SRH services.
- supporting meaningful community engagement beyond monitoring of services, HIV testing, and treatment adherence support.

#### Conclusions/Next steps:

- A lack of meaningful engagement of networks and organisations of women and girls living with HIV and from key populations in development of FR needs to be addressed so that their insights can be better reflected in FRs.
- These findings, ongoing partnership between UNAIDS and the GF, and the new GF Gender Equality Fund, should work together to accelerate progress towards gender equality, including through community engagement and empowerment of women and girls living with HIV and from key populations.

## THPEF676

### Promoting the human rights of LGBT people to access HIV care: lessons for community practice

R. Miller<sup>1</sup>, G. Ayala<sup>2</sup>, The Project ACT Team

<sup>1</sup>Michigan State University, Psychology, East Lansing, United States, <sup>2</sup>Alameda County Public Health Department, Oakland, United States

**Background:** Sexual and gender minority people continue to shoulder disproportionate HIV disease burden, mainly driven by persistent stigma and discrimination. We highlight findings from a 2-year (2018-2020) transnational action-research demonstration project, Project ACT, conducted by community-led organizations (CLOs) based in Burundi, Cameroon, Côte d'Ivoire, the Dominican Republic, Ghana, Jamaica, the United States, and Zimbabwe, to eliminate barriers to HIV prevention and care. Specifically, we examine factors that facilitated successful advocacy outcomes.

**Methods:** Each Project ACT partner pursued locally appropriate advocacy strategies to eliminate barriers to HIV care, decrease violence impeding access, and improve local policies. To examine Project ACT's implementation and outcomes, we employed a longitudinal evaluation design. Data included in-depth interviews (n=121 interviews with 112 respondents), document review (n=107), and field observations (n=68 days).

Analyses employed analytic inductive logic and were guided by leading theoretical frameworks on social action processes and the development of power (e.g., Christens, 2021; Klugman, 2011, 2021).

**Results:** We verified over 100 advocacy outcomes. The most successful Project ACT partners were CLOs that pursued constituent-inclusive advocacy strategies and prepared constituents for social action through activities designed to prompt radical healing from past experiences of stigma and discrimination, instill their sense of personal and political agency, and provide them safe and nurturing pathways of opportunity.

Effective CLOs also identified, created, and then leveraged partnerships with allied organizations to mobilize support and propel action, including securing commitments of duty bearers (movement power). In turn, CLOs increasingly gained institutional influence that led to concrete changes in policies, practices, and access to care (e.g., new resources) and to narrative power (e.g., influencing media coverage) (Table 1).

Type of Power (Klugman, 202X)	Type of Change Observed	Defined as a change in:	Frequency (%)
Power Within Individuals	Consciousness and Capabilities	Skills or actions that demonstrate political consciousness and commitment to the equality of LGBTQI people	38 (36.9%)
Institutional Influence	Resources	Resources, freedoms, or ease of access to resources and freedoms	21 (20.4%)
Movement Power	Advocacy Capacity	Skills, relationships, resources required to advocate	17 (16.5%)
Narrative Power	Agenda Setting and Dialogue	Coverage, framing of issues, messages, messengers, and evidence	12 (11.6%)
Institutional Influence	Norms and Practices	Informal discretionary norms, practices, and structures that drive inequality of access or treatment	12 (11.6%)
Institutional Influences	Formal Rules and Policies	Formal rules laid down in law or policy or the financial allocations to support their implementation	3 (2.9%)

Table 1. Frequency (percentage) of Types of Changes Observed Across Project ACT Partner Countries Over 20 Months.

**Conclusions:** We aimed to fill gaps in knowledge on effective community-led advocacy strategies to address the stigma, discrimination, and violence that impedes access to HIV prevention and care in middle- and low-income countries. We found outcomes from Project ACT correspond closely with leading frameworks on empowerment as a foundation for social change.

Lessons learned are potentially instructive to LGBT advocates leading CLOs, funders, and policy makers, especially as human rights concerns grow and resources shrink.

## THPEF677

Building on the HIV human rights movement to develop an equitable global health R&D advocacy agenda

J. Meade<sup>1</sup>, A. Adrees<sup>2</sup>, K. Halil<sup>3</sup>, M. Awuor Okoth<sup>4</sup>, S. Tenn<sup>5</sup>  
<sup>1</sup>AVAC, New York, United States, <sup>2</sup>Global Health Technologies Coalition, Washington, DC, United States, <sup>3</sup>Medicines for Malaria Venture, Geneva, Switzerland, <sup>4</sup>Amref Health Africa, Nairobi, Kenya, <sup>5</sup>Tenn Global, Baltimore, United States

**Background:** Structural and social determinants of health (SDH) like education, healthcare, housing, income inequality, gender, racism, and colonialization impacts have historically limited which communities participate in research to develop and implement life-saving technologies. Urgency has grown to confront the adverse impact of these forces and broader power imbalances within the R&D sector—highlighted by COVID-19 vaccine disparities. HIV R&D—which has been on the forefront of addressing SDH and prioritizing community engagement, offers a valuable model for best practices that can be adopted sector-wide.

**Description:** Established in 2020, the Global Health Technologies Coalition (GHTC) Equity Working Group (EWG) emerged in response to the social justice issues within global health R&D. Influenced by the health equity challenges brought to light by the COVID-19 pandemic and the tragic murder of George Floyd, the EWG aimed to address the legacies of colonization and racism, promoting a more inclusive and equitable sector.

**Lessons learned:** The HIV/AIDS sector, a stronghold of social justice activism, forged a partnership with global health R&D advocates to document and share best practices to make the R&D sector more equitable and rectify power imbalances. Together partners have organized a workshop at Africa Health R&D Week, emphasizing funding for Africa-led research and approaches to decolonize the R&D landscape, and collaborated with donor governments, sharing insights, and recommending strategies for equitable funding, research, and program approaches. Leveraging the expertise and best practices of the HIV movement from the last 40 years, the partnership has now developed a draft Global Health R&D Equity Compact, a guiding document for the community that will inform a broader Global Health R&D Equity Advocacy Agenda. The agenda will cover a range of focus areas including institutional DEIA (diversity, equity, inclusion, and accessibility), gender inclusion, participatory research, and decolonization.

**Conclusions/Next steps:** The EWG and partners will pilot test the Global Health R&D Equity Compact with researchers, civil society, philanthropic and government R&D funders, so it can inform cross-sector efforts to foster a more equitable global health R&D enterprise.

## THPEF678

Investigating the burden and pattern of intimate partner violence in HIV-positive individuals: evidence from Ghanaian healthcare settings

B. Amadu<sup>1</sup>, I. Abdul-Wahab<sup>1</sup>, E. Adiibokah<sup>1</sup>, D.T. Nartey<sup>1</sup>, H. Tagoe<sup>1</sup>, T.A. Ayuomah<sup>1</sup>, Z.D. Issifu<sup>1</sup>, F. Amihere<sup>1</sup>, R.Y. Ahmed Abdul<sup>1</sup>, H. Nagai<sup>1</sup>  
<sup>1</sup>JSI Research and Training Institute, Inc, Hospital, Sekondi-Takoradi, Ghana

**Background:** Intimate partner violence (IPV) represents a significant global health concern. The prevalence of HIV among people who experience IPV is heightened, while antiretroviral adherence is reduced and viral load suppression is less probable. Currently, there is little evidence regarding the prevalence of IPV among PLHIV in Ghana. Given the above, we investigated to ascertain the prevalence of IPV and the type of IPV suffered by PLHIV in Ghana. We aimed to gain insight into the IPV burden and identify factors that could facilitate the identification of persons at risk.

**Methods:** We extracted data from the USAID Care Continuum project DHIS-based index testing register for the period 2019-2023. Per the project protocol, all HIV-positive clients are screened for IPV, before they are offered index testing. We excluded those with incomplete datasets. The final dataset used in the analysis was from 1855. Descriptive statistics and multivariate logistic regression analysis were run. A risk ratio (RR) with a 95% confidence level (CI) was declared significant.

**Results:** Among the 1855 screened for IPV, 1329(71.6%) were females. The mean age was 36.2[age range 15-79 years]. The prevalence of IPV was 105(5.7%). The type of IPV experienced were; emotional 39(37.1%), Physical 34(32.4%) and the least IPV was sexual 32(30.5%). Females have a higher risk of IPV compared to males (ARR 4.12, 95% CI 2.1-8.2), also, older age was associated with lower risk of IPV (ARR 0.97, 95% CI 0.95-0.99).

**Conclusions:** The prevalence of IPV was found to be 5.7%, with emotional IPV being the most common type. Females and younger individuals were found to be at higher risk of IPV. These findings suggest that IPV screening in healthcare settings may be effective in identifying cases or patterns, and targeted interventions should be developed for females and younger individuals.

## THPEF679

### \$LetsTalkSexualHealth Campaign for Young key population (YKP) in Lagos Nigeria

E.O. Somefun<sup>1</sup>, B. Adelekan<sup>1</sup>, O. Ibrahim<sup>1</sup>, K.K. Samuel<sup>2</sup>, K. Kuawu<sup>1</sup>, G. Addico<sup>1</sup>

<sup>1</sup>United Nations Population Fund, Technical, Abuja, Nigeria,

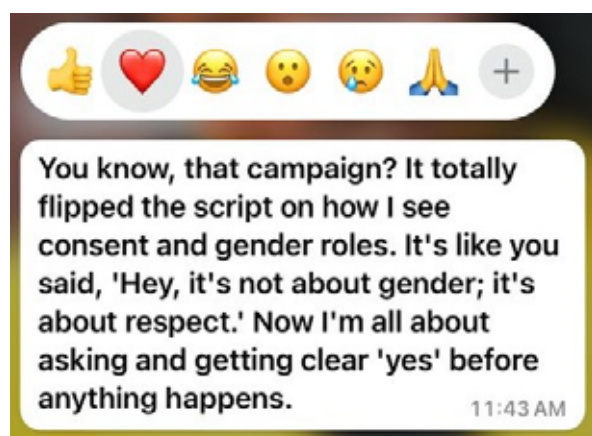

<sup>2</sup>Think Positive Live Positive Support Initiative, Advocacy, Lagos, Nigeria

**Background:** In Nigeria, young people particularly key populations (KP) aged 15-24 years contribute to the high burden of HIV in Nigeria. Despite this reality, many faces additional barriers and discrimination in accessing services and information to prevent acquisition of HIV. It is based on this that an on-line youth led campaign was launched and it sought to raise awareness, provide SRH information, psychosocial support and promote health behaviors among young key population in Lagos State was launched.

**Description:** The daily social media campaign on X, IG, LinkedIn, and closed Facebook group (\$LetsTalkSexualHealth) with engaging posts and infographics was launched and facilitated by trained youth key populations. The on-line campaign covered positive behavioral changes by addressing misconceptions, stereotypes, and risky practices related to sexual and reproductive health. Furthermore, it encouraged the key population to take ownership of their bodies, make informed decisions, and keep healthy relationships.

**Lessons learned:** Supporting Youth key population through on-line platform to access information, services and understand their rights would reduce their vulnerability to acquiring HIV.

A total of 13,000 key population were reached across the various platforms and it was indicated by over 5% that they had a poor understanding of the topics prior to the sessions .

**Conclusions/Next steps:** On-line platform can serve as a safe space , a means to provide CSE and psychosocial support to Young Key Population. There is need to scale up the on-line intervention to reach more left behind Key

populations and consider partnerships with local groups to address conservative resistance and boost access to CSE information.

## THPEF680

### Love Alliance: building resilience in HIV/SRHR in the era of anti-gender movements

K. Cullinan<sup>1</sup>, A. Fetai<sup>1</sup>, R. Adadjisso<sup>2</sup>, A. Fantinatti<sup>3</sup>, C. Zimbizi<sup>4</sup>, A. Aguilar Betancurt<sup>1</sup>

<sup>1</sup>Aidsfonds, Amsterdam, Netherlands, the, <sup>2</sup>ISDAO, Abuja, Nigeria, <sup>3</sup>GNP+, Amsterdam, Netherlands, the, <sup>4</sup>ARASA, Windhoek, Namibia

**Background:** The Love Alliance addresses underfunding, criminalization, and exclusion for the LGBTIQ+, sex workers and people who use drugs communities in their intersectionality, while guaranteeing SRHR for these communities and countering traditional power imbalances between the Global North and South. The organized global anti-gender movement has positioned itself as a major challenge, hindering the realization of SRHR for these populations through discriminatory tactics.

The Love Alliance monitors and responds to this growing phenomenon by bolstering community-led responses to counteract this movement and developing tools aimed at protecting hard won gains.

**Description:** The Love Alliance, through community-led monitoring in East, West, and Southern Africa, researched anti-gender groups' strategies, actors, and discourses. This knowledge empowers community-led and broader civil society organizations to counter the growing movement's tactics including international lobbying, recruiting lawmakers to pass criminalising legislation, creating moral panic, social media campaigns, and appropriation of human rights language to create a facade of supporting fairness and empowerment.

Despite its recent growth, communities reject seeing this as a novel phenomenon, proposing instead to identify local and national perspectives to better understand this phenomenon.

This session will discuss Love Alliance research findings, exploring how communities can use evidence-based strategies to counter this movement and protect/promote enabling environments for SRHR and HIV/AIDS responses.

**Lessons learned:** To combat the anti-gender movement, understanding its operations and coordination is crucial. Countering it involves monitoring activities, understanding their tactics, debunking myths, and reporting hate speech. Rights-based movements must unite and share knowledge across countries. Engagement with sympathetic religious leaders and building relations with governments is vital.

The Love Alliance has developed tools to counter the opposition in global fora, such as a compendium of internationally agreed language on HIV/AIDS.

**Conclusions/Next steps:** Understanding the approaches taken by the anti-rights movement helps us counter the opposition and address the social and structural factors that shape vulnerability and risk. There is a strong need for human rights movements to unite their efforts to counter the anti-rights rhetoric as it is a global threat that is increasingly gaining momentum across numerous countries. Substantially larger investment in community-led initiatives to counter opposition and react to anti-rights groups is needed.

## Ethics and HIV

### THPEF681

**Finding middle ground: public deliberation is a promising method for resolving ethical conflicts in biomedical HIV research with minors**

A. Knopf<sup>1</sup>, S. Perkins<sup>1</sup>, G. Zimet<sup>1</sup>, N. Davis<sup>1</sup>, A. Carrión<sup>2</sup>, R. Arrington-Sanders<sup>3</sup>, D. Motley<sup>4</sup>, D. Straub<sup>5</sup>, M. Ott<sup>6</sup>  
<sup>1</sup>Indiana University, Indianapolis, United States, <sup>2</sup>Ann & Robert Lurie Children's Hospital of Chicago, Chicago, United States, <sup>3</sup>Children's Hospital of Philadelphia, Philadelphia, United States, <sup>4</sup>University of Chicago, Chicago, United States, <sup>5</sup>University of Colorado, Aurora, United States, <sup>6</sup>Mt. Sinai, School of Medicine, New York, United States

**Background:** Minor consent to sexual health research raises ethical conflicts between regulators' and parents' desire to protect minors from harm and minors' concerns about consent-related disclosures of sexual behavior/orientation to parents. Flexible models of consent, such as the option to engage a neutral ombudsperson or a parent, may offer a "middle ground" resolution. In the C-START study, we convened a series of public deliberations (PD)—a method used to educate and then engage laypersons (deliberants) in the resolution of a complex ethical issue—in four U.S. cities in 2021-23, and assessed deliberants' perspectives on traditional and flexible models for minor consent.

**Aims were:**

1. Examine whether participation in the PD changed parents' opinions over time,
2. Determine whether the result of any changes in opinion among parents who participated in PD were significantly different than those from our earlier 2019 *Consent 2.0* study that did not employ PD.

**Methods:** C-START and *Consent 2.0* parents rated (5-point Likert-type scale) the acceptability of three consent approaches:

1. Parental permission,
2. Ombudsperson option,

3. Minor self-consent. C-START parents were surveyed before and after the PD; *Consent 2.0* parents were surveyed once.

**Aim 1 Methods:** C-START parents' scores at the two timepoints were compared using nonparametric tests.

**Aim 2 Methods:** *Consent 2.0* parents' scores were compared to C-START parents' scores at 1) baseline and 2) follow-up.

**Results:**

**Aim 1.** Among C-START parents (N=34), the ombudsperson option was significantly more acceptable after the deliberation ( $p=0.05$ ); there was no change in opinion for the other models.

**Aim 2.** At baseline, there were no differences between the opinions of C-START parents' and *Consent 2.0* parents' (N=125) opinions on any of the consent models. However, after the deliberation C-START parents were significantly more accepting of the ombudsperson ( $p=0.007$ ) and minor self-consent ( $p=0.04$ ) models compared to *Consent 2.0* parents.

**Conclusions:** After participating in PD, parents were more accepting of a "middle ground" model of consent. Further, parents who participated in a PD were significantly more accepting of the ombudsperson model than those surveyed a single timepoint, suggesting PD may offer a path to resolving complex ethical issues in HIV research with minors.

### THPEF682

**An ethical framework for identifying, understanding and addressing bias in EHR-based HIV-related studies**

S. Qiao<sup>1</sup>, A. N'Diaye<sup>1</sup>, G. Khushf<sup>1</sup>, B. Olatosi<sup>1</sup>, J. Zhang<sup>1</sup>, X. Li<sup>1</sup>  
<sup>1</sup>University of South Carolina, Columbia, United States

**Background:** A growing body of literature identifies and describes bias in electronic health records (EHR) used in health research including HIV-related studies. However, little work has considered how diverse types of biases intersect to generate the structural injustices that further propagate biases.

We developed an ethical framework to articulate ethically meaningful biases in large data studies affecting People with HIV (PWH), explore how these biases intersect in reproducing biases, and inform strategies needed to break this vicious cycle.

**Methods:** The ethical framework development was implemented through an iterative process composed of literature/policy review, content analysis, and interdisciplinary dialogues and discussion. We interviewed data curators, end-user researchers, healthcare workers, and PWH representatives throughout all iterative cycles using various formats, including in-depth interviews of 15 key stakeholders, panel discussions in a conference, and a charette workshop.

**Results:** The framework was designed to align Belmont Principles (i.e., respect, beneficence, and justice/fairness). The meaningful biases thus include not only statistical/computational biases but also social biases (e.g., interpersonal bias, institutional bias, structural bias), and representativeness bias (e.g., underrepresented in the EHR data due to care access, affordability, availability, and acceptability). Social biases prevent marginalized populations (e.g., ethnic minorities, sexual and gender minorities) from accessing care and/or prevent healthcare workers from collecting comprehensive and accurate information about ethical issues (e.g., social determinants of health, sexual/gender identities).

A lack of representativeness and engagement when designing EHR data collection and management results in lost opportunities for PWH subgroups to contribute to the dataset or confirm the data accuracy. Such biases will result in missing data and systematic errors (statistical biases).

Interdisciplinary collaboration within the public health research area and intersectional efforts across government and healthcare system in policies, capacity building, and PWH engagement/involvement are needed to manage and address the biases and protect PWH from the threats of unfairness and inequality in health research.

**Conclusions:** The developed framework illustrates the actions and steps that healthcare providers, health systems, data scientists, and population health researchers can collectively take to reduce opportunities that cumulatively work to produce and reproduce social and statistical biases within EHR data and the resulting population health research products/interventions.

## THPEF683

### Conducting experimental medicine vaccine trials (EMVTs) in sub-Saharan Africa and India - complexities and potential safeguards for trial participants

M. Nagrath<sup>1</sup>, S. Chatrath<sup>1</sup>, J. Mukherjee<sup>2</sup>, V. Muturi-Kioi<sup>3</sup>

<sup>1</sup>IAVI, Epidemiology and Clinical Research, Gurugram, India,

<sup>2</sup>IAVI, Access, Gurugram, India, <sup>3</sup>IAVI, Clinical Development, Nairobi, Kenya

**Background:** EMVTs are small, iterative, hypothesis-driven human clinical studies, allowing rapid testing of multiple immunogens to accelerate vaccine development. In the field of HIV, EMVTs address scientific questions necessary for advancement of the field towards producing a vaccine regimen that could be tested in a clinical development program.

More than 30 such trials are planned in various regions, however, there is a need to explore ways to conduct these complex early-stage trials in regions where eventual vaccines would be deployed.

**Description:** A virtual co-learning workshop was conducted in December 2023, engaging 16 domain experts including bioethicists, regulators, clinical researchers, and policy-makers from India, Africa, and globally, to brainstorm on complexities and considerations for EMVTs based on learnings from regionally relevant experiences. Data from the workshop were explored through thematic analysis.

**Lessons learned:** Experience in SSA:

- *Risk-benefit ratio* – This must be understood by participants that there is unlikely to be any direct benefit, but scientific developments could foster positive public health impact. Robust community engagement must be applied to address any misconceptions.
- *Elaboration of study procedures* – Purpose, needs and potential risks must be explained in comprehensible language during informed consent process.
- *Ethically justified compensation* – They should not blind participants to potential risks in the study.
- *Integrated engagement* – Referral systems for medical care, long-term follow-up to manage late side-effects, and minimizing participant burden must be considered.

Considerations for India:

Based on experience from recent development of ethical guidelines for CHIS in India, it was suggested that existing guidance can be drawn on to consider innovative trial designs in local context.

- *Continued community engagement* – Engaging communities from trial conception phase to facilitate co-ownership, avoid stigma, and ensure trial design is sensitive to social, cultural, and religious norms.
- *Capacity building* – Training ethics committees, regulators, investigators, and influencers to ensure scientific rigor in review processes.
- *Health insurance* – Extending insurance beyond research-related injuries and serious adverse events to cover late side-effects.
- *Site selection* – Selecting appropriate sites with trained staff and relevant facilities.

**Conclusions/Next steps:** Advancing the concept in India demands opening communication channels between stakeholders and their buy-in to set the framework for the conduct of EMVTs.

### Revisiting informed assent/consent among MSM minor participants in HIV research: a critical review

W. Waratworawan<sup>1,2</sup>, T. Guadamuz<sup>1,2,3</sup>

<sup>1</sup>Mahidol University's Center of Excellence in Research on Gender, Sexuality, and Health (MUGSH), Phutthamonthon, Thailand, <sup>2</sup>Mahidol University, Department of Society and Health, Faculty of Social Sciences and Humanities, Phutthamonthon, Thailand, <sup>3</sup>Mahidol University, Department of Tropical Hygiene, Faculty of Tropical Medicine, Bangkok, Thailand

**Background:** This review explores the ethical aspects of HIV research with vulnerable groups, specifically MSM under 18 years. Emphasizing human subjects' protections per CIOMS 2016 guidelines, the study examines the informed assent/consent process, prioritizing confidentiality, privacy, and sensitivity. The goal was to systematically synthesize global data on informed assent/consent in HIV research with MSM minors.

**Methods:** We conducted a systematic review of HIV-related studies published in peer-reviewed literature between 2010 to 2021, focusing on the informed assent/consent process for MSM under 18 years. Following the PRISMA guidelines, we used relevant keywords to search in PubMed, Embase, and Scopus databases.

**Results:** Out of 171 articles, only 35 met the study inclusion and exclusion criteria. While all studies implemented an informed consent process, merely 14% incorporated an informed assent process (n=5). Notably, 65% were studies conducted in high-income economies (n=23), with 6% involving people living with HIV (n=2) and only 9% involving transmen and transwomen (n=3). Methodologically, 88% utilized quantitative approaches (n=31), 6% qualitative (n=2), and 6% mixed methods (n=2).

Approximately 26% utilized online platforms for their informed assent/consent process. Furthermore, 20% used waivers of guardian permission (n=7), and 3% sought parental permission (n=1). Noteworthy is the presence of only two studies with a formal built-in informed assent/consent process tailored for MSM minors.

This process included easy-to-understand language, a self-administered assessment of participant understanding, and independent minor advocates ensuring privacy, confidentiality, and sensitivity.

**Conclusions:** In HIV research involving MSM minors, the terminology and processes surrounding informed assent/consent and waivers of guardian permission are often incorrect, unclear, and rushed; creating uncertainty with respects to potential risks and harms, protections from harms, research objectives and methodology, privacy, and confidentiality.

These lack of details from authors may be due to negligence from authors, peer reviewers, and journal editors at best, or due to a lack of information and training in human subjects' protections and informed assent pro-

cess for minors, at worst. Moreover, the few studies that included MSM minors do not reflect the targeted and volatile HIV epidemics globally, indicating that investigators choose to exclude MSM minors. This may indeed be the most shocking finding of all!

## Policy development, implementation and analysis

## THPEF685

### Comparative analysis of the action plans to accelerate HIV prevention options for Persons with Disability in West Africa

A. Ibrahim<sup>1</sup>, I. Olufadewa<sup>2</sup>, Y. Babatunde<sup>3</sup>, O. Adedeji<sup>4</sup>

<sup>1</sup>University of Ilorin Teaching Hospital, Pharmacy, Ilorin, Nigeria, <sup>2</sup>Slum and Rural Health Initiative, Ibadan, Nigeria, <sup>3</sup>University of Ilorin, Ilorin, Nigeria, <sup>4</sup>The National Agency for Food and Drug Administration and Control, Lagos, Nigeria

**Background:** Persons with disabilities (PWDs) are one of the most vulnerable populations when it comes to the spread of HIV. In West Africa, the prevalence of HIV among persons with disabilities is higher than in the general population, highlighting the urgent need for effective action to address their specific needs and reduce their risk of acquiring HIV.

This study is the first of its kind to explore disability inclusion as it relates to HIV prevention services in the National Strategic Plan (NSP) documents of West Africa.

**Methods:** This study reviewed the most recent national strategic plans (NSPs) from countries in West Africa and assessed their efforts to address the unique needs of persons with disabilities in the context of HIV prevention.

A Systematic Approach was utilized in the analysis of the action plans to identify common themes and best practices among the national documents. Only countries in West Africa with updated national strategic plans up to 2010 were included in the study.

**Results:** Out of 16 West African countries, only nine (9) met the inclusion criteria for the study. Analysis of their National Strategic Plans (NSPs) revealed that 33.33% (3 countries: Ghana, Senegal, and Nigeria) recognized Persons with Disabilities (PWDs) as a vulnerable group at high risk of HIV exposure, implementing disability-specific protective measures. Ghana and Senegal (22.22%) developed strategies for PWDs' accelerated access to HIV prevention. However, the remaining 6 countries (66.67%), including Nigeria, failed to recognize PWDs as a high-risk group and lacked strategies for HIV prevention. Despite addressing other vulnerable groups, 77.78% omitted PWDs in HIV prevention in NSPs.

**Conclusions:** Progress in accelerating HIV prevention services among PWDs across West Africa is mostly poor. While countries like Ghana and Senegal are making giant strides, this is not the case for the majority.

This is indicative of the need for policymakers and governments across these countries to implement disability-specific approaches and encourage inclusivity, as seen in the NSPs of Senegal and Ghana.

## THPEF686

### Brazil's PrEP dashboard: online tool for PrEP scale up and social accountability

I. Ornelas Pereira<sup>1</sup>, T. M D Alencar<sup>1</sup>,

A. Olhovetchi Kalichman<sup>1</sup>, T. Benoliel<sup>1</sup>,

M. Camelo Madeira de Moura<sup>1</sup>, T. Cherem Morelli<sup>1</sup>,

F.Á. Paula de França<sup>1</sup>, B. Brittes Kamiensky<sup>1</sup>, A.R. Pascom<sup>1</sup>

<sup>1</sup>Ministry of Health of Brazil, Department of HIV/Aids, Virus Hepatitis, Tuberculosis and STI, Brasília, Brazil

**Background:** Since 2018, oral PrEP has been offered free of charge in all 27 Brazilian states and monitored nationally through a single system that aggregates data from all PrEP users in public pharmacies in the country.

Data are analysed monthly to inform national policy, and they are also available for consultation on an open online platform for local policy, management and social accountability.

**Description:** Since 2018, approximately 150,000 people have accessed oral PrEP free of charge in Brazil in 880 public pharmacies, which are monitored nationally through a single information system (Medicines Logistics Control System - SICLOM).

In 2019, an open online interactive dashboard was developed to publish subnational indicators on PrEP use and discontinuation profiles, disaggregated by race/color, education, gender identity, sexual orientation and age group.

In 2023, this Dashboard was enhanced to make disaggregated data available down to the levels of health units, municipalities, and states.

Through the PrEP Dashboard, policymakers, health workers, and civil society can easily access and monitor information on new users and services that offer PrEP free of charge, thereby promoting municipal, state, and national scale-up targets and ensuring accountability for communities.

Brazil's PrEP Dashboard is available at: <https://www.gov.br/aids/pt-br/assuntos/prevencao-combinada/prep-profilaxia-pre-exposicao/painel-prep>

**Lessons learned:** The online dashboard is a tool for national, local management and for communities-led monitoring, based on accurate, updated and disaggregated data.

**Conclusions/Next steps:** Brazil is committed to expanding PrEP use nationally by 147% by 2027 to impact the HIV

epidemic in the country. The online PrEP Dashboard collaborates with local managers and civil society to equitably expand access to and use of PrEP.

## THPEF687

### Assessment of the implementation of HIV in the workplace policy in public and private organizations in Akwa Ibom State, Nigeria: a cross-sectional study

H. Idiong<sup>1</sup>, A. Ekanem<sup>2</sup>, E. Nwanja<sup>3</sup>, P. Idiong<sup>4</sup>, E. Udofia<sup>5</sup>

<sup>1</sup>Texila American University, Georgetown, Guyana,

<sup>2</sup>Univeristy of Uyo, Department of Community Medicine, Faculty of Clinical Sciences, Uyo, Akwa Ibom State, Nigeria,

<sup>3</sup>Excellence Community Education Welfare Scheme, Uyo, Akwa Ibom State, Nigeria, <sup>4</sup>African Institute for Health Policy & Health Systems, Abakiliki, Ebonyi State, Nigeria,

<sup>5</sup>University of Ghana, Department of Community Health, University of Ghana Medical School, Accra, Nigeria

**Background:** Stigma and discrimination heightens the risk of HIV transmission and worsens health outcome among People Living with HIV (PLHIV). To mitigate this, Akwa Ibom State enacted an anti-stigma & discrimination policy, HIV in the Workplace (AKS\_HIV\_WPP) in 2014. This paper assessed the implementation of this AKS\_HIV\_WPP in the Akwa Ibom, Nigeria.

**Methods:** This cross-sectional study utilized data collected from managers of twenty-two organizations (10 public and 12 private establishments) between October 2022 to February 2023 across the three senatorial districts in Akwa Ibom State, Nigeria. AKS\_HIV\_WPP policy implementation was assessed across seven domains: policy availability, socio-economic and political contexts, stakeholders' involvement, resource availability, leadership, operations and feedback. Each domain was scored 0 for no implementation, 1 for sub-optimal and 2 for optimal implementation. Scores were reported by organization type and total scores less than 30% were categorized as no implementation, 31- 69% as sub-optimal, 70 and above as optimal. Frequencies and percentages were used to summarize socio-demographic characteristics of the participants and chi-square test was used to determine the association between type of organization and the level of implementation of AKS\_HIV\_WPP. Statistical significance was set at  $p < 0.05$ .

**Results:** Of the 22 managers, 13 (59.1%) were males with median age of 38 years (IQR 29 – 46 years). Sixteen (72.7%) had university education and the median work experience as a manager was 5.5 years (IQR: 3-10 years). Twenty-one (95%) of the organizations had sub-optimal implementation of the AKS\_HIV\_WPP. The domains with the least performance were the policy availability and feedback domains, each scoring 3.1%. There was an association between the type of organization and the level of implementation of the AKS\_HIV\_WPP ( $p = 0.004$ ).

**Conclusions:** The implementation of the HIV Workplace policy was suboptimal across most organizations in Akwa Ibom. This gap in HIV stigma and discrimination mitigation could continue to fuel the spread of HIV in the state. HIV in the workplace policy should be made readily available in workplaces in the state and feedback on implementation regularly obtained.

Similar settings where HIV in the workplace policy exist, should consider a monitoring plan that strengthen policy implementation.

## THPEF688

### Policies enabling the transition of HIV financing in Vietnam

H.T. Nguyen<sup>1</sup>, D.T. Nguyen<sup>1</sup>, A.C.T. Nguyen<sup>2</sup>

<sup>1</sup>Abt Global, Local Health System Sustainability Project (LHSS), Hanoi, Viet Nam, <sup>2</sup>USAID Vietnam, Office of Health, Hanoi, Viet Nam

**Background:** Until 2014, ART was financed primarily by international donors. To transition to domestic funding, Vietnam is working to integrate HIV services into Social Health Insurance (SHI). The pre-transition phase, which included the creation of a legal and policy framework to enable HIV financing through SHI, took six years to complete. The government passed legislation to guide how ARVs and treatment should be integrated into SHI, and between 2013 and 2019, developed twenty-four policies to enable the transition of ARVs. This includes guidance for procurement and payment, ensuring access to ARVs without financial hardship, and integration of independent HIV clinics under SHI.

**Description:** USAID support through the Health Finance and Governance and Sustainable Financing for HIV/AIDS (SFA) project (2014–2019) included co-planning the policy agenda and co-development of policy content through an extensive consultation process with government partners.

With appropriate policies in place, the ARV transition began in 2019. USAID, through SFA and the Local Health System Sustainability Project, collaborated with the government to identify implementation issues that could be addressed through the revision of policies. Between 2020 and 2023, three policies were amended to address challenges with national centralized procurement of ARVs.

Figure 1. SHI payment for ARVs and HIV services, 2019 - 2023

**Lessons learned:** As Vietnam transitioned to the domestic funding of the country's ARV supply, lessons from implementation informed policy-making. This new environment required dynamic regulations, whose implementation needed monitoring to assess their effectiveness and if changes were necessary.

**Conclusions/Next steps:** Implementation of the policy framework enabled the provision of SHI-funded ARVs for 165,000 PLHIV from 2019 to 2023, accounting for 96 percent of total PLHIV on ART. Integrated HIV services, not limited to ART, can also be accessed through SHI which provides financial protection for PLHIV. By November 2023, the SHI fund's payment for ARVs has been five times larger than in 2019 and almost doubled for HIV services (Figure 1).

## THPEF689

### Filling the gaps in universal access to Mpox preventative programmes among people affected by HIV: reflections on implementation of Mpox vaccination policies across Australia, Taiwan and the United Kingdom

I.Y.-H. Chu<sup>1,2</sup>, P.A. Joson<sup>3</sup>, P. Wu<sup>3</sup>, S.W.-W. Ku<sup>4</sup>, C.-W. Li<sup>5</sup>, C. Strong<sup>3</sup>

<sup>1</sup>University College London, Institute for Global Health, London, United Kingdom, <sup>2</sup>London School of Hygiene and Tropical Medicine, Department of Public Health, Environments and Society, Faculty of Public Health and Policy, London, United Kingdom, <sup>3</sup>National Cheng Kung University, Department of Public Health, College of Medicine, Tainan, Taiwan, Province of China, <sup>4</sup>Taipei City Hospital Renai Branch, Division of Infectious Diseases, Department of Medicine, Taipei, Taiwan, Province of China, <sup>5</sup>National Cheng Kung University, Center for Infection Control and Department of Internal Medicine, National Cheng Kung University Hospital, College of Medicine, Tainan, Taiwan, Province of China

**Background:** The Mpox pandemic has disproportionately impacted people affected by HIV worldwide. Despite increasing availability, huge gaps in accessible, equitable and person-centred Mpox vaccination persist.

We reflected on policy implementation from countries with universal health coverage to improve Mpox vaccination equity.

**Description:** We compared the implementation process of publicly-funded Mpox vaccination programmes in Taiwan, Australia and the United Kingdom as three representative countries with universal health care in Asia, Oceania and Europe, respectively. After searching governmental documents and public communications published from May 2022 to December 2023, we analysed the eligibility, affordability, accessibility, accountability, scalability and stigma mitigation to synthesise best practices in Mpox vaccination programmes for key populations and people with HIV.

**Lessons learned:** Although all three countries offered free Mpox vaccines to 50,000+ residents affected by HIV through designated public sectors, their strategies for improving equitable vaccine access and mitigating stigma vary (see **Table**).

Firstly, the use of stigma-free language (e.g., Taiwan's governments used 'people engaging in risky sexual behaviour' rather than naming populations with specific gender and sexual orientation) can prevent the unintended spread of Mpox-related stigma.

Secondly, Australia and the UK exemplified co-productive community engagement by working with civil society organisations to not only raise awareness of Mpox but establish social media-based reassurance and trust in Mpox vaccinations.

Thirdly, policymakers should continue normalising Mpox acquisition in health risk communications, so intersecting stigmas of Mpox against key populations can be mitigated.

Policies on person-centred Mpox (self)-care and strategies for regaining social connections after Mpox recovery remain scarce, which devastate populations with limited

social support and/or marginalised identities. Health sectors should continue detecting and tackling misinformation on Mpox vaccination, care delivery and well-being recovery.

**Conclusions/Next steps:** Gender-neutral language use, government-community partnerships and evidence-informed health communications in Mpox prevention, care and recovery are critical for countries to establish preparedness for ongoing syndemics of Mpox and HIV. When planning Mpox vaccination scale-up, countries should always put people first by co-producing accessible, equitable and stigma-free programmes with populations affected by HIV.

Country	Eligibility	Relevance to people with HIV	Affordability	Accountability	Accessibility	Scalability (as of 2023)	Stigma mitigation
Taiwan	<ul style="list-style-type: none"> <li>- High risk contact of Mpox case</li> <li>- People (and their sexual contacts) engaging in risky sexual behaviour or diagnosed with STIs in the last six months</li> <li>- Personnel responsible for Mpox vaccination and care</li> </ul>	<p>People whose CD4 <math>\geq</math>200 cells/mm3: subcutaneous Mpox vaccination</p> <p>People whose CD4 &lt;200 cells/mm3: intradermal Mpox vaccination</p>	Free	Taiwan Centers for Disease Control (CDC)	Medical institutions (both public and private) collaborating with Taiwan CDC	<p>Secured 40,560 vaccines</p> <p>Vaccinated 75,134 persons</p>	Emphasise Mpox as a contact disease (transmitted by close contact) with 1% mortality rate

Impact of third line antiretroviral prices on the comprehensiveness of the Brazilian universal access policy

L. de Melo Nunes Lopes<sup>1</sup>, C. Thays Scopell<sup>1</sup>,  
R. Campos Hallal<sup>1</sup>, G. Luís Meffe Andreoli<sup>1</sup>, M. Vieira Freire<sup>1</sup>,  
F.Á. Paula De França<sup>1</sup>, B. Brittes Kamiensky<sup>1</sup>,  
T. Huana De Souza Nascimento<sup>1</sup>,  
R. Do Socorro Marques De Oliveira<sup>1</sup>, E. Malheiros<sup>1</sup>,  
R. Diquique<sup>1</sup>, M.C. Gianna Garcia Ribeiro<sup>1</sup>

<sup>1</sup>Brazilian Ministry of Health, Department of HIV/AIDS,  
Tuberculosis, Viral Hepatitis and STI (DATHI), Brasília, Brazil

**Background:** Comprehensiveness is a principle of the Brazilian national health system, which means that people living with HIV/aids (PLWHA) have the right to antiretroviral therapy (ART) according to their needs, including when multiple treatments fail.

However, antiretroviral (ARV) high prices can be an obstacle. This study aimed to investigate the impact of third line drugs on ART public budget.

**Methods:** From 2019 to 2023, we investigated annual procurement of enfuvirtide (T20) 90 mg/mL, efavirenz (ETR) 200 mg and maraviroc (MVC) 150 mg from the Brazilian government to identify: volume of tablets purchased, BRL unit price and percentage of the ART public budget consumed. The national ARV logistics system was used to identify the number of PLWHA in ART and in use of each of these drugs in December of each year.

Using the preliminary report made by the National Committee for Health Technology Incorporation, we also simulated the scenario in which fostemsavir was officially incorporated in 2024.

**Results:** From 2019 to 2023, the number of PLWHA in ART increased each year, reaching 751,125 PLWHA in 2023. During the period, an average of 0.40% PLWHA in ART used ETR in their regimens, 0.17% used MVC and 0.02% used T20.

The number of PLWHA using these ARV decreased slowly from 2019 to 2021 and abruptly in 2022: a decrease of 54% for ETR, 58% for MVC and 46% for T20 compared to 2021. In 2023, absolute numbers rose to close to the 2021 pattern. Despite being used by just a few PLWHA, the three drugs together consumed an annual average of 2.32% of the ART public budget.

The unit price of fostemsavir is more than 3 times the unit price of T20. If fostemsavir is incorporated to be used by 500 PLWHA, the drug alone will consume 4.1% of the ART budget amount of 2023 (BRL 1,735,258,658.00).

**Conclusions:** High prices can be a barrier to comprehensive and sustainable access to third line ARV – harming, therefore, the universal access to ART. The scenario tends to become more complex as new sky-high priced therapeutic options are launched.

## THPEF692

Building on Australia's HIV partnerships to forge consensus on Doxy-PEP use in gay and bisexual men who have sex with men

V. Cornelisse<sup>1,2</sup>, B. Riley<sup>1</sup>, N. Medland<sup>1,2</sup>

<sup>1</sup>Australasian Society for HIV, Viral Hepatitis and Sexual Health Medicine (ASHM), Sydney, Australia, <sup>2</sup>Kirby Institute, Sydney, Australia

**Background:** Clinical trials of doxycycline post-exposure prophylaxis (Doxy-PEP) have demonstrated significant reductions in syphilis, chlamydia, and to a lesser degree, gonorrhoea among gay, bisexual, and other men who have sex with men (GBMSM). However, guidance on how to use Doxy-PEP varies significantly across jurisdictions, with differences in expert opinion regarding its benefits and risks, particularly in relation to the potential impact of Doxy-PEP on antimicrobial resistance (AMR).

To ensure a cohesive national approach to Doxy-PEP, the Australasian Society for HIV, Viral Hepatitis and Sexual Health Medicine (ASHM) initiated a consensus-building process that included community representatives, clinicians, policymakers and researchers, building on lessons learned and partnerships formed in Australia's HIV response.

**Description:** The process consisted of a national roundtable (45 participants, March 2023) to discuss Doxy-PEP and formulate recommendations, followed by three rounds of feedback on draft recommendations, and a consensus survey on final recommendations. The Australian Consensus Statement on Doxy-PEP was launched in September 2023, and its recommendations have been implemented in clinical and co-designed community education.

**Lessons learned:** Participants agreed on proposed suitability criteria for prescribing Doxy-PEP, and recommendations to:

- Monitor AMR, and to discuss AMR with Doxy-PEP users
- Develop formal clinical guidelines for Doxy-PEP
- Co-design Doxy-PEP education for clinicians and community

While a large majority of participants stated that Doxy-PEP should be used *primarily* for the prevention of syphilis, several stated that Doxy-PEP should *only* be used for the prevention of syphilis.

The consensus process highlighted the strong relationships between key stakeholders in Australia's HIV response, as although participants differed on some points, all agreed that Doxy-PEP has a role to play in Australia's STI response.

**Conclusions/Next steps:** While several Doxy-PEP guidelines have been developed globally, this Statement is unique as the result of a national consensus process involving clinicians, community, and experts in infectious diseases, public health, epidemiology, microbiology, and antimicrobial stewardship. By including these diverse perspectives, the process has helped ensure Australia's Doxy-

PEP rollout is supported by all key stakeholders. This builds on Australia's history of multi-sector collaboration in the HIV response, in particular, between clinicians and affected communities.

## THPEF693

### Promoting HIV information dissemination and public awareness through media engagement

F. Dube<sup>1</sup>, T. Nyatanga<sup>1</sup>, M. Dube<sup>1</sup>, B. Madzima<sup>1</sup>

<sup>1</sup>National AIDS Council, Harare, Zimbabwe

**Background:** While the media has played a key role in promoting information dissemination and awareness in Zimbabwe, the National AIDS Council noted that the HIV and AIDS story was slowly falling off the radar of media priority and that interventions in most remote areas were barely covered. In addition, detrimental stigmatising and discriminating language characterised various articles. People living with HIV were roundly portrayed as victims and villains, which pushed them to withdrawal and non-utilisation of prevention and treatment services. In response the National AIDS Council in 2022 developed a multi-pronged media engagement strategy to ensure that HIV and AIDS remain relevant to the media.

**Description:** The media engagement strategy has been animated by four pillars namely workshops, tours to community interventions, and timely sharing of diaries and response to media enquiries as well media awards. Through this strategy, two hundred (200) editors and reporters were trained on current HIV trends while two hundred and forty (240) editors and reporters were taken on media tours to various under-reported community interventions.

**Lessons learned:** Following the engagement in 2022 and 2023, 1200 news articles were reported both in print and electronic media in the first year and rose to 1269 in the second year, up from a baseline of 690 in 2019 before the emergence of COVID-19. The COVID years of 2020 and 2021 were excluded as implementation of most HIV interventions was limited. In addition to the increased coverage, the content of the articles also improved with use of stigmatising and discriminating language declining. Articles that used such language declined from 401 in 2019 to 89 in 2021 and 23 in 2022. Although media awards were already in place, the number of articles entered was equal to the those that appeared in the media. New winners emerged following the engagement as more junior reporters started taking more interest in the HIV story.

**Conclusions/Next steps:** The media engagement strategy has led to improved quantity and quality of HIV stories. The strategy has now been turned into an ongoing programme, with partners including various United Nations agencies now supporting the interventions.

## THPEF694

### Unity for purpose: a case for the decriminalization of harm reduction services in Kenya

T. Wandera<sup>1</sup>

<sup>1</sup>Caucus on Harm Reduction and Drug Policy Reforms, Nairobi, Kenya

**Background:** Since its promulgation, section 5 (d) of the Narcotic Drugs and Psychotropic Substances (Control) act criminalized provision of harm reduction services such as: the needle and syringe program in Kenya. This continually led to persons who use drugs dropping out of harm reduction programs for fear of arrest. In the long run this increased the spread of HIV.

**Description:** An opportunity presented itself in 2019 when the Narcotic Drugs and Psychotropic Substances (Control) (Amendment) Bill was tabled in Parliament. With support from Open Society Foundation we embarked on a project where we brought together all like minded organizations and individuals keen on drug policy reforms under an initiative known as the Caucus on Harm Reduction and Drug Policy Reforms (The Caucus); the aim of the caucus was to enable members to leverage on diversity, expertise and skills to catalyze law reforms in Kenya. Through this initiative, we jointly developed memorandums for legislators, we conducted engagement meetings with legislators from various parliamentary committees; we also developed simplified memorandums that outreach workers used to build capacities of persons who use drugs during outreach visits. Unfortunately, the bill passed without our recommendations, which catapulted us to the next phase of our project, where we embarked in an aggressive media campaign: Wrote opinion pieces, spoke on TV and Radio stations all over the country, spreading the message "persons who use drugs need medical intervention and not incarceration".

Our campaign successfully led to the President refusing to assent to the bill and referring it to the Ministry of Health for recommendations. On 24th February 2022 the President assented to the bill, the new law effectively deleted section 5 (d) of the old Act, Our initiative had successfully decriminalized provision of harm reduction services in Kenya.

**Lessons learned:** For a long time drug policy reform advocacy has been done in silos and thus not making any traction. In this project we broke the silos and unified our advocacy initiatives and worked as one team creating a platform for our success.

**Conclusions/Next steps:** We intend on using this model to push for the development of a harm reduction legislation

Impact of COVID-19 on PrEP adherence and condom use in anal sex among adolescent men who have sex with men and transgender women in Brazil

B. Oliveira Leite<sup>1</sup>, L. Magno<sup>2</sup>, L. Amorim<sup>3</sup>, J. Arrais<sup>4</sup>, D. Greco<sup>5</sup>, A. Grangeiro<sup>6</sup>, I. Dourado<sup>1</sup>

<sup>1</sup>Federal University of Bahia / Institute of Collective Health, Epidemiology, Salvador, Brazil, <sup>2</sup>State University of Bahia, Life Sciences, Salvador, Brazil, <sup>3</sup>Federal University of Bahia, Statistics, Salvador, Brazil, <sup>4</sup>Fluminense Federal University, Statistics, Niteroi, Brazil, <sup>5</sup>Federal University of Minas Gerais, Belo Horizonte, Brazil, <sup>6</sup>University of São Paulo, São Paulo, Brazil

**Background:** Amid the COVID-19 pandemic, there may have been an impact on PrEP adherence and sexual behaviors. We aimed to analyze the role of the pandemic on adherence to oral PrEP and the condom use in anal sex (CUAS) among adolescent men who have sex with men (AMSM) and transgender women (ATGW).

**Methods:** PrEP1519 constituted a single arm, multicentric demonstration cohort study focusing on daily oral PrEP among AMSM and ATGW aged 15-19 years, in three Brazilian cities. Baseline assessments were carried out, followed by visits at weeks 4, 12, and then quarterly. Our analysis encompassed two longitudinal outcomes collected between February/2019-December/2021: i) three levels of quarterly adherence assessed by medication possession ratio (MPR) [optimal ( $\geq 0.90$ ) vs. sufficient ( $\geq 0.57$  &  $< 0.90$ ) vs. low ( $< 0.57$ )] and ii) quarterly binary CUAS [Inconsistent vs. Consistent/ absence of sexual partners]. Outcomes were evaluated across three distinct periods: pre-pandemic ( $< 01/04/2021$ ), the 1st pandemic wave ( $\geq 04/01/2021$  to  $\leq 07/11/2021$ ) and the 2nd pandemic wave ( $> 11/07/2021$ ). To estimate the effect of the pandemic on adherence and CUAS, we employed a proportional odds model and binomial logistic regression with mixed effects, respectively. Adjusted odds ratios (aOR) were derived for each regression model.

**Results:** 1,199 adolescents were enrolled, and 76.3% in the 18-19 age group, 91.1% identified as MSM, 72.7% self-declared Black/Brown skin color, 70.8% had completed high school. There was a significant increase in the odds of low adherence in the 1st wave (aOR: 1.39) and 2nd wave (aOR: 1.77). Additionally, there was an increase in the odds of consistent condom use/absence of sexual partners in the 1st wave (aOR: 1.51) and 2nd wave (aOR: 1.53) when compared to the pre-pandemic period.

**Conclusions:** During the COVID-19 pandemic, changes in prevention dynamics and sexual behavior, influenced by lockdowns, social isolation, and negative emotions, may

have impacted PrEP adherence, condom use, and sexual contact. This shift could potentially lead to negative effects on HIV incidence rates, necessitating ongoing surveillance for timely detection and care.

### THPEF696

Pandemic preparedness in Nigeria: an analysis of the intersection of politics, human rights, and legal dynamics in mitigating COVID-19's impact on care and vulnerability of people living with HIV/AIDS (PLHIV)

O. Okediji<sup>1</sup>

<sup>1</sup>University of Ilorin, Pharmaceutical Sciences, Ilorin, Nigeria

**Background:** With an estimated 1.9 million people living with HIV in Nigeria, ensuring their access to essential care during the COVID-19 pandemic was paramount. However, disruptions in antiretroviral therapy (ART) access and heightened vulnerabilities due to legal and human rights concerns raise critical questions about the effectiveness of pandemic preparedness measures.

This study sought to analyse how politics, human rights, and legal dynamics in Nigeria impacted the care and vulnerability of people living with HIV/AIDS (PLHIV) during the COVID-19 pandemic.

**Methods:** A review of Nigeria's most recent National Strategic Plan for HIV/AIDS (2020-2025) and the Nigeria COVID-19 Response Plan (2020) was conducted to understand Nigeria's pandemic preparedness. For insights into HIV prevalence, vulnerability factors, and legal barriers in Nigeria, the UNAIDS Country Profile and the most recent Nigeria HIV/AIDS Indicator and Impact Survey (NAIS) (2018) were scrutinised.

The analysis was further enhanced with insights from relevant quantitative and qualitative studies. The six principles employed in an earlier study, based on the UNAIDS International Guidelines on HIV and Human Rights and the HIV Policy Briefs, were key focus areas in the analysis process.

**Results:** The implementation of laws restricting certain fundamental human rights, like travel restrictions, to manage the COVID-19 pandemic in Nigeria affected the accessibility and availability of HIV services, worsening vulnerabilities and inequalities for PLHIV. It also threatened the achievement of 95-95-95 targets for ending AIDS by 2030, with a notable 10% reduction in ART access reported between January and June 2020. The rights of (PLHIV), particularly the right to health, privacy, and freedom of movement, were violated by lockdown measures. Concurrently, the deployment of human resources from HIV services to the COVID-19 response disrupted tests, diagnoses, and ART initiations.

**Conclusions:** Nigeria's COVID-19 response exposed vulnerabilities in HIV care, stressing the need for a human-centred approach in future pandemics. Travel restrictions

and resource shifts disrupted essential services, widening inequalities and jeopardising progress towards ending AIDS. To protect PLHIV and ensure equitable healthcare for all, future pandemic preparedness must prioritise Human rights. Invest in healthcare infrastructure that can adapt to changing needs and empower vulnerable populations to participate in decision-making.

## THPEF697

Impact of emergency financial support program on testing demand, SARS-CoV-2 incidence, and social isolation during COVID-19 outbreak in Brazil: a quasi-experimental study

G. Morais<sup>1,2</sup>, L. Magno<sup>3</sup>, J. Paim<sup>2</sup>, T. Aranha<sup>3</sup>, I. Dourado<sup>2</sup>

<sup>1</sup>Federal University of Latin American Integration, Latin American Institute of Economics, Society and Politics, Foz do Iguaçu, Brazil, <sup>2</sup>Federal University of Bahia/Institute of Collective Health, Health Science, Salvador, Brazil,

<sup>3</sup>University of the State of Bahia, Life Science Department, Salvador, Brazil

**Background:** Programs offering financial support have been established to mitigate the economic fallout and vulnerabilities arising from the COVID-19 pandemic. Moreover, financial incentives have been introduced to promote compliance with isolation measures, thereby preventing SARS-CoV-2 acquisition and transmission. However, few low- and middle-income countries have implemented financial aid to alleviate the COVID-19 outbreak.

We estimated the impact of the Brazilian Emergency Aid (EA) Program on SARS-CoV-2 testing demand, SARS-CoV-2 incidence, and social isolation levels.

**Methods:** In this quasi-experimental study we assessed microdata information from 380,000 individuals surveyed in COVID-19 National Household Sample Survey between July 1, 2020, and Nov 30, 2020. Individuals meeting the EA eligibility criteria, those who have taken the SARS-CoV-2 test, those diagnosed with COVID-19, and/or those following social isolation were included.

Beneficiaries and non-beneficiaries were matched (1:1) using propensity score matching, considering socioeconomic and health covariates. We performed logistic regression to compute the monthly average impact of EA benefits on the aforementioned outcomes.

**Results:** We included 171,183 performed tests; 19,218 COVID-19 cases; and individuals complying with mild, moderate, and strict social isolation. EA recipients showed greater testing demand (November; odds ratio [OR]=1.014, 95% confidence interval [CI]: 1.001-1.026); however, this did not significantly reduce SARS-CoV-2 incidence.

Beneficiaries adhered better to mild isolation from July-September (Sep; OR: 1.017, 95% CI: 1.007-1.028), with no significant improvement from October-November. EA receipt did not improve adherence to moderate (July, OR:

0.95, 95% CI: 0.94-0.97; November, OR: 0.83, 95% CI: 0.80-0.86) or strict (July, OR: 0.79, 95% CI: 0.75-0.84; November, OR: 0.77, 95% CI: 0.73-0.81) isolation compared to non-beneficiaries.

**Conclusions:** Despite the deteriorating COVID-19 situation in Brazil owing to the lack of effective public health policies and government resistance to scientific guidance, being EA beneficiary is associated with better healthcare access and increased adherence to mild social measures.

PEPFAR adapts to sea-level-rise and storm-surge: potential impacts to coastal cities and facilities (2030)

J. Tobias<sup>1</sup>, M. Jolly<sup>2</sup>, K. Van Baalen<sup>3</sup>, L. Hadj-Chikh<sup>3</sup>, E.P. Vallejo<sup>4</sup>, N. Heard<sup>4</sup>, Z. Haimovich<sup>5</sup>, C. Kalman<sup>6</sup>, B. Kagniniwa<sup>7</sup>, J. Blanton<sup>8</sup>, H. Tolentino<sup>8</sup>

<sup>1</sup>Peraton, GIS, Tucker, United States, <sup>2</sup>Peraton, Epidemiology, Atlanta, United States, <sup>3</sup>Climate Central, Princeton, United States, <sup>4</sup>US State Department, Global Health Security and Diplomacy, Washington, United States, <sup>5</sup>Peraton, GIS, Atlanta, United States, <sup>6</sup>General Dynamics, Washington, United States, <sup>7</sup>USAID, Washington, United States, <sup>8</sup>US Centers for Disease Control and Prevention, Division of Global HIV and Tuberculosis, Atlanta, United States

**Background:** Climate change presents significant threats such as sea-level rise, impacting vulnerable coastal cities and healthcare facilities within the PEPFAR portfolio. By 2030, the year targeted for achieving UNAIDS 95-95-95 goals, significant flooding due to sea-level rise could severely impact HIV epidemic control in these regions.

The displacement caused by these climate events poses a health and climate equity concern, disproportionately affecting marginalized populations, including those targeted by PEPFAR programs.

**Methods:** This study utilizes the Intergovernmental Panel on Climate Change 2018 report and Climate Central's Coastal Risk Screening Tool to analyze the potential impact of sea-level rise and annual flooding on large coastal cities within the PEPFAR portfolio by 2030, under different Representative Concentration Pathways (RCP); specifically comparing the impact under the RCP 2.6 scenario with projected global climate increase under 2 degrees centigrade by 2100, and the RCP 8.5. scenario, with a projected climate increase of 4.4 degrees by 2100.

Geographic Information Systems and data science methodologies were employed to visualize and estimate the impacts of sea-level rise and storm-surge on these cities.

**Results:** Several large coastal cities within the PEPFAR portfolio are at an increased risk of significant flooding by 2030. In the best-case scenario (RCP 2.6), 108 facilities would be vulnerable to flooding by 2030. The number of PEPFAR facilities vulnerable to flooding will increase substantially by 2100 compared to 2030, by (2.8 times) in the RCP 2.5 scenario and (3.81 times) in the RCP 8.5 scenario.

*Table (RCP 8.5):*

	2023	2030	2040	2050	2060	2070	2080	2090	2100
Districts	Potential Flooded Facilities n, (%)								
Abidjan	137	11, (8.0)	12, (8.8)	12, (8.8)	12, (8.8)	39, (28.5)	42, (30.7)	43, (31.4)	44, (32.1)
Bangkok	24	18, (75.0)	18, (75.0)	18, (75.0)	19, (79.2)	19, (79.2)	19, (79.2)	20, (83.3)	21, (87.5)
Ho Chi Minh City	54	2, (3.7)	2, (3.7)	2, (3.7)	2, (3.7)	2, (3.7)	10, (18.5)	20, (37.0)	33, (61.1)
Lagos	94	1, (1.1)	1, (1.1)	2, (2.1)	2, (2.1)	6, (6.4)	9, (9.6)	15, (16.0)	27, (28.7)
Mombasa	90	0, (0.0)	0, (0.0)	0, (0.0)	0, (0.0)	0, (0.0)	0, (0.0)	0, (0.0)	0, (0.0)

**Conclusions:** The findings of this study underscore the urgency of addressing climate change impacts within PEPFAR. It highlights the importance of incorporating climate adaptation and resilience strategies into the strategic planning of PEPFAR programs. The study shows that climate change-induced displacement could hamper the efforts of PEPFAR in reaching and sustaining HIV epidemic control, especially in marginalized populations. The results emphasize the need for integrating climate disaster mitigation strategies into PEPFAR's planning cycle.

## THPEF699

The impact of Uganda's Anti-Homosexuality Act of 2014 on queer women's health and human rights: a retrospective analysis

H.I. Ngusale<sup>1</sup>

<sup>1</sup>United States International University-Africa, PhD Student, Nairobi, Kenya

**Background:** This scholarly study examines the repercussions of Uganda's Anti-Homosexuality Act of 2014 on the health and human rights of queer women, particularly those living with HIV. The Act, criminalizing same-sex relationships, exacerbated existing homophobia, resulting in negative consequences for HIV prevention and treatment.

**Methods:** Findings emanated from surveys from queer women in Uganda, focusing on aspects such as access to healthcare, prevalence of violence, and levels of discrimination available. Additionally statistical data on HIV prevalence and treatment accessibility among the LGBTQ+ community in Uganda.

**Results:** Despite being struck down by the Ugandan Supreme Court in 2014, the Act left enduring challenges, including increased difficulty in accessing essential services, heightened stigma and discrimination, and elevated

levels of violence against queer women. The study underscores the need for sustained efforts to cultivate an inclusive and accepting society, emphasizing the lingering impact on the well-being of queer women in Uganda.

**Conclusions:** The research findings underscore the profound and lasting impact of Uganda's Anti-Homosexuality Act of 2014 on the health and human rights of queer women, especially those living with HIV. The Act, though repealed in 2014, left enduring challenges that persist in the form of heightened stigma, discrimination, and violence against this vulnerable population. Quantitative data revealed tangible difficulties in accessing essential healthcare services, with fear of discrimination or arrest hindering many queer women from seeking HIV prevention and treatment.

<sup>3</sup>Hospital Universitario Rey Juan Carlos, Móstoles, Spain,

<sup>4</sup>Hospital Universitario Fundación Jiménez Díaz, Madrid, Spain, <sup>5</sup>Hospital General Universitario Gregorio Marañón,

Madrid, Spain, <sup>6</sup>Hospital Clínico Universitario San Carlos, Madrid, Spain

**Background:** Elite controllers (EC) are a group of people living with HIV (PLWH) able to control HIV replication without antiretroviral therapy and have been proposed as a model of functional cure. Significant evidence suggests that despite viral control, EC subjects may have altered levels of systemic inflammation. We have performed a comprehensive characterization of the systemic inflammation profile in EC compared to non-controllers PLWH either with or without ART-mediated control of viral replication.

**Methods:** 40 participants were included: 10 EC, 10 non-controllers PLWH on ART (on-ART), 10 non-controllers PLWH ART-naïve (off-ART), and 10 uninfected controls (UC) as reference. Plasmatic levels of 92 surrogate markers of inflammation were assessed using the proximity extension assay (Olink proteomics, Sweden). Differential expression analysis, principal component analysis (PCA), and clustering analysis were carried out using the Metaboanalyst software. Pathway enrichment analysis (PEA) was carried out using the STRING platform.

**Results:** EC and on-ART groups were matched for CD4 counts, years since diagnosis, route of acquisition and gender. CD4 counts were lower in off-ART group ( $p=0.02$ ). Compared to UC, off-ART showed the highest disturbance in the inflammatory markers with 30 different proteins differentially expressed (DE) (29/30 upregulated;  $p<0.05$ ). In contrast, on-ART presented a profile similar to UC with only 4 proteins DE (3/4 upregulated). Interestingly, EC presented a more disturbed inflammatory profile than on-ART, with 10 different proteins DE with respect to UC (10/10 upregulated;  $p<0.05$ ), of which 3 were DE only in EC. Of note, among these 3 proteins were CCL4 (a ligand for HIV-correceptor CCR5) and CCL13 (a ligand for HIV-correceptor CCR2). The comparison between EC and on-ART also supported a higher inflammatory status in EC with 6 proteins DE expressed (5/6 upregulated in EC;  $p<0.05$ ),

and the PEA ( $FDR<0.05$ ) of these proteins revealed several pathways related to "immune defense against other organisms".

**Conclusions:** Our results show that while spontaneous control of HIV is a benefit for EC subjects, it may have an associated cost (probably due to a more efficient immune response against the HIV) reflected in the maintenance of a chronic inflammatory status, what could be a compelling argument to consider treating these EC subjects.

<sup>1</sup>Beijing Key Laboratory of Emerging Infectious Diseases, Institute of Infectious Diseases, Beijing Ditan Hospital, Capital Medical University, Beijing, China, <sup>2</sup>Beijing Institute of Infectious Diseases, Beijing, China, <sup>3</sup>National Center for Infectious Diseases, Beijing Ditan Hospital, Capital Medical University, Beijing, China, <sup>4</sup>National Key Laboratory of Intelligent Tracking and Forecasting for Infectious Diseases, Beijing, China, <sup>5</sup>Clinical and Research Center of Infectious Diseases, Beijing Ditan Hospital, Capital Medical University, Beijing, China

**Background:** Overexpression of CD70 on CD4<sup>+</sup> T cells was recently reported to be associated with highly pathogenic proinflammatory Th1/Th17 polarization in multiple sclerosis. CD70 was found to increase on CD4<sup>+</sup> T cells during HIV infection. However, the role of CD70 in the imbalance of Th polarization during HIV infection is not fully understood.

**Methods:** We performed a study in 200 people living with HIV (PLWH), including 143 treatment-naïve patients (TN) and 57 patients who had experienced antiretroviral therapy (ART). We examined the expression of CD70 on CD4<sup>+</sup> T cells by flow cytometry. Then the specific makers of Th cells were detected by flow cytometry and PCR. Finally, the ROC and KM curve measured the predictive value of the baseline proportion of CD70<sup>+</sup>CD4<sup>+</sup> T cells on immune reconstitution in TNs.

**Results:** We found the frequency of CD70<sup>+</sup>CD4<sup>+</sup> T cells negatively correlated with CD4<sup>+</sup> T cell count and positively correlated with HLA-DR<sup>+</sup>CD38<sup>+</sup>CD4<sup>+</sup> T cells and several plasma inflammatory markers. Moreover, CD70 expression defined a population of proinflammatory Th1/17/22/GM subsets in PLWH, and the mRNA expression of specific markers of Th1/17/22/GM differentiation decreased when blocking

CD70. Notably, CD27 blocking resulted in similar results in Th1 and Th17 polarization, whereas it did not affect the differentiation of Th22 and ThGM. Furthermore, CD70-CD4<sup>+</sup> T cells exhibited higher phosphorylation of JAK/STAT molecules, which could be reversed by blocking CD70 during Th polarization. Finally, patients with a higher baseline percentage of CD70-CD4<sup>+</sup> T cells exhibited a greater risk of poor immune reconstitution after 1 to 5 years of ART than those with low CD70.

**Conclusions:** CD70 defined a more broadly inflammatory subset of Th1/17/22/GM lymphocytes, which led to a sustained and aggravated inflammatory environment during HIV infection. More importantly, the percentage of CD70-CD4<sup>+</sup> T cells at the baseline could predict CD4<sup>+</sup> T cell recovery in PLWH.

## EPA003

The predictive role of CD4/CD8 ratio on T lymphocyte functions in long-term virally suppressed people living with HIV

Q. Xiao<sup>1</sup>, Y. Liu<sup>1</sup>, F. Zhang<sup>2</sup>

<sup>1</sup>Chongqing University Cancer Center, Chongqing, China,

<sup>2</sup>Beijing Ditan Hospital, Capital Medical University, Beijing, China

**Background:** Long-term management of people living with HIV (PLWHs) is currently assessed by monitoring CD4<sup>+</sup> T cell counts to assess their immune recovery, but a single metric provides less information. In contrast, the CD4/CD8 ratio is gradually being recognized as a potential marker of immune dysfunction. To investigate the association between T lymphocyte activities and the CD4/CD8 ratio and its value in predicting immunological traits in PLWHs.

**Methods:** One hundred and twenty-five PLWHs and 31 HIV unacquired controls (UCs) were enrolled and classified into four groups according to their CD4/CD8 ratios (ELR group:  $0.4 < \text{CD4/CD8}$ ; LR group:  $0.4 \leq \text{CD4/CD8} < 0.7$ ; MR group:  $0.7 \leq \text{CD4/CD8} < 1$ ; HR group:  $\text{CD4/CD8} \geq 1$ ), and the activation and proliferation phenotypes, mitochondrial functions and inflammatory indexes of CD4<sup>+</sup> T cells and CD8<sup>+</sup> T cells were detected, and the correlations between CD4/CD8 ratio and T cell functions were analyzed.

**Results:** We found that T cell activation and proliferation were significantly increased in the ELR group compared to UCs. However, compared to the other four groups, the ELR group had a considerably larger proportion of T cells with accumulated lipid peroxidation, mitochondrial lipid reactive oxygen species (ROS), and mitochondrial membrane potential (MMP) abnormality. As the CD4/CD8 ratio increased, the damage of mitochondrial lipid peroxidation was gradually reduced and the MMP was gradually restored. Simultaneously, compared to the other groups, the ELR group had noticeably more inflammatory markers in CD4<sup>+</sup> T cells. The correlation analysis showed that the CD4/CD8 ratio linked with multiple functions of T cells, and the correlation coefficient with mitochondrial function was higher than that of CD4<sup>+</sup> T cell count.

**Conclusions:** In conclusion, the CD4/CD8 ratio was closely related to T lymphocyte functions, and significantly better than the CD4<sup>+</sup> T cell count in predicting the mitochondrial lipid peroxidation level and mitochondrial functions in T lymphocytes.

## EPA004

Safety and pharmacokinetics of SAMT-247 released via intravaginal rings in rhesus macaques

E. Woode<sup>1</sup>

<sup>1</sup>Howard, Pharmaceutical Science, Laurel, United States

**Background:** In 2022, there were 39 million people living with HIV, 1.3 million people were newly infected and of them, 46% were women or girls. Our prior work demonstrated that combining the  $\Delta\text{VIDNA}/\text{ALVAC}/\Delta\text{V1gp120}/\text{Alum}$  vaccine platform with vaginal administration of the zinc-finger protein inhibitor, SAMT-247, augments vaccine efficacy in female rhesus macaques. A limitation of the approach, however, is that SAMT-247 was given in a gel formulation, which may not be sufficiently user-friendly, and therefore affect compliance. We have designed a vaginal ring that might overcome this limitation. Here, we investigate the drug-release rate, stability, and safety of the intravaginal ring (IVR) formulation of SAMT-247 in macaques.

**Methods:** Eight female rhesus macaques were divided into two groups of four. IVR was inserted and maintained in the first group for 2 consecutive weeks and in the 2nd group for 4 consecutive weeks. Blood, vaginal and rectal swabs, and pinch biopsies were collected prior to and/or during the study. IVRs were removed and analyzed for re-

sidual drug. After 3 days of ring removal, 2 animals from each group were sacrificed to investigate vaginal mucosal and other tissue pathology.

**Results:** The *in vivo* drug release rates were 0.97 +/- 0.25 mg/day and 0.84 +/- 0.53 mg/day for the two groups of animals, respectively. Moreover, 81.9 +/- 4.8% and 68.5 +/- 20% of SAMT-247 were retained in the IVRs after study completion, respectively. IVR-loaded SAMT-247 demonstrated an acceptable stability profile, with 88.0% and 79.0%, respectively of the remaining drug retained in its original form. Administering SAMT-247 at the observed rates and duration did not severely alter hematology, clinical chemistry, body weight, and pathology profiles when compared to the baseline controls or reference ranges.

**Conclusions:** Taken together, the IVR formulation of SAMT-247 demonstrated acceptable drug release, stability, and safety profiles for up to 4 weeks.

## EPA005

### Epistatic interaction between ERAP2 and HLA modulates viral adaptation and HIV-1 disease outcome

S. Gaudier<sup>1,2,3</sup>, M. Al-kaabji<sup>1</sup>, P. Deshpande<sup>3</sup>, M. Firth<sup>4</sup>, R. Pavlos<sup>3</sup>, A. Chopra<sup>3</sup>, H. Basiri<sup>4</sup>, J. Currenti<sup>1</sup>, E. Alves<sup>1</sup>, M. John<sup>3,5</sup>, S. Kalams<sup>2</sup>, E. Phillips<sup>2</sup>, S. Mallal<sup>2</sup>

<sup>1</sup>University of Western Australia, School of Human Sciences, Nedlands, Australia, <sup>2</sup>Vanderbilt University Medical Center, Division of Infectious Diseases, Nashville, United States, <sup>3</sup>Murdoch University, Institute for Immunology and Infectious Diseases, Murdoch, Australia, <sup>4</sup>University of Western Australia, Nedlands, Australia, <sup>5</sup>Royal Perth Hospital, Perth, Australia

**Background:** A strong genetic predictor of outcome following untreated HIV-1 infection is the carriage of specific alleles of human leukocyte antigen (HLA) molecules that present viral peptides (epitopes) to T cells. Residual variation in outcome measures may be attributed, in part, to viral adaptation to HLA-restricted T cell responses via mutations that can abrogate HLA-peptide binding, T cell receptor recognition of infected cells, disrupt intracellular epitope processing or create ineffective neoepitopes. HLA adaptation signatures in viral sequence can therefore be used to inform an understanding of other interacting genetic determinants of suppressive antiviral responses. Variants of the endoplasmic reticulum aminopeptidases (ERAPs) influence the repertoire of T cell epitopes presented by HLA alleles as they trim pathogen-derived peptide precursors to optimal lengths for antigen presentation along with other functions unrelated to antigen presentation.

Here, we explore whether ERAP variants influence HLA-associated HIV-1 adaptation with demonstrable effects on overall HIV-1 disease outcome measures at the population level.

**Methods:** To investigate the influence of HLA, ERAP1 and ERAP2 on disease outcome, we utilized high-resolution host and HIV genetic data of 249 pre-treatment individuals living with HIV from the Western Australia HIV cohort with clinical measures.

**Results:** We identified a novel association between two linked ERAP2 single nucleotide polymorphisms (SNPs; rs2248374 and rs2549782) with plasma HIV RNA concentration (viral load) (P adjusted=0.0024 for both SNPs). Greater HLA-associated HIV-1 adaptation in the HIV-1 Gag gene correlated significantly with clinical markers of poor outcome (high viral load and lower CD4+ T cell count and proportion; P=0.0103, P=0.0061, P=0.0061, respectively). Strikingly, there was a significant interaction between the two ERAP2 SNPs and HLA-associated HIV-1 adaptation on viral load (P=0.0111) that accounts for approximately 6% of the variance in HIV viral load in this cohort.

**Conclusions:** We show that epistasis between ERAP and HLA genetic loci modulates HIV adaptation to T cell immunity to influence clinically relevant markers of pathogen fitness in-vivo.

This suggests that the ERAP2 association with antiviral responses is mediated by its role in shaping the peptide repertoire presented to HLA class I-restricted T cells, serving as a model for antigen presentation in the immune defences against viruses.

## EPA006

### Unraveling gender-related molecular patterns in HIV: divergent peripheral blood bioprofiles in young women and men without HIV or with undetectable plasma viremia on ART for targeted care and treatment strategies

L. Yin<sup>1</sup>, S. Borkar<sup>1</sup>, G. Venturi<sup>2</sup>, K.-F. Chang<sup>1</sup>, U. Nepal<sup>1</sup>, J. Shen<sup>1</sup>, I. Raplee<sup>1</sup>, K. De Paris<sup>3</sup>, J. Sleasman<sup>2</sup>, M. Goodenow<sup>1</sup>

<sup>1</sup>National Institute of Allergy and Infectious Diseases, Molecular HIV Host Interactions Section, Bethesda, United States, <sup>2</sup>Duke University School of Medicine, Division of Allergy and Immunology, Department of Pediatrics, Durham, United States, <sup>3</sup>University of North Carolina at Chapel Hill, Department of Microbiology, Chapel Hill, United States

**Background:** Women constitute 53% of people with HIV and 46% of new acquisitions, but their involvement is disproportionately low in HIV treatment (19%), vaccine (38%), or cure research (11%). The current study compares young women and men without or with HIV to define molecular bioprofiles associated with gender.

**Methods:** Study cohort included 90 young adults [median age: 23 years]: 33 women and 57 men. The effect of birth gender without or with HIV was evaluated by comparisons between 16 women and 26 men without HIV (WwoH versus MwoH) and between 17 women and 31 men with HIV (WwH versus MwH) with similar demographic and clinical characteristics (age, CD4 count, limited comor-

bidities, and viral load  $\leq 50$  HIV-1 RNA copies/ml plasma on treatment). The concentrations of twenty-three plasma immune activation and inflammation biomarkers were measured using MesoScale multiplex assays and compared between two groups by a Mann-Whitney test. Peripheral blood-cell mRNA was sequenced using Illumina HiSeq 2500 and analyzed for significant differentially expressed genes (DEGs) using DESeq2 ( $|FC| \geq 1.3$  and  $FDR \leq 0.05$ ) and volcano plot ( $|FC| \geq 2$ ) using Enhanced Volcano. Pathway analysis used Ingenuity Pathway Analysis [ $P < 0.001$ ;  $Z\text{-scores} \geq 1/ \leq -1$ ].

**Results:** Compared with MwoH, WwoH showed increased concentrations of MMP2 (immune activation) and IL-6 (inflammation), 74 DEGs (44 upregulated, 30 down-regulated), significant upregulation of X-linked and down-regulation of Y-linked genes, and a more active interferon  $\alpha/\beta$  signaling pathway. In young adults with HIV and controlled viremia, WwH compared with MwH, had higher LBP (microbial translocation) and sICAM-1 (vascular inflammation) biomarker concentrations, 965 DEGs (561 upregulated, 404 down-regulated), significant up-regulation of MARCH2 (HIV inhibitor) and multiple RNA genes (RNA5515, RNA5-855, RNA57SL2, SNORA10, MIR3648.1, MIR6753), down-regulation of IL-7 (a T cell development cytokine) and Y-linked genes, and multiple activated pathways related to protein synthesis, immune response, anti-oxidation, and metabolism.

**Conclusions:** Molecular bioprofiles distinguish young women from young men without and with HIV. The distinct gender effect in response to HIV-1 and viral suppression is remarkably amplified among young women. Results provide evidence for the need to develop inclusive clinical studies for appropriate gender-centered HIV care, treatment, and cures.

### Immune response patterns among HIV-1 serodiscordant couples in Anambra state Nigeria

U.C. Ogwaluonye<sup>1</sup>, G.O. Chukwuma<sup>2</sup>, C.E. Onah<sup>2</sup>, I. Anagbaoso<sup>3</sup>, G. Nchinda<sup>4</sup>, C. Esimone<sup>1</sup>

<sup>1</sup>Nnamdi Azikiwe University, Department Of Pharmaceutical Microbiology & Biotechnology, Awka, Nigeria, <sup>2</sup>Nnamdi Azikiwe University, Department of Medical Laboratory Science, Awka, Nigeria, <sup>3</sup>Nnamdi Azikiwe University, Molecular Research Laboratory, Awka, Nigeria, <sup>4</sup>Chantal Biya Research Center (CIRCB), Yaounde, Cameroon

**Background:** The current management approach to HIV/AIDS treatment is not associated with curative potential via the HAART regimen. However, for some persons living with HIV, their partners remain seronegative despite constant exposure. Currently, no vaccine has been licensed for the prevention of HIV. Therefore, there is a need to discover potential immunogens that could facilitate the development of a candidate vaccine against HIV. Our study

assessed the formation of naturally occurring protective HIV-specific antibodies among HIV serodiscordant couples in Anambra State, Nigeria.

**Methods:** This study was carried out in five hospitals, all of which manage HIV-positive clients and also offer counselling and case management services. Ethical Approval was obtained from the ethics committees of Chukwue-meka Odumegwu Ojukwu University Teaching Hospital Awka (COOUTH) and Nnamdi Azikiwe University Teaching Hospital (NAUTH), Nnewi. A total of 96 participants were selected for this study. We determined HIV-specific antibodies for NEF, TAT, INT (integrase) and MPER antigens.

**Results:** All HIV antigens assessed produced antigen-antibody reactions for all IgG, IgG subclasses and IgM antibodies tested. The results showed that IgM predominantly reacted with HIV TAT antigen (26% of samples tested positive) while HIV TAT and INT antigens predominantly reacted with IgG (36.5% and 35.4%) antibodies. Additionally, the NEF antibodies were detected near-equally in seropositive and seronegative participants while MPER, TAT and INT were detected predominantly in seronegative participants ( $p > 0.05$ ). Also, McNemar's chi-squared test showed that the development of antibodies in seronegative partners was not dependent on their presence in their seropositive counterparts ( $p > 0.05$ ). Further logistic regression analysis suggested that the presence of MPER antibodies was significantly associated with increased odds for the presence of NEF (OR of 6.32 (95% CI 1.53; 34.74)) and INT (OR of 6.74 (96% CI 1.29; 52.88)) antibodies in seropositive partners; thereby suggesting the possibility of its use for the development of a candidate vaccine.

**Conclusions:** Our study identified the presence of an immune response to all HIV antigens assessed. It further provided evidence for the production of HIV-specific antibodies in exposed seronegative partners which may play a role in protection. Therefore, future studies are needed to explore the protective efficacy of these antibodies.

## EPA008

### Anti-viral and anti-inflammatory effects of novel PPAR $\gamma$ agonist, INT131, in an EcoHIV mouse model: relevance to the treatment of HIV-associated neurocognitive disorders

C. Titus<sup>1</sup>, T. Hoque<sup>1</sup>, R. Bendayan<sup>1</sup>

<sup>1</sup>University of Toronto, Pharmaceutical Sciences, Toronto, Canada

**Background:** Approximately 50% of people living with HIV experience HIV-Associated Neurocognitive Disorders (HAND), characterized by a decline in behavior, motor skills, and cognitive functions. Peroxisome proliferator-activated receptor gamma (PPAR $\gamma$ ), a transcription factor involved in regulating glucose/lipid metabolism, has demonstrated potential for eliciting anti-HIV and anti-inflammatory responses. Our hypothesis centered on the notion that stimulating PPAR $\gamma$  via a novel selective

agonist, INT131, could potentially attenuate HIV-induced brain inflammation in vivo, using an ecotropic HIV-1 (EcoHIV) mouse model that simulates HAND. This study aimed to investigate the ability of INT131 to counteract both viral gene expression and inflammation within various brain regions (cerebellum, subcortex, and cortex) in EcoHIV-inoculated mice.

**Methods:** We quantified markers of interest using qPCR analysis, including viral genes, inflammatory cytokines/chemokines, blood-brain barrier (BBB) tight junction proteins, and examined BBB permeability applying the NaF permeability assay, 21 days post intracranial injection of saline or EcoHIV ( $2 \times 10^6$  pg/ml) in: i) Saline-inoculated mice, ii) EcoHIV-inoculated mice, and iii) EcoHIV-inoculated mice treated with daily oral administration of INT131 (50 mg/kg/day). In parallel, we conducted immunohistochemical analyses on paraffin-embedded sections of human brain tissue extracted from the cerebellum, basal ganglia, and cortex. Our investigation focused on evaluating the protein expression and localization of specific markers: GFAP (indicative of activated astrocytes), Casp-3 (cell death), and PPAR $\gamma$  (utilizing antibody ab59256).

**Results:** Exposure of mice to EcoHIV significantly increased the mRNA expression of viral genes (*Vif* and *Tat*), inflammatory markers (*Tnf- $\alpha$* , *Il-1b*, *Il-6*, and *Ifn- $\gamma$* ) and decreased BBB markers (*Ocln*, *Cldn5* and *Tjp-1*) in brain regions. INT131 significantly reduced the expression of viral genes, inflammatory markers and restored the expression of BBB markers to control levels. INT131 also restored BBB permeability in the EcoHIV mouse model. Moreover, HIV-positive individuals with neurocognitive impairment showed increased GFAP+ and apoptotic cells alongside reduced PPAR $\gamma$  localization in brain tissues compared to HIV-negative individuals and HIV-positive individuals with normal neurocognitive status.

**Conclusions:** Our findings suggest PPAR $\gamma$  as a potential target for treating/preventing HIV-associated brain inflammation, BBB dysfunction, and potentially HAND. Future studies will explore INT131's efficacy in reversing neurocognitive deficits (motor, learning and memory) in the EcoHIV mouse model through behavioural assessments.

**Background:** Although clade-specific and cross-clade mosaic HIV-1 vaccine regimens elicited immune responses in early phase trials, neither regimen prevent HIV acquisition in the Uhambo or Imbokodo efficacy trials in sub-Saharan Africa. Using the rich immunological data from the respective Phase 1/2a trials, HVTN 100 and HVTN 117/HPX2004, we compared immune responses from these trials over time. It is important for future HIV-1 vaccine development to understand the similarities and differences in the immune responses elicited in these early phase vaccine trials.

**Methods:** HVTN100 tested a clade B/C canarypox vector Gag/Env insert prime (ALVAC-HIV (vCP2438)) with ALVAC-HIV + clade C Env gp120/MF59 protein boosts. HVTN117/HPX2004 tested a tetravalent adenovirus serotype 26 vector with mosaic Gag/Pol/Env insert (Ad26.Mos4. HIV) followed by an alum-adjuvanted trimeric subtype C gp140 protein vaccination. We compared antibody, CD4+ and CD8+ T-cell responses in HVTN100 (n=186) with HVTN117/HPX2004 per-protocol vaccinees (n=99) after month 6 and month 12 vaccinations, and at month 18.

**Results:** At month 12.5/13, both regimens induced similarly high IgG breadth scores against gp120, gp140, and V1V2 antigens, with similar IgG responses to gp70caseA2

V1V2. However, IgG V1V2 responses were more durable in HVTN117/HPX2004, with the largest difference at month 18 in the gp70-BCaseAV1V2 IgG response rate (17.8% in HVTN100 vs 61.9% in HVTN117/HPX2004,  $p < 0.001$ ). IgG3 consensus Env antigen responses were higher and more durable in HVTN117/HPX2004 at month 12.5/13. Both regimens induced low IgG3 responses to gp70-BCaseA2 V1V2 at month 12.5/13 (9.6% in HVTN100 vs 10.3% in HVTN117/HPX2004). Polyfunctional CD4+ Env responses were significantly higher in HVTN100, but CD4+ Gag responses were higher in HVTN117/HPX2004. While CD8+ T-cell responses were not seen in HVTN100, HVTN117/HPX2004 elicited CD8+ responses to Env and Gag with response rates reaching 42%.

**Conclusions:** Both regimens induced robust gp120- and gp140-specific IgG responses, while the HVTN117/HPX2004 regimen elicited more durable IgG V1V2 responses. In contrast, HVTN100 induced higher polyfunctional CD4+ Env T cells. Nevertheless, neither vaccine regimen demonstrated protection, suggesting that broader, and/or more robust immune responses likely including neutralization are needed for clinical protection against acquisition.

Fernández-Rodríguez<sup>5,8</sup>, V. Briz<sup>1</sup>

<sup>1</sup>Carlos III Health Institute, Viral Pathogenesis and Immunity, Majadahonda, Spain, <sup>2</sup>La Paz University Hospital, Internal Medicine Service, Madrid, Spain, <sup>3</sup>Doce de Octubre Hospital Biomedical Research Institute, VIH Unit, Madrid, Spain, <sup>4</sup>King's College London University, London, United Kingdom, <sup>5</sup>Carlos III Health Institute, Centro de Investigación Biomédica en Red de Enfermedades Infecciosas (CIBERINFEC), Madrid, Spain, <sup>6</sup>Infanta Leonor University Hospital, Department of Infectious Diseases. HIV/Hepatitis Internal Medicine Service, Madrid, Spain, <sup>7</sup>La Princesa University Hospital, Internal Medicine - Infectious Diseases Service, Madrid, Spain, <sup>8</sup>Carlos III Health Institute, Viral Infection and Immunity, Majadahonda, Spain

**Background:** Spontaneous HCV clearers possess immune strengths which make them able to eliminate HCV in absence of treatment. However, there is little information about its effects on PWH. Our objective is to evaluate how different HCV infection status impact on the immunophenotypic profile of different CD4+ and CD8+ T-cells subpopulations and the levels of Immune Checkpoints (IC).

**Methods:** Cross-sectional study of 116 people with HIV (PWH) classified in 3 groups: a) 36 spontaneous Clearers (SC) who eliminated HCV spontaneously; b) 45 Chronic

Hepatitis C (CHC) with active HCV infection; c) 35 PWH without previous HCV infection, as a control group. Frequencies, activation (middle activation: CD25+HLADR+; late activation: CD38+HLADR+) and senescence (CD57+PD1+) levels of CD4 and CD8 T lymphocytes were measured by spectral cell cytometry. Additionally, soluble IC levels were measured by immunoassay. Differences between groups were evaluated using a GAMLSS model adjusting by age, infection time and baseline clinical stage, with statistical cut-off  $p$ -value  $< 0.05$  and  $q$ -value  $< 0.2$ .

**Results:** Our population median age was 50 years, with 55% males. SC group had a better immune profile than HIV group, with a healthier T lymphocytes compartment, having lower counts of more mature subpopulations like TEMRA both CD4 and CD8, and a generalized reduction of senescence, especially in CD4 Effector Memory (EM) (40% reduction) and CD4t (35% reduction). Also SC had reduced levels of 6 IC, highlighting a reduction of 25% of E-cadherin and TIM-3. In addition, SC group showed a better immune status compared to CHC, having higher counts of CD4t and less mature subpopulations like CD4 EM Th0-1, lower late activation in several subpopulations like CD8 TEMRA and CD8 EM, and decreased levels of 15 IC. Finally, CHC group showed lower levels of middle activation in CD8 increased levels of 10 IC compared to HIV.

**Conclusions:** -SC immune system strengths allow to maintain a healthier immune profile, with lower senescence and activation, reducing the risk of developing age-associated comorbidities.

-CHC group has a worse immune profile than SC, however their T lymphocytes status has no major differences with the HIV group.

Giacoia-Gripp<sup>1</sup>, D.V. Almeida<sup>1</sup>, F.H. Côrtes<sup>1</sup>, M.G. Morgado<sup>1</sup>

<sup>1</sup>Instituto Oswaldo Cruz, Laboratório de AIDS & Imunologia Molecular, Rio de Janeiro, Brazil, <sup>2</sup>Instituto Nacional de Infectologia Evandro Chagas, Laboratório de Pesquisa Clínica em IST e Aids, Rio de Janeiro, Brazil, <sup>3</sup>Centro de Desenvolvimento Tecnológico em Saúde, Rio de Janeiro, Brazil

**Background:** Severe COVID-19 presents a broad spectrum of clinical manifestations associated with a highly inflammatory profile, including cytokine storm, and deregulation of lymphocyte subsets. Depending on the immunosuppression levels, a higher risk of hospitalization and mortality has been described for COVID-19 in people

living with HIV (COVID/PLWH). This study describes clinical and inflammatory markers in COVID-19 clinical outcomes with and without HIV.

**Methods:** The study analyzed 134 inpatients of the Hospital Center for COVID-19 (INI/FIOCRUZ), including 22 cases of COVID/PLWH, stratified according to the severity profiles during hospitalization. Plasma samples were tested for a panel of 15 cytokines by Luminex. Sociodemographic, clinical, and laboratory data were obtained from the patient's clinical records. The Mann-Whitney U-test and Fisher's exact test were performed in the analyses.

**Results:** Among the individuals analyzed, 59.7% were discharged and 40.3% died during the hospital stay. Most of them (76.7%) were classified as having WHO severity scores of 6-8 (severe) and 9-10 (critical). The levels of IL-8 ( $P=0.0002$ ), IL-10 ( $P=0.0012$ ), TNF- $\alpha$  ( $P<0.001$ ), IFN- $\alpha$  ( $P=0.0002$ ), IL-1 $\beta$  ( $P=0.0093$ ), IL-17A ( $P=0.0010$ ), and IL-23 ( $P=0.0064$ ) were higher among individuals with critical COVID-19 than those individuals with severe COVID-19. Besides that, the levels of IL-8 ( $P=0.0030$ ), IL-10 ( $P=0.0191$ ), TNF- $\alpha$  ( $P=0.0022$ ), IFN- $\alpha$  ( $P=0.0020$ ), IL-1 $\beta$  ( $P=0.0060$ ), and IL-6 ( $P=0.0083$ ) were higher among individuals with critical COVID-19 than those individuals with moderate COVID-19 independent of the HIV-associated infection. It is of note that the COVID/PLWH individuals included in our cohort showed CD4 counts of 64 cells/mm<sup>3</sup> (IQR=239), CD8 counts of 514 cells/mm<sup>3</sup> (IQR=351), and a viral load median of 92,151 copies/mL (IQR=628649.75). Individuals with COVID-19 showed significantly elevated levels of IL-1 $\beta$  ( $P<0.0001$ ), IL-8 ( $P=0.0241$ ), IL-10 ( $P=0.0373$ ), IL-17A ( $P<0.0001$ ), IL-17F ( $P=0.0404$ ), IL-23 ( $P=0.0003$ ), TNF- $\alpha$  ( $P<0.0001$ ), and IFN- $\alpha$  ( $P=0.0010$ ) compared with the COVID/PLWH individuals. Regarding comorbidities, only systemic arterial hypertension ( $P=0.012$ ) and active tuberculosis ( $P=0.001$ ) had a difference between the COVID/PLWH and COVID-19 groups.

**Conclusions:** A higher inflammatory profile was observed in our cohort according to the severity of COVID-19 independent of the HIV-associated infection. No difference in mortality was observed between the COVID-19 and COVID/PLWH groups. Tuberculosis was more frequent in the COVID/PLWH group.

Magnitude of food insecurity and associated factors among hiv infected women of reproductive age on art services: in Debre Markos town public health facilities, Northwest Ethiopia, 2021

G.G. Engida<sup>1</sup>, D. Jara<sup>1</sup>, A. Negese<sup>1</sup>, Y. Kassaw<sup>2</sup>

<sup>1</sup>Debre Markos University, Public Health, Debre Markos, Ethiopia, <sup>2</sup>Debre Markos Health Center, ART, Debre Markos, Ethiopia

**Background:** Women are the most affected group by the parallel epidemics of HIV and food insecurity, because of sex discrimination, poverty, and the absence of support as head of household and their primary role is within families in preparing food and feeding families. However, there are some studies done on adult HIV-positive clients that documented the prevalence of food insecurity and associated factors. Still, there are no studies disaggregated by sex for women that show the magnitude and factors of food insecurity specifically in HIV-positive women in Ethiopia.

**Methods:** A cross-sectional study design was conducted at Debre Markos town public health facility from September to October 2020. A total of 406 participants were selected by computer-generated Excel simple random sampling method. Secondary data were collected from the patient's ART record card. Data were collected using a Structured and pre-tested questionnaire to collect sociodemographic, clinical, behavioral, mental health, and nutrition-related data. Data was first coded and entered by Epi data version 3.1 and exported to SPSS Version 25 for further recording, cleaning, and finally analysis. The model fitness was checked by using the Hosmer and Lemeshow goodness of fit test. Analysis done by Binary logistic regression and variables shows a significant association  $P$  value  $< 0.05$  entered to multiple logistic regression to assess the effect of the various factors on food insecurity with statistical tests at  $P < 0.05$  will be considered as significant by using adjusted odds ratio.

**Results:** The prevalence of food insecurity among HIV-infected women in Debre Markos town Public health facility was 42.1% (95% CI (37.5-46.5)). This study identified that factors found to be associated with food insecurity among HIV-positive women were: -education of women who are unable to read and write AOR: 2.53 (95% CI (1.59-4.03)), depression AOR 1.88, 95% CI, (1.18-3.01). and opportunistic infections AOR: 1.64, 95% CI (1.07-2.52) were some of the factors significantly associated with food insecurity.

**Conclusions:** Magnitude of food insecurity among HIV-positive women in Debre Markos town Public health facility was 42.1% with 95% CI (37.5-46.5). Thus, Policymakers and the Ministry of Health need to work collaboratively and plan for decreasing the number of food insecure women in a comprehensive manner with ART.

**Background:** Antiretroviral therapy (ART) has reduced incident TB, HIV-related deaths, and increased longevity in developed settings. However, people with HIV (PWHIV) in developing settings continue to die at higher rates and younger ages than seronegative peers. Accurate causes of death (CoD) determination in virally suppressed (VS) PWHIV in developed settings are poorly reported but needed to improve ART outcomes. We compare CoD in adults admitted to internal medicine wards by VS status.

**Methods:** We included PWHIV,  $\geq 18$ -years who died at Tshepong Hospital, South Africa whose next-of-kin provided consent, who had viral load (VL) prior to death and autopsy within 16 hours. VS was VL  $\leq 400$  copies/ml. Three internists reviewed hospitalization records. Multi-organ tissue samplings were examined by a pathologist. Thereafter, using standardised clinicopathological conferences, immediate, contributing and underlying CoD were determined by consensus according to ICD-10; HIV diagnosis was an underlying CoD in all.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

**Results:** We approached 172 next-of-kin from May 2018 -April 2022; 59 provided consent, 38(64,4%) VS and 21 unsuppressed; respectively, 19(50%) vs 7(33,3%) were women; median age(years):55(IQR:44-61) vs 42(IQR:30-50) and median CD4 count(cells/ $\mu$ l) at death or <12 months:180(IQR:79.5-370) vs 42(IQR:15-139). In VS, median duration of ART was 107.5 months(IQR:31.5-232.5). Over half VS had immune failure and advanced HIV disease(AHD). The prevalence of some CoD differed markedly by viral suppression (Table 1). Leading causes of death are listed(tables 1 and 2).

	Suppressed (N=38) (%)	Unsuppressed (N=21) (%)	Odds Ratio (95% Confidence Interval)
Hypertension	9 (23,7)	5 (23,8)	0.99 (0.28 to 3.47)
Fatty liver disease	5 (13,2)	5 (23,8)	0.49 (0.12 to 1.92)
Tuberculosis	4 (10,5)	5 (23,8)	0.38 (0.09 to 1.59)
Malignant tumours	9 (23,7)	1 (4,8)	5.33 (0.62 to 45.99)
Iron overload	0 (0)	6 (28,6)	0.03 (0.0016 to 0.58)

Table 1: Underlying causes of death with their odds ratios for risk of death from lead causes of death in suppressed compared to unsuppressed decedents.

**Conclusions:** Causes of death were similar in VS and unsuppressed decedents (Table 2). Despite successful ART, immune failure and AHD was frequently observed at time of death, likely due to delayed ART initiation and inadequate adherence. Urgent interventions are needed to address premature mortality through earlier ART commencement at higher Cd4 counts.

	Suppressed (N=38) (%)	Unsuppressed (N=21) (%)	Odds Ratio (95% Confidence Interval)
Respiratory failure <sup>#</sup>	9 (23,7%)	6 (28,6%)	0.78 (0.23 to 2.59)
Sepsis <sup>#</sup>	8 (21,1%)	5 (23,8%)	0.85 (0.24 to 3.04)
Septic shock <sup>#</sup>	2 (5,3%)	7 (33,3%)	0.11 (0.02 to 0.60)
Acute kidney Injury <sup>*</sup>	7 (18,4)	9 (42,9)	0.301 (0.09 to 0.99)
Bacterial Pneumonia <sup>*</sup>	9 (23,7)	6 (28,6)	0.78 (0.23 to 2.59)
Immunological failure <sup>*</sup>	7 (18,4)	2 (9,5)	2.15 (0.40 to 11.42)
Tuberculosis <sup>*</sup>	5 (13,2)	3 (14,3)	0.91 (0.19 to 4.25)
Gastro-enteritis <sup>*</sup>	4 (10,5)	4 (19,0)	0.50 (0.11 to 2.25)

Table 2: Immediate<sup>#</sup> and contributing<sup>\*</sup> causes of death with their Odds ratios for risk of death from lead causes of death in suppressed compared to unsuppressed decedents

## EPB014

### Hospitalization patterns and risk factors among people living with HIV in Luzhou, China (2013-2022): a call for targeted interventions

J. Chen<sup>1</sup>, H. Chen<sup>2</sup>, T. Xiao<sup>2</sup>, X. Chen<sup>1</sup>, R. Chen<sup>1</sup>, A. Li<sup>1</sup>, F. Huang<sup>3</sup>, Y. Chen<sup>4</sup>, S. Fan<sup>1</sup>

<sup>1</sup>School of Public Health, Southwest Medical University, Luzhou, China, <sup>2</sup>Luzhou Center for Disease Control and Prevention, Luzhou, China, <sup>3</sup>Department of Infectious Diseases, Affiliated Hospital of Southwest Medical University, Luzhou, China, <sup>4</sup>School of Nursing, Southwest Medical University, Luzhou, China

**Background:** Despite advances in HIV management, hospitalization remains crucial for people living with HIV (PLWH). This study investigated hospitalization patterns in Luzhou, China, from 2013 to 2022, aiming to understand trends, differentiate AIDS-related vs. non-AIDS-related cases, and identify risk factors. This knowledge is vital for developing targeted interventions to reduce hospitalizations in high-risk PLWH.

**Methods:** A retrospective cohort study analyzed data from 5,265 PLWH with hospitalization records and engaged in comprehensive HIV care in Luzhou. Descriptive statistics and Poisson regression were used to analyze hospitalization types, distributions, and risk factors.

**Results:** Among 12,936 PLWH enrolled, 5,265 were hospitalized (72.9% male). Notably, the proportion of hospitalized patients with CD4 counts <200 cells/ $\mu$ L increased from 11.1% in 2013 to 26.2% in 2022, and the hospitalization rate rose from 0.92 to 12.24 per 100 person-years. Heterosexual transmission was the main risk factor for HIV acquisition (95.7%). Of the hospitalizations, 994 were for AIDS-related conditions and 4,271 were non-AIDS-related. Notably, 34.8% of AIDS-related cases involved CD4 counts  $\leq$ 200, compared to non-AIDS-related cases.

Non-AIDS-related conditions accounted for 81.1% of hospitalizations, with respiratory (14.2%), gastrointestinal (12.9%), and unspecified symptoms (12.9%) being the most common. AIDS-related admissions (18.9%) were primarily due to respiratory illnesses (40.5%) and specific infectious/ parasitic diseases (32.0%).

Multivariable analysis showed that individuals with CD4 counts >200 had lower risks of all-cause, AIDS-related, and non-AIDS-related hospitalizations compared to those with  $\leq$ 200 counts (IRRs: 0.68, 0.43, and 0.77, respectively). Patients with two comorbidities had a higher risk of AIDS-related hospitalization than those with three or more (IRR: 0.78). Hospital stays of 7-14 days were associated with higher risks of non-AIDS-related admissions compared to <7 days and  $\geq$ 14 days (IRRs: 1.61 and 1.80, respectively), while stays  $\geq$ 14 days had a higher risk of AIDS-related admissions compared to <7 days (IRR: 1.80).

**Conclusions:** Non-AIDS-related events remain the primary driver of hospitalizations in PLWH. Studying hospitalization patterns in PLWH provides valuable insights for

prevention, healthcare utilization, and managing HIV and comorbidities in inpatient settings. Targeted interventions should focus on strengthening preventive measures, enhancing treatment and prevention adherence, improving patient compliance, and reducing non-AIDS-related hospitalizations.

## EPB015

### Plasma proteomic signature of HIV death: a nested case-control study

J. He<sup>1</sup>, H. Lin<sup>2</sup>, X. Chen<sup>2</sup>, N. He<sup>2</sup>

<sup>1</sup>Jiayu He, Department of Epidemiology, Shanghai, China,

<sup>2</sup>Fudan University, Department of Epidemiology, Shanghai, China

**Background:** Antiretroviral therapy is shifting the primary driver of mortality for people with HIV (PWH) from opportunistic infections to noncommunicable chronic diseases (NCDs). Protein biomarkers differentiating AIDS-related and NCDs-related deaths may help early and precise risk prediction and intervention of death for PWH.

**Methods:** The prospective Comparative HIV and Aging Research in Taizhou (CHART) cohort with 2608 HIV-positive and 5414 HIV-negative participants had reported 144 HIV deaths during 2017-2022. In this nested case-control study, 126 HIV deaths, 162 age-sex-matched HIV survivors and 152 HIV-negative controls were analyzed with 92 protein biomarkers of the Olink Organ Damage panel by proximity extension assays (PEA). LASSO regression model, logistic regression model and ROC curve were applied to determine candidate protein biomarkers for predicting AIDS-related and NCDs-related deaths.

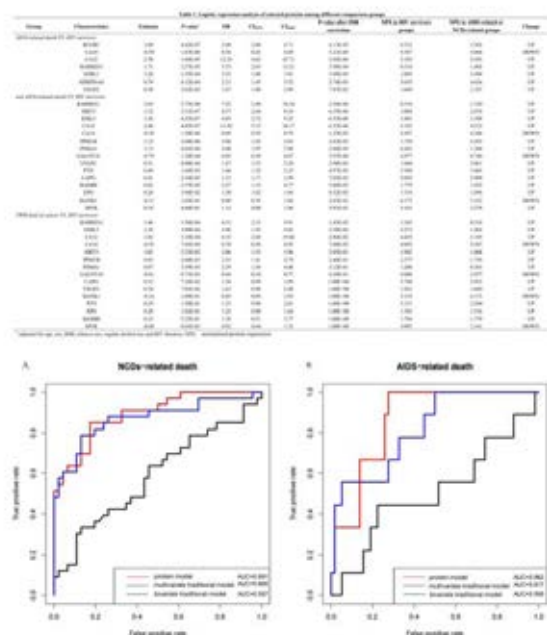

Figure 1. Results on candidate biomarkers. ROC curve of prediction values for different logistic regression models. (A) The ROC curve is differentiating non-AIDS-related deaths from the AIDS-related deaths. (B) The ROC curve is differentiating AIDS-related deaths from the non-AIDS-related deaths. The legend indicates four models: protein model (red line), LASSO model (blue line), multivariate model (black line), and multivariate model including the variables of age, gender, and CD4 (grey line).

**Results:** Thirteen proteins were associated with HIV death, of which seven (SIRT5, PPM1B, PSMA1, GALNT10, VEGFC, PTN, CAPG) were specifically associated with NCDs-related death, two (RCOR1, SERPINA9) were specifically associated with AIDS-related death, and four (CA12, CA14, RARRES1, EDIL3) were associated with both NCDs-related and AIDS-related deaths. The adjusted protein panel well predicted NCDs-related death (AUC=0.891) or AIDS-related death (AUC=0.862) in PWH, respectively.

Several biological pathways were enriched for HIV death, including the one-carbon metabolic process and response to hypoxia. The selected proteins also displayed a significant correlation with traditional biomarkers of NCDs among PWH ( $P<0.05$ ).

**Conclusions:** A distinct panel of plasma protein biomarkers may help identify PWH at high risk of AIDS-related or NCDs-related death. The potential clinical utility of these biomarkers warrants further investigation, which could also shed light on pathogenesis of end-stage organ dysfunction in PWH.

## EPB016

### Implementation of continuous quality improvement to reduce viral load and early infant diagnosis turnaround time in Nigeria

J. Nwofe<sup>1</sup>, E. Ojo<sup>1</sup>, P. Chima<sup>2</sup>, A. Ani<sup>2</sup>, D. Offie<sup>3</sup>, C. Basil<sup>4</sup>, O. Ogunlade<sup>4</sup>, F. Owolagba<sup>1</sup>, E. <sup>1</sup>APIN Public Health Initiatives, Laboratory Services, Abuja, Nigeria, <sup>2</sup>APIN Public Health Initiatives, Laboratory Services, Makurdi, Nigeria, <sup>3</sup>APIN Public Health Initiatives, Laboratory Services, Akure, Nigeria, <sup>4</sup>APIN Public Health Initiatives, Laboratory Services, Osogbo, Nigeria, <sup>5</sup>US Centers for Disease Control and Prevention Nigeria, Laboratory Services, Abuja, Nigeria, <sup>6</sup>US Centers for Disease Control and Prevention Nigeria, Strategic Information and Health Informatics, Abuja, Nigeria, <sup>7</sup>US Centers for Disease Control and Prevention Nigeria, Laboratory Branch, Abuja, Nigeria, <sup>8</sup>US Centers for Disease Control and Prevention Atlanta, Strategic Information and Bioinformatics, Georgia, United States, <sup>9</sup>US Centers for Disease Control and Prevention Atlanta, Laboratory Services, Georgia, United States

**Background:** WHO has recognized virological markers (Viral Load Result) as a gold standard for monitoring treatment response in persons living with HIV. However, there is always a delay in having the results timely for client management. In 2019, the turnaround time (TAT) for HIV Viral load (VL) and Early Infant Diagnosis (EID) testing in Nigeria averaged 39 days as compared to the National goal of  $\leq 10$  days. This study aimed at using continuous quality improvement to reduce the turnaround time of VL and EID in selected Health facilities supported by APIN with PEPFAR funding through the CDC.

**Methods:** We used a continuous quality improvement (CQI) approach focusing on strengthening the Laboratory Interface and processes across the VL/EID cascade. Baseline data were collected monthly between January and April 2021.

We conducted training, Go and see process mapping, and implementation periods between May and August 2021. Endline data were collected from September 2021 to March 2022. The fishbone analysis and the 5 Whys were used to identify root causes for prolonged turnaround time. Contextually appropriate change ideas were identified using a driver diagram and prioritized using an impact-effort matrix. Identified change ideas were tested using the Plan-Do-Study-Act (PDSA) cycles from the Model for Improvement. VL and EID TAT were tracked throughout implementation using run charts.

**Results:** At baseline, 15,226 VL data was retrieved, and 4870 (32%) have complete data. 2289 (47%) met the target of  $\leq 10$  days. 511 EID results were retrieved, 306 (60%) have complete data 119(39%) met the target of  $\leq 10$  days. At the end-line, 65,723 VL results were retrieved, and 64,409 (98%) had complete data. 41,866 (65%) met the target of  $\leq 10$  days. 8746 EID data were retrieved 7959 (91%) had complete data. 3741 (47%) met the target of  $\leq 10$  days. Root causes for long TAT included frequent breakdown of equipment and frequent stockout of reagents.

**Conclusions:** A CQI approach improved VL and EID TAT, through the implementation of contextualized change ideas across the laboratory interface and processes. However, the changes were not sustainable because the facility has no control over some of the factors responsible for long TAT such as equipment breakdown and stock-out of reagents.

OVC Service, Addis Ababa, Ethiopia, <sup>10</sup>St. Paul Hospital, ART

Focal, Addis Ababa, Ethiopia

**Background:** Unsuppressed viral load leads to a higher case fatality rate among children and adolescents living with HIV (CALHIV's) and increases transmission of HIV, making it difficult to achieve UNAIDS objectives and

sustainable development goals. The aim of the quality improvement initiative was to improve viral load re-suppression of CALHIV from 24 to 5 during the QI initiative period at St. Paul Hospital, Addis Ababa City Administration, Ethiopia.

**Methods:** After the quality Improvement (QI) collaborative team established at the community and health facility, QI training was provided for QI collaborative team members. The QI team identified that there were 24 CALHIV with high viral load, which constituted about 15% of all CALHIV in the hospital. The QI team had followed these CALHIV for 28 months (November 2021 to September 2023). Applying QI principles, the team conducted the root causes analysis, generated change ideas using driver diagrams, and tested of change ideas using Plan-Do-Study-Act cycles. A run chart was used to assess changes over time.

**Results:** Following the implementation of the QI initiative, the high viral load of CALHIV improved from 24 to 4, indicating that about 87.5% of CALHIV with a high viral load were suppressed during the QI initiative. The remaining four were switched to second-line ART, and their status was being monitored. The run chart showed a shift on 11 consecutive data points below the median after the QI initiative which indicates a significant improvement.

Figure. Run chart of quality improvement project on OVC\_VL\_Re-suppression at Gulele Sub-City, Ethiopia.

**Conclusions:** High viral load re-suppression among CALHIV at St. Paul Hospital significantly improved as a result of the QI initiative. Quality improvement initiative integrated into clinical settings can effectively improve CALHIV outcomes and care quality in resource limited setting.

### Identifying factors related to unsuppressed viral load among people living with HIV

J. Manalel<sup>1</sup>, J. Kaufman<sup>1</sup>, C. Brandenburg<sup>2</sup>,  
L. Scaccabarozzi<sup>2</sup>, J. Ernst<sup>2</sup>, M. Brennan-Ing<sup>1</sup>

<sup>1</sup>Hunter College, Brookdale Center for Healthy Aging, New York, United States, <sup>2</sup>Amida Care, New York, United States

**Background:** Suppression of HIV viral load is a prime target of many initiatives aimed at reducing HIV prevalence. In addition to the public health impact of viral suppression among people with HIV (PWH), which is based on the idea that "undetectable = untransmittable", there are numerous individual health and well-being benefits to viral suppression. The purpose of this study was to 1) identify patterns of viral suppression over four years, and 2) determine the association of these viral suppression patterns with demographic characteristics.

**Methods:** This study involved a retrospective chart review and analysis of 2,677 adult members of a managed care plan who were continuously enrolled from 2016 through 2019 and who were HIV positive.

**Results:** Using cluster analysis, five distinct viral suppression patterns were identified: unsuppressed (n = 401), became unsuppressed (n = 331), suppression fluctuated (n = 426), became suppressed (n = 314), and consistently suppressed (n = 1,205). In multivariate analyses, PWH aged 30 to 49 (OR = .45, p < .001) and aged 50 and older (OR = .40, p < .001) were less likely to be consistently unsuppressed than young adults aged 18 to 29. Compared to non-Hispanic White individuals, PWH who were non-Hispanic Black (53% of the sample) more likely to become suppressed (OR=1.90, p < .05), become unsuppressed (OR=1.40, p < .01), and be consistently unsuppressed (OR = 4.28, p < .01). Hispanic PWH also had greater odds of being consistently unsuppressed (OR = 2.51, p < .01). In terms of gender identity, PWH who were transgender or gender diverse had a greater likelihood of being in the fluctuating viral load group compared to cisgender (male or female) PWH (OR = 1.94, p < .01).

**Conclusions:** From a practical standpoint, demographic information is useful in identifying groups at risk for unsustained viral suppression, namely young adults, people who are non-Hispanic Black and Hispanic, and those who identify as transgender or gender diverse. These findings are consistent with other research on social determinants of health among PWH, and future research should examine how to reduce barriers to accessing healthcare and medications for these groups.

## EPB019

### Baseline HBsAg quantitative and CD4 cell counts are predictive factors for HBsAg loss in people living with HIV/HBV coinfection

M. Xia<sup>1</sup>, X. Lin<sup>1</sup>, Y. Zhao<sup>1</sup>, T. Yu<sup>1</sup>, G. Liao<sup>1</sup>, Y. Jiang<sup>1</sup>, J. Mao<sup>1</sup>,  
S. Cai<sup>1</sup>, J. Peng<sup>1</sup>

<sup>1</sup>Nanfang Hospital, Southern Medical University, Department of Infectious Diseases, Guangzhou, China

**Background:** Achieving Hepatitis B surface antigen (HBsAg) loss is a significant goal for chronic hepatitis B individuals. This study aims to evaluate HBsAg loss in people living with HIV/HBV coinfection and explore the association of clinical variables with this outcome.

**Methods:** We enrolled 138 subjects with HIV/HBV coinfection from a prospective cohort (ChiCTR2200064212). Additionally, we retrospectively included 480 HBV mono-infected individuals who initiated antiviral treatment for the first time. We employed Kaplan-Meier analysis to compare the rate of HBsAg loss between individuals with HIV/HBV coinfection and those with HBV mono-infection. In the prospectively followed HIV/HBV coinfection cohort, we used Cox proportional hazards models to assess the association between various factors and the incidence of HBsAg loss.

**Results:** The cumulative HBsAg loss rate was higher among people living with HIV/HBV coinfection (13 patients, 11.5% at year 3) compared to HBV mono-infected patients (1 patient, 0.6%). In the HIV/HBV coinfection cohort, the multivariable analysis revealed that a lower baseline HBsAg level (HR 0.53; 95% CI 0.38-0.74, p<0.001) and baseline CD4 cell counts < 180 cells/uL (HR 0.32; 95% CI 0.10-0.96, p=0.042) were associated with an increased risk of HBsAg loss. Additionally, the receiver-operating characteristic curve analysis indicated an area under the curve of 0.771 for baseline HBsAg levels and 0.758 for baseline CD4 cell counts at year 1 in predicting HBsAg loss.

**Conclusions:** After antiretroviral therapy, people living with HIV/HBV coinfection achieve higher rates of HBsAg loss. Baseline HBsAg quantitative levels and CD4 cell counts are predictive factors for HBsAg loss in people living with HIV/HBV coinfection and can inform treatment decisions.

## EPB020

### Assessing the burden of advanced HIV disease and mortality among people living with HIV who are treatment naïve and treatment experience: a quantitative study from Nigeria HIV Program

J. Nwofe<sup>1</sup>, M. Odido<sup>2</sup>, A. Henshaw<sup>3</sup>, T. Omole<sup>2</sup>, O. Amali<sup>4</sup>, M. Onyenike<sup>5</sup>, S. Bodunrin<sup>6</sup>, J. Ogaga<sup>7</sup>, K. **Background:** Antiretroviral treatment (ART) has been massively scaled up to decrease HIV-related morbidity, mortality, and HIV transmission. However, despite documented increases in ART coverage, morbidity and mortality have plateaued since 2014 in Nigeria because a significant proportion of individuals present to care with advanced HIV disease (AHD).

We evaluated the burden of advanced HIV diseases among treatment naïve and treatment-experienced people living with HIV/AIDS and mortality in APIN-managed facilities with support from US-CDC through PEPFAR funding.

**Methods:** A multicenter retrospective study of AHD package of care implementation in 334 treatment sites across APIN-supported states in Nigeria. Persons newly diagnosed with HIV and Clients who returned to care (RTT) after interrupting treatment for at least 90 days and those with unsuppressed viral load for >1 year of treatment between October 2021 and September 2023 who were pro-

vided with complete AHD package of care were assessed. Data was exported from the register to Excel and analyzed using SAS version 9.4. The cause of death was established using the WHO verbal Autopsy standard checklist.

**Results:** 65,714 were screened for CD4, 1315(2%) were RTT, 329(0.5%) were viral unsuppressed. Among treatment naïve, 14,540 (22%) had CD4 below 200 cells/mm<sup>3</sup>. 8987 (62%) were screened for TB using the Abbott Urine Lipoarabinomannan kit, and 1881 (21%) were diagnosed with TB and were started on treatment. 7421(51%) were screened for Cryptococcal infection using Immy Cryptococcal Antigen lateral flow assay, 145(2%) were diagnosed with Cryptococcal infection. 13(30%) were diagnosed with Cryptococcal Meningitis.

Among treatment experience, 720(44%) are AHD. Mortality surveillance was carried out for 671 clients, 320(48%) died of HIV, Malaria 127(19%), chronic diseases 76(11%), Myocardial infarction 20(3%), Pneumonia 20(5%), Cancers 7(1%), Maternal 7 (1), road traffic 47(7%), Other infectious diseases 13(2%), undetermined 34(5%).

**Conclusions:** Advanced HIV disease is still high among individuals newly diagnosed with HIV and contributes to AIDS-related death. HIV-associated morbidity is also largely from treatment-experienced clients not being in continuous care or not being fully virologically suppressed. Screening for persons affected with HIV for opportunistic infection and associated illnesses before ART initiation and when in treatment should be a global focus to reduce HIV-related mortality and achieve epidemic control.

## EPB021

### Lipoarabinomannan urinary antigen (uLF-LAM) and MTB/RIF Xpert Ultra tests for the diagnosis of tuberculosis in PLWH in a tertiary public hospital in Colombia

E. Martinez-Buitrago<sup>1</sup>, E. Gartner<sup>1</sup>, S. Manrique<sup>1</sup>, J.E. Álvarez-Payares<sup>1</sup>, M. Murillo<sup>2</sup>, L. Matta<sup>1</sup>

<sup>1</sup>Universidad del Valle, Internal Medicine, Cali, Colombia,

<sup>2</sup>Hospital Universitario del Valle, Clinical Laboratory, Cali, Colombia

**Background:** Urine lateral-flow lipoarabinomannan assay (uLF-LAM Determine, Abbott) has been used alone and in combination with Xpert® MTB/RIF Ultra (Xpert, Cepheid, Sunnyvale, CA, USA) for the diagnosis of tuberculosis in PLWH, with good diagnostic performance, mostly in African countries, with very scanty reports in Latin America. WHO has prioritized its implementation as a strong recommendation. No experiences have been reported with the use of uLF-LAM and Xpert in combination in Latin America.

Our objective is to determine the diagnostic performance of uLF-LAM alone or in combination with TB Xpert in a public tertiary care hospital in Colombia, a country with a high burden of both HIV and TB.

**Methods:** This is a prospective longitudinal study at the Hospital Universitario del Valle in Cali, Colombia, in which we included consecutive adults living with HIV who were admitted with clinical suspicion of pulmonary or extrapulmonary tuberculosis to the emergency department. After Informed consent was obtained all participants had uLF-LAM and, when possible, respiratory sample for TB-Xpert Ultra. A laboratory-confirmed diagnosis of tuberculosis required a positive culture or TB-Xpert.

**Results:** We enrolled 138 patients between April 2021 and April 2023, 70.4% men, had a median age of 38 years (IQR: 30-47), and 51.4% (n=71) were newly diagnosed with HIV. The CD4+ LT cell count was 41 cells/mm<sup>3</sup> (IQR: 18-119). Urine LF-LAM was positive in 46/138 patients (33.3%), TB-Xpert in 39/132 (29.5%), respiratory AFB smear in 26/138 (19%) and culture in 35/139 (25.4%). A total of 60 cases of tuberculosis were identified, with 43% (n=26) pulmonary. The sensitivity and specificity for urine LF-LAM, were 60 and 76%. LT-CD4+ <100 cells/mm<sup>3</sup> yielded a higher S than in >100 (65 vs 53%). See figure for more test performance results.

**Conclusions:** Urine LF-LAM is a simple, rapid, and point-of-care test that contributes to a prompt TB diagnosis in PLWH in Latin America similar as shown in Subsaharian African countries, and when combined with respiratory Xpert, will result in almost all TB patients being diagnosed expeditely.

### HCV, HBV and syphilis infections incidence among people living with HIV in a Thai cohort

H.M.S. Lwin<sup>1</sup>, T. Nochaiwong<sup>1</sup>, T. Apornpong<sup>1</sup>, W.M. Han<sup>1,2</sup>, S. Gatechompol<sup>1,3</sup>, S.J. Kerr<sup>1,2,4</sup>, A. Avihingsanon<sup>1,3</sup>  
<sup>1</sup>HIV-NAT, Thai Red Cross AIDS Research Center, Bangkok, Thailand, <sup>2</sup>The Kirby Institute, University of New South Wales, Sydney, Australia, <sup>3</sup>Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand, <sup>4</sup>Biostatistics Excellence Centre, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand

**Background:** Sexually transmitted infections (STIs) are major public health issues worldwide. Emerging evidence suggests a rising prevalence of hepatitis C virus (HCV), hepatitis B virus (HBV) infections and other STIs among young men who has sex with man (MSM) living with HIV. Our study investigated the incidence rates of HBV, HCV and Syphilis infections over time in our cohort.

**Methods:** We conducted a longitudinal cohort study of people living with HIV aged ≥18 years who underwent regular STI screening at The HIV Netherland-Australia-Thailand Research Collaboration from 2010-2023. HCV (HCV antibody and/or HCV RNA), HBV (HBs Ag and/or HBc antibody/antigen) and Syphilis (*Treponema pallidum* antibody and/or VDRL test) were performed as screening tests in our clinic annually. A positive test result was defined as an incident infection. We excluded those with positive tests at baseline and who did not have follow-up testings. We assessed incidence rates of HBV, HCV and syphilis infections. Cox-regression was performed for each STI.

**Results:** Of three thousand and fifty-eight participants (3058) in our cohort, 70.3% were male, and 38.2% were men who have sex with men (MSM). Median age was 32 (interquartile range (IQR) 26-39) years and only 3.3% (N=102) self-reported substance use. The overall incidence rate of HCV, HBV or syphilis was 2.92 (95% confidence interval 2.65-3.21) per 100 persons year follow-up (PYFU). In MSM, the incidence rate 7.26 (95%CI 6.42-8.20) per 100 PYFU. For multivariable analysis, Incidence rates of each individual infection were higher in MSM compared to heterosexual men and women, adjusted hazard ratio (aHR) for HCV, HBV and syphilis of 3.09 (95%CI 2.00-4.78; p<0.001), 1.83 (95%CI 1.22-2.74, p=0.003) and 2.88 (95%CI 1.63-5.10); p<0.001) respectively.

**Conclusions:** STIs incidence was significantly higher in MSM than heterosexual clients in our cohort. Regular screening and treatment for STIs should be implemented in prevention packages for young PLWH and high-risk population.

