**Background:** People with HIV (PWH) on effective antiretroviral therapy who achieve and maintain undetectable viral load cannot sexually transmit the virus. This message known as U=U (Undetectable equals Untransmittable) has the power to reduce HIV-associated stigma. Stigma is a significant barrier impacting early diagnosis, retention in care or access to specialized services, and negatively impacts quality of life for PWH.

This study aimed to evaluate public awareness, understanding and acceptance of U=U in three European countries: Austria (AT), Greece (GR) and Switzerland (CH).

**Methods:** We conducted three HIV public opinion surveys, using a questionnaire with closed-ended questions, to understand public opinion towards HIV transmission, PWH and U=U in 2021 (GR) and 2023 (AT, CH). Participants (age ≥18 years) were randomly selected and representative quota sampling across demographic variables such as age, gender, educational level, and geographic location within each country was ensured. Participants were recruited by a panel institute able to provide representative population surveys in each country.

**Results:** A total of 3969 individuals (AT:1000, CH:1015, GR:1954) participated in the surveys (49.0% male, 50.8% female, 0.2% diverse). On average, 64% of participants (AT:69%, CH:76%, GR:55%) stated that they were informed about HIV and 77% (AT:77%, CH:75%, GR:78%) agreed that, due to modern ART, HIV is no longer a deadly but a manageable chronic condition. Approximately 22% (AT:26%, CH:22%, GR:20%) understood the U=U message.

In contrast, 21% (AT), 20% (CH) and 29% (GR) believed that PWH are "a danger to society" and 8% (AT), 5% (CH) and 28% (GR) "not able to work at regular jobs", and 14% (AT, CH) and 25% (GR) would not start a friendship with PWH. Results were similar across gender, age, and education level groups. Knowledge about U=U was slightly greater among people living in urban areas.

**Conclusions:** U=U is a message with limited recognition that is not well understood by the public across 3 European countries. This lack of knowledge is accompanied by HIV-associated stigma. Effective awareness campaigns are needed to spread the U=U message and help foster a more informed and supportive public stance towards PWH.

## WEPEP342

'They think when you go for HIV testing you are a prostitute and suspected to have HIV': client perspectives of HIV treatment services from community-led monitoring in South Sudan

D. Kaawa-Mafigiri<sup>1,2</sup>, D.S. Tobijo<sup>2</sup>, F. Langetio<sup>2</sup>, J. Malia<sup>2</sup>, A. Asiki<sup>2</sup>, J. Okello<sup>2</sup>, A. Mawa<sup>2</sup>, Z.K. Kaunda<sup>2</sup>, J. Kandyang<sup>3</sup>, B.O. Ajack<sup>3</sup>

<sup>1</sup>Makerere University, School of Social Sciences, Kampala, Uganda, <sup>2</sup>The Rescue Initiative South Sudan (TRISS), Juba, South Sudan, <sup>3</sup>USAID South Sudan, Health Office, Juba, South Sudan

**Background:** Adherence to ART is a major challenge in resource limited settings. Communities emerging from recent conflict bear the brunt of low-quality services partly attributed to limitations of conventional, top-down models of design and implementation characterized with no engagement and involvement of affected persons. Community-led monitoring (CLM) models have shown promise in improving quality of services in resource limited settings. It is important to determine the influence of CLM on quality of services from clients' perspectives.

This qualitative study examined the perspectives of ART patients attending 22 PEPFAR funded HIV treatment facilities in 4 states of South Sudan undertaking CLM of quality of services.

**Methods:** Between January – October 2023, utilizing a CLM Citizen Social Science design, and following informed consent, client, health worker and community member interviews (n=1323); and facility observations (n=53) were conducted to understand the perspectives of clients at a total of 22 sites across 11 counties in South Sudan. Thematic content analysis of the interview transcripts was undertaken with the aid of Atlas ti software.

**Results:** Half the participants (50.1%, n=663) were females with a median age of 35 years, reflective of the young population as majority in South Sudan. 48.1% (n=637) had attained primary level or no education. Clients with previous negative experiences with ART services prior to CLM

implementation reported improved quality of services including shorter time spent at the clinics (48.4%, n=640), improved ambience and general cleanliness (60.2%, n=796), greater sense of security at the facility (62.8%, n=831), availability of drugs and supplies and improved health care providers' attitudes and practices towards patients.

These experiences potentially improved their adherence to treatment. Participants' perceived reduction in stigma and discrimination revealed positive perspectives about the CLM model.

**Conclusions:** With the inevitable scale-up of HIV treatment in conflict settings like South Sudan, focusing on efforts to improve quality HIV care services will positively impact patient advocacy and adherence to treatment. The CLM model appears to strength efforts to influence adherence to ART and in turn further reduce new infections in the region.

## WEPEP343

Implementation of a hybrid online-offline intervention to address HIV stigma and gender disparity for women living with HIV in Vietnam

C. Lin<sup>1</sup>, B.D. Nguyen<sup>2</sup>, H. Dang<sup>2</sup>, T.T. Nguyen<sup>2</sup>, L. Li<sup>1</sup>, M.G. Le<sup>2</sup>

<sup>1</sup>University of California, Los Angeles, Los Angeles, United States, <sup>2</sup>Hanoi Medical University, Hanoi, Viet Nam

**Background:** Women Living with HIV/AIDS (WLHA) encounter significant challenges due to HIV stigma and gender disparities. Moreover, in Vietnam's patriarchal society, WLHA often face additional stigmatization for being perceived as not adhering to traditional female virtues and/or unable to fulfill expected family caregiving roles.

This multifaceted stigma and the associated vulnerabilities significantly impede WLHA from seeking necessary HIV treatment and comprehensive healthcare services.

**Methods:** During 2021-2022, the study team developed an intervention combining three modalities: in-person, Zoom, and Zalo (the most popular Vietnamese social media platform) and piloted it with 91 WLHA in Hanoi, Vietnam. The intervention included two in-person sessions, "EMPOWER SELF" and "ENGAGE SUPPORT," focusing on reducing internalized stigma, active coping, effective communication for service-seeking and disclosure, and enhancing family relationships. The "LIVE WELL" Zoom session emphasized health service utilization and overall well-being.

Additionally, a 15-week Zalo curriculum was designed for weekly check-ins to monitor participants' health, reinforce in-person/Zoom session contents, and facilitate resource sharing and support among WLHA participants.

**Results:** There were varying levels of engagement by intervention modalities and participant characteristics. The in-person groups saw higher attendance among those who were unmarried (82% of unmarried WLHA at-

tending both sessions, compared to 48% of their married counterparts;  $p=0.0021$ ) and unemployed (79% vs. 52%;  $p=0.0184$ ). There were temporal fluctuations in in-person session attendance, and the attendance dipped before major lunar holidays.

Only 35 of the participants attended the Zoom session, with work schedule conflicts (19 participants), family responsibilities (9 participants), and technical issues (7 participants) being the main barriers.

The Zalo groups were highly engaging, with 9,307 messages exchanged over six months, featuring spontaneous sharing of employment/health resources and coping strategies.

**Conclusions:** These findings underscore the importance of tailored approaches that consider the WLHA's social/familial responsibilities and digital literacy when implementing an online-offline hybrid intervention.

The employment of mobile technologies, such as widely used social media platforms like Zalo, has a high potential to offer accessible and convenient support to WLHA in Vietnam.

However, additional technical assistance and support are warranted for Zoom to be an effective intervention delivery platform.

## WEPED344

### Understanding experiences of depression amongst adolescents living with HIV in Malawi

S. Mphonda<sup>1</sup>, B. Pence<sup>2</sup>, N. Bhushan<sup>3</sup>, B. Gaynes<sup>4</sup>, M. Stockton<sup>2</sup>, G. Sansbury<sup>5</sup>, H. Hedrick<sup>2</sup>

<sup>1</sup>University of North Carolina Project, Clinical, Lilongwe, Malawi, <sup>2</sup>University of North Carolina at Chapel Hill, Department of Epidemiology, North Carolina, United States, <sup>3</sup>RTI International Center for Communication Science, North Carolina, United States, <sup>4</sup>University of North Carolina at Chapel Hill, Department of Psychiatry, North Carolina, United States, <sup>5</sup>University of North Carolina Project, Lilongwe, Malawi

**Background:** Sub-Saharan Africa has the world's largest population of adolescents living with HIV (ALWH). Compared to adults in the region, ALWH have lower rates of viral suppression and greater rates of lost loss to follow-up. ALWH are at risk of depression, which in turn affects adherence to medication and engagement in HIV care.

This study explored the experiences of adolescents living with HIV and experiencing depression in Malawi to inform intervention development.

**Methods:** We conducted in-depth interviews, focus group discussions, and social support mapping with 25 adolescents living with HIV (ALWH), 13-19 years, diagnosed with depression to understand their experiences living with HIV and experiencing depression. ALWH were screened with the Beck's Depression Inventory II (BDI-II). The interviews were transcribed and thematically coded using Dedoose.

**Results:** Most participants attributed their depression to stigma and poor relationships with family and peers as a result of their HIV status. They described feeling unwanted and less important when people discovered they were HIV positive and were on ART. Self-isolation, sadness, and anger about how they acquired HIV were common, as were feelings of worthlessness and suicidal thoughts. ALWH stated that depression affects their social lives, academic commitments, relationships with family members, and HIV care, which leads to poor ART adherence and poor health. With their HIV status, some adolescents expressed uncertainty about achieving their goals. In addition to taking away their confidence, this uncertainty increases their sadness. There was good knowledge of the burden of depression but participants were not aware of the available treatment options and where to access care.

**Conclusions:** Addressing depression among adolescents is essential for addressing their mental and HIV-related health. Mental health interventions should be tailored to the needs of this population, including providing education and access to mental health services. The findings will inform the development of an intervention that can be implemented in countries with unmet needs for psychosocial counseling and support.

## WEPED345

### Acceptability of point-of-care urine tenofovir testing for ART adherence monitoring in South Africa

N. Bhengu<sup>1</sup>, J. Simoni<sup>2</sup>, M.S. Zondi<sup>1</sup>, K. Tlhaku<sup>1</sup>, E. Hill<sup>3</sup>, J. Dorward<sup>1,4</sup>, N. Garrett<sup>1,5</sup>, P. Drain<sup>3,6,7</sup>, A. Bardon<sup>8</sup>

<sup>1</sup>Centre for the AIDS Programme of Research in South Africa (CAPRISA), Durban, South Africa, <sup>2</sup>NIH Office of Behavioral and Social Sciences Research, Bethesda, United States, <sup>3</sup>University of Washington, Department of Global Health, Seattle, United States, <sup>4</sup>University of Oxford, Oxford, United Kingdom, <sup>5</sup>University of KwaZulu-Natal, Durban, South Africa, <sup>6</sup>University of Washington, Department of Medicine, Seattle, United States, <sup>7</sup>University of Washington, Department of Epidemiology, Seattle, United States, <sup>8</sup>Washington University, Department of Medicine, St. Louis, United States

**Background:** Point-of-care urine tenofovir (POC TFV) testing may detect adherence issues more accurately than self-report and earlier than viral load testing. We aimed to assess the acceptability of monthly POC TFV testing among people living with HIV (PLWH) initiating ART and healthcare workers (HCWs) in KwaZulu-Natal, South Africa.

**Methods:** We conducted semi-structured in-depth interviews (IDIs) with eight HCWs and 20 PLWH who were enrolled in STREAM HIV (NCT04341779), a randomized controlled trial evaluating the effects of a monthly POC TFV

testing intervention to monitor ART adherence in the first five months of treatment. Participants were actively engaged in the testing process and results interpretation. We purposively sampled intervention participants for IDIs at their six-month follow-up visit, aiming to achieve a diverse sample by sex, age, and POC TTV test results.

We coded and analyzed IDI transcripts to identify themes and assess the overall acceptability, preferred form of adherence monitoring among PLWH, and willingness to use the intervention among HCWs.

**Results:** All PLWH and HCWs were highly accepting of monthly POC TTV testing over the first five months of treatment. All PLWH preferred POC TTV testing over self-reporting their adherence, and all HCWs were willing to use POC TTV testing to monitor ART adherence. Generally, POC TTV testing was perceived to be low-burden, have few opportunity costs, and have several positive effects.

The most common reasons for liking the intervention included motivation for improving adherence, accountability for adherence, facilitated adherence counseling, recognition for good adherence, and being included in the testing process. Positive effects mentioned included consistent ART adherence, strong client-provider relationship and communications, and accurate self-reporting of adherence.

Negative perceptions included fear and anxiety about test results, discomfort with providing urine, and concern about the test's utility for PLWH with consistent adherence; but these concerns did not affect their overall acceptability of the intervention.

**Conclusions:** Among HCWs and PLWH initiating ART in South Africa, monthly POC TTV testing was highly acceptable, preferred over self-report, and perceived to have many benefits. POC TTV testing holds promise as an acceptable and beneficial tool for motivating optimal ART adherence, improving adherence monitoring, and improving client-provider relations.

## WEPED346

### Removing socio-economic and structural barriers for the return of interrupting treatment clients

S. Benefour<sup>1</sup>

<sup>1</sup>University of Ghana, Legon, Tema, Ghana

**Background:** Adherence continues to be a major barrier to successful treatment of highly active antiretroviral for People Living with HIV. Non-adherence to ART medications result in the multiplication of HIV and this increases the risk of drug resistance and HIV treatment failure. Poor adherence also leads to the destruction of the immune system thereby making it difficult for the body to fight off diseases. Factors affecting non-adherence are related to PLHIV, the medication and the system of care. In this study, we have chosen to examine factors that are related to client care among interrupting treatment clients.

**Description:** Quarterly data quality assurance exercises are carried out at 84 ART health facilities in the Western, Western North and Ahafo regions in Ghana to assure quality data reporting. Review of programmatic data revealed that 43% of individuals had interrupted treatment. A meeting was held with ART staffs, case managers and PLHIV to identify the causes of skipping treatment. Factors identified included stigma and discrimination, long distances to ART sites and poor transportation networks.

These findings were discussed to the Regional and District Health authorities in the operational sites. Stakeholders' meeting was convened to discuss the social and structural barriers identified. There was a consensus from the meeting to train 54 midwives at Community Health Planning and Services Compounds (CHPS) as medication pick-up points. The training was based on national curricula in line with differentiated service delivery strategies. CHPS are widely located in almost every community. This allows clients choices in deciding where to go for re-fill.

**Lessons learned:** The trained 54 midwives at the 27 pick-up points are sustaining the provision of improved HIV services.

Overall, 225 PLHIV who had previously interrupted treatment were offered enhanced adherence counselling and given the opportunity to decide where to go for re-fill. One hundred and twenty-one (121) out of the 225 (53.77%) PLHIV go for re-fill from CHPS of their choice thereby minimizing transportation costs and avoiding stigma.

**Conclusions/Next steps:** Service providers and Program Mangers should solicit client feedback to help remove remove social and structural barriers impeding access to and retention in care.

## WEPED347

### Motivating HIV-positive sex workers for ARV adherence: a success story from Manthan Foundation

A. Bhatt<sup>1</sup>, D. Nikam<sup>1</sup>, S. Nagarkar<sup>2</sup>

<sup>1</sup>Manthan Foundation, Pune, India, <sup>2</sup>Savitribai Phule Pune University, Pune, Department of Library and Information Science, Pune, India

**Background:** Established in 2010, Manthan Foundation actively supports around 3000 Female Sex Workers (FSWs) in Pune's Budhwar Peth red light area. It has recently introduced the Annapurna program (2022-23) in which a dry nutrition kits were distributed to 90 HIV positive FSWs for one-year. This was also supported by other strategies. The foundation's observation revealed that not all FSWs were undergoing regular viral load testing.

This study identifies key barriers to adherence, such as fears related to ARV side effects and concerns about taking medications without proper nutrition. The program aims to address challenges in Antiretroviral (ARV) adherence among FSWs.

**Description:** In support of the U=U (Undetectable = Untransmittable) campaign, the Manthan Foundation has considered three approaches, including dry nutrition food kits. They've been doing regular counselling, visiting on-site, and organizing support group meetings to encourage FSWs to stick to their ARV medication schedule. They decided to do these extra things because some FSWs lacked confidence due to not being able to read and not knowing much about medicines.

**Lessons learned:** All the strategies have produced significant results, as evidenced by the successful suppression of viral loads among all HIV-positive female sex workers after one year. Out of 90 FSWs tested, 8.88% exhibited viral unsuppression before the study.

After applying four strategies they become virally suppressed. 92% FSWs remain suppressed after one year. Food kit helped in maintaining the health of FSW. Counselling improved mental health whereas sight visits created a sense and belief among FSWs that someone cares for them.

The success of this program for formation of Community ART Refill Group (CARG) as per the National Guidelines for HIV care and treatment, by National Aids Control Organization, Ministry of Health, Government of India.

**Conclusions/Next steps:** The Manthan Foundation will attempt to replicate its success story among transgender individuals and truck drivers. Significant efforts include leveraging technology to enhance ARV literacy. Serving as a community center, Manthan will establish a digital learning facility accessible via mobile phones, ensuring inclusivity for FSWs without smartphones.

Acknowledging information vulnerability arising from information illiteracy, the foundation emphasizes the importance of addressing this for the well-being of this high-risk group.

## WEPED348

Determinants and evolution of quality of life in people living with HIV: analysis of client-reported outcome data in the HIV clinic of Antwerp, Belgium, 2016-2023

G. Scheerder<sup>1</sup>, E. Van Landeghem<sup>1</sup>, T. Smekens<sup>1</sup>, M. Aerts<sup>2</sup>, E. Cleve<sup>2</sup>, K. Courjaret<sup>2</sup>, E. Hemelaer<sup>2</sup>, C. Lamonte<sup>2</sup>, M. Massar<sup>2</sup>, L. Mertens<sup>2</sup>, W. Mertens<sup>2</sup>, W. Vanden Berghe<sup>2</sup>, V. Barvaux<sup>2</sup>, B. Hensen<sup>1</sup>, C. Nöstlinger<sup>1</sup>

<sup>1</sup>Institute of Tropical Medicine, Department of Public Health, Sexual Health and HIV Research Unit, Antwerp, Belgium, <sup>2</sup>Institute of Tropical Medicine, Department of Clinical Sciences, HIV and STI Clinic, Antwerp, Belgium

**Background:** With HIV evolving into a chronic disease, attention is shifting to the '4<sup>th</sup> 90': improving quality of life (QoL) beyond viral load suppression. Little is known, however, about determinants of QoL and how it evolves over time.

**Methods:** We analyzed routine data on QoL of people living with HIV (PLWH) followed-up at the HIV clinic of Antwerp between 2016-2023. We measured QoL through the WHO-QOL-HIV BREF (31 items) and assessed relevant psychosocial characteristics, including the Health Monitor (health control and acceptance). Using logistic regression we analyzed associations of QoL, adjusting for co-variables. Evolution of QoL across repeated measurements was calculated for a standardized time period (mean evolution score per year).

**Results:** We used data from N=1068 PLWH at baseline and n=470 at follow-up. The majority, 873 (82,6%) had a European and 183 (17,3%) a non-European nationality. Overall, 76,0% had a (very) good QoL, but those with non-European nationalities and heterosexual people scored significantly lower compared to those with European nationalities (68,9% vs 77,4%, p=.01) and homo- or bisexual people (72,0% vs 77,9%, p=.04), respectively. The lowest ranking items were anxiety and depression, satisfaction with sex life, and sleep quality. Acceptance of HIV status, nationality, sexual orientation, relationship status, subjective health, medication adherence, comorbidities and perceived control were positively associated with QoL after controlling for co-variables. Those with high acceptance were 8,2 (CI: 4,9 – 14,1) times more likely to have a good QoL. The longitudinal analyses revealed a significant, but limited improvement in QoL over time: a mean increase per year of 1,18 (CI: 0,8 – 1,6) on the WHO-QOL-BREF score. After controlling for co-variables, perceived control was negatively associated with evolution in QoL.

**Conclusions:** 76% of PLWH in our sample had a good QoL. While this is an important achievement, it is below a potential target of 90%. PLWH with a non-European nationality had a lower QoL and may benefit from a targeted approach. Acceptance of HIV status was the strongest determinant of QoL and may thus be an important focus of interventions. The limited progress in QoL over time indicates the need for tailored interventions to improve QoL.

## WEPED349

Substance use, adolescent pregnancy and adverse social factors among young adults living with perinatally-acquired HIV in Argentina

V.Z. Ortiz<sup>1</sup>, M.L. Santos<sup>1</sup>, J. Vega<sup>1</sup>, S. Arazi Caillaud<sup>2</sup>, J.Á.E. Barletta<sup>1</sup>, M.J. Rolón<sup>1</sup>

<sup>1</sup>Hospital Fernandez, Infectious Diseases Division, Ciudad Autónoma de Buenos Aires, Argentina, <sup>2</sup>Hospital Garrahan, Department of Epidemiology and Infectious Diseases, Ciudad Autónoma de Buenos Aires, Argentina

**Background:** Adults living with perinatally-acquired HIV (paHIV) face a high burden of HIV-related and non HIV-related complications. In Latin America, there is no available data regarding the social and behavioral aspects of

this population and their potential impact on HIV-related outcomes. This study aims to describe the prevalence of substance use, adolescent pregnancy, psychotropic medication prescription, incarceration and housing instability in a cohort of adults living with paHIV in Buenos Aires, Argentina.

**Methods:** Retrospective cohort study. PLpaHIV aged >16 linked to care in an HIV clinic in Buenos Aires, Argentina between Oct-2008 and Sep-2023 were included. Data was collected from clinical records and surveillance systems.

**Results:** A total of 169 PLpaHIV were included, characteristics of the study population are shown in table 1. Prevalences of substance use and tobacco smoking were 18% and 19%, respectively (Graphic 1).

There were 107 pregnancies in 54 women. Exact pregnancy dates could be ascertained in 95 cases, and 45% (43/95) were adolescent pregnancies. Prevalence of psychotropic medication prescription was 16%. At least one incarceration was experienced by 3% of the participants and 4% met unstable housing criteria.

	n/median (%/Q1-Q3)
Gender Cis women	101 (59.8)
Trans women	1 (0.6)
Cis men	67 (39.6)
Age at start of follow-up (years)	19 (18-21)
Individual follow-up (years)	5.7 (3.2-9.4)
Prevalence of advanced HIV disease (ever) <sup>1</sup>	109 (64.4)
Viral suppression <sup>2</sup> Participants with undetectable viral load in >90% of determinations	43 (25.4)
Participants without any undetectable viral load determination	38 (22.5)

Notes: <sup>1</sup>Defined as CD4 cell count <200 cel/uL and/or a WHO clinical stage 3/4. <sup>2</sup>Plasma viral load data was missing in 9 participants. Due to changes in the limit of quantification of the available assays, undetectable viral load was defined as <400 copies/mL until 2011 and as <50 copies/mL afterwards.

Table 1 - Cohort characteristics (n=169)

Graphic 1. Frequency of substances used (n=89).

**Conclusions:** In our cohort, adults living with paHIV have a high prevalence of substance use, adolescent pregnancy and adverse social factors. These results highlight the importance of an interdisciplinary approach in the HIV services offered to this population. To our knowledge, this is the first non-biomedical description of adults living with paHIV in Latin America. Further research is needed to explore the potential association between our findings and HIV-related outcomes.

## WEPED350

### Using a behavioral change communication intervention to create demand and enhance PrEP uptake in South Sudan

G. Achan<sup>1</sup>, P. Buruga<sup>2</sup>, A. Kinuthia<sup>3</sup>, E. Tumbare<sup>4</sup>, G. Moses<sup>5</sup>

<sup>1</sup>Ndejje University, Social Sciences, Kampala, Uganda,

<sup>2</sup>Hebrew University of Jerusalem, Public Health, Jerusalem, Israel,

<sup>3</sup>University of Nairobi, Nursing, Nairobi, Kenya,

<sup>4</sup>University of Liverpool, Public Health, Liverpool, United Kingdom,

<sup>5</sup>Gulu University, Public Health, Gulu, Uganda

**Background:** Pre-exposure prophylaxis (PrEP) was first rolled out in South Sudan by the Ministry of Health, with PEPFAR support through USAID's Advancing HIV Epidemic Control Activity (AHEC), implemented by IntraHealth International with local partners. Implementation commenced in September 2022, focusing primarily on key populations. By September 2023, South Sudan had enrolled only 2,416 clients compared to a national target of 4000. This low uptake was attributed to the communities' lack of PrEP information, fear of medication burden, stigma and myths about PrEP being medication only for HIV-positive youth, men, and women.

**Description:** In January 2023, IntraHealth developed communication strategies focused on behavioral change and integrated the intervention into primary health care initiatives and the communities. This included raising PrEP awareness using flyers, community sensitization, health education to improve clients' HIV knowledge, and encouraged behavioral change using socially acceptable modalities. IntraHealth published PrEP success stories and collaborated with Jhpiego to enroll eligible adolescent girls and young women on PrEP.

**Lessons learned:** Structured communication, delivered through multi-media, interpersonal and group-level methods, can facilitate development of PrEP awareness and demand creation for marginalized populations by influencing policy, changing community attitudes, and raising awareness on the impacts of stigma and discrimination to break barriers to HIV service access, increase awareness of service availability and benefits, relieving clients' fear and anxiety. PrEP uptake in South Sudan has increased by 100 percent in a year, from zero in September 2022 to 2,416, in September 2023, following IntraHealth International's initiation of the behavioral change communication strategy in January 2023. Juba recorded the highest PrEP uptake, increasing from zero in September 2022 to 1,450 in September 2023, comprising 60% of the national total, increasing PrEP initiation by 100 percent. This behavioral change adoption resulted from the national commitment to scale-up HIV prevention interventions and strategies designed for key and priority populations.

**Conclusions/Next steps:** Development and implementation of a structured communications strategy is critical for creating demand for new HIV interventions to reduce

the rate of new HIV acquisitions in South Sudan. Intra-Health International will support the Ministry of Health to develop national behavioral change communication strategies for HIV prevention in 2024.

## WEPED351

### Enhancing treatment literacy for people living with HIV: insights from a multi-country qualitative study

A. Ismail<sup>1</sup>, F. Ullah<sup>1</sup>, M. Fernandez<sup>1</sup>, S. Sharma<sup>1</sup>, S. Malone<sup>2</sup>, L. Rambally-Greener<sup>2</sup>, B. Richman<sup>3</sup>, R. West<sup>1</sup>

<sup>1</sup>Ipsos, London, United Kingdom, <sup>2</sup>Population Services International, Johannesburg, South Africa, <sup>3</sup>Prevention Access Campaign, New York, United States

**Background:** Research is needed to better investigate the gaps and challenges in treatment literacy among PLHIV in Malawi, South Africa and Zimbabwe to provide guidance for ways to improve communication and information sharing between healthcare providers and clients, particularly among key and vulnerable populations.

**Methods:** A diverse group of PLHIV including men having sex with men, transgender individuals, and female sex workers, were recruited from the community. Local research teams conducted 60-minute in-depth interviews with a total of 64 participants across the three countries.

**Results:** Interviews were conducted with 62 PLHIV (Malawi n=25, South Africa n=21, and Zimbabwe n=16). Thematic analysis revealed that PLHIV had good understanding of how to take their medication and messaging around compliance and consistency was clear. They had some understanding of why it was important to take ART and how it works, but there was room to strengthen their understanding particularly around U=U. Language used by HCPs was often overly clinical and difficult to understand or perceived as very and negative and critical.

A significant number of PLHIV also reported insufficient information about the potential side effects of their medication, leading to unrealistic expectations and inadequate management of side effects. Respondents generally had a low level of HIV literacy to start with, and persistent misinformation and rumours about ART in the community also belied a need for an ongoing dialogue with their providers about ART.

It was also revealed that information about HIV and ART was typically provided in a one-off engagement (at the point of diagnosis), while the reality of living with a chronic illness means that information about different issues will be required at multiple points along the way.

**Conclusions:** This study identified several ways in which communication about HIV and ART could be improved. Providing more information about how ART works and the long-term benefits of ART, providing information about side-effects so that clients know what to expect and how to manage them, and fostering a supportive

environment are crucial in improving treatment literacy to ensuring better health outcomes for PLHIV. Moreover, building treatment literacy should be viewed as ongoing process, rather than a one-off conversation.

## WEPED352

### Harmonizing faith and health: collaborative strategies for effective HIV interventions – Lessons from Malawi

P. Banda<sup>1</sup>, S. Mapemba<sup>1</sup>, A. Magombo<sup>1</sup>, V.P. Munthali<sup>1</sup>

<sup>1</sup>Palladium Group, PROPEL Health, Lilongwe, Malawi

**Background:** Religious beliefs may sometimes deter access to health care of its members including HIV/AIDS services. PROPEL Health, Malawi has leveraged its partnership with Ministry of Health (MoH) and Faith Based Organizations (FBOs) and coordinated HIV/AIDS activities, data capturing, and planning. The eight FBOs have been provided with grants to reach men and boys with HIV services. Working at the decentralized level, FBOs work with the government team to mobilize faith community members for HIV testing, facilitating linkages to HIV care and supporting treatment adherence.

**Description:** FBOs have gone beyond demand creation through main church or mosque services. They have worked with government to provide HIV services at the places of worship and referred congregants to HIV care. At project design, FBOs workplans are co-created and align with government priorities. HIV messaging package development and HIV trainings are conducted by the Ministry of Health and faith leaders to ensure compliance to national guidelines.

The implementation includes a robust referral system, linking faith leaders/FBOs to health facilities, ensuring eligible clients receive HIV testing, treatment, and care. Referral slips are used in the process. Standardized reporting tools facilitate data sharing between FBOs and the Ministry of Health and provides audit trail for simplified supply chain reconciliation.

#### Lessons learned:

- Strong collaboration established between FBOs and Ministry of Health at all levels is a pivotal factor in ensuring alignment with national health strategies, priorities, and guidelines and being reported from the decentralised level to the national level.
- Leveraging FBOs' pre-existing structures for women, men, and youth streamlines targeted interventions, fostering efficient outreach and engagement. Use of religious stewards and volunteers optimizes the reach of the community in the human resource constrained public health system thereby ensuring sustainability.
- Standardizing Monitoring and Evaluation (M&E) tools with government tools across all FBOs ensures uniform data collection for data quality and validity thereby enhancing comparability of results.

**Conclusions/Next steps:** The collaboration between FBOs and government has demonstrated the effectiveness of aligning community-focused HIV/AIDS interventions with national health strategies, guidelines, and M&E tools. Moving forward, this model will be sustained, and lessons being learned will continuously be adapted.

## WEPED353

Multiple axes of social-structural marginalization associated with multi-faceted enacted HIV stigma in healthcare among women living with HIV in Metro Vancouver, Canada

M. Ohtsuka<sup>1,2</sup>, K. Shannon<sup>1,2</sup>, G.S. Ogilvie<sup>1</sup>, A.M. Gadermann<sup>1</sup>, C.H. Logie<sup>3</sup>, A. Tallo<sup>2</sup>, C. Thompson<sup>2</sup>, E. Aikema<sup>2</sup>, H. Zhou<sup>4,2</sup>, W. Bartels<sup>2</sup>, K.N. Deering<sup>1,2</sup>

<sup>1</sup>University of British Columbia, Vancouver, Canada, <sup>2</sup>Centre for Gender and Sexual Health Equity, Vancouver, Canada,

<sup>3</sup>University of Toronto, Toronto, Canada, <sup>4</sup>Simon Fraser University, Vancouver, Canada

**Background:** Despite evidence suggesting enacted HIV-related stigma is associated with sub-optimal healthcare access and antiretroviral therapy (ART) adherence, limited research has investigated multi-faceted enacted HIV-related stigma within healthcare (i.e., denial of care, HIV status disclosure without consent).

The objectives of this study are therefore to identify the prevalence of, and social-structural factors associated with, enacted HIV-related stigma in healthcare among women living with HIV (WLWH).

**Methods:** Data were drawn from two years (September/20-Aug/22) of the SHAWNA Project (Sexual Health and HIV/AIDS: Women's Longitudinal Needs Assessment)—a longitudinal community-based open cohort with biannual interviews of cis and trans WLWH who live and/or access care in Metro Vancouver, Canada.

Separate multivariable logistic regression models with generalized estimating equations (GEE) were utilized to identify social-structural factors associated with recent (past 6-months) enacted HIV stigma in healthcare. Adjusted odds ratios (AOR) and 95% confidence intervals (95%CI) are presented.

**Results:** The study sample included 200 WLWH with 545 observations. The median age was 50 years (IQR: 42-55 years); 13% reported a minoritized gender; 53% reported being Indigenous, 36% White, 5% Black, and 6% otherwise racialized/women of colour.

Overall, 23% reported ever experiencing enacted HIV-related stigma in healthcare. In a sub-analysis of 52 women who reported perpetrators of enacted HIV stigma in healthcare, the most common were hospital (n=27; 52%) and family physician (n=11; 21%) staff.

In multivariable analyses with GEE, greater odds of reporting enacted HIV-related stigma in healthcare were associated with food and housing insecurity (vs. food and

housing secure) (AOR: 2.88, 95%CI: 1.00-8.30); Indigenous identity (vs. White) (AOR: 3.13, 95%CI: 1.45-6.78), and minoritized sexuality (LGBQ2S) (vs. heterosexual) (AOR: 2.03, 95%CI: 1.09-3.78).

**Conclusions:** Findings suggest WLWH occupying multiple axes of social-structural marginalization (i.e., co-occurring socio-economic insecurities, LGBQ2S, and Indigenous identities) are more likely to experience enacted HIV-related stigma in healthcare. Given ways enacted HIV-related stigma profoundly contributes to sub-optimal healthcare engagement, it remains critical that healthcare provider training and policy guidelines apply evidence-based HIV-related stigma reduction strategies to improve healthcare equity among WLWH. Trauma-informed practices that mitigate effects of HIV-related stigma and intersecting social-structural marginalization must be queer affirming and address anti-Indigenous racism and cultural safety.

## WEPED354

An examination of the cumulative effects of trauma and LGBTQ+-related violence experience on the mental health of Black and Latino sexual minority men at-risk for or living with HIV

W. Bagby<sup>1</sup>, M. Wharton<sup>2</sup>, J. Egbunikeokye<sup>1</sup>, A. Rivas<sup>1</sup>, O. Harris<sup>1</sup>

<sup>1</sup>University of California, San Francisco, Community Health Systems, San Francisco, United States, <sup>2</sup>University of Rochester, School of Nursing, Rochester, United States

**Background:** Black and Latino sexual minority men (BLSMM) living with or at-risk for HIV experience higher rates of trauma and violence, which are greater than their white counterparts. Sexual identity stigma from society, healthcare providers, and self (internalized) create barriers to seeking mental health support or HIV prevention and treatment services. Missing from the literature is thorough examination of the lived experience around the cumulative effects of trauma and LGBTQ-related violence experienced by BLSMM.

Thus, the purpose of this study is to examine the cumulative effects of trauma and LGBTQ-related violence experience on the mental health of BLSMM, and identity opportunities for treatment and support.

**Methods:** In this qualitative descriptive study, we utilized in-depth, individual, semi-structured interviews as the primary source for data collection. Data were collected between August 2021 and December 2022 from 41 adult participants in California and New York. Interviews were recorded, transcribed verbatim, and analyzed using thematic content analysis.

**Results:** Participants range in age from 19-65 years. Majority described their gender as male (93%) with the remaining identifying as other. Black participants comprised majority of the sample (73%), with Latinos account-

ing for 25%. Participant narratives described significant struggles with mental health due to the negative impacts of issues related to their intersectional identities (i.e., homophobia, transphobia, gender nonconforming expressions), experience with racism, violence, and other forms of trauma. Perpetrators of such violence included known individuals (i.e. family members and intimate partners) and unknown individuals (i.e., police or anonymous partners).

Participants also experienced barriers to seeking mental health support in order to heal from the violence and trauma they have experienced due to a dearth of available mental health services and a lack of cultural humility from providers.

Additionally, healing was complicated by both internal and external barriers to mental health treatment and support due to the COVID-19 pandemic.

**Conclusions:** These findings highlight how the cumulative effects of trauma and violence negatively impact mental health. The results also highlight how limited access to mental health support and treatment further exacerbate these challenges among BLSMM. Therefore, urgent public health interventions are needed to strengthen mental health support and treatment services among BLSMM.

## WEPED355

Drivers of viral load suppression among HIV-positive people who inject drugs (H+PWID) in Dhaka Metropolitan Area: accessibility, adherence and social context in Bangladesh

C.A.A. Asif<sup>1</sup>, S. Islam<sup>1</sup>, P. Bouey<sup>2</sup>, I. Muhammad<sup>2</sup>, R. Khan<sup>1</sup>

<sup>1</sup>Save the Children, HIV/AIDS Program, Dhaka, Bangladesh,

<sup>2</sup>Save the Children, HIV/AIDS Program, Washington, United States

**Background:** Save the Children International (SCI) actively addressed HIV in Bangladesh, spearheading PWID interventions across 13 districts. The SCI consortium started viral load testing among H+PWID in June 2022. Till December 2022, 716 H+PWID were tested where 71% of them were virally suppressed.

This study aims to uncover factors contributing to suppressed and non-suppressed viral load results in this population in addressing the challenges faced by H+PWID.

**Methods:** A mixed method design was applied for data collection during November-December 2023. Quantitative survey was conducted with 261 H+PWID (198 virally suppressed and 63 not suppressed) across eight comprehensive drop-in-centers (CDICs) in Dhaka Metropolitan City. Qualitative information in 8 CDICs was collected from 8 focus group discussions with H+PWIDs.

**Results:** The average age of the sampled H+PWID was 44.37 with a variation across virally suppressed (43.01) and not suppressed (48.36) and more than half of them

cannot read and write. The average distance of the H+PWID from CDICs was 2.83 kilometers (2.2 km for virally suppressed and 3.1 for not suppressed). A total of 56% and 44% of the virally suppressed and not suppressed populations respectively reported that they faced side-effects after taking ARV medicine.

Around 50% of the suppressed and 20% not suppressed H+PWID are receiving ARV by their own initiative. Multi-variable logistic regression analysis adjusted for individual reveals that H+PWID were more likely than virally not suppressed to be young (adjusted odds ratio, AOR: 0.94; 95% confidence interval, CI: .88-1.00;  $p < 0.56$ ), proximity to CDIC (AOR: 1.41; 95% CI: .98-2.04;  $p < 0.064$ ), facing no side-effect after receiving ARV (AOR: 0.19; 95% CI: .05-.73;  $p < 0.015$ ) and received ARV medicine willingly (AOR: 0.06; 95% CI: 0.01-0.36;  $p < 0.002$ ). H+PWID are less likely to be virally suppressed were verbally insulted/threatened by the society (AOR: 0.02; 95% CI: 0.001-0.32;  $p < 0.007$ ).

**Conclusions:** To improve long-term adherence, existing national HIV prevention program should increase the availability of ARV drug distribution facilities closer to PWID communities and explore alternative ARV regimens with fewer side effects with easier dosing schedules. In addition, implementing community-based stigma reduction programs to cater to the specific needs of PWID.

## WEPED356

Health-related quality of life pattern and correlates: a cross sectional assessment of people living with HIV in South Carolina

S. Qiao<sup>1</sup>, I. Esu<sup>1</sup>, L. Xiaoming<sup>1</sup>, M. Brown<sup>2</sup>, P. Addo<sup>2</sup>

<sup>1</sup>University of South Carolina, Health Promotion Education and Behavior, Columbia, United States, <sup>2</sup>University of South Carolina, Epidemiology, Columbia, United States

**Background:** The World Health Organization's new global health strategy on HIV highlights the importance of the health-related quality of life (QoL) among people living with HIV (PLWH).

To inform interventions of improving QoL of PLWH, the current study aims to examine correlates of QoL among PLWH using data from South Carolina, USA

**Methods:** Cross-sectional survey data were collected from May 2018 to September 2018 from 517 PLWH receiving care at a large, immunology center in South Carolina that provides comprehensive HIV services.

Data were collected on sociodemographic characteristics, HIV risk behaviors, HIV QoL and other clinical information using existing scales including the WHO quality of life scale (WHOQOL-HIV-BREF), Stigma scale, 9-item Patient Health Questionnaire (PHQ-9) Depression scale and Resilience scale (CD RISC).

Descriptive statistics were calculated and simple and multiple linear regression analyses were used to identify factors associated with HIV QoL.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Results:** This study included 386 (66.7%) males and 131 (33.7%) females. The mean HIV QoL score for each domain were  $11.7 \pm 2.28$  (Physical),  $14.05 \pm 2.87$  (Physiological),  $14.9 \pm 2.59$  (Independence),  $16.59 \pm 3.41$  (social),  $15.98 \pm 3.16$  (Environmental) and  $8.97 \pm 3.10$  (Spiritual). Females scored significantly higher in the social domain of QoL;  $16.36 \pm 3.63$ ,  $16.83 \pm 3.16$  ( $t$  test = -1.294,  $P$ -value = 0.048).

PLWH with higher levels of resilience reported higher scores in the physical, physiological, independence and social domains of the QoL. Coping, resilience, internalized stigma, social support and support for ART adherence were all positively associated with overall QoL.

However, this finding slightly differed for each of the 6 domains that make up the overall QoL.

**Conclusions:** Since QoL is a subjective evaluation of one's perception of their daily life, social factors play a crucial role on how PLWH perceive their QoL. Intervention efforts should include a multidisciplinary approach to ensure holistic management of risk and protective factors to improve QoL for PLWH.

## WEPED357

"We need to continue the services. Don't cut us off." Women living with HIV call for the return of women-centered services

L. Small<sup>1</sup>, N. Sanchez<sup>2</sup>, S. Jones<sup>3</sup>, M. Magana Ceballos<sup>4</sup>

<sup>1</sup>University of California, Los Angeles, Social Welfare, Los Angeles, United States, <sup>2</sup>University of California, Los Angeles, Los Angeles, United States, <sup>3</sup>Charles Drew University, Los Angeles, United States, <sup>4</sup>AT Still University of Health Science, Mesa, United States

**Background:** The reclassification of HIV to a lifelong manageable condition with slowed rates of acquisition for Black and Latina women in the US, has decreased alarm, as well as HIV funding over time.

However, many women of color living with HIV or AIDS continue to struggle with stigma, isolation, and access to care.

These women remain in need of supportive psychosocial service, yet many reside in areas where these types of HIV-related services are minimal or unavailable.

This paper examines the lived experiences of women of color to explore the impact of declining HIV-related funding and the need for psychosocial services to bolster their emotional well-being and HIV treatment engagement.

**Methods:** Fifteen in-depth, semi-structured interviews were conducted with women of color living with HIV or AIDS in a large, urban area of the southwestern US from October to November 2020. These women identified as Black /African American (47%), Latina/o/x (46%), and Asian (7%) and ranged in age from 32 to 77 years.

Participants were asked to identify changes in services impacting them over time. We used thematic analysis and an inductive analytical approach.

**Results:** Participants expressed a high need for nonmedical, HIV-related supportive services. Compounding their HIV diagnoses were their ongoing struggles with food and housing insecurity.

Participants noted the importance of free meals for their families and free childcare during medical visits. For instance, one woman shared, "I needed that lunch, because my kids was hungry because I was homeless."

There was also a strong desire for culturally relevant support groups in their communities and recommendations for safe spaces to discuss their intersectional identities of womanhood, race/ethnicity, and living with HIV or AIDS.

**Conclusions:** This paper recommends increased funding of HIV and AIDS-related, women-centered programs. Although rates have declined, women of color living with HIV or AIDS continue to need culturally-relevant services. Programs offering childcare, peer groups, and mental health are necessary to support the health and well-being of women of color living with HIV or AIDS.

## WEPED358

Decentralization of youth-led community ART adherence clubs to support care and treatment for young people living with HIV in Chipata District, Zambia

Z. Yamba<sup>1</sup>, R. Tipiseni<sup>1</sup>, C. Manyele<sup>2</sup>, C. Mubanga<sup>3</sup>, J. Mbewe<sup>1</sup>, M. Musonda<sup>2</sup>, K. Bhauti<sup>4</sup>, D. Lee<sup>5</sup>, B. Mkandawire<sup>2</sup>

<sup>1</sup>Grassroot Soccer Zambia, Chipata, Zambia, <sup>2</sup>Grassroot Soccer Zambia, Lusaka, Zambia, <sup>3</sup>Grassroot Soccer, Inc., Lusaka, Zambia, <sup>4</sup>Grassroot Soccer, Inc., Wolverhampton, United Kingdom, <sup>5</sup>Grassroot Soccer, Inc., Cape Town, South Africa

**Background:** Young people living with HIV (YPLHIV) in rural areas face long distances to health facilities and a lack of youth-friendly services, challenges that have a negative impact on their ART adherence and retention in care. Grassroot Soccer Zambia (GRSZ) piloted a youth- and community-led adherence support model called 'SKILLZ Plus Clubs,' with the aim of improving ART adherence and retention by establishing decentralized clubs for YPLHIV closer to their homes.

**Description:** Beginning in 2020, decentralized community-based clubs were initiated in partnership with 27 health facilities with support from Neighborhood health committees (NHCs). GRSZ trained young adults living with HIV as 'lead mentors' to facilitate the clubs, holding monthly sessions with fellow YPLHIV in convenient settings in their local communities and allowed for visits to homes of YPLHIV.

Clubs utilize a 10-session curriculum covering ART adherence, disclosure, and healthy behaviors, and lead mentors also follow up on reminders for clinical appointments and make referrals for other HIV-related services.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author

## Lessons learned:

- Forty-six lead mentors established community clubs reaching 1,500+ YPLHIV for ongoing maintenance and improved ART adherence.
- Decentralized clubs were convenient for participants to receive adherence support closer to their communities, but participants still expressed a desire for transportation allowances to attend club sessions.
- The clubs fostered community ownership and empowerment, where communities actively engaged in their establishment, operation, and sustainability through collaboration with NHCs. In some communities, weaker community structures negatively impacted the club implementation.
- Training and empowering local lead mentors who are also living with HIV to facilitate club sessions allowed for relatable support: lead mentors established safe spaces and effectively connected with participants, addressing their concerns and promoting adherence through sharing experiences.

## Conclusions/Next steps:

Decentralization of youth-led community-based SKILLZ Plus Clubs is a promising strategy for facilitating ART adherence support for YPLHIV, increasing accessibility to HIV services, and the importance of partnerships for impact where resource constraints exist. GRSZ is expanding this model to more rural communities in Eastern Province, and promoting the sharing of best practices between community clubs and NHCs.

## WEPED359

### Engaging people living with HIV as community monitors to improve HIV services in Lusaka province, Zambia

D. Kapata<sup>1</sup>, V. Hamusute<sup>1</sup>, K. Kabwela<sup>1</sup>, C. Mubanga<sup>2</sup>, C. Manyele<sup>1</sup>, B. Mkandawire<sup>1</sup>, J. Cardao<sup>3</sup>, C. Mutila<sup>3</sup>, S. Sivile<sup>4</sup>  
<sup>1</sup>Grassroot Soccer Zambia, Lusaka, Zambia, <sup>2</sup>Grassroot Soccer, Inc., Lusaka, Zambia, <sup>3</sup>PEPFAR Zambia, Lusaka, Zambia, <sup>4</sup>Ministry of Health, Zambia, Lusaka, Zambia

**Background:** In order to continue progress toward ending AIDS by 2030, it is imperative that people living with HIV (PLHIV) are engaged in service provision to improve HIV-related service quality and health outcomes. The Community-led Monitoring (CLM) initiative, implemented by Grassroot Soccer Zambia in Lusaka province with support from PEPFAR and the Ministry of Health (MOH), collects and utilizes feedback from PLHIV accessing services at health facilities.

**Description:** GRSZ and health service providers identified PLHIV volunteers to train as Community Monitors (CMs). 350 CMs mobilized 4,894 PLHIV from 30 health facilities between July 2021 and November 2023 in six districts of Lusaka province. This included 991 members of key popu-

lations (318 men who have sex with men, 295 sex workers, 204 transgender persons, 136 prisoners, and 38 persons who inject drugs), 1,263 young people and 143 persons with disabilities. A standardized questionnaire was used to collect feedback from PLHIV on their service experiences and recommendations on HIV treatment and prevention, viral load, tuberculosis, stigma and discrimination.

## Lessons learned:

- CMs built trusted relationships which facilitated a two-way flow of information between PLHIV and health facilities for improved service provision. The proportion of PLHIV who reported receiving adherence counseling increased from 77% (573 /736) in 2021 to 85% (961/1,136) in 2022.
- CMs tapped into their understanding of the local communities and partnerships with community-based organizations to easily reach PLHIV using home visits and phone calls.
- CMs created safe spaces which made PLHIV feel comfortable to share feedback: 71% (3,496) of PLHIV surveyed offered recommendations for improved service delivery.
- Young PLHIV reported insufficient youth-friendly services and recommended additional inclusive differentiated service delivery models.
- Utilizing information and evidence from CM, stakeholders initiated actions to improve provision of HIV services.
- PLHIV from key populations reported experiencing discrimination and stigmatization, recommending additional facility staff training on gender and sexual diversity.

**Conclusions/Next steps:** CMs were empowered as change agents to contribute to improved HIV service delivery. Priority strategies for inclusion of key populations and young people should be considered to amplify their voices in CLM and coordination of the HIV response.

## WEPED360

### Integration of mental health into an ART adherence and support program for young people living with HIV in Lusaka and Chipata districts of Zambia

W. Mwanza<sup>1</sup>, E. Muchelega<sup>2</sup>, P. Banda<sup>2</sup>, C. Manyele<sup>2</sup>, M. Musonda<sup>2</sup>, D.T. Kennedy-Tembo<sup>3</sup>, C. Mubanga<sup>3</sup>, D. Lee<sup>4</sup>, B. Mkandawire<sup>2</sup>

<sup>1</sup>Grassroot Soccer Zambia, Chipata, Zambia, <sup>2</sup>Grassroot Soccer Zambia, Lusaka, Zambia, <sup>3</sup>Grassroot Soccer, Inc., Lusaka, Zambia, <sup>4</sup>Grassroot Soccer, Inc., Cape Town, South Africa

## Background:

Young people living with HIV (YPLHIV) face poor mental health outcomes, and few initiatives integrate mental health and HIV treatment for this group. Beginning in

2021, Grassroot Soccer Zambia (GRSZ) started integration of mental health information and support into its programming for YPLHIV, aiming to promote positive mental health and link young people to support services.

**Description:** GRSZ developed a mental health package for YPLHIV, beginning by integrating mental health information into an existing ART adherence support intervention called SKILLZ Plus.

The 'Enhanced SKILLZ Plus' program with 12 sessions including mental health content was rolled out in 40 Ministry of Health facilities starting in 2021. GRSZ additionally trained near-peer mentor 'Coaches,' who are young people living with HIV, as mental health frontline workers. Coaches were trained to administer the Patient Health Questionnaire (PHQ) to screen SKILLZ Plus participants for depression, and then offer Interpersonal Group Therapy (IPTG) therapy to those with at least moderate depression symptoms. GRSZ also developed and distributed a print comic book-style resource to reinforce positive mental health concepts, called MindSKILLZ magazine, which was distributed through home visits.

**Lessons learned:**

- 4,500+ YPLHIV acquired knowledge on mental health information and services from 2021 to 2023, and 80% of participants completed the SKILLZ Plus sessions and received the comic magazines in their homes.
- Mental health support services were made more accessible to YPLHIV, with over 1,200 reached with PHQ9 screening and IPTG services in their communities.
- While 60 SKILLZ Plus Coaches were trained in the mental health package, they required ongoing support due to limited clinical experience, and mentoring support visits were initiated.
- Partnerships with parents and health facilities were useful in supporting mental health-friendly environments, although integration of the SKILLZ Plus Coaches as frontline workers into community health structures was limited.

**Conclusions/Next steps:** Mental health integration into an existing ART adherence and HIV support treatment program for YPLHIV was feasible and created friendly, accessible mental health services for YPLHIV and their communities.

Efforts to ensure ongoing support for non-clinicians should be considered for mental health programs that work with non-clinical staff.

## WEPED361

### Breaking barriers: a comprehensive social media campaign against HIV discrimination

E.M. Soe<sup>1</sup>, N.M. Tun<sup>1</sup>, M.M. Thet<sup>2</sup>

<sup>1</sup>Population Services International Myanmar, Program Management Division, Yangon, Myanmar; <sup>2</sup>Population Services International Myanmar, Strategic Information Division, Yangon, Myanmar

**Background:** Discrimination against key populations and people living with HIV (PLHIV) remains a significant issue in Myanmar. A 2016 study characterizing HIV-related stigma in Myanmar highlighted the mistreatment of clients in healthcare settings, communities, and within their own households. In response to this challenge, PSI Myanmar conducted an evidence-based zero-discrimination social media campaign on PSI's "Happy Healthy Myanmar" Facebook page.

This initiative utilized the results of PSI's online survey conducted with key populations and PLHIV in 2022, providing a data-driven approach to address and combat discrimination.

**Methods:** PSI conducted an online survey, employing a self-structured questionnaire accompanied by brief qualitative questions on five Facebook pages, frequented by key populations and PLHIV. Based on the survey insights, the campaign featured three comic characters-Zaw, Myo (MSM and TG ART patients), and Rosy (an HIV-negative university student and occasional sex worker) -communicating the insights on discrimination. Key campaign topics included reasons to cease discrimination, the use of discriminatory slangs against LGBT community and PLHIV, and clients' experiences with health care workers. This social media initiative spanned a year, commencing on the Zero Discrimination Day in 2022, providing a sustained effort to address discrimination.

**Results:** A total of 281 participants (55.5% MSM, 3.9% TGW, 19.6% Men, 16.4% Women and 4.6% unspecified) completed the survey. The survey results revealed that 14.3% of respondents indicated healthcare workers exhibited hesitancy to touch them during consultations. Additionally, 8.5% and 4.7% of respondents shared experiences of healthcare workers publicly noting HIV status and confidential personal matters on client record books, respectively. Qualitative data unveiled instances of being called out by name in clinic, color marking of HIV positive clients' medical files, and a disrespect of confidentiality during counseling sessions.

The campaign utilizing these insights, engaged a total of 2.1 million-plus audiences. Post campaign, communities participated in the movement by sharing virtual postcards with motivational message on their Facebook timelines.

**Conclusions:** The study underscored that both key and general populations faced discrimination when seeking health care for HIV related services.

The findings were invaluable for crafting key messages for a social media campaign aimed at mobilizing the communities to actively combat discrimination.

## WEPED362

Putting a stop to HIV self-stigma through a peer led group cognitive behavioral therapy: a promising model for increasing access to psychosocial services for underserved populations in Uganda

S. Babirye<sup>1,1</sup>, J. Namuli<sup>2</sup>, S. Kawooya<sup>2</sup>

<sup>1</sup>Afrislum Uganda, Research and Evaluations, Kampala, Uganda, <sup>2</sup>Afrislum Uganda, Programs, Kampala, Uganda

**Background:** Self-stigma is linked to HIV positive living; yet there is a gap in interventions addressing self-stigma especially in resource limited settings.

With support from VIIV Healthcare Positive Action, Afrislum Uganda is implementing an innovative peer-led group psychosocial therapy model for HIV Self-stigma reduction in Uganda.

**Description:** Afrislum's peer-led cognitive behavioral therapy (CBT) model is being implemented at eight public health facilities serving the urban poor in Mukono and Kampala districts. The model was first tested at four public facilities. The pilot demonstrated that this CBT model had an effect of -1.145 percentage points on HIV self-stigma between baseline and endline, between the intervention and control groups. In 2023, Afrislum scaled up the model to eight facilities in the two districts. At each facility, six HIV expert clients and two health workers were identified and trained to deliver group CBT. The model has 10 different but interrelated topics delivered on a monthly basis. Each expert client was allocated a cohort of 10-12 participants to engage 10 times throughout their EMTCT journey. To-date, 48 expert clients and 16 health workers have been trained to deliver CBT, and over 500 mothers living with HIV engaged in 288 sessions. Beneficiaries are taught cognitive, coping, and assertive skills in order to deal with negative thoughts, interpersonal problems and stigmatizing reactions. The sessions are delivered in the presence of expert psychologists who offer continuous support supervision and assessment of the peers as part of capacity development.

**Lessons learned:** Afrislum's CBT Model has created an opportunity for participants to freely share their HIV-related experiences with peers. This has motivated participants not to miss their clinic days. and improve adherence to treatment. The beneficiaries have also been empowered to manage or control their thought processes-especially the negative thoughts.

Changes in norms and practices have been observed like openness and engaging with others, lessening in worrying about the future and increased selfcare, and self-confidence.

**Conclusions/Next steps:** The use of peer-to-peer group CBT may be a promising approach for increasing access to psychosocial services in resource limited settings, where trained psychologists and mental health counselors are few, and psychosocial interventions are barely present.

## WEPED363

Unveiling the connection: HIV stigma, substance use stigma, and HIV healthcare providers' acceptance of harm reduction

B. De Leon<sup>1</sup>, R. Ahmed<sup>1</sup>, R.W. Coulter<sup>1</sup>, M.R. Friedman<sup>2</sup>, S. Creasy<sup>1</sup>, E.S. Kay<sup>3</sup>, M. Hawk<sup>1</sup>

<sup>1</sup>University of Pittsburgh School of Public Health, Behavioral and Community Health Sciences, Pittsburgh, United States, <sup>2</sup>Rutgers, the State University of New Jersey, School of Public Health Department of Urban-Global Public Health, Newark, United States, <sup>3</sup>University of Alabama at Birmingham, School of Nursing, Birmingham, United States

**Background:** The intertwining stigmas of HIV and substance use impact the adequacy of healthcare service delivery, specifically providers' acceptance and use of evidenced-based harm reduction (HR) strategies to improve health outcomes.

This study aimed to explore HIV healthcare providers' attitudes towards people with HIV (PLWH) and who use substances and identify ways that stigmatizing attitudes are associated with the provision of structural and relational HR.

**Methods:** We disseminated a quantitative cross-sectional survey with key measures from the Harm Reduction Acceptability Scale (HRAS), the Drugs and Drug Problems Perceptions Questionnaire (DDPPQ), and the HIV/AIDS Stigma Scale (HPASS). Data were collected from 128 providers across three HIV clinics in the United States in Birmingham, AL, and Pittsburgh, PA, between April and October 2022.

Multivariable linear regression models were adjusted for confounding variables and used to assess the relationship between provider attitudes and acceptability of HR care.

**Results:** Providers were predominately cisgender women (80%), heterosexual (84%), and non-Hispanic white (59%). Providers had a mean HRAS score of 3.80 (SD=0.56, range=2.5-4.8); DDPPQ score of 2.17 (SD=0.69, range=1.0-3.8); and HPASS score of 1.90 (SD=0.60, range=1.0-4.6).

Regression analyses demonstrated HR acceptance was higher among providers with 6 to 10 years of experience working with PWH ( $b=0.30$ ,  $p<0.01$ ), compared with  $\leq 5$  years of experience.

HR acceptance was lower among providers in Alabama compared to Pennsylvania ( $b=-0.29$ ,  $p<0.01$ ), and among Black providers compared to white providers ( $b=-0.47$ ,

$p < 0.01$ ). Stigmas towards substance use ( $b = -0.18$ ,  $p < 0.01$ ) and HIV/AIDS ( $b = -0.25$ ,  $p < 0.01$ ) were associated with lower HR acceptability.

**Conclusions:** Stigmas towards substance use and HIV/AIDS were associated with lower acceptance of HR, suggesting providers harboring stigma are less inclined to support or engage in HR practices. Provider stigma and lack of acceptance create significant barriers to implementing evidence-based HR and perpetuate health disparities. Stigma in healthcare settings reduces access to HR services and equitable healthcare.

Future research should investigate the relationship between HIV and substance use stigma and how these stigmas interact with attitudes toward HR. Efforts to increase retention in care among PWH who use substances require intersectional stigma-reduction and HR-focused interventions geared toward HIV healthcare providers.

## WEPED364

Household HIV: qualitative accounts of intergenerational stigma and support in Agincourt, South Africa

K. Bärnighausen<sup>1</sup>, H. Schröder<sup>2</sup>, P. Mataboge<sup>1</sup>, M.D. Reñosa<sup>2</sup>, S. McMahon<sup>2</sup>, J.-W. De Neve<sup>2</sup>

<sup>1</sup>University of the Witwatersrand, School of Public Health, Johannesburg, South Africa, <sup>2</sup>University of Heidelberg, Heidelberg Institute of Global Health, Heidelberg, Germany

**Background:** Households can be the most supportive but the most stigmatising environments for people living with HIV. Understanding where intergenerational households can improve quality of life, access to care and reduce stigma is essential for ending late presentation and preventable HIV-related deaths.

**Methods:** Between July and September 2022, we conducted a formative qualitative study using  $n = 46$  semi-structured interviews with

- Young or middle-aged adults on ART (aged 18-59 years old); and
- Older adults (aged  $\geq 60$  years old) that were embedded in the Agincourt Health and Demographic Surveillance System in rural South Africa.

We analysed data following a reflexive thematic analysis approach.

**Results:** Participants described a context where ART enabled families to – once again – live together intergenerationally and provide more traditional patterns of care where elderly family members are supported by younger generations within the same home.

However, within the space of a household, multiple intergenerational experiences of HIV-related illness, acquisition, loss, loneliness, stigma and love facilitate or hinder household care, relationships, access to ART and ART-adherence.

Fear of abandonment upon HIV disclosure and household finances are described as influencing factors for late presentation and ART-adherence.

**Conclusions:** As a major organising principle of society in this region, intergenerational households can provide safe spaces for people living and ageing with HIV and their families.

Leveraging this intimate intergenerational environment to build supportive family relevant HIV-literacy, will be essential to mitigate discrimination and stigma within peoples homes.

Ensuring household-level in-depth, personalised knowledge sharing, referral to services and person-centred long-term care will be essential for future comprehensive HIV programming.

## WEPED365

The use of influencers and community-driven messaging to increase access to HIV-related health services in the Philippines

C.E. Gray<sup>1</sup>, J.D. Rosadiño<sup>1</sup>, R.M. Brines<sup>1</sup>, R. Domingo<sup>1</sup>, K. Silvano<sup>1</sup>, R. Pagtakhan<sup>1</sup>

<sup>1</sup>LOVEYOURSELF, INC, Mandaluyong, Philippines, the

**Background:** According to latest data, the Philippines is far from its 95-95-95 targets, currently registering at 64-66-97 respectively. Diagnosed cases are continually increasing, with 50 Filipinos diagnosed with HIV per day. Numerous barriers still exist in accessing HIV-related health services such as stigma, lack of information, access or untrained medical professionals amongst others.

Here we present evidence of the impact of influencers in increasing access to HIV-related services for a community-based organization in the Philippines.

**Description:** Taking into consideration that the internet penetration rate in the Philippines is 68% and 82.4% of the population use social media, the platforms of Facebook and Instagram were identified to be utilized in collaboration with influencer (Catriona Gray) with a total of 7.7 million and 13.9 million followers on Facebook and Instagram, respectively.

These accounts primarily reach audiences of 18-34 and 25-34 years old which correlate to the primary age of key populations in Philippines as relates to the HIV response. Engaging video content with call to action centric messaging for HIV testing, such as a "Get an HIV test with me" were created and posted, with mindfulness of position, tone and language as guided by Love Yourself, a community-based organization based in the Philippines. The developed content were posted both in LoveYourself social media pages and personal social media accounts of C. Gray.

**Lessons learned:** Engagement from content spanning from 2018 to current day, have resulted in over 4.7 million views on video content alone over the Facebook and In-

AIDS 2024

stagram platforms. This is not yet taking into consideration the number of accounts reached or engaged via picture-form content.

When new HIV testers were asked at Love Yourself Philippines centers on where they found out about the testing services, about 60% said that they accessed the information through social media, with C. Gray (the influencer) is often mentioned as the source of information. LoveYourself provided 52,158 HIV tests in 2023 alone.

**Conclusions/Next steps:** Working to collaborate with individuals with large social media platforms (such as influencers), active community led organizations and health service providing clinics has proven to be a powerful tool for building the bridge towards accessing HIV-related health services.

## WEPED366

The relative popularity of three distinct models of differentiated service delivery (DSD) offered to ART clients in Botswana

P.P. Chibatamoto<sup>1</sup>, W. Gaogane<sup>2</sup>, A. Sejamitlwa<sup>2</sup>, E. Kayane<sup>2</sup>, M. Zulu<sup>2</sup>

<sup>1</sup>Humana People to People Botswana, Project Management Unit, Gaborone, Botswana, <sup>2</sup>Humana People to People Botswana, Gaborone, Botswana

**Background:** HIV programs in Sub-Saharan Africa and beyond are scaling up DSD models to increase access, expand reach, reduce costs, and better sustain ART programs. Evidence shows that DSD helps reduce cost and increase adherence, but less is known about the relative popularity of different DSD models PLHIV may choose from.

**Description:** Local NGO Humana People to People Botswana (HPPB) provides community-based HIV health services in eight health districts in Botswana supporting more than 700 ART clients each year. People stable on ART are offered three models of DSD:

1. **Community Medication Refill (CMR);**
2. **Fast-track queues** at pharmacies for repeat prescriptions, and;
3. **Community Adherence Groups (CAGs).**

The analysis assessed the relative popularity of the three models of DSD among people taking ART in Botswana by reviewing program data retrieved by HPPB Community Health Workers from their data generated over a nearly-three-year period (March 2021 to December 2023).

**Lessons learned:** The chart below shows that HPPB initiated **61.3%** (1,126) clients through DSD models, out of 1,836 people on ART served by the project between March 2021 and December 2023.

The data shows that **approximately half** of the 1,126 clients (55%; 617/1,126) chose to receive ART through the CMR model, while **one-third** (33%; 377/1,126) chose Fast-track queues at pharmacies, and the remaining **one-tenth**

(12%; 132/1,126) chose CAGs. When asked, clients cited several factors influencing their choice of DSD models, including the flexibility of pick up times, transportation costs, and the possibility to access services on weekends.

**Conclusions/Next steps:** DSD reduces burdens on health facilities, enables health facility staff to shift resources towards urgent services, and increases ART clients' ease of access to care.

This study will help us better understand why people chose different DSD options, which will help in further scaling up of DSD, improve client access to medications, and further decongest health facilities.

## WEPED367

Towards attaining the last "95" on children and adolescent living with HIV(C/ALHIV): the efficacy of OVC community clinical model in Manicaland and Masvingo provinces of Zimbabwe

T. Sanyatwe<sup>1</sup>, V. Mubaiwa<sup>1</sup>, B. Magwaza<sup>1</sup>, F. Mwatenga<sup>1</sup>, C. Swikepi<sup>1</sup>, S. Nhongo<sup>1</sup>, C. Mukwekweze<sup>1</sup>, T. Takaidza<sup>1</sup>, T. Chidenge<sup>1</sup>, B. Kashiri<sup>1</sup>, G. Shumba<sup>2</sup>, B. Mukome<sup>2</sup>, T. Chimbidzikai<sup>2</sup>, S. Munyaho<sup>2</sup>, D. Chimedza<sup>2</sup>, D. Kasiyombe<sup>3</sup>, A. Koler<sup>3</sup>, M. Wright<sup>3</sup>, G. Nyahuma<sup>4</sup>, T. Kabai<sup>1</sup>  
<sup>1</sup>FACT Zimbabwe, Strategic Information and Research, Mutare, Zimbabwe, <sup>2</sup>FACT Zimbabwe, Safeguarding Sustainable Livelihoods, Mutare, Zimbabwe, <sup>3</sup>Pact, Pact Global, Washington, United States, <sup>4</sup>USAID Zimbabwe, USAID, Harare, Zimbabwe

**Background:** In 2020, Zimbabwe's viral load suppression gap in children ages 0-17 was 28% compared to 10% in adults (Zimbabwe HIV estimates report, 2021). These gaps can be attributed to factors including difficulties in ART adherence among C/ALHIV stemming from challenges like complex treatment regimens, psychosocial barriers, and limited access to pediatric HIV care resources. In response, FACT Zimbabwe is implementing the PEPFAR/US-AID funded OVC program in Manicaland and Masvingo provinces which supports C/ALHIV in achieving durable viral load suppression.