## EPB023

### Assessing the accessibility of diagnostics and prophylactic medications from the advanced HIV disease package of care in Uganda

G. Saemisch<sup>1</sup>, M. Liu<sup>1</sup>, D. Boulware<sup>1</sup>, R. Rajasingham<sup>1</sup>, D. Srishyla<sup>1</sup>, D. Meya<sup>2</sup>, F. Turya<sup>2</sup>, E. Nalintya<sup>2</sup>, O. Namakula<sup>2</sup>, P. Namuwenge<sup>3</sup>, C. Katureebe<sup>3,3</sup>

<sup>1</sup>University of Minnesota, Minneapolis, United States,

<sup>2</sup>Infectious Disease Institute, Kampala, Uganda, <sup>3</sup>Uganda Ministry of Health, Kampala, Uganda

**Background:** In 2017, The World Health Organization (WHO) published comprehensive guidelines outlining a package of care for persons with advanced HIV disease (AHD) to screen and prevent opportunistic infections. The AHD package of care includes diagnostic tools for common opportunistic infections such as cryptococcus and tuberculosis (TB) and prophylaxis to prevent such infections. Despite WHO guidelines recommending a package of care for AHD, concerns remain about its accessibility in resource-limited settings.

**Methods:** This study was a cross sectional assessment on the availability of the diagnostics and prophylaxis components of the WHO AHD package of care in Ugandan government healthcare facilities in 2019 and 2023. We collected clinic stock data through convenience sampling of government clinics (41 2019, 17 in 2023) using a standardized Microsoft Excel data capture tool.

Availability of key components (antiretroviral therapy (ART), TB lipoarabinomannan (TB-LAM), cryptococcal antigen (CrAg) lateral flow assay (LFA), cotrimoxazole, and fluconazole) served as the primary outcome. Secondary analysis explored temporal changes in access.

**Results:** First-line ART was universally available during 2019 and 2023, while other components showed marked significant increases between the two data collection periods: TB-LAM (23% to 94%,  $P<0.01$ ), Cotrimoxazole prophylaxis (28% to 100%,  $P<0.01$ ), and CrAg LFA (49% to 94%,  $P=0.03$ ).

**Conclusions:** Uganda has demonstrated significant improvement in the availability of diagnostics and prophylaxis associated with the WHO-recommended AHD package of care. Uganda implemented key interventions to improve access to the package of care including forming an AHD technical working group, updating HIV guidelines to include AHD screening and treatment, and expanding national supply chain data tools to include AHD commodities.

This model offers valuable lessons for other countries aiming to scale up AHD services and ending HIV as a public health threat by 2030.

<sup>1</sup>AIDS Healthcare Foundation Eswatini, Manzini,

Eswatini, <sup>2</sup>Center for Global Health Practice and Impact, Georgetown University, Mbabane, Eswatini

**Background:** Tuberculosis prophylactic treatment (TPT) treats latent TB (LTB) and is recommended for preventing active TB in high-risk groups. Left untreated, 5 – 10% of those with LTB can develop active TB disease. PLHIV are 20 times more likely to develop active TB than HIV-negative people. With an HIV prevalence in adults aged  $\geq 15$  years of 24.8% in Eswatini, the Eswatini Ministry of Health (MOH) adopted the WHO recommendations to treat all PLHIV with TPT at least once in their lifetime. A chart audit conducted at AHF LaMvelase, a specialized HIV facility with 15,000+ HIV clients, showed that only 61% of PLHIV had received TPT by September 2021. In March 2022, we implemented a quality improvement project (QIP) to increase TPT coverage to 90% within 12 months.

**Description:** A multidisciplinary QI team identified the root causes of low TPT uptake and developed change packages (Table 1) using the PDSA approach. Identified reasons for low TPT coverage are illustrated in Figure 1.

Figure 1: Root cause analysis

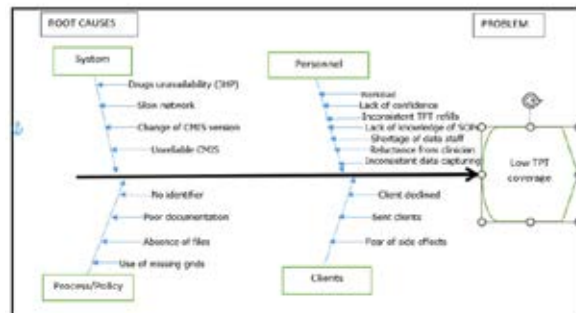

Table 1: Quality improvement objectives and action plan

Objectives	Key action steps	Person responsible	Timeline	Start date	End date
Improve TPT coverage and identification flagging	Training of Healthcare workers on TPT	Clinical lead	November 2021	November 2021	N/A
	Dissemination of SOPs	TB Focal Clinical lead	November 2021	November 2021	N/A
	Use of Service eligibility assessment stickers to identify clients who are not yet on TPT	Clinicians	January 2022	January 2022	Ongoing
	Actively update TPT status in the systems (APMR and CHS). Use the Service eligibility sticker as a flag	Data Clerk	January 2022	January 2022	Ongoing
Improve TPT initiation and documentation	Actively initiate clients on TPT in line with the guidelines, and document in the file, booklet, TPT initiation list, TPT register, CHS and service eligibility assessment sticker	Clinicians	January 2022	January 2022	Ongoing
	Document TPT initiation status in APMR, CHS. Collect the TPT initiation initiation list and register weekly, and update the system. Consistently document TPT completion in the booklet, file, TPT completion list, TPT register and CHS and the completion date on the Service eligibility assessment sticker	Data clerks	January 2022	January 2022	Ongoing
Improve the number of TPT completion	Consistently document TPT completion in the booklet, file, TPT completion list, TPT register and CHS and the completion date on the Service eligibility assessment sticker	TB Focal Clinicians	January 2022	January 2022	Ongoing
	Consistently collect TPT completion forms and update APMR and CHS (if not done by clinicians). Use the completion on the Service eligibility assessment sticker to update the system, and tick next to the date	Data clerks	January 2022	January 2022	Ongoing

**Lessons learned:** TPT coverage increased from 61% to 89% (Figure 2). The absence of identifiers to track eligible clients and the use of multiple documentation systems

hindered the identification of clients initiated on TPT. Limited client education and inconsistent documentation by clinicians and data clerks resulted in low TPT coverage.

**Conclusions/Next steps:** TPT stickers increased the identification of eligible clients, hence TPT initiation and coverage. Actively initiating clients on TPT, strengthening documentation with monthly tracking, continuous engagement with clinicians on the benefits of TPT, and client education are necessary to increase TPT initiation and coverage.

## EPB025

Increased soluble IDO and circulating Treg FoxP3+Helios+ could lead to a tolerogenic response in adults with low-level HIV viremia under long-term ART in the INSTI era

V. Lara-Aguilar<sup>1</sup>, Ó. Brochado-Kith<sup>1</sup>, M. Llamas-Adán<sup>1</sup>, C. Crespo-Bermejo<sup>1</sup>, S. Grande-García<sup>1</sup>, S. Arca-Lafuente<sup>1</sup>, I. De los Santos<sup>2,3</sup>, M. Alía<sup>1</sup>, M.C. Prado<sup>1</sup>, A. Fernández-Rodríguez<sup>1,3</sup>, R. Madrid<sup>4</sup>, L. Martín-Carbonero<sup>5,3</sup>, V. Briz<sup>1</sup>  
<sup>1</sup>Health Institute Carlos III, Majadahonda, Spain, <sup>2</sup>La Princesa University Hospital, Madrid, Spain, <sup>3</sup>Centro de Investigación Biomédica en Red de Enfermedades Infecciosas (CIBERINFEC), Madrid, Spain, <sup>4</sup>Complutense University, Madrid, Spain, <sup>5</sup>La Paz University Hospital, Madrid, Spain

**Background:** The clinical significance of low-level viremia (LLV) (50-200 copies/mL) during antiretroviral therapy (ART) remains unclear. Our objective was to evaluate the impact of LLV on the development of non-AIDS events, such as cancer, in people with HIV (PWH).

**Methods:** Prospective observational study in eighty-one individuals matched for clinical and epidemiological characteristics: i) n=27 PWH with LLV (50-200 copies/mL) (LLV); ii) n=27 PWH with suppressed viremia (<50 copies/mL) (SV); iii) n=27 non-HIV controls (NHC). Twenty-eight soluble immune checkpoint (IC) molecules related to cancer were assessed by immunoassays and regulatory T cells (Treg) subpopulations were characterized by spectral flow cytometry. Differences were evaluated using generalized linear models, adjusted by age, gender and ART. P values were corrected by false discovery rate (q<0.15).

**Results:** The median age was 53 years and 77.8% were male. The predominant ART was integrase inhibitors, accounting for 74% and 48% in the LLV and SV group, respectively. The LLV group showed significantly higher levels of indoleamine 2,3-dioxygenase (IDO) [aAMR=2.32 (1.27-4.24), p=0.008, q=0.118] (Figure 1A) and Treg CD4+CD25+FoxP3+Helios+ cell frequency compared to the SV group [aAMR=1.40 (1.13-1.73), p=0.003] (Figure 1C and B). Both PWH groups showed a significant increase in sICs compared to NHC (26 of 28 biomarkers in LLV vs NHC and 27 of 28 biomarkers in SV vs NHC), highlighting with aAMR>1.5 CD80, CD274 (PD-L1), PDCD1 (PD1), BTLA, TNFRSF9 (CD137), MICA, ULBP4, PRF1 (Perforin), ARG1 (Arginase-1), IDO, and LAG-3 (p<0.001, q<0.001) (Figure 1A).

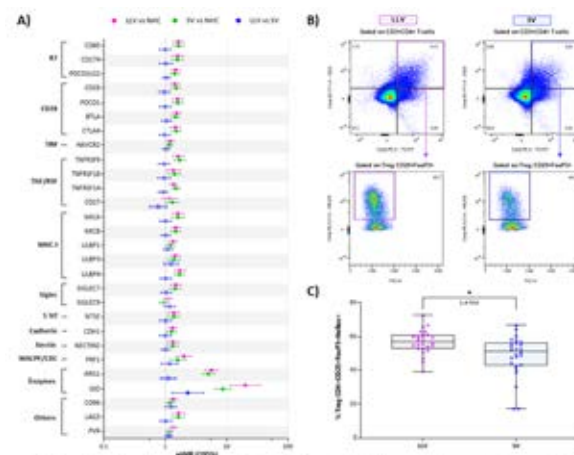

Figure 1. Comparison of immune biomarkers between study groups. A) Comparison of soluble immune checkpoints molecules between the three groups. B) Frequency of Treg cells in LLV and SV groups analyzed by spectral flow cytometry. C) Comparison of Treg frequency between LLV and SV groups. Data are the Arithmetic Mean Ratio was obtained by generalized linear model adjusted by age, gender and antiretroviral therapy. Statistically significant results are represented with filled symbols in \* (post SV and end SV) distributions. LLV: low-level viremia, SV: suppressed viremia, NHC: non-HIV controls, aAMR, Adjusted Arithmetic Mean Ratio, Treg, regulatory T cells.

**Conclusions:** Immune exhaustion produced by viral acquisition facilitated the expression of soluble ICs in both PWH groups. The LLV group showed an increase of the inhibitory molecule IDO that promotes Treg differentiation, which are upregulated. This suggests a higher immunosuppression and tolerogenic response that could increase the risk of comorbidities such as cancer.

These findings strongly advocate for heightened surveillance of these participants to promptly identify potential future complications.

## EPB026

### Association of antiretroviral therapy with cognition and resting-state functional connectivity in people with HIV

Jahanshad<sup>2</sup>, ENIGMA HIV Working Group

<sup>1</sup>University of Cape Town, Department of Psychiatry and Mental Health, Neuroscience Institute, Cape Town, South Africa, <sup>2</sup>University of Southern California, Imaging Genetics Center, Mark & Mary Stevens Neuroimaging & Informatics Institute, Keck School of Medicine, Marina del Rey, United States, <sup>3</sup>University of Maryland, Department of Diagnostic Radiology & Nuclear Medicine and Department of Neurology, School of Medicine, Baltimore, United States, <sup>4</sup>Johns Hopkins School of Medicine, Department of Neurology, Baltimore, United States, <sup>5</sup>University of Florida, Center for Cognitive Aging and Memory, Department of Clinical and Health Psychology, McKnight Brain Institute, Gainesville, United States, <sup>6</sup>University of Hawaii, Hawaii Center for AIDS, Honolulu, United States, <sup>7</sup>University of Hawaii, Department of Tropical Medicine, Medical Microbiology and Pharmacology, Honolulu, United States, <sup>8</sup>Kamehameha Schools - Kapālama, Honolulu, United States, <sup>9</sup>University of Cape Town, Department of Paediatrics & Child Health, Red Cross War Memorial Children's Hospital, Cape Town, South Africa, <sup>10</sup>South African Medical Research Council (SAMRC) Unit on Child and Adolescent Health, Cape Town, South Africa, <sup>11</sup>University of California, Los Angeles, David Geffen School of Medicine, Department of Family Medicine, Los Angeles, United States, <sup>12</sup>University of California, Los Angeles, Department of Psychiatry and Biobehavioral Sciences, Los Angeles, United States, <sup>13</sup>South African Medical Research Council (SAMRC) Unit on Risk and Resilience in Mental Disorders, Cape Town, South Africa

**Background:** Neurocognitive impairment still occurs in controlled HIV diagnosis with antiretroviral therapy (ART). However, it is unclear if and to what extent available treatments play a role in the observed neurocognitive changes.

We aimed to:

1. Examine group differences in cognition and resting-state functional connectivity (RSFC) of brain regions implicated in neuroHIV, and;
2. Examine the association between RSFC and cognition in 3 groups: controls, PWH on ART, and PWH not taking ART.

**Methods:** This was a retrospective, cross-sectional analysis of 569 participants from 4 sites within the ENIGMA HIV working group (USA and South Africa). Participants included controls (n=358), PWH on ART (n=188), and PWH not on ART (n=23). Analysis of variance (ANOVA) test was conducted to examine group differences in:

1. RSFC of the posterior cingulate cortex (PCC) with regions of interest (ROIs) implicated in neuroHIV (i.e., hippocampus, basal ganglia, lateral prefrontal cortex, and posterior parietal cortex (PPC)), and;
2. Global cognition, attention, and working memory performance. Multiple linear regression analysis was conducted to investigate the association between cognition in the 3 groups after controlling for age, sex, and education.

**Results:** There were no significant differences in the PCC RSFC with ROIs between the 3 groups. There was a significant difference in working memory Z scores between the 3 groups (ANOVA:  $p=0.049$ ), mainly between controls and PWH on ART. Increased PCC-Left caudate RSFC was positively correlated with higher scores in global cognition tests in all groups (Pearson's correlation test:  $r=0.19$ ,  $p=0.03$ ). Increased PCC-Left PPC RSFC was negatively correlated with lower scores in attention tests in all groups (Pearson's correlation test:  $r=-0.17$ ,  $p=0.03$ ). There was no significant association between performance on working memory tests and RSFC of the PCC and ROIs.

Performance in working memory was negatively correlated with taking ART (linear regression:  $p=0.05$ ) and positively correlated with length of education (Linear regression: secondary education,  $p=0.04$ ; university education,  $p=0.0002$ ).

**Conclusions:** In this sample, RSFC of ROIs was neither affected by HIV acquisition alone nor by HIV acquisition and taking ART. This may suggest that neurocognitive impairment in PWH may be attributed to aging rather than to HIV acquisition or treatment-related neurotoxicity.

## EPB027

### Cancer Risk in People Living with HIV (PLHIV) and Solid Organ Transplant Recipients (SOTR) – a systematic review and meta-analysis

F. Jin<sup>1</sup>, C.E. Vajdic<sup>1</sup>, IM. Poynten<sup>1</sup>, J.E. McGee-Avila<sup>2,3</sup>, P.E. Castle<sup>2,3</sup>, A.E. Grulich<sup>1</sup>

<sup>1</sup>The Kirby Institute, University of New South Wales, Sydney, Kensington, Australia, <sup>2</sup>Division of Cancer Prevention, National Cancer Institute, Bethesda, United States, <sup>3</sup>Division of Cancer Epidemiology and Genetics, National Cancer Institute, Bethesda, United States

**Background:** Comparing and contrasting patterns of cancer incidence between PLHIV and SOTR could provide unique insights into the role of the immune system in cancer risk.

**Methods:** This systematic review and meta-analysis considered studies published in English and listed on PubMed or Embase before 1 July 2022. Studies were eligible if they used population-based registries and compared cancer incidence in PLHIV or SOTR with the general population in the same geographical area. We extracted the number of observed site-specific cancers and expected cases and

Author Index

calculated meta-standardised incidence ratios (SIR). Patterns of cancer meta-SIR between PLHIV and SOTR were compared.

**Results:** Forty-six studies in PLHIV and 67 in SOTR were included. Meta-SIRs for cancers associated with human papillomavirus (HPV) were increased in both populations, with substantially higher SIR in PLHIV for anal cancer (37.28 vs 7.03) and in SOTR for lip cancer (30.95 vs 2.32). Meta-SIRs were significantly elevated for non-HPV viral-infection-related cancers in both populations, but markedly higher in PLHIV than in SOTR for Hodgkin lymphoma (7.64 vs 4.20), non-Hodgkin lymphoma (32.53 vs 10.24) and Kaposi sarcoma (801.52 vs 47.31). The meta-SIR for cutaneous cancers was increased more so in SOTR than PLHIV. Risk of cancer at some gastrointestinal and urinary tract sites were raised only in SOTR. No cancer type was elevated in risk in PLHIV only.

**Conclusions:** There was a mostly similar elevated risk of a range of viral infection-related cancers in PLHIV and SOTR, but divergent trends in these and other cancers have emerged. The cancer risk patterns largely reflect differences in the degree of impaired immunity, exposure to carcinogenic viruses, and/or perhaps exposure to carcinogenic immunosuppressive agents.

## EPB028

**Prioritizing clients with risk of disengagement from HIV care for screening of mental health disorders: lessons from integration of mental health into HIV in a conflict affected region of Ethiopia**

I. Ahmed<sup>1</sup>, B. Getnet<sup>2</sup>, M. Addisu<sup>2</sup>, A. Mekonnen<sup>3</sup>, G. Derseh<sup>3</sup>, M. Kemal<sup>4</sup>, S. Berhanu<sup>4</sup>, C. Temesgen<sup>1</sup>, A. Mekonnen<sup>1</sup>, F. Tefera<sup>1</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention (CDC), Addis Ababa, Ethiopia, <sup>2</sup>Amhara Regional Health Bureau, Bahirdar, Ethiopia, <sup>3</sup>International Center for AIDS Care and Treatment Programs (ICAP) at Columbia University's Mailman School of Public Health, Bahirdar, Ethiopia, <sup>4</sup>International Center for AIDS Care and Treatment Programs (ICAP) at Columbia University's Mailman School of Public Health, Addis Ababa, Ethiopia

**Background:** Compared to the general population, people living with HIV (PLHIV) have a higher risk for mental health disorders (MHD), which can affect engagement into HIV care. In areas of conflict, like the Amhara region of Ethiopia, exposure to traumatic events may increase the chance of developing MHD. Due to limited psychiatry care in Ethiopia, the Ministry of Health (MoH) has been integrating mental health (MH) services into primary care units.

**Description:** The MoH, in collaboration with the International Center for AIDS Care and Treatment Programs and the U.S. Centers for Disease Control and Prevention, developed a task-sharing approach among lay healthcare

workers (LHCW) who are PLHIV, and antiretroviral therapy (ART) clinicians. LHCW proactively screened clients for MHD and linked those screening positive to ART clinicians for further diagnosis and treatment. Program documents were developed, including standard operating procedures and training materials. A brief MH screening tool assessing common MHD (depression, anxiety, psychosis, mania, depression, epilepsy, and substance use) was prepared in local language. LHCW and ART clinicians were provided with tailored training. We analyzed reports in 153 health facilities which implemented the program from Oct 2022 to Jun 2023.

**Lessons learned:** LHCW targeted clients with increased risk of disengagement from care (clients with detectable viral load (DVL) >50 copies/ml), returned to treatment after interruption (RTT), poor adherence, newly started on ART, refused to start ART, delayed ART initiation, and advanced HIV disease (AHD) for MHD screening.

Overall, LHCW screened 7,529 PLHIV for MHD, 853 (11.3%) were diagnosed as having MHD by clinicians, and 84.5% of these (721/853) were referred to psychiatry clinics. A higher proportion of MHD were reported among clients who refused to start ART (18.0%, 49/272), delayed ART initiation (13.4%, 54/403), and had AHD (13.4%, 33/247), compared to clients who newly started on ART (11.0%, 229/2089), had poor adherence (11.4%, 173/1524), with DVL (10.7%, 181/1690), and RTT (10.3%, 134/1304).

**Conclusions/Next steps:** Prioritizing PLHIV with potential risk of disengagement from care for MHD screening is important to proactively identify and manage clients with MHD. This program highlights the benefits of task-sharing with peers for person-centered integrated services to reinforce clients' retention in HIV care.

## EPB029

### Polyphenol-rich Camu Camu capsules decrease liver inflammation and weight in people living with HIV on antiretroviral therapy

S. Isnard<sup>1,2,3</sup>, L. Royston<sup>1,2,3,4</sup>, T. Mabanga<sup>1,2</sup>, C.A. Berini<sup>1,2</sup>, A. Pagliuzza<sup>5</sup>, S. Kant<sup>1</sup>, T. Bessissow<sup>6</sup>, P.L. Klein<sup>1,2,3</sup>, N. Chomont<sup>5</sup>, B. Routy<sup>5</sup>, A. Marette<sup>7</sup>, J.-P. Routy<sup>1,2,8</sup>

<sup>1</sup>Research Institute of the McGill University Health Centre, Infectious Diseases and Immunity in Global Health, Montreal, Canada, <sup>2</sup>McGill University Health Centre, Chronic Viral Illness Service, Montreal, Canada, <sup>3</sup>CIHR Canadian HIV Trial Network (CTN), Vancouver, Canada, <sup>4</sup>Geneva University Hospital, Division of Infectious Diseases, Geneva, Switzerland, <sup>5</sup>Centre de Recherche du Centre Hospitalier de l'Université de Montréal, Montréal, Canada, <sup>6</sup>McGill University of Health Centre, Division of Gastroenterology, Montréal, Canada, <sup>7</sup>Faculté de Médecine, Département de Médecine, Québec, Canada, <sup>8</sup>McGill University Health Centre, Division of Hematology, Montreal, Canada

**Background:** Non-AIDS comorbidities such as liver steatosis are linked with gut microbiota dysbiosis, gut permeability and inflammation in people living with HIV (PLWH) on ART. Camu Camu (CC), an Amazonian superfruit, modified the gut microbiota and decreased inflammation in obese mice and in smokers.

In a single-arm pilot clinical trial, we assessed the influence of daily intake of CC on gut permeability and inflammation in ART-treated PLWH.

**Methods:** We recruited 22 ART-treated PLWH with a CD4/CD8<1 to select those with higher levels of inflammation. Participants took 1g of CC in capsules daily for 12 weeks while remaining on ART. Blood and stools were collected at 2 baseline visits, after 4 and 12 weeks of CC and 8 weeks after stopping CC. Plasma biomarkers were quantified by ELISA. Stool microbiota was characterized by 16S rDNA sequencing. HIV DNA and RNA in CD4 T-cells were quantified by nested qPCR.

**Results:** Median age of participant was 53, and 21/22 were male. CD4 and CD8 counts (median 473.5 and 756), and plasma viral load remained stable during the study. Participants lost a median of 1.2 kg after 12 weeks of CC. Serum levels of liver enzymes AST and ALT decreased from baseline to week 4 (23.5 vs 20.5 and 18 vs 16 IU/mL respectively,  $p<0.01$  for both), and tended to decrease at week 12. Levels of FGF21, a biomarker a metabolic dysfunction-associated steatotic liver disease (MASLD), decreased at week 4 (63.5 vs 60 pg/mL,  $p<0.05$ ). Levels of gut damage markers I-FABP and REG3 $\alpha$ , as well microbial translocation marker LPS tended to decrease at week 4. Gut microbiota composition remained stable at the genus level during the study.

Plasma levels of CC-chemokine ligand 20 (CCL20), an attractant of protective Th17 T-cells in the gut, decreased at week 4 ( $p=0.002$ ). Plasma TNF $\alpha$  levels tended to decrease at week 4.

HIV DNA levels were stable in CD4 T-cells. A 1.3-fold increase in HIV RNA levels was observed at week 20 only ( $p=0.03$ ).

**Conclusions:** CC intake slightly reduced weight, liver transaminases and tended to decrease inflammation in ART-treated PLWH. This effect should be validated using higher dose of CC in larger studies.

## EPB030

### Prevalence and factors associated with neurocognitive impairment among people living with HIV attending a tertiary care clinic in Colombo, Sri Lanka

P.A.D.M.P. Perera<sup>1</sup>, H.T. Liyanage<sup>1</sup>, N.G. Mahakumbura<sup>1</sup>, U.I.P. Gallage<sup>1</sup>, K. Wirasinghe<sup>1</sup>, N.H. Kumarasinghe<sup>1</sup>, H.P. Perera<sup>1</sup>

<sup>1</sup>National STD/AIDS Control Programme, Colombo 10, Sri Lanka

**Background:** HIV-associated neurocognitive disorder (HAND) is a condition where reductions in neuropsychological functions are seen among people living with HIV (PLHIV). Despite effective antiretroviral treatment (ART), this condition remains a crucial issue.

This study aims to describe the prevalence and factors associated with neurocognitive impairment (NCI) among PLHIV at a tertiary care clinic in Colombo, Sri Lanka.

**Methods:** A descriptive cross-sectional study was conducted at the Central HIV Clinic in Colombo in a study period of six months. Systematic random sampling was done and PLHIV who are more than 18 years and on ART for three months or more were included. Data was collected from 400 participants using a pre-tested semi-structured interviewer-administered questionnaire, Montreal Cognitive Assessment (MoCA), Lawton-Brody Instrumental Activities of Daily Living Scale (LB-IADL) and Patient Health Questionnaire-9. NCI was identified as having abnormal MoCA, with or without abnormal LB-IADL. Univariate analysis and logistic regression were performed to determine the factors associated with NCI.

**Results:** The mean age of the sample was 43.79 years ( $SD\pm 12.3$ ) with a male to female ratio of 4:1. The prevalence of NCI in this study population was 59%. Age, biological sex, education level, monthly income, marital status, belonging to a key population, pre-ART duration, months since HIV diagnosis, ART duration, baseline CD4 count, history of hypertension, substance use including alcohol and substance use duration were significantly associated with the presence of NCI in the univariate analysis. The use of lamivudine, efavirenz, abacavir, zidovudine, nevirapine, dolutegravir and antihypertensive medications was also significantly associated.

The multivariate analysis revealed having only a secondary educational level or below ( $p=0.022$ ,  $OR=2.059$ , 95% CI [1.110, 3.820]), and lower-income ( $p=0.008$ ,  $OR=2.136$ , 95% CI [1.223, 3.732]) as risk factors, while younger age ( $p=0.004$ ,  $OR=0.401$ , 95% CI [0.214, 0.752]) was identified as a protective factor against NCI.

**Conclusions:** The prevalence of NCI is significantly high in this study population and further neuropsychiatric assessment is required. PLHIV from lower socio-economic class should be given more attention to detect NCI-related symptoms early.

### EPB031

#### Monitoring of major adverse cardiac events (MACE) in people living with HIV

C. Atasoy Tahtasakal<sup>1</sup>, O. Derin<sup>1</sup>, B. Mete<sup>2</sup>, D. Yıldız Sevgi<sup>1</sup>, S. Yıldız Kaya<sup>2</sup>, A. Oncul<sup>1</sup>, F. Tabak<sup>2</sup>, ACTHIV-IST

<sup>1</sup>Health Sciences University Sisli Hamidiye Etfal Training and Researching Hospital, Infectious Diseases and Clinical Microbiology, Istanbul, Türkiye, <sup>2</sup>Istanbul University Cerrahpasa Medical Faculty, Infectious Diseases and Clinical Microbiology, Istanbul, Türkiye

**Background:** Currently, expanded access to antiretroviral therapy (ART) has significantly reduced HIV/AIDS-related mortality. In addition to traditional risk factors such as increasing age, comorbidities, smoking, and obesity, some HIV-specific factors are thought to increase the risk of coronary artery disease (CAD). In this study, our aim was to determine CVD risk factors in the long-term follow-up of people living with HIV (PLWH) and receiving ART, and to determine the follow-up and epidemiology of MACE.

**Methods:** In the ACTHIV-IST (Action on HIV in Istanbul) cohort, which included clients from two HIV treatment centers in Istanbul, the data of all PLWH over the age of 18 who had been followed up for at least 10 years were recorded. Clients with a history of MACE before HIV diagnosis and not related cardiac deaths were excluded from the study. MACE refers to acute myocardial infarction, congestive heart failure, recurrent stent thrombosis, malignant arrhythmia, stroke, sudden cardiac death. Statistical analysis was performed with R program and  $p<0.05$  was considered significant.

**Results:** In our study, 900 PLWH who were followed up for at least 10 years were analysed and 40 were excluded. Of 860 (88.3% male, mean age=47) clients, %4.8( $n=40$ , 95% male) developed MACE. Since 6 clients had more than one event, total MACE was 47 (5.73%). Hypertension, diabetes mellitus, hyperlipidemia, history of CAD and HIV diagnosis above the age of 40 years were risk factors for MACE ( $p<0.01$ ). 73% ( $n=29$ ) had no history of HT, DM, CAD before HIV diagnosis and 98% had MACE 6.5 years after HIV diagnosis. There was no statistically significant difference between those who had MACE and those who did not in CD4+ at the time of diagnosis, HIV RNA levels and virolog-

ical response at follow-up, and experience with protease inhibitors, abacavir and integrase inhibitors. The most common MACE were myocardial infarction ( $n=23$ , 57.5%), stroke ( $n=7$ , 17.5%) and dysrhythmia ( $n=5$ , 13%). Statin use was significantly more frequent in MACE cases and 45% ( $n=18$ ) were started after MACE.

**Conclusions:** In PLWH, the development of MACE, particularly MI, has been associated with an increased frequency of comorbidities after HIV diagnosis and advanced age at HIV diagnosis.

### EPB032

#### Liver fibrosis was significantly associated with metabolic but not with nonalcoholic fatty liver disease in large cohort of PLWH in Rio de Janeiro (PROSPEC-HIV)

J. Fittipaldi<sup>1</sup>, S. W Cardoso<sup>1</sup>, E. P Nunes<sup>1</sup>, V. G Veloso<sup>1</sup>, B. Grinsztejn<sup>1</sup>, H. Perazzo<sup>1</sup>

<sup>1</sup>Fundação Oswaldo Cruz (Fiocruz), Rio de Janeiro, Brazil

**Background:** Recently, a multi-societies consensus has recommended to change the terminology from nonalcoholic fatty liver disease (NAFLD) to metabolic dysfunction-associated steatotic liver disease (MASLD). We aimed to evaluate the relationship between advanced liver fibrosis and NAFLD or MASLD and in people living with HIV (PLWH) in Brazil.

**Methods:** This cross-sectional study analyzed data of the PROSPEC-HIV study (NCT02542020) baseline visit. 744 PLWH completed questionnaires, fasting blood sample and transient elastography by Fibroscan [Controlled Attenuation Parameter (CAP) for steatosis and liver stiffness measurement (LSM) for fibrosis] on the same day from July/2015 to June/2019. Hazardous alcohol intake was defined as AUDIT > 8. Participants with unreliable CAP/LSM ( $n=59$ ) and those with missing data for metabolic features ( $n=2$ ) were excluded. Presence of steatosis was defined as CAP  $\geq 248$  dB/m. The primary outcome was the presence of advanced liver fibrosis defined as LSM  $\geq 9.5$  kPa. NAFLD was defined as the presence of steatosis without hazardous alcohol intake or viral hepatitis. MASLD was defined as the presence of steatosis with at least one cardiometabolic risk factor (overweight/obesity; pre-/diabetes; hypertension; high triglycerides or low-HDL-c) without excessive alcohol intake. Logistic regression models were adjusted for age, sex at birth, physical activity, viral hepatitis, CD4 count and duration of antiretroviral therapy.

**Results:** 683 PLWH [52% female; median age=45 (IQR,36-53) years, 87% with HIV mono-infection, BMI=25.6 (23.0-29.3) Kg/m<sup>2</sup>] were included. NAFLD and MASLD were present in 27.9% ( $n=191$ ) and 30.3% ( $n=207$ ) of PLWH, respectively. The prevalence [95%CI] of advanced liver fibrosis was 8.9% [7.0-11.3]. The presence of advanced fibrosis was significantly higher in people with MASLD (13.0 vs 7.1%,  $p=0.013$ ), but not in those with NAFLD (10.0 vs 8.5%,  $p=0.562$ ) com-

pared to those without. In multivariate logistic regression models, MASLD [aOR=2.31 (95%CI, 1.23-4.34),  $p=0.009$ ], but not NAFLD [2.02 (0.96-4.28),  $p=0.065$ ], was independently associated with the presence of advanced fibrosis. Older age [aOR=1.54 (1.14-2.10) and aOR=1.58 (1.16-2.14)] and the presence of viral hepatitis [aOR=6.36 (3.24-12.47) and aOR=7.15 (3.37-15.17)] were also associated with advanced liver fibrosis in models using MASLD or NAFLD as fatty liver disease.

**Conclusions:** PLWH with MASLD are at high risk of liver fibrosis independently of the presence of viral hepatitis.

## EPB033

### Effect of GLP-1 receptor agonists on circulating CD4 cells

S. Noe<sup>1</sup>, A. Ivanova<sup>2</sup>, C. Jonsson-Oldenbüttel<sup>1</sup>, G. Schäfer<sup>3</sup>, C.K. Schewe<sup>3</sup>, C. Hoffmann<sup>3</sup>

<sup>1</sup>MVZ München am Goetheplatz, Munich, Germany,

<sup>2</sup>Hasselt University, Hasselt, Belgium, <sup>3</sup>ICH Study Center, Hamburg, Germany

**Background:** GLP-1 receptor agonists (RA) are an increasingly used group of drugs with unprecedented efficacy in the treatment of type 2 diabetes (T2D) and obesity. However, potential immunologic effects of GLP-1 RA have not been studied until now, despite a widely recognized immuno-metabolic interplay.

**Methods:** Retrospective bi-centric longitudinal study in two large HIV centers in Germany (ICH Hamburg, MVZ München am Goetheplatz), including virologically suppressed people with HIV (PWH) using dula- or semaglutide for either diabetes and/or obesity. A mixed-effect quantile regression for the median was fit to the development of CD4 cells up to 56 weeks prior to and after initiation of GLP-1 RA.

**Results:** Overall, 586 observations from 76 PWH (46.1% from the Hamburg center) were included into the analysis. 52.6% of PWH used GLP-1 RA for diabetes, with semaglutide being the most frequently used drug (55.3%). Being on a GLP-1 RA was significantly associated with a decrease in circulating CD4 cells ( $\beta = -66.0$ , one-sided 95% confidence interval [-206.2; -6.1]), while no significant effects on CD8 cells ( $\beta = -86.9477$  [-211.1; 37.2]) and lymphocytes ( $\beta = -179.5668$  [-620.0; 260.9]) were found.

**Conclusions:** Our data imply a negative association between the use of GLP-1 RA and the subset of circulating CD4 cells in PWH, while no alterations in CD8 cells and overall lymphocytes were found. We encourage further research to verify our findings and to determine the clinical meaning and significance of this effect.

## EPB034

### Association of severity of metabolic dysfunction-associated steatotic liver disease with gut dysbiosis and shift in the metabolic function of the gut microbiota in people with HIV

L.E. Ramos Ballesteros<sup>1</sup>, B. Lebouche<sup>1</sup>, J.-P. Routy<sup>1</sup>, M.B. Klein<sup>1</sup>, J. Szabo<sup>1</sup>, J. Cox<sup>1</sup>, J. Falutz<sup>1</sup>, L.-P. Haraoui<sup>1</sup>, C. Costiniuk<sup>1</sup>, A. De Pokomandy<sup>1</sup>, F. Cinque<sup>1</sup>, T. Pembroke<sup>2</sup>, M. Constante<sup>3</sup>, M. Santos<sup>4</sup>, G. Sebastiani<sup>1</sup>

<sup>1</sup>McGill University Health Centre, Chronic Viral Illness Service, Montreal, Canada, <sup>2</sup>Cardiff University, School of Medicine, Cardiff, United Kingdom, <sup>3</sup>McMaster University, Hamilton, Canada, <sup>4</sup>Universite de Montreal, Department of Medicine, Montreal, Canada

**Background:** The progression of metabolic dysfunction-associated steatotic liver disease (MASLD) to its severe forms (metabolic dysfunction-associated steatohepatitis (MASH) and fibrosis), might be associated to lifestyle and genetic factors. Gut microbial dysbiosis seems a key driver in this process. However, the role of gut dysbiosis in people with HIV (PWH) is unknown.

We aimed to evaluate the association between gut dysbiosis and severe MASLD (MASH and fibrosis) in PWH.

**Methods:** Consecutive PWH underwent transient elastography (controlled attenuation parameter (CAP)+serum cytokeratin-18). Included patients had MASLD (CAP  $\geq 238$  dB/m). Severe MASLD was defined as presence of MASH (cytokeratin-18  $\geq 130.5$  U/L) and/or significant fibrosis (stiffness measurement  $\geq 7.1$  kPa).

Gut microbiota composition was determined using 16S ribosomal RNA in stools. PICRUST-based functional prediction, bacterial and functional differences were assessed using a generalized linear model, with adjustment for age and sex using a negative binomial distribution.

**Results:** 34 patients with MASLD were enrolled (mean age 52 years, 15% females, mean stiffness 6.7 kPa, mean cytokeratin-18 184 U/L). Among them, 32% had severe MASLD. After adjusting for age and sex, severe MASLD explained 7% of the overall variation ( $r^2 = 0.07$ ,  $p = 0.09$ ) in bacterial composition. Several genera were significantly different between PWH with severe MASLD. Functional analysis revealed increases in fatty acid degradation and flavonoid biosynthesis, and decreases in several metabolic pathways.

**Conclusions:** In HIV mono-infection, MASLD severity is associated with gut dysbiosis and a shift in metabolic function of the gut microbiota. Some taxa are similar to those associated with MASLD in HIV-negative populations. Thus, gut microbiota analysis adds information to classical predictors of MASLD severity needing further investigation.

## EPB035

Cognitive Behavioral Therapy (CBT)-based group intervention to reduce psychological distress, facilitate positive behavior change, and mitigate inflammation in Older People with HIV

J. Foley<sup>1</sup>, M. Davis<sup>1</sup>, S. Schiavo<sup>2</sup>, L. Bernier<sup>1</sup>, A. Batchelder<sup>1</sup>

<sup>1</sup>Massachusetts General Hospital, Psychiatry, Boston, United States, <sup>2</sup>Northeastern University, Boston, United States

**Background:** The number of people living with HIV aged 50 or older is growing, with recent estimates of up to 8.1 million globally. Older people with HIV (OPWH) experience significant age-related health disparities, where non-communicable diseases associated with inflammation are the leading cause of death among those with treatment access. There is a critical need to intervene on age-related comorbidities to ultimately improve long-term HIV care.

The current pilot randomized controlled trial (RCT) evaluated the feasibility, and acceptability, and explored preliminary evidence of a signal for a cognitive behavioral therapy (CBT) group to reduce inflammation by teaching skills to cope with psychological distress and make positive health behavior changes.

**Methods:** Participants were 31 virally undetectable OPWH (age  $\geq 50$  years) on antiretroviral therapy and deemed psychiatrically stable based on clinical interview. Recruitment occurred via clinic referrals and community-based outreach. Participants were randomized 1:1 to enhanced usual care or the CBT intervention involving 12 weekly virtual group sessions with two interventionists. Self-report questionnaires and intravenous blood draws were collected at baseline, and follow-up visits 12-16 weeks later, with intervention participants completing an exit interview.

**Results:** Participants had a mean age of 60.5-years old (standard deviation [SD])= 5.3) and were 65% men, 55% White, and 79% non-Hispanic, and 45% reported an annual income between \$20-40,000 USD. Overall, 78% (31/40) of screened participants were eligible, 97% (30/21) of whom were randomized, 87% (13/15) completed the intervention, and 87% (26/30) completed the follow-up. On a scale of 0 to 3, with higher scores indicating greater acceptability, participants reported the intervention to be of high quality (mean(SD)=3.00(0.0)), high satisfaction (mean(SD)=3.00(0.0)), their needs were met (2.67(0.50)), and their coping skills improved (2.60(0.52)).

In exploratory comparisons, intervention participants showed a mean two-point decrease in depressive symptoms (Patient Health Questionnaire-9), and stress (Perceived Stress Scale); 212-minute increase in physical activity; three-point increase in self-reported health-related quality of life; and reduced inflammation (interleukin-6; -1.56 picograms/ milliliter of blood) from baseline to follow-up.

**Conclusions:** CBT group intervention is feasible, acceptable, and displays exploratory evidence of a signal for improving psychological distress, health behaviors, and inflammation for OPWH. A fully powered RCT is strongly warranted.

## EPB036

Genome-wide association study identifies new risk loci of hand grip strength among middle-aged and older people with HIV

Q. Zhou<sup>1</sup>, H. Lin<sup>2</sup>, X. Chen<sup>1</sup>, W. Shen<sup>2</sup>, S. Wang<sup>2</sup>, N. He<sup>1</sup>

<sup>1</sup>Fudan University, School of Public Health, Shanghai, China,

<sup>2</sup>Taizhou City Center for Disease Control and Prevention, Department of AIDS/STD, Taizhou, China

**Background:** Hand grip strength is a marker of frailty and a predictor of various morbidities and mortality in people with HIV(PWH). Genome-wide association study (GWAS) exploring the genetic variation in grip strength among PWH is still lacking.

**Methods:** A two-stage(discovery and replication) GWAS was performed for grip strength among PWH aged  $\geq 40$  years. 1657 PWH(median age, 53.1 years; male 77.2%) from the Comparative HIV and Aging Research in Taizhou (CHART) cohort was included for the discovery GWAS, and 308 PWH (median age, 50.0 years; male 64.9%) from the Dehong HIV Study (DHS) was enrolled for replication. Linear regression analyses were constructed for GWAS and replication analyses.

To discover more susceptible loci, we selected SNPs with  $P < 1.0 \times 10^{-5}$  in the replication stage. Genome-wide interaction analyses were also conducted.

**Results:** After quality control and imputation, we included 3,162,867 variants with an imputation score  $> 0.6$  for GWAS. Two genome-wide significant variants(rs530914722,  $P_{\text{discovery}} = 1.22 \times 10^{-8}$ ; rs142033922,  $P_{\text{discovery}} = 4.63 \times 10^{-8}$ ) and two suggestive significant variants(rs185174154,  $P_{\text{discovery}} = 2.08 \times 10^{-7}$ ; rs1416609628,  $P_{\text{discovery}} = 6.22 \times 10^{-7}$ ) were identified to be associated with grip strength among PWH  $\geq 40$  years in the discovery phase, which were enriched in the molecular function of transferase activity, pyridoxal phosphate and vitamin B6 binding.

Similar analyses were performed in DHS and found three loci were replicated and significantly associated with grip strength (rs2504853,  $P_{\text{replication}} = 0.029$ ; rs142828624,  $P_{\text{replication}} = 0.020$ ; rs185174154,  $P_{\text{replication}} = 0.021$ ). Genome-wide association meta-analysis identified one significant SNP (rs185174154,  $LINC00944$ ,  $P_{\text{meta}} = 1.31 \times 10^{-5}$ ) of grip strength among HIV-positive participants.

Furthermore, genome-wide interaction analyses revealed significant gene-environment interactions with depression, neurocognitive impairment, and diabetes among PWH. This evidence might be useful for discovering high-risk individuals for the prevention of poor grip strength among PWH.

**Conclusions:** This study provided new clues for the genetic contribution of grip strength among middle-aged and older PWH, offering potential directions for improving grip strength and even preventing frailty in the future.

## EPB037

**Reasons, efficacy and safety of switching to dolutegravir-based regimens among virologically suppressed PLWH: a retrospective cohort study of 96 weeks**

M. Deng<sup>1</sup>, N. Chen<sup>1</sup>, X. Lao<sup>1</sup>, X. Wang<sup>1</sup>, J. Fu<sup>1</sup>, L. Xing<sup>1</sup>, H. Zhao<sup>1</sup>

<sup>1</sup>Clinical Center for HIV/AIDS, Beijing Ditan Hospital, Capital Medical University, Beijing, China

**Background:** Dolutegravir (DTG), with a high genetic barrier to HIV resistance, was recommended as core drug for naïve and treatment-experienced people living with HIV (PLWH).

**Methods:** We conducted a retrospective analysis of treatment-experienced PLWH who switched to DTG-based regimens and assessed their outcomes over a 96-week period. Here, data were collected between the 2018 and 2022. PLWH's basic information, treatment details and reasons for switching were collected, through the electrical clinical medical record system and telephone follow-up. Data included the proportion of PLWH with HIV RNA <50 copies/mL, changes in immunological indicators and metabolic metrics at week 48 and week 96.

**Results:** A total of 319 PLWH were included in the analysis. The three major reasons for switching were neurological toxicity (16.30%), simplification (13.79%) and renal toxicity (11.29%).

Our study showed high rates of virologic suppression in the per-protocol analysis (week 48: 99.69%; week 96: 99.29%) after switching to DTG-based regimens. The median CD4+ T cell count increased from 579 cells/μL (IQR 420.5-758) to 642 cells/μL (IQR 466.5-854) at week 96 ( $p < 0.0001$ ). An improvement was observed in liver function (ALT:  $p < 0.0001$ ; AST:  $p < 0.0001$ ) and fasting glucose ( $p < 0.0001$ ).

However, there was an elevation in creatinine (Cr) ( $p < 0.0001$ ) and a slight decrease in estimated glomerular filtration rate (eGFR) ( $p < 0.0001$ ).

Regarding lipid profile, triglyceride (TG) levels declined, while total cholesterol (TC) and low-density lipoprotein cholesterol (LDL-C) levels increased. Further analysis revealed that the increase in TC and LDL-C was associat-

ed with the withdrawal of tenofovir disoproxil fumarate (TDF). This observed increase in lipid parameters only concerned the PLWH who switched from a TDF-containing regimen to a non-TDF regimen.

**Conclusions:** This study confirmed the virologic efficacy of switching to DTG-based regimens in virologically suppressed PLWH over a 96-week period. The findings also expanded the evidence of immune reconstitution and metabolic safety associated with this switch.

## EPB038

**Effect of switching from an efavirenz-based therapy to a dolutegravir-based therapy on clinical and physical outcomes in PLHIV at the Yaoundé Central Hospital, Cameroon**

I. Solomon<sup>1,2,3</sup>, K. Charles<sup>3,4</sup>, B. Cavin<sup>3</sup>

<sup>1</sup>Ministry of Public Health, Yaoundé, Cameroon, <sup>2</sup>Global Research Agency, Dschang, Cameroon, <sup>3</sup>University of Dschang, Dschang, Cameroon, <sup>4</sup>Yaoundé Central Hospital, Yaoundé, Cameroon

**Background:** The current World Health Organisation (WHO) guidelines recommend the use of Dolutegravir (DTG) as preferred first- and second-line treatment for People Living with HIV (PLHIV). This has resulted in millions of PLHIV switching from efavirenz (EFV)-based to dolutegravir-based antiretroviral therapy.

The objective of this study is to assess the effects of dolutegravir-based therapy in PLHIV transitioning from an efavirenz-based therapy, providing recommendations to antiretroviral programs and clinicians.

**Methods:** We conducted a retrospective longitudinal study at the Yaoundé Central Hospital, focusing on the 2018 cohort (monitored from 2018 to 2022) of PLHIV who transitioned from an EFV-based therapy to a DTG-based therapy. Clinical and socio-demographic data were collected from medical records using a pre-tested questionnaire. An exhaustive sampling method was used for all participants who met the inclusion criteria.

The statistical tests of student were used to the compare paired sample means matched of weight, body mass index, and high blood pressure, while viral load was compared using the chi square of McNemar.

**Results:** Of the 456 active patients on EFV in 2018, 293 (64.3%) switched to DTG, with an average age of  $41.7 \pm 10.7$  years and more than half being women (58.4%). The average duration on DTG was 30 months and on EFV 15 months.

After switching, there was a significant increase in mean body weight (69.05 vs 72.56 kg,  $p < 0.05$ ), body mass index (25.29 vs 26.67 kg/m<sup>2</sup>,  $p < 0.05$ ), diastolic blood pressure (78.09 vs 81.58 mmHg,  $p < 0.05$ ), and systolic blood pressure (124.43 to 130 mmHg,  $p < 0.05$ ). Virological failure increased from 24 (8.2%) to 36 (12.3%) patients, but this change wasn't statistically significant ( $p = 0.058$ ).

**Conclusions:** The significant increase in metabolic disorders and virological failure observed among PLHIV switching from EFV to DTG in Cameroon warrants stringent monitoring of body weight, blood pressure and viral load among these patients. The increased virological failure also suggests a possible growing resistance to DTG despite its high genetic barrier.

## EPB039

Comparative effectiveness of dolutegravir and efavirenz-based antiretroviral therapy on risk of all-cause mortality in older people living with HIV: emulation of a randomised target trial using electronic health records

X. Wu<sup>1</sup>, Z. Lu<sup>1</sup>, Y. Chen<sup>1</sup>, W. Zhang<sup>1</sup>, H. Zou<sup>2,3,4</sup>

<sup>1</sup>Sun Yat-sen University, Shenzhen, China, <sup>2</sup>Fudan University, Shanghai, China, <sup>3</sup>Southwest Medical University, Luzhou, China, <sup>4</sup>University of New South Wales, Sydney, Australia

**Background:** Given the unique health challenges faced by older people living with HIV (PLHIV)—including more comorbidities, drug interactions, and metabolic changes - tailored antiretroviral therapy (ART) is needed. However, treatment strategies for older PLHIV often mirror those for younger adults, despite the underrepresentation of this group in randomized controlled trials (RCTs) due to strict criteria and complex health profiles. We aimed to elucidate the comparative effectiveness of dolutegravir and efavirenz-based antiretroviral therapy on risk of all-cause mortality in older PLHIV.

**Methods:** We first specified the protocol of two two-arm RCTs (for 50+ years old [older PLHIV] and 18-49 years old [younger PLHIV]) and then emulated it using the National Free Antiretroviral Treatment Program database from 12 centers across China. This method meticulously minimizes the limitations of observational data to closely approximate the results of RCTs. Patients with confirmed diagnosis of HIV between 1 January 2017 and 31 December 2023, aged 18 years or older on day of diagnosis, started efavirenz- or dolutegravir-based ART, and had no previous exposure to ART medications will be enrolled. The propensity score matching and clone method with inverse probability of censoring weighting was used to balance baseline characteristics between the groups and adjust for informative censoring. The Cox proportional hazards models were used to estimate the adjusted hazard ratios (HR) and 95% confidence intervals (CI).

**Results:** We matched 484 older PLHIV who started dolutegravir-based ART to 4840 who started efavirenz-based ART for the first emulated RCTs, then matched 1223 younger PLHIV who started dolutegravir-based ART to 12230 who started efavirenz-based ART for the second emulated RCTs. After controlling for immortal time bias, informative censoring, and baseline confounders, compared with efavirenz group, older PLHIV who started dolutegravir-based

ART has significant lower risks of all-cause mortality (HR 0.52, 95% CI 0.29-0.92). However, younger PLHIV who started dolutegravir-based ART has no significant differences in risks of all-cause mortality (HR 0.82, 95% CI 0.47-1.42) comparing with efavirenz group.

**Conclusions:** Dolutegravir should be preferentially recommended for older PLHIV, particularly in middle- and low-income countries where its use is not yet extensive.

## EPB040

A point-of-care urine tenofovir assay is highly acceptable and has strong predictive utility for virologic suppression among adolescents/young adults with HIV in Kenya

J.N. Gacheru<sup>1</sup>, P. Mwangi<sup>1</sup>, L. Oluoch<sup>1</sup>, F. Ombeng<sup>1</sup>, J. Keke<sup>1</sup>, S. Ndichu<sup>1</sup>, N. Muteti<sup>1</sup>, C. Koli<sup>1</sup>, C. Biwott<sup>1</sup>, J. Vellozo<sup>2</sup>, M. Gandhi<sup>3</sup>, N.R. Mugo<sup>1,4</sup>, K. Ngure<sup>5,4</sup>

<sup>1</sup>Kenya Medical Research Institute (KEMRI), Nairobi, Kenya, <sup>2</sup>University of California, San Francisco (UCSF), Division of Global Health and Infectious Disease Epidemiology, San Francisco, United States, <sup>3</sup>University of California, San Francisco (UCSF), Division of HIV, Infectious Diseases, and Global Medicine, San Francisco, United States, <sup>4</sup>University of Washington, Department of Global Health, Seattle, United States, <sup>5</sup>Jomo Kenyatta University of Agriculture and Technology, School of Public Health, Nairobi, Kenya

**Background:** Adolescents/young adults on antiretroviral therapy (ART) experience suboptimal viral suppression and greater mortality due to multifactorial challenges. Adherence monitoring of ART could improve adherence rates. Our group developed a point-of-care tenofovir (POC-TDF) immunoassay which can assess pill-taking in real time. We set out to assess the acceptability and accuracy of the assay to monitor adherence and predict viral suppression (VS).

**Methods:** Young adults (ages 18-24 years) living with HIV and participating in a Kenya-based study evaluating the effectiveness of the quadrivalent HPV vaccine were enrolled in our sub-study. During the 12-month follow-up, adherence counselling was provided at each study visit. A cross-sectional survey was done at the last study visit, assessing self-reported adherence to ART and acceptability of the POC-TDF test. In a subset of participants, most of whom were experiencing virologic failure, the POC-test was run, and descriptive statistics analyzed in relationship to VS.

**Results:** In the cohort, 155 participants were seen for the last study visit (median age 22 years (interquartile range [IQR]= 21-23), 82 (52.9%) were female, and most (N=153, 98.7%) called the POC-TDF acceptable. Moreover, 142 (91.6%) did not anticipate the POC-TDF test would impact relationships with their provider, 149 (96.1%) thought the test would improve adherence, and 140 (90.3%) wanted to see the test performed in subsequent visits. The test

Oral  
abstracts

exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

was performed for 58 participants, 48 of whom had virologic failure at the enrollment visit. Of the 58, 47 (81.0%) reported ART use in the past 3 days. Among self-reported ART use participants, 35 (60.3%) had a-positive urine test result. Among the 58 tested, 35 (60.3%) had VS at exit, of whom 33 (94.3%) tested positive. The POC-TDF test had a sensitivity of 89.2% (95% CI: 74.6–97.0) for VS with a specificity of 90.5% (95% CI: 69.6–98.8). The positive predictive value for VS was 94.3% (95% CI: 80.8–99.3), while the negative predictive value was 82.6% (95% CI: 61.2–95.0).

**Conclusions:** The POC-TDF was highly acceptable to this cohort of adolescents/young adults living with HIV, demonstrated high predictive value for assessment of VS and presents an opportunity for objective real time adherence evaluation to support counseling.

## EPB041

Scale up of advanced HIV disease assessment and package of services for children and adolescents living with HIV in Kenya

I. Mutisya<sup>1</sup>, K. Muthoka<sup>2</sup>, A. Kiwara<sup>2</sup>, D. Maangi<sup>1</sup>, E. Muthama<sup>1</sup>, L. Omoto<sup>1</sup>, D. Kimanga<sup>1</sup>, J. Muthusi<sup>1</sup>, A. Katana<sup>1</sup>, J. Odhiambo<sup>2</sup>, L. Torre<sup>3</sup>, S. Hrapcak<sup>3</sup>, N. Agathis<sup>3</sup>

<sup>1</sup>Centers For Disease Control and Prevention, Division of Global HIV and Tuberculosis, Nairobi, Kenya, <sup>2</sup>Palladium, Nairobi, Kenya, Strategic information, Nairobi, Kenya,

<sup>3</sup>Centers for Disease Control and Prevention, Division of HIV and Tuberculosis, Atlanta, United States

**Background:** Advanced HIV disease (AHD) contributes to mortality among children and adolescents living with HIV (CALHIV). In 2023, CDC-supported partners in Kenya implemented a continuous quality improvement (CQI) initiative to improve identification and management of AHD in CALHIV. The CQI included a root cause analysis for missed opportunities, targeted efforts to address gaps, health care worker trainings, regular data review, and sharing lessons learnt. We reviewed changes in AHD assessment, prevalence, and service uptake among CALHIV before and after the initiative.

**Methods:** We analyzed data from the Kenya National Data warehouse describing CALHIV 0–19 years at 963 CDC-supported sites. Using chi-square testing ( $p$ -value  $<0.05$ ), we compared proportions among CALHIV aged  $<5$  years (younger) and 5–19 years (older) who had WHO stage and CD4 documentation and AHD diagnosis between Oct 2021–Sept 2022 and Oct 2022–Sept 2023. AHD was defined as being on ART for  $<12$  months or having treatment failure in younger children, and either having WHO stage 3/4 or  $CD4 < 200$  in older CALHIV. Of those with AHD, we compared proportions receiving cotrimoxazole, malnutrition services, and TB services.

**Results:** Among CALHIV on ART, WHO stage documentation significantly improved among younger (74% to 94%,  $p < 0.001$ ) and older CALHIV (71% to 92%,  $p < 0.001$ ). Among

those eligible, CD4 documentation significantly improved in younger (8%–13%,  $p = 0.001$ ) and older CALHIV (49%–77%,  $p < 0.001$ ). AHD diagnosis significantly increased among younger (36%–44%,  $p < 0.001$ ) and older CALHIV (4.7%–5.2%,  $p < 0.001$ ). TB screening (89%–94%,  $p < 0.001$ ) and TPT uptake (62%–74%,  $p < 0.001$ ) significantly improved in younger children with AHD; no improvements in AHD service uptake were noted for older children (Table 1).

Table: Assessment and Diagnosis of Advanced HIV Disease (AHD) and receipt of AHD services among children and adolescents living with HIV (CALHIV) aged 0–4 years and 5–19 years on antiretroviral treatment (ART) served by CDC Kenya between Oct 2021–Sept 2022 (FY22) and Oct 2022–Sept 2023 (FY23)

	0–4 years			5–19 years		
	FY22	FY23	Percentage-point change (p-value*)	FY22	FY23	Percentage-point change (p-value*)
Documentation of WHO stage (%) among all CALHIV	74.3% (n=2,345)	94.1% (n=2,079)	19.8% ( $<0.001$ )	70.5% (n=47,375)	92.4% (n=47,811)	21.9% ( $<0.001$ )
Documentation of CD4 (%) among those eligible for CD4	7.9% (n=800)	12.6% (n=907)	4.7% ( $<0.001$ )	48.6% (n=3,875)	77.1% (n=4,368)	28.5% ( $<0.001$ )
AHD prevalence (%) among all CALHIV	35.7% (n=2,345)	43.6% (n=2,079)	7.9% ( $<0.001$ )	4.7% (n=47,375)	5.2% (n=47,811)	0.5% ( $<0.001$ )
Receipt of AHD services (%) among CALHIV with AHD						
TB screening	n=802	n=907		n=2,225	n=2,189	
	89.0%	93.9%	4.9% ( $<0.001$ )	97.1%	95.2%	-1.9% ( $<0.001$ )
TB Preventive Therapy (TPT) Cotrimoxazole	61.6%	78.2%	16.6% ( $<0.001$ )	94.5%	93.8%	-0.7% (0.30)
Malnutrition screening	91.8%	91.1%	-0.7% (0.31)	76.9%	79.2%	2.3% (0.05)

\*p-value for chi square test comparing proportions between FY22 and FY23 for each age group

**Conclusions:** Following the Kenya CQI initiative significant improvements in AHD assessment, increased AHD diagnosis among CALHIV, and increased TB service uptake among younger children were seen. However, more work is needed to understand why gaps persist and improve AHD diagnosis and service uptake among CALHIV.

<sup>1</sup>University of Washington, Epidemiology and Global Health, Seattle, United States, <sup>2</sup>University of Nairobi, Paediatrics and Child Health, Nairobi, Kenya, <sup>3</sup>Arizona State University, School of Life Sciences, Tempe, United States, <sup>4</sup>Université de Montréal, Centre de Recherche du CHU St-Justine, Montreal, Canada, <sup>5</sup>Kenyatta National Hospital, Research and Programs, Nairobi, Kenya, <sup>6</sup>University of Washington, Global Health, Seattle, United States, <sup>7</sup>Fred Hutchinson Cancer Center, Division of Human Biology, Seattle, United States

**Background:** It remains unclear if HIV-exposed, uninfected (HEU) infants continue to experience greater morbidity and mortality than HIV-unexposed, uninfected (HUU) infants in the era of universal ART. We assessed whether risk

Oral  
abstracts

exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

of acute diarrhea, respiratory tract infections (RTI), hospitalization, and all-cause mortality in the first two years of life differ between Kenyan infants that are HEU versus HUU.

**Methods:** From December 2018-March 2020 at Mathare North Health Centre in Nairobi, we recruited pregnant women living with HIV on ART for  $\geq 6$  months and pregnant women without HIV from the same community.

We followed mother-infant pairs for 2 years postpartum and collected data on symptoms of illness, health-care-seeking behavior, clinical diagnoses, and infant feeding every 3 months; a self-selected subset of participants received weekly data collection for up to 1 year.

To compare the risk of each outcome between HEU versus HUU infants, we used Andersen-Gill (recurrent morbidity outcomes) and Cox proportional hazards (mortality) regression adjusted for maternal age, marital status, and education level.

**Results:** Postpartum data were available for 187/211 (89%) mother-infant pairs; 86 (46%) infants were HEU and 101 (54%) were HUU. All mothers initiated breastfeeding, but a greater proportion of HEU than HUU infants were exclusively breastfed (EBF) for 6 months (88% vs 57%). There were 5 infant deaths (3 HEU, 2 HUU; 27/1000 live births). There was no significant difference in risk of acute diarrhea (Hazard Ratio [HR]=0.79, 95% CI 0.52-1.22;  $p=0.3$ ), hospitalization (HR=1.11, 95% CI 0.30-4.14;  $p=0.9$ ), or mortality (HR=1.87, 95% CI 0.17-20.5;  $p=0.6$ ).

However, HEU infants had lower risk of pneumonia (HR=0.29, 95% CI 0.09-0.89;  $p=0.03$ ) and any upper/lower RTI (HR=0.60, 95% CI 0.44-0.82;  $p=0.001$ ). Infants that were EBF for  $\geq 6$  months, regardless of HIV exposure, had lower risk of any RTI (HR=0.60, 95% CI 0.44-0.82;  $p=0.001$ ); there was a similar trend for pneumonia (HR=0.31, 95% CI 0.09-1.02;  $p=0.05$ ).

**Conclusions:** Among this cohort of healthy mother-infant pairs in Nairobi, HEU and HUU infants generally had similar morbidity and mortality outcomes in the first 2 years of life. However, HEU infants had substantially lower risk of pneumonia and any RTI, which was likely mediated by longer EBF in this group.

## EPB043

### The effect of feminizing hormone therapy (FHT) on phenotypic and functional attributes of T-cells in transgender women living with HIV (TGWH)

T. Pozniak<sup>1</sup>, S. Kottilli<sup>2</sup>, S. Kattakuzhy<sup>2</sup>, A. Ghosh<sup>2</sup>, E. Rosenthal<sup>2</sup>

<sup>1</sup>Institute of Human Virology University of Maryland School of Medicine, Clinical Division, Baltimore, United States,

<sup>2</sup>Institute of Human Virology, University of Maryland School of Medicine, Clinical Division, Baltimore, United States

**Background:** Transgender women (TGW) live with highest risk for acquisition of HIV. Many TGW use FHT to increase estradiol levels and decrease testosterone levels for maintaining gender affirming physical appearances. However, the influence of FHT on immune system, particularly on HIV-specific immune responses in TGWH is unknown. The main goal of our study was to investigate the changes induced by FHT on the phenotypic and functional attributes of T-cells in TGWH.

**Methods:** We investigated phenotypic and functional characteristics of T-cells in PBMCs collected from 25 TGWH by Flow cytometry. The phenotypic panel included surface markers to investigate frequency of various T-cell subsets (CD4+, CD8+, Tfh, Th<sub>1</sub>, Th<sub>2</sub>, NC, CM, EM, TEMRA) and their activation (CD38, HLA-DR) and exhaustion status (PD1, 2B4, TIGIT). HIV-specific T-cell response was investigated by intracellular cytokine staining (IFN $\gamma$ , TNF $\alpha$ , IL21, IL2, IL17) upon *in vitro* HIV-gag-peptide stimulation.

Participants were divided into 4 groups depending on the use of FHT (confirmed change in sex hormone levels) and viremic status (if level of HIV RNA  $>30$  IU/ml);

1. NoFTH-viremic,
2. NoFTH-Non-viremic,
3. FTH-viremic and;
4. FTH-Non-viremic.

**Results:** Our data indicated increased level of cytokine production to HIV-gag peptides in various CD4+T-cell subsets in FTH-viremic TGWH group compared to rest of the groups (Table1). The increases in cytokines secretion by CD4+T-cells and its subsets positively correlated with the percentages of highly activated CD38+HLA-DR+ cells. No significant differences in the frequencies of any of the T-cell subsets (Tfh, Th1, Th2, NC, EM, CM, TEMRA) were observed due to FHT. Also, frequencies of PD1, 2B4 or TIGIT exhausted T-cells remained unchanged due to FHT.

Table 1. Influence of FHT on HIV-specific T-cell response in viremic-TGWH. (\* -  $P \leq 0.05$ ; \*\* -  $P \leq 0.01$ ; \*\*\* -  $P \leq 0.001$ ).

	Quantities/fold change	IFN $\gamma$	IFN $\gamma$ + TNF $\alpha$	TNF $\alpha$	IL21	IL17A	IL2
CD4+		Increase**		Increase*	Increase**	Increase*	Increase*
Tfh		Increase*		Increase*	Increase**	Increase*	
Th1		Increase*	Increase*	Increase*			
Th17		Increase**	Increase*	Increase*	Increase*	Increase*	
CD4+CD38+		Increase*	Increase*				
CD4+CD38+HLA-DR+	Increase**						
CD4+HLA-DR+	Increase*						
Th1CD38+HLA-DR+	Increase*						
Th1CD38+HLA-DR+	Increase*						
Th17CD38+HLA-DR+	Increase***						

**Conclusions:** FHT induced activation and high pro-inflammatory immune response in various subsets of helper T-cells against HIV-specific peptide in viremic TGWH. Hence, FHT can increase comorbidities associated with HIV due to its enhanced effect on host inflammatory response.

## EPB044

Local response to extreme climate events to mitigate the Impact on service delivery for people living with HIV in Nampula Province, Mozambique

K. Ngale<sup>1</sup>, E. Gusmão<sup>1</sup>, E. Homiak<sup>1</sup>, H. Mutemba<sup>1</sup>, H. Macul<sup>1</sup>, M. Abudou<sup>2</sup>, H. Kamiru<sup>3</sup>, C. Wells<sup>3</sup>, W. El Sadr<sup>3</sup>

<sup>1</sup>ICAP at Columbia University, Maputo, Mozambique,

<sup>2</sup>Provincial Health Services, Nampula, Mozambique, <sup>3</sup>ICAP at Columbia University, New York, United States

**Background:** Climate change represents a great threat to human health in the 21st century, and the most vulnerable are disproportionately affected, including people living with HIV (PLWH). In March 2022, intense tropical cyclone Gombe made landfall in Nampula Province, Mozambique, affecting an estimated 736,015 people. Health service delivery was temporarily interrupted with infrastructure damage and population displacement. We aimed to assess its impact on HIV service delivery.

**Methods:** ICAP worked with local leadership to ensure continued access to essential services. This included rapid allocation of temporary infrastructure; revising client flows; integrating multiple clinical services; and intensifying community-level interventions, including offering prevention, care, and treatment services through Mobile Units. We analysed a subset of routine HIV indicators reported in 18 health facilities supported by ICAP and affected by the cyclone from the pre-cyclone period: October to December 2021 (Q1), during the cyclone: January to March 2022 (Q2); and after the event: April to June 2022 (Q3). We reviewed data from DHIS2 and performed descriptive analyses.

**Results:** Data from October 2021 to June 2022 showed an effect in the number of individuals tested at the supported services (72,605 during Q1, 80,807 in Q2, and 87,869 in Q3). However, we observed a slight decrease in the number of individuals who tested positive (3,143 in Q1, 3,062 in Q2, and 3,170 in Q3) and initiated antiretroviral therapy (ART) (4,454 in Q1, 4,047 in Q2 and 4,441 in Q3). Over the three quarters there was no evidence of deleterious effects on treatment continuation, with the number of clients active on ART increasing over time (42,522 in Q1, 45,319 in Q2, and 49,456 in Q3). There was no increase in proportion of ART clients lost-to-follow-up after the cyclone: 6.7% in Q1, 6% in Q2 and 3.9% Q3.

**Conclusions:** A rapid response was able to mitigate the impact of cyclone Gombe on HIV outcomes. Coordination and collaboration with government and partners was es-

sential to reduce service disruption and reengage clients. However, further service adaptations are needed to build resilient HIV services that can withstand potential disruptions, e.g. implementation of multi-month ART dispensing at locations at high risk of extreme climate events.

## EPB045

Avidity and neutralization: potential of anti-SARS-CoV-2 antibodies in PLWHA and healthy controls

M. Monteiro<sup>1</sup>, V. Folgosi<sup>1</sup>, T.R. Tozetto-Mendoza<sup>2</sup>, M.C. Correa<sup>2</sup>, A. Silva Junior<sup>2</sup>, C. Ceneviva<sup>3</sup>, J. Fernandes<sup>4</sup>, T. <sup>3</sup>Hospital das Clínicas, University of São Paulo Medical School, Central Laboratory Division, Sao Paulo, Brazil,

<sup>4</sup>Faculty of Medicine/Tropical Medicine Institute of São Paulo, São Paulo, SP, Brazil. University of São Paulo Medical School, Brazil, Sao Paulo, Brazil, <sup>5</sup>Hospital das Clínicas, University of São Paulo Medical School. São Paulo, Brazil, Dermatology, Sao Paulo, Brazil

**Background:** HIV primarily targets CD4+ T cells, posing challenges in developing specific immunity against SARS-CoV-2. The co-infection of HIV and SARS-CoV-2 is a significant global concern, especially for those people living with HIV (PLWHA) and having pre-existing conditions, implying a greater risk of morbidity and mortality. Antibodies against SARS-CoV-2 are crucial for an effective neutralizing response.

The objective goal was to compare the levels of neutralizing antibodies and avidity between PLWHA and healthy controls in Brazil.

**Methods:** The ADEE3002/HCFMUSP HIV outpatient clinic follows 450 HIV-1-infected individuals and collects two samples of plasma and buffy coat per year, constituting an important biorepository since 1998. During the COVID-19 outbreak, the ADEE3002 team quickly mobilized to investigate potential coinfections with SARS-CoV-2. In the period from July 2021 to July 2022, 279 HIV-1 plasma samples from the biorepository, collected from December 2019 to April 2020, were screened for SARS-CoV-2 antibodies using an in-house ELISA test (Tozetto-Mendoza TR, et al). To confirm the in-house test, a chemiluminescence immunoassay (CLIA) (Liaison® SARS-CoV-2 TrimericS IgG) was performed. Additionally, neutralizing antibodies against SARS-CoV-2 were quantified using an ELISA Kit (Thermo Fisher®), and an in-house antibody avidity was evaluated using 8 M urea.

**Results:** From 279 samples tested, 36 (12.9%) showed positivity for antibodies against SARS-CoV-2. The cohort was composed of 50% men and 50% women, with an average

age of 49 years. The percentage of neutralizing antibodies in the group of PLWHA was significantly lower when compared to the healthy control group ( $p=0.009$ ).

Despite the significant decrease in the production of these essential molecules for an adequate neutralizing response, PLHIV did not present a more severe form of the disease. The urea analysis revealed a lower avidity in HIV-positive individuals compared to HIV-negative individuals.

**Conclusions:** Significant decreases in the presence of high-affinity antibodies and the quantity of neutralizing antibodies against SARS-CoV-2 were observed in PLWHA when compared to the healthy group.

However, it is important to emphasize that, despite this reduction, cell-mediated response may be a key factor in symptom regulation in PLWHA, underscoring the need to investigate and comprehend this distinctive immune response.

## EPB221

### Prevalence and consequences of low-level viremia among adolescents living with HIV in South Africa: a longitudinal cohort study

Z. Leon<sup>1,2</sup>, O. Edun<sup>3</sup>, S. Zhou<sup>4,1</sup>, G. Sherman<sup>5,6</sup>, E. Toska<sup>1,7,8</sup>

<sup>1</sup>Centre for Social Science Research, Cape Town, South Africa, <sup>2</sup>Division of Computational Biology, Department of Integrative Biomedical Science, University of Cape Town, Cape Town, South Africa, <sup>3</sup>MRC Centre for Global Infectious Disease Analysis, School of Public Health, Imperial College London, London, United Kingdom, <sup>4</sup>Division of Socio-Behavioural Sciences, School of Public Health, University of Cape Town, Cape Town, South Africa, <sup>5</sup>Department of Paediatrics and Child Health, Center for HIV and STIs, University of the Witwatersrand, Witwatersrand, South Africa, <sup>6</sup>National Institute for Communicable Disease, National Health Laboratory Service, Johannesburg, South Africa, <sup>7</sup>Department of Social Policy and Intervention, University of Oxford, Oxford, United Kingdom, <sup>8</sup>Department of Sociology, University of Cape Town, Cape Town, South Africa

**Background:** Low-level viremia (LLV), defined by the World Health Organization as viral load between 51-999 copies/mL, has been shown to be associated with an increased risk of virological non-suppression and failure among adults on antiretroviral therapy (ART). It is unknown if adolescents living with HIV (ALHIV) and on ART, are more likely to have experienced LLV. There is also limited data factors shaping progression to virological failure among ALHIV on ART. We aimed to assess the prevalence of LLV among ALHIV on ART and associations between LLV and progression to virological failure.

**Methods:** We analyzed viral load data from a longitudinal cohort study of ALHIV captured by the National Health Laboratory Services (NHLS) in South Africa. Using

routine viral load data between 2015-2022, we calculated the prevalence of LLV at the first viral load test for all adolescents with results, then testing which socio-demographic factors were associated with LLV at first test.

Among ALHIV who had at least three consecutive viral load tests between 2015-2022, we assessed the relationship between LLV and virological failure controlling for age, sex and mode of HIV acquisition using logistic regression.

**Results:** A total of 737 ALHIV had at least one viral load result between 2015-2022, amongst whom the prevalence of LLV increased from 12.4% in 2015 to 18.3% in 2022. Among those with at least one result, older adolescents were more likely to have LLV (OR: 1.09; CI: 1.03, 1.25). Both sex (OR: 0.95; CI: 0.60, 1.51) and mode of HIV acquisition (OR: 0.96; CI: 0.52, 1.79) were not significant predictors for LLV.

Among 628 ALHIV who had at least three consecutive viral load records, 13.4% had LLV at the first viral load and 18.6% had progressed to virological failure. ALHIV with LLV were two times (OR: 2.98; CI: 1.64, 6.15) more likely to progress to virological failure compared to those with undetectable viral loads.

**Conclusions:** The prevalence of LLV among ALHIV on ART is high and LLV strongly predicts virological failure. Age also serves as a predictor for LLV. This highlights the need for enhanced adherence support among ALHIV with LLV and not just those with viral non-suppression.

## EPB223

### Diagnostic performance of the VISITECT® CD4 Advanced Disease Rapid Test in samples in Panama

Z. Chaverra R.<sup>1</sup>, D. Beltrán<sup>1</sup>, A. Gabster<sup>1</sup>

<sup>1</sup>Gorgas Memorial Institute for Health Studies, Research in Virology and Biotechnology, Panama, Panama

**Background:** People living with HIV in rural zones in Panama may have delayed results for CD4+ lymphocyte cell count due to centralized testing; clinical decision-making may be delayed.

This study aimed to evaluate the VISITECT® CD4 Advanced Disease Rapid Test, a semi-quantitative point-of-care assay, for potential use in rural areas of Panama.

**Methods:** This evaluation compared the diagnostic accuracy of VISITECT® CD4 Advanced Disease Rapid Test (Visitect) to the BD FACScalibur flow cytometry. This evaluation used excess venous blood samples that were collected within 24 hours prior to routine CD4 testing among adults (>17 years) living with HIV at a large antiretroviral clinic in Panama City in 2022.

**Results:** A total of 302 samples were included. The median age of the people who provided samples was 36.5 years (IQR=29-45 years). With BD FACScalibur, the median CD4 count was 301.5 cells/mm<sup>3</sup> (IQR:136-499 cells/mm<sup>3</sup>), and 35.8% of samples had CD4<200 cells/mm<sup>3</sup>.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

The reference flow cytometry testing showed a total of 108/302 (35.8%) individuals had advanced HIV disease (AHD, defined at  $<200$  cells/mm<sup>3</sup>). Visitect was below range in 56.9% (172/302) samples and was above range in 43.0% (130/302) samples tested.

Compared to the BD FACScalibur flow cytometry, the Visitect correctly identified 100/108 as having a CD4 count below 200 cells/mm<sup>3</sup>, giving a sensitivity of 92.6% (95%CI: 89.5-95.6%), giving a specificity of 62.9% (95%CI: 57.4-68.3%). The positive predictive value for a CD4 cell count  $<200$  cells/mm<sup>3</sup> was 58.1% (95%CI: 52.6-63.7). The negative predictive value was 93.8% (95%CI: 91.1-96.6%).

The median CD4 cell count of the 8/302 samples misclassified by Visitect at CD4  $<200$  cells/mm<sup>3</sup> was 329.5 cells/mm<sup>3</sup> (IQR: 157-510), whereas for the 72/302 samples misclassified by Visitect as CD4  $<200$  cells/mm<sup>3</sup>, their median cell count was 301.5 cells/mm<sup>3</sup> (IQR: 139-499). Of the 72 samples with cell counts  $>200$  cells/mm<sup>3</sup> that were misclassified as low range by Visitect, 42 (58.3%) were below 350 cells/mm<sup>3</sup>.

**Conclusions:** The evaluation of VISITECT® showed a low specificity. However, the test had an acceptable sensitivity for emergency clinical decision-making in regions where prompt results from flow cytometry are unavailable. However, we recommended not replacing flow cytometry in these regions but supplementing with Visitect Advanced Disease where necessary for on-site decision-making.

## EPB224

### The use of dried blood spot specimens in the community by peer outreach workers increases HIV viral load testing coverage in Mali

K. Sogoba<sup>1</sup>, M.M.S. Tall<sup>2</sup>

<sup>1</sup>Faculty of Science and Technology, Bamako, Bamako, Mali,

<sup>2</sup>FHI360, Bamako, Mali

**Background:** In 2017, the World Health Organization (WHO) recommended the use of dried blood spot (DBS) specimens to monitor HIV viral load (VL). However, as of September 2020, Mali was still collecting plasma specimens despite facing logistical, infrastructural, and operational barriers preventing routine VL monitoring. Estimated HIV prevalence is 0.8%. Among people living with HIV (PLHIV), 59% know their status and 53% are on treatment. There is no data on VL suppression. The U.S. President's Emergency Plan for AIDS Relief through the U.S. Agency for International Development funded the Meeting Targets and Maintaining Epidemic Control (EpiC) project that offers HIV VL monitoring to key and priority populations living with HIV (KPLHIV/PPLHIV) through public and civil society organization (CSO) led clinics, in the Bamako, Sikasso, and Segou regions in Mali.

**Description:** Changes in VL testing coverage were measured before (October 2019 to September 2020) and after (October 2020 to September 2023) the roll out of an

intervention for which DBS specimens were collected by peer outreach workers in the community (e.g. CSO-led clinics, clients' residences). Before the intervention, specimens for VL were collected only at public clinics by a laboratory technician using whole blood. Retrospective client records were analyzed from October 2019 to September 2023 through aggregated project data of KP/PPLHIV of all ages and sexes who were on antiretroviral therapy (ART) and eligible for VL testing in public and CSO-led clinics. Viral load coverage was defined as the number of KP/PPLHIV whose specimens were collected from those KP/PPLHIV who were eligible for VL testing.

**Lessons learned:** Following the roll out of the intervention, the VL coverage progressively increased from 50% (253/507) at baseline (October-2019-September 2020) to 72% (1,262/1,747) at first follow up (October 2020-September 2021), to 82% (2,910/3,558) at second follow up (October 2021-September 2022), to 89% (3,670/4,128) at third follow up (October 2022-September 2023).

**Conclusions/Next steps:** Our study confirms that the use of DBS in the community and by peer outreach workers is feasible and it can address logistical, infrastructural, or operational barriers, and result in increased VL coverage among KP/PPLHIV, which is key to ensure optimal ART case management.

### EPC046

Prevalence of metabolic syndrome and its associated factors among newly diagnosed ART naïve PLHIV registered at Central HIV Clinic, Sri Lanka

C.D. Ratnayaka<sup>1</sup>, L. Rajapakse<sup>1</sup>

<sup>1</sup>National STD AIDS Control Programme, Colombo, Sri Lanka

**Background:** Metabolic syndrome (MS) also known as syndrome X, Insulin resistance syndrome has a prevalence of 21.5% (95% CI 15.09–26.86) among PLHIV according to a systematic review and is a forerunner of cardiovascular diseases (CVD). Objective is to study the prevalence of MS and its associated factors among newly diagnosed ART naïve PLHIV at HIV Clinic, Colombo, Sri Lanka.

**Methods:** A descriptive cross-sectional study perusing secondary data of adult Sri Lankan PLHIV registered from 2017 – 2019 using simple random sampling technique. MS was defined as per 1999 WHO Clinical Criteria inclusive of preexisting diabetes or impaired fasting glucose with 2 of the below: preexisting hypertension or systolic blood pressure > 140mmHg or diastolic blood pressure > 90mmHg, triglycerides >150mg/dL, HDL < 39 mg/dL in women and < 35mg/dL in men and body mass index (BMI) >30 kg/m<sup>2</sup>.

**Results:** Sample (n=218) was composed of 83.7% males and 16.3% females with a mean age of 35.95 ± 11.09 years. More than 40-year males and females accounted for 24.3% and 62.1% respectively.

Overall prevalence of MS at the time of registration at HIV clinic was 9.6%, while in males and females it was 9.94% and 8.1% respectively. Majority of people with MS (71.4 %) were >40 years old, 33.3 % consumed alcohol, 19 % smoked, 81 % were in WHO stage 1 or 2, 95.2 % were free of diseases caused by opportunistic pathogens including tuberculosis at the time of registration or during past six months, 19 % had CD4 <200 cells/μL, 47.6 % had viral load < 10,000 copies/mL, 19 % had albuminuria and 62 % had high alanine transaminase (ALT). Among them, 62 %, 95 % and 90.5 % were educated ≥ grade 13, employed and had higher monthly income respectively.

Age >40 years, being married, living with family, high ALT, and albuminuria were significant associations. However, age >40 years, living with family and elevated ALT maintained statistical significance in multivariate regression analysis. (p<0.05).

**Conclusions:** MS prevalence was less compared to the global prevalence. PLHIV with an advanced age, living with the family and elevated ALT were the identified risk groups.

### EPC047

Age-standardized comparison of atherosclerotic cardiovascular events and all-cause mortality in people living with HIV and general population

R. Teira<sup>1</sup>, A. Camps-Vilaró<sup>2</sup>, I. Subirana<sup>2</sup>, P. Domingo<sup>3</sup>, A. Curran<sup>4</sup>, M.J. Galindo<sup>5</sup>, M. Montero<sup>6</sup>, A. Romero<sup>7</sup>, I.R. Dégano<sup>8</sup>, J. Marrugat<sup>9</sup>, VACH investigators

<sup>1</sup>Hospital Sierrallana, Infectious Diseases Unit, Torrelavega, Spain, <sup>2</sup>CIBER de Enfermedades Cardiovasculares, Instituto de Salud Carlos III, Madrid, Spain, <sup>3</sup>Hospital de la Santa Creu i Sant Pau, Institut de Recerca del Hospital de la Santa Creu i Sant Pau, Infectious Diseases Unit, Barcelona, Spain, <sup>4</sup>Hospital de la Vall d'Hebron, Infectious Diseases Unit, Barcelona, Spain, <sup>5</sup>Hospital Clínico Universitario de Valencia, Infectious Diseases Unit, Valencia, Spain, <sup>6</sup>Hospital Universitario y Politécnico de La Fe, Infectious Diseases Unit, Valencia, Spain, <sup>7</sup>Hospital Clínico de Puerto Real, Infectious Diseases Unit, Cádiz, Spain, <sup>8</sup>University of Vic-Central University of Catalonia, Faculty of Medicine, Vic, Spain, <sup>9</sup>Hospital del Mar Research Institute, REGICOR Study Group, Barcelona, Spain

**Background:** Despite the advancements in antiretroviral therapy, people living with HIV (PLWH) still face disparities in life expectancy and the prevalence of comorbidities. This study aims to compare the age-standardized incidence rates of atherosclerotic cardiovascular disease (ASCVD) and all-cause mortality between PLWH and the general population in Spain.

**Methods:** We compared the VACH cohort (PLWH) and the REGICOR cohort (general population). Participants aged 25-74 years with no history of ASCVD were tracked for a 15-year period. Baseline data, including demographics, cardiovascular risk factors, and comorbidities, were collected.

Age-standardized incidence rates for 15-year ASCVD (coronary artery disease and stroke) and all-cause mortality were calculated. The comparison of ASCVD and all-cause mortality incidence rates was analyzed using the log-rank test and Cox proportional hazards models. The analyses were stratified by gender and age groups (25-54 and 55-74 years).

**Results:** We included 10,218 participants from the general population (53% women) and 6,829 PLWH (22% women). Men with HIV aged 25-54 years had a higher ASCVD standardized incidence rates compared to men in the general population. Young men and women with HIV exhibited significantly higher all-cause standardized mortality rates compared to their counterparts in the general population.

There was no significant differences in the risk of coronary artery disease and stroke between PLWH and the general population after adjusting for ASCVD risk factors. However, the adjusted risk for all-cause mortality was 3-5 times higher in PLWH (Table 1).

Adjusted for risk factors*	0.35 [0.12-1.01]	0.051	1.33 [0.42-4.23]	0.634	4.71 [3.13-7.09]	<0.001

Table 1. Hazard ratio (HR) and 95% confidence interval (CI) of men and women with HIV in comparison with men and women from general population (reference).

\*Adjusted for age, sex, blood pressure, total and HDL cholesterol, triglycerides, diabetes and smoking.

**Conclusions:** The higher incidence of ASCVD in PLWH, when compared to the general population, can be attributed to differences in the prevalence of ASCVD risk factors. The risk of all-cause mortality among young PLWH was nearly three times higher than that of the general population.

## EPC048

Advanced HIV disease in children and adolescents: review from a large multicenter program in Nigeria

M. Katbi<sup>1</sup>, A. Adedoyin<sup>2</sup>, K. Omo-Emmanuel<sup>1</sup>, D. Ogundehin<sup>1</sup>, J. Pius<sup>1</sup>

<sup>1</sup>USAID, Abuja, Nigeria, <sup>2</sup>Social Impact USAID-MELSA, Abuja, Nigeria

**Background:** Antiretroviral Therapy has averted millions of AIDS-related mortality around the world. However, the high mortality of people with advanced HIV disease (AHD) has led to slowness in the reduction of HIV-associated mortality. Monitoring newly diagnosed PLHIV for AHD is important to reduce HIV-related mortality. We assessed our program for AHD in children and adolescents.

**Methods:** Using multi-stage sampling, 17 States were grouped into 6 clusters. CD4 test was conducted for new PLHIV aged 5 to <15 from October 2021 to March 2023, disaggregated by gender and age. Clients having a CD4 count of <200 were classified as having AHD, based on WHO classifications. Descriptive analysis was used to describe the data by age, sex, and cluster, and the prevalence of AHD was analyzed by cluster. A chi-square test of independence was conducted to determine the association between AHD and the different clusters, age bands, and sex. A binomial Logistic regression ascertains the effects of the clusters, age band, and sex on the likelihood of clients having AHD.

**Results:** Out of 4,229 clients, 35% (N=1473, Female 54%, male 46%) with CD4 results were eligible for the study, 40% were within the age band 5-9 while 60% were within the age band 10-14. Cumulative prevalence of AHD was 20.8%, with Cluster 6 having the highest (43.1%) followed by Cluster 4 (37.8%). Cluster 2 had the lowest AHD rate of 14.1%. chi-square of independence shows a significant association between cluster and AHD,  $\chi^2(9) = 93.89$ ,  $p < .001$ , (Wald = 84.5(5),  $p < 0.001$ ). Cramer's V (0.252) shows a moderately strong association. There was no significant association between AHD and age ( $p=0.14$ ), and AHD and sex ( $p=0.67$ ). The logistic regression model was significant,  $\chi^2(7) = 83.$ ,  $p < .001$ . Hosmer and Lemeshow test shows the model is not a poor fit ( $p=0.48$ ) by correctly classifying 79.2% of cases. Persons with HIV in clusters 6 and 4 had 4.1- and 3.3 higher odds for AHD respectively

**Conclusions:** AHD varies by geography with some areas having a very high prevalence. Resources must intentionally target those clusters to reduce AIDS-related mortality. There is a strong association between state clusters and AHD.

## EPC049

Global and regional genetic diversity of HIV-1 in 2010-2021: systematic review, individual patient data meta-analysis, and trend analysis

M. Nair<sup>1</sup>, L. Gettins<sup>2</sup>, M. Fuller<sup>1</sup>, S. Kirtley<sup>3</sup>, J. Hemelaar<sup>1</sup>

<sup>1</sup>University of Oxford, Infectious Disease Epidemiology Unit, National Perinatal Epidemiology Unit, Oxford Population Health, Oxford, United Kingdom, <sup>2</sup>University of Oxford, Oxford Population Health, Oxford, United Kingdom, <sup>3</sup>University of Oxford, Centre for Statistics in Medicine, Nuffield Department of Orthopaedics, Rheumatology and Musculoskeletal Sciences, Botnar Research Centre, Oxford, United Kingdom

**Background:** The extensive global genetic diversity of HIV-1 poses a major challenge to HIV vaccine development. We aimed to determine recent estimates and trends of the global and regional distributions of HIV-1 genetic variants.

**Methods:** We conducted a systematic literature review by searching PubMed, Embase, Global Health and CINAHL for studies containing country-specific HIV-1 subtyping data, published between Jan 1, 2010 and Sep 16, 2022. The proportions of HIV-1 subtypes, circulating recombinant forms (CRFs), and unique recombinant forms (URFs) in each country were weighted by UNAIDS estimates of the numbers of people living with HIV (PLHIV) in each country to obtain regional and global estimates of HIV-1 diversity for the time periods 2010-2015 and 2016-2021.

**Results:** We obtained 1044 datasets, containing HIV-1 subtyping data from 653,013 PLHIV from 122 countries in 2010-2021. In 2016-2021, subtype C accounted for 50.4% of global HIV infections, followed by subtype A (12.4%), sub-

Oral  
abstracts

type B (11.3%), CRF02\_AG (6.6%), CRF01\_AE (5.4%), subtype G (2.9%), subtype D (2.6%), URFs (2.0%), other CRFs (1.9%), CRF07\_BC (1.2%), and subtype F (0.9%). Subtypes H, J, and K each accounted for  $\leq 0.1\%$  of infections.

Compared to 2010-2015, we observed significant ( $p < 0.00001$ ) increases in global proportions of subtype A (+0.9%), subtype C (+3.4%), and CRF07\_BC (+0.4%), decreases in subtype D (-0.5%), subtype G (-0.8%), CRF02\_AG (-0.8%), other CRFs (-0.7%) and URFs (-2.4%), and no changes for subtype B and CRF01\_AE. The global proportion of infections attributed to recombinants decreased from 21.6% in 2010-2015 to 19.3% in 2016-2021 (-2.3%).

Regional distributions of HIV-1 variants were complex and evolving, with global trends in the prevalence of HIV-1 variants supported by trends across the regions.

**Conclusions:** Global and regional HIV-1 genetic diversity are complex and continue to evolve. Continued and improved surveillance of HIV-1 variants remains vital for HIV vaccine development and implementation.

## EPC050

### Trend of newly diagnosed cases of HIV at Assiut university hospital years 2019-2023

D. Amir<sup>1</sup>

<sup>1</sup>Faculty of Medicine - Assiut University, Assiut, Egypt

**Background:** This study is addressing the scarcity of data on HIV epidemiology in Egypt by providing a description of the 5-year trend of accidentally discovered HIV cases in the largest university hospital in Upper Egypt serving mainly Assiut Governorate; a population of approximately 5 million.

Egypt is reported to have a fastest growing numbers of HIV cases annually with an increase of 25-30%. University hospitals have a limited role in the national AIDS control program (NAP), mainly notification.

**Methods:** A descriptive study of all newly diagnosed cases of HIV at Assiut University Hospitals 'AUH' between 2019 and 2023.

**Results:** Between 2019 and 2023 there were 355 cases. The annual percent increase between 2020 and 2019 was 41.9%, for the other years 29.5%, 49.1% and 60.47% respectively. In 2023 there were 138 cases comprising 43.1% of all identified cases in Assiut Governorate. 79% of the cases were between 20-39 years of age, males represent 95.7% and 51.8% were single and 42.3 % were currently married. 81% of identified cases had clinical complaints, 25.4% were addicts and 10.9% were blood donors.

Second visits were extremely rare, only 6%. 2023 had the largest number of newly identified HIV cases and HIV deaths (19.6%) as well. The outstanding findings were that 78% of HIV cases had HCV, 62.2% of wives were not tested for their status, those who initiated the treatment were 48.9%, whose knew their status but didn't initiate treatment was 18.0% and 33.3% were drop out.

**Conclusions:** Our finding suggested that the increase in cases is alarming and that the efforts of NAP to contain the outbreak in the key population that was reported since the 90s is questionable and needs evaluation. A better coordination with the NAP is needed that would support the program. University hospitals can be involved in clinical management of HIV with HCV comorbidities. Wives of HIV cases are at great risk due to not knowing their HIV status. The few second visits suggest that stigma and discrimination may be the cause.

## EPC051

### Improving identification and management of advanced HIV disease among people living with HIV in Côte d'Ivoire

M.H. Kingbo<sup>1</sup>, A. Bitty-Anderson<sup>1</sup>, L. Denoeud-Ndam<sup>2</sup>, F. Eboumou<sup>3</sup>, A. Mayi<sup>4</sup>, S. Noina<sup>5</sup>, M. N'Goran Kouadio<sup>3</sup>, C.-J. Diby<sup>6</sup>, A. Tiam<sup>7</sup>

<sup>1</sup>Elizabeth Glaser Pediatric AIDS Foundation Côte d'Ivoire, Program Evaluation and Research, Abidjan, Côte d'Ivoire,

<sup>2</sup>Elizabeth Glaser Pediatric AIDS Foundation Geneva, Switzerland, Research, Geneva, Switzerland, <sup>3</sup>Elizabeth Glaser Pediatric AIDS Foundation Côte d'Ivoire, Program, Abidjan, Côte d'Ivoire, <sup>4</sup>Elizabeth Glaser Pediatric AIDS Foundation Nairobi, Kenya, Program, Nairobi, Kenya, <sup>5</sup>Elizabeth Glaser Pediatric AIDS Foundation Washington DC, Medical and Scientific Affairs, Washington DC, United States, <sup>6</sup>Elizabeth Glaser Pediatric AIDS Foundation Côte d'Ivoire, Strategic Information & Evaluation, Abidjan, Côte d'Ivoire, <sup>7</sup>Elizabeth Glaser Pediatric AIDS Foundation Washington DC, Technical Strategies and Innovation, Washington DC, United States

**Background:** Advanced HIV disease (AHD) remains a challenge, with 30% of people living with HIV (PLHIV) presenting with AHD and the majority of HIV-related deaths attributed to AHD. EGPAF introduced a refined and optimized package of care and treatment for AHD clients in five health districts of Abidjan, Côte d'Ivoire.

**Description:** The AHD package of care, implemented in 30 health centers, comprised of monitoring and evaluation capacity building, updated guidelines, standard operating procedures, job aids and tools, training of healthcare workers, technical support and mentorship, strengthened sample transport, and strengthened capacity of lay health workers and expert clients for referrals between hubs and spokes. As of September 2023, clients started to receive AHD screening and care.

**Lessons learned:** From September to December 2023, 1,359 PLHIV were evaluated for AHD (ART naïve individuals 66.1% [n=898], returns to care after ART interruption 28.0% [n=380], ART treatment failure 6.0% [n=81]), among whom 31.1% (n=422) were diagnosed with AHD, compared to 8.2% (n=114) PLHIV with AHD in the previous quarter (June to August 2023),  $P < 0.0001$ . The implementation of the care

package re-introduced the use of CD4 staging for the identification of AHD: 66.4% of eligible clients (n=903) had CD4 tests, compared to 11.8% (n=163) the previous quarter ( $P<0.0001$ ). The emphasis on systematic use of rapid tests has led to an increased use of LF-LAM tests for tuberculosis (TB), with 365/420 (86.9%) PLHIV with AHD screened with LF-LAM vs. 46/114 (40.4%) the previous quarter ( $P<0.0001$ ) resulting in 71 diagnosed with TB (16.9%) this quarter. Similarly, the introduction of the Cryptococcal antigen (CrAg) blood tests resulted in 84.8% (358/422) clients with AHD screened compared to 0% (0/114) previously ( $P<0.0001$ ); the 3.1% (11/358) with CrAg positive tests all received adequate therapy.

**Conclusions/Next steps:** Coaching and mentoring healthcare providers as well as procuring key commodities are essential in the effective implementation of an AHD care package, especially in a low-prevalence setting such as Côte d'Ivoire. This pilot project will continue until October 2024. The effectiveness of this intervention will be measured by comparing clients' outcomes in the periods pre- and post-intervention.

## EPC052

### Estimates of annual HIV incidence and its distribution among key populations in Mexico (2022)

E. Bravo-García<sup>1</sup>, C. Magis-Rodriguez<sup>1</sup>, H. Ortiz-Perez<sup>2</sup>

<sup>1</sup>Universidad Nacional Autónoma de México, Departamento de Salud Pública, Ciudad de México, Mexico, <sup>2</sup>Universidad Autónoma Metropolitana, Departamento de Atención a la Salud, Ciudad de México, Mexico

**Background:** Incidence is the best indicator to understand the evolution of an epidemic and identify the most affected groups. The objective was to estimate the annual incidence of HIV in the adult population and its distribution among key populations in Mexico (2022).

**Methods:** The UNAIDS Modes of Transmission (MoT) model was applied, using the following sources of information: national surveys (Census 2020, ENDISEG 2019, ENCODAT 2016-2017); HIV prevalence (Censida); as well as epidemiological records from health institutions and other additional sources.

**Results:** An estimated 313,000 adults aged 15-49 years were living with HIV (prevalence 0.42%); with an annual incidence of 31 cases per 100 thousand adults (21,300 new HIV cases). 87% of these new cases were concentrated in key populations and their partners: men who have sex with men (73.7%) and their female partners (4.4%); injecting drug users and their partners (5.4%); sex workers, partners and clients (1.5%); trans people (1.3%); and persons deprived of liberty (0.02%). The remaining HIV cases corresponded to low-risk heterosexual population (10.2%) and people who have heterosexual casual sex and their partners (3.3%).

**Conclusions:** MoT provided an estimate of HIV incidence and its distribution among groups by mode of transmission, confirming its high concentration in key populations. Consequently, the best alternative is to prioritize prevention actions in these populations (timely detection of HIV and STIs, condom use, PrEP and PEP). If not, Mexico will hardly meet the 95-95-95 goals by 2030.

## EPC053

### Stigma and use to health services among people who inject drugs in Iran; bio-behavioral surveillance survey in 2020

N. Nasiri<sup>1</sup>, H. Sharifi<sup>2</sup>, A. Mirzazadeh<sup>3</sup>, M. Dehghan<sup>4</sup>

<sup>1</sup>School of Public Health, Jiroft University of Medical Sciences, Jiroft, Iran, Jiroft, Iran, Islamic Republic of, <sup>2</sup>HIV/STI Surveillance Research Center, and WHO Collaborating Center for HIV Surveillance, Institute for Futures Studies in Health, Kerman University of Medical Sciences, Kerman, Iran, Islamic Republic of, <sup>3</sup>Department of Epidemiology and Biostatistics, Institute for Global Health Sciences, University of California San Francisco, San Francisco, CA, USA, California, United States, <sup>4</sup>School of Nursing and Midwifery Nursing Research Center Kerman University of Medical Sciences, Kerman, Iran, Islamic Republic of

**Background:** The use of health services among people who inject drugs (PWID) is crucial for reducing the spread of HIV, sexually transmitted infections, and other diseases. This study aimed to identify the barriers that hinder PWIDs from using health services.

**Methods:** This cross-sectional study was conducted using Respondent-Driven Sampling (RDS) in 11 cities in Iran from June 2019 to March 2020. The data was collected using a standard questionnaire through face-to-face interviews. The questionnaire included participants' demographics, use of health services, income, history of the prison, health condition, and age initiative of drug.

The criteria to participate in the study included;

1. Age  $\geq 18$  years.
2. Confirmed non-medical injection in the last 12 months.

3. Living in the target city of the study.
4. Provide oral consent.
5. Understanding the Persian language, and;
6. Having a valid RDS referral coupon.

A composite variable was calculated to measure stigma and discrimination, with a score range of 0 to 100. Chi-square tests and logistic regression models were used to analyze the data.

**Results:** A total of 2,663 PWIDs-participated in the survey, of which 96% (n=2564) were male. The mean age was  $41 \pm 0.18$  years. Among 2,651 PWID who responded to the question about stigma and discrimination, 41% (n=1,095) had high levels of stigma and discrimination. PWID who experienced high levels of stigma and discrimination had 70% less use of health services (OR=0.3, 95% Confidence interval=0.2-0.4). PWID with insurance had 60% more use of health services (OR= 1.6, CI; 1.3-1.9). The PWID with a university education had the highest usage of health services (OR= 1.6 (CI; 0.98-2.8).

**Conclusions:** The study found that the use of health services was low among PWIDs, and stigma and discrimination were significant barriers. Increasing the knowledge of health workers and the community can help reduce stigma and increase the use of health services. Of course, with rise in coverage of insurance can increase visits to doctors and other health workers.

## EPC054

The relationship between migrant status and HIV status, antiretroviral treatment, and viral load suppression in Zimbabwe, using population-based HIV impact assessment data, 2020

S. Kanno<sup>1</sup>, K. Ganesan<sup>1</sup>, S. Wallach<sup>1</sup>, A. Howard<sup>1</sup>, Y. Hirsch-Moverman<sup>1</sup>, M.A. Chiasson<sup>1</sup>, J. Mantell<sup>2</sup>, A. Low<sup>1</sup>  
<sup>1</sup>Columbia University, Mailman School of Public Health, Epidemiology, New York, United States, <sup>2</sup>Columbia University, Psychiatry, New York, United States

**Background:** To address gaps in the UNAIDS HIV treatment cascade in Zimbabwe, there is a need to focus on priority populations, including migrants, who are vulnerable to HIV acquisition because of family/spouse separation, limited social support, and inadequate healthcare access. We assessed relationships between migration and HIV-positive status (HPS), use of antiretroviral treatment (ART), and viral load suppression (VLS) and examined differences by age, sex, and marital status.

**Methods:** We used data from the 2020 Zimbabwe Population-based HIV Impact Assessment, a household-based national survey (age  $\geq 15$  years) assessing sociodemographic characteristics, ART, and HIV outcomes. We examined the relationship between migration (ever vs. never lived away for >1 month) and HPS; self-reported ART; and VLS (<1000 copies/ml), adjusting for age, sex, urban/rural residence, marital status, education, and wealth quintile,

using jackknife weighting procedures and logistic regression models. We assessed multiplicative interaction by age (10-year groups), sex, and marital status (married vs. nonmarried) using chi-squared tests.

**Results:** Among 19,524 participants, 28.5% were migrants (among migrants: 53.3% female, 46.7% male; and 44.6% married, 55.4% nonmarried). Migrants had greater odds of HPS (aOR:1.27; 95%CI:1.16,1.40). Among those with HPS (n=2,956), there was no association between migrant status and ART use (aOR:0.86; 95%CI:0.55,1.37).

Among those on ART (n=2423), migrants had lower odds of VLS (aOR:0.62; 95%CI:0.46,0.84). We found no significant interaction by age (HPS: p=0.184; ART: p=0.699; VLS: p=0.589) or sex (HPS: p=0.964; ART: p=0.440; VLS: p=0.714).

We found interaction by marital status (HPS: p=0.041; ART: p=0.013; VLS: p=0.848), with married migrants experiencing greater odds of HPS (married: aOR:1.31; 95%CI:1.17,1.48; nonmarried: aOR:1.19; 95%CI:1.02,1.38), and lower odds of ART (married: aOR:0.53; 95%CI:0.29,0.95; nonmarried: aOR:2.11; 95%CI:0.96,5.17).

**Conclusions:** Zimbabwean migrants had greater odds of HPS and lower odds of VLS, and married migrants experienced greater odds of HPS and lower odds of ART. This is one of the first studies to examine HIV treatment and outcomes among migrant populations in Zimbabwe. Future analyses should further examine patterns of HIV acquisition and barriers to accessing HIV services in migrant populations to develop targeted interventions for at-risk subgroups and address gaps in the HIV treatment cascade in Zimbabwe.

**Background:** Despite progress in antiretroviral therapy (ART) access for children living with HIV (CLHIV), achieving viral load coverage (VLC) and viral load suppression (VLS) remains challenging. To address gaps and help achieve

the United Nations Programme on HIV/AIDS' (UNAIDS) goal of 95% VLS among those on ART, the President's Emergency Plan for AIDS Relief (PEPFAR) launched the "Accelerating Progress in Pediatric and Prevention of Mother-to-Child Transmission" (AP3) strategy in October 2022. We describe VLC and VLS trends from 2021 to 2023 among CLHIV at PEPFAR-supported sites across four countries implementing the AP3 strategy.

**Methods:** We analyzed PEPFAR Monitoring, Evaluation, and Reporting quarterly data from January-March 2021 to April-June 2023 for CLHIV aged <15 years attending PEPFAR-supported sites in Mozambique, Nigeria, Tanzania, and Zambia. Quarterly VLC and VLS were calculated overall and for each country. VLC was calculated using the proportion of clients eligible for a VL test (on ART ≥6 months) with a recorded result relative to the total number of clients on treatment two quarters earlier. VLS represents the proportion of clients with a VL result that were <1,000 copies/mL. Trends in VLC and VLS were assessed over the 2.5-year period by calculating percentage-point changes between January-March 2021 and April-June 2023.

**Results:** At the beginning of this analysis, the VLC across all countries was 78% (168,600/215,290). Of those, 80% (135,332/168,600) had VLS. By June 2023, overall VLC increased to 85% (197,743/234,084). Mozambique experienced the largest increase (17%), followed by Tanzania and Zambia (7% and 4%, respectively), and it decreased in Nigeria by 7%. By June 2023, overall VLS increased to 91% (179,209/197,734), with Mozambique and Nigeria experiencing the largest increases (16% and 10%, respectively), followed by Tanzania (9%), and Zambia (8%). Tanzania was the only country to reach the UNAIDS target of 95% VLS.

**Conclusions:** While most countries demonstrated progress in VLC and VLS, achieving the UNAIDS 95% VLS target remains challenging. Findings reveal disparities in improvement across countries, emphasizing the need for continued, targeted strategies tailored to each country's context to ensure equitable access to viral load testing and continuously improve HIV care for all CLHIV.

### Progress towards the UNAIDS 95-95-95 targets and population HIV viral load suppression among female sex workers and sexually exploited girls in six major towns in Zambia

H. Solomon<sup>1</sup>, N. Philip<sup>2</sup>, L. Chelu<sup>3</sup>, R. Handema<sup>4</sup>, L. Chilukutu<sup>3</sup>, K. Kapungu<sup>4</sup>, H. Chung<sup>2</sup>, K. Nkumbwa<sup>5</sup>, T. Dzinamarira<sup>3</sup>, G. Reid<sup>2</sup>, L. Tally<sup>6</sup>, E. Kim<sup>1</sup>, A. Hakim<sup>1</sup>, L. Mulenga<sup>5,7</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States, <sup>2</sup>ICAP at Columbia University, New York, United States, <sup>3</sup>ICAP at Columbia University, Lusaka, Zambia, <sup>4</sup>Tropical Diseases Research Centre, Ndola, Zambia, <sup>5</sup>Ministry of Health Zambia, National HIV/AIDS/STI/TB Council, Lusaka, Zambia, <sup>6</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Windhoek, Namibia, <sup>7</sup>University of Zambia, School of Medicine, Division of Infectious Diseases, Lusaka, Zambia

**Background:** Progress toward achievement of the UNAIDS 95-95-95 targets among female sex workers (FSW, aged ≥18-years(y) and sexually exploited girls (SEG, aged 16-17y) in Zambia is understudied.

We assess achievements towards the UNAIDS 95-95-95 targets and population viral load suppression (VLS) among FSW/SEG in six major towns (Chipata, Kitwe, Lusaka, Mazabuka, Mongu, and Solwezi) in Zambia.

**Methods:** We conducted a cross-sectional respondent-driven-sample (RDS) survey from March-May 2023 among FSW/SEG (N=2308) who exchanged sex for money, goods, or services in the preceding six months.

Consenting participants completed an interviewer-administered questionnaire and tested for HIV and HIV viral load. Town-specific RDS-weighted results were aggregated by accounting town-specific FSW/SEG population size. Chi-squared tests of independence between age categories and each 95-95-95 target was performed. Prevalence ratios (PR) were calculated using generalized

Poisson regression with robust errors to evaluate correlates of unsuppressed viral load (≥1000 cells/microliter). VLS was adjusted to reflect self-reported prior HIV diagnosis and treatment status to account for FSW/SEG who did not disclose a prior diagnosis or being on treatment.

**Results:** HIV prevalence among FSW/SEG was 37.0% (95% confidence interval (CI): 33.8, 40.1); prevalence was 11.7% (8.9, 14.4) among 16-24y and 55.1% (51.0, 59.1) among ≥25y. Among FSW/SEG living with HIV, 89.4% (86.4, 92.4) were previously diagnosed [16-24y: 63.0% (49.2, 76.8); ≥25y: 93.2% (90.6, 95.7); p<0.001].

Among those previously diagnosed, 99.6% (99.3, 99.9) were on treatment [16-24y: 100.0% (100.0, 100.0); ≥25y: 99.6% (99.2, 99.9)]. Among those on treatment, 96.9% (94.7, 99.0) had VLS [16-24y: 98.9% (97.8, 99.9); ≥25y: 96.8% (94.4, 99.1)]. VLS was 87.3% (83.8, 90.8) [16-24y: 64.8% (51.3, 78.3); ≥25y: 90.5% (87.0, 93.9)].

Prevalence of unsuppressed viral load was higher among FSW/SEG 16-24y compared to FSW ≥25y [35.2% versus 9.5%; adjusted PR: 1.11 (1.02, 1.21), p<0.0001].

**Conclusions:** FSW/SEG across major Zambian towns surpassed the UNAIDS 2<sup>nd</sup> 95, 3<sup>rd</sup> 95, and population VLS targets. However, disparities remain with less than two-thirds of young FSW/SEG aware of their HIV status and one-third having an unsuppressed viral load. The elevated risk among individuals under 25 years demands targeted approaches including increased HIV testing and engagement in targeted HIV prevention programs appropriate for younger key populations.

## EPC057

### Dried blood spot samples more likely to be classified as recent HIV infections than venous-blood samples: a comparison of sample types in a national sex worker programme in Zimbabwe

H.S. Jones<sup>1</sup>, F. Machingura<sup>2</sup>, L. Gaihai<sup>2</sup>, M. Makamba<sup>2</sup>, G. Murphy<sup>3</sup>, T. Chanyowedza<sup>2</sup>, P. Masvikeni<sup>2</sup>, E. Matsikire<sup>2</sup>, P. Matambanadzo<sup>2</sup>, S. Musemburi<sup>2</sup>, P.N. Chida<sup>2</sup>, J. Dirawo<sup>2</sup>, O. Mugurungi<sup>4</sup>, S. Bourdin<sup>1</sup>, B. Hensen<sup>5</sup>, L. Platt<sup>1</sup>, J.R. Hargreaves<sup>1</sup>, F.M. Cowan<sup>6,2</sup>, B. Rice<sup>7</sup>

<sup>1</sup>The London School of Hygiene & Tropical Medicine, Public Health & Policy, London, United Kingdom, <sup>2</sup>Centre for Sexual Health and HIV/AIDS Research (CeSHHAR) Zimbabwe, Harare, Zimbabwe, <sup>3</sup>Independent Consultant, London, United Kingdom, <sup>4</sup>AIDS and TB Directorate, Ministry of Health and Child Care, Harare, Zimbabwe, <sup>5</sup>Institute of Tropical Medicine, Sexual and Reproductive Health Group, Dept of Public Health, Antwerp, Belgium, <sup>6</sup>Liverpool School of Tropical Medicine, Faculty of Global Health, Liverpool, United Kingdom, <sup>7</sup>University of Sheffield, Sheffield Centre for Health and Related Research (SCHARR), School of Medicine and Population Health, Sheffield, United Kingdom

**Background:** Routinely delivered recent HIV infection testing could inform our understanding of trends in new HIV infections and improve programme performance. Balancing test accuracy and ease of implementation are important considerations. We implemented a Recent Infection Testing Algorithm (RITA) in a national female sex worker (FSW) programme in Zimbabwe and compared recent HIV infection classifications between dried blood spot (DBS) and venous-blood (plasma) samples.

**Methods:** Between October 2021-January 2023 all FSW newly testing positive were eligible for enrolment. DBS and plasma samples were collected and tested with the Maxim HIV-1 Limiting Antigen Avidity (LAG Avidity) Enzyme Immunoassay (EIA). Plasma samples were tracked and delivered to the laboratory within 24 hours and DBS samples sealed and delivered to the laboratory within 14 days. Samples with a normalized optical density (ODn)

abstracts

Author  
Index

$\leq 1.5$  and a viral load  $\geq 1000$  copies/ml were classified as recent infections. Bland-Altman regression analysis was used to compare sample classification.

**Results:** 467 FSW consented to paired sample collection. Plasma testing classified 10.3% (48/467) and DBS 12.2% (57/467) as recent infections, with 78% (46/59) agreement. Samples from 13 FSW gave discordant results: 11 samples were classified longstanding with the plasma assay but recent with DBS; 2 samples classified as longstanding with DBS were classified as recent with plasma. Plasma samples generally had a higher ODn, by a mean difference of 0.52 ODn (SD 0.99). Variance across ODn values was inconsistent. Based on the plasma-derived percentage of recent infections, DBS gives a false recency rate of 15.8% (9/57).

**Conclusions:** DBS testing for recent HIV infection as part of a RITA is easier to implement in a programme context than plasma testing, but likely to overestimate recent HIV infections. For surveillance, adjustments could be made for potential overestimation but there may be implications if recent HIV infection testing is to inform a programme response.

## EPC058

Resistance mutations in individuals starting antiretroviral therapy containing dolutegravir and associated factors: retrospective cohort, Brazil 2017-2019

I.F. Chagas dos Santos<sup>1</sup>, A. Sampaio Moura<sup>2</sup>, M. Marchesotti Dutra Ferraz<sup>3</sup>, M.d.G. Braga<sup>1</sup>

<sup>1</sup>Universidade Federal de Minas Gerais, Faculdade de Farmácia - Departamento de Farmácia Social, Belo Horizonte, Brazil, <sup>2</sup>Universidade José do Rosário Vellano (UNIFENAS-BH), Belo Horizonte, Brazil, <sup>3</sup>Universidade Federal de Minas Gerais, Instituto de Ciências Exatas - Departamento de Estatística, Belo Horizonte, Brazil

**Background:** The World Health Organization (WHO) recommends dolutegravir (DTG) as a component of the first-line antiretroviral regimen. Since 2017, Brazil's preferred first-line regimen has been DTG + lamivudine (3TC) and tenofovir (TDF). Considering reports of the emergence of mutations associated with DTG resistance, this study aims

to evaluate the presence of integrase viral resistance mutations in individuals initiating antiretroviral therapy (ART) containing DTG who underwent genotyping and the associated factors.

**Methods:** A retrospective cohort study was conducted, including treatment-naïve individuals initiating ART in Brazil. Participants were identified through a probabilistic linkage of three databases provided by the Ministry of Health to the GEADIC research group: the Drug Logistics Control System (SICLOM), the Laboratory Exams Control System (SISCEL), and the Genotyping Exams Control System (Sisgeno).

Sociodemographic, clinical, and treatment-related characteristics of individuals with genotyping records from January 2017 to December 2019 were analysed. DTG resistances were classified using the HIVdb Program, Stanford HIVdb.

Adherence was measured by the proportion of days covered (PDC)  $>80\%$  through the CMA5 calculation. Factors associated with the presence of DTG resistance were assessed through logistic regression.

**Results:** Of the 430 participants, the majority were male (50.9%), aged 30 to 39 years (31.2%), from the southeastern region of Brazil (34.0%), with 8 to 11 years of education (26.0%), of brown skin color (38.8%), single (37.9%) and non-adherent to ART (62.2%).

At the time of HIV-1 diagnosis, 15.8% had a count  $>100,000$  copies/mL, and 22.1% had a count  $\leq 200$  CD4<sup>+</sup> lymphocytes/ $\mu$ L. At the time of genotyping registration, 10.5% had a count  $>100,000$  copies/mL and 17.7% had a count  $\leq 200$  CD4<sup>+</sup> lymphocytes/ $\mu$ L. There was 7.0% DTG resistance (n=30); the most prevalent mutation is N155H (n=10), followed by R263K and Q148R (n=5), E138K and E92Q (n=4), E138A (n=2), G140S, Q148H, S147G, and G188R (n=1).

The final model with the factors associated with resistance ( $p < 0.05$ ) is sex male, use of raltegravir in a regime following the first-line regime, need to switch ART, resistance to NRTI class, viral load at diagnosis.

**Conclusions:** Although DTG resistance in individuals initiating treatment was rare (7.0%), monitoring DTG resistance should be especially vigilant concerning individual, clinical and treatment-related characteristics.

### Population estimates of adolescents living with HIV (ALHIV) 15-19 years and proportions undiagnosed in Cameroon, Ethiopia, Kenya, Namibia and Rwanda using the Population HIV Impact Assessment (PHIA) surveys

C.A. Teasdale<sup>1</sup>, R. Zimba<sup>1</sup>, E.J. Abrams<sup>2</sup>, G. Ekali<sup>3</sup>, Z. Melaku<sup>4</sup>, M. Hawken<sup>5</sup>, V. Mugisha<sup>6</sup>, A. Low<sup>2</sup>

<sup>1</sup>CUNY Graduate School of Public Health & Health Policy, Epidemiology & Biostatistics, New York, United States,

<sup>2</sup>ICAP at Columbia University, New York, United States,

<sup>3</sup>ICAP at Columbia University, Yaounde, Cameroon, <sup>4</sup>ICAP at Columbia University, Addis Ababa, Ethiopia, <sup>5</sup>ICAP at Columbia University, Nairobi, Kenya, <sup>6</sup>ICAP at Columbia University, Kigali, Rwanda

**Background:** It is estimated that only half of adolescents living with HIV (ALHIV) 10-19 years know their status and, among those, only 65% are on antiretroviral therapy (ART). We used Population HIV Impact Assessment (PHIA) surveys conducted in Cameroon, Ethiopia, Kenya, Namibia and Rwanda (2017-2019) to estimate country-specific populations of ALHIV and proportions of ALHIV who were undiagnosed by country.

**Methods:** PHIA surveys are nationally representative household surveys measuring HIV outcomes. HIV rapid test data, ARV detection (with dried blood spot) and self-reported data from participants were used to estimate numbers of ALHIV 15-19 years in each country and to estimate the proportion of undiagnosed ALHIV. ALHIV reporting negative or unknown HIV status who did not have detectable ARVs were considered undiagnosed.

Survey weights with jackknife variance were used to generate national estimates of ALHIV and undiagnosed ALHIV (population estimates derived from national statistical projections).

**Results:** Based on the PHIA surveys, conducted between 2017-2019, there were an estimated 95,945 (95% probability band (PB) 75,989-115,902) ALHIV across the five countries; the largest population was in Kenya (41,877; 95% PB 25,985-57,769), Rwanda had the smallest (7,458; 95% PB 4,736-10,180) (Table 1).

Across all five countries, 30,162 (31.4%) ALHIV were estimated to be undiagnosed; 28.7% of ALHIV 15-17 years and 37.9% of ALHIV 18-19 years were undiagnosed. The proportion of ALHIV who were undiagnosed varied by country; Cameroon had the highest proportion (78.2%) of undiagnosed ALHIV while Kenya (16.2%) and Namibia (17.7%) had the lowest.

	Population estimates ALHIV 15-19 years					Population estimates of undiagnosed ALHIV 15-19 years				
	all 15-19 years	15-17 years	18-19 years	all 15-19 years	% of	all 15-19 years	15-17 years	18-19 years	all 15-19 years	% of
Cameroon (2017-2019)	14,176	6,443 (4,600-8,286)	7,733	4,202 (3,124-5,280)	29.7%	10,974	5,241 (3,715-6,959)	5,733	4,007 (2,844-5,170)	28.3%
Ethiopia (2017-2019)	41,877	20,465 (17,180-23,760)	21,412	11,412 (9,785-13,039)	27.3%	11,412	5,706 (4,891-6,527)	5,706	2,706 (2,187-3,225)	23.6%
Kenya (2017-2019)	41,877	20,465 (17,180-23,760)	21,412	11,412 (9,785-13,039)	27.3%	11,412	5,706 (4,891-6,527)	5,706	2,706 (2,187-3,225)	23.6%
Namibia (2017-2019)	7,458	3,729 (2,460-4,998)	3,729	1,864 (1,152-2,576)	25.0%	1,864	932 (588-1,220)	932	466 (284-644)	25.0%
Rwanda (2017-2019)	7,458	3,729 (2,460-4,998)	3,729	1,864 (1,152-2,576)	25.0%	1,864	932 (588-1,220)	932	466 (284-644)	25.0%
All countries	95,945	47,972 (40,816-55,128)	47,973	25,550 (21,657-29,443)	26.6%	25,550	12,775 (10,915-14,635)	12,775	6,388 (5,194-7,582)	25.0%

95% PB = probability band

**Conclusions:** Across five sub-Saharan African countries, more than 30,000 ALHIV 15-19 years of age were undiagnosed and thus not on ART in 2017-2019. These data are evidence of uneven progress in identifying ALHIV by country, and underscore the need to address gaps in diagnosis and treatment for all ALHIV to improve their health outcomes and reduce HIV transmission.

## EPC060

### Mitigating new AIDS cases through poverty elimination by 2030: a Latin American perspective

A.P. Bertoni<sup>1</sup>, F. Rubio<sup>1</sup>, J.A. Ordoñez<sup>1</sup>, R. Anderle<sup>1</sup>, P. Pinto<sup>1</sup>, C. Chivardi<sup>2</sup>, A. Moncayo<sup>3</sup>, L.E. de Souza<sup>1</sup>, J. Macinko<sup>4</sup>, I. Dourado<sup>1</sup>, D. Rasella<sup>5</sup>

<sup>1</sup>Federal University of Bahia, Institute of Collective Health, Salvador, Brazil, <sup>2</sup>University of York, York, United Kingdom,

<sup>3</sup>Pontificia Universidad Católica del Ecuador, Quito, Ecuador,

<sup>4</sup>University of California, Los Angeles, United States,

<sup>5</sup>Institute of Global Health, Barcelona, Spain

**Background:** Amidst the ongoing global polycrisis marked by conflicts and epidemics, compounded by pervasive poverty and social disparities, vulnerable populations bear a disproportionate burden, elevating their susceptibility to HIV transmission and its progression to AIDS. In response, we predict how poverty elimination by 2030 could affect the incidence of new AIDS cases in Latin American (LA) countries.

**Methods:** We developed a mathematical model to analyze HIV transmission and AIDS progression. The population was split into five compartments incorporating the poverty level effect into the model parameters. We forecasted new AIDS cases from 2020 to 2030, leveraging country-specific data spanning 2000 to 2019. This comprehensive analysis factored in population demographics while integrating poverty data across three scenarios: baseline (reflecting a steady-state trend), decreasing, and increasing poverty levels. Our study includes seven of the most populous countries in LA: Argentina, Brazil, Chile, Colombia, Ecuador, Mexico, and Peru.