**Description:** During the period October to September 2023, 279 C/ALHIV with unsuppressed viral load (>1000 copies/mL) were identified, enrolled in the program, and received comprehensive OVC service package using a case management approach. The cohort was tracked for

adherence to ART and viral load monitoring by a team of trained community health workers (CHWs) in collaboration with local health facilities. The CHWs conducted twice monthly ART adherence monitoring through home visits to facilitate children Enhanced Adherence Counselling (EAC) sessions, which were then reinforced through case conferences. A trend analysis was conducted at the end of the fiscal year to ascertain the changes, if any, in suppression rate of the cohort across the four quarters.

**Lessons learned:** The number of children with high viral load decreased by 84% during the period under review, with the most notable drop occurring within the first quarter and rates leveling out between the last two quarters. 75% (11F, 29 M) of the children with high VL at the end fiscal year were above 10 years.

Figure. Trend analysis of children with unsuppressed VL (October 2022 - September 2023)

**Conclusions/Next steps:** Collaboration between local health facilities and community partners has been pivotal in enhancing viral load suppression CLHIV. In the upcoming phase, the project aims to refine and tailor VLS support, focusing on addressing the specific viral load challenges encountered by adolescents 10-17 years, who are struggling to achieve viral load suppression.

## WEPED368

Voices unveiled, CHER trial adolescents' reflections on living with HIV and their journey with FAMCRU shared through six open letters

T. Boyana<sup>1</sup>, S. Kruger<sup>1</sup>, S. Fry<sup>1</sup>, B. Laughton<sup>1</sup>, S. Barnabas<sup>1</sup>, M. Cotton<sup>1</sup>

<sup>1</sup>Stellenbosch University, Pediatrics, FAMCRU, Cape Town, South Africa

**Background:** Growing up in an environment of non-disclosure challenges children in articulating their thoughts and feelings about living with HIV. In the context of a longitudinal study, researchers established a treatment support group to facilitate the journey of acceptance and positive living with HIV for these children.

This summary outlines how a series of six open letters become a valuable tool in establishing pre-adolescents to express their feelings and gain a deeper understanding of their experiences of living with HIV.

**Description:** Participants in the Children with HIV Early anti-retroviral Therapy (CHER trial) engaged with the Family Center for Research with Ubuntu from before the age of 12 weeks, with the cohort extending well beyond 15 years. Around the age of 12 years old, they were fully disclosed to and started raising questions about treatment despite being asymptomatic.

A support group was established to assist and guide them through the process of acceptance and living positively with HIV. Six open letters emerged during therapeutic sessions to explore the participants' feelings towards HIV.

These letters, themed as "Dear HIV", "Dear ART", "Dear HIV-negative child", "Dear Mama", "Dear Doctor" and "Dear teacher" were instrumental in fostering open communication about their experiences. Debriefing sessions highlighted and reinforced coping skills.

**Lessons learned:** Adolescents highlighted the scarcity of safe spaces to voice their challenges and experiences. The letters created an opportunity to anonymously voice their inner thoughts and feelings, leading to open discussions on topics such as stigma, discrimination, loss, adherence, peer pressure, experimenting with substances, and their journey of living with HIV.

**Conclusions/Next steps:** Adolescents living with HIV benefit from support to lead healthy lives. Treatment support groups are ideal for creating opportunities for youth to express themselves, learn about HIV, and decrease sexual risk-taking and substance use behavior. Structured and continuous support contributes to cohort retention, and improved adherence, and assists many in accepting their HIV status. Researchers should consider budgeting for appropriate support when enrolling children in studies.

### Assessing triggers for dissatisfaction among persons living with HIV receiving differentiated antiretroviral services in Southern Nigeria: a cross-sectional study

U. Akpan<sup>1</sup>, C. Okolo<sup>1</sup>, I. Elechi<sup>2</sup>, E. Nwanja<sup>1</sup>, M. Unimuke<sup>1</sup>, O. Onwah<sup>1</sup>, O. Toyo<sup>1</sup>, D. Ogundehin<sup>3</sup>, C. Obiora-Okafo<sup>3</sup>, A. Idemudia<sup>3</sup>, C. Nwadike<sup>3</sup>, K. Kakanfo<sup>3</sup>, B. Pius<sup>3</sup>, B. Onimode<sup>4</sup>, B. Oyawola<sup>3</sup>, B. Kagniniwai<sup>4</sup>, O. Asaolu<sup>3</sup>, A. Bashorun<sup>5</sup>, A. Gambo<sup>3</sup>, D. Onime<sup>3</sup>, J. Pius<sup>3</sup>, O. Oyelaran<sup>3</sup>, R. Goldstein<sup>3</sup>, E. James<sup>3</sup>, O. Onyedinachi<sup>1</sup>, A. Adegboye<sup>1</sup>, A. Eyo<sup>1</sup>

<sup>1</sup>Excellence Community Education Welfare Scheme (ECEWS), Uyo, Nigeria, <sup>2</sup>Achieving Health Nigeria Initiative (AHNI), Uyo, Nigeria, <sup>3</sup>Office of HIV/AIDS and TB, United States Agency for International Development, Abuja, Nigeria, <sup>4</sup>Office of HIV/AIDS, United States Agency for International Development (USAID), Washington DC, United States, <sup>5</sup>National AIDS, Sexually Transmitted Infections Control and Hepatitis Programme (NASCP), Federal Ministry of Health, Abuja, Nigeria

**Background:** Differentiated Service Delivery (DSD) is recommended for the provision of person-centred antiretroviral therapy (ART) services to improve client satisfaction and treatment continuity among people living with HIV (PLHIV).

This paper assessed satisfaction with ART services and triggers for dissatisfaction among PLHIV enrolled on DSD in southern Nigeria.

**Methods:** This cross-sectional study involved a random sample of 10% of PLHIV aged ≥15 years who received ART for over 12 months across 25 health facilities in Akwa Ibom State. Clients had to be enrolled in a DSD model for at least 12 months to be included in the study. The DSD models analyzed include Community Pharmacy ART-refill (CPAR), Community ART refill group-Healthcare worker-led (CARG-HCW), Community ART refill group-PLHIV-led (CARG-PLHIV), Hub-and-Spoke (HS), Adolescent community ART (ACA), and Fast-track.

Client satisfaction was assessed between June and July 2023 across nine attributes of healthcare service quality domains (privacy, availability of ancillary services, professionalism, confidentiality, flexibility in operating time, staff knowledge and skills, wait time, distance, and convenience) using a validated tool. The cutoff level of satisfaction was determined using a demarcation threshold ( $[(\text{highest} - \text{lowest rating}) / 2] + \text{lowest rating}$ ).

Ratings below the threshold were categorized as "unsatisfied"; and triggers reported by 80% of the respondents were summarized.

**Results:** Of 919 participants enrolled, 64.6% (594) were females, and median age was 35 [IQR: 28-43] years. 450 participants (49.0%) accessed ART through Fast-track, 196 (21.3%) through CARG-HCW, 146 (15.9%) through ACA, 76 (8.3%) through HS, 35 (3.8%) through CARG-PLHIV, and 16

(1.7%) through CPAR. Overall satisfaction score was 95.5% (at a 55% demarcation cutoff), with CPAR (25.0%), and CARG-PLHIV (11.4%) having over 5% respondents below the satisfaction threshold. Triggers reported by respondents in CARG-PLHIV was the perception of the service provider's knowledge and skills to deliver ART services, while confidentiality of client information was added by respondents in CPAR.

**Conclusions:** Clients receiving ART care through peer-led (CARG-PLHIV) model, and fee-paying (CPAR) models have the least satisfaction with service delivery. Interventions to improve satisfaction could prioritize improving the knowledge and skills of service providers.

## WEPED370

### 'myHIV forum' - the importance of an online platform for people living with HIV

J. Fielder<sup>1</sup>, M. Rattue<sup>1</sup>, K. Scott-Loach<sup>1</sup>, G. Taylor<sup>2</sup>, S. Kumar<sup>2</sup>, W. Smith<sup>2</sup>, D. Sgorbati<sup>2</sup>, R. Angell<sup>1</sup>

<sup>1</sup>Terrence Higgins Trust, Living Well, London, United Kingdom, <sup>2</sup>NHS Health Economics Unit, London, United Kingdom

**Background:** Terrence Higgins Trust's (THT) online platform 'myHIV forum' started in 2011. It captures a period of time when online services were still in their infancy. It was set up because PLHIV were experiencing high levels of enacted and internalised stigma around their status and they wanted to share common experiences and support each other. With THT moving to a new digital platform, there was a concern that the information and people's experiences would be lost.

Our goal was to delve into this decade-long collection of personal narratives and identify the trends, medical pathways, and experiences that emerged over time.

We aim to use these insights to inform future client care and enhance the lived experience of PLHIV.

**Methods:** Our analysis stems from a database of 50,821 posts from February 2011 to November 2020, covering 7,046 topics. The forum had 5,067 registered members. Our primary data source is England. We used BERTopic, a Python library, and topic modelling - a statistical NLP technique to unearth the abstract 'topics' within the posts. Our code, which is fully reproducible, is available in Jupyter Notebook.

To ensure the anonymity and confidentiality of forum members, the data was stripped of any identifiers, before being securely moved to an access-restricted NHS server. The Health Economics Unit (HEU) extracted themes using a machine learning algorithm so no analyst directly read the already anonymised data.

**Results:** Results revealed the transformation of discussions over time, from understanding HIV and emotional support (2011), to medication/treatment (2014), to the emotional journey and resource sharing (2016). By 2018,

the emphasis was on testing experiences and emotional support, culminating in 2020 with the high need for emotional help and clinic visit experiences.

**Conclusions:** Our analysis underscored the forum's critical role for PLHIV, particularly in the early days when there was scarce online information. The forum facilitated crucial peer-support and knowledge exchange around treatment aspects.

This peer-to-peer platform fostered a positive shift in living with HIV, emphasising the importance of testing and prevention using PrEP from 2011 to 2022. The findings underline the immense benefits of open online platforms for managing health conditions like HIV.

## WEPED371

### Assessment of stigma experienced by people living with HIV at Mizoram, Northeast India

I. Lalhruaimawii<sup>1</sup>, S. S<sup>2</sup>, R. Radhakrishnan<sup>1</sup>, M. Varma<sup>3</sup>, S. Rai<sup>4</sup>, C. UK<sup>5</sup>, R. C Lalramhluna<sup>6</sup>

<sup>1</sup>Manipal College of Pharmaceutical Sciences, Department of Pharmacy Practice, Manipal, India, <sup>2</sup>Mizoram State AIDS Control Society, Lab Services, Aizawl, India, <sup>3</sup>Kasturba Medical College, Manipal, Department of Infectious Diseases, Manipal, India, <sup>4</sup>Manipal College of Health Profession, Department of Clinical Psychology, Manipal, India, <sup>5</sup>Kasturba Medical College, Manipal, Department of Medicine, Manipal, India, <sup>6</sup>Mizoram State AIDS Control Society, Care, Support and Treatment Division, Aizawl, India

**Background:** HIV-related stigma remains the global challenge among people living with HIV (PLHIV). The National AIDS Control Organization and other non-governmental organizations had contributed lots of awareness programs and measures to prevent, reduce stigma and improve Quality of Life among PLHIV in India.

We conducted this study to assess HIV and its related stigma experienced by PLHIV in Mizoram, India.

**Methods:** This prospective observational study was conducted in ART Centres, in Aizawl, Mizoram, among PLHIV between January and December 2023. A pre-tested questionnaire on four domain of HIV Stigma Scale was administered after translating in local language (Mizo). Enacted stigma score was calculated as Yes=1 and No =0, while vicarious, felt-normative, and internalized stigma scores could range from 0-3 with a higher score indicating higher level of stigma respectively. Kruskal Wallis test was used to analyse the statistical significance.

**Results:** A total of 246 participants consisting of 151(61.4%) male and 95(38.6%) female were recruited in the study with a mean age of 35 years. There were 78 (31.7%) unmarried, 102 (41.5%) married and 66 (26.8%) widowed. The mean score for enacted, vicarious, felt-normative, and internalized stigma were 0.13, 2.50, 10.46 and 6.22 respectively.

Stigma Domain	Male, Mean (SD)	Female, Mean (SD)	p-value
Enacted	0.09 (±0.304)	0.21 (±0.524)	0.030
Vicarious	2.32 (±2.604)	2.78 (±2.506)	0.026
Felt Normative	10.07 (±6.211)	11.07 (±7.365)	0.251
Internalized	7.18 (±4.010)	4.68 (±4.611)	<0.05

Table 1. Stigma score among male and female

Stigma Domain	10 and below Mean (SD)	12 and equivalent Mean (SD)	Graduate and above Mean (SD)	p-value
Enacted	0.10 (±0.372)	0.21 (±0.502)	0.10 (±0.307)	0.110
Vicarious	2.00 (±2.165)	3.01 (±2.870)	3.28 (±2.946)	0.003
Felt Normative	9.59 (±6.717)	10.51 (±6.307)	13.33 (±6.591)	0.015
Internalized	5.60 (±4.199)	7.21 (±4.684)	6.51 (±4.376)	0.067

Table 2. Stigma score among different educational qualification.

**Conclusions:** There is lower level of stigma among male participants compared to female except for the internalized stigma. With increase in educational qualification, it was observed that there was statistically significant higher stigma among the PLHIV. Appropriate education and counselling about HIV are still considered necessary to reduce HIV-related stigma among PLHIV.

### Unraveling the nexus: the impact of depression on virological outcomes among people with HIV in South Africa

J. Edwards<sup>1,2</sup>, J. Brijikumar<sup>3</sup>, M. Dugeon<sup>4</sup>, C. Robichaux<sup>5</sup>, B. Johnson<sup>6</sup>, E. Peterson<sup>1</sup>, L. Rautman<sup>7,8</sup>, R. Powers<sup>8,9</sup>, Y. Sun<sup>9</sup>, S. Pillay<sup>10,11</sup>, C. Ordóñez<sup>8</sup>, J. Castillo-Mancilla<sup>12</sup>, F. Tanser<sup>13,14</sup>, Z. Asghar<sup>15</sup>, P. Mee<sup>15</sup>, H. Sunpath<sup>10</sup>, D. Kuritzkes<sup>16,17</sup>, V. Marconi<sup>14,8</sup>, M.-Y. Moosa<sup>3,10</sup>

<sup>1</sup>Emory University, Biostatistics and Bioinformatics, Atlanta, United States, <sup>2</sup>Stellenbosch University, Epidemiology and Biostatistics, Stellenbosch, South Africa, <sup>3</sup>University of Kwa-Zulu Natal, Nelson R. Mandela School of Medicine, Durban, South Africa, <sup>4</sup>Emory University School of Medicine, Medicine, Atlanta, United States, <sup>5</sup>Emory University School of Medicine, Biomedical Informatics, Atlanta, United States, <sup>6</sup>University of Rochester, Biostatistics and Computation Biology, Rochester, United States, <sup>7</sup>Bernhard-Nocht Institute for Tropical Medicine, Infectious Disease Epidemiology, Hamburg, Germany, <sup>8</sup>Emory University, Global Health, Atlanta, United States, <sup>9</sup>Emory University, Epidemiology, Atlanta, United States, <sup>10</sup>University of Kwa-Zulu Natal, Medicine, Durban, South Africa, <sup>11</sup>Adrenergy Research Innovations, Durban, South Africa, <sup>12</sup>University of Colorado, Medicine, Aurora, United States, <sup>13</sup>Stellenbosch University, Centre for Epidemic Response and Innovation, Stellenbosch, South Africa, <sup>14</sup>African Health Research Institute, Durban, South Africa, <sup>15</sup>University of Lincoln, Lincoln, United Kingdom, <sup>16</sup>Brigham and Women's Hospital, Division of Infectious Disease, Boston, United States, <sup>17</sup>Harvard Medical School, Medicine, Boston, United States

**Background:** Approximately 35% of people with HIV (PWH) in South Africa also experience major depressive disorder. More evidence is needed to understand the dynamics of depression and mental health disorders among PWH in South Africa. Depression is of grave concern given its potential for self-neglect and adherence challenges. This matched case-control study examines the relationship between depression and successful HIV treatment.

**Methods:** This four-year (2014-2018) study, enrolled adult treatment-naïve individuals at two study sites—one rural and one peri-urban. The study involved 98 cases ( $> 1000$  copies/mL) and 199 controls ( $< 1000$  copies/mL) in a 1:2 ratio matched for age, gender, study site, and duration of ART ([EFV/TDF/3TC]).

Both groups participated in a follow-up interview conducted by a blinded research assistant and included a structured questionnaire and the Kessler 10 (K-10) depression scale. We employed conditional logistic regression to explore the relationship between K-10 scores and virologic failure (VF). Additionally, associative modeling using simple linear regression was applied to assess the impact of the total depression score on log TFV levels and medication possession ratio (MPR).

**Results:** Participants who experienced VF exhibited an average depression score of 14.6 (SD 5.4) MPR of 66.7 (SD 39.3), and log TFV level of 5.7<sub>mm/punch</sub> (SD 1.53); however, controls had a depression score of 12.3 (SD 4.4), MPR of 88.6 (SD 22.5), and log TFV of 6.6<sub>mm/punch</sub> (SD 0.64).

Adjusted conditional logistic regression revealed 1.17 times higher odds of viremia associated with a higher depression score ( $p < 0.001$ ). Additionally, a one-unit increase in depression score was associated with a 0.65 decrease in medication possession ratio and a 0.02 mm/punch decrease in log TFV levels.

**Conclusions:** This research underscores the interplay among depression, medication adherence, and VF previously understudied in this population. These findings offer insights for the development of holistic care approaches tailored to the HIV-affected population in South Africa. Emphasis on policies incorporating mental health strategies into the broader framework of the HIV care continuum to enhance overall treatment effectiveness and well-being is essential for continued success for the 95-95-95 goals.

## WEPED373

### Engaging Faith Champions to enhance demand creation of paediatric HIV services

F. Merico<sup>1</sup>, S. Kean<sup>2</sup>, S. Hillis<sup>3</sup>

<sup>1</sup>UNAIDS - PEPFAR Faith Initiative, Influence and Partnerships, Geneva, Switzerland, <sup>2</sup>Interfaith Health Platform, Geneva, Switzerland, <sup>3</sup>PEPFAR Bureau of Global Health Security and Diplomacy U.S. Department of State, Washington D. C., United States

**Background:** Addressing pediatric HIV requires innovative strategies to enhance demand creation for essential services. This research explores initiatives undertaken in Zambia, Nigeria, and Kenya, highlighting the impact of involving religious leaders and faith-based organizations in identifying and supporting children and adolescents with HIV.

**Description:** In Zambia, an integrated health service delivery approach within places of worship led to a 15% increase in the identification of HIV-positive children compared to non-faith community sites (2018 - 2021).

Nigeria's congregation-based HIV testing during Baby Showers significantly improved testing rates among pregnant women (with a 93% linkage) and their male partners, who were 12 times more likely to know their status (2013 - 2014).

Religious leaders and faith-based organizations across various countries have embraced the role of Faith Paediatric Champions. These champions have played a pivotal role in supporting demand creation for children (2016-2021). In Kenya, religious leaders played a crucial role in the referral system, contributing to 47% of total referrals between August 2016 and May 2017. Faith Paediatric Cham-

pions in the country provided crucial adherence support, psychosocial support, and nutritional assistance to 4517 children and young people aged 0 to 24 years.

**Lessons learned: 1. Impact Integration:** Integrating health services into places of worship can significantly increase the identification of HIV-positive children

**2. Congregation-Based Testing:** These interventions demonstrated a substantial improvement in HIV testing rates among pregnant women and their partners.

**3. Advocacy and Community Engagement:** Faith Paediatric Champions have proven effective in advocating for children's access to HIV care and treatment, fostering collaboration between religious leaders, youth leaders, and community members.

**Conclusions/Next steps:** Engaging faith communities and leaders as champions in pediatric HIV enhances demand creation for essential services. The lessons learned from Zambia, Nigeria, and Kenya underscore the potential of faith-based initiatives in identifying and supporting children and adolescents with HIV. This approach increases access to testing and treatment and fosters community collaboration and advocacy.

Next steps involve faith champions in additional regions. Strengthening partnerships between religious leaders, FBOs, and healthcare providers is critical for sustaining and expanding the impact. Ongoing M&E will guide the refinement of strategies to advance results.

and Crime (UNODC), Abuja, Nigeria, <sup>8</sup>Society for Family

Health (SFH), Abuja, Nigeria, <sup>9</sup>HJF, Abuja, Nigeria

**Background:** The Nigeria mode of transmission study in 2020 estimated the incidence of HIV to be 1.7% and 2.1% among male and female PWIDs respectively. Over a 6-year interval, there was a significant rise in the HIV prevalence within the PWID KP typology from 3.4% in 2014 to 11% in 2020[1]. The NAHI implements interventions that provides HTS for PWIDs across 13 states of Nigeria. Services are rendered through the fixed model (One-Stop-Shop) following

a walk-in mostly through social network strategies and the community model through active engagement of PWIDs at hotspots who due to fear of being stigmatized would not easily visit health facilities

**Methods:** A retrospective study of PWIDs provided services in the OSS and Community model in 13 GF-supported states between 2021 and 2023. Data obtained was through District Health Information System (DHIS) disaggregated by testing modalities as either OSS or community (through outreaches) and analyzed using ANOVA and independent t-test statistics at 0.05 alpha level

**Results:** A total of 268,751 (male=207,431(77.1%); female=61,320(22.9%)) PWIDs were provided HTS between 2021-2023. In 2021, (male=20,017, female=4,009) were provided HTS, with 234 (male=138, female=96) positive cases, and 1% positivity rate.

Positivity rate was higher (female=28%) than (male=8%) receiving services at the OSS. The PWIDs receiving services at the Community had lower positivity, female=2%, and male=1% with 855% linkage rate. In 2022, (male=88,947, female=25441) were provided HTS, with 2044 (Male=1918, female=126) positive cases, and 2% positivity rate. Females tested at the OSS had a higher (10%) positivity, than male (5%).

Similarly female tested at the community model had (5%) positivity than male (1%) with 99% linkage rate. In 2023, (Male=98,467, female=31,870) were tested for HIV, with (male=816, female=1,078) positives cases, 1.5% positivity rate.

Female PWIDs tested at the OSS had higher (8%) positivity than male (4%) as against female (3.2%) and male (0.7%) at the community model with 100.5% linkage rate. There was a significant difference between the fixed and community model: positivity  $t(7.58; p=.000)$  and HTS  $t(7.217; p=.000)$ .

**Conclusions:** The bimodal approach on the GF-NAHI grant has increased the reach and access of PWIDs to HTS with corresponding year-on-year improvement in linkage to ART services.

## WEPED376

Village Savings and Loans Associations (VSLA) in Taraba State: catalyst for improved adherence to antiretroviral therapy among children and adolescents living with HIV in Taraba State

A. Nantim Dadi<sup>1</sup>, K. Eruchalu<sup>1</sup>, J. Anyanti<sup>2</sup>, O. Idogho<sup>1</sup>, W. Yakubu<sup>3</sup>

<sup>1</sup>Society for Family Health, Programmes, Abuja, Nigeria,

<sup>2</sup>Society for Family Health, M&E, Abuja, Nigeria, <sup>3</sup>Society for

Family Health, Programmes, Jalingo, Nigeria

**Background:** HIV/AIDS is known to be one of the diseases of poverty and has affected many households in sub-Saharan Africa including Nigeria. Financial resources resulting in unmet socio-economic needs such as

food-and-transportation directly affect retention-in-care among children-living-with-HIV. Children have not been devolved to receive ARV-refills through the differentiated service delivery models due to weight-based regimens. As a result, children and their caregivers are expected to attend appointments regularly. The Village-Savings-and-Loans-Association (VSLA) was established to provide economic-empowerment to the caregivers of children-living-with-HIV with the aim of boosting sustenance and enhancing HIV-treatment-retention and sustained viral-suppression.

**Description:** Sixty-indigent-caregivers of children who were not retained in care and with viral loads above 1000-copies/mL were selected from six-health-facilities to participate in a 3-day-intensive-training-programme on VSLA. Of the sixty-caregivers selected, fifty-two were living-with-HIV and twenty-nine had unsuppressed-viral-load-results. A grant of 50,000 Naira (62.5 USD) was given to each-participant to start a business. They meet twice-a-month with savings of 1,000 Naira (1.25 USD) per individual collected into a-savings-pool in a meeting.

A total of sixty-one infants and children (0-14 years) with viral load greater than 1000 copies/mL were enrolled into the study. Viral load test results of the children at baseline were compared with results at 12-months to determine adherence outcomes.

**Lessons learned:** The findings revealed that there was significant increase in retention in care and adherence-to-treatment. At the end of the study, 92% (56) of the children were virally suppressed. A total of 2 children were not suppressed and 3 deaths were recorded among the children due to co-morbidity and non-disclosure resulting in lack of adherence.

Interestingly, all twenty-nine caregivers with unsuppressed viral load reported 100% viral load suppression. Nine months into the intervention, savings were distributed to members to improve their business and another cycle of savings began.

**Conclusions/Next steps:** This study showed that economic empowerment of indigent-people-living-with-HIV through VSLA can improve retention in care and adherence to live-saving antiretroviral therapy. Other factors associated to retention like age-appropriate disclosure and treatment literacy should be included in the training module of VSLA. Expanding the programme to include more beneficiaries will further improve the second and third 95 UNAIDS goal among children.

# Social, political, legal and behavioural determinants of health in different contexts

## WEPE377

What factors influence whether stigmatizing attitudes change over time? An analysis of HIV stigma attitudes and perceptions among community members participating in the HPTN 071 (PopART) trial

A. Stangl<sup>1</sup>, T. Pliakas<sup>2,3</sup>, T. Mainga<sup>4</sup>, L. Viljoen<sup>5</sup>, V. Bond<sup>2,4</sup>, G. Hoddinott<sup>5,6</sup>, S. Floyd<sup>2</sup>, D. Donnell<sup>7</sup>, S. Fidler<sup>8</sup>, P. Bock<sup>5</sup>, H. Ayles<sup>2,4</sup>, R. Hayes<sup>2</sup>, J. Hargreaves<sup>2</sup>

<sup>1</sup>US Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States, <sup>2</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>3</sup>Impact Epilysis, Thessaloniki, Greece, <sup>4</sup>Zambart, Lusaka, Zambia, <sup>5</sup>University of Stellenbosch, Department of Paediatrics and Child Health, Cape Town, South Africa, <sup>6</sup>The University of Sydney, Sydney, Australia, School of Public Health, Faculty of Medicine and Health, Sydney, Australia, <sup>7</sup>SCHARR, Seattle, United States, <sup>8</sup>Imperial College, Department of Infectious Disease, London, United Kingdom

**Background:** People living with HIV (PLHIV) often experience stigma in the communities where they live, often driven by attitudes and perceptions of community members. While HIV stigma is declining slowly over time at the population-level in sub-Saharan Africa, little is known about factors influencing these reductions.

The availability of universal testing and treatment (UTT) was expected to normalize HIV and reduce stigma, yet evidence from UTT trials found no such impact.

**Methods:** Our data were collected as part of the HPTN 071 (PopART) trial, a cluster-randomized trial of UTT conducted from 2013-2018 in 21 communities (12 in Zambia; nine in South Africa). Eleven individual stigma items were assessed over four time-points among randomly-sampled individuals from each community.

Our analysis samples consisted of 12,241 community members not living with HIV who responded once during the trial and 2,113 who responded at least twice.

Using cluster-level data and linear regression, we examined secular trends over time for individual stigma items among the full sample. Using logistic regression, we assessed sociodemographic and sexual behavior characteristics associated with reductions in negative attitudes and anticipated and perceived stigma in unadjusted and adjusted analyses among those with measures at two time points.

The outcome was a binary variable that captured people who changed from a stigmatizing to a non-stigmatizing response, compared to those who did not.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Results:** We found significant reductions over time in most individual stigma items (absolute % change per year ranged from -1.2 to -3.1; p-values ranged from 0.2 to <0.01). No reductions were observed in the items assessing shame and fear towards PLHIV, or the item assessing perceptions of verbal abuse towards PLHIV in the community. Only one factor emerged in adjusted analyses: older participants ( $\geq 40$  years) were significantly more likely to change to the non-stigmatizing response about perceived stigma in the community settings (adjusted OR=1.53, 95% CI: 1.05-2.23 compared with those 18-24 years).

**Conclusions:** While anticipated and perceived stigma may reduce slowly over time, to intensify these reductions, and shift underlying drivers of stigma, like shame and fear, it will be important to implement targeted, stigma-reduction interventions at community-level.

## WEPED378

A thematic analysis on the awareness and experiences of Ilonggo GBMSM towards the importance of Anti-Discrimination Ordinance (ICADO) in improving sexual health and HIV services in Iloilo City, Philippines

R. Olete<sup>1,2,3</sup>, F. Martinez<sup>3</sup>, C. Strong<sup>1</sup>

<sup>1</sup>National Cheng Kung University, Department of Public Health, Tainan, Taiwan, Province of China, <sup>2</sup>Sustained Health Initiatives of the Philippines (SHIP), Mandaluyong City, Philippines, the, <sup>3</sup>Gabay sa Pulang Laso Inc., Antipolo City, Philippines, the

**Background:** The Iloilo City Anti-Discrimination Ordinance (ICADO) safeguards Ilonggos from discrimination based on sex, gender identity, and sexual orientation. Yet, there's limited knowledge about how gays, bisexuals and other men who have sex with men (GBMSM) perceive ICADO's impact on sexual health and HIV services quality in Iloilo City.

This study explores GBMSM awareness and experiences regarding ICADO's role in enhancing these services.

**Methods:** Using a qualitative descriptive design, key informant interviews (KIIs) between February 15 and March 2, 2023. The inclusion criteria were GBMSM of legal age and accessing sexual health services in Iloilo City. Transcripts were thematically analyzed using Braun and Clarke's approach.

**Results:** A total of 20 participants were included in the KIIs with age ranging from 18-45 years old. There were four themes identified during analysis:

1. ICADO's role in accessing services—generating mix responses where some GBMSM believed that the ordinance would improve their sense of safety in accessing sexual health services while others claimed that there is much work needed on a city-wide discussion to make sure that GBMSM are fully aware of the ordinance;

2. Stigma and discrimination—while all of the respondents reported favorable experiences with their health facilities, some GBMSM experienced discrimination in public venues, workplaces, and educational institutions but had little idea how to use ICADO for their legal protection;

3. Self-care abilities—most GBMSM claimed that their perceived risk and experiencing some symptoms of HIV/STIs are the main factor for them seeking health services while some verbalized embarrassment and self-stigma while accessing sexual health services.

**Conclusions:** The study reveals diverse perspectives among GBMSM regarding ICADO's impact on accessing services. While some anticipate increased safety, others emphasize the need for widespread awareness. Positive experiences were reported in health facilities but instances of discrimination in public spaces indicate the importance of strengthening legal knowledge among GBMSM. Moreover, the influence of self-care abilities on health-seeking behavior emphasizes the significance of tailoring services to address perceived risks and mitigate self-stigma. These insights have implications for refining ICADO implementation, emphasizing education, and fostering an inclusive environment to promote better health outcomes among GBMSM in Iloilo City.

## WEPED379

Evaluating media portrayals: the impact on HIV/AIDS stigma in Uzbekistan

U. Pikirenia<sup>1,2,3</sup>

<sup>1</sup>Mental Health Clinic 'Inson', Bukhara, Uzbekistan, <sup>2</sup>Frankfurt University of Applied Science, Frankfurt, Germany, <sup>3</sup>Bukhara State Medical Institute, Psychiatry, Narcology and Medical Psychology, Bukhara, Uzbekistan

**Background:** This study investigates the portrayal of HIV/AIDS in Uzbekistan's media, focusing on the accuracy and impact of media representations on public perceptions and stigma.

The research aims to analyse how HIV/AIDS is covered in the press, particularly examining the frequency, nature, and style of coverage, and its implications for public understanding and stigma.

**Methods:** The study analysed publications from the 14 most popular media outlets in Uzbekistan from November 1, 2022, to October 31, 2023. Articles were searched using specific keywords in Russian and Uzbek, and 78 relevant articles were identified and categorized based on their content: stigmatizing, anti-stigmatizing, neutral, informative on HIV prophylaxis, or demonstrating incorrect usage of HIV/AIDS terms.

**Results:** The analysis revealed a significant presence of stigmatizing content, with approximately 45% of the articles portraying HIV/AIDS in a negative light, particularly targeting women and sex workers. In contrast, only 5.1% of the articles offered anti-stigmatizing perspectives.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Neutral reporting, predominantly consisting of statistical data, comprised 52.6% of the coverage. The study also uncovered a notable deficiency in information on HIV prevention methods. There was no coverage on blood transmission prevention and only a minimal focus on sexual transmission prevention.

Furthermore, 17.9% of the articles were found to use HIV/AIDS terms incorrectly. The stigmatizing articles often highlighted criminal penalties faced by women under Article 113 of the Criminal Code, disproportionately targeting them despite the majority of HIV-positive cases in Uzbekistan involving men. This gender-biased narrative in media perpetuates inequality and hinders effective public health strategies.

**Conclusions:** The study highlights the need for media reform in Uzbekistan to ensure accurate, respectful, and stigma-free coverage of HIV/AIDS. It calls for the development of guidelines for journalists and the establishment of ethical reporting standards.

Additionally, the study emphasizes the importance of policy changes, particularly the decriminalization of HIV transmission and the cessation of gender-biased legal practices, to improve the lives of people living with HIV and enhance the efficacy of HIV prevention and care services in Uzbekistan.

## WEPED380

The positive experiences and unique challenges of PLWHIV living in temporary accommodation in north-east London

P. Ekakoro<sup>1</sup>, S. Worrall<sup>1</sup>, M. Mancinelli<sup>2</sup>

<sup>1</sup>Positive East, London, United Kingdom, <sup>2</sup>Michael MANCINELLI (EI), Marseille, France

**Background:** This study explores the experiences of People Living with HIV (PLWHIV) in Temporary Accommodation (TA) across North-East London. TA, offered by local authorities to homeless households awaiting permanent housing solutions, includes bed and breakfasts, hostels, managed social housing, and private rented accommodation.

This research addresses gaps in existing studies by exploring how TA specifically impacts the wellbeing of PLWHIV, in terms of both challenges and positive outcomes. Previous research has highlighted poor living conditions, safety hazards, and extended wait times for permanent housing among those in TA. **This study also seeks to uncover potential positive aspects and resilience factors unique to the experiences of PLWHIV.**

**Methods:** Online surveys, 1-to-1 interviews, and a focus group were used to engage PLWHIV. Surveys were distributed to Positive East clients, to HIV clinics to reach those accessing treatment and care, and online via social media and e-newsletters. By reaching PLWHIV from a range of backgrounds and situations, the study aimed to provide

a comprehensive understanding of varied experiences with living in TA and to highlight the potential factors that contribute to positive outcomes in satisfaction and wellbeing among PLWHIV.

**Results:** While 66% of PLWHIV expressed dissatisfaction with living in TA, some key positive findings emerged. Notably, **34% of respondents attributed their positive satisfaction** to factors such as spacious and **private accommodations, proximity to their treatment clinics**, and proactive landlords. Other key reasons for higher satisfaction included: 'having a place to call my own' that provided some **privacy, safety and security**; being able to live **more independently**; and having access to **good transport links and services** in their area.

**Conclusions:** The study's outcomes suggest the need for a balanced narrative when considering the experiences of PLWHIV in TA. Recognizing the clear challenges of TA is imperative, but also **acknowledging positive outcomes is important to draw the attention of local authorities and policy makers to the aspects of TA that foster improved wellbeing among PLWHIV.** Further study of how these aspects and other characteristics of TA can be better-managed and enhanced can help ensure TA meets the unique health and wellbeing needs of PLWHIV.

## WEPED381

An inclusive approach to enhancing healthcare access for people who inject drugs (PWID) in Bangladesh

N.E.Z. Rakhee<sup>1</sup>, S. Rahman<sup>1</sup>, M. Ur-Rashid<sup>1</sup>

<sup>1</sup>CARE Bangladesh, PWID Health and Program, Dhaka, Bangladesh

**Background:** Since 1995, CARE Bangladesh has been actively engaged in addressing the healthcare needs of People Who Inject Drugs (PWID) as part of its HIV program in Bangladesh. The current initiative, supported by the Global Fund and implemented across 20 districts since 2023, focuses on HIV prevention for PWID.

A key project objective involves integrating services into government health facilities and enhancing PWID readiness to access healthcare from these facilities.

**Description:** The project employs diverse activities and strategies to prepare PWID for accessing healthcare and overcoming challenges arising from stigma, fear, and a lack of awareness among the general population. CARE Bangladesh, in collaboration with the consortium partners, implemented various initiatives to prepare PWID to receive health services from government facilities.

Notable strategies included orientation sessions on government health centers, service processes, and behavioral norms through peer education, group education, and counseling sessions. In the initial stages, the project needed assistance in encouraging PWID to seek services at government health facilities, leading to the introduction

of accompanied referrals, particularly for STI and abscess management. Over the years, the project showcased significant progress, with 106 PWID receiving services in the first year, followed by 989 in 2022 and a substantial increase to 1608 in 2023. This upward curve underscores the success of CARE Bangladesh's initiatives in enhancing PWID readiness and acceptance of health services from government facilities.

**Lessons learned:** The key lesson learned from this endeavor is the pivotal role of targeted, comprehensive strategies in gradually overcoming barriers and fostering a positive shift in PWID engagement with government health facilities.

The significant increase in the number of PWID availing services over the years (from 106 in the first year to 1608 in 2023) underlines the success of CARE Bangladesh's initiatives in enhancing PWID readiness and acceptance of health services from government facilities.

**Conclusions/Next steps:** This lesson emphasizes the importance of persistence, adaptability, and collaborative efforts in implementing effective interventions for marginalized populations facing unique healthcare challenges.

## WEPED382

**Personal touch model of care: a strategic approach to improve health outcomes for children and adolescents living with HIV in 4 Counties in Kenya**

L. Matu<sup>1,2</sup>, R. Osofi<sup>2</sup>, S. Ajuoga<sup>2</sup>, M. Kitheka<sup>2</sup>

<sup>1</sup>Gold Star Kenya, Nairobi, Kenya, <sup>2</sup>USAID Tujenge Jamii, Nairobi, Kenya

**Background:** Despite the progress made by Kenya in identifying and starting children and adolescents on treatment, achieving optimal viral load suppression of at least 95% remains a challenge. In September 2019, viral load suppression among children aged 0-9 and 10-19 years was 70% and 73% respectively across the 200 USAID Tujenge Jamii (UTJ) project supported sites.

To achieve the 3<sup>rd</sup> 95%, a different approach was needed, and this informed the personal touch model of care.

**Description:** UTJ team together with the health facility teams formed a multi-disciplinary team (MDT) that discussed and reviewed children and adolescents who had high viral load (HVL) across 200 sites in four counties in Kenya. The MDT then invited the children and their guardians for a one-on-one discussion using a case management approach where barriers to optimal viral load suppression were explored.

Most of the barriers identified were social and structural in nature and varied from family to family. Personalized and achievable health, social, education and other life goals were set jointly with the families. Timelines were given within which to achieve these goals and a date for

review and repeat viral load was set. A case manager was identified to walk with the family beyond that initial discussion with the MDT.

This approach was named "The Personal Touch Model of Care- PTMc" and was implemented in all sites that were serving children 0-9 and adolescents 10-19 years.

**Lessons learned:** Viral load suppression improved 70% and 73% at baseline in 2019 to 91% and 93% for children 0-9yrs and adolescents 10-19yrs respectively in 2023. Personalizing care to each family based on individual circumstances and involving them in the decision making helped achieve set goals including viral load suppression.

**Conclusions/Next steps:** Personal Touch Model of Care is a low-cost easy to implement intervention that takes us closer to the 3<sup>rd</sup> 95 especially among children and adolescents. To achieve the 3<sup>rd</sup> 95, social and structural barriers must be addressed alongside clinical management, and project managers need to incorporate this as an integral part of the package of care for children and adolescents living with HIV.

## WEPED383

**Witness Seminar: a promising methodology for documenting and highlighting community participation in legal reform processes for Universal Health Coverage (UHC)**

C. Serrao<sup>1</sup>, A.C. Zeltman<sup>1</sup>, V. Zalazar<sup>1</sup>, E. Esandi<sup>1</sup>, H. Palacios<sup>2,3</sup>, M. Romero<sup>2,3</sup>, P. Loreti Gambaccini<sup>4</sup>, J. Kors<sup>4</sup>, N. Cardozo<sup>1,2,3</sup>, C. Ryan<sup>4</sup>, Z. Ortiz<sup>1</sup>, I. Aristegui<sup>1</sup>

<sup>1</sup>Fundacion Huesped, Research Department, Buenos Aires, Argentina, <sup>2</sup>Asociación de Travestis, Transexuales y Transgéneros de Argentina (A.T.T.A.), Buenos Aires, Argentina, <sup>3</sup>REDLACTRANS, Buenos Aires, Argentina, <sup>4</sup>Fundacion Huesped, Advocacy area, Buenos Aires, Argentina

**Background:** Social participation in health policies that promote effective universal health coverage (UHC) is poorly documented. Witness Seminar (WS) is a promising methodology, albeit underutilized, particularly in Low- and Middle-Income Countries.

This analysis presents the lessons learned from the implementation of WS to document and provide visibility on how the transgender community participated in the enactment of the Gender Identity Law (GIL) in Argentina in 2012.

**Description:** Two NGOs from Buenos Aires (one research-oriented and a trans community organization) conducted a WS with twenty-two activists from different regions of Argentina, one elected deputy, one former deputy, and two officials from national diversity departments to document the process. This method facilitates the discussion and stance-taking of a group of key witnesses regarding their recollections and perspectives on a recent historic event (the achievement of the GIL).

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Lessons learned:** The collaborative work undertaken was anchored in a decade-long established partnership between institutions. This involved integrating community leaders as peer research associates, conducting weekly meetings, and aligning on a shared agenda from the outset. It was essential for selecting key witnesses, determining the best strategy to conduct the WS, formulating relevant and comprehensive questions and developing a timeline outlining fundamental events for achieving the enactment of the law.

The methodology employed encompassed key stakeholders who were involved in drafting and deliberation processes of the legislation. Also, we engaged young stakeholders to depict the law's impact on their lives.

This approach allowed an accurate organization of information and testimonies, reconstructing transgender social participation in drafting the bill, placing it on the public agenda, and describing its effects on their access to healthcare.

**Conclusions/Next steps:** WS allows the systematization of an experience of social participation on health reforms. By creating space to amplify voices from vulnerable populations, it promotes meaningful engagement and empowerment of marginalized groups.

It is a fundamental part of studies that promote social participation, to conduct collaborative work with the community, favoring joint decision-making. This is crucial to drive political advocacy that fosters advancements towards UHC.

Furthermore, documenting and disseminating the WS can significantly impact other activists to shape advocacy strategies to improve social participation.

## WEPED384

College of Arts and Sciences, Miami, United States, <sup>14</sup>University of Miami, Miami, United States, <sup>15</sup>Pontifica

Universidad Catolica de Chile, School of Medicine, Santiago, Chile, <sup>16</sup>University of Washington, School of

Public Health, Seattle, United States, <sup>17</sup>Boston University, School of Public Health, Boston, United States, <sup>18</sup>Stony

Brook University, School of Social Welfare, Stony Brook, United States

**Background:** People impacted by or living with HIV experience numerous disparities in access to healthcare, including health-harming legal needs (HHLN) such as experiences of discrimination, housing instability, immigration concerns, denial of benefits, and domestic violence. Medical-Legal Partnerships (MLP) provide an opportunity for people vulnerable to or living with HIV to obtain access to legal services that facilitate positive health outcomes, placing the needs of individual participants at the center of these intervention models.

**Description:** We provide an overview of four U.S. federally-funded studies led by a consortium of MLP scholars and practitioners that address health disparities, including disparities in HIV within priority populations such as sexual and gender minorities, gender minority youth, formerly incarcerated individuals, immigrants, and youth. These studies incorporate at least two of these four core components:

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

1. Comprehensive training and capacity building of all staff: medical, social-behavioral, and legal;
2. Comprehensive screening to identify HHLN;
3. Provision of legal support by a partnering local community health organization; and,
4. In-service clinics and workshops at healthcare sites covering HHLN topics with a focus on preventive legal aid.

All of these studies are guided by community advisory boards, ensuring community voices, feedback and representation are integrated into all stages of the research process.

**Lessons learned:** A holistic approach to HIV prevention and care is critical to mitigating health disparities, meeting people where they are, and delivering comprehensive services that prioritize client-centered approaches.

Our collection of MLP studies underscores the following components as critical to increasing positive health outcomes: a committed community organization with dedicated leadership, community-informed outreach of priority populations, client/provider trust, on-site legal services provisions, robust and targeted training for staff, equitably hiring of staff from within priority populations, and sustainable funding.

**Conclusions/Next steps:** Medical Legal Partnerships, as structural interventions, hold the potential to offer an opportunity for the reduction of HHLN and contribute to diminishing barriers to healthcare for individuals impacted by or living with HIV.

Future studies should explore the expansion and integration of various models of MLPs to enhance integration of HIV prevention and care services.

## WEPED385

Out in health: gay, bisexual, and other men who have sex with men's negative experiences discussing sexuality and sexual health with healthcare providers in New Zealand

T.B. Swinburn<sup>1,2</sup>, P. Saxton<sup>1</sup>, M. Lyndon<sup>3</sup>

<sup>1</sup>University of Auckland, Social and Community Health, Auckland, New Zealand, <sup>2</sup>University of Auckland, Medical School, Auckland, New Zealand, <sup>3</sup>University of Auckland, Centre for Medical and Health Science Education, Auckland, New Zealand

**Background:** Gay, bisexual, and other men who have sex with men (GBMSM) in New Zealand (NZ) are disproportionately impacted by HIV and other STIs. Biomedical innovations such as PrEP offer new prevention tools, but these are only accessible through clinical interactions. GBMSM's prior experiences with healthcare providers (HCPs) can impact their willingness to seek out ongoing HIV prevention/testing.

We aimed to understand GBMSM's negative experiences discussing their sexuality and sexual health needs with HCPs.

**Methods:** Open-ended data were analysed from 422 HIV-negative GBMSM participating in the 2022 Sex and Prevention of Transmission Study, NZ's national, cross-sectional HIV bio-behavioural surveillance programme. An inductive thematic analytic approach was used to synthesise free-text responses where participants described an issue that had caused an HCP to react negatively to their sexuality or sexual health needs.

**Results:** We identified four themes.

Firstly, GBMSM encountered judgemental and prejudiced HCPs who made scornful, paternalistic and stereotyped remarks about participants' HIV status, prevention/testing needs, and risk practices.

Secondly, participants experienced discrimination, such as being refused care, stigmatised, or assaulted.

Thirdly, GBMSM described HCPs who were disrespectful, making ridiculing comments about sexuality, acting indifferently towards their sexual health, or lacking sensitivity. Finally, participants encountered HCPs who were inexperienced and unskilled in delivering GBMSM sexual healthcare, often in relation to discussing and prescribing PrEP. GBMSM's negative experiences led them to change HCPs, avoid sexual health services and suffer mental health sequelae, delayed diagnoses, and medical complications.

**Conclusions:** In the biomedical prevention era, GBMSM frequently encountered HCPs who lacked cultural competence, cultural safety, and GBMSM-specific clinical knowledge and skills needed to deliver effective, inclusive sexual healthcare. Improving HCPs' knowledge of and ability to interact safely with GBMSM throughout undergraduate studies, vocational training, and continuing professional development is needed to improve GBMSM's experiences of sexual healthcare services and hence uptake of HIV prevention/testing.

Putting people first in NZ's goal of eliminating local HIV transmission by 2030 will require healthcare environments where GBMSM have positive experiences raising their sexuality and sexual health needs.

### WEPED386

#### Rethinking HIV-PrEP delivery in Canada: marginalized 2SGBQM's views on accessing injectable cabotegravir

T. Curtis<sup>1</sup>, R. Takamatsu<sup>2</sup>, L. Leloup<sup>2</sup>, R. Chin-see<sup>2</sup>, B. Klassen<sup>2</sup>, C. Draenos<sup>2</sup>, C. Schwartz<sup>2</sup>, M. Montess<sup>3,4</sup>, C. George<sup>5</sup>, D. Grace<sup>4</sup>, K. Monteith<sup>6</sup>, A. dela Cruz<sup>7</sup>, H. Pruden<sup>8</sup>, M. Kwag<sup>2</sup>, D. Tan<sup>9,4</sup>

<sup>1</sup>University of Victoria, School of Public Health and Social Policy, Victoria, Canada, <sup>2</sup>Community-Based Research Centre, Vancouver, Canada, <sup>3</sup>Unity Health Toronto, Toronto, Canada, <sup>4</sup>University of Toronto, Toronto, Canada, <sup>5</sup>Buffalo State University, Buffalo, United States, <sup>6</sup>COCQ-SIDA, Montreal, Canada, <sup>7</sup>University of Calgary, Calgary, Canada, <sup>8</sup>BC Centre for Disease Control, Vancouver, Canada, <sup>9</sup>St Michael's Hospital, Toronto, Canada

**Background:** Oral HIV pre-exposure prophylaxis (PrEP) has reduced HIV incidence among Two-Spirit, gay, bisexual, queer and other men who have sex with men (2SGBQM) in Canada, but some marginalized subgroups remain under-represented relative to need. Ahead of the regulatory approval of long-acting injectable cabotegravir (CAB-LA) in Canada, PrEP delivery models must be examined to minimize barriers to PrEP access and use.

**Methods:** 'The Future of PrEP is Now' is a community-based research project examining the needs and preferences of 2SGBQM in Canada for accessing CAB-LA. We conducted 10 focus groups and 9 semi-structured interviews with 2SGBQM across Canada, prioritising participants meeting PrEP guideline indications and who are: Indigenous and Two-Spirit; African, Caribbean or Black; other persons of colour; transgender or non-binary; residents of remote/rural areas; and people who use substances.

We analyzed qualitative data using reflexive thematic analysis to understand acceptability, community needs, and preferences related to CAB-LA.

**Results:** Participants (N=42; 76% with current/previous PrEP experience) were positive about CAB-LA, citing its perceived ease of adherence compared to oral PrEP, and convenience related to not having to store medication. However, many discussed the inconvenience of CAB-LA's two-monthly injection cycle, requiring additional visits to healthcare providers annually on top of the quarterly monitoring visits currently recommended for oral PrEP.

Also of concern was the cost of CAB-LA, especially in provinces without publicly-funded PrEP programs. Participants were interested in PrEP (oral and CAB-LA) delivery through an expanded range of providers, including sexual health clinics, community organisations, pharmacies, and primary care providers (PCPs), though complaints about PCPs' lack of familiarity with PrEP were common.

Finally, 2SGBQM described current PrEP access pathways as overly complicated, desiring more integrated approaches to PrEP consultations, delivery and monitoring.

**Conclusions:** In this sample of marginalized subgroups of 2SGBQM in Canada, recommendations for implementation of CAB-LA include expanding the range of service providers able to administer PrEP, encouraging greater adoption of PrEP care into clinical practice among PCPs, aligning monitoring frequency with CAB-LA administration, better integration of monitoring within PrEP services, and expanding universal publicly-funded coverage.

### WEPED387

#### Positioning PrEP in the hearts and minds of young women: validation findings of a PrEP category brand strategy for adolescent girls and young women

E. Donaldson<sup>1</sup>, C. Bishopp<sup>1</sup>, E. Briedenhann<sup>2</sup>, P. Jeckonia<sup>3</sup>, D. Nhamo<sup>4</sup>, C. Basson<sup>5</sup>, M. Niyibeshaho<sup>3</sup>

<sup>1</sup>FHI 360, Durham, United States, <sup>2</sup>Wits RHI, Johannesburg, South Africa, <sup>3</sup>LVCT Health, Nairobi, Kenya, <sup>4</sup>PZAT, Harare, Zimbabwe, <sup>5</sup>2Stories, Cape Town, South Africa

**Background:** As the pre-exposure prophylaxis (PrEP) category expands to include new products, establishing PrEP as a brand is essential to align all communication under a common strategy and better connect with and effectively communicate choice to today's adolescent girls and young women (AGYW).

The first step toward building that brand is developing a positioning strategy answering the question: What do we want AGYW's hearts to feel and minds to think about PrEP?

**Methods:** We reviewed existing insights and campaigns on AGYW and PrEP, including those on available and pipeline PrEP products. Inputs to the strategy were assessed alongside ministry of health representatives, advocates, and youth advisors. To validate the strategy, we held discussion groups with 121 AGYW in urban, peri-urban, and rural settings in Kenya, South Africa, and Zimbabwe. Creative interpretations of the strategy were presented to participants and evaluated along a set of metrics using projective techniques and co-design activities. Data were analyzed for insights along a marketing framework including culture, category, consumer, product inputs, to identify the key brand benefit (KBB)—the emotionally engaging focus of the brand.

**Results:** Five key insights emerged:

1. PrEP is self-care, and self-care means loving oneself enough to take care of oneself;
2. PrEP provides peace of mind, negating the anxiety of momentary perceptions of risk;
3. PrEP supports AGYW in putting themselves first;
4. PrEP choice puts AGYW in control: they can decide whether and which method to use; and,

5. relationships with intimate partners are the context of AGYW's lives but not the emotional driver of PrEP use.

The KBB is that PrEP is a way for AGYW to prioritize physical health and mental well-being, to live a life uninterrupted by HIV. PrEP affirms that self-love is strength.

**Conclusions:** Self-care, agency, and strength of AGYW are major insights that informed the strategy, creating a unified, evidence-informed brand for PrEP as a category of products.

This strategy will inform high-quality campaigns that connect with AGYW on an emotional level to inspire them to act. PrEP category positioning applied across demand generation efforts provides the foundation for clear, impactful, positive, and consistent communication.

## WEPED389

### Gaymi as a bridge: campaign evaluation of HIV self-testing secondary distribution among YMSM

Z. Yin<sup>1,2</sup>, Z. Yang<sup>3</sup>, T. Feng<sup>4</sup>, B. Cao<sup>1</sup>

<sup>1</sup>Shenzhen University, Shenzhen, China, <sup>2</sup>UNC-Project China, Guangzhou, China, <sup>3</sup>Shenzhen Pingshan Centers for Disease Control and Prevention, Shenzhen, China, <sup>4</sup>Shenzhen Centers for Disease Control and Prevention, Shenzhen, China

**Background:** Gaymi refers to females' intimate gay friends. This relationship found the potential for sexual health promotion for gay men by comprising HIV self-testing secondary distribution. As innovative strategies are needed to expand HIV testing coverage among young students men who have sex with men (YMSM) in China, this study aimed to explore the effectiveness of the Gaymi relationship-leveraged HIV testing promotion for YMSM.

**Methods:** In December 2020, we conducted an HIV testing promotion campaign at a university in China. Online outreach and offline activities were performed by the on-campus community organization. Female college students who had YMSM friends were recruited as the index (who distribute HIV testing kits).

After paying a returnable deposit, indexes obtained an HIV self-testing package comprising a urine testing kit, educational brochures, and a postcard facilitated deposit retrieval. Once the HIV self-testing kits were used by YMSM (alters, who received HIV testing kits), alters were instructed to upload results for their female friends' deposit reimbursement.

Subsequently, both index and alter participants would receive a mixed-method assessment for the process evaluation and effect evaluation following the distribution of HIV self-testing kits.

**Results:** A total of 40 HIV self-testing kits were applied with 50% utilized by the alters. 60% (12/20) of YMSM attempted first-time testing, reporting high perceived ease of use (4.95/5) and intention to use (4.90/5) HIV self-testing. The

perceived instructional and emotional support reached 4.85 and 4.625. Qualitative results from in-depth interviews with 28 participants revealed that the Gaymi relationship was acceptable for the secondary distribution as indexes were sexual minority friendly. Through in-person inspection, and informing before delivering, indexes actively eliminated the on-campus stigma to protect their YMSM friends. Post-intervention, the knowledge and willingness for HIV self-testing of alters were enhanced. Moreover, the Gaymi relationship benefitted those testing inaccessible alters from distant sites. For alters, receiving care from female friends facilitated the stigma reduction, contributing to self-identification. Gaymi's intervention visualized the sexual minorities in China, presenting high sustainability for future iterations.

**Conclusions:** The Gaymi relationship played a feasible bridging role in HIV self-testing distribution, presenting effectiveness in reaching new testers, improving HIV knowledge and testing behavior, bringing emotional support, and facilitating stigma reduction for YMSM.

## WEPED390

### The mLab App, an HIV prevention intervention using mobile technology, for increasing PrEP uptake

R. Schnall<sup>1</sup>, T. Scherr<sup>2</sup>, L. Kuhns<sup>3</sup>, P. Janulis<sup>4</sup>, R. Garofalo<sup>3</sup>

<sup>1</sup>Columbia University, School of Nursing, New York, United States, <sup>2</sup>Vanderbilt University, Nashville, United States, <sup>3</sup>Lurie Children's Hospital, Chicago, United States, <sup>4</sup>Northwestern University, Chicago, United States

**Background:** HIV prevention tools are needed to mitigate new cases in the US, especially among health disparate groups. Extremely high mobile phone use makes mHealth technology an ideal platform for delivering HIV prevention tools. In response, our study team developed the mLab App which incorporates an algorithm to interpret a photograph of the OraQuick rapid home HIV self-test results to provide accessible, objective, secure, and real-time feedback on HIV test results. It also contains an automated data collection and results reporting feature that relays test results back to the research team.

The study participant receives automated messages to encourage future repeat testing, as well as linkage to PrEP care for those who receive a non-reactive test or linkage to confirmatory testing and HIV treatment for those with a reactive test.

**Methods:** This was a multi-site three-arm randomized clinical trial in 525 men who have sex with men and transgender women ages 18-29 years in New York City and Chicago, IL. Participants were randomized to one of three study arms:

1. Receiving the mLab App including HIV home test kits,
2. Standard of care HIV prevention information only, or,
3. HIV home test kits only.

The primary goal was to increase HIV testing. The secondary goal was to increase PrEP uptake, which is the goal of this analysis.

**Results:** In our multivariate analytic models, at 12-months there was a statistically significant higher increase in PrEP use in the mLab App arm compared to standard care arm ( $p < 0.001$ ) with a similar, but non-significant difference ( $p = 0.412$ ), for the mLab App compared to at-home testing only. There was no notable difference in outcomes when stratified by race or gender.

**Conclusions:** In this study, the mLab App demonstrated efficacy in improving PrEP uptake as compared to the standard of care arm. Testing and implementation of this intervention across global settings should be considered given the low uptake of PrEP in high need settings across the globe.

## WEPED391

Understanding young men's perspectives on voluntary medical male circumcision (VMMC): insights from a population-based survey in four counties in western Kenya

K. Ong<sup>1</sup>, E. Odoyo-June<sup>2</sup>, M. Peck<sup>1</sup>, A. Juma<sup>3</sup>, R. Bhatia<sup>1</sup>, T. Lucas<sup>1</sup>

<sup>1</sup>Centers for Disease Control and Prevention, Division of HIV and TB, Atlanta, United States, <sup>2</sup>Centers for Disease Control and Prevention, Division of HIV and TB, Nairobi, Kenya, <sup>3</sup>Ministry of Health, MOH-NASCOP National STD/AIDS Control Program, Nairobi, Kenya

**Background:** With support from the U.S. President's Emergency Plan for AIDS Relief (PEPFAR), Kenya adopted voluntary medical male circumcision (VMMC) for HIV prevention in 2008. We sought to understand men's perspectives on circumcision based on a population survey conducted in 2019 to optimize service uptake and verify VMMC coverage. At that time, Kenya had nearly achieved 80% circumcision coverage in men 15-29 years based on VMMC Decision-Makers Program Planning Tool 2 statistical modelling.

**Methods:** Data were derived from the 2019 population survey of VMMC coverage in Kenya. Males aged 10-29 were surveyed between July and September 2019 via random selection of households in four Western Kenyan counties. Questions included demographics, VMMC status, knowledge and perceptions about circumcision, and VMMC service delivery experiences. Participants were asked for reasons they chose to be circumcised or to remain uncircumcised. Descriptive analyses were conducted.

**Results:** Of 3585 participants, 68% ( $n=2440$ ) were circumcised, 27% ( $n=970$ ) were uncircumcised, and 4% ( $n=158$ ) had unverified circumcision status. Ninety percent of participants ( $n=3232$ ) had family who was circumcised. Of the circumcised, 78% ( $n=1913$ ) had it done between 5-14 years old. Top reasons for forgoing circumcision were unspecific

personal decision (35%,  $n=310$ ), lacking or waiting for parental consent (14%,  $n=140$ ), and not knowing about circumcision (12%,  $n=119$ ). Various fear-related concerns were reported as a reason for forgoing circumcision by 11% ( $n=78$ ) of 10-14-year-old participants, compared to only 2% ( $n=22$ ) of 15-29-year-olds.

Top reasons for choosing circumcision were better hygiene (61%,  $n=1479$ ), HIV risk reduction (49%,  $n=1201$ ), sexually transmitted disease (STI) risk reduction (30%,  $n=731$ ), and being approached about it (47%,  $n=1144$ ), although varying by age group, with respondents 10-14 years old reporting being approached about it more (56%,  $n=754$ ).

**Conclusions:** Even in countries with a mature VMMC program, such as Kenya, continued emphasis on STI prevention and hygienic benefits of VMMC is important. Building relationships with and improving health literacy of parents and targeted outreach to youths to allay fears about circumcision may improve uptake.

Varying motivations in the decision to circumcise suggest the importance of implementing demand creation strategies that systematically assess and tailor to the needs of clients.

## WEPED392

Understanding regulatory processes and gaps that could impede fast-track introduction and rollout of the Dual Prevention Pill (DPP) in Uganda: bridging the gap between community and regulatory bodies

R. Akulu<sup>1</sup>, K. Segal<sup>2</sup>, D. Namutamba<sup>1</sup>, L. Mworeko<sup>1</sup>

<sup>1</sup>International Community of Women Living with HIV Eastern Africa (ICWEA), Wakiso, Uganda, <sup>2</sup>Global Advocacy for HIV Prevention (AVAC), New York, United States

**Background:** Biomedical HIV prevention products take approximately 1-5 years to be approved in Uganda after the World Health Organization and US FDA's approval. The Dual Prevention Pill (DPP), which combines oral PrEP and oral contraception, is currently undergoing bioequivalence studies and could be the next multipurpose prevention technology (MPT) to come to market, possibly available by 2025. The DPP could be a preferred option for adolescent girls and young women (AGYW) in Uganda who currently contribute to 79% of all new HIV acquisitions and are also vulnerable to unintended pregnancies. Engaging community in the regulatory process could fast track introduction.

**Description:** Through Girl Power project, an initiative of the AVAC 2022/23 Fellowship Program, 6 consultation meetings were held with 30 AGYW, 12 CSOs, Uganda National Drug Authority and Ministry of Health to understand what role communities play in influencing fast approval of new HIV products. This culminated in the joint meeting between the stakeholders to better understand regulatory

approval processes for new HIV prevention products and addressed existing regulatory gaps that could impede introduction of the DPP/MPTs in the future.

**Lessons learned:** Regulators noted that the DPP dossier submission would require a bioequivalence study report, which provides requisite evidence for MPTs like the DPP that combine two previously-approved products in addition to other technical screenings of pharmaceutical requirements and Good Manufacturing Practice (GMP) status.

Primary challenges for delayed approval included incomplete submissions, poor adherence to registration guidelines, delayed responses to additional data requested and non-compliance with Good Manufacturing Practices. The meeting established the "Product Regulators Engagement Committee" – a platform to engage regulatory bodies, community and researchers throughout all stages of HIV research and development (R&D), a model that could be replicated across countries. For the DPP and other MPTs containing contraception, this engagement included family planning stakeholders who will have a shared role in product introduction.

**Conclusions/Next steps:** Bringing drug regulators and community to the table early while the products are in R&D to clarify regulatory pathways will increase the likelihood of fast approval and rollout. Swift approval and rollout of new, highly efficacious options could reduce the high HIV incidence among AGYW in Uganda.

## WEPED393

Rapid ART initiation with BIC/FTC/TAF in HIV-positive people who inject drugs (naïve or re-linking to care): a pilot study of an integrated care model

M. Psychogiou<sup>1</sup>, K. Protopapas<sup>2</sup>, S. Roussos<sup>3</sup>, E. Mastrogianni<sup>1</sup>, C. Totsikas<sup>4</sup>, A. Antoniadou<sup>2</sup>, A. Papadopoulos<sup>2</sup>, V. Papastamopoulos<sup>5</sup>, I. Katsarolis<sup>6</sup>, V. Sypsa<sup>3</sup>, A. Hatzakis<sup>3</sup>

<sup>1</sup>National and Kapodistrian University of Athens, First Department of Internal Medicine, Athens, Greece, <sup>2</sup>University General Hospital Attikon, Medical School, National and Kapodistrian University of Athens, Athens, Greece, <sup>3</sup>National and Kapodistrian University of Athens, Department of Hygiene, Epidemiology and Medical Statistics, Athens, Greece, <sup>4</sup>Evangelismos General Hospital, Department of Internal Medicine and Infectious Diseases, Athens, Greece, <sup>5</sup>Evangelismos General Hospital, Athens, Greece, Department of Internal Medicine and Infectious Diseases, Athens, Greece, <sup>6</sup>Medical Affairs, Gilead Sciences Hellas, Athens, Greece

**Background:** HIV-positive people who inject drugs (PWID) face unique challenges in accessing and adhering to antiretroviral therapy. In Greece two HIV major outbreaks have been described in Athens in the past decade. This

pilot study aimed to evaluate the effectiveness and safety of an integrated care pathway combining rapid ART initiation with BIC/FTC/TAF with peer navigation support (PNS) for treatment-naïve or treatment experienced PWID.

**Methods:** This prospective, single-arm, open-label, multicenter study enrolled adult PWID linking or relinking to care at three HIV clinics in Athens, Greece, who received rapid ART initiation with BIC/FTC/TAF combined with PNS from December 2021 to November 2023.

Primary endpoints were viral suppression (VL<40 copies/ml) and % PWID experiencing grade 3/4 adverse event (SAE) related/not related to study treatment at Week-24. Historical controls were used to compare the median time from the date of HIV diagnosis to starting ART and effectiveness at Week-24.

**Results:** A total of 36 PWID were enrolled with a follow-up period of at least 24 weeks. Mean age (SD) at baseline was 40.5 (6.4) years. Most participants were male (83.3%; 30/36), not in an opioid agonist treatment program (75.0%; 27/36), Caucasian (97.2%; 35/36), had a low/basic level of education (58.3%; 21/36), and unemployed (88.9%; 32/36). Four participants (11.1%) were homeless.

Among the 108 visits scheduled up to Week-24, participants attended 68.5%, missed 21.3%, and had upcoming visits planned for 10.2%. Among participants with available HIV-RNA, 66.7%, 70.8%, and 90.9% had VL<40 copies/ml at Week-4, Week-12, and Week-24, respectively.

Four participants had SAE (none related to treatment). The median time to initiate treatment (from the date of screening to the start of BIC/FTC/TAF) was 0 days. For 122 historical controls from the same HIV clinics, the median time (25<sup>th</sup>-75<sup>th</sup> percentile) from diagnosis to initiating ART was 141.5 (43.5-414.5) days, while among those with available HIV-RNA at Week-24, 40% had VL<40 copies/ml.

**Conclusions:** The combination of rapid ART initiation with BIC/FTC/TAF and PNS was effective in achieving high rates of rapid viral suppression among PWID in Greece.

These findings support the implementation of rapid initiation of ART and PNS interventions for PWID to improve HIV outcomes.

Infant and maternal health outcomes and stakeholder perspectives on post-natal home visits in Mathare North, Nairobi, Kenya

E. Ojee<sup>1</sup>, E. Begnel<sup>2</sup>, J. Adhiambo<sup>1</sup>, C. Kundu<sup>3</sup>, H. Moraa<sup>3</sup>, J. Kinuhtia<sup>3</sup>, S. Gant<sup>4</sup>, D. Lehman<sup>2</sup>, K. Beima-Sofi<sup>2</sup>, J. Slyker<sup>2</sup>, D. Wamalwa<sup>1</sup>

<sup>1</sup>University of Nairobi, Pediatrics and Child Health, Nairobi, Kenya, <sup>2</sup>University of Washington, Global Health, Seattle, United States, <sup>3</sup>Kenyatta National Hospital, Research, Nairobi, Kenya, <sup>4</sup>University of Montreal, Pediatrics, Montreal, Canada

**Background:** Strong evidence support home-based delivery of postnatal interventions in improving newborn survival and maternal outcomes. UNICEF and World Health Organization recommend a minimum of two post-natal home visits within the first week of life. Limited data exists regarding successes and challenges of implementation in Kenya, where mothers and infants—including those with or exposed to HIV would benefit.

To address this knowledge gap, we utilized an existing birth cohort study of mother infant pairs on postnatal follow up for two years at a health center in Nairobi to compare health outcomes between those receiving standard clinic visits versus additional home visits for one year.

**Methods:** Mixed methods approach assessed morbidity/mortality and gathered stakeholder perspectives regarding provision and receipt of postnatal home visits. Women living with HIV and HIV-negative women were enrolled during their third trimester. Outcomes were assessed at clinic visits. In-depth interviews among a subgroup of mothers and stakeholders assessed benefits and challenges. Survival analysis methods assessed differences in risk of recurrent acute diarrhea, pneumonia, or hospitalization (Andersen-Gill regression) and mortality (Cox proportional hazards regression) between groups; models were adjusted for maternal HIV status, age, marital status, and education. Thematic analysis with inductive and deductive approaches were iteratively used to explore emerging themes.

**Results:** Exit data were available for 153/211 (73%) mother-infant pairs, 58 (38%) received additional weekly home visits and 95 (62%) received clinic visits only. Among the infants, 74 (48%) were HIV-exposed and 79 (52%) were HIV-unexposed. There was a significant difference in risk of acute diarrhea (adjusted Hazard Ratio [aHR]=0.50, 95% CI: 0.26-0.93; p=0.030), but not in risk of pneumonia (aHR=0.23, 95% CI: 0.036-1.46; p=0.118), hospitalization (aHR=0.15, 95% CI: 0.020-1.20; p=0.073), or mortality (aHR=0.33, 95% CI: 0.042-2.79; p=0.315). Emerging themes on benefits of home visits included psychological support, education on infant danger signs, exclusive breastfeeding, and prevention of HIV transmission to infants. Barriers included stigma, invasion of privacy, and lack of spousal support.

**Conclusions:** Despite limited power, additional post natal home visits may reduce morbidity in the first two years of life. Mothers and providers found home visits beneficial despite some barriers and recommended home for scale in universal health coverage.

## WEPED395

The problem of elimination of mother-child transmission of HIV in the DRC: role of the community

R. Kiningu Kikumbi<sup>1</sup>

<sup>1</sup>University of Kinshasa, Law, Kinshasa, Congo, the Democratic Republic of the

**Background:** Mother-to-child transmission of HIV infection (MTCT) remains a public health problem despite the TEST-TREAT strategy implemented, to bring the MTCT rate to less than 5 % in 2025. This desire has been renewed many times in the different versions of the ETME Plan since 2012.

However, despite all the investments, the situation of the HIV program over the last five years in the DRC remains worrying, with mother-to-child transmission of HIV at 18%.

**Methods:** This is an evaluation conducted using quantitative data from three provinces of the DRC: Haut Katanga, North Kivu and Kasai Oriental.

The study focused on 5 years of data, i.e. from 2017 to 2021 inclusive for indicators directly linked to the cascade of PMTCT services.

This involved evaluating the performance of PMTCT interventions, identifying bottlenecks at the operational and intermediate level as well as the best strategies most suited to scaling up.

**Results:** The main bottlenecks identified were the poor access of pregnant women to Prenatal Consultation (12% of pregnant women do not benefit from any Prenatal Consultation session during pregnancy, 83% do not attend the Prenatal Consultation service before the second trimester, 52% benefit from less than 4 Prenatal Consultation during pregnancy). Lack of knowledge of serological status by HIV+ pregnant women (30% of HIV+ pregnant women not tested and informed of their HIV+ status), failure to put pregnant women tested HIV+ on ARV (at least 30% of pregnant women tested HIV+ and informed of their status did not receive ARV). No access of exposed children to ARV prophylaxis and early HIV diagnosis (1 in 4 exposed newborns did not receive ARV prophylaxis at birth, only 3 infants exposed to HIV did not benefit from early diagnosis according to the national protocol).

**Conclusions:** In the DRC, substantial progress has been made in the prevention of MTCT, however additional efforts must be made to eliminate MTCT by 2025. Thus, these analyses and exchanges must be continued in other provinces to better understand individual problems in each province of the country to optimize PMTCT.

## WEPED396

### CAYA - a nurse case management HIV prevention intervention for youth experiencing homelessness: results from a randomized wait-list controlled trial

D. Santa Maria<sup>1</sup>, M. Paul<sup>2</sup>, A. Nyamathi<sup>3</sup>, M. Lightfoot<sup>4</sup>, Y. Qaudri<sup>5</sup>, N. Padhye<sup>1</sup>

<sup>1</sup>University of Texas Health Science Center at Houston, Cizik School of Nursing, Houston, United States, <sup>2</sup>Baylor College of Medicine, Division of Virology, Houston, United States, <sup>3</sup>University of California Irvine, Sue & Bill Gross School of Nursing, Irvine, United States, <sup>4</sup>Oregon Health & Science University-Portland State University, School of Public Health, Portland, United States, <sup>5</sup>Baylor College of Medicine, Family Medicine, Houston, United States

**Background:** Youth experiencing homelessness (YEH) face numerous challenges that can put them at high risk for HIV infection. Nurse case management has proven effective in managing the complex needs of populations experiencing homelessness and supporting HIV risk reduction. This study aimed to evaluate the CAYA "Come As You Are" intervention, a nurse-led model that provided comprehensive HIV prevention education and services for YEH aged 16-25 years.

**Methods:** The CAYA study began in September 2019, and data for this analysis was collected from November 2019 to May 2023. A randomized wait-list controlled trial was conducted to assess the efficacy of the CAYA intervention compared to usual care. Efficacy measures include uptake of preexposure prophylaxis (PrEP), HIV and STI testing/treatment engagement, and condom use. Follow-up surveys were administered immediately after the 3-month intervention. Descriptive statistics were calculated by study arm for baseline demographic characteristics. Analysis for this study was based on the intent-to-treat principle. Generalized linear mixed models in a Bayesian framework were used to compare the between-group change over time in the dichotomous outcomes assessed at baseline and immediately post-intervention.

**Results:** Four hundred and fifty participants were enrolled using a 2:1 ratio in the intervention and control groups, respectively (intervention = 303; control = 147). On average, the sample was 21 years old, 50.2% male, 43.3% female, 6.4% other/unknown gender, 62.0% Black, 16.0% Hispanic, 11.3% White, and 10.7% other race/ethnicity.

There were no significant demographic differences between the two groups. At baseline, rates of HIV/STIs were high (HIV 3.5%, Syphilis 6.0%, Gonorrhea 4.6%, Chlamydia 11.6%), and condom use at the last sex was low (36.9%). Despite high levels of transiency among the youth, the immediate post-intervention follow-up rate was 70.9%.

Results show a more significant increase in PrEP use from baseline to the first follow-up in the intervention group compared to the control group (OR = 3.31; 95% CI: 1.15 – 10.06). There was no treatment effect on condom use or HIV/STIs.

**Conclusions:** This study demonstrates that a personalized HIV prevention approach led by nurses can increase PrEP uptake and thereby reduce HIV risk among a vulnerable, hard-to-reach population of youth.

## WEPED397

### Empowering communities to advance HIV cure research: a review of an advocacy for cure grant project in Greater Selebi-Phikwe, Botswana

S. Teemane<sup>1,2,3,4,5</sup>, E. Moseki<sup>6</sup>, K. Mupeli<sup>7</sup>

<sup>1</sup>Team Impact Christian University, Department of Theology, Baton Rouge, United States, <sup>2</sup>University of Botswana, Department of Theology and Religious Studies, Gaborone, Botswana, <sup>3</sup>University of Botswana, Bachelor of Arts in Social Sciences, Gaborone, Botswana, <sup>4</sup>Assembly Bible College, Department of Theology, Gaborone, Botswana, <sup>5</sup>Living Waters Bible College, Department of Theology, Harare, Zimbabwe, <sup>6</sup>University of Cape Town, International Research Ethics, Captetown, South Africa, <sup>7</sup>AIDS Alliance, South Africa, South Africa

**Background:** The Tatelo study, a pediatric HIV research initiative in Botswana since 2015, explores early treatment in children. It involves interrupting Antiretroviral Therapy and administering broadly neutralizing antibodies monthly for up to six months.

Some children maintained viral suppression, displaying low, replicate incompetent reservoirs (<https://www.hsph.harvard.edu/shapiro-botswana-research-fund>).

A 2022 baseline in our AIS-funded advocacy for cure project, targeting 7 communities in Greater Selebi-Phikwe Botswana, revealed a knowledge gap in communities regarding ongoing HIV trials.

**Description:** To bridge the gap, 30 community leaders were interviewed to gauge their knowledge on current HIV cure research. Nine chiefs were trained on HIV cure strategies to disseminate information during community gatherings. Dialogues were held with 100 traditional doctors and 100 religious leaders to convey accurate scientific results on HIV cure.

Further dialogues occurred between 12 traditional doctors and 12 heads of District Health Management Teams (DHMTs) to explore collaboration possibilities. Lastly, 30 Civil Society Organizations (CSOs) implementing HIV programs were trained on the two main pathways under investigation in HIV cure research.

**Lessons learned:** The baseline study indicated that only 20% of community leaders could define what an HIV cure is, while by the endline, this figure increased to 67%. Initially, 93% of community leaders were not aware of individuals being cured of HIV; however, by the endline, this number dropped to 57%. Nine chiefs endorsed a memorandum of understanding, committing to incorporate the HIV cure project into their community health plans. Additionally, 66 traditional doctors and 90 religious leaders

signed statements of commitment to refer HIV-positive clients, who have been healed through traditional herbs, for investigation in cure research. They also pledged to do herbal and traditional medicine testing from Laboratory Testing Centers. Traditional doctors and DHMT agreed to make a follow-up on a proposal that was put forth to the Ministry of Health exploring the possibility of collaboration between traditional doctors and physicians practicing Western medicine. Twenty-nine CSOs were trained on pathways for HIV cure research.

**Conclusions/Next steps:** Continued investment in HIV programs will mainstream HIV cure initiatives and increase HIV cure research information dissemination. Strong collaboration between traditional and Western medical practitioners is crucial because of their shared clientele.

## WEPED398

*Clients' perspectives on the feasibility of pre-exposure prophylaxis (PrEP) uptake in private pharmacies in South Africa*

K.E. Oladimeji<sup>1</sup>, A. Nyatela<sup>1</sup>, A. Tembo<sup>1</sup>, N. Ntombela<sup>1</sup>, M. Madzebu<sup>1</sup>, P. Kubeka<sup>1</sup>, M. Nthulana<sup>1</sup>, C. Phahla<sup>1</sup>, S. Tinzi<sup>1</sup>, M.A. Mkansi<sup>1</sup>, S.T. Lalla-Edward<sup>1</sup>

<sup>1</sup>University of the Witwatersrand, Ezintsha, Faculty of Health Sciences, Johannesburg, South Africa

**Background:** Pre-exposure prophylaxis (PrEP) is a highly effective strategy for preventing HIV, acquisition of HIV. Still, there are obstacles to its accessibility and uptake, especially for populations at risk of acquiring HIV. Provision of PrEP offers an opportunity to impact HIV by increasing PrEP uptake and reducing the incidence of HIV.

This study explored the feasibility of PrEP uptake through private pharmacies (independent pharmacist-owned, privately held businesses) in South Africa.

**Methods:** A qualitative research approach was employed to gather insights from private pharmacy clients regarding their perspectives on accessing PrEP through private pharmacies. In-depth interviews (IDIs) were conducted between May and July 2023 using an open-ended question guide to understand the opinions of private pharmacy clients in relation to PrEP uptake in pharmacies. Enrolment of consenting participants was through purposive sampling from eight participating private pharmacies located in two major cities (Johannesburg and Cape Town) in South Africa. Data management and analysis involved verbatim transcription and thematic analysis on MAXQDA version 22 software.

**Results:** A total of 30 participants, of which median age was 22 years (interquartile range: 20-30 years) and 8 (27%) were males. Emerged themes included awareness and knowledge on PrEP and barriers (social and health systems related) to PrEP uptake. Social considerations, such as stigma and privacy concerns, and health system fac-

tors, such as perceived service quality and convenience of access, influenced the feasibility of obtaining PrEP from private pharmacies. Private pharmacy clients' perceptions of PrEP's affordability and cost were other facilitators identified as potentially influencing the feasibility of PrEP uptake at pharmacies.

Almost all the participants stated that low cost, increased affordability, and convenience (easier accessibility) would enhance uptake of PrEP provided through private pharmacies and in general.

**Conclusions:** There are both opportunities and challenges for PrEP uptake in South Africa's private pharmacies. Addressing awareness gaps, reducing stigma, ensuring affordability, and integrating PrEP services into private pharmacy settings are critical to increasing the feasibility of PrEP uptake.

These findings could inform the development of tailored interventions and policies to improve PrEP delivery through private pharmacies, ultimately contributing to the expansion of HIV prevention efforts in South Africa.

## WEPED399

*Paradox of Community – Led Monitoring: community – led approaches to monitor community engagement within HIV Differentiated Service Delivery (DSD) programs across 20 African countries*

P. Murugan<sup>1</sup>, N. Rafif<sup>1</sup>, B. Killingo<sup>1</sup>, S. Baptiste<sup>1</sup>, N. Peerun<sup>2</sup>, S. Perez<sup>3</sup>, Community Advocacy Network South Africa

<sup>1</sup>International Treatment Preparedness Coalition, Build Resilient Communities, Johannesburg, South Africa,

<sup>2</sup>International HIV Consultant, Mauritius, Mauritius, <sup>3</sup>AIDS Strategy, Advocacy & Policy, Hanoi, Viet Nam

**Background:** Community – Led Monitoring (CLM) enables People Living with HIV (PLHIV) to take the lead to routinely monitor issues that affect them. Applying CLM to Community Engagement (CE) is crucial towards achieving quality HIV Differentiated Service Delivery programs.

However, the engagement of PLHIV across HIV DSD programs are often impeded by structural issues at the regional and national level. Targeted community-led approaches are therefore needed to strengthen CE activities and advocacy.

**Methods:** Building on a successful pilot in 2019, the Community Advocacy Network (CAN) innovative application of community-led monitoring to community engagement resulted in an innovative 19- indicator tracking tool for decision-making and programming related to differentiated service delivery at the country level. 20 countries across the African continent collected data retrospectively between July to November 2022 for the period 1 June 2021 to 31 May 2022. The level of engagement was assessed using a six – color coding system ranging from dark green (81-100%) to grey (0%).

**Results:** On average, 50% of results are in the "meaningful engagement" or "satisfactory engagement" achievement rate. Liberia, Cote d'Ivoire and DRC scored meaningful engagement of communities in DSD activities. Rwanda, Zambia, Zimbabwe, Ghana, Ethiopia, Mozambique, and Nigeria scored satisfactory CE. Sierra Leone, Tanzania, Eswatini, South Sudan and Kenya scored minimal CE, but low scores are mostly linked to M&E-stage activities not being conducted yet. 39% of CE results were in the 81-100% achievement rate (meaningful engagement) across Rwanda, Zimbabwe, DRC, Liberia, and Côte d'Ivoire. Nigeria, Kenya, Sierra Leone, and Zambia (10% of the results) scored 61-80% achievement rate (satisfactory engagement). 30% of results were in the red/grey score indicating no CE in specific areas, mainly in South Sudan, Eswatini, Burundi, Senegal, Malawi, Uganda, Cameroon, and Tanzania.

The CE findings have enabled countries to use the data to develop advocacy plans by integrating the CE findings in their CLM feedback meetings and/or have adapted the tool for wider CLM efforts within their national community.

**Conclusions:** CLM underscores the untapped and huge potential for meaningful community engagement by offering pathways for refining strategies to ensure robust community responses that advocate for an appropriate package of services.

## WEPED400

### Understanding antiretroviral (ART) adherence among pregnant women in rural Mpumalanga province, South Africa

S. Ramlogan<sup>1</sup>, K. Peltzer<sup>2</sup>, S. Sifunda<sup>1</sup>

<sup>1</sup>Human Sciences Research Council, Public Health, Societies and Belongings, Pretoria, South Africa, <sup>2</sup>Mahidol University, Department of Health Education and Behavioral Sciences, Bangkok, Thailand

**Background:** South Africa has an extremely high HIV prevalence (12.7%), and although free ART is available to all, mother-to-child transmission remains high. The objective of the project was to understand why some pregnant women do not take their freely available ART medication as well as implement an intervention to increase and sustain adherence.

**Description:** The cluster randomized control trial recruited 673 HIV-positive pregnant women from 12 community health clinics in Mpumalanga province. Women were recruited at less than 24 weeks pregnant to followed-up until continuously until their baby was 12 months old. A theory-based social-cognitive 'Protect Your Family' intervention was given to experimental clinics, while control clinics received time-appropriate general pre/post-natal health information. The intervention consisted of a structured behavioral risk reduction program targeting PMTCT, part-

ner violence, stigma, disclosure, alcohol/drug use, anxiety reduction, communication, disclosure, ART adherence, male involvement, family planning, delivery, safe sex, immunization, nutrition, feeding, and medication.

**Lessons learned:** Over half of the respondents learned they were HIV positive the day they learned they were pregnant. Over time, women in the experimental condition did not become adherent and there was a change to non-adherence. The necessity concerns framework shows that a pregnant woman adhered to ART as she deemed it necessary to protect her fetus from HIV but once the child was born HIV-negative, and the mother had no concern for the transfer of HIV from mother-to-child, the concerns about taking the medication grew, and post-partum ART adherence decreased.

Cultural practices led to high loss to follow-up and thus reduced intervention. Findings show that HIV status knowledge and thus HIV testing needs significant improvement and that comprehensive interventions starting from the time a person is diagnosed and continued for life are urgently required to show the necessity and mitigate the concern of adhering to ART as well as to take cultural beliefs and practices into account.

**Conclusions/Next steps:** Adhering to the ART protocol is not simply a matter of providing free ART medication to all those who require it and expecting them to then take their medication as prescribed. Interventions need to be continual to ensure long-term adherence.

## WEPED401

### Knowledge and experiences of participating in an HIV vaccine efficacy trial with second randomization to oral pre-exposure prophylaxis in South Africa, Tanzania, and Uganda

R. Kawuma<sup>1</sup>, R. Samanthaia Chimukuche<sup>2</sup>, S. Nakamanya<sup>1</sup>, E. Tarimo<sup>3</sup>, J. Ambindwile<sup>4</sup>, J. Seeley<sup>1,2,5</sup>, PrEPVACC Study Group

<sup>1</sup>Medical Research Council /Uganda Virus Research Institute and London School of Hygiene and Tropical Medicine, Uganda Research Unit, Social Science, Entebbe, Uganda, <sup>2</sup>Africa Health Research Institute, University of KwaZulu-Natal, Social Science, Durban, South Africa, <sup>3</sup>Muhimbili University of Health and Allied Sciences, Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>National Institute for Medical Research-Mbeya Medical Research Centre, Mbeya, Tanzania, the United Republic of, <sup>5</sup>London School of Hygiene and Tropical Medicine, Faculty of Public Health and Policy, London, United Kingdom

**Background:** While development of a safe and effective HIV vaccine remains an important priority to contain the epidemic, continued effort is required to ensure that existing prevention strategies are effectively implemented. We assessed knowledge and experiences of participating in a PrEP and HIV vaccine trial (PrEPVacc) among people aged

Oral abstracts

18-40 years at four sites in South Africa, Tanzania, and Uganda. The trial recruited fisherfolk, female sex workers, bar workers and the general population and participants were randomized both to different vaccine delivery arms and two forms of PrEP (Truvada and Descovy).

**Methods:** Between October 2021 and September 2023, 105 males and females were purposively selected to take part in repeat in-depth interviews at 2, 6 and 12 months, and other 94 females and 27 males in 15 focus group discussions across all trial sites. Sampling characteristics included age, gender, PrEP arm, and adherence behavior according to self-report and urine test results. We explored knowledge of trial participation, acceptability and uptake of both PrEP and vaccination, including their disclosure. Data were analyzed manually using thematic framework analysis.

**Results:** Participants understood that they were randomized to both vaccination and PrEP. They were also aware that the vaccine was under trial with a placebo arm, and PrEP could protect them from acquiring HIV. The main motivation for using PrEP was the individual's perception of HIV risk. While both PrEP and the vaccine were accepted, vaccination was preferred because it was administered fewer times and had fewer side effects compared to oral PrEP which had to be taken daily. In addition, some significant others like partners, other family members and peers discouraged PrEP use and vaccination due to fear of possible related side effects, and in the case of PrEP, associations with daily antiretroviral therapy for people living with HIV.

**Conclusions:** Trial randomization was understood, and products accepted. However, individual perceptions of risk, user preference and significant relationships influenced acceptability and use of PrEP and vaccination. Interventions should not only focus on the individual but consider other layers like family and community relations and policy factors that could influence acceptability and use of a product.

# WEPED402

How can the international AIDS conference value and enhance the expertise, leadership and participation of women and trans people living with HIV as equal partners in research?

M. Tholanah<sup>1</sup>, C. Chung<sup>2</sup>, K. Dunaway<sup>3</sup>, J. Ouma<sup>4</sup>, S. Strachan<sup>5</sup>, W. Thamm<sup>6,5</sup>, S. Petretti<sup>7</sup>, R. Mbewe<sup>8</sup>, B. Shahi<sup>14</sup>, M. Vazquez<sup>15</sup>, A. Welbourn<sup>16</sup>, E. Bell<sup>17</sup>, F. Hale<sup>17</sup>, the POWER Group

<sup>1</sup>Making Waves, Harare, Zimbabwe, <sup>2</sup>Transgender Law Center, Oakland, United States, <sup>3</sup>International Community of Women Living with HIV (ICW), Buenos Aires, Argentina, <sup>4</sup>Global Network of Young People living with HIV (Y+), Machakos, Kenya, <sup>5</sup>The Sophia Forum, London, United Kingdom, <sup>6</sup>Hillingdon AIDS Response Trust, Hillingdon, United Kingdom, <sup>7</sup>Positively UK, London, United Kingdom, <sup>8</sup>4M Mentor Mothers Network, London, United Kingdom, <sup>9</sup>University of Oxford, Oxford, United Kingdom, <sup>10</sup>European AIDS Treatment Group, Edinburgh, United Kingdom, <sup>11</sup>Athena Network, Seattle, United States, <sup>12</sup>Positively Young Women Voices, Dandora, Kenya, <sup>13</sup>The Jamaican Community of Women living with HIV (JCW+), Kingston, Jamaica, <sup>14</sup>ICW Asia Pacific, Bangkok, Thailand, <sup>15</sup>Making Waves, Gijon, Spain, <sup>16</sup>Salamander Trust, London, United Kingdom, <sup>17</sup>Making Waves, London, United Kingdom

**Background:** The 2021 Political Declaration on HIV and AIDS commits to community leadership, including supporting community-led monitoring and research. Women and trans people living with HIV and our networks have vast experience and expertise. Is this recognised in global agenda setting platforms like the International AIDS Conferences (IAC), which aims to increase knowledge exchange, advocacy, and community engagement?

**Methods:** We collected data on women and trans people living with HIV at AIDS2022 through:

- Data requests to IAS for numbers of women and trans people living with HIV as invited speakers, abstract presenters and scholarship recipients at AIDS2022.
- Review of AIDS2022 abstracts to determine how many were co/authored with/by representatives of networks/ organisations of women and trans people living with HIV.
- Analysis of data to assess representation trends.

## Results:

Speakers and scholarships:

	Total	Women living with HIV	Trans, non-binary and non-conforming people living with HIV	Trans women living with HIV
Invited speakers	173 (100%)	16 (9%)	2 (1.2%)	1 (0.58%)
Abstract presenters	2450 (100%)	59 (2.4%)	9 (0.37%)	0
Scholarships	1602 (100%)	97 (6%)	27 (1.7%)	9 (0.6%)

## Abstracts:

- Only 3 of 120 oral abstracts at AIDS2022 were co-authored by organisations of women and trans people living with HIV. All 3 specifically focused on health, wellbeing and lives of women and girls living with HIV, with 2 focused on trans women living with HIV.
- 24 posters were co/authored: these all directly address key issues of women and girls and trans people living with HIV.
- 99% of abstracts at AIDS2022 were authored by academics, medical institutions, governments, international agencies, NGOs, pharmaceutical companies, with **no co-authors from organisations of women and trans people living with HIV.**
- 9% of oral abstracts (n=11) had **community co-authorship that included but was not limited to women and trans people living with HIV.**

**Conclusions:** At IAC there are persistent disparities in the representation of networks of women and trans people living with HIV.

We are underrepresented in scholarships, as speakers and abstract presenters, and as co/authors of abstracts. Our vast expertise is sidelined within HIV research.

IAS should:

- ensure women and trans people living with HIV in speaking and leadership roles at IAC and monitor this.
- promote community co/authorship in research (e.g. through abstract and review instructions) to amplify diversity of expertise in the global HIV response.

## WEPED403

Crowdsourcing and message testing to reduce stigma among women who exchange sex and/or use drugs and healthcare providers in Kazakhstan: examining tensions between community and provider needs and goals

B.S. West<sup>1</sup>, M. Darisheva<sup>2</sup>, K. Alipova<sup>2</sup>, D. Gryazev<sup>2</sup>, N. Zholnerova<sup>3</sup>, E. Grigorchuk<sup>4</sup>, A. Terlikbayeva<sup>2</sup>, S. Primbetova<sup>2</sup>, A. Davis<sup>1</sup>, L. Starbird<sup>5</sup>, V. Frye<sup>1</sup>

<sup>1</sup>Columbia University, School of Social Work, New York, United States, <sup>2</sup>Global Health Research Center for Central Asia, Almaty, Kazakhstan, <sup>3</sup>Amelia NGO, Taldykorgan, Kazakhstan, <sup>4</sup>Community Friends NGO, Almaty, Kazakhstan, <sup>5</sup>University of Pennsylvania, School of Nursing, Philadelphia, United States

**Background:** Anticipated or experienced stigma from healthcare providers (HCPs) prevents engagement of women who exchange sex and/or use drugs (WESUD) in HIV prevention and care services. Conventional approaches to designing HIV prevention or stigma reduction interventions often do not sufficiently involve focal communities. By contrast, crowdsourcing relies on high community involvement in the design and dissemination

of public health messages and intervention strategies. We discuss preliminary results of a crowdsourcing contest and subsequent message testing in Kazakhstan designed to engage WESUD and develop a multimedia anti-stigma campaign for HCPs.

**Methods:** From January-March 2023, we held a nation-wide crowdsourcing contest to elicit WESUD experiences in seeking HIV and drug-related health services in the form of text, audio, image or video submissions. We completed a content and thematic analysis to identify potential messages for future testing.

In Fall 2023, we conducted 5 message testing focus groups with WESUD (N=22) and 3 focus groups with HCPs (N=14) to elicit feedback on potential messaging campaign ideas.

**Results:** We received crowdsourcing submissions from 90 WESUD, which included both positive and negative experiences in HIV prevention settings. Participants described substantial stigma and fear and a desire to be treated with dignity.

Four campaign ideas were developed and tested in focus groups: 2 on advancing WESUD identity and rights (i.e. disclosure of sex work/drug user identity, human rights and equity) and 2 on advancing clinician skills (i.e. provider communication, clinics as a source of support/protection). WESUD preferred campaign ideas that focused on identity and rights, as well as on shifting clinics to be more supportive. HCPs, on the other hand, had negative responses to identity/rights based messaging and were more receptive to skills-based messaging.

**Conclusions:** Crowdsourcing with highly stigmatized groups, like WESUD, is an effective tool for supporting the development of community-responsive strategies that counter stigma and shift the landscape of HIV service provision. Tensions around messaging preferences highlight key challenges in the development of anti-stigma messaging. Future messaging campaigns must be responsive to the divergent needs and agendas of WESUD vs. HCPs to ensure that intervention efforts both represent WESUD voices and effectively engage HCPs in stigma reduction.

## WEPED404

Relationship functioning moderates primary outcomes in two trials of a couple-based HIV prevention program for young sexual minority men

M. Newcomb<sup>1</sup>, G. Swann<sup>2</sup>, S. Whitton<sup>3</sup>, B. Mustanski<sup>1</sup>

<sup>1</sup>Northwestern University, Medical Social Sciences, Chicago, United States, <sup>2</sup>Northwestern University, Institute for Sexual and Gender Minority Health and Wellbeing, Chicago, United States, <sup>3</sup>University of Cincinnati, Psychology, Cincinnati, United States

**Background:** 2GETHER is a relationship education and HIV prevention program designed for young male couples in the United States. This status neutral intervention is com-

posed of two groups sessions (i.e., didactic skills instruction, interactive activities) and two skills coaching sessions (i.e., facilitated skills practice for each couple). 2GETHER has demonstrated efficacy in reducing biomedical and behavioral indicators of HIV risk, including rectal sexually transmitted infections (STIs) and condomless anal sex (CAS), in two randomized control trials (RCTs): "2GETHER Chicago" (delivered face-to-face) and "2GETHER USA" (delivered via telehealth across the U.S.).

The goal of the current analyses was to examine whether relationship functioning at study entry impacted RCT outcomes using a combined dataset of these two trials.

**Methods:** 2GETHER Chicago enrolled 128 dyads ( $N=256$ ) from 2017-2021, and 2GETHER USA enrolled 200 dyads ( $N=400$ ) from 2018-2020. Participants in each trial had high retention at 12-month follow-up (i.e., 91.4% and 88%, respectively). The two trials used the same measures, allowing us to combine datasets for the current analyses. We used multilevel models in MPlus to examine how baseline relationship functioning (i.e., satisfaction, positive communication, negative communication) impacted change in primary outcomes (i.e., rectal STIs, CAS with outside partners) across 12-months.

**Results:** Among participants randomized to the 2GETHER (active) condition, those who reported higher relationship satisfaction, more positive communication, and less negative communication at baseline experienced a steeper decline in CAS partners across 12-months. Participants with more negative communication at baseline reported a steeper decline in rectal STIs at 12-months.

**Conclusions:** Overall, young sexual minority men who entered the trial with higher-functioning relationships tended to benefit more from the HIV prevention content in 2GETHER in terms of behavior change at 12-months. This may indicate that more "distressed" couples cannot engage fully with the HIV prevention content because these skills require effective communication between partners. However, those with worse communication showed greater reductions in rectal STIs.

Perhaps 2GETHER taught those in poorer-functioning relationships how to integrate certain prevention strategies despite their poorer communication skills. More thorough integration of communication skills training and conflict resolution may help couples with less developed relationship skills take full advantage of couple-based HIV prevention.

## WEPED405

### Identifying gaps in the ability of pharmacy staff to initiate pre-exposure prophylaxis (PrEP) in community pharmacies in South Africa

S. Tinzi<sup>1</sup>, E.K. Oladimeji<sup>1</sup>, A. Nyatela<sup>1</sup>, A. Tembo<sup>1</sup>, T. Wonderlik<sup>1</sup>, T. Nyamuzihwa<sup>1</sup>, E. Edem<sup>1</sup>, N. Martyn<sup>1</sup>, L. Makola<sup>1</sup>, M.A. Mkansi<sup>1</sup>

<sup>1</sup>Ezintsha, Research, Johannesburg, South Africa

**Background:** Pharmacy delivery of pre-exposure prophylaxis (PrEP) is a novel strategy for reaching populations at substantial risk of HIV acquisition and reducing the number of new HIV acquisition, particularly in low -and middle -income countries. Consequently, clinical staff readiness, knowledge, and abilities to provide PrEP services in pharmacy settings, must be investigated.

This study explored the ability of pharmacy clinical staff to initiate PrEP in community pharmacies in two South African provinces.

**Methods:** In this qualitative study, in depth interviews (IDIs) were conducted among eleven pharmacy health care workers who were conveniently sampled from the nine participating pharmacies across Cape Town and Johannesburg, South Africa. The approximately 40 minutes each IDIs were conducted using a semi-structured interview guide.

Participants were asked to freely express their thoughts, knowledge, and experience in providing PrEP services. With participants consent, all interviews were audio-recorded, transcribed verbatim, and cleaned data analyzed using thematic analysis technique.

**Results:** Pharmacy healthcare workers enrolled comprised of 1(9%) managerial staff, 2 (18%) nurses and 8 (73%) pharmacists. Key emerged themes were centered on gaps identified in practical aspects of PrEP initiation, experience, and training. The pharmacy clinical staff expressed concerns with implementing PrEP, especially in the absence of nursing support.

While some were familiar with dispensing PrEP through prescription from doctors or hospitals, initiating it independently was a new challenge for them as they lacked experience with the counselling aspects.

Furthermore, despite having experience dispensing PrEP, staff had not received specific training in PrEP initiation.

**Conclusions:** These findings are consistent with similar studies conducted in the United States and Kenya, which identified lack of PrEP knowledge, experience, and training amongst clinical staff in pharmacy settings.

Consequently, the findings underscore the necessity for targeted training inclusive of PrEP delivery and management to enhance provider confidence and competence to deliver this critical service. This will potentially increase acceptability and uptake for PrEP in South Africa and other regions considering pharmacy-led delivery model.

## WEPED406

### Disclosing participation in an HIV vaccine and PrEP trial in Southwestern Uganda – the effect on participant engagement

S. Nakamanya<sup>1</sup>, R. Kawuma<sup>1</sup>, G. Nabaggala<sup>1</sup>, S. Kusemererwa<sup>1</sup>, E. Ruzagira<sup>1,2</sup>, J. Seeley<sup>3</sup>, PrepVacc Study Group

<sup>1</sup>Medical Research Council/Uganda Virus Research Institute and London School of Hygiene and Tropical Medicine, Uganda Research Unit, Kampala, Uganda, <sup>2</sup>Faculty of Epidemiology and Population Health, London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>3</sup>London School of Hygiene and Tropical Medicine, Department of Global Health and Development, London, United Kingdom

**Background:** Development of a safe and effective vaccine against HIV remains a key strategy for the control of the epidemic. However, development and testing of such a vaccine faces a range of social and behavioural challenges including potential stigmatisation for trial participants.

We investigated disclosure of participation in an HIV PrEP and vaccine trial (PrepVacc) to understand the impact on participant engagement.

**Methods:** Between October 2021 and August 2023, 5% (30) of men and women aged between 18 and 45 years in the PrEPVacc trial in southwestern Uganda were purposively selected for repeat in-depth interviews at 2, 6 and 12 months during the trial. Others were selected to take part in six focus group discussions of 10 to 12 participants, divided equally by gender. Discussants and interviewees represented good adherers, poor adherers, and PrEP refusers. Experiences with vaccination, motivation to participate and disclosure of participation were explored. Data were analysed manually using thematic framework analysis.

**Results:** Participants noted that disclosing participation to others improved their participation in the trial. Reasons for disclosing included a desire to participate openly and comfortably, to gain others' support including financial and physical, and to motivate others. They disclosed to friends, sexual partners, family members and employers. Men disclosed more easily than women. Younger participants disclosed more than older participants. Concerns like fear of being suspected of infidelity or having HIV, social harm, blame, and relationship breakages hampered disclosure. A lack of confidence in having the correct study information prevented disclosure, as a failure to explain what they were doing attracted negative reactions including disapproval.

As participants gained confidence in the study, approval and support from others improved. Participants who disclosed their participation tended to adhere to the study requirements and encountered less discomfort about taking part, and potential social harm.

**Conclusions:** Successful HIV intervention trial participation calls for proactive public engagement and awareness raising. Disclosure by study participants to significant others about taking part can increase participation, strengthen retention and adherence, and reduce social harms.

## WEPED407

### "You cannot be HIV+ and infertile": examining the relationship between stigma, disclosure and COVID-19 vaccination infertility rumours among young women living with HIV in Khwisero, Kenya

M.F. Yusuf<sup>1,2</sup>

<sup>1</sup>University of Nairobi, Anthropology and Gender Studies, Nairobi, Kenya, <sup>2</sup>University in Oslo, Community Medicine and Global Health, Oslo, Norway

**Background:** Following the WHO guidelines, the government of Kenya recommended that all PWH receive at least two doses of the COVID-19 vaccine and successful boosters.

We aimed to understand the correlation between COVID-19 vaccination uptake among YWLWHIV and HIV stigmatization, disclosure and the ongoing fertility controversies surrounding the COVID-19 vaccination in Khwisero in western Kenya.

**Methods:** KISA WEST is a region in Khwisero in western Kenya that is still struggling with high HIV prevalence rates, stigma and disclosure. The women in this setting experience their reality through their childbearing capabilities. Therefore, Ethnographically, from January 2023 to July 2023, we recruited 53 young women between the ages of (18-30) individually and in focus group discussions.

Forty-eight women made up the 4- focus group discussions – each with 12 women segregated by their COVID-19 vaccination status and anti-retroviral therapy. The remaining five women– 3 unvaccinated and on ARVS and two partially vaccinated and not on ARVs, participated in the continuous In-depth interviews.

Participants were sampled purposively through the help of a mentor mother (a woman living with HIV and working in community comprehensive clinic services).

**Results:** 1. Women who had yet to start on ART due to the stigma of being labelled as "HIV+" and the community narrative that "women with HIV were incapable of reproducing" had no vaccination reservations as they hoped the vaccine would act as permanent contraceptive plan following the infertility rumours.

2. Women who were on ART but had yet to disclose their status to their family and friends avoided the vaccine in fear of vaccination side effects brought about by the belief of reaction between the ARVs and the vaccines. The women believed that the reaction of the two would make them sick and expose their status to their loved ones.

**Conclusions:** COVID-19 vaccine uptake among young women with HIV in Khwisero is still suboptimal; understanding that vaccination rates are driven not only by individual beliefs but also by interconnected multifactorial long-term experiences of YWLHIV is critical for present and future pandemics. Therefore, examining such interlinks is needed to develop target strategies for addressing current and future health intervention uptake among PWH.

## WEPED408

### Awareness of HIV and test-taking behavior among Nepalese migrants living in Japan

S. Shakya<sup>1</sup>, T. Kitajima<sup>2</sup>, A. Kc Bhandari<sup>3</sup>, P. Shakya<sup>4</sup>, S. Shakya<sup>5</sup>

<sup>1</sup>Japan Foundation for AIDS Prevention, Tokyo, Japan,

<sup>2</sup>Kyorin University, Faculty of Social Sciences, Tokyo, Japan,

<sup>3</sup>St. Luke's International University, Graduate School of Public Health, Tokyo, Japan, <sup>4</sup>Independent Researcher, Kathmandu, Nepal, <sup>5</sup>Kawakita General Hospital, Department of Cardiology, Tokyo, Japan

**Background:** HIV awareness and access to testing and treatment are crucial, as it is still a major global health problem. As of June 2023, the number of Nepalese migrants increased over 156,000 in Japan, the 5<sup>th</sup> largest international migrant population in Tokyo. However, the number of Nepalese participations in HIV testing activities targeted for international migrants has remained stagnant despite being publicized in Nepali.

Thus, we assessed the need for HIV testing and factors that might promote test-taking behavior among Nepalese in Tokyo.

**Methods:** We conducted a self-administered questionnaire survey on HIV awareness and test-taking behavior during the Nepal Festival in Tokyo from July 22<sup>nd</sup> to 23<sup>rd</sup>, 2023. Convenience sampling method was employed to recruit participants. Participants received the questionnaire either in Nepali or English, on paper or online from scanned QR code.

**Results:** Of 305 participants, 71.2% were male, the average age was 31.2±7.8 years, 30.8% were single, 90.8% had a high school diploma or higher, 71.4% had lived in Japan for 5 years or longer. Seventy-seven (25.2%) responded that they would be interested in taking an HIV test in Japan in future.

In the logistic regression analysis, those with higher perceived risk of HIV infection (aOR:4.11; 95% CI: 1.61-10.46), those with lower AIDS-related stigma scores (aOR1.05; 95% CI: 1.01-1.1), and those who knew that they could be legally allowed to stay in Japan even if they were infected with HIV (aOR: 1.75; 95% CI: 1.01-3.01) were associated with positive attitudes toward taking the test.

**Conclusions:** Despite the interest in taking HIV test, only a few Nepalese are getting tested during outreach testing activities. The study findings indicate the need to modify

the outreach testing activities so as to effectively cover those who feel they may be at risk for HIV infection and those willing to know their status with testing. Since 25.3% of respondents at the Nepal Festival stated they would be interested in testing, it is crucial to lessen the stigma linked to HIV, and spread accurate information about HIV among Nepalese communities in Japan.

## WEPED409

### Covering ALL women via AEGIDA: experiences of transgender women who exchange sex and engaged with an HIV prevention study in Kazakhstan

M. Darisheva<sup>1</sup>, B. West<sup>2</sup>, T. McCrimmon<sup>3</sup>, A. Terlikbayeva<sup>1</sup>, S. Primbetova<sup>1</sup>, D. Belkesheva<sup>1</sup>, S. Kuskulova<sup>1</sup>, M. Nurkatova<sup>1</sup>, O. Balabekova<sup>1</sup>, P. Gulyaev<sup>1</sup>, N. Zholnerova<sup>4</sup>, E. Grigorchuk<sup>5</sup>, L. Starbird<sup>6</sup>, L. Gilbert<sup>2</sup>, N. El-Bassel<sup>2</sup>, V. Frye<sup>2</sup>

<sup>1</sup>Global Health Research Center of Central Asia, Almaty, Kazakhstan, <sup>2</sup>Columbia University, School of Social Work, New York, United States, <sup>3</sup>Columbia University, School of Public Health, New York, United States, <sup>4</sup>NGO "Amelia", Taldykorgan, Kazakhstan, <sup>5</sup>NGO "Community friends", Almaty, Kazakhstan, <sup>6</sup>University of Pennsylvania, Penn Nursing, Philadelphia, United States

**Background:** HIV prevention/care with transgender women (TGW) is growing globally, although nascent in Central Asia. TGW are vulnerable to HIV, facing stigma and discrimination that reduce access to testing and prevention/care. Here, we present data on a sub-sample of TGW who exchange sex and use substances (TGWESUS) enrolled in AEGIDA, 4-session, NIH-funded intervention to support consistent HIV testing.

**Description:** TGWESUS were recruited through local LGBTQAI+ influencers and snowball sampling. Twenty TGWESUS completed screening interviews (February-August 2023); seven were eligible. Six women enrolled; four completed exit interviews. AEGIDA applied cognitive restructuring (reframing and self-compassion), peer education/training (HST), and motivational interviewing. We assessed feasibility and acceptability and conducted post-follow-up exit interviews to evaluate how AEGIDA affected thoughts, feelings, and behaviors around HIV testing.

**Lessons learned:** The majority (80%) of TGWESUS screened reported condomless vaginal/anal sex with any sexual partner in past 90 days; 40% reported drug use and 53% alcohol abuse in the past year. AEGIDA was feasible and acceptable for TGWESUS; 83% completed all four sessions and attendance 100%/100%/83%/83% was good.

Median days to session completion was 40 (13-63 days), which was longer compared with cisgender participants, which will be factored into future adaptation. In exit interviews, TGWESUS participants noted improvements in self-worth and compassion: "My self-care has strength-

ened, I had been checked before, but now I realized that this is even more important" "That stage in life (AEGIDA) taught me to value my body and myself in general."

Another noted that the peer education was useful: "My thoughts became a little different, feeling appeared that I could give something to others," as well as the cognitive restructuring and self-efficacy focus "AEGIDA helped me establish myself as a person who will not allow [myself] to be insulted, I could take care of myself".

**Conclusions/Next steps:** High vulnerability to HIV and stigma among TGWESUS highlight the need to tailor research and programming for TGW. AEGIDA with its focus on self-care via HST, anti-internalized stigma via cognitive restructuring and empowerment may be an important way to engage TGWESUS in HIV prevention/care and enhance their health and well-being.

## WEPED410

**Making HIV prevention herstory: the African Women's Community Prevention Accountability Board, the Choice Manifesto and lessons for primary prevention, women's health and long-term success in the HIV response**

Y.A. Raphael<sup>1</sup>

<sup>1</sup>APHA, Johannesburg, South Africa

**Background:** The African Women's Community Prevention Accountability Board (AWCPAB) grew out of nearly fifteen years of African feminist-led engagement with researchers, policy makers and governments seeking to ensure that trials, products and approaches reflect the needs and priorities of adolescent girls and women in all their diversities, who remain disproportionately impacted by HIV.

Independent, outcome and impact focused advocacy models led by and for impacted communities are urgently needed for the changing HIV landscape. The AWCPAB and its evolving approaches and tactics can be used by other groups to develop nimble, responsive coalitions and campaigns that achieve results.

**Description:** Starting in 2010, when an ad-hoc group of East and Southern African women engaged the team conducting a trial looking at the relationship between various contraception methods and HIV, this group has secured unique, fit-for-purpose engagement structures that shape how research is conducted and communicated and roll out is planned for.

The table offers select time points, actions taken, lessons and broader applications. This ongoing advocacy has secured support from the highest level at government and UNAIDS, changed research approaches and kept a focus on technologies such as the dapivirine ring that are life-saving tools which donors might otherwise have set aside.

### Making HIV Prevention Herstory: A Selected Timeline

2010: African feminists, led by WLHIV, demand that the investigators and funders of the ECHO trial convene a Global Community Advisory Board of above-site activists and advocates. The first-ever GCAB guides messaging, protocol development and results dissemination activity.

2016-2018: G-CAB members join with other women prevention advocates to review and demand changes to the protocol for HPTN 084, with continued engagement across the lifespan of the trial

202xx-present: The dapivirine ring shows efficacy in reducing HIV risk - AWPCAB members push back against resistance at funder, implementer and normative levels that the ring is not a relevant part of the prevention toolbox, and that it should be set aside in favor of long-acting injectable cabotegravir, rather than implemented as one of a tool box of options.

2023: Launch of the CHOICE manifesto - AWPCAB brings its product specific concerns together in a CHOICE manifesto that calls all stakeholder to account for programs and policies that reflect women's priorities. This is one of the first broadly-supported primary prevention focused agendas by and for African women living with and at risk of HIV.

### Lesson and Broader Application

New technologies and key research questions and approaches should engage communities where products will be tested and informed activists and advocates who come from and work with these constituencies and communities. Common in HIV treatment, this approach should also be used in HIV prevention and AWPCAB shows it is possible.

Community engagement has to start while protocols are still in development; above-site input can transform approaches.

Product developers do not listen to community preferences without sustained and persistent advocacy—even when there is an effective product. In spite of unchanged incidence in adolescent girls and young women over many years, stakeholders with resources to accelerate or obstruct product introduction do not listen to women's preferences for choice and reversible methods, even though the evidence from family planning backs up this programmatic strategy.

Single-product advocacy is important, so is a broad and ambitious campaign for changes in business as usual.

**Lessons learned:** The AWPCAB has been successful in devising structures that engage duty-bearers and hold them accountable for actions at every stage of the primary prevention product development pathway. It has done so by diplomatically and firmly refusing to accept engagement approaches that replicate the status quo, and by rejecting the idea that funders and governments should decide which products women should have access to to reduce HIV risk.

Challenges include: turning commitments into action, ensuring broad input into documents and positions, ie the CHOICE manifesto, and a continued fight to make women's issues central to the HIV response.

**Conclusions/Next steps:** AWPCAB is not a program or institutional initiative. It is a self-organized and -governed African feminist movement that will continue until our CHOICE agenda is a reality.

### Optimizing antiretroviral therapy delivery: lessons learned and best practices from a community-based model in Cambodia

P. Chhoun<sup>1,2</sup>, S. Tuot<sup>3,4,5</sup>, V. Ouk<sup>6</sup>, S.C. Choub<sup>7</sup>, S. Seum<sup>8</sup>, S. Han<sup>9</sup>, V. Kong<sup>10</sup>, C. Phorn<sup>7</sup>, S. Samreth<sup>6</sup>, B. Ngauv<sup>6</sup>, S. Yi<sup>11,12</sup>

<sup>1</sup>KHANA Center for Population Health Research, Research Center, Tonle Bassac, Cambodia, <sup>2</sup>University of Health Sciences, School of Public Health, Phnom Penh, Cambodia, <sup>3</sup>KHANA Center for Population Health Research, Research Center, Phnom Penh, Cambodia, <sup>4</sup>The University of Tokyo, Department of Community and Global Health, Tokyo, Japan, <sup>5</sup>Royal University of Phnom Penh, Phnom Penh, Cambodia, <sup>6</sup>National Center for HIV/AIDS, Dermatology and STD, Phnom Penh, Cambodia, <sup>7</sup>KHANA, Phnom Penh, Cambodia, <sup>8</sup>Cambodian People Living with HIV Network, Phnom Penh, Cambodia, <sup>9</sup>ARV User Association, Phnom Penh, Cambodia, <sup>10</sup>Partner in Compassion, Phnom Penh, Cambodia, <sup>11</sup>National University of Singapore, Singapore, Singapore, <sup>12</sup>Touro University California, California, United States, Public Health Program, California, United States

**Background:** Stable people living with HIV (PLHIV) can safely decrease clinic visits and potentially access antiretroviral therapy (ART) within the community setting. The Community Antiretroviral Therapy Delivery (CAD) model plays a crucial role in Cambodia's HIV response. This study seeks to chronicle the insights gained from the CAD model's development, implementation, and assessment, contributing to establishing a sustainable continuum of HIV care for PLHIV in Cambodia.

**Description:** The CAD constituted a 36-month quasi-experimental encompassing six months of intervention development, followed by 24 months of implementation, and a six-month evaluation of impacts and cost-effectiveness. This project operates across 10 ART sites, spanning the capital city and four provinces. Community ART Group (CAG) leaders have been tasked with collecting and delivering pre-packaged antiretrovirals to stable PLHIV. Additionally, they engage in outreach activities such as counseling, group education sessions, monitoring ART adherence, checking vital signs, following up on missed appointments, and referring unwell PLHIV to clinics.

**Lessons learned:** The project successfully enrolled 2,057 stable PLHIV in the intervention, with 59% being females. Among them, 48 were adolescents (aged 15 to 19 years), and 40 belonged to key populations, including men who have sex with men, transgender women, and female entertainment workers. Eighty-two CAGs were established, half of which were led by women living with HIV. The project engaged 76 healthcare providers, with 27 of them being females.

Results from the midterm qualitative evaluation underscored the project's positive impact, particularly on PLHIV and healthcare providers at ART clinics. Key influencing

factors included the empathy and compassion demonstrated by CAGs towards their peers, the willingness of ART site staff to collaborate, and the high level of stakeholder commitment. The model exhibited practicality and significant potential for success, with indications of local ownership at various levels being robust and encouraging.

**Conclusions/Next steps:** The CAD model is proven to be relevant, viable, and highly impactful, reducing burdens for PLHIV and the health system. Positive outcomes strongly advocate for scaling up the CAD model, emphasizing its potential for meaningful improvements in HIV care. The evidence underscores its effectiveness, making it a valuable guide for enhancing and expanding community-based antiretroviral therapy initiatives.

## WEPE412

### Negotiating safer chemsex: a qualitative study among sexual minority men who engage in chemsex in Singapore

E.J. Ong<sup>1</sup>, R. Tan<sup>1</sup>, K. Naidu<sup>2</sup>

<sup>1</sup>National University of Singapore, Saw Swee Hock School of Public Health, Singapore, Singapore, <sup>2</sup>National University Health System, Department of Psychological Medicine, Singapore, Singapore

**Background:** Chemsex, or the confluence of substance use and sexual activity among certain populations has been identified as a potential driver of HIV transmission. In Singapore, stringent and punitive drug laws and HIV criminalization laws persist that limit research and the reach and impact of community-led interventions.

This study explores the subculture of safer chemsex, as individuals navigate the complex interplay between legal frameworks surrounding HIV disclosure and drug use, with the role of negotiation within the subculture of safer chemsex as a protective mechanism against harms typically associated with chemsex, including HIV transmission.

**Methods:** Semi-structured in-depth interviews were conducted with 33 purposively sampled GBMSM seeking treatment for chemsex in Singapore. Interview topics included participants' experiences and life histories of chemsex, substance use, incarceration, trauma, and ongoing recovery from chemsex. Interviews were audio-recorded, transcribed and analyzed using inductive thematic analysis, from which the negotiation within the subculture of safer chemsex emerged.

**Results:** Our findings highlight the centrality of negotiation in the practice of safer chemsex. Participants engage in comprehensive negotiations, covering diverse aspects crucial for risk reduction.

Negotiations around HIV prevention methods were common, with participants actively discussing and agreeing upon the use of condoms or PrEP. Negotiations around HIV status and individuals at sessions demonstrated a commitment to transparency and informed decision-making.

The negotiation of session duration emerged as a factor influencing risk, with participants recognizing the correlation between prolonged sexual activity and increased vulnerability to HIV. Establishing ground rules was a prevalent subcultural practice, contributing to the co-creation of consensual and safer spaces.

Power dynamics in negotiation, such as the exchange or payment of drugs and control over their type and administration also played a pivotal role.

**Conclusions:** This study sheds light on the multifaceted nature of negotiation within the subculture of safer chemsex and its potential role as a protective mechanism against harms typically associated with chemsex, including HIV transmission.

Recognizing negotiation as a subcultural practice and ritual in safer chemsex is essential for designing targeted interventions that harness existing protective behaviors. Understanding and leveraging negotiation dynamics can inform HIV prevention strategies tailored to the unique challenges presented in Singapore.

## WEPED413

**Integration of HIV, FP and PrEP youth-friendly services to improve service uptake and completion, amongst adolescent girls and young women in South Sudan**

K. Mazaiwana<sup>1</sup>, A. Marwiro<sup>2</sup>, K. Jansuk<sup>3</sup>

<sup>1</sup>Jhpiego, ACHIEVE Project, Juba, South Sudan, <sup>2</sup>Jhpiego, Jhpiego Global, Gaborone, Botswana, <sup>3</sup>USAID South Sudan, Health, Juba, South Sudan

**Background:** In South Sudan, it is a challenging task for adolescent girls and young women (AGYW) to access comprehensive and integrated sexual reproductive health (SRH) services. Young people shy away from accessing services from health facilities, as services are deemed not youth friendly.

This, coupled with entrenched, harmful patriarchy, gender disparities, and discrimination, resulting in AGYW having less involvement in their SRH rights and access in South Sudan.

**Description:** The Determined, Resilient, Empowered, AIDS-free, Mentored, and Safe (DREAMS) initiative is implemented by Jhpiego under USAID/PEPFAR-funded ACHIEVE project in Juba, targeting out of school AGYW 15-24 years. It provides youth friendly services through 73 trained mentors, who refer and support, enrolled AGYW, to access and complete different clinical services using a community coordinated approach, where various providers come to the same site, for AGYW to access and complete different services of their choice and in accordance to their needs.

**Lessons learned:** A total of 4,119 AGYW (2,290 aged 15-19 and 1,829 age 20-24) in October 2022 to September 2023, were screened for HIV risk and enrolled in DREAMS. Of these, 82.7% (3,408) completed the life skills primary pack-

age that is inclusive of curriculum based, group facilitated sessions and 3,527 completed secondary services inclusive of HTS, PrEP, post GBV services, and STI screening and testing. Through this approach AGYW completed referrals to the following services: HTS: 3,021, STI screening and treatment: 338, family planning: 269, PrEP: 268, PEP: 7 and post-GBV: 235. This approach resulted in more than 300% increase in the number of AGYW completing secondary services, relative to FY 21 and FY 22.

**Conclusions/Next steps:** Integration of multiple services, in DREAMS safe spaces using the community outreach approach, improves referral completion rate and allows AGYW to have the confidence to initiate and access desired health services in their own preferred community youth friendly space.

## WEPED414

**Resilience of peer navigation among HIV positive older people (50+) in multi-crisis during the war in Ukraine**

I. Zaviriukha<sup>1</sup>, N. Radich<sup>2</sup>, A. Deac<sup>3</sup>, O. Zeziulin<sup>1</sup>, S. Shenoi<sup>4</sup>, J. Rozanova<sup>4</sup>

<sup>1</sup>European Institute of Public Health Policy, Kyiv, Ukraine,

<sup>2</sup>NGO, Kyiv, Ukraine, <sup>3</sup>King's College, London, United

Kingdom, <sup>4</sup>Yale University, New Haven, Ukraine

**Background:** We explored how older people with HIV (OPWH, defined as ≥50 years) may learn and practice Peer Navigation in Ukraine during a multi-crisis with progressively diminishing means of subsistence, destruction of critical public infrastructure and individuals' homes through military bombings, and forced loneliness when loved ones must flee. We evaluated how Supervision may support Peer Navigators (PNs) in this context.

**Methods:** For OPWH, we developed a peer navigation program consisting of a team of 6 PNs (4 women and 2 men) running June-December 2023 in Kyiv city. PN eligibility criteria included being a OPWH with virologic suppression for at least 12 months, and, crucially, wishing to help other OPWH. Clients' eligibility criteria were out-of-care OPWH, including both recently diagnosed and long-term 'lost to follow up'. PNs were trained including Motivational Interviewing techniques, by a supervising practicing psychologist. An HIV physician was appointed to be available for consultation on medical questions by the PNs.

**Results:** We learned that the appropriate capacity for each PN is 5-7 OPWH for 3 months. Over the 7 months, the supervisor conducted 10 group consultations and approximately 30 individual consultations for each PN.

We learned that one of the major obstacles for PN was how to draw appropriate boundaries between themselves and their client.

Furthermore, PNs preferred on-demand consultations as needed instead of pre-planned meetings. There was less demand for consultation with the HIV clinician than ex-

pected, with 3 group sessions and 5 on-demand individual consultations over seven months. PNs preferred in-person group discussion of cases and problem solving rather than online meetings. Though PNs were initially were hesitant to share their own experience as a OPWH. Through facilitated guidance from the PN supervisor, PNs practice evolved to disclose their own experience with HIV and ART to help their clients. A commune of people was formed who are able to cooperate and be friends.

**Conclusions:** PNs working with OPWH require both social and professional support to cope with their personal challenges. Flexible supervision following OPWH's needs was vital for PNs' survival and maintaining their mental health under the multi-crisis conditions during the war in Ukraine.

Needs assessment towards online and less frequent PrEP monitoring: focus group perspectives from young and migrant men who have sex with men and transgender persons in the Netherlands

M.L. Groot Bruinderink<sup>1,2</sup>, A. Deuring<sup>1</sup>, L. de Vries<sup>1</sup>, H.M. Götz<sup>3,4</sup>, L. Blitz<sup>5</sup>, S. Boers<sup>6</sup>, K. Vermey<sup>7</sup>, A.R. Feddes<sup>2</sup>, M.F. Schim van der Loeff<sup>1,8,9,10</sup>, H.M.L. Zimmermann<sup>1,11</sup>, U. Davidovich<sup>1,2</sup>

<sup>1</sup>Public Health Service Amsterdam, Department of Infectious Diseases, Amsterdam, Netherlands, the, <sup>2</sup>University of Amsterdam, Department of Psychology, Amsterdam, Netherlands, the, <sup>3</sup>Public Health Service of Rotterdam-Rijnmond, Department of Infectious Diseases, Rotterdam, Netherlands, the, <sup>4</sup>Erasmus MC, University Medical Center, Department of Public Health, Rotterdam, Netherlands, the, <sup>5</sup>Public Health Service of Haaglanden, Department of Sexual Health, The Hague, Netherlands, the, <sup>6</sup>Public Health Service of Gelderland-Zuid, Nijmegen, Netherlands, the, <sup>7</sup>Aidsfonds – Soa Aids Nederland, Amsterdam, Netherlands, the, <sup>8</sup>Amsterdam UMC, Location University of Amsterdam, Department of Internal Medicine, Amsterdam, Netherlands, the, <sup>9</sup>Amsterdam Institute for Immunology and Infectious Diseases (AII), Amsterdam, Netherlands, the, <sup>10</sup>Amsterdam Public Health Research Institute (APH), Amsterdam, Netherlands, the, <sup>11</sup>Maastricht University, Department of Work and Social Psychology, Maastricht, Netherlands, the

**Background:** Frequent in-clinic PrEP monitoring visits may be barriers hampering scale-up of PrEP. Online monitoring and less frequent monitoring may reduce such barriers. We aimed to identify the perspectives of (future) PrEP users on such alternative PrEP provision models.

**Methods:** We conducted five online focus group discussions (FGDs) in June 2020 with men-who-have-sex-with-men (MSM) aged 18-25 years, recently migrated MSM, transgender men and women, and MSM who regularly

attend sexual health centers (SHC). The FGDs aimed to explore participants' thoughts on the current monitoring model (3-monthly in-clinic), and alternative monitoring models (6-monthly; online). In the Netherlands, each PrEP monitoring visit includes STI-screening. The FGDs were audio-recorded and transcripts were analyzed using thematic analysis.

**Results:** Participants (n=27) were receptive to the ideas of reducing the number of PrEP monitoring visits and conducting these (partly) online. Online and 6-monthly monitoring were perceived to be efficient and convenient, saving time and (travel) costs, and beneficial for those who prefer to avoid clinical settings. The latter was particularly important for transgender participants in transition who expressed an already high burden of medical appointments.

Main concerns with 6-monthly monitoring were related to delayed diagnosis and treatment of STIs and anticipated difficulties with arranging STI-testing appointments at the SHC (free of charge) due to limited capacity, and the general practitioner due to costs of STI-testing.

Concerns related to online care were: safeguarding privacy of video consultations and delivery of PrEP at home when living with others (young MSM) and perceived inability to master the online monitoring procedures due to insufficient language proficiency and unfamiliarity with the Dutch health care system (migrant MSM).

Participants recommended an in-clinic start to ensure good knowledge of PrEP intake schedules and to gain familiarity with PrEP monitoring before commencing with 6-monthly and online monitoring. Participants also recommended to adapt monitoring location and frequency according to individual needs.

**Conclusions:** Our study indicates willingness of (potential) PrEP users to adopt new PrEP modalities and underlines the importance of incorporating individual choice in deciding frequency as well as location of monitoring. The outcomes of this study provide concrete pointers for developing and implementing online and 6-monthly PrEP monitoring.

## WEPED416

Addressing challenges faced by people who use injectable drugs and people living with HIV/AIDS in rehabilitation centers: insights from FASAA Rehabilitation Centre, Zimbabwe

A. Magwenzi<sup>1</sup>

<sup>1</sup>International Institute of Social Studies (ISS), Public Policy and Administration, The Hague, Netherlands, the

**Background:** The correlation between drug abuse and HIV/AIDS transmission is well-known, driven by risky behaviors such as unprotected sex and syringe sharing among people who use drugs (PWUDs). This case study examines the relationship between drug abuse and HIV/

AIDS infection within FASAA Rehabilitation Centre, Zimbabwe, and explores the challenges faced by clients experiencing dual stigma as PWUDs and individuals living with HIV.

**Methods:** Data was collected from 50 respondents at FASAA Rehabilitation Centre through focus group discussions, questionnaires, and counseling sessions. From February 2023 to January 2024, the majority (90-95%) of clients suffered from Substance Induced Psychosis (SIP) and Substance Use Disorders (SUDs). The center primarily provided acute care for issues related to domestic violence, public violence, and gender-based violence. Most admissions (95%) were involuntary, resulting from trauma, violence, and mental health problems. Counseling and psychosocial interventions were crucial for repairing family relationships. Female admission rates were low, possibly due to engagement in sex work. Approximately 8% of clients were receiving HIV treatment, with one case of co-occurring tuberculosis (TB). FASAA Rehabilitation Centre also served as a safe space for LGBTQ individuals, ex-prisoners, females, the elderly, and others in need of rehabilitation services.

**Results:** Dual Stigma: Clients facing both drug abuse and HIV/AIDS stigma require comprehensive support to address their unique challenges.

Importance of Acute Care: Rehabilitation centers play a crucial role in stabilizing individuals experiencing substance-induced psychosis and providing initial interventions.

Gender Disparities: Efforts must be made to understand and address barriers preventing females, especially those engaged in sex work, from seeking rehabilitation services.

Holistic Approach: Integrating HIV/AIDS and other healthcare services within rehabilitation centers is crucial to address the complex needs of PWUDs.

**Conclusions:** This study highlights the significance of addressing the relationship between drug abuse and HIV/AIDS within rehabilitation centers. Despite challenges related to dual stigma and gender disparities, FASAA Rehabilitation Centre has provided essential acute care and support to clients. However, there is a need to enhance interventions and adopt a holistic approach to address HIV/AIDS, mental health, and other healthcare needs of PWUDs.

## WEPED417

### Boosting access to community-health worker information: what do you want to know?

K. Choga<sup>1</sup>, P. Charashika<sup>1</sup>, K. Takarinda<sup>1</sup>, K. Masiye<sup>1</sup>, I. Nhiringi<sup>1</sup>, L. Gale<sup>2</sup>, S. Moore<sup>2</sup>, K. Webb<sup>1</sup>

<sup>1</sup>Organisation of Public Health Interventions and Development, Harare, Zimbabwe, <sup>2</sup>Avert, London, United Kingdom

**Background:** Enhancing equitable access to community health worker (CHW) information is vital for improving quality of healthcare outreach in low resource settings. Understanding the diverse informational needs of CHWs is critical for tailoring training and support.. The Boost digital application is a freely available, data-light digital job aide co-created with CHWs in sub-Saharan Africa.

Our objective was to explore the content topics that CHWs access frequently, offering insights into the knowledge needs of CHWs in high HIV burden settings.