**Results:** The model showed that in the absence of further interventions and with the assumption of continued poverty reduction reaching zero by 2030, there is a potential decrease in AIDS incidence ranging from 3.75% to 13.86% compared to the baseline scenario. Conversely, under a scenario of gradually increased poverty, our estimates suggest a rise in AIDS incidence between 6.13% to 13.87%.

**Conclusions:** It was possible to show the importance of poverty reduction on the HIV/AIDS dynamics. Eliminating poverty by 2030 holds the potential to initiate a favorable trend, resulting in a decline in new AIDS cases. This, in turn, can play a crucial role in advancing the objectives outlined in the UNAIDS Global Plan, Ending the HIV/AIDS epidemic by 2030. Poverty elimination can positively impact healthcare access, raise awareness, and enhance overall

health conditions, thereby further reducing HIV transmission and improving AIDS care. This study underscores the substantial contribution of poverty alleviation efforts and other social protection policies in the fight against the HIV/AIDS pandemic.

## EPC061

### Pre-Exposure Prophylaxis (PrEP) program performance indicators by race/ethnicity among transgender persons receiving CDC-funded HIV testing in the United States

D. Patel<sup>1</sup>, W. Williams<sup>2</sup>, C. Wright<sup>1</sup>

<sup>1</sup>Centers for Disease Control and Prevention (CDC), Division of HIV Prevention, Atlanta, United States, <sup>2</sup>Public Health Analytic Consulting Services, Inc., Hillsborough, United States

**Background:** Although pre-exposure prophylaxis (PrEP) is effective at reducing the risk of HIV acquisition, disparities exist for use. Among transgender persons, PrEP use is particularly low among minoritized racial/ethnic groups. We examined program performance indicators for PrEP use and PrEP-related services by race/ethnicity among transgender persons with negative CDC-funded HIV tests in non-healthcare settings in the United States.

**Methods:** We used 2019-2021 HIV testing data submitted by CDC-funded state and local health departments (n=60) and community-based organizations (n=150) to the National HIV Prevention Program Monitoring & Evaluation system.

We analyzed the following program performance indicators for transgender persons with negative CDC-funded HIV tests: current PrEP use, eligibility for PrEP referral among those not currently using PrEP, referral to a PrEP provider among those eligible, and assistance with linkage to a PrEP provider among those who received a referral.

To compare each indicator by race/ethnicity, we calculated adjusted prevalence ratios (aPRs) with 95% confidence intervals (CIs) and p-values (adjusted for age, U.S. Census region, and year).

**Results:** The prevalence of current PrEP use among transgender persons was 10.6% overall and ranged from 5.7% to 14.8% by race/ethnicity; in adjusted models, current use was higher for Asian (14.8%; aPR: 1.64), Hispanic/Latino (12.2%; aPR: 1.34), and Black/African American (10.6%; aPR: 1.16) persons, and lower for American Indian/Alaska Native (5.7%; aPR: 0.56) persons, compared to White persons (8.6%; all p<0.05). Eligibility was higher for American Indian/Alaska Native (75.1%; aPR: 1.34) and Black (69.0%; aPR: 1.17) persons compared to White persons (61.9%; all p<0.001). Referral was higher for Native Hawaiian/Pacific Islander (59.5%; aPR: 1.36) persons, but lower for American Indian/Alaska Native persons (29.9%; aPR: 0.71), compared to White persons (49.0%; all p<0.05).

Assistance with linkage was higher among Black/African American (73.7%; aPR: 1.07) persons compared to White persons (69.7%; p<0.05).

**Conclusions:** PrEP use was low among transgender persons with negative CDC-funded HIV tests. The prevalence of PrEP-related services varied by racial/ethnic group and program performance indicator, suggesting that PrEP-related services could be expanded broadly to reach transgender persons of all racial/ethnic groups to increase PrEP use and reduce HIV acquisition for all transgender persons at greater risk for HIV infection.

## EPC062

### Model of voluntary medical male circumcision (VMMC) in Papua, Indonesia

N. Muryani<sup>1</sup>, I. Praptoraharjo<sup>1</sup>, J. Levy<sup>2</sup>, R.C. Bailey<sup>3</sup>

<sup>1</sup>University Centre of Excellence – AIDS Research Center Health Policy and Social Innovation, Atma Jaya Catholic University of Indonesia (UCoE – ARC HPSI AJCU), South Jakarta, Indonesia, <sup>2</sup>School of Public Health, University of Illinois at Chicago (UIC), Health Policy and Administration, Chicago, United States, <sup>3</sup>School of Public Health, University of Illinois at Chicago (UIC), Epidemiology and Biostatistics, Chicago, United States

**Background:** Voluntary medical male circumcision (VMMC) as a one-time procedure has been shown to reduce the risk of heterosexually acquired human immunodeficiency virus (HIV) in men by approximately 60%. Most men in Indonesia are circumcised except in Tanah Papua. HIV prevalence in Tanah Papua is ten times higher at 5% than the rest of Indonesia, and nearly all new HIV transmissions in Papua occur through heterosexual encounters.

This study was designed to develop a Papuan model of VMMC and to assess its feasibility, acceptability and safety as a comprehensive, culturally and age-appropriate intervention for HIV prevention among males ages 15-19 years.

**Methods:** Using a community-based participatory approach, the study was conducted from 10/21 – 09/23 in Nabire District, Central Papua Province. A Papuan model of VMMC was developed based on numerous meetings with government officials, health providers, teachers, students, parents, and community leaders, then subsequently introduced in 3 community health facilities. While all males over age 15 years were eligible for VMMC, recruitment focused especially on ages 15-19 years.

**Results:** A total of 104 males were screened at the 3 health facilities. Of these, 2 were underage, 1 lacked parental consent, 2 opted out of participation, 3 were ineligible for circumcision due to steroid injections to enlarge their penis and foreskin, and 2 tested HIV positive and declined circumcision. In total, 94 participants were circumcised of which 52 (55%) were ages 15-19 years. The

average pain score reported by participants was low: 3.4 (out of 10) immediately after circumcision and 3.3 at 30 minutes post-circumcision. No severe adverse events (AE) occurred. Two participants (2.1%) experienced a moderate AE. Upon follow-up, 98.9% said that all men in Papua should be circumcised; 100% agreed, that, "If I had a son, I would get him circumcised."; and 97.8% of participants reported that if they had it to do again, they would get circumcised.

**Conclusions:** Despite low VMMC uptake, the Papuan model proved feasible and safe with high satisfaction among participants. With additional education and community engagement, adoption should increase and VMMC expanded as an alternative intervention for HIV prevention in Papua.

## EPC063

Factors associated with increased HIV pre-exposure prophylaxis (PrEP) stigma among sexually active, HIV-negative transgender and gender-diverse adults in the United States

G. Vulakh<sup>1</sup>, L. Listerud<sup>2</sup>, W.Y. Lin<sup>2</sup>, F. Momplaisir<sup>3</sup>, J.A. Bauermeister<sup>2</sup>, D.L. Watson<sup>3</sup>

<sup>1</sup>Perelman School of Medicine, University of Pennsylvania, Philadelphia, United States, <sup>2</sup>School of Nursing, University of Pennsylvania, Department of Family and Community Health, Philadelphia, United States, <sup>3</sup>Perelman School of Medicine, University of Pennsylvania, Department of Medicine, Philadelphia, United States

**Background:** PrEP uptake remains low among transgender and gender-diverse (TGD) people in the United States (U.S.) due to a number of barriers including stigma. Among TGD adults in the U.S., we examined factors associated with stigma due to perceived PrEP-user stereotypes.

**Methods:** Data from this study come from a national online survey conducted with sexually active, HIV-negative TGD adults between April 2022 and June 2022 to examine participants' PrEP experiences and preferences. Univariate and multivariable logistic regressions were used to examine associations between high stigma levels due to PrEP-user stereotypes (mean PrEP Stereotype Subscale score >2.2 [range: 1-4] and participants' sociodemographic characteristics; expected disapproval from others for using PrEP (mean PrEP Disapproval Subscale score); and sexual history.

**Results:** Among 304 participants, 272 reported PrEP awareness and were included in the analysis: the median age was 24 years [range 18-56, SD: 5.9]; 150 (55.1%) were transmasculine or trans men; 89 (32.7%) nonbinary or genderqueer; 33 (12.1%) transfeminine or trans women; 165 (60.7%) non-Latinx white, 38 (14.0%) Latinx, 28 (10.3%) non-Latinx Black, and 41 (15.1%) non-Latinx another race. In the multivariable logistic regression model, the odds of high stigma levels due to PrEP-user stereotypes sig-

nificantly decreased as participants' age increased (adjusted odds ratio, aOR: 0.76, p=0.03) and significantly increased as participants' mean PrEP disapproval subscale scores increased (aOR: 3.31, p<0.001). Race and ethnicity, gender identity, and sexual history were not associated with increased PrEP stereotype stigma.

### Outcome: High PrEP-related stigma due to PrEP-user stereotypes (mean PrEP Stereotype Subscale score >2.2)

Characteristic	Unadjusted Odds Ratio [95% CI]	p-value	Adjusted Odds Ratio [95% CI]	p-value
Age (years)	0.80 [0.64, 0.99]	0.04	0.76 [0.59, 0.98]	0.03
Race & Ethnicity (Reference: Non-Latinx White)				
Non-Latinx Black	1.15 [0.51, 2.56]	0.74	1.66 [0.68, 4.06]	0.27
Non-Latinx Another Race	0.85 [0.42, 1.70]	0.64	0.81 [0.38, 1.74]	0.60
Latinx, Any Race	0.61 [0.29, 1.29]	0.20	0.65 [0.29, 1.45]	0.29
Gender identity (Ref: Transfeminine or trans woman)				
Transmasculine or trans man	1.26 [0.57, 2.79]	0.57	0.90 [0.37, 2.19]	0.82
Nonbinary, genderqueer, or another gender identity	1.87 [0.81, 4.31]	0.14	1.54 [0.61, 3.85]	0.36
PrEP-related disapproval stigma score, mean	3.07 [1.86, 5.08]	<0.001	3.31 [1.96, 5.58]	<0.001
Reports sex work (Ref: No sex work)	0.66 [0.36, 1.21]	0.18	0.71 [0.37, 1.38]	0.31
Reports prior STI diagnosis (Ref: No prior STI)	0.80 [0.46, 1.39]	0.43	1.10 [0.58, 2.06]	0.77

Table 1. Multivariable logistic regression analysis of factors associated with high PrEP-related stereotype stigma among a national online sample of HIV-negative transgender and gender-diverse adults in the United States (N=272).

Abbreviations: Ref, reference; 95% CI, 95% confidence interval.

**Conclusions:** Expected disapproval from others for using PrEP and younger age were associated with high levels of PrEP stigma among a diverse sample of HIV-negative TGD adults in the U.S. Tailored interventions should be developed by and in collaboration with young TGD people to disrupt community-level PrEP stigma and ensure interventions are salient to the needs of this diverse priority population.

## EPC064

### Relationship between secondary services referrals and services uptake to facilitate service Layering among adolescent girls and young women 10-24 years: a comparative analysis in four Provinces of Zimbabwe, 2023

E. Mugariri<sup>1</sup>, F. Mudzengerere<sup>2</sup>, D. Dhakwa<sup>3</sup>, K. Yogo<sup>3</sup>, F. Mudhokwani<sup>3</sup>, H. Mafaune<sup>4</sup>, T. Masoka<sup>4</sup>, T. Bhatasara<sup>5</sup>, M. Mutseta<sup>6</sup>, B. Nyamwanza<sup>7</sup>, R. Yekeye<sup>7</sup>, B. Madzima<sup>7</sup>, E. Tachiwenyika<sup>2</sup>, T. Tapfuma<sup>3</sup>

<sup>1</sup>Zimbabwe Health Interventions, Strategic Information, Marondera, Zimbabwe, <sup>2</sup>Zimbabwe Health Interventions, Knowledge Management, Harare, Zimbabwe, <sup>3</sup>Zimbabwe Health Interventions, Programs, Harare, Zimbabwe, <sup>4</sup>Zimbabwe Health Interventions, Strategic Information, Harare, Zimbabwe, <sup>5</sup>USAID, Programs, Harare, Zimbabwe, <sup>6</sup>MOHCC, Programs, Harare, Zimbabwe, <sup>7</sup>National AIDS Council, Programs, Harare, Zimbabwe

**Background:** Zimbabwe Health Interventions (ZHI) is implementing the Determined, Resilient, Empowered, AIDS-free, Mentored and Safe (DREAMS) program to reduce HIV incidence among adolescent girls and young women (AGYW) in 9 high HIV burden districts of Zimbabwe. Service layering is achieved through the referral of AGYW to clinical and other specialized service providers based on their vulnerabilities.

The program recorded low (60%) sexual and reproductive health (SRH) service referral completion between October 2021 and September 2022.

We assessed the relationship between service referrals and service uptake and availability within communities where DREAMS was implemented.

**Methods:** We conducted a descriptive cross-sectional study where routine program data for the period October 2022 to September 2023 were extracted from the DREAMS database. Relationship analysis was conducted using SPSS version 23 and MS Excel generating proportions and correlations between being referred for a secondary service and receiving the service.

The assessment was covered by the Medical Research Council of Zimbabwe-approved non-research determination protocol (MRCZ/E/254).

**Results:** A total of 23, 348 AGYW were referred for secondary services between October 2022 and September 2023 of which 4% were aged 10-14 years, 57% 15-19 years and 39% 20-24 years. About 93% (22,0930/23,348) received secondary services they were referred for. Uptake of services was 94% for the 10-14 years, 93% for the 15-19 years, and 94% for the 20-24 years.

Availability of services for referred AGYW at referral organizations was 99% across all age groups. There was a strong positive correlation between being referred for services and receiving the services referred for ( $r=0.9998$ ),  $p<0.01$ .

**Conclusions:** Service layering through referrals is an effective strategy for ensuring the provision of comprehensive, need-based HIV prevention services to AGYW. We recommend continued convening of weekly referral technical working group meetings to ensure that AGYW receive and/or take up the services they require.

## EPC065

### HIV Pre-exposure Prophylaxis (PrEP) coverage by geography and population among PEPFAR countries, 2022-2023

R. Yee<sup>1</sup>, E. Rowlinson<sup>1</sup>, C. Suraratdecha<sup>1</sup>, P. Vinayak<sup>1</sup>, J. Blanton<sup>1</sup>, H. Demeke<sup>1</sup>, S. Patel<sup>1</sup>, J. Abellera<sup>1</sup>, P. Patel<sup>2</sup>, PrEP-to-Need Collaborators

<sup>1</sup>The United States Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States, <sup>2</sup>The United States Centers for Disease Control and Prevention, National Center for Immunization and Respiratory Diseases, Atlanta, United States

**Background:** Pre-exposure prophylaxis (PrEP) is a valuable intervention in preventing HIV infections and ending HIV as a public health threat. It is important to ensure that PrEP is accessible to populations at highest risk of HIV.

We examined PrEP coverage in countries supported by the President's Emergency Plan for AIDS Relief (PEPFAR) to inform future programming.

**Methods:** To assess PrEP coverage, a PrEP-to-Need ratio (PnR) was calculated as the ratio of the number of individuals newly enrolled on PrEP to the number of new HIV diagnoses by country, key populations (men who have sex with men, female sex workers, transgender persons, persons who inject drugs), and age/sex.

We analyzed two PEPFAR Monitoring, Evaluation, and Reporting indicators, restricting data to the 49 countries that distributed PrEP in the last 12 months. Data may be subject to duplication and reporting errors.

**Results:** From October 1, 2022 to September 30, 2023, 1.9 million individuals were initiated on PrEP and 1.7 million persons were newly diagnosed with HIV. The PnR among countries and populations varied widely, ranging from 0.07-4.38 and 0.17-6.28, respectively (Figures 1 and 2).

PnRs were high for key populations (range: 1.69-4.08). PnRs tended to decrease with age.

Figure 1. PnRs of PEPFAR-Supported Countries.

Late-breaker  
abstracts

Author  
Index

**Results:** One hundred and eighty-nine participants, median age 29 years, were recruited and randomized to the DST (n=95) or routine care (n=94). Seventy-six percent identified as Black/African American and 13% identified as Hispanic/Latine.

One percent identified as gender non-binary. Participants reported income <\$10,000 annually (40%), unstable housing (25%), and food insecurity (10%). There were no statistical differences in socio-demographics between intervention and control groups.

At baseline, 25% of participants had ever heard of PrEP, without differences by group. DST exposure increased participants' ability to correctly define PrEP and PEP and identify who may use, how to use, and side effects of PrEP (table).

Correctly identified that:	Total	DST group	Control group	p-value
PrEP is a daily pill to prevent HIV	91 (50%)	54 (59%)	37 (41%)	0.02
PrEP is for all adults	133 (73%)	75 (82%)	58 (64%)	0.01
PrEP will not work if taken once a week	54 (30%)	30 (41%)	16 (18%)	<0.01
PrEP does not prevent STDs other than HIV	83 (46%)	51 (55%)	32 (36%)	<0.01
PrEP side effects do not last forever	74 (41%)	51 (55%)	23 (26%)	<0.01
A baby could be born to HIV discordant parents without transmitting HIV	77 (42%)	46 (50%)	31 (34%)	0.03
There is medication that you can take after sex to prevent HIV (PEP)	72 (40%)	51 (55%)	21 (23%)	<0.001
PrEP efficacy is > 95%	92 (51%)	43 (47%)	49 (54%)	0.29

**Conclusions:** A client-facing HIV prevention DST increased clients' knowledge of PrEP in an urban U.S. public health clinic, serving primarily Black/African American reproductive-age clients facing multiple structural health determinants.

## EPC068

Perinatal outcomes associated with pre-exposure prophylaxis for HIV prevention during pregnancy: a systematic review and meta-analysis

A. Erlwanger<sup>1</sup>, I. Rocroi<sup>1</sup>, S. Kirtley<sup>2</sup>, J. Hemelaar<sup>1</sup>

<sup>1</sup>University of Oxford, National Perinatal Epidemiology Unit, Infectious Disease Epidemiology Unit, Oxford Population Health, Oxford, United Kingdom, <sup>2</sup>University of Oxford, Centre for Statistics in Medicine, Nuffield Department of Orthopaedics, Rheumatology and Musculoskeletal Sciences, Botnar Research Centre, Oxford, United Kingdom

**Background:** The World Health Organization recommends tenofovir disoproxil fumarate (TDF)-based oral pre-exposure prophylaxis (PrEP), dapivirine vaginal ring, and long-acting intramuscular injectable cabotegravir (CAB-LA) for HIV prevention in populations at substantial risk of HIV infection. Pregnancy is a period of elevated risk of maternal HIV infection and transmission to the infant.

This systematic review and meta-analysis assessed the risk of adverse perinatal outcomes among HIV-negative pregnant women with exposure to any PrEP modality.

**Methods:** We conducted a systematic review by searching Medline, EMBASE, CINAHL, Global Health, the Cochrane Library, WHO ICTR, ISRCTN, PACTR, and ClinicalTrials.gov for studies published between 1 January 2000 and 29 August 2023. We included studies reporting on the association of antenatal exposure to any PrEP modality with 13 perinatal outcomes: preterm birth (PTB), very PTB, spontaneous PTB, spontaneous very PTB, low birthweight (LBW), very LBW, term LBW, preterm LBW, small for gestational age (SGA), very SGA, miscarriage, stillbirth, or neonatal death (NND). Fixed-effects meta-analyses were conducted to calculate odds ratios (ORs) and 95% confidence intervals (95%CI).

**Results:** Of 18,598 citations identified, 13 studies (eight randomised controlled trials and five cohort studies), assessing 8,712 pregnant women in Africa, were included. Oral PrEP, compared to no PrEP, was not associated with PTB in meta-analyses of six RCTs (OR 0.73, 95%CI 0.43-1.26; *I*<sup>2</sup>=0.0%) or five unadjusted cohort studies (OR 0.84, 95%CI 0.69-1.03; *I*<sup>2</sup>=0.0%), but was associated with a reduced risk of PTB in three adjusted cohort studies (aOR 0.67; 95%CI 0.52-0.88, *I*<sup>2</sup>=0.0%).

There was no association of oral PrEP with LBW, vLBW, SGA, or NND, compared to no PrEP. There was no association with PTB when oral TDF/FTC PrEP, oral TDF PrEP, and tenofovir vaginal gel were compared to each other. There was no association of the dapivirine vaginal ring with PTB or NND, compared to placebo or oral TDF/FTC PrEP. We found no data on CAB-LA.

**Conclusions:** We found no evidence of adverse perinatal outcomes associated with PrEP exposure during pregnancy. Our findings support the WHO recommendation to provide oral PrEP to women of reproductive age and pregnant women. More data is needed to assess the safety of all PrEP modalities in pregnancy.

## EPC069

Exploring the effectiveness and sociocultural influences of Voluntary Male Medical Circumcision (VMMC) programs in HIV prevention in Gulu District: a comprehensive analysis

M. Anguyo<sup>1</sup>

<sup>1</sup>Gulu University, Faculty of Medicine, Uganda, Uganda

**Background:** Global HIV prevalence remains a pressing public health concern, impacting approximately 38 million individuals (UNAIDS, 2022). Voluntary male medical circumcision (VMMC) is recognized as a vital intervention, demonstrating a substantial 60% reduction in heterosexual HIV transmission risk (Auvert et al., 2005; WHO, 2007). This study delves into the effectiveness of VMMC in HIV prevention, considering both medical outcomes and sociocultural influences.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

**Methods:** Employing a mixed-methods approach, this study included a diverse sample of 500 participants, comprising VMMC recipients, healthcare providers, and community members. Quantitative analysis, conducted using SPSS, explored medical outcomes, with logistic regression identifying predictors of positive results such as age and regular access to post-circumcision care. Qualitative insights were gathered through interviews and focus groups, providing a nuanced understanding of sociocultural factors influencing VMMC acceptance.

**Results:** Quantitative Outcomes: Participant Characteristics: The study encompassed 500 participants, including VMMC recipients (n=300), healthcare providers (n=100), and community members (n=100). VMMC recipients, with a mean age of 28.5 years (SD = 5.7), represented diverse age groups and socioeconomic backgrounds.

Medical Outcomes: Analysis of medical records revealed a significant ( $p < 0.001$ ) 58% reduction in HIV transmission among VMMC recipients compared to the control group. The prevalence of sexually transmitted infections significantly decreased post-circumcision.

Logistic Regression Analysis: Logistic regression identified significant predictors of positive medical outcomes, including age, socio-economic status, and access to post-circumcision care services. Participants with regular follow-up exhibited a 32% lower likelihood of complications (OR = 0.68, 95% CI [0.52, 0.89],  $p = 0.005$ ).

Qualitative Insights: Sociocultural Factors: In-depth interviews highlighted a range of beliefs among VMMC recipients, with 78% expressing positive narratives emphasizing health benefits. Cultural norms influenced decision-making for 22%, acting as barriers.

Focus Group Discussions: Focus groups emphasized the dual role of cultural norms (63% facilitators, 37% barriers) and the influential role of community leaders in shaping perceptions and promoting acceptance.

**Conclusions:** This study significantly advances our understanding of VMMC's impact on HIV prevention. The effectiveness of VMMC, both medically and socioculturally, underscores the need for tailored interventions. Integrating these insights into future initiatives is imperative for maximizing VMMC's contribution to the global fight against HIV/AIDS.

## EPC070

### Willingness to take and ever use of pre-exposure prophylaxis among men who have sex with men in Ghana

A. Apreku<sup>1</sup>, C. Guure<sup>2</sup>, S.K. Dery<sup>2</sup>, Y. Alhassan<sup>2,3</sup>, D. Holdbrook<sup>1</sup>, S.A. Addo<sup>4</sup>, K. Torpey<sup>1</sup>

<sup>1</sup>University of Ghana School of Public Health, Department of Population, Family and Reproductive Health, Accra, Ghana, <sup>2</sup>University of Ghana School of Public Health, Department of Biostatistics, Accra, Ghana, <sup>3</sup>Total Family Health Organisation (TFHO), Research Department, Accra, Ghana, <sup>4</sup>Ghana Health Service, National AIDS/STI Control Programme, Accra, Ghana

**Background:** HIV prevalence among men who have sex with men (MSM) is 18.1% as compared to 1.6% in the general population. Pre-exposure prophylaxis (PrEP) is a drug taken by people who are HIV negative and at high risk of acquiring HIV. Since implementation in Ghana, little is known about the national prevalence of PrEP among MSM.

The objective of this study is to assess the willingness and ever use of PrEP among MSM in Ghana and its contributing factors.

**Methods:** We conducted a bio-behavioral survey among MSM aged 18 years and above in Ghana from August 2022 to July 2023 using respondent-driven sampling (RDS). RDS Analyst was used to compute weight based on participants network and Stata version 18 was used for data analysis. Analysis was done on MSM who tested negative to HIV and were sexually active. "Have you ever taken PrEP" and, "Would you take PrEP to prevent HIV" was used to assess uptake and willingness.

We estimated the prevalence of willingness and ever taken and weighted multivariable logistic regression was used to assess associated factors.

**Results:** Out of 2,627 MSM with complete data on ever taken PrEP, 17.8% reported to have ever taken PrEP. Out of 1,094 MSM with complete data on willingness to take PrEP, 90.3% reported their willingness to take PrEP. The median age of the respondent was 24 (IQR=21-27). MSM who had completed Tertiary had 3 times higher odds of ever taking PrEP (aOR: 3.14, 95% CI: 1.26-7.81), 25% higher among those who have come in contact with a peer educator (aOR: 3.08, CI: 1.52-6.2) and 90% lower likelihood among those who have never tested for HIV (aOR: 0.10, 95% CI: 0.06-0.16). MSM aged 25-34 were less likely to use PrEP, (aOR: 0.18, 95% CI: 0.05-0.57) as well as those who were married (aOR: 0.15, 95% CI: 0.05-0.41) and high alcohol intake (aOR: 0.40, 95% CI: 0.16-0.98).

**Conclusions:** In Ghana, willingness to use PrEP to prevent HIV is high but uptake is low. Our results highlight the need for interventions to improve the overall uptake of PrEP among MSM in Ghana.

## EPC071

### Disparities in PrEP use and unmet need across PEPFAR-supported programs in Africa: doubling down on prevention to put people first and end HIV as a public health threat by 2030

T. Mukherjee<sup>1</sup>, M. Koluch<sup>2</sup>, G. Eyassu<sup>3</sup>,

S. Alemayehu Abayneh<sup>4</sup>, S. Herbst<sup>2</sup>

<sup>1</sup>USAID, Office of HIV/AIDS, Prevention, Care and Treatment Division, Biomedical Prevention Branch, Washington DC, United States, <sup>2</sup>U.S. Department of State, Bureau of Global Health Security and Diplomacy, President's Emergency

Plan for AIDS Relief (PEPFAR), Office of Program Impact, Monitoring, and Epidemiology (PRIME), Washington DC, United States, <sup>3</sup>U.S. Embassy in Ethiopia, USAID/Ethiopia, Health Office, Infectious Disease, Addis Ababa, Ethiopia,

<sup>4</sup>U.S. Embassy in Rwanda, PEPFAR Coordination Office, Kigali, Rwanda

**Background:** In 2022, there were 1.3 million people with newly acquired HIV, over half of whom were in Africa. In the same year, only 2.5 million individuals received pre-exposure prophylaxis (PrEP), falling short of the UNAIDS target of 10 million by 2025. With nearly 80% of global PrEP programming supported by PEPFAR, a better understanding of PrEP coverage and unmet need is needed to inform PEPFAR's approach to reach and deliver prevention services and achieve UNAIDS 95-95-95 goals in all populations by 2025.

**Methods:** We analyzed FY2023 Monitoring, Evaluation, and Reporting (MER) results from 25 PEPFAR countries in Africa to calculate PrEP-to-need ratios (PnR) by country, age, sex, and key population subgroups. PnR was calculated as the ratio of PrEP users to the number of new HIV diagnoses  $[(PrEP\_NEW + PrEP\_CT) / HTS\_TST\_POS]$ , averaged across each quarter. A higher PnR indicates more PrEP users relative to PrEP need in a population. PnR may be a useful proxy measure for PrEP coverage in settings where PrEP uptake and HIV incidence cannot be directly measured.

**Results:** In FY23, 1,342,379 people initiated PrEP, and a total of 1,275,334 people tested HIV-positive across the 25 PEPFAR countries. Overall country-level PnR ranged from 0.23 to 8.90. 10 (40%) countries had more HIV-positive tests than PrEP users (PnR <1). People 15-24 years old, female sex workers (FSW), and men who have sex with men (MSM) had the highest PnR. Conversely, individuals >35 years had the lowest PnR. Key population data showed lower PnR among transgender persons, people who inject drugs, and prison populations.

**Conclusions:** PrEP use relative to population need varied greatly by country and subpopulation across PEPFAR programs, suggesting a need for greater advocacy, inclusivity, accessibility and integrated prevention programming. PnR can be a useful indicator of population PrEP coverage and unmet need, and can inform effective, data-driven and person-centered prevention programs and policies.

Tailoring PrEP scale-up strategies by age, sex, key population and geography is crucial to achieving UNAIDS targets and ending the HIV/AIDS epidemic as a public health threat for all by 2030.

## EPC072

### Written on the skin: participants' perspectives on scarring, discolouration and implant site reactions experienced during a Phase I clinical trial for a subdermal HIV prevention implant in South Africa

E. Durden<sup>1</sup>, E. Govender<sup>1</sup>, N. Myeni<sup>2</sup>, I. Harkoo<sup>2</sup>,

L.E. Mansoor<sup>2</sup>, Q. Abdool Karim<sup>3</sup>, S.S. Abdool Karim<sup>3</sup>,

T.N. Gengiah<sup>2</sup>

<sup>1</sup>University of KwaZulu Natal, Culture, Communication and Media Studies, School of Applied Human Sciences, Durban, South Africa, <sup>2</sup>Centre for the AIDS Programme of Research in South Africa, Durban, South Africa, <sup>3</sup>Columbia University Mailman School of Public Health, Department of Epidemiology, New York City, United States

**Background:** To address the high proportion of new HIV acquisitions amongst adolescent girls and young women in South Africa, research into innovative HIV prevention technologies such as the tenofovir alafenamide (TAF) implant has been undertaken.

This study sought to understand the experiences of trial participants after exiting a Phase 1 clinical trial for a sub-dermal TAF implant, to highlight considerations for future innovations.

**Methods:** Qualitative research conducted in Durban, South Africa in 2023 included interviews with 29 study participants (all Black, African, females, with median age 26 (21.5-29.5) years), 18 of whom also participated in focus group discussions. Interviews and discussions were recorded and transcribed, and data was coded with the use of NVivo software for thematic analysis.

**Results:** Participants appreciated the implant's lack of visibility after insertion, maintaining a sense of privacy and avoiding the need to explain it to others. Bandages and implant site reactions (ISRs) did, however, draw unwanted attention to the implant site, causing a level of social discomfort.

In some instances, ISRs and the implant removal process left longer-lasting and more severe skin changes. Participants' perceptions of these were influenced by concerns about their appearance, social stigma, and associations between scars and surviving violence. Mild skin changes were deemed acceptable by 95% of women, while severe scarring and discolouration caused concerns about attracting negative attention and had lower acceptability (22%). Few women expressed concerns about their own scars, considering these minor and comparable to a regular bump or scratch. However, visible scars which might be mistaken for a contraceptive implant and lead to unwanted questions or judgements, caused concern.

Despite these concerns, 61% of participants preferred the implant as an HIV prevention method over injectable HIV PrEP, due to its long-acting nature, reducing clinic visits and ensuring adherence.

**Conclusions:** Despite concerns regarding changes to the skin, the positive reaction from participants for this type of technology suggests that there would likely be high uptake of a sub-dermal implant should it be effective in preventing HIV.

Continued research with an improved formulation should consider how best to minimise the severity of ISRs and visible skin changes.

## EPC073

### Actions To Equitably Expand PrEP in a Municipal Healthcare System

E. Kaplan-Lewis<sup>1</sup>, E. Casey<sup>1</sup>, K. Gala<sup>1</sup>, Z. Li<sup>1</sup>, G.M. Cohen<sup>1</sup>

<sup>1</sup>New York City Health and Hospitals, Office of Ambulatory Care and Population Health, New York, United States

**Background:** NYC Health and Hospitals (H+H) is the largest municipal healthcare system in the United States and provides comprehensive primary and specialty care to all New Yorker's regardless of ability to pay or immigration status. As such, H+H is the healthcare provider for many of New York's most marginalized populations.

We sought to expand PrEP services across the H+H system to meet community needs and reduce inequity in access to high quality PrEP services.

**Description:** Data tools and technical assistance/trainings to support clinical teams were developed and implemented in 2022 to improve identification of individuals most likely to benefit from PrEP and assist clinicians in providing PrEP. These include electronic medical record (EMR) order sets; a metric to identify individual PrEP eligibility based on recent STI diagnoses, and STI and HIV testing patterns; and a series of technical assistance/training supports to improve utilization of tools and build clinical skills and understanding of PrEP.

We assessed the impact of our efforts by comparing PrEP reach, defined as the proportion of individuals identified as PrEP eligible who are actively on PrEP, during the pre-intervention period (4/1/22-9/1/22) compared to the post intervention period after tools and resources were distributed (4/1/23-9/1/23).

**Lessons learned:** Implementation of tools and technical assistance/training led to an overall increase in PrEP reach (Table 1) and across most races. Cisgender women had a significant increase in PrEP reach, indicating the potential for PrEP expansion efforts within Women's Health clinics. People with straight or bisexual sexual orientation had a significant increase in PrEP reach as well, however a limitation of these data is the high frequency of missing data for gender identity and sexual orientation.

	PrEP reach* Pre- intervention	PrEP reach* Post- intervention	P value
Overall	5%	8.2%	<.0001
Race/Ethnicity			
Asian/Native Hawaiian/Pacific Islander	10.8%	21.4%	<.0001
Black/AA	3.2%	5.2%	<.0001
Hispanic	4.8%	7.6%	<.0001
Native American/Alaskan	0.0%	7.4%	.05
White	22.6%	34.4%	<.0001
Two or more races	13.8%	15.2%	.837
Gender Identity			
Cis female	1.3%	2.0%	.0007
Cis male	54.2%	53.9%	.904
Trans female	36.4%	61.9%	.098
Trans male	40%	11.1%	.224
Something else	41.2%	45.5%	.725
Sexual Orientation			
Lesbian/Gay/Queer	69%	75.8%	.067
Bisexual	16.3%	26.9%	.003
Straight	2.3%	3.4%	.0002
Something else	9.4%	14.4%	.285
Choose not to disclose	13.2%	16.8%	.334

\*PrEP reach is calculated as PrEP active/PrEP eligible.

Table 1: Change in PrEP Reach After Support Tool Implementation.

**Conclusions/Next steps:** EMR-imbedded data tools and technical assistance/training, can result in large scale increases in PrEP services across diverse populations. Future work is needed to understand ongoing disparities in PrEP reach as well as facilitators and barriers to PrEP retention.

## EPC074

### TelePrEP experience in Brazil: a municipal public-health service for HIV Pre-Exposure Prophylaxis (PrEP) using telemedicine in the city of Florianópolis, Santa Catarina

M. Medeiros<sup>1</sup>, F. Karolinne Melchior Silva Pinto<sup>1</sup>, R. Zonta<sup>1</sup>

<sup>1</sup>FioCruz, Rio de Janeiro, Brazil

**Background:** Florianopolis, the capital of the state and Santa Catarina, an island with a population of 537.213 people recorded 9.7 deaths related with AIDS for every 100,000 inhabitants last year – a number higher than the national rate and an AIDS detection rate of 49.1 per 100 thousand inhabitants, in need of new strategies to prevent and combat HIV.

**Description:** The TelePrEP program works with 3 prescriber physicians who make medical appointments through a messaging app and in some cases video calls with the clients, they answer a series of questions for assessing risk for HIV, such as histories of sexual behaviour and drug use mainly with the use of a structured form and complementary messages shared for any doubts elicited.

After this, the client can pass to a scheduled appointment for rapid HIV test, STI tests and other PrEP-related testing with the nurse team or an even more convenient option recently implemented, called HOME PrEP, where it is possible to make a self-HIV Test (supplied in all public health clinics in the city, delivered together with the PrEP for the

next appointment and also possible to request home delivery by mail) and share a picture or video of the result via app, the doctors then prescribe the PrEP and its only necessary to visit for specimen collection for the tests and to withdraw the PrEP, during the opening hours of dispensing pharmacies without the need for an appointment.

**Lessons learned:** Offering PrEP through telemedicine, TelePrEP, is an incipient and evolving care option with the potential to improve access, convenience, and adherence for some PrEP users. It also poses numerous challenges, such as obtaining specimens for routine HIV, STI, and other PrEP-related testing, few dispensing pharmacies and specimen collection places, some PrEP users do not have smartphones, or lack reliable internet connections.

**Conclusions/Next steps:** TelePrEP may increase PrEP access for people who live far away from main clinics that offer PrEP or who otherwise face transportation or schedule difficulties that make in-person appointments impossible or inconvenient.

It Could also help to overcome stigma and fears about confidentiality that hat keep some people from seeking PrEP care face-to-face.

## EPC075

### Multiple choices for HIV testing can lead to high uptake of PrEP: an example from a key population-led clinic in Viet Nam

V.T.T. Nguyen<sup>1</sup>, T.T. Le<sup>2</sup>, V.N. Nguyen<sup>3</sup>, C. Johnson<sup>4</sup>, R. Bagga<sup>4</sup>

<sup>1</sup>World Health Organization, Country Office in Viet Nam, Hanoi, Viet Nam, <sup>2</sup>Minh Phat Social Enterprise and Community Development, Vinh, Viet Nam, <sup>3</sup>Viet Nam Administration for HIV/AIDS Prevention and Control, Ministry of Health, Hanoi, Viet Nam, <sup>4</sup>World Health Organization, Global HIV, Viral Hepatitis and STIs Programmes, Geneva, Switzerland

**Background:** The government of Vietnam aims to achieve the goal of ending AIDS by 2030. Scale-up HIV testing and linking to prevention and treatment services is the way to reach this goal.

We supported a key population-led clinic in Nghe An province to provide multiple choices for HIV testing and linking clients to PrEP and ART services.

**Methods:** In 2023, a clinic led by MSM in Nghe An was supported to provide various testing approaches including web-based HIV self-test (HIVST) together with condoms, lubricants, and needle syringes on demand.

In addition, social network-based testing for HIV and syphilis was implemented with a focus on high risk MSM was carried out. Clients with an HIV-positive result or clients with an HIV-negative result reporting ongoing risks were provided HIVST to give to their partners.

Basic data on demographic from national testing consent form and outcomes of service linkage was collected.

**Results:** From Jan to Dec 2023, 6532 clients accessed HIV testing from either virtual platform, social network-based testing or secondary HIVST distribution. Of 6380 HIV-negative clients, 1055 (16.5%) initiated PrEP. Of 154/6380 (2.4%) clients had HIV reactive, 152 (98.7) confirmed HIV positive and 151/152 (99.3%) initiated ART (Table 1). In addition, social network-based testing also provided syphilis testing services for 552 clients. Of 85 (15.4%) clients who had syphilis positive, 73 confirmed active syphilis (RPR positive) and all received syphilis treatment (Table 2). Through the website, 1920 condoms, 1560 sachets of lubricants and 127 needles and syringes were distributed to clients with or without HIVST based on their requests.

HIV testing approach	Testing uptake	HIV negative n (%)	PrEP uptake among HIV negative clients n (%)	HIV reactive n (%)	HIV positive among reactive clients n (%)	ART uptake n (%)
Web-based HIVST distribution	5570	5477 (98.3)	735 (13.4)	95 (1.7)	93 (97.9)	93 (100)
Social network-based HIV testing	688	659 (95.8)	243 (36.9)	29 (4.2)	29 (100)	29 (100)
Chemsex	290	274 (94.5)	115 (42.0)	16 (5.5)	16 (100)	16 (100)
Camping	217	209 (96.3)	74 (5.4)	8 (3.7)	8 (100)	8 (100)
Sugar daddy-sugar baby	181	176 (97.2)	54 (30.7)	5 (2.8)	5 (100)	5 (100)
Secondary HIVST distribution to sexual partners	274	244 (89.1)	77 (31.6)	30 (10.9)	30 (100)	29 (96.7)
TOTAL	6532	6380 (97.7)	1055 (16.5)	154 (2.4)	152 (98.7)	151 (99.3)

Table 1. Results of multiple HIV testing approaches and linkage to PrEP and ART

**Conclusions:** Key populations benefit from having access to multiple testing approaches which increase access to HIV prevention and treatment, as well as integrated services. This model can be replicated by sharing experiences with other community-based and key population-led testing for further scale-up.

### Association between frailty and low sexual function among older adults living with HIV in China: a multi-centre cross-sectional study in China

B. Wang<sup>1</sup>, X. Peng<sup>1</sup>, Y. Lu<sup>2</sup>, L. Fu<sup>1</sup>, X. Li<sup>1</sup>, Z. Lu<sup>1</sup>, T. Tian<sup>1</sup>, W. Zhang<sup>1</sup>, X. Xiao<sup>1</sup>, L. Ouyang<sup>3</sup>, Y. Wang<sup>4</sup>, M. Yu<sup>5</sup>, G. Wu<sup>3</sup>, Y. Cai<sup>4</sup>, D. Wu<sup>6</sup>, W. Tang<sup>7</sup>, J. Tucker<sup>8</sup>, H. Zou<sup>9</sup>  
<sup>1</sup>Sun Yat-sen University, School of Public Health (Shenzhen), Shenzhen, China, <sup>2</sup>Guizhou Medical University, Guiyang, China, <sup>3</sup>Chongqing Center for Disease Control and Prevention, Chongqing, China, <sup>4</sup>Shanghai Jiao Tong University School of Medicine, Shanghai, China, <sup>5</sup>Tianjin Center for Disease Control and Prevention, Tianjin, China, <sup>6</sup>Nanjing Medical University, Nanjing, China, <sup>7</sup>University of North Carolina Project-China, Guangzhou, China, <sup>8</sup>London School of Hygiene & Tropical Medicine, London, United Kingdom, <sup>9</sup>Fudan University, Shanghai, China

**Background:** The expanding aging population increases the importance of understanding frailty and related impacts on health. Our objectives were to examine the sexual function and its association between frailty and sexual function among older adults aged 50+ living with HIV (OALHIV).

**Methods:** A multi-centre cross-sectional study (the sexual well-being [SWELL]) was conducted between September 2021 and July 2022. We enrolled OALHIV from specialized infectious disease hospitals providing HIV care in four cities in China. Data were collected through an investigator-administered questionnaire about demographic characteristics, health characteristics (general health and specific health), frailty status (assessed using the 5-item FRAIL scale), and sexual function status (measured by a validated scale [the Natsal-SF]).

Logistic regression was used to assess correlates of lower sexual function (defined as the highest quintile of distribution of Natsal-SF scores).

**Results:** Overall, 239 sexually active OALHIV (40 women and 199 men, mean age: 57.6±7.2 years) were included in the present analyses. The majority were living in urban areas (66.1%), employed (62.8%), satisfied with their life (70.3%) and having sexual needs (89.5%). 53 (22.2%) participants had frailty.

About two-fifths (37.7%) reported at least one sexual difficulty lasting 3 months or more in the past year (frail group: 50.9% vs. non-frail group: 33.9%,  $P=0.036$ ). Lack of interest in having sex was the most commonly reported sexual response problem (27.2%).

Approximately three-quarters (70.3%) expressed dissatisfaction with their sex life. 49 participants were categorised as having low sexual function.

Participants dissatisfied with their life ( $aOR$  2.33, 95% CI 1.03-5.24) were more likely to have low sexual function. Frailty (3.03, 1.22-7.53) was associated with low sexual function.

**Conclusions:** Frailty was associated with poor sexual function among sexually active OALHIV. OALHIV with frailty should be screened for sexual function problems. More efforts should be made to integrate sexual health services into geriatric services, ensuring comprehensive care that addresses their specific sexual concerns.

## EPC077

### Campus Guardians: gender desk initiative to address HIV and GBV at the University of Nairobi

J. Kamau<sup>1</sup>, M.-F. Agblo-Hientz<sup>1</sup>, D. Blanc<sup>2</sup>, R. Shawa<sup>3</sup>  
<sup>1</sup>UNESCO, Nairobi, Kenya, <sup>2</sup>UNESCO, Harare, Zimbabwe, <sup>3</sup>UNESCO, Johannesburg, South Africa

**Background:** In Kenya, young individuals in Higher and Tertiary Education Institutions (HTEI) face a multitude of challenges, ranging from Gender-Based Violence (GBV), HIV transmission, and unplanned pregnancies, mental health issues and substance abuse (UNESCO 2022).

Regrettably, the existing infrastructure lacks sufficient safe spaces where these young people can access confidential support free from judgment.

**Description:** To address incidences of GBV and HIV at HTEIs, UNESCO with the University of Nairobi (UoN) established a gender desk in December 2022. The gender desk is a central place in the campus where students can receive information on HIV and GBV, report GBV cases, access health services, be linked to legal, sheltering and campus services in a confidential manner. Health workers and non-academic personnel were trained to foster a safer and more inclusive environment.

**Lessons learned:** By the end of 2023, the gender desk at UoN has been instrumental to achieve the following:

- Empowered 14,700 students with knowledge about GBV, including crucial aspects like sexual harassment and HIV vulnerability.
- Connected over 84 GBV survivors with health services, ensuring they have the resources they need to stay healthy. Facilitated HIV testing for 1,634 students, promoting early detection and treatment.
- Forged powerful partnerships among University, UN agencies, CSOs, and key government departments. This collaborative effort significantly strengthened support systems for those affected by GBV and HIV, ensuring they have access to the help they need.

The gender desk has become a vital resource for students, offering a safe and confidential space to access support services and report incidents GBV. The UoN's unwavering commitment, demonstrated by its allocation of dedicated personnel and resources, has solidified the desk's institutionalization and ensured its long-term sustainability.

**Conclusions/Next steps:** The model underscores the imperative of a one-stop resource hub, empowering young people to access comprehensive array of services within a secure environment. The next phase involves scaling the

model to five campuses to benefit over 20,000 students. This strategic expansion aims to enhance its transformative impact, fostering a safe and supportive academic environment for all young people.

## EPC078

### How many men who have sex with men (MSM) are there in Bhutan?

L. Khandu<sup>1</sup>, T. Tobgay<sup>2</sup>, T. Gyeltshen<sup>3</sup>, J. Hallett<sup>4</sup>, G. Crawford<sup>4</sup>, D. Vujcich<sup>5</sup>, W. McFarland<sup>6</sup>

<sup>1</sup>National HIV, AIDS and STIs Control Program, Department of Public Health, Ministry of Health, Thimphu, Bhutan,

<sup>2</sup>Institute of Health Partners, Thimphu, Bhutan, <sup>3</sup>Pride Bhutan-LGBTIQ+ Community, Thimphu, Bhutan, <sup>4</sup>Curtin University, School of Population, Faculty of Health Sciences, Bentley, Perth, Australia, <sup>5</sup>WAAC, Perth, Australia, <sup>6</sup>San Francisco Department of Public Health, San Francisco, United States

**Background:** Globally, men who have sex with men (MSM) bear a burden of HIV that is nearly 20 times that of the general population. In some parts of the world, including Asia, HIV prevalence among MSM is rising. Despite this, few countries have rigorous estimates of the number of MSM. Size estimation of MSM populations is an important tool for effectively allocating resources and monitoring HIV prevention, care, support, and treatment programs.

**Methods:** In our January-June 2020 Bhutan study, we estimated the MSM population using a hybrid venue- and peer-referral-based survey in 9 districts. Employing service multiplier data from the MSM community-based organization (CBO), unique object multiplier, and wisdom-of-the-crowd methods, Bayesian analysis synthesized the final estimate. For national extrapolation, we used linear regression, with licensed alcohol outlet density as the proxy indicator, showing the highest correlation to MSM population size (highest R<sup>2</sup>). This choice aligns with urban areas and entertainment hubs hosting more alcohol outlets, enhancing accuracy in predicting the MSM population size across all 20 districts.

**Results:** A total of 273 MSM aged 18 and older were included. The survey proportion for CBO membership and the CBO member count as the service multiplier was estimated at 1,769 (95% CI 669-2,86) MSM. The survey proportion receiving the unique object and number disrupted as the count estimated 1,283 (95% CI 852-1,714) MSM. The median wisdom-of-the-crowd response was 1,313 (IQR 552-2,074). Bayesian synthesis arrived at 1,463 MSM (credible interval 1,006-2,030) in the 9 study districts. Extrapolation yielded a national estimate of 1,726 MSM.

**Conclusions:** Our estimate of 1,726 MSM in Bhutan represents 1.58% of urban men aged 15 and older, aligning with regional trends. This figure is pivotal, serving as a benchmark for HIV prevention initiatives. It guides efforts to achieve a 90% testing rate and peer education

for MSM, vital steps towards ending the AIDS epidemic by 2030. However, limitations exist, as the study primarily focuses on urban areas, potentially overlooking isolated rural members.

Challenges arose due to the absence of district-level MSM estimates, urging consideration of alternative methods for a more comprehensive distribution in future studies, such as Bayesian synthesis or anchored multiplier methods.

## EPC079

### Factors associated with high uptake of sexual reproductive health rights services among adolescent girls and young women to reduce vulnerability to HIV: lessons from DREAMS program in Zimbabwe, 2023

F.H. Mudzengerere<sup>1</sup>, H.W. Mafaune<sup>2</sup>, D. Dhakwa<sup>3</sup>, K. Yogo<sup>3</sup>, F. Mudokwani<sup>4</sup>, B. Nyamwanza<sup>4</sup>, B. Madzima<sup>5</sup>, R. Yekeye<sup>4</sup>, T. Masoka<sup>2</sup>, A. Muchedzi<sup>3</sup>, T.A. Tafuma<sup>3</sup>, T. Bhatasara<sup>6</sup>, M. Mutseta<sup>7</sup>, E. Tachiwenyika<sup>1</sup>

<sup>1</sup>Zimbabwe Health Interventions, Knowledge Management, Harare, Zimbabwe, <sup>2</sup>Zimbabwe Health Interventions, SIE, Harare, Zimbabwe, <sup>3</sup>Zimbabwe Health Interventions, Administration, Harare, Zimbabwe,

<sup>4</sup>National AIDS Council, Zimbabwe, Programs, Harare, Zimbabwe, <sup>5</sup>National AIDS Council, Administration, Harare, Zimbabwe, <sup>6</sup>United States Agency for International Development, Programs, Harare, Zimbabwe, <sup>7</sup>Ministry of Health and Child Care, Zimbabwe, Programs, Harare, Zimbabwe

**Background:** Eastern and southern Africa accounts for two-thirds of new HIV acquisitions among 25-24-year-old adolescent girls and young women (AGYW). Among the key drivers of vulnerability to HIV are gender-based violence, low levels of education, and low uptake of sexual reproductive health and rights (SRHR). Zimbabwe among other African countries is implementing the Determined, Resilient, Empowered, AIDS-free, Mentored and Safe (DREAMS) program to reduce HIV incidence among AGYW. The program refers and promote uptake of SRHR services among AGYW. Between October 2022 and September 2023, 91% (21,129/ 23,277) vulnerable AGYW referred for SRHR services accessed the services.

We assessed factors associated with high uptake of SRHR services among AGYW referred through the DREAMS program.

**Methods:** We conducted a cross sectional study among AGYW aged 9-19 years enrolled in the DREAMS program from the 1<sup>st</sup> of October 2022 to the 30<sup>th</sup> of September 2023. Data were collected from randomly selected AGYW using structured questionnaires within Kobo Collect; study was conducted across all 9 Zimbabwe Health Interventions (ZHI)-supported high HIV burdened districts. Data were analysed using STATA generating descriptive statis-

tics and measures of association. Study received ethics approval from Medical Research Council of Zimbabwe (MRCZ/A/2933).

**Results:** A total of 2,143 AGYW were interviewed of which 32.1% were aged 15-19 years, 3.8% were married, and 74% were in-school. Nearly 92% (596/648) AGYW who were referred for SRHR accessed the services, with 93% (454/488) of AGYW in-school and all the married (22) AGYW having accessed SRHR services. AGYW who were out of school were less likely to access SRHR services than those in-school [COR= 0.589; 95% CI (0.40; 0.87)]. Also, AGYW who were single/widowed were less likely to access SRHR services than those who were married [COR= 0.53; 95% CI (0.30; 0.93)].

**Conclusions:** SRHR service uptake was high among eligible AGYW, however those out of school and either single (never married) or widowed were less likely to receive SRHR services they were referred for. We recommend targeted interventions for out-of-school and single/widowed AGYW to match their counterparts.

## EPC080

**Patterns of chemsex substance use and its association with sexual risk behaviors among men who have sex with men in Thailand: a latent class analysis**

D.H. Cheung<sup>1</sup>, Y. Kongjareon<sup>1</sup>, N. Samoh<sup>1</sup>, T.E. Guadamuz<sup>1</sup>

<sup>1</sup>Mahidol University, Bangkok, Thailand

**Background:** Sexualized substance use or chemsex may contribute to the HIV epidemic among MSM in Thailand. Specific patterns of chemsex usage may be associated with differing HIV/STI transmission risks.

**Methods:** We examined typologies and correlates of sexualized substance use among a sample of high-risk MSM (n=532) who have attended a private sex party or circuit party in the past 3 years using latent class analysis.

**Results:** We identified a 3-class model as best fitting model, which included:

1. "Non-chemsex users", who had never engaged in chemsex in the past 6 months,
2. "Variety chemsex users", who had high level of sexualized alcohol use and a wide range of other substances before or during sex in the past 6 months,
3. "Ice chemsex users", who predominately use crystal methamphetamine, amyl nitrite and erectile dysfunctional drugs before or during sex in the past 6 months. Compared to "non-chemsex users", "ice chemsex users" were more likely to be HIV positive, more likely to have 6 or more sexual partners in the past 6 months, less likely to have consistent condom use at last anal intercourse and more likely to have provided sex work. Relative to "non-chemsex users", "variety chemsex users" were more likely to not know their HIV status and reported more frequent online sex seeking behaviors.

**Conclusions:** These subgroups of Thai MSM have distinct substance use patterns and HIV-related risk profiles, which provides implication for tailored HIV prevention in this subpopulation.

## EPC081

**Female sex workers and sexually exploited minors' population size estimation using privatized network sampling, Rwanda, 2023**

E. Elysee<sup>1</sup>, C. Kayitesi<sup>2</sup>, E. Remera<sup>2</sup>, S. Malamba<sup>3</sup>, I. Kabano<sup>1</sup>, A. Chukwu<sup>4</sup>

<sup>1</sup>University of Rwanda, African Center of Excellence in Data Science (ACE-DS), Kigali, Rwanda, <sup>2</sup>Rwanda Biomedical Centre (RBC), Institute of HIV Disease Prevention and Control, Kigali, Rwanda, <sup>3</sup>Health Research and Evaluation Consultant, Kampala, Uganda, <sup>4</sup>University of Ibadan, Department of Statistics, Ibadan, Nigeria

**Background:** Female sex workers (FSW) are at increased risk of HIV and other STI. In addition, the burden of HIV infection among this group is much higher when compared to adult females in the general population. Estimating the number of FSW helps HIV/STI prevention through program design, planning, and implementation in Rwanda.

**Methods:** Data were collected from May 8<sup>th</sup> to June 24<sup>th</sup>, 2023, across 10 study sites countywide. Privatized network sampling (PNS) was used, which is a population size estimation method that uses the network information collected within a bio-behavioral survey (BBS) that used respondent-driven sampling (RDS). To estimate the FSW and sexually exploited minors' population size, three PNS estimators were used: Cross-Sample, Cross-Alter, and Cross-Network.

**Results:** The national-level FSW population size was estimated at 98,587 (95% CI: 82,978 – 114,196), corresponding to 2.3% of the total adult female population aged 15 years and above in Rwanda. We estimated that in the City of Kigali, 5.3%, in the West Province, 2.2%, in the East and South province, 1.7% each, and in the North province 1.6% were FSW as % of adult female population 15 years of age and older who were living in Kigali and these Provinces. We estimated that in the City of Kigali, 5.3%, in the West Province, 2.2%, in the East and South province, 1.7% each, and in the North province 1.6% were FSW as % of adult female population 15 years of age and older who were living in Kigali and these Provinces.

**Conclusions:** This was the first time that PNS was implemented as a PSE method in Rwanda, adding to the emerging tools that we have in the hard-to-reach PSE field. The PSE provides fundamental information to design, plan, and implement programs for FSW at the provincial level in Rwanda. Furthermore, these estimates will help to generate positive policy changes and to advocate for resources that will help in the effort to achieve a sustained HIV epidemic control in the country.

## EPC082

### Prioritizing high-risk sub-Saharan African adolescent girls and young women for prevention interventions using a Bayesian spatial model

S. Gutreuter<sup>1</sup>, L. Denhard<sup>1</sup>, J. Logan<sup>1</sup>, J. Blanton<sup>1</sup>, H.J. Cham<sup>1</sup>

<sup>1</sup>Centers for Disease Control and Prevention, Division of Global HIV & TB, Atlanta, United States

**Background:** Adolescent girls and young women (AGYW) remain at high risk of acquiring HIV compared to male counterparts in sub-Saharan Africa (SSA). The President's Emergency Plan for AIDS Relief (PEPFAR) funds programs focused on reducing HIV acquisition among AGYW in SSA. However, the challenge of identifying AGYW most vulnerable to HIV acquisition remains. Our objective was to develop a model that predicts the probability of acquiring HIV based on individual-level characteristics, demographic factors, and the severity of the local epidemic as measured by population viral load.

**Methods:** We developed a novel multi-level Bayesian joint mixed-effects spatial model for HIV prevalence among AGYW and district-level population HIV viral load (PVL) in 13 SSA countries using data from Population HIV Impact Assessment surveys. Probabilities of HIV acquisition among individual AGYW were estimated from individual behavioral and demographic factors, area-level PVL, country-level random effects, and spatially correlated area-level random effects. A

rea-level PVL was jointly estimated with error from observations of individual viral load. Associations were presented as adjusted odds ratios (aORs) and Bayesian Pr(0.95) credible intervals (CIs).

**Results:** District-level PVL estimates ranged from 0.00–0.55 log<sub>10</sub>(copies/ml + 1). District-level PVL was, by far, the most important predictor of HIV positivity (aOR=72.3, CI: 44.6–125.1 per 0.5 unit change), followed by HIV-positive partner status (aOR=18.7, CI:14.7–23.8). Older age (20–24 versus 15–19) incurred higher risks if there was no employment during the past year regardless of whether sexual debut was delayed past age 16 (aOR=2.7, CI:2.10–3.4) or whether debut occurred at age 16 or younger (aOR=3.8, CI: 2.9–4.9). Other important risk factors included history of pregnancy with no current partner, transactional sex, and educational attainment. The cross-validated receiver-operating characteristic curve for classification of elevated risk had an area of 0.82 (CI: 0.81–0.83) across all countries, enabling predictive classification with sensitivity ~70–90% and corresponding specificity range of ~78–50%.

**Conclusions:** The model enables prioritization of AGYW for enrollment in HIV prevention services based on predicted HIV acquisition risk, with useful levels of sensitivity and specificity across a broad geographic range in SSA.

## EPC083

### Elimination of Mother to Child Transmission of HIV, syphilis and hepatitis B: progress in the Middle East and North Africa/Eastern Mediterranean region

S. Mark Prabhu<sup>1</sup>, M. Chakroun<sup>2</sup>, M.S. Jamil<sup>3</sup>, J.G. Hermez<sup>3</sup>

<sup>1</sup>UNICEF Middle East and North Africa Regional Office, Amman, India, <sup>2</sup>University of Monastir, Faculty of Medicine, Monastir, Tunisia, <sup>3</sup>WHO Eastern Mediterranean Regional Office, Cairo, Egypt

**Background:** In the Middle East and North Africa (MENA)/ Eastern Mediterranean (EM) region, the coverage of prevention of mother-to-child transmission (PMTCT) interventions is low. Only Oman has been validated for the elimination of MTCT of HIV and syphilis (2022).

We conducted a regional assessment of progress towards achieving elimination targets and key challenges to inform policy decisions and accelerate progress.

**Methods:** The assessment (January – November 2023) included a desk review of national policies and strategies, key informant interviews and review of process and impact indicators reported in GAM.

We reported pooled summary statistics for the region and compared with WHO criteria for validation of elimination of mother to child transmission of HIV, syphilis and hepatitis B virus.

**Results:** Despite low national HIV prevalence, the access of pregnant women (PW) to PMTCT services is still challenging. Except for Oman, the vertical transmission rate of HIV in the region is high and estimated at 32%. Data from 23 countries showed that efforts towards triple EMTCT of HIV, syphilis and hepatitis B remains slow except for few countries. Lack of political commitment coupled with low community engagement partly explain the delay in progress. Table 1 summarizes the key data on process and impact indicators.

	Target achieved	Close to achieving targets	Far from achieving targets	No reported data
Targets for indicators	≥95%	80%-94.9%	<80%	
ANC-1 coverage	11 (47.8%)*	6 (26.1%)	6 (26.1%)	0 (0.0%)
HIV testing among PW	1 (4.3%)	0 (0.0%)	10 (43.5%)	12 (52.2%)
ART among PW	2 (8.7%)	0 (0.0%)	12 (52.2%)	9 (39.1%)
Syphilis testing among PW	2 (8.7%)	0 (0.0%)	11 (47.8%)	10 (43.5%)
Adequate treatment of syphilis seropositive PW	5 (21.7%)	2 (8.6%)	1 (4.3%)	15 (65.2%)
Targets for indicators	≥90%	80%-89.9%	<80%	
HepB testing among PW	3/3 (13.1%)	0 (0.0%)	0 (0.0%)	20 (86.9%)
HepB-BD vaccine coverage	10 (43.5%)	1 (4.3%)	4 (17.4%)	8 (34.8%)

Table 1: Number of countries meeting targets for process and impact indicators (WHO criteria for EMTCT of HIV, Syphilis and Hepatitis).

\* The numbers in brackets represent the percentages of countries achieving the corresponding targets.

**Conclusions:** The regional progress is off-track from achieving EMTCT of HIV, syphilis, and Hepatitis B with only 5 countries that have achieved or close to achieving all targets. Low service coverage, weak surveillance systems, lack of community and private sector engagement pose consistent challenges in achieving and validating progress. Concerted efforts and strong political commitment are urgently needed to accelerate progress towards triple elimination in the region.

## EPC084

### HIV prevalence and barriers to testing among 0-14 year old children in Nigeria: a population-based survey

T. Lawal<sup>1</sup>, N. Andrew<sup>1</sup>, O. Oyedele<sup>1</sup>, F. Murtala-Ibrahim<sup>2</sup>, A. Bashorun<sup>3</sup>, N. Sam-Agudu<sup>1,4,5</sup>

<sup>1</sup>International Research Center of Excellence, Institute of Human Virology Nigeria, Abuja, Nigeria, <sup>2</sup>Strategic Information Department, Institute of Human Virology Nigeria, Abuja, Nigeria, <sup>3</sup>Federal Ministry of Health, Abuja, Nigeria, <sup>4</sup>Pediatric and Adolescent HIV Unit, Institute of Human Virology Nigeria, Abuja, Nigeria, <sup>5</sup>Global Pediatrics Program and Division of Infectious Diseases, Department of Pediatrics, University of Minnesota Medical School, Minnesota, United States

**Background:** Early initiation of antiretroviral therapy in infants and children living with HIV is life-saving and mitigates long-term adverse outcomes. Thus, it is important to continuously evaluate the prevalence of HIV and barriers to timely testing in this population.

**Methods:** This study utilized population-based cross-sectional data from the 2018 Nigeria National HIV/AIDS Indicator and Impact Survey, which was conducted across all 6 geopolitical regions. Weighted frequency and percentages were employed to describe HIV prevalence and barriers to testing among 0-14-year-olds. Bivariate and multivariable analysis was performed with statistical significance set at 5%.

**Results:** Overall HIV prevalence among children was 0.1%. Disaggregation showed that prevalence among children under 5, 5-10 and 10-14 years was 0.1%, 0.2% and 0.2% respectively. Pediatric HIV prevalence was highest in the South-South and North-Central regions (0.2% respectively). A total of 139,138 (96.4% of children surveyed) had never been HIV-tested for HIV prior to the survey.

The most reported barrier to HIV testing among never-tested children was "mother's belief that they were at low risk/test was unnecessary" (43.6%). Other reasons included "distance to health facility" (5.5%), "high test costs" (4.9%), high transportation costs (3.9%), and religious objection (1.8%). Among previously never-tested children found to be HIV-positive, the most reported barrier to testing was "low risk/the feeling that the test was unnecessary" (39.1%), and "unsure of test location" (20.2%). We

also found that 1.5% of surveyed women were HIV-positive, and 6.4% of HIV-positive mothers had HIV-positive children; the odds of having an HIV-positive child was higher among HIV-positive mothers as opposed to HIV-negative mothers (=843.28;  $p < 0.001$ ).

**Conclusions:** HIV prevalence among Nigeria children is relatively low, however, this and the vertical transmission rate needs to approach zero to achieve the WHO target of an AIDS-free generation. Given that the vast majority (~97%) of children had never been tested, there are potential missed opportunities for early detection and treatment of HIV. Addressing the testing barriers and misconceptions through community health education, awareness campaigns and affordable/free/more accessible tests could increase uptake of HIV testing and overcome these barriers.

## EPC085

### CDC-funded HIV testing services outcomes among women of reproductive age in the United States, 2019-2022

D. Patel<sup>1</sup>, W. Williams<sup>2</sup>, C. Wright<sup>1</sup>

<sup>1</sup>Centers for Disease Control and Prevention (CDC), Division of HIV Prevention, Atlanta, United States, <sup>2</sup>Public Health Analytic Consulting Services, Inc., Hillsborough, United States

**Background:** Women comprised 18% of new HIV diagnoses in 2021 in the United States, with the greatest proportion among women of reproductive age (WRA). We examined newly diagnosed HIV positivity and linkage to HIV medical care among WRA receiving CDC-funded HIV testing services in the United States.

**Methods:** 2019-2022 HIV test-level data from the National HIV Prevention Program Monitoring & Evaluation system among WRA (aged 15-44 years) were analyzed. Pregnancy status was available for WRA with positive HIV test results. Bivariable associations between sociodemographic characteristics and pregnancy status were analyzed using Chi-Square. Multivariable robust Poisson models were used to assess the associations between sociodemographic characteristics with newly diagnosed HIV positivity. Linkage to HIV medical care within 30 days was analyzed among WRA with newly diagnosed HIV using the same approach, including pregnancy status as an independent variable.

**Results:** Of the 2,216,978 CDC-funded HIV tests conducted among WRA, 2,393 (0.11%) were positive for new HIV infection. HIV positivity was highest within each respective characteristic among WRA who were aged 40-44 years (0.18%; all other age groups with adjusted prevalence ratios [aPRs] < 1,  $p < 0.05$ ); Black/African American (0.15%; aPR=1.66) versus White (0.09%); resided in the US Dependent Areas (0.24%; aPR=3.04) versus South (0.11%); tested in non-healthcare settings (0.16%; aPR=1.59) ver-

sus healthcare settings (0.09%); and reported injection drug use (0.33%; aPR: 1.96) versus reported heterosexual contact only (0.16%) (all  $p < 0.001$ ). Age was the only socio-demographic characteristic significantly associated with pregnancy status ( $p < 0.05$ ), with the highest prevalence among 20-34 years.

Pregnancy status was not associated with linkage to HIV medical care in multivariable models. Linkage to HIV medical care was 73.1% overall. Linkage was highest for aged 15-19 years (86.1%; aPR=1.18) versus aged 40-44 years (70.2%) and resided in the Northeast (82.2%; aPR=1.16) versus South (70.9%); and lowest for WRA reporting injection drug use (61.9%; aPR=0.83) versus those reporting heterosexual contact only (75.3%) (all  $p < 0.05$ ).

**Conclusions:** Among WRA receiving CDC-funded HIV tests, newly diagnosed HIV positivity was higher among WRA reporting injection drug use whereas linkage to HIV medical care was lower among these WRA. HIV prevention efforts could be expanded to ensure WRA who use injection drugs are reached.

## EPC086

### Using a telehealth platform to optimize HIV testing prioritization through virtual screening and risk assessment

J. Ssenkumba<sup>1</sup>, L. Kamulegeya<sup>1</sup>, J. Bwanika<sup>1</sup>

<sup>1</sup>The Medical Concierge Group (TMCG), Projects and Research, Kampala, Uganda

**Background:** Uganda has made significant progress towards attaining the 95-95-95 targets. However, identifying and testing those with the highest risk or with potentially the highest positivity yield still remains a challenge and innovative approaches are being sought to mitigate the shortfall. We share lessons from telehealth-enabled risk assessment and screening pilot.

**Description:** Implemented in the Uganda USAID Social Behavioral Change Activity, the initiative utilizes digital platforms to boost HIV prevention in Uganda. A 24/7 Telehealth Centre operates a toll-free hotline and SMS platform, disseminating health messages and efficiently referring beneficiaries to testing facilities. Virtual screening during client-health worker interactions identifies high-risk individuals, leading to referrals for comprehensive HIV testing. Periodic follow-up calls ensure service uptake and linkage to care for those testing positive.

**Lessons learned:** In our January 2021 analysis of 15,000 calls and 10,000 SMS texts within the USAID-funded Social Behavioral Change Activity's tele health center, we focused on user engagement patterns to gauge the telehealth center's effectiveness in HIV testing and care. With 75% calls and 25% SMS texts, we observed communication preferences, influencing the center's approach to provide accessible channels. Gender representation, with 60% males and 40% females (median age: 28, 18-45), informed

tailored telehealth services. We identified risk groups, including 15% men who have sex with men, 20% commercial sex workers, and 10% adolescents.

The study highlighted the call center's efficiency in directing individuals for testing, underlining telehealth's crucial role in facilitating follow-ups for potential HIV cases. Insights from individuals initiated on treatment and those sharing results emphasized trust and effective communication in the telehealth process.

**Conclusions/Next steps:** Telehealth and related digital tools can be valuable platforms for screening and risk stratification for optimal HIV testing and linkage to care.

## EPC087

### Prevalence and factors associated with late diagnosis of people living with HIV in Hunan, China 2018-2021

X. Su<sup>1</sup>, X. Zhong<sup>1</sup>, Y. Gao<sup>2</sup>, X. Zou<sup>3</sup>, X. Chen<sup>3</sup>, H. Wang<sup>1</sup>, J. He<sup>3</sup>, Y. Zhou<sup>1</sup>

<sup>1</sup>Xiangya Nursing School, Central South University, Changsha, China, <sup>2</sup>Shenzhen Institute of Advanced Technology, Chinese Academy of Sciences, Shenzhen, China, <sup>3</sup>Chinese Center for Disease Control and Prevention, Hunan, China, Changsha, China

**Background:** The proportion of late HIV diagnosis has remained high worldwide. People living with HIV (PLWH) who were diagnosed late experienced poorer quality of life, higher morbidity and mortality rates, and higher costs of HIV care than those who were not diagnosed late. In addition, not knowing their HIV status increased the risk of HIV transmission. However, reasons for late HIV diagnosis are largely unknown, and relevant research is limited, especially in China.

This study aims to investigate the prevalence of late HIV diagnosis and identify associated factors among PLWH in Hunan, China.

**Methods:** A consecutive cross-sectional study was conducted from 2018 to 2021 in Hunan, China. We collected socio-demographic, epidemiological, and immunological information from the HIV/AIDS Comprehensive Response Information Management System of China. Late HIV diagnosis was defined as HIV diagnosis with a CD4 count  $< 350$  cells/ $\mu$ L or an AIDS-defining event. The prevalence of late HIV diagnosis with various characteristics was calculated. A chi-squared test and multivariable logistic regression analysis were used to identify risk factors for late HIV diagnosis.

**Results:** A total of 22504 PLWH were included. 14988 were classified as late HIV diagnosis, with a high proportion of 66.6% and much higher in PLWH aged 50 years and above (71.2%). PLWH aged 50 and above had a greater risk of getting a late HIV diagnosis compared to those aged 25 and under (odds ratio (OR): 2.246; 95% confidence interval (CI): 1.917-2.631).

This study revealed that PLWH registered in western Hunan (OR = 1.475, 95% CI: 1.306-1.666), transferred from health facilities (OR=1.331, 95% CI: 1.246-1.420), and acquired HIV through heterosexual sexually transmitted (OR=1.518, 95% CI: 1.127-2.045) were more likely to experience late diagnosis ( $P<0.05$ ).

**Conclusions:** Late diagnosis of PLWH remains a severe issue in Hunan, China, especially in the elderly population. Targeted strategies should be promptly instituted to promote HIV test and decrease late HIV diagnosis.

## EPC088

### Household-based support factors associated with viral load suppression among adolescents living with HIV in western Kenya

E. Abuonji<sup>1</sup>, D. Aduda<sup>1</sup>, I. Marete<sup>2</sup>, A.J. Ochung<sup>1</sup>, I. Okanda<sup>1</sup>, P.O. Owili<sup>3</sup>, G. Ayodo<sup>1</sup>

<sup>1</sup>Jaramogi Oginga Odinga University of Science and Technology, Department of Public and Community Health, Bondo, Kenya, <sup>2</sup>Moi University, Department of Pediatric health, Eldoret, Kenya, <sup>3</sup>African Population and Health Research Center, Nairobi, Kenya

**Background:** Although extensive efforts have been put in place to achieve the global target of 95% viral suppression (VS) rate among adolescents living with HIV (ALHIV), the VS rate among adolescents is generally lower compared to younger children and adults. Achieving VS targets is necessary to ensure zero HIV transmission, reduce the risk of opportunistic infections, drug resistance and AIDS. To ensure Antiretroviral Therapy (ART) adherence among adolescents, various support strategies have been implemented. Their success depends on how successful they are implemented. Adolescents majorly rely on caregivers, hence, there is a need to assess the components of household support systems and what elements can be attributable to VS.

**Methods:** Using a cross-sectional design with a quantitative approach, data was collected from 263 (10-19-year-old) adolescents during their routine clinic visits at Academic Model Providing Access to Healthcare (AMPATH) based Rafiki Center and Module 4 clinics. Respondents were identified using systematic random sampling technique. A structured questionnaire was used to assess the demographic and household factors. The viral load data was obtained from Electronic medical records. Viral suppression was defined as having a viral load of  $<200$  copies/ml of blood.

**Results:** Of the 263 adolescents, 85.6% ( $n=225$ ) were virally suppressed. Older participants (AOR = 0.62; 95% CI = 0.50-0.78;  $p < 0.001$ ), living with single parents (AOR = 0.30; 95% CI = 0.11-0.81;  $p = 0.017$ ) or guardians (AOR = 0.29; 95% CI = 0.11-0.81;  $p = 0.018$ ) had lower odds of viral suppression. Participants who talked freely with caregivers about HIV (AOR=3.53, 95%CI=1.40-8.92,  $p$ -value=0.008), who

got reminders from their caregivers to take medication (AOR=2.30, 95%CI=1.20-3.38,  $p$ -value=0.032), whose family were aware of their HIV status (AOR=1.67, 95%CI=1.19-4.21,  $P$ -value=0.048), who got financial support to get to the facility (AOR 1.97, 95%CI=1.26-5.03,  $P$ -value=0.039) and who joined a social support group (AOR=3.04, 95%CI=1.09-8.50,  $p$ -value=0.34) were more likely to be virally suppressed.

**Conclusions:** The findings highlight stable living family relationships, communication among family members and social support as potential household interventions for improving VS. Addressing the highlighted interventions is essential to meeting the 95% VS goal by 2030. Further studies should explore the identified factors for programmatic interventions.

## EPC089

### Validation of PoZQoL scale in Turkish population living with HIV: a cross-cultural adaptation study

S. Atalay<sup>1</sup>, Z. Varol<sup>2</sup>, İ. Ödemiş<sup>1</sup>, S. Singil<sup>1</sup>, U. Sönmez<sup>3</sup>

<sup>1</sup>University of Health Sciences Tepecik Training and Research Hospital, Infectious Diseases and Clinical Microbiology, İzmir, Türkiye, <sup>2</sup>Dokuz Eylül University, Department of Public Health, Division of Epidemiology, İzmir, Türkiye, <sup>3</sup>University of Health Sciences Bozyaka Training and Research Hospital, Infectious Diseases and Clinical Microbiology, İzmir, Türkiye

**Background:** The increasing number of people living with HIV requires a simple and easy- to-use quality of life (QoL) scale for people living with HIV (PLWH). This study aims to adapt the PozQoL scale to Turkish and assess its reliability and validity for the PLWH population in Turkey.

**Methods:** Translation-back translation methodology was employed, and face-to-face interviews were conducted with 130 PLWH using the PozQoL, sociodemographic, and clinical data questionnaire. Exploratory Factor Analysis (EFA) and Confirmatory Factor Analysis (CFA) were used to identify the underlying factor structure and examine the validity of the measurement model, respectively. Cronbach's alpha and intraclass correlation coefficients (ICCs) were used to assess internal consistency and test-retest reliability, respectively.

**Results:** The study group consisted of 119 (91.5%) male subjects, of whom 94 (72.3%) had a secondary school education or less and ranged in age from 20 to 76 years (mean age  $40.2 \pm 12.2$  years). EFA revealed four factors with an eigenvalue of 0.88, explaining 62.1% of the cumulative variance. The loading weights, obtained with the EFA, are shown in Table 1.

CFA indicated that the four-factor solution achieved good levels of fit. The total Cronbach's alpha was 0.81, indicating high internal consistency. Cronbach's alpha values ranged from 0.39 to 0.74 (Table 2). The ICC for the total score was 0.92 (95% confidence interval [CI] = 0.90-0.94;  $p<0.05$ ), demonstrating high test-retest reliability. All

items had positive and significant correlations with their respective scales, indicating good internal consistency (Table 3). The correlations ranged from 0.55 to 0.85, indicating strong associations between the items and their corresponding subdimensions.

Item 12	0.42	0.42	0.42	0.42
Item 13	0.81	0.81	0.81	0.81

**Conclusions:** PoZQoL was found to be a valid and reliable tool to assess the health quality of PLWH in Turkey. This scale can be used in the assessment of QoL of PLWH in our country and in studies to be conducted in this population.

## EPC090

### Utilizing existing HIV/STI outreach to reduce disparities in Mpox vaccination

S. Young<sup>1</sup>, C. Rohr-Allegrini<sup>1</sup>

<sup>1</sup>San Antonio AIDS Foundation, San Antonio, United States

**Background:** Communities disproportionately affected by HIV are more susceptible to Mpox. As Mpox cases increased in Bexar County, the San Antonio AIDS Foundation (SAAF) began incorporating Mpox vaccination into existing HIV/STI outreach events. SAAF's strategy focused on fighting stigma and addressing barriers to accessing Mpox prevention.

While communities of color, men who have sex with men (MSM), and individuals experiencing homelessness are disproportionately affected by Mpox, only 15% of Texans who could benefit from vaccination received at least one dose.

First-come first-served models favor individuals with resources such as transportation and paid work leave, contributing to disparities in vaccination rates. To increase equity, SAAF began providing free Mpox vaccination during HIV testing outreach events, providing dual services from our mobile testing van.

**Description:** From February through July 2023, SAAF hosted 17 vaccination events, which were held at homeless shelters, recovery residencies, and LGBTQ spaces. Public health messaging was shared in English and Spanish, allowing staff to address misinformation about vaccine efficacy and safety.

To encourage participants to receive their second dose, whenever available, the mobile van would return to the

same location 4 weeks following the previous event, following the CDC recommendation. All clients were also given the option to book an appointment at SAAF.

**Lessons learned:** Over five months, 176 Mpox doses were administered. Of these, 53.9% are homeless, 51.7% are Hispanic, 20.5% are Black, and 21% identify as MSM.

The largest barrier faced during the project involves the reliability of clients returning for their second dose. Due to the transient nature of many participants, only 11.93% of clients reappeared for their second dose (8.52273% returned to an event location, and 3.4091% booked an appointment).

Best practices include contacting clients in advance to share information about upcoming opportunities to receive their second dose, along with posting ample signage at the homeless shelters since many of those clients do not have cell phone or email access.

**Conclusions/Next steps:** Mobile clinics from a trusted source created equitable access to Mpox vaccines, especially for vulnerable populations. This strategy was well received by the community and is successful at maximizing vaccine uptake, improving community health.

## EPC091

### Impact of CD4 and viral load on risk of COVID-19 in-hospital mortality in people living with HIV

S. Inzaule<sup>1</sup>, R. Silva<sup>1</sup>, N. Ford<sup>1</sup>, S.S. Thwin<sup>1</sup>, J. Waasila<sup>2</sup>,

M. Doherty<sup>1</sup>, J. Diaz<sup>1</sup>, S. Bertagnolio<sup>1</sup>

<sup>1</sup>World Health Organization, Geneva, Switzerland,

<sup>2</sup>National Institute for Communicable Disease, Johannesburg, South Africa

**Background:** There is limited data on correlates of COVID-19 mortality among people living with HIV (PLHIV). We investigated the impact of viral non-suppression and immunosuppression on in-hospital COVID-19 mortality among PLHIV.

**Methods:** We analyzed individual-level data from the WHO Global Clinical Platform <https://www.who.int/teams/health-care-readiness/covid-19/data-platform>) comprising 774,761 hospitalized children and adolescents (0-18 years) and adults from 59 countries. We used Cox regression to evaluate associations between in-hospital mortality and HIV co-infection stratified by CD4 and viral load (VL) as a composite variable (see Table). Models were adjusted for demographic factors, comorbidities, COVID-19 severity at admission, SARS-CoV-2 variants.

**Results:** Compared to HIV negative population, mortality risk was significantly higher among PLHIV with CD4 <200 cells/mL and VL ≥1000 cps/ml (aHR 2.82, 95%CI 2.47-3.22) or VL <1000 cps/ml (aHR 2.19, 95%CI 1.95-2.45), in those with CD4 ≥200 cells/mL and VL ≥1000 cps/ml (aHR 1.48, 95%CI 1.12-1.97) or VL <1000 cps/ml (aHR 1.30, 95%CI 1.20-1.42) (Table). Compared with immunocompromised PLHIV despite viral suppression (with CD4<200 cells/mL and VL<1000cps/

ml), the risk of in-hospital death was 39% lower (aHR 0.61, 95%CI 0.53-0.71) among those with CD4  $\geq$ 200 cells/mL and VL <1000cps/ml and 42% lower among those with CD4  $\geq$ 200 cells/mL and VL  $\geq$ 1000cps/ml. There was a tendency towards higher risk of death among those with lower CD4 cell counts and unsuppressed viremia (aHR 1.10, 95%CI 0.92-1.31) (Table).

**Conclusions:** PLHIV with low CD4 counts had a comparatively higher risk of in-hospital death, with the risk being highest among those with viral non-suppression. This observation highlights the need to fast track rapid treatment initiation, provide support for treatment adherence to ensure viral suppression and immune recovery as well as prioritizing PLHIV for COVID-19 immune booster vaccines as recommended by WHO.

Characteristic	N	Deaths n(%)	aHR (95%CI)	P-value
HIV negative	593942	112953 (19)	1.0	
PLHIV VL $\geq$ 1000 cps/ml + CD4 <200 cells/mL	1894	539 (28)	2.82 (2.47-3.22)	<0.001
PLHIV VL <1000 cps/ml + CD4 <200 cells/mL	2045	636 (31)	2.19 (1.95-2.45)	<0.001
PLHIV VL $\geq$ 1000 cps/ml + CD4 $\geq$ 200 cells/mL	693	121 (17)	1.48 (1.12-1.97)	0.006
PLHIV VL <1000 cps/ml + CD4 $\geq$ 200 cells/mL	5426	1099 (20)	1.30 (1.20-1.42)	<0.001
PLHIV				
PLHIV VL <1000 cps/ml + CD4 <200 cells/mL	2045	636 (31)	1.0	
PLHIV VL <1000 cps/ml + CD4 <200 cells/mL	1894	539 (28)	1.10 (0.92-1.31)	0.3
PLHIV VL $\geq$ 1000 cps/ml + CD4 $\geq$ 200 cells/mL	693	121 (17)	0.58 (0.43-0.78)	<0.001
PLHIV VL <1000 cps/ml + CD4 $\geq$ 200 cells/mL	5426	1099 (20)	0.61 (0.53-0.70)	<0.001

*Table: Risk of in-hospital death among people living with HIV (PLHIV) infected with COVID-19 by viral load and CD4 counts*

Models were adjusted for age, sex, SARS CoV-2 variants, COVID-19 severity and comorbidities including asplenia, asthma, chronic cardiac disease, chronic kidney disease, chronic liver disease, neurological disorder, pulmonary disease, current smoking, diabetes, hypertension, cancers, obesity and tuberculosis.

## EPC092

### SARS-CoV-2 seroprevalence and anti-S IgG concentration in adolescents according to HIV status in Lomé (Togo) in 2022

Y.R. Konu<sup>1,2</sup>, F. Damond<sup>3</sup>, I.W.O. Adama<sup>1</sup>, N. Dapam<sup>4,1</sup>, V.M. Ferré<sup>3</sup>, O.E. Takassi<sup>5</sup>, M.K. Tchankoni<sup>1</sup>, A.J. Sadio<sup>1,2</sup>, C. Charpentier<sup>3</sup>, D.K. Ekouevi<sup>1,2</sup>

<sup>1</sup>Université de Lomé, Département de Santé Publique, Lomé, Togo, <sup>2</sup>GHiGS Team, Bordeaux Population Health Centre, Inserm (UMR 1219), IRD (EMR 279), University of Bordeaux, Bordeaux, France, <sup>3</sup>Service de Virologie, Université Paris Cité, INSERM, IAME, UMR 1137, AP-HP, Hôpital Bichat-Claude Bernard, Paris, France, <sup>4</sup>Centre Médicosocial Lucia, ONG Espoir Vie Togo, Lomé, Togo, <sup>5</sup>Service de Pédiatrie, CHU Sylvanus Olympio, Lomé, Togo

**Background:** There is limited data on the circulation of SARS-CoV-2 among adolescents living with HIV in Africa. The aim of this study was to estimate seroprevalence and compare anti-S IgG SARS-CoV-2 antibody concentrations among adolescents in Lomé according to HIV serostatus.

**Methods:** A cross-sectional study was conducted between August and November 2022 in three pediatric wards. A standardized questionnaire was administered. A blood sample was collected and plasma aliquots were sent to the virology laboratory at Hôpital Bichat-Claude Bernard (Paris, France). Qualitative and quantitative testing for SARS-CoV-2 anti-S and anti-N immunoglobulin G (IgG) was performed using the Alinity SARS-CoV-2 IgG commercial kit (CLIA, Abbott, IL, USA). Natural log-transformed linear regression was used to compare anti-S antibody concentrations according to HIV serostatus.

**Results:** A total of 634 adolescents (47.7% girls) with a median age of 13 years (interquartile range, IQR: 7-18 years) were included. Adolescents living with HIV (ALWHIV) accounted for 41.6% (n=262) and had a median duration of antiretroviral therapy of 8.0 years (IQR: 4.9-11.4); 85.6% initiated dolutegravir-based therapy (n=231) and 61.0% had an HIV viral load < 50 copies/mL. Among adolescents, 22.2% reported being vaccinated against COVID-19 and (12.9% in ALWHIV vs 37.1% in HIV-negative subjects, p=0.001). Seroprevalence for anti-S IgG was 88.0% (IC95%: 85.2 - 90.4) and for anti-N IgG 46.1% (IC95%: 42.1 - 50.0). There was no difference in the prevalence of these antibodies according to HIV serostatus (Anti-S: 87.5 vs 88.4%, p=0.737; Anti-N: 43.6% vs 47.8%, p=0.287). Among anti-S-positive adolescents, median anti-S antibody concentration was similar according to HIV status (766 AU/mL (191-1,959) vs 844 (203-2,422), p=0.417). The relative mean was 39% (95% CI -15 -64; p=0.002) lower in HIV-positive than in HIV-negative adolescents (after adjustment for age and gender).

**Conclusions:** Eight out of ten percent of the adolescents had anti-SARS-CoV-2 antibodies. In anti-S-positive in HIV positive adolescents, lower IgG concentrations may reflect a lesser serological response to infection, supporting the promotion of COVID-19 vaccination in this population.

## EPC093

### Investigation of multimorbidity based on self-reported chronic conditions among Chinese men who have sex with men: a network analysis approach

J. Mu<sup>1</sup>, F. Jing<sup>2</sup>, X. Zhang<sup>1</sup>, S. Hu<sup>1,3,4</sup>, Y. Zhou<sup>5</sup>, J. Zhou<sup>6,7</sup>, W. Tang<sup>1,3</sup>

<sup>1</sup>University of North Carolina Project – China, Guangzhou, China, <sup>2</sup>Faculty of Data Science, City University of Macau, Taipa, Macao SAR, Macau, China, <sup>3</sup>Dermatology Hospital of Southern Medical University, Guangzhou, China, <sup>4</sup>School of Public Health, Southern Medical University, Guangzhou, China, <sup>5</sup>Zhuhai Center for Diseases Control and Prevention, Zhuhai, China, <sup>6</sup>Warwick Medical School, The University of Warwick, Coventry, United Kingdom, <sup>7</sup>LKS Faculty of Medicine, The University of Hong Kong, Hong Kong SAR, China

**Background:** Men who have sex with men (MSM), at high risk of HIV/AIDS transmission, typically tend to be young. Once infected with HIV, they become vulnerable to various diseases. Multimorbidity (the co-existence chronic of two or more conditions) is a global challenge, increasingly prevalent in younger populations. It is associated with reduced functioning and quality of life, as well as increased healthcare utilization.

We aim to investigate multimorbidity networks in MSM to optimize HIV and chronic disease care services.

**Methods:** We conducted a cross-sectional study to investigate the multimorbidity network among Chinese MSM (n=888) based on 17 self-reported chronic diseases. These data were collected by six local LGBT community-based organizations (CBOs) through WENJUANXING from March to April 2022.

We compared characteristics and sexual-related factors between MSM with and without chronic conditions using Mann-Whitney U test and chi-square ( $\chi^2$ ) test. Social network analysis (SNA) and the fast greedy algorithm were employed to depict multimorbidity patterns and predict clusters of the 17 chronic diseases.

**Results:** A total of 351 individuals had at least one chronic condition, and they were older than the 537 healthy participants (median age: 28 vs. 25 years,  $P<0.001$ ) with lower PrEP uptake (15.2% vs. 20.8%,  $P<0.001$ ).

Obesity, hypertension, diabetes, and liver disease serve as central nodes in the multimorbidity network, showing more combination with other chronic diseases, with high degree values (e.g. obesity: 16, hypertension: 14) and eigenvector centrality scores (e.g. obesity: 0.586, hypertension: 0.476).

For the coexisting chronic conditions edge, the obesity and hypertension edges show the highest weight in both the overall network (edge betweenness=0) and other subnetworks. Comparing those who have never taken PrEP (n=701) with the 160 MSM confirmed PrEP usage, the latter group, experiencing more multimorbidity (e.g.,

obesity, hypertension, diabetes, liver disease, and thyroid conditions). In the cluster analysis, self-reported chronic conditions were grouped into three clusters.

**Conclusions:** Based on self-reported chronic diseases online, obesity and hypertension appear to be more prevalent among Chinese MSM. We need to pay more attention to preventing multimorbidity, especially among those with PrEP uptake, including conditions such as obesity, hypertension, diabetes, liver disease, and thyroid disease.

## EPC094

### Exposure to Covid-19 related stressors and their correlation with pandemic-related distress and growth in people with HIV in Nouvelle Aquitaine, France (ANRS CO3 AQUIVIH-NA QuAliCOV Study)

**Background:** People with HIV (PWH) were at risk of severe COVID-19 and poorer health outcomes due to their HIV and other risk factors for severe COVID-19, underlying psycho-social characteristics, disruptions in care. Adopting a syndemic perspective, we investigated PWH's exposure to pandemic-related stressors and analyzed their correlation with pandemic-related distress and personal growth.

**Methods:** PWH enrolled in the ANRS CO3 AQUIVIH-NA cohort's QuAliV study (Nouvelle Aquitaine, France) completed an adapted CAIR Lab Pandemic Impact Questionnaire (C-PIQ), encompassing stressors (e.g., 'became ill with coronavirus'), distress (e.g., 'how stressful have changes in social contacts been?'), and personal growth (e.g., 'strengthened relationships with others') between 9/2021 and 3/2022. We described cumulative stressor exposure

(score 1-15) and explored variation by PWH's characteristics (demographic, HIV-related, risk-factors, psycho-social vulnerability/resilience). We assessed whether stressors and/or characteristics were associated with distress (score 0-23, higher = greater distress) and growth (score 0-20, higher = greater growth) using linear and zero-inflated Poisson regression respectively. We presented stratified (age) and adjusted analyses (depression, HIV-related stigma).

**Results:** Participants' (N=374) characteristics were similar to those in care. However, fewer were foreign-born. 76.2% were men, aged 58. 99.2% were on ART, 95.7% had achieved viral suppression, 71.1% had at least one risk factor for severe COVID-19, 25.8% reported moderate-severe depression, and 29.6% reported difficulties meeting basic needs in years preceding the pandemic. Exposure to stressors was significantly higher in those <60 and the psycho-socially vulnerable (depressed, stigma, socially-isolated). Each additional stressor correlated with a 0.8-point increase (95% C.I. 0.6-1.0,  $p<0.001$ ) in distress scores and a 0.1-point increase (95% C.I. 0.04-0.08,  $p<0.001$ ) in growth scores.

Results were similar for growth after stratification by age and for distress after stratification by age and adjustment for depression, HIV-related stigma. While not associated with stressors, PWH's vulnerability as opposed to their risk factors for severe COVID-19 was associated with greater distress while the contrary was true for growth.

**Conclusions:** Exposure to stressors was strongly correlated with distress but also growth. Independent of exposure to stressors, PWH's social vulnerability/resilience were associated with distress/growth respectively as opposed to other characteristics (e.g., risk factors), similar to the general population.

## EPC095

Patterns and influences of comorbidities in HIV: insights from a population-based study in Luzhou City, China, 2001-2022

B. Yu<sup>1</sup>, H. Chen<sup>2</sup>, T. Xiao<sup>2</sup>, X. Chen<sup>1</sup>, R. Chen<sup>1</sup>, A. Li<sup>1</sup>, F. Huang<sup>3</sup>, Y. Chen<sup>4</sup>, S. Fan<sup>1</sup>

<sup>1</sup>Southwest Medical University, School of Public Health, Luzhou, China, <sup>2</sup>Luzhou Center for Disease Control and Prevention, Luzhou, China, <sup>3</sup>Affiliated Hospital of Southwest Medical University, Department of Infectious Diseases, Luzhou, China, <sup>4</sup>Southwest Medical University, School of Nursing, Luzhou, China

**Background:** Managing people living with HIV (PLWH) who present with multiple comorbidities is increasingly challenging. This study aims to understand comorbidity patterns in PLWH, examine differences in comorbidities among various subgroups, explore the factors influencing HIV comorbidity, and provide a scientific basis for the health management, diagnosis, and treatment of PLWH in complex contexts.

**Methods:** We analyzed data from 13,884 newly reported HIV/AIDS cases residing in Luzhou City by the end of 2022, obtained from the "China AIDS Integrated Prevention and Control Information System." Disease information was organized according to the ICD-11 code, including 36 secondary diseases classified into 21 diagnostic groups.

We employed a systematic clustering method to analyze comorbidity patterns in PLWH, determining the core comorbidity cluster through central analysis. Time-series clustering was used to describe the progression trends of comorbidities based on their onset time, and a multivariate logistic regression model analyzed the factors influencing comorbidities in PLWH.

**Results:** The 21 diagnostic groups were systematically clustered into four comorbidity clusters: Cardiac Disorders and Inflammatory Disease (3 diagnostic groups), Metabolic Disorder and Lung Disease (5 diagnostic groups), contagious Diseases and Metabolic Disease (9 diagnostic groups, the core comorbidity cluster), and Chronic Disease (4 diagnostic groups). Additionally, PLWH under 50 years of age, females, and individuals with homoexual behavior exhibited a comorbidity pattern of „Tumors and Sexually Transmitted Diseases." Time-series clustering algorithm results indicate that the two clusters (21 diagnostic groups) showed an overall upward trend before 2019, with a turning point occurring in that year. The first cluster (9 diagnostic groups including viral hepatitis, tuberculosis, and sexually transmitted diseases) experienced significant fluctuations during the COVID-19 pandemic. Influencing factors for the development of comorbidities in PLWH include gender, age, marital status, ethnicity, education level, route of transmission, WHO clinical staging, and initial CD4 counts.

**Conclusions:** It is vital to strengthen comprehensive management for PLWH with the comorbidity pattern of „Lung Disease combined with Metabolic Disorders," particularly in individuals under 50, females, and those with homoexual behavior, who present with „Tumors and Sexually Transmitted Diseases." Effective disease prevention and risk factor monitoring are essential components of this management approach.

## EPC096

A comparison of two recent infection testing algorithms using HIV-1 viral load or CD4 cell count to identify potential misclassification of false recent infections in Thailand, 2020-2022

T. Tasaneeyapan<sup>1</sup>, P. Chaiphosri<sup>2</sup>, S. Jirajariyavej<sup>3</sup>, S. Tanpradech<sup>1</sup>, T. Naiwattanakul<sup>1</sup>, A. Kanphukiew<sup>1</sup>, K. Jantarasorn<sup>2</sup>, S. Ussavarajpong<sup>4</sup>, M. Martin<sup>5</sup>, C. Yang<sup>5</sup>, B. Parekh<sup>5</sup>, S. Northbrook<sup>1</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV/TB, Nonthaburi, Thailand, <sup>2</sup>Office of Public Health Communicable Diseases, Department of Health, Bangkok Metropolitan Administration, Bangkok, Thailand, <sup>3</sup>Taksin Hospital, Bangkok, Thailand, <sup>4</sup>Bangkok Metropolitan Administration, Department of Medical Services, Bangkok, Thailand, <sup>5</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV/TB, Atlanta, United States

**Background:** A rapid test for recent HIV-1 infection (RTRI) combined with HIV-1 viral load (VL) as part of a recent infection testing algorithm (RITA) is a recommended approach to reduce false-recent misclassification among antiretroviral treatment (ART) experienced individuals. Immune changes associated with advanced HIV-disease, that correlate with low CD4 count, can also impact RTRI results and cause misclassification. We constructed two RITA algorithms (baseline VL or CD4) and compared misclassification of each algorithm to improve recent infection surveillance in Thailand.

**Methods:** Newly diagnosed HIV-1 positive individuals aged ≥13 years seen at 21 sites in 3 provinces between October 2020 and September 2022 were enrolled in recent infection surveillance and tested with RTRI after informed consent. We used National HIV Program data to exclude individuals with prior HIV diagnosis and ART history. Specimens with VL <1,000 copies/ml or CD4 <200 cells/mm<sup>3</sup> were defined as misclassified potentially as recent infection.

**Results:** Of 1,442 new diagnoses tested with RTRIs, 136 (9.4%) were RTRI recent cases. Of the 136, 133 (97.8%) had baseline VL, 99 (72.8%) had baseline CD4, and 96 (70.6%) had both baseline VL and CD4. Women had higher proportion of RTRI, RTRI-VL RITA, and RTRI-CD4 RITA recent infections (11.0%, 9.5%, and 5.7%, respectively). Men who have sex with men had the highest proportion of recent RTRI-VL RITA (8.5%) and RTRI-CD4 RITA (4.6%) after excluding other population groups with small numbers. Comparing RTRI-VL RITA and RTRI-CD4 RITA recent results (see Table), 30/86 (34.9%) may be misclassified by RTRI-VL RITA due to low CD4 (<200) while 9/65 (13.8%) may be misclassified as recent by RTRI-CD4 RITA due to low VL (<1,000).

**Conclusions:** Routine baseline CD4 as part of RITA combined with case surveillance can improve the accuracy of recent infection surveillance in Thailand. Using RTRI-VL RITA ≥1,000 alone in Thailand (high proportion of late diagnoses with advanced HIV disease) may result in higher false recent infection classification.

RTRI-CD4 RITA	RTRI-VL RITA		
	Recent ≥1,000	Long Term <1,000	Total
Recent ≥200	56	9	65
Long Term <200	30	1	31
Total	86	10	96

Table: Comparison of recent infection reclassification by RTRI-VL RITA and RTRI-CD4 RITA among newly diagnosed PLHIV in 3 provinces in Thailand, 2020-2022.

## EPC097

Improving GBV data quality to monitor PEP completion in GBV clients

A. Schmale<sup>1</sup>, E. Reitenauer<sup>1</sup>, L. Malilo<sup>2</sup>, V. Kanje<sup>3</sup>, A. Wurzburg<sup>1</sup>, M. Dennison<sup>1</sup>, W. Jose<sup>1</sup>

<sup>1</sup>United States Agency for International Development (USAID), Office of HIV/AIDS, Washington DC, United States, <sup>2</sup>United States Agency for International Development/Malawi, Project Development and Analysis, Lilongwe, Malawi, <sup>3</sup>United States Agency for International Development/Malawi, Health Population and Nutrition, Lilongwe, Malawi

**Background:** HIV and gender-based violence (GBV) are syndemic. Addressing GBV is essential to controlling the global HIV epidemic. GBV is underreported globally, including in Malawi where adolescent girls, women, and key populations experience high rates of GBV. Improved GBV data quality is crucial to measuring the impact of GBV on HIV services, including HIV post-exposure prophylaxis (PEP), and ensuring survivors receive care to achieve optimal HIV outcomes.

It is critical to identify gaps within PEP service delivery to provide appropriate support to prevent HIV seroconversion for survivors. The United States President's Emergency Plan for AIDS Relief (PEPFAR), through USAID, measures delivery of the World Health Organization's (WHO) minimum package of post-GBV clinical care services, including HIV testing and PEP, through the GEND\_GBV indicator.

**Description:** USAID conducted a GEND\_GBV data quality assessment (DQA) to identify issues in data collection through quantitative and qualitative methods at eight sites across Malawi. The DQA recounted totals for fiscal year 2022, quarters two and four, for GEND\_GBV, including PEP completion, and to assess consistency, compare results, and identify gaps in PEP service delivery. The DQA compared reported and recounted results with a verification factor (VF) to assess quality.

**Lessons learned:** The quantitative analysis found between quarters two and four, six sites improved data quality and one remained consistent. The DQA team was unable to recount the quarter four results for one site. Qualitatively, the DQA revealed that while overall staff had a thorough understanding of the GEND\_GBV indicator, inconsistent data collection practices specific to each site led to issues with reporting, especially for PEP comple-

tion. Key recommendations included improving PEP cascade documentation and follow up to ensure eligibility, initiation, and completion are correctly captured; standardizing data collection tools; and clear documentation of the minimum package availability at site.

**Conclusions/Next steps:** This DQA found that facilities need to implement processes to improve documentation of PEP services to accurately monitor PEP completion and support HIV prevention efforts for GBV survivors. Subsequent DQAs will be held in PEPFAR-supported countries to improve GBV and PEP data quality for this population.

## EPC209

Integration of key population-friendly HIV prevention services in public health facilities: results from a sub-county hospital in Kitui County, Kenya

N. Ndone<sup>1</sup>, P. Eshikumo<sup>2</sup>, D. Muriungi<sup>3</sup>, F. Kimithi<sup>4</sup>, E. Ekisa<sup>1</sup>, J. Gachoki<sup>1</sup>, S. Mualuko<sup>1</sup>, M. Makau<sup>4</sup>, J. Okumu<sup>1</sup>, P. Nzioki<sup>1</sup>, S. Wafula<sup>3</sup>, P. Kyalo<sup>2</sup>

<sup>1</sup>Centre for International Health, Education and Biosecurity (CIHEB), Kitui, Kenya, <sup>2</sup>Centre for International Health, Education and Biosecurity (CIHEB), Machakos, Kenya,

<sup>3</sup>Centre for International Health, Education and Biosecurity (CIHEB), Nairobi, Kenya, <sup>4</sup>Ikutha Level 4 Hospital, Kitui, Kenya

**Background:** Key populations (KP), including female sex workers (FSWs) and men who have sex with men (MSM) contribute significantly to new HIV infections in Kenya. Stigma, discrimination, and hostility hinder their access to health services underscoring the need for tailored KP-friendly services. Integrating these services into public health facilities is recommended, but a persistent „know-do“ gap hampers effective integration. This study described integration of KP-friendly health services at Ikutha Sub-County Hospital, Kitui County, Kenya.

**Description:** Collaborative efforts involved program staff working with KP peer leaders, hospital staff, and the sub-county health management team members. Strategies included training hospital staff in KP-friendly service provision, identifying a hospital focal staff for integration, monthly microplanning with peer leaders, and conducting peer-led integrated community outreaches with linked referrals to the hospital. Data analysis focused on the proportion of the net-enrolled KPs reached (provided HIV prevention/ treatment services) and retained (contacted within the last three months), comparing pre-integration (Oct 2021 to Sep 2022) and post-integration (Oct 2022 to Sep 2023) periods. Paired t-test statistics was applied to assess primary outcomes associations with age and KP typology, with significance set at  $p < 0.05$

**Lessons learned:** Post-integration, 809 KPs (442 FSWs and 367 MSM) were enrolled compared to the 484 (309 FSWs and 175 MSM) pre-integration. The proportion of net-en-

rolled KPs reached, increased significantly among FSWs from 29% to 45% ( $t = -110$ ), while MSM showed an insignificant marginal drop from 41.9% to 41.4% ( $t = 1.06$ ). Retention significantly increased from 12% to 58% ( $t = -68.5$ ) among FSWs, and from 26% to 50% ( $t = -19.41$ ) among MSM. Age had no significant association with reach and retention.

**Conclusions/Next steps:** Collaborative efforts, guided by a peer-led model, successfully increased reach and retention in HIV prevention services for FSWs and MSM. The findings advocate for integrating KP-friendly services in public health facilities, ensuring sustainability amid evolving health resource constraints. This approach addresses the "know-do" gap and sets a precedent for inclusive and sustainable HIV prevention strategies.

## EPC220

Factors affecting viral suppression or rebound among persons living with HIV and on antiretroviral therapy in Ghana

A.T. Boateng<sup>1,2</sup>, J. Aboagye<sup>1,3</sup>, H. Lamptey<sup>1</sup>, C. Abana<sup>1,2</sup>, A. Abaidoo-Myles<sup>1,2</sup>, D. Quansah<sup>1</sup>, S. Agyemang<sup>4,2</sup>, Y. Awuku-Larbi<sup>1</sup>, G. Ansa<sup>5</sup>, J. Oliver-Commey<sup>6</sup>, V. Ganu<sup>7</sup>, G. Kyei<sup>1,3,8</sup>, P. Puplampu<sup>7</sup>, E. Bonney<sup>1</sup>

<sup>1</sup>Noguchi Memorial Institute for Medical Research, Virology, Accra, Ghana, <sup>2</sup>West African Centre for Cell Biology of Infectious Pathogens, Department of Biochemistry, Cell and Molecular Biology, College of Basic and Applied Sciences, Accra, Ghana, <sup>3</sup>Medical and Scientific Research Center, University of Ghana Medical Center, Accra, Ghana, <sup>4</sup>Korle-Bu Teaching Hospital, Immunology Department, Central Laboratory, Accra, Ghana, <sup>5</sup>University of Ghana Hospital, Public Health Unit, Accra, Ghana, <sup>6</sup>LEKMA Hospital, Accra, Ghana, <sup>7</sup>University of Ghana School of Medicine, Department of Medicine, Accra, Ghana, <sup>8</sup>Washington University School of Medicine in St Louis, Department of Medicine and Molecular Microbiology, St Louis, United States

**Background:** Regular viral load testing for people living with HIV (PLWH) is key to attaining the UNAIDS' fast track 95:95:95 strategy to end the HIV epidemic by 2030. However, viral load testing is sporadic in routine HIV care in most resource-limited settings, including Ghana. We investigated factors affecting viral suppression or rebound among PLWH in Ghana.

**Methods:** This study analyzed data from a hospital-based cohort study focused on HIV cure research. The cohort study was conducted at three hospitals in the Greater Accra region of Ghana. Demographic characteristics were captured from participants' folders and CD4+ T cell count and viral loads were measured from blood samples collected at baseline, 6 months, and 18 months.

**Results:** The study participants were predominantly female (68%), and had a median age of 45 (IQR: 21 – 76 years), with 52% on ART for more than 6 years and 74%

Oral  
abstracts

Poster  
exhibition

Index

on dolutegravir-based regimens. Viral load was <50 copies/ml in 74% at baseline and 88% at 18 months with 80% having CD4+ T cell count >350 cells/ $\mu$ l. Age group [<40 vs >40 years] (OR 2.35, 95% CI: 1.21-4.58, p-value=0.012), CD4+ T cell count [>350 vs <350 cells/ $\mu$ l] (OR 4.35, 95% CI: 2.32-8.18, p-value<0.001) and ART regimen [NVP based vs DTG based] (OR 7.0, 95% CI: 1.15-42.57, p-value=0.034) were associated with viral suppression of <50 copies/ml.

However, the overall viral rebound rate was estimated at 13.6 per 1,000 person-months (95% CI 10.5 – 17.7) with the rates decreasing with time. Educational level up to Junior High School (p=0.011) was significantly associated with viral rebound.

**Conclusions:** Measuring viral loads at 3-time points within 2 years was peculiar to our study and may explain the high viral suppression observed. The viral rebound was linked to low education levels, which calls for targeted education of PLWH with JHS level education or less. Regular viral load monitoring and implementation of measures against viral rebound particularly among PLWH with lower education up to JHS level will push Ghana towards attaining the third '95 of the UNAIDS ambitious 95:95:95 target by 2030.

## EPC226

Overcoming HIV self-testing hurdles: insights from sub-Saharan Africa's self-testing adoption among at-risk populations

F.E. Anyiam<sup>1</sup>, M.N. Sibiya<sup>2</sup>, O. Oladimeji<sup>3</sup>

<sup>1</sup>Durban University of Technology, Faculty of Health Sciences, Durban, South Africa, <sup>2</sup>Mangosuthu University of Technology, Division of Research, Innovation and Engagement, Durban, South Africa, <sup>3</sup>Sefako Makgatho Health Sciences University, Department of Epidemiology and Biostatistics, Pretoria, South Africa

**Background:** With a high HIV burden in Sub-Saharan Africa, expanding access to testing remains pivotal. HIV self-testing (HIVST) offers a discreet alternative, yet uptake among vulnerable populations is not well understood. This study assesses factors influencing HIVST use to inform targeted interventions.

**Methods:** A retrospective analysis of Demographic Health Surveys (2009-2019) spanning 24 SSA countries, involving 594,639 participants aged 15-49, was undertaken. The association between HIVST uptake and socio-demographic, socio-economic, and behavioural attributes was examined. Logistic regression models evaluated the influence of these factors on self-testing behaviours.

**Results:** From the analysis involving 594,639 individuals, 2.5% (9955.56) reported using HIVST. The likelihood of using HIVST was significantly higher in urban areas (Urban: 3.7%, Rural: 1.7%;  $\mu$ 2=1534.50, p<0.001) and among those with prior HIV testing experience (aOR=3.33, CI: 3.08-3.60; p<0.001). Education played a key role, with a higher

likelihood of engaging in HIVST among those with higher education (aOR=7.36, CI: 6.62-8.18; p=0.001). Economic status also influenced HIVST uptake, with the richest individuals being significantly more likely to use HIVST compared to the poorest (aOR=3.28, CI: 2.95-3.65; P<0.001). Individuals who have heard of STIs have significantly higher adjusted odds of using HIVST kits (aOR=33.43; 95% CI: 11.03-101.24; p<0.001) compared to those who have not heard.

Prior HIV testing experience (aOR =3.33, CI: 3.08-3.60; P<0.001) and knowledge of testing locations (aOR =1.52, CI: 1.33-1.72; P<0.001) significantly increase the likelihood of HIVST uptake. Contrarily, holding misconceptions about HIV transmission, such as believing it can be spread by sharing food (aOR=0.39, CI: 0.18-0.87; P=0.022) or through mosquito bites (aOR=0.68, CI: 0.48-0.98; P=0.036), was associated with lower usage of HIVST.

The stigma associated with HIV, particularly the fear of societal response following a positive diagnosis, emerged as a significant barrier, notably reducing self-testing odds (aOR=0.49, CI: 0.41-0.59; P<0.001). The study also underlined employment status as a determinant; those working for someone else were more likely to utilize HIVST (aOR=1.37, CI: 1.23-1.52; P<0.001) than self-employed counterparts.

**Conclusions:** These findings suggest that interventions aimed at increasing HIVST uptake should focus on enhancing education, addressing misconceptions, and mitigating stigma, while also considering the impacts of urbanization and economic status.

## EPC227

Assessing PrEP influence on HIV incidence in Brazil: a straightforward indicator for strategic public health policymaking

I. Ornelas Pereira<sup>1</sup>, T. Benoliel<sup>1</sup>, T. M. D. de Alencar<sup>1</sup>, T. C. Morelli<sup>1</sup>, F.Á. P. de França<sup>1</sup>, M. C. M. de Moura<sup>1</sup>, A.R. Pascom<sup>1</sup>

<sup>1</sup>Ministry of Health of Brazil, Department of HIV/AIDS, Tuberculosis, Viral Hepatitis and Sexually Transmitted Infections, Brasília, Brazil

**Background:** Since 2018, Brazil has expanded its free-of-charge HIV Pre-Exposure Prophylaxis (PrEP) program nationwide, with 143,840 individuals enrolled until December 2023. To assess its impact and to identify further expansion targets, an indicator was created to measure influence of PrEP use on HIV incidence.

**Methods:** The indicator was calculated by dividing the number of individuals on PrEP on June 2023, by the number of newly identified people living with HIV linked to healthcare services between January to June 2023. Each city in Brazil with more than 50,000 inhabitants was classified into one of five groups according to the PrEP:HIV ratio: Group 0: Ratio < 1  
Group 1: Ratio  $\geq 1$  and < 2  
Group 2: Ratio  $\geq 2$  and < 3

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

Group 3: Ratio  $\geq 3$  and  $< 4$

Group 4: Ratio  $\geq 4$

The monthly growth rate of known new HIV cases between January 2019 and December 2022 for each group was calculated using the Generalized Least Squares with Autoregressive Errors (GLSAR) model, adjusted for the Durbin-Watson test result closest to 2, with the rho value ranging from 0 to 5.

**Results:** Considering the confidence interval (95%CI), cities with PrEP:HIV ratio above 3 have shown negative monthly growth rate of new HIV cases, indicating a declining HIV incidence during this period (Figure 1).

Figure 1. Monthly growth rate of known new HIV cases writing PrEP:HIV ratio groups, Brazil, 2019-2023. Green and red lines represent the Confidence Interval (95%CI) of each group.

**Conclusions:** The correlation between higher PrEP:HIV ratio and decreased HIV incidence, while not proving causality, suggests that extensive PrEP use in cities is a proxy of an effective implementation of combination HIV prevention.

Therefore, a PrEP:HIV ratio over 3:1 indicates an effective HIV care and prevention network, leading to lower HIV incidence rates.

Updated biannually, this indicator is a straightforward yet robust tool to monitor HIV case trends and to assess PrEP's impact and reach, thereby informing policy decisions and resource allocation. Moreover, it will allow to guide a nationwide large-scale PrEP offer.

## EPC228

USAID CHEKUP I partnership with public health sector for community-based delivery of PrEP to adolescent girls and young women in the DREAMS program: opportunities and challenges

J.M. Walusiku<sup>1</sup>, M. Musheke<sup>1</sup>, W. Khondowe<sup>1</sup>, B. Mushiki<sup>1</sup>, F. Mwape<sup>1</sup>, B. Siamasuku<sup>2</sup>, M. Siwela<sup>3</sup>, C. Kanene<sup>4</sup>, A. Phiri<sup>4</sup>  
<sup>1</sup>Centre for Infectious Disease Research in Zambia, Lusaka, Zambia, <sup>2</sup>Young Women Christian Association, Lusaka, Zambia, <sup>3</sup>PACT Inc, Lusaka, Zambia, <sup>4</sup>United States Agency for International Development, Lusaka, Zambia, Lusaka, Zambia

**Background:** In Zambia, 38% of new HIV cases occur among young people, with females representing 78% and males 22%. Although pre-exposure prophylaxis (PrEP) is effective, adolescent girls and young women (AGYW) encounter barriers to access. We explore the impact of community-based PrEP delivery to enhance AGYW access.

**Description:** USAID's Controlling HIV Epidemic for Key and Underserved Populations (CHEKUP) I implements the Determined, Resilient, Empowered, AIDS-free, Mentored, Safe (DREAMS) program in 37 communities across seven districts in Zambia. DREAMS center nurses conduct PrEP sensitizations during social asset-building activities, expand HIV testing through DREAMS and outreach, and offer differentiated service delivery. Biomedical commodities are sourced from the Zambian Ministry of Health. HIV-positive AGYW are referred for antiretroviral therapy (ART), while HIV-negative AGYW initiate PrEP within DREAMS centers post-screening.

**Lessons learned:** Community-based PrEP delivery enhances AGYW access. From October 2022 to September 2023, 115,411 AGYW were reached, with 10,169 at-risk AGYW tested for HIV, and 4,388 (43.2%) initiated PrEP. The remaining 5,781 (56.8%) were either HIV-positive (7.2%) or excluded due to lower risk factors (49.6%). Notably, 79.7% were aged 20-24, showing effectiveness in reaching this older vulnerable group. While PrEP initiation was high at 93.6%, continuation at subsequent refills declined to 52.7% at the second refill and 26% at the third. Anxieties, disclosure concerns, and stigma hindered sustained uptake. Sero-conversion was low at 0.1%, highlighting DREAMS' efficacy in reducing HIV risk.

**Conclusions/Next steps:** Community-based delivery of PrEP effectively enhances uptake among population groups that may not readily access conventional government health facilities for PrEP services. Sensitization on PrEP benefits, adherence support, and family communication are critical for sustained access. Injectable PrEP introduction may alleviate stigma and reduce the pill burden.

## EPD098

Enhancing uptake of HIV and sexual reproductive health services by adolescent girls and young women in rural areas using the "stop the bus" strategy: lessons from Matobo District, Zimbabwe, 2023

K. Dube<sup>1</sup>, P. Mangena<sup>1</sup>, F.H. Mudzengerere<sup>1</sup>, H.W. Mafaune<sup>1</sup>, D. Dhakwa<sup>1</sup>, F. Mudokwani<sup>1</sup>, K. Yogo<sup>1</sup>, B. Madzima<sup>2</sup>, R. Yekeye<sup>2</sup>, B. Nyamwanza<sup>2</sup>, T. Bhatasara<sup>3</sup>, M. Mutseta<sup>4</sup>, T.A. Tafuma<sup>1</sup>, E. Tachiwenyika<sup>1</sup>

<sup>1</sup>Zimbabwe Health Interventions, Harare, Zimbabwe,

<sup>2</sup>National AIDS Council, Harare, Zimbabwe, <sup>3</sup>United States Agency for International Development, Harare, Zimbabwe,

<sup>4</sup>Ministry of Health and Child Care, Zimbabwe, Harare, Zimbabwe

**Background:** Zimbabwe Health Interventions (ZHI) is implementing the Determined, Resilient, Empowered, AIDS free, Mentored and Safe (DREAMS) program to reduce new HIV infections among adolescent girls and young women (AGYW) in 9 high HIV burdened districts of Zimbabwe. Accessing comprehensive HIV prevention and sexual reproductive health and rights (SRHR) services reduces risk of HIV among AGYW.

We document lessons from the "Stop the Bus" campaign strategy implemented in Matobo district in 2023.

**Description:** ZHI and a consortium of partners implemented the "Stop the Bus" campaign targeting high volume, HIV transmission hot-spot areas with combination HIV prevention and SRHR services to 15-24-year-old AGYW. The campaign was conducted from October 2022 to September 2023 in ward 2 and involved implementing partners that include ZHI, Population Solutions for Health (PSH) and Musasa, working with village health workers (VHW) from the Ministry of Health and Child Care (MOHCC). Services offered included HIV pre-exposure prophylaxis (PrEP), HIV Testing Services (HTS), family planning, sexually transmitted infection (STI) screening and treatment and post gender-based violence (GBV) services at one-stop shop. Data were collected using paper tools and captured into the web based DHIS2 program database. HIV prevention and SRHR service uptake in ward 2 was compared with ward 14 where the intervention was not implemented.

**Lessons learned:** Out of the 347 AGYW reached with the DREAMS primary package in ward 2, 291 (84%) received HIV prevention and SRHR services through the "stop the bus" strategy whilst, in Ward 14, only 24% (87/362) accessed services. In ward 2, 149 AGYW accessed FP, 48 received HTS, 20 PrEP, 48 STI services whilst 26 received psycho-social support. The program learnt that AGYW prefer "stop the bus" to access combination HIV prevention and SRHR services. Effective collaboration with MOHCC strengthened mobilization of AGYW to access SRHR services.

**Conclusions/Next steps:** The stop the bus strategy increased access to and uptake of HIV prevention and SRHR services by AGYW in ward 2 of Matobo district. We recommend roll out of the strategy to all wards including hard-to-reach ones, and improved collaboration between implementing partners for effective HIV prevention and SRHR service provision.

## EPD099

Young and positive: how young people in Australia make sense of their HIV diagnosis using a multidimensional theoretical approach

L. Wojciechowski<sup>1</sup>, L. Harms<sup>1</sup>, A. Carter<sup>2</sup>, C. Newman<sup>3</sup>

<sup>1</sup>University of Melbourne, Department of Social Work, Melbourne, Australia, <sup>2</sup>Kirby Institute, Surveillance and Evaluation Research Program, Sydney, Australia, <sup>3</sup>University of New South Wales, Centre for Social Research in Health, Sydney, Australia

**Background:** The scientific, political and community response to HIV has changed significantly over the last 40 years of the pandemic and, with it, the lived experience of people with HIV in Australia. Young people diagnosed with HIV today receive their diagnosis in a very different context than those diagnosed in previous generations. However, very little research has explored how young people with HIV in Australia feel make sense of their diagnosis, and how this in turn impacts engagement in HIV treatment and care; this is a missed opportunity to ensure they are being meaningfully recognised and supported.

**Methods:** This analysis draws from the Young + Positive study, the first national study in Australia documenting perspectives of young people (18-29) living with HIV. Guided by GIPA and MIPA principles, a steering committee, including young individuals with HIV, advised on methodology, tools, and analysis. Utilising a convergent parallel mixed-method design grounded in a multidimensional theoretical approach, survey data (n=60) and qualitative interviews (n=25) were collected between 2018 and 2019. The data were analysed to explore how young people understand their HIV diagnosis, and how this impacted their engagement patterns with HIV treatment and care.

**Results:** Participants identified mainly as male (93.3%), LGBTIQ+ (79.7%) and Australian born (64.2%). Findings confirmed that despite having no living memory of the 'AIDS-crisis' in Australia, most interviewees typically made sense of their HIV diagnosis by locating themselves in the broader social, cultural, temporal and geographic context of the Australian HIV epidemic.

This process of inner and outer world location revealed intergenerational tensions, resulting in many struggling to find a sense of belonging within the Australian 'HIV community' and subsequent HIV services or community spaces.

AIDS 2024

**Conclusions:** These findings reveal how young people navigate places and spaces of potential belonging (or not belonging) in existing HIV services and community settings. The extent to which young people felt a sense of belonging was an important consideration as it impacted their engagement with HIV treatment and care.