**Methods:** We conducted an analysis of the frequencies of access to different health topics made by community health workers on the Boost Application in Zimbabwe from May to December 2023. Access to content topics were abstracted from application dashboards and disaggregated by all HIV-related topics. Content access was disaggregated by language preference (English, Shona, Ndebele), geography (urban vs rural) and sex.

**Results:** From May to December 2023, a total of 5,556 content views were recorded. The majority, 76%(n=4223) accessed the application through the English module, 20% accessing the Ndebele modules, and 4% accessing the Shona module. Most content views (94%; n=5223) were in rural regions, while 6% were accessed in urban areas. Rural users most frequently accessed basic HIV information, including what HIV is and how it is transmitted. Urban users most frequently accessed topics related to HIV prevention, testing, and myths.

Figure. Overall content views.

**Conclusions:** We demonstrate the utility of digital job aides for increasing knowledge among CHWs in a high burden setting. Varying preferences in accessing healthcare information between urban and rural regions, emphasize the need for co-created and tailored health education programs for CHWs to understand and address specific community needs effectively.

## WEPED418

Combining a traditional peer-to-peer model with IT for better HIV programming for Young Key population persons during COVID; a case study of HOYMAS-Kenya, a key population-led organization working in Kenya

P. Irungu<sup>1</sup>, J. Mathenge<sup>1</sup>, J. Maina<sup>1</sup>, M. Njoroge<sup>1</sup>, J. Ngene<sup>1</sup>

<sup>1</sup>Health Options for Young Men on HIV/AIDS and STIs (HOYMAS), Nairobi, Kenya, Research and Learning, Nairobi, Kenya

**Background:** Traditionally in Kenya, most programs targeting GBMSM have been based on peer-to-peer programming, especially for community-based organizations. In 2020 as a result of the COVID-19 pandemic, they were forced to abandon traditional one-on-one outreaches and focus on utilizing alternative digital means of conducting outreaches.

One such organization is HOYMAS-Kenya a community-based and led organization established in 2009 to promote health and human rights of key populations in Kenya.

**Description:** Since 2010, all HOYMAS programs have been led and executed by peer educators who have been trained by the Ministry of Health to offer information and encourage testing and safer sex practices among key populations physically.

At the onset of COVID, all the PE were trained on how to utilize digital media platforms to give out sexual health information crafted, designed, and approved by the peer outreach team and adopted an online appointment booking system (Quickres) for our clients which saves them time, and also sends them reminders when they are due to visit the clinic.

**Lessons learned:** In the last year, despite regular anti-LGBTQ protests, HOYMAS digital outreaches have been able to reach 5294 GBMSM with health information and services. Among these: all 5294 are receiving HIV, stigma reduction, violence response and SRHR commodities monthly, 320 clients currently on PrEP, 467 clients living with HIV accessing ART in the facility, 97% of these virally suppressed and undetectable.

For a population that is criminalized and has to avoid care in public facilities, it is imperative to enhance the peer-to-peer model of service delivery while being dynamic and allowing room for innovation and change by ensuring communities are equipped with skills to enable them to offer online and digital services during uncertain times.

**Conclusions/Next steps:** HOYMAS will accelerate community-led message creation exercises that take into account the different personas being targeted and current barriers to engagement with HIV and SRH messaging can increase the rate of conversion between seeing such messages and taking proposed action and lead to higher rates of engagement and uptake of HIV testing services.

Using an automated platform to disseminate messages and peer support is key to ensuring service delivery to harder-to-reach populations.

## WEPED419

Developing a multi-level HIV navigation program for Latinos/as/xs living in Prince George's County, Maryland, United States: opportunities and lessons learned from community-academic partnership

T.S. Karver<sup>1</sup>, A. Suarez<sup>2</sup>, W. Saba<sup>3</sup>, K.R. Page<sup>4</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Health, Behavior and Society, Baltimore, United States, <sup>2</sup>La Clínica del Pueblo, Washington, United States, <sup>3</sup>Maryland Latinos Unidos, Baltimore, United States, <sup>4</sup>Johns Hopkins School of Medicine, Baltimore, United States

**Background:** In Maryland, United States, Latinos/as/xs face a disproportionate burden of HIV, being five times more likely to be diagnosed compared to non-Latino/a/x whites. This is particularly pronounced in Prince George's County (PGC), a county in Maryland where many Latino/a/x residents are predominantly foreign-born noncitizen immigrants and experience challenges related to limited English proficiency and lack of health insurance. In PGC, Latinos/as/xs have the highest rate of late HIV diagnoses, and between 2018 and 2020, HIV diagnoses among Latinos/as/xs in the county nearly doubled from 7.5% to 14.9%.

To address this, our community-academic partnership initiated a project aiming to establish a culturally and linguistically appropriate HIV multi-level systems navigation and support intervention for Latinos/as/xs living with HIV in PGC.

**Description:** We plan on conducting formative work to examine the HIV care landscape in PGC. We will assess the HIV care landscape by conducting clinic assessments and observations through value stream mapping and individual process mapping of Latino/a/x clients assessing these facilities. In-depth interviews with engaged and not engaged Latinos/as/xs living with HIV, clinical care providers/staff, and local key informants will explore feasibility and acceptability of establishing and integrating a multi-level HIV navigation and support intervention.

**Lessons learned:** Funded through a community-academic research grant, our project strategically placed community partners at the forefront during the conceptualization, research planning and subsequent execution and dissemination phases. Key lessons learned to date underscore

1. The pivotal role of knowledge sharing in establishing and maintaining community-academic partnerships;
2. Upholding community priorities in all phases of our research strategy, ensuring that the community serves as a catalyst for the overall planning and execution of the project;

3. Emphasizing the importance of interdisciplinary partnerships with members who represent and reflect the community we aim to serve; and

4. Recognizing the need of integration into a broader Latinx community-government-academic network to strengthen our collective collaboration and effectively identify and address possible barriers and challenges.

**Conclusions/Next steps:** The next phase involves implementing the research plan while maintaining strong community-academic partnerships.

Our goal is to address the HIV burden among Latino/a/x communities in PGC through a comprehensive, linguistically and culturally-congruent intervention.

## WEPED420

### Lessons learned from standing up the South Sudan military voluntary medical male circumcision (VMMC) program

H. Awongo<sup>1</sup>, A. Changjowk<sup>1</sup>, A. Lasu<sup>2</sup>, P. Komakech<sup>1</sup>, J.E. Woja<sup>3</sup>, M. Moi<sup>4</sup>, R. Dillon<sup>5</sup>, L. Courtney<sup>2</sup>

<sup>1</sup>RTI, Juba, South Sudan, <sup>2</sup>RTI, Washington, DC, United States, <sup>3</sup>South Sudan People's Defense Force, Juba, South Sudan, <sup>4</sup>US DoD HIV/AIDS Prevention Program, Juba, South Sudan, <sup>5</sup>US DoD HIV/AIDS Prevention Program, San Diego, United States

**Background:** In the complex landscape of South Sudan, the HIV Secretariat of the South Sudan People's Defense Force (SSPDF) offers quality HIV services for a resource-poor population with limited access to healthcare services. In 2018, with support from the DOD HIV/AIDS Prevention Program (DHAPP) and the implementing partner RTI, the HIV Secretariat began offering voluntary medical male circumcision (VMMC) services to male troops, their family members, and the surrounding communities as part of a comprehensive HIV/AIDS service initiative. The facility-based services have expanded to three military hospitals in Juba, Wau and Jonglei, each serving as a hub, coordinating mobile services. The program focuses on three main goals: increasing male military participation in VMMC services, enhancing awareness and demand for VMMC within the SSPDF, and building the capacity of health facilities to provide safe, high-quality VMMC services.

**Description:** Since 2018, the SSPDF has completed over 30,000 circumcisions. Clients receive the WHO recommended minimum package of services, including HIV testing and counseling, screening and treatment for sexually transmitted infections, provision of male and female condoms, counseling on safer sex practices and risk reduction, and male circumcision through surgical removal of the foreskin. This holistic approach contributes to preventing HIV within the military and civilian populations.

**Lessons learned:** Creating a diverse team of VMMC practitioners from different facilities enhances camaraderie and facilitates the transfer of knowledge from experi-

enced surgeons to others, including Training of Trainers participants. The military community faces stigma, reflected in clients seeking services discreetly in the evenings and entering through the rear door. Using peer to peer awareness to counter myths and misinformation is critical. Local authorities from the county health department play act as gatekeepers to community access for VMMC services. Additionally, radio is a helpful communication channel to share VMMC messages.

**Conclusions/Next steps:** Moving forward, community engagement involving political and community leaders is recommended to enhance access and strengthen VMMC services. Sharing VMMC messages broadly with the community, and collaboration with local health authorities and partners is helpful for resource mobilization, knowledge exchange, and the continual improvement of the program's impact on HIV prevention within the military.

## WEPED421

### Enhancing inclusivity: examining the global impact of cultural competency on clinical trial recruitment in HPTN – 10 year update

C. Watson<sup>1,2</sup>, J. Lucas<sup>1</sup>, S. Fields<sup>1</sup>, D. Wheeler<sup>1</sup>

<sup>1</sup>HIV Prevention Trials Network, Black Caucus, Durham, United States, <sup>2</sup>Morgan State University, Center for Urban Equity, Baltimore, United States

**Background:** In the past decade, clinical trial recruitment within the HIV Prevention Trials Network (HPTN) has evolved significantly in response to the influential blueprint outlined by the Black Caucus in their 2014 report, "A Way Forward for Clinical Trials."

This study investigates the global impact of integrating cultural competency into recruitment efforts, aligning with industry standards to address challenges posed by the HIV epidemic.

**Description:** The research details key recommendations from the Black Caucus's 2014 report, emphasizing the standardization of HPTN networks and the implementation of mandatory unconscious bias training for NIH-funded clinical sites. Triggered by the HPTN 073 study, which highlighted the underrepresentation of Black MSM in clinical trials, the study further recommends improved recruitment strategies and resources for this demographic. Structural and institutional changes were subsequently implemented, aligning with industry best practices to facilitate essential trainings across all HPTN studies.

**Lessons learned:** Results highlight the profound impact of integrating unconscious bias training into recruitment efforts, resulting in the enrollment of nearly 10,000 individuals from historically marginalized communities. Globally, NIH-funded sites have adopted strategies to include overlooked communities, fostering diverse trial populations and achieving key milestones in the fight against HIV.

Notable outcomes include demographic shifts in trial populations, increased accessibility to innovative methodologies, and the integration of training programs into industry-specific registrational trials for new drugs.

**Conclusions/Next steps:** The study concludes that unconscious bias training, in part, is imperative for the inclusion of key prioritized populations in clinical trials. Structural, individual, and institutional shifts are essential for sustained approaches to diversify clinical trials, emphasizing the industry's commitment to ongoing efforts in solidifying inclusivity.

The findings provide crucial insights for shaping industry-specific public health sustainability models, guiding future endeavors to effectively combat the HIV epidemic. To achieve an end to the epidemic, future focus must include clear pathways to including necessary groups in all levels of clinical trial development.

## Key populations and other vulnerable populations: Behavioural, social and cultural issues and contexts

### WEPED422

Information-sharing within social networks of women who exchange sex and use drugs/alcohol in Kazakhstan: implications for increasing consistent HIV testing

O. Cordingley<sup>1,2</sup>, T. McCrimmon<sup>3</sup>, B.S. West<sup>3</sup>, M. Darisheva<sup>4</sup>, N. Zholnerova<sup>5</sup>, E. Grigochuk<sup>6</sup>, S. Primbetova<sup>4</sup>, A. Terlikbaeva<sup>4</sup>, L. Gilbert<sup>2</sup>, N. El-Bassel<sup>2</sup>, V. Frye<sup>2</sup>

<sup>1</sup>Drexel University, Dornsife School of Public Health, Philadelphia, United States, <sup>2</sup>Columbia University, School of Social Work, New York, United States, <sup>3</sup>Columbia University, Mailman School of Public Health, New York, United States, <sup>4</sup>Global Health Research Center of Central Asia (GHRCCA), Almaty, Kazakhstan, <sup>5</sup>Amelia NGO, Almaty, Kazakhstan, <sup>6</sup>Community Friends NGO, Almaty, Kazakhstan

**Background:** Women who exchange sex and use drugs/alcohol in Kazakhstan are susceptible to HIV/STI infection. Social support and information-sharing may facilitate HIV testing, including self-testing that avoids a major barrier to testing: stigma. However, little is known about how HIV and sexual health communication function within social networks of women exchanging sex in Kazakhstan.

**Methods:** We conducted formative qualitative research, 30 in-depth interviews and 4 focus groups (n=48), with women in two Kazakhstani cities, Almaty and Taldykorgan. Researchers recruited participants through snowball sampling with assistance from local NGO leaders/co-authors. Interviews discussed friendships, communication, and information-sharing, particularly related to HIV/STIs.

**Results:** Participants report that they are more receptive to information about HIV from peers, compared with professionals: "It is useless for a specialist to come and start talking, no one will sit and listen [...] But if a friend whom I know will competently tell me everything about it, I will listen to her." Women communicate frequently about testing: "Yes, we constantly discuss this, share the results, show each other. [...] We sometimes advise each other where to go to get tested for HIV. We prompt each other." They share their feelings on stigma around testing: "My acquaintances completed the test and said: 'yes, I have HIV, so what?' But I feel fear and shame," and promote testing despite anticipating negative outcomes: "we share our emotions, there were girls who were afraid: 'Oh, I'm afraid.' I said to them: 'Don't be afraid, it doesn't hurt.'" In focus groups, differences in conversations about testing with coworkers were described:

1. It seems to me this is a sensitive topic, I myself do not discuss it.
2. I had such discussion, I even offered them to be tested.
3. We discuss HIV testing with our girls we work with, and sometimes they all cry together during discussion."

**Conclusions:** Social support and networks can be strong facilitators for information-sharing to promote HIV prevention/treatment among women in Kazakhstan, but notable gaps in communication were noted.

Efforts that support organizing among sex workers may accelerate the positive impact of information exchange, supporting consistent HIV testing and access to treatment/prevention.

### WEPED423

An integrated strategy to maintain continuity of access to HIV and STI services in an anti-LGBTQ sociopolitical climate: lessons learned from community-based HTS implementation project with MSM in Tamale, Ghana

S. Owiredu Hanson<sup>1</sup>, S.K. Abbah<sup>1</sup>, M.-D. Cobbinah<sup>1</sup>, S. Dauda<sup>2</sup>

<sup>1</sup>CEPEHRG, Programs, Accra, Ghana, <sup>2</sup>Ghana Health Service, ART Unit, Tamale, Ghana

**Background:** In Ghana, the current sociopolitical environment is hostile to Key Population (KP) programming. Men-who-have-sex-with-men (MSM) continue to be target of marginalization and are not afforded equal legal protection. In Tamale, anti-LGBTQ societal norms and hostile community attitudes undermine large-group outreach thereby increasing social isolation and decreasing access to HIV testing services for MSM. We describe an integrated strategy that maintained access to HIV&STI services in an anti-LGBTQ community in Tamale.

**Description:** CEPEHRG intensified peer-led rapid HIV testing services by halting large-group interventions and used one-on-one and social media interventions to reach

their peers. Due to the topography in Tamale, the area is characterized by dispersed settlements making it extremely difficult to reach peers. Irrespective of this, Peer Educators (PE) scheduled with their peers to converge at safe locations at different times and transported them on their motorbikes to the health facilities for HTS and STI services. For security purposes, PEs transported one peer at a time. The daily average number of peer transports to a health facility was four per PE.

**Lessons learned:** The peer-led integrated strategy improved uptake of STI and HIV services among MSM in Tamale. Prior to the intervention, from January-March 2023, 17 MSM were reached and none of them was tested for HIV or STI. After the introduction of integrated peer-led strategy using one-on-one and social media, from April-May 2023, the project reached 312 MSM.

Out of this, 209 tested for HIV; 32 (15%) tested HIV+ and all 32 (100%) were initiated on ART. 115 (55%) were enrolled on PrEP, 16 (8%) were treated for genital warts, 19 (9%) for gonorrhea, 11 (5%) for discharges, and 13 (6%) for syphilis.

**Conclusions/Next steps:** Concept of peer-led integrated strategies to HIV testing is time-consuming and labour intensive but effective in reaching out to MSM in an anti-LGBTQ community. The team will continue to scale up one-on-one and social media interventions to improve KP program and share the best practices with partners and community members.

## WEPE424

Identifying patterns of negotiation strategies used by men having sex with men to ascertain their HIV protection when having sex with non-steady partners

D. Gredig<sup>1</sup>, J. Bogdanovic<sup>2</sup>, D. Bigoni<sup>1</sup>, P. Weber<sup>1</sup>

<sup>1</sup>University of Applied Sciences and Arts Northwestern Switzerland, School of Social Work, Olten, Switzerland,

<sup>2</sup>University of Applied Sciences and Arts Northwestern Switzerland, School of Applied Psychology, Olten, Switzerland

**Background:** Pursuing a specific HIV prevention strategy depends on the acceptance and cooperation of sexual partners and must be negotiated. Early HIV-related research focused on condom negotiation strategies and proved that negotiations asserted condom use and reduced HIV vulnerability. However, negotiation strategies used specifically among men having sex with men (MSM) remained underexamined. Moreover, current negotiation strategies in the face of Pre-Exposure Prophylaxis (PrEP), the 'undetectable=untransmittable' and 'treatment as prevention' paradigm and in times of online dating are still unknown.

Against this background, this project aimed to establish negotiation strategies for HIV protection among MSM before and during sex with non-steady partners.

**Methods:** We conducted in-person interviews with 29 seronegative MSM living in Switzerland who had sex with non-steady partners they dated online or in gay saunas. We combined three interview approaches:

- Narrative and episodic interviewing;
- A virtual-reality serious game developed in this project to immerse participants in situations similar to those they might encounter in real life;
- Another narrative sequence and a short survey. We analyzed the interview data using open coding.

**Results:** We identified seventeen negotiation strategies used by MSM in chats, during in-person dates or when having sex to motivate their non-steady partners to accept and follow their preferred HIV protection strategy.

These negotiation strategies can be grouped into three categories: subject-centred strategies (such as being authoritative); strategies leveraging sexual arousal (such as seduction); and strategies centred on risk communication (such as providing risk information).

Further, we identified actions taken by MSM to end negotiations which did not meet their aims and to break off interactions. In the course of negotiation, these strategies were combined into patterns.

We identified four patterns:

- Assertion or
- Defense of the preferred protection strategy,
- Flexible adaptation to the partner's preference,
- Surrender to the partner's will.

**Conclusions:** Current HIV protection negotiation strategies take various forms and go beyond condom negotiations. They may be directed to condom use or condomless sex, depending on the individual protection strategy MSM have adopted.

In prevention counselling, negotiation strategies should be addressed, and the negotiation skills of MSM should be developed.

## WEPED425

Examining the role of posttraumatic stress and depressive symptoms in HIV pre-exposure prophylaxis (PrEP) motivation among women survivors of intimate partner violence

K. Phillips<sup>1</sup>, K. Alexander<sup>2</sup>, T. Kershaw<sup>3</sup>, L. Sharpless<sup>4</sup>, M. Katague<sup>5</sup>, T. Willie<sup>1</sup>

<sup>1</sup>The Johns Hopkins Bloomberg School of Public Health, Mental Health, Baltimore, United States, <sup>2</sup>The Johns Hopkins School of Nursing, Baltimore, United States, <sup>3</sup>Yale University, School of Public Health, Social and Behavioral Sciences, New Haven, United States, <sup>4</sup>UNC Gillings School of Global Public Health, Health Behavior, Chapel Hill, United States, <sup>5</sup>University of California San Diego, Division of Infectious Diseases and Global Public Health, La Jolla, United States

**Background:** Post-traumatic stress disorder (PTSD) and major depressive disorder (MDD) are associated with functional impairments, yet little is known about their influence on HIV pre-exposure prophylaxis (PrEP) motivation among women survivors of intimate partner violence (IPV). Understanding how PTSD and MDD symptoms influence PrEP motivation is particularly important given survivors of IPV have an increased risk for HIV acquisition. The present study assessed the association between PrEP motivation (PrEP motivational cascade) with latent profiles of PTSD and MDD symptoms among women survivors of IPV.

**Methods:** Data were collected from a sample of 285 women from Baltimore, MD, and New Haven, CT. Latent profile analysis was performed to identify patterns of depressive and PTSD symptoms among women survivors of IPV. Logistic regression was performed to examine the association of profile membership on PrEP motivation.

**Results:** A six-profile solution was determined to best fit the data. Profiles were characterized: Profile 1, very low depressive and PTSD symptoms; Profile 2, average depressive symptoms and low (below the mean) PTSD symptoms; Profile 3, high depressive symptoms and low PTSD symptoms; Profile 4, moderate depressive symptoms and high PTSD symptoms; Profile 5, high PTSD avoidance and average depressive symptoms; Profile 6, high depressive and high PTSD symptoms. The odds of being in Stage 3 (PrEPparation) than Stage 1 (Precontemplation) were lower for women assigned to the low depressive and PTSD symptom profile (Profile 1) than women in the high depressive and PTSD symptom profile (Profile 6) (OR=0.22, 95% CI= .06,.76, p=.02). Women assigned to the low PTSD and average depressive profile (Profile 2) had lower odds of being in Stage 3 than Stage 1 compared to women assigned to the high depressive and PTSD symptom profile (Profile 6) (OR=.25, 95% CI= 0.07, 0.92, p=.037).

**Conclusions:** Women with higher PTSD and MDD symptoms expressed greater motivation to engage in PrEP than women with low PTSD and MDD symptoms.

Findings support the CDC's clinical PrEP recommendations to integrate depression screening into PrEP services, but there is a critical need to also include PTSD screening. Precision care should synchronize trauma-informed practices and mental health treatment to engage survivors in PrEP services.

## WEPED426

Using a digitized ecosystem to provide integrated HIV and SRH: using mixed health systems in Burkina Faso, Kenya, South Africa and Uganda

S. Malaba<sup>1</sup>, B. Renard<sup>2</sup>, N. Nogueira<sup>3</sup>, L. Wanaswa<sup>1</sup>, N. Niwagaba<sup>4</sup>, P. Mokooane<sup>5</sup>, H. Essendi<sup>6</sup>, N.-A. Donjon<sup>7</sup>, G. Kiema<sup>8</sup>

<sup>1</sup>Tiko Africa, Operations, Nairobi, Kenya, <sup>2</sup>Tiko Africa, Cape Town, South Africa, <sup>3</sup>Tiko Africa, Technology, Porto, Portugal, <sup>4</sup>Tiko Africa, Operations, Kampala, Uganda, <sup>5</sup>Tiko Africa, Operations, Johannesburg, South Africa, <sup>6</sup>Tiko Africa, MERL, Nairobi, Kenya, <sup>7</sup>Tiko Africa, Operations, Cape Town, South Africa, <sup>8</sup>Tiko Africa, Operations, Ouagadougou, Burkina Faso

**Background:** The HIV prevalence among adolescent girls and young women in sub-Saharan Africa is more than three times than among their male counterparts. Greater access to convenient HIV and SRH services can ensure increased uptake of integrated services HIV and sexual and reproductive health services, thereby addressing the dual threat of HIV and unplanned pregnancy. Tiko Africa harnesses the power of technology to create a digitized ecosystem that delivers youth friendly, judgment free HIV services alongside SRH services to low-income adolescents and young people of 15-24 years.

**Description:** Working with Ministries of Health, Tiko Africa identifies settings where adolescent girls and young women (AGYW) are at highest risk of acquiring HIV, have heightened adolescent pregnancies and live in multidimensional poverty. Ecosystems consisting of community based organizations (CBOs), public and private health care facilities and pharmacies are mapped and on-boarded onto the Tiko platform. CBO-linked and trained community mobilizers deliver information on HIV and SRH services to AGYWs, enroll them on the Tiko platform and refer them to Tiko-accredited facilities.

The digital ecosystem provides AGYW with the choice of accessing free services and fully subsidized services at public and private clinics respectively. The outputs of the AGYW user journey are reflected on real time dashboards. Data is used to inform targeting and improvements.

**Lessons learned:** In 2023, Tiko provided 553,000 to 347,190 adolescents and young people. 29% of the services were HIV testing services. As a result, 2,133 individuals were initiated on PrEP and 322 on ART. 61% of all the services were contraceptives. 25% more AGYW took integrated services between July - December 2023 compared to Jan -June

2023. Inclusion of HIV self testing at pharmacies and addition of public facilities with free HIV services were cited as primary reasons for seeking for more than one service.

**Conclusions/Next steps:** AGYW can be effectively reached with integrated HIV and SRH services by affording them the choice of when, where and how to access services. Using the Tiko application to digitize an ecosystem of quality assured, youth friendly service providers allows young people to choose where to access services and rate services, which allows for timely improvements.

## WEPED427

'Oh, why are PrEP Gays always like this...': psychosocial influences on U.K. based MSM's relationship with, and use of PrEP

A. Gifford<sup>1</sup>, R. Jaspa<sup>2</sup>, B. Jones<sup>1</sup>, D. McDermott<sup>1</sup>

<sup>1</sup>Nottingham Trent University, Psychology, NG1 4FQ, United Kingdom, <sup>2</sup>University of Brighton, PVC Office, Brighton, United Kingdom

**Background:** Pre-Exposure Prophylaxis (PrEP) is medication used to prevent the spread of Human Immunodeficiency Virus (HIV). At-risk populations, including Men who Have Sex with Men (MSM), are eligible for PrEP for free in the UK. However, uptake is not universal with many individuals still reporting barriers to accessing PrEP. This current study aimed to increase our understanding of psychosocial factors that influence PrEP usage.

**Methods:** Twenty-two MSM residing in the UK participated in a interview study and Reflexive Thematic Analysis was used to analyse the data. Participant ages ranged from 20 – 56 years ( $M = 29.40$ ,  $SD = 8.0$ ), with 12 participants currently using, or had historically used PrEP (i.e., PrEP Users) and 10 participants who had never taken PrEP (Non-PrEP Users).

**Results:** The results are presented under three themes:

1. 'HIV Anxiety and the LGBTQ+ Community',
2. 'Condomless Sex Facilitation and Condom Morality', and;
3. 'Microaggressions Towards PrEP Usage'.

These describe how perceptions of HIV and condom preferences influence the decision to take PrEP. These coalesce into a 'PrEP user' identity, carrying a risk of anticipated or enacted stigma. From this, a framework that could predict the psychosocial influences on PrEP uptake started to form.

**Conclusions:** This study highlights current psychosocial barriers to PrEP, as well as the benefits (e.g., reduced HIV anxiety) that PrEP usage brings. It also highlights novel ways in which stigma towards PrEP is perceived and constructed through microaggressions and downward social comparisons.

Importantly, it highlighted how PrEP can cause cognitive dissonance within even those who take it, resulting in concealment and denial of PrEP usage. This is beneficial for informing future PrEP uptake campaigns and ameliorating access to vital anti-HIV medication, for example, with targeted public health messaging to reduce stigma.

## WEPED428

HIV-related discussions with sex partners by Nigerian transgender women and men who have sex with men

A.B. Tiamiyu<sup>1,2,3</sup>, F. Hu<sup>3,4</sup>, A. Kokogho<sup>1,2,3</sup>, M.E. Charurat<sup>5</sup>, C. Ekeh<sup>6</sup>, S. Adebajo<sup>7</sup>, E. Shoyemi<sup>8</sup>, M. Iroezindu<sup>1,2,3</sup>, J.A. Ake<sup>3</sup>, S.D. Baral<sup>9</sup>, R. Nowak<sup>5</sup>, T.A. Crowell<sup>3,4</sup>, TRUST/RV368 Study Group.

<sup>1</sup>Henry Jackson Medical Research International, Clinical Research Center, Abuja, Nigeria, <sup>2</sup>U.S. Army Medical Research Directorate, Abuja, Nigeria, <sup>3</sup>U.S. Military HIV Research Program, Walter Reed Army Institute of Research, Silver Spring, United States, <sup>4</sup>Henry M. Jackson Foundation for the Advancement of Military Medicine, Bethesda, United States, <sup>5</sup>University of Maryland School of Medicine, Institute of Human Virology, Baltimore, United States, <sup>6</sup>Population Council, Abuja, Nigeria, <sup>7</sup>University of Maryland, Maryland Global Initiatives Corporation, Baltimore, United States, <sup>8</sup>Centre for Population Health Initiatives, Lagos, Nigeria, <sup>9</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, United States

**Background:** Discussion of HIV and other sexually transmitted infections (STIs) among sex partners facilitates risk reduction. We evaluated HIV/STI-related communications and sexual behaviors among a historically marginalized community of sexual and gender minorities (SGM) in Abuja and Lagos, Nigeria.

**Methods:** From March 2013-August 2018, we enrolled people assigned male sex at birth, aged 16+ years in Abuja and 18+ in Lagos, who reported anal sex with men. At enrollment and 3, 9, and 15-month follow-up visits, participants were asked about their sexual behaviors, condom usage, and HIV/STI-related communications with main sexual partners (MSP) and casual sexual partners (CSP), including whether they discussed their own HIV status and their partners' HIV status.

Robust Poisson regression models with generalized estimating equations were used to estimate relative risks (RRs) and 95% confidence intervals (CIs) for factors potentially associated with HIV/STI-related communications with each type of sexual partner.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

**Results:** Among 2795 SGM enrolled, questions about HIV/STI-related communications with MSP were answered by 2436 (87.2%) and with CSP by 2398 (85.8%). HIV/STI-related communications were reported with some or all MSP by 68.1% (1659/2436) and with CSP by 43.9% (1052/2398). The median age for both groups was 23 years (interquartile range 20–27).

Among participants who reported HIV/STI-related communications with MSP, 54.1% (897/1659) discussed their own HIV status and 55.8% (925/1659) discussed their partner's status.

Among participants who reported HIV/STI-related communications with CSP, 37.0% (389/1052) discussed their own HIV status and 36.6% (385/1052) discussed their partner's status.

In multivariable analyses limited to 1958 participants with both MSP and CSP, condom use at last sex with CSP was associated with HIV/STI-related communication with MSP (RR 1.16 [95% CI 1.08 – 1.25]) and with CSP (RR 1.22 [95% CI 1.08 – 1.38]).

**Conclusions:** HIV/STI-related communications with main and casual sex partners were strongly linked and both were associated with increased condom use with casual partners.

HIV prevention and treatment programs for SGM should promote open communications in sexual relationships—including through the deployment of modern strategies such as digital platforms to facilitate disclosure—to help reduce HIV/STI transmission risks particularly in the context of individual and structural stigmas including criminalization.

## WEPED429

Toward key population-friendly services:  
defining tailored approaches for men who  
have sex with men in Kenya

E. Mwore<sup>1</sup>, J. Walimbwa<sup>1</sup>, S. Tabbu<sup>2</sup>, J. Zech<sup>3</sup>  
<sup>1</sup>Ishtar MSM Health and Wellness Center, Research,  
Nairobi, Kenya, <sup>2</sup>Kenya Youth Development and Education  
Support Association (Kydesa), Research, Nakuru, Kenya,  
<sup>3</sup>ICAP at Columbia University, Research, New York, United  
States

**Background:** This abstract outlines the key findings of a qualitative research study conducted in Kenya, aimed at defining and enhancing Key Population-friendly services for Men who have Sex with Men (MSM).

The study investigates the specific healthcare needs, challenges, and preferences of MSM individuals to inform the development of targeted and inclusive services.

**Methods:** Utilizing a qualitative approach, the research engaged MSM individuals and healthcare providers in open-ended interviews and focus group discussions across wellness centers that offer health care services to MSMs in Kenya.

The study sought to identify barriers to accessing healthcare, elucidate perceptions of current services, and explore opportunities for tailoring healthcare delivery to better suit the unique needs of MSM.

**Results:** Preliminary analysis revealed several challenges faced by MSM individuals, including stigma, discrimination, and a lack of cultural competence among healthcare providers. Participants emphasized the importance of confidentiality, non-judgmental attitudes, and inclusivity in healthcare settings.

Furthermore, the study identified potential strategies to enhance key population-friendly services, including specialized training for healthcare professionals, community involvement, and the establishment of safe spaces for healthcare access.

**Conclusions:** The findings highlight the need for a paradigm shift in healthcare provision to address the specific concerns of MSM individuals. Key population-friendly services should be grounded in cultural competence, inclusivity, and a commitment to eradicating stigma.

Collaborative efforts between healthcare providers, policymakers, and MSM communities are essential for the successful implementation of such services.

This abstract underscores the importance of defining and implementing key population-friendly services for MSM in Kenya. By addressing the identified barriers and incorporating the preferences of MSM individuals, healthcare services can become more accessible, acceptable, and effective.

The study advocates for the integration of these findings into national health policies and calls for greater inclusivity and cultural sensitivity in healthcare provision for MSM in Kenya.

## WEPED430

Assessment of knowledge, attitude and risk  
practices for HIV transmission among people in  
prisons in Ghana

N.A. Acheampong<sup>1</sup>, E.O. Ankrah<sup>1</sup>, R. Afriyie<sup>1</sup>  
<sup>1</sup>Ghana AIDS Commission, Accra, Ghana

**Background:** In Ghana, HIV prevalence in prisons is greater than in the general population. However, HIV response in prisons have been overlooked and little has been done. Quality data on attitudes and practices in prison is needed to inform the development of appropriate HIV intervention programs in prisons.

This study aimed to assess knowledge, attitude and risk practices related to HIV transmission among people in prisons.

**Methods:** A cross-sectional design using solely quantitative data collection techniques was adopted. Systematic random sampling was used to select 1055 people in prisons to participate in this study. Ethical approval was obtained before commencing this study from the Ghana

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

Health Service-Ethics Review Committee, permission to conduct the study was sought from Ghana Prisons Service and informed consent was obtained from the participants. Statistical Package for Social Sciences program was used to analyze data. Median range and proportions for different variables were estimated.

**Results:** Out of the 1055 study participants, 69.5% reported that consensual sex happens in prison. Consensual sex was found to be a more commonplace practice among males compared to females (61.4% vs 4.1%). Knowledge on HIV transmission was found to be high among people in prisons.

The knowledge of unprotected vaginal intercourse as a route of HIV transmission was higher among females (98.6%) compared to males (94.7%) However some misconceptions regarding HIV transmissions were found.

About 43.2% of people in prisons incorrectly accepted the misconception that HIV may be contracted from mosquito bites and 40% believed that HIV may be contracted via contact with the toilet seat. Risk practices were found to have statistical significant association with knowledge on HIV transmission ( $P = 0.02$ ) and attitude towards HIV prevention ( $p = 0.01$ ).

**Conclusions:** Participants have high risky behavior due to misconceptions about HIV transmission and negative attitudes towards HIV. Public health priorities should include HIV education and contraceptive access in prisons in Ghana.

The use of condoms and lubricants are currently prohibited in Ghanaian prisons although prisoners are at risk of contracting HIV and other STIs. Condom access in prisons has been shown to not threaten security and not enhance sexual activity.

## WEPED431

MoH-led key population condom supply chain mechanism improves uptake of condoms among female sex workers: Pakachere IHDC experience in Malawi

C. Kamba<sup>1</sup>, G. Kumwenda<sup>1</sup>, S. Sikwese<sup>1</sup>, O. Kumwenda<sup>2</sup>

<sup>1</sup>Pakachere IHDC, Blantyre, Malawi, <sup>2</sup>USAID Malawi, Lilongwe, Malawi

**Background:** Access and use of condoms and lubricants among FSWs in Malawi is affected by structural and social factors including supply chain, gender norms and low risk perception. We describe efforts by the Ministry of Health (MoH) in Malawi to collaborate with key population (KP) implementing partners to improve the condom and lubricant supply chain and address stockouts in high-risk venues.

Data from PEPFAR-supported programs (LINKAGES & LEAP) in 4 high HIV burden districts of Malawi is analyzed as a case study pre and post MOH KP condom supply mechanism.

**Description:** In 2018, MoH introduced a KP condom and lubricant supply chain mechanism for PEPFAR and GF implementing partners in Malawi. KP sites including 19 PEPFAR supported Drop-in-Centres were mapped and added to the national distribution plan. KP implementing partners were trained in quantification, forecasting, reporting, commodity management, storage, and quality improvement. Peer Educators were mentored to use tools for calculating the condom needs of FSWs based on number of sexual encounters per day. National level stock cards were used for each site and program to ensure standard reporting to MoH.

**Lessons learned:** From October 2016 to September 2018, a total of 6,131,247 male condoms, 143,992 female condoms and 812,372 packets of lubricants were distributed to FSWs in Blantyre, Lilongwe, Mzimba and Mangochi with significant condom stockouts in KP sites across this period. Condoms were sourced from public health facilities in this period. Comparatively, from October 2020 to September 2022 in the same districts and KP sites, a total of 16,050,887 male condoms, 720,238 female condoms and 1,494,924 lubricants were distributed following the introduction of MoH KP condom supply mechanism.

Meaningful engagement of KP program with the (MOH) Department of HIV, STI and Viral Hepatitis on KP condom needs, quantification, forecasting and supply chain improves condom supply among Key and priority populations with lesser stockouts.

**Conclusions/Next steps:** The MoH-led KP commodity supply chain mechanism has significantly addressed condom stockouts in KP sites in Malawi. MoH is conducting an additional mapping to expand the delivery of commodities to KP-led organizations beyond PEPFAR and Global Fund partners. Trainings for peer cadres will be conducted to ensure efficiencies.

## WEPED432

Unveiling the HIV/STI vulnerability among transgender men in Rio de Janeiro, Brazil

E. Carvalheira<sup>1</sup>, C. Jalil<sup>1</sup>, C. Coutinho<sup>1</sup>, E. Jalil<sup>1</sup>, L. Monteiro<sup>1</sup>,

D. Bezerra<sup>1</sup>, M. St Silva<sup>1</sup>, S. W. Cardoso<sup>1</sup>, J. Freitas<sup>1</sup>,

B. Hoagland<sup>1</sup>, T. Santos<sup>1</sup>, V. Veloso<sup>1</sup>, T. Torres<sup>1</sup>, B. Grinsztejn<sup>1</sup>

<sup>1</sup>Oswaldo Cruz Foundation (Fiocruz) / National Institute of Infectious Diseases (INI), Rio de Janeiro, Brazil

**Background:** Transgender individuals face a disproportionate burden of HIV worldwide, yet data on sexual behavior and HIV prevention use among transgender men are still scarce. This study aimed to shed light on the characteristics of transgender men attending a large HIV/sexually transmitted infection (STI) referral center in Rio de Janeiro, Brazil.

**Methods:** The study included individuals who self-identified as transgender men attending a large referral HIV/STI prevention/care service in Rio de Janeiro/Brazil (INI/Fi-

Oral  
abstracts

Index

ocruz) between March 2018 and December 2023. Individuals completed a brief survey and were offered HIV testing, same-day pre-/post-exposure prophylaxis (PrEP/PEP) or antiretroviral therapy (ART) as applicable.

**Results:** Among 9,339 individuals seeking care at the referral service, 132 were transgender men (52.0% Black/Pardo, 59.0% with secondary education). The median age was 24 years (IQR:21-28).

The primary reason of attendance was access to Itinerant Justice (63.0%), a partnership between Fiocruz and the Rio de Janeiro State Court to promote access to free legal services; 25.0% sought HIV/STI testing. The most common referral was by friends and peers (83.0%). Most transgender men reported sexual interest in cisgender women (75.8%), followed by transgender women (28.8%), and cisgender men (26.5%). In the previous 6 months, 23.75% of individuals had 2+ sex partners, 6.4% reported transactional sex, 6.5% had a partner living with HIV (LWH), and 17% reported unprotected receptive anal sex.

Overall, 26.5% refused HIV/STI testing. Among those tested, 94 (96.8%) were HIV-negative and 3 (3.2%) were LWH (2 with known HIV-status, 1 new diagnosis). Among those LWH (n=3), one was on ART (33.3%) and virologically suppressed (33.3%). Among HIV-negative individuals, 4.3% (N=4/94) initiated PrEP; 39.36% (N=37/94) had PrEP indication, 22% (N=21/94) initiated PrEP, and 42.9% (N=9/21) remained on PrEP by December 2023.

**Conclusions:** The susceptibility of transgender men to HIV is often underestimated. Current findings highlight their vulnerability to HIV/STI infections, indicating the potential benefits of implementing HIV prevention strategies for this demographic. Transgender men face challenges related to invisibility and barriers to accessing health services. A comprehensive understanding of the HIV/STI dynamics specific to transgender men is imperative for tailoring approaches and interventions appropriate for this population.

## WEPED433

Empowering youth through comprehensive approaches to adolescents' sexual health, gender relations, and violence prevention in the LISS project, Dominican Republic

M. Jaar Guérin<sup>1</sup>, A. Martin Ortiz<sup>1</sup>

<sup>1</sup>Centro de Orientación e Investigación Integral (COIN), Programs Department, Santo Domingo, Dominican Republic, the

**Background:** The LISS project addresses HIV transmission risk factors in Dominican Republic youth, focusing on sexual and reproductive health education and gender-based violence.

This abstract explores strategies employed to effectively engage diverse youth in the implementation of HIV risk factor workshops.

The workshops, comprising 16 consecutive sessions implemented weekly, integrated a sexual and reproductive health manual developed in collaboration with medical students and an adapted version of the Healthy Relationships Plus Program for violence prevention.

**Description:** The success of this intervention hinged on the strategic integration of a dual approach encompassing classic HIV prevention for youth and a contemporary strategy for violence prevention. Recognizing the significance of both enhancing knowledge about sexual and reproductive health and fostering skills for violence prevention, the project adopted a comprehensive methodology. The violence prevention program specifically aimed at addressing adolescent risk behaviors through a multifaceted approach. This approach included not only the traditional focus on personal safety, substance use, and delaying sexual relationships but also delved into critical aspects like violence, the impact of technology, mental health, and positive coping strategies.

By adopting a holistic perspective that considers the interconnected nature of these factors, the program sought to empower youth with the knowledge and skills needed to navigate the complex landscape of sexual health and interpersonal relationships.

**Lessons learned:** Key lessons learned include notable improvements in knowledge about sexual and reproductive health, evidenced by an 18.78 percentage point increase in posttests scores. Similarly, awareness and knowledge around GBV and interpersonal skills increased by 26.65 percentage points.

Considering the specific needs of diverse communities and emphasizing community involvement were crucial factors in enhancing violence prevention efforts and increasing impact.

Other engagement methods, such as adapting to youth schedules and employing peer facilitators, played a pivotal role in sustaining program engagement and impact.

**Conclusions/Next steps:** The next steps involve scaling up of programs to additional diverse communities, further tailoring interventions to meet specific youth needs, sustaining engagement through ongoing innovative methods, and prioritizing continued community involvement to enhance overall impact and effectiveness.

## WEPED434

### Telehealth use and engagement in care in adolescents/youth with HIV in Texas, USA pre- and post-COVID-19 emergence

E.A. Barr<sup>1</sup>, T.P. Giordano<sup>2</sup>, R. Hardwicke<sup>3</sup>, L. Koshy<sup>4</sup>, H. Armitage<sup>1</sup>, N. Holstine-Johnson<sup>4</sup>, H. Wu<sup>5</sup>, Q. Qian<sup>6</sup>, M.E. Paul<sup>4</sup>

<sup>1</sup>University of Texas Health Science Center at Houston Cizik School of Nursing, Department of Research, Houston, United States, <sup>2</sup>Baylor College of Medicine, Houston, United States, <sup>3</sup>University of Texas Health Science Center at Houston, McGovern School of Medicine, Houston, United States, <sup>4</sup>Baylor College of Medicine, Texas Children's Hospital, Houston, United States, <sup>5</sup>University of Texas Health Science Center at Houston, McWilliams School of Biomedical Informatics, Houston, United States, <sup>6</sup>University of Texas Health Science Center at Houston School of Public Health, Department of Biostatistics & Data Science, Houston, United States

**Background:** Youth with HIV (YWH) are less likely than adults to be in care and virologically suppressed. In Houston, Texas, a priority area for Ending the HIV Epidemic (EHE), 39% newly diagnosed were 13-29 years in 2021. During the COVID-19 pandemic HIV clinics shifted to telehealth. Evidence is needed to describe telehealth impact on YWH.

**Methods:** Retrospective chart reviews on YWH (16 - 29 years) at 3 high volume HIV clinics in Houston examined data (3/15/2019 to 8/31/2022) on telehealth, engagement in care (EIC) using Ryan White criteria, HIV RNA PCR, substance use, mental health, housing status, race, ethnicity, and mode of acquisition. Results were categorized by time periods (Table). Descriptive statistics (mean, SD) were calculated. Outcomes were tested using multiple linear and logistic regression.

Time Periods (PE <sup>1</sup> = 3/15/2020)	Type of Visits					Met Criteria for EIC <sup>2</sup> n (%)
	In-person visits	Audio telehealth	Video telehealth	Total telehealth combined	All Visit Types	
Mean visits per participant (All time periods)	6.25	0.77	0.16	0.93	7.18	---
1-year pre-PE n (%)	550 (100%)	0 (0%)	0 (0%)	0 (0%)	550 (100%)	125 (57%)
1st-year post-PE n (%)	311 (70%)	105 (24%)	28 (6%)	133 (30%)	444 (100%)	97 (44%)
2nd-year post-PE n (%)	351 (86%)	51 (12.5%)	6 (1.5%)	57 (14%)	408 (100%)	105 (48%)
All time periods (3/15/2019 - 8/31/2022)						31 (14%)

Notes: <sup>1</sup>YWH = Youth with HIV; <sup>2</sup>PE = COVID-19 Pandemic Emergence; <sup>3</sup>EIC = Engagement in Care

Table. Types of visits and engagement in care by time period in YWH<sup>1</sup> (N = 119).

**Results:** Participants (N = 219) were 77% male sex assigned at birth (SAAB), 22% Female SAAB, 1(0.46%) documented trans-female, 84% Black, Indigenous, and/or people of color, 33% Hispanic, 37% with perinatally acquired HIV, 40% with mental health diagnosis, 66% with documented substance use disorder, and 12% unstably housed. Telehealth was used by 43% of participants with 0.93 (SD = 1.37) mean telehealth visits and 7.18 (SD = 4.57) total mean

visits/participant. Telehealth use ( $p < .001$ ), situationally acquired HIV ( $p < .004$ ), and younger age (16 - 21 years) ( $p < .001$ ) were significant factors in improving EIC in all time periods and in individual time periods. Telehealth was predominantly via telephone (Table). Telehealth use decreased 58% in year 2 of the pandemic.

**Conclusions:** While video telehealth was not employed robustly in YWH in Houston, and its use was reduced after year 1 of the pandemic, telehealth may be a powerful strategy to support accessing care and EHE in YWH. While EIC decreased with the pandemic, this study shows that telehealth, whether completed with audio or with video, positively impacts EIC.

## WEPED435

### Cross partner community led monitoring initiative on an orphan and vulnerable children (OVC) project for Haitian Migrants and their descendants on the Dominican Republic: learnings and best practices

F. Marmol<sup>1</sup>, C. Canales<sup>1</sup>, D. Luis<sup>1</sup>, A. Koler<sup>2</sup>, D. Kisyombe<sup>2</sup>

<sup>1</sup>PACT, Building Resilience Project I Program, Santo Domingo, Dominican Republic, the, <sup>2</sup>PACT, Global Health, Washington DC, United States

**Background:** The USAID-funded Building Resilience project, an OVC initiative in the Dominican Republic, focuses on Haitian Migrants and their descendants, targeting households with at least one member living with HIV. This family-centered community-based project operates across six provinces, implemented by four local sub-partners. It Offers tailored services in health, protection, education, and stability through a comprehensive case management.

A community Led Monitoring (CLM) was designed to add the voices of the priority population and community case workers (CCW) to drive and influence service delivery priorities, quality and address services gaps relative to their needs.

**Description:** The pilot was implemented, from September to December 2023, and involved: Introduction and Planning of CLM activities, Formation of the Community Committee, Discussion Groups/Interviews, and Presentation of Results. During the Planning phase, key stakeholders and sub-partners staff convened to discuss program objectives and schedule, sign confidentiality agreements, and facilitate the selection of CLM committee participants. The Committee included: Caregivers, adolescents, CCW, Supervisors, M&E, and the project coordinator. The Discussion Groups/Interviews phase was organized into three groups: Caretakers, adolescents, and CCW.

**Lessons learned:** The CLM pilot underscore the value of inclusive participation, adaptability to local contexts, inter-partner collaboration and learning, Capacity building through CLM and Community-Centric Data Gathering,

particularly when working with such a highly vulnerable population. The pilot's 84% participation rate highlighted the importance of involving community members and CCW in the project's monitoring activities and decision-making. Partners collaboration brought unique perspectives, enabling a better understanding of regional variations in challenges and needs, this fostered a more tailored and context-specific approach to addressing HIV/AIDS concerns.

By involving beneficiaries and CCW, valuable skills were developed, enhancing their ability to contribute actively to future community-led initiatives and ensures that the information collected is closely tied to the priorities and concerns of the targeted population.

**Conclusions/Next steps:** The application of CLM across all provinces is the next step to solidify these findings and refining the methodology for future implementations, a mixed communication method could be explored, including face-to-face, telephone and suggestion boxes. This initiative will reduce implementation costs, improve execution time, and maintain high-quality data with a minimal learning curve.

## WEPED436

### Cultural consensus modeling to inform culturally-tailored HIV and pregnancy prevention interventions for South African adolescents

J. Brown<sup>1</sup>, L. Marais<sup>2</sup>, J. Cloete<sup>2</sup>, J. Sales<sup>3</sup>, C. Sharp<sup>4</sup>, M. Lenka<sup>2</sup>, K. Rani<sup>2</sup>, D. Twitty<sup>5</sup>, L. Gomez<sup>1</sup>

<sup>1</sup>Purdue University, Psychological Sciences, West Lafayette, United States, <sup>2</sup>University of the Free State, Bloemfontein, South Africa, <sup>3</sup>Emory University, Atlanta, United States, <sup>4</sup>University of Houston, Houston, United States, <sup>5</sup>University of Cincinnati, Cincinnati, United States

**Background:** South African (SA) adolescents experience high rates of STI/HIV and unintended pregnancies. Cultural consensus modeling (CCM) is a methodology to determine shared cultural beliefs or norms to arrive at a culturally sensitive understanding of a topic. The aim of this study was to use a CCM approach to examine the acceptability of HIV and pregnancy prevention practices and factors that affect method acceptability among SA adolescents.

**Methods:** Participants were Black, Sesotho-speaking, SA adolescents (N=2325; aged 14-17 years; Mean age = 15.4) recruited from 15 schools in the Manguang Metropolitan Area of South Africa. Participants completed demographic and sexual health questionnaires and a culturally-grounded measure assessing the acceptability of HIV and pregnancy prevention methods.

Cultural consensus analysis (akin to an exploratory factor analysis using participants rather than items) was employed to identify the number of clusters of similar responses for method acceptability (termed cultural mod-

els); this analytic approach also produces a 'culturally correct' answer key for each item. Exploratory bivariate analyses examined whether there were potential demographic and sexual health differences between participants who were/were not consonant with the identified cultural model.

**Results:** A single cultural model was identified (largest eigenvalue = 688.9; second largest eigenvalue = 78.9; ratio of largest to next = 8.7). Approximately 3.2% of participants were not well aligned with the identified cultural model; those not aligned were more likely to be male (p=.002) and younger (p=.03).

Findings highlight the importance of social motivators (e.g., positive peer affiliation) for HIV and pregnancy prevention combined with access to free condoms and other public reproductive health services. Highly acceptable methods included having a single sexual partner and use of male condoms.

**Conclusions:** Results point to the importance of cultural context for HIV and pregnancy prevention method acceptability. Most adolescents were consonant with the identified cultural model. In line with prevalent SA HIV prevention messaging (Abstinence, Be Faithful, and Condom Use: ABC), ABC prevention themes emerged combined with an important role of peers, sources of sexual health information, and free clinic service access. There was lower acceptability for other prevention methods. Results can inform future culturally-sensitive SA HIV interventions.

## WEPED437

### PrEP awareness and interest among a rural Indigenous population in the United States

A. O'Rourke<sup>1</sup>, S.T. Allen<sup>2</sup>, K. Schneider<sup>2</sup>, P. Hughes<sup>3</sup>, M. Reid<sup>2</sup>, M. Walls<sup>4</sup>

<sup>1</sup>George Washington University, Prevention and Community Health, Washington, United States, <sup>2</sup>Johns Hopkins University, Bloomberg School of Public Health, Health, Behavior, and Society, Baltimore, United States, <sup>3</sup>University of Minnesota, College of Pharmacy, Duluth, United States, <sup>4</sup>Johns Hopkins University, Center for American Indian Health, International Health, Baltimore, United States

**Background:** American Indians/Alaska Natives (hereafter referred to as "Indigenous Peoples") have over twice the rate of HIV acquisition as compared to their white counterparts, and they are more likely to die from HIV-related complications. Pre-exposure prophylaxis (PrEP) holds considerable potential for reversing HIV inequities among Indigenous Peoples; however, PrEP prescribing is low among Indigenous Peoples and little research has explored PrEP awareness and interest among this population.

This research explores PrEP awareness and interest among a rural population of Indigenous Peoples in Minnesota (United States).

**Methods:** A survey was conducted in a rural tribal community in Minnesota during Fall 2022. Surveys were administered via ACASI in diverse locations throughout the reservation, including during a Powwow, at a casino, and in public spaces. Eligibility criteria included being 18 years old and having ever used drugs. Measures included demographics, sociostructural factors, HIV-related behaviors, and PrEP awareness and interest.

The analytic sample consisted of surveys from 224 individuals who self-identified as American Indian and did not report current PrEP use or HIV diagnosis. Univariate and bivariate analyses were conducted to examine differences in PrEP awareness and interest.

**Results:** Participants were primarily female (58.9%), heterosexual (89.3%), single (52.9%), and had graduated from high school (88.1%). Reported engagement in HIV-related behaviors included having 2 or more sexual partners in past 6 months (13.4%), past year STI testing (32.6%), past year HIV testing (23.2%), and recent drug use (21.9%).

Approximately one in four (27.7%) reported PrEP awareness prior to taking the survey and 17.0% indicated they were interested in taking PrEP. Recent HIV testing was significantly ( $p < .05$ ) associated with increased PrEP awareness (42.3% vs. 23.3%).

Indigenous Peoples reporting 2 or more sexual partners (30.0% vs. 15.0%), past year STI testing (31.5% vs. 10.0%), past year HIV testing (30.8% vs. 12.9%), and past 6-month drug use (31.3% vs. 13.1%) were significantly more likely to indicate interest in taking PrEP.

**Conclusions:** Although PrEP awareness was low, Indigenous Peoples who reported HIV risk behaviors were significantly more interested in taking PrEP than their peers. Steps should be taken to increase PrEP access in Indigenous communities through culturally appropriate collaborative efforts.

## WEPED438

### Client-perpetrated violence and psychosocial well-being among cis men and trans women offering online transactional sex

J. Castro Avila<sup>1</sup>, R. Diagne<sup>1</sup>, Y. Yatine<sup>1,2</sup>, D. Michels<sup>1,3</sup>, M. Lixandru<sup>1,4</sup>, J. Esteves<sup>1,5</sup>, H. Mendoza<sup>1,6</sup>, J. Sagaon-Teyssier<sup>12,1</sup>, D. Rojas Castro<sup>1,12</sup>, SEXTRA Study Group

<sup>1</sup>Coalition PLUS, Community-based Research Laboratory, Pantin, France, <sup>2</sup>ALCS - Association de Lutte contre le Sida, Casablanca, Morocco, <sup>3</sup>AIDES, Pantin, France, <sup>4</sup>ARAS - Romanian Association Against AIDS, Bucharest, Romania, <sup>5</sup>GAT - Grupo de Ativistas em Tratamentos, Lisbon, Portugal, <sup>6</sup>IpDH - Instituto para el Desarrollo Humano, Cochabamba, Bolivia, Plurinational State of, <sup>7</sup>Corporación Kimirina, Quito, Ecuador, <sup>8</sup>PILS - Prévention Information Lutte contre le SIDA, Port-Louis, Mauritius, <sup>9</sup>REZO, Montreal, Canada, <sup>10</sup>Centre d'Estudis Epidemiològics sobre les Infeccions de Transmissió Sexual i Sida de Catalunya (CEEISCAT), Departament de Salut, Generalitat de Catalunya, Badalona, Spain, <sup>11</sup>Centro de Investigación Biomédica en Red de Epidemiología y Salud Pública (CIBERESP), Madridsp, Spain, <sup>12</sup>Aix Marseille Univ, Inserm, IRD, SESSTIM, Sciences Economiques & Sociales de la Santé & Traitement de l'Information Médicale, ISSPAM, Marseille, France

**Background:** Sex workers experience high rates of violence linked to criminalisation and insufficient legal protection. Online transactional sex (OTS; trading sex for money/goods online) seems a safer option, particularly for cis men (CM) and trans women (TW), although data on violence experienced by them is scarce.

This study aimed to identify profiles of client-perpetrated violence and psychosocial well-being among CM and TW offering OTS in 8 countries, and factors associated with class membership.

**Methods:** ANRS-SEXTRA is a community-based cross-sectional study among CM and TW offering OTS in Bolivia, Canada, Ecuador, France, Morocco, Mauritius, Portugal and Romania. Data were collected via an online questionnaire (June 2021-May 2022) including four types of client-perpetrated violence (never-sometimes/frequently) and five psychosocial well-being scores (0-10) (Table 1).

A latent class analysis identified 4 profiles. Factors associated with profiles' membership were estimated using multinomial logistic probit regression, controlling for country fixed-effects. Only comparison between class 1 vs. 4, the most different ones, is presented here.

**Results:** Among 1610 participants (median[IQR] age 29[24;36], 75.4% CM, 19.2% TW, 5.4% non-binary), 56.5% experienced at least one form of client-perpetrated violence. Four profiles emerged (Table 1): class 1 (8.5%), was labeled "High violence, low well-being"; and class 4 (32.5%), "Low violence, high well-being".

Oral abstracts

Integration in society	4.46 (0.19)	6.90 (0.09)	8.70 (0.09)	8.97 (0.08)
Health	2.95 (0.19)	5.91 (0.10)	8.11 (0.10)	8.59 (0.08)
Strength	3.13 (0.18)	5.70 (0.10)	8.40 (0.10)	8.66 (0.08)

Table 1: Latent class analysis results for client-perpetrated violence and psychosocial well-being scores among CM and TW offering OTS ( $n=1610$ ).

**Conclusions:** These results reveal diverse violence and psychosocial well-being experiences among CM and TW in OTS, highlighting the need to prevent violence against sex workers while recognizing nuanced challenges and multiple vulnerabilities faced by this population. Further analysis will explore how these experiences may influence HIV/STI exposure among this group.

### Depression among trans women and men who have sex with men from Brazil, Mexico, and Peru: who has the highest odds?

E.H. Vega-Ramirez<sup>1</sup>, T.S. Torres<sup>2</sup>, K.A. Konda<sup>3,4</sup>, C. Guillen-Diaz-Barriga<sup>5</sup>, D. Diaz-Sosa<sup>6</sup>, R. Robles-Garcia<sup>1</sup>, O.A. Elorreaga<sup>3</sup>, B. Hoagland<sup>2</sup>, J.V. Guanira<sup>3</sup>, C. Coutinho<sup>2</sup>, M. Benedetti<sup>2</sup>, C. Pimenta<sup>2</sup>, B. Grinsztejn<sup>2</sup>, C.F. Caceres<sup>3</sup>, V.G. Veloso<sup>2</sup>, ImPrEP Study Group

<sup>1</sup>National Institute of Psychiatry Ramon de la Fuente Muñiz, Division of Epidemiology and Psychosocial Research, Mexico City, Mexico, <sup>2</sup>Nacional Institute of Infectiology Evandro Chagas, Fundação Oswaldo Cruz, Rio de Janeiro, Brazil, <sup>3</sup>Universidad Peruana Cayetano Heredia, Center for Interdisciplinary Studies in Sexuality, AIDS and Society, Lima, Peru, <sup>4</sup>USC Keck School of Medicine, Division Disease Prevention, Policy and Global Health, Department of Population and Public Health Sciences, Los Angeles, United States, <sup>5</sup>National Autonomous University of Mexico, Faculty of Psychology, Mexico City, Mexico, <sup>6</sup>National Autonomous University of Mexico, Faculty of Superior Studies Iztacala, Tlalnepantla, Mexico

**Background:** Depression is frequent among trans women (TW) and gay, bisexual, and other men who have sex with men (GBMSM), as compared to cisgender/heterosexual populations, and may be associated with their HIV status, specific sexual experiences, and indicators of social inequality.

We aimed to identify factors associated with depression among TW/GBMSM from Latin America.

**Methods:** We conducted a cross-sectional web-based survey among adult (age  $\geq 18$  years) TW/GBMSM living in Brazil, Mexico, and Peru in 2021. We collected sociodemographic, behavioral, and substance use data. Mental health well-being was assessed with the mental health module of the Short Form Health Survey.

We defined depression according to the Patient Health Questionnaire (score  $\geq 3$ ) and used this as an outcome for logistic regression analyses. In the final multivariable model, we kept all significant variables ( $p \leq 0.05$ ).

**Results:** The study included 18,397 participants (60.7% Brazil, 28.9% Mexico, and 10.4% Peru) with mean age of 33.5 (SD=9.4) years; 96% were GBMSM, 4% TW, 32.6% had secondary education, and 15.3% reported they were living with HIV. Over half of the participants (60.8%) reported none/low individual income.

Participants with depression were 23.1% (25.4% Brazil, 22.8% Peru, and 18.4% Mexico), and the mean score of mental health well-being was 20.3 (SD=8.2) (20.8 [SD=5.0] Mexico, 20.1 [SD=5.2] Brazil, and 19.9 [SD=4.9] Peru). Brazilians, young individuals, people living with HIV, having none/low individual income, and not having a partner were all associated with higher odds of depression (Table). Those with higher mental health well-being score had lower odds of depression.

\* $p \leq 0.05$ ; \*\* $p \leq 0.01$ ; \*\*\* $p \leq 0.001$

Table.

**Conclusions:** The frequency of depression among TW and GBMSM surpasses that of the general population in each country, and is associated with indicators of higher social vulnerability. The integration of mental health services should be considered to strengthen the HIV prevention and care cascade for sexual and gender minorities.

## WEPED440

Mental health is not an issue, it is a huge problem: mental health challenges experienced by men who have sex with men (MSM) in Johannesburg, South Africa

M. Slabbert<sup>1</sup>, D. Nel<sup>2</sup>, L. Xulu<sup>3</sup>, D. Gule<sup>4</sup>

<sup>1</sup>MS Assist (Pty) Ltd, Consultant, City of Tshwane, South Africa, <sup>2</sup>OUT LGBT Wellbeing, Director, Pretoria, South Africa, <sup>3</sup>OUT LGBT Wellbeing, Community Engagement, Johannesburg, South Africa, <sup>4</sup>OUT LGBT Wellbeing, M&E, Johannesburg, South Africa

**Background:** Behavioural, social-cultural and structural risk factors, including stigma and discrimination, restrict the ability of MSM to access and remain in health services, contribute to poor social and economic status, and fuel human rights violations. These factors decrease the agency of MSM in decision-making around sexual health. Minimal research is available on MSM mental health challenges in resource limited settings.

With funding from Gilead, OUT LGBT Well-being conducted a needs assessment to understand the mental health and economic challenges of MSM. Results were used to design and provide appropriate support to MSM through OUT's USAID/PEPFAR-funded HIV program.

**Description:** Between June 2022-January 2023, trained OUT peer educators used the validated Brief Mental Health questionnaire to screen MSM in Johannesburg. MSM were recruited from the EMH health clinic, small group events, social media and outreach events such as Soweto Pride.

The questionnaire included mental health measures for symptoms of depression, anxiety, alcohol and was adapted to include drug use and suicide ideation. Item scores of 3+ were used to identify symptoms of possible mental health disorders.

We also screened for employment status and living arrangements. Screened clients were offered individual counselling, job skills workshops, social and recreational upliftment activities, and referrals to shelters and health services.

**Lessons learned:** 2040 MSM were screened. Of those, 31% (n=642) had symptoms of anxiety, 22% (n=441) of depression, 51% (n=1050) of harmful alcohol and 24% (n=491) drug use. 7% (n=149) were at risk of suicide and 56% were unemployed. A third (317) of MSM matched to health data, were HIV-positive (30%).

**Conclusions/Next steps:** The program has important policy implications for services provision for MSM in resource limited settings. MSM require targeted support focusing on emotional and social wellbeing. OUT secured funding from Elton John Aids Foundation to test if this package of services would improve retention of HIV-positive MSM, who engage in chemsex, in programs.

## WEPED441

Self-silencing is often an overlooked interference to PrEP interest and initiation among U.S. Black cisgender women in Baltimore, Maryland

T. Willie<sup>1</sup>, D. Knight<sup>2</sup>, T. Kershaw<sup>3</sup>, K. Phillips<sup>1</sup>, S. Baral<sup>4</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Mental Health, Baltimore, United States, <sup>2</sup>Johns Hopkins Bloomberg School of Public Health, International Health, Baltimore, United States, <sup>3</sup>Yale University School of Public Health, Social and Behavioral Sciences, New Haven, United States, <sup>4</sup>Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States

**Background:** Sociostructural factors related to U.S. Black cisgender women's experience of racism and sexism (i.e., gendered racism) provides a rationale for low HIV pre-exposure prophylaxis (PrEP) engagement, despite the sustained HIV burden. In response, Black women have been shown to self-silence in adhering to The Superwoman or Strong Black Woman Schema which obligates women to self-silence to be strong, suppress emotions, and resist vulnerability to survive. Self-silencing may include minimizing their needs for HIV prevention such as PrEP, to exhibit strength.

This study sought to investigate the association and mediators between self-silencing behaviors and PrEP engagement among Black cisgender women in Baltimore, Maryland.

**Methods:** An online survey was conducted between April 2023 and December 2023 with adult PrEP-eligible, Black cisgender women engaged in healthcare services in Baltimore.

Oral abstracts

Author Index

timore, Maryland, United States. The online survey assessed demographics, self-silencing, depression, and PrEP engagement (i.e., interest, uptake, intentions, coercion, embarrassment, and candidacy). Multivariate mediation analysis with bootstrapping was performed to examine depression as a mediator of self-silencing and PrEP engagement.

**Results:** Among the 300 participants, higher self-silencing were associated with having a partner interfere her PrEP access and being embarrassed to discuss PrEP with a healthcare provider ( $p < .05$ ). Higher depressive symptoms were associated with higher PrEP interest; stronger willingness to take PrEP; perceived PrEP candidacy; and have higher self-silencing ( $p < .05$ ). Depressive symptoms partially mediated the relationship of self-silencing with PrEP interest; PrEP uptake willingness; and perceived PrEP candidacy ( $p < .05$ ).

**Conclusions:** Historically-driven sociostructural factors may influence PrEP engagement among Black cisgender women in Baltimore, Maryland. Self-silencing makes it difficult to assess depressive symptoms among Black women, although this group is highly interested in PrEP. PrEP programs serving Black women should offer trauma-informed care routinely to address women's mental health. Future research should consider culturally-responsive interventions that promote PrEP by empowering Black women and engaging stress reduction.

## WEPE442

Going digital: assessing virtual HIV interventions for key populations in Bhutan, Mongolia and Sri Lanka

P.C. Loh<sup>1</sup>, J. Fontilla<sup>2</sup>, N. Suwandi<sup>3</sup>, M. Kusen<sup>1</sup>, P. Shah<sup>4,5</sup>, M. Merrigan<sup>6</sup>, F. Young<sup>6</sup>

<sup>1</sup>Health Equity Matters, Bangkok, Thailand, <sup>2</sup>Independent Consultant, Manila, Philippines, the, <sup>3</sup>APCOM Foundation, Bangkok, Thailand, <sup>4</sup>UNAIDS Asia-Pacific, Bangkok, Thailand, <sup>5</sup>World Health Organization, Geneva, Switzerland, <sup>6</sup>Health Equity Matters, Sydney, Australia

**Background:** Online interventions can revolutionize healthcare service accessibility, provide information, and reduce stigma and discrimination throughout all HIV services. As part of the Sustainability of HIV Services in Asia 2

(SKPA-2) Program, we evaluated virtual HIV interventions in Bhutan, Mongolia, and Sri Lanka, identifying gaps, including linkages between virtual and in-person services for key populations.

**Methods:** From December 2023 to January 2024, we reviewed virtual HIV interventions in Bhutan, Mongolia, and Sri Lanka. Information was extracted through desk reviews, key informant interviews, focus group discussions, and stakeholder consultations. A checklist was developed to assess digital information and outreach availability and quality, online linkage to services, and virtual service delivery. Interview guides gathered inputs on key population needs and preferences for virtual interventions. Individualized subgroup analysis was conducted, focusing on men who have sex with men, transgender individuals, people who inject drugs, sex workers, and people living with HIV.

For each group, we assessed the targeting of virtual HIV interventions, utilization of telehealth, and platforms being employed, and identified perceived and existing gaps in implementation.

**Results:** Virtual interventions predominantly targeted men who have sex with men, and female sex workers, focusing on HIV prevention, condom distribution, and HIV testing. Gaps were identified for people who inject drugs, and transgender individuals. There is high demand for creating innovative community-led messaging on social media designed by youth.

Our study ranked HIV service availability for each key population and identified a clear roadmap for service providers and policymakers to expand programming.

**Conclusions:** Virtual services can alleviate the burden on healthcare facilities and provide self-care options for populations. They enhance access to services, reach previously untested populations, and introduce new strategies such as HIV Self-testing and PrEP for hidden populations and can help countries meet their 95-95-95 targets. In small countries with concentrated key population HIV epidemics, many offline outreach programs may have saturated their reach. Virtual interventions help identify and connect new people with services.

Our findings underscore the imperative to broaden virtual interventions to raise awareness, generate demand, and improve access to services.

## WEPED443

### Inuka coaching problem-solving therapy to support mental health and HIV medication adherence among status-neutral men who have sex with men in South Africa

L. Tsope<sup>1</sup>, J. Pienaar<sup>2</sup>, E.M. van der Elst<sup>3</sup>, C. Denousse<sup>4</sup>, M. Mabena<sup>5</sup>, P. Komane<sup>6</sup>, M. Sibanyoni<sup>7</sup>, B. Ramashala<sup>8</sup>, A. Gakunu<sup>4</sup>, D. Giovenco<sup>9</sup>, D. Operario<sup>9</sup>, E.J. Sanders<sup>10</sup>

<sup>1</sup>The Aurum Institute, Implementation Research, Johannesburg, South Africa, <sup>2</sup>The Aurum Institute, District Operations HSD Key Populations Program, Johannesburg, South Africa, <sup>3</sup>University of Amsterdam, Global Health Department, Amsterdam, Netherlands, the, <sup>4</sup>The Inuka Foundation, Nairobi, Kenya, <sup>5</sup>The Aurum Institute, District Operations HSD Area Operations, Ekurhuleni, South Africa, <sup>6</sup>The Aurum Institute, District Operations HSD Key Populations Program, Pretoria, South Africa, <sup>7</sup>The Aurum Institute, Technical Operations M&E Technical Support, Johannesburg, South Africa, <sup>8</sup>The Aurum Institute, District Operations HSD Area Operations, Johannesburg, South Africa, <sup>9</sup>Emory University, Department of Behavioral, Social, and Health Education Sciences, Atlanta, United States, <sup>10</sup>The Aurum Institute, Disease Prevention HIV, Johannesburg, South Africa

**Background:** Mental health challenges are common among men who have sex with men (MSM) in South Africa (SA) and impact ART and PrEP medication adherence. A status-neutral mental health intervention for depression and medication adherence support has not been offered to MSM in South Africa.

**Description:** Five MSM lay coaches were certified in the Inuka coaching method, based on the evidence-based Friendship Bench program, which includes four individual coaching sessions (offered online or in-person) to support mental health. Twenty MSM with symptoms of mild to moderate depression (PHQ-9 scores 5-14) who were using PrEP or ART received mental health and medication adherence support at two clinics in Johannesburg and Pretoria from October-December 2023.

Pre- and post-intervention changes in mental health were assessed using the SRQ-20, and post-intervention in-depth interviews (IDIs) with participants and coaches assessed the utility of the Inuka method for mental health and medication adherence support among MSM.

**Lessons learned:** After completion individual sessions, participants' median SRQ-score increased from 12 to 18 ( $p < 0.001$ ). IDIs were conducted with 15 of 18 participants and all 5 lay coaches, producing three major themes. First: 'the power of being listened to and then take actions', stresses Inuka's utility for MSM and lay coaches to engage with each other, offer mental health support, and improve adherence behaviour.

Second: 'camaraderie', highlights Inuka's accessibility to provide an inclusive space to mitigate loneliness and social isolation in this highly stigmatized group. Third,

'learning new skills', emphasizes the utility of this coaching approach to offer skills to participants and lay coaches that may help mitigate future mental health challenges. Participants prioritized mental health over medication adherence as personal challenges, and thus coaches expressed the desire to learn skills to emphasize the connection between mental health and medication adherence during coaching. Participants expressed equal preference for online and in-person individual sessions, and emphasized the role of MSM group support sessions to improve connection and reduce isolation.

**Conclusions/Next steps:** Inuka coaching, with adaptations of training material for MSM lay coaches on medication adherence, may offer a useful approach to improve mental health and medication adherence for MSM in South Africa.

## WEPED444

### Community support, a key factor in access to and health maintenance in a context of multidimensional crisis: the case of Haiti

A. Arciniegas<sup>1</sup>, S. Lustin<sup>2</sup>, H. Estimphil<sup>3</sup>, R.-K. Bastien<sup>4</sup>, L. Balhan<sup>5</sup>, J.C. Jones<sup>5</sup>, C. Piedrafita<sup>1</sup>, R. Zeriuoh<sup>6</sup>, J.M. Meme<sup>3</sup>

<sup>1</sup>AIDES, Programme Innovation Division, Pantin, France, <sup>2</sup>Promoteurs Objectif Zerosida (POZ), Port au Prince, Haiti, <sup>3</sup>Kouraj Pou Pwoteje Dwa Moun, Port au Prince, Haiti, <sup>4</sup>Fondation pour la Sante Reproductrice et l'Education Familiale, Port au Prince, Haiti, <sup>5</sup>AIDES\_Coalition PLUS, Laboratoire de Recherche Communautaire, Pantin, France, <sup>6</sup>AIDES, Pantin, France

**Background:** With a prevalence rate of 1.8%, Haiti is the Caribbean country most affected by HIV/AIDS. The lack of appropriate services, harm reduction and discrimination, put key populations (KP), at higher risk of contracting HIV. In 2020, despite the context of the COVID-19, the PRINCE project was launched.

Developed in a challenging political, social and security context, the project is coordinated by AIDES and involves three Civil Society Organizations (CSO) (POZ, FOSREF and KOURAJ). Its objective is to enhance innovative, community-based HIV services tailored to the needs of KP.

**Description:** PRINCE is a community-based program that focuses on the key role of peer educators (PE). A training of trainers in community support for sexual health was co-developed with CSO. The new trainers from the organizations then synergised their skills to train the CSO's PE. The PE, belonging to KP (Men who have sex with men, Sex workers and Trans people) reside in the project's targeted areas.

Despite the structural dysfunctions linked to the country's crises, the PE remain key players within their communities. Trained up, they actively engaged in physical or virtual outreach to raise people's awareness of sexual health

from 2021 to 2023. Responding to needs, they provided referrals to health services, particularly for testing and accessing Pre-exposure Prophylaxis (PrEP).

**Lessons learned:** Six trainers were trained, and they in turn successfully trained up another 35 PE. Community support for PE in the area of sexual health was maintained throughout the project, despite the obstacles in the country, thereby enhancing access to sexual health services and to PrEP for KP. The PE reached 10,330 individuals from the KP, and 1987 people initiated a PrEP protocol. The exchange of experiences among PE highlighted the importance of facilitating PrEP access and developing complementary strategies, particularly in communication, to reach new generations.

**Conclusions/Next steps:** The PE, trained and supported in a context of multiple crises, are maintaining their awareness-raising activities and ensuring the continuity of support in sexual health and access to care. The knowledge of the PEs has been acquired, they are recognized, and they will be able to continue their involvement in their communities.

## WEPED445

### Estimated prevalence of mental health conditions among key populations in Zambia: the case of Lusaka Wellness Center

L. Kalungwana<sup>1</sup>, H. Mwanza<sup>1</sup>, N. Nkhoma<sup>2</sup>, E. Chanda<sup>3</sup>, L. Chingumbe<sup>4</sup>, K. Mwanda<sup>5</sup>

<sup>1</sup>USAID Controlling the HIV Epidemic for Key and Underserved Populations (CHEKUP-II), Mental Health, Lusaka, Zambia, <sup>2</sup>USAID Controlling the HIV Epidemic for Key and Underserved Populations (CHEKUP-II), Strategic Information, Lusaka, Zambia, <sup>3</sup>USAID Controlling the HIV Epidemic for Key and Underserved Populations (CHEKUP-II), Lusaka Wellness Centre, Lusaka, Zambia, <sup>4</sup>USAID Controlling the HIV Epidemic for Key and Underserved Populations (CHEKUP-II), Key Populations Technical Lead, Lusaka, Zambia, <sup>5</sup>USAID Controlling the HIV Epidemic for Key and Underserved Populations (CHEKUP-II), Chief of Party, Lusaka, Zambia

**Background:** Mental health problems affect the well-being of key populations in Zambia, contributing to their vulnerabilities to HIV infection. In this context, key populations include men who have sex with men (MSM), female sex workers (FSWs), and transgender persons (TGs). Key populations face stigma and discrimination in communities, including gender-based violence, which leads to mental health problems—which can significantly contribute to high-risk sexual behaviours.

However, there remains a dearth of literature on the estimated prevalence of mental health problems among key populations.

**Methods:** The USAID Controlling HIV Epidemic for Key and Underserved Populations (CHEKUP II) Activity works to provide comprehensive services including mental health to key and underserved populations in Zambia.

As part of service delivery, we screened 890 key populations for common mental health problems between January and November 2023. Of those screened, 429 (48%) were MSMs, 447 (50%) were FSWs and 14 (2%) were TGs. We assessed for depression using the Patient Health Questionnaire (PHQ-9), anxiety using the Generalised Anxiety Disorder Scale (GAD-7), and substance use using the CAGE-AID tool. Any participants who responded 'yes' to question 9 on the PHQ-9 (on whether they have suicidal thoughts) were further screened using the suicide safety questionnaire.

**Results:** Results showed that 72% (FSWs), 83% (MSM), and 71% (TGs) had mild depressive symptoms, whereas 28% (FSWs), 17% (MSM) and 29% (TGs) had moderate-severe depressive symptoms. Suicide screening results showed that 10% (FSWs), 2% (MSM), and 21% (TGs) had positive suicide ideation. Anxiety screening results revealed that 79% (FSWs), 88% (MSM), and 64% (TG) had mild anxiety, whereas 21% (FSWs), 12% (MSM), and 36% (TGs) had moderate-severe anxiety. Alcohol and substance use screening revealed that 42% (FSWs), 40% (MSM), and 43% (TGs) are dependent on alcohol.

**Conclusions:** Mental health problems (depression, anxiety, substance abuse, and suicide ideation) were more prevalent among TGs than FSWs and MSMs. Integrating mental health services is critical in understanding and managing the well-being of KPs, beyond biomedical services.

The increased presence of substance abuse and suicide ideation calls for augmented action to improve the well-being of key populations as a part of the HIV prevention and treatment program.

## WEPED447

### Sex work venue and vulnerability to HIV acquisition among women who exchange sex and use substances in Kazakhstan

T. McCrimmon<sup>1</sup>, M. Darisheva<sup>2</sup>, V.A. Frye<sup>3</sup>, N. Zholnerova<sup>4</sup>, E. Grigorchuk<sup>5</sup>, A. Terlikbayeva<sup>2</sup>, S. Primbetova<sup>2</sup>, L. Gilbert<sup>3</sup>, N. El-Bassel<sup>3</sup>, B.S. West<sup>3</sup>

<sup>1</sup>Columbia University Mailman School of Public Health, New York, United States, <sup>2</sup>Global Health Research Center of Central Asia, Almaty, Kazakhstan, <sup>3</sup>Columbia University School of Social Work, New York, United States, <sup>4</sup>NGO Amelia, Taldykorgan, Kazakhstan, <sup>5</sup>Community Friends, Almaty, Kazakhstan

**Background:** HIV acquisition among women engaged in sex work (WESW) is driven by structural factors, including the physical working environment. Global research has found that street-based sex work venues are the contexts

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

for higher levels of HIV vulnerability, compared to indoor venues like brothels. However, fewer studies have focused on subpopulations of WESW affected by syndemic condition-related behaviors, including sex work and substance use, and few have been conducted in Kazakhstan, where the HIV epidemic is growing.

**Methods:** Between November 2022 and August 2023, we enrolled 90 HIV-negative WESW who use drugs in AEGIDA, a HIV self-testing intervention. Baseline survey data included sociodemographics (age, ethnicity, marital status, education), sex work venue (i.e., indoor venues – brothel, hotel, sauna; public venues – street, car; private dwellings; or online), alcohol or substance use prior to sex work, and exchanging sex for any goods (food, housing, drugs, or alcohol). We utilized logistic regression models (unadjusted and adjusted for all covariates) to characterize the association between each sex work venue and any condomless sex with a paying partner in the prior 90 days.

**Results:** Participants conducted sex work in indoor venues (n=70, 77.78%), in private dwellings (n=39, 43.3%), and in public venues (n=23, 25.56%). Only 8 (8.89%) engaged in online sex work. Engaging in sex work in a public venue (vs. not) was associated with nearly 4 times the likelihood (aOR=3.85, 95% CI: 1.14, 14.68) of having had condomless sex with a paying partner in adjusted models. No other venue was significantly associated with condomless sex with a paying partner.

Across all venues, alcohol or substance use prior to sex work was associated with an increased likelihood of condomless sex with a paying partner (aOR range: 4.94 - 6.43).

**Conclusions:** Similar to other global settings, conducting sex work in public spaces was associated with a greater likelihood of condomless sex and thus increased vulnerability to HIV.

Our findings emphasize the additional risk from substance use prior to commercial sex. Combination interventions addressing both HIV and substance use risks, as well as interventions that address structural drivers of HIV risk in street-based sex work are needed.

## WEPED448

### Navigating fear and stigma: LGBTI experiences after Uganda's 2023 Anti-Homosexuality Act

D. Mugisha<sup>1</sup>, C. Nameere<sup>1</sup>, A. Kisaka<sup>1</sup>

<sup>1</sup>Extend A Life Initiative Uganda (ELI-U), Wakiso, Uganda

**Background:** Despite progress in HIV prevention and treatment in Uganda, LGBTI individuals (lesbian, gay, bisexual, transgender, and intersex) face a disproportionate burden of HIV and severe legal and social challenges. The 2023 anti-homosexuality act with harsh penalties for same-sex acts and "promotion of homosexuality" further exacerbated these challenges. This research explored the lived experiences of LGBTI individuals in Wakiso District following the act's passage.

**Methods:** We conducted in-depth interviews with 22 LGBTI individuals – 12 gays and 10 transgender persons. These interviews focused on their experiences and perceptions of the act's impact on their lives and access to HIV prevention and treatment services. We analyzed the data using thematic analysis.

**Results:** Our findings revealed profound fear, stigmatization, and isolation among LGBTI individuals. Participants reported feeling unsafe leaving their homes, limiting their access to basic necessities and HIV prevention services like condoms and lubricants. Fear of arrest and violence led to decreased utilization of HIV treatment services, jeopardizing their health and well-being.

**Conclusions:** The 2023 anti-homosexuality act has had a devastating impact on the lives and health of LGBTI individuals in Wakiso District, hindering their access to vital services and fostering an environment of fear and discrimination. Urgent action is required by human rights and HIV activists to engage policymakers and advocate for revision or repeal of the discriminatory clauses. Additionally, comprehensive support systems and safe spaces are crucial to protect and empower LGBTI individuals in navigating this challenging landscape.

## WEPED449

### A longitudinal exploration of mental health among adolescent mothers living with HIV in South Africa: insights from the COVID-19 pandemic

K. Steventon Roberts<sup>1,2</sup>, L. Sherr<sup>2</sup>, L. Cluver<sup>1,3</sup>, W. Saal<sup>4</sup>, J. Tolmay<sup>5</sup>, N. Langwenya<sup>1</sup>, J. Chen-Charles<sup>1,6</sup>, J. Kelly<sup>5</sup>, J. Jochim<sup>1</sup>, L. Gittings<sup>7</sup>, E. Toska<sup>5,8,1</sup>

<sup>1</sup>University of Oxford, Social Policy & Intervention, Oxford, United Kingdom, <sup>2</sup>University College London, Institute for Global Health, London, United Kingdom, <sup>3</sup>University of Cape Town, Psychiatry & Mental Health, Cape Town, South Africa, <sup>4</sup>Sol Plaatje University, Psychology, Kimberley, South Africa, <sup>5</sup>University of Cape Town, Centre for Social Science Research, Cape Town, South Africa, <sup>6</sup>University of Cape Town, Department of Medicine, Cape Town, South Africa, <sup>7</sup>Western University, London, Canada, <sup>8</sup>University of Cape Town, Department of Sociology, Cape Town, South Africa

**Background:** The COVID-19 pandemic negatively impacted the lives of young people living in adversity, increasing the risk of unintended adolescent pregnancies and exacerbating mental ill-health.

Understanding the possible impact of COVID-19 on the mental health of young mothers affected by HIV is critical to current and future response planning for both this group and their children.

**Methods:** We analysed longitudinal data from n=704 adolescent mothers (first child ≤19 years), living with (n=213) and not living with HIV (n=488), residing in the Eastern Cape Province, South Africa (age [follow-up]: M=22.2[IQR:21.1-23.3]).

Symptoms of depression, anxiety, posttraumatic stress, and suicidality were assessed using validated measures in two waves of data collection (pre-COVID-19 [2018-2019], and post COVID-19 [2021-2022]).  $\chi^2$ /t-tests explored changes in mental health symptom prevalence over time (using cut-off scores), differences according to HIV status, and differences in sample characteristics according to mental health status. Resilience was examined by comparing those with constant or improved mental health to those chronically or newly symptomatic.

**Results:** 30.3% (213/704) of the sample were living with HIV. Significant increases in poor mental health were identified on all measures of mental health symptoms post onset of the COVID-19 pandemic. Any common mental disorder symptomology rose from 13.4% pre-COVID-19 to 49.7% post-COVID-19 onset ( $\chi^2=215.5, p<0.0001$ ).

This increase was similar for all individual mental health symptoms, including comorbid mental health conditions (scoring above the cut-off on one or more mental health scales). Half (49.7%; 350/704) of participants reported chronic or deteriorating mental health symptoms. Changes in mental health prevalence over time were not found to differ by HIV status.

Participants reporting resilient mental health were more likely to report no baseline experience of abuse ( $p=0.007$ ), domestic violence ( $p<0.0001$ ), or community violence ( $p<0.0001$ ), and were more likely to be food secure ( $p<0.0001$ ).

**Conclusions:** Globally, this is the largest longitudinal exploration of mental health among adolescent mothers, including young mothers living with HIV. These analyses identify a critical need for mental health provision to support all adolescent mothers and identify possible factors (violence reduction and food security) to promote resilience and mental health. Further explorations of pathways to mental health risk and resilience among this group are required.

## WEPED450

Using rapid service coverage and routine program data to understand access to/use of condoms and STI diagnosis among men who have sex with men and female sex workers in Eswatini

M. Matsebula<sup>1</sup>, N. Dlamini<sup>1</sup>, B. Sithole<sup>1</sup>, V. Dlamini<sup>1</sup>, B. Vilakati<sup>1</sup>, W. Simelane<sup>1</sup>, C. Akolo<sup>2</sup>, G. Parola<sup>2</sup>, V. Ranebennur<sup>2</sup>, S. Matse<sup>3</sup>, K. Lukhele<sup>3</sup>

<sup>1</sup>FHI 360, EpiC, Mbabane, Eswatini, <sup>2</sup>FHI 360, EpiC, Washington, DC, United States, <sup>3</sup>Ministry of Health, Eswatini National AIDS Program, Mbabane, Eswatini

**Background:** The PEPFAR/USAID-funded Meeting Targets and Maintaining Epidemic Project (EpiC) Eswatini project conducted its first rapid coverage survey (RCS) in September 2023. The objectives of the study were to understand key populations (KP) access to services; and to ascertain

the proportion of KPs who use HIV prevention, care and treatment interventions, and knowledge provided specifically on condom access and use compared to sexually transmitted infection (STI) cases diagnosed.

**Methods:** A structured tool specifically designed for the study was used to interview participants. The survey was approved by ethics committees from FHI 360 and National Health Research Review Board in Eswatini.

We also used EpiC routine KP program data collected between October 2022 and September 2023 on number of STI cases by population and location. Data analysis was done with Excel and unweighted data was used to interpret and present results.

**Results:** Among the interviewed participants, [men who have sex with men (MSM) (N=772) and female sex workers (FSW) (N=1,685)], access to free condoms was reported to be higher among MSM at 85% (n=433) compared to 57.9% (n=975) among FSW. Condom use in last sexual encounter; 58.2% (n=981) FSW whilst MSM reported 63% (n=488) use which translates to about 40% inconsistent condom use by each population.

In Hhohho and Manzini regions FSW reported above average for both free condoms and condom use in last sexual encounter; 78.1% and 61.7% respectively, whilst below average for MSM at 75% and 68% respectively.

FSWs further provided information on clients influencing non-condom use (multiple responses); 58.2% regular, 37.4% high paying, 17% new clients, 12.6% depend on client's preference and 24% non-response.

Program data also shows high STI diagnosis in both regions; FSW diagnosed in Hhohho and Manzini were 8% (188/2,456) and 13% (339/2,675), MSM 8% (101/1,330) and 10% (137/1,330) compared to the others which range between 2% and 7%.

**Conclusions:** The survey identified gaps in access to free condoms at KP hotspots and its consistent use to prevent the spread of HIV as well as STIs.

The findings will help the KP program to provide targeted program interventions that will address the gaps identified per sub-population and location.

## WEPED451

### Supporting efforts to reduce key population stigma among healthcare workers in Mombasa, Kenya: results from an ongoing prospective cohort

J. Odingo<sup>1</sup>, I. Ciglenecki<sup>2</sup>, C. Kithinji<sup>3</sup>, P. Owira<sup>4</sup>, A. Guadarrama<sup>2</sup>, A. Adam<sup>3</sup>, M. Kimani<sup>5</sup>, M. Pastrana<sup>2</sup>, M. Tamariz<sup>7</sup>, K. Khabala<sup>6</sup>, J.P. Ouamba<sup>6</sup>, I. Japitana<sup>1</sup>, T. Omarche<sup>7</sup>, H. Masud<sup>1</sup>, D. Callander<sup>8,1</sup>

<sup>1</sup>Médecins Sans Frontières, Mombasa Project, Mombasa, Kenya, <sup>2</sup>Médecins Sans Frontières, Operational Centre Geneva, Geneva, Switzerland, <sup>3</sup>Mombasa County Department of Health, Mombasa, Kenya, <sup>4</sup>International Centre for Reproductive Health, Mombasa, Kenya, <sup>5</sup>Kenya Medical Research Institute, Kilifi, Kenya, <sup>6</sup>Médecins Sans Frontières, Kenya Mission, Nairobi, Kenya, <sup>7</sup>Youth Advisory Champions for Health, Mombasa, Kenya, <sup>8</sup>University of New South Wales, Kirby Institute, Sydney, Australia

**Background:** Key populations that bear a disproportionate burden of HIV – sex workers, people who use drugs, transgender people, and sexual minorities (i.e., men who have sex with men) – face high levels of interpersonal stigma, including when accessing healthcare. Such stigma is detrimental to health outcomes. In Mombasa, Kenya there are several ongoing interventions to reduce key population stigma among healthcare workers.

To guide these interventions and track impact, this study details data from a newly established multi-year cohort.

**Methods:** The *Mombasa Healthcare Worker Study* is a prospective cohort launched August 2023 with ongoing enrolment of clinical and non-clinical employees at public health facilities. Via repeated digital surveys, key population stigma is measured with the Bogardus Social Distance Scale.

Participants rate willingness to engage with key populations at different social levels (e.g., neighbours, friends, family) with 'high stigma' defined as scores exceeding the 50<sup>th</sup> percentile of the possible range.

Logistic regression analyses investigated differences between sub-samples and associated characteristics with adjusted odds ratios (aOR) and 95% confidence intervals (CIs).

**Results:** From six public health facilities across Mombasa, 272 healthcare workers have been enrolled with 92% retention between the first two waves. Of these, 235 (86.4%) are clinicians and 37 (13.6%) are non-clinicians (e.g., administrators, cleaners).

At Wave 1, 70.8% of healthcare workers demonstrated high stigma towards at least one key population, which remained stable at Wave 2 (73.4%,  $p=0.143$ ). High stigma was most common towards people who use drugs (55.4% at wave 1), followed by sexual minorities (48.1%), transgender people (48.0%) and sex workers (34.1%).

This hierarchy was consistent at Wave 2. In a multivariable analysis, at baseline the following factors were independently associated with high stigma towards key

populations: less than one year working in healthcare (aOR=1.78, 95%CI:1.07-2.93,  $p=0.032$ ) and being a non-clinician (aOR=1.12, 95%CI:1.03-1.98,  $p=0.004$ ).

**Conclusions:** Key population stigma is prevalent among healthcare workers in Mombasa, likely undermining quality and uptake of care. High levels of stigma among the non-clinical workforce suggests that interventions should include all healthcare workers, while involving more experienced workers as leaders of anti-stigma initiatives could prove effective. This cohort will monitor the impact of such interventions over time.

## WEPED452

### Why did I quit oral PrEP? If you bring CAB-LA, will I sign up? – female sex workers share views and experiences

K. Mwanda<sup>1</sup>

<sup>1</sup>Diligent Health Initiatives, Technical, Lusaka, Zambia

**Background:** The HIV prevalence rate among female sex workers in Zambia is over four times higher than in the general population (48% vs. 11%). However, oral PrEP continuation rates among FSWs are not significantly higher compared to the rest of the population. Reasons for discontinuation, duration on oral PrEP, and likelihood to take up injectable PrEP once available, remain undocumented among this high risk population.

**Description:** Between October and December, 2023 we undertook to engage with female sex workers that had once accessed oral PrEP, but had since discontinued. From client data, we reviewed their demographic details, date of last visit for oral PrEP purposes, while via phone calls, we recorded their reasons for discontinuing PrEP, and their likelihood to take up long acting injectable cabotegravir (CAB-LA), and recorded reasons, if any, why they would choose not to.

**Lessons learned:** 108 FSWs were engaged. Age distribution was 18 to 51 years. Majority (72.2%) were aged 20-34 years old. Most had attained primary (49.1%) or secondary (47.2%) school education. Majority (51.9%) last attended clinic at one month of oral PrEP and had collected medicines for up to Month 4, while 35.2% and 8.3% came for their Month 4 and Month 7 visits respectively. The largest proportion (33.3%) cited "side effects", while 18.5% cited "Got tired of pills", 13.0% "feared their clients/partner's perceptions", 11.1% said "high mobility" and 8.3% gave "Tablets too big" as reasons. One (0.9%) client seroconverted. Most (84.3%) did not seek medical advice when discontinuing, while 66.7% immediately replaced PrEP with use of condoms.

The majority (89.8%) said they would take up injectable PrEP once offered; 6.5% indicated "May be" and 3.7% indicated they would not take injectable PrEP. Among those that responded "May be" and "No", the majority (86.5%) cited "fear for long term side effects".

**Conclusions/Next steps:** FSWs largely discontinue oral PrEP due to side effects. As these do not normally last over a month, there is need for improved counselling, support and managing expectations among this population. Though the drop off rates for oral PrEP are high, FSWs are eager to take up long-acting injectable PrEP.

## WEPED453

### Factors related to the intention to use long acting pre-exposure among transgender women in Argentina

R. Caballero<sup>1,2</sup>, J. Zeggagh<sup>3</sup>, V. Zalazar<sup>1</sup>, M.I. Figueroa<sup>1</sup>, E. Esandi<sup>1</sup>, D. Salusso<sup>1</sup>, E. Panizoni<sup>1</sup>, P.D. Radusky<sup>1,2</sup>, E. Frontini<sup>1</sup>, M.C. Trejo<sup>1</sup>, A. Zeltman<sup>1</sup>, N. Cardozo<sup>1,4,5</sup>, M. Duarte<sup>1,5</sup>, S. Fabián<sup>1,6</sup>, C. Perez<sup>1</sup>, C. Cesar<sup>1</sup>, I. Aristegui<sup>1</sup>

<sup>1</sup>Research Department, Fundación Huésped, Buenos Aires, Argentina, <sup>2</sup>Universidad de Buenos Aires, School of Psychology, Buenos Aires, Argentina, <sup>3</sup>Hôpital Necker-Enfant Malades, Service des maladies infectieuses et tropicales, Paris, France, <sup>4</sup>REDLACTRANS, Buenos Aires, Argentina, <sup>5</sup>Asociación de Travestis, Transexuales y Transgéneros de Argentina (A.T.T.A.), Buenos Aires, Argentina, <sup>6</sup>Asociación Civil Gondolin, Buenos Aires, Argentina

**Background:** Since 2021, Argentina has been offering oral PrEP at no cost to key populations. Transgender women (TGW) have a high HIV prevalence; nevertheless, uptake and persistence of PrEP has been notably low. Studies in other countries suggest preferences for long-acting PrEP (LA-PrEP) over oral PrEP.

This study analyzed factors related with intention to use LA-PrEP among TGW in Buenos Aires, Argentina.

**Methods:** We conducted a cross-sectional study using a convenience sample of TGW who attended an NGO's HIV testing service between February-July 2023. A self-administered questionnaire covered psychosocial and sociodemographic variables, knowledge and intention to use LA-PrEP, preference for PrEP modalities (injectable/implant) and sexual behavior.

We explored correlates of intention to use LA-PrEP applying chi-square tests, odds ratios (OR), confidence intervals (CI) and Student's t-tests.

**Results:** In total, 89 TGW participated, with a median age of 28 years (IQR=24-35). Regarding sociodemographic characteristics, 27% informed incomplete secondary education, 20.2% were migrants and 27% were currently engaged in sex work. Receptive condomless anal sex (CAS) was reported by 42.2%.

Also, 32.6% reported use of oral PrEP currently. In the last three months, 51.7% used substances before or during sex, mainly cannabis (50.6%) and cocaine (19.1%).

Only 11.2% were aware of LA-PrEP and 65.2% expressed intention to use it (45.9% preferred implants, 31.1% subcutaneous, and 23% intramuscular). Who did not intend to

use LA-PrEP exhibited significant concerns about potential interactions with gender-affirming hormone therapy ( $t(76)=29.307$ ;  $p<0.05$ ). Intention to use LA-PrEP was significantly associated ( $p<0.05$ ) with current sex work (OR=5.30, 95%CI=1.44-19.55), migration (OR=3.08, 95%CI=1.11-8.55), incomplete secondary education (OR=3.55, 95%CI=1.09-11.58), use of cocaine before or during sex (OR=3.55, 95%CI=1.09-11.58).

**Conclusions:** Intention to use LA-PrEP was high among TGW at risk and with social vulnerability. Low awareness, concerns and factors related with a positive intention to use LA-PrEP, must be considered to develop strategies to implement a comprehensive, sensitive, and effective LA-PrEP delivery program in Argentina.

## WEPED454

### Transgender community engagement in designing a virtual HIV intervention for TGWs with limited digital literacy in Delhi NCR India: experience sharing from workshops

Y. Singh<sup>1</sup>, Y. Singh<sup>2</sup>, M. Ali<sup>2</sup>, S. Sharma<sup>3</sup>, S. Guru<sup>4</sup>

<sup>1</sup>Pahal Foundation, Programmes, Faridabad, India, <sup>2</sup>Pahal Foundation, Delhi, India, <sup>3</sup>Kinnar Bharti, Delhi, India, <sup>4</sup>Kashish Foundation, Patiala, India

**Background:** In strengthening community-based interventions focused on Transgender women (TGW), gathering insights through community consultations, particularly in Delhi NCR. Limited accessible research exists on integrating and centring transgender communities in such interventions.

As part of initiative Transcending, a virtual multi-level intervention focused on increasing HIV testing and status-neutral linkage to care among TGW, workshops were conducted with community stakeholders to guide intervention development and implementation.

**Description:** Six workshops took place at community-based organizations in Delhi NCR, India, from Apr - Oct 2023. The aim was to design a multi-level WhatsApp-based intervention incorporating messaging to enhance HIV testing uptake among TGW. Approximately 20 participants, including TGW with diverse field experiences such as community healthcare workers and HIV intervention beneficiaries, engaged in the workshops.

The TGW groups are very diverse in India, the literacy levels, digital literacy and other key factors were considered. The workshops applied socio-ecological and information-motivation-behaviour (IMB) frameworks to guide intervention component selection.

**Lessons learned:** The community centric design and open space technology approach facilitated impactful discussions between community members and the intervention team. Key stakeholders provided valuable insights, informing optimal targets for behaviour change, recruitment strategies, enrolment procedures, and reten-

tion efforts. Workshop participants played a crucial role in selection of digital content formats – largely voice based, including word choice. Further self-explanatory pictorial designs for IEC for community with limited literacy.

**Conclusions/Next steps:** Integrating the valuable inputs from transgender community and stakeholders into all aspects of intervention and research processes enhances participant engagement in virtual behavioural interventions.

The combination of inclusive processes and rigorous theoretical models enabled the successful development of a community-centred, multi-level, multi-component virtual intervention for transgender community.

This participatory approach serves as a model for developing theoretically grounded and community-centered virtual behavioral interventions, particularly with community with limited digital literacy.

## WEPED455

Community connect: transformative strategies for community referral and testing for HIV to identify discordant couples in Muhuru ward, Migori County

B. Okome<sup>1</sup>, E. Ariya<sup>2</sup>, W. Otieno<sup>3</sup>, S. Oyugi<sup>3</sup>, T. Audoh<sup>1</sup>, D. Menya<sup>4</sup>, C. Odera<sup>2</sup>, H. Ngeso<sup>5</sup>

<sup>1</sup>Catholic Medical Mission Board, Program, Migori, Kenya,

<sup>2</sup>Migori County, Health, Migori, Kenya, <sup>3</sup>Catholic Medical Mission Board, MEAL, Migori, Kenya, <sup>4</sup>Catholic Medical Mission, Program, Siaya, Kenya, <sup>5</sup>Catholic Medical Mission Board, Program Management, Kisumu, Kenya

**Background:** Identifying and retaining discordant couples on care remains a challenge, primarily due to the veil of secrecy surrounding the relationships. Approximately two-thirds of couples living with HIV in the country are discordant. A collaborative strategy, CMMB in partnership with Kenya Redcross Society (KRCS) and MoH Migori County through Global Fund HIV transmission prevention program sought to address this issue.

The strategy focused on empowering discordant couples' peer educators to deliver accurate information, motivate their peers to access comprehensive care services, and bridge the gap between facility-based services and community needs.

**Description:** In May 2022, 24 discordant couples, including one from Muhuru Sub County Hospital in Migori County, were identified. A dedicated couple, navigating a discordant relationship for two years, underwent training in peer education, communication, and community-facility referrals for HIV management services.

Assigned to Muhuru ward, they became peer educators, conducting home visits, establishing support groups, sensitizing community meetings, and utilizing social media for information dissemination. Their pivotal role included building trust, facilitating discussions, providing HIV prevention information, and linking couples to health

services. Monthly analysis of peer calendars and referral forms offered insights into service provision for targeted couples.

**Lessons learned:** The peer educators played a crucial role in linking couples to health services, building trust, and facilitating productive conversations. By December 2023, the enrolment of discordant couples had increased from 32 to 86, resulting in improved HIV prevention and treatment outcomes. These outcomes included heightened knowledge, enhanced communication, and increased utilization of prevention methods.

**Conclusions/Next steps:** The success of the program in recruiting and engaging discordant couples underscores the significance of community-based HIV program approaches.

Integrating the program into the health system is crucial for sustainability, scalability, and long-term engagement. This integration is expected to lead to reduced new infections and improved treatment outcomes in Migori County.

## WEPED456

Young trans people first: youth-inclusive gender-affirming services facilitate access to HIV and sexual health services among young transgender women in Bangkok, Thailand

K. Samitpol<sup>1,2</sup>, R. Janamnuysook<sup>1,2</sup>, P. Getwongsa<sup>1</sup>, T. Amatsombat<sup>1</sup>, A. Chancham<sup>1</sup>, V. Sripoonbun<sup>1</sup>, K. Suttanan<sup>1</sup>, P. Mingkwanrungruang<sup>1</sup>, A. Arunmanakul<sup>3</sup>, S. Mills<sup>3</sup>, N. Phanuphak<sup>1,2</sup>

<sup>1</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>2</sup>Center of Excellence in Transgender Health, Chulalongkorn University, Bangkok, Thailand, <sup>3</sup>USAID EpiC Thailand, FHI 360, Asia Pacific Regional Office, Bangkok, Thailand

**Background:** Globally, young key populations are disproportionately affected by HIV. In order to address the gaps, the Tangerine Clinic, a transgender-led gender-affirming sexual health clinic in Bangkok, integrated youth-inclusive gender-affirming care into HIV services. This approach aims to minimize the harms of self-medicated hormone treatment, as gender-affirming care had yet to be covered under the Thailand's Universal Health Coverage, and to facilitate access to HIV and sexual health services among young transgender populations.

We conducted an observational cohort examining access to HIV and other sexual health services among young transgender clients of the Tangerine Clinic.

**Methods:** We analyzed data collected from clients of the Tangerine Clinic during November 2015–September 2023. Data on HIV and sexually transmitted infections (STI) services accessed by transgender women aged ≤24 years, who used gender-affirming care as a service entry point, and service outcomes were reported.

Gender-affirming care at the Tangerine Clinic included gender-affirming care counseling, hormone treatment and hormone level monitoring.

**Results:** Of 6,280 transgender women clients of the Tangerine Clinic, 2,839 (45.2%) aged  $\leq 24$ . Among them, 2,012 (70.9%) reported gender-affirming hormone treatment as their primary reason for a clinic visit. Of those, 1,924 (95.6%) received HIV testing and 39 (2%) who tested HIV-positive, 35 (89.7%) initiated same-day antiretroviral treatment and 28 (71.8%) achieved virologic suppression. Pre-exposure prophylaxis was prescribed to 390 (20.7%) and post-exposure prophylaxis to 65 (3.4%) individuals who tested HIV-negative. Psychoactive substance use was reported by 7 (0.3%) and 188 (9.3%) engaged in sex work. Syphilis testing by TPHA was conducted in 1,665 (82.8% of 2,012), 23 (1.4%) were confirmed by VDRL to have active syphilis, and 21 (91.3%) received treatment. Of 256 (12.7% of 2,012) who tested for chlamydia/gonorrhea by nucleic acid amplification testing, 59 (23%) tested positive and 52 (88.1%) received treatment.

**Conclusions:** Integration of youth-inclusive gender-affirming care into sexual health services successfully facilitated access to HIV prevention and treatment, STI testing and treatment, and safe hormone treatment among young transgender women. It is crucial to nationally scale up the youth-inclusive gender-affirming HIV service intervention for young transgender populations in Thailand in order to accelerate an ending AIDS goal by 2030.

## WEPED457

Social systems exclusion associated with increased HIV and bacterial STIs among transgender women and transfeminine non-binary persons living in the U.S.: racial and ethnic differences and implications for intervention

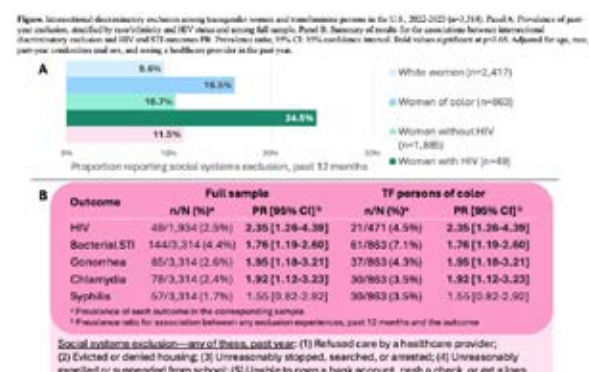

K. Atkins<sup>1</sup>, J.M. Wiginton<sup>2</sup>, T. Carpino<sup>3</sup>, A. Scheim<sup>4</sup>, S. Murray<sup>5</sup>, T. Sanchez<sup>6</sup>, S. Baral<sup>3</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, International Health, Baltimore, United States, <sup>2</sup>University of California, San Diego, San Diego, United States, <sup>3</sup>Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States, <sup>4</sup>Drexel University Dornsife School of Public Health, Epidemiology and Biostatistics, Philadelphia, United States, <sup>5</sup>Johns Hopkins Bloomberg School of Public Health, Mental Health, Baltimore, United States, <sup>6</sup>Emory University Rollins School of Public Health, Epidemiology, Atlanta, United States

**Background:** Intersectional discrimination is an established determinant of poor health among gender diverse populations. We sought to investigate discrimination as a potential driver of HIV and STI outcomes among transgender women and transfeminine non-binary persons (TF persons) in the US.

**Methods:** A US nationwide online survey (June 2022-July 2023) of TF persons assessed social systems exclusion with five items identified via factor analysis as a single domain of the Intersectional Discrimination Index (**Figure**), a non-attributable measure of stigma. We measured differences in exclusion experiences by race/ethnicity and HIV status, using modified Poisson regression with robust variance estimation to calculate prevalence ratios (PR) for associations between exclusion and self-reported (1) HIV status and (2) STI diagnoses in the last year.

**Results:** Of 3,314 TF participants, 1,666 (50.3%) reported lifetime experiences of exclusion, 979 in the past year. Past-year exclusion was more prevalent among TF persons of color (i.e., non-white; PR 1.71, 95% CI 1.41-2.07) and TF persons with HIV (PR 2.29, 95% CI 1.37-3.80; **Figure**). Those reporting past-year exclusion had over double the HIV prevalence and 76% higher past year bacterial STI prevalence, including nearly double the prevalences of gonorrhea and chlamydia, as those reporting no past-year exclusion (**Figure**). These effects were more profound among TF persons of color for HIV prevalence, bacterial STI prevalence, and syphilis.

**Conclusions:** Social systems exclusion is a form of intersectional discrimination associated with markedly higher prevalence of HIV and bacterial STIs among TF persons. TF persons of color and those with HIV are subjected to multiple forces of marginalization (transphobia and racism; HIV stigma and transphobia) and disproportionately affected by social systems exclusion.

To protect the rights and well-being of transgender women, there is an urgent need for structural intervention to ensure access to social, economic, healthcare, and safety resources to foster improved sexual health and HIV outcomes.

## WEPED458

### Bridging the gap: enhancing pre-exposure prophylaxis uptake and continuity among key populations at substantial risk of HIV in Uganda

P. Ogunsanya<sup>1</sup>, E. Kihika<sup>1</sup>, A. Ogunsanya<sup>1</sup>, C. Adongo<sup>2</sup>, G. Nsabimana<sup>3</sup>, J. Ayebazibwe<sup>3</sup>, C. Ndeloo<sup>4</sup>, A. MacDonald<sup>5</sup>, M. Camacho<sup>6</sup>

<sup>1</sup>Alive Medical Services, Clinical and Management, Kampala, Uganda, <sup>2</sup>Alive Medical Services, Monitoring and evaluation, Kampala, Uganda, <sup>3</sup>Alive Medical Services, Programs, Kampala, Uganda, <sup>4</sup>Elton John AIDS Foundation, Global Leadership, London, United Kingdom, <sup>5</sup>Elton John AIDS Foundation, Grants, London, United Kingdom, <sup>6</sup>Elton John AIDS Foundation, Monitoring and Evaluation, London, United Kingdom

**Background:** In Uganda, where the annual incidence of up to 52,000 acquiring new HIV persists, addressing the unique challenges faced by Key Populations (KPs) in accessing and maintaining Pre-Exposure Prophylaxis (PrEP) is of paramount importance. The criminalization of specific sexual identifications and practices under the Anti-Homosexuality Act, coupled with deep-rooted fears of stigma, abuse, harassment, and legal consequences, creates formidable barriers that hinder PrEP uptake and continuity among high-risk individuals and threatens Uganda's overall progress in the HIV response.

Program data from Ministry of Health PrEP tracker 2020 showed that continuity on PrEP for persons at risk was approximately 20% compared to the national target of 60%.

**Description:** With support from the Elton John AIDS Foundation, Alive Medical Services (AMS) is spearheading a targeted initiative addressing PrEP utilization complexities among KPs in 63 health facilities in 25 districts in Uganda. Each PrEP user is connected with a trained Peer Educator, discreetly managing community-based follow-ups and refills using blood-based self-test kits. Peer Educators mobilize KPs to hotspots and engage empowered health workers to initiate PrEP in the community.

**Lessons learned:** Between February 2023 and September 2023, 2,876 KPs were initiated on PrEP. Of these 2,444 had a refill at month 1 (85% continuity) whilst 1,036 had a refill at 3 months (71% continuity).

In the face of an unfavourable social and legal environment, peer educators expressed concerns about navigating community activities. Regular mentorship visits empowered and encouraged them.

Feedback from Health workers highlights a notable improvement attributed to trusting relationships Peer-educators cultivated in the community. This has resulted in individuals facilitating seamless connections to the 63 health facilities for refills.

**Conclusions/Next steps:** Peer-led community-based approaches addressing stigma and mental health increases PrEP uptake and continuity. This is consistent with the evidence that peer-led interventions can increase uptake

of HIV services. It is recommended for other CSOs delivering health programming in Uganda to follow similar approaches. Scaling up mental health services and addressing stigma in health facilities are the next priorities to further improve PrEP uptake and continuity, underscoring AMS' dedication to dynamic and responsive interventions to meet the evolving needs of the communities we serve.

## WEPED459

### Insights and learnings on HIV status process approach among OVC households in the Dominican Republic

C. Canales<sup>1</sup>, F. Mármol<sup>1</sup>, D. Luis<sup>1</sup>, A. Koler<sup>2</sup>, D. Kisiyombe<sup>2</sup>

<sup>1</sup>Pact, Building Resilience Project | Program, Santo Domingo, Dominican Republic, the, <sup>2</sup>Pact, Global Health, Washington, United States

**Background:** The USAID-funded Building Resilience project in the Dominican Republic aims to improve HIV detection and antiretroviral treatment adherence among Haitian migrants and their descendants, ultimately reducing viral load in these communities.

**Description:** Building Resilience project employs a family-focused service model to enhance the health of orphans and vulnerable children (OVC) by identifying HIV cases, promoting treatment adherence, and monitoring viral load. The target population faces challenges such as higher HIV prevalence, limited awareness, and access to antiretroviral treatment (ART), exacerbated poverty, lack of legal documentation leading to deportations, and restricted access to social protection programs.

**Lessons learned:** The project is contributing to the global 95-95-95 goal by ensuring that targeted children, adolescents, and caregivers know their HIV status. From September 2021 to 2023, 12,913 beneficiaries were reached. Initially (September 2020), only 38% knew their HIV status. Through adjusted approaches and new strategies, by September 2023, 93% knew their HIV status.

Addressing complexities in raising HIV status awareness highlighted key lessons, emphasizing improving community volunteer effectiveness and sensitizing caregivers to their religious and cultural beliefs about HIV risk in children. Optimizing volunteer training, particularly in age-appropriate assessments, and redesigning the HIV Risk Assessment Tool were crucial in easing volunteers' discomfort with sensitive sex-related questions. Establishing trust through continuous training and fostering a psychological connection between volunteers and caregivers further enhanced volunteers' ability to assess HIV risk and facilitate necessary testing referrals.

Integrating cultural and religious sensitivities into HIV education, dispelling prevalent myths, and sensitizing caregivers, specifically addressing their limited acceptance of risk assessments for their children were crucial. By concentrating efforts on these areas, a more supportive and

effective approach for conducting HIV risk assessments, referring for HIV testing, and ensuring completed referrals was implemented. This resulted in a significant improvement in the percentage of children in the program who knew their HIV status.

**Conclusions/Next steps:** Culturally sensitive, comprehensive approaches are crucial for assessing HIV risk and delivering services to this vulnerable population. Effective communication, rapport-building, and targeted interventions are vital to engage 95% of people with HIV in knowing their serostatus. This involves raising awareness about the importance of HIV testing and ensuring broad access.

## WEPED460

Exploring self-perceived HIV risk and associated factors among sexual and gender minority adolescents in Brazil: findings from the PrEP1519 cohort study

F. Soares<sup>1</sup>, L. Magno<sup>2</sup>, L. Amorim<sup>3</sup>, J. Pinto Júnior<sup>4</sup>,

T. Aranha Rossi<sup>2</sup>, A. Grangeiro<sup>5</sup>, D. Greco<sup>6</sup>, I. Dourado<sup>1</sup>

<sup>1</sup>Universidade Federal da Bahia, Instituto de Saúde Coletiva, Salvador, Brazil, <sup>2</sup>Universidade do Estado da Bahia, Departamento de Ciências da Vida, Salvador, Brazil, <sup>3</sup>Universidade Federal da Bahia, Departamento de Estatística, Salvador, Brazil, <sup>4</sup>Universidade Federal Fluminense, Instituto de Matemática e Estatística, Rio de Janeiro, Brazil, <sup>5</sup>Universidade de São Paulo, Departamento de Medicina Preventiva, São Paulo, Brazil, <sup>6</sup>Universidade Federal de Minas Gerais, Faculdade de Medicina, Belo Horizonte, Brazil

**Background:** Sexual and gender minority adolescents (SGMA) in Brazil are more prone to discontinuing PrEP compared to adults, potentially due to their perception of HIV risk. We aimed to assess the factors influencing self-perception of HIV risk among adolescent men who have sex with men (AMSM) and transgender women (ATGW).

**Methods:** PrEP1519 constituted a single arm, demonstration cohort study focusing on daily oral PrEP among AMSM/ATGW aged 15-19 years, in three Brazilian cities. Baseline assessments were carried out, followed by quarterly visits. For this longitudinal analysis, we included adolescents enrolled in PrEP from February 2019-February 2022.

We analyzed up to 12 observations from each participant using random (intercept) effects logistic model to estimate adjusted odds ratios (aOR) and 95% confidence intervals (95%CI) of factors associated with self-perception of HIV risk (low vs moderate/high).

**Results:** 1,234 adolescents were included. The majority were MSM (91.0%), aged 18-19 years (76.0%), black/brown skin color (70.5%), attended secondary school (69.2%); 75.9% and 59.2% reported condomless receptive anal sex with a steady partner and with casual partners over the past 3 months, respectively.

Adolescents with secondary and college education were more likely to perceive themselves at moderate/high HIV risk (aOR=3.5;95%CI:1.4-8.4 and aOR=3.3;1.3-8.4), respectively.

Furthermore, engaging over the past 3 months in condomless receptive anal sex with casual partners (aOR=1.8;1.3-2.6), in group sex (aOR=1.8;95% CI:1.3-2.6), in transactional sex (aOR=2.2; 95% CI:1.1-4.5), and having more than four casual partners (aOR of 2.6;95%CI:2.0-3.5) were factors associated with self-perception of moderate/high HIV risk.

**Conclusions:** Adolescents engaging in high-risk HIV behaviors were more likely to be aware of their risks. Nevertheless, there exists a subset of adolescents at HIV risk, albeit less overtly, who may not perceive themselves as vulnerable to acquire HIV. We posit that those with greater access to information are more aware of HIV risks. Consequently, schools can play a crucial role as an essential strategy in advocating for HIV prevention measures among SGMA.

## WEPED461

HIV vulnerabilities and extreme disparities among young transgender women in Lima, Peru

A. Silva-Santisteban<sup>1</sup>, D. Apedaile<sup>2</sup>, A. Perez-Brumer<sup>3</sup>, S. Leon<sup>4</sup>, L. Huerta<sup>5</sup>, F. Leon<sup>1</sup>, R. Aguayo-Romero<sup>6</sup>, S. Reisner<sup>7</sup>

<sup>1</sup>Universidad Peruana Cayetano Heredia, Center for Interdisciplinary Research in Sexuality, AIDS and Society, Lima, Peru, <sup>2</sup>University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, <sup>3</sup>University of Toronto, Dalla Lana School of Public Health, Toronto, Peru, <sup>4</sup>Universidad Privada San Juan Bautista, Lima, Peru, <sup>5</sup>Feminas Peru, Lima, Peru, <sup>6</sup>Harvard, Harvard T.H. Chan School of Public Health, Boston, United States, <sup>7</sup>Harvard, Harvard T.H. Chan School of Public Health, Lima, Peru

**Background:** In Peru, transgender women are most affected by HIV, with a prevalence of 20.8-29.8% compared with 0.2-0.3% in the general population. Peruvian young transgender women (YTW) ages 16-24 years are a critical but understudied group for primary HIV prevention efforts. Previous studies show sharp increases in HIV prevalence among transwomen ages 25 years and older.

**Methods:** Between February-July 2022, a cross-sectional quantitative study with YTW ages 16-24 years (N=211) was conducted in Lima, Peru, consisting of a biobehavioral survey accompanied by laboratory-based testing for HIV and other STIs (syphilis, chlamydia, gonorrhea, and hepatitis B). Bivariate and multivariable Poisson regression models were used to estimate risk ratios between sociodemographic and behavioral characteristics and HIV status.

**Results:** Among participants (median age 23 years), HIV prevalence was 41.5% (95% CI: 33.9-49.4%), recent syphilis acquisition 19.4% (95% CI: 12.7-28.4), chlamydia 6.3% (95%

CI: 3.1-11.1), and gonorrhea 12.3% (95% CI: 7.9-18.7). Almost half (47.9%) reported condomless anal sex in the past six months, 50.7% reported sex work in the past 30 days and 13.7% reported accepting more money for condomless sex.

There were no significant differences in reported sexual behaviors by HIV status. Only 60.8% of participants reported ever having been tested for HIV, and 25.6% reported a past 6-month STI test.

More than two-thirds (67.8%) had not heard of PrEP and only 4.7% had taken PrEP in the past month. Most (58.8%) reported ever experiencing violence, including psychological (56.4%), physical (44.5%), sexual (26.1%), and transgender-specific intimate partner violence (24.6%).

Current moderate-to-severe psychological distress was endorsed by 20.3%, 20.4% reported PTSD symptoms, 10.0% reported attempting suicide in the past 6 months, and 64% reported alcohol misuse.

**Conclusions:** Findings highlight that the HIV epidemic for YTW in Lima, Peru, is situated in a context of widespread social exclusion, including economic vulnerabilities, violence victimization, and its mental health sequelae that starts early in life. There's an urgent societal need to improve the quality of life of YTW.

Additionally, reducing HIV inequities and guaranteeing access to prevention and care for YTW, will require interventions that target developmentally-specific clusters of stigma-related conditions.

## WEPED462

### The price of protection: quantifying differences in compensation for vaginal sex with and without condoms among female sex workers living with HIV in South Africa

J.G. Rosen<sup>1</sup>, C.A. Comins<sup>2</sup>, M. Mcingana<sup>3</sup>, H. Hausler<sup>3,4</sup>, L. Shipp<sup>2</sup>, S. Makama<sup>5</sup>, N. Mulumba<sup>5</sup>, S. Mishra<sup>6</sup>, D.R. Phetlhu<sup>7</sup>, J. Steingo<sup>3</sup>, K. Atkins<sup>1</sup>, K.B. Rucinski<sup>1</sup>, A. Rao<sup>2</sup>, R. Dawit<sup>2</sup>, S.D. Baral<sup>2</sup>, S.R. Schwartz<sup>2</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Department of International Health, Baltimore, United States, <sup>2</sup>Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology, Baltimore, United States, <sup>3</sup>TB HIV Care, Cape Town, South Africa, <sup>4</sup>University of Pretoria, Department of Family Medicine, Pretoria, South Africa, <sup>5</sup>TB HIV Care, Key Populations Programme, Durban, South Africa, <sup>6</sup>University of Toronto, Division of Infectious Diseases, Toronto, Canada, <sup>7</sup>Sefako Makgatho Health Sciences University, Department of Nursing Science, Ga-Rankuwa, South Africa

**Background:** Amid financial instability and other structural injustices, female sex workers (FSW) living with HIV face competing incentives to protect their health and safety while maximizing earnings, sometimes at the expense of condom use.

**Methods:** We leveraged data from an 18-month trial of adaptive strategies to improve HIV treatment outcomes among FSW in Durban, South Africa (*Siyaphambili*)—implemented through TB HIV Care. We estimated per-act payment differentials for vaginal sex with and without condoms (in Rand, 50ZAR:3.85US\$) by subtracting self-reported average compensation for vaginal sex with condoms from anticipated compensation for condomless vaginal sex.

Multivariable Poisson regression with robust standard errors estimated associations between payment differentials for vaginal sex with and without condoms and past-month client condom use behaviors.

**Results:** Among 1,391 FSW, the median compensation for vaginal sex with and without condoms was 100 ZAR (interquartile range [IQR]:50-150) and 150 ZAR (IQR:100-200), respectively—corresponding to a median payment differential of 50 ZAR (IQR:30-100). FSW paid <100 ZAR for vaginal sex with condoms were more likely to report unstable housing ( $p=0.022$ ), solicit clients in outdoor/public spaces ( $p<0.001$ ), and experience sexual violence ( $p=0.010$ ). Actual and anticipated compensation amounts for vaginal sex with and without condoms, respectively, varied by client solicitation venue (Figure).

Per-act payment differentials  $\geq 50$  ZAR were associated with inconsistent condom use with regular (adjusted prevalence ratio [adjPR]=1.97, 95% confidence intervals [95%CI]:1.36-2.87) and new (adjPR=2.12, 95%CI:1.45-3.10) clients, as well as more frequent condomless vaginal sex acts with clients (adjusted incidence rate ratio [adjIRR]=1.99, 95%CI:1.23-3.22).

**Conclusions:** Payment differentials for vaginal sex with and without condoms disincentivized condom use with clients, reaffirming the importance of doxycycline pre-exposure prophylaxis and long-acting contraception for preventing bacterial STIs and unwanted pregnancy, respectively, in this population.

By offsetting anticipated compensation deficits attributed to condom use, economic strengthening and financial stabilization interventions could facilitate increased condom use with clients.

Awareness, preferences, and attitudes towards three types of pre-exposure prophylaxis among Chinese MSM: a national cross-sectional study

H. Lin<sup>1</sup>, P. Guo<sup>2</sup>, X. Wang<sup>3</sup>, J. Li<sup>2</sup>, W. Cao<sup>1</sup>

<sup>1</sup>Peking University, Beijing, China, <sup>2</sup>Sun Yat-sen University, Guangzhou, China, <sup>3</sup>Chengdu Tongle Health Consulting Service Center, Chengdu, China

**Background:** This study aimed to assess the knowledge and preferences of Chinese men who have sex with men (MSM) regarding long-acting injectable (LAI) pre-exposure prophylaxis (PrEP), as well as their attitudes and intentions towards three types of PrEP (daily oral, on-demand oral, and LAI-PrEP), and to provide a valuable reference for the implementation and promotion of PrEP among the MSM population in China.

**Methods:** A cross-sectional study was conducted between December 2023 and January 2024 in 20 cities across different regions of China. HIV-negative MSM participants were recruited using purposeful sampling, with sample sizes proportionate to the population density of each city. The survey instruments included socio-demographics, PrEP eligibility assessment, and PrEP-related cognitions, including preferences for the three types of PrEP and the reasons. Data were collected using electronic questionnaires and analyzed descriptively.

**Results:** The study included 1,544 participants with a mean age of  $30.0 \pm 7.5$  years. According to the Chinese PrEP guidelines, 54.4% of participants were eligible for PrEP. Three-quarters (74.4%) perceived their risk of HIV infection as low or very low. The awareness rate of PrEP was 90.6%, and a quarter (24.5%) reported a PrEP use history. When PrEP can be provided for free, there were 36.4%, 75.4%, and 53.6% of the participants reported a willingness to use daily oral, on-demand oral, and LAI-PrEP, respectively; these numbers were reduced substantially with the real market price. Participants perceived the on-demand oral PrEP to require less time (73.2%), lower cost (70.4%), higher convenience (69.5%), and better privacy (58.9%).

**Conclusions:** Chinese MSM demonstrated a high level of awareness and interest in PrEP, with substantial preferences for on-demand oral and long-acting injectable PrEP.

Factors such as convenience, cost, privacy, safety, and effectiveness influenced their preferences. Individual preferences and characteristics should be considered when implementing and promoting PrEP among MSM in China.

## WEPED464

Developing indicators to sustain the gains of the 95-95-95 targets and beyond

R.M.A. Sharaf<sup>1</sup>, S. Balsamo<sup>2</sup>

<sup>1</sup>Aidsfonds, Key Populations, Amsterdam, Netherlands, the, <sup>2</sup>Aidsfonds, International Team, Amsterdam, Netherlands, the

**Background:** As we near 2025, five countries have achieved 95-95-95 targets, 16 are on their way (UNAIDS 2023 Global Report). The 10-10-10 targets on social enablers highlight the link between criminalization and social behavior towards the prevalence of HIV.

However, the social enablers in their current format do not clarify indicators that could guide high achieving countries on sustaining their gains. There is a need for a set of indicators through which countries can periodically anticipate the risk of resurgence and work towards HIV/AIDS resilience.

**Description:** Aidsfonds has been collecting and analyzing, best practices, reflections and feedback on the linkage between social behavior, criminalization and advocacy. This combination, together with the existing body of knowledge, positions the organization to lead efforts on drafting indicators that could shape the sustainability of retaining the 95-95-95 gains.

**Lessons learned:** Through projects on service delivery, policy change, training of health care workers, and community outreach across Europe and Africa.

We have the following assumptions to back up efforts in suggesting a global Theory of Change which would guide the production of those indicators. For example:

- There is a co-relation between Key Population integration in overall society and accessibility to testing, *by proxy, this could indicate the decreasing levels of testing in case of anti-rights polarization.*
- There is a co-relation between mental health of Key Population groups and accessibility to testing, *by proxy, the degrees of mental fatigue experienced by Key Population groups could indicate the accuracy of testing being indicative of HIV infection rates.*

**Conclusions/Next steps:** Conclusions: Building an HIV/AIDS resilience Theory of Change (ToC) for beyond 95-95-95 targets is possible through the expanding body of knowledge on the linkage between public perception and policy making, on the infections rate for HIV.

Next Steps: Invite community leadership, key stakeholders and global decision making bodies to prioritize efforts for substantiating the work being done on the development of this Theory of Change with its operational indicators.

## WEPED465

The use and consequences of liquid silicone injections. A key problem in the trans community living with HIV

C. Valeriano<sup>1</sup>, C. Lupi<sup>2</sup>, M.A. Gonzalez<sup>2</sup>, L. Weitz<sup>2</sup>, J. Kors<sup>2</sup>, P. Loreti Gambaccini<sup>2</sup>, N.F. Cardozo<sup>2</sup>

<sup>1</sup>Fundacion Huesped, Buenos Aires, Argentina, <sup>2</sup>Fundación Huésped, Buenos Aires, Argentina

**Background:** An argentinian organization with over thirty years work on a comprehensive approach to HIV response is working on the consequences of the use of Liquid Silicone Injections (LSI) in the trans community (TC). Focusing on this key population with a high HIV rate has helped identify healthcare barriers due to stigma and discrimination, which complicates seeking care and adequate treatment. There is a central challenge in the use of LSI and its complications on TC living with HIV.

The need to achieve rapid body changes and the pressure of gender stereotypes often leads to dangerous procedures such as body modifications through the use of LSI (studies show that half of TC have done so).

**Methods:** This organization initiated a project with a state health program focused on gender and diversity. The research involved a descriptive diagnose study with a cross-sectional qualitative methodology, including a literature review and 14 in-depth interviews with healthcare professionals regarding the current situation on the consequences of the use of LSI in the TC.

**Results:** The complications of LSI are often caused by the use of high volumes of non approved products, applied by untrained individuals. These complications can be divided into short and long-term, with local, distant, or systemic effects that can be life threatening. The most frequent are long-term complications which involve siliconomas that can cause pain and inflammation, as well as migration and deformities.

Multiple specialties are involved in addressing these complications, including surgery, rheumatology, dermatology, and palliative care. Guidelines tend to focus on prevention but lack specific information on how to manage these complications.

Moreover, the existing knowledge comes from the experience of professionals who report individual cases.

**Conclusions:** There is no evidence-based clinical practice guideline that addresses comprehensively the diagnosis, treatment, and management of complications due to the use of LSI.

It is urgent and necessary to highlight this issue and to engage in scientific discussion to develop standardized responses to improve the quality of life of transgender community and its healthcare access, particularly for those who live with HIV and are affected by the use of SLI.

## WEPED466

Violence response intervention provided by peers is more effective to that provided by traditional health care workers

A. Mwakibete<sup>1</sup>, E. Mpinga<sup>1</sup>, A. John<sup>1</sup>, E. Herman<sup>1</sup>, N. Persaud<sup>2</sup>, D. Carpenter<sup>2</sup>, C.F. Walker<sup>2</sup>, C. Akolo<sup>2</sup>, J. Ng'weshemi<sup>1</sup>, B. Ogwang<sup>1</sup>, D. Boyee<sup>1</sup>

<sup>1</sup>FHI 360, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>FHI 360, Washington DC, United States

**Background:** Violence remains a significant barrier for key and vulnerable populations (KVP) to access health services in both communities and facilities. In Tanzania, 27% of women aged 15-49 years have experienced physical violence, and 12% experienced sexual violence; 38% of these reported seeking help. Peer-led approaches are known to be good strategies for violence prevention and response (VPR). It is speculated that, among violence survivors it's easier to disclose violence experience to a peer than to a health care provider (HCP). EpiC, a PEPFAR/USAID-funded project is using peer-led approach to reach KVP with education, information, and messages about VPR to create a supportive environment for survivors to seek help.

We aim to quantify the outcomes of peer-led approach in helping KVP access post violence care health services.

**Description:** From October-December 2022, 141 peer educators and navigators (PE/PN) in 11 regions were trained on VPR as community VPR teams. We analyzed routine data on violence among KVP who accessed biomedical services between January 2023 and September 2023, and those who disclosed violence at the community through peers.

We determined the rate of disclosure of violence through VPR teams against disclosure through health care providers while accessing biomedical services and determined proportion that received different services.