## EPD100

Acceptability of online peer support groups as a strategy to improve antiretroviral therapy adherence among young people living with HIV: a qualitative study from Kampala Uganda

Y. Kiirya<sup>1</sup>, S. Kitaka<sup>2</sup>, J. Kalyango<sup>3</sup>, J. Rujumba<sup>4</sup>, J. Nangendo<sup>3</sup>, G. Amoaka<sup>5</sup>, C. Karamagi<sup>3</sup>, P. Musoke<sup>2</sup>, A. Katahoire<sup>4</sup>

<sup>1</sup>Makerere University School of Medicine, Clinical Epidemiology and Biostatistics, Kampala, Uganda, <sup>2</sup>Makerere University School of Medicine, Department of Paediatrics and Child Health, Kampala, Uganda, <sup>3</sup>Makerere University School of Medicine, Clinical Epidemiology Unit, Kampala, Uganda, <sup>4</sup>Makerere University College of Health Sciences, Child Health and Development Centre, Kampala, Uganda, <sup>5</sup>University of Ghana, Nutrition and Food Science, Accra, Ghana

**Background:** Peer support groups are central to antiretroviral therapy (ART) adherence among young people living with HIV (YPLHIV). However, in Uganda and elsewhere in Sub-Saharan Africa, peer support activities occur face-to-face and thus have structural limitations and may not be readily available when young people need them. Online peer support has the potential to help YPLHIV access regular psychosocial support without significant effort or cost. Acceptability is key to the successful design, implementation, and evaluation of virtual peer support. We assessed the acceptability of WhatsApp-based peer support groups as a strategy to improve ART adherence among Ugandan YPLHIV.

**Methods:** We conducted a formative qualitative study in three Health Centre IVs in Kampala Uganda, between July and August 2022. We held four focus group discussions with twenty-seven YPLHIV seeking services at the study facilities. We also conducted six key informant interviews with health providers attached to adolescent HIV care clinics. The data was analyzed using thematic analysis guided by the acceptability framework to understand socio-cultural beliefs and perceptions towards utilizing WhatsApp-based peer support groups for HIV care.

**Results:** Overall, peer support groups on WhatsApp were acceptable for use among YPLHIV. The young people regarded them as convenient because they saved time and were more cost-effective compared to the transport costs of in-person meetings. Health providers revealed that virtual peer support groups could reduce the stigma associated with community follow-up for non-adhering

young people and empower YPLHIV to overcome stigma. Both the young people and health providers agreed that online peer support would provide accessible emotional support which could improve their psychosocial well-being and enhance adherence to ART.

However, participants raised concerns about privacy, the cost of data, and smartphones, especially for younger adolescents.

**Conclusions:** Online peer support groups are acceptable to Ugandan YPLHIV and hold promise in enhancing psychosocial support and improving treatment adherence in this sub-population. There is a need for research to evaluate the feasibility and effectiveness of this peer support model in Uganda. In implementing online support groups, due consideration should be given to the development of open-source software tools with high privacy standards.

## EPD101

Acceptance and commitment therapy for hope, psychological flexibility, depression and quality of life among people living with HIV/AIDS: a randomized controlled trial

R. Wang<sup>1</sup>, X. Li<sup>1</sup>

<sup>1</sup>Central South University, Xiangya School of Nursing, Changsha, China

**Background:** HIV and mental health problems are a global syndemic. People living with HIV/AIDS are vulnerable to mental health problems. Mental health problems adversely impact HIV treatment outcomes and lower their quality of life. However, the significant mental health problems among people vulnerable to acquiring or living with HIV have not been fully addressed. Therefore, integrating HIV and mental health interventions to address this global syndemic among PLWHA is urgently needed, as noted by the journal *Lancet HIV* in June 2022.

The purpose of this study was to investigate the effectiveness of acceptance and commitment therapy for hope, psychological flexibility, depression and quality of life among PLWHA.

**Methods:** Seventy HIV-infected patients with mild to moderate depressive symptoms were recruited from Designated AIDS Hospital in Changsha and randomly assigned to intervention groups (7 sessions) or control groups (7 sessions). The control group had access to 7 sessions of one-on-one conventional health education about HIV; those in the intervention group were provided with 7 sessions of psychological counseling based on Acceptance and Commitment.

**Results:** Mean age was 26 years; 73.5% attended college; 95.6% were single. The analysis population who completed the follow-up questionnaire included 34 (97%, 34/35) in the intervention and 34 (97%, 34/35) in the control group. The time effect on depression scores among patients in

abstractsAuthor  
Index

both groups was significant ( $F=233.625$ ,  $P<0.001$ ); the group effect was not significant ( $F=1.238$ ,  $P=0.274$ ); but the interaction effect of time and group was significant ( $F=67.710$ ,  $P<0.001$ ). For the quality of life among patients in both groups, the time effect on psychological function scores was significant ( $F=23.228$ ,  $P<0.001$ ); so was the group effect ( $F=12.564$ ,  $P<0.001$ ); and the interaction effect of time and group ( $F=16.755$ ,  $P<0.001$ ). The time effect on AAQ-II scores among patients in both groups was significant ( $F=1766.113$ ,  $P<0.001$ ); the group effect was not significant ( $F=3.440$ ,  $P=0.073$ ); but the interaction effect of time and group was significant ( $F=1037.737$ ,  $P<0.001$ ).

**Conclusions:** Acceptance and commitment therapy may be an appropriate psychological intervention for reducing the symptoms of PLWHA with depression symptoms and helping them to improve psychological flexibility, hope level and quality of life.

## EPD102

### Emotional and behavioral health among adolescents living with HIV in seven cities in Indonesia

G.V. Simanullang<sup>1,2</sup>, J. Levy<sup>2</sup>

<sup>1</sup>Atma Jaya Catholic University of Indonesia, University Centre of Excellence – AIDS Research Center Health Policy and Social Innovation, Jakarta, Indonesia, <sup>2</sup>University of Illinois at Chicago (UIC) – School of Public Health, Health Policy and Administration, Chicago, United States

**Background:** Adolescents everywhere face various psychosocial and behavioral challenges as they move through the developmental stages of human maturation toward adulthood. Living with HIV can introduce additional challenges to an already complex developmental process. Yet, HIV studies focusing on emotional and behavioral health among adolescents living with HIV (ALWH) are sparse along with a notable absence of culturally adapted, context-specific recommendations for such youth in low middle-income countries including Indonesia. This study investigates the emotional and behavioral health of ALWH in Indonesia as measured by self-reported emotional and behavioral problems and symptoms of depression and general anxiety.

**Methods:** This cross-sectional study enrolled 143 ALWH ages 13-18 living with HIV in seven cities in Indonesia who have been told about their HIV serostatus from February to May 2023. The youth were referred by local HIV nongovernment organizations in each city. The youth's self-reported emotional and behavioral health was measured through face-to-face interviews using the Strength Difficulties Questionnaire (SDQ), Patient Health Questionnaire (PHQ)-9, and Generalized Anxiety Disorder (GAD)-7.

**Results:** Participants' averaged 15.9 years of age. Slightly more than half were girls (55.94%). Of the 143 participants, somewhat more than half (55%) reported experiencing

a high degree of emotional and behavioral problems in the past six months, and slightly less than half (45.5%) reported symptoms of moderate to severe depression and slightly more than a third (38%) reported experiencing moderate to severe general anxiety in the past two weeks. Girls reported greater emotional and behavioral problems, symptoms of depression, and general anxiety than boys.

Multivariate analyses showed an association between one or more of these 3 outcomes and gender, means of HIV acquisition, perception of illness, boy/girlfriend relationships, ARV utilization, and main caregiver.

**Conclusions:** As possibly the first research to examine the psychosocial health of ALWH in Indonesia, the study's results point to the importance of developing and offering mental health support and culturally tailored services for ALWH. HIV programs for ALWH could include strategies that help them in identifying and adopting effective coping methods, resilience in overcoming the possible adversities of illness, and feelings of empowered in successfully confronting the challenges of living with HIV.

## EPD103

### Community led model for optimal Advance HIV disease diagnosis, treatment and care in the United Republic of Tanzania

B.T. Haule<sup>1</sup>

<sup>1</sup>AFROCAB Treatment Access Partnership, Lusaka, Zambia

**Background:** In Tanzania, where 4.4% of the population is living with HIV, the impact of Advanced HIV Disease (AHD) remains severe. In 2021, 29,000 deaths were reported due to AIDS-related complications, with 3.7% of attendees in rural Care and Treatment Centers having Cryptococcal Meningitis, highlighting the prevalence of AHD. Tuberculosis continues to be a leading cause of death among People Living with HIV (PLHIV) in both rural and urban areas. In 2021-2022, African Community Advisory Board (AFROCAB) Treatment Access Partnership, in collaboration with the Clinton Health Access Initiative, spearheaded a community-led initiative to address AHD in Tanzania.

**Methods:** The project employed a multi-faceted approach:

1. Survey Questionnaire: An initial online and physical survey identified community gaps regarding AHD, informing the subsequent project implementation.
2. Formal and Non-formal Training: PLHIV networks, clusters, and peer educators underwent formal training sessions, followed by non-formal cluster training conducted by these individuals. Specific handouts, guided them in disseminating knowledge within their communities.

**Results:** The results underscored a critical lack of awareness, with 84% and 72% of participants from physical and online surveys, respectively, being unaware of AHD. Of the 2,305 PLHIV reached, 23.8% were supported, linked,

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

and tested for CD4 levels, leading to the identification of 12.02% of AHD cases. Notably, those diagnosed and supported adhered to treatment, emphasizing the project's impact.

**Conclusions:** In conclusion, sustained and expanded community engagement is crucial for AHD awareness. Various communication channels, including community meetings and social media, should be leveraged. Technology integration, such as user-friendly digital resources, can broaden the reach. Advocacy efforts for policy changes supporting community-led models and increased CD4 accessibility are imperative.

The aim is to ensure that individuals living with HIV can easily access testing services, enabling early identification and prevention of AHD cases. The project's success calls for ongoing initiatives to foster shared responsibility and empower communities in addressing AHD comprehensively.

## EPD104

Enhancing digital literacy for health: peer-led solutions for PLHIV in Queensland, Australia

J. Radcliffe<sup>1</sup>, L. Wojciechowski<sup>1</sup>, G. McGuirk<sup>1</sup>

<sup>1</sup>Queensland Positive People, Brisbane, Australia

**Background:** Research demonstrates that people living with HIV (PLHIV) in Queensland, Australia living in rural and remote locations faced challenges during the digital shift prompted by COVID-19 and experienced higher rates of social isolation. Digital Health Connect (DHC) aimed to enhance digital competency among PLHIV in regional localities. DHC focused on improving access to reliable health information, active participation in healthcare services, and confidence in using online platforms.

**Description:** The Peer Navigation (PN) team at Queensland Positive People (QPP) led nine interactive workshops over six months for PLHIV. These aimed to address specific challenges like communication with healthcare providers, navigating online access, and online safety. The co-designed content, guided by PN insights, addressed gaps in digital skills identified during casework with PLHIV.

**Lessons learned:** Participant feedback emphasised the need for safe spaces where PLHIV could address digital barriers collaboratively. Ensuring safety around sexual and gender identity and HIV status improved the learning environment, fostering personal connections. Consequently, the program not only increased digital platform confidence but also heightened social connections, reducing social isolation. The participatory, peer-led approach effectively built a supportive community, resulting in tangible skill improvements in several domains: operation skills increased from a mean of 3.00 to 3.94, internet skills from 3.16 to 4.00, program skills from 2.21 to 3.63, document skills from 1.76 to 3.67, online safety skills from 2.37 to 3.94, and online health record skills from 2.11 to 3.75

Logistical insights from workshop delivery emphasised the need for careful selection of location due to participant dispersion, acknowledgment of resource-intensive travel costs, and a reliance on personal networks for project promotion and phone calls for intake.

**Conclusions/Next steps:** Data from DHC workshops highlighted the efficacy of peer-led strategies in enhancing digital literacy among specific PLHIV populations. DHC's success lay in its participatory design grounded in PN's real-world experiences. The integration of practical digital skills seamlessly improved participants' lives, increasing engagement with online health services and social networks. This success had broader implications for quality-of-life outcomes, emphasising the need for tailored, peer-driven interventions globally. DHC could inform the development of similar programs, addressing distinct challenges faced by PLHIV in the digital era.

## EPD105

Exploring the influence of intersectional stigma on ART adherence for selected young key populations in Malawi, Zambia, and Zimbabwe: findings from a mixed methods study

P. Nyamaruze<sup>1</sup>, R. Armstrong<sup>1</sup>, K. Govender<sup>1</sup>

<sup>1</sup>HEARD, University of KwaZulu Natal, School of Accounting, Economics and Finance, Durban, South Africa

**Background:** Across southern Africa, young (18-24 years) men who have sex with men (MSM) and transgender women have become priorities for HIV programming, especially those living with HIV. Reaching them takes place in contexts where stigma and discrimination remain daily risks. Little region-specific data is available about the influence of stigma on their adherence to anti-retroviral treatment (ART) and only emergent consideration of concepts of minority stress and intersectional stigma in these endeavours.

**Methods:** The study followed a mixed-methods design with simultaneous collection of quantitative and qualitative data. Participants were young MSM or transgender women self-disclosed as living with HIV and on ART. Research assistants guided participants to complete questionnaires and conducted audio-recorded interviews. Qualitative data was analysed using thematic analysis and quantitative data was analysed using descriptive statistics, and bivariate and multivariate regression analysis with missed ART doses as the dependent variable. A dialogic approach to triangulation was employed to build complementary, reflexive links between the two types of data.

**Results:** There were 158 participants with a mean age of 22 years. On gender identity, 40% were transgender or female, although assigned male at birth. Half (52%) were on ART for two years or less (since 2019) at the time of data collection. Between 36% (Malawi and Zimbabwe) and

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

50% (Zambia) had missed ART doses, 47% within the past month. Missing doses occurred for stigma-related reasons, including not taking ART in situations where there was the risk of being seen, or due to mental-health-related factors. Intersectional stigmas were potent influences on the participants, although with variations across countries (stigma was less in Malawi), groups (stigma was greater for transgender women). Participants had become adept at mitigating stigma through various strategies for disclosure and concealment to anticipate or avoid its influence. Such efforts had consequences, including mental health burdens (depression, anxiety and thoughts of suicide) as well as frequent reliance on alcohol consumption as a coping mechanism.

**Conclusions:** Achieving long-term ART adherence for young MSM and transgender women requires additional efforts. While addressing problematic laws linked to sexual and gender diversity remains necessary, seeking to address intersectional stigma offers more proximate opportunities.

## EPD106

Does partner HIV disclosure enhance the family function for married HIV positive MSM? A secondary data analysis from a cross-sectional study in China

Y. Shen<sup>1</sup>, X. Li<sup>1</sup>, Y. Chi<sup>2</sup>, L.A. Goldsamt<sup>3</sup>, C. Zhang<sup>1</sup>

<sup>1</sup>Central South University, School of Nursing, Changsha, China, <sup>2</sup>Chengdu Blood Center, Chengdu, China, <sup>3</sup>New York University, Rory Meyers College of Nursing, New York, United States

**Background:** Partner HIV disclosure has been advocated by World Health Organization due to its potential benefits for individuals and public health. However, it is challenging for married men who have sex with men (MSM) to disclose HIV status to their spouses, due to afraid of affecting their family function. How the partner HIV disclosure would affect family function was unknown among Chinese HIV positive MSM, which led to unclear guidance on how to instruct partner HIV disclosure for this vulnerable population.

**Methods:** We did a secondary data analysis using data from a cross-sectional study conducted among HIV positive MSM in three cities of a province in China from December 2019 to May 2020. Analysis of variance, t-test and Pearson correlation analysis were conducted to explore the differences and relationships of family function scores in different characteristics. We performed the hierarchical logistic regression to examine the impact of HIV disclosure on family function, including family cohesion and family adaptability.

**Results:** Of the 309 participants, only 31.1% reported disclosing HIV status to their spouses. Those who disclosed HIV status to spouse had averagely higher scores of fam-

ily cohesion (63.31±10.15 vs 56.49±11.08,  $p<0.001$ ) and family adaptability (48.81±7.93 vs 42.80±9.02,  $p<0.001$ ), compared to those who did not. There were significant differences in family cohesion by age, province, monthly income, main source of family income, whether having children, sexual orientation, whether disclosing sexual orientation to spouse and extramarital homosexual behaviors (all  $p<0.05$ ).

There were significant differences in family adaptability by province, main source of family income, time period of getting married, whether having children, sexual orientation, whether disclosing sexual orientation to spouse, whether receiving ART and extramarital homosexual behaviors (all  $p<0.05$ ).

After controlling for other variables, the logistic regression analysis showed that whether disclosing HIV status to spouse explained an additional 2.3% of the total variance in predicting family cohesion and 3.3% in family adaptability (both  $p<0.001$ ).

**Conclusions:** Disclosing HIV status to spouse could enhance family function for married HIV positive MSM. Appropriate disclosing strategies and encouragement should be advocated for HIV positive MSM in VCT clinics and designated hospitals in China.

## EPD107

Improving HIV viral suppression among children and adolescents using directly observed therapy in Mubende region, Uganda

I.M. Awor<sup>1</sup>, J. Nakawezi<sup>1</sup>, E. Katto<sup>2</sup>, E. Namusoke Magongo<sup>2</sup>, W. Nansumba<sup>1</sup>, E. Nazziwa<sup>3</sup>, C. Senyimba<sup>4</sup>, J. Nakakande<sup>5</sup>, I. Kasamba<sup>5</sup>, I. Mubangizi<sup>5</sup>, B. Mukasa<sup>6</sup>

<sup>1</sup>Mildmay Uganda, Paed and Adolescents, Kampala, Uganda, <sup>2</sup>Ministry of Health Uganda, AIDS Control Program, Kampala, Uganda, <sup>3</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Kampala, Uganda, <sup>4</sup>Mildmay Uganda, Directorate of Programs, Kampala, Uganda, <sup>5</sup>Mildmay Uganda, Mildmay Uganda Research Centre, Kampala, Uganda, <sup>6</sup>Mildmay Uganda, Directorate Of Programs, Kampala, Uganda

**Background:** Antiretroviral therapy (ART) is key for people living with HIV (PLHIV) for attainment of viral suppression (VS) and a good quality of life. However, the VS rates for children and adolescents living with HIV (C/ALHIV) are less than those of adults due to dependency on caregivers for adherence support, peer pressure, self and community-inflicted stigma, and busy school schedules. Directly Observed Therapy (DOTs) is one of the ways to ensure that clients take all their drugs as prescribed by health workers.

**Description:** During June 2022-February 2023, the CAG-DOTs model was implemented in five selected facilities with more than five non-suppressed C/ALHIV <15years. These included Mityana Hospital, Kiganda H/C IV,

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Mubende Regional Referral Hospital, Kiboga Hospital and St Mary's Kasaala HC IV in Mityana, Kasanda, Mubende, Kiboga and Luwero districts. We identified caregivers of C/ALHIV who were virally suppressed and trained them to work as CAGDOTs "mentors".

CAGDOTs mentors were attached to households with non-suppressed C/ALHIV to share information and enrol clients in the program. CAGDOTs supported the households with daily DOTs, treatment literacy, assessment and management of adherence barriers, and psychosocial support.

**Lessons learned:** Overall, 74 C/ALHIV were enrolled on CAGDOTs. Of these, 49 (66%) were ages 1-10 years and 25 (34%) were 11-15 years. Sixty-three (85%) C/ALHIV were on dolutegravir (DTG) based ART regimens and of these, 60 (95%) re-suppressed.

The remaining 11 (15%) were on protease inhibitor, 9 (81.8%) of whom re-suppressed. Thirty-nine (53%) C/ALHIV had been on ART for  $\geq 5$  years and 17 (23%) had received multi-month ART refills of  $\geq 3$  months. After nine months of DOTs implementation, 58 (78%) C/ALHIV had VL results and of these, 53 (91% 95%CI: 81%-97%) achieved viral re-suppression ( $p < 0.001$ ).

Participants on the DOTs intervention for  $\geq 61$  days seemed to be associated with lower risk of viral non-suppression (Odds Ratio (OR)=0.15; 95%CI: 0.02-1.01;  $p$ -value=0.05) than those with a duration of  $\leq 60$  days.

**Conclusions/Next steps:** The CAGDOTs model achieved a high viral re-suppression rate for C/ALHIV on both DTG and protease inhibitors ART- based regimens, and among C/ALHIV exposed to the intervention longer than 60 days. Scaling up this model could further accelerate HIV epidemic control.

## EPD108

### Feasibility and acceptability of integrating chemsex intervention into existing HIV services: an implementation study of a 4-month piloted harm reduction intervention

G.G. Langji<sup>1</sup>, D. Devika<sup>1</sup>, E. Sindunata<sup>1</sup>, N. Muryani<sup>1</sup>, H. Hasbulah<sup>2</sup>, L. Nevendoff<sup>1,3</sup>

<sup>1</sup>AIDS Research Center - Atma Jaya Catholic University of Indonesia (ARC AJCU), Jakarta, Indonesia, <sup>2</sup>National Network of Key Population for Gay, MSM and Transwomen (GWL-INA), Jakarta, Indonesia, <sup>3</sup>Disease Elimination Program, Burnet Institute, Melbourne, Australia

**Background:** The United Nations has recognized the importance of contextually developing and integrating sexualised drug use (chemsex) risk reduction intervention into HIV-related responses. In response to emerging chemsex practices among men who have sex with men (MSM) and transwomen, as well as limited resources availability in the current HIV response, our study aimed to assess the feasibility and acceptability of integrating

harm reduction chemsex interventions into existing HIV services provided by civil society organisations (CSOs) and HIV clinics that formally appointed by Indonesian Ministry of Health.

**Methods:** The chemsex intervention included chemsex training, online and offline educational materials, chemsex and mental health screening tools, and referral pathways, that were intended to be integrated into the existing HIV service flows. The integrated intervention was piloted for four months in 3 CSOs and 23 clinics across three major cities in Indonesia. We used mixed-methods to assess intervention implementation using the Reach, Effectiveness, Adoption, Implementation and Maintenance framework. The feasibility was measured from implementers, and the acceptability was sourced from beneficiaries. Data was analysed using descriptive analysis for quantitative and thematic analysis for qualitative.

**Results:** In total, the intervention reached 2746 beneficiaries (53% from clinics, 47% from CSOs), was considered qualitatively effective to increase knowledge of safe sex and drugs, encouraged behavioural changes (average 3.9/5), and willingness to access health services (average 4.1/5). The CSOs and clinic staff found the intervention was easily adopted and implemented under current HIV service flows; hence, it has the potential to be continued and expanded in the future.

The beneficiaries found the intervention highly acceptable by:

1. Developing a culturally sensitive approach according to chemsex users' characteristics;
2. Screening materials that met the need;
3. Usefulness – as marked by 80% beneficiaries shared the intervention-related information to peers; and,
4. All intervention components were aligned with needs.

**Conclusions:** Our results demonstrate that integrating the chemsex intervention model for MSM and transwomen into the existing HIV services in Indonesia via CSOs and HIV clinics was deemed feasible and acceptable. In order to ensure the sustainability and acceptability of chemsex intervention within the context of the HIV response, support from national policies is required.

## EPD109

### Leveraging digital technologies to improve the experience and satisfaction of clients on antiretroviral therapy: insights from a Telehealth medical call center in Uganda

M. Amony<sup>1</sup>, L.H. Kamulegeya<sup>1</sup>, B. Lwasampijja<sup>1</sup>, A. Atyam<sup>1</sup>, P. Onyutta<sup>1</sup>, A. Isakiye<sup>1</sup>, J. Ssenkumba<sup>1</sup>, C. Niwagaba<sup>1</sup>, L. Nabirye<sup>1</sup>, D. Musinguzi<sup>1</sup>, J.M. Bwanika<sup>1</sup>

<sup>1</sup>The Medical Concierge Group, Kampala, Uganda

**Background:** Uganda has 1.4 million persons living with HIV/AIDS, 93% aged above 15 years. Challenges experienced by people living with HIV/AIDS include distant health facilities, long queues and waiting times at health facilities, and limited access to comprehensive medical consults, among others.

With digital technologies taking center stage in the health sector, we share insights on how a private telehealth company uses a call center to improve clients' experience on antiretroviral therapy (ART) in Uganda.

**Description:** The Medical Concierge Group (TMCG), a digital health partner on the USAID-funded Social Behavioural Change Activity (2020-2024), implemented a Quality Assurance system (QA) to track client experience, including turnaround time for service access and quality of care. The QA system further supports scheduling follow-up calls to healthcare clients and call interaction assessments for providers based on a preset checklist that fosters continuous medical education for providers. The turnaround time (TAT) target is <20 minutes, while the QA service level target is >85%.

**Lessons learned:** In total, 6,237 individuals living with HIV/AIDS contacted TMCG's Telehealth center over the 12-month period, 70% being male; 35% individuals contacted the call center more than two times in the year. The average turnaround time between the initiation of a request by a client and being called back by a Telehealth provider was 21 minutes and 12 seconds.

The service quality performance over the period was 84%, and the Data accuracy rating among the Telehealth providers was 85%. A total of 11,796 encounters were registered, with primary reasons for contact being general healthcare inquiries (55%), family planning (8%), HIV/ART (8%), medical male circumcision (7%), Sexual & Reproductive Health (6%), Maternal & Child Health (4%) and PrEP (2%) among others.

**Conclusions/Next steps:** The Telehealth center facilitated real-time resolution of clients' inquiries remotely. In addition, the ability to track providers' service delivery quality helped address gaps early and avoided unforeseen complications.

## EPD110

### Integrated peer-driven advocacy for HIV prevention in tertiary institutions

C. Mpaso<sup>1</sup>, I. Mahaka<sup>1</sup>, D. Nhamo<sup>1</sup>, R. Manyanga<sup>1</sup>, J. Murungu<sup>1</sup>, B. Lesnar<sup>2</sup>, N. Jain<sup>2</sup>

<sup>1</sup>Pangaea Zimbabwe, Programs, Harare, Zimbabwe, <sup>2</sup>AVAC, Research Engagement, New York, United States

**Background:** Adolescent girls and young women (AGYW) aged 15–24 years, experience higher HIV incidence (0.54%) compared to their male (0.20%) counterparts in Zimbabwe. Although these young people, particularly AGYW are at high risk of HIV, they have limited access to services and information. This has the potential to increase the number of new HIV cases given that tertiary institutions have a large pool of adolescents and young people at high risk of HIV, STIs and unintended pregnancy.

To this end, Pangaea Zimbabwe implemented a peer led intervention in seven tertiary institutions with the aim to expand access to HIV prevention options among AGYW in tertiary institutions

**Description:** In 2022 and 2023, 35 prevention champions in seven tertiary institutions (5 per institution) were purposively sampled targeting those within provinces with higher incidence and representing most provinces with high HIV incidence in Zimbabwe. The Hive model assumes that peers act as catalysts for change since they have a lived understanding of situations faced. Two institutions were purposively assigned to the HIVE method. Five prevention champions mobilized and introduced new beneficiaries (24 AGYW) and cascaded SRH and HIV prevention knowledge. In the remaining five institutions, champions disseminated information to their peers using already existing college structures. Increased HIV prevention awareness and access was assessed by an increase in prevention options offered in the institution.

**Lessons learned:** From March to November 2023 the champions reported that 911 AGYW were reached with information and 325 were initiated on oral PrEP (pre-exposure prophylaxis). Oral PrEP services increased from 2/7 tertiary institutions in 2022 to 5/7 tertiary institutions. Champions installed local-level (institution-based) structures for HIV prevention advocacy. Some formed committees to train students whilst some elected intermediaries who collected HIV prevention supplies on behalf of others.

**Conclusions/Next steps:** Peer driven initiatives pinpoint the root causes of limited use of HIV prevention methods in tertiary institutions. They also have an impact of increasing awareness, knowledge and destigmatization. Tertiary institutions play a vital role as providers of PrEP services and in offering youth-friendly services. Hence this should be built upon to improve tertiary institution HIV prevention service delivery.

### Training and incentive-driven approach for community 'médiatrices' supporting women living with HIV in Niger

Z.I. Abdou<sup>1</sup>, H. Lawel<sup>1</sup>, M. Schiff<sup>2</sup>, M. Haidara<sup>1</sup>, I. Karimou<sup>1</sup>, O. Gado<sup>2</sup>

<sup>1</sup>SongES, Niamey, Niger, the, <sup>2</sup>The Palladium Group, Washington, DC, United States

**Background:** The Nigerien context is challenging for the estimated 20,000 women living with HIV (WLHIV). Niger's religious and cultural environment limits male-female interaction, including in healthcare. WLHIV experience discrimination from their communities and even health workers, which discourages HIV testing, care-seeking, and treatment adherence.

Niger's community 'médiatrices', or mediators, are essential to fighting HIV/AIDS, with their innovative, contextualized approach to reaching WLHIV. Nigerien NGO SongES, with international partners Palladium, Instiglio, and the Global Fund, supports médiatrices through training, supportive supervision, and performance management.

**Description:** Médiatrices are women chosen by their communities based on their leadership, age, and status in the community. These characteristics allow médiatrices to engage with WLHIV with no special authorization. Partnering with health centers, médiatrices refer and accompany women to health facilities, organize educational events, conduct household visits, seek out WLHIV lost to follow-up, and more.

To optimize médiatrices' impact, SongES, Palladium, and Instiglio developed and implemented a comprehensive training curriculum and clear performance standards linked to médiatrices' remuneration.

**Lessons learned:** Through their work, médiatrices effectively demystify HIV and reduce stigmatization. Through education and awareness-raising, médiatrices help their communities to better understand HIV—including transmission, prevention, and treatment—and, importantly, recognize that HIV is not fatal. Médiatrices are the epicenter of community mobilization and demand creation. One médiatrice reported women's "stronger comprehension of the [health] themes we cover, which gives us... a feeling of pride that we're contributing significantly in women's lives."

**Conclusions/Next steps:** Thanks to médiatrices' support, between December 2022 and October 2023, 9,570 pregnant women not receiving prenatal care were identified, referred, and treated at health centers. Médiatrices also referred 3,133 women who had given birth at home for treatment and reengaged 4,134 pregnant women previously lost to follow-up.

Providing clear performance metrics tied to remuneration allowed médiatrices to track and target lifesaving services for women who may not otherwise have received care. Médiatrices' unique approach is ideally suited to

communities, especially in rural areas, where traditional health approaches can overlook WLHIV. As SongES continues its strong support, médiatrices could reach even more WLHIV with engagement from Nigerien health stakeholders to support and recruit additional médiatrices.

## EPD112

### Exploring association between intoxication and contraception choices among female students at public colleges in Zambia

G. Mwale<sup>1</sup>, D. Blanc<sup>2</sup>, V. Phiri<sup>3</sup>, N. Mwanza<sup>3</sup>, A. Saili<sup>1</sup>, P. Machawira<sup>4</sup>

<sup>1</sup>UNESCO, Lusaka, Zambia, <sup>2</sup>UNESCO, Harare, Zimbabwe,

<sup>3</sup>Copperbelt University, Kitwe, Zambia, <sup>4</sup>UNESCO, Johannesburg, South Africa

**Background:** High alcohol consumption among young Zambians, particularly heavy episodic drinking prevalent in 62.9% of 15-19 year old drinkers, raises concern about potential sexual health risks (WHO, 2018). Worryingly, young people (15-25years) fuel over 40% of new HIV acquisition annually, with girls disproportionately affected (UNAIDS 2022).

This increased vulnerability to sexual health risks necessitates investigating whether intoxication influences female students' choices about contraception and whether such choices are associated with a higher risk of STIs, including new HIV acquisition.

**Methods:** A descriptive cross-sectional quantitative study methodology was employed. The target sample was 215 female students, 15 to 25 years from Northern Technical College in Ndola, Zambia. The female students were selected randomly from a population of 286 residing on campus.

The data was collected through questionnaires administered using Kobo toolbox and hard copies. Data was analysed using SPSS. Associations were established using the Chi-square test at the 5% significance level.

**Results:** Almost half (49.04%) of the participants had taken alcohol or recreational drugs in the six months preceding the study. Notably, 68 percent (n=75) of participants who reported alcohol abuse also utilised emergency contraceptives resulting from risky sexual behaviour.

In contrast, 72 percent (n=71) of those who did not consume alcohol did not use emergency contraception. An association between engaging in sexual activity under the influence of substances and a history of STI diagnosis showing risky behaviour was also established (p = .015).

**Conclusions:** There's a strong association between consuming alcohol and utilizing emergency contraceptive methods. This indicates risky sexual behaviour under the influence of alcohol or drug consumption.

This research shows the importance of incorporating substance abuse in sexual and reproductive health programming. Increased awareness, education, and interventions

targeting both substance use, and safe sexual practices will contribute positively to reducing new HIV and STIs incidences valuable to address these concerns.

## EPD113

### Impact of HIV transmission knowledge and stigma awareness on discriminatory attitudes among women (15-49) in Southern African Countries: a trend analysis of demographic and health surveys of two decades

F. Effiong<sup>1</sup>, H. Mugauri<sup>2</sup>, I. Ogunkola<sup>3</sup>, D. Adewole<sup>4</sup>

<sup>1</sup>University of Calabar, Medical Laboratory Science, Calabar, Nigeria, <sup>2</sup>University of Zimbabwe, Faculty of Medicine and Health Sciences, Department of Global Public Health and Family Medicine, Harare, Zimbabwe, <sup>3</sup>University of Calabar, Public Health, Calabar, Nigeria, <sup>4</sup>University of Ibadan, Department of Health Policy and Management, Ibadan, Nigeria

**Background:** Stigma poses negative effects on the health outcomes of people living with HIV/AIDS (PLWHIV), including sub-optimal medication adherence, lower visit adherence, higher depression, and overall lower quality of life. This study aims to investigate the impact of knowledge of HIV transmission and HIV stigma awareness on discriminatory attitudes among women (aged 15-49) in Southern African Countries.

**Methods:** We have used the Demographic and Health Surveys (DHS) that were conducted in Southern African Countries and published between 2013 to 2023. Three discriminatory attitude questions were computer to obtain the outcome variable (discriminatory attitude towards PLWHIV). Independent variables included in the model were knowledge of HIV transmission, HIV stigma awareness, and sociodemographic characteristics. DHS of countries that did not report these key independent variables were excluded. Five DHS of five countries (Eswatini 2006-2007, Lesotho 2009, Namibia 2006, Zambia 2007 and Zimbabwe 2005-2006) were included in the final analysis. A total sample of 38,467 women were used for the final analysis. The data were analyzed using a chi-squared test and bivariate logistic regression.

**Results:** The prevalence of discriminatory attitudes towards PLWHIV in the 5 Southern African Countries ranged from 33.7% in Eswatini to 57.2% in Zimbabwe. In the regression analysis, respondents who were youths, were never married, had no formal education, were living in rural areas, and from the poor/poorest wealth quintile had higher odds of exhibiting discriminatory attitudes towards PLWHIV. Knowing people who have been stigmatized before (denied healthcare services, access to social events, or verbally abused because of AIDS) was not a significant predictor of discrimination in any of the countries. However, those who believed that HIV can be transmitted by sharing food were more likely to exhibit discriminatory

attitudes towards PLWHIV in Zimbabwe (aOR: 3.42, CI:2.92-4.01), Zambia (aOR:3.46, CI: 2.93-4.09), Lesotho (aOR:4.56, CI:3.97-5.24), Eswani (aOR: 2.82, CI:2.36-3.40), and Namibia (aOR: 2.07, CI: 1.80-2.38).

**Conclusions:** Poor understanding of the patterns of HIV transmission led to higher odds of exhibiting discriminatory behaviours.

Efforts to increase understanding of the consequences of stigma and patterns of HIV transmission will likely be effective in reducing the rate of stigmatization towards PLWHIV in Southern African countries.

## EPD114

### Prevalence and correlates of HIV-related stigma among people living with and without HIV in Lesotho

K. Ganesan<sup>1</sup>, A.S. Fotso<sup>2,3</sup>, F. Ndagije<sup>4</sup>, S. Kanno<sup>1</sup>, L. Maile<sup>5</sup>, M. Tlomola<sup>5</sup>, W.M. El-Sadr<sup>1</sup>, A. Low<sup>1</sup>

<sup>1</sup>ICAP at Columbia University, Mailman School of Public Health, New York, United States, <sup>2</sup>L'Institut National d'Études Démographiques, Aubervilliers, France, <sup>3</sup>Centre Population & Développement, Université Paris-Cité, Paris, France, <sup>4</sup>ICAP at Columbia in Lesotho, Maseru, Lesotho, <sup>5</sup>Ministry of Health, Maseru, Lesotho

**Background:** HIV-related stigma is a notable barrier to HIV prevention, testing, and treatment. HIV-related stigma in Lesotho, a high HIV prevalence country, has rarely been characterized in the general population using a nationally representative sample.

We assessed the prevalence and socio-demographic correlates of self-reported HIV-related stigma and discriminatory attitudes among people living with HIV (PLWH) and people not living with HIV (PNLWH) in Lesotho.

**Methods:** We used the Lesotho Population-based HIV Impact Assessment, a cross-sectional, household-based survey that used two-stage sampling to collect nationally representative data from adults aged ≥15 years. Between 2015-2017, data from interviews, home-based HIV testing, and laboratory testing were collected. Questions from the HIV/AIDS knowledge and attitudes module were used to characterize self-reported HIV-related stigma into five categories.

Logistic regression was used to determine socio-demographic factors associated with HIV-related stigma in PLWH and PNLWH aged 15-59 years.

**Results:** Of 3,199 PLWH, 36.7% (95% CI: 35.0-38.4) reported internal stigma, 40.9% (95% CI: 39.0-42.8) reported associated stigma, and 6.63% (95% CI: 5.63-7.79) reported received and institutional stigma. Of 8,483 PNLWH, 43.2% (95% CI: 41.9-44.4) reported stigmatizing attitudes, and 9.93% (95% CI: 9.24-10.7) reported discriminatory behavior towards PLWH. PLWH in higher wealth quintiles had significantly higher adjusted odds of internal stigma (Table 1).

Significance levels: \* p<0.05, \*\* p<0.01

Table 1. Adjusted odds ratio of socio-demographic correlates of different types of stigma among PLWH and PNLWH.

**Conclusions:** In this nationally representative sample of Lesotho, HIV-related stigma was highly prevalent. Prioritization of HIV education and awareness for men, young people and those from lower socioeconomic strata is paramount. HIV-related stigma reduction efforts in health services are required, particularly for those providing care for older PLWH. Support groups for PLWH is necessary to combat internal stigma across socioeconomic strata.

## EPD115

### Medicaid insurance expansion and its association with HIV outcomes in Nebraska, USA: an observational prospective cohort study

E.N. Essam Nkodo<sup>1</sup>, R. Furl<sup>1</sup>, E. Lyden<sup>2</sup>, M. Arroyo<sup>1</sup>, N. Fadul<sup>1</sup>

<sup>1</sup>University of Nebraska Medical Center, College of Medicine, Omaha, United States, <sup>2</sup>University of Nebraska Medical Center, College of Public Health, Omaha, United States

**Background:** In Nebraska, the rate of HIV viral suppression as of 2018 was 66% (National HIV Strategy viral suppression target rate is 90%). The recent Medicaid expansion in October 2020 in Nebraska provided us with a great opportunity to study the impact of Medicaid enrollment on viral suppression (VS) and investigate changes in healthcare barriers, access, and utilization in people with HIV (PWH) who enroll into Medicaid.

**Methods:** PWH were recruited for a prospective observational cohort study that included healthcare clients 19 or older who enrolled in Medicaid between October 1, 2020, and December 31, 2021, and those who were eligible but did not enroll. We collected baseline demographic and clinical information and conducted chart reviews every three months to collect HIV viral load, and other

health-related variables. A questionnaire was administered at baseline and every three months up to one year to evaluate access and barriers to care. An Adherence Barrier Questionnaire (ABQ-HIV) was administered at baseline and at the end of the study.

**Results:** Diverse healthcare clients were included in the study, with 101 enrolled in Medicaid vs. 96 eligible but did not enroll (Table 1).

For enrollees, there was a statistically significant difference in the proportion of participants (58%) with VS<50 (HIV RNA <50 copies/mL) at baseline compared to 77% with VS<50 at the end of the study (p=0.0018). 58.4% of enrollees had VS<50 at baseline compared to 77.2% at follow-up. Statistical significance was still consistent when comparing VS<200 (HIV RNA <200 copies/mL) at baseline and follow-up (p<0.001).

Moreover, among respondents to the baseline and end-of-study surveys, results were statistically significant for feeling they could afford care (p<0.001), ease in scheduling visits with providers (p=0.053), having more routine checkups (p=0.0159), feeling it was less difficult to pay for medication (p=0.0374), reduction in rationalization of HIV medication (p=0.0016), ease of finding providers when they need care (p=0.0250), and increased median number of outpatient visits (p=0.0034).

**Conclusions:** Medicaid expansion led to the improvement of HIV outcomes (VS) post-enrollment compared to baseline. Barriers to healthcare (access and affordability) were eased, leading to increased healthcare utilization among participants who enrolled in Medicaid.

## EPD116

### Characteristics and sexual behaviour patterns of clients who discontinued PrEP in Kenya

L. Oluoch<sup>1</sup>, P. Mwangi<sup>1</sup>, D. Mwangi<sup>1</sup>, M. Mwangi<sup>1</sup>, L. Etyang<sup>1</sup>, V. Ogello<sup>1</sup>, E. Owidi<sup>1</sup>, N. Mugo<sup>1,2</sup>, K. Ngure<sup>2,3</sup>, K. Mugwanya<sup>2</sup>

<sup>1</sup>Kenya Medical Research Institute, Centre of Clinical Research, Nairobi, Kenya, <sup>2</sup>University of Washington, Global Health, Seattle, United States, <sup>3</sup>Jomo Kenyatta University of Agriculture and Technology, Community Health, Nairobi, Kenya

**Background:** The decision to initiate and continue oral pre-exposure prophylaxis (PrEP) is intricately linked to an individual's perceived susceptibility to HIV acquisition. We explored the characteristics and sexual behaviour patterns of individuals who opted to discontinue PrEP use.

**Methods:** Between 2020 and 2022, we administered a standardized phone survey to clients who discontinued PrEP at four large public HIV care clinics in Central Kenya. The survey assessed socio-demographic characteristics, reasons for discontinuation, risk perception and sexual behaviours. Log binomial method was used to assess demographic factors linked to early PrEP discontinuation, defined as use for less than three months.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Results:** Overall, 300 individuals discontinued PrEP; the median age was 35 (IQR 23-43) years. More than half of the individuals, 177/300 (59%), reported discontinuation of PrEP within the first three months of initiation. Out of the 300, 116 (65.5%) were female.

Primary reasons for discontinuation included reduced HIV risk perception (43.7%), separation and reduced risk (23.0%) and side effect concerns (8.7%).

Young adults (<30 years) were more likely to discontinue early than older adults (aRR=1.31, 95% CI: [1.09, 1.59]). Higher income was correlated with a lower likelihood of early PrEP discontinuation (aRR=0.76, 95% CI: [0.62, 0.94]).

Approximately one third, 57/177 (32.2%), of individuals reported having a sexual partner whose HIV status was unknown. Individuals whose last sexual partners were known to be living with HIV showed a lower likelihood of early PrEP discontinuation compared to those whose partners' HIV status was negative (aRR=0.60, 95% CI: [0.46, 0.78]).

**Conclusions:** There is a need for tailored support systems to sustain HIV prevention efforts beyond PrEP cessation, emphasizing the ongoing significance of comprehensive preventive strategies. Additionally, targeted supportive counselling for PrEP continuation among the younger population, who face a higher risk of incident HIV acquisition and those with fewer years of education, would be beneficial.

## EPD117

**Synergistic interaction between pay-it-forward incentives and recreational drug use on hepatitis B virus and hepatitis C virus testing among men who have sex with men in China**

W. Ai<sup>1,2</sup>, Y. Xie<sup>1</sup>, H. Lu<sup>3</sup>, Y. Zhang<sup>2</sup>, G. Marley<sup>1</sup>, D. Wu<sup>2</sup>, J. Ong<sup>4,5</sup>, J. Tucker<sup>6,1</sup>, W. Tang<sup>1,2</sup>

<sup>1</sup>University of North Carolina Project-China, Guangzhou, China, <sup>2</sup>Nanjing Medical University, School of Public Health, Nanjing, China, <sup>3</sup>Yale University, Department of Epidemiology of Microbial Diseases, New Haven, United States, <sup>4</sup>Monash University, Central Clinical School, Melbourne, Australia, <sup>5</sup>Alfred Health, Melbourne Sexual Health Centre, Carlton, Australia, <sup>6</sup>London School of Hygiene and Tropical Medicine, Clinical Research Department, London, United Kingdom

**Background:** Men who have sex with men (MSM) have a high risk of hepatitis B virus (HBV) and hepatitis C virus (HCV) infection, but testing rates remain low among them in China, especially those who are using recreational drugs. Pay-it-forward incentives effectively promote HBV and HCV testing by offering participants free testing and a chance to donate to support subsequent testing. This study aims to explore the interaction between pay-it-forward incentives and recreational drug use on HBV and HCV testing uptake among MSM in China.

**Methods:** We pooled data from two pay-it-forward studies (a randomized controlled trial and a quasi-experimental study) that aimed to promote dual HBV and HCV testing among MSM in Jiangsu, China. We explored factors associated with dual HBV and HCV testing uptake in the two study groups and examined the potential interaction between pay-it-forward incentives and recreational drug use on hepatitis testing uptake on multiplicative and additive scales.

**Results:** Overall, 511 MSM participated in these two studies, with 265 participants in the pay-it-forward incentives group and 246 participants in the standard-of-care group. The median age of participants was 29 years old (interquartile range [IQR], 25-39) in the pay-it-forward incentives group and 30 years old (IQR, 25-37) in the standard-of-care group. Among these participants, 59.3% in the pay-it-forward incentives group and 24.8% in the standard-of-care group received HBV and HCV testing, respectively. In the pay-it-forward incentives group, participants who used recreational drugs in the past 12 months (adjusted odds ratio [AOR]=1.83, 95% CI: 1.09-3.06) were more likely to receive HBV and HCV testing, compared with those who never used recreational drugs, whereas in the standard-of-care group, those who used recreational drugs were less likely to receive HCV testing (AOR=0.38, 95% CI: 0.18-0.78). There was a synergistic interaction on both the multiplicative (ratio of ORs = 4.83, 95%CI: 1.98-11.7) and additive scales (the relative excess risk due to interaction [RERI]=2.97, 95%CI: 0.56-5.38) of pay-it-forward incentives and recreational drug use behaviors on HBV and HCV test uptake among MSM.

**Conclusions:** Pay-it-forward incentives may be particularly useful in promoting hepatitis testing among MSM who use recreational drugs.

## EPD118

**Development of Community-Led Monitoring dashboard page for oral PrEP program in Indonesia**

T.A. Putri<sup>1</sup>, F.F. Rakhmat<sup>1</sup>, S.R. Fauziah<sup>1</sup>, M. Handayani<sup>1</sup>, M.N. Pohan<sup>1</sup>, B.W. Putra<sup>2</sup>, I. Nugraha<sup>2</sup>, M. Slamet<sup>2</sup>, A. Nugroho<sup>3</sup>, A. Dewiyanti<sup>3</sup>, R. Wisaksana<sup>1</sup>

<sup>1</sup>Research Center for Care and Control of Infectious Disease (RC3ID) Universitas Padjadjaran, Bandung, Indonesia, <sup>2</sup>Gaya Warna Lentera Indonesia (GWL-INA), Jakarta, Indonesia, <sup>3</sup>UNAIDS Indonesia, Jakarta, Indonesia

**Background:** Pre-exposure Prophylaxis is one of the HIV prevention program that is currently being rolled out in Indonesia. To improve the quality of PrEP service delivery, Community-Led Monitoring (CLM) has been carried out in collaboration with HIV community organizations. While CLM is a common concept for HIV program monitoring, a lot of the results are still presented through anecdotal reporting mechanism.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

In order to gather and present evidence-based data from the on-going program, an additional tool is needed to capture and report the result of CLM. Therefore, a dashboard page is also developed to display the data that has been collected.

**Description:** CLM was implemented by PrEP Focal Point in 21 cities and districts, initiated by GWL-INA as a representative community organization in Indonesia. The aim is to systemically and routinely collect and analyze data on PrEP delivery in health services and how the program had been rolled out in each city or district. The results were then used for program improvements based on community access for PrEP itself. Data collection was carried out every three months starting in 2023, using online questionnaires developed by RC3ID Universitas Padjadjaran. Data was captured through Google Form while the dashboard page was developed on LookerStudio platform. All CLM-related activities were funded by UNAIDS Indonesia.

**Lessons learned:** The purpose of CLM is to serve as surveillance and accountability mechanism for health services, therefore the results are seen from the point of view of community as the main beneficiary of PrEP. Through CLM, we can see how PrEP is being provided through access experience and find out points that need improvements. The dashboard page that presents the results of CLM can be used as the source of data for an evidence-based advocacy initiated by community-led organizations. With advocacy being carried out frequently, loops of rapid feedbacks and improvements are expected to reach the ideal PrEP service delivery.

**Conclusions/Next steps:** An accessible dashboard page that displays data from CLM is helpful to gather accountable results and serve an evidence-based advocacy. It can be used as an additional tool for community-led organizations to carry out CLM in more systematic manner.

## EPD119

Exploring the multidisciplinary approach to individuals living with HIV and chemsex: a case study of harm reduction therapeutic community in Taiwan

X.R. Lin<sup>1</sup>, S.C.P. Hsu<sup>1</sup>

<sup>1</sup>Taiwan Lourdes Association, Taipei City, Taiwan, Province of China

**Background:** Recent surveys by the Taiwan Centers for Disease Control indicate a rising trend in sexualized drug use among MSM, with the prevalence reaching 18% over the past three years. The survey also revealed a higher HIV positivity rate among individuals who use substances (5.4% compared to 1.2%), suggesting a greater likelihood of being HIV-positive in this group. Given the expanding population of people engaging in chemsex, providing care for them is essential in responding to the HIV epidemic.

**Methods:** This study focuses on a harm reduction approach, encompassing more than just monitoring an individual's substance use. It considers the complex interplay of factors inherent in substance use disorders, including the social, environmental, and psychological contexts of everyone. Particularly in Taiwan, these individuals face multifaceted pressures. In traditional Chinese families, the focus on lineage can lead to less acceptance of LGBTQ+ individuals, adding to the societal stigma and internal conflict experienced by those living with HIV and substance use disorders. Backed by government funds, our harm reduction strategy for HIV and substance use disorders builds a multidisciplinary model.

The study utilized a therapeutic community setting to aid clients through structured daily routines, engaging in agricultural work, and learning various thematic subjects. Social workers and peer counselors facilitated the development of self-awareness about substance use and interpersonal relationships. This holistic approach focuses on comprehensive care, including physical, mental, social, and spiritual well-being, while emphasizing trauma care and relationship restoration. It employs both short and long-term recovery strategies, involving families.

**Results:** From 2019 to 2023, our program supported 529 individuals and their families, enhancing average family function by 1.6 points as per the APGAR assessment. Addiction severity, measured by the SDS, decreased by 2.8 points. Notably, 90% of individuals maintained contact with our services after leaving our therapeutic community.

This study outlines effective recovery strategies for substance use disorders, highlighting the success of localized harm reduction treatments for HIV and substance use.

**Conclusions:** Acknowledging the recovery challenges, our initiatives have reduced relapse severity and drug use disorder. Our collaborative, multidisciplinary methods have significantly contributed to mental health and established a harm reduction model in Chinese communities.

## EPD120

Differential appointment reminder strategies for unlettered patients in an under-resourced environment in Limpopo Province, South Africa

M.P. Lowane<sup>1</sup>

<sup>1</sup>Sefako Makgatho Health Science University, Public Health, Ga-Rankuwa, Pretoria, South Africa

**Background:** With the increased medical care needs for people living with HIV (PLWH) on antiretroviral therapy (ART) in recent years, achieving optimal appointment adherence is becoming the biggest challenge in an outpatient setting. Despite the strategies used to document the appointments, patients are still faced with the challenge of forgetting the dates scheduled for their next treatment refills and other medical follow-ups. Various

strategies were employed to remind patients about the next appointment dates, however, patients who cannot read and write, lack mobile phones, and in hard-to-reach communities are not covered by most of the reminder strategies.

Hence this study explored alternative reminder strategies suitable for illiterate patients in an under-resourced rural area of Limpopo Province.

**Methods:** Semi-structured interviews were conducted among twelve PLWH on antiretroviral therapy who missed two or more appointments in the period of 12 months. Data collected from October 2018 to January 2019 in the local languages used in Limpopo Province.

Interviews were audio-recorded and transcribed verbatim, coded for themes, and used a phenomenological deductive and inductive approach for thematic data analysis.

**Results:** Reminder strategies currently employed, forgetting the appointment date, failure to read what is written in a patient retain appointment cards, and no cancellation and rescheduling of new dates were identified as barriers affecting adherence to appointments. The finding of the study revealed many challenges and factors that contribute to the missing of appointments; however, not all will be applicable to resolve some factors or challenges.

**Conclusions:** Improving medical appointment keeping is a challenge because the strategies used for reminder is not feasible to all PLWH on antiretroviral therapy. Alternative strategies that would suit patients' special needs were suggested to facilitate appointment-keeping. Patients in an underprivileged setting were the ones mostly affected by the strategies set to be used to increase appointment keeping. Healthcare providers must acknowledge that patients should be treated differently according to the patients' situation when providing appointment dates. Patients' level of understanding is important and healthcare providers should explore an alternative strategy that will work best to remind the patient to honor the next appointment date.

## EPD121

Associations between community engagement and support from peers and family on willingness to participate in HIV prevention research: findings from a cross-sectional survey

V. Loganathan<sup>1</sup>, R. Nelson<sup>1</sup>, M. Shunmugam<sup>1</sup>,

V. Chakrapani<sup>1</sup>, P. Saha<sup>2</sup>, N. Khan<sup>2</sup>, J. Mukherjee<sup>2</sup>, S. ul Hadi<sup>2</sup>

<sup>1</sup>Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, <sup>2</sup>IAVI, Gurugram, India

**Background:** Community engagement (CE) is critical to inform the delivery and uptake of existing and upcoming HIV prevention products. Little information exists on how communities are involved in HIV prevention research. Ac-

cordingly, we aimed to understand the nature of community engagement practices in relation to HIV biomedical/prevention research and how perceived benefits and expectations of CE are associated with willingness to participate in HIV prevention research.

**Methods:** Between November 2021 and September 2022, we conducted a self-administered online survey among 143 peer-driven sample of community representatives and a criterion-based sample of 35 researchers in India. Scales were used to measure willingness to participate in research, perceived benefits and expectations of community engagement, trust in research/researchers, and perceived support from family/peers. Among the community sample, we used multivariable linear regression to identify significant predictors of willingness to participate in HIV prevention research.

**Results:** The community participants' (n=143) mean age was 30.6 years (SD=8.2) and mean monthly income was INR 13764 (SD=15422). About half were women, 48% had a college degree, 41% were employed, and 58% were key populations. The researchers (n=35) had an average of 9.7 (SD 7.5) years of experience in HIV prevention research. Only 58% community participants agreed that they trust researchers and research institutions; 88% highlighted critical information need on study purpose, procedures, associated benefits, possible risks, and grievance redressal mechanism to improve informed decision-making. Among researchers, 77% reported difficulty in gaining the support of community leaders/gatekeepers for initiating research and 100% appreciated the need for researchers' capacity strengthening on CE and building trust. A multiple regression showed that community expectation of a reciprocal feedback-based CE (b=.13, 95% CI .09 to .18, p<.001) and perceived support of their peers/community (b=.22, 95% CI .04 to .30, p<.05) were positively associated with their willingness to participate in HIV prevention research.

**Conclusions:** The findings highlighted that fulfilling CE expectations and increasing support from peers/community will help improve the communities' participation in HIV prevention research. Steps need to be taken to strengthen researchers' capacities to meaningfully engage study communities and strengthen communities' (e.g., community advisory board) capacities to contribute more effectively to research planning and implementation.

## EPD122

Voices from the past charting the way forward: examining the role of information in combatting HIV/AIDS

E. Van Laer<sup>1</sup>

*<sup>1</sup>Previous university: KU Leuven; Now I am volunteering at Sensoa, Antwerp, Belgium*

**Background:** Despite the availability of simple and well-tolerated therapies, targets set by UNAIDS for combatting HIV/AIDS have not been fully met. To understand why, this study utilized oral history methodology to examine how information about the disease was disseminated in the past and what lessons can be learned from these experiences to improve current efforts to achieve those targets.

**Methods:** Interviews were conducted with 12 Flemish „experts by experience“ (individuals living with HIV or loved ones of HIV-positive people) and 7 Flemish „specialists“ (doctors, nurses, or professors with expertise in HIV/AIDS research like Peter Piot or Marie Laga). The aim of the study was to explore how information circulated among the formal network (governmental communication), the informal network (communication with loved ones, peers, and buddies), and the medical network (communication with medical staff) during the HIV/AIDS epidemic.

**Results:** The interviews revealed various problems from the past within these networks, including persistent ignorance, silences on the virus in waves, inadequate communication adapted to culture and target groups, and the importance of the informal network. The significance of emotions in communication beyond the correctness of information was also emphasized by the interviewees.

**Conclusions:** This study's results demonstrate that the circulation of information plays a crucial role in combatting HIV/AIDS. Although therapies have been a turning point in the disease's history, proper communication is necessary to implement them efficiently. Society has learned from past mistakes in communication since the early 1980s to some extent, but some of them still persist. By examining the past and engaging with individuals who have experienced the disease firsthand, lessons can be learned to improve current efforts.

The findings of this study suggest that current efforts to combat HIV/AIDS must keep prioritizing the involvement of informal networks and tailored communication strategies that promote the normalization of the virus, rather than its banalization. By building on these lessons from the past, more effective strategies for HIV/AIDS prevention and treatment can be developed to achieve the targets set by UNAIDS and improve the lives of those affected by the disease.

## EPD123

Using a community mobilization approach to eliminate harmful social norms that fuel HIV infection among adolescent girls and young women: lessons from Insiza district of Zimbabwe

C. Rugube<sup>1</sup>, D. Dhakwa<sup>1</sup>, F. Mudokwani<sup>1</sup>, I. Mushayi<sup>1</sup>, H. Mafaune<sup>1</sup>, F. Mudzengerere<sup>1</sup>, E. Tachiwenyika<sup>1</sup>, B. Madzima<sup>2</sup>, B. Nyamwanza<sup>2</sup>, R. Yekeye<sup>2</sup>, T. Bhatasara<sup>3</sup>, D. Nyakudya<sup>1</sup>

*<sup>1</sup>Zimbabwe Health Interventions, Programs, Harare, Zimbabwe, <sup>2</sup>National Aids Council, Harare, Zimbabwe, <sup>3</sup>United States Agency for International Development, Harare, Zimbabwe*

**Background:** Zimbabwe Health Interventions (ZHI) is implementing the Determined, Resilient, Empowered, AIDS free, Mentored and Safe (DREAMS) program to reduce HIV incidence among adolescent girls and young women (AGYW). There is growing focus on behavioural and structural interventions that facilitate achievement of HIV epidemic control.

The DREAMS program uses community mobilization approach to drive locally led community actions through community leader (traditional and religious) engagements to eliminate harmful social norms and negative behaviours that increase HIV infection risk.

**Description:** Results from the 2022 ZHI-commissioned gender equality and social inclusion (GESI) analysis showed that harmful norms exist in communities that increase HIV infection risk to AGYW, including child marriages, suboptimal parental communication, and support; other risk factors were artisanal mining, migration, and drug and substance use. The DREAMS program adopted transformative approaches for behaviour and norms change, including intensified community dialogues with diverse groups (traditional leaders, men, boys, girls, and women) to address challenges affecting AGYW and increasing their HIV infection risks.

Multiple platforms e.g., church gatherings, chief's council meetings, community gatherings and sensitization meetings were utilized to reflect on these challenges and through transformative dialogues communities identified and, prioritized issues and made commitments to act.

**Lessons learned:** Routine program monitoring has shown that community leaders were taking an active role in addressing identified risk behaviours in Insiza district. Community actions taken include identifying and banning selling of unlicensed alcohol and drug substances and night parties, instituting community by-laws, instituting local by-laws to prevent and stop child marriages, and targeted dialogues with young men at farming and mining sites and sports gatherings. Targeted dialogues and provision of HIV services within reach of young men at mining sites increases access to and uptake of services while promoting health seeking behaviours.

**Conclusions/Next steps:** Community mobilization through engagement of leaders was effective in reducing harmful social norms. We recommend continued engagement of traditional and religious leaders to address structural and behavioural challenges that increase HIV infection risk among AGYW. The DREAMS program should develop and implement interventions targeted at men and boys to address negative masculinity and norms which place them, and AGYW at HIV infection risk.

## EPD124

### Obstacles and hesitations in the use of HIV pre-exposure prophylaxis (PrEP) among gay adolescents in project PrEP 15-19, Brazil: pathways to overcome barriers

E. Dumont Pena<sup>1</sup>, L.L. Faria<sup>2</sup>, E.W. Rodrigues Vieira<sup>1</sup>, A.P. Silva<sup>2</sup>, M.R. Westin<sup>3</sup>, M. Greco<sup>3</sup>, U. Tupinambás<sup>2</sup>, D. Bartolomeu Greco<sup>2</sup>

<sup>1</sup>UFMG, Department of Maternal and Child Nursing and Public Health, Belo Horizonte, Brazil, <sup>2</sup>Federal University of Minas Gerais (UFMG), Belo Horizonte, Brazil, <sup>3</sup>Federal University of Minas Gerais (UFMG), Belo Horizonte, Brazil

**Background:** In Brazil, many gay adolescents are disproportionately affected by HIV infection. The integration of Pre-Exposure Prophylaxis (PrEP) into combined prevention initiatives is crucial for epidemic control and holds significance for this vulnerable population. Adolescence, marked by life cycle transitions and continuous learning, suggests a heightened susceptibility to adopting new behaviors, both in terms of increased vulnerability to sexually transmitted infections and openness to new prevention methods.

This study aims to comprehend the obstacles and hesitations surrounding PrEP utilization among gay adolescents, providing insights to overcome barriers to HIV prevention in this context.

**Methods:** Conducted within the theoretical and methodological framework of Interpretative Anthropology, this qualitative study engaged in eight in-depth interviews with gay men aged 15 to 19, supplemented by ethnographic follow-up. The participants, residents of Belo Horizonte, deliberately chose not to utilize Pre-Exposure Prophylaxis (PrEP) in the „PrEP 15-19 Study.“ This initiative constitutes a multicenter prospective PrEP demonstration cohort research project involving Brazilian adolescents. The study, officially titled „PrEP 15-19 Study,“ commenced with a minimum follow-up duration of three months, beginning in July 2020.

**Results:** The study's findings highlight hesitations and barriers related to health literacy, covering various aspects: a) Individual capacity, a.1) Informed decision-making, a.2) Knowledge acquisition, a.3) Navigation of the health system; b) Evaluation of health information; and c) Management of one's health and well-being. Adoles-

cents' individual capacity is characterized by insufficient knowledge acquisition in schools, among friends, or online, with limited consideration for health services as an option. However, they emphasize the positive service experience of the "PrEP 15-19" project.

Some narratives, after accessing combined prevention information, demonstrate a low perception of HIV risk, often associated with infrequent sexual activity or a stable partnership.

Family experiences act as barriers to health management, particularly inhibiting homoaffective sexual practices. Additionally, the requirement for parental consent for those under 18 poses a significant impediment.

**Conclusions:** This study underscores the importance of reflecting on health literacy in the context of HIV prevention among adolescents. It emphasizes the necessity of comprehensive health education, considering information quality, family context, and autonomy. Urgent measures include the release of PrEP for adolescents without parental consent.

## EPD125

### Determining post exposure prophylaxis (PeP) efficacy amongst survivors of sexual and gender based violence; lessons learnt from Zimbabwe

M. Majachani<sup>1</sup>

<sup>1</sup>Chinhoyi University of Technology, Big Data Analytics, Harare, Zimbabwe

**Background:** This study explores the uptake of Post-Exposure Prophylaxis (PeP) among survivors of sexual and gender-based violence (SGBV) in Zimbabwe, focusing on data gathered from four Family Support Clinics in 2023.

The importance of timely and comprehensive PeP administration to prevent HIV transmission in this vulnerable population underscores the need for a detailed analysis of uptake, default rates, and treatment outcomes.

**Description:** The research involved a retrospective analysis of PeP administration data for 1269 survivors of SGBV across the four Family Support Clinics. Key variables included the number of individuals receiving PeP, the incidence of defaulting from treatment, and subsequent seroconversions. Additionally, the study examined factors contributing to completion or discontinuation of PeP among survivors.

**Lessons learned:** In 2023, 1269 survivors received PeP, reflecting a significant commitment to addressing HIV prevention in the aftermath of SGBV. However, concerns arise from the 57 (4.5%) individuals who defaulted from treatment, indicating potential barriers to sustained care. Alarming, 8 seroconversions (0.6%) were observed, with 2 occurring among those who completed the PeP regimen. This prompts a critical examination of the efficacy of the current PeP protocols and the identification of factors contributing to treatment failure.

**Conclusions/Next steps:** The findings emphasize the urgency of addressing barriers to PeP completion among survivors of SGBV. Understanding the reasons behind defaulting and seroconversions, especially in those who complete treatment, is crucial for refining clinical protocols and support systems. Recommendations include enhanced counseling services, improved follow-up mechanisms, and community-based interventions to address stigma and other psychosocial factors affecting PeP adherence. Strengthening the integration of HIV prevention within the broader context of survivor support is essential for achieving better outcomes and preventing new incidences among this vulnerable population.

## EPD126

### SIMBIHealth Project: women groups shaping HIV care in Nasarawa State

M. Adesina<sup>1,2</sup>, R. Oladele<sup>1,2</sup>, T. Olufadewa<sup>1,2</sup>, I. Olufadewa<sup>1,2</sup>

<sup>1</sup>Slum and Rural Health Initiative, Ibadan, Nigeria,

<sup>2</sup>University of Ibadan, Ibadan, Nigeria

**Background:** Rural communities in Nigeria often face unique challenges in accessing sexual and reproductive services - SRH (especially HIV) due to various factors. These communities tend to have limited healthcare infrastructure, inadequate resources, and a lack of healthcare professionals trained in providing comprehensive care. Additionally, socio-cultural norms and beliefs may contribute to barriers in seeking care and addressing women's health needs. Coalition-building plays a crucial role in addressing these challenges and improving outcomes in rural communities.

**Description:** SIMBIHealth Community Advocacy Project involved the selection of 10 women leaders from ten rural communities in Toto Local Government Area, Nasarawa State, Northern Nigeria. These women were trained extensively for two months on how to conduct sexual and reproductive health (especially HIV) outreaches within their local communities, dialoguing with leaders for program plus policy change and supporting them to create women's groups. Ten women groups have been created which are made up of ten to thirty-four members and have identified priority challenges which HIV being one of the common ones. They have conducted internal capacity building on HIV prevention and treatment among the group members, community wide sensitization campaigns along with advocacy visits to traditional, community, primary healthcare leaders across the ten communities and visited the local government area vice chairman on SRH priority area (including HIV/AIDS).

**Lessons learned:** Rural women when properly trained can serve as revolutionary champions of HIV care in their communities. The SIMBIHealth project didn't just train the women to be HIV Advocates/Champions but we also provided them with resources and opportunities to

train other women as advocates, and conduct community-wide sensitization campaigns we also linked them up to stakeholders that can help especially those that are influential in changing the narrative. This has been effective as these women have performed exceptionally in advocating and improving access to HIV prevention and treatment whether among their colleagues or health professionals, religious leaders, traditional leaders and many more.

**Conclusions/Next steps:** Findings from the SIMBIHealth Community Advocacy Project have shown that rural women are influential and fundamental channels if the HIV burden is to be reduced in rural communities in Nigeria and Africa.

## EPD127

### Influential factors affecting adherence & continuation of care among adolescent girls and young women (aged 10-24) receiving antiretroviral treatment in Abia State Nigeria

J.A. Ike<sup>1</sup>, M. Uzu<sup>1</sup>

<sup>1</sup>Imo State University, Medical Laboratory Science, Owerri, Nigeria

**Background:** Adherence and retention in antiretroviral therapy (ART) are pivotal for effective HIV management, especially among Adolescent Girls and Young Women (AGYW) aged 10-24 in Abia State, Nigeria. AGYW face unique challenges in adhering to ART, due to stigma, limited family /social support, welfare programs, and pill-related issues. making it imperative to address these issues comprehensively. Recognizing adherence as a critical marker of quality care.

**Description:** This research project, conducted in Abia State, Nigeria, focuses on the influential factors affecting adherence and continuation of care among Adolescent Girls and Young Women (AGYW) aged 10-24 receiving antiretroviral treatment (ART). aiming to enhance overall HIV infection management in the region.

The study adopts a structured questionnaire, & focus group discussions are utilized to gather comprehensive data on the factors influencing adherence and continuation of care among AGYW.

**Lessons learned:** Findings reveal that socioeconomic factors, including income levels and access to education, significantly influence AGYW's adherence to antiretroviral treatment. Out of the the 200 participants included in the study, 139(69.5%) live in rural (village) areas, facing difficulties accessing the OSS facility for care.130(65%) haven't disclosed their HIV status, impacting adherence and retention. 153 adolescent girls and young women who missed doses, 117(58.5%) lack family support, which is essential for adherence, retention and care continuation. 91(59.5%) cited pill size as a reason, emphasizing the need for reduction. 86(56.2%) face transportation challenges.

60(39.2) was due to fear of disclosure. 42(27.5) believed they are healed. 44(28.8) was due stigma and discrimination, and 133(86.9%) was due to forgetfulness, affecting adherence and retention.

**Conclusions/Next steps:** Despite ongoing efforts to improve ART adherence among adolescent girls and young women in Abia State, Nigeria, persistent low rates pose a challenge to meeting UNAIDS 2030 targets. To enhance adherence, providing education, and garnering support from societal, familial, and healthcare realms are crucial. Encouraging research for smaller ART pill sizes, leveraging technology, such as mobile apps for medication reminders, fostering community-based peer support networks, can promote consistent adherence to HIV treatment, and expanding Outpatient Service and Support (OSS) facilities are recommended strategies. These efforts collectively aim to strengthen HIV care and contribute to global endeavors to combat HIV/AIDS.

## EPD128

**Influential factors affecting adherence and continuation of care among adolescent girls and young women (AGYW Aged 10-24) receiving antiretroviral treatment in Abia state, Nigeria**

M. Uzu<sup>1</sup>, J. Ike<sup>1</sup>, I. Onyiriofor<sup>2</sup>, G. Osuji<sup>3</sup>

<sup>1</sup>Imo State University, Medical Laboratory Science, Owerri, Nigeria, <sup>2</sup>Imo State University, Hospitality and Tourism Management, Owerri, Nigeria, <sup>3</sup>Ebonyi State University, Medical Laboratory Science, Abakaliki, Nigeria

**Background:** Adolescent girls and young women (AGYW) aged (10-24) encounter obstacles in HIV care due to stigma, limited family and societal support, limited social welfare programs, limited social support, and pill-related issues (pill size). Tackling these challenges is paramount. Implementing targeted counseling, peer support networks, society and family support can significantly improve health outcomes, fostering adherence and continuity in HIV treatment for AGYW in Abia state.

**Methods:** The study employed a structured questionnaire and client record review to gather data on adherence and retention among adolescent girls and young women undergoing treatment for over six(6) months in Abia OSS(one stop shop) facility.

Adherence was determined through self-reported missed pills, pharmacy refill record and viral load test, and factors influencing it were examined.

**Results:** Of the 200 adolescent girls and young women clients aged (10-24) who participated in the study, 139(69.5%) live in rural (village) areas, facing difficulties accessing the OSS facility for care. 130(65%) haven't disclosed their HIV status, impacting adherence and retention. Of 153 adolescent girls and young women who missed doses, 117(58.5%) lack family support, which is essential for adherence, retention and care continuation. 91(59.5%)

cited pill size as a reason, emphasizing the need for reduction. 86(56.2%) face transportation challenges. 60(39.2) was due to fear of disclosure. 42(27.5) believed they are healed. 44(28.8) was due stigma and discrimination, and 133(86.9%) was due to forgetfulness, affecting adherence and retention.

**Conclusions:** Despite efforts on interventions to improve ART adherence and retention among adolescent girls and young women in Abia state Nigeria, rates remain low posing a challenge to achieving the UNAIDS 20230 targets.

Strategies to improve adherence should focus on addressing the negative influencing factors, and HIV program management should consider these variations, when designing programs, to improve client retention and adherence to treatment.

Awareness, education and support from Society, family, and treatment providers can improve adherence to ART among adolescent girls and young women. Also research to develop smaller ART pill size should be, ensuring easier ingestion for clients and promoting better adherence to HIV treatment.

mobile apps medication reminders and community based peer support networks, and more OSS facilities is highly recommended.

## EPD129

**Adverse social determinants of health predict reduced ART access and increased psychological distress among sexual and gender minority PLHIV in the COVID-19 pandemic: a 3-country explanatory mixed methods study**

P. Newman<sup>1</sup>, V. Chakrapani<sup>2</sup>, N. Massaquoi<sup>3</sup>, S. Tepjan<sup>4</sup>, B. Mohan<sup>5</sup>, D.A. Dinh<sup>6</sup>, P. Akkakanjanasupar<sup>7</sup>, S. Waewklaihong<sup>8</sup>, S. Rawat<sup>5</sup>, S. Rongprakhon<sup>9</sup>, C.C. Williams<sup>1</sup>, N. Phanuphak<sup>8</sup>

<sup>1</sup>University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, <sup>2</sup>Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, <sup>3</sup>University of Toronto, Scarborough, Health and Society, Toronto, Canada, <sup>4</sup>VOICES-Thailand Foundation, Chiang Mai, Thailand, <sup>5</sup>The Humsafar Trust, Mumbai, India, <sup>6</sup>Queen's University, Health Sciences, Kingston, Canada, <sup>7</sup>Chulalongkorn University, Educational Policy, Management, and Leadership, Bangkok, Thailand, <sup>8</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>9</sup>Rajamangala University of Technology Phra Nakhon, Computer Science, Bangkok, Thailand

**Background:** Globally, sexual and gender minority (SGM) populations experience health disparities and adverse social determinants of health (SDOH) that exacerbated vulnerability to COVID-19 pandemic-related adversities. We explored pandemic-related disruptions in ART access and psychological distress among PLHIV in 3 countries.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Methods:** We used an explanatory sequential mixed methods design. A cross-sectional, web-based multi-platform survey was conducted with SGM PLHIV recruited through community-based organizations in Bangkok, Mumbai, and Toronto, with follow-up semi-structured online interviews, to explore COVID-19 pandemic-related changes in ART access and psychological distress. Survey items assessed pandemic-related access to ART, anxiety and depression, and SDOH (water insecurity, food insecurity, health insurance). Multivariable logistic (reduced ART access) and linear (depression and anxiety scores) regression analyses were conducted using R-4.3.2. Qualitative data were explored using thematic analysis in ATLAS.ti and integrated with survey findings.

**Results:** From March–November 2021, 57 PLHIV (mean age=35.5 years [SD 9.9]), from Bangkok (n=23, 40%), Mumbai (n=25, 44%), and Toronto (n=9, 16%) completed the survey. Fourteen (25%) identified as trans/gender diverse (TGD), 43 (75%) cisgender (largely [n=39] MSM). Overall, 25% (n=14) reported reduced ART access, 32% screened positive for clinically-significant anxiety and 25% clinically-significant depression.

In multivariable analyses, those without health insurance had 5-fold higher odds (aOR=4.96, 95% CI 1.20, 23.75; p=.03) and those reporting water insecurity 6-fold higher odds of reduced ART access (aOR=6.01, 95% CI 1.22, 34.96; p=.03), respectively. Chi-square analysis revealed more pervasive reduced ART access among TGD (42.8%) vs. cisgender people (16.2%, p=.04) (nonsignificant in multivariable analysis). Water insecurity was positively associated with anxiety ( $\beta=1.26$ ; 95% CI .17, 2.35; p=.02). COVID-19 stress scores were positively associated with anxiety ( $\beta=0.10$ ; 95% CI .03, .17; p=.004) and depression ( $\beta=0.10$ ; 95% CI .05, .16; p<.001).

Findings from qualitative interviews (May–December 2022) elucidated ART access challenges and pandemic-related psychological distress across sites, and experiences of water insecurity in Mumbai and Bangkok.

**Conclusions:** Substantial pandemic-related reductions in ART access among SGM PLHIV, especially TGD individuals, and pervasive pandemic impacts on psychological distress indicate the critical importance of targeted structural interventions to improve SDOH (affordable healthcare, water security) among PLHIV, LGBTQ+-affirmative psychosocial support, and ensuring inclusion of SGM PLHIV in future pandemic-preparedness efforts.

## EPD130

### 'Moral degradation': culture-based stigmatizing attitude towards condom use among the Chinese older adults: a qualitative study

W. Peng<sup>1</sup>, Q. Zhou<sup>1</sup>, L.A. Goldsamt<sup>2</sup>, Y. Shen<sup>1</sup>, R. Wang<sup>1</sup>, X. Li<sup>1</sup>

<sup>1</sup>Central South University, Xiangya School of Nursing, Changsha, China, <sup>2</sup>New York University, Rory Meyers College of Nursing, New York, United States

**Background:** Consistent condom use has been demonstrated to be an effective strategy for preventing sexually transmitted diseases. However, the rate of consistent condom use among older adults in China is notably low. Understanding older adults' psychological and culture-based barriers toward condom use would contribute to designing sensitive behavioral interventions for this HIV-vulnerable population.

We explored the attitudes towards condom use and the underlying reasons for its low use frequency among this population in China.

**Methods:** The interpretive phenomenology analysis was adopted to guide the data collection and data analysis. Participants aged 50 years or above who had engaged in sexual activities within the previous year were eligible for the study. Purposive sampling and snowball sampling methods were used in this study. The sample size was determined based on data saturation. Qualitative data were collected through 15 face-to-face in-depth interviews and 30 field observations among old adults.

**Results:** In total, 30 older adults reviewed the educational flyers on the square in one morning, and 9 were observed by our researchers, including 5 females and 4 males. Fifteen participants took part in our interviews including 13 males and 2 females. Through interpretive phenomenological analysis, three main themes emerged: perceived unnecessary to use condom, interactive stereotypes toward condom use, and stigmatized social norms towards condom use.

Theme 1 included two sub-themes: "Perceiving no need for contraception" and "Perceiving low HIV/STIs risk".

Theme 2 included four sub-themes: "Condom use-related topic was shameful", "Using condom meant distrust", "Using condom meant impaired sexual health", and "Using condom contradicted the traditional meaning of sex".

Theme 3 included two sub-themes: "Using condom was considered as moral degradation" and "Gender vulnerability in condom use".

**Conclusions:** These findings shed light on the complex barriers to condom use behaviors among older adults in China and emphasized the need for tailored interventions addressing misconceptions, promoting awareness, and reducing culture-rooted stereotypes and stigmas surrounding condom use.

## EPD131

### Perceptions of early marriage as a strategy for HIV risk prevention: a male perspective from former child labourers in informal mining in the Democratic Republic of Congo

B.T. Makenishe<sup>1</sup>

<sup>1</sup>University of KwaZulu-Natal, School of Social Sciences/  
Maurice Webb Race Relations Unit, Durban, South Africa

**Background:** There is a degree of consensus that early marriage exacerbates the risks of HIV acquisition in the literature. This position is generally supported by evidence of unequal power relations embedded in marriage between underage girls and older men. However, this position is disputed by relatively recent empirical evidence showing that the rate of HIV did not significantly correlate with the rate of early marriages in Sub-Saharan Africa where the two phenomena predominate.

This paper focuses on the nexus between HIV risk exposure and early marriage, not necessarily child marriage, among former child miners. It investigates the lived experiences and perceptions of those adult males who during their childhood worked in informal mining, which is considered a high-risk sector in the context of HIV.

**Methods:** The findings are based on nine focus group discussions conducted in two rural communities. In total, 89 male participants were selected purposively and allocated to groups by age categories and marital status. Each group comprised between six and 13 participants. The discussions were recorded, transcribed and analysed thematically using NVivo.

**Results:** The findings show that there were optimistic and pessimistic views about the relationship between HIV risks and early marriage. The optimistic view was pro-early marriage, perceived as a necessary measure to avoid HIV. This is because there was a requirement for pre-marriage testing and subsequent faithfulness in marriage which entailed that some participants felt safe from HIV risks as they married.

In contrast, the pessimistic view portrayed early marriage as an unsafe mode of prevention because the faithfulness of both marriage partners is not always a given especially when young partners are involved.

**Conclusions:** Whereas the pessimistic view underscores a more cautious approach underpinned by the lack of trust and confidence in both self and partner's ability to maintain faithfulness in marriage, the optimistic view is likely to promote early marriage and can unwittingly exacerbate the risk of HIV for marriage partners.

Therefore, HIV education is necessary for marriage partners, especially those located in high-risk and economically depressed settings.

## EPD132

### Concurrent psychoactive substance use among the clients of methadone maintenance treatment (MMT) in Bangladesh

T.K.I. Shafiq<sup>1</sup>, M. Reza<sup>2</sup>, G.S. Mohammad Pritom<sup>3</sup>,  
M.M.M. Hemel<sup>2</sup>, S. Chowdhury<sup>2</sup>, A. Taher<sup>4</sup>, S. Khan<sup>5</sup>,  
A.M. Rana<sup>2</sup>, S.I. Khan<sup>2</sup>

<sup>1</sup>University of South Carolina, Health Promotion,  
Education and Behavior, Arnold School of Public  
Health, Columbia, United States, <sup>2</sup>International  
Centre for Diarrhoeal Disease Research, Bangladesh  
(icddr), Programme for HIV and AIDS, Dhaka,  
Bangladesh, <sup>3</sup>University of South Carolina, Health  
Promotion, Education and Behavior, Columbia,  
United States, <sup>4</sup>United Nations Office on Drugs  
and Crime, HIV and AIDS, Dhaka, Bangladesh, <sup>5</sup>UNAIDS,  
Dhaka, Bangladesh

**Background:** Concurrent psychoactive substance use during methadone maintenance treatment (MMT) adversely affects the treatment outcome. This cross-sectional study evaluated the reasons and factors associated with concurrent substance use with methadone in Bangladesh.

**Methods:** People who inject drugs (PWID) receiving methadone (N = 402) for at least one year were enrolled in five MMT clinics in Dhaka between July 2019 and March 2021. Consented participants were selected through proportionate random sampling, and data was obtained through a semi-structured questionnaire. Random oral fluid samples were tested on the study site for methamphetamine, benzodiazepine, opioids, and cannabis.

**Results:** Of the 402 study participants, 90% reported at least one concurrent substance use along with methadone in the last six months. The most used substance was benzodiazepine (60.2%), followed by methamphetamine (55.2%) and cannabis (55%). Alcohol (14.1%) and opioids (6.7%) were also reported to be used concurrently with methadone. The major reason reported for using benzodiazepine was difficulty sleeping (74.3%) and feeling good or "getting high" (37.6%).

The reasons for using methamphetamine were to feel good or "get high" (65.5%, n = 121), to have work stamina (37.5%, n = 75), to have a good time with friends (27.5%, n = 55), when money was in hand (22.5%, n = 45), and to have good sex (10.5%, n = 33). The reasons for using cannabis were to feel good or get high (64.3%), induce sleep (20.6%) and to increase appetite (22.1%).

Multivariate analysis showed that age of starting any substance use, duration of MMT, and depression status were significantly associated with concurrent use of psychoactive substances among the MMT clients.

**Conclusions:** We found a high prevalence of benzodiazepine, methamphetamine, and cannabis use among the MMT clients. Younger age of starting substance use (20–24 years), longer duration of MMT (2–4 years and >4 years),

and extremely severe depression were significantly associated with concurrent use of psychoactive substances among the MMT clients.

## EPD133

### Higher burden of depression among black sexual and gender minorities in Brazil: the role of discrimination

C. Guimarães<sup>1</sup>, L. A. Freitas<sup>1</sup>, B. Grinsztejn<sup>1</sup>, V. G. Veloso<sup>1</sup>, P. M. Luz<sup>1</sup>, T. S. Torres<sup>1</sup>

<sup>1</sup>Evandro Chagas National Institute of Infectious Diseases, Rio de Janeiro, Brazil

**Background:** Depression, characterized by long-lasting symptoms such as loss of interest and pleasure in activities, has stressful situations as a risk factor. Black people and sexual and gender minorities (SGM) are frequent victims of stigma and discrimination which may lead to depression. We assessed factors associated with depression among SGM from Brazil.

**Methods:** Cross-sectional online study among SGM ≥18 years recruited on social media (Facebook/Instagram) and dating apps (Grindr/Hornet/Scruff) between November/2021 and January/2022. We measured the severity of depression symptoms using Patient Health Questionnaire (PHQ-9; scores range 0-27) and validated instruments to measure discrimination (8-item Explicit Discrimination Scale [EDS], scores range 0-24) and internalized homonegativity (7-item Internalized Homonegativity Scale [IHS], scores range 0-42); higher scores=higher discrimination/internalized homonegativity. We used linear regression models to quantify the association of discrimination and other factors with PHQ-9 scores, models were stratified by race (Black, Pardo and White).

**Results:** Of 6,459 participants, 58.0% were White, 26.1% Pardo, 12.2% Black. Median age was 36 years (IQR:29-44); 97.6% were cis-MSM, 22.5% had low income, and 25.4% were living with HIV. Mean scores of EDS and IHS were 3.5(SD3.8) and 10.3(SD8.2), respectively. Mean PHQ-9 score was higher for Black (9.6 SD7.5) and Pardo (9.3 SD7.2) than White SGM (8.4 SD7.0) ( $p<0.0001$ ). Higher EDS scores and younger age were associated with higher PHQ-9 scores regardless of race (Table).

	Black		Pardo		White	
	Estimate (SD)	p-value	Estimate (SD)	p-value	Estimate (SD)	p-value
Age (per year)	-0.18 (0.03)	<0.0001	-0.15 (0.02)	<0.0001	-0.17 (0.03)	<0.0001
Family monthly income (ref. high: >USD1450/month)						
Low (<=USD480/month)	0.98 (0.77)	0.20	2.00 (0.49)	<0.0001	1.37 (0.34)	<0.0001
Middle (<USD480-1450/month)	-0.08 (0.68)	0.90	0.49 (0.42)	0.24	0.81 (0.24)	0.00095
IHS	-0.00 (0.03)	0.97	0.06 (0.02)	0.0033	0.06 (0.01)	<0.0001
EDS	0.58 (0.06)	<0.0001	0.62 (0.043)	<0.0001	0.68 (0.03)	<0.0001

Models adjusted by gender, orientation, education, region, living in State capitals and HIV status

Table.

Lower income and higher IHS scores were associated with higher PHQ-9 scores for Pardo and White SGM, but not Black SGM.

**Conclusions:** Black and Pardo SGM had higher PHQ-9 scores than White SGM. Experiences of discrimination were associated with higher depression scores among Brazilian SGM. Age was inversely associated with depression scores, pointing to an increased burden of mental health related-issues among the youngest. Lack of association of lower income and internalized homonegativity with PHQ-9 scores only among Black SGM warrants further investigation.

## EPD134

### Structural drivers of HIV prevention and healthcare inequities among sexual and gender minority populations in the COVID-19 pandemic: a 3-country cross-sectional survey

P.A. Newman<sup>1</sup>, V. Chakrapani<sup>2</sup>, N. Massaquoi<sup>3</sup>, S. Tepjan<sup>4</sup>, P. Akkakanjanasupar<sup>5</sup>, S. Sebastian<sup>6</sup>, B. Mohan<sup>7</sup>, S. Rawat<sup>7</sup>, S. Waewklaihong<sup>8</sup>, S. Rongprakhon<sup>9</sup>, N. Phanuphak<sup>8</sup>

<sup>1</sup>University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, <sup>2</sup>Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, <sup>3</sup>University of Toronto, Scarborough, Health and Society, Toronto, Canada, <sup>4</sup>VOICES-Thailand Foundation, Chiang Mai, Thailand, <sup>5</sup>Chulalongkorn University, Educational Policy, Management, and Leadership, Bangkok, Thailand, <sup>6</sup>Women's Health in Women's Hands Community Health Centre, Toronto, Canada, <sup>7</sup>The Humsafar Trust, Mumbai, India, <sup>8</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>9</sup>Rajamangala University of Technology Phra Nakhon, Computer Science, Bangkok, Thailand

**Background:** The COVID-19 pandemic and efforts to control it exerted disparate impacts on sexual and gender minority populations. We examined pandemic-related impacts on access to HIV testing, condoms, and healthcare among LGBTQ+ individuals in three countries.

**Methods:** We conducted a cross-sectional, multiplatform web-based survey with the #SafeHandsSafeHearts cohort that recruited sexual and gender minority adults online through community-based organizations in Bangkok, Mumbai, and Toronto for a psychosocial eHealth intervention during the COVID-19 pandemic. We examined access to HIV testing, condoms, and general healthcare, along with structural drivers—discrimination in healthcare, health insurance and homelessness, sex work involvement, and demographics (age, education, gender/sexual self-identification). Our analytic sample included HIV-negative/unknown-status individuals. Multivariable logistic regression analyses were conducted using R-4.3.2.

**Results:** From March to November 2021, we enrolled 795 individuals (mean age=30.1 years [SD=8.0]) from Bangkok (42.4%), Mumbai (33.3%) and Toronto (24.3%). Over one-

third (36.0%) identified as trans/gender diverse (TGD) (22.3% trans women, 13.7% trans men), 31.9% cisgender gay/MSM and 32.1% cisgender lesbian/bisexual women. Overall, more than one-fourth (28.0%) reported reduced HIV testing access, 32.8% reduced access to condoms and 29.2% needing healthcare but unable to afford it. In multivariable analyses, those who experienced discrimination in healthcare had higher odds of reduced HIV testing access (aOR=1.11, 95% CI 1.00-1.22, p=.048) and inability to afford healthcare (aOR=1.29, 95% CI 1.19-1.40, p<.001). Those who experienced homelessness (aOR=1.81, 95% CI 1.19-2.76; p=.006) and who lacked health insurance (aOR=1.94, 95% CI 1.35-2.79; p<.001) had nearly twofold higher odds, respectively, of being unable to afford healthcare. Sex work involvement was associated with twofold higher odds of reduced HIV testing access (aOR=2.26, 95% CI 1.47-3.47, p<.001) and reduced condom access (aOR=1.92, 95% CI 1.26-2.87, p=.002). Gay/MSM and trans women had higher odds of reduced HIV testing access (ref. cisgender women).

**Conclusions:** We identified pervasive reductions in access to HIV prevention and healthcare during the pandemic among LGBTQ+ individuals from three countries. Inequities due to healthcare discrimination, lack of health insurance, homelessness, and sex work involvement rendered LGBTQ+ individuals significantly more vulnerable. Structural interventions and pandemic preparedness approaches tailored for the most marginalized LGBTQ+ populations are needed to protect those at greatest risk for HIV.

## EPD135

Assessing cisgender women's access to comprehensive HIV/PrEP education from reproductive health visits in Jacksonville, Florida, USA

R. Logan<sup>1</sup>, S. Graves<sup>2</sup>, S. Davis<sup>2</sup>, W. Wilson<sup>1</sup>, S. Wulf<sup>1</sup>, K. Jones<sup>2</sup>, A. Pope<sup>2</sup>, C. Dehlendorf<sup>1</sup>, D. Seidman<sup>3</sup>

<sup>1</sup>University of California San Francisco, Family & Community Medicine, San Francisco, United States,

<sup>2</sup>Florida Department of Health, Duval County, Jacksonville, United States, <sup>3</sup>University of California San Francisco, Obstetrics, Gynecology & Reproductive Sciences, San Francisco, United States

**Background:** Black cisgender women in the southern United States (US) have the highest HIV prevalence among US cisgender women. Despite many cisgender women routinely interacting with the healthcare system for reproductive needs, few are aware of HIV pre-exposure prophylaxis (PrEP). Although the Centers for Disease Control and Prevention recommend discussing PrEP with all sexually active people, gaps remain regarding how health providers implement this guidance during reproductive healthcare.

**Methods:** As part of a larger trial, this sub-study recruited and randomized HIV-negative clients presenting to a public reproductive health clinic in Jacksonville, Florida, to view an HIV prevention decision support tool (DST) before their visit or receive routine care. Participants and providers consented to have an audio-recorder in the room during clinical visits. We transcribed the recordings verbatim and coded transcripts deductively and inductively.

**Results:** Between 2021-2022, 26 visits were audiotaped. Participants self-identified as cisgender women (all), African American/Black (19 of 26; 73%), white (6 of 26; 23%), multi-racial (1 of 26, 4%), Hispanic/Latine (3 of 26; 11%), and had a median age of 33.5 (18-45) years. Most participants reported having sex in the last six months (21 of 26; 81%). Sixty-five percent of participants (17 of 26) viewed the DST pre-visit. A provider mentioned HIV prevention in visits with three non-DST participants, two of which also included the mention of PrEP. No clients initiated such conversations. During the two visits that mentioned PrEP, providers inquired about clients' awareness of PrEP and briefly described it but did not ascertain interest in PrEP. Overall, providers offered eight people HIV testing, 12 people testing for other sexually transmissible infections (STI), and five people condoms. In no visits did providers help clients assess their vulnerability to HIV.

**Conclusions:** A sample of audiotaped reproductive health visits at a public facility in the southern US demonstrated sparse information sharing about HIV prevention and PrEP, even as more than half of clients viewed an HIV prevention DST. Frequent HIV/STI testing revealed missed opportunities for HIV prevention conversations. Reproductive health providers need additional training on approaches to integrate comprehensive, personalized HIV and PrEP education into reproductive healthcare.

## EPD136

Sex talks and encounters: an evaluation of young people's encounter of HIV-AIDS in the rural communities of Negros Occidental

J.R. Reyes<sup>1</sup>

<sup>1</sup>Negrosanon Young Leaders Institute Inc., Bacolod City, Philippines, the

**Background:** The cases of HIV-AIDS in the rural communities of Negros Occidental are deeply entrenched in the prevalence of child sexual abuse and exploitation. This has been identified as one of the prevalent factors influencing the health-seeking behaviors of young people with their sexual health. While modern communities get more access to information about HIV-AIDS, rural areas acquire it through traditional means, including 'word of mouth,' local newspapers, and radio stations. This study examined the social factors attributing to the perception of young people about HIV-AIDS and the structural gaps that influence the formation of these perceptions.

E-posters

Late-breaker abstracts

Author Index

**Methods:** The study employed a qualitative method through focused group discussions and key informant interviews with 60 participants from 10 key cities and municipalities in Negros Occidental. The data was complemented with existing literature and research about HIV-AIDS and sex education, alongside available public data on transmission in rural communities.

The data was analyzed using N'Vivo Software to generate word clouds and textual analysis based from the data derived from the participants. Thematic analyses was also conducted to generate general themes and concepts.

**Results:** The results showed that most young people acquired the perception of HIV-AIDS due to their exposure to stories and narratives from People Living with HIV and their caseworkers/barangay health workers. These include both online and offline mediums and the transmission brought about by instances of sexual abuse and exploitation, mostly in rural schools and educational institutions.

Lastly, it highlights how social environments empowered a culture of silence where sex-related topics, including abuse and HIV-AIDS are not discussed, making it prone to cultivate disinformation and stigma.

**Conclusions:** Young people in rural areas are prone to misinformed data on sex and HIV-AIDS, which increases their risk and susceptibility to acquiring the disease. Moreover, the study sought that the relationship between sexual abuse and HIV-AIDS transmission to be among the most primary factors that drive its plummeting. The study recommends examining social and behavioral lenses and frameworks with local health service delivery to identify patterns of health-seeking behaviors by young people in the context of rural communities and rural governing mechanisms.

## EPD137

### "Being different is a challenge" – Results from the first assessment among transgender people in Mozambique

C. Semá Baltazar<sup>1</sup>, A. Ribeiro Banze<sup>1</sup>, M. Boothe<sup>2</sup>, E. Muamine<sup>1</sup>, J. Seleme<sup>3</sup>, I. Sathane<sup>1</sup>, R. Muleia<sup>1</sup>, R. Paulo<sup>4</sup>, P. Fumo<sup>5</sup>, P. Manuel<sup>6</sup>, A. McIntyre<sup>7</sup>, J. McOwen<sup>6</sup>

<sup>1</sup>Mozambique National Institute of Health, Surveys and Health Surveillance, Marracuene, Mozambique,

<sup>2</sup>UNAIDS, Maputo, Mozambique, <sup>3</sup>Ministry of Health, Maputo, Mozambique, <sup>4</sup>Lambda, Maputo, Mozambique,

<sup>5</sup>Transformar, Maputo, Mozambique, <sup>6</sup>CDC, Maputo, Mozambique, <sup>7</sup>CDC, Atlanta, United States

**Background:** Transgender individuals face an elevated risk of mental health issues and substance abuse, and are at heightened vulnerability to HIV infection. Globally, they encounter significant barriers to accessing healthcare due to pervasive stigma and discrimination. Mo-

zambique has one of the highest HIV burdens worldwide, however, there is limited information about the transgender population.

**Methods:** In 2022, we conducted a qualitative study utilizing key informant interviews (KII), focus group discussions (FGD), and semi-structured questionnaires to gather insights into gender identity, stigma, risky behaviors, and accessibility and utilization of healthcare and social services among transgender individuals across six Mozambican provinces. KII and FGD were conducted until responses reached saturation. Data analysis was based on the qualitative research principles of grounded theory.

**Results:** A total of 141 individuals (>18 years) participated in KIIs and FGDs, comprising 77 transgender males and 64 transgender females. Participants shared the following key findings:

1. Transgender individuals often grapple with self-doubt and challenges stemming from societal perceptions - *"A trans man...always raises these doubts, being different is a challenge."*
2. High levels of stigma and discrimination - *"They discriminated against us a lot, and we even ended up giving studying."*
3. High-risk behavior, comprising unprotected sex and alcohol-related risky sex practices - *"... We don't use condoms, neither lucid nor drunk..."*
4. Experiences of hostile and discriminatory conduct by healthcare professionals as a significant barrier to accessing healthcare services, including HIV treatment - *"Because of the stigma among key populations on ART, they end up not adhering to treatment services because of the lack of secrecy, confidentiality on the part of health professionals."*

**Conclusions:** Our study highlights the significant challenges faced by transgender individuals in Mozambique, including self-doubt, stigma, high-risk behaviors, and obstacles to accessing essential healthcare services like HIV treatment. Anti-discrimination laws, policies for transgender care, and healthcare provider training could remove these barriers and improve healthcare access for this marginalized population, ultimately enhancing their well-being and quality of life.

## EPD138

### The influence of housing status and food insecurity on a behavioral HIV/STI prevention intervention for Black women under community supervision in New York City: a moderation analysis

N. Dsouza<sup>1</sup>, L. Gilbert<sup>1</sup>, M. Russo<sup>1</sup>, M. Chang<sup>1</sup>, A. Dasgupta<sup>1</sup>, N. Sabounchi<sup>2</sup>, D. Lounsbury<sup>3</sup>, E. Wu<sup>1</sup>, N. El-Bassel<sup>1</sup>, D. Goddard-Eckrich<sup>1</sup>

<sup>1</sup>Columbia University School of Social Work, Social Intervention Group, New York, United States, <sup>2</sup>City University of New York, Health Policy and Management, New York, United States, <sup>3</sup>Albert Einstein College of Medicine, New York, United States

**Background:** Black women in community supervision programs (CSPs) are disproportionately affected by HIV and other sexually transmitted infections (STIs). Empowering African-American Women on the Road to Health (E-WORTH), a 5-session culturally tailored group-based intervention, demonstrated effectiveness in reducing sexual risk behaviors and STI incidence among Black women in CSPs. Housing insecurity is high among those in CSPs, and homelessness is associated with higher rates of sexual risk behavior (resulting in higher rates of HIV & STIs). Individuals who are housing insecure also tend to be food insecure, but little is known of how these factors moderate effectiveness of risk reduction interventions. This secondary analysis aimed to assess the moderating effects of housing and food security on E-WORTH effectiveness in reducing sexual risk behaviors and cumulative incidence of STIs over a 12-month period.

**Methods:** We conducted a secondary analysis of data from the E-WORTH randomized control trial, conducted with a sample of 351 Black women in CSPs in New York City who use drugs and/or engage in binge drinking who reported engaging in HIV risk behaviors or testing positive for HIV. We examined the moderating effects of housing stability variables (housing status and housing independence) and food insecurity on reducing cumulative STI incidence and number of unprotected sex acts using fit mixed-effects negative binomial regression and logistic regression models that controlled for age, high school education, employment status, and marital status, and baseline measure of the outcomes (i.e., confirmed STI at baseline or counts of condomless sex, respectively).

**Results:** Findings indicate that the intervention effect on condomless sex was moderated by housing status, but not housing independence or food security. Compared to the control group, E-WORTH participants who were housing insecure had 63% fewer acts of condomless sex. Regression models with the outcome of prevalence of STIs and either moderator (housing instability or food insecurity) were not statistically significant.

**Conclusions:** Our findings highlight the importance of interventions designed for women in CSPs that account for upstream determinants of health and include ser-

vice linkages to basic needs provisions. Further research is needed to unpack the cumulative impacts of multiple experiences of poverty faced by this population.

## EPD139

### Often silenced and overlooked, a look into the exclusion of LBQ women and AFAB GNC folks in HIV/AIDS conversations

B. Opiyo<sup>1,2</sup>

<sup>1</sup>University of Nairobi, Faculty of Law, Kisumu, Kenya,

<sup>2</sup>Kisumu Feminists Society, LGBTIQ+ RIGHTS, Kisumu, Kenya

**Background:** In the landscape of HIV/AIDS discourse, LBQ (Lesbian, Bisexual, and Queer) women and AFAB (Assigned Female at Birth) GNC (Gender Non-Conforming) individuals remain a marginalized and often ignored demographic. The NGLHRC's 2018 study in Kenya unveiled alarming statistics, indicating a higher prevalence of HIV among LBQ women compared to the general population. Shockingly, 36% of LBQ women reported facing physical violence from healthcare providers, with 70% experiencing discrimination or stigma. Such adversities deter LBQ women from seeking HIV services, reinforcing the misconception that they are at lower risk, and ultimately perpetuating their exclusion from mainstream HIV/AIDS programming.

**Description:** In response to these pressing issues, the Kisumu Feminists Society, in collaboration with LBQ women and AFAB GNC individuals, secured funding from the Global Fund for Women and Purposeful.Org. This initiative aimed to address sexual reproductive health rights and gender-based violence within the context of the Generation Equality Forums. Findings revealed that 8 out of 10 participants felt uncomfortable seeking HIV-related services due to pervasive stigma, discrimination, and the misguided belief that LBQ individuals were not susceptible to HIV/AIDS.

**Lessons learned:** The continual exclusion of LBQ individuals from HIV/AIDS conversations has led to the trivialization of their sexual and reproductive health rights (SRHR), fostering damaging myths. Among these misconceptions is the dangerous assumption that LBQ women are immune to STIs, perpetuating a false sense of safety. A poignant example emerged from our research, where a masculine-presenting lesbian woman seeking HIV testing faced ignorance from a healthcare provider fixated on her sexual orientation rather than providing the necessary services. This experience underscores the urgent need to challenge these misconceptions and enhance awareness among healthcare providers.

**Conclusions/Next steps:** A transformative shift in healthcare practices is needed, involving training for providers to ensure cultural sensitivity and inclusivity. Collaborative efforts with policymakers should result in the integration of LBQ individuals into national HIV/AIDS strategies, ac-

knowledging their unique challenges. Additionally, community empowerment initiatives, led by LBQ individuals, are crucial in fostering awareness, education, and support networks.

The AIDS Conference 2024 has a platform to amplify these findings, fostering dialogue and catalyzing tangible steps towards inclusivity and effectiveness in combatting HIV/AIDS.

## EPD140

Multiple sexual partners increase vulnerability of adolescent girls and young women aged 15 to 24 years to other HIV infection risks; evidence from four provinces of Zimbabwe, 2023

E. Mugariri<sup>1</sup>, F. Mudzengerere<sup>2</sup>, D. Dhakwa<sup>3</sup>, K. Yogo<sup>3</sup>, F. Mudhokwani<sup>3</sup>, H. Mafaune<sup>1</sup>, T. Masoka<sup>1</sup>, T. Bhatasara<sup>4</sup>, T. Tapfuma<sup>3</sup>, M. Mutseta<sup>5</sup>, B. Nyamwanza<sup>6</sup>, R. Yekeye<sup>6</sup>, B. Madzima<sup>6</sup>, E. Tachiwenyika<sup>2</sup>

<sup>1</sup>Zimbabwe Health Interventions, Strategic Information, Harare, Zimbabwe, <sup>2</sup>Zimbabwe Health Interventions, Knowledge Management, Harare, Zimbabwe, <sup>3</sup>Zimbabwe Health Interventions, Programs, Harare, Zimbabwe, <sup>4</sup>USAID, Programs, Harare, Zimbabwe, <sup>5</sup>MOHCC, Programs, Harare, Zimbabwe, <sup>6</sup>National AIDS Council, Programs, Harare, Zimbabwe

**Background:** Zimbabwe Health Interventions (ZHI) is implementing the Determined, Resilient, Empowered, AIDS-free, Mentored and Safe (DREAMS) program which seeks to reduce HIV incidence among adolescent girls and young women (AGYW) in 9 districts of Zimbabwe. The program uses a screening tool to assess the eligibility of AGYW for the program before they are enrolled and provided with required services.

It was not clear if having multiple sexual partners (MSP) as a primary vulnerability increased the chances and emergence of secondary HIV infection vulnerabilities among AGYW. We assessed the association of having MSP among AGYW with other key vulnerabilities.

**Methods:** We conducted a descriptive cross-sectional study where routine program data for all AGYW enrolled in the DREAMS program in Mashonaland Central, Midlands, Bulawayo, and Matabeleland South provinces for the period October 2022 to September 2023 were extracted from the DREAMS database. Prevalence analysis was conducted using SPSS version 23 and MS Excel generating proportions and measures of association between having multiple sexual partners and other HIV infection vulnerabilities. The assessment was covered by Medical Research Council of Zimbabwe approved non-research determination protocol (MRCZ/E/254).

**Results:** Data for 33,220 AGYW screened and enrolled in DREAMS were analysed of which 65% (21,593/33,220) were aged 15 to 19 years whilst 35% were aged 20-24 years. About 17% (5,496/33,220) reported having MSP. AGYW with

MSP were more likely to have STI symptoms than those without [COR=4.64, 95% CI (4.17-5.18)], more likely to report history of pregnancy [COR=1.17, 95% CI (1.051-1.30)], more likely to abuse alcohol [COR=3.69, 95% CI (3.38-4.05)], more likely to engage in transactional sex [COR=15.49, 95% CI (14.34-16.74)] and more likely to suffer from sexual violence [COR=1.98, 95% CI (1.66-2.38)]. MSP was significantly associated with STI symptoms, Alcohol abuse, history of pregnancy, transactional sex, and sexual violence.

**Conclusions:** Having multiple sexual partners increases the chances of AGYW having STI symptoms, experiencing sexual violence, pregnancy, engaging in transactional sex and alcohol which increase their HIV infection risk.

We recommend that the DREAMS program identify and address the root causes of MSP as that has the potential to address other HIV infection risks.

## EPD141

Uptake of post gender-based violence services among adolescent girls and young women across four high HIV burdened districts of Zimbabwe, October 2022 to September 2023

M. Ndlovu<sup>1</sup>, T. Chimwaza<sup>2</sup>, F. Mudzengerere<sup>1</sup>, J. Muguse<sup>3</sup>, B. Chindove<sup>3</sup>, M. Muzondo<sup>2</sup>, G. Choga<sup>4</sup>, T. Tafuma<sup>5</sup>, A. Muchedzi<sup>5</sup>, T. Apollo<sup>6</sup>, C. Mupanguri<sup>7</sup>, M. Mukuzunga<sup>8</sup>, M. Muchekeza<sup>9</sup>, S. Mukungunungwa<sup>10</sup>, M. Mhangara<sup>10</sup>, K. Nyathi<sup>5</sup>, T.P. Sibanda<sup>5</sup>, E. Tachiwenyika<sup>1</sup>, T. Nyamundaya<sup>5</sup>  
<sup>1</sup>Zimbabwe Health Interventions, Knowledge Management, Harare, Zimbabwe, <sup>2</sup>Zimbabwe Health Interventions, Programs, Harare, Zimbabwe, <sup>3</sup>Zimbabwe Health Interventions, Strategic Information and Evaluation, Harare, Zimbabwe, <sup>4</sup>Zimbabwe Health Interventions, Programs, Gweru, Zimbabwe, <sup>5</sup>Zimbabwe Health Interventions, Senior Management, Harare, Zimbabwe, <sup>6</sup>Ministry of Health and Child Care, Director, Harare, Zimbabwe, <sup>7</sup>Ministry of Health and Child care, AIDS and TB Program, Harare, Zimbabwe, <sup>8</sup>Ministry of Health and Child Care, Provincial Medical Director, Mutare, Zimbabwe, <sup>9</sup>Ministry of Health and Child Care, Midlands Medical Director, Gweru, Zimbabwe, <sup>10</sup>United States Agency for International Development (USAID), Programs, Harare, Zimbabwe

**Background:** Gender-based violence (GBV) is a widespread concern in Sub-Saharan Africa, affecting the health and well-being of adolescent girls and young women (AGYW). The 2019 violence against children survey in Zimbabwe revealed that 26% of young people aged 18-24 years experienced childhood violence, and those who experienced violence were more likely to have HIV infection.

Additionally, GBV increases likelihood of developing mental health disorders. Zimbabwe Health Interventions (ZHI) is implementing the Determined, Resilient, Empowered, AIDS free, Mentored and Safe (DREAMS) program across

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

high HIV burdened districts to reduce HIV incidence among AGYW. We assessed uptake of post-GBV services by AGYW.

**Methods:** A descriptive cross-sectional study was conducted where routine program data for all AGYW enrolled in the DREAMS program in Chipinge, Gweru, Makoni, and Mutare districts for the period October 2022 to September 2023 were extracted from the program DHIS2 database. Data were analyzed using STATA version 17 generating frequencies, proportions, and measures of central tendency, and spread. The assessment was covered by the Medical Research Council of Zimbabwe approved non research determination protocol (MRCZ/E/159).

**Results:** Data for 7,445 AGYW who experienced GBV were analyzed. About 53% (n= 4008) of those who received post GBV services were aged 20-24; median age (years) was 20 (IQR 23 -18). About 91% (6,762/7,445) experienced emotional and physical violence, and 9% (675/7,445) experienced sexual violence. Of those who experienced sexual violence, 84% (n=564) received rapid HIV tests, 97% (n = 656) STI screening and treatment, 89% (n=600) family planning, and 2% (n=16) psychosocial support (PSS). About 66% (n= 445) of AGYW who experienced sexual abuse were in the 15 - 19-year-age-group. Among those that experienced sexual violence, 5% (31/675) accessed post GBV services within 72 hours, and of these, 74% (n=23) received post exposure prophylaxis (PEP), and 29% (n=9) received emergency contraceptives.

**Conclusions:** There are significant gaps in post-GBV service uptake among adolescent girls and young women, particularly timely access to care, provision of PEP, emergency contraceptives, and psychosocial support. We recommend enhancing awareness and accessibility of immediate post-GBV care, tailoring services to different age groups, especially adolescent girls.

## EPD142

### Prevalence and factors associated with ever paying for sex among men in Zambia: an analysis of the 2018 Demographic and Health Survey

M. Limbada<sup>1</sup>, T. Smekens<sup>1</sup>, B. Hensen<sup>1</sup>

<sup>1</sup>Institute of Tropical Medicine, Department of Public Health, Antwerp, Belgium

**Background:** Zambia has one of the highest burdens of HIV globally, with a prevalence of 11% among adults aged 15-59. Men who pay for sex are considered a bridging population for HIV transmission yet little is known about the prevalence and characteristics of men who pay for sex. We examined the prevalence of and factors associated with paying for sex among men in Zambia.

**Methods:** Using the 2018 Zambia Demographic and Health Survey, we analyzed data from 10,324 men aged 15-59 who ever had sex. Our primary outcome was self-reporting ever paying for sex. Variables explored for their

association with this outcome included socio-demographic factors, sexual behaviors, and use of technology. Multivariable logistic regression, adjusted for survey design, was used for this analysis.

**Results:** Overall, 16.8% of men reported ever paying for sex. Paid sex was highest in Lusaka province (32.5%), among urban residents (20.1%), men aged 25-34 (39.9%), those with higher educational attainment (18.9%), skilled manual workers (22.5%), widowed, separated or divorced men (29.2%), and who reported >1 lifetime sexual partner (36.6%). In adjusted analyses, ever paying for sex was associated with residing in Lusaka (aOR=5.54, 95% CI: 3.75,8.17) relative to Central province, engaging in skilled (aOR=1.91, 95% CI: 1.45, 2.54) or unskilled manual occupations (aOR=1.71 95% CI:1.26, 2.33) compared to not working, being divorced/widowed or separated (aOR=2.23, 95% CI: 1.71, 2.92) compared to being married, and reporting more lifetime sexual partners (aOR=1.93, 95% CI: 1.55,2.40 for 6-10 partners compared to 1-5 partners) (Table).

Variables*	Total		Reported ever paying for sex

\*Adjusted OR for sociodemographic factors \*\*Adjusted OR for all factors  
† Variables such as wealth index, sexual activity and away from home were excluded from the table as they did not show any statistical significance

Table 1. Logistic regression analysis of men who ever paid for sex in Zambia.

**Conclusions:** Almost 20% of men aged 15 to 59 reported ever paying for sex in Zambia. Paid sex was associated with residing in Lusaka, marital status and occupation. Additional research and tailored interventions, particularly for previously married men engaged in skill and unskilled manual occupations, are crucial for understanding and addressing, respectively, the complexities of paid sex among men.

Exploring HIV/STI perspectives among adolescents in Berlin's Precarious Milieus (Germany). A qualitative study on attitudes, stigma, and violence

T. Wilke<sup>1</sup>

<sup>1</sup>IU International University of Applied Sciences, Social Sciences, Berlin, Germany

**Background:** Despite not being considered a vulnerable group for HIV infections in Germany, the attitudes of adolescents towards HIV and sexually transmitted infections (STIs) are relatively underexplored. However, as the emerging generation, they play a crucial role in combating stigmatization and discrimination.

**Methods:** Between 2015 and 2018, 16 interviews were conducted with adolescents from disadvantaged Berlin milieus to explore their sexual values and lifestyles. Participants were recruited through youth probation services and juvenile detention centers. Data analysis was performed using Grounded Theory and the Documentary Method. Two male cases were intensively analyzed in relation to HIV/STIs, as well as associated stigmatizing attitudes and behaviors.

**Results:** The study reveals that due to school dropouts, institutionalizations, and other biographical disruptions, adolescents are largely disconnected from HIV education. The two case analyses also demonstrate stigmatization and discrimination towards individuals with HIV and STIs. The interviewed boys report tendencies towards physical and psychological violence against girls they perceive as „sluts“ and assume may be living with HIV or have STIs after intercourse. It becomes evident that the some adolescents view girls as inferior, and there is a general lack of knowledge regarding HIV and STIs. The misogynistic attitudes and lack of awareness legitimize violence against girls and presumed HIV-positive or sexually promiscuous girls.

**Conclusions:** HIV/STI stigma and double standards are deeply rooted in precarious environments. HIV/STI prevention in Germany predominantly focuses on schools, leading to limited sexual education in such milieus. There is a need for a reorientation in prevention efforts that actively engage adolescents within their specific contexts.

## EPD144

It is not only HIV! The men who have sex with men (MSM) population who are using gay social applications are under threat

M. Mahathir<sup>1</sup>, B.P. Wenny<sup>1</sup>, E. Oktarina<sup>1</sup>, W. Winbaktianur<sup>2</sup>, K.H. Safitri<sup>3</sup>, N. Nurlita<sup>1</sup>, L.K. Syadri<sup>1</sup>, N.D. Putra<sup>4</sup>

<sup>1</sup>Universitas Andalas, Padang, Indonesia, <sup>2</sup>Universitas Islam Negeri Imam Bonjol, Padang, Indonesia, <sup>3</sup>Institut Teknologi Kesehatan dan Sains Wiyata Husada, Samarinda, Indonesia, <sup>4</sup>Yayasan Akbar Sumatera Barat, Padang, Indonesia

**Background:** Marginalized men who have sex with men (MSM) populations in Indonesia are still struggling to find recognition and a place in society. However, believing that this group deserves to be treated unfairly is unwise. Beyond the risk of communicable diseases, MSM as key populations have experienced a range of undesirable situations. The purpose of this study is to investigate the unpleasant experiences of the MSM population whilst using social applications.

**Methods:** The qualitative phenomenological methodology was applied. Using a purposive sample technique, 22 MSM who used homosexual dating social apps in Padang, Indonesia, participated in semi-structured interviews in September until December 2023. They received semi-structured questions about their experiences whilst using the app. Thematic analysis was conducted using the Stevick Colaizzi Keen approach.

**Results:** Themes that depict the unfavorable experiences the MSM group had were highlighted by this investigation. Experiences of the MSM included being robbed, being threatened, being victims of physical violence, discrimination from within their own community, and being unwilling to disclose negative occurrences. These findings imply that in addition to stigma and the risk of obtaining transmissible diseases, the major MSM groups deal with a range of difficult life events. This group's psychological state will undoubtedly suffer from being exposed to a variety of unpleasant situations. Even worse, due to the confidentiality surrounding their sexual orientation, many are unable to report or seek protection for the threats, assaults, and negative encounters they have endured. In order to evade societal scrutiny, they feel they must keep quiet about these dreadful occurrences, which amplifies their fears even further. MSM should be entitled to social protection, safety, and legal rights even if they are subjected to criminalization by others. The claims that „the impact is not too big“ and „the incidents are too few“ are rhetorical and hypocritical of those who choose to ignore the fact that everyone should be concerned about these unfortunate events and must lend their hand to it.

**Conclusions:** It is critical to view this group from a broad humanistic perspective in order to prevent stigmatizing actions against them from defending the morality of their bad experiences.

## EPD145

## Mitigating HIV transmission risks from young/teen mothers to children: lessons from the Let Girls Shine programme for underprivileged Adolescent Girls and Young Women (AGYW)

M. Juwayeyi<sup>1</sup>, T.J. Kasiya<sup>1</sup><sup>1</sup>Forum for AIDS Counselling and Training (FACT) a Local Youth Led Organization, Blantyre, Malawi

**Background:** Let Girls Shine program is a comprehensive initiative focused on empowering underprivileged AGYW in the areas of gender equality, HIV prevention, and education. The programme addresses the unique challenges faced by this demographic, including issues related to early pregnancies, child marriages, and the heightened risk of HIV transmission.

The primary purpose is to create a supportive environment that fosters the well-being of AGYW while promoting gender-sensitive HIV prevention strategies.

**Description:** Implemented between 2021 and 2023, the Let Girls Shine programme operates in semi urban localities of Blantyre City commonly referred to as "the ghetto", where AGYW face increased vulnerabilities. The programme structure includes a combination of educational sessions, health interventions, and community engagement activities. Key populations served are young/teen mothers. Activities encompass antenatal care, educational workshops, and support services aimed at reducing the risk of HIV transmission.

**Lessons learned:** Several critical findings emerged.

Firstly, the lack of a structured system to retest children after their initial negative HIV status during birth poses a significant risk. Expressive breastfeeding, extending up to 24 months, leads to undetected transmission when mothers contract HIV post-childbirth.

Secondly, societal stigma and fear of judgment often deter mothers living with HIV from providing necessary medication to their children living with HIV, exacerbating transmission risks.

Lastly, the programme uncovered instances where mothers living with HIV, fearing abandonment by their partners, discontinued medication, leading to an increase in viral load and subsequent transmission to their children. These lessons highlight the need for improved testing protocols, destigmatization efforts, and tailored interventions addressing the unique challenges faced by young/teen mothers within the context of HIV prevention.

**Conclusions/Next steps:** The significance of these findings extends to the broader field of HIV prevention, treatment, and care. Implementing targeted interventions based on the lessons learned from the Let Girls Shine programme is crucial to reducing mother-to-child transmission rates.

Future implications involve refining programme strategies, strengthening healthcare systems, and advocating for policy changes to address the complex socio-cultural

factors influencing HIV prevention. By sharing these insights, we aim to contribute to the development of more effective, culturally sensitive approaches in the ongoing global efforts to combat HIV and AIDS.

## EPD146

## Mapping, population size estimation and characteristics of venue-based female sex workers in Iran

M.S. Bazrafshani<sup>1</sup>, S. Mehmandoost<sup>1</sup>, N. Ghalekhani<sup>1</sup>, A. Bazrafshan<sup>1</sup>, A. Mirzazadeh<sup>1</sup>, H. Sharifi<sup>1</sup><sup>1</sup>HIV/STI Surveillance Research Center, and WHO Collaborating Center for HIV Surveillance, Institute for Futures Studies in Health, Kerman University of Medical Sciences, Kerman, Iran, Islamic Republic of

**Background:** Female Sex Workers (FSW) are one of key populations affected by HIV. This study aimed to estimate the population size of FSW, mapping the geographical locations of venues and determine the characteristics of venue-based FSW in Iran.

**Methods:** This cross-sectional research conducted among venue-based FSW in three large cities representing different geographical regions of Iran (Tehran, Shiraz, and Abadan) from 22 June 2019 to 19 March 2020. Women 15 years and older who had history of sex (vaginal, anal or oral intercourse) with more than one man in exchange of money, drugs, services, or etc. in the last 12 months were eligible and recruited to the study through venues. The number of FSW in each city estimated through four different size estimation methods including FSW opinions, secondary key informants' opinions, observations of study teams and service multiplier method. demographic, sexual, drug and alcohol, and HIV testing data of participants were collected in each venue.

**Results:** The total estimation of FSW (uncertainly limit) in Abadan, Shiraz and some selected districts in Tehran was 317 (173-435), 415 (324-687) and 503 (455-577), respectively. We interviewed with 633 FSW. The median (Interquartile Range) age of sexual contact among them were 17 (15-19). The prevalence of non-injection and injection drug use in the last three months was 34.6% (Confidence Interval (CI) 95%: 30.8-38.4) and 30.0% (CI 95%: 6.7-65.2), respectively. The lifetime history of HIV testing 90.3% (N=558) and the prevalence of self-reported HIV infection was 3.0% (95% CI:1.5-4.4) among who ever tested for HIV.

**Conclusions:** Estimating the population size of FSW in three selected cities in Iran with different social and cultural context revealed a considerable proportion of FSW in these cities. Due to prevalence of high-risk behaviors among FSW, by providing harm reduction services near to venues and enhancing HIV prevention programs, may control the HIV among them and their partners.

Leveraging digital innovation and community engagement for health promotion among vulnerable populations

R. Mora<sup>1</sup>, J. Mena<sup>1</sup>

<sup>1</sup>Asociación Stop Sida, Barcelona, Spain

**Background:** Since its establishment in 1986, Stop Sida has dedicated itself to promoting sexual health among the LGBTI+ community, women, trans individuals, and male sex workers, with a strong emphasis on community engagement, inclusivity, and digital innovation. Recognizing the specific challenges faced by the LGBTI+ community in Spain, particularly in accessing health services like HIV/AIDS testing and treatment, Stop Sida initiated the „Innovació Democràtica i Digitalització” (IDD) project. This initiative aims to harness digital empowerment as a key tool for enhancing health outcomes and encouraging political participation within these communities.

**Description:** IDD focuses on empowering the LGBTI+ community through digital tools. It aims to enhance participation in community and political activities, particularly for more vulnerable subgroups such as trans individuals, sex workers, and people with HIV.

IDD leverages digital tools to facilitate access to HIV/AIDS-related information and services. It includes training in digital skills, development of digital resources, and digital platforms for community engagement and political advocacy. This approach aims to bridge the digital divide and enable the LGBTI+ community, especially the most vulnerable subgroups, to better navigate health systems and advocate for their rights.

**Lessons learned:** Preliminary results from the project indicate a significant increase in digital autonomy among participants, along with improved access to sexual health resources. This has fostered greater engagement in both political and community spheres. The innovative use of digital strategies has not only broadened the project's reach geographically but has also proven effective in engaging and empowering the LGBTI+ community, contributing to heightened awareness and advocacy in health-related and political domains. These developments underscore the effectiveness of digital tools in supporting marginalized groups.

**Conclusions/Next steps:** The next phase of Innovació Democràtica i Digitalització (IDD) will advance digital empowerment for the LGBTI+ community, specifically in the context of HIV/AIDS. This includes expanding digital training and developing more tailored digital resources to enhance the community's capacity in health advocacy and political participation. These efforts demonstrate the significant role of digital tools in promoting health and advocacy, focusing on integrating community feedback for continued improvement and empowerment of vulnerable populations.”