**Lessons learned:** 2,186 KVP disclosed violence during biomedical services while 4,102 KVP disclosed violence through peers (3,310 experienced physical/emotional and 566 sexual violence). The violence experience disclosure rate was 47% higher among KVP reached by PE/PN than those reached during biomedical services. 20% of violence survivors reported through HCP while accessing biomedical services referred for post-violence care.

Among those KVP disclosed violence through peers, 3,603 received first-line support, and 65% (2,375/3,603) referred for post-violence services. 16% (380/2375) received HTS, 7 tested HIV positive, and 6 linked to HIV treatment. 1% (24/2375) of those referred received contraceptives and 2% (49/2375) received post-exposure prophylaxis (PEP).

**Conclusions/Next steps:** Peer-led community VPR teams can be an effective approach for coordinating prevention and response among survivors. A well-coordinated VPR presents an opportunity for KVP to access health services. Scaling up the use of peers for VPR is important strategy for effective programming.

### Characterization of neighborhood violence and HIV/STI testing among sexual minority youth in the United States using the 2021 youth risk behavior surveillance system

B.P. Takenaka<sup>1</sup>, S. Weerakoon<sup>2,3</sup>, M. Sobrino<sup>4</sup>, M.J. Bustamante<sup>5</sup>, C. Herrera<sup>6</sup>, J. Flores<sup>7</sup>, F. Sesenu<sup>8</sup>, R. Johnson<sup>9,10</sup>, K. Ansarizadeh<sup>11</sup>, U. Nwaozuru<sup>12</sup>, I. Opara<sup>1</sup>  
<sup>1</sup>*Yale School of Public Health, Social and Behavioral Sciences, New Haven, United States*, <sup>2</sup>*Yale School of Public Health, New Haven, United States*, <sup>3</sup>*Yale School of Medicine, New Haven, United States*, <sup>4</sup>*City University of New York (CUNY), Basic and Applied Social Psychology, New York City, United States*, <sup>5</sup>*Boston University, Boston, United States*, <sup>6</sup>*Northeastern University, Institute for Health Equity and Social Justice Research, Boston, United States*, <sup>7</sup>*George Washington University, Psychological & Brain Sciences, Washington, United States*, <sup>8</sup>*University of Kentucky College of Communication and Information, Lexington, United States*, <sup>9</sup>*Harvard Medical School, Boston, United States*, <sup>10</sup>*Massachusetts General Hospital, Boston, United States*, <sup>11</sup>*Washington University School of Medicine in St. Louis, St. Louis, United States*, <sup>12</sup>*Wake Forest University, School of Medicine, Winston-Salem, United States*

**Background:** Within the U.S., HIV/STIs continue to structurally oppress Black and Brown sexuality minority youth (SMY). Preventative measures such as frequent testing remain low for SMY and further inequities among SMY of color. Access to HIV/STI prevention measures among SMY may largely be shaped by socio-structural factors such as neighborhood violence.

Thus, we examine the associations between HIV/STI testing and neighborhood violence among SMY in the US.

**Methods:** We analyzed 2021 CDC Youth Risk Behavioral Surveillance System (YRBSS). Multivariate logistic regressions models were used to determine odds of testing for HIV/STIs among SMY of color, with experienced neighborhood violence.

Interaction analysis explored the intersection of ethnoracial identity and HIV/STI testing among SMY; separate models were run for each predictor. Analyses conducted in IBM SPSS.

**Results:** Among 4240 SMY, approximately 7% ever tested for HIV and 6% for STIs. We observed statistically significant decreased odds HIV/STI testing among SMY who witnessed someone being attacked in their neighborhood ( $\alpha\text{OR}=0.274$ ; 95% CI: 0.274, 0.512 &  $\alpha\text{OR}=0.478$ ; 95% CI: 0.345, 0.663), not attending school due to not feeling unsafe on their way to or from ( $\alpha\text{OR}=0.369$ ; 95% CI: 0.262, 0.520 &  $\alpha\text{OR}=0.594$ ; 95% CI: 0.404, 0.873), and were themselves threatened or injured with a weapon at school ( $\alpha\text{OR}=0.469$ ; 95% CI: 0.249, 0.547 &  $\alpha\text{OR}=0.599$ ; 95% CI: 0.381, 0.940). Black SMY and SMY of other/multiple ethnoracial identities showed decreased odds of ever testing for HIV if they were ever witnessed someone attacked in their neigh-

borhood ( $\alpha\text{OR}=0.388$ ; 95% CI: 0.220, 0.686 &  $\alpha\text{OR}=0.309$ ; 95% CI: 0.207, 0.406) and were themselves threatened or injured with a weapon at school ( $\alpha\text{OR}=0.316$ ; 95% CI: 0.127, 0.788 &  $\alpha\text{OR}=0.323$ ; 95% CI: 0.182, 0.572) compared to their White counterparts. Similar trends among Black SMY and SMY of other/multiple ethnoracial identities were observable for STI testing.

**Conclusions:** Decreased odds in HIV/STI testing among SMY, particularly Black and SMY of other/multiple ethnoracial identities highlight neighborhood violence as a possible target of future intervention and equitable HIV/STI testing policies.

Future work may benefit from qualitative perspectives and the utility of local spatial units of how intersectional experiences of neighborhood violence impede access to and utilization of testing among SMY.

## WEPED468

### Ukrainian refugees in European countries: barriers, solutions and best practices access to HIV and tuberculosis care

D. Kashnitsky<sup>1</sup>, O. Maksimenko<sup>2</sup>, Z. Abrosimova<sup>3</sup>, K. Rivera<sup>4</sup>, O. Savenko<sup>5</sup>, T. Makarevich<sup>6</sup>, V. Rabinciu<sup>7</sup>, G. Kvinikadze<sup>8</sup>  
<sup>1</sup>*Paris Cité University, Cermes3, Villejuif, France*, <sup>2</sup>*Kyiv-Mohyla Academy, Sociology, Kyiv, Ukraine*, <sup>3</sup>*Regional Expert Group on Migration and Health, Academic Relations, Tbilisi, Georgia*, <sup>4</sup>*Regional Expert Group on Migration and Health, Berlin, Germany*, <sup>5</sup>*Ukrainischer Verein in Niedersachsen - UVN e. V., Hannover, Germany*, <sup>6</sup>*WHO Poland, Warsaw, Poland*, <sup>7</sup>*Community centre PULS, Bălți, Moldova, the Republic of*, <sup>8</sup>*Tbilisi State University, Tbilisi, Georgia*

**Background:** HIV incidence rate in Ukraine was 37 people per 100 thousand people in 2021, whereas the number of people living with HIV was estimated at 240,000. Existing HIV rates in Ukraine are 6 times higher than in the EU average. European Center for Disease Prevention and Control estimated the number of Ukrainian refugees living with HIV staying in the EU countries in the range from 9000 to 33 000 in the first months following the start of the Russian aggression against Ukraine.

**Methods:** A qualitative study was carried out with Ukrainian refugees in 6 receiving countries: Germany, Poland, France, Lithuania, Georgia, and Moldova. We interviewed Ukrainian refugees living with HIV and/or affected by TB as well as care providers and public health experts (total number of interviews = 89).

The aim of the study was to explore barriers in access to care, the role of stigma and of discrimination, formal and informal strategies for overcoming the barriers, success stories, including civil society practices.

**Results:** European countries have demonstrated unprecedented support for Ukrainian refugees, extending assistance to individuals living with HIV and other key affected populations. However, amidst this commendable effort,

systemic challenges, particularly bureaucratic complexities, necessitate proactive interventions from social workers and volunteers, who often possess limited knowledge about social diseases.

Adaptation difficulties have a detrimental impact on treatment adherence, with refugees prioritizing basic needs amid overwhelmed healthcare systems in some host countries, notably Germany and Poland, which received the highest numbers of refugees.

Addressing post-traumatic stress disorder and providing mental health support, alongside extended waiting times and limited access to community groups for people living with HIV, presents a substantial challenge to the well-being and a comprehensive care of Ukrainian refugees in Europe.

**Conclusions:** EU countries set an unprecedented benchmark for Ukrainian refugees implementing the "temporary protection" policy although not fully in line with the specific needs of key populations.

It is much recommended to give a voice to community based groups among Ukrainian refugees and adapt existing services as well as decision and funding mechanisms in HIV care for migrants and refugees.

## WEPED469

### Emerging HIV vulnerability: a comparative analysis of HIV prevention and care outcomes among Young Transgender Women in Brazil

E. Jalli<sup>1</sup>, C. Coutinho<sup>1</sup>, T. Warggas<sup>1</sup>, E. Peixoto<sup>1</sup>, C. Arsolino<sup>1</sup>, C. Yanovich<sup>1</sup>, N. Bertoni<sup>1</sup>, I. Moura<sup>1</sup>, R. Moreira<sup>1</sup>, M. Silva<sup>1</sup>, S. Cardoso<sup>1</sup>, L. Monteiro<sup>1</sup>, V. Veloso<sup>1</sup>, S. Teixeira<sup>2</sup>, B. Grinsztejn<sup>1</sup>, E. Wilson<sup>3</sup>, BeT study group

<sup>1</sup>Oswaldo Cruz Foundation, Evandro Chagas National Institute of Infectious Diseases, Rio de Janeiro, Brazil, <sup>2</sup>Oswaldo Cruz Foundation, Oswaldo Cruz Institute, Rio de Janeiro, Brazil, <sup>3</sup>Center for Public Health Research, San Francisco Department of Public Health, San Francisco, United States

**Background:** Addressing the HIV epidemic among young transgender women (YTGW) in Latin America requires targeted interventions for prevention and care. This study assessed the impact of an intervention by comparing HIV prevention/care outcomes pre- and post-intervention among Brazilian YTGW.

**Methods:** Data are from the baseline assessment of an HIV status-neutral-intervention study conducted in Rio de Janeiro, Brazil, between February-July 2022. YTGW (18-24 years) participated in structured surveys and underwent testing for HIV. Participants were categorized into HIV-negative, known, and newly diagnosed (self-reported HIV-negative who tested HIV-positive). HIV knowledge was assessed using an adapted HIV Knowledge Questionnaire-10 with 8 items. Recent HIV infection was identified using Maxim HIV-1 Lag-Avidity EIA assay.

Multivariable analysis compared newly diagnosed YTGW to those who were HIV-negative.

**Results:** Among 164 YTW, 13% (n=21) were living with HIV [LWH], with 68% (n=15) unaware of their HIV status, including 33% (4/12) recently acquiring it. Compared to youth with known HIV-positive status, newly diagnosed YTGW identified as Black/*Pardo* (67% vs. 43%), live with parents/family (74% vs. 14%), and have fewer housing concerns (27% vs. 43%). In comparison to HIV-negative YTGW, those newly diagnosed had less education (40% vs. 70%), more transactional sex (66% vs. 46%), reported an unknown number of sexual partners (40% vs. 19%), and had lower HIV knowledge (47% vs. 23%). Lower education (aOR:7.99[95%CI:1.78-47.85]) and moderate/high risk of crack/cocaine use (aOR:8.6[95%CI:1.44-54.91]) were associated with higher odds of new HIV diagnosis. Participants aged 20-24 years had lower odds of new HIV diagnosis (aOR:0.18[95%CI:0.04-0.73]).

	Total n=164	HIV new diagnosis n=15 (9%)	HIV negative n=142 (87%)	HIV known diagnosis n=7 (4%)

Partner	9 (5%)	1 (7%)	8 (6%)	0 (0%)
Friends	15 (9%)	0 (0%)	14 (10%)	1 (14%)
Other	8 (5%)	1 (7%)	5 (4%)	2 (29%)
Had concerns with housing situation <sup>1</sup>	45 (27%)	4 (27%)	38 (27%)	3 (43%)
Had food insecurity <sup>2</sup>	97 (59%)	7 (47%)	87 (61%)	3 (43%)
Crack/cocaine use				
Low risk	149 (91%)	133 (94%)	5 (71%)	11 (73%)
Moderate/high risk	15 (9%)	9 (6%)	2 (29%)	4 (27%)
Transactional sex	81 (50%)	10 (66%)	65 (46%)	6 (86%)
Unknown HIV status of sex partners	36 (22%)	6 (40%)	27 (19%)	3 (43%)
Low HIV knowledge <sup>3</sup>	43 (26%)	7 (47%)	33 (23%)	2 (29%)

IQR: interquartile range, TGW: transgender women. <sup>1</sup>In prior 6 months, <sup>2</sup>In prior 3 months, <sup>3</sup>HIV knowledge range:0-8, low knowledge <6.

Table 2. Factors associated with a new HIV diagnosis among YTW enrolled in BeT study, Rio de Janeiro, Brazil, 2022.

Variables <sup>1</sup>	aOR	95%CI	p-value
Age 20-24	0.18	0.04-0.73	0.021
Schooling ≤8 years	7.99	1.78-47.85	0.017
Schooling 9-11 years	1.6	0.33-7.18	0.543
Moderate/high risk of crack/cocaine use <sup>2</sup>	8.6	1.44-54.91	0.018
Low HIV knowledge	3.02	0.83-11.52	0.094

aOR: associated odds ratio, CI: confidence interval, YTW: young transgender women. <sup>1</sup>Adjusted for Race, transactional sex, fillers, and binge drinking. <sup>2</sup>Measured by the "Alcohol, Smoking and Substance Involvement Screening Test" (ASSIST); score range:0-12, moderate/high risk>2.

Table 1. Sociodemographics, sexual behavior and HIV knowledge among young TGW enrolled in BeT study, Rio de Janeiro, Brazil, 2022.

**Conclusions:** The findings highlight a lack of awareness of HIV-positive status among many YTGW, emphasizing the need for tailored interventions addressing the intersection of HIV prevention, social factors, and structural needs for this vulnerable youth population. Interventions should include education, substance use reduction, and comprehensive support to effectively curb the HIV epidemic in YTGW.

HIV/AIDS prevention materials at funk parties and high school students: a qualitative study in Heliópolis Favela, Brazil

T. Corsino<sup>1</sup>, V. Paiva<sup>1</sup>, V. Silva<sup>1</sup>, AIDS Prevention Nucleus of the University of São Paulo (NEPAIDS)

<sup>1</sup>University of São Paulo / Institute of Psychology, Department of Social Psychology, São Paulo – SP, Brazil

**Background:** STI/AIDS prevention communication to young people has been quite invisible for years as it disseminates decontextualized information, due to preventive strategies that don't include this key population in their development and implementation process. Preventive materials are distributed at funk parties, cultural events of Brazilian peripheries, to reach socially vulnerable population.

We sought to understand how favela young people evaluate materials distributed at these events.

**Methods:** A semi-structured interview was conducted in 2023 with the coordinator of "Heliópolis Investindo na Vida" (H.I.V.) project, which aims to prevent HIV/AIDS in Heliópolis region of São Paulo, Brazil. Preventive materials produced by the project and disseminated at funk parties during 2022 - a pamphlet and preventive materials, including condoms - were indicated as the key material for evaluation.

A talking circle was held in September 2023 with students from Heliópolis School (aged 16-18) to discuss the distribution strategy, acceptability and quality of these materials. The analysis was based on Vulnerability and Human Rights framework applied to health.

**Results:** Ten students living in the Heliópolis region were included in the study, 3 black cis women, 5 white cis women and 2 white cis men. Regarding the distribution of the materials, they agreed that they would not take the pamphlets. If they did, they wouldn't read it and would discard it.

Still, they wouldn't accept condoms due to potential judgment from friends and family, upon returning home, and pointed out the difficulty in hearing the people distributing the materials, because of very loud sound.

Regarding the pamphlet, they indicated excessive text, lack of illustrations and a bad overuse of slang. They suggested visual elements be more contextualized with funk parties. Finally, they pointed to party DJs as the best potential communication channels about prevention information in these events.

**Conclusions:** There are challenges to implementing prevention strategies to peripheral young people. Although developed in the area where they are distributed, the results suggest that the prevention materials could be better received if they keeping coherence with the specificities of funk parties. HIV/AIDS prevention contextualized to this cultural and health space should be better explored by IST/AIDS programs with youth participation.

## WEPED471

Prediction of substance use among 10974 individuals using machine learning algorithms

E. Mekhael<sup>1</sup>, M. Saade<sup>1</sup>, N. Nassim<sup>1</sup>, F. Khalil<sup>2</sup>, A. Assi<sup>2,1</sup>, S. Abu Zaki<sup>2</sup>

<sup>1</sup>University of Saint Joseph, Beirut, Lebanon, <sup>2</sup>Marsa Sexual Health Center, Beirut, Lebanon

**Background:** There has been a rise in substance-use and chemsex among people in Lebanon as a result of the compounded socio-economic and political crises the country has been experiencing since 2019. Given the shortage of accessible and non-stigmatizing harm reduction services, people who use substances, and particularly those who use substances during or prior to sexual activity, are at risk of potential harm to their health and well-being. The stigmatization of substance-use and sexual and reproductive health have led to a scarcity in data on substance-use and chemsex limiting the ability of public health interventions to appropriately respond to the rising trend.

As such, this study aims to investigate the main predictors of substance-use among young individuals voluntarily accessing anonymous sexual health services in Beirut.

**Methods:** An anonymous standardized questionnaire was administered by a healthcare provider to subjects who presented to a sexual-health clinic in Lebanon between 2015 and 2023. Data on demographics, substance-use, sources of sexual education, sexual practices, and condom-use were collected.

The main predictors of substance-use were determined using two separate machine-learning models (for drug and alcohol-use) with calculation of the percentage of contribution to the prediction.

**Results:** 10974 subjects (27%F, 54%M, 18%other, age: 32±7 years) were enrolled. The main predictors of drug-use were cigarette smoking and sexual practices (percentage of contribution: 32% and 29% respectively), with an accuracy of prediction of 76%, a recall of 81% and AUC (area under the curve) of 73% (IC95%: 71-75%).

The main predictors of alcohol-use were level of education, source of sexual education and age (percentage of contribution: 34%, 11 and 11% respectively), with an accuracy of prediction of 81%, a recall of 92% and AUC (area under the curve) of 75% (IC95%: 73-77%).

**Conclusions:** The findings highlight the significance of cigarette smoking as a major predictor of drug-use, emphasizing the need for targeted interventions for smoking and use of other substances.

Additionally, the association between unreliable sources of sexual education with substance-use reveals a need for incorporating integrated inclusive and non-stigmatizing public health interventions addressing both sexual health education and harm reduction to minimize the risks of substance-use and enhance overall well-being.

## WEPED472

### Unravelling barriers: a study on access challenges to HIV prevention services among adolescent and young men who have sex with men in Mexico

F. Rivera-Buendía<sup>1</sup>, M. Leyva-Hernández<sup>1</sup>, N. Izquierdo-Gutiérrez<sup>1</sup>, S. Bautista-Arredondo<sup>2</sup>, A. Piñeirúa-Menéndez<sup>1</sup>

<sup>1</sup>CISIDATAC, Cuernavaca, Mexico, <sup>2</sup>Instituto Nacional de Salud Pública, Cuernavaca, Mexico

**Background:** In the current landscape, adolescents and young adults are disproportionately affected by new HIV infections globally. In Mexico, studies highlight that youth and male-male sexual encounters contribute to clustered HIV outbreaks. Notably, findings from the ImPrEP project emphasized that older age and higher education levels correlated with better retention in PrEP. Despite these insights, HIV prevention strategies inadequately target young individuals.

This study aims to uncover barriers obstructing access to HIV prevention for adolescents and young men who have sex with men (AYMSM) in Mexico.

**Methods:** Conducted in collaboration with Community Led Organizations in Chiapas, Yucatán, and Jalisco states, this study involves data obtained through structured questionnaires from AYMSM reaching HIV prevention services.

We collected information regarding sociodemographic characteristics, sexual behavior, drug use and perceived barriers to access services. Using Likert scales, all answers reported as significant or very significant in the perceived barriers section were considered as "identified barriers". A comparison between those identifying or not identifying barriers was then conducted.

	Overall n=392 (%)	Did not identified barriers n=240 (%)	Identified barriers n=152 (%)	P-value
Education				
Primary school or less	44 (11.22)	28 (11.7)	16 (10.5)	NS
Financially dependent	174 (44.4)	95 (39.6)	79 (52)	<0.001
Condomless anal sex in the last 6 months	215 (54.9)	107 (44.6)	108 (71.1)	<0.001
Have felt pressured to have unprotected sex	24 (6.4)	1 (0.4)	24 (15.8)	<0.001
Chemsex				
Rarely	5 (1.1)	25 (37.3)	30 (26.8)	<0.001
Often	21 (46.7)	12 (17.9)	33 (29.5)	
Usually	16 (35.6)	8 (11.9)	24 (21.4)	
Unknown	1 (2.2)	8 (11.94)	9 (8)	
Preferred not to answer	2 (4.4)	14 (20.9)	16 (14.3)	
Distance from their home to the HIV community center				
<60 minutes	343 (87.5)	219 (91.3)	124 (81.6)	0.005
≥60 minutes	49 (12.5)	21 (8.8)	28 (18.4)	

**Results:** A total of 392 participants were included, 38.8% (152) identified at least one barrier to accessing prevention services. Mean age of participants was 21.1 yrs (SD 1.09). Among the reported barriers, 20.2% cited non-friendly

services, 16.3% mentioned inconvenient time schedules, 18.1% indicated economic limitations, 19.4% highlighted transportation issues, and 20% pointed to stigma. Notably, only 2.8% of the total participants were using PrEP. Table 1 provides a summary of observed differences between AYMSM's perception of or lack of perception of barriers to accessing services.

**Conclusions:** AYMSM experiencing economic dependence and reporting higher risk sexual behaviors perceived significantly more barriers to access HIV prevention services. Adequately targeting their specific needs is key in order to improve PrEP and PEP uptake, as well as timely HIV diagnosis in this particular population.

## WEPED473

### Older people with HIV living in Ukraine during crisis: mental health and substance use implications

L. Bulka<sup>1</sup>, I. Zaviryukha<sup>2</sup>, O. Zeziulin<sup>2</sup>, S. Shenoi<sup>3</sup>, R. Greenley<sup>4</sup>, J. Rozanova<sup>3</sup>

<sup>1</sup>King's College London, London, United Kingdom,

<sup>2</sup>European Institute of Public Health Policy, Kyiv, Ukraine,

<sup>3</sup>Yale University, New Haven, United States, <sup>4</sup>London

School of Hygiene and Tropical Medicine, London, United Kingdom

**Background:** Ukraine has the second highest rate of new HIV cases in Europe and roughly 25% are older people with HIV (OPWH), defined by UNAIDS as individuals 50 years or older. OPWH often navigate complex stressors related to chronic diseases, mental health, substance use, ageism, and stigma. Existing stressors were exacerbated by the 2022 Russian invasion of Ukraine.

This analysis sought to examine the impact of crisis on the mental health and resilience of a sample of OPWH, and to assess any variation in outcomes between those with a diagnosed substance use disorder and those without.

**Methods:** The quantitative analysis assessed data from a sample of 98 OPWH recruited from two HIV clinics in Kyiv. The analysis used data collected through telephone questionnaires from May – July 2022. Primary outcomes included depression, anxiety, and trauma symptoms, as well as resilience scores.

Multivariable logistic regression models were constructed to assess the impact of prior substance use on mental health symptoms and self-perceived resilience during humanitarian crisis.

**Results:** The prevalence of mental health symptoms was high among the sample, with over 70% reporting depression symptoms, nearly 60% reporting anxiety symptoms, and over 60% reporting 6 or more trauma symptoms.

Gender, age, employment, chronic diseases, war-related experiences, and substance use disorder diagnosis were associated with negative mental health outcomes. Participants diagnosed with a substance use disorder were

4 times more likely to report depression symptoms, 9 times more likely to report anxiety symptoms, and nearly 7 times more likely to report 6 or more trauma symptoms. However, they were 4.5 times more likely to score higher on the Brief Resilience Scale than those without a substance use disorder.

**Conclusions:** These findings indicate that a substance use disorder diagnosis was the greatest predictor of mental health outcomes within the sample of OPWH. However, it was also a predictor of higher self-perceived resilience. The findings support a need for strengths-based approaches in HIV care that acknowledge the skills and psychological resources of individuals in recovery. Future research is needed to investigate the role of overcoming addiction in building resilience from the perspective of service users.

## WEPED474

### Sexualised drug use among transgender women in the TransCITAR cohort in Argentina

I. Aristegui<sup>1</sup>, P.D. Radusky<sup>1,2</sup>, E. Frontini<sup>1</sup>, N. Cardozo<sup>1,3,4</sup>, R. Caballero<sup>1,2</sup>, M. Duarte<sup>1</sup>, A.C. Zeltman<sup>1</sup>, R. Acuña<sup>1</sup>, M.C. Trejo<sup>1</sup>, A. Exner<sup>1</sup>, D. Salusso<sup>1</sup>, V. Zalazar<sup>1</sup>, M.I. Figueroa<sup>1</sup>, TransCITAR Study Group

<sup>1</sup>Fundacion Huesped, Research Department, Buenos Aires, Argentina, <sup>2</sup>Universidad de Buenos Aires, Facultad de Psicología, Buenos Aires, Argentina, <sup>3</sup>Asociacion de Travestis, Transexuales y Transgeneros de Argentina, Buenos Aires, Argentina, <sup>4</sup>Casa Trans, Buenos Aires, Argentina

**Background:** Sexualised drug use (SDU), including chemsex, is a public health concern as it increases the risk of HIV acquisition and mental health problems. It has been widely studied among men who have sex with men; however, information is scarce among transgender women (TGW).

This work aimed to estimate the prevalence of SDU and its associated factors in TGW participating in TransCITAR cohort study in Buenos Aires, Argentina.

**Methods:** This study analyzed the subsample of TGW from TransCITAR, a cohort study that assesses physical and mental health of transgender and non-binary people. Participants were enrolled between Sept/2019-2022 and completed questionnaires on sociodemographic variables, alcohol use (AUDIT  $\geq 8$ ), illicit drug use (DAST-10  $\geq 6$ ), sexual behavior (condomless anal sex [CAS]). SDU was defined as having used any illicit drug (cocaine, crack, ecstasy or other amphetamines, ketamine, meth, and poppers) before/during sex in the last month. Bivariate analyses were conducted to explore associations with SDU.

**Results:** Sample consisted of 413 TGW with a median age of 31 years (IQR: 26-38). Sociodemographic characteristics of the sample were: 31.2% foreign-born, 41.6% unstable housing, 50.6% incomplete high school or lower educa-

tional level, 54.7% current engagement in sex work and 43.1% were living with HIV. More than a half (58.1%) reported SDU in the last month, being the most frequently used cocaine (29.9%), ecstasy (5.8%), crack (2.2%), ketamine (1.9%), amphetamines (1.5%), and poppers (0.2%). Among the participants, 23.3% showed hazardous drinking, 4.4% possible drug dependence, and 32.4% significant depressive symptoms.

A considerable proportion (39.2%) reported CAS at least once in the last month. SDU was associated with unstable housing (OR=1.72; 95%CI=1.15-2.58), current sex work (OR=2.85; 95%CI=1.90-4.24) and depressive symptoms (OR=1.60; 95%CI=1.04-2.45).

**Conclusions:** SDU among TGW is substantial. However, unlike other key populations, it seems to be more associated to sex work in a context of psychosocial vulnerability than to recreational purposes.

More studies are required to better understand this phenomenon of SDU among TGW from Latin America, to explore motives and implications and compare patterns of behavior with other populations and regions of the world.

## WEPED475

### Pilot SMART trial of motivational enhancement interventions to increase pre-exposure prophylaxis use in sexual minority men

L. Davis Ewart<sup>1</sup>, D. Ghanooni<sup>1</sup>, M. Larson<sup>1</sup>, R. Verhagen<sup>2</sup>, J. Manuel<sup>3</sup>, B. DeVries<sup>2</sup>, S. Doblecki-Lewis<sup>2</sup>, I. Nahum-Shani<sup>4</sup>, C. Grov<sup>5</sup>, A.W. Carrico<sup>1</sup>

<sup>1</sup>Florida International University, Health Promotion and Disease Prevention, Miami, United States, <sup>2</sup>University of Miami, Miami, United States, <sup>3</sup>University of California, San Francisco, San Francisco, United States, <sup>4</sup>University of Michigan, Ann Arbor, United States, <sup>5</sup>City University of New York, New York, United States

**Background:** Although pre-exposure prophylaxis (PrEP) could substantially mitigate HIV risk, sexual minority men (SMM) who use stimulants commonly experience difficulties with engaging in PrEP clinical services. Motivational interviewing (MI) and contingency management (CM) reduce substance use and condomless anal sex in this population, but interventions require adaptation to promote engagement along the PrEP care continuum.

**Methods:** This pilot sequential multiple assignment randomized trial (SMART) tested the feasibility, acceptability, and preliminary effectiveness of distinct combinations of telehealth MI and CM in 70 SMM who use stimulants that were not currently taking PrEP. A national US sample was recruited via social networking applications to complete a baseline assessment and mail-in HIV testing.

Those with non-reactive HIV results are randomized to either:

1. A 2-session MI intervention focusing on PrEP use and concomitant stimulant use or condomless anal sex; or,

2. A CM intervention with incentives for evidence of PrEP clinical evaluation by a medical provider (\$50) and filling a PrEP prescription (\$50). The primary outcome was documented evidence of filling a PrEP prescription (e.g., photo of a medication bottle) over 6 months.

**Results:** There were high rates of engagement in the MI and CM interventions. Participants completed 75 of 78 MI sessions (96%) and 100% received overviews of CM financial incentives. Sessions rated using the MI Treatment Integrity (MITI) fidelity rating system were indicative of high levels of facilitator adherence to the intervention protocol.

Mean MITI global scores generally exceeded 4 out of 5: cultivating change talk mean 4.36 (SD = 0.6); softening sustain talk mean 3.91 (SD = 0.51); partnership 4.46 (SD = 0.57) and empathy mean 4.24 (SD = 0.59).

More than one-third of randomized participants (27/70; 39%) provided documented evidence of PrEP use over the 6-month follow-up, but there were not significant differences between those initially randomized to MI versus CM (OR = 1.01; 95% CI = 0.35, 2.87).

**Conclusions:** Telehealth motivational enhancement interventions are feasible and acceptable with SMM who use stimulants. Although we observed a high rate of PrEP use over follow-up, more definitive randomized controlled trials are needed to test distinct combinations of MI and CM.

## WEPED476

### Leveraging the Needle Syringe Program for harm reduction among persons who inject drugs in Nigeria

**Background:** The United Nations in 2019 issued a ministerial declaration on the need to strengthen actions at the national, regional, and international levels to accelerate the implementation of joint commitments to address and counter the world drug problem. Per the Nigeria national drug use survey, 14.4% of the general population use drugs, a rate higher than the global average of 5.6%. People who inject drugs (PWIDs) can thus, be associated with increased transmission of HIV and blood-borne infections like Hepatitis B&C. The Global Fund (GF) in collaboration with the National Agency for Control of AIDS (NACA), the Federal Ministry of Health (FMoH), through FHI360 supported the scale-up of NSP among PWIDs between July 2022 and December 2023.

This study examines the scale-up of NSP during the intervention period.

**Methods:** The study is a retrospective review of program data for NSP and associated services including Opioid overdose management, and wound management provided to PWIDs in 7 states from July 2021 – November 2023 in Nigeria. Community facilitators were engaged to provide clean needles to PWIDs while retrieving used needles for disposal.

Data was obtained from the District Health Information System (DHIS) and the registers. Data was analysed with Person correlation statistic.

**Results:** A total of 48,205 (Male = 36,865(76.4%), Female =11,340(23.6%)) PWIDs were enrolled on NSP. They were provided with a total of 2,715,113 (male=2,087,844, female=627,269) needles and syringes with 2,099,427 (male =1,606,840(76.5%), female =492,587(23.5%) syringes retrieved. A total of 253 (211M, 42F) PWIDs were treated for injection-related wounds, while 8 (7M, 1F) PWIDs were treated for opioid overdose with Naloxone.

Also, there was significant relationship between PWID recruited for treatment/care and needles and syringes distributed ( $r$ -value = 0.916\*\* $;$   $p$  =0.000)

**Conclusions:** The NAHI grant ensured that PWIDs who share needles were provided with clean and safe needles, while clients who had opioid-related overdoses were treated with Naloxone.

This continuous access to NSP services will lead to a reduction in HIV and other blood-borne infections if sustained. There is a need to scale up the intervention to ensure more PWIDs are reached with the services for better outcomes.

## Sexuality, gender, relationships and sexual cultures

### WEPED477

Sexual minority men's experiences of, and strategies for emotional intimacy in intimate partner relationships – findings from a photovoice study

C. Fernandez<sup>1</sup>, N. Gao<sup>2</sup>, M. Wilson<sup>3</sup>, T. Goodyear<sup>2</sup>, Z. Seidler<sup>4</sup>, P. Sharp<sup>5</sup>, S. Rice<sup>6</sup>, A. Krusi<sup>1</sup>, M. Gilbert<sup>1</sup>, J. Olliffe<sup>2</sup>

<sup>1</sup>University of British Columbia, School of Population and Public Health, Vancouver, Canada, <sup>2</sup>University of British Columbia, School of Nursing, Vancouver, Canada, <sup>3</sup>University of Melbourne, Centre for Youth Mental Health, Melbourne, Australia, <sup>4</sup>Movember, Melbourne, Australia, <sup>5</sup>University of New South Wales, Sydney, Australia, <sup>6</sup>University of Melbourne, Orygen, Melbourne, Australia

**Background:** Emotional intimacy is fundamental to promote intimate relationship quality and satisfaction. However, research on emotional intimacy has predominantly focused on heterosexual relationships, with little evidence about sexual minority men's experiences of, and strategies for emotional intimacy.

The overemphasis on sexual minority men's sexual practices and sexual health vulnerabilities in existing sexual minority men research has also undersold emotional intimacy as a critical asset for sexual minority men to build healthy and sustainable relationships, and aid their psychological well-being.

Hence, using a strengths-based approach, this study aimed to understand sexual minority men's experiences of, and strategies for emotional intimacy in their intimate relationships.

**Methods:** Building on a larger qualitative photovoice study that explored men's experiences and strategies in building equitable intimate partner relationships, this analysis focused on the experiences of 16 sexual minority men from diverse locales globally.

Participants were recruited via online recruitment platforms including Twitter, and completed virtual, semi-structured, individual Zoom photovoice interviews between May to November 2022. Data was transcribed verbatim, coded using NVIVO 12 and thematically analyzed using interpretive descriptive methodologies.

**Results:** Three distinct yet entwined themes characterized emotional intimacy in sexual minority men's relationships.

In the first theme, i) *embracing vulnerabilities to drive self-acceptance*, courage, resilience and introspection underpinned sexual minority men's efforts to tackle wide-ranging challenges that threaten emotional intimacy in their relationships.

In theme two, ii) *building relationality with partners*, participants spoke about the value of empathy, trust and compromise in their communication and support for each other.

Lastly, in iii) *securing social connections with family, friends and the community*, the need for familial, friends' and community acceptance was positioned by participants as key to promoting their sense of belonging, which bolstered emotional intimacy in their relationships.

**Conclusions:** These insights highlight emotional intimacy as a prized asset for sexual minority men and foundation for building healthy relationships. The thematic findings can inform health promotion efforts to reduce risks for distressed and/or disrupted intimate partner relationships and promote sexual minority men's psychological well-being in the long term.

### WEPED478

Identifying and characterizing relationship typologies by multilevel predictors among adolescent mothers in sub-Saharan Africa

L. Gebrekristos<sup>1</sup>, A. Groves<sup>2</sup>, M. Stoner<sup>3</sup>, A. Ezech<sup>2</sup>, L. Robinson<sup>1</sup>, F. Le-Scherban<sup>1</sup>

<sup>1</sup>Drexel University School of Public Health, Epidemiology & Biostatistics, Philadelphia, United States, <sup>2</sup>Drexel University School of Public Health, Community Health & Prevention, Philadelphia, United States, <sup>3</sup>RTI International, Berkeley, United States

**Background:** In sub-Saharan Africa (SSA), there is heterogeneity within adolescent mothers' (AMs') sexual relationships. However, existing studies focus on a single relation-

ship characteristic even though these characteristics do not operate in isolation; moreover, no studies have examined multilevel predictors of AMs' relationship typologies. Identifying and characterizing typologies by multilevel factors can inform targeted interventions to lower HIV risk.

To address these gaps, this study aims to identify relationship typologies and characterize typologies by multilevel factors among AMs.

**Methods:** Data are from the Population-based HIV impact Assessment (PHIA) Project from 9 SSA countries (2015–2019). Using a sample of 2,761 AMs (15–19 years old) across 1,816 PHIA clusters, we conducted multilevel latent class analysis to identify typologies at the AM and PHIA cluster-levels using 5 indicators: uninformed of partner's HIV status, age-disparate relationship (partner <5 versus ≥5 years older), married/cohabiting, participated in transactional sex, and worked in last year.

We conducted multinomial logistic regression to characterize typologies by individual (age, school enrollment, AM's household wealth) and community-level (urbanization and percentage of low-wealth households in PHIA cluster) predictors.

**Results:** There were 3 relationship types.

Typology 1 (61%): Age-disparate marriage with minimal transactional sex;

Typology 2 (30%): Uninformed of partner's HIV status and unmarried peer partnership;

Typology 3 (9%): Working and in an age-disparate marriage.

Compared to Typology 2, Typologies 1 and 3 were characterized by AMs who were older and had low school enrollment; Typology 1 AMs were also more likely to be in low-wealth households and live in rural communities than Typology 2.

We identified 2 classes at the PHIA cluster-level. PHIA Class 1 (51%): high prevalence of Typology 1 AMs; PHIA Class 2 (49%): high prevalence of Typology 2 AMs. Rural and low-wealth communities had higher odds of being in PHIA Class 1.

**Conclusions:** Results suggest that AMs' relationships fall into 3 distinct typologies with age, schooling, household wealth, and urbanization predicting AMs' typology.

Further, 2 PHIA cluster-level classes were identified with urbanization and percentage of low-wealth households predicting these classes.

Further research is needed to understand how interventions can be tailored to specific relationship typologies in this vulnerable population.

## WEPED479

### Similarities and distinctions in the drug use and sexual behavior of transgender women and nonbinary adults assigned male at birth in the United States

D. Cain<sup>1</sup>, H. Thompson<sup>2</sup>, T.J. Starks<sup>1,3</sup>

<sup>1</sup>Hunter College, City University of New York, New York, United States, <sup>2</sup>Howard Brown Health, Chicago, United States, <sup>3</sup>Graduate Center of City University of New York, Doctoral Program in Health Psychology and Clinical Science, New York, United States

**Background:** Transgender women (TW) are at elevated risk for acquiring HIV. Nonbinary assigned male at birth individuals (NBAMAB) are those who exhibit gender fluidity, or identify as both male and female, or no gender, and have largely been overlooked in HIV research. Further, research on substance use and HIV transmission risk behaviors (TRB) among TW and NBAMAB has not investigated relationship factors and their associations with these behaviors.

The goal of this study was to examine similarities and differences of the HIV TRB between TW and NBAMAB with respect to drug use and relationship correlates.

**Methods:** Data were gathered from a large screening survey intended to determine eligibility for various research studies in the United States. Recruitment occurred through social media and geosocial sexual networking apps. Socio-demographics, drug use, sexual behavior, relationship status, sexual agreements, main partner gender, and other partner characteristics were measured. Descriptive comparisons were evaluated in bivariate analyses.

Multi-group hurdle models predicted the occurrence and frequency of condomless anal sex (CAS) with casual cis male partners.

**Results:** Surveys were completed between November 2017 and March 2020 with 2758 TW and 2347 NBAMAB respondents. The likelihood of being single was comparable; however, among those with a main partner, NBAMAB respondents were more likely to have a non-monogamous sexual agreement. In both groups, illicit drug use was associated with higher occurrence and frequency of CAS with casual cis male partners.

Cannabis use was not significantly associated with either. TW with a non-monogamous agreement and either a cis male or a TW main partner reported the highest rates of HIV TRB. For NBAMAB with a non-monogamous agreement, main partner gender identity did not differ with the occurrence or frequency of CAS with casual cis male partners.

**Conclusions:** These results suggest that some NBAMAB may face risks for sexual HIV transmission similar to those seen in TW. Among those who are partnered, differences in HIV TRB between TW and NBAMAB were characterized by sexual agreements, main partner gender identity, and

relationship duration. These findings illustrates that relationship factors may be a substantive determinant of health behavior and should be considered further among gender minorities.

## WEPED480

**Leveraging animated sexuality education videos in rural Namibia: young women and adolescent girls living with HIV take the lead to deliver sexuality education to adolescents in partnership with schools**

H. Nangombe<sup>1</sup>, N. Cheetham<sup>2</sup>, E.A. Georges Stevens<sup>3</sup>

<sup>1</sup>Young Women Empowerment Network, Oshigamba, Namibia, <sup>2</sup>Advocates for Youth, International Youth Health and Rights, Washington, United States, <sup>3</sup>Advocates for Youth, International Youth Health and Rights, Washington, DC, United States

**Background:** The purpose of the program is to engage and reach Adolescent Girls and Young Women (AGYW) ages 10-16 in and out-of-school in rural Namibia with sexuality education.

Objectives include breaking down harmful taboos around sexual health; providing accurate sexual health information; and creating a safe environment.

**Description:** Launched by the Young Women Empowerment Network with Advocates for Youth through the AMAZE initiative, the program focused on identifying priority topics for sexuality education among adolescents, adapting and developing sexuality education animated videos in local languages, and disseminating these with educational brochures through participatory educational sessions and outreach delivered in-school and out-of-school in 5 regions of Namibia (Karas, Kavango East, Oshikoto, Oshana, and Oshana).

Based on discussions with AGYW, four existing AMAZE videos were adapted on sexual abuse, sexual assault, menstruation, HIV disclosure, and one new video developed on mental health. These videos were translated into Oshindonga, Rukwanga, Damara/Nama, and Namibian sign language.

**Lessons learned:** Educational sessions and outreach were conducted using the materials in 18 schools including two special needs schools, four youth centers, four faith-based Sunday schools, teen clubs, and clinics. A total of 2,740 adolescent girls were reached in multiple sessions over eight months, including girls with disabilities and girls living with HIV. Initial anecdotal evidence suggests improved knowledge, heightened awareness of the topics, an increased sense of empowerment, and initiation of health-seeking behavior among adolescent girls.

Best practices included engaging AGYW in content selection, development, and dissemination; investing time to develop trust with schools; and using thumb drives to facilitate offline use and what's app for video sharing.

Main challenges included time needed to adapt and develop materials, identifying additional services to support girls who have been raped, and responding to demand from other schools.

**Conclusions/Next steps:** Many girls in rural Namibia encounter misinformation, health challenges, gender inequality, violence and poor access to sexual and reproductive health services, yet few programmes reach them or respond to their needs. Acknowledging and addressing the knowledge gaps through participatory activities that leverage innovative sexuality education resources in local languages and linkages to services can contribute to empowering girls to stay healthy and seek care.

## WEPED481

**Empowering futures: a comprehensive sex-education initiative for HIV/AIDS and teenage pregnancy prevention in Mityana district, Uganda**

A. Mutegeki<sup>1</sup>, R. Nabaganyani<sup>1</sup>, C. Mukite<sup>1</sup>, M. Lubega<sup>2</sup>, J. Mwangi<sup>3</sup>

<sup>1</sup>Alliance for Youths and Adolescents Health Organization (AYAH Organization), Health, Kampala, Uganda, <sup>2</sup>Maanyi Parents Primary School, Education, Mityana, Uganda, <sup>3</sup>Mityana District Local Government, Health, Mityana, Uganda

**Background:** "Comprehensive Sex-Education Initiative for HIV/AIDS and Teenage Pregnancy Prevention," addresses the heightened risk of HIV/AIDS, early marriages, and teenage pregnancies, particularly exacerbated by the COVID-19 pandemic in Uganda. The broad objective of the program was to improve the sexual and reproductive health outcomes of adolescents and youth aged 14-24 years.

This comprehensive program aimed at empowering young people with accurate information, life skills, and a supportive environment to make informed decisions regarding their sexual health, ultimately reducing the risk of HIV/AIDS transmission and teenage pregnancies.

**Description:** The project's duration was one year, starting in January 2023, focusing on Mityana District. AYAH-Organization collaborates with 10 schools, including Buzibazi, St. Henny, Bujubi, Avima, St. Kizzito, Maanyi Community P/S, Maanyi Parents P/S, Bujubi P/S, Sserinya P/S, and Misigi P/S. The initiative targeted young men and women aged 14-24 and involved recruiting and training 100 young people as peer educators and 10 teachers as mentors. Activities included training of peer educators and peer mentors, sex-education, parental education, HIV counseling and testing campaigns and referral services.

**Lessons learned:** The project experienced notable success, with outcomes indicating increased awareness and knowledge among participants. Findings reveal improved understanding of HIV/AIDS transmission, prevention, and

other related topics. The peer education model demonstrated efficacy in mobilizing students for HIV counseling and testing campaigns. Lessons learned include the importance of tailored training manuals, engaging parents in sex education, and sustaining collaborations with schools for continued impact.

**Conclusions/Next steps:** The significance of the project lies in its potential to reduce HIV/AIDS prevalence and teenage pregnancies through targeted sex education. The peer education approach, coupled with parental involvement, emerged as a successful strategy. The project's outcomes underscore the importance of comprehensive sex education in mitigating reproductive health risks.

Future implications involve sustaining partnerships, expanding to other districts, and advocating for continued support for similar initiatives. The project lays the groundwork for fostering positive behavior among adolescents and contributing to broader HIV prevention efforts in Uganda.

## WEPED482

Whether relationship quality is associated with risk or resilience for drug use and condomless sex among sexual minority men in relationships depends upon what they believe their partners do

J. Hillesheim<sup>1</sup>, T. Starks<sup>1</sup>

<sup>1</sup>Hunter College, CUNY, Psychology, New York, United States

**Background:** Drug use is common among SMM and associated with sexual risk behavior, such as condomless anal sex (CAS) with a casual partner. Recent work suggests SMM in relationships tend to use drugs similar to their partners. Similarity in drug use may contextualize associations among relationship functioning, drug use, and sexual risk taking.

This study tested the hypotheses that perceptions of a relationship partner's drug use and sexual behavior would predict personal drug use and sexual behavior as well as moderate the association between relationship functioning and these outcomes.

**Methods:** A sample of 5511 partnered, cisgender, SMM recruited via geosocial networking apps in the US completed an online survey. They reported their own drug use and sexual behavior with casual partners in the past 30 days; their belief about their partner's drug use and sexual behavior in the past 30 days; and completed three subscales of the Perceived Relationship Quality Components (PRQC) scale.

**Results:** Overall, participants who reported cannabis use, other illicit drug use, or CAS with a casual partner were more likely to report their partner did as well. Among participants who indicated their partner did not use cannabis or other illicit drugs, relationship quality was negatively associated with personal use ( $OR_{cannabis}=0.985$ ,

$p<.001$  and  $OR_{illicit\ drugs}=0.973$ ,  $p<.001$ ); meanwhile, among those who reported their partner used cannabis or other illicit drugs – relationship functioning was positively associated with personal use ( $OR_{cannabis}=1.018$ ,  $p<.001$  and  $OR_{illicit\ drugs}=1.015$ ,  $p<.001$ ).

Above and beyond sexual agreement, relationship quality was negatively associated with personally engaging in CAS with casual partners among those who reported their partner did not ( $OR=0.979$ ,  $p<.001$ ) and positively associated with engagement in CAS with casual partners among those who believed their partner did ( $OR=1.019$ ,  $p<.001$ ).

**Conclusions:** These findings suggest that partners in male couples tend towards similar drug use and sexual behavior. Accomplishing changes in use, and associated sexual HIV risk reduction, may depend upon joint goal setting and support for relationship quality.

Findings support the development and dissemination of interventions that engage relationship partners together as well as individual interventions that integrate communication skill development and planning (skills necessary to engage relationship partners).

## WEPED483

Reconciling resilience: assessing Adverse Childhood Experiences (ACEs), transactional sex, and socio-ecological resilience as moderators among young South African women

D. Baron<sup>1</sup>, S. Maman<sup>1</sup>, N. Gottfredson O'Shea<sup>2</sup>, C. Kuo<sup>3</sup>, F.X. Gómez-Olivé<sup>4</sup>, K. Kahn<sup>4,5</sup>, S.A. Lippman<sup>6,5</sup>, A. Pettifor<sup>7,5</sup>

<sup>1</sup>Gillings School of Global Public Health, University of North Carolina, Department of Health Behavior, Chapel Hill, United States, <sup>2</sup>RTI International, Research Triangle Park, United States, <sup>3</sup>American University, Department of Health Studies, Washington, DC, United States, <sup>4</sup>MRC/Wits Rural Public Health and Health Transitions Research Unit, Agincourt, South Africa, <sup>5</sup>University of the Witwatersrand, School of Public Health, Johannesburg, South Africa, <sup>6</sup>University of California San Francisco, Division of Prevention Science, San Francisco, United States, <sup>7</sup>Gillings School of Global Public Health, University of North Carolina, Department of Epidemiology, Chapel Hill, United States

**Background:** Young South African (SA) women, a population disproportionately impacted by HIV, commonly suffer adverse childhood experiences (ACEs). ACEs, which include experiences such as being orphaned or witnessing or experiencing violence, co-occur in youth, creating life trajectories of cumulative risk exposures. ACEs have been linked to HIV risk behaviors, including risk of transactional sex (TS). Socio-ecological resilience—conceptualized as resources at the individual, interpersonal and community levels that facilitate positive adaptation following trauma—may buffer effects between ACEs and sexual risk behaviors and needs to be explored further.

**Methods:** We conducted an analysis using data from annual questionnaires completed during a 2012-2018 cohort study in rural Ehlanzeni District, Mpumalanga. We examined the association between ACEs (binary) and TS (binary); and tested moderation effects of five resilience scales across social-ecological levels (psychological, social support, cohesion, organizations, community consciousness) hypothesized to buffer the relationship between ACEs and TS. Inclusion criteria was women 18-25 years old who participated in the 2018 data wave.

**Results:** Our analysis included 1,222 women aged 18-25 years ( $m=22.79$  years), of whom 714 (58.43%) reported ACE exposure, with 519 (42.47%) reporting low (1-2) ACEs and 195 (15.96%) reporting high ( $\geq 3$ ) ACEs; 345 (28.23%) reported engaging in TS.

Among ACE-exposed women, mean psychological resilience scores were significantly higher (3.29 points,  $p<0.01$ ) for women with 1-2 ACEs ( $m=68.87$ ) than those with  $\geq 3$  ACEs ( $m=65.58$ ), suggesting more cumulative ACEs is linked with lower resilience. Social support mean scores were comparable across ACE sub-groups. Young women reporting ACE-exposure had increased odds of TS than those without ACE exposure, controlling for confounders, AOR = 1.57,  $p<0.001$ , 95% CI [1.21-2.04].

Among ACE-exposed women, women with high ACEs had 2.58 times the odds of TS than women with low ACEs,  $p<0.001$ , 95% CI [1.81-3.68]. The adjusted moderation analysis showed none of the resilience measures moderate effects between ACEs and TS.

**Conclusions:** Our study found significant links between ACEs and TS. Although resilience has shown protective benefits against HIV risk behaviors for ACE-exposed women elsewhere, these measures did not safeguard against TS. Further research examining how resilience factors may help ACE-exposed women reduce unsafe transactional relationships is warranted.

## WEPED484

### Managing co-morbidities together: relationship dynamics and partner support predict medication adherence for HIV and hypertension

A. Conroy<sup>1</sup>, J. Bidwell<sup>2</sup>, R. Butterfield<sup>1</sup>, A. Ruark<sup>3</sup>, S. Weiser<sup>1</sup>, T. Neilands<sup>1</sup>, J. Jere<sup>4</sup>, N. Mulauzi<sup>5</sup>, J. Mkandawire<sup>5</sup>

<sup>1</sup>University of California San Francisco, Department of Medicine, San Francisco, United States, <sup>2</sup>University of California Davis, School of Nursing, Davis, United States, <sup>3</sup>Wheaton College, Biological and Health Sciences, Wheaton, United States, <sup>4</sup>University of California Berkeley, School of Public Health, Berkeley, United States, <sup>5</sup>Invest in Knowledge, Zomba, Malawi

**Background:** Cardiometabolic disorders (CMDs) are highly prevalent among people living with HIV, complicating the medication management of both conditions. Primary partners provide key sources of support for antiretroviral

therapy (ART) adherence, however, little research has considered their role in the context of co-morbidities. Using data from the *Healthy Hearts* couples cohort study, we investigated associations between relationship dynamics and medication adherence for both HIV and hypertension in Malawi.

**Methods:** *Healthy Hearts* is an observational cohort study with people living with HIV and CMD (hypertension/HTN or diabetes), and their primary partners. Index partners were asked questions on relationship dynamics (i.e., relationship closeness, partner support for CMD and HIV, illness-related communication) and medication adherence for HIV and HTN (based on the Visual Analog Scale, ranging from 0-100).

Based on the underlying distribution and standard cut-points, we created a composite measure consisting of four categories: high HIV/high HTN adherence (reference category), low HIV/low HTN adherence, low HIV/high HTN adherence, and high HIV/low HTN adherence.

Multinomial regression models tested for associations between relationship dynamics and medication adherence, controlling for demographics.

**Results:** Index partners ( $N=156$ ) were gender-balanced (52% male), 52 years on average, and had low education levels (81%). Approximately 18%, 17%, 21%, and 45% of the sample had low HIV/low HTN, low HIV/high HTN, high HIV/low HTN, and high HIV/high HTN adherence, respectively. Compared to the reference group (high/high), reporting low HIV/low HTN adherence was associated with lower closeness ( $B=-0.39$ ,  $p<0.05$ ), lower partner support for CMD ( $B=-0.96$ ,  $p<0.01$ ), lower partner support for HIV ( $B=-0.59$ ,  $p=0.03$ ), and lower illness-related communication ( $B=-0.95$ ,  $p<0.01$ ).

Reporting low HIV/high HTN adherence was associated with lower relationship unity ( $B=-0.38$ ,  $p=0.01$ ) and lower illness-related communication ( $B=-0.97$ ,  $p<0.01$ ). Reporting high HIV/low HTN adherence was associated with lower partner support for CMD ( $B=-0.95$ ,  $p<0.01$ ), and lower illness-related communication ( $B=-0.83$ ,  $p=0.02$ ).

**Conclusions:** Successful approaches that involve primary partners in disease management should be extended for CMD such as hypertension. The role of primary partners may be even more important in helping people successfully manage multiple competing health priorities such as HIV and CMD.

Couple-based interventions should target dyadic processes such as closeness/unity, illness-related communication, and disease-specific social support.

**WEPED485****The gendered limits to "E" in DREAMS: a narrative analysis of beneficiaries' agency in sexual relationships before, during and following DREAMS participation**

K. Stoebe<sup>1</sup>, M. Mwamba<sup>2</sup>, M. Mwale<sup>3</sup>, C. Maambo<sup>3</sup>, G. Muchanga<sup>3</sup>, S. Toussaint<sup>1</sup>, A.K. Kashyap<sup>1</sup>, M. Alvarez-Peralta<sup>1</sup>, C. Bwalya<sup>1</sup>, C. Baumhart<sup>4</sup>, C. Muleya<sup>5</sup>, A. Mwila<sup>5</sup>, C. Claassen<sup>4</sup>

<sup>1</sup>University of Maryland School of Public Health, Behavioral and Community Health, College Park, United States,

<sup>2</sup>CIHEB, Lusaka, Zambia, <sup>3</sup>Maryland Global Initiatives Corporation, Lusaka, Zambia, <sup>4</sup>University of Maryland School of Medicine, Institute of Human Virology, Baltimore, United States, <sup>5</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Lusaka, Zambia

**Background:** In countries across sub-Saharan Africa (SSA), adolescent girls and young women (AGYW) remain at disproportionate risk of HIV, including in Zambia. The combination HIV prevention program DREAMS—or Determined, Resilient, Empowered, AIDS-free, Mentored, and Safe—aims to prevent HIV among AGYW in high HIV prevalence SSA contexts. The DREAMS theory of change suggests that through layered programming addressing the community, family, and the beneficiary, AGYW who choose to have sex will engage in protected, more equitable sexual relationships.

Therefore, to understand the effectiveness of DREAMS, it is important to assess whether and how DREAMS influences AGYW's sexual relationship dynamics.

**Methods:** We conducted a qualitative case-study evaluation of DREAMS in Zambia across three purposively selected sites (April-July 2023). We conducted semi-structured interviews (SSI), focus groups (FGDs) and community observations with AGYW beneficiaries (n=55) and non-beneficiaries (n=11) ages 16-21, and implementers (n=51). The SSI with AGYW included a romantic life history calendar; participants detailed their romantic and sexual relationships over time.

We used narrative analysis – summarizing and comparing the chronology and context of participants' sexual relationships vis-a-vis the timing of DREAMS participation—to compare accounts by beneficiary status and exposure to DREAMS.

**Results:** Beneficiaries described improved understanding of the importance of HIV testing, condom use, and women's rights. Specifically, AGYW described learning they had the right to decide when and under what conditions they had sex.

However, beneficiaries' descriptions of their sexual relationships demonstrate ongoing limitations to act on these lessons. AGYW's narratives suggest some evidence of improved engagement in HIV testing with their partners following DREAMS participation; however, the narratives suggest little change in the gender power dynamics

within their relationships, including on condom use, regardless of exposure-level to DREAMS, or in comparison to non-beneficiaries. AGYW's matter-of-fact recounting of unequal sexual decision-making in their relationships demonstrates intrapersonal and interpersonal limits to empowerment messages within broader patriarchal contexts.

**Conclusions:** While DREAMS has provided important tools to AGYW beneficiaries, without addressing men and boys more directly, it may continue to fall short of the gender transformative change needed to substantially lower AGYW's risk to HIV in ongoing gender-inequitable relationships.

**WEPED486****Empowering young women as near-peer mentors to support gender equality using soccer- and rights-based approaches in Eastern Province, Zambia**

J. Mbewe<sup>1</sup>, R. Nkweto<sup>2</sup>, J. Shingalili<sup>3</sup>, C. Manyele<sup>4</sup>, M. Musonda<sup>4</sup>, C. Mubanga<sup>5</sup>, D. Lee<sup>6</sup>, B. Mkandawire<sup>4</sup>

<sup>1</sup>Grassroot Soccer Zambia, Chipata, Zambia, <sup>2</sup>Muchinga Corridors, Nakonde, Zambia, <sup>3</sup>Adolescent Reproductive and Health Advocates (ARHA), Mongu, Zambia, <sup>4</sup>Grassroot Soccer Zambia, Lusaka, Zambia, <sup>5</sup>Grassroot Soccer, Inc., Lusaka, Zambia, <sup>6</sup>Grassroot Soccer, Inc., Cape Town, South Africa

**Background:** Young women face high rates of HIV and often have limited opportunities for leadership in addressing gender inequalities such as child marriage, teenage pregnancies, and sexual and gender-based violence (SGBV) which are persistent in rural areas of Zambia. Grassroot Soccer Zambia (GRSZ) partnered with Muchinga Corridors and Adolescent Reproductive Health Advocates to empower young women as agents of change in three rural districts to achieve gender equitable environments.

**Description:** Between 2021 and 2023, GRSZ and partners designed and implemented a soccer- and rights-based package led by young women trained as near-peer mentor 'Coaches.'

Coaches delivered an 11-session, soccer-based, gender-focused SRHR and HIV prevention curriculum, called SKILLZ Girl, to girls aged 15-24 years who were at risk of or survivors of SGBV.

Radio and door-to-door campaigns alongside home visits with parents or guardians led by young women were used to speak out on the rights of girls. Escorted referrals and outreach events linked girls to health services in partnership with health service providers.

**Lessons learned:**

- The program mobilized 7,314 girls and built their confidence to demand for their rights, build connections with their peers, and create a network for advocacy.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

- The program fostered collaboration and cooperation: 2,233 girls were linked to different youth-friendly SRHR services, and Coaches visited 7,923 household members who supported girls' rights-focused interventions. Low uptake of SGBV services was common.
- A sports and human rights based-dual approach was practical in enhancing skills of 60 near-peer mentor Coaches and their recognition as gender advocates.
- The program showcased the positive influence of young women's leadership, where few rural communities had negative perceptions.

**Conclusions/Next steps:** Utilization of young women as near-peer mentors, combined with soccer- and rights-based approaches, appears to be a potent strategy in advancing gender equality. The involvement of these mentors facilitates a unique and relatable connection with young girls, offering guidance, inspiration, and a powerful representation of what is achievable.

It's important to acknowledge the significance of partnerships for the long-term viability and expansion of this model, particularly in collaboration with parents and service providers.

## WEPED487

### Development and pilot of an LGBTQ+ inclusive sexual health education curriculum with an emphasis on HIV prevention

G. Feerasta<sup>1</sup>, E. Goncy<sup>2</sup>, K. Clonan-Roy<sup>2</sup>, S. Naser<sup>2</sup>, K. Fuller<sup>2</sup>, J. Caldwell<sup>1</sup>, M. Swanbeck<sup>1</sup>, A. Franz<sup>1</sup>, A. Burkette<sup>1</sup>, N. Gupta<sup>1</sup>  
<sup>1</sup>The LGBT Community Center of Greater Cleveland, Cleveland, United States, <sup>2</sup>Cleveland State University, Psychology, Cleveland, United States

**Background:** Leaders in the LGBTQ+ and education fields developed and piloted a LGBTQ+ Inclusive Sexual Health Education Curriculum focusing on HIV prevention for youth ages 12-27. This curriculum fills a gap in culturally attuned sex education inclusive of LGBTQ+ identities that addresses increased risk of HIV infection and transmission and limited access to HIV services for LGBTQ+ youth in northeast Ohio.

**Description:** This project took place from January 2022 - December 2023 in Cleveland, Ohio and targeted LGBTQ+ youth ages 12-27 - a priority population as outlined in the Ending the HIV Epidemic Plan: Cuyahoga County (EHE). Major activities included:

1. The development of an evidence based, LGBTQ+ inclusive sexual health curriculum in three instructional formats including in-person, hybrid, and e-learning;
2. A pilot of the curriculum to 52 young participants ages 12-27, which included the execution of eight focus groups and four structured interviews;
3. The completion of a community stakeholder review involving 24 community stakeholders reviewing for accuracy, inclusion, and efficacy; and,

4. The compilation and analysis of data on knowledge acquisition, utility and relevance of the curriculum, and overall experience and engagement.

**Lessons learned:** Major findings found that after engaging with the curriculum: 82% of pilot participants were able to identify the four components of routine HIV testing and prevention; 82% of participants were able to identify three safer sex practices to prevent HIV infection and transmission; and 98% of participants were able to identify an STI/HIV testing site local to them.

A majority of youth participants also indicated that the curriculum dispelled myths about HIV and STIs, including the prevalence, and treatable nature of HIV.

**Conclusions/Next steps:** Project findings suggest the efficacy of an LGBTQ+ inclusive sexual health curriculum on reducing general stigma and fear around HIV and increasing knowledge of HIV prevention methods and how to access HIV resources in youth ages 12-27.

This project is the first step in the creation of a replicable sexual health education model with an emphasis on HIV prevention that can be used in schools, youth programs, and community centers for broad dissemination.

## WEPED488

### Intimate partner violence and vertical transmission of HIV during pregnancy and postpartum: a qualitative study in southwestern Kenya

L. Schrubbe<sup>1</sup>, C. Makokha<sup>2</sup>, L. Kimbo<sup>3</sup>, A. Helova<sup>3</sup>, Z. Kwena<sup>2</sup>, L. Darbes<sup>4</sup>, M. Okombo<sup>2</sup>, E. Owengah<sup>2</sup>, C. Calvert<sup>5</sup>, H. Stöckl<sup>6</sup>, E.A. Bukusi<sup>2</sup>, J.M. Turan<sup>3</sup>, A.M. Hatcher<sup>7</sup>

<sup>1</sup>London School of Hygiene and Tropical Medicine, Faculty of Epidemiology and Population Health, London, United Kingdom, <sup>2</sup>Kenya Medical Research Institute, Centre for Microbiology Research, Nairobi, Kenya, <sup>3</sup>University of Alabama at Birmingham, Department of Health Policy and Organization, School of Public Health, Birmingham, United States, <sup>4</sup>University of Michigan, Department of Health Behavior and Biological Sciences, School of Nursing, Ann Arbor, United States, <sup>5</sup>University of Edinburgh, Centre for Global Health, Usher Institute, Edinburgh, United Kingdom, <sup>6</sup>Ludwig-Maximilians-University, Institute for Medical Information Processing, Biometry and Epidemiology, Munich, Germany, <sup>7</sup>University of North Carolina at Chapel Hill, Department of Health Behavior, Chapel Hill, United States

**Background:** Quantitative evidence suggests intimate partner violence (IPV) is associated with HIV health outcomes among perinatal women. We conducted a qualitative study nested within an ongoing trial among perinatal women in rural Kenya to explore how and why certain types of IPV may influence HIV treatment during pregnancy and postpartum.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Methods:** In 2022, postpartum ( $\leq 24$  months) women living with HIV who reported ever experiencing IPV in their current relationship in trial questionnaires were invited to participate in an interview exploring how IPV affected their HIV treatment.

A trained female researcher fluent in Dhuluo conducted 23 individual semi-structured interviews that were translated into English, transcribed verbatim, and thematically coded in Dedoose.

**Results:** Women ( $N=23$ , median age=27) discussed experiencing IPV over the course of their current relationship, the majority occurring perinatally. Nearly all women reported psychological and financial IPV, the majority reported physical IPV, half reported male controlling behaviors, and many reported sexual IPV.

In addition, approximately half of the women reported reproductive coercion, including forced removal of contraception, psychological pressure to become pregnant, and forced sex resulting in pregnancy. In one instance, a male partner denied a laboring woman skilled health care by locking her out of the home and insulted her for having a baby while living with HIV.

Many women described a direct link between IPV and their challenges with perinatal HIV care and treatment. These pathways between IPV and HIV care/treatment included:

1. Psychological IPV leading to difficulty with antiretroviral treatment (ART) adherence due to effects on mental health;
2. Partners directly sabotaging ART or insisting women discontinue ART;
3. Periods of non-adherence due to leaving the home after severe physical IPV; and,
4. Challenges with ART adherence due to strategic HIV status non-disclosure to prevent violence escalation.

One participant struggled to give her infant ART out of fear of her partner's response.

**Conclusions:** Women living with HIV and experiencing IPV described IPV as detrimental to maintaining optimal HIV treatment. To end vertical transmission of HIV and improve maternal and infant health, efforts to address IPV within maternal health settings should be prioritized in HIV policy and programming.

## WEPED489

### Adolescent girls and young women's leadership and voice in the HIV response

N. Damji<sup>1</sup>, E. Kudravtseva<sup>1</sup>

<sup>1</sup>UN Women, New York, United States

**Background:** According to UNAIDS, in 2022, there were an estimated 4,000 new HIV infections weekly among adolescent girls and young women (AGYW) aged 15–24 worldwide. Unequal gender norms and practices contribute to higher vulnerability to HIV among AGYW by creating

significant barriers in accessing HIV prevention and treatment services. UN Women and the United States President's Emergency Plan for AIDS Relief (PEPFAR) collaborated to invest in the leadership and voice of young women in the HIV response to advance sustainable, long-term change to prevent HIV and mitigate the impact of HIV/AIDS among AGYW.