## EPD148

Cultivating connections: a triple “i” approach to multilingualism and cultural awareness in India's HIV care landscape

L. Arora<sup>1</sup>, S. Rajan<sup>1</sup>, S. Bhavsar<sup>1</sup>, S. Purohit<sup>1</sup>, P. Sahu<sup>1</sup>,

CSA. Lincoln<sup>1</sup>, G. Ngaihte<sup>1</sup>

<sup>1</sup>National AIDS Control Organization (NACO), Ministry of Health and Family Welfare (MoHFW), New Delhi, India

**Background:** Within the framework of delivering comprehensive HIV care, the significance of multilingualism and multiculturalism becomes evident, especially in a country like India, characterized by a historical backdrop of criminalization, pathologization, and marginalization of key populations. The vast landscape of Indian multilingualism encompasses a multitude of 1620 mother tongues streamlined into 200 languages and diverse cultures.

**Description:** Existing models of comprehensive HIV care lack sufficient consideration for the intricacies of multilingual interactions within heterogeneous communities. Our proposed triple „i” model addresses diverse HIV care needs by recognizing that successful projects demand linguistic knowledge and an understanding of multicultural communities. The model's three parameters—Information, Investigation, and Interpersonal Engagement—focus on essential knowledge through experience sharing, critical and self-directed approach to information, and group dynamics respectively.

**Lessons learned:** By December 2023, 148 outreach workers in 25 Indian states through GFATM-funded One Stop Centres have successfully established connections with culturally diverse and multilingual individuals such as ice-cream vendors, dhaba-persons, Hijra Gurus, alcohol vendors, rag-pickers, and transport contractors. Multi-lingual Information, Education, and Communication (IEC) materials were developed, and assistance from multi-lingual counsellors was sought through the NACO digital app and AIDS national helpline, supporting HIV care for mobile migratory drug users, transgender persons and bridge populations through effective linguistic and cultural expressions. Within this setting, communities felt empowered to embrace risks and freely express themselves, regardless of their language proficiency and cultural background.

**Conclusions/Next steps:** By introducing cross-cultural learning in HIV care module to outreach workers in 25 states, we can employ problem-based learning methodology over 12 sessions for an investigative approach to inter-cultural learning. There are challenges in transitioning from information and investigation to on-ground interpersonal engagement, but the triple „i” integration can be proved effective, with a high response rate of 96% (mean:25.2, SD:3.1).

Over time, expected communication barriers will diminish, reflected through rising response ratings for active participation in interpersonal engagement. The model's

success in linguistic-cultural aspects of HIV care result from introducing knowledge acumen, investigative process, and group process simultaneously. Our experience highlights the need for volunteers like inter-region migratory vendors, rag-pickers and transport-contractors with diverse cultural and linguistic proficiencies in future HIV care projects.

## EPD211

### Enhancing HIV case identification through strategic risk network referral among key and vulnerable populations

Z. Remy<sup>1</sup>, E. Herman<sup>2</sup>, D. Boyee<sup>3</sup>, C. Akolo<sup>4</sup>, B. Mwaifunga<sup>5</sup>, E. Ndutula<sup>6</sup>, W. Wambura<sup>7</sup>, N. Mtitu<sup>8</sup>

<sup>1</sup>FHI360, Biomedical, Mtwara, Tanzania, the United Republic of, <sup>2</sup>FHI360, Biomedical, Dar es salaam, Tanzania, the United Republic of, <sup>3</sup>FHI360, Monitoring and Evaluation, Dar es salaam, Tanzania, the United Republic of, <sup>4</sup>FHI360, Technical Management, Washington, United States, <sup>5</sup>COCODA Tanzania, Monitoring and Evaluation, Mtwara, Tanzania, the United Republic of, <sup>6</sup>FHI360, Regional Program Management, Mtwara, Tanzania, the United Republic of, <sup>7</sup>FHI360, Monitoring and Evaluation, Mtwara, Tanzania, the United Republic of, <sup>8</sup>FHI360, Community Engagement, Mtwara, Tanzania, the United Republic of

**Background:** Despite the deployment of several HIV testing modalities to attain the UNAIDS goal of 95-95-95 by 2025, Tanzania lags in case identification, with the first 95% at 82.7%. PEPFAR and USAID-funded EpiC project is collaborating with the Ministry of Health in incorporating Risk Network Referral (RNR) with other HIV testing modalities for key and vulnerable populations (KVP). We described our experiences using RNR to improve case identification among KVP.

**Description:** RNR implemented in Mtwara, Tanzania, from October 2022 to September 2023, giving people living with HIV (PLHIV) options to refer their social networks for HIV testing (HTS) and prevention services. Trained HCWs offer PLHIV additional, self-guided options to informally refer for HTS services their friends and acquaintances who have similar risk behaviors. Using coupon-based referrals, PLHIV do not name contacts to make referrals, rather serve as informants to reach their social networks. Individuals' service data were recorded in National and project-based registers. We analyzed the HIV case identification rate when RNR was used and compared it with outcomes of index and mobile outreach testing during the same period and determined statistical significance using the Chi-squared test.

**Lessons learned:** 254 individuals were identified as HIV positive from all testing approaches, of whom 137 (25 Female sex workers [FSW], 21 Adolescent girls and young women [AGYW], 54 other adult women at risk [ADWR], and 37 other adult men at risk [ADMR]) accepted to refer 567

social contacts for testing. 93% of contacts (526/567) were reached and tested, with an HIV case finding rate of 12% (63/526) compared to 14% (75/539) from index testing, and 1% (101/8744) during mobile outreach,  $p < 0.001$ . Among contacts tested, 87 were FSW with a case finding rate of 11% and 46 AGYW with 7% case finding. The table below shows age and population case finding among social contacts reached.

OUTCOMES	FSW <25yrs	FSW ≥25 yrs.	AGYW <25yrs	ADMR <25yrs	ADMR ≥25 yrs.	ADWR <25yrs	ADWR ≥25 yrs.
Tested positive	0	10	3	1	18	2	29
Tested negative	14	63	43	9	133	20	181
HIV-case finding (%)	0%	14%	7%	10%	12%	9%	14%

**Conclusions/Next steps:** RNR is an effective approach to identifying previously undetected cases. This approach complements index testing as it goes beyond sexual partners to maximize HIV testing coverage.

## EPD213

### Alcohol, cocaine/crack, marijuana use among transgender women living with HIV in Goiás, Central Brazil: findings from a respondent-driven sampling survey

L. Magalhães<sup>1</sup>, K.A. Caetano<sup>2</sup>, P. Valverde<sup>3</sup>, K. Cardoso<sup>2</sup>, B. Diniz e Silva<sup>2</sup>, S. Teles<sup>2</sup>

<sup>1</sup>UFG, College of Nursing, Goiânia, Brazil, <sup>2</sup>UFG, Goiânia, Brazil, <sup>3</sup>PUC-Goiás, Goiânia, Brazil

**Background:** Substance use constitutes a major public health issue. Studies have demonstrated a heightened prevalence of alcohol, cocaine, and cannabis consumption among transgender women (TGW). Additionally, some evidence has indicated an association between substance use and non-adherence to antiretroviral treatment. Therefore, the objective of this study was to delineate the prevalence and consumption patterns of alcohol, cannabis, and cocaine/crack among TGW in Central Brazil.

**Methods:** This cross-sectional study was conducted between April 2018 and November 2019 among TGW in Goiás, Central Brazil. This study was conducted in three cities: Goiânia (population: 1,437,366; Human Development Index [HDI]: 0.799), Itumbiara (population: 107,970; HDI: 0.752), and Jataí (population: 105,729; HDI: 0.757) Participants were recruited using a respondent-driven sampling method and underwent face-to-face interviews regarding substance use. The Alcohol Smoking and Substance Involvement Screening Test were utilized to evaluate substance use. The positivity for HIV was identified through a rapid test. Prevalence was estimated with a 95% confidence interval.

**Results:** A total of 440 transgender women participated in the study, with a median age of 25 years (interquartile range: 20.5–29.5 years). The majority of participants were single (85.5%) and had engaged in sex work during their lifetime (58.6%). Among TGW living with HIV, our findings revealed high prevalences of alcohol use (73.7%), cannabis use (51.6%), and cocaine/crack use (27.2%) over their lifetime.

Our results also demonstrated that harmful substance use is prevalent among TGW living with HIV. Additionally, 35% of participants reported using both drugs.

**Conclusions:** Our study identified a high frequency and significant overlap in the use of alcohol, cannabis, and cocaine/crack among TGW residing in three cities along a drug-trafficking route in Central Brazil. This suggests that drug use is associated with the vulnerabilities experienced by this population.

Consequently, multi-level interventions and resources are imperative to enhance treatment availability and access to health services, underscoring the urgent need for health policies addressing drug disorders in this socially marginalized group.

## EPD214

Enforcement of Harm Reduction: prevention, health care, and treatment services for women who use drugs in Nepal

P. Dhaulakoti<sup>1</sup>

<sup>1</sup>Asian University for Women, Public Health, Chittagong, Bangladesh

**Background:** Nepal is a strongly male-dominated country and has a limited harm reduction (HR) services program for Women who use Drugs (WWUD). In this context, Nepal successfully got the harm reduction(HR) project funded by ViiV Healthcare UK-based pharmaceutical company.

Recovering Nepal (RN) started the HR services in four districts of Nepal including (Chitwan, Hetauda, Rupandehi, and Banke) for WWUDs.

**Description:** RN implemented gender-specific HR services; Needle Syringe Exchange Program customized for WWUD. In coordination with the government, NCASC (National Center for AIDS & STDs Control) for HR commodities. In 26 months, we have been able to identify new WWUDs in 4 districts of Nepal and have provided services to 992 WWUDs till December 2023.

The project also includes the SRHR, HIV/AIDS awareness program among beneficiaries, School/College awareness program in regards to HIV and drugs, Community-based harm reduction program, Focus Group Discussion with the service provider as well as receiver, Referral services, Drug treatment support, Documentation of violence. Besides HR services, we have also conducted surveys among our clients.

**Lessons learned:** From the results of the survey that we took at the end of the year 2023, we came across more WWUDs and more vulnerable yet marginalized communities & and neglected even from the national HIV/AIDS program. There is an urgency for BCC, IEC on HIV, enlargement of existing HR services geographically.

A survey among 992 WWUDs in 4 districts that we work for showed that 90% requested the sustainability of existing HR services, and 10% requested gender-sensitive services with additional services like legal action against all forms of violence, child custody, and citizenship issues.

Among those 85%- 25% showed harassment from police, 25% stigma and discrimination in hospital settings, and 5% demanded women-friendly services and requested free rehabilitation services.

**Conclusions/Next steps:** The project outcome showed an immediate call to scale up gender-sensitive HR services as the project is women's specific. PHC services were provided by ViiV (Positive Action Grant) in 5 districts of Nepal from April 2023 which was a great outcome of the project. The national consultation was also proposed to Global Fund: Save the Children (PR) to scale up gender-friendly HR services for WWUDs.

## EPD217

Eclipse of silence: exposing the hidden epidemic of abuse & stigma among girl child living with HIV in IDP camps in Northeastern Nigeria

**Background:** According to report by Displacement Tracking Matrix Round, 2,388,703 persons are living in IDPs in camps and camp-like settings in Borno, Adamawa, and Yobe (BAY) states. Amidst the turmoil of displacement, girls child are faced with forced marriage, physical assault, rape, survival sex, sexual assault and denial of resources.

**Methods:** This study employed a mixed-methods approach using surveys, and focus group discussion to assess the prevalence, nature, and consequences of Abuse and Stigma among participants in Northeastern.

A Multi-stage cluster sampling method was used to select 4,554 girl children aged 10–24 living with HIV from 6 IDP camps in Borno, Adamawa and Yobe state. Data analysis involved were descriptive, qualitative methodology and quantitative methodology.

**Results:** The study revealed that a majority of the participating girls, aged 15-24, across all North-East states were affected. Notably, approximately one-third (8.5%) experienced sexual violence, while (4.3%) reported physical violence. Almost 35% faced emotional violence, and roughly half were subjected to harmful traditional practices, along with denial of resources (30%). Borno State notably had higher instances of sexual and emotional violence (16.5%), while the prevalence of physical violence varied among states, with Borno and Yobe experiencing over a quarter of reported cases, whereas Adamawa and Gombe had around a ten percentage.

**Conclusions:** The study emphasizes how important it is to have a variety of interventions in place to fight stigma and abuse directed towards girls in IDP camps who are HIV positive. By establishing inclusive environments, stigma's negative effects are lessened, people's rights are upheld, and discrimination is prevented.

To safeguard and empower these vulnerable girls, as well as to provide equal access regardless of HIV status, immediate action encompassing education, community awareness, and healthcare training is imperative.

## Track E: Implementation science, economics, systems and synergies

### EPE149

#### Finding the undiagnosed: a largescale Index Testing Services program implementation experience from a High Burden Province in India

C. Kechamada Uthappa<sup>1</sup>, J. Williams<sup>2</sup>, V. Armugam<sup>2</sup>, S. Kumar<sup>2</sup>, R. Pampana<sup>2</sup>, S. Chawla<sup>3</sup>, R. Prasad<sup>4</sup>, K. Prasad<sup>4</sup>, M. Nyendak<sup>3</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention (CDC), Division of Global HIV & TB (DGHT), Delhi, India, <sup>2</sup>Voluntary Health Services, Chennai, India, <sup>3</sup>U.S. Centers for Disease Control and Prevention (CDC), Delhi, India, <sup>4</sup>Andhra Pradesh State AIDS Control Society, Vijayawada, India

**Background:** Index testing services (ITS) is an effective case-finding strategy that prioritizes the exposed contacts of PLHIV for testing. In collaboration with APSACS, we present data from a large ITS program from Andhra Pradesh, India.

**Description:** We describe index testing uptake, acceptance, and positivity. We analyzed ITS program data from September 2020- 2023. We calculated the proportion of newly diagnosed PLHIV by testing modality and plotted scale-up of facilities and HIV testing through ITS over 12 program quarters [Fig1].

**Lessons learned:** We offered ITS to 74,046 index clients; 38,606 (52%) men; 27,033 (36.5%) aged 35 to 44 years; 69,213 (93%) general clients; 4,585 (6%) Key populations; and 248 (0.33%) biological children. 65,762 (89%) accepted ITS with acceptance higher among men (52%). Of the 108,352 contacts elicited (1.6 elicitation ration), 83,247 (81%) tested for HIV (men 51%); 18,573 (22%) were newly diagnosed (men 51%); and 17,491 (94%) were initiated on ART. The number of persons tested using ITS increased by fivefold from 1,668 in 2021 Q1 to 8,473 in Q4 2023 and the number of positives identified more than tripled from 484 in 2021 Q1 to 1,792 in Q4 2023. ITS was responsible for 40% (18,573/46,830) of all tests reported among HIV testing modalities and the number of facilities implementing ITS nearly tripled from 96 to 284. Of those reached through partner elicitation, 79,158 (73%) were other sexual partners; 20,431 (19%) were spouses; and 8,550 (8%) were biological children.

**Conclusions/Next steps:** Volume and efficiency of index testing increased with scale-up of ITS. We reached as many men as women, and other sexual partners suggesting ITS is an efficient method for identifying HIV-positive men, and other sexual partners who might be missed with other approaches. Scaling-up ITS with fidelity may increase the number of new HIV-positive persons who know their status thereby fast tracking UNAIDS 2030 goals.

### HIV self-test distribution by people living with HIV to catalyze testing and linkage in Central Kenya

C. Kiptinness<sup>1,2</sup>, P. Mwangi<sup>1</sup>, D. Githuka<sup>1</sup>, F. Ambiyi<sup>1</sup>, M. Mureithi<sup>3</sup>, A. Osofi<sup>4</sup>, N. Mugo<sup>1</sup>, R. Heffron<sup>5</sup>

<sup>1</sup>Kenya Medical Research Institute, Centre for Clinical Research, Nairobi, Kenya, <sup>2</sup>University of Nairobi, Department of Public & Global Health, Nairobi, Kenya, <sup>3</sup>University of Nairobi, Department of Medical Microbiology & Immunology, Nairobi, Kenya, <sup>4</sup>University of Nairobi, Department of Obstetrics and Gynecology, Nairobi, Kenya, <sup>5</sup>University of Alabama at Birmingham, Department of Medicine, Birmingham, United States

**Background:** HIV-negative people with known partners living with HIV (PLHIV) are a target population for testing and may benefit from innovative testing strategies, such as HIV self-testing (HIVST). We explored the impact of secondary distribution of HIVST kits by PLHIV enrolled in HIV care to catalyze testing of their sexual partners.

**Methods:** A prospective interventional study was conducted at four Kenyan HIV care clinics between August 2020 – November 2022, deploying two strategies to reach partners of PLHIV with testing: a standard-of-care (SOC) phase where PLHIV invited their partner to the clinic for an HIV test conducted by a counselor and a subsequent phase where PLHIV distributed HIVST kits to their partners for them to test themselves. Interviewer-administered surveys were conducted with partners to capture whether they completed HIV testing and were linked to any follow-on care (HIV treatment or prevention). Linkage to care was confirmed through clinic records. Multivariable log-binomial regression was used to compare the proportion of partners who tested and linked to care across study phases.

**Results:** 345 PLHIV (178 SOC and 167 HIVST phase) and 274 (79.4%) of their sexual partners (135 SOC and 139 HIVST phase) were enrolled. PLHIV enrolled during the HIVST phase included a greater proportion of men (81.3% vs. 57%) and more frequent condom use (10.1% vs. 19.3%) than those in the SOC phase.

Overall, relationship duration  $\geq 6$  months was 96.4% and similar across phases. Partners were more likely to test (98% vs. 80%, PR=1.23, 95% CI [1.13 – 1.34]) and were more likely to link to care (71.9% vs. 49.6%, PR=1.45, 95% CI [1.18 – 1.76]) during the HIVST phase than the SOC phase. 27.5% of partners had a reactive HIV result (47.4% testing in SOC and 52.6% in HIVST phase). Our linkage results were similar when we limited to the subset of partners testing HIV-positive.

**Conclusions:** Secondary delivery of HIVST to partners by PLHIV increased the frequency of HIV testing and linkage to care. This strategy warrants further investigation to determine its potential for widespread scale-up.

## EPE151

### Digital intervention engagement mediates the relationship between intrapersonal measures and pre-exposure prophylaxis adherence: a secondary analysis of a randomized controlled trial of sexual and gender minority youth on pre-exposure prophylaxis

M. Williams<sup>1</sup>, J. Manjourides<sup>1</sup>, L.H. Smith<sup>2,1</sup>, C.B. Rainer<sup>3</sup>, L.B. Hightow-Weidman<sup>3</sup>, D.F. Haley<sup>4</sup>

<sup>1</sup>Northeastern University, Bouve College of Health Sciences, Boston, United States, <sup>2</sup>Northeastern University, Roux Institute, Portland, United States, <sup>3</sup>Florida State University, College of Nursing, Tallahassee, United States, <sup>4</sup>Boston University, Department of Community Health Sciences, Boston, United States

**Background:** Digital health interventions (DHIs) for Pre-Exposure Prophylaxis (PrEP) in young sexual and gender minority men who have sex with men (YSGMMSM) show promise for reducing HIV burden. Effectively engaging (engagement sufficient to solicit PrEP adherence) YSGMMSM is an ongoing challenge.

**Methods:** This secondary analysis of the P3 (Prepared, Protected, emPOWERed: a digital PrEP adherence intervention) randomized controlled trial (RCT) utilized causal mediation to quantify whether and to what extent baseline survey measures of phone and phone app usage, mental health, and sociodemographics were related to effective engagement for PrEP adherence in YSGMMSM. Of 246 YSGMMSM participants aged 16-24 in the primary RCT, 140 participants were eligible for the present analysis (retained at follow-up, received DHI condition, complete trial data). Participants earned and lost US currency for daily usage/non-usage of P3; dollars accrued by 3 months was used to measure engagement. PrEP non-adherence was measured via blood serum levels consistent with  $\leq 4$  doses weekly at 3-month follow-up. Logistic regression was used in a causal mediation approach to estimate the total effects of baseline survey measures, represented as non-adherence odds ratios (NAR), and direct and indirect effects mediated by engagement.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Results:** Engagement was strongly related to the outcome: for every \$1 earned above the mean (\$96), participants had 1.6% (NAR=0.984, 95% CI=0.97,0.99) lower odds of PrEP non-adherence. Frequently using phone apps to track health information was associated with a 71% (NAR=0.29, 95% CI=0.06,0.96) lower odds of PrEP non-adherence.

This was overwhelmingly a direct effect, not mediated by engagement, with a percent mediated (PM) of 1%. Participants with depressive symptoms and anxious symptoms had 3.4 (NAR=3.42, CI=0.95,12.00) and 3.5 (NAR=3.51, CI=1.06,11.55) higher odds of non-adherence to PrEP at 3 months, respectively. Anxious symptoms largely operated through P3 engagement (PM=51%).

**Conclusions:** P3 engagement was strongly related to lower odds of PrEP non-adherence. Several measures were related to effective engagement which suggests that PrEP adherence DHIs for YSGMMSM should tailor intervention content to emphasize engagement facilitators and abate engagement barriers. Evaluating effective engagement in DHIs with causal mediation approaches provides a clarifying and mechanistic view of how DHIs impact health behavior.

## EPE152

Accelerating ending the HIV epidemic with artificial intelligence and automation: a systematic review of HIV pre-exposure prophylaxis interventions

E. Kamitani<sup>1</sup>, Y. Mizuno<sup>1</sup>, G.M. Khalil<sup>1</sup>, A. Viguerie<sup>1</sup>, J.B. DeLuca<sup>1</sup>, N. Mishra<sup>1</sup>

<sup>1</sup>US Centers for Disease Control and Prevention, Division of HIV Prevention, Atlanta, United States

**Background:** In November 2022, OpenAI released the Chat Generative Pre-trained Transformer (ChatGPT) an artificial intelligence (AI) chatbot. Such AI and digital technology have rapidly been adopted and grown in medical care, especially during the COVID-19 pandemic. Use of AI and automation can be unlimited, but our knowledge and utilization as it relates to HIV Pre-exposure prophylaxis (PrEP) care are still limited.

In this systematic review, we explored:

1. Characteristics of studies aimed to promote PrEP care with the use of AI/automation identified by the research team,
2. How AI/automation is used in these PrEP studies, and;
3. How AI/automation can be used in PrEP interventions to improve PrEP use and/or persistence.

**Methods:** We queried the CDC HIV/AIDS Prevention Research Synthesis (PRS) database of HIV prevention literature (automated and manual searches), RePORTER, clinicalTrials.gov, and International Standard Randomized Controlled Trial Number registry. Studies published or registered in English between 2012 and 2023 and report-

ed using generative and non-generative AI in PrEP interventions were eligible. Trained coders identified eligible citations, abstracted intervention characteristics, and assessed risk of bias with using either the Cochrane Risk-of-Bias Tool for randomized trials or an adapted Newcastle-Ottawa Quality Assessment scale.

**Results:** Among 12 eligible interventions, we identified four types of AI/automation: chatbot (AI-based or non-AI-based) (n=8), machine learning (n=1), natural language processing (n=1) and other types of AI (n=2).

Currently available intervention studies showed AI/automation interventions were acceptable and feasible for patients and providers in PrEP care while improving PrEP-related outcomes (i.e., knowledge, uptake, adherence, discussion with providers).

These interventions have utilized AI/automation to reduce providers' workload (e.g., education of patients and providers) and help non-HIV specialists prescribe PrEP with AI-generated clinical decision-support.

**Conclusions:** AI/automation has high potential to improve PrEP access and uptake although patient acceptability and feasibility of using AI technologies in resource-limited settings or potential for clinical misdiagnoses can still be a problem.

Despite limitations of included studies (e.g., small sample sizes and less rigorous study designs), our review suggests that by taking advantage of technology and using aspects of AI/automation appropriately we may accelerate PrEP use to reduce HIV infection and then end HIV.

## EPE153

Preference and retention of daily and event-driven pre-exposure prophylaxis for HIV prevention: a prospective cohort in Can Tho city, Viet Nam

V.T.T. Nguyen<sup>1</sup>, Q.D. Vu<sup>2</sup>, M.T. Huynh<sup>3</sup>, A.T. Pham Nguyen<sup>3</sup>, T.L. Doan<sup>4</sup>, C. Johnson<sup>5</sup>, R. Bagga<sup>5</sup>, T.T.H. Phan<sup>4</sup>

<sup>1</sup>World Health Organization, Country Office in Viet Nam, Hanoi, Viet Nam, <sup>2</sup>Hanoi Medical University, Hanoi, Viet Nam, <sup>3</sup>Can Tho Centre for Diseases Control, Can Tho, Viet Nam, <sup>4</sup>Viet Nam Administration for HIV/AIDS Prevention and Control, Ministry of Health, Hanoi, Viet Nam, <sup>5</sup>World Health Organization, Global HIV, Viral Hepatitis and STIs Programmes, Geneva, Switzerland

**Background:** Pre-exposure prophylaxis (PrEP) was introduced in Viet Nam in 2017, but data on oral PrEP preference and retention beyond 3-months are limited.

We aimed to evaluate PrEP preferences, factors influencing PrEP choice, and barriers to PrEP access and retention.

**Methods:** This prospective cohort study was conducted in Can Tho city, Viet Nam. Participants who were eligible for PrEP and provided informed consent were interviewed at baseline on demographic information, willingness to

Oral  
abstracts

exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

pay, reasons for choosing their PrEP regimen and the anticipated difficulties in taking PrEP and followed-up at 3 months, 6 months and 12 months after PrEP initiation.

**Results:** Between May 2020 and April 2021, 926 individuals at substantial risk for HIV were enrolled for PrEP. Of whom 673 (72.7%) choose daily PrEP and 253 (27.3%) choose event-driven PrEP (ED-PrEP). Majority of participants were men (92.7%), only 0.5% were transgender women. Median age was 24 years and 84.7% participants reported as exclusively homosexual. The three most common reasons for choosing daily PrEP were PrEP effectiveness (24.3%), having more frequent sex (15%) and easy to adhere, and for choosing ED-PrEP were PrEP effectiveness (22.7%), convenience (18.0%) and ease to adhere (12.0%).

Only 7.8% of PrEP users indicated their unwillingness to pay for PrEP and 76.4% would be willing to pay if PrEP were less than US \$15 per month. The proportion of retention at 12 months was 43.1% and 99.2% in daily PrEP and ED-PrEP users, respectively.

Factors that independently associated with daily PrEP retention were having less frequency of sex ( $\leq 2$  times per week) ( $P=0.003$ ), having sex without condom with people who were at risk of HIV within the past 6 months ( $P=0.01$ ), used PrEP within the past 6 months ( $p=0.001$ ), anticipated barrier to PrEP ( $P=0.034$ ).

**Conclusions:** ED-PrEP was preferred by more than a quarter of 23.5% of the participants and factors that influence their choices were PrEP effectiveness, convenience and easy to adhere. High retention rate was reported by ED-PrEP users. Factors associated with retention of daily PrEP suggested further research to understand and address the barriers to daily PrEP retention to inform national PrEP programme implementation in Viet Nam.

## EPE154

### Heterogeneity in women's preferences for the delivery of HIV prevention services during pregnancy

M. Mugambi<sup>1</sup>, B. Ochieng<sup>1</sup>, A. Dollah<sup>2</sup>, M. Marwa<sup>3</sup>, J. Nyakina<sup>2</sup>, J. Kinuthia<sup>3</sup>, J. Baeten<sup>4</sup>, B. Weiner<sup>1</sup>, G. John-Stewart<sup>5</sup>, R. Barnabas<sup>6</sup>, B. Hauber<sup>1</sup>

<sup>1</sup>University of Washington, Seattle, United States, <sup>2</sup>UW

Kenya, Nairobi, Kenya, <sup>3</sup>Kenyatta National Hospital, Nairobi, Kenya, <sup>4</sup>Gilead Sciences, San Francisco, United States, <sup>5</sup>University of Washington, Seattle, Kenya,

<sup>6</sup>Massachusetts General Hospital, Boston, United States

**Background:** Community pharmacies might create opportunities for pregnant women to access HIV prevention services earlier and more consistently, but their role in HIV prevention during pregnancy – a high-risk period for HIV acquisition – is relatively unexplored.

We evaluated whether women of childbearing age have different preferences for accessing HIV prevention services during pregnancy in Western Kenya.

**Methods:** We conducted a face-to-face discrete choice experiment survey among women aged 15 to 44 years in Homa Bay, Kisumu, and Siaya counties in Kenya. The survey evaluated preferences for HIV prevention services described by seven attributes: service location, travel time, type of HIV test, availability of STI testing, partner HIV testing, and PrEP services. Participants answered a series of 12 choice questions. Each question asked them to select one of two different service options or opt-out ("no services"). We used a latent class model with effects-coded attribute levels to explore preference heterogeneity.

**Results:** Overall, 302 participants completed the survey; the median age was 23 years (IQR: 19–29); 48% were married, 42% were employed, and 69% had been pregnant before. The latent class analysis identified five groups of participants, each with unique preferences. The price-sensitive group (15%) preferred low-cost services and blood-based self-tests over provider-assisted tests.

The pharmacy-seeking group (16%) valued accessing services in community pharmacies with private rooms over clinics and had a strong preference for STI testing availability. The partner-testing group (23%) cared more about the availability of partner HIV testing than the other groups. The closer-the-better group (15%) preferred shorter travel times and cared less about STI testing availability.

The all-about-PrEP group (31%) preferred PrEP availability and accessing services in clinics. No participants preferred the "no services" option.

**Conclusions:** Women in this study exhibited a strong desire for HIV prevention services during pregnancy but had different preferences for accessing these services, revealing the limitations of a one-size-fits-all approach. Service design could benefit from tailored messaging and strategies to diverse groups, including those who are more price-sensitive, prefer pharmacy access, and have varying preferences for HIV test type, emphasizing the importance of each service (PrEP, STI testing, and partner testing) in HIV prevention.

## EPE155

### Key influences on decisions to discontinue and restart PrEP among women of reproductive age attending family planning clinics in Kenya

S. Urusaro<sup>1</sup>, K. Beima-Sofie<sup>1</sup>, A. Dollah<sup>2</sup>, M. Auwor<sup>2</sup>, W. Atieno<sup>2</sup>, D. Matemo<sup>2</sup>, C. Wandera<sup>2</sup>, V. Kemunto<sup>2</sup>, A. Lee<sup>1</sup>, J. F. Morton<sup>1</sup>, J. Kinuthia<sup>1,2</sup>, K. K. Mugwanya<sup>1,3</sup>, for the FP Plus Project Team

<sup>1</sup>University of Washington, Department of Global Health, Seattle, United States, <sup>2</sup>Kenyatta National Hospital, Research & Programs, Nairobi, Kenya, <sup>3</sup>University of Washington, Department of Epidemiology, Seattle, United States

**Background:** Oral pre-exposure prophylaxis (PrEP) delivery is gradually scaling up in Africa with notably high initial uptake. However, there remains inconsistent utilization of PrEP among adolescent girls and young women, a priority population for prevention due to their disproportionately high HIV risk.

Understanding influences on women's PrEP utilization, including discontinuation and restart, may provide insights to improve PrEP services.

**Methods:** From September–November 2023, we conducted semi-structured individual interviews (IDIs) with women without HIV participating in a cluster-randomized trial to integrate PrEP delivery in public family planning clinics (FP clinics) in Kisumu, Kenya. Trained social scientists conducted, audio recorded, translated, and transcribed IDIs. We conducted a thematic analysis of IDI summaries and a subset of complete transcripts to identify experiences, influences on decisions and characteristics of women who discontinued and those who restarted PrEP.

**Results:** Thirty-two women – 10 adolescents and 6 adult women who discontinued PrEP, and 10 adolescents and 6 adult women who restarted PrEP – were interviewed. Their median age was 24 (range 20–38) years, 56% were married, and many had used PrEP for 3–6 months.

Almost all women shared that their initial decision to use PrEP was influenced by perceived high risk for HIV, intricate partner dynamics (violence, long-distance relationships, multiple partners), and enhanced by provider counseling. Women who discontinued PrEP cited primary reasons of feeling less at risk, concern about pill burden and size, partner influence, stigma, and side effects.

While women and girls converged on feeling reduced risk for HIV as a primary influence to discontinue, and in most cases due to partner dynamics, adolescents reported this more than adults. Similarly, restarting PrEP was strongly prompted by perceived increase in HIV risk and change in partner dynamics (return of a partner, change in relationship, additional partners).

Women preferred PrEP delivery integrated into FP clinics because it reduced stigma and created a single location for accessing HIV and pregnancy prevention services.

**Conclusions:** PrEP discontinuation and restart among women reflects dynamic partner relationships and weighing of individual perceived HIV risk. Clear counseling on HIV risk will be critical to ensure PrEP is used effectively to prevent new transmission among this key population.

## EPE156

### Systematic review of PrEP interventions in Africa 2010 – 2023: barriers and facilitators affecting uptake and adherence

V.O. Femi-Lawal<sup>1</sup>, J.L. Ibekwe<sup>1</sup>, Y.N. Kabiawu<sup>2</sup>

<sup>1</sup>College of Medicine, University of Ibadan, Ibadan, Nigeria,

<sup>2</sup>College of Health Sciences, Obafemi Awolowo University, Ile-Ife, Nigeria

**Background:** Despite having the highest global burden of HIV/AIDS, coverage of PrEP in Africa is vastly below the continent's needs. However, interventions to improve PrEP uptake and adherence in Africa have had varying degrees of success. We systematically reviewed the scientific literature to highlight the barriers and facilitators influencing the efficacy of interventions to improve PrEP uptake and adherence.

**Methods:** The systematic review followed the PRISMA guidelines, and a search for peer-reviewed literature was carried out in PubMed, Cochrane Library, Google Scholar and EMBASE for studies published from January 2010 – December 2023. Eligible studies for inclusion were interventional studies targeted at improving PrEP uptake or adherence and carried out in Africa.

**Results:** From 1281 identified records, 40 eligible studies were conducted in 13 African countries, with South Africa (16) and Kenya (13) having the most interventions. The six key intervention types, implemented over an average of 9 months, were peer support programmes and community ambassadorship initiatives; utilization of mobile health applications; PrEP training and counseling; integration of PrEP into public HIV care clinics and family planning services; utilization of pharmacies for PrEP delivery; and use of mass media to create awareness. Uptake of PrEP varied between 27% and 98%, with most studies recording over a 50% uptake. However, a decline in retention was observed with each passing month during the studies, particularly with mobile health applications. Major barriers and facilitators to PrEP uptake and retention were identified. The barriers included loss or damage of mobile devices, belief that condom alone suffices, financial insecurity, partner/peer stigma and misconceptions, and concerns about privacy, side effects, and self-efficacy. The key facilitators were community engagement, ease of access, positive provider attitudes, perceived effectiveness of PrEP, partner and peer support, a person-centered approach to individual needs, integration into existing health services, and understanding and addressing risk perceptions.

**Conclusions:** Challenges with PrEP access, fear of discrimination, and poor risk perceptions are among the significant barriers to the efficacy of PrEP intervention programmes. Strategies to facilitate community engagement and address existing barriers are important to consider when designing future interventions and national roll-out programmes for PrEP in Africa.

## EPE157

### Reducing harm behind bars: a scoping review of implementation strategies for harm reduction interventions in carceral settings

P. Baker<sup>1</sup>, S. Alsallum<sup>1</sup>, A. Fakhre Yaseri<sup>1</sup>, C. Rodriguez<sup>2</sup>, E. Falluji<sup>2</sup>, A. Weitensteiner<sup>3</sup>

<sup>1</sup>University of South Carolina, Epidemiology and Biostatistics, Columbia, United States, <sup>2</sup>Johns Hopkins University, Baltimore, United States, <sup>3</sup>University of California San Diego, San Diego, United States

**Background:** Drug-related harms (i.e. HIV, overdose) disproportionately impact people who use drug in incarcerated settings, where harm reduction program availability, modality, and implementation lag far behind those in community settings. International governing bodies have called for scale-up in carceral settings and many novel implementation strategies have been deployed globally but have not been systematically assessed.

Using an implementation science lens, we aim to synthesize tested, real-world strategies to inform scale-up of future jail- and prison-based harm reduction programs.

**Methods:** Between February 16 and June 19, 2023, we screened MEDLINE, sociological databases, and gray literature for studies with detailed, individual-level primary data on harm reduction program implementation in incarcerated settings (PROSPERO #CRD42023400682). For eligible studies, we used a consensus approach to extract study data, determine study validity using the Quality Assessment for Diverse Studies (QuADS) tools, and infer (unless explicitly stated) discrete implementation strategies. We report study characteristics, implementation outcomes, targets, theoretical frameworks, and provide a synthesis of tested implementation strategies mapped along the Consolidated Framework for Implementation Science (CFIR) domains to identify specific implementation gaps and opportunities.

**Results:** We screened 4,197 abstracts, 448 full-text articles, and included 46 eligible analyses (from North America, Europe, Asia, Australia, and the Middle East) reporting implementation strategies related to MOUD (n=35, 76%), SSP (n=5, 11%), overdose prevention (n=4, 8.7%) and other HIV prevention interventions (n=2, 4.3%). Three studies explicitly stated their implementation strategy (we inferred the strategy for 43 studies [93.5%]). Primary implementation outcomes identified were adoption, acceptability, retention, feasibility, and sustainability. We identified studies

using implementation strategies successfully targeting all five domains of the CFIR framework (Outer Setting, Inner Setting, Individuals, Process, and Intervention characteristics).

Table 1. Characteristics of 18 (of 46) eligible studies included in the review and corresponding evidence-based interventions, implementation strategy, and Consolidated Framework for Implementation Research (CFIR) domain target

Author (Last Name) (Date)	Location	Study Design	Participants (sample size)	Evidence-based Intervention	Implementation Strategy	CFIR Domain

Wickertshaus (2012)	Malawi (Blantyre, Lilongwe)	Cross-sectional	Prisoners living with HIV (n=72)	MOUD	New policy procedures	Outer, Process

\*Within the formatting requirements of AIDS abstracts (20 rows max); data from 18-46 studies presented here. Full results (and additional tables/figures) to be displayed at conference.

**Conclusions:** Our findings highlight a range of tested implementation strategies, outcomes, and related barriers that can inform future innovation in and scale-up of harm reduction interventions tailored to incarcerated settings.

## EPE158

### Assessing preferences of long-acting PrEP modalities among oral PrEP-experienced postpartum individuals in Cape Town, South Africa: a qualitative study

N. Wara<sup>1</sup>, L. Court<sup>2</sup>, K. Moopelo<sup>3</sup>, N. Mashele<sup>3</sup>, C. Ntwasa<sup>3</sup>, R. Mvududu<sup>3</sup>, A. Miller<sup>4</sup>, S. Schoetz Dean<sup>5</sup>, C. Orrell<sup>6</sup>, L. Knight<sup>2,7</sup>, L. Myer<sup>3</sup>, R. Hoffman<sup>5</sup>, D. Joseph Davey<sup>3,5,8</sup>

<sup>1</sup>University of California Los Angeles David Geffen School of Medicine, Los Angeles, United States, <sup>2</sup>University of Cape Town School of Public Health, Division of Social and Behavioural Sciences, Cape Town, South Africa, <sup>3</sup>University of Cape Town School of Public Health, Division of Epidemiology and Biostatistics, Cape Town, South Africa, <sup>4</sup>San Diego State University School of Public Health, Division of Epidemiology and Biostatistics, San Diego, United States, <sup>5</sup>University of California, Los Angeles David Geffen School of Medicine, Division of Infectious Diseases, Los Angeles, United States, <sup>6</sup>University of Cape Town, Desmond Tutu HIV Centre, Cape Town, South Africa, <sup>7</sup>University of the Western Cape School of Public Health, Bellville, South Africa, <sup>8</sup>University of California Los Angeles Fielding School of Public Health, Department of Epidemiology, Los Angeles, United States

**Background:** Postpartum people in South Africa (SA) are at increased risk of HIV acquisition, posing increased risk for vertical transmission. Long-acting HIV pre-exposure prophylaxis (PrEP) may mitigate structural and sociocultural barriers postpartum individuals in SA face in accessing and persisting on daily oral PrEP. We qualitatively

assessed theoretical preferences for and facilitators and barriers to long-acting PrEP use among postpartum individuals with experience using oral PrEP.

**Methods:** We conducted individual, semi-structured in-depth interviews with 20 postpartum individuals enrolled in an observational PrEP study in Cape Town. Trained peer interviewers asked participants about theoretical preferences regarding future PrEP modalities, and facilitators and barriers to using injectable PrEP or the vaginal ring. We performed thematic analysis using an inductive and deductive approach, achieved reliability through the joint coding of 25% of transcripts by two coders as well as iterative feedback with the research team that conducted and transcribed the interviews, and organized the data by emerging themes related to the theoretical acceptability of each long-acting PrEP modality discussed.

**Results:** From September to November 2022, we conducted in-depth interviews with 20 postpartum individuals (median age 30 years [IQR 24-35]). Participants reported substantial theoretical preference for long-acting injectable PrEP over oral PrEP due to effectiveness in HIV prevention, increased duration of protection, and discreteness, but identified injection pain and possible side effects as potential barriers to use. Many participants described a preference for oral PrEP over the PrEP vaginal ring due to concerns regarding the need for vaginal insertion as well as concerns about effectiveness, although some identified the ring's longer duration of effectiveness and perceived painlessness as potential facilitators. Participants largely disclosed their oral PrEP use to individuals in their social circles (e.g., partners, family, friends), and were open to potentially disclosing their long-acting PrEP use to similar individuals.

**Conclusions:** Our sample of postpartum individuals had varied theoretical preferences regarding PrEP use, highlighting the necessity of increased availability of diverse PrEP options in SA, providing individuals with choice in HIV prevention methods. Future research should explore the feasibility of offering short- and long-acting PrEP modalities in particular to postpartum individuals in SA.

## EPE159

Development and evaluation of a pre-exposure prophylaxis (PrEP) eligibility prediction tool: improving public health outcomes through accurate risk identification

C. Odhiambo<sup>1</sup>, R. Marima<sup>1</sup>, E. Kubo<sup>1</sup>, D. Achwoka<sup>2</sup>, T. Simiyu<sup>2</sup>, J. Mecha<sup>1</sup>, F. Otieno<sup>1</sup>

<sup>1</sup>University of Nairobi, Clinical Medicine and Therapeutics, Nairobi, Kenya, <sup>2</sup>USAID Kenya/East Africa, Nairobi, Kenya

**Background:** Pre-exposure prophylaxis (PrEP) has emerged as a highly effective tool for preventing the transmission of HIV among individuals at high risk. Accurately identifying individuals who are eligible for PrEP is

crucial for optimizing resource allocation and improving public health outcomes. The aim of this study was to develop and evaluate a PrEP eligibility prediction tool aimed at identifying individuals who are eligible for PrEP.

**Methods:** A dataset of 19,894 individuals was used to develop and validate the PrEP eligibility prediction tool. The dataset included comprehensive demographic, behavioral, and clinical variables associated with PrEP eligibility. Selected machine learning algorithms, in particular logistic regression (LR), decision trees (DT), and random forests (RF), were used and systematically compared for model development. Performance evaluation was conducted using accuracy, sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), and area under the curve (AUC).

**Results:** The PrEP eligibility prediction tool demonstrated an overall accuracy of 88.2%. Out of the total sample, 16,256 instances were correctly predicted as suitable (positive), while 1,148 instances were incorrectly predicted as suitable (false positives). Additionally, 1,198 instances were incorrectly predicted as unsuitable (false negatives), and 1,292 instances were correctly predicted as unsuitable (negative). The AUC value of 0.82 indicated good discriminatory power of the tool in distinguishing between suitable and unsuitable individuals for PrEP. The RF model obtained the best performance in prediction resulting to the sensitivity of 88.5%, specificity of 88.1% with AUC of 0.82 on the training data, and sensitivity of 89.7%, specificity of 85.3% with AUC of 0.91 on the testing data.

**Conclusions:** The developed PrEP eligibility prediction tool shows promise in accurately identifying individuals suitable for PrEP. The tool's high accuracy, sensitivity, specificity, F1 score and AUC values suggest its effectiveness in identifying individuals who are eligible for PrEP initiation and adherence support. Integration of this tool into clinical practice has the potential to ensure that those at highest risk of HIV transmission receive appropriate preventive care, and optimize resource allocation. Furthermore, comparing different ML algorithms uncovered patterns in predicting PrEP use with comparatively reduced uncertainty and, therefore, making it important for effective decision-making.

### The South-South Learning Network provides effective ways to learn and share best practices in HIV prevention in sub-Saharan Africa

B. Gbeh<sup>1</sup>, M. Emmanuel<sup>2</sup>, K. Mangold<sup>3</sup>, L. Lunika<sup>4</sup>, T. Ofem<sup>2</sup>

<sup>1</sup>Genesis-Analytics, Abidjan, Côte d'Ivoire, <sup>2</sup>Genesis-Analytics, Lagos, Nigeria, <sup>3</sup>Genesis-Analytics, Johannesburg, South Africa, <sup>4</sup>Genesis-Analytics, Nairobi, Kenya

**Background:** HIV prevention in sub-Saharan Africa remains a complex challenge, requiring innovative approaches to reduce HIV incidence. The South-South Learning Network (SSLN) is a program designed to strengthen national HIV prevention programs in 15 African countries through shared learning of best practices in HIV prevention. In the mid-term evaluation of this 4-year program, the preferred and most effective learning activities for SSLN countries were identified.

**Methods:** SSLN offers countries thirteen types of learning activities and each country has a unique set of activities they attend based on their program needs. A mixed-methods approach was used to establish the effectiveness of the SSLN program which included an in-depth review of program documents, an online survey completed by country HIV prevention stakeholders (n=296), and in-depth interviews (n=60).

**Results:** The most frequently attended activities were webinars (65%), completion of prevention self-assessment tools (64%), country champion meetings (61%), Link & Learn sessions (35%), and regional champions meetings (28%). Participants showed a clear preference for in-person engagements. The five activities that were perceived as most effective were the in-person activities, which came out strongly in both the survey (Figure 1) and the key informant interviews.

The interviews unanimously highlighted the effectiveness of activities with small-group interactions. Passive information activities such as webinars, online resources, and virtual site visits, seemed less effective, but are often a conversation starter and a jumping-off point for more intensive engagement.

Figure. Perceived effectiveness among survey respondents of different SSLN learning activities.

**Conclusions:** Les activités du SSLN, en particulier les activités d'apprentissage en personne, sont très appréciées et très efficaces pour partager les apprentissages et les meilleures pratiques en matière de prévention du VIH. Les initiatives qui souhaitent promouvoir l'apprentissage des meilleures pratiques en matière de VIH devraient se concentrer sur la promotion des engagements en petits groupes et, si possible, faire en sorte que ces apprentissages aient lieu en personne.

## EPE161

### Perspectives of cisgender women, transgender men, and healthcare providers on an HIV risk self-assessment digital chatbot

S. Mathur<sup>1</sup>, W. Tun<sup>1</sup>, A. Eromhonsele<sup>2</sup>, Z. Vallarino<sup>3</sup>, O. Ononye<sup>2</sup>, C. Savel<sup>3</sup>, M. Akoro<sup>4</sup>, E. Oche<sup>5</sup>, A. Adedimeji<sup>6</sup>, E. Shoyemi<sup>7</sup>

<sup>1</sup>Population Council, Washington DC, United States, <sup>2</sup>Population Council, Lagos, Nigeria, <sup>3</sup>Population Council, New York, United States, <sup>4</sup>TIRS, Lagos, Nigeria, <sup>5</sup>Population Council, Abuja, Nigeria, <sup>6</sup>Consultant, New Jersey, United States, <sup>7</sup>CPHI, Lagos, Nigeria

**Background:** To facilitate PrEP uptake among populations at risk for HIV, we tested a digital chatbot for cisgender women and transgender men (assigned female at birth who self-identify as man) to use at health facilities while clients wait to see their providers. Co-designed with community members, the chatbot provided information on HIV prevention, helped individuals consider their own HIV risk, and prompted them to discuss HIV and PrEP with their healthcare providers. In July 2023, cisgender women (N=133) and transgender men (N=18) aged 18-49 with self-reported HIV negative/unknown status seeking health services from a community clinic providing HIV/STI services and 4 public health facilities (family planning/HIV service units) used the chatbot.

**Methods:** One-month post-implementation, we conducted in-depth interviews with a subset of participants (cisgender women=15; transgender men=10) and 10 healthcare providers to obtain feedback on their attitudes and experiences with the chatbot and conducted qualitative thematic analysis.

**Results:** Findings focused around three categories: Content, delivery mode, and implementation issues. **Content:** (a) Clients reported gaining new knowledge on HIV prevention, risk factors, and PrEP, and that it helped to dispel misconceptions around HIV and PrEP; (b) Clients felt empowered and more comfortable speaking with the provider about HIV/PrEP after using the chatbot; and (c) Providers felt that sessions with chatbot users were more interactive, efficient, and potentially facilitated PrEP uptake. **Delivery:** (a) Clients appreciated the confidentiality provided by the chatbot, and that it was non-stigmatizing; and (b) Clients enjoyed the interactive interface.

**Implementation:** (a) Chatbot was a good use of waiting time; (b) Providers expressed that the chatbot is ideal in a facility setting but expressed concern for its use in the community setting. When asked about whether their provider should be able to see their chatbot responses, most were not in favor of their personal information being shared.

**Conclusions:** Pre-service waiting time is an ideal opportunity for clients to learn about HIV prevention and reflect on their HIV risk prior to meeting with a healthcare provider. The chatbot was well-received by both clients and healthcare providers and has the potential for rapid scale-up to facilitate PrEP uptake among cisgender women and transgender men.

**"Yeah they suck. It's like they don't care about our health." Perceptions on provider mistrust and PrEP among Black women under community supervision in New York City**

D. Goddard-Eckrich<sup>1</sup>, K. Stringer<sup>2</sup>, A. Richer<sup>3</sup>, A. Dasgupta<sup>1</sup>, D. Brooks<sup>1</sup>, M. Cervantes<sup>1</sup>, D. Downey<sup>1</sup>, P. Keller<sup>1</sup>, S.L. Bell<sup>4</sup>, T. Hunt<sup>1</sup>, E. Wu<sup>1</sup>, K. Johnson<sup>5</sup>, J. Hall<sup>1</sup>, G.-A. Guy-Cupid<sup>6</sup>,

B. Thomas<sup>1</sup>, K. Edwards<sup>1</sup>, V. Ramesh<sup>1</sup>, L. Gilbert<sup>1</sup>

<sup>1</sup>Columbia University, Social Work, New York, United States,

<sup>2</sup>Middle Tennessee State University, Murfreesboro, United States, <sup>3</sup>University of Utah, Salt Lake, United States, <sup>4</sup>Saint Louis University, St Louis, United States, <sup>5</sup>University of Alabama, Tuscaloosa,, United States, <sup>6</sup>University of The Virgin Islands, St Thomas, United States

**Background:** Black women experience some of the poorest health outcomes and this is especially true for Black women involved in the carceral system, who are at elevated risk for HIV/STI infections, poor sexual and reproductive health, and chronic diseases. There is an urgent need for more effective healthcare engagement, prevention, and treatment for Black women.

This study aims to investigate the experiences of accessing healthcare services for Black women who are drug-involved and under community supervision.

**Methods:** We conducted semi-structured interviews with 43 Black drug-involved women under community supervision in New York City from a sub-sample from Project Eworth. Participants were asked how concerned they felt about healthcare issues in general; experiences with healthcare providers, including barriers faced in accessing gynecological care; attitudes and beliefs and level of trust/mistrust in healthcare providers; communication with their doctor about concerns related to HIV/STI risk, PrEP as a form of HIV prevention and if they would take PrEP if they were trying to get pregnant. HIV-positive participants were not asked the PrEP questions. Nvivo12 was used, and we employed a team-based approach to cod-

ing. Codes and themes relating to accessing healthcare, experiences with providers, and perceptions and attitudes of the healthcare system are presented.

**Results:** We identified three themes through analysis that influenced Black women's ability to engage with healthcare providers and systems:

1. Lack of knowledge and trust for PrEP for HIV prevention;
2. Provider-level barriers (e.g., provider judgment around drug use, withholding information; lack of communication; lack of knowledge of participants' prior medical information); and,
3. Mistrust of providers and the medical system.

**Conclusions:** Our findings highlight the need to improve trust and collaboration between healthcare providers and Black women, including for HIV prevention. This study addresses a critical gap in understanding perceptions of discrimination, stigma barriers to attaining quality health care, and has implications for PrEP uptake and adherence. Providers must be held accountable by funders and accreditation agencies in providing diversity, equity, and inclusion training for providers and healthcare organizations. Greater representation of Black healthcare providers who can identify with this population may impact access to and retention in care.

## EPE163

**Enhancing communication but falling short on timely visits: a case study of the Medical Appointment Notification Assistance (MANA) application in HIV client care, Bangkok**

S. Nookhai<sup>1</sup>, P. Tharee<sup>2</sup>, P. Soontarawirat<sup>2</sup>, S. Jangkhum<sup>3</sup>, P. Mookleemas<sup>3</sup>, T. Ungkatreerat<sup>2</sup>, A. Kanphukiew<sup>1</sup>, N. Pattarapayoon<sup>3</sup>, S. Northbrook<sup>1</sup>

<sup>1</sup>Division of Global HIV and Tuberculosis, U.S. Centers for Disease Control and Prevention, Nonthaburi, Thailand, <sup>2</sup>Lerdsin Hospital, Department of Medical Service, Thailand Ministry of Public Health, Bangkok, Thailand, <sup>3</sup>Division of AIDS and STI, Department of Disease Control, Thailand Ministry of Public Health, Nonthaburi, Thailand

**Background:** In 2020, the Medical Appointment Notification Assistance (MANA) application was developed to improve on-time patient visits by sending appointment reminders. We analyzed the frequency of on-time and late clinic visits among person living with HIV who enrolled in MANA at a large tertiary hospital in Bangkok from May 2020 through October 2023.

**Methods:** MANA was offered to every client visiting the clinic for ARV or viral load services, with electronic consent obtained through the application at time of registration. Reminders were sent three times before drug refill and viral load test appointments (7, 3, and 1 day before), and two times after missed appointments (5 and 7 days). De-

mographic and visit data were stored using the hospital information system. Median and chi-square tests were performed to assess statistical significance using STATA.

**Results:** Of 4,537 patients, 1,653 (36.4%) accepted MANA reminders (73.7% male, 89.2% Thai nationality) while 2,884 (63.6%) did not (69.6% male, 87.4% Thai nationality). No significant difference in median age found between the two groups. MANA users accounted for 6,901 (40.7%) of visits while non-MANA users accounted for 10,055 (59.3%) of visits ( $p < 0.001$ ). Both groups had a median visit count of 5. MANA users had a lower percentage of on-time visits compared to non-MANA users (32.0% and 38.0%, respectively,  $p < 0.001$ ).

	Non-MANA user n= 2,884 n (%)	MANA user n= 1,653 n (%)	p-value	Total N= 4,537 n (%)
Median Age (IQR)	40 (31-48)	41 (33-47)	0.43	40 (32-48)
Male	2,006 (69.6)	1,218 (73.7)	<0.01	3,224 (71.1)
Thai	2,521 (87.4)	1,475 (89.2)	<0.001	3,996 (88.1)
Total number of visits*	10,055 (59.3)	6,901 (40.7)	<0.001	16,956 (100)
Early or on time visits*	3,816 (38.0)	2,211 (32.0)		6,027 (35.5)
Late 1-7 days	1,185 (11.8)	603 (8.7)	<0.001	1,788 (10.5)
Late 8-28 days	1,841 (18.3)	1,402 (20.3)		3,243 (19.1)
Late >28 days	3,213 (32.0)	2,685 (38.9)		5,898 (34.8)

\*total adds up to 16,956 visits

**Conclusions:** While MANA successfully enhances communication between ARV staff and clients, it falls short of improving on-time clinic visits as initially proposed. The findings highlight the limitation of relying solely on message alerts and suggest the need for additional interventions. Bi-directional messages between ARV staff and clients may prove to be a more efficient strategy for encouraging timely clinic visits. Our results emphasize the importance of ongoing learning and adaptation in the development and implementation of healthcare management tools, particularly in the context of HIV client care.

## EPE164

### The emergence of HIV treatment opportunity deserts in Malawi

J. Ponce<sup>1</sup>, J. Okano<sup>2</sup>, A. Low<sup>3</sup>, L. Dullie<sup>4</sup>, W. Mzumara<sup>5</sup>, S. Blower<sup>2</sup>

<sup>1</sup>Arizona State University, Mathematics, Tempe, United States, <sup>2</sup>University of California Los Angeles, Semel Institute for Neuroscience, Los Angeles, United States, <sup>3</sup>ICAP at Columbia University, New York, United States, <sup>4</sup>Partners in Health/Abwenzi Pa Za Umoyo, Neno, Malawi, <sup>5</sup>Department of HIV and AIDS, Ministry of Health Malawi, Lilongwe, Malawi

**Background:** UNAIDS' has set treatment targets for ending the HIV pandemic by 2030, and an additional goal of eliminating inequities in access to treatment. A major issue is inequity in access between different geographic

areas. Before inequities can be overcome, they need to be found and their underlying causal factors identified. We show how this is possible by analyzing data from Malawi, which has one of the most severe HIV epidemics worldwide (~9% prevalence).

**Methods:** We designed a mathematical modeling framework that can be used in any sub-Saharan African country, with an HIV epidemic, to:

- Quantify geographic inequities in the opportunity to access treatment,
- Determine the location of treatment opportunity deserts, and;
- Identify causal factors underlying treatment opportunity deserts.

Our framework is based on a Floating Catchment Area model, and data collected in 2021. FCA models calculate the opportunity to access a particular resource.

Opportunity is calculated as a function of the supply of the resource, the demand for the resource, the time spent traveling from the demand site to the supply site, the mode of transportation, and human behaviors that affect travel.

**Results:** We find significant geographic inequities in the opportunity to access treatment. Communities with a low opportunity are spatially clustered (Moran's Index = 0.5 to 0.98); this results in dozens of treatment opportunity deserts. Surprisingly, some deserts occur in urban areas. We find that deserts have arisen because of a combination of two factors: the number of healthcare facilities (HCFs) that a community can reach within a maximum travel time (range: zero to 300 HCFs), and localized supply to demand ratios for ART (ranging from over-supply (25) to under-resourced (0)).

**Conclusions:** Treatment Opportunity deserts have arisen in Malawi because there are either only a few reachable HCFs, or many HCFs where the localized demand for ART is greater than the supply. We discuss how deserts may be contributing to ongoing HIV transmission, and recommend strategies to satisfy UNAIDS' goals of reducing geographic inequities in access to treatment, whilst increasing coverage. If deserts are not targeted for additional resources, existing geographic inequities in access will be greatly exacerbated.

## EPE165

### High probability of treatment failure after HIV care transition among adolescents living with HIV in Kenya

S. Goldin<sup>1</sup>, L. Montoya<sup>2</sup>, L. Abuogi<sup>3</sup>, J. Lewis-Kulzer<sup>4</sup>, G. Ontuga<sup>5</sup>, E. Nyageosa<sup>5</sup>, E. Nyandieka<sup>5</sup>, N. Sang<sup>6</sup>, E.A. Bukusi<sup>6</sup>, E. Geng<sup>7</sup>

<sup>1</sup>University of Colorado Anschutz Medical School, Aurora, United States, <sup>2</sup>University of North Carolina at Chapel Hill, Department of Biostatistics, Chapel Hill, United States, <sup>3</sup>University of Colorado, Denver, Department of Pediatrics, Aurora, United States, <sup>4</sup>University of California, San Francisco, Department of Obstetrics, Gynecology, and Reproductive Science, San Francisco, United States, <sup>5</sup>Kenya Medical Research Institute, Kisumu, Kenya, Research Care and Training Program, Center for Microbiology Research, Kisumu, Kenya, <sup>6</sup>Kenya Medical Research Institute, Research Care and Training Program, Center for Microbiology Research, Kisumu, Kenya, <sup>7</sup>School of Medicine, Washington University, St. Louis, St. Louis, United States

**Background:** The impending transition of five million adolescents with HIV (AWH) globally to adult HIV care requires urgent attention given the known service disengagement risks and suboptimal clinical outcomes. To address limited data on AWH transition of care in high-burden settings, we evaluated post-transition outcomes among AWH in an ongoing trial in southwestern Kenya.

**Methods:** A total of 880 participants ages 14-24 years were enrolled at three high-volume public facilities in Kisumu County, Kenya between April 2021 and March 2022 in the Adapt for Adolescents study (A4A). We present secondary analysis among AWH who transitioned during study follow-up. A survival analysis to estimate the probability of no failure after transitioning was conducted. Failure was defined as either a high viral load (> 200 copies/ml) or missing scheduled visits by > 14 days post-transition. A Kaplan-Meier estimator was used for estimating the survival curve and point estimates of the probability of survival 6 months and 48 weeks post-transition.

**Results:** A total of 65 AWH (7.4%) transitioned to adult care during study follow-up, 44 (67.7) were female and median age was 19.0 (intraquartile range 18.0-21.0). Figure 1 shows the estimated probability curve of not experiencing post-transition failure among participants. By 6 months, 19 (29.2%) participants had a failure event (8 [12.3%] viral load failure and 11 [16.9%] visit lapse), resulting in probability of no post-transition failure by 6 months of 69.5% (CI 58.1-81.0%). By 48 weeks post-transition, 23 (35.5%) participants experienced any failure event (8 [12.3%] viral load failure and 15 visit lapses [23.1%]); probability of non-failure estimated to be 60.4% (CI 47.3-73.4%).

\*VL failure= Viral load > 200 copies/ml

Figure 1. Survival probability among adolescent with HIV who transitioned to adult clinics.

**Conclusions:** Preliminary findings suggest a high likelihood of treatment failure or disengagement post-transition among AWH in Kenya. Additional research is required to identify risk factors linked to these adverse outcomes and assess tailored programs to mitigate post-transition failure, improving AWH survival rates.

## EPE166

### A mixed-methods cluster-randomised study to test the efficacy, acceptability and feasibility of WhatsApp-based microlearning for HIV training of healthcare workers in remote South African clinics

B. Chisholm<sup>1</sup>, C. Orrell<sup>2</sup>, M. Blockman<sup>1</sup>

<sup>1</sup>University of Cape Town, Division of Clinical Pharmacology, Department of Medicine, Cape Town, South Africa,

<sup>2</sup>University of Cape Town, Centre for Adherence and Therapeutics, Desmond Tutu Health Foundation, Faculty of Health Sciences, Cape Town, South Africa

**Background:** HIV management changes with new developments, requiring regular guideline updates and ongoing training of healthcare workers (HCWs). In South Africa, this has traditionally been face-to-face, at centralised points, but distance, cost and lack of resources reduce uptake. South Africa has 100% cellphone penetration and 93.2% of adults use WhatsApp. We designed and tested the efficacy, acceptability, and feasibility of short, accessible, scalable, and sustainable microlearning using WhatsApp.

**Methods:** A pragmatic, mixed-methods, cluster-randomised study at 50 clinics in remote Eastern Cape. HCWs were invited to join during explanatory clinic visits. HCWs in the intervention arm received 15-minute, 'live' lessons offered at lunchtime over three weeks. Case-based les-

sons with learning points from the ART guidelines were given on two WhatsApp groups: one for nurses (seven lessons), the other for community health workers (five lessons).

Outcomes were measured using online questionnaires testing knowledge of learning points, WhatsApp analysis and focus groups. Baseline knowledge was measured, with repeated questionnaires by the intervention groups immediately after training; and control and intervention groups three months later. Quantitative results were reported descriptively and inferentially using linear mixed-effects regression analysis, adjusted for clustering (SPSS™). Qualitative results were described descriptively using proportions and thematic analysis (nVivo™).

**Results:** Uptake and attendance was good. 232/293 (79%) of nurses and 207/271 (76%) of CHWs agreed to participate. In the intervention group, nurses' attendance of the 'live' sessions ranged from 27/101 (27%) to 51/101 (51%); CHWs 27/97 (28%) to 53/99 (54%). Two weeks later, 97/101 (96%) of nurses and 86/98 (88%) of CHWs had read the lessons. Linear mixed regression modelling, adjusted for age, gender, years of experience, stratification, clustering and repeated measures showed a statistically significant improvement in knowledge between the intervention and control arm after three months follow-up for both nurses (0.049; 95% CI 0.01-0.98; p=0.0489) and CHWs (0.74; 95% CI 0.24-1.26; p=0.0039).

Post-training surveys showed 99% of nurses (66/67) and CHWs (70/71) enjoyed the training, saying they would participate in this kind of training if it were weekly. Barriers to 'live' participation were network issues and/or loadshedding.

**Conclusions:** WhatsApp-based HIV training for HCWs is effective, acceptable, and feasible.

## EPE167

### Optimization of treatment outcomes using client segmentation: differences between clients who missed and adhered to clinical appointments

H.T. Dang<sup>1</sup>, V.T. Nguyen<sup>1</sup>, V.T. Nguyen<sup>2</sup>, T.T. Bui<sup>1</sup>, T.A.T. Vuong<sup>1</sup>, H.T.T. Phan<sup>2</sup>, R.S. Coley<sup>1</sup>, D.M. Levitt<sup>1</sup>

<sup>1</sup>FHI 360 Vietnam, Ha Noi, Viet Nam, <sup>2</sup>Vietnam Administration for HIV/AIDS Control, Ha Noi, Viet Nam

**Background:** Missed appointments for antiretroviral therapy (ART) are associated with negative consequences among HIV clients. To gauge ART adherence and continuity, the USAID/PEPFAR-funded Meeting Targets and Maintaining Epidemic Control (EpiC) project collaborates with the Vietnam Administration for HIV/AIDS Control to conduct routine client tracking.

We analyzed client records to determine the characteristics of ART clients who missed an appointment in Dong Nai and Tay Ninh provinces to tailor and optimize strategies to improve ART adherence and continuation.

**Methods:** We analyzed de-identified data for ART clients from October 2022 through September 2023. We defined clients with missed appointments as those exceeding 28 days since their expected appointment. Demographic data and appointment-related variables were extracted from client records. Univariate and multivariate logistic regression were used to calculate odds ratios ([OR]) reflecting associations between clients who missed appointments and those who did not.

**Results:** Of 8,577 clients, 5.7% were categorized as having at least one missed appointment, 80.3% of whom were males. Mean age was 33.9 (±10.0), and mean duration of treatment was 55.7 months (±52.1). For clients reached after missed appointments (n=280), the primary reason was relocation for work in another province (30.4%), followed by no social health insurance or no validation of social health insurance (12.6%). Age and treatment duration were directly associated with missed appointments.

	OR	p-value	95%CI
Age	1.013	0.022	1.002 – 1.025
Gender	0.933	0.613	0.713 – 1.220
ART duration (months)	1.006	<0.01	1.004 – 1.008

Table 1. Multiple analysis of the factors associated with missed appointments

**Conclusions:** In Vietnam, tailored and enhanced support may be needed for older clients, those on long-term ART, clients working away from home, and those lacking valid social health insurance. Strengthening data systems to comprehensively address factors contributing to missed appointments, and putting greater effort in client tracking, are crucial for optimizing adherence and ensuring continued treatment.

### "I have to feel comfortable": attitudes towards pharmacy-administered long-acting injectable antiretroviral therapy in a sample of people with HIV

J. Cocohoba<sup>1</sup>, Y. Cuca<sup>2</sup>, E. Sherman<sup>3</sup>, K. Hester<sup>4</sup>, G. Udeani<sup>5</sup>, M. Sigua<sup>1</sup>, P. Saberi<sup>6</sup>

<sup>1</sup>University of California San Francisco School of Pharmacy, Department of Clinical Pharmacy, San Francisco, United States, <sup>2</sup>University of California San Francisco School of Nursing, Department of Community Health Systems, San Francisco, United States, <sup>3</sup>Nova Southeastern University College of Pharmacy, Department of Pharmacy Practice, Fort Lauderdale, United States, <sup>4</sup>Auburn University Harrison School of Pharmacy, Department of Pharmacy Practice, Auburn, United States, <sup>5</sup>Texas A&M Irma Lerma Rangel School of Pharmacy, Department of Pharmacy Practice, Kingsville, United States, <sup>6</sup>University of California San Francisco School of Medicine, Division of Prevention Science, Department of Medicine, San Francisco, United States

**Background:** Long-acting injectable antiretroviral therapy (LA-ART) has transformed the landscape of treatment for Human Immunodeficiency Virus (HIV). Currently available LA-ART requires administration by a healthcare provider, and can be challenging to integrate into overburdened health systems. Tasking community pharmacies to administer LA-ART is one potential opportunity to diffuse workload.

Prior to implementing and disseminating this service, it is important to understand perceptions of this differentiated care model in people with HIV (PWH).

**Methods:** A mixed-methods study was conducted in PWH in four geographic areas of the United States (Northern California, Southern Texas, Central Alabama, and Southern Florida) from 6/2022-10/2023 to assess attitudes, implementation barriers, and facilitators for pharmacy-based administration of LA-ART. Respondents completed a baseline survey and semi-structured interview. A thematic analysis was conducted focusing on the attitudes and perceptions of relative advantages or disadvantages of pharmacy-administered LA-ART.

**Results:** The study included 24 PWH. Mean age was 53 years (SD= 13.9) and 50% identified as female. Distribution of participants was 25% from Alabama, 25% from Florida, 42% from Northern California, and 8% from Texas. Seven participants (29%) were currently using LA-ART.

Only six people not on LA-ART (35%) had ever discussed it with their clinician. Participants provided 108 statements expressing attitudes towards pharmacy-administered LA-ART. People on LA-ART tended to express more negative attitudes while people not on LA-ART held more positive views. Negative attitudes stemmed from a lack of established relationships with pharmacy staff, lack of privacy in the pharmacy setting, and perceptions about pharmacy

workload. Both groups described multiple aspects of convenience (general convenience, ease of making appointments, location, extended hours, ability to shop for other items while in the pharmacy) as the main advantages of pharmacy-administered LA-ART. Persons on LA-ART were concerned about pharmacy staff turnover while persons not on LA-ART believed pharmacy wait times were going to be the main disadvantage.

**Conclusions:** In this sample of PWH from four states, persons using LA-ART held more negative attitudes toward pharmacy-administered LA-ART. Their concerns about staff turnover underscore the importance of adequate staffing, communications training, and continuity of pharmacist care to foster trusting pharmacist-client relationships for successful pharmacy-administered LA-ART.

## EPE169

### Association between multi-month ART dispensing and retention in care among people living with HIV in Tanzania

A. Hazlett<sup>1</sup>, J. Kadota<sup>1</sup>, R. Ghosh<sup>2</sup>, S. Kwilasa<sup>3</sup>, W. Maokola<sup>3</sup>, S. Shabani<sup>3</sup>, P. Njau<sup>3</sup>, A. Sabasaba<sup>4</sup>, S.I. McCoy<sup>1</sup>

<sup>1</sup>University of California Berkeley, Public Health, Berkeley, United States, <sup>2</sup>University of California San Francisco, San Francisco, United States, <sup>3</sup>Tanzanian National AIDS, STIs and Hepatitis Control Programme (NASHCoP), Ministry of Health, Dodoma, Tanzania, the United Republic of, <sup>4</sup>Health for a Prosperous Nation, Dar es Salaam, Tanzania, the United Republic of

**Background:** Implementation of multi-month dispensing (MMD) can relieve congestion in health facilities and improve convenience for people living with HIV (PLHIV) who are established on ART. To gauge MMD's impact on retention in care, we used routinely collected electronic medical record data to evaluate the association between MMD and treatment engagement among a cohort of PLHIV starting ART.

**Methods:** This is a retrospective cohort study of PLHIV in Tanzania who initiated ART between January 2018 and November 2021 and who were eligible for MMD six months later (on first or second line ART, kept appointments for six months, undetectable viral load, no opportunistic infections, and not currently pregnant).

Data were collected between 2018 and 2023 from 355 government HIV care and treatment clinics in Kagera and Geita regions. MMD was defined as receipt of one or more 3-month ART refills (3MMD) within the first 18 months of treatment. Disengagement from care was measured 18 months after ART initiation, and was defined as being > 28 days late for their last scheduled ART pickup.

A linear probability model was used to estimate adjusted risk difference (RD) for treatment disengagement comparing PLHIV who received MMD to those who received monthly dispensing, among the subset of eligible people.

AIDS 2024

Author Index

**Results:** 52,112 eligible PLHIV were included in the cohort, among whom 53% were in Kagera and 59% were female. 81% received at least one 3MMD refill during their first 18 months on ART. Among this group, 20% had disengaged from ART at 18-months, compared to 56% of participants who received monthly dispensing (RD: -0.387; 95% confidence interval [CI]: -0.397, -0.377). A higher proportion of male than female participants received MMD (86% vs 78%), and the association with disengagement was stronger among males (RD: -0.505; CI: -0.522, -0.488) compared to females (RD: -0.328; CI: -0.342, -0.314).

**Conclusions:** The results suggest that MMD may be associated with higher retention in care in the first 18 months of ART, with the strongest association among males. These results suggest that MMD may achieve its intended benefits and reduce the risk of treatment interruption.

## EPE170

**Empowering communities: a catalyst for change in HIV prevention and treatment through community voices & preparedness for long-acting injectables**

M. Sundararaj<sup>1</sup>, N. Rafif<sup>2</sup>, B. Killingo<sup>3</sup>, P. Murugan<sup>2</sup>, L. Simelane<sup>3</sup>, C. Kelemi<sup>4</sup>, M. Soboyisi<sup>5</sup>

<sup>1</sup>Momentum Strategies LLC, Oakland, United States,

<sup>2</sup>International Treatment Preparedness Coalition,

Johannesburg, South Africa, <sup>3</sup>Dream Alive, Mbabane,

Eswatini, <sup>4</sup>Botswana Network on Ethics Law and HIV AIDS,

Gaborone, Botswana, <sup>5</sup>NACOSA, Cape Town, South Africa

**Background:** The „Community Voices & Preparedness for New Treatment Innovations” project, spearheaded by the International Treatment Preparedness Coalition (ITPC), seeks to bridge the gap between HIV innovators and communities affected by HIV. The initiative's primary objective is to bolster awareness, education, access, demand, and affordability of innovative HIV treatments through robust community engagement.

With the global challenges of escalating HIV transmissions and obstacles in achieving viral suppression, the imperative for ongoing innovation is paramount. Long-acting injectables (LAIs) emerge as a transformative force in HIV prevention and treatment.

**Description:** In its current phase, the project has actively involved community groups from Botswana, Eswatini, and South Africa in a multi-stakeholder forum. This approach ensures that community insights inform the efforts of the ITPC, facilitating the introduction of LAIs with genuine community input.

A key focus is to empower HIV innovators, integrating their advancements into normative guidelines and procurement processes while amplifying civil society and community voices on a global scale. Employing an inclusive strategy, ITPC identified and engaged over 50 HIV community leaders from diverse backgrounds across

these countries, who in turn helped address knowledge gaps, concerns, and expectations regarding LAIs for both prevention and treatment.

**Lessons learned:** Knowledge on HIV and LAIs among community stakeholders in the target countries was low and uneven, emphasizing the need for comprehensive HIV education initiatives. Concerns related to safety, injection frequency, cultural considerations, convenience, transition challenges from pills, and potential stigma from healthcare professionals were articulated. Readiness gaps in healthcare facilities, including provider training, resource challenges, security risks, infrastructure limitations, and access difficulties, were identified.

However, the dialogues also highlighted the opportunities that LAIs present, including decongesting healthcare facilities, improving the quality of life for specific groups, addressing treatment fatigue, mobilizing resources, escalating advocacy, and enhancing social lives.

**Conclusions/Next steps:** The recommendations arising from the community dialogues underscore the importance of ongoing community engagement in the design and implementation of LAIs. Key suggestions include the development of targeted community education initiatives, ensuring accessibility and affordability, transparent communication on safety concerns, inclusive decision-making processes, tailored support programs, and the establishment of continuous dialogue platforms.

## EPE171

### Enhancing viral load monitoring among people on antiretroviral therapy using structured mentorship by cluster differentiated service delivery nurses: lessons from Buhera District of Zimbabwe, 2023

G. Kufo<sup>1</sup>, G. Rusere<sup>2</sup>, M. Ndlovu<sup>3</sup>, R. Mataruse<sup>4</sup>, T. Chimwaza<sup>5</sup>, J. Maguse<sup>6</sup>, B. Chindove<sup>1</sup>, M. Muzondo<sup>7</sup>, P. Mhangara<sup>12</sup>, T.P. Sibanda<sup>8</sup>, K. Nyathi<sup>13</sup>, T. Nyamundaya<sup>8</sup>  
<sup>1</sup>Zimbabwe Health Interventions, Strategic Information and Evaluation, Harare, Zimbabwe, <sup>2</sup>Zimbabwe Health Interventions, Programs, Buhera, Zimbabwe, <sup>3</sup>Zimbabwe Health Interventions, Knowledge Management, Harare, Zimbabwe, <sup>4</sup>Zimbabwe Health Interventions, Strategic Information Evaluation, Mutare, Zimbabwe, <sup>5</sup>Zimbabwe Health Interventions, Programs, Harare, Zimbabwe, <sup>6</sup>Zimbabwe Health Interventions, Strategic Information Evaluation, Harare, Zimbabwe, <sup>7</sup>Zimbabwe Health Interventions, Programs, Mutare, Zimbabwe, <sup>8</sup>Zimbabwe Health Interventions, Senior Management, Harare, Zimbabwe, <sup>9</sup>Ministry of Health and Child Care, Executive, Harare, Zimbabwe, <sup>10</sup>Ministry of Health and Child Care, National Antiretroviral, Harare, Zimbabwe, <sup>11</sup>Ministry of Health and Child Care, Provincial Medical Directorate, Mutare, Zimbabwe, <sup>12</sup>United States Agency of International Development, Programs, Harare, Zimbabwe, <sup>13</sup>Zimbabwe Health Interventions, Senior Management, Harare, Zimbabwe

**Background:** Zimbabwe Health Interventions (ZHI) is supporting government of Zimbabwe (GoZ) to achieve and sustain HIV epidemic control. Despite the country achieving 95% viral load (VL) coverage, some districts remain with suboptimal coverage. Between January and March 2022, Buhera district had a VL coverage of 62% and this can result in suboptimal viral suppression and its negative outcomes including HIV transmission, development of opportunistic infections, development of HIV drug resistance and death.

We documented effectiveness of structured mentorship by cluster differentiated service delivery (DSD) nurses in improving VL coverage in Buhera district for the period October 2022 to December 2023.

**Description:** Cluster DSD nurses were hired and deployed by ZHI to support a cluster of health facilities, and their activities included cohort cleaning i.e. ensuring clients' health records were well documented, line listing of clients due for VL testing, mobilization of clients who missed VL testing through phone calls and home visits by lay community referral facilitators (CRFs), and targeted follow-ups for community ART refill groups (CARG) and hard-to-reach clients. VL service uptake data were captured in health facility registers, and the program DHIS2 database. Data for the January 2022 to December 2023 period were

analysed using Ms Excel and STATA 15 generating proportions and assessing differences between proportions. The assessment was covered by the Medical Research Council of Zimbabwe approved protocol (MRCZ/E/159).

**Lessons learned:** Viral load coverage significantly increased from 62% in January to March 2022 to 88% ( $z = -59.52$ ,  $p < 0.0001$ ), in the July to September 2023 period. Similarly, VL suppression increased from 93% in January to March 2022 to 98% ( $z = -21.36$ ,  $p < 0.0001$ ) in the July to September 2023 period.

**Conclusions/Next steps:** Use of structured mentorship and quality improvement approach to a cluster of health facilities by DSD nurses contributed to the significant improvement in VL coverage and suppression rates in Buhera district.

We recommend interventions that optimize identification of clients due for VL test, mobilization of clients who missed VL testing, and targeted follow-ups of community ART refill groups and hard-to-reach clients.

## EPE172

### Intervention to improve HIV continuous care monitoring in public-sector HIV care sites in São Paulo, Brazil: a pre-post implementation evaluation

M. Fonsi<sup>1</sup>, S. Queiroz Rocha<sup>1</sup>, K. Wolfenbüttel<sup>1</sup>, G. Maciel Della Cruz<sup>1</sup>, L.A. Souza Neves<sup>1</sup>, R. Ferreira de Oliveira<sup>1</sup>, A. <sup>2</sup>Faculdade de Medicina da Universidade de São Paulo, São Paulo, Brazil, <sup>3</sup>ViiV Healthcare, Rio de Janeiro, Brazil,

<sup>4</sup>GSK Brazil, Rio de Janeiro, Brazil

**Background:** In Brazil, a nationwide electronic Clinical Monitoring System (SIMC) provides HIV public health facilities (HPHF) with lists of patients who have had their viral load tested and have not started treatment (Gap) or have interrupted antiretroviral therapy (ART interruption).

**Methods:** We are carrying out an intervention in 30 selected HPHF in the state of São Paulo, Brazil, aiming to improve the utilization of SIMC reports for the re-engagement of patients identified in gap or ART interruption. The intervention includes the consistent use of a SIMC e-learning platform and monitoring by trained healthcare professionals. Here we present the percentage variation in the proportion of Gap and treatment interruption between November 2022 and November 2023. Additionally, we calculated the proportions of positive responses to 10 indicators on processes related to the consistent use of SIMC at the selected HPHF, obtained in a local survey carried out before and 12 months after the start of the intervention.

**Results:** We observed a reduction in the proportion of gap (81.81%) and ART interruption (18.20%) and an increase in the use of SIMC-related processes at the HPHF (78.33%) within 12 months of the start of the intervention (Table 1).

	2022		2023		PV 2022-2023 (%)
	n	%	n	%	
Gap <sup>#</sup>	1591	7.86	283	1.43	81.81
ART interruption <sup>#</sup>	1907	10.22	1630	8.36	18.20
SIMC utilization processes		24.7		79.33	78.33

*Table 1. Average percentage and percentage variance (PV) of Gap, ART interruption and SIMC utilization processes in 30 selected HPHF, November/2022 and November/2023, São Paulo, Brazil.*

<sup>#</sup>Related to 20248 PLWHA in 2022 and 19788 in 2023

<sup>#</sup>Related to 18657 PLWHA in 2022 and 19505 in 2023

**Conclusions:** The results suggest that adoption of SIMC as a monitoring tool is feasible and that consistent use of an e-learning platform combined with monitor support can contribute to the re-engagement of PLWHA in HIV treatment and care.

## EPE173

**Increase in retention rate with a model combining tasks shifting to paramedical staff and differentiated follow-up of PLWH in Senegal**

A. Diouf<sup>1</sup>, N.M. Dia-Badiane<sup>2</sup>, L. Fortes<sup>1</sup>,  
N.B. Ndiaye-Coulibaly<sup>3</sup>, DECPOST

<sup>1</sup>Cheikh Anta Diop, Infectious Diseases, Dakar, Senegal,

<sup>2</sup>Gaston Berger, Infectious Diseases, Saint Louis, Senegal,

<sup>3</sup>NA, DLSI, Dakar, Senegal

**Background:** Maximizing people living with HIV (PLWH) retention in care is critical to the long-term success of PLWH management.

To do this, services must be accessible to PLWH. We hypothesized that a model of tailored care (MTC) for PLWH with more flexible and accessible services delivered by paramedical staff would improve PLWH retention.

**Methods:** We conducted a cluster randomized trial among antiretroviral therapy (ART)-naïve PLWH and ART-stable (on ART for  $\geq 6$  months with a stable condition) PLWH in two Senegalese cities. Intervention health districts received the MTC delivered by paramedical staff with clinician support. MTC included: 1) task shifting of PLWH management to health posts, 2) Differentiated follow-up of ART-stable PLWH: appointments every 3-6 months. Control health districts received standard of care.

The primary outcome was retention rate. Geographical and financial accessibility was a secondary outcome. Arms were compared using TMLE, accounting for clustering.

**Results:** From During September 2017-July 2018, 1014 patients in 13 health districts were included (504 intervention; 510 control). The mean age was  $40.6 \pm 13$  years; 55.5% were female, 39.7% at WHO stages 3-4 and 89.5% ART-stable.

After a mean follow-up duration of  $9 \pm 3$  months, the retention rate was 94.4% [95% CI: 93.8-96.2] in the intervention group versus 92.8% [95% CI: 90.2-93.7] in the control group, HR: 1.12 [1.04-1.33];  $p = 0.04$ ). Access to services was better in the intervention group with shorter travel time (31 minutes vs. 68 minutes;  $p < 0.001$ ), lower transportation cost (US\$1 vs. US\$6;  $p < 0.001$ ) and shorter time spent in the health facility (25 min vs. 89 minutes;  $p < 0.001$ ).

**Conclusions:** In this cluster randomized trial, shifting PLWH services to paramedical staff at health posts with differentiated follow up makes them more accessible with better retention rate. Such a model deserves more attention for proper scaling up to improve PLWH retention of PLWH in care.

## EPE174

**Leakages in the viral load monitoring cascade: an evaluation of the HIV antiretroviral therapy program focusing on viral load monitoring in Sanyati District, 2023**

T. Munetsi<sup>1</sup>, D. Chirundu<sup>2</sup>, H. Mugauri<sup>1</sup>, T. Juru<sup>1</sup>,  
G. Shambira<sup>1</sup>, A. Chadambuka<sup>1</sup>, N. Gombe<sup>3</sup>, M. Tshimanga<sup>1</sup>

<sup>1</sup>University of Zimbabwe, MPH FETP, Harare, Zimbabwe,

<sup>2</sup>Kadoma City, Health Department, Kadoma, Zimbabwe,

<sup>3</sup>AFENET, FETP, Harare, Zimbabwe

**Background:** Viral load (VL) was recommended as the preferred monitoring approach to diagnose and confirm treatment failure. It consists of VL testing after every 12 months and enhanced adherence counselling (EAC) should be done for all people living with HIV (PLHIV) on ART who have a viral load  $>50$  copies/ml. In Sanyati District the proportion of PLHIV with a high VL who had enhanced adherence counselling decreased from 54% in 2021 to 30% in 2022. The target recommended by WHO for enhanced adherence counselling is 100%.

We evaluated the HIV program focusing on VL monitoring to determine reasons for not achieving targets on enhanced adherence counselling.

**Methods:** A descriptive cross sectional study using a process outcome evaluation based on the logic framework was done. The study was conducted in Sanyati District, Zimbabwe with 26 health facilities.

The study population consisted of health workers in Sanyati District. Interviewer administered questionnaires were used to collect data on knowledge of health workers.

A checklist and records review were used to collect data on inputs, processes, outputs and outcomes. Frequencies, medians and proportions on the inputs, processes, outputs and outcomes were calculated.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

**Results:** Sixty-six health workers were interviewed with 49 (74.2%) being females. The median years in service of respondents was 9 ( $Q_1=5$ ;  $Q_3=14$ ). Forty-seven percent of the respondents were registered general nurses. There were frequent breakdowns of VL testing machines. Fifty-two percent of health workers had average knowledge on VL monitoring. Of the 1659 PLHIV who had high VL and only 497 (30%) had at least one EAC session, 344 (69%) completed EAC and had a second VL test. Among those with a second VL results, 54 had high VL and 21 (39%) were switched to second line.

**Conclusions:** The VL monitoring program in Sanyati District had leakages at every step of the cascade. The VL testing machines had frequent breakdowns that affected the VL monitoring program including EAC sessions. Some PLHIV remained on EAC because of lack second VL results. We recommended adopting point of care VL testing, use of job aids in EAC and refresher training on managing high VL among PLHIV.

## EPE175

Waiting for a PrEP appointment: how many people have seroconverted?

M. Rocha<sup>1</sup>, T. Batista<sup>1</sup>, I. Correia<sup>1</sup>, M. Oliveira<sup>1</sup>, L. Veríssimo<sup>1</sup>, A. Carrodegua<sup>2</sup>, J. Gonzalez<sup>2</sup>, A. Trombetta<sup>1</sup>

<sup>1</sup>GAT - Grupo de Ativistas em Tratamentos, Lisbon, Portugal, <sup>2</sup>Gilead Sciences, Madrid, Spain

**Background:** In Portugal, both HIV pre-exposure prophylaxis (PrEP) and treatment as prevention (TasP) are accessed in National Health Service (NHS) HIV hospitals units. The Treatment Activists Group (GAT) refers to both according to the status of HIV. The time to complete the first consultation is 30 days after the referral date. People referred for PrEP are at substantial risk for HIV or seroconversion. We aim to estimate the number of people referred for PrEP who seroconverted before accessing the first PrEP medical appointment.

**Methods:** Community health workers provide access to combination prevention according to the status of HIV identified through HIV-1/HIV-2 antibody testing. Referrals for PrEP and TasP are made via a form sent to the hospital consultation email. We extracted referrals made between 2019 and 2023 from the computer archive. We ran statistics for age, gender, country of birth, and key populations. We isolated sequential referrals from PrEP to TasP. We calculated consecutive days between referral dates. We classified cases as "before the first PrEP appointment," "after the first PrEP appointment," and "undetermined" seroconversions. Then, we performed counts and proportions.

**Results:** We referred 8136 people to PrEP.

We identified 53 (0.65%) people referred for TasP after a previous PrEP referral: 20 were cases of seroconversion "before the first PrEP appointment," 27 "after the first PrEP appointment," and 6 "undetermined."

Cases had a median (1Q-3Q) age of 29 (25-31).

These cases occurred mainly in cis men (92.5%) who had sex with men (90.6%) born in Brazil (58.5%).

The distribution of cases by calendar year (2019 to 2023) in the "before the first PrEP appointment" group was 0, 3, 2, 4, and 11, and in the "after the first PrEP appointment" group was 2, 10, 6, and 9. The average (minimum-maximum) interval of consecutive days between referrals in the first group was 139 (58-300), and in the second, 559 (40-1312).

**Conclusions:** The delay in starting PrEP may have contributed to the 20 seroconversions "before the first PrEP appointment" referenced by the GAT between 2019 and 2023. An increasing distribution of these cases/yearly, with half of these occurring in 2023, is of note.

## EPE176

Domestic public spending on HIV in low-and-middle-income countries: current landscape, trends, and determinants (2012-2022)

D. Mattur Ranganath<sup>1</sup>, S. Javadekar<sup>2</sup>

<sup>1</sup>UNAIDS, Equitable Financing Practice, 1202, Switzerland,

<sup>2</sup>University of Bath, Bath, United Kingdom

**Background:** Utilizing econometric modeling and reports to UNAIDS from 108 countries, the analysis on Domestic public spending unveils crucial insights into the determinants of government expenditures on HIV. It provides a comprehensive evaluation of trends (2012-2022) and the present landscape.

**Methods:** The study employs panel data random effects model, analyzing 1600 country-year data points from UNAIDS reports and detailed information on country Gross Domestic Product (GDP), expenditures on health, HIV Prevalence, treatment coverage, residual of Human Development Index (HDI) and other independent variables. Global AIDS Monitoring data for nine countries reporting recent domestic public spending – South Africa, China, India, Turkey, Thailand, Indonesia, Brazil, Russian Federation and Argentina were used instead of modelled estimates.

**Results:** Significant positive associations were found between a country's HIV Prevalence and non-GDP residuals of the HDI and its level of domestic public spending on HIV. Other predictors were GDP per capita, the share of health in total government expenditures, per capita government expenditure, fragile state and political stability index. With an overall goodness of fit of 0.455 and an F-test p-value below 0.05, the model significantly explains the variation in domestic expenditures.

Over the last decade, domestic public funding significantly fuelled the growth of HIV resources, surging by 36.5%. Despite steady growth until the mid-2010s, the momentum slowed, coming to a halt in 2019. By 2022, Domestic resources for HIV were over 3% lower than in 2021 and 7% lower than the peak observed in 2019.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

**Conclusions:** The study underscores the main determinants of domestic public spending for HIV, emphasizing the importance of a country's ability to pay, disease burden, HDI residuals, and the national prioritization of health in government expenditures. Despite past growth, recent declines as evidenced in the study highlight the urgency of sustained investment to resource mobilization targets outlined in the 2021 Political Declaration.

## EPE177

### User costs of accessing HIV testing services among rural communities in Zimbabwe

P. Chiworeka<sup>1</sup>, L. Mashoko<sup>1</sup>, C. Watadzaushe<sup>1</sup>, M. Tumushime<sup>1</sup>, E. Matsikire<sup>1</sup>, J. Dirawo<sup>1</sup>, K. Hartzold<sup>2</sup>, E. Corbett<sup>3</sup>, F. Cowan<sup>1</sup>, E. Sibanda<sup>1</sup>, F. Terris-Presholt<sup>4</sup>, C. Mangenah<sup>1</sup>

<sup>1</sup>CeSHHAR Zimbabwe, SRH, Harare, Zimbabwe, <sup>2</sup>PSI, Harare, Zimbabwe, <sup>3</sup>LSTM, London, United Kingdom, <sup>4</sup>LSHTM, London, United Kingdom

**Background:** Out-of-pocket health care user costs exceeding 10% to 40% of daily income are considered catastrophic health expenditure. Although HIV testing services (HTS) are free in Zimbabwe public health facilities, user costs may discourage uptake. We evaluated user costs associated with accessing HIV testing Zimbabwean rural communities in 2018.

**Methods:** Following community-based distribution of HIV self-tests in 40 rural communities from five districts, we analysed a cost survey nested within a population-based survey among participants reporting health-facility provider-delivered HTS in the last 12 months. Participants completed a self-administered questionnaire including questions on their most recent facility-based provider-delivered HTS episode. We elicited direct and indirect costs including transport, food and incidentals, and childcare, and lost time in productive activities. Opportunity cost of time was valued from self-reported lost time accessing services. Costs were analysed by individual, summarised by district and compared to World Bank national extreme poverty line estimates (\$1.80/day).

**Results:** Among 1,212 participants, mean user cost for testing access was US\$5.96 (US\$5.31-US\$6.61), Table 1. The largest contributor was food and other incidentals (\$3.10, 52%). Time spent accessing services (time for travel, waiting and actual testing tie) averaged 3 hours, translating

to an opportunity cost of US\$1.48. Transport costs were \$1.38 (US\$0.78-US\$1.70). The average user cost for testers exceeded the daily national extreme poverty line by \$4.16(231%).

District							
n=1212							
Cost item	Average costs in USD (2018)						
Transportation	\$1.70	\$0.78	\$1.50	\$1.21	\$1.70	\$1.38	23%
Food and incidentals	\$2.62	\$2.80	\$2.80	\$4.03	\$3.28	\$3.10	52%
Opportunity cost of time	\$1.71	\$1.73	\$1.80	\$0.52	\$1.63	\$1.48	25%
Total user cost	\$6.02	\$5.31	\$6.11	\$5.75	\$6.61	\$5.96	100%
% above poverty line (\$1.80)	234%	195%	239%	219%	267%	231%	

**Conclusions:** Although testing itself was free, respondents incurred substantially high HTS costs, exceeding their daily income and could create uptake barriers. Reducing waiting time at facilities and community-based and community-led provision of services would directly reduce user cost and indirectly the need for purchasing food and other incidentals. If universal health coverage is to be attained, recognizing user costs as a substantial barrier to service uptake and identifying ways to reduce this will be crucial.

## EPE178

### Cost-effectiveness analysis of a community-based model for delivery of anti-retroviral therapy among stable people living with HIV in Cambodia

<sup>4</sup>University of Tokyo, Graduate School of Medicine, Department of Community and Global Health, Tokyo, Japan, <sup>5</sup>National Center for HIV/AIDS, Dermatology and STD, Phnom Penh, Cambodia

**Background:** People living with HIV (PLHIV) need lifelong antiretroviral treatment (ART) to keep their viral load suppressed, maintain a healthy immune system, and reduce the risk of transmitting HIV. However, adherence to ART among PLHIV is affected by many factors, including access to antiretrovirals (ARV), stigma, and lack of social support.

Community-based care has been instrumental in supporting patient management in many countries. This study evaluated the cost-effectiveness of a community-based ART delivery (CAD) intervention among stable people living with HIV in Cambodia.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Methods:** This quasi-experimental study involved 2,040 stable PLHIV in the intervention arm (CAD) and 2,049 PLHIV in the control arm. The CAD intervention involved community action workers (CAWs), who are PLHIV themselves, collecting pre-packaged ARVs from the ART clinics and dispensing them to PLHIV in the communities. PLHIV in the control arm visited the ART clinic and received a 3- to 6-month supply of ARVs under the multi-month dispensing (MMD) model. A cost-effectiveness analysis was conducted with the primary analysis from the public health system perspective, accounting for resource use in the ART clinics between the CAD and MMD arms over the trial period. Using a societal perspective, the secondary analysis included both direct and indirect out-of-pocket expenditure (OOP) incurred by PLHIV and their caregivers in both arms. Additionally, a cost-utility analysis was performed by remapping from Short-Form 12 (SF-12) to EQ-5D-3L.

**Results:** The incremental cost-effectiveness ratio (ICER) for the CAD model was \$3504 per PLHIV adhering to ART and \$2057 per percentage point improvement in the physical component summary (PCS). Both ICERs fell below the defined threshold of three times the gross domestic product (GDP) of Cambodia, rendering the CAD model a cost-effective intervention.

**Conclusions:** This study demonstrated the cost-effectiveness of the CAD intervention in having PLHIV serving as CAWs in delivering ARV to their fellow peers in the community. The results complemented the intervention's effectiveness and implementation feasibility and contributed to the evidence supporting community-based interventions in the care and management of PLHIV in Cambodia.

## EPE179

### Health system determinants and optimizing HIV/AIDS data utilization in health facilities supported by WISH2ACTION in Uganda

H. Opira Kiteze<sup>1</sup>, S.P. Lugolobi<sup>2</sup>, H. Wasswa<sup>3</sup>

<sup>1</sup>Reproductive Health Uganda, Monitoring and Evaluation, Uganda, <sup>2</sup>Reproductive Health Uganda, Clinical Services, Kampala, Uganda, <sup>3</sup>Reproductive Health Uganda, Technical Services, Kampala, Uganda

**Background:** The main goal of this study is to examine how routine health information is used to monitor and make decisions in health facilities supported by the Women's Integrated Sexual Health Programme (WISH2ACTION) in Uganda. The study assumes that using health data effectively leads to better decision-making and improved healthcare outcomes.

**Methods:** The research employs a mixed-method approach that includes quantitative and qualitative data collection techniques through self-administered questionnaires with qualitative insights. The sample size is determined using a two-stage cluster design representing urban and rural health facilities. The target popula-

tion comprises healthcare workers, facility in-charges, clinicians, nurses, midwives, and information officers. Quantitative data analysis involves descriptive statistics, Pearson's Chi-Square test, and Generalized Estimating Equations (GEE) to account for facility-level clustering and correlation.

**Results:** The study received an impressive response rate of 112.5% of the expected sample size, which suggests high participant interest and commitment. Of the total respondents, 58.6% demonstrated the ability to use data for decision-making. The gender distribution of the respondents showed a higher representation of females (64.3%) compared to males (35.7%).

The study identified health facility type, location, and staff education level as the key determinants of FP/RH data use, with a statistically significant correlation ( $p=0.000$ ). Supervisory visits were found to play a crucial role in data utilization, with checklists positively impacting data use ( $p=0.0000$ , 2.0270) and discussions negatively impacting it. The availability of national/district strategic plans and guidelines, creating data visuals, receiving feedback reports, and having a performance monitoring team positively influenced data use. The study also found that staff competence in verifying data accuracy and explaining findings enhances data use.

**Conclusions:** The study offers several recommendations considering the educational background of staff when implementing data utilisation strategies, conducting more frequent supervisory visits with a checklist-based approach to improve data quality, and providing education on the importance of national/district strategic plans and guidelines. Health facilities' management creates an organisational culture that promotes the demand for and use of evidence-based decision-making. Finally, the study established that building staff capacity in data utilisation and emphasising the review of minutes from performance monitoring meetings can enhance data utilisation in healthcare facilities.

## EPE181

### An optimized integrated mechanism to shorten the time from HIV screening to successful enrollment in ART in Beijing city of China

Z. Ding<sup>1</sup>, X. Xiu<sup>1</sup>, A. Alikan<sup>1</sup>, Y. Bao<sup>1</sup>, D. Lu<sup>2</sup>, Y. Shen<sup>3</sup>

<sup>1</sup>AIDS Health Foundation (AHF), Beijing, China, <sup>2</sup>Beijing People Health Foundation, Beijing, China, <sup>3</sup>Beijing Haidian Center for Disease Control and Prevention, Beijing, China

**Background:** Early treatment of people living with HIV (PLHIV) is very important to curb the spread of HIV/AIDS and improve the health of PLHIV. Since August 2023, we began to implement integrated mechanism to optimize the sequence "diagnosis-referral-antiretroviral therapy (ART) enrollment" in pilot health facilities, to shorten the time from HIV screening to successful enrollment in ART.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

**Description:** Before implementing the optimized mechanism, referrals of HIV positive clients were just initiated starting from WB confirmation without involvement of ART clinics, and less communication happened among related facilities, so referrals were basically relied on clients themselves. The optimized mechanism was created including preliminary screening testing facilities, local Centers for Disease Control and Prevention (CDC) and ART clinics with clear duties. ART clinics were required to step in from the positive preliminary screening results to provide tracing and follow-up.

The whole referral was proceeded under close interactions of all related facilities. Under the premise of data protecting, a WeChat working group was established to ensure timely communication among above facilities, so that the positive clients can be identified, contacted and referred in time. Case managers of ART clinics were also newly engaged starting from the preliminary screening to ensure good health education.

**Lessons learned:** From January to July 2023, a total of 25 positive clients were identified locally and successfully enrolled to ART clinics, the average time from preliminary screening to successful enrollment for these cases was 27 days. From August to November 2023 we implemented the optimized mechanism, with 34 positive clients identified and successfully enrolled, the average time from screening to enrolment being 15 days.

This period for 34 positive clients was 12 days shorter than for 25 positive clients. However, the time from HIV screening to confirmation did not change and takes at average 7 days.

**Conclusions/Next steps:** The pilot can help HIV/AIDS clients to get enrollment of ART service sooner. Early involvement of ART clinics and effective communication and progressive intervention between various units can shorten the time from screening to enrollment.

## EPE182

### Implementing cervical cancer screening in routine care for older women living with HIV: experience of VIHEILLIR project in Cameroon

G. Manirakiza Mberyo<sup>1</sup>, L. Ciaffi<sup>2</sup>, S. Modibo<sup>3</sup>, J. Mbah<sup>4</sup>, M. Ngalle<sup>4</sup>, R. Ntolo<sup>4</sup>, E. Mamang<sup>5</sup>, E. Dongmo<sup>5</sup>, S. Yamen<sup>5</sup>, C. Danwe<sup>4</sup>

<sup>1</sup>Projet VIHEILLIR, Yaounde, Cameroon, <sup>2</sup>Université de Montpellier, TransVIHMI UMI 233 IRD U1175 INSERM, Montpellier, France, <sup>3</sup>Comité National de Lutte contre le Sida, Yaounde, Cameroon, <sup>4</sup>Military Hospital Region 1, Yaounde, Cameroon, <sup>5</sup>Bafia District Hospital, Bafia, Cameroon

**Background:** Women living with HIV are six times more at risk of developing cervical cancer (CC). WHO recommends screening with an Human Papilloma Virus (HPV) test, followed by triage with either visual methods or cytology

and treatment of those positive. We share the experience of VIHeillir project (care of comorbidities in elderly people living with HIV) in Cameroon.

**Description:** We offered HR-HPV/DNA testing to women over 50 in two HIV care units, in Yaoundé and Bafia both equipped with PCR testing systems. Project provided HPV cartridges and thermocoagulators. HPV positive women where triaged by visual inspection with Acetic Acid and Lugol's Iodine (VIA/VILI) in the gynaecological service. If eligible, women were treated by thermocoagulation. Biopsies for unclear results were done and confirmed CC referred for management. Beforehand, staff was trained in diagnosis of precancerous lesions.

**Lessons learned:** The CC screening started in March 2022, during 21 months of activities we learned:

Organizational issues:

- All services engaged in care delivery should be involved: identify key persons constantly present in the service and interested in collaboration
- Optimize care pathway between services to ensure inclusion and follow up: awareness by all providers on the need of screening and permanent availability of dedicated staff facilitate procedures.
- Organize steady supply and management of consumables to avoid waste and stock ruptures: a regular follow up of stocks, expiration dates should be in place
- Avoid dependence on a unique screening algorithm and plan for alternatives in case of breakdown of the PCR device,

Communication and training issues:

- Share care algorithms with all care providers: support of nationally recognized experts has an impact on acceptability of the strategy.
- Information on CC and HPV during routine visits improves women adherence to care: verify the effective use of educational tools and assess patients understanding
- Organize inclusive and continuous training with an engaged pool of trainers

**Conclusions/Next steps:** The integrated strategy « test and treat » in HIV units is feasible in Cameroon. Challenges with medical supplies, maintenance of equipment and limited knowledge of women on the need for screening could be barriers to effective implementation.

## EPE183

### Sustaining HIV epidemic control through locally-led approaches

D. Khaoya<sup>1</sup>, K. Marra<sup>2</sup>

<sup>1</sup>Palladium, Nairobi, Kenya, <sup>2</sup>Palladium, Washington DC, United States

**Background:** Approaches to sustain epidemic control must be contextualized, locally led, and adaptable. Through comprehensive insurance benefit packages, improved workforce information systems, and enhanced capacity in financial management and regulation of social contracting, our activities empower partners to advance global health goals and sustain improved health outcomes.

**Description:** The presentation demonstrates four locally led approaches:

#### 1. Integrating HIV into Health Financing Mechanisms

In Nigeria, the project collaborated to develop national and state-level blueprints, leading to over 90% of facilities providing HIV services through health insurance and the expansion of coverage to 611,000 individuals. Success has extended to Tanzania, Burkina Faso, and Ethiopia, with Cambodia catalyzing universal access to free healthcare, including HIV care.

#### 2. Improving Public Financial Management

Capacity strengthening and mentorship support in 14 countries focused on key efficiency drivers including PFM, activity-based costing, and program-based budgeting. In Kenya, this resulted in 26 counties mobilizing \$20 million for HIV. In Nigeria, budget allocation increased 67% with a 193% increase in funds released for HIV.

#### 3. Supporting Social Contracting

The project has supported 22 countries in operationalizing and optimizing social contracting mechanisms, particularly through the development of an adaptable social contracting diagnostic tool. In the Kyrgyz Republic funding for social contracting increased by 35%.

#### 4. Strengthening Health Workforce through Improved Health Information Systems

In Botswana, the project upgraded and migrated the integrated Human Resource Information System (iHRIS), ensuring an up-to-date and accessible health workforce database critical for sustained epidemic control and preparedness for future crises.

**Lessons learned:** Our approaches emphasize locally led and adaptable solutions. Successes include the elimination of user fees, strategy development for domestic resource mobilization, effective extension of social protections, and strengthened PFM.

Lessons learned underscore the significance of tailored, evidence-based approaches and collaboration with local stakeholders, ensuring the integration of HIV services into broader health systems for sustained epidemic control.

**Conclusions/Next steps:** The project and its results demonstrate the importance of intentional, embedded, and localized sustainability efforts. In the context of do-

nor transition, competing priorities, and compressed fiscal space, it's paramount that sustainability is treated as an ongoing, transformative process to protect gains and safeguard against reversals.

## EPE184

### The last mile: can the achievement of UNAIDS 95-95-95 targets be sustained in a region with high burden of HIV? Comparing serial population-based surveys in western Kenya, 2018-2022

E. Katiku<sup>1</sup>, A. Cleveland<sup>1</sup>, L. Nganga<sup>1</sup>, M. Otieno<sup>2</sup>, S. Khagayi<sup>2</sup>, V. Kamire<sup>2</sup>, D. Kwaro<sup>2</sup>, S. Gachau<sup>1</sup>, A. Aoko<sup>1</sup>, R. Joseph<sup>3</sup>

<sup>1</sup>CDC, Kenya, DGHT, Village Market, Kenya, <sup>2</sup>KEMRI, Kisumu, Kenya, <sup>3</sup>CDC, South Africa, Pretoria, South Africa

**Background:** Western Kenya is home to ~30% of Kenya's estimated 1.4 million people living with HIV (PLHIV). We analyzed data from two serial population-based HIV bio-behavioral surveys (HBBS) done in 2018 and 2022 to determine status of the Joint United Nations Programme on HIV/AIDS (UNAIDS) 95-95-95 targets and compared social and behavioral factors in the population across both surveys in a region with high burden of HIV.

**Methods:** We analyzed data on health services, behavioral risks, HIV status, and viral load, from 20,742 persons aged 15+ years in Siaya County, western Kenya of whom 2,878 were PLHIV: 1,756 in 2018 and 1,122 in 2022. We calculated weighted prevalence of demographic and behavioral factors, HIV infection, knowledge of status, antiretroviral (ART) use and viral load suppression (VLS; <1,000 copies/mL) and compared data between survey years using chi-squared tests.

**Results:** Majority, (70%) of the PLHIV were female, and median age was 41 years (interquartile range, 33-50). HIV prevalence declined from 15.8% (95% confidence interval [CI]15.5-16.1) in 2018 to 11.5% (95% CI 11.2-11.7) in 2022; and was higher in females than males (18.9% vs. 11.0% in 2018; 13.6% vs. 8.6% in 2022).

Overall, there were significant decreases in having: ever experienced violence (19.4% vs. 9.4%,  $p<0.001$ ), sexually transmitted infection in the past 12 months (5.5% vs. 3.9%,  $p<0.029$ ) and multiple sexual partnerships (27.1% vs. 21.1%,  $p<0.001$ ). Among males, HIV disclosure to partners decreased from 86.3% to 80.8% ( $p=0.03$ ); and use of mind-altering substances remained high; 28.8% in 2018 vs. 32.7% in 2022 ( $p=0.20$ ). In 2018, 95.7% of PLHIV knew their HIV status, 96.1% of whom were on ART, and 92.4% were virally suppressed while in 2022 the achievement was 97.3%, 98.5%, and 98.5%.

**Conclusions:** The 2020 UNAIDS 90-90-90 and more ambitious 95-95-95 targets were surpassed in 2018 and 2022 respectively, highlighting the effectiveness of Siaya County's HIV program. Nevertheless, strategies to increase disclosure of HIV status and address high prevalence of

mind-altering substance use among males may be useful. A limitation of our study is the paradox of decline in HIV prevalence and may be a pointer to attrition and mortality.

## EPE185

Cardiovascular health assessment in people living with HIV in Sub-Saharan Africa

G.J. Manyangu<sup>1</sup>, S. Khan<sup>2</sup>, R.N. Peck<sup>3</sup>

<sup>1</sup>Bugando Medical Centre, Research and Consultancy, Mwanza, Tanzania, the United Republic of, <sup>2</sup>Weill Cornell Medical College-Qatar, Weill Cornell Medical College, Qatar, Qatar, <sup>3</sup>Weill Cornell Medicine, Center of Global health, New York, United States

**Background:** People living with HIV (PLWH) are at elevated risk of cardiovascular disease due to traditional, HIV-specific, lifestyle factors; their cardiovascular health profiles (CVH) are therefore complex and require thorough characterization to guide primary prevention efforts.

The American Heart Association's Life's Simple 7 (LS7) scale was employed in PLWH receiving antiretroviral therapy (ART), and there is limited data on ART-naïve individuals. Therefore, we applied LS7 scale to compare CVH between ART-Naïve PLWH and HIV-negative adults in Tanzania.

**Methods:** A cross-sectional analysis was conducted using the HTN& HIV and CICADA Datasets with PLWH and HIV-negative adults recruited from HIV clinics in Mwanza, Tanzania, East Africa. Modified Life's Simple 7 (LS7) definitions were applied to the cohorts.

Ordinal regressions were employed to investigate associations between HIV status and each individual LS7 metric adjusting. Poisson regressions to evaluate relationship between HIV status and Total LS7 Score.

**Results:** Our study included 2219 participants, where 492 PLWH and 503 controls in HTN& HIV and 860 PLWH, 364 HIV-negative in CICADA cohort. PLWH had higher total LS7 scores (4.3 vs 3.9,  $p<0.001$ ) and (4.16 vs 3.85,  $p=0.015$ ) in HIV & HIV and CICADA cohorts respectively.

PLWH also had higher prevalence of ideal overall CVH (47% vs 33%,  $p<0.001$ ) and (40% vs 35%,  $p<0.001$ ) in the respective cohort. This difference remained significant even after adjusting for potential confounding.

In both cohort, PLWH had higher prevalence of Ideal BMI, Ideal Blood Pressure, Ideal Total Cholesterol than HIV-negative counterparts and lower prevalence of Ideal Smoking.

By contrast, PLWH in HTN & HIV cohort had lower prevalence of Ideal Physical Activity while PLWH in CICADA cohort had lower prevalence Ideal Blood Glucose.

**Conclusions:** Cardiovascular disease prevention for newly diagnosed PLWH in Sub-Saharan Africa should prioritize primary prevention strategies such as smoking cessation, enhancing physical activity levels, and screening for diabetes.

Figure 2: Distribution of Life's Simple 7 Metrics in PLWH and HIV-negative participants in HTN&HIV cohort

Figure 1: Distribution of Life's Simple 7 Metrics in PLWH and HIV-negative participants in CICADA cohort

## EPE186

A mixed methods evaluation of barriers to and clinical outcomes of lung cancer screening among people living with HIV

A. Hatch<sup>1</sup>, B. Toll<sup>1,2</sup>, A. Rojewski<sup>1,2</sup>

<sup>1</sup>Medical University of South Carolina, Public Health Sciences, Charleston, United States, <sup>2</sup>Hollings Cancer Center, Charleston, United States

**Background:** People living with HIV (PLWH) experience higher rates of tobacco use and lung cancer than the general population. Lung cancer screening (LCS) with low-dose computed tomography (LDCT) may identify lung cancer at earlier, more treatable stages, yet the uptake of LCS among PLWH is low. Understanding physician knowledge of and barriers to LCS referral may increase screening rates. Evaluating the clinical outcomes of PLWH who engaged in LCS shared decision-making visits may provide additional data to highlight the importance of preventive screening.

**Description:** This quality improvement project was conducted to identify potential barriers and facilitators to increasing referrals of PLWH to an LCS program at an academic medical center in the United States.

Phase 1 consisted of chart extraction identifying PLWH who have undergone a shared decision-making visit for LCS from 2015-2023.

Phase 2 consisted of a survey of infectious disease providers' knowledge of and perceived barriers to LCS. Screening outcomes and provider perceptions of LCS were evaluated to understand barriers and facilitators in the LCS pathway of PLWH.

**Lessons learned:** A shared decision-making visit was attended by 61 PLWH and 96.7% subsequently completed the LDCT. At the baseline scan, the average age was 61 years. Individuals were 56% Black, 73% male, and average

pack year smoking history was 41. At the baseline scan, 31% had a positive screen (lung nodule  $\geq 4\text{mm}$ ) and 2 lung cancers were identified. Twelve providers responded to the survey with 100% agreeing that LCS is beneficial to PLWH. Providers endorsed perceived barriers to LCS including 83% citing a lack of knowledge on LCS eligibility guidelines.

**Conclusions/Next steps:** PLWH that engage in a shared decision-making visit are likely to complete the LDCT. The benefit of LCS in this population is highlighted by the screening findings. Survey results highlight that providers understand the importance of LCS but encounter many barriers to education and referral. Decreasing barriers to referral may have a positive impact on screening rates, prognosis, and treatment of lung cancer among PLWH. Next steps include incorporating provider referral pathways and alerts into the electronic health record and engaging care team members to promote LCS.

early detection and treatment. The Image Service is part of our strategy; for this reason, we have a doctor specializing in Neuro-Imaging who responds primarily to queries from the Neuro-AIDS subdivision, which improved care and prevented delays in requesting CT and MRI.

## EPE187

### Integration in the care and treatment of Neuro-AIDS in HIV: experience of the Centenario Provincial Hospital from Argentina

M. Mian<sup>1,2</sup>, S. Frioni<sup>1,2</sup>, P. Parenti<sup>1,2</sup>

<sup>1</sup>National University of Rosario, School of Medicine, Rosario, Argentina, <sup>2</sup>Hospital Provincial del Centenario, Medicine, Rosario, Argentina

**Background:** The objective of the work is to carry out a retrospective analysis of the experience of integration of the HIV/AIDS Service, Imaging Service and Neurology Service (Neuro-AIDS) at the Centenario Provincial Hospital.

**Description:** We mainly treat patients in the Neuro-AIDS stage, for which we established a joint approach strategy between Neuro-Infectology and Neuro-Imaging specialists, by offering specific consultations within the HIV/AIDS Service, achieving greater adherence to specific treatments. Our HIV/AIDS Service operates within the Centenario provincial Hospital, where it is integrated into the *Imaging and Neurology Services (Neuro-AIDS)* in a joint approach strategy.

We develop healthcare tasks such as HIV detection campaigns in our community, while providing access to the *National Program for Treatment and Response to HIV/AIDS* in Argentina, making it easier for patients to monitor and control the infection, antiretroviral therapy, and we offer a medical team made up of specialists from different Services.

**Lessons learned:** The *Comprehensive Approach Strategy for Neuro-AIDS* has demonstrated a significant reduction in its occurrence within our service, a fact demonstrated by Neurology admissions to ICUs in 2023 with Neuro-AIDS deaths (1 of 89 patients). In turn, we have established a limit point in the case of Neurosyphilis for screening at 1/32 as an indication for Lumbar Puncture, which allowed

**Conclusions/Next steps:** Neuro-AIDS is composed of extremely aggressive pathologies with great morbidity and mortality; for this reason, we have established a joint approach strategy that has proven to reduce its appearance and improve the life expectancy of those who suffer from it. We believe that integration in Neuro-AIDS care means a better quality of life for patients.

## EPE188

### Integration of comprehensive infectious disease screening within an inpatient detoxification unit in Philadelphia: capitalizing on engagement opportunities to reduce harm and improve patient outcomes

K. Dyer<sup>1</sup>, S. Sabetan<sup>2</sup>, M. Bourbeau<sup>3</sup>, W.-T. Yang<sup>1</sup>, J. Torgersen<sup>1</sup>, N. Aitchison<sup>1</sup>

<sup>1</sup>University of Pennsylvania, Infectious Disease, Philadelphia, United States, <sup>2</sup>University of Pennsylvania, Psychiatry, Philadelphia, United States, <sup>3</sup>University of Pennsylvania, Philadelphia, United States

**Background:** People living with substance use disorders (SUD) are at higher risk for infectious diseases (ID) relative to people without SUD but have low rates of screening given barriers to accessing care. Short-stay detoxification units offer engagement opportunities for ID screening, but challenges to implementation include limited time for disclosing results and appropriate management. We explored the feasibility and uptake of embedding comprehensive ID screening labs into an inpatient detoxification unit in Philadelphia.

**Description:** From July 10, 2023 to January 10, 2024, patients admitted to a 12-bed inpatient detoxification unit embedded within an acute medical center were offered opt-out ID screening by attending addiction psychiatrists.

Screening tests included HIV antigen/antibody, Hepatitis A (HAV) IgG, Hepatitis B (HBV) (surface antigen, surface antibody, core IgG antibody), Hepatitis C (HCV) antibody with reflex to confirmatory viral load, interferon gamma release assay (IGRA), and sexually transmitted infections (STIs) (syphilis, gonorrhea, chlamydia, trichomonas). The proportion of labs collected, identified infections, and preventive service needs were assessed. No systematic screening existed prior to this intervention.

**Lessons learned:** Of 242 patients admitted to the unit during the study period, screening was completed in 132 (55%) for HIV, 114 (47%) for HAV, 138 (57%) for HBV, 143 (59%) for HCV, 118 (49%) for IGRA, 143 (59%) for syphilis and 108 (45%) for gonorrhea/chlamydia.

Of patients who were screened, 69 (50%) and 51 (45%) were identified as needing HBV or HAV vaccination respectively. 5(4%) individuals living with HIV who were out of care were identified and re-linked to care. 44 (31%) of patients screened for HCV needed treatment and 19 incident episodes of STIs were identified.

Facilitators to screening included invested providers and presence of phlebotomy on-site. Barriers included short stay and off-site outpatient clinic which limited patients' ability to follow up on results despite linkage to outpatient ID care.

**Conclusions/Next steps:** Embedding ID screening tests into a short-stay detoxification unit was feasible and resulted in timely identification of previously undetected cases of infectious diseases, facilitating prompt linkage to care. Future implementation research should evaluate the effectiveness and sustainability of an integrated admission order-set and track receipt of follow up care to build on this work.

## EPE189

### Providers' and PLHIVs' perspectives on integrating the management of hypertension into community ART delivery models in Uganda

M. Muddu<sup>1</sup>, R. Namaganda<sup>2</sup>, F. Ayebare<sup>3</sup>, J.L. Davis<sup>4</sup>, J. Kiwanuka<sup>2</sup>, M. R. Kamya<sup>2</sup>, A. R. Katahoire<sup>2</sup>

<sup>1</sup>Infectious Diseases Research Collaboration (IDRC), Clinical, Kampala, Uganda, <sup>2</sup>Makerere University College of Health Sciences, Kampala, Uganda, <sup>3</sup>IDRC, Kampala, Uganda, <sup>4</sup>Yale University School of Public Health, New Haven, United States

**Background:** Although community antiretroviral therapy (ART) delivery models improve retention and viral load suppression for PLHIV, hypertension management is not integrated into these models, yet over 20% of PLHIV receive care in the community and are at risk of cardiovascular disease.

This study sought to explore stakeholders' perspectives on integrating hypertension care in community ART delivery models in Uganda.

**Methods:** We conducted 39 interviews with healthcare providers (n=12), health leaders (n=5), policymakers (n=3) and PLHIV with hypertension (n=19). The study was conducted in four health facilities in three districts including Butambala, Gomba and Sembabule in central Uganda. Interviews were audio recorded, transcribed verbatim, and later translated into English. We de-identified the data by adding unique labels to audio files and transcripts. A codebook was developed with major codes identified and their definitions. All the transcripts and the codebook were uploaded into NVivo 20 software for further coding and analysis. Data was analyzed thematically.

**Results:** We identified two major themes; *experiences of PLHIV with hypertension services in community ART models*, and *stakeholder perspectives on how to integrate hypertension services in community ART delivery models*. Regarding their experiences, PLHIV either received no hypertension services at all or they only received prescriptions for hypertension medicines that they had to buy from private pharmacies. There were frequent stock outs of hypertension medicines and when medicines were available, options were limited. As a result, patients often resorted to alternative medicines especially herbal medicines. In relation to stakeholder perspectives, the study reveals the need to engage and work with PLHIV peers, community health workers and other community providers. Additionally, training healthcare providers, ensuring availability of medicines and BP machines, putting in place guidelines to ensure integration of hypertension management in community ART delivery and setting up monitoring and evaluation systems for hypertension are needed.

**Conclusions:** Non-integration of hypertension care in community ART puts PLHIV at risk of cardiovascular disease and use of unreliable care. Leveraging existing community structures, training providers, ensuring medicine availability and routine service monitoring for hypertension would go a long way to ensure integration of hypertension care in community ART delivery models.

## EPE190

### Leveraging Geo-NLP for enhanced antiretroviral drug distribution in Nigeria using social media and news data

O. Bashirudeen<sup>1</sup>

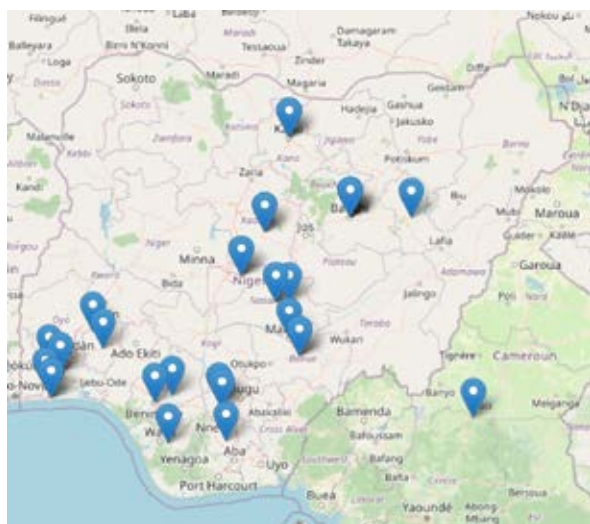

<sup>1</sup>University of Ibadan, Pharmacy, Ibadan, Nigeria

**Background:** In Nigeria, the timely and efficient distribution of antiretroviral drugs (ARVs) is crucial for supporting people living with HIV/AIDS. This study revolutionizes ARV distribution in Nigeria using Geo-NLP, analyzing 52,858 words from online sources about HIV/AIDS and ARVs. It addresses key distribution challenges by efficiently processing complex textual data.

**Methods:** Employing **spaCy** an open source software library for advanced natural language processing, the Geo-NLP model demonstrated exceptional accuracy in categorizing data across multiple labels, including HIV/AIDS-related terms, antiretroviral drugs, and geographical locations, ensuring precise demand analysis and intervention identification.

**Results:** The model's high performance (Precision up to 0.99, Recall up to 0.98) allowed for unparalleled insights into regional ARV needs, reshaping the distribution strategies to be more responsive and efficient.

**Label: HIV/AIDS-RELATED TERMS**

- Precision: 0.95
- Recall: 0.93
- F1-score: 0.94

**Label: ANTIRETROVIRAL DRUGS**

- Precision: 0.95
- Recall: 0.94
- F1-score: 0.95

**Label: GEOGRAPHICAL LOCATION**

- Precision: 0.98
- Recall: 0.95
- F1-score: 0.96

**Label: DATES AND TIMES**

- Precision: 1.00
- Recall: 0.97
- F1-score: 0.98

**Label: NUMBERS AND STATISTICS**

- Precision: 0.96
- Recall: 0.93
- F1-score: 0.95

**Label: ORGANISATIONS**

- Precision: 0.99
- Recall: 0.98
- F1-score: 0.99

**Conclusions:** The innovative use of Geo-NLP to analyze social media and news data offers a novel approach to addressing the distribution challenges of ARVs in Nigeria. This method can enhance the effectiveness of HIV/AIDS treatment programs by ensuring better alignment of

supply with actual regional demands, potentially shaping future strategies in global health management and intervention planning.

## EPE191

### Evaluating expenditures: automating HIV financial data quality reviews for improved reporting

L. Hart<sup>1</sup>, G. Morgan<sup>1</sup>, E. Dunlap<sup>1</sup>

<sup>1</sup>U.S. Agency for International Development, Office of HIV/AIDS, Washington, DC, United States

**Background:** For transparency and accountability, recipients of PEPFAR funding have provided detailed annual expenditure data since 2014, using a Financial Classification Guide to categorize spending by a program area, population, and cost element. Differing interpretations of the guidance can result in inconsistent representation of investments and annual spend per results on key focus areas such as treatment and prevention. High-quality financial data is critical for PEPFAR's evidence-based approach to resource allocation, financial monitoring, and stakeholder reporting. It is also crucial for strategic planning for a sustainable transition of donor-funded HIV programming to country government-funded programming.

**Methods:** USAID automated new data quality checks across dimensions of timeliness, completeness, adherence, accuracy, integrity, validity, and reliability. A global qualitative and quantitative analysis across 56 countries and 575 unique USAID Implementing Mechanisms (IMs) triangulated budget, expenditure, and program monitoring data to identify issues of alignment and adherence to financial classification guidance. Country-level results reports summarized IMs' data quality findings for discussion and partner revision, as necessary, prioritizing missing submissions and subrecipients' misclassified costs attributed to program management.

**Results:** Completeness: In FY23, 490 of 575 (85%) eligible IMs initially submitted data. After performing the global completeness check, USAID increased data completeness to 507 (88%), resulting in a 3% submission increase, totaling \$45,520,185 in previously unreported HIV investments. Validity: Initial submissions revealed 156 subrecipients (totaling \$10,814,113) reporting >50% of investments spent on operational costs. After investigating which dollars did not meet the definition of technical vs operational costs, the number was reduced to 61 subrecipients reporting 50% or more of their HIV investments on operating costs, or \$4,959,056.

#### Conclusions:

As PEPFAR engages global stakeholders in discussion of sustainability, USAID relies on high quality data for policymakers to understand how investments in treatment, prevention, and key and priority populations advance progress toward UNAIDS 95-95-95 goals for HIV control.

More investigation is required of PEPFAR investments to explore trends and best practices that can be shared across countries and used to inform data-driven policy decisions.

## EPE192

Evaluate and elevate: leveraging the CASPR Outcomes Assessment Tool (COAT) to enhance advocacy impact

P.R. Mharire<sup>1</sup>, B. Ncube<sup>1</sup>, G. Tetteh<sup>2</sup>, R. Sutton<sup>2</sup>

<sup>1</sup>Pangaea Zimbabwe, Monitoring, Evaluation, Results and Learning, Harare, Zimbabwe, <sup>2</sup>AVAC, Monitoring, Evaluation, Results and Learning, New York, United States

**Background:** Advancing community-centered HIV prevention research relies on strong, evidence-based advocacy by coalitions and civil society representing community demands. However, it can be challenging to identify which strategies are successful amongst many stakeholders in a complex research and policy environment. This calls for an effective approach to assess intended and unintended outcomes, sustainability, and establish corrective actions to strengthen future advocacy work.

**Description:** The CASPR Outcomes Assessment Tool (COAT) is a unique tool designed to help advocates quantitatively assess results, analyze the impact of their work, and use that evidence for decision-making and planning the next steps. Advocates start by identifying outcomes, then connect them to key activities/strategies, and evaluate evidence of their contributions to the result. They assign a quantitative rating to 3 dimensions: Influence, Recognition, and Durability, and provide qualitative evidence for the rating. An impact score for each outcome is calculated from 0 (low impact) to 12 (high impact). In the Summary Action Plan, advocates devise follow-up actions for outcomes with low impact, strengthening results and adjusting tactics. The completed COAT report showcases attained outcomes, outlines adjustment plans for underperforming outcomes, and the collective value and influence on the HIV Prevention research agenda.

**Lessons learned:** The COAT effectively assesses advocacy outcomes within CASPR, a consortium of eleven African partners focusing on HIV Prevention Advocacy Research. Unlike traditional methods, CASPR partners use the COAT to brainstorm results, evaluate impact over time, and continuously learn about effective strategies. These impactful results are shared with the Coalition, aiding partners in refining their approaches. The COAT has documented successful advocacy, including the effectiveness of research literacy efforts to strengthen community and stakeholder engagement during clinical trials.

**Conclusions/Next steps:** The COAT enables advocates to concentrate on outcomes rather than solely engaging in activities. It is a valuable tool to gauge the impact of advocacy activities on HIV prevention research and access

and guides them in creating a clear roadmap of successful strategies and areas for improvement. The COAT allows advocates to refine their approach, enhance their impact, and ultimately drive meaningful change in their respective spheres of influence.

## EPE193

Social Network Analysis of MSM in Zhuhai based on a geosocial networking application

J. Mu<sup>1</sup>, F. Jing<sup>2</sup>, X. Zhang<sup>1</sup>, S. Hu<sup>1,3,4</sup>, Y. Zhou<sup>5</sup>, Y. Ye<sup>6</sup>, W. Tang<sup>1,3</sup>

<sup>1</sup>University of North Carolina Project – China, Guangzhou, China, <sup>2</sup>Faculty of Data Science, City University of Macau, Taipa, Macao SAR, Macau, China, <sup>3</sup>Dermatology Hospital of Southern Medical University, Guangzhou, China, <sup>4</sup>School of Public Health, Southern Medical University, Guangzhou, China, <sup>5</sup>Zhuhai Center for Diseases Control and Prevention, Zhuhai, China, <sup>6</sup>Center for Infectious Disease Modeling and Analysis, Yale School of Public Health, Yale University, New Haven, United States

**Background:** Social network analysis (SNA) can enhance our understanding of the social network structure among men who have sex with men (MSM), aiding in the implementation of social-network based interventions.

**Methods:** We used a web crawler to gather data on 11,026 Blued users from September 2021 to November 2021. After that, 3321 inactive users were excluded. Each node represents a user located in Zhuhai. An edge between two nodes represents the existence of the follower/followee relationship or interactions between them. MSM network was constructed with 7,705 nodes and 84,020 edges, weighted by the frequency of digs and comments. We analyzed the topological properties of the entire MSM social network and plotted the subgroup networks for MSM who reported their occupation, number of partners, HIV self-testing status, and pre-exposure prophylaxis (PrEP) use.

**Results:** The majority of Blued users in Zhuhai are young (median: 31 years), 83.7% of users are between 17 and 39 years old. About 37.2% of MSM prefer not to disclose their sexual role, with those identifying as top, bottom, and versatile accounting for 22.5%, 13.4%, and 26.8%, respectively. The number of self-reported sex partners for MSM ranges from 1 to 8, with a median of 2. The overall MSM network exhibits low reciprocity (0.08) and negative assortativity (-0.04), with other topological characteristics such as all degree (average: 22.22), edge density (0.002), transitivity (0.048), and eigenvector centrality scores (0.0002). Among the 901 MSM who self-reported their occupation, students (13%) and tourism/hotel/catering workers (13%) constitute the main populations. Those employed in film/entertainment/culture (5%) show greater activity than others, with biggest all degree (average: 39.15) and betweenness (average: 0.014). In the sub-networks of individuals who have

taken an HIV self-test (n=243) and used PrEP (n=33), young people remain a key population, mirroring the characteristics of the overall network.

**Conclusions:** The Zhuhai MSM population is predominantly young, and the overall network exhibits low reciprocity, indicating a failure to establish reciprocal friendships with others. Additionally, the negative assortativity of the overall network suggests that nodes prefer to attach to others with dissimilar degrees. These topological properties are similar to those of the global MSM Blued network.

## EPE194

### Youth community-led monitoring (Youth-CLM) data collection model for monitoring free HIV/AIDS services (user fees) in Cameroon

L. Sonwa Lontsi<sup>1</sup>, P. Kedy Guy<sup>1</sup>, E.B. Monthe<sup>1</sup>, L. Lontsi Tsakou<sup>1</sup>, P. Fouda<sup>1</sup>

<sup>1</sup>Réseau Camerounais des Adolescents et Jeunes Positifs, Yaoundé, Cameroon

**Background:** The contribution of community-led monitoring mechanisms to improving practices and the quality of HIV/AIDS services offered to people living with HIV is well established. However, the quality of the data obtained is often called into question. In order to ensure the quality of this data, we are sharing a model for data collection. We are sharing a data collection model implemented by the Cameroon Network of Positive Adolescents and Young People (RéCAJ+) and used as part of Youth Community-Led Monitoring (Youth-CLM).

**Description:** Since December 2022, RéCAJ+ has been implementing Youth-CLM in 50 health facilities in the country's 10 regions, with a focus on monitoring the policy of free HIV services (user fees) in health facilities (FOSA). Two collection methods are highlighted with 3 data sources. The first method consists of data collection by sentinels rigorously trained among adolescents and young people living with HIV (AJvVIH) and health providers in health facilities using questionnaires.

The second method consists of data collection through visits to health facilities by mystery shoppers using an evaluation grid.

**Lessons learned:** During quarter 1 2023, 400 AJvVIH beneficiaries and 191 healthcare providers responded to the questionnaires. Mystery shopper data were collected in 14 health facilities. 11.5% (46/400) of beneficiaries and 5.2% (10/191) of health providers said they were not aware of the free services policy. 9.3% (39/400) said they had paid for free services. In addition, during a visit to the health facilities, a mystery shopper paid for a free service.

The reasons given for non-compliance with user fees were: 18.8% (38/191) non-reimbursement of facility invoices, 3.7% (7/191) partial reimbursement, 3.1% (6/191) late reimbursement and 1.6% (3/191) input stock shortages.

**Conclusions/Next steps:** The time taken to reimburse hospital bills needs to be reduced, and awareness-raising campaigns for PLHA beneficiaries and healthcare providers need to be carried out to ensure that user fees are properly implemented.

The triangulation of methods within the framework of community-led monitoring makes it possible to verify and complete the data obtained in order to propose targeted actions to improve the situation.

## EPE195

### What are the results of HIV prevention programs? Developing a Theory of Change and Results Framework to guide Global Fund investments

A. Gerritsen<sup>1</sup>, J. Zhao<sup>1</sup>, L. Aloo<sup>1</sup>, S. McLean<sup>1</sup>

<sup>1</sup>The Global Fund, Geneva, Switzerland

**Background:** The pathway of change for HIV primary prevention is more intricate than for HIV treatment. Measuring prevention results is also more complex. This complexity is exacerbated by increasing numbers of people living with HIV that are virally suppressed.

For Global Fund-supported HIV programs, there is a need to increase the understanding about how prevention interventions work and what the important results are.

Figure 1. Theory of change - Underlying GF investment in HIV primary prevention - pathways of change / how the programme works.

Figure 2. Global Fund HIV primary prevention Results Framework - results chain (from inputs to impact)

**Description:** Based on literature reviews and consultations, two HIV prevention frameworks were developed:

1. A Theory of Change (Figure 1) illustrating that biomedical interventions have a shorter pathway to reducing the risk of HIV acquisition than behavioural and structural interventions, but at the same time that these interventions support each other to achieve the results;

2. a Results Framework (Figure 2) elucidating the relationships between inputs (investments), outputs (coverage), outcomes (use, behaviour) and impact (change in new infections). It categorizes outcomes closely tied to impact as "primary".

**Lessons learned:** During the funding request processes of Grant Cycle 7, the Results Framework guided Global Fund grant recipients and relevant stakeholders to prioritize HIV prevention interventions for which there is evidence that these lead to changes in primary outcomes such as more people using HIV prevention options like condoms or PrEP.

**Conclusions/Next steps:** The process highlighted a notable absence of routine collection of prevention outcome data, as surveys are conducted infrequently. The next step for the Global Fund is to promote rapid, easy to administer and cost-effective methods to monitor outcome data to inform and monitor HIV prevention programs.

## EPE210

Provider perceptions of the implementation context for interventions to support people returning to HIV care in Cape Town, South Africa

T. Phillips<sup>1</sup>, N. Gwiji<sup>1</sup>, H. Wolpe<sup>1</sup>, K. Clouse<sup>2</sup>, S. Maman<sup>3</sup>, B. Chi<sup>4</sup>, L. Myer<sup>1</sup>, L. Knight<sup>1</sup>

<sup>1</sup>University of Cape Town, School of Public Health, Cape Town, South Africa, <sup>2</sup>Vanderbilt University, School of Nursing, Nashville, United States, <sup>3</sup>University of North Carolina, Gillings School of Global Public Health, Chapel Hill, United States, <sup>4</sup>University of North Carolina, Department of Obstetrics and Gynecology, Chapel Hill, United States

**Background:** People on lifelong antiretroviral therapy may cycle in and out of care over time. Understanding provider perceptions about supporting people returning to treatment will aid the development of scalable interventions.

**Methods:** We conducted in-depth interviews with nurses (n=5), counsellors (n=3) and clerks (n=3) at two large HIV clinics in Cape Town, South Africa. Using thematic analysis, guided by the constructs of the Consolidated Framework for Implementation Research Inner Setting domain, we explored the current implementation context for interventions to support return to HIV care after a treatment interruption.

**Results:** *Culture, Relational Connections and Communication:* Providers' feelings towards returning clients ranged from enthusiastic to frustrated. Providers felt that fostering supportive and caring relationships with clients was critical but suggested that anticipated and/or experienced stigma and poor care experiences, including rude providers and long waiting times for those without appointments, were common reasons for repeat disengagement and failure to return to care. Fast-tracked ser-

vices are available for returning clients but are not well known, and fears about negative experiences may lead people to misrepresent themselves as new clients on return, rather than identify as having interrupted care. Positive staff attitudes were highlighted as a necessity across all cadres of staff in the clinic, along with clearer communication between teams, to encourage re-engagement.

*Structural Characteristics and Available Resources:* Missing folders, lack of coordination within a clinic and difficulties transferring between clinics, were reported to create confusion and delays. Linked electronic record systems across clinics are available for the Western Cape province but respondents noted limited use due to poor information technology infrastructure.

Insufficient staff and training were also raised as barriers to providing efficient and supportive care to returning clients. Providers identified flexible service options, like community adherence clubs and treatment buddies to collect medication, as missed opportunities to support returning clients as local guidelines restrict eligibility to those who are virally suppressed.

**Conclusions:** Although providers recognize the need to support returning clients after a treatment interruption, the implementation context in this high burden setting is complex. Interventions are needed to encourage welcoming and simplified services to support providers and people returning to HIV care.

## EPE212

Development of a case-finding algorithm to identify people living with HIV in Medicaid claims data

E.E. Corbin-Gutierrez<sup>1</sup>, K. Outlaw<sup>1</sup>

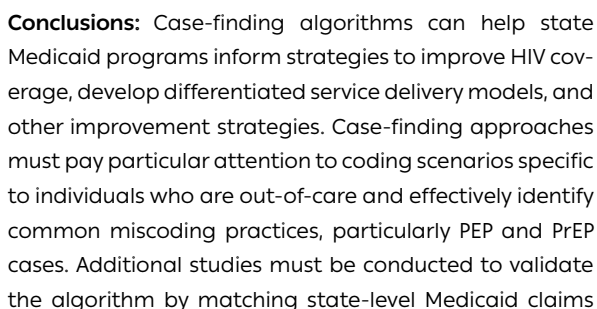

<sup>1</sup>NASTAD (National Alliance of State and Territorial AIDS Directors), Washington, United States

**Background:** State Medicaid programs cover 43 percent of all people with HIV in the United States. Identifying people with HIV in Medicaid claims datasets can be challenging; states report almost 20 percent of Medicaid beneficiaries missing HIV-related claims. Similarly, state HIV surveillance and Medicaid programs report miscoded in claims data is more common than previously thought. Accurately identifying people with HIV in claims data is essential to understanding this population, developing differentiated service delivery models, implementing quality measures, and coordinating services across systems of care.

**Methods:** The team conducted a review of peer-reviewed articles and grey literature published 2013–2023, to understand the various methods previously used to identify people with HIV in claims datasets. An algorithm synthesizing these findings was developed. The algorithm's inclusion criteria included: HIV diagnosis, and procedure codes for specific sequences and combinations of an-

This algorithm also expanded inclusion scenarios to improve recognition of individuals who are not in regular HIV care through sequential claim groups and a multi-year lookback period.

**Conclusions/Next steps:** The future plan involves hospital-led research to establish coordinated mechanisms for HIV prevention and treatment, optimizing resource allocation, enhancing service fairness, efficiency, and quality.

A vertical strip of a colorful geometric pattern. It features a series of overlapping shapes in red, yellow, blue, and black. At the top is a red circle. Below it is a yellow circle. Further down is a blue circle. The pattern continues with various geometric shapes, including squares and circles, in the same color palette, creating a vibrant, abstract design.

It aims to deepen the involvement of social organizations, improve the one-stop referral service for early HIV detection and treatment, leverage exemplary projects for exchange and research among designated hospitals, and increase resource investment in other regions. The goal is to refine the formulation, procurement, and supervision of HIV/AIDS services, enhancing the efficiency of service procurement models.

## EPE218

### Empowering communities for enhanced Pre-Exposure Prophylaxis (PrEP) uptake Mombasa County (USAID Tujitegemee OVC and DREAMS Program)

P. Odongo<sup>1</sup>, J. Mwarika<sup>1</sup>, I. Yonga<sup>2</sup>

<sup>1</sup>Ananda Marga Relife Team (AMURT), USAID Tujitegemee OVC DREAMS, Mombasa, Kenya, <sup>2</sup>USAID Mission, Nairobi, Kenya

**Background:** The global health priority in the fight against HIV/AIDS necessitates innovative strategies for preventing new infections. Pre-Exposure Prophylaxis (PrEP) has emerged as a powerful tool, particularly in high-risk populations. This abstract explores the implementation of community-led monitoring initiatives within the Mombasa County DREAMS Program in Kenya, focusing on the vulnerability of adolescent girls and young women to HIV through a multifaceted approach.

**Description:** Methods: Active participation of the Project Advisory Committee, including community members and AGYW, was integral to the community-led monitoring intervention, evaluating PrEP services. Tools were developed to assess PrEP awareness, accessibility, and acceptability. Data collection methods encompassed surveys, focus group discussions, and key informant interviews, tracking PrEP initiation, follow-up visits, and addressing potential adherence barriers.

**Results:**

Increased PrEP Awareness:

- Baseline: 60% prior PrEP knowledge.
- Post-implementation: 85% awareness among actively involved community members.

Improved Uptake Rates:

- Baseline: 30% PrEP uptake in the target population.
- Post-implementation: 55% uptake among those engaged in community-led monitoring.

Barriers Identified:

Stigma Reduction:

- Baseline: 45% concerned about stigma.
- Post-implementation: Stigma concerns decreased to 15%.

Misinformation Mitigation:

- Baseline: 25% had misconceptions.
- Post-implementation: Misinformation decreased to 5%.

**Discussion:** This abstract discusses the significance of community-led monitoring in HIV prevention programs, emphasizing its potential to bridge gaps between healthcare providers and communities. Actively involving community members in the Mombasa County DREAMS Program has created a dynamic feedback loop, facilitating continuous improvement overall program effectiveness.

**Lessons learned:** • Community Engagement is Paramount: Actively involving the community positively influences program outcomes.

- Targeted Interventions Yield Results: Tailored approaches addressing stigma, misinformation, and logistical challenges are effective.
- Holistic Strategies Mitigate Barriers: Combining educational campaigns, stigma reduction, and logistical support is more effective than isolated interventions.
- Real-time Data Enhances Adaptability: Community-led monitoring facilitates adaptive strategies through real-time data.

**Conclusions/Next steps:** Community-led monitoring is a promising strategy for enhancing PrEP uptake. Integrating community perspectives and active participation is imperative for preventive intervention success. The lessons learned from the USAID Tujitegemee DREAMS Program emphasize the need for comprehensive, adaptable HIV prevention initiatives. Further exploration of community-led monitoring in diverse settings is encouraged to optimize PrEP implementation and contribute to the global effort to end the HIV epidemic.

## EPE219

### Collaborative quality improvement activities strengthened viral load sample collection in Zimbabwe's Clinic-Lab Interface Initiative

R.R. Katekwe<sup>1</sup>, B. Makunike - Chikwinya<sup>1</sup>, G. Gonese<sup>1</sup>, F. Petracca<sup>2</sup>, S. Wiktor<sup>2</sup>, Z. Bangani<sup>3</sup>, B. McKinney<sup>4</sup>, E. Govha<sup>5</sup>, L. Vere<sup>6</sup>, K. Yao<sup>7</sup>

<sup>1</sup>Zimbabwe Technical Assistance and Training Education Center for Health (Zim-TTECH), Harare, Zimbabwe,

<sup>2</sup>University of Washington, Division of Global HIV & TB (DGHT), Seattle, United States, <sup>3</sup>U.S. Centers for Disease

Control and Prevention (CDC), Harare, Zimbabwe, <sup>4</sup>Global Health Consulting BCM, Washington, United States,

<sup>5</sup>Ministry of Health and Childcare, Harare, Zimbabwe,

<sup>6</sup>Biomedical Research and Training Institute (BRTI),

Harare, Zimbabwe, <sup>7</sup>U.S. Centers for Disease Control and Prevention (CDC), Atlanta, United States

**Background:** HIV viral load (VL) testing is an important component of HIV care and treatment. The World Health Organization's (WHO) guidelines recommend annual VL monitoring. In 2019, less than 50% of clients engaged in HIV care met WHO's VL testing guidelines. To address the

low viral load coverage gap, in 2020, the Zimbabwe Ministry of Health and Childcare in 2020 developed a clinic laboratory interface (CLI) quality improvement (QI) initiative with several implementing partners to improve VL sample collection in supported facilities.

**Methods:** The Laboratory African Regional Collaborative (LARC) provided CLI training and coordination to health care workers. Sites were selected based on high volume and low sample collection rates. Baseline data on eligible clients were collected from October through December 2021. Change ideas from the driver diagram was used to systematically plan the project to achieve the aim of improving sample collection were tested using Plan-Do-Study-Act cycles. Capacity-building activities such as joint site support, mentorship visits, a tablet-based QI course for self-study, and learning sessions were used to improve viral load sample collection.

**Results:** The number of sites implementing the collaborative increased from 59 sites in October 2021 to 207 sites by March 2023. Process mapping to identify implementation gaps revealed low adherence to VL guidelines and poor clinic/lab communication. Change ideas found to be most effective included: collecting samples by cohort, synchronizing sample collection with medication pick-up, and sending appointment reminders to clients. The initiative increased VL samples collected from eligible clients from 40% at baseline to 85% between October 2021 and March 2023 within the implementation period.

**Conclusions:** The CLI collaborative approach improved VL sample collection through implementation of change ideas adapted to the context of individual clinics. Laboratory/clinic staff phone contact improved sample collection and transportation. Future focus areas could include sustaining the gains and management of clients with high VL.

dren of FSWs in three regions (Bamako, Sikasso, Segou) in Mali through the offer of index testing to FSW living with HIV.

**Description:** Index testing was offered to 1,097 FSWs, 619 of whom agreed to list contacts (an acceptance rate of 56%). A total of 434 children under 15 years (237 males and 197 females) were listed. However, only 15% (63/434) of the contacts listed were found and tested. Among the 11 HIV cases identified, a high HIV case finding rate of 17% (11/63) was found in children of FSWs.

**Lessons learned:** The rate of finding and testing remains low, due to the mobility of FSWs, the absence of some of the children in their mothers' area of activity, discrimination, and stigmatization. There are another 44% of HIV+ FSW who did not give contacts where HIV positive children could be found. Efficient strategies, such as collaboration with other implementing partners in Epic and non-Epic areas, could prove effective in reaching the maximum number of children that need to be tested.

**Conclusions/Next steps:** Index testing gave us a 17% yield among children of FSW. Nevertheless, the number of children listed and found remains low, due to several factors such as stigmatization, discrimination and the mobility of FSW. Combating stigmatization, discrimination and violence, and orienting clinical and community workers to offer safe and ethical index services could prove effective in reaching the greatest number of child contacts to be tested.

### Challenges in reaching and testing the children of sex workers through the index testing strategy in Mali

B. Boubacar Sidiki<sup>1</sup>, A. Lambart<sup>2</sup>, M.M.S. Tall<sup>3</sup>

<sup>1</sup>Family Health International-FHI 360, Monitoring & Evaluation, Bamako, Mali, <sup>2</sup>Family Health International-FHI 360, HIV Programs-Epic Special Studies and Assessments, Cape Town, South Africa, <sup>3</sup>Family Health International-FHI 360, Bamako, Mali

**Background:** Mali is lagging in achieving the UNAIDS 95-95-95 targets for children, particularly for the first 95 with a realization rate of 58%. Mali has an HIV prevalence rate of 8.7% among female sex workers (FSW).

With low uptake of pre-natal services in many parts of Mali, this increases risk for transmission of HIV to children of FSWs. The FHI 360 Mali PEPFAR/USAID- funded Epic key population (KP) project offered HIV testing services to chil-

### EPF196

Nepal's current legislation in protecting the rights of people living with HIV- findings of an intensive assessment of current laws, policies and instruments

S. Rayamajhi<sup>1,2</sup>, G. Panta<sup>3</sup>, I. Muhammad<sup>4</sup>, R. Bhattarai<sup>3</sup>

<sup>1</sup>Save the Children, The Global Fund, Kathmandu, Nepal,

<sup>2</sup>Tribhuvan University, Gender Studies, Kritipur, Nepal,

<sup>3</sup>Save the Children, Kathmandu, Nepal, <sup>4</sup>Save the Children, London, United Kingdom

**Background:** Nepal's discriminatory laws and regulations, as well as inadequate execution of existing ones, have a direct impact on the rights of People Living with HIV (PLHIV). Over the years, the country has made encouraging progress in formulation/implementation of laws, policies, and international treaties; nonetheless, remaining impediments and ineffective and insufficient implementation have raised major concerns and require immediate action to protect the overall well-being of PLHIV.

**Methods:** An assessment was carried out to determine how current laws, policies, and instruments have protected the rights of PLHIV in Nepal. An intensive review of existing laws, directives, policies, guidelines, and draft bills under the current Nepalese legal system was conducted. The Constitution of Nepal (2015) and 313 Acts, 293 Regulations, 67 Policies, 13 Guidelines, and 6 Bills were reviewed in this study. Relevant Supreme Court rulings were examined for case studies. Similarly, 20 key informant interviews and 4 focus group discussions were held with key populations and stakeholders from Nepal's seven provinces.

**Results:** Regulations required for implementation of some acts including the Narcotic Drug Control Act (1977) have not been developed resulting in stigma and discrimination against HIV acquired and affected people and communities. The state's Social Security Act has not addressed issues of CABA children; the only nutrition assistance they receive is from a partner organization and is less than \$10 per month. Many people benefit from the government's health insurance plan; yet Nepal's life insurance regulation statute remains quiet on HIV life insurance. Ambiguity in the legal wordings for Punishment of Offence has allowed justice based on the interpretation of the phrases, rendering PLHIV more vulnerable.

**Conclusions:** Despite national and international commitments, laws and policies that perpetuate stigma, discrimination, violence, and other breaches of human rights continue to be serious impediments. Legal and legislative barriers continue to hinder an effective HIV response among disadvantaged communities, restricting access to services. Governments should develop/revise laws and policies that discriminate against key popula-

tions based on their HIV status. Consistent lobbying and campaigning with political leadership and government authorities is essential.

### EPF197

Gender-based violence among female sex workers in South Sudan: opportunities and challenges for HIV prevention

E.A.J. Tumbare<sup>1</sup>, M. Galla<sup>2</sup>, A. Kinuthia<sup>2</sup>, S. Alemi<sup>2</sup>

<sup>1</sup>IntraHealth International, Programs, Chapel Hill, United States, <sup>2</sup>IntraHealth International, Programs, Juba, South Sudan

**Background:** HIV prevalence among female sex workers (FSWs) in South Sudan is high, at 13% compared to 1.9% among the adult population. Ongoing conflict, high poverty, and cultural norms enable gender-based violence (GBV). The socio-economic environment increases women's vulnerability to sex work, which is criminalized, leading to arrests and money extortion by authorities. Effective HIV prevention approaches are needed for this vulnerable population.

**Description:** The USAID Advancing HIV & AIDS Epidemic Control (AHEC) Activity, led by IntraHealth International, focuses on HIV prevention, care and treatment services for all populations at 14 health facilities in South Sudan. Using a peer-facilitated direct service delivery and technical assistance approach, AHEC also provides integrated HIV and sexual reproductive health services for FSWs at 6 community sites, including a package of post-GBV services. Services are provided in a person-centered and non-stigmatizing manner in the community where FSWs live and work.

**Lessons learned:** AHEC was able to integrate post-GBV services in routine community-based peer education and outreach services. Data shows GBV is high among FSWs with about 25% screened in the period October 2022-September 2023 reporting having experienced some form of GBV (see Fig 1).

Fig 1: GBV Cascade Among Female Sex Workers, Oct 2022 - Sep 2023

Utilizing a peer approach, where FSWs are trained to provide services to other FSWs, AHEC scaled-up services to meet 97% of annual targets. Challenges still exist, how-

ever, with under-reporting due to fear of criminalization and gaps in the cascade for services that cannot be given onsite.

**Conclusions/Next steps:** Peer-led provision of decentralized HIV prevention services is an innovative approach to reach underserved populations. Criminalization remains a barrier to service access for many key populations. To strengthen progress towards HIV epidemic control, governments should expand safe spaces that allow for key populations to access friendly, person-centered services.

## EPF198

**Lack of access to treatment and criminalization of labor migrants based on HIV-positive status: based on a review of HIV policy progression and migrant's health rights in five origin countries**

M. Perveen<sup>1</sup>

<sup>1</sup>CARAM Asia Berhad, Kuala Lumpur, Malaysia

**Background:** Coordination of Action Research on AIDS and Mobility in Asia - CARAM Asia has conducted the research „A Review of HIV Policy Progression and Migrant's Health Rights in Five Origin Countries“ in Asia. This study explores the complex context of healthcare rights for migrants in South and Southeast Asian nations, where labor migration is widely encouraged as an economic remedy. In the quest for macroeconomic advantages, migrants often face a disregard for their rights, particularly in terms of discriminatory health screenings.

The main goal of the study is to assess how HIV and AIDS policies affect the health rights of migrants, particularly in terms of HIV prevention and care. The study aims to uncover barriers and promote comprehensive measures at every phase of migration.

**Methods:** CARAM Asia is a regional network of migrant and migrant support organizations dedicated to promoting and safeguarding health rights of labor migrants, with a specific focus on HIV/AIDS and SRHR issues. The study mentioned above has been conducted by CARAM member organizations in Bangladesh, Cambodia, Pakistan, the Philippines, and Sri Lanka.

The study utilized a thorough methodology, which involved a comprehensive review of migration policies, health laws, strategic plans, and HIV trends. Interviews with key policymakers, such as representatives from The National Center for HIV/AIDS, Dermatology and STD (NCHADS) and the National AIDS Control Program (NACP), along with focus group discussions (FGDs) with HIV-positive migrants, provided insights into the practical impact of policies on the ground.

**Results:** The study reveals critical policy gap in addressing labor migrants' health needs concerning HIV/AIDS in sending and receiving countries. There is a lack of recognition in National AIDS plans, hardly labeled as "vulnerable populations" rather than "Most at Risk for contracting

HIV." It highlights discriminatory health policies in receiving countries that criminalize (arrest, detention, and deportation) labor migrants based on HIV-positive status rather than providing them access to health services.

**Conclusions:** Conclusion and recommendations include the removal of discriminatory health policies particularly in labor migrant's receiving countries, removal of mandatory health testing, exclusionary conditions in recruitment based on HIV status, and the integration of migrants into National AIDS Programs.

## EPF199

**Raising the voice of the HIV community: lessons from strengthening capacity to implement community led monitoring (CLM) in Indonesia**

M.D.P. Negara Puteri<sup>1</sup>, G.G. Langi<sup>1</sup>, T.P. Kusumoputri<sup>1</sup>, L.V. Wongso<sup>1</sup>, I. Praptoraharjo<sup>1</sup>

<sup>1</sup>HIV AIDS Research Center, Atma Jaya Catholic University, Jakarta Selatan, Indonesia

**Background:** The HIV epidemic status in Indonesia has significantly improved in recent years, with remarkable progress against HIV. Stopping the pandemic, however, requires more than scientific breakthroughs or expanded services—it requires a better initiative involving more parties, particularly HIV response beneficiaries.

In this light, strengthening capacity of PLHIV and key population networks to monitor quality of service delivery and to advocate equal access to HIV services, becomes a strategic way to improve cascade of care in Indonesia.

**Description:** In 2022, seven PLHIV and key population networks formed an alliance named Joint-CLM to implement community-led monitoring. In collaboration of HIV AIDS research Atma Jaya Catholic University as technical assistance, we conducted five phases: 1) develop capacity building plan, 2) conduct series of workshop with PLHIV and KP networks in district level, 3) designing CLM implementation strategies, 4) CLM implementation and quality assurance, and 5) policy dialogue

**Lessons learned:** The technical assistant successfully empowered Joint-CLM to monitor the quality of HIV-related services in 19 districts which consist of 41 primary health cares, 3 hospitals, 1 clinic and 3 CSOs. Before conducting data collection using surveys, focal points in the regions received capacity building in the form of CLM organization, data collection techniques, data processing and analysis techniques, and advocacy skills.

The training was deemed successful since there was a gain in knowledge based on the average pre-test and post test scores of 49.2 to 65. Through the capacity building process, Joint-CLM are able to conduct evidence-based advocacy with the dashboard platform developed to present monitoring results, enhanced partnerships with health providers and CBOs, and build collaborative learning through Joint-CLM.

**Conclusions/Next steps:** Based on the assisting technical CLM activities, several follow-up activities need to be carried out to ensure the sustainability of CLM implementation are:

1. Monitoring of service improvement commitment,
2. Expanding the coverage to include more cities/district as intervention areas,
3. Maintaining the CLM management model in additional districts to provide mentoring among focal points,
4. Maximizing the utilization of the Joint-CLM dashboard,
5. Establishing a shared understanding regarding CLM among stakeholders involved at the national level to facilitate the implementation of CLM in new districts.

## EPF200

Association of sexual assault with mental health, behavior, cardiovascular disease and HIV infection: a Mendelian randomization study

X. Wu<sup>1</sup>, L. Yang<sup>1</sup>, H. Zou<sup>2,3,4</sup>

<sup>1</sup>Sun Yat-sen University, Shenzhen, China, <sup>2</sup>Fudan University, Shanghai, China, <sup>3</sup>Southwest Medical University, Luzhou, China, <sup>4</sup>University of New South Wales, Sydney, Australia

**Background:** Existing evidence has indicated that sexual assault is associated with cardiovascular disease (CVD). However, the causal effect is unknown. We aimed to examine whether sexual assault have a causal effect on mental health, behavior, cardiovascular disease and HIV infection.

**Methods:** We conducted a two-sample Mendelian randomization study using the summary statistics of victim of sexual assault from the UK Biobank (17,230 cases and 99,441 controls). The summary statistics of two phenotypes of mental health (depression and anxiety or panic attacks), five phenotypes of behavior (smoking initiation, bulimia nervosa, risk-taking behavior, age at first sexual intercourse, and age at first birth), eight phenotypes of CVD (hypertension, coronary artery disease, stroke, heart failure, atrial fibrillation, peripheral arterial disease, aortic aneurysm, and venous thromboembolism), and HIV-1 infection were extracted from several large-scale genetic consortia or meta-analyses targeting individuals of European ancestry only. The primary approach employed was the random-effects inverse-variance weighted (IVW) estimation method, accompanied by several alternative estimators serving as supplementary methods.

**Results:** Only one SNP associated with sexual assault was selected as instrumental variables (IVs). IVW analysis indicated that genetically predicted sexual assault was significantly associated with depression (OR 1.22, 95% CI 1.09-1.37; P value <0.001), smoking initiation (12.09, 5.11-28.61; <0.001), risk-taking behavior (1.81, 1.45-2.26; <0.001), age at first birth (0.01, 0.00-0.13; <0.001), coronary artery disease (15.61, 2.85-85.51; <0.001), and atrial fibrillation (19.16, 3.27-112.20; <0.001). In addition, sexual assault presented a sug-

gestive association with age at first sexual intercourse (0.56, 0.34-0.93; 0.030), hypertension (1.28, 1.04-1.57; 0.020), venous thromboembolism (1.09, 1.01-1.18; 0.030), and HIV-1 infection (20.17, 1.14-357.04; 0.040).

**Conclusions:** We found significant causal association between sexual assault and CVD. Efforts should prioritize the development and implementation of robust prevention strategies for sexual assault, considering its significant causal association with various health outcomes. Concurrently, it is imperative to perpetually assess and enhance the existing supportive interventions for victims, ensuring they are comprehensive and adept at addressing the multifaceted consequences of sexual assault.

## EPF201

Barriers to harm reduction: a qualitative study of the challenges faced by people who inject drugs in Burundi

E. Haragirimana<sup>1</sup>

<sup>1</sup>Village Health Action, Bujumbura, Burundi

**Background:** This study aimed to evaluate the challenges in delivering harm reduction interventions for people who inject drugs (PWID) in Bujumbura, the capital city of Burundi. Harm reduction interventions, such as needle and syringe programs (NSP) and opioid agonist therapy (OAT), are proven to reduce the transmission of HIV and hepatitis C among PWIDs. Still, their coverage and accessibility are low in many settings.

**Description:** We used a qualitative study approach, collecting and analysing qualitative data from 2 participants comprising people from PWIDs, harm reduction centres, service providers, policymakers, and civil society organisations in Burundi interviewed five people from policymakers and civil society organisations in Bujumbura. We interviewed 25 participants and conducted two policy documents (constitution, penal code) to assess harm reduction services' availability, utilisation, policy landscape, and implications for public health.

**Lessons learned:** We found that NSP programs were less available to PWID, and none of the harm reduction clinics visited provided the OAT. The majority of the participants said that the main barriers to accessing harm reduction services were the lack of services and the lack of equipment for harm reduction clinics. We also found that the laws are highly punitive and may lead to fear of seeking health services. Few of harm reduction service providers have enough training. Lastly, most participants highlighted the social stigma they face in their families leading to being changed from their families.

**Conclusions/Next steps:** We recommend that the government of Burundi should reform the laws and policies to decriminalise drug use to protect and promote the human rights of these groups. We also suggest that the service providers improve the quality and coverage of their

interventions and that civil society and the international community support these groups' advocacy, service delivery and empowerment.

We also propose that further research should be conducted to monitor and evaluate the impact of these punitive laws on the HIV epidemic and the health outcomes of these groups.

## EPF202

### Breaking chains, building lives: embracing compassionate alternatives for people who inject drugs in Kenya

T. Mutuku<sup>1</sup>, F. Kyalo<sup>2</sup>, R. Musundi<sup>3</sup>, J. Mbau<sup>4</sup>

<sup>1</sup>Technical Support Unit - National AIDS and STI Control Program, Key Population, Nairobi, Kenya, <sup>2</sup>Support for Addiction Prevention and Treatment in Africa, Clinical, Nairobi, Kenya, <sup>3</sup>National Syndemic Diseases Control Council, Stakeholder Division, Nairobi, Kenya, <sup>4</sup>National AIDS and STI Control Program, Key Population, Nairobi, Kenya

**Background:** Kenya has an estimated 26,673 people who and inject drugs (PWIDs) (NASCOP 2021) with a HIV prevalence of 18.7%, 6 times higher than that of the general population at 3.7% (NSDCC 2023). The Kenya AIDS Strategic Framework 2020/21-2024/25 describes comprehensive programming with PWIDs as a key strategy for HIV prevention.

The punitive approach of drug policies, which focus on punishment rather than rehabilitation, has failed to address the root cause of addiction. This approach has worsened the impact of the disease, leading to increased rates of relapse and recidivism.

**Description:** The National Harm Reduction Program adopts the Diversion Policy, a comprehensive strategy, redirecting PWIDs from the criminal justice system to rehabilitation programs. It features a collaborative Drug Panel, engagement of multifaceted stakeholders, and specialized drug courts prioritizing rehabilitation. Recognizing substance abuse as a health issue, the program integrates mental health services into healthcare systems, addressing co-occurring disorders with positive outcomes. Success is bolstered by impactful public awareness campaigns, reducing addiction stigma, and fostering an environment where PWIDs are more likely to seek help.

**Lessons learned:** Combining these strategies, societies have effectively shifted focus from punitive measures to a more compassionate and therapeutic approach, ultimately fostering better outcomes for PWIDs. Diversion programs offer treatment and rehabilitation options instead of incarceration, addressing the underlying issues of addiction and providing support for recovery. These alternatives prioritize rehabilitation and aim to break the cycle of drug abuse and criminal behavior.

**Conclusions/Next steps:** Shifting to alternatives like rehabilitation and specialized drug courts, recognizing addiction as a health issue, and prioritizing treatment over punishment is key to programming with PWIDs. This approach acknowledges the need for support and care for PWIDs, breaking the cycle of addiction, reducing recidivism, and fostering lasting health and well-being in society.

## EPF203

### Section 144 and constitutional rights of transgender persons: unravelling the complex nexus of HIV risks in Nagpur district of Maharashtra, India

A. Lamba<sup>1</sup>, R. Khan<sup>2</sup>, L. Arora<sup>3</sup>

<sup>1</sup>Pandit Deen Dayal Upadhyay Government Medical College, Rajasthan University of Health Sciences, Churu, India, <sup>2</sup>Aarju Foundation, Mumbai, India, <sup>3</sup>Ally Heart, Mumbai, India

**Background:** This study delves into the complex interplay between constitutional rights and governmental restrictions, focusing on the application of Section 144 of the Code of Criminal Procedure, 1973, in curbing the fundamental rights of transgender individuals and its repercussions on HIV transmission. According to Article 19(1)(a) of the Indian Constitution, individuals possess the right to freedom of speech and expression.

However, recent events from January to October 2023 in Maharashtra's Nagpur District have spotlighted the clash between the broad scope of Article 19(1)(a) and governmental limitations.

**Description:** The Nagpur District Administration issued an order prohibiting transgender individuals from seeking alms in various public settings. Citing disruptions caused by beggars, the City Commissioner of Police justified the directive to maintain public order.

Violation of this order carries legal consequences, with potential jail terms ranging from one to six months based on the severity of disobedience and its impact on public order.

**Lessons learned:** Charges filed under various sections of the Indian Penal Code included offenses such as disobedience (section 188), unlawful assembly (section 143), rioting (section 147), public nuisance (section 159 and 268), extortion (section 384), and criminal intimidation (section 506). This legal response significantly affected the cultural practice of managati (collecting alms) within the Transgender-Hijra community, pushing many to resort to sex work as a primary means of livelihood.

Simultaneously, disruptions in the supply chain of essential items like condoms and lubricants, facilitated by the state administration, heightened the risk of unprotected sex and increased the probability of HIV transmission among transgender individuals in the district.

Author Index

**Conclusions/Next steps:** Advocacy efforts ensued, with local organizations (CBO's and NGO's) and representatives engaging in meetings with the Nagpur district administration. The Commissioner, in response, promised to explore alternative livelihood options, ensuring basic minimum wages according to norms and potential monthly earnings of up to Rs15,000. This situation calls for a comprehensive analysis of constitutional freedoms, weighing the impact of imposing curfews under Section 144 on livelihoods, cultural practices, and its impact on HIV transmission. Adhering to the principle of proportionality is essential to guarantee fundamental rights while maintaining law and order.

## EPF204

### Meaningful inclusion of the transgender community in implementing community led monitoring in Zimbabwe

G. Bonzo<sup>1</sup>

<sup>1</sup>Trans Smart Trust, Programs, Harare, Zimbabwe

**Background: Purpose:** Over the years, transgender persons have not been included in all community initiatives particularly those involving monitoring and evaluating the impact of programs. Not only has this been a hindrance to the meaningful involvement of the community, but it has also had a bearing on the attainment on positive public health outcomes.

The program sought to deliberate on ways in which transgender persons could be meaningfully involved in the community led monitoring mechanisms in Zimbabwe

#### Objectives:

1. To create space for the transgender communities to lead in implementing and monitoring of health service delivery
2. To develop a stigma free CL program model for Transgender and Intersex persons
3. To advocate for the inclusion of gender affirming health care services in public health facilities for the transgender and intersex persons

**Description:** As an active implementer of the CLM program with support from UNAIDS in Zimbabwe, I have gained an understanding of how the programme is designed, its shortcoming and enablers for optimal delivery. I work with a group of community health advocates who were trained in technical areas that aid their advocacy work such as lobbying and advocacy, monitoring and evaluation. Using the skills gained, community health advocates from the transgender community have been conducting monitoring in selected health facilities in both rural and peri urban areas.

This programme has assisted the advocates to surface key issues and experiences of the transgender communities which were missed in the mainstream CLM programme.

**Lessons learned:** One key lesson was that transgender and intersex persons are best placed to solicit for feedback and document experiences of their community as they elate to accessing services from health facilities. Qualitative data collected through the community health advocates reflected several unknown realities such as that Transgender and Intersex persons seeking to access services from facilities were either denied access or recorded under sex workers or MSM despite them being totally different communities with peculiar needs.

**Conclusions/Next steps:** Trans Smart Trust will advocate for the development of a National CLM strategy that has a structure which is inclusive of all the various Key and Vulnerable populations existing in Zimbabwe.

## EPF205

### Prevalence of violence among adolescent girls aged 10 to 14 years who experienced early sexual debut: evidence from 4 Provinces of Zimbabwe, 2023

E. Mugariri<sup>1</sup>, H. Mafaune<sup>1</sup>, F. Mudzengerere<sup>1</sup>, D. Dhakwa<sup>2</sup>, K. Yogo<sup>2</sup>, F. Mudhokwani<sup>2</sup>, T. Masoka<sup>1</sup>, T. Bhatasara<sup>3</sup>, B. Nyamwanza<sup>4</sup>, R. Yekeye<sup>4</sup>, B. Madzima<sup>4</sup>, M. Mutseta<sup>5</sup>, T. Tapfuma<sup>2</sup>, E. Tachiwenyika<sup>6</sup>

<sup>1</sup>Zimbabwe Health Interventions, Strategic Information, Harare, Zimbabwe, <sup>2</sup>Zimbabwe Health Interventions, Programs, Harare, Zimbabwe, <sup>3</sup>USAID, Programs, Harare, Zimbabwe, <sup>4</sup>National AIDS Council, Programs, Harare, Zimbabwe, <sup>5</sup>MOHCC, Programs, Harare, Zimbabwe, <sup>6</sup>Zimbabwe Health Interventions, Knowledge Management, Harare, Zimbabwe

**Background:** Violence against women and children remains a public health challenge in Zimbabwe, and one of the drivers of new HIV infections. Zimbabwe Health Interventions (ZHI) is implementing the Determined, Resilient, Empowered, AIDS free, Mentored and Safe (DREAMS) program which seeks to reduce HIV incidence among adolescents' girls and young women (AGYW) in 9 high HIV burden districts of Zimbabwe.

The DREAMS program assesses experiences of various types of violence at enrolment and during program implementation. About 0.6% (329/48,990) of adolescent girls (AG) aged 10-14 years reported having had sexual intercourse during DREAMS enrolment.

We assessed prevalence of violence among 10-14-year-old AG who reported having had sex at program enrolment.

**Methods:** We conducted a descriptive cross-sectional study where routine program data for AG aged 10-14 years for the period October 2022 to September 2023 were extracted from the DREAMS DHIS II database. Prevalence analysis was conducted using SPSS version 23 and Ms Excel generating frequencies, proportions, and measures of association between early sexual debut and various forms of violence perpetrated against them.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

The assessment was covered by medical Research Council of Zimbabwe approved non-research determination protocol (MRCZ/E/254).

**Results:** A total of 48,990 AG aged 10-14 years were enrolled in the DREAMS program between October 2022 and September 2023. Out of these, 0.6% (329/48,990) reported having had sex in their life. About 33% (107/329) of those who had sex experienced some form of violence in their lives. AG aged 10-14 years who had ever had sex were more likely to have experienced some form of violence [COR=2.3, 95% CI (1.81-2.87),  $p<0.05$ ] than those who did not. 33% (107) of the AG were not planning on using condoms in their next sexual encounter. About 18% (60/329) of the AG who had early sexual debut reported having had forced sex.

**Conclusions:** Prevalence of violence was high among adolescent girls aged 10-14 years who had early sexual debut, and there was a strong association between early sexual debut and experience of childhood violence. We recommend further analysis of program data, and implementation of violence prevention and response interventions targeting AG, parents/guardians, and community members.

## EPF206

### Integration of the World Health Organization pediatric and adolescent advanced HIV disease package into national HIV guidelines: a policy review

M. Nyannor<sup>1</sup>, S. Hrapcak<sup>1</sup>, N. Agathis<sup>1</sup>

<sup>1</sup>U.S. CDC, Division of Global HIV and TB, Atlanta, United States

**Background:** In July 2020, World Health Organization (WHO) released their STOP AIDS Package offering recommendations for identifying, preventing, and managing advanced HIV disease (AHD) in children and adolescents living with HIV (CALHIV). Comprehensive inclusion of these recommendations in national policy can help guarantee CALHIV receive the recommended services and help reduce AHD-related mortality. We identified national guidelines updated after July 2020 from six high HIV-prevalence countries (Kenya, Malawi, South Africa, Uganda, Zambia, and Zimbabwe) and reviewed their inclusion of the package's recommendations.

**Methods:** We categorized STOP AIDS Package recommendations into themes, encompassing general AHD considerations, malnutrition, TB, cryptococcal meningitis (CM), rapid ART initiation and optimization, miscellaneous aspects including serious bacterial infections (SBIs), immunizations, and other general pediatric services, and monitoring and evaluation (M&E). We reviewed the inclusion of 37 recommendations in publicly available national HIV guidelines. Frequencies describing the inclusion of these recommendations were summarized.

**Results:** The number of recommendations included in the national guidelines of each country ranged between 20 (54%) and 35 (94%). Five countries included AHD definitions for CALHIV, though only two included reinitiating care after treatment interruption in their definitions. Five countries included recommendations on malnutrition screening and four on treatment for severe acute malnutrition. All countries included TB screening recommendations; five included TB prevention, diagnosis, and treatment recommendations. All countries included CM screening and prophylaxis recommendations; five included treatment recommendations. All countries recommended rapid optimized ART initiation within seven days of diagnosis. All recommended cotrimoxazole prophylaxis, but two lacked SBI treatment recommendations. Five countries included immunization recommendations, though none highlighted measles revaccination after immune reconstitution. Three countries included recommendations on other pediatric services like vitamin A and deworming. One country included M&E considerations for CALHIV with AHD.

**Conclusions:** This review demonstrated varying inclusion of WHO-endorsed pediatric AHD recommendations in recently updated national HIV guidelines, noting gaps in recommendations on general pediatric services, immunizations (specifically measles revaccination), and M&E considerations. Expanding options for integration with maternal child health services may facilitate better adoption of WHO's STOP AIDS Package within national policies and programs and improve CALHIV health.

## EPF207

### Optimizing advanced HIV disease diagnosis and treatment: the impact of CD4 testing in enhancing disease management for people living with HIV

T. Bui<sup>1</sup>, T. Bui<sup>1</sup>, T. Vuong<sup>1</sup>, H. Dang<sup>1</sup>, V. Nguyen<sup>1</sup>, D. Levitt<sup>1</sup>, H. Phan<sup>2</sup>, N. Do<sup>2</sup>, L. Vu<sup>2</sup>

<sup>1</sup>FHI 360, Hanoi, Viet Nam, <sup>2</sup>Vietnam Administration of HIV/AIDS Control, Hanoi, Viet Nam

**Background:** The World Health Organization defines advanced HIV disease (AHD) using clinical staging or CD4 cell counts. In Vietnam, despite national guidance recommending CD4 testing at treatment initiation, AHD is primarily determined using clinical staging due to limited resources, which may lead to missed diagnoses. The US-AID/PEPFAR-funded Meeting Targets and Maintaining HIV Epidemic Control (EpiC) project and the Vietnam Administration for HIV AIDS Control collaborated to determine how AHD can be better prevented and managed through a retrospective review.

**Description:** We conducted a cross-sectional review of client records in six HIV treatment facilities in two southern provinces in Vietnam to identify those with AHD and determine the potential extent of missed AHD diagnoses. Records reviewed were from October 2021 through Sep-

Oral  
abstracts

tember 2022 for individuals newly initiated on antiretroviral therapy (ART) within the last 12 months, and those who returned to treatment after loss to follow-up, experienced treatment failure, or died. We examined symptoms recorded in client records to reevaluate indication of opportunistic infections and determine clinical staging, and CD4 counts for those for whom the diagnostic was conducted.

**Lessons learned:** Of 1,246 records reviewed, 234 (18.8%) in individuals were retrospectively identified with AHD. Among individuals with AHD, 105 (44.9%) had had a CD4 test, and 129 (55.1%) were diagnosed based on clinical staging only (three or four). Among those with AHD and a CD4 result, only nine had CD4 counts  $>200$  cells/ $\text{mm}^3$  and would automatically have been identified as having AHD. Of the remaining 96 individuals with CD4 counts  $\leq 200$  cells/ $\text{mm}^3$ , 50 (52.1%) were characterized at clinical stage one or two and would not have been diagnosed with AHD using clinical staging alone. The majority of this subgroup (43/50; 86%) were individuals newly initiated on ART.

**Conclusions/Next steps:** Reliance on clinical staging alone may pose a high risk of missed AHD diagnosis in Vietnam, particularly among clients newly initiated on ART. Reinforcing the importance of and affordable access to CD4 testing is crucial for early AHD detection, enabling effective prevention and management. Considerations for innovations like point-of-care diagnostics and enforcement of guidance by the government can help overcome implementation challenges.

## EPF208

Investigating the spatial association between supervised consumption services and homicide in Toronto

H.S. Sung<sup>1</sup>, M. Karamouzian<sup>1</sup>, I. Rammohan<sup>1</sup>, J. Eeuwes<sup>1</sup>, A. Smoke<sup>2</sup>, D. Werb<sup>1</sup>

<sup>1</sup>Centre on Drug Policy Evaluation, Toronto, Canada,

<sup>2</sup>Northumberland Drug Users, Toronto, Canada

**Background:** Supervised injection sites (SIS) are effective at reducing HIV transmission risk among people who inject drugs. However, their effect on public safety remains contested. In Toronto, Canada, a fatal drug market-related homicide near an SIS in 2023 prompted a provincial SIS audit. We therefore sought to investigate the homicide rate in areas proximal to SIS before and after their implementation within Toronto.

**Methods:** Using decedent files from Ontario's Office of the Chief Coroner (January 2016 to December 2019), we created three geographic zones related to SIS using Euclidean distance: within 500 meters ('near'), between 500 meters and 3 kilometers ('far'), and beyond a 3-kilometer radius of an SIS ('out'). We compared fatal shooting and stabbing rates occurring over two 18-month periods: prior to SIS implementation (January 2016 to July 2017) vs.

post-implementation (July 2018 to December 2019). Incidence rate ratio (IRR) and 95% confidence intervals (CI) were calculated for deaths in each zone using a negative binomial regression model. We undertook a sensitivity analysis whereby we adjusted the near zone boundary to 250m, 500m, and 1000m from an SIS.

**Results:** Between August 2017 and June 2018, 9 SIS were established in Toronto. Overall, 140 fatal shootings and fatal stabbings occurred (Incident rate [IR] = 5.06 per 100,000 population; 95% CI = 4.26 to 5.97) across Toronto. As shown in Table 1, compared to the period prior to SIS establishment, there was no significant increase in the incidence rate of fatal shootings and stabbings in the near and far zones proximal to SIS.

	Near Zone		Far Zone		Out Zone	
	Post vs Pre-SIS (Rate Ratio; 95% CI)	P-value	Post vs Pre-SIS (Rate Ratio; 95% CI)	P-value	Post vs Pre-SIS (Rate Ratio; 95% CI)	P-value
250 m	0.38 (0.03 to 2.35)	0.267	1.09 (0.51 to 2.36)	0.795		
500 m	0.43 (0.11 to 1.35)	0.121	1.51 (0.60 to 3.95)	0.341	1.64 (1.08 to 2.53)	0.014
1000 m	0.73 (0.28 to 1.80)	0.466	1.26 (0.41 to 3.98)	0.655		

Table 1. Changes in monthly fatal shooting and stabbing rates surrounding SIS in Toronto, before (January 1 2016 - July 30 2017) and after (July 1 2018 - December 31 2019) implementation.

**Conclusions:** We found no evidence of a spatial association between the location of SIS implementation and the rate of fatal shootings and stabbings in Toronto. These results can inform efforts to understand the public safety effects of SIS.

## EPF215

Enhancing knowledge dissemination on HIV/AIDS among young career researchers in Northern Uganda

R. Otim<sup>1</sup>, J. Opiyo<sup>2</sup>

<sup>1</sup>Gulu University, Reproductive Health, Gulu, Uganda,

<sup>2</sup>East African Institute of Medical Studies, Nursing and Midwifery, Gulu, Uganda

**Background:** Despite global progress in addressing HIV/AIDS, targeted efforts are essential to enhance knowledge dissemination among young career researchers in Uganda. This study assesses current awareness, challenges, and opportunities related to HIV/AIDS knowledge dissemination, aiming to identify strategies to empower young researchers in shaping effective responses to the epidemic in Northern Uganda.

**Methods:** A cross-sectional mixed methods study design was used with a total of 69 participants with diverse affiliations, including universities, health organizations, and hospitals, engaged in the study using a snowball sam-

pling method. Data was collected using a structured on-line questionnaire. Quantitative data, including age and Likert-scale responses, were analyzed to generate summary statistics using descriptive statistics measures. Data analysis was done using Artificial intelligence derivatives likened to R. This study adhered to ethical guidelines, ensuring participants' anonymity and confidentiality. Informed consent was obtained before participation, and participants were assured that their responses would be used for research purposes only.

**Results:** Overall, the survey comprised 69 participants with an average age of 28.2 years (SD = 4.09), showcasing varied perceptions of the effectiveness of current dissemination channels. The age of participants correlates positively ( $r = 0.45$ ,  $p < 0.05$ ) with perceptions of current dissemination channels, indicating older participants hold more positive views. Frequent attendance at HIV/AIDS events is significantly associated (chi-square = 14.21,  $p < 0.01$ ) with reporting positive outcomes from collaborative efforts. Role differences (students vs. researchers) are evident ( $t(27) = 2.36$ ,  $p < 0.05$ ), with researchers placing a higher emphasis on collaboration. Affiliation influences challenges faced (ANOVA  $F(2, 26) = 5.12$ ,  $p < 0.01$ ), as those in health organizations report more challenges than those in universities and hospitals.

**Conclusions:** These findings emphasize the need for age-tailored strategies, the importance of active participation, role-specific interventions, and organizational context considerations in strengthening knowledge dissemination on HIV/AIDS among young career researchers in Northern Uganda is imperative.

## EPF222

### The ethics of biobanking research involving African youth living with HIV: discrepancies between individual perceptions and policy considerations

K. Griffiee<sup>1</sup>, W. Nyandiko<sup>2,3</sup>, S. Sawarkar<sup>1</sup>, A. Chory<sup>1</sup>, E. Gillette<sup>1</sup>, M. Scanlon<sup>4</sup>, J. Aluoch<sup>3</sup>, H. Koros<sup>3</sup>, D. Lagat<sup>5</sup>, N. Choudhury<sup>6</sup>, D. Munyoro<sup>3</sup>, C. Ashimosi<sup>3</sup>, W. Beigon<sup>3</sup>, J. Lidweye<sup>3</sup>, J. Nyagaya<sup>3</sup>, A. DeLong<sup>7</sup>, V. Naanyu<sup>5</sup>, R. Vreeman<sup>1</sup>, R. Kantor<sup>7</sup>

<sup>1</sup>Icahn School of Medicine at Mount Sinai, New York, United States, <sup>2</sup>Moi University College of Health Sciences, Eldoret, Kenya, <sup>3</sup>Academic Model Providing Access to Healthcare (AMPATH), Eldoret, Kenya, <sup>4</sup>Indiana University Center for Global Health, Indianapolis, United States, <sup>5</sup>Moi University School of Arts and Social Sciences, Eldoret, Kenya, <sup>6</sup>NYU Grossman School of Medicine, Department of Population Health, New York, United States, <sup>7</sup>Alpert Medical School at Brown University, Providence, United States

**Background:** Biobanking is often used in research involving youth living with HIV (YLWH). The ethics of this practice and policies guiding it must be carefully considered as its use persists.

**Methods:** We conducted a qualitative analysis comparing perspectives on biobanking obtained in interviews with Kenyan YLWH, caregivers, and subject matter experts (SMEs), with a critical review of available guidelines and policies from African countries on biobanking involving youth.

**Results:** Interviews were conducted with 99 participants: 40 YLWH, 20 caregivers, and 39 SMEs (community leaders, healthcare providers, clinical researchers, social scientists, international research experts, and laboratory experts). Interviewees across all three groups stressed the importance of confidentiality, transparency, informed consent, and secure storage. Other notable themes included concerns about long-term biospecimen storage, unauthorized use, and sharing of biospecimens with ill-intentioned individuals; requests, by some, for assurances of participant benefits, and faith, from others, that researchers would act in participants' best interest; and disagreement over the use of identifiers in biospecimen labeling, with interviewees weighing the risk of disclosure against the advantage of easy follow-up. Relevant policy documents, published between 2004-2023, were only available from 12 countries: Botswana, Ethiopia, Kenya, Malawi, Nigeria, Rwanda, South Africa, Sudan, Tanzania, Uganda, Zambia, and Zimbabwe. All countries had policies on confidentiality and consent. Most ( $n=11$ ) had policies addressing transparency and sharing biospecimens with other researchers or institutions ( $n=9$ ). Fewer countries had policies governing biospecimen use ( $n=5$ ) and storage ( $n=4$ ), delineating participant benefits ( $n=4$ ), and biospecimen labeling ( $n=4$ ).

**Conclusions:** Perceptions regarding ethical considerations in biobanking research involving African YLWH demonstrated some consensus, though inconsistently. Discrepancies were observed when comparing interviewee responses to limited, and occasionally dated, country policies. Results emphasize the need for clear, improved, and timely policy guidance on these issues, which should be addressed as important research involving this vulnerable population continues.

**Background:** A scalable cure for HIV remains elusive. Successful cases, including the pioneering cure observed in the so-called Berlin patient, are limited to individuals receiving allogeneic hematopoietic stem cell transplantations (aHSCT) with homozygous CCR5 $\Delta$ 32/ $\Delta$ 32 allografts that confer resistance to HIV infection. Transplants with functional CCR5 were previously thought to be ineffective

for sustaining HIV long-term remission without antiretroviral therapy (ART). Recently, the case of the Geneva patient demonstrated extended viral control for 18 months after aHSCT from a wild-type CCR5 donor.

**Methods:** Longitudinal follow-up analyses of patient samples, including gut biopsies, from 2009 to 2024. Testing for HIV RNA, HIV DNA, viral tropism, CCR5-expression, viral outgrowth, antiretroviral drug levels and HIV-specific immune responses.

**Results:** We found prolonged HIV remission exceeding five years without ART following heterozygous CCR5 WT/ $\Delta$ 32 aHSCT for acute myeloid leukemia (AML) in a heterozygous CCR5 WT/ $\Delta$ 32 male. HIV RNA and total HIV DNA were detected pre-aHSCT with predicted R5 viral tropism. Transplantation from an HLA-matched (10/10) unrelated donor in October 2015 led to full-donor chimerism and AML remission.

Acute graft-versus-host disease (Grade I) was limited to the skin and treated with topical steroids. CD4+ T cell CCR5 expression levels matched CCR5 WT/ $\Delta$ 32 controls. HIV remains undetectable in plasma (LOD 20 copies/ml) 5.5 years after treatment interruption (TI) in September 2018. Repeated HIV DNA measurements were negative in peripheral blood as well as duodenal and ileum biopsies. No viral outgrowth was detected from stimulated CD4+ T cells. Antiretrovirals were undetectable throughout TI, with HIV-specific antibody levels decreasing and no detectable HIV-specific T cell responses post-aHSCT.

**Figure 1: Longitudinal follow-up from 2009 to 2024**  
Plasma HIV-1 RNA levels (black line; left y-axis) and T cell counts (CD4, pink; CD8, blue; right y-axis) from time of HIV diagnosis to today. Donor chimerism (%donor cells; green; second right y-axis). Red triangles indicate the time of HIV diagnosis and aHSCT. Gray shaded areas indicate time on ART (Raltegravir (RAL), Abacavir/Lamivudine (ABC/3TC)). Blue and black triangles indicate timepoints of therapeutic drug monitoring (TDM) with or without detectable antiretroviral drug levels (i.e. RAL), respectively. Blue and black dots indicate timepoints with or without detectable total HIV proviral DNA, respectively.

**Conclusions:** HIV cure induced by aHSCT is not restricted to the use of homozygous CCR5 $\Delta$ 32/ $\Delta$ 32 donors. Effective reservoir reductions, durable HIV remission and potential cure can also be achieved with functional viral co-receptors, suggesting that allogeneic immunity fundamentally contributes to HIV eradication.

No confirmed virological failures (CVF) for 144 weeks when switching 2-/3-/4-drug ART to DTG/3TC in heavily treatment-experienced PLWHA with prior M184V/I and virological failures (VF) in the prospective SOLAR-3D study

G. Blick<sup>1</sup>, E. Cerreta-Dial<sup>1</sup>, G. Mancini<sup>1</sup>, A. Cosenza<sup>1</sup>, L. Fang<sup>2</sup>

<sup>1</sup>Health Care Advocates International, Stratford, United States, <sup>2</sup>Pharstat, Raleigh, United States

**Background:** DTG/3TC is not approved for stable-switch in individuals with known history of DTG and/or 3TC resistance or prior VF. The majority of heavily treatment-experienced (HTE) PLWHA do not qualify for on-label switch to DTG/3TC. Large prospective studies evaluating DTG/3TC's ability to maintain PCR<50 in virologically suppressed individuals switching ART in the setting of prior/current M184V/I and multiple VF are lacking.

SOLAR-3D, the largest and longest prospective comparative study to-date, preliminarily demonstrated no CVF through 96-weeks. Week 144 results will be presented.

**Methods:** SOLAR-3D, a prospective, open-label, comparative 144-week study, evaluates switching 2-/3-/4-drug ART to STR DTG/3TC in HIV-1 HTE adults with multiple prior VF, prior/current M184V/I, virologic suppression for ≥6mos, and ≥2 prior ART.

Participants were consented/enrolled from 5/2/2019-10/16/2020 at the NGO, HCAI, in Stratford CT(USA).

There were no exclusions for prior INSTI use, any CD4, prior M184V/I or K65R, or 3TC-associated mutations detected at BL by ProViral DNA NGS.

Week-144 results were analyzed by ITT-E and PP using FDA snapshot analyses.

**Results:** N=100 participants switched to DTG/3TC, n=50 with historical/prior M184V/I (37% with current M184V/I by ProViral DNA NGS) and n=50 without prior M184V/I.

Participants with prior M184V/I had significantly greater median prior VF (n[IQR]: 9[7-13] vs 4[3-5], p<0.001), longer duration HIV (28.4 vs 15.5yrs, p<0.001), longer ART duration and duration PCR<50c/mL, and were older with lower nadir CD4.

Median time on DTG/3TC was 192-weeks for both groups. Through Week 144, no difference in efficacy was observed between those with vs without prior M184V/I:

- Primary Endpoint: PCR≥50, n[%]: 2[4%, 2 of 2 re-suppressed] vs 3[6%, 2 of 3 re-suppressed], by ITT-E (5.1% vs 7.9%, PP);
- Secondary Endpoint: PCR<50, n[%]: 37[74.0%] vs 36[72.0%], by ITT-E (94.9 vs 92.3%, PP);
- No CVFs, treatment-emergent resistance were observed, nor differences regarding PCR TND(<20), viral blips, AEs, or treatment discontinuations.

**Conclusions:** SOLAR-3D is the largest prospective trial to demonstrate neither prior nor current M184V/I impact the efficacy and durability of switching virologically suppressed PLWHA with prior VF to DTG/3TC through

144-weeks. Switching to DTG/3TC must be explored in economically-developing countries where economic/safety advantages of discontinuing TDF could be consequential.

**Background:** Prevention of bacterial STIs with post-exposure doxycycline (Doxy-PEP) in MSM raised concerns regarding antimicrobial resistance (AMR). We studied the impact of Doxy-PEP on *Neisseria gonorrhoeae* AMR in the ANRS DOXYVAC trial.

**Methods:** 545 MSM on HIV PrEP were randomized to Doxy-PEP (n= 362) or No-PEP (n=183) and followed for a median of 14 months. Participants were tested at baseline and every 3 months by nucleic acid amplification technic (NAAT) using the Cobas 6800 (Roche) and culture for GC detection in urine, oro-pharyngeal and anal samples. Etest (Biomérieux) determined MICs and EUCAST guidelines were used for interpretation. Molecular analysis was performed by Whole Genome Sequencing on GC isolates and on NAAT-positive samples in search of molecular determinants of resistance (*tetM* gene, V57M substitution in S10 protein, MtrR and its promotor modification, mutations in the genes coding for 23S rRNA, S91F substitution in GyrA protein, *penA* mosaic gene). P-values were calculated using Fisher's exact test.

**Results:** From January 2021 to February 2023, 450 samples (278 patients) were GC-positive by NAAT. Seventy-eight GC obtained in cultures (7 at baseline, 40 No-PEP group, 31 Doxy-PEP group) and 231 GC-NAAT-positive samples (38 at baseline, 99 No-PEP group, 94 Doxy-PEP group) were retained for molecular testing.

MICs of ceftriaxone, fluoroquinolones and aminoglycosides were similar in the Doxy-PEP and No-PEP groups and no significant change in genetic determinants for these antibiotics was found. Only TEM-1 genes associated with penicillin resistance were more frequently observed in the doxyPEP group than in the no-PEP group (40.4% vs 17.5% of cases respectively,  $p=0.04$ ).

All GC isolates were resistant to tetracycline, with a significant increase in rate of high-level tetracycline resistance in the Doxy-PEP vs. No-PEP group (35.5 vs 12.5%, respectively  $p=0.04$ ). In addition, the genetic determinant *tetM* was significantly more frequent in the Doxy-PEP group as compared to the No-PEP group (55/94=59.1% vs 23/99=23.7%), respectively ( $p<0.0001$ ). No mutation in the gene encoding 23S rRNA was observed.

**Conclusions:** All GC were resistant to tetracycline but rate of high-level resistance mediated by the *tetM* gene were higher with Doxy-PEP. No impact of Doxy-PEP on Ceftriaxone susceptibility was found.

Tenofovir-diphosphate concentrations and viral suppression following monthly point-of-care urine tenofovir testing among adults initiating antiretroviral therapy: primary outcome of the randomised controlled STREAM HIV trial

N. Garrett<sup>1</sup>, K.K. Thomas<sup>2</sup>, J. Dorward<sup>3</sup>, Y. Sookraj<sup>4</sup>, E. Hill<sup>2</sup>, A. Bardon<sup>5</sup>, M. Khanyile<sup>1</sup>, U. Singh<sup>1</sup>, P. Munatsi<sup>1</sup>, N. Samsunder<sup>1</sup>, M. Wang<sup>2</sup>, P. Belaunzaran-Zamudio<sup>6</sup>, N. Naicker<sup>1</sup>, D. Donnell<sup>2</sup>, C. Celum<sup>2</sup>, M. Gandhi<sup>7</sup>, P. Moodley<sup>8</sup>, T.R. Cressey<sup>9</sup>, P.K. Drain<sup>2</sup>

<sup>1</sup>Centre for the AIDS Programme of Research in South Africa, Durban, South Africa, <sup>2</sup>University of Washington, Department of Global Health, Seattle, United States, <sup>3</sup>University of Oxford, Nuffield Department of Primary Care Health Sciences, Oxford, United Kingdom, <sup>4</sup>eThekweni Municipality Health Unit, Durban, South Africa, <sup>5</sup>Washington University, St. Louis, United States, <sup>6</sup>Division of AIDS, National Institute of Allergy & Infectious Diseases, Rockville, United States, <sup>7</sup>University of California San Francisco, Department of Medicine, San Francisco, United States, <sup>8</sup>University of KwaZulu-Natal, Discipline of Virology, Durban, South Africa, <sup>9</sup>Chiang Mai University, AMS-PHPT, Faculty of Associated Medical Sciences, Chiang Mai, Thailand

**Background:** Point-of-care urine tenofovir (TFV) tests may improve HIV treatment outcomes and need to be assessed in randomized trials. The STREAM HIV trial evaluated whether monthly urine TFV testing among people with HIV (PWH) initiating dolutegravir-based antiretroviral therapy (ART) improved adherence.

**Methods:** We recruited PWH initiating first-line ART at three public clinics in South Africa and randomised participants 1:1 to the intervention (monthly point-of-care urine TFV testing [UCSF/Abbott] with adherence counselling) or control arm (monthly adherence counselling without urine TFV testing).

The primary outcome was adherence at 24 weeks, assessed by intracellular TFV-diphosphate concentrations in dried blood spots using mass spectrometry.

Secondary outcomes were retention-in-care and viral suppression (VS <200 copies/ml). We compared log<sub>10</sub> TFV-diphosphate concentrations using t-tests and estimated risk ratios (RR) using modified Poisson regression.

**Results:** 539 participants (58% female, mean age 33 years, CD4 count 393 cells/μl, median viral load 38,163 copies/ml, 5.8% active TB) were initiated on ART between 02/2021-06/2023. At 24 weeks, 242/270 intervention and 234/269 control arm participants had TFV-diphosphate results for analyses. Geometric mean TFV-diphosphate concentrations were similar among intervention and control participants (1,253 versus 1,198 fmol/punch,  $p=0.510$ ).

However, the proportion with detectable TFV-diphosphate (≥200 fmol/punch) was higher in the intervention than control arm (98.8% versus 92.7%, RR=1.06, 95%CI

1.02-1.11,  $p=0.001$ ), Figure 1. Retention-in-care (88.5% versus 86.2%,  $RR=1.03$ , 0.96-1.09), VS (93.8% versus 91.4%,  $RR=1.03$ , 0.97-1.08) and Retained+VS (82.2% versus 78.8%,  $RR=1.04$ , 0.96-1.13) were slightly higher in the intervention than control arm, but not significantly different.

Figure 1. Tfv-diphosphate concentrations and viral suppression dynamics in the STREAM HIV trial at 24 weeks.

**Conclusions:** In this South African cohort initiating dolutegravir-based ART, overall adherence and VS were high at 24 weeks. Monthly point-of-care urine Tfv testing led to more participants achieving detectable Tfv-diphosphate concentrations, but did not produce higher drug concentrations or more VS. The impact of urine Tfv testing in combination with point-of-care viral load testing will be assessed at 72 weeks.

## SS0406LB

### Automated 24/7 dispensing of HIV prevention goods and self-tests via vending machines

R. Poverga<sup>1</sup>

<sup>1</sup>Public Association "Positive Initiative", Chisinau, Moldova, the Republic of

**Background:** To overcome barriers in accessing HIV prevention products and self-tests—such as reducing dependency on physical interactions with staff, operating hours, and geographic limitations of service providers—in 2023, a network of vending machines (VMs) was launched in Moldova as part of enhanced HIV/AIDS response measures.

**Description:** The VM network was launched in 2023, it consisted of 25 vending machines that provide free, round-the-clock, automated dispensing of preventive goods and self-testing kits for HIV. These were located in 14 major cities across Moldova and are maintained by nine CSOs providing HIV prevention services.

Utilizing RFID cards, clients can access goods in accordance with limits and sets based on their affiliation with one or more KG. The VMs are integrated into a digital ecosystem and provide real-time information on the utilization of goods linked to the client's de-personalized demographic profile.

**Lessons learned:** From 1 June 2023 to 29 April 2024, the VMs provided access to preventive goods and HIV self-tests 29,836 times to 3,513 representatives of key groups. Considering that a social worker typically spends 3 to 7 minutes per transaction for the distribution and registration of preventive goods, the automated dispensing saved over 300 workdays, which were reallocated to addressing complex cases in providing HIV prevention, care, and support services. The service was most popular among PWUD (3,015 of 3,513), followed by SW (619), MSM (104), and PLHIV (131), noting that one individual may belong to multiple key groups. 26.56% of users were female and 73.44% were male.

**Conclusions/Next steps:** The 24/7 automated dispensing of HIV preventive goods is essential for broadening service access. It eliminates barriers like discrimination and geographic limitations by allowing non-stop access without direct human contact, enhancing service perception through initiatives like prize draws. The pilot's success demonstrates potential for expansion, particularly to regions like penal systems with restricted access. Digital tracking enables targeted, data-driven resource allocation by providing insights into user trends and needs.

## SY25 Use of long-acting injectable cabotegravir in pregnant and lactating people

### SY2503

Initial evaluation of injectable cabotegravir (CAB-LA) safety during pregnancy in the HPTN 084 open-label extension

S. Delany-Moretlwe<sup>1</sup>, E. Voldal<sup>2</sup>, F. Saidi<sup>3</sup>, L. Stranix-Chibanda<sup>4</sup>, M. Bhondai-Mhuri<sup>4</sup>, P. Mandima<sup>4</sup>, P. Mukwekwerere<sup>4</sup>, J. Cohen<sup>21</sup>, M. Hosseinipour<sup>3,21</sup>, HPTN 084 study team  
<sup>1</sup>University of the Witwatersrand, Wits RHI, Johannesburg, South Africa, <sup>2</sup>Fred Hutchinson Cancer Research Institute, Statistical Centre for HIV/AIDS Research Prevention, Seattle, United States, <sup>3</sup>UNC-Project Malawi, Lilongwe, Malawi, <sup>4</sup>University of Zimbabwe, Clinical Trials Research Centre, Harare, Zimbabwe, <sup>5</sup>UVR-I-IAVI, Entebbe, Uganda, <sup>6</sup>Baylor College of Medicine Children's Foundation, Kampala, Uganda, <sup>7</sup>Makerere University, Johns Hopkins University Research Collaboration, Kampala, Uganda, <sup>8</sup>University of Cape Town, Desmond Tutu Health Foundation, Cape Town, South Africa, <sup>9</sup>South African Medical Research Council, HIV and other infectious diseases Research Unit, Durban, South Africa, <sup>10</sup>University of Stellenbosch, Desmond Tutu TB Foundation, Cape Town, South Africa, <sup>11</sup>University of the Witwatersrand, PHRU, Johannesburg, South Africa, <sup>12</sup>ICAP at Columbia University Mailman School of Public Health, Eswatini Prevention Center, Mbabane, Eswatini, <sup>13</sup>Kamuzu University of Health Sciences, Johns Hopkins Research Project, Blantyre, Malawi, <sup>14</sup>Botswana-Harvard AIDS Institute Partnership, Gaborone, Botswana, <sup>15</sup>Kenya Medical Research Institute, Kisumu, Kenya, <sup>16</sup>FHI360, Durham, United States, <sup>17</sup>Johns Hopkins University School of Medicine, Department of Pathology, Baltimore, United States, <sup>18</sup>National Institute for Allergy and Infectious Diseases, Division of AIDS, Rockville, United States, <sup>19</sup>Gilead Sciences, Foster City, United States, <sup>20</sup>ViiV Healthcare, Durham, United States, <sup>21</sup>University of North Carolina at Chapel Hill, Chapel Hill, United States

**Background:** HPTN 084 demonstrated that long-acting injectable cabotegravir (CAB-LA) significantly reduced HIV acquisition compared to daily oral TDF/FTC in individuals born female. Few data exist regarding the safety of CAB-LA during pregnancy.

From 2022, eligible participants were offered the choice of open-label CAB-LA or TDF/FTC as PrEP in the ongoing HPTN 084 open-label extension (OLE), and contraceptive

restrictions were removed. Participants could consent to continue CAB-LA injections throughout pregnancy. We report on maternal safety and pregnancy outcomes during the OLE.

**Methods:** Pregnancies confirmed on two separate samples on the same day from OLE start through to November 2023 are included in this analysis. Pregnancies were categorised by exposure into:

1. CAB-LA injections during pregnancy,
2. CAB-LA prior to pregnancy only, or;
3. No CAB-LA exposure (TDF/FTC group).

Pregnancy incidence, maternal adverse event (AE) incidence, and poor pregnancy outcomes (composite outcome of spontaneous abortion <20 weeks, intrauterine fetal death or stillbirth ≥20 weeks, premature birth <37 weeks, or small for gestational age) were assessed.

**Results:** Of 2472 participants in the OLE, there were 351 confirmed incident pregnancies in 334 participants over 3118 person years (incidence 11.3/100 person-years [py]; 95% CI 10.1 – 12.5). Among participants with CAB-LA use during or prior to pregnancy, median time from last injection to pregnancy detection was 8 (IQR 7-9) and 13 (IQR 8-56) weeks respectively. A median of 4 (IQR 2-4) injections were received by participants with CAB-LA use during pregnancy. There were no maternal deaths. Pregnancy-related maternal AE incidence was 43.7 (95% CI 30.9-60.0), 52.9 (95% CI 24.2-100.5), and 40.0 (95% CI 14.7-87.1) per 100 py among those using CAB-LA during pregnancy, prior to pregnancy or no CAB-LA respectively.

Poor pregnancy outcome rates were similar across groups with negative outcomes reported in 28% (55/194), 35% (24/69), and 26% (11/43) of pregnancies with CAB-LA use, prior CAB-LA or no CAB-LA respectively. One major congenital anomaly was observed overall (CAB-LA during pregnancy group).

**Conclusions:** CAB-LA was well tolerated in pregnant women. Maternal and pregnancy outcomes were consistent across non-randomized exposure groups and with expected background rates. These data provide reassurance regarding use of CAB in pregnancy.

## SY2504

### Evaluation of long-acting cabotegravir (CAB-LA) pharmacokinetics during pregnancy: a sub-study analysis of the HPTN 084 open label extension study

M. Marzinke<sup>1</sup>, E. Voldal<sup>2</sup>, B. Hanscom<sup>2</sup>, X. Guo<sup>2</sup>, E. Piwowar-Manning<sup>1</sup>, Y. Agyei<sup>1</sup>, J. Farrior<sup>3</sup>, L. Cohen<sup>11</sup>, M. Hosseinipour<sup>11,6</sup>, S. Delany-Moretlwe<sup>12</sup>, HPTN 084 Study Team

<sup>1</sup>Johns Hopkins University, Pathology, Baltimore, United States, <sup>2</sup>Fred Hutchinson Cancer Center, Vaccine and Infectious Disease Division, Seattle, United States, <sup>3</sup>FHI 360, Durham, United States, <sup>4</sup>University of Zimbabwe, Child, Adolescent and Women's Health Department, Harare, Zimbabwe, <sup>5</sup>Makerere University-Johns Hopkins University Research Collaboration, Kampala, Uganda, <sup>6</sup>UNC Project-Malawi, Lilongwe, Malawi, <sup>7</sup>GlaxoSmithKline, Research Triangle Park, United States, <sup>8</sup>ViiV Healthcare, Durham, United States, <sup>9</sup>Gilead Sciences, Foster City, United States, <sup>10</sup>National Institute of Allergy and Infectious Diseases, Division of AIDS, Rockville, United States, <sup>11</sup>University of North Carolina (UNC) at Chapel Hill, Department of Medicine, Chapel Hill, United States, <sup>12</sup>University of the Witwatersrand, Wits RHI, Johannesburg, South Africa

**Background:** HPTN 084 found that long-acting cabotegravir (CAB-LA) was well-tolerated and significantly reduced the risk of HIV acquisition in women compared to tenofovir disoproxil fumarate/emtricitabine (TDF/FTC). In the HPTN 084 open label extension (OLE) study, long-acting contraceptive requirements were removed, and pregnant participants could consent to CAB-LA injections during pregnancy. A nested sub-study evaluated the pharmacokinetics of CAB-LA among a subset of participants who continued to receive CAB-LA injections during pregnancy.

**Methods:** Fifty HIV-negative participants who enrolled in the pregnancy sub-study between 11 May 2022 and 13 July 2023 and received  $\geq 4$  CAB-LA injections in the 12 months prior to pregnancy and during pregnancy were evaluated in this analysis. Participants underwent monthly PK sampling during pregnancy. Trough ( $C_{trough}$ ) CAB concentrations were averaged (geometrically) within each participant over the pre-pregnant, pregnant, and post-partum (through 24 weeks) periods and during each pregnancy trimester, and then summarized. Area under the concentration-time curve (AUC) was determined during each trimester. Ratios of  $C_{trough}$  CAB concentrations between pregnant and pre-pregnant periods were determined for each participant.

**Results:** The mean weight for participants in the pre-pregnant, pregnant, and postpartum periods were 66.3 kg, 71.8 kg, and 68.6 kg, respectively. The median number of CAB-LA injections administered in the year prior to

pregnancy was 6 (range: 4-7) and during pregnancy was 4 (range: 4-5). Median  $C_{trough}$  concentrations during the pre-pregnant, pregnant, and postpartum periods were 2.1  $\mu\text{g/mL}$  (IQR: 1.3, 2.7), 1.9  $\mu\text{g/mL}$  (IQR: 1.5, 2.2), and 2.6  $\mu\text{g/mL}$  (IQR: 1.9, 3.5), respectively. Median  $C_{trough}$  concentrations during the first, second, and third trimesters were 2.5  $\mu\text{g/mL}$  (IQR: 2.0, 3.2, min: 1.3), 1.8  $\mu\text{g/mL}$  (IQR: 1.5, 2.4, min: 0.8), and 1.6  $\mu\text{g/mL}$  (IQR: 1.3, 2.0, min: 0.6); median AUCs were 88.9 (first trimester), 125.0 (second trimester), and 108.3 (third trimester) days\* $\mu\text{g/mL}$ . Median individual  $C_{trough}$  ratios comparing each trimester to the pre-pregnant period were 1.3, 0.9, and 0.8 for the first, second, and third trimester, respectively.

**Conclusions:** Initial analyses suggest that CAB concentrations decrease throughout pregnancy; however, concentrations largely remain above protocol-defined exposure targets. While dose modifications are unlikely to be required for those who continue CAB-LA during pregnancy, additional analyses are required.

### OAA02 It's about timing: When to start, when to stop

#### OAA0206LB

##### Factors influencing time to viral rebound during analytical treatment interruptions in HIV cure trials

V. Kastrup<sup>1,2</sup>, J.D. Gunst<sup>1,2</sup>, T.A. Rasmussen<sup>1,2</sup>, M. Tolstrup<sup>1,2</sup>, O.S. Soegaard<sup>1,2</sup>

<sup>1</sup>Aarhus University, Department of Clinical Medicine, Aarhus, Denmark, <sup>2</sup>Aarhus University Hospital, Department of Infectious Diseases, Aarhus, Denmark

**Background:** Achieving sustained control of HIV replication in the absence of ART is an important goal in HIV cure research. To identify factors associated with time to detectable viremia and time to loss of virologic control, we conducted a meta-analysis among participants in 6 interventional HIV cure trials.

**Methods:** Each of the 6 trials included an analytical treatment interruption (ATI). We determined factors influencing time to detectable viremia (defined as plasma HIV-1 RNA  $\geq 50$  copies per ml) and time to loss of virologic control (defined as either restart of ART or two consecutive measurements of plasma HIV-1 RNA  $\geq 5,000$  copies per ml) using cox proportional hazard regression to calculate hazard ratios.

**Results:** Among the 114 included participants median age was 47 years (range: 22 to 68 years). The trials investigated the following interventions alone or in combination: broadly neutralizing antibodies (bNAbs) (3BNC117, 10-1074), histone deacetylase inhibitors (HDACi) (romidepsin, pa-

nobinostat), HIV-1 peptide vaccine (Vacc-4x) and toll-like receptor 9 (TLR9) agonist (MGN1703). We found that pre-ATI total HIV-1 DNA  $\geq 850$  copies as well as intact proviral DNA  $\geq 70$  copies per  $10^6$  CD4+ T cells were associated with shorter time to detectable viremia (HR = 1.94, 95% CI: 1.27, 2.98; HR = 1.75, 95% CI: 1.01, 3.00).

Total HIV DNA  $\geq 850$  copies per  $10^6$  CD4+ T cells also predicted shorter time to loss of virologic control; as did time from diagnosis to ART  $\geq$  one year (HR = 1.60, 95% CI: 1.05, 2.45; HR = 1.56, 95% CI: 1.02, 2.39). HDACi treatment seemed to predict shorter time to loss of virologic control, whereas bNAb treatment at ART initiation of individuals harboring 3BNC117-sensitive viruses was associated with delayed time to loss of virologic control (HR = 1.69, 95% CI: 1.09, 2.62; HR = 0.26, 95% CI: 0.09, 0.73).

**Conclusions:** Our findings shed new light on factors influencing time to viral rebound as well as loss of virologic control. These findings can inform the design of novel cure trials but also highlight the potential impact of early bNAb treatment on virological control during ATI.

## OAA06 HIV in children: What are the challenges?

### OAA0606LB

HIV infection alters the breastmilk virome of mothers living with HIV and the gut virome of related infants through early life.

B. Brown<sup>1,2</sup>, B. Maust<sup>1,2</sup>, C. Feng<sup>2</sup>, A. Happel<sup>3</sup>, S. Minot<sup>4</sup>, A. Varsoni<sup>5,3</sup>, H. Jaspan<sup>1,3,2</sup>

<sup>1</sup>University of Washington, Pediatrics, Seattle, United States,

<sup>2</sup>Seattle Children's Hospital, Seattle, United States,

<sup>3</sup>University of Cape Town, Cape Town, South Africa, <sup>4</sup>Fred Hutch Cancer Center, Seattle, United States, <sup>5</sup>Arizona State University, Phoenix, United States

**Background:** Infants born to mothers living with HIV that remain uninfected (HEU) experience higher risk of morbidity and mortality, reduced responses to vaccination, and altered gut bacterial microbiota. However, little is known regarding the effect of maternal HIV infection on the establishment and composition of the infant gut virome.

**Methods:** From a cohort of South African mothers living with HIV and related HEU infants (n=40 pairs) and an age-matched control group of mothers not living with HIV and their infants (n=40 pairs), we undertook viral DNA and RNA metagenomic sequencing of purified viral particles. Viral and bacterial communities were analyzed in maternal stool and breast milk and infant stool through the first 36 weeks of life. Vaccine responses were measured via multiparameter flow cytometry and bacterial communities were profiled using 16S rRNA gene sequencing.

**Results:** We find that maternal HIV status is significantly associated with distinct composition of the breast milk (F = 3.28, P < 0.001) and gut viromes of related infants (F = 1.93, P = 0.004), relative to controls. HEU infants also display 11-fold increased relative abundance of putative *Bifidobacteria* bacteriophages (P < 0.001) and a concomitant 24-fold reduction in the abundance of *Bifidobacteria* (P < 0.001) in the first week of life, relative to unexposed infants.

*Bifidobacterium longum* abundance in the first week of life was significantly positively correlated with later responses to Bacille Calmette-Guerin (BCG) vaccination (R<sup>2</sup>=0.35, P=0.002), which was contrasted by a significant inverse correlation between the abundance of a eukaryotic DNA virus within the *Smacoviridae* during the first week and BCG responses (R<sup>2</sup>=0.12, P = 0.04).

**Conclusions:** Mothers living with HIV have significantly different composition of the breast milk virome, and the gut virome of their related infants also significantly differs compared to infants not exposed to HIV. These shifts include increases in the relative abundance of putatively *Bifidobacteria*-infecting bacteriophages and reductions in the relative abundance of *Bifidobacteria* in HEU infants relative to unexposed infants.

These results provide early insights into the effect of maternal HIV infection on the establishment of the infant gut virome and its relationship to bacterial microbiota and responsiveness to vaccination.

### OAA1306LB

Potent and broadly neutralizing HIV-1 antibodies with improved pharmacokinetics achieved by negative supercharging

Y.D. Kwon<sup>1</sup>, M. Bender<sup>1</sup>, E.S. Yang<sup>1</sup>, K. McKee<sup>1</sup>, S. O'Dell<sup>1</sup>, E. Tourtellott-Fogt<sup>1</sup>, I-T. Teng<sup>1</sup>, D. Wang<sup>1</sup>, A. Pegu<sup>1</sup>, T. Zhou<sup>1</sup>, N. Doria-Rose<sup>1</sup>, T. Pierson<sup>1</sup>, R. Koup<sup>1</sup>, P. Kwong<sup>1</sup>

<sup>1</sup>National Institutes of Health, Vaccine Research Center, Bethesda, United States

**Background:** Our previous work demonstrated that reducing the net charge of the variable domain of HIV-1 antibodies diminishes off-target binding and enhances pharmacokinetics (PK).

In this study, we investigated whether reducing the net charge by substituting select Arg or Lys with Gln or Glu in the first constant Ig domain of the heavy chain (CH1) and the constant domain of the light chain (CL), or by incorporating various acidic regions present in human protein molecules into the C-termini of the heavy and light chains, could enhance the PK of HIV-1 antibodies.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Methods:** We engineered a panel of HIV-1 antibody variants with Arg or Lys residues systematically substituted with Gln or Glu in the CH1 and CL domains in the presence or absence of acidic regions incorporated into the C-termini of the heavy and light chains and assessed neutralization potency against a 12-virus panel and PK in Tg32 hFc mice.

**Results:** Our findings revealed that K129E, K210E, and K214E substitutions in the CH1, and K128E, K147E, K190E, and K192E substitutions in the CL improved the PK of VRC01.23LS, VRC07-523LS, and N6LS while maintaining potency. Antibody variants with their net charge optimized in both the variable and CH1/CL domains displayed significantly extended PK compared to variants with substitutions in either the variable or constant domain alone. Interestingly, incorporating the acidic tail of alpha-synuclein (ATS) into the C-termini of the heavy and light chains of HIV-1 antibodies also enhanced PK without compromising potency. Furthermore, when the acidic tails were added to the charge-optimized variants, not only did PK further improve, but the potency of VRC01.23LS, VRC07-523LS, N6LS, PG9LS, PGT128LS, 3BNC117LS, 10-1074LS, and VRC34.01LS<sub>mm28</sub> increased unexpectedly by 6- to 10-fold compared to their wild-type counterparts.

**Conclusions:** While confirmation is needed regarding whether the enhanced potency observed in *in vitro* pseudovirus assays translates to improved protection in non-human primates, the conservation of the CH1 and CL domains in IgG1 suggests that these substitutions in the CH1 and CL, along with the addition of acidic tails, have the potential to enhance the PK and potency of various therapeutic antibodies.

### OAA2806LB

Spatial characterization and phenotypic profile of macrophage HIV reservoirs in lymph node and gut tissues from subtype C HIV infection

M. Moodley<sup>1</sup>, C. Chasara<sup>1</sup>, T. Khaba<sup>2</sup>, S. Nxele<sup>1,2</sup>, B. Mahlobo<sup>1</sup>, Z. Ndhlovu<sup>1,2,3</sup>

<sup>1</sup>Africa Health Research Institute (AHRI), University of KwaZulu-Natal (UKZN), Durban, South Africa, <sup>2</sup>HIV Pathogenesis Programme (HPP), University of KwaZulu-Natal (UKZN), Durban, South Africa, <sup>3</sup>Ragon Institute of MGH, MIT and Harvard, Cambridge, United States

**Background:** HIV Cure is impeded by the incomplete characterization of all sources of rebound-competent HIV reservoirs to direct targeted eradication therapies. Lymph node (LN) and gut tissues are key sites of HIV res-

ervoir persistence, where most research focuses on follicular helper T cell reservoirs. Emerging evidence reveals that macrophages may also harbour HIV, however there are controversies regarding their role as productively HIV infected reservoirs, partially due to their phagocytic role. This study aimed to characterize macrophage subtype C HIV reservoirs in human lymph node and gut tissues in terms of their phenotype, location, and their potential for sustained productive infection during suppressive antiretroviral therapy (ART).

**Methods:** Formalin-fixed paraffin-embedded LN and gut tissues from 20 people living with HIV (subtype C) in South Africa obtained from the FRESH and the HPP lymph node cohorts. Multi-colour immunofluorescence microscopy combined with in-situ hybridization RNAscope was employed to characterize and localize macrophage sub-populations containing HIV protein antigens and viral RNA. High-resolution oil-immersion microscopy was used to distinguish between macrophages that were productively infected and those that had ingested infected CD4+ T cells.

**Results:** Lymph node germinal centre (GC) CD68+ macrophages harboured both HIV gag-p24 protein and HIV gag-pol RNA. In HIV infection, the frequency of LN CD68+ macrophages was elevated ( $p=0.0039$ ). The density of GC CD68+P24+ macrophages was higher in late-treated compared to early-treated PLWH. There was a strong positive correlation between the density of GC CD68+P24+ macrophages and plasma viral load in late-treated individuals ( $p=0.0167$ ;  $r=1$ ). High-resolution imaging techniques revealed that phagocytic macrophages exhibited intracellular staining for CD4+ T cells, and were distinctively localized outside the GCs. In contrast, productively infected macrophages within GCs displayed gag-p24 co-localization in the absence of intracellular CD4 ingestion. In the gut, CD68+ macrophages harboured HIV gag-pol RNA and gag-p24 protein in the lamina propria and Peyer's Patches.

**Conclusions:** This study reveals that CD68+ macrophages are productively HIV infected tissue reservoirs, capable of contributing to viral rebound. These findings offer significant insights into the spatial distribution and characteristics of macrophage-associated reservoirs, establishing a basis for developing targeted strategies aimed at eliminating these reservoirs in LN and gut tissues.

### OAA3506LB

Natural killer cell in lymph nodes; phenotype, location, and function during acute infection and how HIV modulates their effector functions

M. Mlaba<sup>1,2,3</sup>, Z. Ndhlovu<sup>4,5,1</sup>, N. Ngema<sup>1</sup>

<sup>1</sup>Africa Health Research Institute (AHRI), Durban, South Africa, <sup>2</sup>University of KwaZulu-Natal, Medical Microbiology, Durban, South Africa, <sup>3</sup>HIV Pathogenesis Programme (HPP), Durban, South Africa, <sup>4</sup>Harvard, Immunology, Cambridge, United States, <sup>5</sup>Ragon Institute of Mass General, MIT & Harvard, Immunology, Cambridge, United States

**Background:** The persistence of HIV reservoirs in lymph node (LN) germinal centres (GC) despite HAART remains a barrier to achieve complete eradication of HIV. There is growing evidence that lymph nodes lack cytolytic responses, that may be linked to poor infiltration by dysfunctional cytolytic T cells. Natural killer (NK) cells represent the cytolytic arm of innate immunity with CXCR5+ NK cells having been correlated to decreased viral burden SIV infected LNs. However, there remains a paucity of information concerning migration and cytotoxicity of NK cells in human LNs.

Therefore, our aim was to assess the presence and functional capabilities of these CXCR5+ NK cells during treated HIV infection in the lymph node using immunofluorescent staining assays and flow cytometry.

**Methods:** PBMC and lymph node tissues (formalin-fixed paraffin-embedded tissue and dissociated LMC) were obtained from the HIV Pathogenesis Programme (HPP) lymph node study (LNS) and FRESH cohort, Durban, South Africa. Frozen PBMC and LNC were phenotypically and functionally characterised using flow cytometry analysis with standardized surface stain and ICS protocols, while LN tissues were imaged and analysed using Immunofluorescence microscopy.

**Results:** NK cells identified in the tissues of ART-treated PLWH lack CXCR5 expression required for migration into GC where we have showed HIV persists. Furthermore, there were significantly more CXCR5- NK cells ( $p = 0.0087$ ) when compared to CXCR5+ NK cells in HIV infected individuals.

Further, the NK cells were consistently found to localise outside the GCs. These NK cells also exhibited reduced expression of cytolytic markers CD107a and granzyme B. Additionally, while the overall frequency of CD56+ NK cells remained steady during HIV infection, HIV- samples displayed a notably higher density of CD56+ CD16+ NK cells ( $p = 0.0159$ ) compared to infected individuals.

**Conclusions:** The observed localization outside the GC and the reduced expression of cytolytic markers in NK cells are noteworthy and parallels similar observations in

CD8+ T cells, suggesting potential common mechanisms contributing to HIV persistence in tissues. This study contributes to a more comprehensive understanding of how HIV-1 infection impacts the immune system, particularly NK cell biology, during treatment.

Efficacy of dolutegravir/lamivudine (DTG/3TC) in adults with HIV-1 and isolated reactive hepatitis B core antibody (anti-HBc): results from the phase 3/3b GEMINI-1/-2, STAT, TANGO, and SALSA studies

D. Fox<sup>1</sup>, J. Slim<sup>2,3</sup>, E.T. Overton<sup>1</sup>, A. Doblado-Maldonado<sup>4</sup>, P. Jeffery<sup>5</sup>, R.A. Grove<sup>5</sup>, C.M. Parry<sup>6</sup>, M. Underwood<sup>1</sup>, B. Jones<sup>6</sup>

<sup>1</sup>Viiv Healthcare, Durham, United States, <sup>2</sup>New York Medical College, Valhalla, United States, <sup>3</sup>Saint Michael's Medical Center, Newark, United States, <sup>4</sup>Viiv Healthcare, Wavre, Belgium, <sup>5</sup>GSK, Brentford, United Kingdom, <sup>6</sup>Viiv Healthcare, Brentford, United Kingdom

**Background:** As 2-drug antiretroviral therapy regimens emerge, clinical management of people living with HIV-1 and isolated reactive anti-HBc is important. In real-world studies of people living with HIV-1 switching to 2-drug regimens, reactive anti-HBc was associated with lower HIV-1 suppression rates but not elevated liver enzymes or hepatitis B virus (HBV) reactivation. However, further evaluation is warranted.

We present outcomes for participants with isolated reactive anti-HBc receiving DTG/3TC vs comparator regimens in phase 3/3b studies.

**Methods:** This analysis includes individuals with past HBV exposure (reactive anti-HBc), no evidence of active HBV infection, and non-reactive HBV surface antibody among treatment-naïve participants in GEMINI-1/-2 and STAT and virologically suppressed participants in TANGO and SALSA.

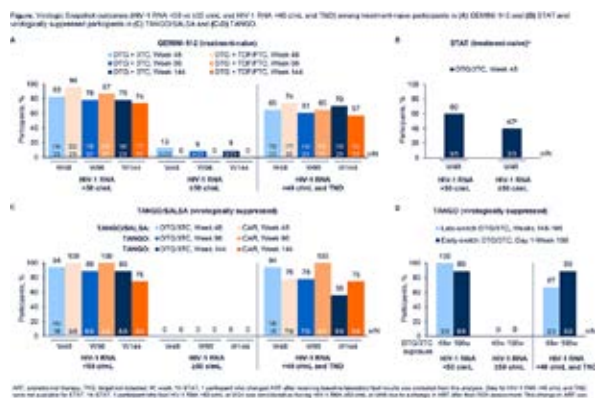

#### Results:

Overall, 46 participants in GEMINI-1/-2, 5 in STAT, 13 in TANGO, and 12 in SALSA had isolated reactive anti-HBc. Proportions of participants with HIV-1 RNA <50 c/mL or HIV-1 RNA <40 c/mL and target not detected were generally high and comparable between treatment groups across all studies; few participants experienced HIV-1 RNA ≥50 c/mL (Figure).

Liver function test toxicities were reported in 10/23 (43%) participants receiving DTG + 3TC in GEMINI-1/-2 and 3/16 (19%) receiving DTG/3TC in TANGO/SALSA; most were grade 1 or 2. Across studies, 1 participant receiving DTG + 3TC in GEMINI-1/-2 had hepatitis E virus infection and liver enzyme elevations that met liver-stopping criteria, which

led to treatment discontinuation at ~144 weeks and study withdrawal. Adverse events typically associated with HBV were reported in 5/23 (22%) participants receiving DTG + 3TC in GEMINI-1/-2 and 1/9 (11%) receiving DTG/3TC in TAN-GO. No HBV reactivation was reported in any study.

**Conclusions:** Among people living with HIV-1 with isolated reactive anti-HBc, DTG/3TC demonstrated high and similar HIV-1 suppression rates vs 3-/4-drug comparator regimens, with few liver enzyme elevations leading to discontinuation and no reports of HBV reactivation.

Knowing the true prevalence of tuberculosis (TB) in Nigeria: a call for the bi-directional diagnostic approach to TB detection

D.S. Adeniyi<sup>1</sup>, M.D. Agwo<sup>2</sup>, L.K. Biringmiap<sup>3</sup>, G.A. Dapye<sup>4</sup>, P.C. Okonkwo<sup>1</sup>, S. Wekpe<sup>1</sup>, L.S. Madukaji<sup>5</sup>, F.E. Owolagba<sup>5</sup>, E. Ofuche<sup>5</sup>, I. Onwuatuolo<sup>5</sup>, M. Okoye<sup>6</sup>, J. Samuels<sup>5</sup>, P. Okonkwo<sup>5</sup>

<sup>1</sup>APIN Public Health Initiatives, Directorate of Laboratory Services, Jos, Nigeria, <sup>2</sup>SMOH, TB Unit, Jos, Nigeria, <sup>3</sup>PLASU, Medical Laboratory, Bokkos, Nigeria, <sup>4</sup>SMOH, Epidemiology Laboratory, Jos, Nigeria, <sup>5</sup>APIN Public Health Initiatives, Laboratory Services, Abuja, Nigeria, <sup>6</sup>US CDC, Global HIV & TB, Abuja, Nigeria

**Background:** Tuberculosis (TB) is an infection which primarily attacks the lungs. Currently in Nigeria, emphasis is laid on initial diagnosis made on the Cepheid GeneXpert® system. The molecular technologies employed on the GeneXpert® allows for the quick and easy detection of TB infection in sputum samples. However, with Nigeria still leading Africa in TB prevalence, and in the number of undetected cases, diagnosing presumptive TB clients with only the GeneXpert® system becomes inadequate in the presence of Extra-pulmonary TB (EPTB).

This study seeks to highlight the comparative benefits of applying a bi-directional diagnostic approach to TB screening in Nigeria.

**Methods:** In this cross-sectional study, a total of 1,415 randomly diagnosed Advanced HIV Disease (AHD = CD4<200 cells/mm<sup>3</sup>) clients in Plateau State, North-Central Nigeria were tested for the *Mycobacterium tuberculosis* (Mtb) lipopolysaccharide using the Urine TB LF-LAM® test kit. This study took place from October 2022 to December 2023. Clients who were positive with the Urine TB LF-LAM® further produced sputum samples which were used for the MTB/RIF GeneXpert® testing. Obtained data were analyzed using simple descriptive statistics.

**Results:** From the 1,415 AHD clients in this study, 91/1,415 (6.4%) tested positive with the Urine TB LF-LAM®; while 17/91 (18.7%) were Mtb detected on the GeneXpert® machine. 74/91 (81.3%) EPTB and 17/91 (18.7%) Pulmonary TB (PTB) prevalence were recorded respectively.

**Conclusions:** Considering the current national emphasis on GeneXpert® screening for initial TB diagnosis, results obtained in this study indicates a large number of presumptive TB clients with EPTB are largely left undiagnosed. It is recommended that all presumptive TB clients be bi-directionally diagnosed using the Urine TB LF-LAM® and the GeneXpert® screening tests. This double-pronged approach will help to optimize the TB case detection in Nigeria.

**Key Words:** TB, EPTB, AHD, Nigeria, Urine TB LF-LAM®, GeneXpert®

on NAOMI HIV estimates, South Africa has the largest pediatric HIV epidemic globally, with an estimated 152,984 children <15 years living with HIV in 2024<sup>1</sup>.

**Methods:** We conducted a retrospective review of program data from 2018 to 2023, District Health Information System (DHIS II). Data is based on the Government of South Africa financial year (April to March). Data was for children aged 18 months: i) HIV tests, ii) Hexa-4 vaccinations, iii) live births 18 months prior to the review period, and iv) census estimates for age one year.

**Results:** There was a 48% increase in the number of children tested annually from 238,392 in 2018 to 352,827 in 2023. The proportion of children with a recorded vaccination who were tested for HIV increased from 32% in 2018 to 45% in 2023, while HIV positivity decreased from 0.6% to 0.3% over the same period. Over the five-year period, 36% (1.35 million) of the 3.8 million children receiving the Hexa-4 vaccine were tested for HIV. The Hexa-4 vaccination coverage was 69.7% compared to the estimated population.

**Conclusions:** Our findings indicate scale-up of integrated EPI and HIV testing services at 18 months of age. However, these data also highlight missed opportunities for universal testing currently. This novel policy is critical to closing the pediatric HIV case finding gaps, key on identifying slow progressors, and children with disadvantaged backgrounds who do not present to the healthcare facilities.

**Background:** Long-acting (LA), intramuscular (IM) cabotegravir+rilpivirine is the first LA combination antiretroviral treatment (ART) regimen. [IMPAACT 2017](#) evaluates the safety, acceptability, tolerability, and pharmacokinetics (PK) of this combination in virologically-suppressed (HIV-1 RNA <50 c/mL) adolescents. Data through Week-48 are presented.

**Methods:** In this Phase I/II trial, virologically-suppressed adolescents (12-18 years;  $\geq 35$  kg) with HIV-1 switched from their pre-study ART to at least 4 weeks of daily oral CAB+RPV followed by 600 mg CAB-LA + 900 mg RPV-LA IM (3-mL each) in the contralateral gluteus medius at Week 4 and 8, and then every 8-weeks.

**Results:** Eighteen centers in 5 countries enrolled 144 participants: median (range) age 15 years (12-17), body mass index 19.5 kg/m<sup>2</sup> (16.0-34.3), weight 48 kg (35-101), 51% female, 74% Black and 92% vertically acquired infection. Most participants received  $\geq 1$  injection (142/144), completed Week-48 (140/144) and received the number of injections expected (140/144).

Fifty-six (39%) participants experienced a drug-related adverse event (AE); three (2%) were  $\geq$  Grade 3 AE (injection site [IS] pain and abscess [n=1]; IS abscess [n=1]; anaphylaxis leading to study drug discontinuation [n=1]). Most common drug-related non-IS AEs were rash (n=4), headache (n=3) and nausea (n=2).

Fifty-two participants (36%) experienced a drug-related IS AE; mostly Grade 1 (92%) resolving within 7-days (86%). No confirmed virologic failures occurred through Week-48. Median (Q1-Q3) Week-48 observed pre-dose concentrations for CAB (2.77  $\mu$ g/mL[1.99-3.55]) and RPV (67.9 ng/mL[52.8-82.4]) approximated those in adults and were well above the respective protein-adjusted IC<sub>90</sub> (Figure). While 44% and 93% of CAB-LA and RPV-LA recipients reported some pain during injection, all reported preferring LA injections to daily oral treatment at Week-48 (140/140).

Figure. IMPAACT 2017 CAB and RPV troughs (black lines - medians [solid] with 5<sup>th</sup> - 95<sup>th</sup> [dashed]) compared to adults (blue lines) from LATTE-2/ATLAS-2M studies and protein-adjusted IC<sub>90</sub>s (red lines).

**Conclusions:** Week-48 multinational data from the first, virologically-suppressed adolescents living with HIV-1 who switched from daily oral to injectable CAB-LA + RPV-LA every 8-weeks demonstrate favorable safety/PK profile, strong participant preference and inform clinical use and regulatory submissions.

## OAB34 Co-morbidities: The heart of the matter

**Background:** Major adverse cardiovascular events (MACE) are more common in people with HIV (PWH). In REPRIEVE, pitavastatin reduced MACE by 35% among PWH with low-to-moderate traditional risk. We evaluated the role of prior and current use of antiretroviral agents (ART) on the development of MACE.

**Methods:** The trial enrolled PWH age 40-75 years on ART for at least 180 days, with a CD4 count  $>100$  c/mm<sup>3</sup> and low-moderate CVD risk. ART history was collected at baseline, including duration of exposure to select agents. Analyses in the REPRIEVE ITT population were performed for first MACE (including MI, TIA/stroke, revascularization, CV death), with median follow-up of 5.6 years. Cox proportional hazards models stratified by treatment group were used to account for treatment group differences. Effects of ART exposure were estimated in models unadjusted and adjusted for entry risk factors.

**Results:** Among 7,769 participants, 31.1% were natal female and 65.2% non-White. Median age was 50 years, LDL 108 mg/dL, 10-year ASCVD risk score 4.5%, CD4 621 cell/

mm<sup>3</sup> (447,826 c/mm<sup>3</sup>) with 88% having an HIV viral load <400 copies/mL. The median duration of ART use was 9.5 years (5.3,14.8 years) and varied by Country. Overall, 22% reported prior exposure to abacavir (ABC), 86% to Tenofovir (TDF), 49% to Thymidine analogs (AZT/d4T), and 47% to protease inhibitors (PIs). At study entry 13% were using ABC, 61% TDF, 10% AZT/d4T, and 26% PIs. Entry regimens included 2 NRTIs plus an NNRTI–47%, INSTI–25%, or a PI–19%. In adjusted analyses including the baseline regimen, both former and current use of ABC was associated with higher incidence of MACE (Figure). Former or current use of other ART agents was not associated with MACE (data not shown).

**Conclusions:** Former and current use of abacavir was associated with a higher incidence of subsequent major adverse cardiovascular events in the REPRIEVE trial.

**Background:** DTG/3TC and BIC/FTC/TAF are preferred regimens in major guidelines, but there are no fully powered trials comparing between them.

**Methods:** PASO-DOBLE (ClinicalTrials.gov NCT04884139) is a randomized, open-label trial conducted at 30 sites throughout Spain. Virologically suppressed PWH on reg-

imens containing  $\geq 1$  pill/day, boosters, or drugs with cumulative toxicity such as efavirenz or TDF were eligible. Participants were randomized (1:1) to switch stratifying by TAF in the regimen discontinued and sex. Primary end-point was the proportion of PWH with RNA  $\geq 50$  copies/mL at 48 weeks (FDA snapshot, 4% non-inferiority margin) in the exposed intention-to-treat population. Weight changes were also evaluated.

**Results:** Between 14-July-2021 and 24-March-2023, 553 PWH initiated DTG/3TC (n=277) or BIC/FTC/TAF (n=276), including 155 (28%) with TAF in the regimen discontinued and 147 (27%) women. At 48 weeks, DTG/3TC was non-inferior to BIC/FTC/TAF [risk difference between DTG/3TC (2.2%) minus BIC/FTC/TAF (0.7%) 1.4%, 95%CI -0.5 to 3.4] (Figure A). HIV RNA levels were low ( $\leq 282$  copies/mL) in those showing detectable viral load.

Mean adjusted weight increased significantly more with BIC/FTC/TAF (1.81kg, 95%CI 1.28-2.34) than with DTG/3TC (0.89kg, 95%CI 0.37-1.41) [difference 0.92kg, 95%CI 0.17-1.66]. The proportion of participants with weight gain  $>5\%$  at 48 weeks was 29.9% for BIC/FTC/TAF vs. 20% for DTG/3TC (adjusted OR 1.81, 95%CI 1.19-2.76).

While proportions of PWH experiencing  $>5\%$  weight gain with DTG/3TC were similar irrespective of the nucleos(t)ide reverse transcriptase inhibitor (NRTI) backbone discontinued, proportions of PWH experiencing  $>5\%$  weight gain with BIC/FTC/TAF were 50% or 100% higher than those with DTG/3TC when switching from abacavir or TDF (Figure B). Weight change in women (OR 1.131, 95% CI: 0.700-1.826) didn't differ from that in men. There were few discontinuations (DTG/3TC=1, 0.4%; BIC/FTC/TAF=2, 0.7%) due to adverse events.

**Conclusions:** Switching to DTG/3TC demonstrated non-inferior efficacy and resulted in less weight gain than switching to BIC/FTC/TAF at 48 weeks.

## OAB38 An INSTIgrated tale

### OAB3806LB

Dolutegravir with recycled nucleoside reverse transcriptase inhibitors maintains better viral suppression than protease inhibitor based antiretroviral therapy over 144 weeks: VISEND Trial

S. Sivile<sup>1,2,3</sup>, S. Fwoloshi<sup>1,2,3</sup>, D. Engamba<sup>1,4</sup>, A. Mweemba<sup>4,1</sup>, M. Siwingwa<sup>1,3</sup>, D. Kampamba<sup>1,2</sup>, M. Mbewe<sup>1</sup>, A.P. Kumar<sup>1</sup>, N. Mbewe<sup>1,5</sup>, H. Phiri<sup>2</sup>, A. Shibemba<sup>1</sup>, B.P. Haabari<sup>1</sup>, E. Mwamba<sup>1</sup>, B. Simons<sup>6</sup>, C.W. Wester<sup>7,8</sup>, L. Chirwa<sup>1</sup>, A. Hill<sup>9</sup>, L. Mulenga<sup>1,3,2,7,8</sup>

<sup>1</sup>University Teaching Hospital, Adult Infectious Diseases Center, Lusaka, Zambia, <sup>2</sup>Ministry of Health, Division of Infectious Diseases, Lusaka, Zambia, <sup>3</sup>University of Zambia, School of Medicine, Division of Infectious Diseases, Lusaka, Zambia, <sup>4</sup>Levy Mwanawasa Medical University, Division of Infectious Diseases, Lusaka, Zambia, <sup>5</sup>Zambia National Public Health Institute, Lusaka, Zambia, <sup>6</sup>London School of Economics & Political Science, London, Zambia, <sup>7</sup>Vanderbilt Institute for Global Health, Nashville, United States, <sup>8</sup>Vanderbilt University Medical Center, Department of Medicine, Division of Infectious Diseases, Nashville, United States, <sup>9</sup>Liverpool University, Department of Translational Medicine, Liverpool, United Kingdom

**Background:** Dolutegravir (DTG) is recommended for both first and second line antiretroviral therapy (ART). Despite emerging evidence on positive clinical outcomes among individuals failing NNRTI-based ART and switched to DTG-based regimens with maintained NRTIs, there is paucity in data on longer-term outcomes. We hereby report the 144-week outcomes of the VISEND trial.

**Methods:** We conducted a 144 week, randomized, open-label, phase 3 non-inferiority trial in Zambia. We randomized adults with viral load (VL)  $< 1000$  copies/mL on tenofovir disoproxil fumarate (TDF), lamivudine (3TC) plus efavirenz (EFV) or nevirapine (NVP) to TDF,3TC,DTG (TLD) or tenofovir alafenamide fumarate (TAF), emtricitabine (FTC), DTG (TAFED) [Arm A]. Participants with VL  $< 1000$  copies/mL were randomized to TLD or TAFED or standard-of-care (SOC) second line comprising Lopinavir/ritonavir (LPV/r) or atazanavir/r (ATV/r), zidovudine (ZDV), 3TC [Arm B]. Primary end point was VL  $< 1,000$  copies /mL (viral suppression (VS)), assessed using the FDA snapshot algorithm (intent-to-treat (ITT) population). Noninferiority was tested with a margin of 10 percentage points.

**Results:** Of 1,201 participants, 99% in Arm A maintained viral suppression on both TLD and TAFED [difference, -0.0%, 95% CI -0.02- 0.02] at week 144. In Arm B, 98% TLD-treated adults achieved VS, compared to 96% for TAFED and 89% for 3TC/ZDV/PI/r. Noninferiority of switching to both DTG-based arms was achieved compared to the SOC (TLD versus ZDV/3TC/PI/r difference, 9.9% [5.9 - 13.9]; TAFED versus ZDV/3TC/PI/r difference, 8.8% [4.7 - 12.9]). The base-

line prevalence of tenofovir and lamivudine/emtricitabine associated resistant mutations was 56% (204/363) and 75%, (273/363) respectively. In those randomised to TDF/3TC/DTG and TAF/FTC/DTG, 61% and 52% had no predicted tenofovir activity respectively; whereas 75% had no predicted lamivudine or emtricitabine activity in both groups. There was no major resistant mutations to DTG but 26 to bPI and 32 to NRTIs among those with virologic failure over the study period.

**Conclusions:** In the VISEND trial, HIV-positive adults with virologic failure to TDF/3TC/NNRTI, had favourable outcomes when switched to DTG with recycled NRTIs compared to those switched to SOC boosted-PI despite high baseline resistance to NRTIs.

No emergent INSTI mutations were reported at week 144. We recommend recycling of TDF(TAF)/3TC with DTG following failure.

## OAC10 Paving the way to safety: Harm reduction successes in challenging settings

### OAC1006LB

Explaining the transmission dynamics of mpox in Europe and the Americas between 2022-2024: findings from an online survey in 23 countries

M. Prochazka<sup>1</sup>, P. Vinti<sup>2</sup>, A. Hoxha<sup>1</sup>, A. Seale<sup>1</sup>, A. Mozalevskis<sup>1</sup>, R. Lewis<sup>1</sup>, R. Mayorga Sagastume<sup>3</sup>, M. Scherzer<sup>2</sup>, L. Dore<sup>1</sup>, M. Doherty<sup>1</sup>

<sup>1</sup>World Health Organization, Geneva, Switzerland, <sup>2</sup>WHO Regional Office for Europe, Copenhagen, Denmark, <sup>3</sup>Pan American Health Organization, Washington DC, United States

**Background:** After rapid epidemic growth between May-August 2022, new mpox diagnoses declined in Europe and the Americas, with low-level transmission continuing thereafter. Characterising the extent of behavioural adaptation, mpox vaccination, and mpox prevalence across these regions during the first year of the outbreak can support understanding transmission dynamics.

**Methods:** WHO conducted a retrospective online survey in 23 countries in Europe and the Americas between 19-31 May 2023. The survey was advertised via four geospatial dating applications used by gay, bisexual and other men who have sex with men, and trans and gender diverse people. We described and regionally compared the mpox prevalence, mpox vaccination rates (2 doses) and the extent and duration of behavioural adaptation. We estimated crude and adjusted prevalence ratios (PRs) with confidence intervals (CI) for behavioural outcomes using generalised linear models.

**Results:** Of 16,875 participants, 6.4% (1,086) reported having mpox during the outbreak. Vaccination with at least one vaccine dose was reported by 29.6% (4,987/16,875) of participants; 20.8% (3,502/16,875) reported two doses. Complete vaccination in Latin America (3.5%) and in Eastern Europe and Western Balkans (1.6%) was significantly lower than in Western Europe (27.7%) and North America (51.3%,  $p<0.001$ ). Adaptations to sexual behaviour were reported by 50.9% (8,583/16,875) and across all regions. Among those who made adaptations, 35.5% (3,045/8,583) said they continued adapting their sexual behaviour up to May 2023. In regression models, participants who reported concerns about mpox (58.6%) were more likely to adapt their behaviour (aPR95%CI: 2.43 [2.34-2.53]), whereas participants who reported vaccination (aPR95%CI: 0.25 [0.28-0.31] or having had mpox (aPR95%CI: 0.37 [0.30-0.44]) were less likely to continue adaptations. Participants in Latin America or North America were significantly more likely to adapt their sexual behaviour and to continue with adaptations compared to participants in Western Europe ( $p<0.001$ ).