**Description:** Implemented across 15 sub-Saharan Africa countries over 18 months, this partnership between UN Women and PEPFAR, and in collaboration with the Global Fund to Fight AIDS, Tuberculosis and Malaria and its HER Voice Fund, has built feminist leadership skills of 185 young women leaders and connected 144 of them with 63 established women leaders from various sectors as their mentors.

The partnership also created and sustained spaces for young women engagement and advocacy through engaging in the UN Women High-Level Meeting in Tanzania that resulted in a set of policy commitments for action, a satellite event at the IAC 2022 and other national policy opportunities.

**Lessons learned:** 80% of participating young women leaders reported acquiring a great deal of confidence in their leadership capacities and valued their mentorship experiences. Collective action through feminist leadership training and mentorship, movement building and networking, intergenerational dialogues with established women leaders, and creating spaces for young women to engage meaningfully are all critical components of a holistic approach to HIV prevention fostering critical conversations about gender norms, taboos on sexuality.

**Conclusions/Next steps:** Investing in the leadership of AGYW in the HIV response is critical for ensuring that HIV prevention, treatment and care respond to their priorities and needs. It is a long-term investment in the goal of HIV prevention, that can lead to transforming the trajectory of the HIV epidemic.

The next phase of the partnership will support young women leaders and their organizations, both technically and financially, in strengthening their capacities, their networks, and their ability to influence change.

"Prostitutes are the ones who like using PrEP": a qualitative analysis exploring barriers and facilitators to PrEP uptake among DREAMS recipients in Zambia

S. Toussaint<sup>1</sup>, K. Stoebe<sup>1</sup>, M. Mwale<sup>2</sup>, G. Muchanga<sup>2</sup>, C. Maambo<sup>2</sup>, M. Mwambax<sup>3</sup>, A. Kashyap<sup>1</sup>, M. Alvarez-Peralta<sup>1</sup>, L.K. Mwangi<sup>3</sup>, C. Baumhart<sup>4,5</sup>, C. Muleya<sup>6</sup>, A. Mwila<sup>6</sup>, C.W. Claassen<sup>2,4,5</sup>

<sup>1</sup>University of Maryland, Behavioral and Community Health, College Park, United States, <sup>2</sup>Maryland Global Initiatives Corporation Zambia, Lusaka, Zambia, <sup>3</sup>Ciheb Zambia, Lusaka, Zambia, <sup>4</sup>Center for International Health, Education, and Biosecurity, University of Maryland School of Medicine, Baltimore, United States, <sup>5</sup>Institute of Human Virology, University of Maryland School of Medicine, Baltimore, United States, <sup>6</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Lusaka, Zambia

**Background:** In sub-Saharan Africa, including Zambia, adolescent girls and young women (AGYW) face a heightened risk of contracting HIV. To combat this issue, the Determined, Resilient, Empowered, AIDS-free, Mentored, and Safe (DREAMS) program provides a comprehensive approach to HIV prevention, including social and economic empowerment, youth-friendly sexual and reproductive healthcare, and access to pre-exposure prophylaxis (PrEP). To encourage greater use of PrEP among AGYW, it is essential to identify the barriers and facilitators of PrEP usage within the DREAMS program.

**Methods:** Our team evaluated the DREAMS program in three districts of Zambia between April – July 2023. We collected data from AGYW beneficiaries (n=55) and program implementers (n=51) using interviews and focus groups. Using thematic analysis, we identified factors that influenced beneficiaries' PrEP use as described by DREAMS beneficiaries and implementers. Data were analyzed by a team of Zambia and U.S.-based researchers using Atlas-ti (v23).

**Results:** Beneficiaries described benefits and facilitators of PrEP use. We identified two themes:

1. Improved knowledge of PrEP and its benefits,
2. PrEP as security and empowerment.

Beneficiaries expressed a sense of distrust toward their partners, driven by uncertainties about their partners' HIV status or potential engagement in other relationships, which emerged as facilitators for PrEP use.

Beneficiaries expressed barriers to PrEP use, including concerns about potential consequences and PrEP stigma, some grounded in misconceptions. Some AGYW mistakenly believed that PrEP was the same as antiretroviral drugs and could lead to illness.

Beneficiaries also expressed concerns about potential stigma, fearing that using PrEP could lead to promiscuity and negative labeling as they associated PrEP use with

sex workers. Implementers also described misconceptions about PrEP as a key barrier to its use, along with the need for parental consent for AGYW under age 16.

**Conclusions:** The inclusion of PrEP services within the DREAMS biomedical packages has been well-received by AGYWs in Zambia, underscoring its significance in empowering them to manage their health effectively. However, despite its benefits, certain beneficiaries still face challenges in accessing PrEP due to stigmatization. Therefore, it is imperative to implement targeted interventions to address and alleviate PrEP-related stigma and ensure equal access to PrEP services for all.

## WEPED491

Cognition and underlying beliefs precipitating problematic chemsex practices among gender and sexually diverse populations in Bangladesh

S. Islam Khan<sup>1</sup>, T. Rahman<sup>1</sup>, G. Sarwar<sup>1</sup>, P.K. Das<sup>1</sup>, M.N. Morshed Khan<sup>1</sup>, M. Reza<sup>1</sup>

<sup>1</sup>International Centre for Diarrhoeal Diseases Research, Bangladesh, Program for HIV and AIDS, Health Systems and Population Studies Division, Dhaka, Bangladesh

**Background:** Problematic chemsex, constituting drug use during sexual encounters, often propagates addictive cycles of recurring drug-induced sex. Each addiction has underlying cognitions which is influenced by associated cues. Despite behavioral modification initiatives, relapse remains a risk due to unawareness of these cognitions. Therefore, Cognitive Behavioral Therapy (CBT) has been recommended in chemsex intervention guidelines.

This abstract aims to bridge research gaps regarding beliefs and cognitions of individuals engaged in chemsex, to inform effective CBT implementation.

**Methods:** Two rounds of in-depth interviews were conducted on 12 purposively selected participants [eight men who have sex with men (MSM) and four transgender women (TGW)] involved in chemsex between January and June 2023 from four drop-in centers in Dhaka city.

The first interview explored participants' significant life events and degree of chemsex practices.

The second interview applied the downward arrow technique (by David Burns) to explore phenomenological experiences and nuanced cognitions shaping these individuals' chemsex involvement episodes. These interviews were audio-recorded, transcribed, and thematically analyzed.

**Results:** Findings revealed that various chemsex episodes were driven by different cognitions triggered by specific circumstances. MSM's cognitions were governed by perceived performance: "My sexual life will be impaired without Yaba". They expressed fear originating from being "bottom-shamed": "without drugs, my penis will not erect sufficiently, so they (partners) will call me a bottom and treat me like a girl". Because of this narrative, they be-

lieved that bottom-shaming would threaten their masculinity and their ability to attain partners, making them feel like a "worthless person". For TGW, these beliefs and cognitions were rooted in their gender identity.

TGW reported that ostracization from family members led to their engagement in chemsex, perpetuating beliefs like: "with Yaba, I can live in my dream world (of being treated as a wife) again" and "whenever I engaged in chemsex, it felt like I was back in my own life (as a feminine male). It is liberating".

**Conclusions:** This study shows that chemsex is not always a planned behavior, rather it is often cue-dependent, like other addictions. Effectively, eliciting cognitions could be proved valuable by incorporating them into psychotherapy and relapse prevention.

## WEPED492

**Inclusive comprehensive sexuality education (CSE) programme for adolescents and young people with disability in Lagos, Nigeria**

E.O. Somefun<sup>1</sup>, B. Adelekan<sup>1</sup>, O. Ibrahim<sup>1</sup>, R. Umar<sup>2</sup>, K. Kuawu<sup>1</sup>, G. Addico<sup>1</sup>, T. Ucheagbu<sup>3</sup>, CSE Nigeria Team  
<sup>1</sup>United Nations Population Fund, Technical, Abuja, Nigeria, <sup>2</sup>Lagos State Ministry of Youth and Social Development, Youth Development, Lagos, Nigeria, <sup>3</sup>Speaking Fingers Network, Persons with Hearing Impairment, Lagos, Nigeria

**Background:** In Nigeria, 7% of the 29 million people with disabilities are adolescents and young people. Majority of whom are at risk of unintended pregnancy, acquiring HIV and sexually transmitted infections (STIs) and gender-based violence.

Access to inclusive health services and comprehensive sexuality education (CSE) can improve the sexual reproductive health of young PWD. Based on this gap, the inclusive CSE programme was developed.

**Description:** The programme which commenced in 2023 is being implemented in 18 special schools and 3 Local Government Areas in Lagos state, Nigeria. The aim of the programme is to provide life skills 'Sexual Reproductive Health information and services to in and out of school adolescents and young people with disabilities..

The programme commenced with a multi-stakeholder meeting which involved young people with disabilities, youth led CSOs, Ministries of education and Youth and community leaders to highlight the gaps in the SRH needs of young PWD and its impact on their abilities to make informed choices and decisions.

In the second phase, a technical committee was set up to deliberate on the adaptation of the existing CSE manual and curriculum to suit the needs of young PWDs and preferred modalities delivery. The third phase involved the selection of special schools and a capacity building workshop for instructors, counselors and community CSOs and

development of the inclusive CSE curriculum and manual including the braille versions. The Fourth Phase heralded the roll out and review meetings.

**Lessons learned:** The programme has led to the legislative approval for the integration of CSE, development of a nine-month curriculum and manual (braille versions) with 9 modules, 36 topics and increased capacity of 18 instructors /counselors and 2 community CSOs to deliver inclusive CSE. The roll out phase showed an increased SRHR knowledge among 465 in-school and out of school adolescents and youth aged 13 -24 years across disability clusters and parental involvement.

**Conclusions/Next steps:** Inclusive Comprehensive sexuality education can serve as an HIV prevention strategy for Adolescents and Young people with disabilities in developed countries.

## WEPED493

**Behavioural insights on injectable PrEP acceptance and uptake amongst adolescents and young people (AYP) in Zambia**

D. Mukube<sup>1</sup>, M. Njelesani-Kaire<sup>1</sup>  
<sup>1</sup>USAID DISCOVER-Health, Social Behaviour Change, Lusaka, Zambia

**Background:** In Zambia, 38% of new HIV infections occur among adolescents and young people, 78% of which are among adolescent girls and young women (ZAMPHIA, 2021). In response, the Zambian Ministry of Health (MOH) is prioritising AYP in the first phase introduction of injectable cabotegravir for HIV prevention (injectable PrEP) in 2024. The USAID DISCOVER-Health Project supported the MOH in gathering behavioural insights to inform the rollout of injectable PrEP amongst key groups, including AYP.

**Methods:** Methods to gather behavioural insights included a human-centred design (HCD) rapid assessment, using Key informant interviews, focus group discussions and development of personas and journey maps leading to creative briefs with key messages. Findings were triangulated through technical expert meetings. Resultant SBC products were pre tested and validated. The processes engaged 122 AYP and covered five of the six sites[1] where injectable PrEP will be rolled out.

**Results:** The HCD revealed various barriers and facilitators for acceptance and uptake of injectable PrEP by adolescents and young people.

Facilitators:

- Highlighting that injectable PrEP is convenient, discrete, safe to use.
- Messages and approaches relating to young people's aspirations, especially how health can support economic independence.
- At the interpersonal communication level –addressing fears and concerns about sexual health, alcohol, and drugs.

- Engaging key influencers, especially trusted older uncle/aunt figures and training peers.

Barriers:

- Stigma associated with HTS, ARVs, being HIV-positive
- Risky sexual behaviours linked to drug & alcohol abuse
- Shame associated with sex and sexuality - fear of judgement from parents, guardians, and religious leaders.
- Concerns about the impact of injectable PrEP on sexual performance, libido, fertility.

These behavioral insights informed the first phase suite of injectable PrEP SBC products tailored to adolescents and young people and spanning the service delivery cascade, including an HIV self-assessment tool (digital, USSD and paper), discrete appointment card, fact sheet, and peer, stakeholder, and media engagement packages.

**Conclusions:** These processes proved valuable in creating a tailored collection of products, establishing trust that the materials and approaches developed are appropriate, and accessible, and ultimately increasing the acceptance for the uptake of injectable PrEP among AYP.

## WEPED494

Gender inequitable attitudes among HIV providers and clinic staff in Uganda: prevalence, determinants, and associations with the provision of gender-sensitive care

R. Luttinen<sup>1</sup>, R. Wanyenze<sup>2</sup>, A. Anecho<sup>3</sup>, C. Semei<sup>3,4,5</sup>, S. Dworkin<sup>6</sup>, J. Dovidio<sup>7</sup>, T. Kershaw<sup>7</sup>, K. Sileo<sup>1</sup>

<sup>1</sup>The University of Texas at San Antonio, San Antonio, United States, <sup>2</sup>Makerere School of Public Health, Kampala, Uganda, <sup>3</sup>Infectious Diseases Institute, Kampala, Uganda, <sup>4</sup>Mash Research Uganda, Kampala, Uganda, <sup>5</sup>Mildmay Uganda, Kampala, Uganda, <sup>6</sup>University of Washington Bothell, Bothell, United States, <sup>7</sup>Yale University, New Haven, United States

**Background:** In settings where gender norms are a driver of men's and women's HIV risk and care engagement, like in sub-Saharan Africa, the provision of gender-sensitive care is critical to HIV service quality and client outcomes. More research is needed on how gender inequitable attitudes among HIV providers and staff may be affecting the provision and quality of care for HIV clients.

**Methods:** A cross-sectional, interviewer-administered computerized questionnaire was completed by 144 HIV providers and clinic staff involved in HIV services working in six rural and peri-urban government health facilities in central Uganda.

We measured inequitable gender attitudes (personal endorsement of gender inequitable norms) through the Gender Equitable Men scale (validated for use with men and women), and two indicators of gender-sensitive care: 1. An overall gender-sensitive care score (measured through a Provider Cultural Competence scale adapted to be gender-focused) and;

2. A self-efficacy for client-centered communication score (measured through the Self-Efficacy Questionnaire [SE-12] for provider communication), adapted to measure provider's confidence in engaging in gender-sensitive, client-centered communication.

Using multivariate linear regression models, we investigated determinants of inequitable gender attitudes, and tested the association between gender inequitable attitudes and indicators of gender-sensitive care, controlling for identified covariates (gender, cadre, clinic, years of experience, and education level).

**Results:** The sample had moderate endorsement of gender inequitable attitudes (M=35, SD=7.89, scale range=24-72). Controlling for covariates, women, those of lower education levels, and clinic staff with limited client contact (compared to lay and health professionals) had greater gender inequitable attitudes. Controlling for covariates, we found that HIV providers/staff with more inequitable gender attitudes had lower gender-sensitive care scores (B=-0.253 SE= 0.84, p=0.002) and lower self-efficacy for gender-sensitive/client-centered communication scores (B=-0.62, SE=0.032, p=0.05, marginally significant).

**Conclusions:** Gender-transformative interventions often focus on changing gender norms among men, but this study demonstrates the need for interventions that challenge inequitable gender attitudes among HIV providers and staff (including women) to improve the provision of gender-sensitive, client-centered care, and thus client outcomes.

## WEPED495

Enhancing status neutral testing through social network strategies. Experiences from Laikipia County, Kenya

A. Odongo<sup>1,2</sup>, R. Osoti<sup>3,2</sup>, N. Osinde<sup>4,2</sup>

<sup>1</sup>Laikipia Health Services, Health, Nairobi, Kenya, <sup>2</sup>USAID Tujenge Jamii, Health, Nakuru, Kenya, <sup>3</sup>GSK, Nairobi, Kenya, <sup>4</sup>GSK, Health, Nairobi, Kenya

**Background:** To achieve the global 95;95;95 goal of Testing, linking to care and retaining the newly identified HIV infections and linking the ones tested Negative to HIV Prevention Services, People newly diagnosed with HIV should be reached and put on treatment and those that test negative be linked into prevention services. Laikipia County has an estimated 11352 people living with HIV of whom 9786 (86%) have been identified and linked to HIV treatment. In regions where HIV treatment coverage is high, identifying the remaining <14% and linking the negatives at high risk to HIV prevention services remains a challenge. Status Neutral testing is therefore critical to help in the Tracking of the infection chain.

**Methods:** The USAID Tujenge Jamii (UTJ) project working with the County Department of Health in Laikipia County implemented Status Neutral testing through Social Net-

work Strategy in 13 health facilities) aiming at reaching to the population at high risk of acquiring HIV and following the networks of those that consent and recruit. This was done among the 305 clients identified to be at high risk of acquiring HIV virus through risk assessment screening in the 13 facilities between October 2022 and May 2023 and accepted to be seeds.

**Results:** A total of 305(201female and 104male) clients were offered Social Network Services and consented of which 319 social contacts were identified, of the 319 contacts identified all were eligible for testing and 199 reached and tested giving a 62% testing rate. Of those tested 8 were identified to be positive a positivity rate of 4% and all of them linked to care. Among the 191 that had negative results and were still at risk of acquiring HIV, 57 were initiated on Pre-Exposure Prophylaxis (PrEP), achieving a PrEP uptake of 30%. This Strategy therefore facilitated both Linkage to treatment and linkage to prevention services to those that tested negative.

**Conclusions:** Social Network Strategy is the way to go in ensuring Status Neutral testing among the population at risk of Acquiring HIV infection and should be adopted to scale in the HIV prevention interventions.

## WEPED496

### Creating HIV empowered champions among youth through youth centres in Bulawayo

S. Nyathi<sup>1</sup>, D. Moyo<sup>1</sup>, F. Dube<sup>1</sup>, B. Madzima<sup>1</sup>, R. Yekeye<sup>1</sup>, P. Dube<sup>1</sup>

<sup>1</sup>National AIDS Council, Harare, Zimbabwe

**Background:** Although youth centres started in the 1970s as meeting places and sports centres for school leavers where employers would come and select prospective employees in Bulawayo, they have evolved as strategic safe places for the empowerment of young people to effectively respond to HIV and develop durable life skills.

Following the rise in new HIV cases among adolescents and emerging trends of drugs and sex filled youth parties, exposing them to the risk of acquiring HIV, the Bulawayo City Council and the National AIDS council enhanced the centres with HIV and life skills education.

**Description:** The two organizations remodeled youth centres as empowerment places and increased them from the original 11 to 21 in 2016, where youth access educational material for their studies, play educational and health awareness sports and interact with models who had passed through the centres and established successful careers. These include soccer players and captains of industry among others. HIV and general health programmers also conduct regular exhibitions and present life skills coaching clinics emphasising the importance of delayed sexual debut, use of various HIV prevention methods, uptake of treatment while discouraging the use of drugs. The centres conduct regular engagement with

parents to share strategies of empowering youths and conduct community mobilizations to attract more young people. Edutainment is used to attract the youth and keep them engaged.

**Lessons learned:** From the remodeling of the youth centres as HIV and life skills empowerment places in 2016, membership has grown from an average of 19 per youth centre to 312 per centre. The number of youth centres members who completed high school also rose from 6 per centre per year to 89 between 2016 and 2023.

The number of youth centres who tested positive for HIV also dropped from 5 per year to 1 per centre per year. Youth centre graduates who enrolled into major sports teams and played professional sports also rose from 1 per year per centre to 7. Risky behaviour has overall decreased.

**Conclusions/Next steps:** Youth centres have contributed to the transformation and empowerment of young people against HIV leading to better outcomes of the response to HIV.

## Sexualities and sexual cultures: Meanings, identities, norms and communities

### Revamping HIV screening strategies for Bridge population in post-COVID India: lessons learned from One Stop Centres

S.S. Vohra<sup>1</sup>, A. Rawat<sup>1</sup>, R. Rana<sup>1</sup>, K. Biswas<sup>1</sup>, M. Asif<sup>1</sup>

<sup>1</sup>Plan International (India Chapter), New Delhi, India

**Background:** The Bridge population has historically played a significant role in India's HIV epidemic, acting as a transmission bridge. The COVID-19 pandemic has led to substantial transformations within this group, necessitating a re-evaluation of HIV screening strategies to meet India's national goal of 95-95-95.

**Description:** To tackle this challenge, 34 One Stop Centres (OSCs) were established across 16 states in India from March 2023. These centres aimed to provide integrated HIV prevention and care cascade services, addressing the health and non-health needs of the Bridge population unreached by conventional interventions. Strategically located near hotspots, including highways, transshipment sites, lodges, transportation hubs, and industrial settings, the OSCs targeted migrants, both domestic and cross-border, and other vulnerable groups.

**Lessons learned:** In just eight months, OSCs screened 46,213 clients for HIV, revealing a positivity rate of 0.36%. The evolving landscape post-COVID became evident, marked by increased migration, economic vulnerabilities,

a shift from brothel to home-based sex work, and a rise in inter & intra-city cab drivers. Challenges in treatment linkages were amplified by the absence of dedicated truck helpers, higher rates of mental health issues, substance use, and communication barriers.

The inadequacy of traditional risk assessment tools was observed during implementation, leading to indiscriminate kit usage and a frequent nationwide shortage. Data obtained through OSCs were shared with partners and stakeholders, fostering cross-sectional learnings, including with Nepal.

**Conclusions/Next steps:** The findings underscore the urgent need for a substantial revision of HIV screening guidelines for the Bridge population, considering the post-COVID economic and behavioural shifts.

As vulnerability evolves, strategies must adapt to ensure effective reach, assessment, and screening, contributing to India's ambitious 95-95-95 goal. This shall address immediate challenges, as well as provide a resilient framework for future public health responses in dynamic scenarios.

## WEPED498

**Sexualised substance use posing new HIV risks among men who have sex with men (MSM) and transgender (TG) persons in India**

K. Kishore<sup>1</sup>, JK. Mishra<sup>2</sup>, D. Mukherjee<sup>3</sup>

<sup>1</sup>India HIV/AIDS Alliance (Alliance India), Harm reduction, Delhi, India, <sup>2</sup>Delhi State AIDS Control Society, Targeted Intervention, Delhi, India, <sup>3</sup>Independent Consultant, Research, Kolkata, India

**Background:** Newer risk factor of Sexualised Substance Use (SSU) among Men who have sex with Men (MSM) and transgender (TG) persons are threatening new HIV infections in India. Use of psychoactive drugs for the purpose of enhancing sexual pleasure, extended duration of sex acts and reduction of pain attributable to sexual activities, especially among MSM and transgender persons also increases the risk of, STIs, HIV and other blood borne viruses.

**Methods:** Focus Group Discussions (FGD) among MSM and Transgender community members who had experiences of using drugs for enhancing sexual experiences. Qualitative responses provided during FGDs were further quantified, wherever possible using 'search' for key words/phrases.

**Results:** Two hundred and eight (208) MSM (64) and TG (144) persons reported using Cocaine (20.2%), Crystal Meth (30.3%), Ecstasy (16.3%), Poppers (Amyl Nitrite) (13.5%), alcohol (86.5%) heroin (27.9%), pharmaceutical opioids (22.6%) and sedative hypnotics (23.1%) for the purpose of enhancing sexual experiences. While, 22.1% injected drugs, 24% reported consistent condom use under the influence of these drugs.

**Conclusions:** Use of drugs for the purpose of enhancing sexual experiences, exists among MSM and TG persons poses dual risk of HIV and other blood borne viruses through injecting coupled with unprotected sex. Peer influence often leads to group sex further lowering condom use. Lowered inhibition, poor cognition and judgement further amplifies risks of intimate partner violence and mental health too. Interventions to reduce risks and HIV harms needed urgently.

## WEPED499

**Socio-economic approach to addressing structural barriers for HIV prevention in Eswatini**

T. Dlamini<sup>1</sup>

<sup>1</sup>World Vision Eswatini, Halt Project, Mbabane, Eswatini

**Background:** In Eswatini 79% of the population constitutes youth with adolescents constituting a quarter of the population. 12.2% of new HIV infections are recorded amongst 15-24-year-olds Adolescent Girls and Young Women (AGYW). World Vision is implementing Global Fund - funded project targeting out of school youth 10-24 years aimed at Halting the spread of HIV and reversing its impact. The project operates at Mhlume In Mgidzangcunu community which is characterized by high HIV incidence, poverty, gender inequalities and risky sexual behaviors. Observing these characteristics led the project to drive a socioeconomic empowerment initiative aimed at addressing the existing structural HIV predisposing conditions at this community towards zero new infections.

**Description:** The project enrolled 15 AGYW 10-24 years from Mgidzangcunu into worth group savings. This group was reached with

1. Comprehensive, layered HIV prevention package and high impact HIV services and
2. Gender sensitive Skills Building including entrepreneurship and employability.

They were encouraged to start Income Generation Activities (IGAs) which successfully earned them \$1051.10 profit, from group savings amounting to \$2627.76 since 2022. Additionally they established thriving sole proprietary businesses in food, beauty and care industries earning them combined profits worth \$1576.66. Dependency on their partners for economic security has dropped drastically. Risky HIV behaviors have significantly waned amongst these AGYW: none registered risky behaviors in the last 12 month and have all accessed high impact HIV interventions such as PrEP and HIV testing services with no recorded sero-conversions.

**Lessons learned:** It is important to recognize the significance of socioeconomic empowerment to mitigate HIV risks in implementing community HIV prevention program. Delivery of HIV programs focusing on socioeconomic empowerment initiatives is transformational beyond health to general improvement across all spheres

of well-being for the AGYW including confidence to access resources for healthcare, negotiate safer sex practices, and challenge gender norms that contribute to HIV vulnerability.

**Conclusions/Next steps:** Socio-economic predisposition amongst AGYW has a stake in the fight against HIV. Through holistic approach and integration efforts, we can pave a way for AGYW to thrive in both their businesses and their health including sustained behavior change.

## Implementation science and scale up of HIV testing

### WEPEE500

Reaching online networks when social networks disappear: enhancing HIV testing in Ukraine through targeted online campaigns and mail order HIV self-testing programs amidst the Ukrainian-Russian war

I. Kovalchuk<sup>1</sup>, Y. Zelinskyi<sup>1</sup>, T. Klymenko<sup>2</sup>

<sup>1</sup>FHI 360, Kyiv, Ukraine, <sup>2</sup>USAID/PEPFAR Community Action for HIV Control Project, Kyiv, Ukraine

**Background:** Despite free and differentiated HIV testing options, the Ukraine-Russian war has led to low testing uptake by key and priority populations (KPs) due to physical destruction or damage to medical facilities, evacuation of medical personnel, displacement of people within the country, and prioritization of immediate physical and humanitarian consequences of war over other health needs.

To improve and sustain HIV case finding in the context of war, it is important to deploy innovative health communication and promotion strategies, especially in regions with limited access to healthcare services.

**Description:** Funded by PEPFAR and implemented by PACT, FHI360, AFEW, and local NGOs, the Community Action for HIV Control implemented targeted online advertising campaigns for HIV self-testing kits from March to July 2023. Led by NGOs and targeted to KPs, the campaign included online advertising, enhanced digital communication strategies and intensive client engagement. The program utilized various platforms associated with KPs interest and use (Facebook, Instagram, Telegram, Google Search, Google display network, YouTube) and several types of publications and visual messages on those platforms targeted toward specific populations were trialed.

Eighteen million displays were achieved, and about a thousand orders for HIV self-test kits were made. The click-through rate (CTR) was 4.33% for Meta, 4.84% for Google Search, and 1.11% for Google Display Network. Cost per click (CPC) – \$0.12

**Lessons learned:** The war introduced atypical challenges, including disrupted access and shifted priorities, to already vulnerable and difficult to reach populations. The targeted online communication campaign increasing HIV testing awareness and HIVST, showing the resilience and effectiveness of digital platforms.

Specific outcomes, such as high CTR and modest CPC, demonstrated the success in reaching KPs and enhancing NGOs' online presence using limited financial resources.

**Conclusions/Next steps:** The program's success amidst the war underscores the pivotal role of digital health initiatives. Future strategies should focus on expanding targeted digital approaches to promote HIV services, ensuring continuous support and accessibility even in unstable conditions. HIVST offers options for HIV testing in volatile context and for KPs in remote areas with limited testing availability at health facilities or NGO outreach. Online engagement and promotion of HIVST can sustain this case finding strategy.

### WEPEE501

Motivating HIV testing uptake through online risk assessments among key populations in Namibia

A. Simmonds<sup>1</sup>, S. Chaudhary<sup>1</sup>, K. Stankevitz<sup>1</sup>,

I. Mendes-Siyamba<sup>2</sup>, C. Fischer Walker<sup>1</sup>, B. Eveslage<sup>1</sup>

<sup>1</sup>FHI 360, HIV, Durham, United States, <sup>2</sup>IntraHealth, Namibia, Windhoek, Namibia

**Background:** QuickRes, globally managed by FHI 360, empowers clients to understand their HIV service needs through an optional self-guided online risk assessment (RA) that provides personalized recommendations. Clients access QuickRes through referrals and social media promotions. After completing the RA, clients receive service recommendations tailored to their history and risk profile.

In Namibia, QuickRes has promoted HIV testing and treatment since October 2020. As of September 2023, case managers facilitated 16,867 HIV test appointments, 36.4% of which were for clients who had completed the online RA.

**Description:** To understand the relationship between RA outcomes and appointment adherence among clients, including key populations (men who have sex with men [MSM], female sex workers, and transgender women), we conducted a series of analyses including Chi-Square tests and logistic regression with odds ratio calculations. We focused on factors such as risk profile, population type, HIV testing history, age, and sex to determine their impact on the likelihood of individuals arriving for HIV testing appointments.

**Lessons learned:** The analysis showed that individuals who completed the online RA had 1.5 times the odds of attending their appointments ( $p < 0.001$ ) (see figure). Additionally, MSM were notably more likely to attend, with 1.8 times the odds compared to other groups ( $p < 0.001$ ). Individuals who had not undergone HIV testing in the past three months were more likely to attend their appointments ( $p < 0.001$ ).

Age and sex also influenced attendance patterns: The odds of attending appointments increased by 7% for every additional decade of age ( $p < 0.001$ ), and men were less likely to attend compared to women ( $p = 0.002$ ).

**Conclusions/Next steps:** Online RAs such as those offered through QuickRes push the boundaries of traditional screening by motivating HIV testing uptake through client-centered, informed decision-making. In-depth exploration of user barriers and motivations is vital for evolving these tools into comprehensive service navigators.

## WEPEE502

**Innovative testing approaches to increase HIV case finding among men-who-have-sex-with-men (MSM): lessons learnt from the implementation of the Sexual Network Testing (SNT) approach in Kumasi, Ghana**

J. Martin<sup>1</sup>, B.N.K. Nkrumah<sup>1</sup>, S. Owiredu<sup>2</sup>

<sup>1</sup>CEPEHRG, Peer Educator, Accra, Ghana, <sup>2</sup>Center for Popular Education and Human Rights, Ghana (CEPEHRG), Programs Coordinator, Accra, Ghana

**Background:** HIV testing is a key entry point to HIV prevention and treatment and efforts to achieve the first 95% of the UNAIDS 95-95-95 targets. In Ghana, testing outcomes and identification of men who have sex with men (MSM) who are living with HIV is low. The use of innovative testing strategies to identify HIV positive MSM is crucial to increasing HIV+ yield since the traditional peer education referral of MSM have produced low yield.

We describe the successful implementation of the SNT strategy to increase the identification of HIV+ MSM in Ashanti Region of Ghana.

**Description:** The SNT strategy was introduced in three districts in May 2023 to identify MSM who are HIV positive. SNT uses the sexual network of HIV+ MSM to link their sexual partners within the last six months for HIV testing. The SNT approach was applied in two ways in three districts in the Ashanti Region.

**Approach #1 (PLHIV Partner Testing) [PPT]:** Nurses and case managers encouraged MSM PLHIV who had been initiated on ART to introduce their recent MSM partners to a targeted mobile HTS outreach session.

**Approach #2 (Target referral):** Peer educators and field officers were educated to identify harder-to-reach MSM who engage in high-risk sexual behavior and their sexual partners and refer them for HTS at the facility.

**Lessons learned:** The SNT strategy introduced in three districts increased the HIV positive yield among MSM. In April 2023, prior to the SNT strategy, 318 MSM were tested using the conventional outreach and peer education referral approach; 19 MSM (HIV+ yield of 6.6%) were diagnosed positive across the 3 districts. After the introduction of SNT in May 2023, 391 MSM were tested and 48 were diagnosed HIV positive (12.3% yield) across the 3 districts.

**Conclusions/Next steps:** Innovative and targeted approaches to HTS are essential in increasing HIV+ yield among MSM. SNT approach is an effective and efficient way of providing tailored services to closeted MSM and should be extended to other districts in the country. As a next step, we will explore which of the SNT approach is more efficient at attaining greater HIV+ yield.

## WEPEE503

**The Asanté™ HIV-1 Rapid Recency® Assay is reliable, feasible, and acceptable for use at the point-of-care in Lusaka, Zambia**

S. Iyer<sup>1</sup>, M. Herce<sup>2</sup>, C. Mwila<sup>1</sup>, H. Kapesa<sup>1</sup>, M. Moono<sup>1</sup>, C. Frimpong<sup>1</sup>, M. Nanyangwe<sup>1</sup>, L. Phiri<sup>1</sup>, R. Ngandu<sup>1</sup>, P. Sakanya<sup>1</sup>, S. Mwansa<sup>1</sup>, T. Phiri<sup>1</sup>, M. Hachiwa<sup>1</sup>, P. Maritim<sup>1</sup>, B. Parekh<sup>3</sup>, K. Lee<sup>4</sup>, M. Arons<sup>3</sup>, T. Aholou<sup>5</sup>, P. Minchella<sup>6</sup>, T. Savory<sup>1</sup>, C. Bolton<sup>1,7</sup>, J. Pry<sup>1,8</sup>

<sup>1</sup>Centre for Infectious Disease Research in Zambia, Lusaka, Zambia, <sup>2</sup>University of North Carolina, Chapel Hill, United States, <sup>3</sup>US Centers for Disease Control and Prevention, Division of Global HIV and Tuberculosis, Atlanta, United States, <sup>4</sup>US Centers for Disease Control and Prevention, Division of AIDS, STD and TB Laboratory Research, Atlanta, United States, <sup>5</sup>US Centers for Disease Control and Prevention, Division of HIV/AIDS Prevention, Atlanta, United States, <sup>6</sup>US Centers for Disease Control and Prevention, Division of Global HIV and Tuberculosis, Windhoek, Namibia, <sup>7</sup>University of Alabama, Birmingham, United States, <sup>8</sup>University of California, Davis, United States

**Background:** Zambia established an HIV recent infection surveillance program that utilizes a novel rapid test for recent infection (RTRI)—Asanté™ HIV-1 Rapid Recency® Assay—to differentiate between persons with recent (i.e., acquired within the last 12 months) versus long-term HIV infection. The surveillance program applies a recent infection testing algorithm (RITA) consisting of the RTRI and viral load (VL) testing.

In this pilot study, we describe field-performance of the Asanté RTRI when implemented by Ministry of Health (MOH) healthcare workers at the point-of-care (POC) compared to the central laboratory (CL), and as part of the national RITA to inform surveillance programming.

**Methods:** We enrolled participants found to be HIV-positive during routine HIV testing services between 20 May 2021–10 March 2022 at two MOH health facilities ("sites") in Lusaka, Zambia.

Participants underwent POC RTRI testing by MOH staff trained by the national surveillance program. For each participant, one additional blood sample was collected for repeat RTRI testing at the CL to verify POC results, and to perform baseline VL testing.

Twenty-eight MOH staff participated in 4 focus group discussions (FGD) to share perspectives on POC RTRI implementation. We estimated agreement between POC and CL RTRI testing using Cohen's Kappa statistic, and calculated sensitivity and specificity of these tests compared to RITA as the reference standard.

**Results:** Agreement of recent infection classification between RTRI performed at POC and CL was 96.0%, with a Kappa coefficient of 0.821 (95% confidence interval [CI]: 0.713-0.928). Compared to RITA, the CL RTRI had perfect sensitivity (100.0%) while the POC RTRI had lower sensitivity (85.0%). Discrepancies between the POC and CL RTRI results were resolved with in-person and tele-monitoring quality control procedures. All FGD participants noted that RTRI testing was acceptable, appropriate, and feasible at the POC.

**Conclusions:** We describe strong correlation between POC and CL-performed RTRI, and healthcare worker-endorsed feasibility of POC RTRI testing.

Our findings suggest that RTRI can feasibly be done at POC when complemented by training, quality control, and supportive supervision.

Findings from our pilot study suggest a possible role for decentralized RTRI testing in current national HIV recent infection surveillance programs.

## WEPEE504

Collaborative efforts between HIV programs and traditional healers and community leaders increased case finding and treatment initiation among Haitian migrants and individuals of Haitian descent in the Dominican Republic

De Sena<sup>4</sup>, I. Berique<sup>4</sup>, Y. De La Rosa<sup>4</sup>, C. Martinez<sup>4</sup>, L. Severino<sup>5</sup>, M. De los Santos<sup>6</sup>, A. Lorenzo<sup>7</sup>, Y. Molil<sup>8</sup>, C. Casalini<sup>9</sup>

<sup>1</sup>FHI360, Santo Domingo, Dominican Republic, the, <sup>2</sup>USAID, Santo Domingo, Dominican Republic, the, <sup>3</sup>Batey Relief Alliance, Santo Domingo, Dominican Republic, the, <sup>4</sup>ADOPLAFAM, Santo Domingo, Dominican Republic, the, <sup>5</sup>Aid for AIDS, Santo Domingo, Dominican Republic, the, <sup>6</sup>Fundacion Activo 20-30, Santo Domingo, Dominican Republic, the, <sup>7</sup>Clinica Esperanza y Caridad, San Pedro de Macoris, Dominican Republic, the, <sup>8</sup>Clinica de la Familia, La Romana, Dominican Republic, the, <sup>9</sup>FHI360, Washington DC, United States

**Background:** The HIV Services and System Strengthening (HS3) project and the Enhanced HIV Services for Epidemic Control (EHSEC) project, funded by PEPFAR through

the United States Agency for International Development (USAID), offer HIV testing services to priority populations (PP), who are Haitian migrants and individuals of Haitian descent in the Dominican Republic. As of September 2021, HS3 reported 5% HIV case finding and 83% treatment initiation among PP, and the country estimated 76% of PP living with HIV knew their serological status and 54% were on treatment. HS3 consulted with PP to design innovative strategies to strengthen its contribution to UNAIDS goals. Traditional healers and community leaders were identified as playing a crucial role in the health-seeking behavior of PP by providing individualized care, psychosocial support, and providing a familiar cultural context for health care delivery.

Hence, from October 2021, the project trained and engaged 37 traditional healers and 36 community leaders to offer HIV testing services and support treatment initiation.

**Methods:** We analyzed retrospective clients' records from October 2021 to September 2023, using routinely collected, aggregated program data for PP ages 15 and older who received an HIV test and its result. Community leaders mobilized and navigated PP to project testing sites, while traditional healers hosted project testing counselors within their clinics. Both provided community-based education to address treatment myths and tailored psychosocial support to PP living with HIV to initiate treatment.

**Results:** The projects tested 78,857 PP, identifying 4,913 living with HIV and initiating 96% on treatment: 6,218 (8%) were tested through traditional healers and community leaders, identifying 422 (7%) living with HIV and initiating 418 (99%) on treatment, while other testing modalities yielded 6% case finding and 96% treatment initiation. There was no difference in case finding or treatment initiation between testing through traditional healers and community leaders.

**Conclusions:** Our study shows that collaborative efforts between traditional healers and community leaders and HIV programs are feasible. Traditional healers and community leaders are trusted providers and prominent community members and could be important partners in closing the gap of UNAIDS 95 goals in the Dominican Republic.

## WEPEE505

### Scaling-up HIV self-testing to enhance case finding in Central Asia

A. Deryabina<sup>1</sup>, V. Ivakin<sup>1</sup>, Z. Tatkeyeva<sup>1</sup>, G. Esenkeldieva<sup>2</sup>, S. Yusufbekova<sup>3</sup>, N. Ryapolova<sup>1</sup>, A. Howard<sup>4</sup>

<sup>1</sup>ICAP at Columbia University, Almaty, Kazakhstan, <sup>2</sup>ICAP at Columbia University, Bishkek, Kyrgyzstan, <sup>3</sup>ICAP at Columbia University, Dushanbe, Tajikistan, <sup>4</sup>ICAP at Columbia University, New York, United States

**Background:** Reaching the first "95" remains a challenge in Central Asia, especially among key population (KP) groups and men. To improve access to HIV testing, ICAP at Columbia University supports implementation of an innovative online self-test order portal called HIVTEST, which enables people to test at a private location and provides information about what to do with the test results.

**Description:** HIVTEST is implemented in Almaty and Ust-Kamenogorsk (Kazakhstan), Bishkek and Osh (Kyrgyzstan), and Dushanbe (Tajikistan). HIV self-test kits ordered online can be collected, for free, at local pharmacies or self-service postbox terminals open 24/7, or participating NGOs and healthcare facilities during opening hours; or they can be delivered to a client's preferred location by courier service.

When ordering tests online, clients are asked to complete a risk assessment and report the reason they ordered an HIV self-test. HIVTEST invites clients to report their results through the portal.

**Lessons learned:** Between February 18, 2022, and December 31, 2023, 7,421 HIV self-tests were delivered to clients across three countries. Of 3,489 (47.0%) test results reported, 47 (1.3%) were reactive. 4,632 clients (62.4%) identified themselves as men, 2,689 (36.2%) as women, 21 as transmen, 21 as non-binary, 8 as transwomen, and 50 did not specify their gender.

Median age was 26 years old (IQR 22-31). 41.7% were first-time testers, 23.7% last tested for HIV >12 months ago, 34.2% last tested during the past year, and <1% ordered a test to reconfirm their HIV-positive status. 3,503 clients (47.2%) collected their test-kits at local pharmacies, 1,737 (23.4%) at postbox terminals, 1,621 (21.8%) used courier service, 552 (7.4%) collected it from a health facility and 8 (0.1%) from an NGO. 13.2% of men reported having sex with men. Of 4,731 (63.8%) clients completing risk assessment, 80 (1.7%) reported drug use, and 1,814 (38.3%) reported high-risk sexual behaviors (unprotected intercourse, sex with a high-risk partner, sex under the influence of drugs/alcohol).

**Conclusions/Next steps:** Online distribution of HIV self-test kits is an effective approach to expand access to HIV self-testing, especially among younger people, men, and first-time testers. To succeed, a variety of delivery options for HIV self-tests must be offered.

## WEPEE506

### Pat: improving access to HIV testing and sexual health information through AI chatbot technology

I. Montgomery<sup>1</sup>, I. Folland<sup>2</sup>

<sup>1</sup>Positive East, London, United Kingdom, <sup>2</sup>Japeto, London, United Kingdom

**Background:** Digital cultures have transformed how people access services and information, with chatbots becoming ubiquitous. The emergence of artificial intelligence (AI) and algorithmic medicine also means that the sexual health (SH) sector needs to consider chatbots in line with current communication trends.

A 2019 study revealed that 66% of people in the UK would be willing to use a chatbot for health-related queries, with 50% specifically for SH.

Positive East (PE) is an East London-based HIV charity. To leverage this shift and willingness to use AI, PE developed the chatbot Pat. Pat aimed to pilot a new approach regarding HIV Testing/SH information dissemination to increase good SH within the community.

**Description:** In 2018/19, Pat was co-designed through extensive community consultations involving surveys, focus groups, user testing, and analysis. PE used this data to create over 300 pre-programmed responses, "intents", actioned using user-inputted Natural Language Processing, each dealing with a different SH topic, e.g. HIV testing.

Monthly user reports further inform development, allowing Pat to remain responsive to community needs. Site visitors can interact with Pat via a chat window on the PE website.

**Lessons learned:** In 2023, Pat had 1,510 unique chat sessions. Key user themes include HIV testing (42%), HIV/STI window periods (15%) and STI symptoms (12%).

Pat is an effective tool with high message accuracy (96.8%) and user satisfaction - "it was a smooth, easy [HIV] booking experience...I might have backed out without the easy experience I had."

The initial implementation of Pat resulted in a 77% decrease in SH-related emails to PE's switchboard, redirecting focus to face-to-face interventions.

Pat is currently deployed on four SH service websites, including the NHS. In 2023, across all platforms (PE & SH services), Pat had 1,600 monthly average unique chat sessions, amplifying efforts to enhance SH. Pat remains unique in the SH sector.

**Conclusions/Next steps:** Pat has proven its utility in the SH sector. Pat supports increased SH awareness and contributes to research and policy. By efficiently advising a large number of users at a lower cost, Pat enhances capacity to promote SH, supporting the goal of zero new HIV transmissions.

Raji<sup>10</sup>, D. Onime<sup>10</sup>, A. Bashorun<sup>11</sup>, A. Gambo<sup>12</sup>, R. Goldstein<sup>10</sup>

<sup>1</sup>Centre for Clinical Care and Clinical Research, Nigeria, Prevention, Care and Treatment, Abuja, Nigeria,

<sup>2</sup>Association for Reproductive and Family Health (ARFH), PMTCT/CECAP, Ilorin, Nigeria, <sup>3</sup>Centre for Clinical Care and Clinical Research, Nigeria, Strategic Information, Ilorin, Nigeria, <sup>4</sup>Jhpiego, Strategic Information, Abuja, Nigeria, <sup>5</sup>Centre for Clinical Care and Clinical Research, Nigeria, Program Management, Abuja, Nigeria, <sup>6</sup>Jhpiego, Prevention Services, Abuja, Nigeria, <sup>7</sup>Centre for Clinical Care and Clinical Research, Nigeria, Program Management, Ilorin, Nigeria, <sup>8</sup>USAID, HAT, Abuja, Nigeria, <sup>9</sup>Association for Reproductive and Family Health (ARFH), TB/HIV, Ilorin, Nigeria, <sup>10</sup>USAID, Office of HIV/AIDS and TB, Abuja, Nigeria, <sup>11</sup>National AIDS, Sexually Transmitted Infections Control and Hepatitis Programme (NASCP), Federal Ministry of Health, Department of AIDS and STI/Hepatitis, Abuja, Nigeria, <sup>12</sup>National Agency for the Control of AIDS (NACA), Program Management, Abuja, Nigeria

**Background:** ANC coverage has been low (67%) with a few pregnant women (39%) that deliver in health facilities in Nigeria [UNAIDS, 2020]. Despite the robust HIV response program in-country, PMTCT coverage has remained largely facility based leaving out over 39% of pregnant women that either receive pregnancy care in the community or at home (NPC, 2013). Distance to health facilities, user fees and preference for non-formal healthcare by most pregnant women (PW) are few contributing factors of poor uptake of PMTCT services.

This study was to evaluate access and uptake of PMTCT services among underserved PW.

**Description:** A systematic review of collected data from pregnant women across communities in Niger and Kwara states, Nigeria between January and December 2023. Using a context-specific approach, consultative workshops were held with key players to explore barriers to PMTCT services across communities.

With the findings, rapid community PMTCT (cPMTCT) readiness assessment and activation was conducted across the mapped community ANC/birth centres. 128 cPMTCT outlets were activated across 41LGAs in the 2states with a Hub-Spoke arrangement with PEPFAR-supported facilities. Providers were trained and supported with mentorship/coaching sessions during which they were encouraged to support PW across communities to attend ANC,

accept HTS, and ensure referral of identified HIV-positive pregnant women (PPW) to facilities. Descriptive analysis of the data was conducted to delineate uptake of PMTCT services.

**Lessons learned:** 9,800 PW attended the cPMTCT outlets and received HTS with 32 previously known and 14 newly identified PPW who were referred and commenced on ART. Without the intervention, these PPW would have been missed with an increased risk of vertical transmission.

We observed an increased uptake of PMTCT services across communities with 21% increase in overall number of pregnant women with known HIV status in the states.

**Conclusions/Next steps:** The out-of-facility expansion of PMTCT services was effective in reaching the underserved pregnant women and other population with HIV prevention services across communities. It eliminated the barriers related to distance and user-fees at large-scale facilities and facilitated seamless access to PMTCT services. Further studies are needed to explore the opportunity of utilizing the platforms to provide PrEP to partners of PW.

## WEPEE508

**Reaching unreached PWID through Integration of PWID-centric approaches in hard-to-reach areas in Northern Myanmar**

W. Toe<sup>1</sup>, T. Lin<sup>1</sup>, W. Zaw<sup>1</sup>, H.T. Aung<sup>1</sup>, S.T. Lwin<sup>1</sup>, Z.M. Thant<sup>1</sup>

<sup>1</sup>Asian Harm Reduction Network, Yangon, Myanmar

**Background:** The phenomenon of drug use in Myanmar is more pronounced in rural areas, particularly in the northern region, where Asian Harm Reduction Network (AHRN) is actively involved in harm reduction activities. In 2020, the COVID-19 pandemic disrupted HIV prevention, care, and services, especially for People Who Use or Inject Drugs (PWUD/PWID). The conditions were worsened by the ongoing political crisis, making healthcare access challenging for PWID. More specifically, prolonged conflicts and COVID-19 measures heightened barriers for service providers to reach PWID/PWUD, given their natural reluctance to access healthcare.

**Description:** To address these issues, in 2022, AHRN and Best Shelter to target disengaged PWID in hard-to-reach and conflict-affected areas by integrating new approaches into existing outreach, mobile outreach, and HIV testing services.

These approaches included recruiting additional residential peers, providing needle and syringe services through secondary distribution, implementing flexible working hours, community-based peer-led HIV screening, and establishing extended outreach outposts in difficult-to-access locations.

**Lessons learned:** Despite challenges posed by COVID-19 and political crises, AHRN/Best Shelter outreach and HIV testing services (HTS) team successfully implemented a PWID-centric approach in hard-to-reach areas. This led to

reaching more PWID, an increase in commodity distribution, and higher rates of HIV testing, resulting in a positive yield, especially in new coverage areas.

In 2021, the program reached 25,623 individuals, distributing nearly 16 million needles and syringes, and 1.7 million condoms. The program also tested 11,745 PWID for HIV and had a positive yield of 18%. These numbers significantly increased in 2022 and Jan-Jun 2023.

In 2022, AHRN/BS reached 28,395, distributed about 18 million needles and syringes, and 2 million condoms. The program tested 15,092 PWID for HIV and had a positive yield of 17%.

In 2023, community-based outreach activities were extended to extremely hard-to-reach areas in Myanmar, establishing four outreach outposts, and, significantly, the program found an HIV-positive yield that increased to 25% in these areas.

**Conclusions/Next steps:** To sustain and expedite the above-mentioned activity, the implementers will maintain the current activities and scale their reach to additional PWID/PWUD in hard-to-reach areas.

This program will continue to provide much-needed prevention services while monitoring positivity yield and increasing ART uptake.

## WEPEE509

### Optimizing HIV self-testing for young key populations: evidence from 7 provinces in Thailand

S. Janyam<sup>1</sup>, C. Phaengnongyang<sup>1</sup>, S. Sukthongsa<sup>2</sup>, P. Leksiri<sup>2</sup>, K.H. Thy<sup>2</sup>, P. Patpeerapong<sup>3</sup>, S. Sittikarn<sup>4</sup>, T. Prasarnpim<sup>5</sup>, N. Saejung<sup>6</sup>, S. Mills<sup>6</sup>, P. Rattakitvijun Na Nakorn<sup>7</sup>

<sup>1</sup>Service Workers in Group Foundation, Bangkok, Thailand,

<sup>2</sup>Service Workers in Group Foundation, Pattaya, Thailand,

<sup>3</sup>MPLUS Foundation, Chiang Mai, Thailand, <sup>4</sup>Caremat

Foundation, Chiang Mai, Thailand, <sup>5</sup>Rainbow Sky

Association of Thailand, Bangkok, Thailand, <sup>6</sup>FHI 360, EpiC

Thailand, Bangkok, Thailand, <sup>7</sup>United States Agency for

International Development, Bangkok, Thailand

**Background:** Young key populations face heightened risks of HIV acquisition and significant barriers in accessing HIV prevention and testing services. With the support of US-AID/PEPFAR/EpiC Project, four Key Population-Led Health Service (KPLHS) organizations strived to make HIV testing more accessible through online outreach and distribution to young KPs.

**Description:** KPLHS clinics use online platforms to promote their HIV/STI services among key populations, predominantly Facebook, X (Twitter), TikTok, and dating applications. For those interested, clients made an online reservation for preferred services or could request an HIV self-test kit on the online booking system, TestMeNow.

For those opting for the latter, HIVST kits were shipped based on client preferred venues, with follow-up con-

ducted online. Those with a reactive result were referred to confirmatory HIV testing at KPLHS clinics or nearby hospitals and initiated ART on the same day.

**Lessons learned:** During October 2022 to September 2023, KPLHS clinics distributed 2,230 HIVST kits to key populations, 83% of distributed kits (n=1,843) were utilized, yielding 102 reactive clients. Approximately 40% of HIVST kits were distributed among young KPs aged 15 – 24 years, and 37 reactive cases were found, accounting for 36% of the total reactive cases.

Comparing case finding rates between routine HIV testing at KPLHS clinics and mobile testing, and HIVST, the latter yielded a higher rate of 6% (37 reactive/1,843 tests) compared to 2% case finding rate (866 positive/40,217 tests). The confirmatory ratio among all reactive cases (n=84) was 82% but lower (62%) among young KP clients (n=20). Notably, 93% of all confirmed HIV positive were successfully enrolled on ART.

**Conclusions/Next steps:** HIV self-testing is instrumental in accessing young key populations aged 15 – 24 years exposed to higher risk of HIV and who face stigma and discrimination in seeking HIV services at hospitals. Further initiatives to scale up the use of HIVST on online platforms should be explored as well as young KP-specific follow-up/support systems.

## WEPEE510

### Lessons learned from implementing multilingual HIV and syphilis testing events for international migrants in Japan

T. Kitajima<sup>1</sup>, T. Sawada<sup>2</sup>, H. Miyakubi<sup>3</sup>, T.T. Hue<sup>4</sup>, Y. Ikushima<sup>5</sup>, S. Shaky<sup>6</sup>, C. Li<sup>7</sup>, H. Nakamura<sup>8</sup>, N. Shinzato<sup>9</sup>, N. Honda<sup>10</sup>

<sup>1</sup>Kyoto University, Faculty of Social Sciences, Tokyo,

Japan, <sup>2</sup>Minatomachi Clinic, Yokohama, Japan, <sup>3</sup>Kyorin

University, Faculty of Foreign Studies, Tokyo, Japan,

<sup>4</sup>Kobe Women's University, Kobe, Japan, <sup>5</sup>Place Tokyo,

Tokyo, Japan, <sup>6</sup>Japan Foundation for AIDS Prevention,

Tokyo, Japan, <sup>7</sup>The University of Tokyo, Tokyo, Japan,

<sup>8</sup>University of the Ryukyus, Graduate School of Medicine,

Okinawa, Japan, <sup>9</sup>University of the Ryukyus Hospital,

First Department of Internal Medicine, Okinawa, Japan,

<sup>10</sup>Dokkyo Medical University Saitama Medical Center,

Koshigaya, Japan

**Background:** As of 2023, about 3.2 million international migrants lived in Japan, with 80% from neighboring Asian countries. Nearly 50% of the migrants are in their 20s and 30s. In 2022, about 28% of international migrants in Japan were not aware of their HIV status until they developed HIV-related advanced symptoms.

**Description:** We organized 21 free and anonymous multilingual HIV and syphilis testing events across multiple prefectures in Japan, including Tokyo (since 2021), Okinawa (since 2022), Sendai (since 2023), and Saitama (since

2023). The project is funded by the Health Labour Sciences Research Grant, aiming to improve access to HIV testing and medical services among international migrants.

We advertised the testing events in multiple languages (e.g., English, Chinese, Vietnamese, and Nepali) via global social media platforms (e.g., Facebook), migrant communities, and dating apps with direct links to the testing booking site in respective languages. At testing sites, participants could ask for online medical interpretation free of charge. A total of 247 people made reservations, of whom 67.7% (n=167, from 22 nationalities) came to the event and received tests. About 81.0% were male, 85.9% were in their 20s or 30s, and 35.9% tested for HIV for the first time. One HIV-positive case (0.6%) and two new syphilis cases (1.2%) were identified and referred to medical facilities accordingly. Nearly 50% of the participants opted for PrEP consultation.

**Lessons learned:** Our HIV/syphilis testing project demonstrated the feasibility of expanding HIV testing among international migrants in Japan through multilingual outreach efforts and testing services. Although PrEP has not been officially approved in Japan, there is a substantial interest in using PrEP as regular HIV prevention among international migrants.

The high non-attendance rate among those who made online appointments suggests the potential barriers from the intention of testing to actual testing uptake. More research in diversifying HIV testing provision - especially in non-clinical settings is highly needed.

**Conclusions/Next steps:** We want to explore the possibilities of:

1. Adding our multilingual testing model to HIV testing services at public health centers and medical facilities,
2. Engaging international communities in organizing the testing events, and;
3. Providing mail HIV testing in multilingual formats.

## WEPEE511

### Identifying and treating acute HIV infection among high-risk individuals: a combination intervention to tackle the uncontrolled HIV epidemic among MSM in Jakarta and Bali, Indonesia

I. Irwanto<sup>1</sup>, N. Nurhayati<sup>2</sup>, H. Luis<sup>3</sup>, E.P. Sihotang<sup>2</sup>, P.P. Januraga<sup>4</sup>, M. Oktaviani<sup>5</sup>, S. Suwanti<sup>5</sup>, D. Rahmawati<sup>5</sup>, E. Yanihastuti<sup>6</sup>, M. Dijkstra<sup>7</sup>, E.J. Sanders<sup>8</sup>, F.S. Wignall<sup>2,3</sup>, K. Gedela<sup>9</sup>, R.L. Hamers<sup>10,5</sup>

<sup>1</sup>HIV/AIDS Research Centre, Atma Jaya Catholic University, Jakarta, Indonesia, <sup>2</sup>Klinik Utama Globalindo, Jakarta, Indonesia, <sup>3</sup>Yayasan Bali Peduli, Denpasar, Indonesia, <sup>4</sup>Centre for Public Health Innovation, Udayana University, Denpasar, Indonesia, <sup>5</sup>Oxford University Clinical Research Unit Indonesia, Faculty of Medicine Universitas Indonesia, Jakarta, Indonesia, <sup>6</sup>Dr. Cipto Mangunkusumo Hospital, Faculty of Medicine Universitas Indonesia, Jakarta, Indonesia, <sup>7</sup>Department of Internal Medicine, Amsterdam University Medical Centers, University of Amsterdam, Amsterdam, Netherlands, the, <sup>8</sup>The Aurum Institute, Johannesburg,, South Africa, <sup>9</sup>56 Dean Street clinic, Chelsea & Westminster Hospital NHS Trust, London, United Kingdom, <sup>10</sup>University of Oxford, Nuffield Department of Medicine, Oxford, United Kingdom

**Background:** Indonesia has one of the highest numbers of new HIV infections globally, estimated at 24,000 in 2022, particularly among key populations. One in three men who have sex with men (MSM) in Jakarta and Bali are living with HIV (PLWH). Use of pre-exposure prophylaxis is still low.

There is an urgent need for innovative and tailored interventions to curb the epidemic.

**Description:** The aim of the Indonesia Intervention Study to Test & Treat people with Acute HIV Infection (AHI) (INTERACT) is to demonstrate that implementing a clinical pathway to identify AHI, coupled with immediate ART initiation, can improve the HIV care cascade for key populations.

Between May-December 2023, 1879 individuals (≥16 years old) who attended a non-governmental sexual health service were enrolled for AHI screening, including an AHI risk score followed by point-of-care Xpert HIV-PCR (either individual or pooled) testing. Newly HIV-diagnosed participants were offered immediate ART and partner notification.

**Lessons learned:** Median age was 27 years (IQR24-31). 77.5% were male. MSM accounted for 50.4%, clients of sex workers for 20.1%, and sex workers for 5.2%. 43.0% had an AHI risk score of ≥2. 99.3% (1866/1879) received an HIV-antigen/antibody test, of whom 113 individuals tested positive. Of those testing HIV-antigen/antibody negative or inconclusive, 99.7% (1748/1753) received an HIV-PCR test, of whom an additional 6 individuals tested positive. Hence, the use of HIV-PCR enabled an additional 5.3% (95%CI1.9-

11.2; 6/113) of HIV diagnoses, at an AHI prevalence of 0.32% (95%CI 0.11-0.69; 6/1866). Of 119 newly HIV-diagnosed (6.4% [119/1866] positivity), 116 (97.5%) were linked to care and 94 (79.0%) started ART; among those 71 (75.5%) started the same day and 91 (96.8%) within a week.

**Conclusions/Next steps:** Identification of individuals with AHI, who are most infectious and would have been missed by standard HIV- antigen/antibody testing, augments opportunities to interrupt onward transmission. Participant follow-up will allow for HIV and AHI incidence estimation as well as constructing HIV care cascade outcomes.

We are implementing a tailored digital community engagement intervention to improve AHI test uptake and retention in care during 2024. Study data will be used to inform person-centered HIV care models in Indonesia.

## WEPEE512

Reaching the unreached: a transformative approach to HIV and allied health services for key populations in India

S. Dutta<sup>1</sup>, K. Krishnan<sup>1</sup>, G. Kumar<sup>1</sup>, A. Srikrishnan<sup>1</sup>, S. Singla<sup>2</sup>, K. Biswas<sup>2</sup>, R. Rana<sup>2</sup>

<sup>1</sup>YRG CARE, Programs GFATM, New Delhi, India, <sup>2</sup>PLAN India, Programs GFATM, New Delhi, India

**Background:** India aims to end the AIDS epidemic by 2030, in alignment with the Sustainable Development Goals. Embracing the global 90-90-90 targets and the FastTrack target of 95-95-95, the National Strategic Plan for HIV/AIDS and STI includes the innovative One Stop Centers (OSC) initiative under NACP V. OSCs target hard-to-reach populations often excluded from national HIV control due to stigma and lack of awareness, offering risk assessment, HIV screening, treatment, preventive services, and social support.

**Description:** The OSCs serve as a unified approach to engage Key Populations (KP) and Bridge Populations (BP) usually beyond the reach of traditional HIV programs. These centres, established across 25 Indian states, cater to various groups including Migrants, Transport Workers, the Transgender community, and People Who Inject Drugs (PWID). They provide a comprehensive set of services tailored to client needs, including clinical screenings (HIV, STIs, TB, Viral Hepatitis, NCDs), behavioural counselling, mental health support, and access to social protection schemes. OSCs facilitate streamlined service delivery, enhancing individual and community health outcomes.

**Lessons learned:** OSCs have shown remarkable impact within their first year. Among BP, 67,187 individuals were registered, showing a 0.4% HIV incidence and high rates of ART linkage (89%) and viral load suppression (75%). For PWID, the figures are equally notable: 9,734 registered, with a 4.13% HIV incidence, 86% ART linkage, and 23% viral load suppression.

The transgender community saw 7,280 registrations, a 2.33% HIV incidence, 92% ART linkage, and 56% viral load suppression. Index testing indicates significant HIV incidence among partners of these populations.

**Conclusions/Next steps:** Looking forward, the OSC model stands as a promising star in health service delivery. Its success hinges on robust coordination with stakeholders, efficient supply management, and the provision of value-added services. Strengthening mental health services and enhancing social protection linkages will solidify OSCs as comprehensive one-stop shops for health care. This holistic model not only addresses immediate health concerns but also mitigates broader community-level health challenges, marking a significant stride towards an inclusive and accessible health system for all.

## Implementation science and scale up of prevention

from the primary study and the literature to parameterize a 3-state Markov model (HIV, AIDs, Dead) and a 1-year Markov cycle. All costs were estimated from the Infectious Diseases Institute accounts records and the literature and were reported in 2021 US dollars. The main outcomes were the mean annual costs in US dollars (\$), disability-adjusted life years (DALYs), and incremental cost-effectiveness ratio (ICER). We also conducted the univariate and probabilistic sensitivity analyses to test the impact of model parameters on results.

**Results:** Compared to the SOC, the CLF-IVR was associated with fewer mean annual costs (\$148 vs. \$793) and DALYs (3.42 vs. 6.31), leading to a cost saving of \$223 per DALY averted from the societal perspective. From the payer perspective, the CLF-IVR was associated with fewer mean annual costs (\$78 vs. \$555) and DALYs (3.42 vs. 6.31), leading to a cost saving of \$165 per DALY averted. In the incremental analysis, the SOC was dominated by the CLF-IVR, i.e., it was costlier and less effective. These results were robust to univariate and probabilistic sensitivity analyses.

**Conclusions:** CLF-IVR is both cost-effective and cost saving, and it may be an efficient strategy to promote treatment adherence among YPLHIV in Uganda, and limit transmission as U=U. Similar interventions may lead to greater returns in promoting adherence to ART among YPLHIV and other vulnerable groups.

## WEPEE514

Utilization of social media platforms to identify and link HIV services to unreached female sex workers in the Eastern Region of Ghana

Y.C. Mensah<sup>1</sup>, S.E. Owusu<sup>2,3</sup>

<sup>1</sup>Heart for Help Foundation, Programs, Accra, Ghana,

<sup>2</sup>Heart for Help Foundation, Accra, Ghana, <sup>3</sup>Maritime Life Precious Foundation, Takoradi, Ghana

**Background:** Social media is becoming an accessible platform for communication among female sex workers (FSWs) in Ghana. Social media has emerged as an avenue where FSWs are increasingly soliciting for potential sexual clients rather than physical hotspots. In Ghana, the HIV prevention program for FSWs is often implemented through traditional peer outreach.

However, there are some segments of FSWs who engage in risky sexual behaviors but are unreached with HIV prevention programs via physical outreach.

Recognizing the unique vulnerabilities of this hidden population calls for a comprehensive approach that combines outreach, education, and support through various social media channels.

**Description:** HeHeF conducted a rapid assessment to identify social media platforms mostly used for finding potential sexual clients by FSWs such as Facebook, Snapchat, Instagram and Tinder. Tailored content on HIV services were posted on these platforms to raise aware-

ness, destigmatize HIV-related issues and promote HIV services. A dedicated landing page was set up on HeHeF website together with a booking form linked to health-care professionals who provided confidential interactions with the FSWs recruited and supported them to seek HIV services at sensitized clinics.

Comparative analysis was carried out between physical and social media contacts.

**Lessons learned:** Total number of FSWs reached from February to July 2023 was 3412. (21% from February to April and 79% from May to July). In-post links to health-service providers was generated by 2674 users. Data collected also showed that social media reached out to more high risk FSWs than through physical outreach. 57% of FSWs recruited through social media had never tested for HIV compared with 33% reached via physical outreach. 61% of FSWs recruited on social media had unprotected sex with non-paying partners compared to 46% recruited through physical contact.

Additionally, 2100 FSWs tested for HIV through social media; 370 were diagnosed HIV+ (17.6% HIV+ yield). Comparatively, 4960 FSWs tested for HIV through physical outreach; 298 were diagnosed HIV+ (6% HIV+ yield).

**Conclusions/Next steps:** Social media in HIV service delivery is an effective tool of reaching high risk FSWs not traditionally accessed by peer educators. It should be adopted as an integral outreach approach for HIV prevention interventions moving forward.