**Conclusions:** Adaptations to sexual behaviour due to mpox were widespread and dynamic, and responded to evolving individual risk perceptions. Given stark vaccine inequity during the first year of the global response, but comparable reduction in transmission, we propose that the sudden decline in mpox transmission seen at the end of 2022 occurred as a combination of community-led behavioural adaptation and naturally-acquired immunity.

## OAC15 Meeting people where they are: Interventions to support testing

### OAC1506LB

Risk factor assessment for HIV, HBV, and HCV in migrants from Central and South America

R. Lara-Medrano<sup>1</sup>, V. Baylon-Valdez<sup>1</sup>, L.G. Castillo-Reyna<sup>2</sup>, G.M. Aguirre-García<sup>1</sup>, M.T. Ramírez-Elizondo<sup>1</sup>, D. Ramonfau-Gracia<sup>1</sup>, M.F. Martínez-Reséndez<sup>1</sup>, F.J. Bosques-Padilla<sup>1</sup>

<sup>1</sup>School of Medicine and Health Sciences, Instituto Tecnológico y de Estudios Superiores de Monterrey, Monterrey, Mexico, <sup>2</sup>Consejo Estatal para la Prevención y el Control del SIDA. Secretaría de Salud, Monterrey, Mexico

**Background:** The unprecedented increase of migratory flow in the Americas region, with individuals seeking to reach the United States of America via Mexico, represents a significant challenge for local health authorities. These key populations are exposed to numerous risks, such as sexual violence and drug use, which pose a risk of expo-

sure to HIV and viral Hepatitis. This study aims to assess the risk factors involved in the incidence of these infections among migrants.

**Methods:** Community-based screening programs were conducted in shelters, refugee centers, and migrant houses in the state of Nuevo Leon, Mexico. Between December 2023 and April 2024, adults from Central and South America, transiting through Nuevo Leon to the United States, were invited to participate. A sociodemographic questionnaire was administered, and screening was performed using rapid tests for HIV, hepatitis B and C viruses, and syphilis.

**Results:** A total of 117 migrants participated, with 59% identifying as males and a mean age of  $33 \pm 9$  years. Predominantly from Honduras (46%), Venezuela (13%), and Guatemala (11%), primary motivations for migration included fleeing violence (46%) and seeking employment (35%), with a mean transit duration of 9 months. Eighty-seven percent reported engaging in heterosexual intercourse, yet only 38% used contraceptive methods, with condoms being the most common (62%). Drug use was documented in 16% of participants, mainly marijuana (84%). Use of drugs during sexual intercourse was reported in 12%, with marijuana being the most common. Sale of sexual services occurred in 10%, with only 25% of these using condoms. Sexual abuse was reported by 12% of participants. Screening acceptance rates for HIV and syphilis tests were 86%, for Hepatitis B 93%, and for Hepatitis C 85%. Three participants had a positive rapid HIV test, confirmed with HIV viral load; one of them had a positive rapid syphilis test. All were referred for treatment initiation and follow-up.

**Conclusions:** These findings underscore the critical importance of tailored interventions for HIV prevention, treatment, and care within migrant populations. Highlighting the urgent need for comprehensive public health strategies addressing the intersecting vulnerabilities faced by migrants, including access to sexual health education and interventions for people who use drugs.

<sup>1</sup>University Teaching Hospital, Adult Infectious Diseases Center, Lusaka, Zambia, <sup>2</sup>Ministry of Health, Division of Infectious Diseases, Lusaka, Zambia, <sup>3</sup>University of Zambia, School of Medicine, Division of Infectious Diseases, Lusaka, Zambia, <sup>4</sup>Vanderbilt University Medical Center, Department of Medicine, Division of Infectious Diseases, Nashville Za, Zambia, <sup>5</sup>National AIDS Council, Lusaka, Zambia, <sup>6</sup>Ciheb Zambia, Lusaka, Zambia, <sup>7</sup>JSI DISCOVER Health, Lusaka, Zambia, <sup>8</sup>U.S. Agency for International Development, Lusaka, Zambia, <sup>9</sup>University of Maryland School of Medicine, Division of Infectious Diseases, Baltimore, United States, <sup>10</sup>World Health Organisation, Lusaka, Zambia

**Background:** To further curb new HIV infections, injectable long-acting cabotegravir (CAB-LA) pre-exposure prophylaxis (PrEP) was introduced routinely in Zambia in February 2024, the second country after the USA to roll out CAB-LA PrEP outside research settings. It is critical to understand risks of resistance and optimal HIV testing strategies in such real-world settings.

We describe early experience and challenges in identifying acute HIV infection (AHI) in a low-resource implementation environment.

**Description:** Using clinical screening tools, at-risk priority and key populations are identified and screened for CAB-LA PrEP eligibility. Screening includes assessment for AHI, HIV testing using third-generation rapid diagnostic antibody test (RDT), and HIV nucleic acid amplification test (NAAT), though it has a two-week turn-around time. If HIV RDT and AHI screening is negative, CAB-LA initiation injection 1 is administered; injection 2 is given one month later after confirming continuation eligibility. NAAT is used to confirm eligibility upon receipt of results.

**Lessons learned:** From 9 February to 30 April 2024, we screened 927 individuals for substantial HIV acquisition risk. 853 screened RDT/AHI negative and were initiated on CAB-LA PrEP. Among them, 4/853 (0.5%) individuals (3 men,

1 woman, ages 21-28) tested NAAT positive. Three of the four (75%) had received dose 1; one (25%), had received both dose 1 and 2 by the time NAAT results were received. HIV-1 RNA levels among the four NAAT+ persons were <30, <30, 141, and 533,000 copies/mL. Resistance testing on the HIV-1 RNA >1,000 copies/mL sample showed sensitivity to integrase strand transfer inhibitors. Furthermore, two discordant results (RDT negative and NAAT+) were recorded prior to CAB-LA initiation. There was better consistency in results with NAAT when a different RDT was used.

**Conclusions/Next steps:** Early experience in CAB-LA PrEP revealed challenges in identifying AHI in resource-limited settings using WHO-recommended RDTs for HIV screening. Two different serological assays showed better concordance to NAAT. Vigilant monitoring and stringent testing protocols are critical for accurate AHI identification and program optimization.

We recommend two different serology tests and/or virologic testing to detect AHI among persons initiating CAB-LA PrEP to prevent resistance. Point of care PCR platforms could reduce NAAT turnaround time and improve early AHI diagnosis.

### OAC2906LB

The impact of Russia's war in Ukraine on opioid agonist treatment (OAT) services, a primary HIV prevention strategy among people who inject drugs (PWID)

R. Ivasiy<sup>1</sup>, L.M. Madden<sup>2</sup>, A. Meteliuk<sup>3</sup>, T. Fomenko<sup>3</sup>, E. Machavariani<sup>1</sup>, D.J. Bromberg<sup>4</sup>, M. Filippovych<sup>5</sup>, I. Kharandiuk<sup>5</sup>, S.O. Farnum<sup>2</sup>, Z. Islam<sup>3</sup>, F.L. Altice<sup>1</sup>

<sup>1</sup>Yale University - School of Medicine, AIDS Department, New Haven, United States, <sup>2</sup>APT Foundation, New Haven, United States, <sup>3</sup>ICF „Alliance for Public Health“, Kyiv, Ukraine, <sup>4</sup>Yale University - School of Public Health, AIDS Department, New Haven, United States, <sup>5</sup>Ukrainian Institute of Public Health Policy, Kyiv, Ukraine

**Background:** Russia's full-scale war in Ukraine since 24-Feb-2022 has greatly disrupted OAT services for PWIDs, especially in high HIV burden southeastern regions, leading to internal displacement. Our study seeks to assess how the war and internal relocation affect OAT retention, critical for HIV prevention among PWIDs.

**Methods:** We conducted a two-year comparative cohort survival analysis using Ukraine's national OAT registry from 252 clinics across 25 regions. The study compared local OAT patients in conflict-remote regions with con-

flict-affected regions and internally displaced patients. Regions were clustered into frontline, target, and remote based on conflict-related metrics: numbers of air raids, explosions, artillery attacks, and percentages of internally displaced population.

The primary outcome, treatment retention, was assessed considering time-dependent displacement status, medication type (methadone vs. buprenorphine), OAT dose (optimal (methadone:  $\geq 90$ mg; buprenorphine:  $\geq 16$ mg) vs. suboptimal), dispensation strategy (daily vs. THD: take-home dosing), age, sex, inject drug duration, HIV-status.

**Results:** The nationwide sample of PWID receiving OAT as of 23-Feb-2022 comprised 17,265 individuals, with 4,953 (28.7%) in frontline, 8,786 (50.9%) in target, and 3,526 (20.4%) in remote regions. Most were male (84.6%), averaging  $38.9 \pm 7.5$  years old. From 24-Feb-2022 through 01-Jan-2024, 519 (0.03%) individuals underwent internal relocation, and 5,040 (29.2%) experienced treatment dropout.

Compared to the local patient cohort in remote regions, patients local to target and frontline regions had elevated risk of treatment discontinuation (adjusted hazard ratios (aHR): 1.31, 95%CI: 1.27-1.35; aHR: 6.92, 95%CI: 6.87-6.97, respectively). Internally displaced patients in target, frontline, and remote regions faced significantly greater dropout risk than local patients in conflict-distant regions (aHR: 5.95, 95%CI: 5.80-6.03; aHR: 6.80, 95%CI: 6.73-6.87; aHR: 16.79, 95%CI: 16.61-16.95, respectively).

The dropout risk for internally displaced patients in remote areas mirrored that of patients in frontline regions. Predictors of higher treatment retention included optimal dosing (aHR: 0.79, 95%CI: 0.76-0.82), THD (aHR: 0.72, 95%CI: 0.68-0.76), and receiving methadone (aHR: 0.88, 95%CI: 0.84-0.92). Females and people with HIV had a heightened risk of treatment discontinuation (aHR: 1.17, 95%CI: 1.13-1.21; aHR: 1.07, 95%CI: 1.04-1.11).

**Conclusions:** Russia's full-scale war in Ukraine increased the risk of OAT discontinuation for patients in conflict-affected regions and all internally displaced patients, undermining HIV prevention efforts among PWIDs.

Further research on national OAT service preparedness for disasters is crucial for uninterrupted care for key populations.

# OAC33 The long and winding road: Trends in HIV diagnosis, treatment and mortality

## OAC3306LB

Tracking progress in HIV control among male prison inmates in North India: findings from HIV Sentinel Surveillance 2019–2023

L. PVM<sup>1</sup>, A.K. Sethi<sup>1</sup>, P. Kumar<sup>2</sup>, C. Das<sup>2</sup>, S. Biswas<sup>2</sup>

<sup>1</sup>Postgraduate Institute of Medical Education and Research, Department of Community Medicine and School of Public Health, Chandigarh, India, <sup>2</sup>National AIDS Control Organization, New Delhi, India

**Background:** India's National AIDS and STD Control Programme targets 80% reduction in new infections from 2010 to 2026. Further, 95% of people living with HIV (PLHIV) should know their status, and 95% of those who know their status should receive treatment. Prison inmates are at substantial risk of HIV infection. We therefore aimed to track progress in HIV control from 2019 to 2023 among prison inmates in North India.

**Methods:** We did a secondary analysis of data for male prison inmates in seven Central Prisons across six States / Union Territories in North India. Data were collected during the 2019, 2021 and 2023 rounds of HIV Sentinel Surveillance. We examined the trends across surveillance rounds in HIV seroprevalence, knowledge of HIV status among PLHIV, and uptake of antiretroviral therapy by PLHIV who knew their status, using mixed-effects logistic models accounting for prison-level clustering. Additionally, we fitted models adjusting for socio-demographics, imprisonment characteristics, knowledge of HIV, behavioural risks and HIV testing.

**Results:** We included 8,400 prison inmates, i.e. 2,800 in each round. From 2019 to 2023, HIV seroprevalence increased from 3.8% to 5.7%. There were declines in awareness of HIV status among PLHIV (65.4% in 2019 to 28.1% in 2023) and uptake of antiretroviral therapy among PLHIV who knew their status (94.3% in 2019 to 84.4% in 2023). The trend in HIV seroprevalence was partly explained by injecting drug use, but persisted despite adjustment. The trend in knowledge of HIV status was explained by HIV testing and knowledge of HIV.

**Conclusions:** Injecting drug use is an important contrib-

utor to HIV infection among prison inmates in North India. Further, HIV testing and treatment coverage remain low in this population. Innovations in programme implementation are needed to enhance behaviour change, HIV testing and antiretroviral therapy coverage in prison settings.

## OAD07 Emerging patterns: Exploring trends and shifts in drug use

### OAD0706LB

"The simplest way to go:" A mixed methods analysis of why women who inject drugs selected long-acting injectable cabotegravir instead of daily oral PrEP

A.M. Roth<sup>1</sup>, A.K. Groves<sup>1</sup>, K.R. Amico<sup>2</sup>, E.C. McDowell<sup>1</sup>,

K.M. Ward<sup>1</sup>, E. Forman<sup>1</sup>, S. Palmer<sup>1</sup>, A. Crayton<sup>1</sup>,

D.S. Krakower<sup>3</sup>, A. Carrico<sup>4</sup>, K. Mims<sup>5</sup>, T.S. Bartholomew<sup>6</sup>

<sup>1</sup>Drexel University, Department of Community Health & Prevention, Philadelphia, United States, <sup>2</sup>University of Michigan, Department of Health Behavior and Health Education, Ann Arbor, United States, <sup>3</sup>Harvard Medical School, Department of Population Medicine, Boston, United States, <sup>4</sup>Florida International University, Health Promotion and Disease Prevention, Miami, United States, <sup>5</sup>Prevention Point Philadelphia, Philadelphia, United States, <sup>6</sup>University of Miami Miller School of Medicine, Department of Public Health Sciences, Miami, United States

**Background:** Women who inject drugs (WWID) have disproportionately high rates of HIV, and thus would benefit from HIV pre-exposure prophylaxis (PrEP). WWID who struggle with daily adherence may prefer long-acting injectable cabotegravir (CAB-LA) however, few studies have assessed product preference, and none have described the process of product selection among WWID who were offered both modalities.

**Methods:** Quantitative data are from 82 English-speaking, cisgender WWID ≥18 years, who received a PrEP prescription (oral PrEP or CAB-LA) from a provider integrated within a syringe services program (SSP) in Philadelphia (USA). Qualitative data are from a subset who completed a semi-structured interview (n=18 who chose CAB-LA, n=7 who chose oral PrEP). All participants are part of an ongoing RCT designed to reduce HIV acquisition risk. We used thematic analysis to explore the process of product selection.

**Results:** Most WWID selected CAB-LA (75/82). Higher frequency of injection drug use and higher average number of sexual partners were each associated with selecting CAB-LA (93% daily vs 70% less than daily,  $p=0.056$ ; 1 vs 0,  $p<0.01$ , respectively). No matter which product WWID se-

lected, the decision-making process was similar. Product selection, as described in participant interviews, was informed by their perceived risk for HIV exposure, if/how adherence might be impacted by their individual context (e.g., addiction severity), the brief individual counseling session they received prior to making their selection, and prior experience with oral and/or injectable medications. For WWID selecting CAB-LA, reducing day-to-day action to receive long-term prevention benefits was important, as few believed they would adhere daily.

Those selecting oral PrEP expressed more medical mistrust and dislike of needles and injectable medications. All women felt supported in their product selection by their PrEP providers.

**Conclusions:** Nearly all WWID in our study selected CAB-LA, suggesting a strong preference for this modality in this group. Women, including those selecting oral PrEP, had strong rationales for their choice. Offering women a wider array of products to choose from will likely increase uptake, as it has for other sexual health tools, like contraceptives.

## OAD16 Catalysts of change: Key population-led innovations

### OAD1606LB

Key strategic actions to improve uptake of and create demand for pre-exposure prophylaxis (PrEP) among key populations (KPs): qualitative evidence from Cambodia

K. Seang<sup>1</sup>, S. Ky<sup>2</sup>, V. Ouk<sup>2</sup>, S. Samreth<sup>2</sup>, B. Ngauv<sup>2</sup>, P. Ung<sup>3</sup>, V. Saphonn<sup>4</sup>

<sup>1</sup>University of Health Sciences, Grant Management Office, Phnom Penh, Cambodia, <sup>2</sup>National Center for HIV/AIDS, Dermatology and STD, Phnom Penh, Cambodia, <sup>3</sup>UNAIDS, Phnom Penh, Cambodia, <sup>4</sup>University of Health Sciences, Rectorate, Phnom Penh, Cambodia

**Background:** The majority of new HIV infections were among KPs but the uptake and retention rates of PrEP among MSM, TGW and female entertainment workers (FEW) in Cambodia were limited (about half of those previously enrolled in PrEP program discontinued PrEP). Additional evidence and support are required to better understand their suboptimal demand, uptake and retention of PrEP in order to come up with effective improvement strategies.

**Methods:** A qualitative study was conducted among policy-level stakeholders (n=9), potential PrEP clients (n=70) and PrEP providers (n=26) using key informant interview for the first group and focus group discussions as well as in-depth interviews for the last two. The data collection

took place in six selected PrEP sites across three provinces and Phnom Penh capital. The analysis was based on Braun & Clarke's thematic analysis methodology highlighting contextual, political, sociodemographic and behavioral factors that impact PrEP demand and use.

**Results:** Side effects, stigma/discrimination, misinformation, ineffective risk communication strategies and low HIV risk perception were commonly reported barriers to PrEP demand and uptake. Raising PrEP credibility and accessibility, encouraging involvements from KP community, and other public and private sectors and improving messages surrounding PrEP and PrEP users, should be considered to improve this suboptimal demand and uptake.

Socio-demographics	MSM (n=25)	TGW (n=21)	FEW (n=24)
Age (median, IQR)	(26, 9)	(24, 8)	(24, 11)
Education			
None to some or completed primary	1	7	16
Some secondary to ≥ BA (Bachelor) degrees	24	14	8
PrEP use			
Current users (on-demand or daily)	13	10	11
Non-users (including never users)	12	11	13

FEW, biological females, exchanged vaginal/oral/anal sex for money, goods, or gifts in past 12 months

IQR, Interquartile range

PrEP non-users, those who never use PrEP or have stopped using PrEP ≥3 months

Commonly reported challenges/barriers	Commonly suggested strategies for improvement

<p><b>Prior prescription</b></p> <ul style="list-style-type: none"> <li>• Lack of information on PrEP (what it is, how it works, where to get it, how to use it, etc.)</li> <li>• Lack of knowledge on HIV risk (what it is, how it is spread, etc.)</li> <li>• Lack of motivation to get PrEP (e.g., "I don't want to take it every day")</li> <li>• Lack of knowledge on where to get PrEP (e.g., "I don't know where to go")</li> <li>• Lack of knowledge on how to use PrEP (e.g., "I don't know how to take it")</li> </ul>	<ul style="list-style-type: none"> <li>• Provide regular technical and non-technical training to PrEP providers and community-based organizations (CBOs)</li> <li>• Make sure the information on PrEP is communicated in clear, simple, and easy-to-understand language</li> <li>• Make sure that PrEP is also communicated in a way that is acceptable to the target population</li> <li>• Provide information on HIV risk and how to reduce it</li> <li>• Provide information on where to get PrEP</li> <li>• Provide information on how to use PrEP</li> </ul>
<p><b>PrEP providers</b></p> <ul style="list-style-type: none"> <li>• Lack of information on PrEP (what it is, how it works, where to get it, how to use it, etc.)</li> <li>• Lack of knowledge on HIV risk (what it is, how it is spread, etc.)</li> <li>• Lack of motivation to get PrEP (e.g., "I don't want to take it every day")</li> <li>• Lack of knowledge on where to get PrEP (e.g., "I don't know where to go")</li> <li>• Lack of knowledge on how to use PrEP (e.g., "I don't know how to take it")</li> </ul>	<ul style="list-style-type: none"> <li>• Provide regular technical and non-technical training to PrEP providers and community-based organizations (CBOs)</li> <li>• Make sure the information on PrEP is communicated in clear, simple, and easy-to-understand language</li> <li>• Make sure that PrEP is also communicated in a way that is acceptable to the target population</li> <li>• Provide information on HIV risk and how to reduce it</li> <li>• Provide information on where to get PrEP</li> <li>• Provide information on how to use PrEP</li> </ul>
<p><b>PrEP users</b></p> <ul style="list-style-type: none"> <li>• Lack of information on PrEP (what it is, how it works, where to get it, how to use it, etc.)</li> <li>• Lack of knowledge on HIV risk (what it is, how it is spread, etc.)</li> <li>• Lack of motivation to get PrEP (e.g., "I don't want to take it every day")</li> <li>• Lack of knowledge on where to get PrEP (e.g., "I don't know where to go")</li> <li>• Lack of knowledge on how to use PrEP (e.g., "I don't know how to take it")</li> </ul>	<ul style="list-style-type: none"> <li>• Provide regular technical and non-technical training to PrEP providers and community-based organizations (CBOs)</li> <li>• Make sure the information on PrEP is communicated in clear, simple, and easy-to-understand language</li> <li>• Make sure that PrEP is also communicated in a way that is acceptable to the target population</li> <li>• Provide information on HIV risk and how to reduce it</li> <li>• Provide information on where to get PrEP</li> <li>• Provide information on how to use PrEP</li> </ul>

**Conclusions:** KP-tailored messages to promote PrEP might be more cost-efficient but could risk inducing stigma and discrimination against this population. Prevention efforts related to PrEP should focus more on effectively communicating HIV risks with correct (factual) information and simple wording rather than on KP populations due to their explicitly stated sexual-orientation-and-gender-identity-related HIV risks.

## OAD32 Unveiling layers: Exploring intersectionality and addressing HIV stigma and discrimination

Unveiling the hidden truth: HIV-related stigma and discrimination among European healthcare workers

T. Noorj<sup>1</sup>, A. Sullivan<sup>2</sup>, F. Burns<sup>2</sup>, J. Del Amo<sup>3</sup>, C. Deogan<sup>1</sup>, K. Darling<sup>4</sup>, E. Vaughan<sup>5</sup>, D. Simoes<sup>6</sup>, A. Garner<sup>7</sup>, S. Pasanen<sup>8</sup>, J. Verluyten<sup>9</sup>, E. Martinez<sup>10</sup>, A. Méndez López<sup>11</sup>

<sup>1</sup>European Centre for Disease Prevention and Control (ECDC), Solna, Sweden, <sup>2</sup>NHS Foundation Trust, London, United Kingdom, <sup>3</sup>Ministry of Health, Madrid, Spain, <sup>4</sup>CHUV, Lausanne, Switzerland, <sup>5</sup>University of Galway, Galway, Ireland, <sup>6</sup>Grupo de Ativistas em Tratamentos, Lisbon, Portugal, <sup>7</sup>MPACT Global, Los Angeles, United States, <sup>8</sup>Positiiviset ry, HivFinland, Helsinki, Finland, <sup>9</sup>European AIDS Clinical Society, Brussels, Spain, <sup>10</sup>Hospital Clínic & University of Barcelona, Barcelona, Spain, <sup>11</sup>Universidad Autónoma de Madrid, Madrid, Spain

**Background:** HIV-related stigma in healthcare settings is recognised as a barrier to achieving positive health and well-being and is linked to negative healthcare outcomes. Data on HIV stigma in the healthcare setting has been lacking, and as a result the European Centre for Disease Prevention and Control and the European AIDS Clinical Society partnered to conduct the first ever European-wide HIV stigma survey.

**Methods:** A survey, translated into 38 languages, was developed and conducted from September 15 to December 5, 2023, targeting clinical and non-clinical professionals in healthcare settings. A non-probability sample was recruited via a multi-channel campaign, leveraging national healthcare professional networks and social media. The survey measured respondents' HIV-related knowledge and training, personal attitudes and behaviours towards people living with HIV (PLHIV).

**Results:** In total, 18,430 healthcare workers from 54 countries responded to the survey. Most respondents were female (74%) and occupied a variety of healthcare roles, although doctors (44%) and nurses (22%) were the most common. Knowledge about HIV on the concept of 'undetectable equals untransmittable' (U=U), post-exposure prophylaxis (PEP), and pre-exposure prophylaxis (PrEP) varied across types of professional roles and health facilities, with many (69%) not agreeing with correct statements of HIV transmission and prevention.

More than half of respondents would be worried when providing care to PLHIV, including drawing blood (57%) or dressing wounds (53%). Eight percent reported they would avoid physical contact and a quarter (26%) that they would wear double gloves when providing care to PLHIV. Twelve percent of healthcare workers preferred not

to provide care to people who inject drugs, while 6% preferred not to provide care to men who have sex with men, sex workers, and transgender persons. Twenty-two percent reported having witnessed unwillingness to provide care, 19% witnessed disclosure of HIV status without consent, 18% poorer quality of care, and 30% discriminatory remarks or talking badly about PLHIV.

**Conclusions:** This study identifies an urgent need for robust, multifaceted interventions, encompassing education and facility-levels to eliminate stigma, improve HIV knowledge among healthcare workers, and ensure equitable, non-stigmatizing care for all PLHIV, ultimately contributing to the global goal of ending the AIDS epidemic by 2030.

## OAD37 Exploring the kaleidoscope of experiences among people living with HIV

"It's going to be hell": Impact of the Ghanaian anti-LGBT bill on the lives and health of sexual minority men and trans and gender diverse people living with HIV

A.O. Gyamerah<sup>1</sup>, A. Bello<sup>1</sup>, M.B. Tawiah<sup>2</sup>, N.M. Bawa<sup>2</sup>, P.K. Ayeh<sup>3</sup>, P.J. Anatsui<sup>3</sup>, M. Mensah<sup>2</sup>, N.A. Vanderpuye<sup>3</sup>, M. Lightfoot<sup>4,5</sup>, S.A. Lippman<sup>5</sup>

<sup>1</sup>University at Buffalo, Community Health and Health Behavior, Buffalo, United States, <sup>2</sup>Independent Scholar, Accra, Ghana, <sup>3</sup>West Africa AIDS Foundation, Accra, Ghana, <sup>4</sup>OHSU-PSU School of Public Health, Portland, United States, <sup>5</sup>University of California, San Francisco, Division of Prevention Science, San Francisco, United States

**Background:** Criminalization of LGBTQ+ Ghanaians poses a threat to the wellbeing of sexual minority men (SMM) and trans and gender diverse (TGD) people living with HIV (PLHIV), populations whose HIV prevalence are 18.1% and 46.1% respectively. In 2021, an anti-LGBT bill was introduced in Ghana's Parliament and subsequently passed in 2024.

To understand the effects of criminalization on Ghana's key populations, we examined the impact of the bill on the lives and HIV treatment and care of SMM and TGD PLHIV.

**Methods:** Between April 2023-January 2024, we conducted in-depth interviews (N=46) and focus group discussions with a subsample of 12 HIV-positive SMM and TGD people in Accra, Ghana. Participants were purposefully sampled through HIV clinics/organizations. Eligibility criteria were: assigned male at birth, has sex with men, HIV-positive, and ≥18 years. Questions explored the impact of crimi-

nalization and other stressors on mental health and HIV treatment and care. Interview transcripts were analyzed using thematic analysis.

**Results:** Participant mean age was 28.5 years. Most participants shared that the bill negatively impacted their lives and the LGBTQ+ community. Reported impacts included fear of going outside, dating, or socializing with other LGBTQ+ people and increased personal and community experiences of stigma/discrimination and verbal/physical violence.

Participants anticipated experiencing more stressors, losing their jobs, being outed, or facing arrest if the bill becomes law; some planned to leave Ghana.

Nearly half indicated that the bill had impacted or will impact their HIV treatment and care and that of other SMM and TGD PLHIV, including avoiding clinics in fear of being stigmatized/reported to police/outed as gay by providers; limited/no access to treatment and care; worsening mental distress from living with HIV; and fear of death. Some stopped going for HIV care or stopped taking ARVs; many shared experiencing psychological distresses such as fear, stress, worry, sadness, and suicide ideation.

**Conclusions:** Ghana's anti-LGBT bill increased violence/other stressors facing SMM and TGD PLHIV and negatively impacted HIV treatment and care. HIV stakeholders must exert pressure against the signage of the bill into law and support local groups to mitigate its effects, including provision of mental health support for SMM and TGD PLHIV.

## OAE04 Advanced HIV disease: Hiding in plain sight

### OAE0406LB

Performance characteristics of HIV RNA screening with long-acting injectable cabotegravir (CAB-LA) pre-exposure prophylaxis (PrEP) in the multicenter global HIV Prevention Trials Network 083 (HPTN 083) Study

<sup>1</sup>University of California, Los Angeles, David Geffen School of Medicine, Los Angeles, United States, <sup>2</sup>Fred Hutchinson Cancer Center, Vaccine and Infectious Disease Division, Seattle, United States, <sup>3</sup>Johns Hopkins University, School of Medicine, Baltimore, United States, <sup>4</sup>Fred Hutchinson Cancer Research Center, Seattle, United States, <sup>5</sup>Louisiana State University, Health Sciences Center, New Orleans, United States, <sup>6</sup>University of North Carolina at Chapel Hill, Chapel Hill, United States, <sup>7</sup>St Jude Children's Research Hospital, Infectious Diseases, Memphis, United States, <sup>8</sup>University of Cincinnati, Cincinnati, United States, <sup>9</sup>University of Pittsburgh, Department of Medicine, Pittsburgh, United States, <sup>10</sup>FHI 360, Durham, United States, <sup>11</sup>National Institute of Allergy and Infectious Disease, Rockville, United States, <sup>12</sup>Gilead Sciences, Foster City, United States, <sup>13</sup>ViiV Healthcare, Durham, United States, <sup>14</sup>ViiV Healthcare, Research Triangle Park, United States, <sup>15</sup>Instituto de Pesquisa Clinica Evandro Chagas-Fiocruz, Rio de Janeiro, Brazil

**Background:** Long-acting cabotegravir (CAB-LA) is highly effective for HIV pre-exposure prophylaxis (PrEP) but complicates detection of HIV infection. HIV RNA screening is the most sensitive method for detecting infections in persons using CAB-LA PrEP, usually detecting infections before integrase strand transfer inhibitor resistance emerges. We evaluated the performance HIV RNA screening in the HPTN 083 Open Label Extension study (OLE) among MSM/TGW.

**Methods:** In the OLE, sites performed rapid testing, antigen/antibody (Ag/Ab) testing, and HIV RNA testing at every study visit. HIV status was determined based on-site testing and retrospective testing at a central laboratory. We calculated the positive predictive value (PPV) and false positive rate (FPR) of isolated positive RNA results and the sensitivity of RNA screening with other tests.

**Results:** This analysis included 27,335 visits conducted for 2,620 participants through 11/30/23. Twenty-nine participants acquired HIV during the OLE. In 5/29 (17.2%), HIV in-

fection was first identified by an isolated positive RNA test result (true positives, Table); in 2 of these cases, HIV infection was first identified at OLE enrollment. Twenty-three additional participants had an isolated positive RNA test result (22 HIV negative [false positives], 1 HIV status indeterminant). The PPV for detecting infection by RNA screening for participants with vs. without CAB-LA in the past 6 months was 9.1% (95% CI 1.6, 30.6) vs. 60% (95% CI 17, 92.7), respectively. The FPR and sensitivity for RNA screening for participants with vs. without CAB-LA in the past 6 months were: FPR: 0.08 (95% CI 0.05, 0.13) vs. 0.06 (95% CI 0.01, 0.24); sensitivity: 87.5% (95% CI 46.7, 99.3) vs. 100% (95% CI 80, 100), respectively.

Case number	Original randomized study arm	Case type	Days between the last CAB injection and the 1st HIV-positive visit	Site HIV RNA result at the 1st HIV-positive visit (copies/mL)
1	Cabotegravir	Infection detected at OLE entry, >6 months after the last CAB injection	425	1,597
2	Cabotegravir	Infection detected at OLE entry, >6 months after the last CAB injection	486	493
3	TDF-FTC	Infection during the oral CAB phase	No CAB injections	1,830
4	TDF-FTC	Infection with delayed CAB injection	38	124
5	TDF-FTC	Infection with delayed CAB injection	57	4,120

Table. HPTN 083 participants who had a positive HIV RNA screening test with non-reactive HIV rapid and Ag/Ab tests at the first HIV-positive visit over 3,893 person-years of follow-up.

**Conclusions:** HIV RNA screening performed poorly for detecting HIV infection during CAB-LA PrEP injections; performance was better immediately prior to CAB-LA initiation. Although infrequent, most isolated positive RNA test results while on CAB-LA were false-positive results. Guidelines for HIV testing algorithms designed to screen for long-acting PrEP failure should consider these performance characteristics.

<sup>2</sup>Ukrainian Institute of Public Health, Kyiv, Ukraine, <sup>3</sup>Yale

School of Public Health, New Haven, United States,

<sup>4</sup>European Institute of Public Health, Kyiv, Ukraine,

<sup>5</sup>Community Health Center Inc, Middletown, United States

**Background:** Ukraine's HIV epidemic is concentrated among people who inject drugs (PWID). As Ukraine prioritized primary care (PCC) over specialty addiction centers (SAC), we compared quality health indicators (QHIs) in individuals receiving opioid agonist therapies (OAT) in SAC (standard-of-care) and PCCs.

**Methods:** Starting in 2018, we conducted a multi-phase, Type-2 hybrid implementation trial comparing QHI outcomes (percentage) in participants prescribed OAT in SACs and PCCs in 13 cities. PCC:SAC allocation was 2:1 and PCC-allocated participants were stratified in clinics receiving pay-for-performance (P4P) or not. QHIs were measured every 6 months over 24 months and included standardized measures for specialty (HIV, TB, OAT) and primary care (i.e., recommended screening for prostate/cervical cancers, etc.) outcomes.

To increase confidence in providing specialty services in PCCs, clinicians participated in weekly tele-education training sessions. QHI outcomes were compared between PCC and SAC using likelihood-based mixed models with missing at random assumptions.

**Results:** Among 1,459 participants enrolled, there were no differences in sex (male=83%), age (mean=39 years), HIV (41.9%) and HCV (57.0%) prevalence in those in SAC (N=509) or PCC (N=950) participants.

At baseline, composite mean QHIs did not differ between arms, however, mean QHIs were consistently higher at PCC vs SAC at 6 (5.7; 95%CI 1.5-9.9;  $p=0.010$ ), 12 (9.1; 95%CI 4.8-13.4;  $p<0.001$ ), 18 (10.2; 95%CI 5.9-14.5;  $p<0.001$ ), and 24 (9.0; 95%CI 4.6-13.3;  $p<0.001$ ) months.

The composite QHIs were further divided into primary and specialty care outcomes, with primary care QHIs significantly higher at all follow-up timepoints and specialty QHI scores higher later at 18 and 24 months. Composite and specialty QHIs were significantly higher for P4P versus non-P4P PCCs only at 24 months.

**Conclusions:** Integrating services in PCCs resulted in better comprehensive outcomes relative to SACs for PWID confirming the need to integrate care for PWID with or at high risk for HIV and TB.

## OAE23 Realizing nothing about us without us: Communities in the lead, ensuring accountability and quality

### OAE2306LB

Differentiated service delivery of PrEP with key population- led organizations in Myanmar

T. Yamin Pyone<sup>1</sup>, L. Htet<sup>1</sup>, L. Aung Thu<sup>1</sup>, Y. Min Thaung<sup>1</sup>, M. Kyaw Kyaw<sup>1</sup>, K. Phyo Naing<sup>1</sup>, S. Lone Tip<sup>2</sup>

<sup>1</sup>HIV/TB Agency, Information, and Services (AIS) Activity, Community Partners International, Yangon, Myanmar;

<sup>2</sup>United States Agency for International Development (USAID), Yangon, Myanmar

**Background:** In Myanmar, HIV prevalence is significantly high among key populations; 34.9% in PWIDs, 8.8% in MSMs, and 8.3% in FSWs (UNAIDS, 2021) where prevalence among the general population is less than 1%. Pre-exposure prophylaxis is a proven effective combination prevention globally and is effectively introduced in Myanmar in 2020. Since the reception, HIV/TB Agency, Information, and Services (AIS) Activity, through its two implementing partners, were the first PrEP implementers in Myanmar. In 2022, AIS expanded PrEP with KP-led CSOs to improve PrEP availability and strengthen the role of KP-led organizations in HIV service provision.

**Description:** In 2022, AIS collaborated with three KP-led CSOs and set-up PrEP distribution points at six KP-run community outlets, where a medical team from AIS IPs conducted regular mobile visits to the sites. The CSO partners generate the demand, bring clients to the facilities, ensure enrollment in PrEP and other services. AIS IPs

provided training to the CSO staff to improve their PrEP knowledge and demand generation capacities to reach the hard-to-reach KP. The CSOs partners also take the role in PrEP counseling and baseline investigations for PrEP. After initiating, they also follow-up the clients for adherence and PrEP refill. In mid-2023, AIS expanded collaboration with one more CSO for PrEP provision to FSW.

**Lessons learned:** From Feb 2022 to Mar 2024, 1600 clients have been initiated for PrEP through 7 community outlets in Yangon; 1352 MSM, 123 TG, and 125 FSW. This represents around 30% of overall PrEP enrollment of AIS projects. Despite the political instability, KP-led CSOs improved client recruitment and PrEP service provision through community outlets.

**Conclusions/Next steps:** KP-led CSO involvement in PrEP service provision improved KP enrollment in PrEP, especially the hidden population. KP-friendly community outlets provide more options and improve KP access to PrEP. This model improves the capacity of KP CSOs and promotes their role in service provision. Further institutionalization and expansion of this model will improve the PrEP coverage among KP in Myanmar.

## OAE25 Integrating social enterprise for sustainability of key population programmes

### OAE2506LB

Incremental uptake of HIV and sexually transmitted infections testing, treatment, and prevention services by integrating gender-affirming care to sexual health service delivery model: The Tangerine Clinic

B. Sawatwipachai<sup>1</sup>, S. Youngkong<sup>2</sup>, N. Phanuphak<sup>3</sup>, K. Samitpol<sup>3</sup>, L. Anuratpanich<sup>2</sup>

<sup>1</sup>Faculty of Pharmacy, Srinakharinwirot University, Social and Administrative Pharmacy, Nakhon Nayok, Thailand,

<sup>2</sup>Faculty of Pharmacy, Mahidol University, Bangkok, Thailand, <sup>3</sup>Institute of HIV Research and Innovation, Bangkok, Thailand

**Background:** The Tangerine Clinic in Bangkok was opened in 2015 to offer a trans-led health service which integrates gender affirming care with sexual health service. We examined the effectiveness of the Tangerine Clinic model in increasing the utilization of HIV and sexually transmitted infection (STI) testing, treatment, and prevention among transgender clients of the Tangerine Clinic.

**Methods:** The Tangerine Clinic performance outputs in 2021, including number of clients reached, recruited, tested and treated for HIV, syphilis, gonorrhea/chlamydia, post-exposure prophylaxis (PEP), and pre-exposure pro-

phylaxis (PrEP), were used for the analysis. We explored the ratio of provider-initiated HIV testing (conducted when offered as part of gender affirming care) to self-initiated HIV testing. Then we calculated the hypothetical outputs of four service delivery models: a) solely HIV service, b) integrated hormone and HIV service, c) HIV/STI service, and d) integrated hormone and HIV/STI service.

**Results:** The ratio of provider-initiated:self-initiated HIV testing was 0.79:0.21. Integrating gender-affirming care to HIV service resulted in additional 1,369 HIV testing, 24 clients with HIV diagnoses, 20 starting HIV treatment, 51 starting PEP, and 329 starting PrEP. If gender-affirming care was integrated into HIV/STI service, 1,594 additional cases would be tested for syphilis, 67 newly diagnosed, and 62 treated. For gonorrhea and chlamydia, 332 additional cases would be tested, 74 newly diagnosed, and 74 treated. When only STI was integrated to HIV service without gender-affirming care, only 339 syphilis testing were conducted, 14 diagnosed, and 13 treated. Only 71 gonorrhea/chlamydia testing were made, 16 diagnosed, and 16 treated.

**Conclusions:** Integrating gender-affirming care to sexual health services at the Tangerine Clinic led to an increase uptake of HIV and STI testing and treatment services. PrEP and PEP services can also be scaled up among transgender people through this integrated gender-affirming and sexual health service model.

## OAE30 The new vital sign: Evidence for action to improve mental health access for diverse populations

### OAE3006LB

Moral injury or burnout? The personal impact on health care workers delivering HIV care and treatment in an under-capacitated health system in Mozambique

C. Audet<sup>1</sup>, E. Graves<sup>2</sup>, P. Paulo<sup>3</sup>, V. Cumbe<sup>4</sup>, F. Mambo<sup>3</sup>, R. Fernando<sup>3</sup>, T. Oyekunle<sup>2</sup>, C. De Schacht<sup>3</sup>

<sup>1</sup>Vanderbilt University, Health Policy, Nashville, United States, <sup>2</sup>Vanderbilt University, Institute for Global Health, Nashville, United States, <sup>3</sup>Friends in Global Health, Maputo, Mozambique, <sup>4</sup>Central Hospital Beira, Beira, Mozambique

**Background:** People living with HIV enrolled in antiretroviral treatment in Mozambique report being treated with disrespect by healthcare workers (HCW). We have hypothesized that HCWs' negative behavior towards patients is likely a reflection of burnout, compassion fatigue, and moral injury associated with delivering treatment in resource-limited settings. A pilot intervention addressing resilience and burnout among health providers to

improve provider mental health/wellbeing and clients' health-related outcomes began in January 2024 in Zambezia Province, Mozambique.

**Methods:** Four health facilities were randomized to one of four conditions: an anti-stigma intervention, a resilience intervention, a combination anti-stigma/resilience intervention, or control. In January and February 2024, we conducted 100 surveys with HCW to measure baseline resilience (decompression and activation factors from the Early Warning Resilience Survey), burnout (Copenhagen Burnout Inventory), and moral injury (MISS-HF). Data were collected into a secure REDCap database via tablets. Descriptive analysis was performed.

**Results:** Participants were mostly female (63%), married (66%), and median age was 33 years. Forty-four percent of participants had clinical degrees (e.g., nurses, physicians), 29% were health counselors, and the remainder were in non-clinical roles. Participants had worked a median of 6.5 years providing health care services. Participants scored very high on the resilience measure (median score 32/40). Few participants reported burnout (1 person scoring above 50, indicating moderate burnout). In contrast, moral injury was identified among 36% of participants (moral injury is identified with a score of 36 or higher). Among the most reported moral injury items, 29% felt guilty they could not prevent someone from dying, 28% acted in a way that violated their own morals, and 21% felt betrayed by other health care professionals. Despite these concerns, only 15% reported that the feelings have caused them significant distress or have impaired their ability to function in relationships, work or in other areas of life that are important to them.

**Conclusions:** With a third of health care workers screening positive for moral injury, delivery of quality HIV services is potentially put at risk. Specific psychosocial support to providers targeted at improving their well-being could have a positive impact on care delivery.

## OAE39 New strategies for optimizing person-centred care

### OAE3906LB

Game-changing Injectable PrEP: how layering the new HIV prevention method onto existing person-centered service delivery is supporting client continuation in Zambia

M. Musonda<sup>1</sup>, A. Ndhlovu<sup>2</sup>, L. Kawanga<sup>2</sup>, D.J. Phiri<sup>2</sup>, J. Musangulule<sup>2</sup>, I. Siluka<sup>2</sup>, N. Chibesakunda<sup>2</sup>, S. Hatchard<sup>2</sup>, D. Mwamba<sup>1</sup>, L. Mulenga<sup>3</sup>

<sup>1</sup>United States Agency for International Development, Health Office, Lusaka, Zambia, <sup>2</sup>JSI DISCOVER-Health, Lusaka, Zambia, <sup>3</sup>The Ministry of Health, Lusaka, Zambia

**Background:** In February 2024, Zambia introduced CAB-LA, with the USAID DISCOVER-Health project implementing in six sites in two districts. CAB-LA has expanded HIV prevention choices for high-risk individuals, particularly for those who struggle with oral PrEP continuation. Challenges for some include pill burden, lack of privacy and stigma associated with the daily pill.

**Description:** CAB-LA introduction was layered onto existing oral PrEP service provision, at high performing sites with high PrEP initiation. Best practices from oral PrEP provision were used to address possible adherence issues, including training healthcare workers in comprehensive counseling, and utilizing community health workers as PrEP mentors to generate demand, and provide in-person psychosocial counseling. To help CAB-LA clients adhere to appointments, they are provided with appointment cards with the next injection date clearly indicated, coupled with automated reminders and telephone follow-ups.

**Lessons learned:** From February 9 - March 31, 2024, USAID DISCOVER-Health initiated 641 clients on CAB-LA. 208 (32%) were adolescent girls and young women (AGYW), 215 (33%) were adolescent boys and young men (ABYM), 170 (27%) were high-risk individuals >25 years, 27 (4%) were female sex workers (FSW) and 10 (2%) were men who have sex with men (MSM). As of March 31, 446 clients were due for their one-month visit (initiation injection two), with 335 receiving the second injection, representing a one-month continuation rate of 75.1%. When broken down by population type, one-month continuation was 70%, 82%, 77% and 33% for AGYW, ABYM, FSW and MSM respectively. In the period under review, 631 clients were initiated on oral PrEP at the same sites. 463 clients were due for a one-month visit, and 345 (74.5%) returned at one-month.

**Conclusions/Next steps:** Early implementation of CAB-LA demonstrates minimal difference in continuation between oral PrEP (74.5%) and CAB-LA (75.1%) at sites with established peer support and strong oral PrEP performance. This demonstrates the timely gains in layering a new HIV prevention option onto a strong existing service

delivery platform, with established client trust and skilled staff. Longitudinal tracking of this initial cohort of CAB-LA clients will be critical to determining CAB-LA continuation over several months and its possible impact on reducing HIV transmission.

## OAF03 The law, human rights and access to medicines

Are countries allowing communities to lead? The global landscape of national civil society laws and their association with HIV 95-95-95 indicators

S. Mukherjee<sup>1</sup>, V. Srivatsan<sup>1</sup>, E. Lamontagne<sup>2</sup>, M. Kavanagh<sup>1</sup>

<sup>1</sup>Center for Global Health Policy and Politics, O'Neill Institute for National and Global Health Law, Georgetown University, Washington DC, United States, <sup>2</sup>The Jointed United Nations Programme on HIV/AIDS (UNAIDS), Johannesburg, South Africa

**Background:** Civil society organizations (CSOs) are essential for the HIV/AIDS response. CSOs mobilize communities, engage with marginalized and key populations, and participate in advocacy efforts to address AIDS-related stigma and discrimination, and in service delivery by ensuring access to treatment services and treatment adherence support. National laws dictate whether CSOs can register and operate freely and whether CSOs can receive government funds to provide services and are hypothesized to matter in the AIDS response. The actual effect of these laws, however, has not been shown or measured. This study provides an overview of global adoption of civil society related laws and tests their association with HIV 95-95-95 targets.

**Methods:** Text of laws and legal information was collected by the HIV Policy Lab through in-depth legal and policy review for 194 countries from 2017-2023. Laws were coded by legal experts to measure two indicators: i) presence of social contracting policies for financing CSOs and ii) capability of CSOs to register and operate freely under national law. Countries were coded as 'Adopted' (both indicators adopted), 'Partially Adopted' (one adopted) and 'Not Adopted' (neither adopted). Using a cross-sectional dataset, fractional logistic regression was used to determine associations between the adoption of CSO laws and HIV 95-95-95 indicators.

**Results:** The number of countries that adopted and partially adopted Civil Society policies has significantly increased between 2017 (n=85, 70.8%) and 2023 (n=90, 84.1%) ( $\chi^2(1, N=227)=4.9, p<0.05$ ). Results from fractional logistic regression show that the odds of PLHIV knowing their HIV status increases by a factor of almost 2 in countries which

Oral

Author  
Index

have adopted civil society freedom policies compared to countries without civil society freedom policies and legislation [OR:1.899, 95%CI:1.42-2.53,  $p<0.0001$ ].

**Conclusions:** Legislation and freedom policies for civil society impact national ability to reach AIDS targets. The adoption of national laws supporting both CSO operational freedom and social contracting should be a priority for the global AIDS response. Tracking the national policy environments for CSOs is an important step to ensuring that countries adopt policies that reduce the burden of HIV/AIDS, both nationally and globally.

## OAF11 The HIV response in the context of political instability and emergencies

### OAF1106LB

Community-level HIV stigma and discrimination's impact on HIV testing, treatment uptake, and viral load suppression in 33 African countries: a pooled analysis of 76 nationally representative surveys (2000-2022)

S. Kuchukhidze<sup>1</sup>, M.-C. Boily<sup>2</sup>, S. Niangoran<sup>3</sup>, L. Platt<sup>4</sup>, F. Terris-Prestholt<sup>5</sup>, K. Dumchev<sup>6</sup>, P. Vickerman<sup>7</sup>, A. Arteni<sup>7</sup>, J. Stone<sup>7</sup>, M. Maheu-Giroux<sup>1</sup>

<sup>1</sup>McGill University, Department of Epidemiology and Biostatistics, Montreal, Canada, <sup>2</sup>Imperial College London, MRC Centre for Global Infectious Disease Analysis, School of Public Health, London, United Kingdom, <sup>3</sup>Programme PAC-CI/ANRS Research Site, CHU de Treichville, Abidjan, Côte d'Ivoire, <sup>4</sup>London School of Hygiene and Tropical Medicine, Department of Public Health, Environments and Society, London, United Kingdom, <sup>5</sup>Warwick Medical School, Coventry, United Kingdom, <sup>6</sup>Ukrainian Institute on Public Health Policy, Kyiv, Ukraine, <sup>7</sup>University of Bristol, Bristol Medical School (PHS), Bristol, United Kingdom

**Background:** Stigma and discrimination may hinder reaching the UNAIDS 95-95-95 targets for HIV diagnosis, treatment, and viral load suppression (VLS), particularly in high-burden African countries. Despite global goals of "zero discrimination", comprehensive, comparable, cross-country analyses that strengthen the evidence-base linking stigma to HIV outcomes are lacking.

**Methods:** We pooled individual-level data from 76 nationally representative surveys with information on HIV stigma, past-year HIV testing (self-reported), ART uptake and VLS (both biomarker-based). We included Demographic and Health Surveys, Population-based HIV Impact Assessment, and country-specific surveys. We analyzed three stigma measures: 1) discriminatory attitudes towards people living with HIV (PLHIV), 2) shame of associating with PLHIV, and 3) perceived HIV stigma.

We used generalized estimating equations with robust standard errors to estimate adjusted prevalence ratios (aPR) for each stigma measure's association with HIV outcomes. Individual-level stigma was averaged at a community-level (survey cluster). Models were adjusted for sex, age group, rural/urban residence, marital status, education, regional HIV prevalence (HIV testing analysis), country and year. We present aPRs for a 50% increase in community stigma prevalence.

**Results:** Data from 842,169 respondents (70,109 PLHIV) across 33 countries were included. Median discriminatory attitudes, shame of associating with PLHIV and perceived stigma were 36% (IQR:19-64%), 18% (IQR:0-33%) and 79% (IQR:64-92%) respectively. All stigma measures were associated with lower past-year HIV testing (Figure). As community-level discriminatory attitudes increased by 50%, PLHIV were 17% (95%CI:0.78-0.87) less likely to be on ART and had 15% lower VLS (95%CI:0.8-0.9). In communities with greater HIV shame, PLHIV had lower ART uptake (aPR=0.88; 95%CI:0.81-0.95) and VLS (aPR=0.89; 95%CI:0.81-0.98), with similar results for perceived HIV stigma.

Figure. Crude and adjusted prevalence ratios for the impact of stigma on HIV outcomes. PR = prevalence ratio; N<sub>surv</sub> = number of surveys; n = sample size.

**Conclusions:** In one of the largest studies of this type, stigma was linked with reduced engagement at every stage of HIV care. Addressing stigma and discrimination could strengthen the HIV response and improve treatment outcomes among PLHIV.

## OAF27 Criminalized populations addressing human rights barriers: Pathways to progress

### OAF2706LB

Sustaining KP service delivery in harsh legal push-back environments among LGBTQ populations in Uganda amidst the 2023 anti-homosexuality act (AHA)

F. Engwau<sup>1</sup>, P. Mudioppe<sup>2</sup>, P. Kyambadde<sup>3</sup>, G. Pande<sup>3</sup>, B. Epoku<sup>4</sup>, D. Byamukama<sup>5</sup>, R. Kindyomunda<sup>6</sup>

<sup>1</sup>UNFPA, HIV, Kampala, Uganda, <sup>2</sup>Ministry of Health, HIV and STI Prevention, Kampala, Uganda, <sup>3</sup>Ministry of Health, HIV/STI Treatment, Kampala, Uganda, <sup>4</sup>Ministry of Health, HIV and STI Prevention, Kampala, Uganda, <sup>5</sup>Uganda AIDS Commission, Prevention, Kampala, Uganda, <sup>6</sup>UNFPA, HIV/AIDS, Johannesburg, South Africa

**Background:** In 2023, the Ugandan Parliament passed a bill to criminalise homosexuality and proposed harsh penalties to all those that may be convicted of the offence of homosexuality and those abating homosexuality. The social and legal ramifications pushed LGBTQ communities underground, limiting access to HIV prevention services.

Although Uganda has made tremendous progress in reducing the prevalence of HIV and AIDS among adults from 18% in 1992 to the current 5.2% (UPHIA 2020), the Anti-Homosexuality Act (AHA) threatens these achievements and goals. HIV among men having sex with men is at 13.2%, female sex workers at 31.1%, and people with injecting drug use at 17%.

**Description:** Following the ascent to the AHA 2023, there was a surge in heightened discrimination, violence incidents, arrests, mob justice, services providers fearing to treat LGBTQI, and disruptions to health services utilization.

To these consequences,

1. A Response Team (RT) from Ministry of Health, Uganda AIDS Commission, CCM and UNAIDS/UNFPA) was formed to address,
2. The adaptation framework for continuity of services was established,
3. MOH provided a guidance through a circular, on provision of services to all people without discrimination,
4. Training of health workers in the provision of KP friendly services in 24 most affected districts.

Targeted dialogue meetings reached 180 policymakers, law enforcers and health workers in 24 hotspot districts. The KP community peers were facilitated to conduct client follow up, refills and linkages.

**Lessons learned:** The AHA enactment of 2023 led to increased discrimination, violence, and disruptions in accessing healthcare services for LGBTQ communities in Uganda.

Establishment of a Rapid Response Team (RRT) facilitated coordinated efforts among different partners to address the adverse effects of the legislation on LGBTQ individuals. Reorientation trainings for service providers and the implementation of adaptation frameworks were effective strategies to ensure continuity of LGBTQ-friendly services in affected districts.

**Conclusions/Next steps:** The AHA significantly impeded HIV prevention efforts targeting LGBTQ populations, posing a threat to Uganda's goal of ending AIDS as a public health threat by 2030.

Collaborative initiatives involving government agencies, CSOs are vital for mitigating the negative impact of discriminatory laws and promoting access to health services for key populations.

## OAF31 Transformative leadership and approaches for people living with HIV and criminalized populations

### OAF3106LB

Promoting equality in the labor market: a study on the HIV law and discrimination against PLHIV in Brazil

D.A. Calixto<sup>1</sup>

<sup>1</sup>Fundação Oswaldo Cruz, Public Health, Brasília, Brazil

**Background:** The law 12,984/2014, known as the "HIV Law", plays a important role in criminalizing discrimination against People Living with HIV (PLHIV) in Brazil, standing out as an strategic tool in combating stigma and discrimination.

**Methods:** The study period covered data from 2015 to 2022, with the setting being Brazil. A retrospective observational study design was employed, analyzing discrimination cases against PLHIV reported to the Federal Public Ministry (MPF).

The study population consisted of individuals who faced discrimination due to their HIV status. Data collection involved gathering information from MPF records.

Analysis was conducted using Excel, focusing on quantifying, and categorizing discrimination cases by region and type.

**Results:** During the study period, a total of 2,119 discrimination cases against PLHIV were reported in Brazil, with 1,077 cases investigated and resulting in 569 convictions. The Southeast region recorded the highest number of cases (1,012), followed by the Northeast region (520). Primary forms of discrimination included denial of employment (941 cases), dismissal (234 cases), and segregation (103 cases).

Number of cases by region of Brazil

**Conclusions:** Despite advancements in legal frameworks, challenges persist in effective law enforcement, including the need for a greater understanding of legislation and the complexity of proving discrimination, which is often obscured or indirect. The threat of stigma and discrimination undermines fundamental rights at work, highlighting the ongoing necessity to address barriers and foster more inclusive work environments. It is necessary to undertake comprehensive measures to enhance awareness of existing laws, provide robust training for government and organizations of workers and employers, and strengthen mechanisms for reporting and supporting PLHIV who face discrimination.

## OAF41 Removing legal, policy and human rights barriers for children and young people

### OAF4106LB

Challenges in access to identification documentation and protection services for unaccompanied minors and undocumented children

D.C. Monare<sup>1</sup>, A. Ncube<sup>1</sup>

<sup>1</sup>University of the Free State, Disaster Management Training and Education Centre for Africa, Bloemfontein, South Africa

**Background:** This research investigates challenges faced by unaccompanied minors and undocumented children in South Africa regarding access to identification documents and protection services. It addresses root causes hindering access, explores interventions, and gathers officials' perceptions from DSD, DOE, and DHA. Lack of documentation jeopardizes access to services, posing risks of statelessness. Climate change exacerbates vulnerabilities.

Recommendations include interdepartmental committees, policy changes, temporary documents, and strengthening family tracing efforts to address these complex challenges.

**Methods:** The research delineates a qualitative methodology to explore into accessibility challenges faced by children, particularly regarding identification documents and Child Protection Services (CPS). It involves participants from DHA, DSD, and DOE, employing a multi-stage sampling technique. Qualitative research, emphasizing depth over quantity, engages 47 respondents through questionnaires, interviews, and workplace observations. Triangulation of content and thematic analysis methods was done to ensure reliability by combining various data sources and analysis techniques, enhancing understanding of challenges and policy practices.

**Results:** The study examines challenges faced by undocumented children and unaccompanied minors accessing basic services, focusing on DOE, DSD, and DHA. DOE challenges are with strict admission policies, leading to dropouts. DSD faces discrepancies in service rendering due to resource constraints. DHA finds it difficult to register undocumented children, compounded by DNA testing requirements. Recommendations include simplifying DHA registration, enhancing interdepartmental collaboration, and improving communication within DOE. These interventions aim to create a more inclusive support system despite persistent challenges, emphasizing streamlined processes and capacity building.

**Conclusions:** In the early 2000s, South Africa faced a surge in HIV/AIDS orphaned children, overburdening the state and family resources. A conference convened to address the crisis, advocated for an intersectoral structure involving government, civil society, and business. This study emphasizes interdepartmental cooperation to support Vulnerable Children (OVC&Y), noting DSD challenges denying services due to lack of documentation. DHA's complex registration, including mandatory DNA testing, which pose financial burdens. Capacity-building and policy shifts are here-by urged to streamline services and allocate resources effectively, ensuring coordinated action for OVC&Y protection.

**The HIV-1 Tat protein released by infected cells increases virus infectivity and modifies Env antigenicity by stabilizing the open conformations of Env**

P. Monini<sup>1</sup>, S. Moretti<sup>1</sup>, M.R. Pavone Cossut<sup>1</sup>, I. Schietroma<sup>1</sup>, F. Ferrantelli<sup>1,2</sup>, A. Cafaro<sup>1</sup>, S. Farcomeni<sup>1</sup>, M. Chen<sup>4</sup>, K.K. Lee<sup>4</sup>, R. Fioravanti<sup>5</sup>, M. Belfiore<sup>6</sup>, Z. Maurizio<sup>7</sup>, M. Severino<sup>8</sup>, F. Magurano<sup>5</sup>, A. Tran<sup>8</sup>, G. Ozorowski<sup>8</sup>, A.B. Ward<sup>8</sup>, M.A. Diaz-Salinas<sup>9</sup>, A. Jain<sup>9</sup>, J.B. Munro<sup>9</sup>, B. Ensoli<sup>1</sup>

<sup>1</sup>Istituto Superiore di Sanità (ISS), National HIV/AIDS Research Center (CNAIDS), Rome, Italy, <sup>2</sup>Present address, National Center for Global Health, ISS, Rome, Italy, <sup>3</sup>University of Ferrara, Section of Medical Biochemistry, Molecular Biology and Genetics, Department of Neuroscience & Rehabilitation, Ferrara, Italy, <sup>4</sup>University of Washington, Department of Medicinal Chemistry, Seattle, United States, <sup>5</sup>Istituto Superiore di Sanità (ISS), Department of Infectious Diseases, Rome, Italy, <sup>6</sup>Istituto Superiore di Sanità (ISS), National Centre for Drug Research and Evaluation, Rome, Italy, <sup>7</sup>Istituto Superiore di Sanità (ISS), Core Facilities, Rome, Italy, <sup>8</sup>The Scripps Research Institute, Department of Integrative Structural and Computational Biology, La Jolla, United States, <sup>9</sup>UMass Chan Medical School, Department of Microbiology and Physiological Systems, Worcester, United States

**Background:** The HIV-1 Tat protein released by infected cells (extracellular Tat, eTat) exerts several actions increasing virus infectivity both at the portal of entry and in the acute and chronic phases of infection. In this context, we have previously shown that eTat binds Env forming a novel cell-entry complex (the Tat/Env complex), which enhances virus capture by dendritic cells as well as infection of CD4+ T cells through a transactivation-independent mechanism (P. Monini, PlosOne 2012).

We now show that Tat enhances HIV-1 infectivity by altering the conformational dynamics of Env, thus affecting both CD4 recognition and Env antigenicity.

**Methods:** Single cycle HIV-1 was incubated with the transactivation-silent mutant Tatcys22 and added to CD4+ T cells (A3.01, T2M-bl) in the presence/absence of soluble CD4 (sCD4) or the monoclonal antibody b12. The effects of recombinant Tat on Env conformational dynamics was determined by single-molecule fluorescence resonance energy transfer (smFRET). Surface plasmon resonance, Isothermal titration calorimetry, electron microscopy and hydrogen-deuterium exchange-mass spectrometry were used to study Tat binding to soluble, native-like BG505 and B41 SOSIP.664 gp140.

**Results:** Tat binding to native Env on virus particles induces/stabilizes the open conformation(s) of Env. Through this action, Tat enhances HIV-1 infectivity by favoring CD4 recognition. At the same time, this affects Env antigenicity as indicated by the increased neutralization potency of sCD4 and mAb b12 in the presence of Tat. Noteworthy, the ratio between enhanced infectivity and increased vulnerability to sCD4 and mAb b12 is shifted by Tat in favor of virus infection. Env opening by Tat was observed also with SOSIP Envs; however, stoichiometric concentrations of Tat lead to SOSIP gp140 collapse/dissociation and aggregation.

**Conclusions:** These data highlight that Tat and the Tat/Env complex are key targets for an effective vaccine against HIV. Further advancement of soluble native-like Envs is needed to develop immunogens based on the Tat/Env complex; alternatively, mRNA vaccines assembling the native Tat/Env complex in the context of virus-like particles may represent a new avenue for a preventative vaccine.

(Funding: B&MGF INV-037179)

## LB02

**Interferon signature contributed to CD4+ T cell depletion among immunological non-responders under ART**

X. Liu<sup>1,2</sup>, X. Feng<sup>3</sup>, M. Zhang<sup>3</sup>, L. Zhang<sup>3</sup>, L. Chen<sup>2</sup>, L. Zheng<sup>2</sup>, L. Lu<sup>2</sup>, Y. Wu<sup>2</sup>, Y. Yang<sup>2</sup>, Y. Han<sup>2</sup>, X. Song<sup>2</sup>, W. Cao<sup>2</sup>, L. Zhang<sup>3</sup>, T. Li<sup>1,2</sup>

<sup>1</sup>Tsinghua University, Beijing, China, <sup>2</sup>Peking Union Medical College Hospital, Beijing, China, <sup>3</sup>Institute of Biophysics of Chinese Academy of Sciences, Beijing, China

**Background:** Even with sustained viral suppression achieved under ART, 20-30% of people with HIV (PWH) are prone to experiencing a challenging aspect of incomplete immune reconstitution. However, the underlying mechanisms driving CD4+ T cell depletion in immunological non-responders (INRs) remain incompletely understood.

**Methods:** To characterize the immunological features during CD4+ T cell depletion, we performed 5' V(D)J 10x Genomics scRNA-seq and scTCR-seq on peripheral blood mononuclear cells (PBMCs) from INR (n=9), immunological responders (IR, n=14), and healthy donors (HD, n=10) to gain insights into the dynamics of CD4+ T cell depletion. Flow cytometry and public bulk RNA-seq data analysis were applied to validate the findings.

**Results:** In total, we analyzed the single-cell transcriptomes of 232,369 PBMCs derived from 33 individuals, including PWH and healthy donors. Utilizing UMAP and Louvain clustering, we identified 8 major cell subsets and 51 minor cell subsets. Individuals with immune non-response (INRs) among PWH exhibited significantly reduced levels

of naïve-like CD4<sup>+</sup> T cells, along with increased proportions of central memory-like, exhausted-like, and proliferating-like CD4<sup>+</sup> T cell subsets. Differential expression analyses unveiled a heightened interferon (IFN)-gamma response transcriptional profile in CD4<sup>+</sup> T cells from INRs compared to those from individuals with IRs and HDs. Clonotype and trajectory analyses suggested a tendency of CD4<sup>+</sup> T cells from INRs to differentiate into exhausted T cells, while pseudotime analysis highlighted a strong association between IFN signatures and exhaustion signatures during CD4<sup>+</sup> T cell differentiation. Bulk RNA-seq analysis on public data further validated that the inhibition of IRF and STAT family transcription factors in primary CD4<sup>+</sup> T cells using shRNA led to decreased expression of HAVCR3.

**Conclusions:** Together, our study provides high-resolution insights into the immune landscape in INRs. The heightened IFN response pathway in CD4<sup>+</sup> T cells emerges as a significant immunological feature of INRs, contributing to CD4<sup>+</sup> T cell exhaustion and depletion in INRs undergoing ART.

Single-cell multi-omics reveals the mechanisms behind the failure of immune reconstitution in people living with HIV after receiving antiretroviral therapy

J. Yu<sup>1</sup>, C. Liu<sup>2</sup>, Y. Wang<sup>1</sup>, Y. Yuan<sup>2</sup>, X. Shi<sup>2</sup>, M. Zhu<sup>1</sup>, J. Yin<sup>2</sup>, W. Zhang<sup>2</sup>, S. Yang<sup>3</sup>, Z. Yang<sup>1</sup>, J. Chen<sup>3</sup>, D. Yan<sup>1</sup>, S. Duan<sup>3</sup>, L. Zuo<sup>2</sup>

<sup>1</sup>Affiliated Hangzhou Xixi Hospital, Zhejiang University of Traditional Chinese Medicine, Department of Infection, Hangzhou, China, <sup>2</sup>BGI Research, Shenzhen, China, <sup>3</sup>BGI Research, Hangzhou, China

**Background:** Antiretroviral therapy (ART) can successfully suppress HIV viral replication, but about 15-30% of people living with HIV (PLWH) still fail to recover their CD4<sup>+</sup> T cell counts and are more susceptible to various comorbidities and at a higher risk of mortality.

The study aims to explore the mechanism behind the failure of immune reconstitution by utilizing single-cell multi-omics analysis.

**Methods:** We performed a multiomics (scRNA-seq and scATAC-seq) analysis on peripheral blood mononuclear cells collected from Hangzhou Xixi Hospital. PLWH required receiving treatment for at least 4 years and having a viral load < 50 copies/mL. And finally we recruited 46 PLWH immune responders (PLWH-IRs), 43 immune non-responders (PLWH-INRs) and 53 healthy individuals (HDs).

**Results:** We analyzed a large dataset consisting of a total of 2,680,107 single cell transcriptome and 1,174,029 single cell chromatin accessibility profiles. From the single-cell transcriptome data, we identified 36 cell subtypes. When comparing with PLWH-IRs and HDs, we observed a sig-

nificant decrease in CD4<sup>+</sup> T cells (CD4<sup>+</sup> Naive T, CD4<sup>+</sup> Tcm, CD4<sup>+</sup> Th17, CD4<sup>+</sup> Tfh, CD4<sup>+</sup> Treg), CD8<sup>+</sup> Naive T cells, and B cells (Naive B, Memory B) in PLWH-INRs. On the other hand, there was an increase in CD8<sup>+</sup> CTL (GZMB<sup>+</sup> CTL, GZMK<sup>+</sup> CTL), NK cells (CD16<sup>+</sup> NK, XCL<sup>+</sup> NK), Myeloid cells (CD14<sup>+</sup> Mono, CD16<sup>+</sup> Mono, CD34<sup>+</sup> HSPC), and Plasma B cells. Meanwhile, we observed signaling pathways such as inflammatory response, AP-1 Score and Cytotoxic Score activated in many cell types of PLWH-INRs.

Moreover, the expression of IL1 $\beta$  and CCL3 (positive regulators of inflammatory response) was significantly increased, while CCR7 (involved in T cell differentiation and activation) showed a significant decrease in PLWH-INRs. These findings are consistent with clinical observations of higher inflammation and lower CD4<sup>+</sup> T cell counts in PLWH-INRs.

Notably, abnormal activation of the apoptosis signal in CD4<sup>+</sup> T cells in PLWH-INRs, which may be related to the poor recovery of CD4<sup>+</sup> T cell counts in PLWH-INRs.

**Conclusions:** We provided a comprehensive analysis of the single-cell multi-omics landscape in a cohort of PLWH, revealed distinct levels of inflammatory response, T cell differentiation, activation and apoptosis in long-term treatment PLWH.

**Background:** People with HIV (PWH) experience HIV-enhanced aging having an increased risk of early onset chronic diseases typically developing later in life and premature DNA methylation (DNAm) changes. To assess the impact of pathogenic HIV/SIV infection on aging, we studied epigenetic aging during pathogenic SIVmac infection in the rhesus macaque (RMs) using DNAm-based clocks.

**Methods:** We analyzed DNAm profiles across a SIVmac infection in young and old RMs in 40 longitudinal PBMC samples from the baseline, acute, early- and late chronic infection, and 56 samples from the cerebellum, colon, liv-

Index

er, heart, fat, and spleen from the advanced stage of infection. We estimated epigenetic age (EA) and epigenetic age acceleration (EAA), and tested associations of EA and EAA with pathogenesis biomarkers.

**Results:** The late stage of infection was associated with an increased EA in the PBMCs in the young, but not in the old RMs. EA in the PBMCs was associated with the CD4+ T-cell depletion and activation of circulating CD4+ and CD8+ lymphocytes in the young, and increased plasma levels of inflammatory marker CRP and macrophage activation marker sCD163 in the old.

During the advanced stage of SIV infection, EAA was increased in the young compared to the old RMs in the cerebellum and heart according to 10 and 9 clocks, respectively, suggesting that the long-lived brain and cardiac cells are more vulnerable to premature dysfunctions in the young.

EAA in the spleen and colon was positively correlated with the immune activation of the CD8+ T-cells (CD8+CD38+HLA-DR+) in the circulation in the young RMs; while EAA in the spleen was correlated with the proportion of CD8+Ki67+ T-cells in the old. In the young RMs, EAA in the colon correlated with the plasma levels of interleukin IL-8, while EAA in the cerebellum anticorrelated with the plasma levels of IL15 (a longevity factor for CD8+ T-cells). In the old RMs, EAA in the spleen was correlated with circulating levels of interleukins IL-1b and IL-12.

**Conclusions:** 1) Infection drives aging in tissue-specific and age-dependent manner. 2) Virus-enhanced aging is linked to different aspects of pathogenesis in young and old individuals.

Garcia-Beltran<sup>1</sup>, A. Hoelzemer<sup>1</sup>

<sup>1</sup>University Medical Center Hamburg-Eppendorf (UKE), First Department of Medicine; Institute for Infection and Vaccine Development (IIRVD), Hamburg, Germany, <sup>2</sup>Leibniz Institute of Virology, Virus Immunology, Hamburg, Germany, <sup>3</sup>Ulm University Medical Center, Institute of Molecular Virology, Ulm, Germany, <sup>4</sup>University Hospital Tübingen, Institute for Medical Virology and Epidemiology of Viral Diseases, Tübingen, Germany, <sup>5</sup>Massachusetts General Hospital/Harvard Medical School, Department of Pathology, Boston, United States

**Background:** In addition to T cells, the human immunodeficiency virus type I (HIV-1) infects macrophages and establishes a latent myeloid reservoir, which is one of the barriers to current HIV-1 cure efforts. Natural killer cells

(NK) are innate antiviral immune cells that are filled with cytotoxic granules to kill virus-infected cells. They are currently studied in "shock and kill" approaches to eliminate the HIV-1 reservoir. However, they require priming by macrophages to become fully activated against virus-infected targets. Here, we investigated whether HIV-1 infection of macrophages results in priming of NK cells and is a sufficient trigger to boost their antiviral function.

**Methods:** We infected primary monocyte-derived macrophages (MDM) *in vitro* with HIV-1 (strains 89.6, THRO) and assessed priming of MDM phenotype, NK cell cytotoxicity and antiviral cytokine production using flow cytometry, qPCR and degranulation assays after MDM/NK cell co-culture (N=6 -13). Additionally, we investigated whether NK cells from PLWH remain responsive to priming by autologous monocyte-derived macrophages pre-activated with LPS/IFN $\gamma$  (N=7).

**Results:** HIV-1 infected MDM showed a significant induction of *IL15RA* compared to bystander MDM, which was one log below the *IL15RA* mRNA levels detected after LPS/IFN $\gamma$  stimulation. In comparison to the strong proinflammatory stimulus mediated by LPS, priming of NK cells by HIV-1-infected macrophages failed to potently induce cytotoxicity, but skewed NK cells towards production of TNF and IFN $\gamma$ , despite the upregulation of activating NKG2D ligands and CD48 on the surface of MDM upon HIV-1 infection. Crosstalk of NK cells with MDM resulted in upregulation of the inhibitory NK-cell receptor ligand HLA-E on the surface of resting macrophages. In PLWH, we identified CD56dim NK cells expressing inhibitory HLA class I binding receptors (KIR and NKG2A) as the subset most reactive to MDM-priming, whereas CD56low NK cells remained dysfunctional despite co-culture with MDM.

**Conclusions:** In summary, HIV-1 infection of macrophages alone was ineffective in priming NK cell cytotoxicity. Additionally, macrophages protected themselves during the priming process by upregulating inhibitory NK-cell signals. These results support the need for further NK cell boosting regimens to accompany latency reactivation and cure efforts aimed at long-term functional immune control of the myeloid HIV-1 reservoir.

### Pharmacological manipulation of HIV-1 RNA splicing enhances innate immune sensing and selective cell death of the transcriptionally-competent viral reservoir

S. Rao<sup>1</sup>, L. De Vries<sup>1</sup>, J. Reinders<sup>1</sup>, T. Hossain<sup>1</sup>, R. Crespo<sup>1</sup>, K.S. Hensley<sup>2</sup>, C. Rokx<sup>2</sup>, T.-W. Kan<sup>1</sup>, C. Lungu<sup>1</sup>, R.-J. Palstra<sup>1</sup>, T. Mahmoudi<sup>1</sup>

<sup>1</sup>Erasmus Medical Centre, Biochemistry, Rotterdam, Netherlands, the, <sup>2</sup>Erasmus Medical Centre, Internal Medicine, Rotterdam, Netherlands, the

**Background:** Antiretroviral therapy (ART) can control HIV-1 infection, but is not curative. A latent viral reservoir persists in presence of ART and people with HIV (PWH) still experience chronic inflammation during therapy. Viral RNA (vRNA)-expression in cells of the transcriptionally-competent reservoir has been implicated in contributing to the chronic inflammation observed in PWH, and post-transcriptional processes like vRNA splicing can influence innate immune recognition.

**Methods:** Here, we utilise an innovative strategy to eliminate the transcriptionally-competent viral reservoir by manipulating HIV-1 RNA splicing to enhance intracellular innate immune sensing, thereby triggering apoptotic pathways to selectively induce cell death of the viral RNA-expressing cells. Multiplexed single-cell fluorescence *in situ* hybridisation technology was used to concurrently measure HIV-1 viral RNA expression, innate immune activation, and apoptosis.

**Results:** In both a primary *in vitro* HIV-1-infected CD4+ T-cell model of latency and *ex vivo* CD4+ T-cells from PWH, unspliced viral RNA, both intact and defective, efficiently activated innate immune responses, as indicated by IFN- $\beta$  mRNA co-expression. Pharmacologically inhibiting HIV-1 RNA splicing with Filgotinib combined with latency-reversal enhanced IFN- $\beta$  mRNA expression and increased apoptosis susceptibility in unspliced vRNA-expressing cells, resulting in a ~35% reduction in the size of the inducible transcriptionally-competent reservoir in *ex vivo* CD4+ T-cells from PWH after five days.

**Conclusions:** These findings firstly highlight the important role played by unspliced vRNAs, including defective vRNAs, in inducing innate immune activation, and support the feasibility of targeting HIV-1 RNA metabolism coupled with apoptosis induction as a promising strategy to eliminate the transcriptionally-competent viral reservoir towards an HIV-1 Cure.

### Comparative analysis of antibody responses to CN54gp140 and AIDSVAX B/E in the PrEPVacc trial

J. Serwanga<sup>1</sup>, B. Gombe<sup>1</sup>, C. Holm Hansen<sup>2</sup>, E. Ruzagira<sup>2</sup>, P. Kaleebu<sup>1</sup>

<sup>1</sup>MRC/UVRI and LSHTM Uganda Research Unit, Viral Pathogen Discovery, Diversity and Impact on Epidemic and Disease Outcome, Entebbe, Uganda, <sup>2</sup>MRC/UVRI and LSHTM Uganda Research Unit, Viral Pathogen Epidemiology and Interventions, Entebbe, Uganda

**Background:** The PrEPVacc trial assessed two different vaccination regimens and compared their efficacy in preventing HIV acquisition to placebo in a Phase IIb trial. Participants were randomized to receive either (DNA HIV PT123 + AIDSVAX B/E) four times or (DNA HIV PT123 + CN54/MPLA) twice followed by (MVA-CMDR/ CN54gp140/MPLA) twice or placebo over a 48-week vaccination period. The main immunological endpoint was titre of binding antibodies to both CN54gp140 or AIDSVAX at week 26, two weeks after the third vaccination.

Arm	Week 0	Week 4	Week 24	Week 24
A	DNA-HIV-PT123 AIDSVAX B/E	DNA-HIV-PT123 AIDSVAX B/E	DNA-HIV-PT123 AIDSVAX B/E	DNA-HIV-PT123 AIDSVAX B/E
B	DNA PT123 CN54gp140+ MPLA-L	DNA PT123 CN54gp140+ MPLA-L	MVA-CMDR CN54gp140+ MPLA-L	MVA-CMDR CN54gp140+ MPLA-L
C	Placebo+ Placebo	Placebo+ Placebo	Placebo+ Placebo	Placebo+ Placebo

**Methods:** The trial enrolled 1512 participants across four sites: MRC SA, Durban, South Africa; NIMR MMRC, Mbeya, Tanzania; MUHAS, Dar es Salaam, Tanzania; and MRC/UVRI & LSHTM, Masaka, Uganda. Serum samples were collected at week 0, week 26 post vaccination, and at additional timepoints not presented here. The endpoint titre was determined by serial dilution by ELISA for all those samples positive at a dilution of 1:100.

**Results:** An interim pooled analysis of 248 samples shows a binding antibody endpoint titer indicates a higher geometric mean for CN54 (3031, IQR: 2700 – 8100) compared with AIDSVAX specific antibodies (1182, 300 – 8100). Further analysis will categorize total antibody titres, assess response determinants of responses (gender, age, and site), and associations with HIV infection post-week 26.

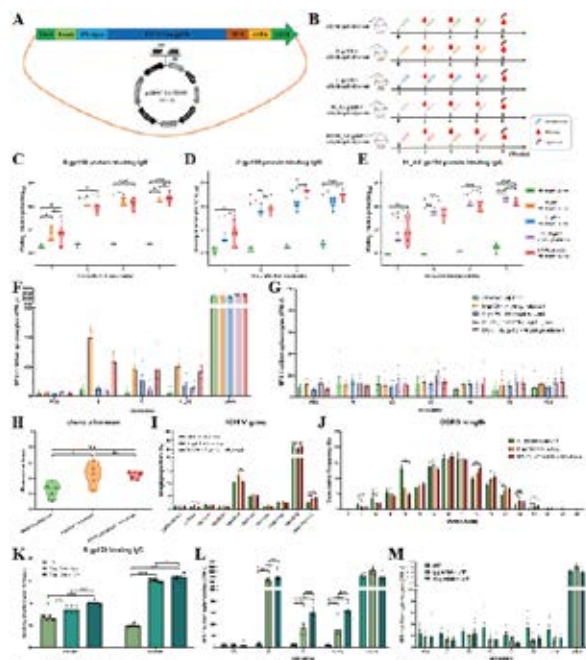

**Conclusions:** This interim pooled analysis of a subset that completed 3 vaccinations suggests higher geometric mean titers of binding antibodies to CN54gp140 compared to AIDSVAX B/E at week 26. Further unblinded analysis of the full dataset will be presented at the meeting.

**Background:** An effective HIV-1 vaccine should elicit high-titer broad neutralizing antibodies and robust specific T-cell responses.

**Methods:** Consensus sequences of HIV-1 B, C, and 01\_AE-gp120 proteins were obtained using online tools. These sequences were then used to express polymerized proteins in CHO-S cells and combined with alhydrogel for four times immunization in Balb/c mice. The binding antibody levels in mouse serum were determined using ELISA, specific T-cell responses in spleen cells were evaluated via Elispot, and the sorted CD19<sup>+</sup> cells from splenocytes were used for BCR sequencing.

**Figure 1.** (A) The structure of the protein expression vector based on the consensus sequence of HIV-1 gp120. (B) The schematic diagram of the multi-valent vaccine immunization strategy. (C) Bar graph showing the binding antibody levels (OD) for gp120, gp120 (B), and gp120 (C) in mouse serum at weeks 0, 2, 4, 6, and 8. (D) Bar graph showing the binding antibody levels (OD) for gp120, gp120 (B), and gp120 (C) in mouse serum at weeks 0, 2, 4, 6, and 8. (E) Bar graph showing the binding antibody levels (OD) for gp120, gp120 (B), and gp120 (C) in mouse serum at weeks 0, 2, 4, 6, and 8. (F) Bar graph showing the binding antibody levels (OD) for gp120, gp120 (B), and gp120 (C) in mouse serum at weeks 0, 2, 4, 6, and 8. (G) Bar graph showing the binding antibody levels (OD) for gp120, gp120 (B), and gp120 (C) in mouse serum at weeks 0, 2, 4, 6, and 8. (H) Bar graph showing the binding antibody levels (OD) for gp120, gp120 (B), and gp120 (C) in mouse serum at weeks 0, 2, 4, 6, and 8. (I) Bar graph showing the binding antibody levels (OD) for gp120, gp120 (B), and gp120 (C) in mouse serum at weeks 0, 2, 4, 6, and 8. (J) Bar graph showing the binding antibody levels (OD) for gp120, gp120 (B), and gp120 (C) in mouse serum at weeks 0, 2, 4, 6, and 8. (K) Bar graph showing the binding antibody levels (OD) for gp120, gp120 (B), and gp120 (C) in mouse serum at weeks 0, 2, 4, 6, and 8. (L) Bar graph showing the binding antibody levels (OD) for gp120, gp120 (B), and gp120 (C) in mouse serum at weeks 0, 2, 4, 6, and 8. (M) Bar graph showing the binding antibody levels (OD) for gp120, gp120 (B), and gp120 (C) in mouse serum at weeks 0, 2, 4, 6, and 8.

**Results:** During the immunization of Balb/c mice, a single protein vaccine can produce sufficient binding antibody levels after the second immunization. However, the significant IFN- $\gamma$  T cell response was not observed in the

V1-V5 region peptides, and only the immunogen-specific T cell response was generated. For multi-valent vaccine immunization, the IFN- $\gamma$  T cell response and the binding antibody level of three kinds of immunogen-specific can be generated meanwhile, and there is no significant difference from the single immunogen immunization group. After the protein vaccine's four consecutive immunizations, the cloning diversity of the HIV-1 B-gp120 protein immunization group and the multi-valent vaccine immunization group has increased significantly. At the same time, it was found that the CDR3 BCR clone ratio increased by 15-19 amino acids, and the multi-valent vaccine immunization group was more significant. Among the B-gp120 mRNA vaccine-immunized mice, high-titer immunogen-specific binding antibodies and the IFN- $\gamma$  T cell response can be detected. Among them, the T cell response is more advantageous.

**Conclusions:** Multi-valent vaccine immunization, based on various protein vaccines, did not markedly diminish the specific binding antibody levels or T-cell responses compared to single immunogen immunization. Moreover, hybrid immunization enhanced BCR cloning diversity and the ratio of CDR3 length with 15-19 amino acids. The mRNA vaccine platform demonstrated remarkable advantages in enhancing T-cell responses.

<sup>1</sup>University of Pittsburgh School of Medicine, Department of Pathology, Pittsburgh, United States, <sup>2</sup>University of Pittsburgh School of Medicine, Division of Infectious Diseases, Department of Medicine, Pittsburgh, United States, <sup>3</sup>University of Pittsburgh School of Medicine, Department of Surgery, Pittsburgh, United States, <sup>4</sup>University of Pittsburgh School of Public Health, Department of Infectious Diseases and Microbiology, Pittsburgh, United States, <sup>5</sup>UPMC Hillman Cancer Center, Pittsburgh, United States

**Background:** Control of the COVID 19 pandemic requires systemic vaccination to prevent severe diseases and death of the SARS-CoV-2 patients. As these vaccines induce T- and B-cell activation and systemic inflammation for priming the immune responses to vaccine, it is important to assess the impact of these immune responses on the outcome of ART-suppressed HIV infection.

**Methods:** Eight rhesus macaques (RM) were intravenously SIVmac239-challenged (300 TCID<sub>50</sub>), and virus was suppressed with antiretroviral therapy (ART) at 42 days post challenge (pc) for six months. Then, 6 RMs received

an adjuvanted Delta (B.1.617.2) S1 SARS-CoV-2 subunit vaccine with Toll-like receptor 4 agonist RS09 (rS1RS09) twice (intradermally-224 dpc; intramuscularly-329 dpc) with Squalene-based oil-in-water adjuvant in a prime-boost regimen, every three weeks; two RMs received sham vaccination. Plasma viral loads (pVLs), T- and B-cell counts and activation and proliferation, as well as biomarkers of inflammation, gut integrity and coagulation (D-dimer) were monitored.

**Results:** SARS-CoV-2 vaccination induced robust humoral immune responses, which neutralized the infectivity of SARS-CoV-2 variants, including Wuhan and Delta (B.1.617.2), and less effectively Omicron (BA.1). This robust immune response triggered increased T- and B-cell activation and proliferation (Ki-67, CD69, HLA-Dr) and increased systemic inflammation (CRP, inflammatory cytokines). Consequently, postvaccine viral blips occurred in both vaccinated and sham-receiving animals, but not in a historic control group receiving ART only. Viral blips were reduced in size ( $\approx 10^2$  copies/ml) and duration, being rapidly controlled. No discernible impact on gut integrity was observed after vaccine administration (sCD14, sCD163, I-FABP, collagen).

**Conclusions:** Our SARS-CoV-2 vaccine formulation induced immune (T- and B-cell activation and proliferation) and inflammatory responses that triggered viral blips in ART-suppressed SIVmac in RMs. These blips were transient and relatively low, and thus they did not induce significant mucosal damage. However, such blips of replication should be closely monitored, as they may contribute to the resistance to ART.

<sup>2</sup>University of British Columbia, Vancouver, Canada, <sup>3</sup>CIHR Canadian HIV Trials Network, Vancouver, Canada, <sup>4</sup>Unity Health Toronto, Toronto, Canada, <sup>5</sup>University of Toronto, Toronto, Canada, <sup>6</sup>BC Centre for Excellence in HIV/AIDS, Vancouver, Canada, <sup>7</sup>Case Western Reserve University, Cleveland, United States, <sup>8</sup>Ottawa Hospital Research Institute, Ottawa, Canada, <sup>9</sup>Nova Scotia Health, Halifax, Canada, <sup>10</sup>St. Paul's Hospital, Vancouver, Canada

**Background:** Doxycycline post-exposure prophylaxis (doxyPEP) is efficacious in preventing bacterial sexually transmitted infections (STI) in men who have sex with men (MSM). Doxycycline pre-exposure prophylaxis (doxy-PrEP) has also shown promise and may represent another option for STI prevention. We undertook a pilot study of doxyPrEP in MSM living with HIV.

**Methods:** MSM living with HIV with previous syphilis were randomized 1:1 to receive 48 weeks of daily doxycycline 100mg orally versus placebo in this double-blind pilot study in Toronto and Vancouver, Canada. Participants were followed quarterly with STI screens (syphilis serology, gonorrhea/chlamydia nucleic acid amplification testing of urine, pharynx, and rectum), adherence and sexual behaviour questionnaires, and adverse event (AE) assessments. Nasal swabs were collected to evaluate the emergence of doxycycline resistance in *Staphylococcus aureus* carriers. STI rates were compared between arms using Poisson regression.

**Results:** Fifty-two MSM were enrolled with median age of 43 years (interquartile range [IQR], 38-54), from 01/2020 to 01/2023. Forty-one participants (78.8%) completed the study protocol. We observed a reduction of 79%, 92%, and 68% in syphilis, chlamydia, and gonorrhea, respectively, in the doxycycline arm relative to placebo (Table). There were no between-arm differences in drug adherence (pill count) or sexual behaviours (number of partners, condomless sex acts) at any time point. Most AEs (78.4%) were mild, and the proportion of AEs related to study drug did not differ by study arm. There was one drug-related discontinuation (worsening gastroesophageal reflux), and one serious adverse event (mpox-related proctitis; unexpected and unrelated to drug), both in the doxycycline arm. New doxycycline resistance developed in 3/19 and 2/19 ( $p=0.57$ ) *S. aureus* isolates from baseline to week 48 in the doxycycline and placebo arms, respectively.

<sup>1</sup>Queen Mary University of London, SHARE Collaborative, Blizard Institute, London, United Kingdom, <sup>2</sup>Barts Health NHS Trust, Department of Infection and Immunity, London, United Kingdom, <sup>3</sup>Queen Mary University of London, SHARE Collaborative, Wolfson Institute for Population Health, London, United Kingdom, <sup>4</sup>Queen Mary University of London, Pragmatic Clinical Trials Unit, Wolfson Institute for Population Health, London, United Kingdom, <sup>5</sup>University of Oxford, Nuffield Department of Primary Care Health Sciences, Oxford, United Kingdom, <sup>6</sup>Kings College London, Infectious Diseases, London, United Kingdom, <sup>7</sup>Guy's and St Thomas' NHS Foundation Trust, Infection and Immunity, London, United Kingdom, <sup>8</sup>Chelsea and Westminster Hospital NHS Foundation Trust, London, United Kingdom, <sup>9</sup>University Hospitals Sussex NHS foundation Trust, Royal Sussex County Hospital, Brighton, United Kingdom, <sup>10</sup>Liverpool University Hospitals NHS Foundation Trust, Liverpool, United Kingdom, <sup>11</sup>Royal Free London NHS Foundation Trust, London, United Kingdom

**Background:** Limited evidence exists on community delivery of long-acting injectable cabotegravir+rilpivirine (CAB+RPV-LAI). Prior studies significantly underrepresented women, racially minoritised, and older people. ILANA

is the first to deliver CAB+RPV-LAI in community settings using an inclusive protocol to recruit equitably. We present primary endpoint (M12), and pre-specified sub-group analyses (gender/race/age).

**Methods:** ILANA is an on-label 1-year UK-based implementation study where participants received 2-monthly CAB+RPV-LAI in clinic and community settings. We present M12 primary endpoint: Feasibility of Intervention Measure (FIM) for injection and community; secondary endpoints: Acceptability of Intervention Measure (AIM), Intervention Appropriateness Measure (IAM), HIV Treatment Satisfaction Questionnaire (HIVTSQs-12).

**Results:** Between May-December 2022, we enrolled 114 participants (53% female, 51% Black, 40% >50yrs, 68% heterosexual). Median time on ART=11 years (IQR 7,16). One participant experienced virological failure, 12 discontinued.

Among participants with completed questionnaires (n=95), M12 injection feasibility, acceptability, and appropriateness were high: 79.0%, 85.3%, and 87.4% agreed or completely agreed with each measure (≥4), respectively. Women scored lower on injection feasibility (FIM: W:69.1% vs M:92.5%, p=0.01) and appropriateness (IAM: W: 80.0% vs M:97.5%, p=0.01) as did Black participants (FIM: B:65.3 vs NB:93.5, p<0.01; IAM: B:65.3% vs NB:93.5%, p<0.01).

M12 community setting feasibility, acceptability, and appropriateness were low overall: 47.4%, 44.2%, and 47.4% respectively. All scores were lower in Black versus non-Black participants (FIM: 36.7% vs 58.7%, p=0.03; AIM: 34.7% vs 54.4%, p=0.05; IAM: 36.7% vs 58.7%, p=0.03).

Treatment satisfaction improved significantly from baseline (mean difference +6.52 (SD 11.38), p<0.01). Women (+4.35 (10.61) versus men (+9.5 (11.85), p=0.03) and Black versus non-Black participants (+3.76 (10.44) vs +9.46 (11.71), p=0.01) had smaller increases.

Outcomes at M12	Overall (n=95)	p-value	Women (n=55)	Men (n=40)	p-value	Black (n=49)	Non-Black (n=46)	p-value	<50 (n=57)	≥50 (n=38)	p-value
Injection: n (%) that agree or completely agree (≥4)	FIM	75 (79.0)	38 (69.1)	37 (92.5)	0.01	32 (65.3)	43 (93.5)	<0.01	48 (84.2)	27 (71.1)	0.12
	AIM	81 (85.3)	46 (83.6)	35 (87.5)	0.60	39 (79.6)	42 (91.3)	0.11	49 (86.0)	32 (84.2)	0.81
	IAM	83 (87.4)	44 (80.0)	39 (97.5)	0.01	38 (77.6)	45 (97.8)	<0.01	53 (93.0)	30 (79.0)	0.06
Community setting: n (%) that agree or completely agree (≥4)	FIM	45 (47.4)	23 (41.8)	22 (55.0)	0.20	18 (36.7)	27 (58.7)	0.03	31 (54.4)	14 (36.8)	0.09
	AIM	42 (44.2)	22 (40.0)	20 (50.0)	0.33	17 (34.7)	25 (54.4)	0.05	29 (50.9)	13 (34.2)	0.11
	IAM	45 (47.4)	23 (41.8)	22 (55.0)	0.20	18 (36.7)	27 (58.7)	0.03	31 (54.4)	14 (36.8)	0.09
HIV-TSQs change from baseline: mean difference (SD)	6.52 (11.38)	<0.01	4.35 (10.61)	9.50 (11.85)	0.03	3.76 (10.44)	9.46 (11.71)	0.01	7.70 (11.76)	4.74 (10.69)	0.22

**Table 1. Implementation outcomes overall and by sub-group**

**Conclusions:** Participant perceptions of CAB+RPV injection feasibility, acceptability and appropriateness are high. We demonstrate notable differences in women and Black

### High viral suppression after transition from nonnucleoside reverse transcriptase inhibitor- to dolutegravir-based antiretroviral therapy in the Thai national treatment programme

O. Putcharoen<sup>1</sup>, C. Lertpiriyasuwat<sup>2</sup>, S. Noknoy<sup>2</sup>, J. Sophonphan<sup>3</sup>, S. Jirajariyavej<sup>4</sup>, S. Kerr<sup>5,6</sup>, P. Chetchotisakd<sup>7</sup>, C. Bowonwatanuwong<sup>8</sup>, K. Ruxrungtham<sup>3</sup>, A. Avihingsanon<sup>3,9</sup>

<sup>1</sup>Faculty Medicine, Chulalongkorn University, Medicine, Bangkok, Thailand, <sup>2</sup>Division of AIDS and STI, Department of Disease Control, Ministry of Public Health, Nonthaburi, Thailand, <sup>3</sup>HIV-NAT, Thai Red Cross AIDS Research Center, Bangkok, Thailand, <sup>4</sup>Taksin Hospital, Bangkok, Thailand, <sup>5</sup>Biostatistics Excellence Centre, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand, <sup>6</sup>The Kirby Institute, University of New South Wales, Sydney, Australia, <sup>7</sup>Faculty of Medicine, Srinagarind Hospital, Khon Kaen University, Khon Kaen, Thailand, <sup>8</sup>Thai AIDS Society, Bangkok, Thailand, <sup>9</sup>Center of Excellence in Tuberculosis, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand

**Background:** Dolutegravir based ART, mainly fixed dose combinations of tenofovir disoproxil fumarate/lamivudine/dolutegravir (TLD) has been rapidly scaled up as 1<sup>st</sup> and 2<sup>nd</sup> line ART for people living with HIV (PLWH) in many low-middle income countries. Thailand's National HIV program transitioned from predominantly nonnucleoside reverse transcriptase inhibitor (NNRTI)-based ART to DTG-based ART in 2020. We assessed treatment outcomes among Thai PLWH who transitioned from NNRTI to DTG based ART under the National AIDS Program (NAP) in Thailand.

**Methods:** PLWH aged ≥15 years who transitioned from NNRTI- to DTG-based ART in the UHC from 2020-2023 with at least 1 viral load (VL) available after 6 months of DTG treatment were included. Viral suppression and VL failure were defined as VL <50 copies/ml and ≥1000 copies/mL, after at least 6 months of DTG, respectively. Vital status was confirmed with Death Registry.

**Results:** Of 302,018 PLWH who transitioned from NNRTI (mainly efavirenz)- to DTG-based ART, 3,726 (1.2%) died, 41,628 (13.8%) were lost to follow-up, and 155,911 participants were eligible for this analysis. Median age was 46.6 years, 58.8% were female and median CD4 was 508 cells/mm<sup>3</sup>. Median NNRTI duration before DTG was 8.1 years, median duration from DTG switch to VL measurement was 8.6 (IQR 6.5-11.3) months, and 5% had VL > 50 copies/mL at DTG switch. Among 148,018 PLWH with VL < 50 cop-

ies/mL at DTG switch, 95.7%, 98.3% and 0.8% had VL <50, <200 and ≥1000 copies/mL, respectively. Of 7,893 PLWH with VL >50 copies/mL at DTG switch, 76.8%, 90% and 6.5% had VL < 50, <200 and >1000 copies/mL, respectively. Compared to PLWH aged > 50 years, adolescents and young adults (aged <24 years) had higher VL failure rates (8.1% vs 4.3%).

**Conclusions:** In PLWH who transitioned from NNRTI- to DTG-based ART with pre-switch VL<50 copies/mL, and ≥6 months of follow-up, the majority remained virologically suppressed, and only 0.8% experienced VL failure. The higher rate of VL failure (6.5%) among those with VL >50 copies/mL at DTG switch, especially in adolescents and young adults (8.1%) suggest close VL monitoring and a need of long acting ART in this population. National DTG resistance surveillance is warranted.

## LB14

### Transitioning adolescents living with HIV to tenofovir/lamivudine+dolutegravir despite a detectable baseline viral load and previous exposure to tenofovir/lamivudine+efavirenz ensures higher virological response: the CIPHER-ADOLA Study in Cameroon

**Background:** WHO recommends transitioning to tenofovir/lamivudine/dolutegravir (TLD)-regimen to improve virological success (VS), considering vulnerable populations like adolescents living with HIV/AIDS (ADLHIV). Due to scarcity of evidence in this target population, we sought to ascertain VS and virological rebound (VR) among Cameroonian ADLHIV after switching to TLD in real-life.

**Methods:** Multicentre cohort-study was conducted among ADLHIV (aged 10-19) switching/starting TLD monitored with  $\geq 2$  HIV-RNA load (VL) measurements after switch. Survival analyses were performed to evaluate VS (VL<200 copies/mL in the viremic-group) and VR (VL $\geq$ 1000 copies/mL among non-viraemic-group) according to baseline parameters.

**Results:** Overall, 351 ADLHIV were enrolled (52.1% female, median [IQR] age 14[12-15] and weight 40[34-52] Kg). At baseline, 62.1% (n=218) were non-viremic and 37.9% (n=133) viremic; 60.5% switched from a TDF/3TC-based regimen. Overall, VS at 12- and 24-months was 65.0% and 94.3%, achieved in a median-time of 6.8 [4.8-8.6] months. At 24-months, 100% of males achieved VS versus 90.4% in females,  $p=0.065$ ; 100% ADLHIV starting TLD as their first-line treatment achieved VS, compared to those switching with a detectable VL (VL=51-999 copies/mL: 96.1%; VL $\geq$ 1000 copies/mL: 91.1%,  $p=0.620$ ). No difference in VS was found between switching from TDF/3TC-backbone (89.9%) versus ABC/3TC (100%),  $p=0.353$ . Of the 7 cases of non-VS, 57.1% switched from TDF/3TC-backbone and 57.1% had a VL $\geq$ 1000 copies/mL. VR at 12- and 24-months was 2.8% and 10.8%, respectively. At 24-months, ADLHIV switching from ABC/3TC showed a lower probability of VR (16.7%) versus TDF/3TC (23.9%) and AZT/3TC (70.2%),  $p=0.008$ . Lower VR in ADLHIV switching from EFV-based (6.6%) versus DTG (31.4%) and LPV/ATZ/r (40.3%),  $p=0.008$  was observed. Of the 25 ADLHIV experiencing VR, most received TD-F/3TC (52.0%) versus ABC/3TC (32.0%) and AZT/3TC (16.0%),  $p=0.035$ . At multivariate analysis, switching from DTG-

based regimen had 8-times more risk of VR (aHR [95% CI]: 8.099 [1.404-46.730],  $p=0.019$ ) compared to switching from EFV-based regimen.

**Conclusions:** In Cameroon, switching ADLHIV to TLD favours a sustained viral control after switch. However, VR occurs in some cases, especially when switching from a DTG-based regimens. Thus, scaling-up the transition of ADLHIV to TLD, regardless of previous exposure to TD-F/3TC/EFV and baseline VL, would contribute to markedly decreasing, down toward eliminating, paediatric AIDS.

### Accelerating treatment optimization for children in South Africa: the introduction of paediatric dolutegravir in a large-scale paediatric HIV programme.

T. Silere-Maqetseba<sup>1</sup>, L. Bamford<sup>2</sup>, L. Khan<sup>3</sup>, K. Segwele<sup>3</sup>, Y. Maharaj<sup>3</sup>, Z. Kwindi<sup>3</sup>, B. Mugisa<sup>4</sup>

<sup>1</sup>National Dept of Health, Child, Youth and School Health, Pretoria, South Africa, <sup>2</sup>National Dept of Health, Maternal and Child Health, Pretoria, South Africa, <sup>3</sup>Clinton Health Access Initiative, SRH and Paeds HIV, PRETORIA, South Africa, <sup>4</sup>United States Agency for International Development, South Africa, Paeds HIV, PRETORIA, South Africa

**Background:** South Africa has made strides towards the UNAIDS 95-95-95 target for ending the AIDS epidemic, achieving a general population cascade of 95-78-92 by the end of 2023. However, the children's cascade lags at 82-66-67. In response, South Africa introduced Paediatric Dolutegravir (pDTG) 10mg tablets in 2023 to enhance adherence, expedite viral load suppression, and provide a cost-effective regimen for children living with HIV (CLHIV). **Description:** In 2023, South Africa adopted the use of pDTG 10mg as first-line antiretroviral therapy for children living with HIV (CLHIV) who are at least 4 weeks old and weigh 3-20 kg. National guidelines training ensued with training of provincial trainers, followed by training of healthcare workers at facilities. South Africa then began to switch and initiate CLHIV to a pDTG-containing regimen in April 2023 prioritizing those newly identified and those not virally suppressed.

**Lessons learned:** Between April 2023 and March 2024, the proportion of CLHIV under 10 years transitioned and/or initiated on pDTG-containing regimen increased from 20% to 48%. Viral load suppression for CLHIV under 10 years on ART increased from 64.2% to 73.3%. Critical to this successful transition was collaboration across program, supply chain and community, as well as communication of set targets and availability of job aids such as the ARV dosing charts. Ongoing engagements with suppliers ensured stock availability and monthly provincial meetings promoted equitable stock distribution, and maximized expiring medicines use.

**Conclusions/Next steps:** The transition and initiation rates onto pDTG-containing regimens, coupled with the applaudable increase in viral load suppression, underscore the effectiveness of this strategic shift. The strategy forms part of Global Alliance country plan; stakeholders will continue collaborating to transition all CLHIV to pDTG, train, monitor uptake, and assess its impact on ART retention rates.

**Background:** Most people with HIV (PWH) in low- and middle-income countries now receive dolutegravir (DTG)-based ART. It is critical to monitor the emergence of DTG resistance in different settings and in different HIV-1 subtypes.

**Methods:** In DTG RESIST, clinics of the International epidemiology Databases to Evaluate AIDS (leDEA) network enrol adults and adolescents (≥10 years) on DTG-based ART for >3 months with >1 routine viral load (VL) ≥1000 copies/mL, regardless of prior treatment history. We perform VL testing in a central laboratory in Durban, South Africa on plasma or dried blood spot specimens followed by HIV-1 pol sequencing for specimens with VL ≥1000 copies/mL. We present data as of 5 April 2024.

**Results:** Since June 2022, we have enrolled 590 participants in 15 countries. Participant's median age was 35 years (IQR 23-46 years), 338 (57%) were women and 523 (89%) from sub-Saharan Africa. So far, of the 307 specimens from 14 sites in 6 African countries received at the laboratory, 145 (47%) had a VL ≥1000 copies/mL. From 117 specimens processed, we obtained 115 integrase sequences (all non-B subtypes: 57% C, 17% CRF02\_AG, 8% A1, 18% others). Twenty-eight (24%) had at least one major INSTI drug resistance mutation (DRM), all from treatment-experienced individuals. Most had multiple major INSTI DRMs ± accessory/other INSTI DRMs, and all had NRTI

DRMs. The most frequently observed INSTI DRMs were E138AK (n=23), G118R (n=20), L74IM (n=14), and T66AI (n=12) (Figure); the most frequently observed combination was G118R + E138AK (n=14).

Figure. INSTI drug resistance mutations (DRMs) in genotypes with ≥1 major INSTI DRM (n=28).

**Conclusions:** In this prospective multi-country study of people living with non-B HIV subtypes, approximately one in five individuals with confirmed viraemia on DTG-based ART had high-level DTG resistance. G118R and the G118R + E138AK combination seem to be common resistance mutations, highlighting that resistance pathways likely differ between non-B and B subtypes.

## LB17

### Increased incidence of emergent integrase drug resistance with cabotegravir versus dolutegravir in randomised switching trials

A. Perez Navarro<sup>1</sup>, M.J. Siedner<sup>2,3</sup>, S.M. McCluskey<sup>2,3</sup>, A. Hill<sup>4</sup>  
<sup>1</sup>Imperial College London, Faculty of Medicine, London, United Kingdom, <sup>2</sup>Massachusetts General Hospital, Division of Infectious Diseases, Boston, United States, <sup>3</sup>Harvard Medical School, Boston, United States, <sup>4</sup>University of Liverpool, Department of Pharmacology and Therapeutics, Liverpool, United Kingdom

**Background:** The long-acting injectable regimen of cabotegravir plus rilpivirine (CAB/RPV), has been evaluated for treatment of HIV, predominantly in switch studies for people with HIV who have achieved virologic suppression. Improved adherence from long-acting treatments is hypothesized to decrease risk of treatment failure and treatment-emergent resistance. Yet, comparisons between failure and resistance rates for this injectable regimen versus oral integrase inhibitor regimens have not been made.

**Methods:** We conducted a systematic review of clinical trial registries, PubMed and EMBASE to identify all randomised controlled trials of CAB/RPV or dolutegravir (DTG) for people switching after obtaining virologic suppression (HIV RNA<50 copies/mL). We extracted 48-week (±4 weeks) data on virologic failure (VF) and emergence of HIV drug resistance mutations (DRMs), defined as presence of major integrase inhibitor (INSTI) mutations, based on the

Stanford algorithm. We compared incidence of VF and emergent DRMs between CAB/RPV and DTG trials using Fisher's exact tests.

**Results:** Seven switch trials were identified for CAB/RPV (n=2588), and eleven trials were identified for DTG (n=2733). In trials of CAB/RPV, 26/2588 people (1.0%) developed protocol-defined VF, versus 28/2733 (1.0%) in trials of DTG (p=1.00). In CAB/RPV trials 17/26 people with VF (65%) had major INSTI DRMs versus 0/28 (0%) in DTG trials (p<0.0001). The predominant major INSTI-associated DRMs arising in the CAB/RPV trials were Q148R (30%), N155H (27%), E138K (12%), G140R (12%), and Q148K (7%). Intermediate or high-level cross-resistance to DTG in the CAB/RPV trials was present in 7/17 (41%) cases with INSTI DRMs.

	CAB trials	DTG trials	p-value
Sample size	2588	2733	
Virological failure cases	26	28	1.00
≥1 INSTI-associated DRMs	17	0	<0.0001*
Predominant DRMs	Q148R, N155H, E138K, G140R, Q148K	NA	
Sensitivity analysis †			
Sample size	2769	2733	
Virological failure cases	32	28	0.70
≥1 INSTI-associated DRMs	18	0	<0.0001*

\* Statistically significant result in Fischer's exact test

† Inclusion of results from LATTE study assessing oral CAB  
CAB, cabotegravir; DTG, dolutegravir; INSTI, integrase strand transfer inhibitor; DRMs, drug-resistance mutations

**Conclusions:** Treatment-emergent INSTI resistance was more common with use of CAB/RPV than for DTG in switch trials, despite the perceived adherence benefits associated with long-acting formulations. Significant cross-resistance with DTG was seen for those failing CAB/RPV with resistance. Close monitoring of INSTI resistance in individuals and populations may be warranted as injectable CAB is more widely implemented.

**Background:** Ensitrelvir, an oral SARS-CoV-2 3CL protease inhibitor, has demonstrated virologic and clinical efficacy in prior studies. The SCORPIO-HR trial assessed efficacy and safety of ensitrelvir in non-hospitalized adults with symptomatic mild-to-moderate COVID-19.

**Methods:** In this global randomized (1:1) trial (August 2022-December 2023), adults (≥18 years) with COVID-19 symptom onset ≤5 days received once-daily ensitrelvir (375 mg day 1, 125 mg days 2-5) or placebo. The primary endpoint was time to sustained (≥2 days) resolution of 15 COVID-19 symptoms, recorded in participant diaries, through day 29 in participants starting treatment ≤3 days of symptom onset.

Other endpoints included reduction in SARS-CoV-2 RNA, viral culture, RNA rebound, and safety.

**Results:** Of 2093 participants, 1888 (90%) started treatment  $\leq 3$  days of symptom onset. The mean ( $\pm$ SD) age was  $41 \pm 14$  years; 55% female; 76% vaccinated; 31% high-risk ( $\geq 65$  years or  $\geq 1$  risk factor for severe disease); 42% White; 41% Asian; 9% Black; 45% Hispanic/Latino.

The primary endpoint of restricted mean time to symptom resolution was not significantly different between ensitrelvir (12.5 days) and placebo (13.1 days; difference, -0.6 days; 95%CI: -1.4, 0.2;  $p=0.14$ ; Table). At day 4, ensitrelvir reduced least-squares mean RNA by 0.72  $\log_{10}$  copies/mL more than placebo (95%CI: 0.55, 0.90;  $p<0.001$ ).

Among those with positive viral culture at enrollment and available data, 274/287 (95%) ensitrelvir-treated versus 210/280 (75%) placebo-treated participants had negative culture at day 4 ( $p<0.001$ ). Through day 29, RNA rebound was uncommon and similar ( $<1.5\%$ ) between treatment arms.

Adverse events were reported in 638 (62%) ensitrelvir-treated and 635 (61%) placebo-treated participants. No treatment-related serious adverse events or deaths occurred, and only 4 participants had COVID-related hospitalizations by day 29.

Endpoint	Analysis population	Symptom resolution period	Mean days to symptom resolution			Restricted mean difference	p-value
			Ensitrelvir	Placebo	Difference (95% CI)		
Primary endpoint	Symptom onset $\leq 3$ days (n=1888)	$\geq 2$ consecutive days	12.5	13.1	-0.6 (-1.38, 0.19)	0.14	0.07
Pre-specified supportive analyses**	Symptom onset $\leq 3$ days with positive PCR test at baseline (n=1535)	$\geq 2$ consecutive days	12.3	13.0	-0.7 (-1.56, 0.16)	0.11	0.08
	Symptom onset $\leq 3$ days (n=1888)	$\geq 1$ day	11.4	12.2	-0.8 (-1.53, 0.02)	0.06	0.03

\*Fifteen COVID-19 symptoms: stuffy nose, runny nose, sore throat, cough, low energy or tiredness, feeling hot or feverish, shortness of breath or difficulty breathing, chills or shivering, muscle or body aches, diarrhea, nausea, vomiting, headache, loss of taste, and loss of smell.

\*\*Supportive analyses were not part of the statistical hierarchy, were not adjusted for multiplicity, and should be interpreted in an exploratory manner. Peto-Prentice's generalized Wilcoxon test for supportive analyses were not prespecified.

Table. Time to Sustained Resolution of 15 COVID-19 Symptoms\* through Day 29.

**Conclusions:** Despite demonstrating antiviral activity, safety, and a trend toward shorter time to symptom resolution, ensitrelvir did not meet its symptom resolution primary endpoint, highlighting the challenge of relating antiviral activity and clinical endpoints when evaluating novel COVID-19 therapeutics in the current era.

## LB19

### Trends in the HIV epidemic of Puerto Rico: 1981-2023

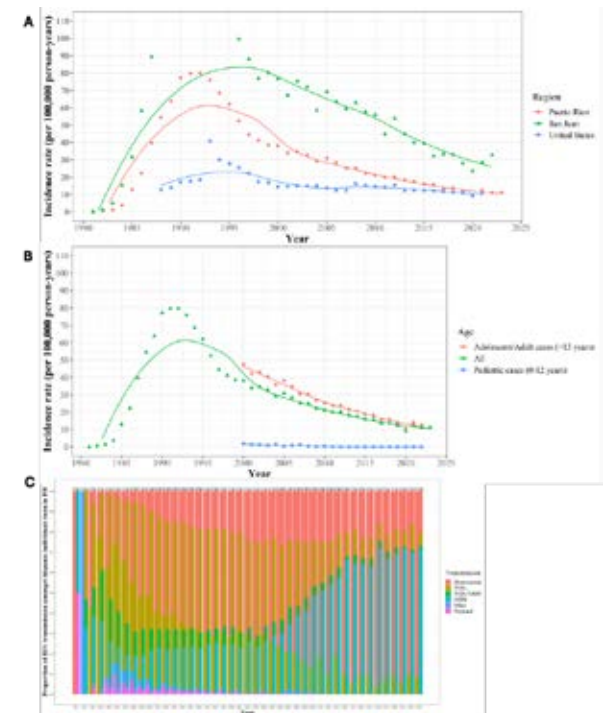

R. Gupta<sup>1</sup>, C. Zorrilla<sup>2</sup>, E. Marrero Cajigas<sup>3</sup>, S. Vermund<sup>4</sup>

<sup>1</sup>University of Minnesota School of Medicine, Minneapolis, United States, <sup>2</sup>University of Puerto Rico School of Medicine, San Juan, Puerto Rico, <sup>3</sup>Puerto Rico Department of Health, San Juan, Puerto Rico, <sup>4</sup>Yale School of Public Health, Department of Epidemiology and Microbial Disease, New Haven, United States

**Background:** Puerto Rico (PR) ranks amongst US states/territories with the greatest HIV burden and presents a unique case-study of the HIV epidemic with unique transmission periods and program successes. Yet the history of HIV in PR remains largely unappreciated. We provide an epidemiological summary of the PR HIV epidemic.

This study highlights transmission trends and provides an underpinning for future programmatic analyses.

**Methods:** The PR Department of Health provided annualized, de-identified HIV case and risk-factor data from 1981-2023. CDC provided national case data for 1988-2021. We compared trends in prevalence and incidence rate, stratified by geography and demographics, and evaluated trends in mode of transmission.

**Results:** All-age HIV incidence rates (per 100,000 person-years) increased throughout the 1980s reaching peaks in PR in 1992 (79.8 cases) and nationally in 1993 (40.8 cases) before decreasing to 11.3 cases and 10.8 cases in PR and nationally, respectively, at the study end. San Juan's incidence remained above the national average. From 2000-2023, PR incidence rates (per 10,000 person-years) declined from 47.4 to 12.5 cases for adolescents/adults and from 1.9 to 0 cases for pediatrics. Amongst

**Conclusions:** Despite the high HIV incidence in San Juan, broadly, PR has narrowed the incidence gap with the US nationally over three decades and is one of the first globally to eliminate mother-to-child transmission. Historically, transmission drivers of HIV have varied with a marked decline in IDU-related and perinatal cases. This study provides insights on PR HIV epidemic trends to inform policy analyses and future prevention initiatives nationally.

# Pre-treatment drug resistance in Colombia, a nationwide survey of antiretroviral resistance associated mutations through next-generation sequencing

E. Martínez-Buitrago<sup>1,2</sup>, A. Zapata<sup>2</sup>, L.C. Rubiano<sup>2</sup>,  
L.M. Sañudo<sup>2</sup>, J.M. Oñate<sup>2</sup>, W. Lenis<sup>2</sup>, J.F. García-Goez<sup>2</sup>,  
J.E. Álvarez<sup>2</sup>, S. Ávila-Ríos<sup>3</sup>, Fundación REVIVA, Clinical  
Research, Cali, Colombia

<sup>1</sup>Universidad del Valle, Internal Medicine, Cali, Colombia, <sup>2</sup>Fundación REVIVA, Cali, Colombia, <sup>3</sup>Centre for Research in Infectious Diseases, National Institute of Respiratory Diseases, Mexico city, Mexico

**Background:** In Colombia, current National Guidelines recommend the use of second-generation integrase inhibitors (INSTI) containing regimens as the initial antiretroviral treatment; however, efavirenz-based regimens are still the most prescribed in more than half of initiators, followed by ritonavir-boosted protease inhibitors. INSTI use is slowly increasing but is mainly restricted to switch therapy or virologic failure.

The prevalence of transmitted resistance in Colombia is unknown, a crucial gap in our knowledge to support country level guidelines.

**Methods:** We aimed to assess the prevalence of HIV pre-treatment drug resistance (PDR) through Next-Generation Sequencing (NGS) in plasma samples from volunteers initiating or reinitiating first-line ART in Colombia with all country regions represented. Recruitment was conducted according to the HIV prevalence rates reported to a surveillance system.

We present the results from 483 samples collected between Jul-2021 to Oct-2023. NGS threshold of 20% was performed by the Centre for Research in Infectious Diseases, National Institute of Respiratory Diseases, Mexico City. Stanford HIVDB 9.3 was used for RAM analysis. Study data are shown in cumulative rates.

**Results:** We recruited 483 volunteers nationwide, 98.3% harbored HIV sub-type B clade, 94.3% had Colombian citizenship, and female sex was 12.7%, the median age was 32.4, LT-CD4 count of 674 cells/uL, 24.8% less than 200 cells/uL; median HIV-1 RNA viral load was 213,930 copies/mL. Only 6.1% were reinitiating ART. Genotyping found wild-type virus in 61.7%, and unsuccessful amplification occurred in 12 samples. At a 20% threshold level, mainly NNRTIs transmitted RAMs were detected, primarily K103NS (11%). INSTI RAMs displaying intermediate and low resistance levels were found in 2.1%.

**Conclusions:** Our country-wide resistance data indicates that the use of NNRTI as a first-line therapy must be discouraged. We found a low 2.1% prevalence of INSTI RAMs. These data provide a valuable PDR profile for Colombia to support the National HIV Guidelines for treatment initiation.

# Evaluating the impact of increased provision of low dead space syringes on HIV and HCV transmission among people who inject drugs: a modelling analysis for 19 countries

J. Stone<sup>1</sup>, N. Martin<sup>2</sup>, A. Chaillon<sup>2</sup>, E. Wisse<sup>3</sup>, P. Lamand<sup>3</sup>,  
R. Csak<sup>4</sup>, C. Daniels<sup>4</sup>, L. Degenhardt<sup>5</sup>, P. Vickerman<sup>1</sup>

<sup>1</sup>University of Bristol, Bristol, United Kingdom, <sup>2</sup>University of California San Diego, San Diego, United States, <sup>3</sup>Médecins du monde, Paris, France, <sup>4</sup>Harm Reduction International, London, United Kingdom, <sup>5</sup>University of New South Wales, Sydney, Australia

**Background:** Low dead space syringes (LDSS) may reduce HIV and HCV transmission risk among people who inject drugs (PWID) compared to high dead space syringes (HDSS). We evaluated the potential impact of introducing detachable LDSS into needle and syringe programs (NSPs) across 19 countries.

**Methods:** We adapted an existing dynamic mathematical model of HIV and HCV transmission among PWID to include different types of syringe use. We parameterized use of LDSS and HDSS based on surveys of service providers in each of the 19 countries. Based on laboratory experiments, we assumed that use of fixed and detachable LDSS reduced risk of HCV transmission by 80% and 44%,

respectively, compared to HDSS. For each country, the model was calibrated within a Bayesian framework to country-specific data from global systematic reviews. We estimated the proportion of new HIV and HCV infections that could be averted over 2024-2030 if HDSS distributed by NSPs were replaced with detachable LDSS over 2024-2027, with and without a concurrent scale-up of NSP coverage to 75%.

**Results:** Replacing HDSS with detachable LDSS could avert 1.7% (95% credibility interval: 1.1-2.6) and 1.4% (1.1-1.8) of new HIV and HCV infections, respectively, over 2024-2030. Greater impact would be achieved across countries with higher (>40) NSP coverages: 11.9% (8.0-16.0) and 14.3% (12.7-16.2) of HIV and HCV infections averted.

Across all 19 countries, scaling up NSPs to 75% coverage could avert 39.4% (29.4-47.5) and 29.6% (24.4-35.0) of HIV and HCV infections. However, this scale-up could avert 46.1% (36.7-53.4) and 36.1% (30.8-41.2) of new HIV and HCV infections if NSPs switched from providing HDSS to detachable LDSS.

**Conclusions:** Switching from providing HDSS to effective detachable LDSS can substantially increase the impact of NSPs and may provide an important tool for the elimination of HIV and HCV among PWID.

## LB22

Dating and social media app mining predicts pre-exposure prophylaxis (PrEP) uptake in young sexual and gender minority young people in the United States

C. Bokor<sup>1</sup>, M. Beikzadeh<sup>2</sup>, C. Hong<sup>3</sup>, C. Cascalheira<sup>4</sup>, E.S.C. Wu<sup>3</sup>, M. Sarrafzadeh<sup>2</sup>, I.W. Holloway<sup>3</sup>

<sup>1</sup>University of California, Los Angeles, Epidemiology, Los Angeles, United States, <sup>2</sup>University of California, Los Angeles, Computer Science, Los Angeles, United States, <sup>3</sup>University of California, Los Angeles, Social Welfare, Los Angeles, United States, <sup>4</sup>VA Puget Sound Health Care System, PTSD Outpatient Clinic, Seattle, United States

**Background:** Pre-exposure prophylaxis (PrEP) is an essential tool for HIV prevention and is underutilized in key populations such as sexual and gender minorities (SGM). Given the widespread use of LGBTQ-specific dating and social media apps, we leveraged data from these apps in order to inform targeted and innovative interventions to enhance PrEP utilization.

**Methods:** We adapted eWellness, an Android mobile phone app, to passively collect data from research participants through app use, keystroke, and GPS location monitoring for use in a machine-learning model from 2021-2024.

The model was trained to identify PrEP usage, which was independently validated through participant-submitted photos of PrEP pill bottles. To measure the accuracy of our predictive model, we calculated F1 scores for PrEP predic-

tion based on collected data. Ethical safeguards and privacy measures were stringently adhered to throughout the study.

**Results:** A total of 82 SGM were enrolled into our study, of which 46 (56%) were taking PrEP at baseline. The machine-learning model demonstrated strong predictive accuracy for PrEP usage with an F1 score of 0.79 when taking all mobile app data into account, including messaging, dating, and social media apps.

Other features were tested such as use of social media apps exclusively, usage of words associated with sexual and substance use risk, and location monitoring, though all demonstrated less predictive power (F1 scores: 0.70, 0.55, 0.50, respectively), compared to all mobile app data, inclusive of both dating and social media apps.

**Conclusions:** Our findings underscore the potential of leveraging app data as a strong predictive tool for PrEP uptake. These insights hold potential for improving global HIV prevention efforts through customized PrEP promotion interventions, especially in areas with high usage of LGBTQ-specific apps.

Future research should explore the model's applicability to different regions and varied SGM subpopulations to enhance its generalizability.

## LB23

Uptake of doxycycline post-exposure prophylaxis (doxyPEP) and declines in bacterial sexually transmitted infections following doxyPEP initiation among HIV PrEP users in a real-world setting

M. Traeger<sup>1,2,3</sup>, W. Leyden<sup>4</sup>, J. Volk<sup>5</sup>, M. Silverberg<sup>6</sup>, M. Horberg<sup>6</sup>, T. Davis<sup>7</sup>, K. Mayer<sup>8,9</sup>, D. Krakower<sup>1,10</sup>, J. Young<sup>1</sup>, S. Jenness<sup>11</sup>, J. Marcus<sup>1,8,9</sup>

<sup>1</sup>Department of Population Medicine, Harvard Pilgrim Health Care Institute, Boston, United States, <sup>2</sup>Burnet Institute, Melbourne, Australia, <sup>3</sup>School of Public Health and Preventive Medicine, Monash University, Melbourne, Australia, <sup>4</sup>Division of Research, Kaiser Permanente Northern California, Pleasanton, United States, <sup>5</sup>Department of Infectious Diseases, Kaiser Permanente San Francisco, San Francisco, United States, <sup>6</sup>Kaiser Permanente Mid-Atlantic States, Permanente Medical Group, Rockville, United States, <sup>7</sup>Centre for Research and Evaluation, Kaiser Permanente Georgia, Atlanta, United States, <sup>8</sup>The Fenway Institute, Fenway Health, Boston, United States, <sup>9</sup>Harvard Medical School, Harvard University, Boston, United States, <sup>10</sup>Division of Infectious Diseases, Beth Israel Deaconess Medical Center, Boston, United States, <sup>11</sup>Emory University, Rollins School of Public Health, Georgia, United States

**Background:** Data are limited on real-world use and effectiveness of doxycycline post-exposure prophylaxis (doxyPEP) for prevention of bacterial sexually transmitted infections (STIs).

We evaluated doxyPEP uptake and changes in STI testing and incidence following doxyPEP initiation in a large cohort of HIV PrEP users.

**Methods:** Kaiser Permanente Northern California, a large integrated healthcare system, implemented doxyPEP in November 2022. Electronic health records of adults dispensed HIV PrEP from November 2022–December 2023 were extracted, with pharmacy data used to identify doxyPEP users. We compared characteristics of doxyPEP users and non-users using chi-square tests. Among doxyPEP users, we measured quarterly chlamydia, gonorrhea and syphilis testing (proportion tested at least once per quarter) and positivity (proportion testing positive at least once per quarter). We used Poisson regression to compute risk ratios (RRs) comparing mean STI positivity from 24 months before to 12 months after starting doxyPEP. To minimize bias from increased STI detection around the time of doxyPEP initiation, we excluded a baseline window from 90 days before to 14 days after individuals' doxyPEP initiation date.

**Results:** Among 11,551 PrEP users, 2,253 (19.5%) initiated doxyPEP, of whom 98.9% had male sex recorded at birth and 48.6% had a bacterial STI in the year before starting doxyPEP.

Compared with non-users, doxyPEP users were older (mean, 40.3 vs 38.8 years), more likely to be commercially insured (92.8% vs 88.9%) and had used PrEP longer (mean, 3.7 vs 2.2 years; all  $P < 0.001$ ).

Among doxyPEP users, mean proportion tested per quarter remained stable from pre-doxyPEP (74.1%) to post-doxyPEP (76.1%;  $P = 0.297$ ).

Quarterly chlamydia positivity decreased from 9.6% pre-doxyPEP to 2.0% post-doxyPEP (RR=0.21, CI=0.16–0.27,  $P < 0.001$ ), with declines at each anatomical site (all  $P < 0.001$ ). Quarterly gonorrhea positivity decreased from 10.2% pre-doxyPEP to 9.0% post-doxyPEP (RR=0.88, CI=0.77–1.00,  $P = 0.048$ ); site-specific declines were observed for rectal ( $P = 0.022$ ) and urethral ( $P = 0.001$ ), but not pharyngeal ( $P = 0.240$ ), gonorrhea.

Quarterly syphilis positivity decreased from 1.7% pre-doxyPEP to 0.3% post-doxyPEP (RR=0.20, CI=0.11–0.37,  $P < 0.001$ ).

**Conclusions:** In this cohort of HIV PrEP users, 1 in 5 initiated doxyPEP during the first year of availability. Receipt of doxyPEP was associated with substantial declines in chlamydia and syphilis, and modest declines in gonorrhea, varying by anatomical site.

## LB24

### Optimizing HIV testing among sex workers through moonlight testing in Harare, Zimbabwe

A. Muzondiona<sup>1</sup>, R. Kuyala<sup>2</sup>, N.T. Ndagurwa<sup>1</sup>, L. Sinandima<sup>1</sup>

<sup>1</sup>National Aids Council, Programmes, Harare, Zimbabwe,

<sup>2</sup>National AIDS council, programmes, Harare, Zimbabwe

**Background:** To increase access to HIV testing and counseling services for female sex workers in Harare, Zimbabwe. The project focuses on broadening HIV and Sexual Reproductive Health and Rights Service (SRHR) delivery options among female sex workers who face barriers to accessing traditional facility-based services. The aim of the intervention is to increase HIV testing uptake among sex workers through Moonlight testing and to promote early HIV diagnosis and linkage to care and treatment services for female sex workers.

**Description:** To increase the HIV and Aids service uptake among female sex workers, National Aids Council (NAC) Harare as the coordinating board, partnered with Implementing Partners and adapted Moonlight testing as way of expanding service delivery options between January and April 2024. The project operates under the leadership of NAC which is mandated to coordinate multisectoral response to HIV and AIDS.

#### Intervention Activities:

- Conduct hot spot mapping and validation
- Community mobilization and engagement:
- Deploying mobile testing units to hot spots
- Distributing self-test kits to Female sex workers
- Offer pre- and post-test counseling, as well as referrals for HIV treatment, care, and support services

**Lessons learned:** Table 1.0 Shows HIV testing among female sex workers in Harare January –April 2024

Performance Indicator	Static -Facility Based HIV testing	Daily outreaches HIV testing	Moonlight HIV testing
HTS -TST	3751	4126	1120
HTS (POS)	262 (7%)	371 (9%)	134 (12%)
TX New	256 (98%)	356 (96%)	127 (95%)

HTS TST = Number of newly tested HIV individuals

TX new = Number of individuals initiated on ART

HTS (POS) = Percentage of HIV positive individuals

Table.

- Moonlight testing increased the uptake HIV service among female sex workers
- Positivity rate is higher for moonlight testing compared to facility based and day outreach.
- Linkage to care through Moonlight testing was found to be above 95%

#### Conclusions/Next steps:

- Moonlight testing proved to be a viable option to expand HIV testing uptake among female sex workers in Harare.

- Project data indicates that Moonlight testing is a viable strategy for achieving the 95-95-95 targets for female sex workers which is key to attain epidemic control for key populations.

## LB25

### Factors associated with non-disclosure of HIV status: findings from a People Living with HIV Stigma Index 2.0 study in the country of Georgia

T. Zurashvili<sup>1</sup>, M. Pashalishvili<sup>1</sup>, S. Walters<sup>2</sup>, N. Zakareishvili<sup>3</sup>, M. Djibuti<sup>4</sup>

<sup>1</sup>I. Javakhishvili Tbilisi State University, Faculty of Medicine, Tbilisi, Georgia, <sup>2</sup>New York University, School of Public Health, New York, United States, <sup>3</sup>UNFPA Georgia, Tbilisi, Georgia, <sup>4</sup>Partnership for Research and Action for Health, Tbilisi, Georgia

**Background:** In Georgia, PLHIV face heightened risk due to widespread stigma and discrimination. Due to stigma, PLHIV struggle to disclose their HIV status. However, disclosure has many positive outcomes, including reduced internalized stigma and stress, strengthened relationships, empowerment, and improved access to treatment and support.

This study aimed to examine the dynamics between stigma, discrimination, and status disclosure using data from the Georgian PLHIV Stigma Index 2.0 study.

**Methods:** Utilizing data from the PLHIV Stigma Index 2.0 conducted by a PLHIV community-based organization in Georgia in 2022-2024, participants were recruited from HIV-specific healthcare centers and NGOs using venue-based and limited chain referral sampling methods. Data collection employed a comprehensive questionnaire covering demographics, stigma experiences, healthcare interactions, human rights, and non-HIV-related discrimination. Ethical approval was obtained, ensuring confidentiality and respecting participants' rights.

**Results:** Overall, 765 PLHIV completed the survey. The mean age of the respondents was 40.6 (SD=10.8) years and 67.3% were men, of those currently in being in sexual relationship (61.9%) almost half (46.2%) new about their partners' HIV positive status.

We found high levels of non-disclosure in our sample: 91.4% found it difficult to disclose their status and 86.9% reported hiding it from others. Nearly 40% of respondents reported not sharing their status with their sexual partner. In the bivariate model, factors such as age, partner's HIV status, previous disclosure experiences, enacted and internalized stigma, self-discriminatory actions, and access to treatment were significantly associated with non-disclosure.

Logistic regression analysis further highlighted older individuals (OR: 3.35; 95% CI: 1.27-8.83) and those perceiving disclosure positively (OR: 14.87; 95% CI: 6.27-35.19) as more likely to disclose their HIV status to sexual partners.

**Conclusions:** Study finds significant challenges surrounding HIV status among PLHIV in Georgia, where high levels of non-disclosure prevail. Key findings highlight the significant impact of age, partner's HIV status, previous disclosure experiences, enacted and internalized stigma, self-discriminatory actions, and access to treatment on the decision to disclose HIV status to sexual partners. These insights underscore the urgent need for tailored interventions to address stigma, improve disclosure experiences, and promote open communication within intimate relationships, ultimately enhancing the well-being of PLHIV in Georgia.

## LB26

### Preliminary results of a stigma reduction intervention clinical trial among urban and rural Tanzanian women with HIV

M.V. Relf<sup>1</sup>, M. Kilonzo<sup>2</sup>, D. Kisamo<sup>2</sup>, R. Mtei<sup>3</sup>, W. Pan<sup>1</sup>, L. Nyblade<sup>3</sup>

<sup>1</sup>Duke University, School of Nursing, Durham, United States, <sup>2</sup>Muhimbili University of Health and Allied Sciences, Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>RTI International, Washington, United States

**Background:** In Tanzania, HIV is a leading cause of death and an estimated 810,000 women are living with HIV (WLWH). Stigma is a barrier to testing, prevention, treatment, and well-being for WLWH, yet few evidence-based interventions exist to address it. This study tested preliminary efficacy of a theoretically-based, culturally relevant, linguistically sensitive, sex-specific stigma-reduction intervention, *Labda Siku Moja* (Maybe Someday) through a pilot randomized clinical trial.

**Methods:** The stigma-reduction intervention consisted of five video stories comprised of personalized stigma coping messages acted by and relevant to Tanzanian WLWH, and guided by the Theory of Narrative Transportation. WLWH watched the videos in groups of 8 to 10 organized by age groups. Motivational Interviewing was used as the mechanism of debriefing each of the five stories. To test preliminary efficacy and determine effect sizes of this intervention, a 2 (treatments) x 4 (time points [baseline, 30, 90, 180 days]) repeated-measures RCT was used. Participants were recruited from one urban and one rural health center.

**Results:** Of the 192 WLWH screened for study participation, 167 met enrollment criteria; 87 were randomized to the intervention and 80 to the control, stratified by age (18-24/25+). Retention was high; 154 (92%) completed the 30-day and 155 (93%) completed the 90-day follow-up surveys. From baseline through 90-days, participants in the intervention arm significantly reduced scores more than the control arm for overall stigma ( $p<.0001$ ) and sub-scales: perceived ( $p=.0006$ ), anticipated ( $p<.0001$ ), health sector ( $p=.0328$ ), experienced ( $p=.0024$ ), internalized

( $p<.0001$ ), and disclosure related stigma ( $p<.0001$ ). There was a significant increase on coping self-efficacy ( $p=.006$ ), self-esteem ( $p=.0015$ ), resilience ( $p=.0086$ ), and disclosure of HIV status ( $p=.0012$ ) among women in the intervention arm more than the control arm over the same follow-up period.

**Conclusions:** These findings suggest that it is possible to mitigate the negative effects of stigma among WLWH. Further analysis is planned to evaluate the durability of the intervention through 180 days. Further research is necessary to determine how to scale the intervention for widespread dissemination.

Similarly, as stigma experiences differ among men and women, additional research is also needed to develop and test a stigma reduction intervention for men living with HIV.

## LB27

### The HIV fashion extravaganza: reducing stigma and increasing PrEP uptake among Pakistani gender diverse population through fashion advocacy

S. ----<sup>1</sup>

<sup>1</sup>University of Iceland, Reykjavik, Iceland

**Background:** Stigma on enjoying various forms of sexual experiences, kinks and fantasies among gender diverse population of Pakistan is highly stigmatized. The fear of getting HIV is restraining them from enjoying pleasurable sexual experiences. It was noticed that there are no such mediums to increase awareness of using Prep and supporting them in accessing the medication in the country. Realizing that LGBTQIA+ community has a higher level of interests with shopping, dressing and fashion. This project developed a small scale pilot clothing services which talks about Prep and uses the collection of the money to arrange medication for them in two cities of Pakistan.

**Description:** The individuals are accessed and connected through snowball connections and have been ordering shirts, stoles and basic coats. The dress packaging has a prep information leaflet in the parcel and a safer platform to connect for information, services and medication related support. The brand also provides kink affirming information so the individuals can also receive any specific products safely and enjoy better pleasurable sex experiences with their partners. Some of the clothes also have designs and patterns which exhibit HIV and Prep related information or small mottos which they can safely wear in private and personal events. Currently 11 young people from gender diverse and key populations are part of the pilot and they are sexually active living with their partners covertly or meeting multiple partners in their cities.

**Lessons learned:** 9 out of 11 of these had never used Prep or had no kink affirming or sexual pleasure related information which enhanced and the project supported them to

initiate Prep. They also believed that there are no safety or prevention options to HIV apart from a condom. Remaining 2 were somehow aware and could also afford Prep and the project provided them safe support for re-filling prescriptions and getting medications.

**Conclusions/Next steps:** Gender diverse populations are sexually active and are at moderate risk of contracting HIV due to lack of awareness about Prep. Innovative means like fashion and clothing brands can be a new generation tool to bring awareness for Young people in countries like Pakistan.

## LB28

### Identifying prospective HIV cure adopters in the Netherlands: a latent class analysis of the perceived importance of optimal HIV cure attributes

M.A.J. Noorman<sup>1</sup>, J.B.F. de Wit<sup>2</sup>, T.A. Marcos<sup>3</sup>, S.E. Stutterheim<sup>4</sup>, T. Albers<sup>5</sup>, K.J. Jonas<sup>3</sup>, C. den Daas<sup>6</sup>

<sup>1</sup>Utrecht University, Department of Interdisciplinary Social Science, Utrecht, Netherlands, the, <sup>2</sup>Utrecht University, Department of Interdisciplinary Social Science, Utrecht, Netherlands, the, <sup>3</sup>Maastricht University, Department of Work and Social Psychology, Maastricht, Netherlands, the, <sup>4</sup>Maastricht University, Department of Health Promotion and Care and Public Health Research Institute, Maastricht, Netherlands, the, <sup>5</sup>Hiv Vereniging, Amsterdam, Netherlands, the, <sup>6</sup>University of Aberdeen, Health Psychology Group Institute of Applied Health Sciences, Aberdeen, United Kingdom

**Background:** In the pursuit of HIV eradication or ART-free durable control, it is imperative to consider the perspectives of people with HIV (PWH), the prospective adopters. The study aimed to identify subgroups of PWH based on their perceived importance of potential optimal HIV cure attributes. It also assessed how these subgroups differ regarding acceptance of potential cure strategies that may come available for clinical assessment departing from ideal standards.

**Methods:** Between July 2023 and March 2024, a cross-sectional survey was conducted among 420 PWH in the Netherlands. Participants rated the importance of eight optimal attributes and acceptance of fifteen minimal attributes. Latent class analysis categorized prospective adopters based on their ratings of optimal HIV cure attributes (important-neutral-unimportant). Analyses of variance examined differences in acceptance of minimal HIV cure attributes between adopter classes.

**Results:** Most participants found optimal HIV cure attributes like "No HIV transmission risk" (76.4%), "full immune system recovery" (66.4%), "full protection from HIV reinfection" (63.8%) important optimal HIV cure attributes important. Approximately half considered "no more need for ART" (54.8%), "no serious side effects" (51.0%), and "HIV

AIDS 2024

eradication from the body" (49.3%) important. Fewer rated "one-time procedure" (42.9%), and "short regimen duration" (29.8%) as important. Four latent classes were identified: *idealists* (30.71%), who found all attributes important, *indifferentists* (28.81%), who rated all attributes neutral, *pragmatics* (6.7%), who found most attributes not important, and *outcome-prioritizers* (35.24%), who found most attributes important except for cure regimen-related factors. The only minimal HIV cure attributes considered unacceptable were "severe side effects", "potential relapse of ART-free durable control", and "risk of reinfection". Pragmatics were generally most accepting of minimal HIV cure attributes, followed by outcome-prioritizers, idealists, and indifferentists.

**Conclusions:** Distinct subgroups of prospective adopters of HIV cure were identified, with pragmatics and outcome-prioritizers likely to become earlier adopters compared to idealists and indifferentists. Findings also suggested that ART-free durable control may be acceptable, as HIV removal was not considered most important, and many minimal HIV cure attributes were acceptable. These insights can shape and tailor communication strategies to further increase acceptance of clinical assessments deviating from ideal standards.

## LB29

### Africa and Appalachia: shared challenges, shared solutions

A.T. Young<sup>1</sup>, K. Keith<sup>1</sup>

<sup>1</sup>Community Education Group, Lost River, United States

**Background:** This project aimed to address the high HIV/AIDS burden in Africa and Appalachia—regions with significant healthcare access barriers, including stigma, geographic isolation, and limited resources. The objective was to enhance HIV prevention and treatment through robust community engagement and innovative approaches.

**Description:** The initiative operated across diverse locales in Africa and Appalachia. In Africa, where an estimated 25.7 million people live with HIV, the project implemented telemedicine solutions leveraging the widespread use of mobile phones to facilitate remote healthcare consultations, medication adherence reminders, and health education, particularly in rural and underserved areas. With 26.3 million residents across 423 counties, Appalachia utilized community health workers (CHWs) to educate and connect individuals to HIV services. CHWs, often with personal experiences related to HIV/AIDS or substance misuse, were instrumental in building trust within communities, thereby enhancing healthcare access and reducing new infections.

**Lessons learned:** The project demonstrated significant outcomes, with telemedicine in Africa enhancing treatment adherence by approximately 30% and improving

patient follow-up care by 40%. In Appalachia, the involvement of CHWs led to a 25% increase in HIV testing rates and a 20% increase in linkage to care within the first year of intervention. These interventions highlighted the critical role of trust and community involvement in the success of health programs.

**Conclusions/Next steps:** The effectiveness of integrating technology and personal outreach in HIV/AIDS interventions underscores the need for continued innovation and community involvement in health strategies. Future efforts should focus on expanding successful models, increasing community-led initiatives, and fostering global partnerships to address common challenges.

The project's success advocates for sustained investment in traditional and innovative methods, aiming to enhance the global HIV response by adapting strategies based on regional cultural and structural dynamics.

## LB30

### Structural interventions and biomedical HIV prevention in the context of widow cleansing and wife inheritance in western Kenya: a mathematical modeling study

D.K. Gathungu<sup>1,2</sup>, V.N. Ojiambo<sup>1</sup>, M.E. Kimathi<sup>2</sup>, D. Kaftan<sup>3</sup>, H.-Y. Kim<sup>3</sup>, D.T. Citron<sup>3</sup>, I. Platais<sup>3</sup>, D. Bridenbecker<sup>4</sup>, C. Kirkman IV<sup>4</sup>, S.M. Mwalili<sup>1,2</sup>, A. Bershteyn<sup>3</sup>

<sup>1</sup>Jomo Kenyatta University of Agriculture and Technology, Nairobi, Kenya, <sup>2</sup>Strathmore University, Nairobi, Kenya,

<sup>3</sup>New York University Grossman School of Medicine, Department of Population Health, New York, United States,

<sup>4</sup>Institute for Disease Modeling at the Bill & Melinda Gates Foundation, Seattle, United States

**Background:** In parts of Africa, women who become widowed lose housing, bank accounts, and other property and must re-marry to avoid extreme poverty. To re-marry, some women are required to undergo widow „cleansing“ – condomless sex with a man who removes „impurities“ ascribed to her from her husband's death – and are „inherited“ as a wife of a brother-in-law.

This study explores how HIV biomedical and structural interventions could reduce HIV-related harms associated with these practices.

**Methods:** We adapted an HIV agent-based network transmission model (EMOD-HIV) previously calibrated and validated for the Nyanza region of western Kenya. Building on the model's pre-existing configuration of marriages, mortality, and widowhood, we added widow cleansing and wife inheritance with assumptions based on literature and the authors' contextual expertise. Modeled HIV prevalence among inherited widows was validated to match observed data. We modeled the effect of widowed women, cleansers, and inheritors receiving biomedical HIV interventions (testing, treatment for those tested positive, and one year of pre-exposure prophylaxis (PrEP)

initiated at cleansing for those tested negative) with or without structural interventions (female empowerment). We modeled low (30%) and high (70%) intervention uptake and reported HIV outcomes including cumulative infections over 2025–2050.

**Results:** Modeled HIV prevalence among inherited widowed women was 61.1% (95% CI: 60.6–61.5%), comparable to observed prevalence of 64.1% (95% CI: 63.2–65.4%). Among all widowed women, biomedical interventions averted 3.2% (95% CI: 1.1%–5.3%) of HIV infections with low uptake and 5.9% (95% CI: 3.8%–7.9%) with high uptake. Combined biomedical and structural interventions averted 12.9% (95% CI: 11.1%–14.6%) of HIV infections with low uptake and 26.4% (95% CI: 24.8%–27.9%) with high uptake. Impacts were smaller for men, e.g., high-uptake structural and biomedical interventions averted 2.5% (95% CI: 0.8%–4.1%) of infections among cleansers and 3.5% (95% CI: 2.4%–4.5%) among inheritors.

**Conclusions:** Widowed women are a vulnerable population with extremely high HIV prevalence. Combined biomedical and structural interventions focused on the practice of widow cleansing and wife inheritance have the potential to avert up to one-quarter of HIV infections among widowed women, and a smaller proportion among men participating in these practices.

### Drivers and barriers to PrEP uptake in the Western Balkans: findings from a behavioural and cultural insights study in North Macedonia

P.L.G. Vinti<sup>1</sup>, A. Vasilevska<sup>2</sup>, N. Lunchenkov<sup>3,4</sup>,

J. Skou Jakobsen<sup>5</sup>, B. Curtis<sup>5</sup>, V. Grankov<sup>1</sup>,

B. Gunsenheimer-Bartmeyer<sup>3</sup>, K. Bach Habersaat<sup>5</sup>,

D. Schmidt<sup>3</sup>, E. Ognenovska<sup>2</sup>, M. Scherzer<sup>5</sup>

<sup>1</sup>WHO Regional Office for Europe, Joint Infectious Diseases Unit, Copenhagen, Denmark, <sup>2</sup>TIM Institut, Skopje, North Macedonia, <sup>3</sup>Robert Koch Institute,

Department for Infectious Disease Epidemiology, Berlin, Germany, <sup>4</sup>Technical University of Munich,

School of Social Science and Technology, Munich, Germany, <sup>5</sup>WHO Regional Office For Europe,

Behavioural and Cultural Insights Unit, Copenhagen, Denmark

**Background:** North Macedonia in 2021 was the first Western Balkans country to pilot PrEP. Currently, one clinic in Skopje delivers PrEP, but uptake has been slow. A behavioural and cultural insights study was implemented by World Health Organization Regional Office for Europe (WHO/Europe) and local stakeholders to explore the views of representatives of key populations (KPs) and healthcare workers (HCWs), within a WHO/Europe Tailoring Health Programmes project, aimed at investigating drivers/barriers to PrEP uptake and developing tailored interventions to increase PrEP coverage.

**Methods:** 41 in-depth interviews with KPs representatives who had ever/never used PrEP (purposive sampling), and 4 focus group discussions with HCWs involved in PrEP delivery or referral (voluntary response sampling), were conducted between December 2023 and February 2024 in all regions of North Macedonia. Recordings were analysed through content analysis, with results entered into rapid analysis process sheets using the COM-B framework (Capability, Opportunity, Motivation-Behaviour).

**Results:** Participants' demographics.

	Key populations representatives (n=41) n (%)	HCWs involved in PrEP delivery (n=7) n (%)	HCWs involved in PrEP referral (n=20) n (%)
Gender identity			
Cisgender men	28 (68.3%)	2 (28.6%)	7 (35.0%)
Cisgender women	5 (12.2%)	5 (71.4%)	13 (65.0%)
Transgender men	2 (4.9%)	-	-
Transgender women	6 (14.6%)	-	-
Key population			
Gay, bisexual and other men who have sex with men	27 (65.9%)	1 (14.3%)	-
Persons who inject drugs	2 (4.9%)	-	-
Sex workers	11 (26.8%)	-	-
PrEP use			
Ever used PrEP	12 (29.3%)	1 (14.3%)	-
Ethnicity			
Macedonian	30 (73.2%)	7 (100%)	19 (95.0%)

Among KPs, detailed knowledge of PrEP (including dosing schedules, side effects, contraindications) was a much stronger driver for uptake than awareness of PrEP as an HIV prevention method alone. Knowing someone who had used and recommended PrEP was another strong driver. Anonymous HIV testing, low costs, competent and sensitive staff at the clinic encouraged PrEP uptake. Centralization of PrEP delivery and lack of anonymous access to PrEP services were identified as critical barriers. Among HCWs, lack of information about PrEP was the main barrier for referring clients for PrEP. Insufficient knowledge, myths and stigma around PrEP, and stigma towards KPs in healthcare settings were identified as important barriers both among KPs and HCWs.

Barriers and drivers identified were relevant across gender, key population, age, ethnicity, region.

**Conclusions:** These findings provide important insights for co-designing with local stakeholders effective interventions to increase PrEP uptake in North Macedonia, and other Western Balkan countries with comparable backgrounds.

Understand how health, well-being, social support, violence, and stigma shape resilience pathways among Kenyan youth aged 15-24 living with HIV in urban informal settlements through structural equation modeling

Y. Wang<sup>1</sup>, H. Owoko<sup>2</sup>, C. Kabiru<sup>2</sup>, P. Gorbach<sup>3</sup>, S. Muyingo<sup>2</sup>

<sup>1</sup>University of California, Los Angeles, Dentistry, Los Angeles, United States, <sup>2</sup>APHRC - African Population and Health Research Center, Nairobi, Kenya, <sup>3</sup>University of California, Los Angeles, Public Health, Los Angeles, United States

**Background:** Resilience among young people living with HIV is shaped by their behavior and self-perceived HIV management skills. The COVID-19 pandemic disrupted the livelihoods particularly in urban informal settlements in Kenya further marginalizing already vulnerable residents. Yet, little is known about contextual factors associated with resilience among this population.

**Methods:** We conducted across-sectional survey between February and April 2024 recruiting participants aged 15 to 24 from three HIV clinics located in two informal settlements: Korogocho and Viwandani. Resilience was measured by 25-item standard scale, with two factors described as personal competence and acceptance of self and life. General health status is measured by GHQ-28 with four subscales, somatic symptoms, anxiety and insomnia, social dysfunction and severe depression. Linear regression analysis is used to model the association between resilience and HIV self-management (measured by Perceived HIV self-management Scale) and adherence to treatment (measured by HIV Adherence Self-Efficacy Scale).

Further, we evaluated the complex pathway of the relationship between resilience and general health status, social support, adverse childhood experiences, HIV stigma using structural equation modeling (SEM).

**Results:** Of 300 eligible participants, the majority were from Korogocho (62%) and were female (80%), lived in semi-permanent housing (60%), and living with HIV for more than 10 years (35%). About two thirds, or 57%, had secondary as their highest education level. Resilience explained 14% (13%) of the variance of perceived HIV self-management (adherence) in the linear regression model.

After adjusting for age, sex, language, education, years since HIV diagnosis, general health, and distance to clinic, resilience was significantly associated with perceived HIV self-management ( $p < 0.001$ ) and adherence to treatment ( $p < 0.001$ ).

Pathway analysis showed a direct effect of better general health on the higher level of resilience ( $p = 0.006$ ), with Bentler's Comparative Fit Index 0.93. The most notable path relationship suggested was between the social dysfunction of general health and resilience ( $p < 0.001$ ).

**Conclusions:** In this cross-sectional study, youth aged 15-24 living with HIV experienced high levels of distress, significantly associated with resilience levels. Adverse childhood experiences and social dysfunction that focus on self-esteem were significantly related to resilience levels and may provide avenues for intervention strategies among this population.

## LB33

Effectiveness of Needle and Syringe Program on HIV prevention and PrEP uptake among people who use drugs: outcome of National Pilot program in Nigeria

A. Adebiyi<sup>1</sup>, O. Amiola<sup>2</sup>, H. Okiwu<sup>2</sup>, J. Salaudeen<sup>3</sup>

<sup>1</sup>Liverpool School of Tropical Medicine, International Public Health, Liverpool, United Kingdom, <sup>2</sup>YouthRISE Nigeria, Abuja, Nigeria, <sup>3</sup>Federal Ministry of Health Nigeria, Hospital Services, Abuja, Nigeria

**Background:** Needle and Syringe Programme (NSPs) is a key recommendation by WHO for HIV prevention among People Who Inject Drugs (PWID). Despite the growing data on injecting practices across Sub-Saharan Africa, there has been a great reluctance by Government entities to approve NSP within their national program. In 2019, the Government of Nigeria established the national harm reduction programme and commissioned a needle and syringe program pilot in four different states including the Federal Capital territory (FCT).

The key objective of the pilot study was to assess the acceptability of implementing NSP in Nigeria and evaluate the optimization of HIV service delivery and uptake among PWID. The result presented in this study is the recent validated outcome of the FCT pilot.

**Methods:** The NSP pilot was implemented over a period of 10 months and was independently evaluated using mixed methods. The pilot utilized a cohort approach with three hundred (300: 73% males; 27% females) PWIDs enrolled in two phases. Each cohort was exposed to an 8-week peer education program on HIV and received a package of defined services (HIV testing Services (HTS),

**Results:** Evaluation showed that NSP program implementation is feasible in the FCT with opportunities of scaling up services to other locations. More so, provision of clean needles and syringes was highly accepted among PWIDs with expressed desire that it should be sustained. At baseline more than three quarter of the cohort reported sharing needles and syringes, an experience higher among the females. At evaluation, the percentage of needle sharing reduced by almost 45% with only 20% reduction among the females.

Also, only 35% knew their HIV status (49.3% females vs 30.9% males) at baseline but this increased to 79.3% (75.7% females vs 85.8% males) at the end. 33 PWIDs tested positive to HIV, 11 persons for HBV while no positive case for

HCV at baseline. At the project evaluation, no new cases of HBV and HCV was recorded but 8 new cases of HIV who are all females. Prep usage increased from 0% to 30.7% at evaluation.

**Conclusions:** The leadership of the Government is critical to the implementation of comprehensive harm reduction program

## LB34

### Using longitudinal genetic-network to understand the Risk of Secondary HIV-1 Transmission among HIV/AIDS Individuals Receiving ART: A Longitudinal Observational Study in Guangxi, China

J. He<sup>1,2</sup>, S. Zhong<sup>1,2</sup>, C. Qin<sup>1,2</sup>, A. Nong<sup>3</sup>, Z. Lin<sup>4</sup>, H. Liang<sup>1,2</sup>, F. Zhang<sup>1,2</sup>, J. Jian<sup>1,2</sup>, P. Pan<sup>2,1</sup>, W. Wei<sup>1,2</sup>, J. Liu<sup>1,2</sup>, D. Liu<sup>4</sup>, L. Ye<sup>1,2</sup>, H. Liang<sup>1,2</sup>, B. Liang<sup>1,2</sup>

<sup>1</sup>Guangxi Medical University, Guangxi Key Laboratory of AIDS Prevention and Treatment, School of Public Health, Nanning, Guangxi, China, <sup>2</sup>Guangxi Medical University, Guangxi Engineering Center for Organoids and Organ-on-chips of Highly Pathogenic Microbial Infections & Biosafety III laboratory, Life Science Institute, Nanning, Guangxi, China, <sup>3</sup>Chongzuo Center for Disease Control and Prevention, Chongzuo, Guangxi, China, <sup>4</sup>Qinzhou Center for Disease Control and Prevention, Qinzhou, Guangxi, China

**Background:** The „Treat-all“ policy is crucial for controlling secondary HIV-1 transmission (SHT). However, data on the prevalence of SHT and its correlates among antiretroviral therapy(ART) patients is limited.

This study aims to assess the prevalence of SHT and its correlates among ART patients in Guangxi, China.

**Methods:** A longitudinal genetic network study was conducted from January 1, 2000 to December 31, 2021 in Guangxi. Patients diagnosed from 2000 to 2017 were classified as baseline patients, and newly diagnosed HIV cases from 2018 to 2021 were defined as follow-up patients.

Patients who genetic linked to the patients diagnosed in baseline or preceding year of the follow-up were identified as secondary HIV-1 transmission. The Generalized Estimating Equations (GEE) model was used to identified the correlates of SHT.

**Results:** Of 3,177 identified HIV patient with sequences, 2,245 patients were at baseline, and 932 were newly diagnosed patients with HIV at follow-up. A total of 10,331 baseline objectives were observed by repeated measurement analysis. The prevalence of SHT was 10.8% (1,117/10,331). In the GEE model, patients who self-reported condomless sex in the past three months have a secondary transmission risk of 41%.

Participants with diagnosed age of 30-49 and aged 50 or older had 52% and 87% increased risk of SHT, respectively. This age trend was non-linearly related to the risk of SHT with a cut-off value of 43.13 years.

Furthermore, individuals whose steady sexual partners or spouse are seropositive for HIV also increased 32% of SHT. Conversely, those patients with high education were found to be reduced SHT risk. Some factors were associated with SHT, including men, minority HIV-1 subtypes (CRF07\_BC, CRF08\_BC, others), higher CD4-T cell count ( $\geq 350$  cells/ul, CD4).

**Conclusions:** The study indicated a moderate SHT among ART patients in Guangxi. This study is the first to identify that older ART patients with condomless sex presented a heightened risk of secondary HIV transmission, indicating the necessity to enhance the practice of safe sex among the patients received ART. Urgent enhancements to the efficacy of ART for patients, coupled with targeted interventions for high-risk individuals, are essential as the scale of ART implementation expands

## LB35

### Acceptability and feasibility of social norms intervention for integrated adolescent HIV-violence prevention in South Africa

H. Adrian<sup>1</sup>, C. Kuo<sup>1,2</sup>, A. Rasmeni<sup>3</sup>, N. Gana<sup>3</sup>, L. Orchowski<sup>4</sup>, A. Berkowitz<sup>5</sup>, A. Harrison<sup>6</sup>, Y. Sikweyiya<sup>7,8</sup>, C. Mathews<sup>1</sup>  
<sup>1</sup>American University, Department of Health Studies, Washington, United States, <sup>2</sup>South African Medical Research Council, The University of Cape Town, Cape Town, South Africa, <sup>3</sup>South African Medical Research Council, Health Systems Research Unit, Cape Town, South Africa, <sup>4</sup>Rhode Island Hospital, Alpert Medical School of Brown University, Providence, United States, <sup>5</sup>Independent Researcher and Practitioner, Mount Shasta, United States, <sup>6</sup>Brown University, School of Public Health, Providence, United States, <sup>7</sup>South African Medical Research Council, Gender and Health Research Unit, Cape Town, South Africa, <sup>8</sup>University of the Witwatersrand School of Public Health, Faculty of Health Sciences, Johannesburg, South Africa

**Background:** *Schools Championing Safe South Africa* is an intervention targeting prevention of sexual violence perpetration and HIV risk behavior among teenage boys. The intervention is developmentally tailored, leveraging the power of school environments in prevention. It works by combining correction of misperceived norms via school poster campaigns with behavioral training delivered via two interactive health behavior lessons. We report on the acceptability and feasibility of the intervention.

**Methods:** A pilot randomized controlled trial (RCT) of N=282 teenage boys between 15-17 years old was completed between 2020-2023 at two high schools in South Africa. To evaluate acceptability, surveys on satisfaction with the content, format, and delivery of the intervention were administered to participants and teachers at the intervention school. To evaluate feasibility, we examined recruitment and retention data and intervention attendance.

**Results:** Boys reported completing acts of unwanted sexual petting, oral, vaginal, and anal sex (55%, 32%, 38%, 24%, respectively). Risk for HIV infection was also high; 82% of participants reported ever having vaginal sex and 34% reported ever having anal sex. Of those who reported having sexual intercourse, 66% reported using a male or female condom during sexual intercourse (anal and/or vaginal). There was high satisfaction with the intervention. Of the 142 adolescent boys who received the intervention, 99% responded to the evaluation survey. 84.3% reported the quality of the program as "good" or "excellent". 93.5% reported that the content in the intervention met "most" or "almost all" of their needs. 88.6% reported they would come back to the program or want to see the program run again. Teachers also found the program to be highly acceptable. 92.5% reported they would come want to see the program run again. There was excellent feasibility with 99% retention at the 6-month follow up timepoint. Among the intervention group, 79% and 75% reported receiving the first and second sessions of the intervention, respectively.

**Conclusions:** Promising results on acceptability and feasibility indicate a need to further test the efficacy of this developmentally tailored intervention concurrently targeting prevention of HIV and sexual violence among teenage boys by means of a novel norms correction and behavioral skills training.

## LB36

HIV risk and role of biomedical, bio-behavioral, and structural interventions for adolescents and young adults participating in traditional funeral practices in western Kenya: a mathematical modeling study

S.M. Mwalili<sup>1</sup>, D.K. Gathungu<sup>2,3</sup>, J. Chemutai<sup>1</sup>, E. Musyoka<sup>1</sup>, D. Bridenbecker<sup>3</sup>, C. Kirkman IV<sup>3</sup>, D. Kaftan<sup>4</sup>, H.-Y. Kim<sup>4</sup>, I. Platais<sup>4</sup>, A. Bershteyn<sup>4</sup>

<sup>1</sup>Strathmore University, Nairobi, Kenya, <sup>2</sup>Jomo Kenyatta University of Agriculture and Technology, Nairobi, Kenya, <sup>3</sup>Institute for Disease Modeling at the Bill & Melinda Gates Foundation, Seattle, United States, <sup>4</sup>New York University Grossman School of Medicine, Department of Population Health, New York, United States

**Background:** A *disco matanga*, or "disco funeral," is a celebration of a decedent's life that is culturally important in parts Africa, often involving overnight travel and alcohol consumption. These are known risk factors for HIV, which is prevalent in many areas where *disco matanga* is practiced. However, the contribution of *disco matanga* to HIV transmission is not well-understood.

We used agent-based network modeling to estimate how *disco matanga* impacted HIV transmission, and to explore relevant biomedical, biobehavioral, and structural interventions.

**Methods:** We adapted EMOD-HIV, a previously validated network-based model of HIV in the Nyanza region of Kenya, to incorporate *disco matanga* assumptions informed by literature review. Occurrence of *disco matanga* was modeled to occur following any death in the population. We compared past HIV incidence (1980–2024) with and without incorporating *disco matanga*, and future HIV incidence (2025–2050) with different interventions for *disco matanga* attendees:

1. Biomedical (HIV prophylaxis),
2. Bio-behavioral (reduction in condomless sex partners),
3. Structural (female empowerment to avoid unwanted sex).

We estimated HIV infections and deaths averted in the overall population, with sensitivity analysis around intervention uptake.

**Results:** Over 1980–2024, *disco matanga* contributed 7.8% (95% CI: 5.5%–9.3%) of all HIV infections, an effect that peaked at 9.9% (95% CI: 6.4%–12.0%) in the year 2004, coinciding with a peak in all-cause mortality due to HIV/AIDS. Biomedical prevention at *disco matanga* could avert up to 9.7% (95% CI: 8.9%–10.5%) of adult HIV infections and 2.3% (95% CI: 1.9%–2.6%) of deaths; bio-behavioral 2.9% (95% CI: 2.1%–3.6%) of infections and 0.9% (95% CI: 0.6%–1.2%) of deaths; and structural 1.2% (95% CI: 0.5%–1.8%) of infections and 0.5% (95% CI: 0.2%–0.7%) of deaths. Results were highly sensitive to intervention uptake.

**Conclusions:** We conducted the first modeling study, to our knowledge, simulating the interactions between *disco matanga*, HIV/AIDS, and intervention options. We found that biomedical, biobehavioral, or structural interventions aimed at *disco matanga* could substantially reduce HIV transmission and mortality in the Nyanza region. Research is needed to understand the feasibility and acceptability of HIV interventions tailored to local cultural practices.

## PLWHA Ukrainian war refugees in Slovakia: a retrospective, observational study

Pasteur University Hospital, Košice, Slovakia, <sup>6</sup>F.D. Roosevelt University Hospital, Banská Bystrica, Slovakia, <sup>7</sup>Clinic of Infectology University Hospital, Nitra, Slovakia, <sup>8</sup>Clinic of Infectology and Travel Medicine in JFMED CU and Martin University Hospital, Martin, Slovakia, <sup>9</sup>Národní referenční laboratoř pro HIV/AIDS - SZÚ, Prague, Czechia, <sup>10</sup>Department of Infectious Diseases, Faculty Hospital Bulovka, Prague, Czechia

**Background:** In order to a better understand the medical needs from Ukrainian war refugees living with HIV/AIDS. We decided to describe virological status, coinfections and treatment of the Ukrainian PLWHA war refugees in Slovakia.

**Methods:** Between 1 march, 2022 and 31 march, 2023 we conducted multicenter, retrospective, observational study in Slovakia. Data were collected from all Ukrainian with refugee status who were living with HIV or were newly diagnosed and presented to any of the five HIV/AIDS centers in Slovakia. The information was obtained through medical interviews, physical examinations, and laboratory tests.

Additionally, a medical report containing the medical history of each patient was requested from the Ukrainian Ministry of Health.

**Results:** 141 refugees from Ukraine presenting at our outpatient clinic were included. Most were women (56.74%, n=80/141). Median age was 41 years (range 16-60). The median CD4+ cell count was 680 cells/mL (range 20-1670 cells/mL), and 69.29 % (n = 97/141) had viral load (HIV RNA) < 40 copies/ml (Graf n. 1). At the time of arrival in Slovakia, 87.86% (N= 123/140) was receiving ART and 90.24% (N: 111/123) were on dolutegravir (DTG)-based regimens. Coinfections with hepatitis C virus 31.06% (n = 41/132), hepatitis B virus 12.50% (N: 17/136) and active pulmonary tuberculosis 1.74% (N: 2/115) were reported. Three newly diagnosed participants died from acquired immune deficiency syndrome complications.

Figure. Graf n.2 Frequency and percentage of viral suppression status in war refugees Ukrainian PLWHA.

**Conclusions:** The description of the epidemiological, demographic, immunological, coinfection and treatment characteristics of Ukrainian PLWHA displaced by the war has allowed Slovak HIV specialists to understand better their medical needs and to provide the best possible medicale care. Patient databases accessible online can help coordination between and within countries; however, adequate data protection remains a challenge. As the war appears unlikely to end in the near future, it is necessary to be prepared to receive more refugees in the coming months.

### A blended learning implementation package to increase HIV index case testing outcomes in Malawi: a cluster randomized controlled trial

J. Wang<sup>1</sup>, K.R Mollan<sup>2,3</sup>, T.A. Tembo<sup>4</sup>, K.R. Simon<sup>4,5</sup>, S.E. Rutstein<sup>3</sup>, M.J. Chitani<sup>6</sup>, V. Mwapasa<sup>6</sup>, V. Go<sup>1</sup>, M.H. Kim<sup>4,5</sup>, N.E. Rosenberg<sup>1</sup>

<sup>1</sup>University of North Carolina Chapel Hill, Health Behavior, Chapel Hill, United States, <sup>2</sup>University of North Carolina Chapel Hill, Epidemiology, Chapel Hill, United States, <sup>3</sup>University of North Carolina Chapel Hill, School of Medicine, Chapel Hill, United States, <sup>4</sup>Baylor College of Medicine, Children's Foundation, Lilongwe, Malawi, <sup>5</sup>Baylor College of Medicine, Department of Pediatrics, Houston, United States, <sup>6</sup>Kamuzu University of Health Services, Blantyre, Malawi

**Background:** Index Case Testing (ICT) is an evidence-based intervention to diagnose people living with HIV (PLHIV), yet faces implementation challenges to scale up in sub-Saharan Africa. The WHO endorses digital approaches to overcome implementation barriers in resource-limited settings. We developed and evaluated a blended learning implementation package that combines digital and face-to-face training modalities to enhance health care worker ICT skills.

**Methods:** We conducted a cluster randomized controlled trial from October 2022 to September 2023 at 33 health facilities (clusters) in South-eastern Malawi. Clusters were randomly assigned in a 2:1 ratio to receive standard ICT

Oral abstracts

Poster exhibition

Late-breaker abstracts

Author Index

implementation (Standard arm) versus the blended learning implementation package (Enhanced arm). Index clients were PLHIV who were newly or previously diagnosed with HIV. Contact clients were their sexual partners, biological children and other household members.

We fit a negative binomial mixed-effects model to estimate intervention impact on the HIV index case testing cascade. Primary outcomes data was abstracted quarterly from Malawi ministry of health HIV registers and calculated as facility-level rates accounting for facility size variation. All models accounted for longitudinal measures within cluster.

**Results:** Clusters were randomly assigned to the Enhanced (n=11) or Standard (n=22) arm. We observed trends in a positive direction for all indicators: index client participation in ICT (RR=1.25, CI: 0.93, 1.69), contacts elicited (RR=1.39, 95% CI: 1.07, 1.79), contact clients tested (RR=1.47, CI: 1.01, 2.14), and contact clients newly diagnosed with HIV (RR=1.20, CI: 0.82, 1.76). In the Enhanced arm, index clients also received more HIV self-test kits for secondary distribution (RR=2.32, 95% CI: 1.11, 4.85).

**Table 1.** Outcomes for HIV Index Case Testing cascade per total potential indexes (N=33 clusters, 4 quarterly time-points)

	Enhanced Median counts (25 <sup>th</sup> , 75 <sup>th</sup> percentile)	Standard Median counts (25 <sup>th</sup> , 75 <sup>th</sup> percentile)	Rate Ratio (95% Confidence Interval)
Total potential index clients	487 (386, 820)	550 (449, 859)	Not applicable
Index clients who participated in ICT	140 (114, 226)	132 (78, 212)	1.25 (0.93, 1.69)
Contact clients elicited	63 (42, 86)	42 (26, 64)	1.39 (1.07, 1.79)
Contact clients tested	39 (24, 59)	27 (17, 39)	1.47 (1.01, 2.14)
Contact clients newly diagnosed HIV+	2 (1, 3)	2 (1, 3)	1.20 (0.82, 1.76)
HIV self-test kits distributed	5 (3, 10)	1 (0, 7)	2.32 (1.11, 4.85)

**Conclusions:** Blended learning implementation package increased contact clients elicited, contact clients tested, and HIV self-test kits distribution compared to standard implementation and could be a useful tool for scaling up ICT programs.

## LB39

### Enhancing HIV self-testing (HIVST) coverage among diverse communities and future directions in Myanmar: insights from a pilot project (May 2022 - March 2024)

T.T. Win<sup>1</sup>, M.K. Kyaw<sup>1</sup>, Y.M. Thaung<sup>1</sup>, L. Htet<sup>1</sup>, T. Soe<sup>1</sup>, S.L. Tip<sup>2</sup>

<sup>1</sup>Community Partners International, Yangon, Myanmar,

<sup>2</sup>United States Agency for International Development (USAID), Yangon, Myanmar

**Background:** In Myanmar, HIV/AIDS remains a significant public health concern, exacerbated by limited testing coverage and accessibility barriers. Traditional testing methods face barriers such as stigma and limited health-care infrastructure, necessitating innovative approaches like HIVST. This study examines factors influencing access to HIV testing through self-testing initiatives and investigates three distinct channels for amplifying HIVST adoption across the nation.

**Description:** HIVST pilot project was introduced in three States/Regions in May 2022 to assess its feasibility and acceptability across diverse communities. A comprehensive program review was conducted, synthesizing data from HIVST pilot project and evaluations conducted by implementing partners. The analysis examined the uptake and acceptability of three different HIVST strategies. Factors influencing access to HIV testing were scrutinized to understand their impact on testing outcomes. Three channels were assessed: online Sate Cha platform linked with 16 private pharmacies, key-population led distribution involving five community-based organizations and four healthcare facilities.

**Lessons learned:** From May 2022 to Mar 2024, 3,850 individuals were tested, with 97% from key populations. 68% (n=2,613) underwent their first HIV test using HIVST kits, revealing its effectiveness in reaching new testers. The reactive rate was 6% (n=219) among 3,757 reported results. Factors influencing access to HIV tests, stigma and confidentiality concerns (24%, n=923), and accessibility (32%, n=1,237), were clarified. Distribution channels varied, with online reaching 12%, key-population-led 42%, and facility-based 46%. This shows the varied effectiveness of different distribution strategies and emphasizes the importance of a multifaceted approach. Partnerships among stakeholders, alongside digital technologies, were vital lesson learned for scaling up HIV self-testing initiatives effectively.

**Conclusions/Next steps:** The review highlights HIVST as a valuable tool for expanding testing coverage and reaching underserved populations in Myanmar through three different distribution channels. Addressing identified barriers and fostering collaboration among stakeholders are crucial next steps to scale up HIVST effectively and combat the HIV/AIDS epidemic.

## LB40

### Generic production of lenacapavir targeting under \$100 PPPY[1]: Analysis of the Active Pharmaceutical Ingredient

J. Fortunak<sup>1</sup>, J. Layne<sup>1</sup>, M. Johnson<sup>1</sup>, D. Roberts<sup>1</sup>, A. Hill<sup>2</sup>,

J. Levi<sup>3</sup>, C. Fairhead<sup>3</sup>, V. Pilkington<sup>4</sup>, J. Wang<sup>5</sup>

<sup>1</sup>Howard University, Chemistry, Washington DC,

<sup>2</sup>Liverpool University, Pharmacology and Therapeutics, Liverpool, United Kingdom,

<sup>3</sup>Charité University Hospital, Berlin, Institute of Tropical Medicine and International Health, Berlin, Germany,

<sup>4</sup>Kings College, HIV Research Team, London, United Kingdom,

<sup>5</sup>Oxford University, Clinical Academic Graduate School, Medical Sciences Office, Oxford, United Kingdom

**Background:** Cost-Plus (Cost+) pricing and voluntary licensing (VL) to generic companies has enabled 30M+ people to receive HIV treatment in low-resource settings. Licensors, licensees, and funders heroically collaborate so poor people do not die because of property rights (Patents). Twice-yearly lenacapavir as PrEP could substantially reduce the current rate of 1.3M new infections/year. Lenacapavir is presently far too expensive (\$25k-\$45k/pppy) for low-resource settings.

Lenacapavir is a complex small molecule with a Cost-of-Goods (COGs) heavily dependent on the Active Pharmaceutical Ingredient (API). But lenacapavir is a low-dose drug (approximately 2 grams/patient-year).

**Methods:** We questioned whether lenacapavir could realistically achieve \$100/pppy and subsequently \$35-\$40/pppy for maintenance PrEP, with: 1) Cost+ pricing; and 2) guaranteed purchases of 1M and 10M treatments/year. This represents approximately 2,000kg and 20,000kg of API demand. We targeted API pricing of \$25,000/kg and \$10,000/kg to enable these COGs. There is very limited data available for lenacapavir API pricing, and the originator's (Gilead Sciences) cost basis is very different from that for generic production.

We evaluated the API Routes of Synthesis (ROS) and Key Starting Materials (KSMs) in patents/publications. Quotes/discussions and rates for Overhead and Labor (OHL) were obtained from generic companies. Standard tools used by pharma companies were used to project API COGs.

**Results:** Our analysis and quotes for KSMs/APIs support that \$25,000/kg is achievable for lenacapavir API, with a committed demand of 2,000kg/A. An API COGs of \$10,000/kg requires substantial changes to the ROS. Bioequivalence trials and the R&D expense of a better synthesis are needed. Yet, \$10,000/kg seems reasonably achievable with R&D investment at suppliers and 20MT/A volume demand. At these API COGs, target pricing for the finished product (\$100 and \$35-\$40/pppy) can likely be met.

**Conclusions:** Lenacapavir API can achieve pricing of \$25,000/kg, potentially falling to \$10,000/kg or less with R&D investment and scaled demand.

This would result in eventual pricing for PrEP of \$35-\$40/pppy. Mass-production of generic lenacapavir, under VLs is required to achieve this. Gilead has not yet agreed to provide VLs for lenacapavir.

## LB41

### Reaching the unreached and hidden key population by leveraging on virtual platforms in Nairobi, Kenya - KP Program

A. Kariri<sup>1</sup>, J. Kimani<sup>2</sup>, L. Lumumba<sup>3</sup>, M. Mbuthia<sup>4</sup>, Y. Otieno<sup>3</sup>, L. Gelmon<sup>4</sup>

<sup>1</sup>Partners for Health and Development in Africa, Nairobi, Kenya, <sup>2</sup>Partner for Health & Development in Africa, Nairobi, Kenya, <sup>3</sup>Center for International Health, Education, and Biosecurity, Nairobi, Kenya, <sup>4</sup>University of Manitoba, Winnipeg, Canada

**Background:** Since COVID-19, we have seen increased key population (KP) activity on online platforms (social media fora, mobile applications, websites, geosocial networking, social networking applications). KP and hidden/hard-to-reach populations are increasingly reverting to virtual spaces to network and seek sexual partners. The SWOP program in Nairobi, Kenya serving over 40,000 KPs (SWs, MSM, TG) has applied novel approaches implementing virtual KP programming to harness online platforms, expand access to unreached individuals facing high risks, and additionally reaching existing program beneficiaries already using online and mobile platforms.

**Description:** From October 2022 to September 2023 the SWOP Program undertook activities aimed at increasing Virtual KP Engagement.

- Conducted Community Engagement (through KP Community sensitization) using peer educators and community champions;
- Developed a KP-friendly mobile application "Safe Clinic Network"
- Conducted staff sensitization and training of virtual peer educators on Virtual KP Programming.
- Conducted virtual spaces and social apps mapping used by different KP typologies; engaged peers online by sign posting health information and direct messaging while promoting download of the safe clinic app.
- Linked clients with services at the clinic.

**Lessons learned:** 5012 KPs were contacted and reached with HIV prevention messages on the virtual spaces: 28.5% SW's, 24.3% MSM and 47% Transgender. Of the 5012, 573 (11%) were enrolled into a facility and received clinical services.

Messaging Apps (WhatsApp) had the most online interactions (over 21%), Social networking (Facebook) accounted for over 16% of the total engagements. Social Networking and dating apps were popular among MSM, MSW and TG's, (Grinder- 13.5%, Romeo - 12.3%.

## Conclusions/Next steps:

- Hidden and hard-to-reach populations can be reached leveraging on virtual KP programming. Sensitization and capacity building in all stakeholders is critical for successful programming.
- Programs need to plan and dedicate resources for linkage of services from virtual space to service delivery facilities.
- Need to strengthen M&E for the strategy (realistic/simple data collection tool)
- Address security concerns
- by digital literacy; MSM reporting cases of blackmail and sexual predators targeting FSW's in the virtual spaces
- Align to data privacy laws and regulations for virtual programming and health applications
- Conduct Virtual spaces mapping and size estimates for effective Virtual programming

Differentiated service delivery: rapidly identification of eligible clients to be shifted in less intensive model through clinical mentorship in Rwanda

U. Marie Madeleine<sup>1</sup>, G. N.RWBASIRA<sup>1</sup>, S. TUYISHIME<sup>1</sup>, M. GASANA<sup>1</sup>, I. N.TUYISHIME<sup>1</sup>

<sup>1</sup>Rwanda Biomedical Center, HIV/AIDS&STIs, Viral Hepatitis and OVDC, Kigali, Rwanda

**Background:** Since 2016, Rwanda adopted the "Treat all" strategy following the World Health Organization recommendations, and all clients who test HIV-positive are linked to care and initiated Antiretroviral therapy on the same day where feasible. This strategy has led to an increase in the number of patients on ART. Rwanda has adapted its national HIV treatment guidelines to include differentiated service delivery.

This model was initiated among stable clients and they benefited from three or six multi-months drug dispensing (3MMD&6MMD) to reduce the burden of visits for People Living with HIV (PLHIV) and the workload for health care providers.

**Description:** Clinical mentors from all hospitals were invited for an orientation meeting, where guidance and required tools and materials were provided. Teams were established by coupling a medical doctor and nurse. Each team was appointed generally to reach at least 5 sites (health facilities) per week. Supervisors from RBC were also appointed to support and coordinate clinical mentor's activities. Clinical mentors had the responsibility to provide all necessary information to Health Care Providers and collect data from registers to identify PLHIV who were eligible to be shifted to less intensive Model in DSD. In total 561 health facilities have been visited and the total number of 195,220 PLHIV on the ART; 20,3%(39,708) are on

one-month pharmacy dispensing, 24,8%(48,536) on 3MMD and 54,3%(105,922) on 6MMD. In 39,708 on one month, 5,156(13%) were stable and eligible to be shifted in less intensive model.

**Lessons learned:** Shifted clinical mentorship was a good way to reach health care providers and identification of eligible clients for less intensive model to sustain DSD. Eligible clients have been shifted to the less intensive model(3MMD&6MMD) to decreased the number of required clinical visits for PLHIV and the workload of overloaded health care providers.

**Conclusions/Next steps:** Clinical mentor facilitated on-site refresher training of Health care providers and identification of PLHIV eligible to be shifted in less intensive model. This ensure uninterrupted access to antiretroviral therapy and limit the frequency of visits. Both PLHIV and healthcare providers are in appreciation of the model and commended its sustainability toward HIV epidemic control.

## LB43

Implementation and impact of the advanced HIV disease response strategy in Brazil: a comprehensive analysis

A. Freire da Silva<sup>1</sup>, M. Vieira Freire<sup>1</sup>, M.C. Gianna Garcia Ribeiro<sup>1</sup>, B. Brites Kamiensky<sup>1</sup>, I. Ornelas Pereira<sup>1</sup>, A.R. Pati Pascom<sup>1</sup>, A.C. Garcia Ferreira<sup>1</sup>, P.R. Abrão Ferreira<sup>1</sup>, L. Melo Nunes Lopes<sup>1</sup>, T.H. Souza Nascimento<sup>1</sup>, R. Campos Hallal<sup>1</sup>

<sup>1</sup>Ministry of Health of Brazil, Department of Hiv/Aids, Tuberculosis, Viral Hepatitis and Sexually Transmitted Infections, Brasília, Brazil

**Background:** The prevalence of advanced HIV disease (AHD) among people living with HIV (PLHIV) remains concerning, with 28% affected, and 66,000 PLHIV lost to follow-up in Brazil in 2023. To tackle this challenge, the Brazilian Ministry of Health introduced the Advanced HIV Disease Response Strategy, with the goal of improving care delivery in five states.

This study aims to describe the initial six months of implementation and present data on prevalence and compliance.

**Methods:** The Advanced HIV Disease Response Strategy was implemented in 22 Brazilian cities across five states to address HIV healthcare gaps and improve access to care. This analysis focuses on healthcare facility gaps, capacity-building initiatives, and its impact on HIV care access. Key actions included point-of-care CD4 tests, Urine Lipoarabinomannan Assay (LAM), Urinary Histoplasma Antigen test (HistoAg), Cryptococcal Antigen Assay (CrAg), care linkage, primary prophylaxis, opportunistic infection treatment, tuberculosis preventive treatment(TPT), and antiretroviral therapy(ART) within 7 days. Additionally, an online monitoring system was developed (click here).

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Results:** The AHD Response Strategy trained 5,653 health-care workers and provided care to 2,651 PLHIV from June to December 2023. Characteristics of the population included a predominantly young demographic, low education levels, and a significant representation of marginalized groups: 83% aged 25-39yo, 43% with  $\leq 7$  years of schooling, 73% Black, 22% men who have sex with men, and 5% transgender.

Among these, 25%(n=663) were reached through a re-engagement strategy, 39%(n=1034) joined post-diagnosis, and 36%(n=954) presented spontaneously due to illness. Point-of-care testing was crucial in assessing this population: the results revealed positivity rates of 28% for LAM, 3.3% for CrAg, and 5.8% for HistoAg, underscoring the prevalence of opportunistic infections. Furthermore, 1,383 PLHIV(57%) received cotrimoxazole prophylaxis, while 1,843 individuals (76%) initiated ART, 66% within seven days of enrollment.

**Conclusions:** Implementation of AHD response strategy highlights POCT's role in identifying infections and guiding interventions. Adherence to the package, including POCT, care structuring, PLHIV follow-up and hospital support, was notable.

Challenges persist, especially in vulnerable populations, due to staff overload and limited resources. Introducing point-of-care diagnostics may revolutionize HIV care, impacting treatment adherence. The implementation underscores successes and challenges, emphasizing ongoing support and adaptation to meet PLHIV's complex needs, especially those with advanced disease.

## LB44

### Disseminating U=U improves retention in care and viral suppression: a pilot RCT in South Africa

Access Campaign, New York, United States, <sup>7</sup>Maastricht

University, Health and Social Psychology, Maastricht,

Netherlands, the

**Background:** People living with HIV (PLHIV) who are virally suppressed cannot transmit the virus sexually: "Undetectable = Untransmittable (U=U)". However, in many settings, PLHIV do not receive information on U=U as part of routine HIV counselling. There is limited evidence of the impact of U=U communication strategies on PLHIV clinical care outcomes.

**Methods:** We developed a video-based App, called "Undetectable & You", to deliver information on U=U through testimonials of PLHIV and their partners and piloted the App in a randomized pilot trial. PLHIV (n=135) were recruited from public sector clinics in Johannesburg following HIV counselling.

After a baseline survey, participants were randomized 1:1 to the App (~15 minutes) or to control (no intervention). Intervention participants also received monthly text messages on U=U.

Knowledge and attitudes were assessed immediately after the intervention and participants were followed for 10 months in clinical charts to assess retention in care and documented viral suppression (<200 copies at 3-10 months, our primary outcome).

**Results:** Participants in the intervention arm (n=64) and control arm (n=69) had similar baseline characteristics. The intervention increased U=U knowledge, i.e. the percentage believing there was zero risk of transmission if virally suppressed, from 42% (control) to 76% (intervention) (p<0.01). Percent retained in care (any medication pick-ups) beyond 30 days was 81% in the control arm and 94% in the intervention arm (risk difference: 13%, p=0.030).

The retention gap between intervention and control participants widened from 6% in the first two months to 13% in months 3-4 and 17% in months 5-6 (Figure).

Percentage virally suppressed was 35% in the control arm and in 55% in the treatment arm (risk difference: 20%; p=0.021). Participants reported high intervention acceptability and that they could relate to the characters in the videos.

**Conclusions:** In a pilot RCT, interacting with the "Undetectable & You" App after HIV counselling increased U=U knowledge, retention in care, and viral suppression.

## LB45

### Sustainability of national financing in response to HIV in the Republic of Kazakhstan

T. Davletgaliyeva<sup>1</sup>

<sup>1</sup>Kazakh Scientific Center of Dermatology and Infectious

Diseases of the Ministry of healthcare of the Republic

of Kazakhstan, Project Implementation Unit, Almaty,

Kazakhstan

**Background:** The Republic of Kazakhstan faces a concentrated HIV epidemic, with a prevalence of 0.3%, primarily affecting key populations (KP), including people who inject drugs (7.2% - IBBS, 2022) and men who have sex with men (6.5% - IBBS, 2021).

In 2022, the government funding for the HIV program covered around 92% of the national response. However, to achieve 95-95-95 targets by 2030, annual HIV program budget should be increased and optimized resource allocation for the prioritized programs can have an impact in reducing infections and deaths.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Description:** The Global Fund grant aimed to strengthen the sustainability of national financing for HIV programs through State Social Orders (SSO) for NGO engaged in HIV prevention among KPs and PLHIV. The Principal Recipient developed terms of reference for NGOs and outreach workers, guidelines for obtaining SSOs, and facilitated advocacy meetings among decision-makers. Additionally, they provided training to enhance the capacity of NGOs to obtain SSOs.

Notably, amendments were made to the "On Public Health And Healthcare System" code, specifically regarding the norms governing the allocation of SSOs to NGOs for HIV prevention.

Additionally, reductions in dumping rates associated with SSO procurement, were implemented, lowering them from 20% to 10%. Furthermore, the government reduced the payment for participation in public procurement portals for SSOs from 30 monthly calculation index (MCI) (130\$) to 1 MCI (7\$).

**Lessons learned:** Advocacy efforts resulted in heightened government interest and increased SSOs allocations to NGOs serving KPs and PLHIV. Financing surged from KZT 16.1M in 2020 to KZT 150B in 2023, with the number of NGOs receiving SSOs rising from 4 in 2020 to 15 in 2023 (Table 1).

Year	2020	2021	2022	2023
Financing for SSO for HIV prevention, KZT	16.1M	19.7M	74.2M	150.0M
Number of NGO received SSOs	4	5	7	15

Table 1. Changes in the financing for SSO targeting KPs and PLHIV in RK, 2020-2023.

**Conclusions/Next steps:** The increased SSO allocations for NGOs working with KPs and PLHIV indicate the effectiveness of advocacy and partnership efforts in Kazakhstan's healthcare system. Future steps include maintaining government policies to improve access of NGOs to apply for government funding via SSOs.

## LB46

### Mass generic production of lenacapavir could cost under \$100 per person-year: the need for voluntary licensing

A. Hill<sup>1</sup>, J. Levi<sup>2</sup>, C. Fairhead<sup>2</sup>, V. Pilkington<sup>3</sup>, J. Wang<sup>4</sup>, M. Johnson<sup>5</sup>, J. Layne<sup>5</sup>, D. Roberts<sup>5</sup>, J. Fortunak<sup>5</sup>

<sup>1</sup>Liverpool University, Department of Pharmacology and Therapeutics, Liverpool, United Kingdom, <sup>2</sup>Charité University, Department of International Health, Berlin, Germany, <sup>3</sup>King's College London, HIV Research Team, London, United Kingdom., United Kingdom, <sup>4</sup>Oxford University Clinical Academic Graduate School, UK Medical Sciences Office, Oxford, United Kingdom, <sup>5</sup>Howard University, Chemistry and Pharmaceutical Sciences, Washington D.C., United States

**Background:** Despite improvements in access to both HIV treatment and oral PrEP, there were 1.3 million new HIV infections in 2022. If the PURPOSE trials demonstrate preventative efficacy, six-monthly lenacapavir PrEP could benefit millions of people worldwide. However, lenacapavir prices are currently up to \$44,819pppy.

**Methods:** We projected minimum pricing of lenacapavir based on generic mass-production and a Cost-Plus (Cost+) model. Current lenacapavir Active Pharmaceutical Ingredients (API) and Key Starting Materials (KSMs) costs were obtained from export databases (Panjiva and Trade Visions LLC). Routes of synthesis (ROS) were analysed to project a Cost of Goods (COGs) for initial and increasing demand.

The costs of formulation, vials and profit margins were included using standardised algorithms and Cost+ pricing. We estimated Cost+ prices with scale-up to produce sufficient doses for 1M then 10M treatment-years and compared this with current national list prices.

Figure. Lenacapavir course prices (pppy) compared with cost+ based course prices.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Results:** Lenacapavir API is currently exported for \$64,480/kg on 1kg scale. Based on the ROS and KSMs, an API COGs of \$25,000/kg is achievable for a committed demand of 1-million treatments (2000kg/year of API). An API COGs of \$10,000/kg for 10M treatment-years is achievable to drive cost reductions on further scale-up, but requires substantial improvements by manufacturers to the ROS. Including formulation, vials and profit margins, generic injectable lenacapavir could be mass-produced for \$63-93pppy for 1M treatment-years, falling to \$26-\$40pppy for 10M treatment-years. These prices require voluntary licenses and competition between generic suppliers. Current prices for 1-year of lenacapavir PrEP were \$25,395-44,819pppy in countries with available data.

**Conclusions:** We demonstrate that lenacapavir can be mass-produced for \$63-\$93pppy, potentially falling to \$26-\$40pppy with scale-up. Mass-production of generic lenacapavir, under voluntary license by multiple suppliers, is required to achieve these prices. This mechanism is already in place for the mass-production of other antiretrovirals. Gilead has not yet agreed lenacapavir voluntary licenses with the Medicines Patent Pool.

## LB47

### Cost-effectiveness of PrEP provision in the combination HIV prevention and community engagement (COPE) intervention for men and transgender women who exchange sex in Bangkok and Pattaya, Thailand

B.W. Weir<sup>1,2</sup>, V.H. Vu<sup>1</sup>, J.P. Ngo<sup>1</sup>, H.I. Sisel<sup>1</sup>, P. Sullivan<sup>3</sup>, T.H. Holtz<sup>4</sup>, S.D. Baral<sup>1</sup>, A.L. Wirtz<sup>1</sup>, C. Beyrer<sup>1,5</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Center for Public Health and Human Rights, Department of Epidemiology, Baltimore, United States, <sup>2</sup>Johns Hopkins Bloomberg School of Public Health, Department of Health, Behavior & Society, Baltimore, United States, <sup>3</sup>Emory University Rollins School of Public Health, Department of Epidemiology, Atlanta, United States, <sup>4</sup>Emory University Rollins School of Public Health, Department of Global Health, Atlanta, United States, <sup>5</sup>Duke University, Duke Global Health Institute, Durham, United States

**Background:** The COPE study was an open-label daily PrEP study among young men who have sex with men (MSM) and transgender women (TGW) who exchange sex in Thailand. HIV incidence was significantly lower during time on PrEP than off PrEP (PMC10442968). To inform PrEP implementation and scale-up in Thailand, we estimated the incremental cost-effectiveness ratio (ICER) for the COPE intervention with PrEP as implemented to a similar hypothetical combination HIV prevention intervention without PrEP use.

**Methods:** Participants recruited from community clinics included 846 Thai MSM and TGW in Bangkok and Pattaya who exchanged sex in the last year, were aged 18-26

years, and were confirmed to be not living with HIV. Intervention components included community engagement, venue outreach, social media, HIV testing, STI testing and treatment, and optional daily oral PrEP at no cost.

Participants could start and stop PrEP during study participation. Micro-costing and direct observation were used to identify resources associated with PrEP use with participant travel costs based on surveys.

Discounted (3%) lifetime quality-adjusted life-years (QALYs) and medical care costs were estimated from state-transition Markov modeling. Results are reported in 2018 USD and Thai Baht (฿).

**Results:** The incremental cost of PrEP provision was \$415.82 (฿13,413) per person-year on PrEP and \$248,824 for all 598.4 person-years on PrEP during study participation.

Estimated impacts include 21 infections prevented, 52.9 discounted QALYs saved, and \$154,904 discounted lifetime medical care costs averted. The ICER was \$1,774 (฿57,236) per QALY saved—less than the willingness-to-pay threshold in Thailand of \$4,960 (฿160,000).

Cost-effectiveness of PrEP provision as part of a combination HIV prevention intervention for young Thai MSM and TGW who exchange sex (2018-2020).

	Total		Per person-year	
	USD	Thai Baht	USD	Thai Baht
Clinical costs	\$ 68,881	฿2,222,000	\$115.11	฿3,713
PrEP medication	\$135,836	฿4,382,000	\$227.00	฿7,323
Costs to participants (time and travel)	\$ 44,106	฿1,423,000	\$ 73.71	฿2,378
Total intervention cost	\$248,824	฿8,027,000	\$415.82	฿13,413
HIV medical care costs averted	\$154,904	฿4,997,000	\$258.66	฿8,350
Incremental cost	\$ 93,920	฿3,030,000	\$156.95	฿5,063
Cost per QALY saved (52.9 QALYs)	\$ 1,774	฿57,000		

**Conclusions:** Adding daily oral PrEP access to a combination clinic-based and community-based intervention was cost-effective for preventing HIV infections and averting future morbidity, mortality, and health care costs.

From medical care and social perspectives, no-cost PrEP at community-based clinics for MSM and TGW who exchange sex is a worthwhile investment.

### Leveraging integrated disease testing to enhance access to early infant diagnosis of HIV in Cross River State, Nigeria.

O.R. Anika<sup>1</sup>, N. Bassey<sup>2</sup>, F. Abbah<sup>1</sup>, B. Igwe<sup>1</sup>, J. Arney<sup>1</sup>, J. Nwodo<sup>1</sup>, O. Ibitham<sup>1</sup>, A. Agorye<sup>2</sup>, U. Onwuzuruigbo<sup>2</sup>, E. Nwanja<sup>2</sup>, O. Onwah<sup>2</sup>, U. Akpan<sup>2</sup>, M. Unimuke<sup>2</sup>, C. Okolo<sup>2</sup>, O. Toyo<sup>2</sup>, C. Nwangenah<sup>1</sup>, B. Oyawola<sup>3</sup>, U. Omo-Emmanuel<sup>3</sup>, D. Ogundehin<sup>3</sup>, E. James<sup>1</sup>, O. Onyedini<sup>1</sup>, A. Adegboye<sup>2</sup>, A. Eyo<sup>2</sup>, C. Casalini<sup>1</sup>  
<sup>1</sup>FHI360 Nigeria, Technical, Abuja Federal Capital Territory, Nigeria, <sup>2</sup>ECEWS, Technical, Uyo, Akwa Ibom, Nigeria, <sup>3</sup>United States Agency for International Development, Laboratory Services, Abuja Federal Capital Territory, Nigeria

**Background:** A delayed detection and treatment initiation among HIV-exposed infants (HEI) caused by a prolonged turnaround time (TAT) using molecular PCR laboratories was observed in Cross River State, Nigeria. Recognizing the pivotal role of integrated disease testing and taking advantage of multi-disease testing platforms in the TB program, we explored its potential in improving diagnostic accessibility and healthcare outcomes as part of the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) U.S. Agency for International Development (USAID)-funded ACE 5 project.

**Methods:** Assessment of the testing capacity of existing GeneXpert machines running at less than 50% informed the decision for integration, providing an opportunity for optimization through the inclusion of samples from the HIV program. Discussion with the TB program led to the agreement to pilot the proposed HIV and TB partnership, leveraging existing GeneXpert platforms.

Through a collaboration with the public healthcare facilities, we integrated HEI testing with TB diagnostic testing using five GeneXpert machines supplied by the TB program and trained healthcare professionals on the use of the multi-disease testing platform in Cross River State. We present the TAT from sample receipt to analysis and test result release (analytic stage) before and after the introduction of the GeneXpert multi-disease testing platform.

**Results:** Among 241 HEI whose samples were tested through the GeneXpert multi-disease platform, the average TAT from receipt at the laboratory to analysis was 0.9 days, and from sample analysis to result release was 0.2 days (total 1.1 days compared to 60 days prior to the intervention); 25 (10%) HEI had samples collected and tested within 72 hours compared to <5% prior to the intervention.

**Conclusions:** The integrated disease testing approach demonstrated significant success in overcoming barriers to accessibility and enhancing timely access to diagnostic services for HEI. A significant reduction in TAT was observed.

The findings emphasize the importance of collaboration across programs, technology adoption, and capacity building for sustained improvements in healthcare services. Implementing integrated testing models can contribute to a more robust and accessible healthcare infrastructure, improving health outcomes, particularly among pregnant and breastfeeding women living with HIV and their HEI, and ultimately reducing mother-to-child transmission.

## LB49

### Integrating 5As counseling and pharmacotherapy in tobacco use cessation into HIV care continuum: results from a clustered randomized trial study in Kisumu, Kenya.

C. Osongo<sup>1,2</sup>, S. Shade<sup>3</sup>, R. Onyango<sup>1</sup>, P. Chatterjee<sup>4</sup>, Z. Kwen<sup>1</sup>, L. Onger<sup>5</sup>, P. Magati<sup>6</sup>, C. Cohen<sup>1</sup>, M. Vijayaraghavan<sup>7</sup>, J. Nutor<sup>7</sup>, Y. Olando<sup>8</sup>, E. Bukusi<sup>9</sup>, S. Bialous<sup>7</sup>, F. Odhiambo<sup>1</sup>

<sup>1</sup>Kenya Medical Research Training Institute, Center for Microbiology Research, Kisumu, Kenya, <sup>2</sup>University of Washington, Department of Global Health, Seattle, United States, <sup>3</sup>University of California San Francisco, Department of Epidemiology and Biostatistics, San Francisco, United States, <sup>4</sup>University of California San Francisco, Department of Obstetrics, Gynecology & Reproductive Sciences, San Francisco, United States, <sup>5</sup>Kenya Medical Research Training Institute, Center for Clinical Research, Nairobi, Kenya, <sup>6</sup>Economist, Nairobi, Kenya, <sup>7</sup>University of California San Francisco, Department of Medicine, San Francisco, United States, <sup>8</sup>National Authority for the Campaign against Alcohol and Drug Abuse, Nairobi, Kenya, <sup>9</sup>Kenya Medical Research Training Institute, Center for Microbiology Research, Nairobi, Kenya

**Background:** People with HIV (PWH) use tobacco more often than the general population. Tobacco use among PWH is associated with higher rates of AIDS and non-AIDS-related disease and death. To address these issues, we conducted a cluster-randomized trial in 20 clinics to compare the effect of the integration of a brief intervention and an intensive tobacco cessation intervention into HIV care in Kisumu Kenya.

**Methods:** Providers received a brief online training on the provision of the five As from Kenya's *National Guidelines for Tobacco Dependence Treatment and Cessation*. (Ask, Advice, Assess, Assist, and Arrange) or an intensive online training on the five As and the provision of pharmacotherapy. All completed an online survey three months post-training. Patients in 10 sites assigned to the brief intervention received a single counseling session and referral to a national Quitline in line with the *National Guidelines*. Patients in 10 sites assigned to the intensive intervention received four monthly counseling sessions, referral to the Quitline, pharmacotherapy.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

All participants were surveyed and had exhaled carbon monoxide measured, at baseline and three months. We used generalized estimating equations to compare the providers' five As, self-reported tobacco use and exhaled carbon monoxide at three months.

**Results:** Relative to providers in clinics that implemented the brief intervention (N=104), providers in clinics that implemented the intensive intervention (N=121) were no more likely to always or usually ask (89% vs .93%; difference=-4%, 95%CI=-12.2%-4.2%), advise(93% vs. 93%; difference=0%, 95%CI=-7.6%-7.3%), assess(87% vs. 91%; difference=-5%, 95%CI=-4.4%-13.6%), assist (89% vs. 91%; difference=-2%, 95%CI=-6.5%-10.7%), and arrange (83% vs. 81%; difference=2%, 95%CI=-12.9%-9.2%). Relative to patients in clinics that implemented the brief intervention (N=288), patients in clinics that implemented the intensive intervention (N=290) were more likely to report no tobacco use (47.1% vs. 15.3%; difference=32%, 95%CI=24.1%-39.4%) and lower mean, SD exhaled CO measured at three-months (7.5, 5.6 vs. 9.6,6.1; difference=2.07, 95%CI=1.09-3.04).

**Conclusions:** Integration of intensive tobacco cessation counseling and pharmacotherapy into HIV care was associated with significantly more provision of tobacco smoking cessation services and tobacco cessation among PWH compared to a standard brief intervention. Scale-up of this intensive intervention could substantially enhance tobacco cessation among PWH.

## LB50

### Improving HIV mortality surveillance in Malawi through civil registration and vital statistics system

N. Kalata<sup>1</sup>, P. Dindi<sup>2,3</sup>, E. Mkambankhani<sup>4</sup>, G. Mtonga<sup>1</sup>, A. Nyaka<sup>5</sup>, M. Mussa<sup>3</sup>, R. Langwe<sup>3</sup>, Y. Luwe<sup>5</sup>, M. Chizonda<sup>1</sup>, F. Mukhupa<sup>3</sup>, K. Nkanauneka<sup>1</sup>, M. Sambo<sup>3</sup>, K. Mirkovic<sup>1</sup>, N. Wadonda<sup>1</sup>, A. Kabaghe<sup>1</sup>

<sup>1</sup>United States Centers for Disease Control and Prevention, Epidemiology, Lilongwe, Malawi, <sup>2</sup>University of Washington, Department of Global Health - I-TECH, Lilongwe, Malawi, <sup>3</sup>Ministry of Homeland Security, National Registration Bureau, Lilongwe, Malawi, <sup>4</sup>Elizabeth Glaser Pediatric AIDS Foundation, Civil Registration and Vital Statistics, Lilongwe, Malawi, <sup>5</sup>Ministry of Health, Curative and and Medical Rehabilitation, Lilongwe, Malawi

**Background:** Timely and accurate data on HIV/AIDS-related deaths are needed to inform policies and strategies for addressing the epidemic. In most resource-limited settings affected by HIV, mortality data are primarily from health facilities and may underestimate the true burden of deaths occurring outside the health system.

**Description:** We describe lessons learned from establishing and scaling up mortality surveillance in Malawi to improve timeliness and accuracy of HIV-related mortality. A civil registration and vital statistics (CRVS) system was adapted from the United Nations Principles and Recom-

mendations for a vital statistics system to include a compulsory medical certification of cause of death (CoD) at the facility level and a World Health Organization (WHO) verbal autopsy (VA) tool for community deaths. Trained health care workers and village custodians recorded deaths in hospitals and communities, respectively. An agile software development approach was used to design, develop, and implement a flexible electronic system from open sources. CoD data from the facility and VA were coded using the International Classification of Diseases (ICD) system and analyzed using the ANACOD electronic tool and InterVA5 software, respectively.

**Lessons learned:** Between 2017 to 2023, the system was implemented and scaled up from 4 to all 28 districts. As of January 2024, 127,275 deaths were captured, with 31% (39,050/127,275) being registered from communities. Of the 127,275 deaths, 28% were successfully assigned a CoD. CRVS was implemented by the National Registration Bureau using Ministry of Health (MOH) staff which limited MOH ownership. Clinicians were trained on-the-job, but not legally compelled to certify and report CoD. CoD reporting has been incorporated into clinician training to embed in clinical practice. Data were not routinely used at facility level to provide demand for death reporting and therefore, computerizing the system has ensured timely access of data.

**Conclusions/Next steps:** Through implementation of the CRVS system, Malawi is routinely, accurately. and expeditiously monitoring CoD, in health facilities and communities. Linking mortality data in CRVS to electronic medical records may improve death estimates and documentation of CoD among people living with HIV.

## LB51

### The impact of recent anti-transgender laws on transgender adolescents' trust and interactions with healthcare providers

M. Ybarra<sup>1</sup>, E. Saewyc<sup>2</sup>, L.Z. DuBois<sup>1</sup>, H. Mofidi<sup>1</sup>, C. LeBranche<sup>1</sup>  
<sup>1</sup>Center for Innovative Public Health Research, San Clemente, United States, <sup>2</sup>University of British Columbia, Stigma and Resilience Among Vulnerable Youth Centre, Vancouver, Canada, <sup>3</sup>University of Oregon, Anthropology, Eugene, United States

**Background:** If the anti-transgender laws proliferating across the US are impeding access to healthcare and services, this has implications for HIV prevention.

**Methods:** To inform a sexual risk reduction program for transgender, non-binary and other gender diverse adolescents assigned female at birth (hereafter referred to as TNB), 4 online, asynchronous focus groups of youth ages 14-18 across the US were conducted in March, 2024 (n=73; 59 identified as a transgender boy; 25 as non-binary, genderfluid, genderqueer, bigender, demigender, or unsure). Groups were stratified by sexual experience (ever

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

vs. never, self-defined) and residence in "not hostile" versus "hostile" states, defined as those that have passed or are proposing anti-transgender legislation. Focus group questions asked how anti-trans laws impacted behavior and sexual decisions.

**Results:** Many TNB youth in both hostile and non-hostile states said the laws made them hesitant to talk to their doctor. Some have avoided accessing healthcare altogether. Many reported lying about their gender identity to protect their safety: "I've stopped being completely honest with my doctor, because I fear they might put me on some type of list or something."

Others said the laws made them feel rushed to access gender affirming care for fear it might be taken away: "I feel like I'm living in a constant state of fear and desperation." Youth also talked about traveling to other states to access care: "Finding an endocrinologist willing to treat trans minors became increasingly difficult, as my doctors faced being sued. I ended up needing to drive 1h30 to get to a doctor."

Others stopped or delayed medical care: "My transition has been incredibly delayed as I am a transgender man at 18 who is still not on HRT. Many of our HRT clinics were... shut down." Not all youth were affected: "I'm lucky enough to live in a progressive blue state, and none of those anti-trans laws have impacted me."

**Conclusions:** Most TNB youth report a significant increase in barriers to health care access, including sexual health care; and decreased trust in doctors because of anti-trans laws, putting them at greater risk for HIV.

## LB52

### State-level transgender policy Index and implications on the U.S. HIV response

D.V. Stenoien<sup>1,2</sup>, E. Dusic<sup>3</sup>, L. Brunet<sup>1</sup>, S. Senn<sup>1</sup>, E. Lankiewicz<sup>1</sup>, J. Sherwood<sup>1</sup>, D. Operario<sup>4</sup>, A. Restar<sup>3,5</sup>

<sup>1</sup>amfAR, The Foundation for AIDS Research, Washington DC, United States, <sup>2</sup>The Heller School for Social Policy and Management, Institute for Global Health and Development, Waltham, United States, <sup>3</sup>University of Washington School of Public Health, Seattle, United States, <sup>4</sup>Emory University, Atlanta, United States, <sup>5</sup>Yale University, New Haven, United States

**Background:** Since 2019, the U.S. has invested in the Ending the HIV Epidemic (EHE) initiative targeting 7 states and 48 counties with additional HIV resources. Simultaneously, the U.S. has seen a significant increase in legislation restricting health access and rights of transgender people – a population most-at-risk for HIV.

Given the known relationship between unsupportive policy environments and poor HIV outcomes, we measure state-level anti-trans policies by EHE area.

**Methods:** The Trans Policy Index (TPI) utilizes data from ACLU and Movement Advancement Project (MAP) policy trackers to summarize the severity of each state's an-

ti-trans legislation across 6 categories (accurate IDs; civil rights; free speech and expression; healthcare; inclusion in public spaces and services; school and education). State policies in each category were independently rated by two researchers, from most restrictive/discriminatory (1) to most protective for trans health (5), with disagreements settled by a third team member (TPI score range: 0 - 88). State TPI scores are reported as values, percentage of each category, and compared by t-tests for;

- 1) EHE states (n=7),
- 2) States with EHE counties (n=20), and;
- 3) Non-EHE states (n=24).

**Results:** Overall, EHE states had the lowest average TPI score (27/88, 31%) followed by states with EHE counties (56/88, 63%), and non-EHE states (60/88, 69%); this trend was observed for each TPI sub-category.

On average, EHE states scored significantly lower than non-EHE states in the subcategories of civil rights (2/16 vs. 13/16,  $p < .01$ ), healthcare (4/16 vs. 11/16,  $p < .001$ ), public inclusion (4/12 vs. 9/12,  $p < .001$ ), and school and education (6/20 vs. 14/20,  $p < .001$ ).

**Conclusions:** High HIV-burden areas like EHE states have harsher legislative landscapes for transgender people, which may negatively influence access to HIV prevention, testing, and treatment and ultimately undercut the goals of the EHE. Such landscapes include laws restricting gender-affirming care and permitting trans discrimination by health insurers, which overall can drive trans people away from healthcare sites, including HIV services. Given the intersection between trans rights, healthcare accessibility, and HIV outcomes, policies aimed at protecting the rights of those most-at-risk for HIV are necessary to end the U.S. HIV epidemic.

## LB53

### Meaningful youth leadership and participation in comprehensive sexuality education: the West and Central Africa regional landscape

B. Ssebadduka<sup>1</sup>, A. Adou<sup>2</sup>, B. Deperthes<sup>3</sup>, A. Chilanga<sup>1</sup>

<sup>1</sup>United Nations Population Fund, West and Central Africa Regional Office, Sexual and Reproductive Health Department, Dakar, Senegal, <sup>2</sup>University of Bouaké, Anthropology and Sociology, Abidjan, Côte d'Ivoire, <sup>3</sup>United Nations Population Fund HQ, Technical Division, New York, United States

**Background:** West and Central Africa is the global epicentre of youthful demographics, with over 64% of its population under 24 years. Yet, the region lags behind its adolescent and youth sexual and reproductive health and HIV prevention targets. Only 23% of women and 31% of men have comprehensive HIV knowledge, which highlights the need for youth-centred comprehensive sexuality education to bridge the gap. However, meaningful youth leadership and participation data are lacking in this area.

**Methods:** This was a descriptive cross-sectional study employing qualitative data collection and analysis approaches. Data was collected from randomly and purposively selected respondents from 12 countries from November 2023 to January 2024 using interviewer-administered questionnaires and Key Informant Interviews.

#### Results:

Youth participation in comprehensive sexuality education was low in 58% of the countries and insufficient to initiate structural changes for adolescents and youth as it focuses more on programming and less on sustainable youth engagement components like, policymaking, financing, and institutional structures. Barriers noted included the higher age threshold for consent and the requirement of parental consent, lack of autonomy, high gender inequalities disproportionately affecting female participation leadership; weak institutional capacity of youth-led organizations; limitation of efforts to urban areas; limited funding for youth-led programmes; inability to mobilize resources to finance efforts; and high levels of illiteracy in some countries like Chad at 64.7%.

**"We [the youth] are the most impacted. Nobody wins if we are consistently left out of the equation?"**

FGD Respondent, Ghana

**Conclusions:** Over half of the surveyed countries have low youth participation in comprehensive sexuality education that targets youth. This concerning revelation is a clear call to address gender disparities, which disproportionately affect the participation of girls and young women. Additionally, there is a need for multidimensional, sustained youth participation efforts that cater to the diverse needs of youth and to reposition youth as active contributors and indispensable allies, not merely beneficiaries in comprehensive sexuality education policies, funding mechanisms, interventions, and institutional structures.

## LB54

Romances & negligence – living experiences of young PLHIVs in migration and their spouses in villages of India

L. Misra<sup>1</sup>, B. Pattanaik<sup>2</sup>

<sup>1</sup>ARUNA, Social Development, Berhampur, India, <sup>2</sup>ARUNA, Social Development, Brahmapur, India

**Background:** India has one of the world's largest HIV epidemics, where migration is a major drive of HIV spread. Ganjam-Surat migration corridor is known for high prevalence of HIV.

Location		Study Location					
Total number of PLHIV=1795		Blocks: 06, Gram Panchayats: 102, Population: 0.6 million, HIV population: 662					
District	Ganjam, Odisha, INDIA	0-18 years	18-35 years	35 years and above			
Type	Source Migration district	Boys	Girls	Male	Female	Male	Female
Population	3.6 million (2011 census)	18	12	95	112	244	181
Sex distribution	Male-50.48%, Female-49.42%						
Population density	429 / square kms.						
Geography	8070 square kms.						
Blocks	22						
Gram panchayats	503						

**Methods:** Study period: December 2023 - February 2024 in 6 blocks of Ganjam.

Respondents were 63 (33 Male, 30 Female) between the age group of 18-35 year young adults living with HIV.

Migrants and Spouses of migrants

Set of questions on 8 impact areas:

1. Infection history
2. Status disclosure to partner, community
3. Treatment / ART
4. Marriage, family life
5. Workplace life
6. Status disclosure to employer
7. Psychosocial factor
8. Life with HIV

**Results:** Respondents are from 63 different families. 29 male and 5 female contracted HIV before marriage. Disclosure of HIV status is high among women before marriage than men. In case of 5 women both the partners were positive before marriage. 5 women living alone; 4 are separated and one widow. 10 CLHIV living both parents and 4 living with single parent.

24 men are taking ART regularly. 7 women are not taking ART including 7 children with them. No persistent depressive symptom in the responses of migrants.

Women are worried for their children and have miserable depressive symptoms. Finance is an issue, 50 respondents are enrolled under Pension Scheme of Odisha government.

**Conclusions:** In this qualitative study, disclosure concerns are more in PLHIV in personal and professional life. Despite concentrated efforts on ART inclusion and adherence is a big challenge. U=U paradigm and to end the epidemic by 2030 needs more coordinated GO-NGO efforts.

## LB55

### Social pact for non-discrimination and equality treatment associated with HIV in Spain

J. del Amo<sup>1</sup>, A. Koerting<sup>2</sup>, M.J. Fuster<sup>3</sup>, C. Iniesta<sup>2</sup>, L. Martin Carbonero<sup>3</sup>, J. Colom<sup>4</sup>, R. Mansilla<sup>4</sup>, M.A. Ramiro<sup>5</sup>, J. de la Torre<sup>6</sup>, C. Zamora<sup>6</sup>, R. Velayos<sup>7</sup>, A. Poveda<sup>7</sup>, C. Martín<sup>8</sup>

<sup>1</sup>Ministry of Health, Division of HIV, STI, Viral Hepatitis and TB, Madrid, Spain, <sup>2</sup>SEISIDA, Madrid, Spain, <sup>3</sup>GeSIDA, Madrid, Spain, <sup>4</sup>Generalitat de Catalunya, Agència de Salut Pública de Catalunya Departament de Salut, Barcelona, Spain, <sup>5</sup>University of Alcalá, Philosophy of Law, Madrid, Spain, <sup>6</sup>Consejería de Sanidad de Andalucía, Plan Andaluz de VIH e ITS, Sevilla, Spain, <sup>7</sup>CESIDA, Madrid, Spain, <sup>8</sup>Trabajando en Positivo, Madrid, Spain

**Background:** People living with HIV (PLWH) experience stigma and discrimination in multiple aspects of their lives. On November 2018, the Ministry of Health of Spain adopted the Social Pact against Discrimination and for Equality for PLWH (from now onwards the Pact), a long-requested demand from civil society which acknowledges the need of consistent and stable multi-sectorial and inter-sectorial responses to address structural discrimination against PLWH. We summarize steps taken by public administrations and political actors in advancing the Pact from November 2018 till April 2024.

**Description:** The agreement of Council of Ministers, November 2018, approved instructions to eliminate generic medical causes of exclusion to accessing public employment, such as HIV, diabetes, celiac disease and psoriasis. Interterritorial Health and Social Services councils in 2019 forbade discrimination of PLWH in accessing residential homes for the elderly. An agreement between the General Directorate of Public Health, the State Coordinator of HIV and AIDS and University of Alcalá analyses legal norms that discriminate PLWH and rolls-out studies on attitudes towards PLWH, and perception of stigma and discrimination by PLWH. Law 15/2022, Integral for Equal Treatment and Non-Discrimination includes for the first time HIV serological status as a reason for non-discrimination. Sports Law 39/2022 introduces measures against any kind of discrimination, with reference to HIV-related discrimination. Modification of Royal Decree 2487/1998, November 1998, allows since June 2023 PLWH to work in armed private security.

**Lessons learned:** As a result of the work within the Pact above summarized, the elimination of HIV-related stigma and discrimination became a political priority of the

Spanish Presidency of the European Union in the last semester of 2023, which amplified the political visibility the subject and led to the publication of report HIV-related stigma and discrimination: the challenge in collaboration with the Ministry of Health of Spain, ECDC, SEISIDA, UNAIDS, WHO/Euro.

**Conclusions/Next steps:** The work conducted within the Pact has been (and continues to be) an important advance in the protection of the rights of PLWH in Spain and has contributed to advancing the European political agenda on HIV-related stigma and discrimination at various levels of the European commission and European parliament.

## LB56

### Strengthening technical capacity and leadership of implementers on community-led monitoring (CLM) in West and Central Africa (WCA)

D. Niang<sup>1</sup>, S. Thiam<sup>2</sup>, D. Diouf<sup>3</sup>

<sup>1</sup>National AIDS Control Council, Monitoring Evaluation and Research Unit, CLM Focal Point, Dakar, Senegal, <sup>2</sup>National AIDS Control Council, Executive Secretary, Dakar, Senegal, <sup>3</sup>National Network of Key Populations, Dakar, Dakar, Senegal

**Background:** Community-Led Monitoring (CLM) is an ongoing process in which those affected by health inequalities systematically monitor services, analyze the data they collect and conduct evidence-based advocacy to improve service delivery and create an environment conducive to their well-being. Although the concept is not new, it has gained momentum in recent years, thanks to the financial support from donors such as PEPFAR and the Global Fund. UNAIDS is committed to supporting

CLM to enable community organizations and networks to participate in routine activities aimed at improve the quality, availability, accessibility, acceptability and relevance of services.

in Senegal, two managers,

1. OCT (Community Treatment Observatory) On screening issues ; Treatment issues , Viral load , Management of a favorable environment for patient retention in care
2. OCASS (Observatoire Citoyen pour l'Accès aux Services de Santé - Citizens' Observatory for Access to Health Services) Observatory integrated with 3 Diseases (HIV, Malaria and TB)

OCASS will address issues of discrimination and barriers to access to quality health services by users. People affected by these 03 diseases will have the opportunity to report abuses, so that national programs in charge of combating the 3 diseases and more broadly can Contribute to the reduction of human rights-related obstacles

## Methods: Evidence

Site-level data collection

Data analysis

advocacy, Development and implementation of advocacy plan Engagement

Set up Community Consultative Group (CCG) made up of community leaders and programmatic and government decision-makers

**Results:** Organize a sharing meeting on the various "CLM" projects to gain a common understanding of approaches (targeting and methodology). Set up a single Community Consultative Group (GCC)

Strengthen the managerial and resource mobilization capacities of CLM host community organizations

Recruit Pop-Clés collectors in collaboration with key population

Negotiate the reorganization of available CLM budgets to integrate data digitization

**Conclusions:** The workshop provided a dynamic platform for the exchange of experiences, practices and challenges in CLM implementation. Discussions and group work led to the development of strategic and operational plans, strengthening regional collaboration for the effective implementation of CLM in the region. Participants came away with clear commitments and concrete action plans for moving forward in their respective national contexts.

## LB57

### Advancing human rights in Africa: addressing structural barriers to HIV services for marginalized communities

G. Mululu<sup>1</sup>

<sup>1</sup>University of Nairobi, College of Medicine, Nairobi, Kenya

**Background:** In Africa, discriminatory legislation, exemplified by the Ugandan Anti-Homosexuality Act 2023 and similar laws across the continent, presents formidable obstacles to HIV/AIDS prevention and treatment, especially among marginalized communities like LGBTQ+ individuals.

In response, a comprehensive advocacy campaign emerged, aiming to dismantle these structural impediments while advancing human rights across Africa.

**Description:** The campaign is a multi-level advocacy initiative aimed at advancing human rights in Africa, with a particular focus on addressing the challenges faced by marginalized communities, LGBTQ+ individuals, due to discriminatory legislation such as the Ugandan Anti-Homosexuality Act 2023, and a similar law in Ghana. It operates through proactive engagement, strategic partnerships, and targeted interventions to foster meaningful change. The campaign operates through a collaborative framework involving diverse stakeholders, including civil society organizations, grassroots groups, faith-based organizations, and influential individuals.

## Lessons learned:

- **Inclusive Engagement:** Diverse perspectives, from marginalized communities, are essential for designing effective interventions and ensuring their relevance and impact.
- **Strategic Partnerships:** Collaborating with a range of stakeholders strengthens advocacy efforts and amplifies impact.
- **Leveraging Media:** Social media and digital platforms crucial for expanding outreach, raising awareness, and mobilizing support for human rights initiatives
- **Building Capacity:** Investing in civil society organizations enhances their ability to advocate for change, engage with stakeholders, and navigate complex policy environments effectively.
- **Political Engagement:** Engaging key stakeholders is key to advancing human rights agendas and securing commitments for policy reform and implementation.
- **Sustained Advocacy:** Continuous efforts are essential for driving long-term systemic change and addressing persistent human rights challenges.

**Conclusions/Next steps:** The outcomes of this campaign hold significant implications for HIV prevention, treatment, care, and support efforts, particularly in the context of communities, such as LGBTQ+ individuals, facing discrimination and barriers to accessing essential services. By addressing the policy root causes and legal barriers, the program contributes to creating an enabling environment for comprehensive HIV responses and advancing human rights in Africa. To build on these, future steps entails scaling up successful interventions, sustaining policy advocacy efforts, empowering communities, conducting rigorous research and evaluation, and fostering sustainable financing mechanisms.

## LB58

### Towards creating a tool kit for reporting on HIV & AIDS and other infectious diseases in Africa

W. Njuguna<sup>1</sup>

<sup>1</sup>Namibia University of Science & Technology, Journalism & Media Technology, Windhoek, Namibia

**Background:** Journalism reporting tool kits are numerous world over. Most are generalized, while others are specific to workplace and education. However, this researcher has found none that encompasses HIV & AIDS and other Infectious diseases in Africa.

**Description:** Researching on tool kits in the world for a PhD research completed in 2020, online review of tool kits was done. One of the recommendations was to create a tool kit specifically for journalists writing on HIV & AIDS and other infectious diseases. During the period 2020 to 2024, a review of more than 30 tool kits or similar documents worldwide have been reviewed. In 2020, beside previously known infectious diseases such as HIV & AIDS,

Ebola and many others, COVID-19 created a new cohort of infectious diseases and it's reporting created concerns as evidenced in many newspaper and research papers. A mixed method approach through content analysis of 30 tool kits world wide and PhD thesis between 2020 and 2024 was done, with an aim of creating a relevant tool kit for Africa reporting on the varied diseases.

**Lessons learned:** Between 2020 and 2024, more than 30 documents that have been created as guidelines on reporting on HIV & AIDS and some infectious disease have been interrogated. No one singular document/Tool Kit that encompasses both HIV & AIDS and other infectious diseases in Africa was found. However, many of the documents reviewed provide key themes in common: social responsibility, ethical reporting, sensi.

However, only UNAIDS Reporting Guidelines provide key words that should not be reported when writing about HIV & AIDS. Whereas none was found that included other infectious diseases, the findings of the 2020 PhD dissertation inform current project which includes words to be avoided. Some of these are: victims, fight/war against, killer/deadly disease, scourge, risk group. Same words are relevance to other infectious diseases but interviews will provide better data.

**Conclusions/Next steps:** Findings prove that this kind of a tool kit is long overdue. The final phase of this document will include results of interviews with people who have had infectious diseases and that is expected to further enrich the final Tool Kit/Reporting Guidebook.

### Breaking barriers: improving HIV/AIDS testing and treatment accessibility among rural communities in Uganda

T.A. Mahikaho<sup>1,2</sup>

<sup>1</sup>Uganda Management Institute, Social Research, Kampala, Uganda, <sup>2</sup>Intergrated Efforts in Culture for Development, Kampalaugandaugau, Uganda

**Background:** In Uganda, rural communities face formidable challenges in accessing HIV/AIDS testing and treatment services due to a myriad of barriers, including limited healthcare infrastructure, transportation challenges, stigma, socio-economic factors, and lack of awareness. These barriers contribute to low testing rates, late diagnosis, and poor treatment adherence, exacerbating the HIV/AIDS epidemic in rural areas.

**Description:** Titled "Breaking Barriers: Enhancing HIV/AIDS Testing and Treatment Accessibility in Rural Uganda," this study uncovers challenges hindering service access. Employing mixed-methods research, it unravels barriers limited healthcare infrastructure, transport issues, stigma, socio-economic factors, and awareness gaps impacting testing, treatment, and health outcomes. Urgent interventions are needed to improve access, advocating

for infrastructural upgrades, transport solutions, stigma reduction, socio-economic support, and community education. Emphasizing collaboration, the study stresses holistic approaches to combat the rural HIV/AIDS epidemic, underscoring the importance of dismantling barriers and enhancing services for underserved populations.

**Lessons learned:** The findings reveal significant barriers to HIV/AIDS testing and treatment accessibility in rural Uganda. Limited healthcare infrastructure, including inadequate facilities and trained personnel, impedes access to services. Transportation challenges, exacerbated by poor road conditions and long distances to healthcare facilities, further hinder access to care. Stigma and discrimination surrounding HIV/AIDS deter individuals from seeking testing and disclosing their status. Socio-economic factors, such as poverty and limited financial resources, prevent individuals from affording transportation costs, medical fees, and medications. Additionally, lack of awareness and education about HIV/AIDS contributes to low testing rates and late diagnosis.

**Conclusions/Next steps:** Addressing the barriers to HIV/AIDS testing and treatment accessibility among rural communities in Uganda requires a holistic approach that encompasses infrastructural improvements, transportation solutions, stigma reduction initiatives, socio-economic support programs, and community-based education efforts. By implementing evidence-based interventions tailored to the specific needs of rural populations, Uganda can break down barriers, improve access to care, and mitigate the impact of the HIV/AIDS epidemic. This study underscores the urgency of addressing these challenges and underscores the importance of collaborative efforts to achieve equitable access to HIV/AIDS services in rural Uganda.

## LB60

### An overview of European consent requirements for HIV and viral hepatitis B and C testing

J. Rockstroh<sup>1</sup>, EuroTEST Steering Committee

<sup>1</sup>University Clinic Bonn, HIV Outpatient Clinic, Infectious Diseases and Immunology, Bonn, Germany

**Background:** Complicated consent procedures for blood-borne virus testing are a barrier for implementation, particularly in non-specialist healthcare settings. European and global guidelines no longer recommend written consent and individualised pre-test counselling. An overview of testing consent requirements in Europe is lacking.

**Methods:** An online survey on legal and policy frameworks and daily implementation was developed by a working group under the [EuroTEST Initiative](#) and disseminated to clinical and community-based testing facilities and national public health institutions in the countries of the WHO European Region. Data collection and validation occurred between October 2023 and April 2024. Respons-

es were validated via email and/or bilateral discussions if diverging across same-country respondents to obtain one answer per country.

**Results:** 84 responses from 36 community-based testing sites, 33 healthcare facilities and 15 public health institutes in 34 countries were included. Written or documented consent remains a requirement for HIV testing according to legal frameworks and/or national policy/guidelines in eleven countries (4/18 western, 5/11 central, 2/5 eastern, p72). In a third of these, written consent is required in some settings only (hospitals/other healthcare). Practices for how consent is obtained in reality vary widely by setting and do not always follow legal/policy requirements (e.g. hospitals/healthcare settings obtaining written consent even if not required, written consent requirements not strictly adhered to in community settings or legally omitted for anonymous testing). For viral hepatitis, consent requirements are less strict in many countries with written or documented consent being a requirement in six (1/18 west, 3/11 centre, 2/5 east) – generally in the form of a broad consent for all investigations.

**Conclusions:** Written or documented consent remains a requirement for HIV testing in more than a third of responding countries. A recommended procedure for obtaining consent in different settings will help reduce testing barriers and support European countries in reaching the first 95 target.

## LB61

### Increasing hepatitis C virus self testing (HCVST) testing uptake to improve access to HCV services in Nigeria

U. Daniel<sup>1</sup>, National Viral Hepatitis TWG (NVHTWG)

<sup>1</sup>United Nations Office on Drugs and Crime (UNODC), HIV/AIDS, Abuja, Nigeria

**Background:** 2.5 million people are infected with HCV in Nigeria, thereby making it a major public health concern. Though efforts around creating an enabling environment for eradication intensifies, uptake of testing remains painfully slow. To address this challenge, the FMOH, assisted by partners, adopted the WHO-recommended HCVST to increase testing uptake. The National Guidelines for Pre-

vention, Treatment and Care of Viral Hepatitis in Nigeria (2023) was also developed and more activities to generate evidence carried out.

**Description:** A HIVST feasibility study among 1,964 participants made up of PLHIV, PWID, MSM and SW was conducted in Nasarawa state, North Central Nigeria (2023). The study aimed at generating data on:

- 1) feasibility;
- 2) acceptability,
- 3) cost-effectiveness of HCVST (2023 – 2024).

The findings of the study would provide content for the first ever national guideline for HCVST.

**Lessons learned:** The study report showed that participants saw HCVST as feasible because it was convenient, private and it encouraged good health-seeking behaviours. The acceptability of HCVST was demonstrated in participants' knowledge and preference for the types of HCVST kits (blood-based, oral), as well as ease of use. For cost-effectiveness, HCVST was recommended as an additional approach to HCV testing, for community-based interventions and an effective strategy where there are appropriate and sustainable referrals and linkages. Findings from the study also informed the development of the National Guidelines for Hepatitis C Virus Self Testing which was launched on April 30, 2024.

**Conclusions/Next steps:** Evidence now exists that HCVST is feasible, acceptable, affordable and it can improve HCV testing rates. This is very useful as we begin to roll-out the Global Fund (GF) Grant Cycle 7 (GC7) from 2024 - 2026 in the country.

Scaling up this study to more states for more audience, age, gender and context-specific data that will further inform policy and programming even beyond 2026 is a priority activity in the updated national VH testing framework.

## LB62

### Fast track cities Bogota: an experience of multisectoral articulation for HIV response.

J.D.L.M. (Juan Franco)<sup>1</sup>, J.L. Ortiz<sup>2</sup>, V.A. Esteban<sup>3</sup>, M. Vera<sup>4</sup>, K.D. Mican<sup>3</sup>, L. Quitian<sup>4</sup>

<sup>1</sup>Fast Track Cities Committee, Bogota, Colombia, <sup>2</sup>UNAIDS, HIV Advisor for UNAIDS in RCO Colombia, Bogota, Colombia, <sup>3</sup>UNFPA Colombia, Professional specialized in combined HIV prevention, Bogota, Colombia, <sup>4</sup>District Secretary of Health of Bogota, HIV and Combination Prevention Referent, Bogota, Colombia

**Background:** In Latin America 56 cities have signed up to the Paris Declaration that includes them in the Fast Track Cities strategy, some have ratified their commitment to put communities at the center with the Seville Declaration.

On June 14, 2023, these Declarations were signed in Bogota. Since then, an Impulse Committee was formed.

The purpose of this intervention is to position the needs of the communities most affected by HIV in the agenda of the health, education, social integration and women's sectors of the local government.

**Description:** The Impulse Committee is made up of 15 civil society organizations from PLHIV and KP (transgender, sex workers, drug users, women, LGBTIQ+); international co-operation projects, health institutions, UN agencies (PAHO-UNFPA-UNAIDS) and the Health Secretariat.

The experience is a pioneer in the innovative approach because:

We have managed to involve the women's, education and social integration secretariats in the response to HIV, in addition to LGBTIQ+ public policies and sex work; generating a multisectoral response.

It has managed to regain trust between CBOs, local government and UN.

It has strengthened the advocacy capacity of CBOs. We have positioned The Work Plan with the new city government, achieving its inclusion in the draft 2024-2028 district development plan that guarantees its financial sustainability.

**Lessons learned:** Development of a work plan that seeks to strengthen the district's response to HIV with the adoption of combination prevention strategies.

Sustainability can be threatened by changes of government in countries with unstable democratic structures.

Putting communities at the center of the HIV response requires ensuring participation at all stages. A horizontal dialogue is necessary. In addition, to have sources of funding that allow their participation.

**Conclusions/Next steps:** The urban response to HIV is has a high potential to more accurately reflect the specific needs of a particular context.

The combination prevention approach allows linking sectors of government that have not been integrated into the HIV response.

The sustainability of the HIV response depends in turn on the sustainability of the involvement of activists and CBOs.

We are in the process of developing a guide for cities adapted to the Latin American context.

## EPLB01

Peer navigator support increases positive social support and smoking abstinence in people with HIV who smoke

P. Cioe<sup>1</sup>, M. Pinkston<sup>2</sup>, G. Stang<sup>1</sup>, K. Tashima<sup>3</sup>, C. Kahler<sup>1</sup>

<sup>1</sup>Brown University, Behavioral & Social Sciences, Providence, United States, <sup>2</sup>Brown University, Warren Alpert Medical School, Providence, United States, <sup>3</sup>Brown University, Infectious Diseases, Providence, United States

**Background:** Smoking prevalence among people with HIV (PWH) is high (40-50%) compared to the general U.S. population (13%), is associated with lung and other smoking-related cancers. PWH report that because smoking is common in their social networks, they lack social support for quitting.

We developed a tailored intervention entitled, *Peer navigation for social support for smoking cessation* (PNSS-S). This 24-week randomized pilot study examined feasibility, acceptability, and preliminary efficacy.

**Methods:** Sixty-four participants in the Northeast United States were enrolled between July 2020 and May 2022. Participants were randomized to PNSS-S or to standard care (SC; i.e., nurse-provided recommendation to quit and a quit line referral). All participants met once with a clinic nurse to discuss quitting strategies. Participants in the PNSS-S condition received 12 weekly phone calls from a peer navigator (PN) who was trained in standard smoking cessation counseling. Assessments were conducted at baseline, 4, 12, and 24 weeks.

**Results:** Mean age was 54.5 years (SD 10.9); 41% female. Mean cigarettes per day was 16.0 (SD 9.1). Average time smoking was 35.5 (SD 12.5) years; 14.9 (SD 44.8) lifetime quit attempts. Acceptability was high: mean number of calls with the PN was 8.9 (SD 3.1), and one-quarter of PNSS-S participants completed all 12 weekly calls with their PN. Mean satisfaction scores differed significantly by condition: PNSS-S (29.1 [SD 3.0]), control (25.8 [SD 4.1],  $p = .001$ ; scale range: 8-32). A significant increase in positive social support from baseline to week 12: 17.4 (SD 11.4) to 25.1 (SD 12.2), ( $t=2.4$ ,  $df$  26,  $p = .01$ ) (scale range: 0-40) was seen in PNSS-S but not in the control group, ( $t = 1.11$ ,  $df$  29,  $p=.24$ ). At week 24, 5 (16.6%) participants in PNSS-S and 3 (8.8) in SC endorsed 7-day point prevalence smoking abstinence: OR=2.045 95% CI=[0.45-10.88].

**Conclusions:** Cross-training HIV clinic-based PNs in smoking cessation is feasible. Engaging in peer-based smoking cessation counseling is acceptable to PWH and seems to provide increased social support. Preliminary abstinence rates favor the active intervention. PNSS-S shows preliminary promise as a strategy to increase positive social support for quitting smoking and increasing quit rates. Further study is warranted.

## EPLB02

HIV prevalence and viral load suppression among persons in prisons and staff in Uganda: results of a 2023 nationally representative prevalence survey

J. Ssempiira<sup>1</sup>, D. Lukoye<sup>2</sup>, J.B. Bwanika<sup>3</sup>, C. Kavuma<sup>4</sup>, R. Ssenyonga<sup>3</sup>, R. Nakityo<sup>4</sup>, K. Mwambi<sup>5</sup>, P. Birungi<sup>3</sup>, G.W. Kasule<sup>3</sup>, S. Sendagala<sup>4</sup>, G. Nantege<sup>5</sup>, S. Walusimbi<sup>3</sup>, D. Kasozi<sup>3</sup>, L. Malungu<sup>6</sup>, G. Tumusinze<sup>3</sup>, J. Kisambu<sup>6</sup>, E. Buregyeya<sup>3</sup>, S. Kasasa<sup>3</sup>, R.K. Wanyenze<sup>3</sup>, L.A. Mills<sup>7</sup>, L.J. Nelson<sup>7</sup>, S. Alamo<sup>5</sup>, A.G. Fitzmaurice<sup>1</sup>

<sup>1</sup>United States' Centers for Disease Control and Prevention (CDC) in Uganda, Office of Science, Kampala, Uganda,

<sup>2</sup>United States' Centers for Disease Control and Prevention (CDC) - Uganda, Health Services Branch, Kampala, Uganda,

<sup>3</sup>Makerere University School of Public Health, Kampala, Uganda, <sup>4</sup>United States' Centers for Disease

Control and Prevention (CDC) - Uganda, Data Science and Informatics, Kampala, Uganda, <sup>5</sup>United States' Centers for

Disease Control and Prevention (CDC) - Uganda, Kampala, Uganda, <sup>6</sup>Uganda Prisons Service, Kampala, Uganda,

<sup>7</sup>United States' Centers for Disease Control and Prevention (CDC), Atlanta, United States

**Background:** HIV prevalence in the general population (GP) in Uganda is 5.8%, but persons in prisons (PIP) face a greater HIV risk. A nationally representative survey was conducted in Uganda prisons in July and August 2023 to determine the prevalence of HIV and progress towards UNAIDS 95-95-95 targets among PIP and staff.

**Methods:** Using a multistage probability sampling design, 6,787 participants including 5,200 male PIP, 781 female PIP, and 806 prison staff were selected from 38 prisons in Kampala and four regions of Uganda (i.e., Eastern, Northern, Western, and Central).

All PIP aged  $\geq 18$  years and staff who were physically present on the day of the survey were eligible for the survey and provided venous blood samples to determine their HIV status (using national HIV rapid test algorithm) and viral load (VL).

Weights were calculated to account for differential selection probabilities and non-response. Descriptive and chi-square statistics were used to summarize and assess association between variables.

**Results:** A total of 6,065 (89.4%) participants were interviewed: including 4,647 (89.4%) male PIP, 707 (90.5%) female PIP, and 711 (88.2%) staff. Median age (interquartile range) was 30 (25-39) years.

A total of 5,743 (94.7%) were tested for HIV: 4,374 (94.1%) male PIP, 686 (97%) female PIP, and 683 (96.1%) staff. HIV prevalence was 10.9 % (95% CI: 10.0%-11.9%): 21.1% (95%CI: 18.2%-24.4%) among female PIP, 11.1% (95%CI: 10.2%-12.1%) among male PIP, and 2.3% (95% CI: 1.4%-3.8%) among staff. Out of the 654 participants with HIV, 606 (92.4%) were aware of their status, of whom 99.2% (601) were on

antiretroviral treatment (ART). Among those on ART, only 70% (394) had viral load suppression (VLS). All staff with HIV had VLS; VLS among female PIP was significantly lower than that of male PIP (53.1% vs. 69.9% ( $p < 0.0001$ )). VLS varied by region: 59.0% in Eastern to 83.5% in Central region.

**Conclusions:** HIV prevalence among PIP in Uganda was high - almost twice that in the GP. The 2<sup>nd</sup> 95 was achieved but the 1<sup>st</sup> and 3<sup>rd</sup> were still below the target of 95%. Enhanced diagnosis and treatment support for HIV among Ugandan PIP are needed to meet 2025 targets.

of Public Health Sciences, Rochester, United States, <sup>12</sup>Yale

University, Center for Interdisciplinary Research on AIDS,

School of Public Health, New Haven, United States

**Background:** Transgender women (TGW) experience more stigmatizing attitudes from institutions, social groups, and individuals. In Ghana, stigmatizing attitudes are exacerbated by legislation, cultural norms, and religious beliefs that favor heterosexuality and demonize other sexual orientations. As a result, TGW often feel devalued, anticipate external hostility, and internalize negative beliefs about their sexual orientations. Recent data suggest sensitization efforts are hampered by reinforced stigma within and across various socio-economic levels.

**Methods:** We used a qualitative research approach to investigate stigma experienced by TGW living in urban slum communities in Ghana. Participants were recruited through purposive sampling and snowball techniques. 20 TGW meeting specific criteria were interviewed individually, providing insights into the various forms of stigma they encounter, and at which levels these stigmas occurred.

**Results:** The data revealed that TGW experience stigma across various socio-ecological levels. At the public policy level, the LGBTQ+ bill emerged as a key driver of stigma. Various subcategories related to this bill included:

- Restrictions on freedom of expression,
- Potential to incite violence against LGBTQ+ individuals,
- Increased isolation to avoid harm,
- Fear of arrest and imprisonment.

At the institutional level, TGW encountered stigma in three areas. The first was at the Healthcare sector, this included, a. rude and unwelcoming behavior from medical staff.

The second was from Law enforcement officers, this included; a. extreme harassment and extortion by officers. Community level stigma encompassed;

- Insults, name-calling,
- Risk of physical harm due to cross-dressing, and,
- General fear of attacks from communities.

At the interpersonal level, TGW experienced,

- Fear of physical attacks,
- Threats of bodily harm,
- Emotional distress and suicidal thoughts,
- Rejection by family and friends.

At the individual/self-stigma level TGW experienced;

- Self-doubt and internal struggles,
- Feelings of regret and guilt,
- Increased stress, and anxiety.

**Conclusions:** Our result highlights the experiences of stigma for TGW living in urban slums. These results also highlight the pervasive and multi-layered stigma faced by TGW across different levels of society. Addressing this stigma requires a comprehensive approach that tackles issues from public policy to individual self-acceptance.

## EPLB04

### Expanding HIV viral load testing accessibility: lessons from differentiated service delivery (DSD) in Indonesia

I. Pambudi<sup>1</sup>, E. Lukitosari<sup>1</sup>, R. Romauli<sup>1</sup>, J. Sugiharto<sup>2</sup>,  
A. Juan<sup>2</sup>, A. Yuvensia<sup>2</sup>, Y. Runtu<sup>2</sup>, M. Soemarno<sup>2</sup>, A. Lailiyah<sup>2</sup>,  
M. Meilani<sup>2</sup>, D. Komalasari<sup>2</sup>

<sup>1</sup>Ministry of Health of Republic of Indonesia, Communicable Disease Prevention and Control, Jakarta, Indonesia, <sup>2</sup>Yayasan KNCV Indonesia, Jakarta, Indonesia

**Background:** Access to viral load (VL) testing for HIV treatment monitoring remains challenging for many individuals in Indonesia, with only 19% of those on antiretroviral therapy (ART) undergoing testing in 2022. Barriers such as stigma, distance, and limited opening hours persistently limit PLHIV's access to VL tests.

To tackle these obstacles, Yayasan KNCV Indonesia (YKI) supported the Indonesian National AIDS Program (NAP) to pilot a differentiated service delivery (DSD) model for VL

services aimed at improving VL testing coverage, as part of overall YKI's GF-supported technical assistance project in 2022-2023.

**Description:** The pilot targeted 25 high HIV-burdened districts with low VL testing coverage. Customizable service delivery models were offered to cater to the diverse needs of PLHIV. Each district selected suitable delivery models based on local contexts, with implementation lasting 1 to 4 months in 2023. Options included:

1. Extended Hours: Increasing HIV care, support, and treatment (CST) service duration by four hours on weekdays and weekends to assist PLHIV facing difficulties in accessing VL tests during the facility's normal hours.
2. Mobile VL: Providing VL testing outside CST facilities to support PLHIV experiencing stigma. This involved collaboration with community supporters to mobilize PLHIV to designated testing locations.
3. Home Visits: Healthcare workers visited PLHIV at their homes to collect VL specimens, addressing challenges related to distance and transportation costs.

**Lessons learned:** Results showed a significant 185% increase in the monthly average number of PLHIV whose specimens were sent for VL testing during the DSD periods compared to non-DSD periods in 2023. The „extra hours“ model demonstrated the highest increase at 191%.

DSD model	Number of districts	The average number of PLHIV whose specimens were sent for VL testing per month without DSD	The average number of PLHIV whose specimens were sent for VL testing per month during DSD	% increase
Extra hours	13	132	384	191%
Mobile VL	5	99	249	152%
Home visits	5	68	153	125%
Extra hours & home visits	2	138	393	185%
Total	25	113	322	185%

**Conclusions/Next steps:** The success of DSD underscores its efficacy in addressing access challenges to HIV VL testing. As all models showcased improvement, DSD is strongly recommended to support PLHIV encountering difficulties in accessing essential testing services. These findings highlight the positive impact of DSD on societal health outcomes, emphasizing its importance in HIV care strategies moving forward.