## WEPEE515

HIV Pre-Exposure Prophylaxis Access Retention and Education Research (HIV-PREPARER) among general practitioners and clients in Paris, France

V. Manda<sup>1</sup>, M. Monnet<sup>2</sup>, S. Bunting<sup>3</sup>, J. Talandis<sup>3</sup>, G. Liegeon<sup>3</sup>, J. Schneider<sup>3</sup>, J.-M. Molina<sup>1,4</sup>, A. Hazra<sup>3</sup>

<sup>1</sup>Hôpital Saint-Louis AP-HP, Paris, France, <sup>2</sup>Centre de Santé Richerand, Paris, France, <sup>3</sup>University of Chicago Medicine, Section of Infectious Diseases and Global Health, Chicago, United States, <sup>4</sup>Université Paris Cité, Paris, France

**Background:** Implementation of PrEP in primary care settings has started in France in June 2021 to broaden and facilitate PrEP access. We completed a pilot mixed-methods study of Parisian general practitioners (GP) and PrEP-eligible clients to evaluate knowledge and attitudes towards PrEP two years after its availability in primary care clinics.

**Methods:** An anonymous survey was sent to a GP network to assess their awareness and confidence in PrEP prescription. Respondents also completed a validated 19-item true/false knowledge scale regarding PrEP and HIV prevention.

Concurrently, PrEP-eligible clients of busy primary care practice in Paris completed an anonymous survey assessing their knowledge and attitudes regarding HIV preven-

tion as well as preferences in PrEP prescribers. A subset of GPs and clients participated in 1-hour focus groups about these items. Focus group discussions were transcribed, translated to English, and thematically analyzed.

**Results:** Of 150 GPs reached, 25 completed the survey. All GPs were aware of PrEP, 80% reported ever prescribing PrEP, and 92% reported interest in prescribing PrEP. The most common barrier to prescription was unclear process for urgent HIV referrals (36%).

The HIV/PrEP knowledge scale mean was 85.9% (SD=8.6%) corresponding to an average of 16.2 items correct out of 19 (median = 17).

Among 44 PrEP-eligible clients surveyed, they were predominantly cisgender men (93%) and gay (86%), with a mean age of 37. All were aware of PrEP, 93% had taken PrEP, 95% felt comfortable discussing it with their GP, and 50% preferred their GP as their PrEP prescriber.

Focus group insights from GPs acknowledged the benefits of providing PrEP but highlighted challenges in discussing PrEP with women and migrant populations.

Client focus groups outlined difficulties in finding a trusted PrEP prescriber with many reporting a preference for infectious diseases specialists due to perceived expertise in LGBTQ issues and sexual health.

**Conclusions:** We identified high interest and sound knowledge of PrEP by both GPs and clients. However, concerns in reaching non-MSM populations as well as difficulty accessing LGBTQ-affirming primary care were potential barriers for some GPs and clients respectively.

These highlight the need for targeted interventions to ensure broader PrEP access in French primary care settings.

## WEPEE516

### Barriers and facilitators to implementing a pharmacy-based pre-exposure prophylaxis (PrEP) service delivery model among key populations, PrEP prescribers and community pharmacists in the Klang Valley, Malaysia

Y.N. Gan<sup>1,2</sup>, S.H. Lim<sup>1,3</sup>, S.A. Hafidzar<sup>3</sup>, R. Ahmad Zaki<sup>1,4</sup>, M. Ahmad Nizaruddin<sup>5</sup>, F. Altice<sup>3,6,7,8</sup>, I. Azwa<sup>3,9</sup>

<sup>1</sup>Universiti Malaya, Department of Social & Preventive Medicine, Kuala Lumpur, Malaysia, <sup>2</sup>Ministry of Health Malaysia, Malaysian Health Technology Assessment Section (MaHTAS), Putrajaya, Malaysia, <sup>3</sup>Universiti Malaya, Centre of Excellence for Research in AIDS (CERIA), Kuala Lumpur, Malaysia, <sup>4</sup>Universiti Malaya, Centre for Epidemiology and Evidence-Based Practice (CEBP), Kuala Lumpur, Malaysia, <sup>5</sup>University of Cyberjaya, Faculty of Pharmacy, Department of Community & Pharmacy Practice, Cyberjaya, Malaysia, <sup>6</sup>Yale School of Medicine, Section of Infectious Diseases, Department of Internal Medicine, New Haven, United States, <sup>7</sup>Yale School of Public Health, Department of Epidemiology of Microbial Diseases, New Haven, United States, <sup>8</sup>Yale University, Center for Interdisciplinary Research on AIDS (CIRA), New Haven, United States, <sup>9</sup>Universiti Malaya, Infectious Diseases Unit, Department of Medicine, Kuala Lumpur, Malaysia

**Background:** HIV pre-exposure prophylaxis (PrEP) uptake remains inadequate in Malaysia. As community pharmacists are recognized as accessible and trusted healthcare professionals, there is potential to expand PrEP access through a simplified, demedicalized service delivery model in the community pharmacy setting.

This study aimed to understand the barriers and facilitators to implementing a pharmacy-based PrEP service delivery model among key populations, community pharmacists and PrEP prescribers in the Klang Valley, Malaysia.

**Methods:** A qualitative study involving 38 semi-structured in-depth interviews was conducted with 18 key population members, 10 PrEP prescribers and 10 community pharmacists in the Klang Valley from January to April 2023. Key population members included 6 men who have sex with men (MSM), 5 transgender women (TGW), 3 female sex workers (FSW), and 4 people who inject drugs (PWID); 1 MSM and 4 TGW also engaged in sex work while 1 FSW reported injection drug use. Participants were recruited using purposive sampling. All interviews were conducted online in English or Malay for about an hour, audio-recorded, and transcribed verbatim. Thematic analysis was performed using NVIVO.

**Results:** All groups identified common barriers: privacy, confidentiality, affordability, and poor awareness about pharmacy-based PrEP service. Key population members additionally reported poor awareness about PrEP, while PrEP prescribers highlighted barrier related to unavailability of laboratory testing service. Community pharma-

cists reported other barriers such as lack of training, staff, time, and counselling/private space. Most participants expressed strong support for implementing the service and perceived availability of private space, assurance of confidentiality, affordable pricing, adequate training, digitalized assessment, and collaboration with physicians and non-government organization community health workers for seamless referrals as facilitators to this service.

**Conclusions:** This study provided valuable insights on the barriers and facilitators to implementing a pharmacy-based PrEP service in the Klang Valley. The findings indicate there is a need and demand for an additional choice of accessing PrEP.

Future research should focus on developing an implementation plan addressing identified barriers and capitalizing on facilitators, followed by implementation and evaluation of implementation outcomes to inform the viability of pharmacy-based PrEP service delivery model as a novel implementation strategy to increase PrEP uptake in Malaysia.

## WEPEE517

Using an outreach model of service delivery to improve uptake of cervical cancer screening among women living with HIV in Northeastern Uganda, 2021-2023

S. Ssentongo<sup>1</sup>, B. Bakashaba<sup>1</sup>, B. Oryokot<sup>1</sup>, R. Opito<sup>1</sup>, M. Nakawuka<sup>2</sup>, A. Munina<sup>1</sup>, S. Alwedo<sup>1</sup>, B. Etukoit<sup>1</sup>, Y. Miya<sup>1</sup>, K. Mugisha<sup>1</sup>, J. Kalamya.N.<sup>3</sup>

<sup>1</sup>The AIDS Support Organization, Kampala, Uganda,

<sup>2</sup>Ministry of Health AIDS Control Program, Kampala,

Uganda, <sup>3</sup>US Centers for Disease Control and Prevention, Global Health Center, Division of Global HIV and TB, Kampala, Uganda

**Background:** Cervical cancer (CxCa) is the leading cause of cancer-related death in Uganda with women living with HIV (WLHIV) being six times more likely to develop CxCa. At the start of the CxCa screening program for WLHIV aged 25-49 in January- March 2021, the uptake of the service was low, achieving only 3% of the quarterly target. This was attributed to screening at only static facilities. This report demonstrates how CxCa screening uptake was improved by using an outreach model of service delivery in North-Eastern Uganda.

**Description:** During January 2021 to January 2023, 25 health facilities (HFs) were equipped to offer CxCa screening in the region.

Additionally, 61 outreach HFs were identified and a team of health workers (HWs) at each of the outreach HFs was trained on CxCa service provision, and given supplies to screen and treat precancerous lesions. At each outreach site, a line list of eligible WLHIV was generated from HIV clinic registers. Phone calls or short message services

were used to book and invite eligible WLHIV for screening. Trained HWs conducted health education and WLHIV who consented were screened by visual inspection with acetic acid.

WLHIV identified with precancerous lesions were treated by thermal ablation, while those with cancerous lesions were referred to the referral hospital for further management. We analyzed routine program data to show the number of WLHIV screened for CxCa.

**Lessons learned:** During January 2021-January 2023, a total of 17,345 WLHIV of 25-49 years were screened for CxCa at static and outreach facilities. Of those screened, 1,159 WLHIV were identified with precancerous lesions yielding a positivity of 6.7% (1,159/17,345) while 52 had suspected cancerous lesions. The outreach HFs contributed 46.7% (8,112/17,345) of the total WLHIV screened. The number of WLHIV screened for CxCa increased from 52 in January-March 2021 to 1,381 in January-March 2023 after scaling services in outreach sites. All WLHIV with precancerous lesions were treated.

**Conclusions/Next steps:** Scaling up CxCa screening in outreach sites increased the number of WLHIV screened, for CxCa. Moving services nearer to clients through an outreach model could increase access and uptake of CxCa services in similar settings.

## WEPEE518

A time-and-motion study of resources required for HIV pre-exposure prophylaxis-related service delivery in South Africa

R. Dawit<sup>1</sup>, C. Singh<sup>2</sup>, N. Matenjwa<sup>3</sup>, N. Dladla<sup>3</sup>, L. Shipp<sup>1</sup>, M. Mcingana<sup>4</sup>, J. Mcloughlin<sup>4</sup>, S. Mishra<sup>5</sup>, J. Steingo<sup>4</sup>,

A. Rao<sup>1</sup>, J.G. Rosen<sup>6</sup>, S. Baral<sup>1</sup>, H. Hausler<sup>4,7</sup>, S.R. Schwartz<sup>1</sup>

<sup>1</sup>Johns Hopkins University, Department of Epidemiology, Baltimore, United States, <sup>2</sup>TB HIV Care Center,

Pietermaritzburg, South Africa, <sup>3</sup>TB HIV Care Center,

Key Populations Programme, Durban, South Africa, <sup>4</sup>TB

HIV Care Center, Cape Town, South Africa, <sup>5</sup>University

of Toronto, Department of Medicine, Toronto, Canada,

<sup>6</sup>Johns Hopkins University, Department of International

Health, Baltimore, United States, <sup>7</sup>University of Pretoria,

Department of Family Medicine, Pretoria, South Africa

**Background:** Despite widespread availability, pre-exposure prophylaxis (PrEP) persistence remains suboptimal for adolescent girls and young women (AGYW) and female sex workers (FSW) in South Africa. This time-and-motion study examines factors that may influence PrEP persistence by assessing the time and resources required to attend PrEP-related services.

**Methods:** We quantified the time spent on PrEP-related services across 13 different sites for AGYW and FSW receiving care through TB HIV Care across South Africa. Wilcoxon rank-sum tests were used to compare the median time engaged in services.

Opportunity costs were assessed for a subset of FSW clients who provided self-reported wages forgone due to time spent receiving PrEP services.

**Results:** A total of 149 AGYW (40%) and FSW (60%) were enrolled. Overall, median time spent receiving PrEP services was 25 minutes (interquartile range [IQR]:14-38 minutes). The median time spent during PrEP visits was 33 minutes (IQR: 21.0-53.5) for AGYW and 22 minutes (IQR:13.0-33.0) for FSW ( $p=0.0014$ ). Significant differences in time spent were also observed for PrEP initiations (41 minutes, IQR:25.0-69.0) versus PrEP refills (20 minutes, IQR:12.5-30.0) ( $p<0.0001$ ) as well as time spent by the care sites ( $p=0.0008$ ). Across all visits, among FSW providing self-reported lost wages ( $n=54$ ), median total opportunity cost was 250 South African Rand (IQR:150-450). Non-statistically significant differences in opportunity cost were observed among FSW initiating PrEP versus refill visits, receiving services from mobile van versus drop-in centers, between TB HIV Care sites, and among those traveling to receive care (Table).

Characteristics	Minutes spent on total visit (Median [interquartile range])	Wilcoxon rank-sum p-value
Overall time spent	25 (14-38)	
Population		0.0014
AGYW	33 (21.0-53.5)	
FSW	22 (13.0-33.0)	
Initiating or refilling PrEP		<0.0001
Initiation visit	41 (25.0-69.0)	
Refill visit	20 (12.5-30.0)	
Location		0.1318
Mobile van	24.5 (14.0-37.5)	
Drop-in center	30 (18.0-55.0)	
Traveled to receive care		0.1638
No, it's occurring at my home or another convenient place	24 (15.0-36.0)	
No, it's occurring at work	25 (12.0-35.0)	
No, it's occurring at my school	26 (19.0-50.0)	
Yes, I travelled specifically for this visit	56.0 (36.0-179.0)	

\*AGYW: adolescent girls and young women; FSW: female sex workers

Table. Time spent receiving PrEP related services for clients in the TB HIV Care Center in South Africa ( $n = 149$ ).

**Conclusions:** A substantial amount of time is dedicated to PrEP services for AGYW, PrEP initiators, women at drop-in centers, and those traveling for care. The associated time and costs might lead to decreased PrEP persistence, particularly as cost accumulates over time. Exploring efficient PrEP delivery options, especially in economically marginalized communities at high HIV risk, could enhance PrEP persistence.

## WEPEE519

Insights and learning from developing sexual and mental health content for chatbot and social media – Young Africa Live

S. Moore<sup>1</sup>, Y. Azgad<sup>1</sup>, F. Roff<sup>1</sup>

<sup>1</sup>Avert, Brighton, United Kingdom

**Background:** To engage young people in sexual and mental health and ensure they can make informed choices, a new approach is needed. South Africa has over 20 million young people, but current approaches do not meet their needs. Relationships, sex, sexuality and mental health are topics they value, but are often communicated

in inaccurate, antiquated and judgemental ways by moralising, unrelatable authority figures. Young people are less informed and have poorer linkages to and retention within services than adults. They are also disproportionately impacted by HIV and STIs.

**Description:** Young Africa Live (YAL) aimed to provide young South Africans with access to accurate and reliable sexual and reproductive health information through judgement-free private conversations on a WhatsApp chatbot, and peer discussion on Facebook and Instagram.

Implemented by a consortium led by Reach Digital Health, Avert led content development and social media marketing to drive awareness and engagement. YAL's channels were integrated within the Department of Health-sponsored B-Wise sexual health information brand.

### Lessons learned:

- Social media marketing can be a cost-effective way to recruit large numbers of users to a chatbot platform, with over 100,000 users recruited in less than a year.
- Social media platforms' unclear content policies, and their lack of understanding of sexual health communications, pose a challenge to social media marketing efforts. The project faced increasing, inconsistent, censorship of sex-positive health education content by these platforms.
- Chatbot content that required user engagement, such as quizzes, was particularly popular. Push notifications and serialised content supported longterm engagement.
- Social media analytics show that sex-related content is what grabs young people's attention. Bold creatives that put sex at the forefront were by far the most popular social content throughout the project.
- Social media engagement highlighted topics where further education is needed or issues are misunderstood, such as consent and mental health.

**Conclusions/Next steps:** YAL demonstrates the value in using chatbots and social media to deliver relevant, engaging sexual and mental health content to youth using a sex-positive, youth-friendly approach, empowering young people to make informed decisions. An evaluation is being finalised by Reach Digital Health to assess YAL's impact on health information seeking behaviours.

Long-acting oral PrEP is preferred to injections:  
findings from an online sample of American gay,  
bisexual, and other men who have sex with men

R.M. Gravett<sup>1</sup>, D.M. Long<sup>2</sup>, K. Biello<sup>3,4,5</sup>, K. Mayer<sup>3</sup>,  
B. Johnson<sup>1</sup>, R. Lillis<sup>6</sup>, Y. Whiteside<sup>7</sup>, L. Elope<sup>1</sup>

<sup>1</sup>University of Alabama at Birmingham, Division of  
Infectious Diseases, Department of Medicine, Heersink  
School of Medicine, Birmingham, United States,

<sup>2</sup>University of Alabama at Birmingham, Department  
of Biostatistics, School of Public Health, Birmingham,  
United States, <sup>3</sup>The Fenway Institute, Fenway Health,  
Boston, United States, <sup>4</sup>Brown University, Department  
of Behavioral and Social Sciences, School of Public  
Health, Providence, United States, <sup>5</sup>Brown University,  
Center for Health Promotion and Health Equity,  
School of Public Health, Providence, United States,  
<sup>6</sup>Louisiana State University, School of Medicine, New  
Orleans, United States, <sup>7</sup>Merck & Co., Inc., Rahway,  
United States

**Background:** Despite high HIV incidence in the United States (US), pre-exposure prophylaxis (PrEP) access varies among gay, bisexual, and other men who have sex with men (GBM) due to multi-level barriers (e.g., systemic racism, medical mistrust). New or emerging modalities may circumvent some barriers, but other barriers could negate this benefit.

This study examines the structural, social, and personal context informing PrEP preferences.

**Methods:** We used social media to recruit American adult GBM for an online survey assessing preferred PrEP options (see Table).

Surveys collected data on sociodemographics, perceptions of barriers, stigma, and social support. We created frequency tables with descriptive statistics and used multivariable exploded logit regression to evaluate PrEP preference rankings (vs. daily pill).

**Results:** 723 GBM completed the survey; 59.5% were White, and 26.5% were Black. The median age was 34 years. 28.6% most preferred a monthly pill compared to 25.4% for a daily pill, 15.6% for biannual subcutaneous injections, 11.8% for implants, 10.7% for an on-demand pill, 6.3% for bimonthly intramuscular injections, and 1.7% for rectal douches. We found significant differences in preference rankings by structural and behavioral variables (see Table for selected variables).

Black and other-race participants ranked the monthly pill higher compared to White participants (odds ratio [OR] 1.296 and 1.32 vs. 0.938,  $p=0.00$ , respectively).

As scaled variables and barrier ranking increased, the preference was higher for monthly pill, yearly implant, and subcutaneous injections but lower for intramuscular injections and rectal douche when each were compared to daily oral pill.

Variable	On-Demand Pill OR p-value	Monthly Pill OR p-value	Every 2 Month IM Inj OR p-value	Yearly Implant OR p-value	Rectal Douche OR p-value	Every 6 Month SC Inj OR p-value
Baseline	0.92 0.0603	1.19 0.000	0.73 0.000	1.07 0.008	0.77 0.000	1.31 0.000
Black Race	0.907 0.860	1.296 0.000	0.689 0.026	1.117 0.055	0.760 0.292	1.330 0.045
White Race	0.894 -	0.938 -	0.817 -	0.974 -	0.824 -	1.172 -
Other Race	0.961 -	1.320 -	0.733 -	1.035 -	0.702 -	1.437 -
Barrier: Side Effects	0.974 0.006	1.035 0.000	0.944 0.000	1.011 0.048	0.934 0.000	1.068 0.000
Barrier: Adherence	0.982 0.019	1.031 0.000	0.946 0.000	1.012 0.009	0.951 0.000	1.050 0.000
Trust in HCP scale	0.989 0.032	1.021 0.000	0.967 0.000	1.007 0.014	0.969 0.000	1.033 0.000
PrEP Knowledge scale	0.999 0.047	1.002 0.000	0.996 0.000	1.001 0.001	0.997 0.000	1.003 0.000
Social Support scale	0.985 0.106	1.041 0.000	0.936 0.000	1.016 0.002	0.941 0.000	1.061 0.000

**Conclusions:** Among U.S. GBM, the largest proportion favored oral PrEP, taken monthly more so than daily or on-demand, but there was some interest in non-oral forms of PrEP delivery. There were significant differences in preference rankings by structural and behavioral variables. Nuanced understanding of these associations may improve messaging and reduce barriers to PrEP access to improve disparities.

## WEPEE521

The Anti-homosexuality Act 2023 dilemma:  
Innovative adaptation approaches to accelerate  
pre-exposure prophylaxis (PrEP) access and  
uptake among Lesbian, Gay, Bisexual, Trans, Queer  
(LGBTQ+) and other sexual minorities in Uganda

R. Nakigozi<sup>1</sup>, K.A. Kajura<sup>2</sup>

<sup>1</sup>Villa Maria, HIV Care and Treatment, Kampala,  
Uganda, <sup>2</sup>Villa Maria, Kampala, Uganda

**Background:** In Uganda, HIV incidence is higher (25%) among LGBTQ+ and their sexual partners. The Anti-Homosexuality Act 2023 has **created a volatile homophobic atmosphere** threatening PrEP uptake, and reversing progress in overall HIV responses.

With funding from the Uganda Foundation-UK, in August 2023 Villa Maria Hospital discreetly engaged LGBTQ+ communities in Kampala and suburbs to design masked, differentiated, person-centered approaches aimed at intensifying PrEP **awareness, access and uptake** within LGBTQ+ secret shelters.

**Description:** Through December 2023, our trained medical staff used a snow ball approach to identify and obtain permission from LGBTQ+ leadership to penetrate LGBTQ+ settings in Kampala and suburbs.

We used human rights illustrations that demonstrate support for equal rights including equal access to PrEP and other HIV prevention services. We provided HIV and PrEP counseling, social stigma reduction counselling, per-

sonalized HTS, STI management, bleeding for creatinine, PrEP initiation, ART initiation, condom and lubricants distribution within LGBTQ+ settings. Data on personal demographics, risk perception, stigma, sexual behavior, PrEP awareness, condom use were collected using interview guided questionnaires and analyzed using STATA Version 14.

**Lessons learned:** 14 LGBTQ+ shelters and settings were quietly identified, 298 LGBTQ+ were mobilized (94 MSM, 58 Lesbian, 85 Bisexual, 38 Queer, 23 transgender). Up to 39(13%) were aged 16-19, 167(56%) were between 20-30, and 92(31%) above 30 years. 298(100%) received HIV and PrEP counseling, sexuality and social stigma reduction, 173 (58%) STI management, 806 (96%) received condoms and lubricants, 277(93%) received HTS, HIV prevalence was 12%, (244HIV-, 33HIV+), 63 (23%) were first time testers, 216 (78%) were bled for creatinine, 216 (78%) were initiated on PrEP, 33(12%) were referred for ART initiation.

Overall, PrEP awareness was high (71%) but initiation was low (29%) among HIV negatives.

Willingness to use PrEP was higher among those aged 25 and above compared to their younger counterparts. Participants suggested preference of longer-acting PrEP such as the injectable PrEP.

Secrecy of location, engagement of LGBTQ+ leadership and service integration were cited as primary reasons for increased PrEP uptake.

**Conclusions/Next steps:** Innovative approaches tailored to personal and community contexts may enhance uptake of PrEP and other biomedical HIV prevention services among LGBTQ+ and other high homophobic settings.

## WEPEE522

### Co-producing interventions to promote equitable access to HIV pre-exposure prophylaxis (PrEP) among Black women in England

F. Coukan<sup>1,2</sup>, W. Thamm<sup>3,4,5</sup>, F. Afolabi<sup>6</sup>, K.-K. Murray<sup>1,2</sup>, A. Pattison Rathbone<sup>7</sup>, J. Saunders<sup>8,9</sup>, C. Atchison<sup>2,10</sup>, H. Ward<sup>1,2,10</sup>

<sup>1</sup>National Institute for Health Research Applied Research Collaboration North West London, Chelsea and Westminster Hospital, London, United Kingdom, <sup>2</sup>Patient Experience Research Centre, School of Public Health,

Imperial College London, London, United Kingdom, <sup>3</sup>Newcastle University, Newcastle upon Tyne, United Kingdom, <sup>4</sup>The Sophia Forum, London, United Kingdom,

<sup>5</sup>Hillingdon AIDS Response Trust (HART), London, United Kingdom, <sup>6</sup>Youth Involvement and Engagement Lab, London, United Kingdom, <sup>7</sup>Newcastle University, Newcastle Upon Tyne, United Kingdom, <sup>8</sup>Blood Safety, Hepatitis,

Sexually Transmitted Infections (STI) and HIV Division, UK Health Security Agency, London, United Kingdom, <sup>9</sup>UCL Centre for Clinical Research in Infection and Sexual Health, Institute for Global Health, University College London,

London, United Kingdom, <sup>10</sup>National Institute for Health Research Imperial Biomedical Research Centre, London, United Kingdom

**Background:** Black women are some of the most underserved populations by HIV pre-exposure prophylaxis (PrEP) in England (UK). This is due to a complex interplay between various barriers at the individual, provider and system level. Using the Behaviour Change Wheel (BCW) framework, this study explored the impact of co-design strategies within programme improvement science to tackle barriers to PrEP access in Black women in England.

**Methods:** We held separate co-design workshops with three stakeholder groups: Black women, healthcare professionals (HCPs), and a mixed group that brought together Black women and HCPs. Workshop participants agreed on which key barrier to develop an intervention for, mapped the involved stakeholders, and co-designed an intervention using the BCW. The newly designed interventions were evaluated and compared via the APEASE criteria (acceptability, practicality, effectiveness, affordability, safety, and equity) to determine which stakeholder group designed the best-suited intervention to tackle barriers to PrEP access.

**Results:** All three workshops chose to address the lack of awareness and knowledge of HIV/PrEP among Black women as it represented the first barrier along the PrEP Care Continuum. As a result, co-designed interventions all consisted of a multimodal PrEP awareness campaign that involved national mass media and local engagement events embedded within the community. Key to those interventions was that Black women would be the face of such campaigns to establish trust with the Black community.

However, the disparities that existed across the co-designed interventions reflected the experiences of the respective stakeholders that co-designed them: the Black women-only workshop emphasised the importance of Black women's involvement throughout the campaign planning and implementation but did not discuss how the campaign would be funded; while the HCP-only workshop supported a much broader coalition that would include the UK Government for funding and integration into the broader HIV elimination strategy.

**Conclusions:** The study underscores the value of Black women's unique expertise and the importance of bringing said expertise into the policy-making process, as it is often tokenised in decision-making proceedings. This fits within a programme science approach that focuses on context-specific strategies to implement tailored and effective interventions that meet the needs of those underserved populations.

## WEPEE523

Impact of CyberRwanda on adolescent family planning and reproductive health: findings from a randomized effectiveness-implementation study in Rwanda

L. Hunter<sup>1</sup>, R. Hémono<sup>1</sup>, E. Gatare<sup>2</sup>, L. Kayitesi<sup>2</sup>, N. Ippoliti<sup>3</sup>, D. Cerecero<sup>4</sup>, D. Contreras-Loya<sup>5</sup>, S. Bautista<sup>4</sup>, F. Sayinzoga<sup>2</sup>, M. Mugisha<sup>6</sup>, S. Bertozzi<sup>7</sup>, R. Hope<sup>3</sup>, S. McCoy<sup>1</sup>

<sup>1</sup>University of California, Berkeley, Division of Epidemiology, Berkeley, United States, <sup>2</sup>Youth Development Labs, Rwanda, Kigali, Rwanda, <sup>3</sup>Youth Development Labs, Berkeley, United States, <sup>4</sup>National Institute of Public Health, Cuernavaca, Mexico, <sup>5</sup>Tecnologico de Monterrey, Institute for Obesity Research, Monterrey, Mexico, <sup>6</sup>University of Rwanda, Gasabo, Rwanda, <sup>7</sup>University of California, Berkeley, Health Policy and Management, Berkeley, United States

**Background:** Digital health interventions have the potential to improve family planning and reproductive health (FP/RH) and HIV outcomes among adolescents. CyberRwanda, a digital platform developed using a participatory human-centered design process, provides adolescents with FP/RH information (e.g., on HIV/STI prevention and contraception) and a direct-to-consumer online store for discreet access to contraception and other FP/RH products at nearby pharmacies and health facilities.

**Methods:** We conducted a Type 2 Hybrid Effectiveness-Implementation study (clinicaltrials.org: NCT04198272) to evaluate CyberRwanda in 60 schools across eight Rwandan districts.

Schools were randomized 1:1:1 to the control arm or to one of two CyberRwanda implementation models: self-service (self-guided access on tablet computers) or facilitated (self-guided access plus peer-led club sessions with guided in-person activities). Students aged 12–19 years

were randomly selected for participation and completed surveys at baseline, 12 months, and 24 months. Using generalized linear mixed models, we estimated prevalence ratios (PRs) comparing the primary outcomes of modern contraceptive use, initiation of childbearing, and HIV testing by arm.

Secondary outcomes hypothesized to be on the impact pathway included FP/RH knowledge, attitudes, self-efficacy, and behaviors.

**Results:** We enrolled 6,078 participants between February–May 2021 (51% female, median age: 15 years); 91% were retained at 24 months. CyberRwanda had no effects on contraceptive use, childbearing, and HIV testing in the full sample.

However, secondary analyses among the 27% of participants who reported past sexual intercourse (n=1,477) found significantly higher contraceptive use in the facilitated arm relative to the control arm (63% vs. 53%, PR: 1.2, 95% confidence interval [CI]: 1.1–1.4), in part due to increased condom use among males (63% vs. 50%, PR: 1.3, 95% CI: 1.1–1.5).

Participants in the CyberRwanda arm(s) also had more favorable condom beliefs (facilitated model), higher emergency contraceptive knowledge (both models), and increased contraceptive discussions with partners (facilitated model) compared to the control arm.

**Conclusions:** CyberRwanda was associated with positive shifts in FP/RH-related knowledge, attitudes, and behaviors among adolescents. Our findings suggest that digital interventions may benefit from in-person education to reinforce digital content, although further research is warranted to examine CyberRwanda's longer-term effectiveness as more of the study population becomes sexually active.

## WEPEE524

### Awareness, utilization and willingness to use long-acting PrEP in a statewide sample of transgender and nonbinary adults

A. Restar<sup>1,2</sup>, A. Ogunbajo<sup>3</sup>, J.G. Gutiérrez<sup>1</sup>, R. Lucas<sup>1</sup>, E. Dusic<sup>1</sup>, A. Bambilla<sup>1</sup>, N. Widmann<sup>1</sup>, A. Martin<sup>4</sup>, A. Shook<sup>5,6</sup>, B. Karrington<sup>6</sup>, D. Schwarz<sup>7</sup>, G. Shimkin<sup>1</sup>, V. Grandberry<sup>7</sup>, X. Xanadu<sup>1</sup>, P. Cleary<sup>8</sup>, E. Brooks<sup>8</sup>, E. Sessle<sup>9</sup>, S. Sawyer<sup>10</sup>, O. Martinez<sup>11</sup>, S. Wallace<sup>1</sup>, R. Heffron<sup>12</sup>, O. Galárraga<sup>13</sup>, D. Operario<sup>14</sup>, K. Gamare<sup>15</sup>

<sup>1</sup>University of Washington, Departments of Epidemiology, and Health Systems and Population Health, Seattle, United States, <sup>2</sup>Yale University, Social and Behavioral Sciences, New Haven, United States, <sup>3</sup>RAND Corporation, Washington, United States, <sup>4</sup>Public Health – Seattle & King County, Seattle, United States, <sup>5</sup>Seattle University, College of Nursing, Seattle, United States, <sup>6</sup>Seattle Children's Hospital, Seattle, United States, <sup>7</sup>Washington State Department of Health, Tumwater, United States, <sup>8</sup>Seattle's LGBTQ Center, Seattle, United States, <sup>9</sup>Lifelong, Seattle, United States, <sup>10</sup>People of Color Against AIDS Network (POCAAN), Seattle, United States, <sup>11</sup>University of Central Florida, Department of Population Health Sciences, College of Medicine, Orlando, United States, <sup>12</sup>University of Alabama at Birmingham, School of Medicine, Birmingham, United States, <sup>13</sup>Brown University School of Public Health, Department of Health Services, Policy and Practice, Providence, United States, <sup>14</sup>Emory University Rollins School of Public Health, Department of Behavioral, Social, and Health Education Sciences, Atlanta, United States, <sup>15</sup>University of Michigan School of Public Health, Department of Health Behavior and Health Education, Ann Arbor, United States

**Background:** Recently, substantial scientific progress has been made in the development, testing, and approval of new modalities for PrEP including long-acting modalities (LA-PrEP) like injectable and implants, which could be highly beneficial for transgender and nonbinary (trans) adults at heightened risk for HIV acquisition.

To inform future LA-PrEP programming in this population, we characterized the prevalence and correlates of awareness, utilization, and willingness to use LA-PrEP among trans adults in the state of Washington.

**Methods:** We analyzed data from the Washington Priority Assessment in Trans Health (PATH) Project, a community-informed, statewide health and wellness cross-sectional study developed for, by, and with trans Washington state residents conducted during March-April 2023. Descriptive statistics with exact confidence intervals (Clopper-Pearson) assess proportion estimates, and a series of multivariable logistic regressions with lasso selection explore correlates of PrEP outcomes.

**Results:** Among PrEP-eligible trans adults (n=752/797), 97.5% (95%CI=96.1%-98.5%) were PrEP aware, 18.0% had a history of PrEP use and (95%CI=15.3%-20.9%) and 65.8%

(95%CI=62.3%-69.2%) were willing to use LA-PrEP. In multivariable models, younger age and living in the suburbs were significantly associated (p<0.05) with higher PrEP awareness. Younger age, homelessness in the previous year, sex work, and unmet need for mental health treatment in the previous year were significantly associated with history of PrEP use.

Lastly, younger age and engagement in sex work were significantly associated with willingness to use LA-PrEP while living in the suburbs, having private insurance, receiving mental health treatment in the previous year, and currently on hormone therapy were significantly associated with less willingness to use LA-PrEP.

**Conclusions:** Our results suggest that while there is high awareness of PrEP among trans adults, utilization of PrEP and willingness to use LA-PrEP are suboptimal in this sample. More research is needed to contextualize further how LA-PrEP fits into the lives and geographical contexts of trans adults, including approaches to ensure equitable access to new HIV biomedical products for trans communities.

Strengthening support for trans-led community-based clinics that provide gender-affirming medical and behavioral health services with multisector partnerships that are well-connected to trans communities to leverage existing systems and increase education on LA-PrEP could significantly improve engagement for this population.

## WEPEE525

### Are we doing enough to understand other drivers of low oral PrEP continuation rates? Learnings from oral PrEP programming in Zimbabwe

J. Mavudze<sup>1</sup>, N. Taruberekera<sup>2</sup>, B. Mutede<sup>2</sup>, S. Leuschner<sup>3</sup>, G. Ncube<sup>4</sup>, M. Mhangara<sup>5</sup>

<sup>1</sup>Population Solutions for Health, Evidence, Harare, Zimbabwe, <sup>2</sup>Population Solutions for Health, Harare, Zimbabwe, <sup>3</sup>Populations Services International, Harare, Zimbabwe, <sup>4</sup>Ministry of Health and Child care, Harare, Zimbabwe, <sup>5</sup>USAID Zimbabwe, Harare, Zimbabwe

**Background:** Since the introduction of oral Pre-exposure Prophylaxis (PrEP) in 2012, approximately 4 million people initiated by 2023 globally. Despite encouraging progress in oral PrEP initiations, PrEP continuation rates have been consistently low; 28% at 6 months and 19% at 12 months according to programme data from Cameroon, and Zimbabwe has similarly low rates. Currently, PrEP continuation rates do not consider intended duration. This background motivated us to explore if intended duration on PrEP has implications on continuation rates.

**Methods:** We analysed program data from October 2021 to June 2023 for the PEPFAR-supported HIV Control program across six clinics in five urban areas in Zimbabwe. STATA was used for data analyses.

AIDS 2024

Author index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Results:** During this period, 38,239 were initiated on PrEP, and 31% intended to be on oral PrEP for 1 month, 7% for 2 months, 40% for 3 months, and 22% for 4 months or more. About 57.2% (95% CI: 56.4-58.0) of men who have sex with other men, 51% of transgender persons (95% CI: 47.3-53.7), 63%, (95% CI: 62.5-64.4) of female sex workers and 87.7%, (95% CI: 86.9-88.4) of AGYW intended to be on PrEP for 3 months or less. Using intended duration on PrEP, we noted that 74% (95% CI: 73.1-74.2) continued at month 1, 66% (95% CI: 65.1-66.3) at month 3, and 40% (95% CI: 39.2-41.7) at month 6. Continuation rates without factoring intended duration were 47% (95% CI: 46.6-47.6) at month 1, 39% (95% CI: 46.6-47.6) at month 3, and 21% (95% CI: 20.4-21.2) at month 6.

**Conclusions:** Majority of beneficiaries intended to be on PrEP for not more than 3 months hence the very low PrEP continuation after 3 months. Intended duration on PrEP should be considered when calculating PrEP continuation rates. It is key to understand and address reasons why majority of recipients of care prefer to be on PrEP for shorter period to realise optimal effectiveness of oral PrEP.

## WEPEE526

### Association of provider type with overestimated self-reported PrEP adherence among sexual minority adolescents in Brazil

D.R. Zeballos Rivas<sup>1</sup>, L. Magno<sup>2</sup>, L. Amorim<sup>2</sup>, J.A. Pinto Junior<sup>3</sup>, D. Greco<sup>4</sup>, A. Grangeiro<sup>5</sup>, I. Dourado<sup>1</sup>, The PrEP1519 Study Group

<sup>1</sup>Universidade Federal da Bahia, Instituto de Saúde Coletiva, Salvador, Brazil, <sup>2</sup>Universidade do Estado da Bahia, Salvador, Brazil, <sup>3</sup>Universidade Federal Fluminense, Rio de Janeiro, Brazil, <sup>4</sup>Universidade Federal de Minas Gerais, Belo Horizonte, Brazil, <sup>5</sup>Universidade de São Paulo, São Paulo, Brazil

**Background:** Self-report measures offer valuable insights into PrEP adherence among adolescents; however, a limitation arises from the potential influence of social desirability bias. In Brazil, nurses and physicians prescribe PrEP, and it is unclear if provider type is associated with the overestimation of self-reported adherence among adolescent men who have sex with men (AMSM) and transgender women (ATGW).

**Methods:** PrEP1519 constituted a single arm, multicentric demonstration cohort study focusing on daily oral PrEP among AMSM and ATGW aged 15-19 years, in three Brazilian cities. We conducted a cross sectional analysis using data from adolescents who initiated PrEP between February 2019 and December 2020, incorporating results of the quantification of tenofovir diphosphate (TFV-DP) in Dried Blood Spots. Protective TFV-DP levels were specified as being  $\geq 800$  fmol/punch, equivalent to a weekly intake of 4 pills or more. Self-reported adherence was considered high when adolescents reported losing less than 60% of

their pills in the last 30 days. To identify those overestimating PrEP adherence, we examined whether self-reported high adherence matched with protective TFV-DP levels. If these measures were equivalent or self-reported was lower, there was no overestimation.

Employing logistic regression, we estimated adjusted Odds Ratios (aOR) and 95% Confidence Intervals (95%CI) to examine the association of the provider type (comparing services that include both physicians and nurses as providers to those with only physicians) and the overestimation of self-reported PrEP adherence adjusted by age and gender of the adolescent.

**Results:** 174 adolescents were included, with 85.1% falling within the 18-19 age group, 78.2% identified as MSM, 67.8% self-reported black/brown skin color. Regarding provider type, most were attended in services with both physicians and nurses as providers (70.1%).

Attendance at services with both physicians and nurses reduced the likelihood of overreporting PrEP adherence by 73.5% (aOR=0.26; 95%CI: 0.13 – 0.53) compared to those attending services with only physicians as providers.

**Conclusions:** Expanding the scope of PrEP providers may demonstrate enhanced effectiveness in serving sexual minority adolescents. Services that included nursing in PrEP prescribing had more accurate self-reported adherence measures, potentially alleviating the desirability bias often associated with self-reported adherence. This information can improve PrEP care and effectiveness.

## WEPEE527

### "PrEP on the Go": implementing a low-barrier approach in response to client feedback to increase uptake and retention, Jamaica

S.-K. Blackwood<sup>1,2</sup>, R. Brown<sup>1</sup>, T. Ellis<sup>2</sup>, J. Ricketts<sup>3</sup>, S. Walker<sup>1</sup>, O. Neil<sup>1</sup>, R. Price<sup>1</sup>, J. Latty-Dixon<sup>1</sup>, S. Williams-Hemmings<sup>1</sup>, K.-A. Pate-Robinson<sup>1</sup>, E. Rowlinson<sup>3</sup>, S. Jarrett<sup>4</sup>

<sup>1</sup>University Hospital of the West Indies, Centre for HIV/AIDS Research Education and Services, Kingston, Jamaica, <sup>2</sup>University of California, San Francisco, Jamaica Country Programs, Kingston, Jamaica, <sup>3</sup>Centers for Disease Control and Prevention, Caribbean Regional Office, Kingston, Jamaica, <sup>4</sup>University of California, San Francisco, San Francisco, United States

**Background:** HIV Pre-exposure Prophylaxis (PrEP) was approved for roll-out in Jamaica in 2023. The initial PrEP launch enrolled only 25 persons in the first 6-months. We explored client experiences to tailor ways to reduce barriers to PrEP use.

**Description:** Working through the Centre for HIV/AIDS Research, Education and Services (CHARES) weekly PrEP clinics, information from peer outreach workers, referrals from serodifferent partnerships, and the social networks of key populations (e.g., men who have sex with men) was leveraged to increase enrollment and retention on PrEP.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

Peer navigators interviewed 54 contacts with whom they had engaged over the first 6-months but who had not yet initiated PrEP. These key informants identified limited appointment slots at CHARES, delays in laboratory testing, and lack of information on PrEP.

**Lessons learned:** CHARES designed a bridge modality called "PrEP on the Go". This process, adapted to Jamaican and WHO guidelines, facilitated initiation of PrEP by delivering a two-week starter pack following a non-reactive HIV test and medical interview.

The program lowered barriers to initiation and expanded access outside the clinic, compensating for limited timeslots at CHARES, while outreach activities improved the community's awareness of and knowledge about PrEP.

Required laboratory specimens were obtained at the initial engagement and reviewed within two weeks to determine eligibility to continue PrEP beyond the starter pack. PrEP on the Go was thereby able to meet all protocol requirements while increasing demand, accelerating initiation, and shortening follow-up.

By year-end, this re-strategizing of PrEP delivery, coupled with continued comprehensive case management services, led to increased PrEP uptake with 63 persons enrolled in the second 6-months of roll-out. In addition, the program achieved 99% retention on PrEP to the year end.

**Conclusions/Next steps:** The initiative rapidly and successfully used feedback from clients to improve PrEP enrollment and retention. Community-based PrEP interventions reduce barriers to PrEP uptake.

We envision a continuous process to better tailor client-centered approaches to deliver PrEP. "PrEP on the Go" can be used to inform improvements in onboarding for other public health sites and as a community-based model for increasing PrEP access and enrollment in resource limited settings.

## WEPEE528

### Characteristics of the primary care providers engaged in PrEP care and opportunities for PrEP implementation in Puerto Rico

C.E. Rodriguez-Diaz<sup>1</sup>, Y. Santiago-Rivera<sup>2</sup>, I.M. Otero-Cruz<sup>3</sup>, E.I. Santiago-Rodriguez<sup>3</sup>, S.M. Malave-Rivera<sup>3</sup>, S. Rivera-Leon<sup>4</sup>, D.M. Gely-Rodriguez<sup>3</sup>

<sup>1</sup>Boston University School of Public Health, Community Health Sciences, Brookline, United States, <sup>2</sup>George Washington University, Milken Institute School of Public Health, Washington, United States, <sup>3</sup>University of Puerto Rico-Medical Sciences Campus, School of Public Health, San Juan, United States, <sup>4</sup>University of Puerto Rico-Medical Sciences Campus, San Juan, United States

**Background:** Pre-exposure Prophylaxis (PrEP) effectively reduces the risk of HIV transmission. However, Puerto Rico (PR) has the lowest PrEP uptake of all the jurisdictions of

the United States. Primary Care Providers (PCPs) are ideally situated to facilitate PrEP uptake among those most in need. In this study, we identified the characteristics of PCPs engaged in PrEP care in PR to nurture the factors driving successful implementation.

**Methods:** Data were collected in the summer of 2021 among personnel in the primary care centers. Participants were recruited by email to answer an online culturally congruent survey, including questions about their individual and professional characteristics, their training and experience prescribing PrEP, and PrEP stigma. Data was analyzed using SPSS.

**Results:** Of all the PCPs invited to participate, 63.2% (n=225) completed the survey. Of these, 80.4% (n=181) were PCPs directly interacting with patients (vs. those in administrative roles), constituting the analytical sample. 58% of the sample reported ever prescribing PrEP.

Multivariate analysis showed that PrEP stigma was lower rated among PCPs with less professional experience (0.956 (0.924, 0.990)). Longer tenure in the organization (OR 0.959, 95% CI 0.928, 0.991), older age (OR 0.955, 95% CI 0.924, 0.988), self-identifying as heterosexual (OR 0.315, 95% CI 0.121, 0.817), and being a physician (OR 0.448, 95% CI 0.222, 0.904) were associated with less likelihood of engaging in PrEP care.

In contrast, those who self-identified as male (OR 2.311, 95% CI 1.186, 4.506) and with more PrEP training (OR 1.197, 95% CI 1.116, 1.285) were more likely to engage in PrEP care. For every unit increase in hours of PrEP training, the odds of engaging in PrEP care increased by 19.7%.

**Conclusions:** Results underscore the importance of PrEP capacity-building. Training PCPs on PrEP care works. Considering all the factors that predicted engagement in PrEP care, future interventions to increase PrEP uptake should focus on modifiable factors like in-service training and integrating biomedical HIV prevention into the curricula of PCPs in formation. There are also opportunities to improve PrEP implementation by deliberately engaging PCPs other than physicians.

### Assessing acceptability of implementation strategies to improve pre-exposure prophylaxis (PrEP) uptake among Black cisgender women in the United States

S.A. Devlin<sup>1,2</sup>, E.E. Friedman<sup>1,2</sup>, A.K. Johnson<sup>3,4</sup>, N. Kasal<sup>1,2</sup>, O.E. Enaholo<sup>3</sup>, G. Liegeon<sup>1,2</sup>, M. Pyra<sup>4</sup>, J. Simon<sup>5</sup>,

L.R. Hirschhorn<sup>4</sup>, K. Ducheny<sup>6</sup>, S. Haider<sup>7</sup>, E. Tumiel<sup>8</sup>, L. Vazquez<sup>8</sup>, E. Bennett<sup>9</sup>, J. Santini<sup>9</sup>, J.P. Ridgway<sup>1,2</sup>

<sup>1</sup>University of Chicago, Section of Infectious Diseases and Global Health, Chicago, United States, <sup>2</sup>Chicago Center for HIV Elimination, Chicago, United States, <sup>3</sup>Ann & Robert H. Lurie Children's Hospital of Chicago, Chicago, United States, <sup>4</sup>Northwestern University, Chicago, United States, <sup>5</sup>AllianceChicago, Chicago, United States, <sup>6</sup>Howard Brown Health, Chicago, United States, <sup>7</sup>Rush University, Chicago, United States, <sup>8</sup>Erie Family Health Centers, Chicago, United States, <sup>9</sup>Evava Health, St. Petersburg, United States

**Background:** In the United States, Black cisgender women remain disproportionately impacted by HIV yet have a low uptake of pre-exposure prophylaxis (PrEP). Few implementation strategies have been designed to increase PrEP uptake in this population, and the acceptability of these strategies is unknown.

We aimed to explore existing PrEP awareness and acceptability of strategies for increasing PrEP awareness and uptake among Black women.

**Methods:** From August 2023 to January 2024, healthcare providers and Black women clients were surveyed at two federally qualified health centers in the Midwestern and Southern U.S. on PrEP awareness and implementation strategies. Data were analyzed descriptively with frequencies and percentages for clients (n=39) and providers (n=11).

**Results:** Nearly half (49%) of women had never heard of PrEP, with the majority (92%) reporting that a provider had never talked to them about PrEP. Among providers, 30% had never initiated a conversation about PrEP with, and 73% had never prescribed PrEP to, a Black female client. When asked about different methods to increase PrEP awareness and uptake among Black women, educational brochures (36%) ranked highest among clients, followed by discussions with providers (28%), and interactions with support staff (i.e., a PrEP navigator) (21%).

The majority of women (69%) said receiving educational materials (i.e., a brochure) would improve their understanding of PrEP.

Providers were asked to rank five different strategies for increasing PrEP uptake among Black women; 55% of providers ranked PrEP education first, followed by provider training (36%), PrEP navigation (36%), clinical champions (27%), and electronic medical record (EMR) optimization (27%). Most providers thought each strategy was relevant and would likely increase the number of Black female clients who start PrEP (100% for clinical champions, 91% for

PrEP education, 91% for provider training, 82% for PrEP navigation, and 82% for EMR optimization).

**Conclusions:** There was low PrEP awareness/experience among participants, yet high interest and acceptability of the proposed implementation strategies, particularly PrEP education.

There is a need for implementation strategies that address barriers among both providers and women to increase PrEP awareness and uptake among Black female clients. The feasibility and effectiveness of these implementation strategies will be evaluated in future studies.

## WEPEE530

### Working with satisfied VMMC users to increase demand for Voluntary Medical Male Circumcision services among men 30+ years. Implementation experiences from Ankole region, Uganda

N. Mwanja<sup>1</sup>, A. Kwiseera<sup>1</sup>, M. Kidega<sup>1</sup>, A. Nkoyoyo<sup>1</sup>

<sup>1</sup>The AIDS Support Organisation, USAID LPHS Ankole, Kampala, Uganda

**Background:** Strategies to identify and circumcise men 30+ years who are sexually active and more at risk to heterosexual HIV transmission requires understanding contextual barriers to guide targeted innovative demand creation using quality improvement approaches.

Sexually active non-circumcised Men 30+ yrs continue to be at risk of HIV transmission for their sexual partners including STIs and penile human papillomavirus (HPV) associated with female cervical cancer.

USAID Local Partner Health Services Ankole region worked with 13 districts at 35 VMMC accredited facilities in Ankole region to put deliberate quality Improvement and community interventions to increase VMMC men 30+ years uptake.

#### Description:

- A root Cause Analysis conducted revealed fear for adverse events, myths about VMMC, lack of safe adult space in addition to partner acceptance limiting men 30+ yrs taking on services as the major reasons for low uptake
- The health facility identified satisfied men 30+ years and MCH/AGYW partner champions to create awareness and mobilize men within their profiled work-stations
- A champion was also attached to targeted busy stations like boda-boda stages, churches, towns and prisons use of flexible days and hours, separating men 30+ years and children circumcision space and weekly review stakeholder feedback meetings

#### Lessons learned:

- Proportion of men 30+ years circumcised against the COP target progressively increased from 12 % in October 2022 to 109% by September 2023.
- There was an improvement from 10% (450/4432) October 2022 to 32% (150/464) July 2023 of achieved of the total men circumcised monthly

**Conclusions/Next steps:**

- Use of targeted peer led satisfied users and partners of MCH and AGYW users champions are critical in VMMC demand creation
- Profiling Men 30+ year is an opportunity increase VMMC services uptake, social dimensions determine the mobilization approach and champions to be assigned a particular group or class
- Uganda and the world needs to adopt these strategies for improved VMMC uptake

## WEPEE531

Increasing access of women who inject drugs (WWIDs) to harm reduction services through women-specific/led intervention: a successful differentiated service delivery model in Nepal

S. Baidhya<sup>1</sup>, B. Gurung<sup>2</sup>, H. Shrestha<sup>3</sup>, B. Fual Sharma<sup>2</sup>, U. Karmacharya<sup>2</sup>

<sup>1</sup>Women's Support Group (WSG), Lalitpur, Nepal,

<sup>2</sup>Recovering Nepal, Head Office, Lalitpur (Kathmandu), Nepal, <sup>3</sup>Recovering Nepal Women, Lalitpur, Nepal

**Background:** In Nepal, women who inject drugs (WWID) make up a significant proportion (10%) of the total people who inject drugs. (NCASC, 2017) However, WWIDs are disproportionately affected by HIV and have significantly lower access to health services, including harm reduction services due to structural factors such as stigma, gender-based discrimination and violence, human rights violations, and criminalization.

Several efforts to introduce women-specific NSP services were made since 2008 but were not sustained. In 2021, women-specific NSP was finally established with funding from the Global Fund (Save the Children as PR) in five high-burden districts of Nepal.

**Description:** Women's Support Group (WSG), a women-led community organization, implemented the women-specific NSP services through a drop-in center (DIC) in Lalitpur District. WSG mobilized resources from VIIV Healthcare and AIDS Health Foundation to integrate primary healthcare services at the DIC, including free health check-ups, SRH services, abscess treatment, and referrals for legal aid and testing and treatment of STI and HCV – making it the only DIC in Nepal with inte-

grated services. WSG's NSP site has been recognized as a best practice in Nepal by funding partners and the government of Nepal.

**Lessons learned:** Through August 2021, a total of 214 women who inject drugs were reached (surpassing NCASC 2017 estimates of a maximum of 193 WWID in the district), of which 190 have been regularly accessing services, including NSP, educational sessions, and monthly free health check-ups.

Nearly 70% of the total reached were below the age of 30. The regularly accessing WWIDs have been tested for HIV through community-led testing every six months and to date, there have been no positive cases. However, there were notably high cases of unwanted pregnancies (n=7, aged 18-24 years) and STI (n=4, aged below 30 years) among WWIDs and all were referred for free treatment and successfully treated.

Two cases of HCV and 3 abscess cases were referred and successfully treated free of charge. Similarly, two WWIDs who reported intimate partner violence were referred for legal aid and both cases are still ongoing in court.

**Conclusions/Next steps:** WWIDs can effectively be reached through women-specific and women-led services, therefore, this model should be scaled up.

## WEPEE532

Community HIV programming and its contribution to national HIV epidemic control

M. Alene<sup>1</sup>, D. Gashaw<sup>2</sup>, F. Keder<sup>1</sup>, K. Belete<sup>3</sup>, G. Eyassu<sup>3</sup>, P. Ndase<sup>1</sup>

<sup>1</sup>Population Services International, HIV/TB/NCD, Addis

Ababa, Ethiopia, <sup>2</sup>Population Services International, Monitoring and Evaluation, Addis Ababa, Ethiopia, <sup>3</sup>USAID, HIV/TB, Addis Ababa, Ethiopia

**Background:** In Ethiopia, female sex workers (FSWs) and their clients play a key role in HIV transmission dynamics. Of the estimated 240,000 FSWs in Ethiopia, 18.7% (44,880) are living with HIV, with a significant treatment gap of 72.5% by June 2023. Across 1,076 sub-national units (SNUs) nationally, USAID funds two geographically separate community Key Populations programs (PSI's MULU and Amhara KP) in 147 SNUs.

Implementation is through drop-in-centers (DICs), which are stigma-free, friendly centers strategically situated in FSW hotspots, offering a comprehensive package of biomedical, behavioral, and structural HIV prevention, care, and treatment interventions.

**Description:** Across the two USAID programs, 45 DICs in eight regions (33 ART, 12 non-ART) were supported over the two years, representing 32% coverage (85/265) of high HIV burden SNUs.

Based on analysis from MoH's national DHIS2 and our DATIM report for national fiscal years 2022/2023, we analysed USAID's two community KP programs' contribution

Author Index

towards national progress in HIV epidemic control across the HIV care cascade, with a specific focus on Mulu KP program's contribution.

**Lessons learned:** The two programs contributed 44% (121,385/272,866) of national FSW HIV testing, and 82% (7,629/9,332) of all new FSW HIV positives nationally over same period. 60.7% (7,490/12,325) of national FSW HIV treatment (TX-CURR) at end FY23 were on treatment at 33 ART DTCs across the two USAID funded programs. The remaining 39.3% accessed treatment at the approximately 120 public sector and other ART sites.

PSI's Mulu KP program implemented in 12% SNUs (129/1,076), achieved HIV case yield rates of 7.2% (twice higher the national average) over the two years. Despite accounting for 23.5% (64,694/272,866) of national FSW testing, the program contributed 49% (4,558/9,332) of all HIV positive FSWs nationally. 38.7% (4,767/12,325) of the national FSW TX\_CURR was also under the program's DTCs, with viral suppression rates of 98% as of end of FY 2023.

**Conclusions/Next steps:** HIV programming at community level is highly accepted and contributes over 60% national response for HIV services among FSWs. Targeted community HIV programming achieves greatly in national HIV epidemic control efforts and should be embraced as a feasible way forward for many African countries.

## WEPEE533

### Mental health and substance use disorders among people living with HIV initiating TB preventive therapy: a prospective cohort study in South Africa

A. Johnson<sup>1,2</sup>, L. Chimoyi<sup>3,4</sup>, S. Sheno<sup>1,2,5</sup>, M. Brault<sup>6</sup>, V. Chihota<sup>3</sup>, L. Forastiere<sup>7</sup>, S. Charalambous<sup>3,4</sup>, J.L. Davis<sup>2,8</sup>

<sup>1</sup>Yale School of Medicine, New Haven, United States,

<sup>2</sup>Yale School of Public Health, Epidemiology of Microbial Diseases, New Haven, United States, <sup>3</sup>The Aurum Institute, Implementation Research Division, Johannesburg, South Africa, <sup>4</sup>University of the Witwatersrand, School of Public Health, Johannesburg, South Africa, <sup>5</sup>Yale School of Medicine, Department of Internal Medicine: Infectious Diseases, New Haven, United States, <sup>6</sup>University of Texas Health Science Center School of Public Health, Houston, United States, <sup>7</sup>Yale School of Public Health, Department of Biostatistics, New Haven, United States, <sup>8</sup>Yale School of Medicine, Department of Internal Medicine: Pulmonary, Critical Care, and Sleep Medicine Section, New Haven, United States

**Background:** TB preventive therapy (TPT) reduces TB-related mortality among persons living with HIV (PLHIV). 3HP, a shorter three-month TPT regimen of weekly isoniazid and rifapentine, is becoming widely implemented to potentially facilitate TPT completion. Mental health and substance use disorders are common among PLHIV, and there are associations between these conditions and re-

duced ART adherence. However, evidence around their prevalence in TPT-initiating PLHIV and impact on TPT adherence and completion is scarce.

We conducted a prospective cohort study to determine the prevalence and impact of mental health and substance use disorders on 3HP completion among PLHIV in South Africa.

**Methods:** We recruited PLHIV on ART initiating 3HP at two primary healthcare facilities in southwest Johannesburg, South Africa between August-December 2023. We defined 3HP completion as taking  $\geq 11/12$  recommended 3HP doses within 12 weeks monitored by electronic medication boxes. We measured anxiety (GAD-7  $\geq 5$ ), depression (PHQ-9  $\geq 5$ ), problematic alcohol use (AUDIT-C  $\geq 4$  (men),  $\geq 3$  (women)), and other problematic substance use (ASSIST  $\geq 4$ ) at enrollment.

We constructed a multivariate logistic regression including these four variables and adjusting for age, gender, and time on ART to determine their associations with 3HP completion.

**Results:** We enrolled 224 PLHIV, including 136 (61%) women; median age was 44 years (IQR 14) and median time on ART 7.2 years (IQR 7.1). Only 111 (50%) participants completed 3HP. Eighty-one (36%) participants screened positive for depressive symptoms and 63 (28%) for anxiety. Seventy-six (34%) reported problematic alcohol use, and 60 (27%) tobacco use, but fewer than 10% reported using other substances. In bivariate analysis, the odds of 3HP completion were substantially lower among those with anxiety (OR 0.63, 95%CI 0.35-1.13,  $p=0.12$ ), depressive symptoms (OR 0.45, 95%CI 0.26-0.78,  $p=0.005$ ) and problematic tobacco use (OR 0.54, 95%CI 0.29-0.98,  $p=0.044$ ), but not among those with problematic alcohol use (OR 0.69, 95%CI 0.39-1.20,  $p=0.19$ ).

Using a multivariate model adjusting for confounders, only depressive symptoms remained significantly associated with 3HP completion (OR 0.52, 95% CI 0.29-0.94,  $p=0.033$ ).

**Conclusions:** Anxiety, depressive symptoms, problematic alcohol use, and tobacco use were common among PLHIV initiating 3HP in South Africa. Depressive symptoms were strongly and independently associated with 3HP non-completion.

Future studies should explore whether integrating and strengthening mental health and substance use treatment for PLHIV initiating 3HP can improve 3HP completion.

## WEPEE534

Promoting access and adherence of combination HIV prevention interventions among adolescent and young people through HIV prevention indexing in Central and Copperbelt Provinces of Zambia

J. Mwanza<sup>1</sup>, L. Kawanga<sup>1</sup>, A.P. Ndhlovu<sup>1</sup>

<sup>1</sup>JSI/USAID DISCOVER Health, Lusaka, Zambia

**Background:** Adolescent and young people continue to be a population more vulnerable to acquiring new HIV. The ministry of health of Zambia in 2023 reported that 37% of the new HIV incidences were among adolescent and young people aged 15 to 24. The Zambia Population-Based HIV Impact Assessment (ZAMPHIA 2021) reported that 55.5% adolescents who had one sex partner were living with HIV.

The highest population in this study was females representing 74% (ZAMPHIA, 2021). USAID DISCOVER Health project implemented by JSI, aiming to reach adolescent and young people with combination HIV prevention services developed and rolled out HIV prevention indexing (HPI) strategy.

**Description:** HPI is an ethical model for reaching to sex partner of clients on pre-exposure prophylaxis (PrEP) with HIV prevention interventions. This intervention educates adolescent and young people on combination HIV prevention interventions.

Adolescent and young people (AYP) seeking PrEP were offered HIV prevention indexing with an opportunity to accept or decline with no implication to access of services. Data was collected and analyzed using Microsoft excel from October 2022 to September 2023.

**Lessons learned:** A total of 26,336 AYP were enrolled on PrEP from October 2022 to September 2023, males 9,954 (37.8%) while females 16,382 (62.2%). Those aged 15 to 19 were 7,574 (28.8%) and those aged 20 to 24 were 18,762 (71.2%). HPI was offered to 16,258 with 97% accepting giving us 21,892 sex partners. 14,041 (69.5%) were tested and 361 (2.6%) were found to be living with HIV while 13,680 tested negative. 8224/13680 (60%) received combined HIV prevention services (PrEP-80.4%, VMMC-20.6%). 2053/21892 (9.4%) partners were known status and on treatment. No seroconversion among those who had partners living with HIV was reported during the same period.

**Conclusions/Next steps:** HPI promoted access and adherence to combination HIV prevention interventions among adolescent and young people.

This strategy is recommended in Zambia recording high incidence rates of new HIV among adolescent and young people.

## WEPEE535

Unlocking untapped potential in HIV prevention: a comparative analysis of national PrEP guidelines in Kenya, Mozambique, Nigeria, South Africa, Uganda, and Zambia

D. Resar<sup>1</sup>, A. Olowu<sup>2</sup>, K. Welch<sup>3</sup>, M. Rodolph<sup>4</sup>,

M. Prochazka Nunez<sup>4</sup>, R. Baggaley<sup>4</sup>, S. Jenkins<sup>5</sup>

<sup>1</sup>Clinton Health Access Initiative, Lusaka, Zambia, <sup>2</sup>Clinton Health Access Initiative, Abuja, Nigeria, <sup>3</sup>Independent Consultant, London, United Kingdom, <sup>4</sup>World Health Organization, Geneva, Switzerland, <sup>5</sup>Clinton Health Access Initiative, Boston, United States

**Background:** Oral pre-exposure prophylaxis (PrEP) was approved by the US FDA for HIV prevention in 2012. In the last twelve years, while there have been an estimated 16.4 million new HIV acquisitions globally - 1.3 million in 2023 alone - there were fewer than six million cumulative PrEP initiations. Introduction of new PrEP products and simplification of PrEP delivery offer opportunities to increase coverage and choice.

However, impact will be limited unless there is an enabling policy environment to address delivery, supply and demand-side bottlenecks.

**Description:** We conducted a comparative analysis of national guidelines in six high-volume PrEP programs in sub-Saharan Africa to identify opportunities for improving the PrEP policy environment. This analysis assessed seven policy areas, informed by the latest WHO recommendations and implementation guidance on differentiated and simplified PrEP for HIV prevention.

Country	Products: Inclusion of new PrEP products (e.g., ring, injectable)	Access: Prioritization of PrEP offer to those requesting PrEP	Access: Pregnant and breastfeeding women are eligible for oral PrEP	Testing: Optional creatinine screening for those <30 years without kidney-related comorbidities	Testing: Use of HIV self-testing for oral PrEP initiation	Use: Use of HIV self-testing for oral PrEP continuation	Use: Inclusion of event-driven oral PrEP
Kenya	Yes	No	Yes	Yes	No	No	Yes
Mozambique	No	Yes	Yes	Yes	No	No	Yes
Nigeria	No	No	Yes	No	No	No	Yes
South Africa	No	Yes	No	Yes	No	No	No
Uganda	Yes	Yes	Yes	Yes	No	Yes	Yes
Zambia	Yes	Yes	Yes	Yes	No	Yes	Yes

**Lessons learned:** Across all six countries, there are opportunities to optimize PrEP policies to improve person-centered services. Some policy areas demonstrate strong alignment with WHO recommendations, including oral PrEP eligibility during pregnancy and breastfeeding, optional creatinine screening, and event-driven oral PrEP. However, other areas - such as use of HIV self-testing and inclusion of new PrEP products - have been less widely adopted. Of the countries assessed, Uganda and Zambia's guidelines reflect the strongest alignment with WHO recommendations; likely due to their recent publication. Nigeria's guidelines offer the greatest potential for strengthening across the PrEP cascade.

**Conclusions/Next steps:** Despite years of experience in high-volume programs, there are significant policy gaps across the PrEP cascade. While new PrEP modalities offer opportunities to better meet user needs, adequate policies must be in place to support choice, access, uptake, and use. Given persistent oral PrEP policy barriers, countries must ensure policy assessments are incorporated into introduction strategies for new products, with plans to review policy landscapes with emerging evidence. Countries may also consider releasing interim policy updates or addendums to ensure programming remains aligned with the latest evidence in prevention science.

## WEPEE536

### Developing a practice-driven taxonomy of implementation strategies for HIV prevention

S. Golub<sup>1,2,3</sup>, C. Wolfer<sup>1,2</sup>, B. Lane<sup>4</sup>, K. Meyers<sup>4</sup>

<sup>1</sup>Hunter College of the City University of New York, Psychology, Hunter Alliance for Research & Translation, New York, United States, <sup>2</sup>Graduate Center of the City University of New York, Basic and Applied Social Psychology, New York, United States, <sup>3</sup>Einstein-Rockefeller-CUNY Center for AIDS Research, Behavioral and Implementation Science Core, Bronx, United States, <sup>4</sup>Columbia University, Aaron Diamond AIDS Research Center, New York, United States

**Background:** Effective implementation of evidence-based HIV interventions continues to be a challenge, and the field is increasingly turning to implementation science for solutions. Much of this research is focused on developing and defining specific implementation strategies -- methods and techniques designed to enhance adoption and sustainment of interventions in practice. However, there is a fundamental disconnect between the implementation science literature, which focuses almost exclusively on systems-level and program-level strategies that impact provider-level implementation outcomes, and the needs and interests of HIV prevention researchers and front-line practitioners, who focus almost exclusively on provider-level strategies to impact client-level intervention adoption and sustainment. There is an urgent need to expand the existing taxonomy of implementation strategies to better reflect work being done in the field.

**Description:** We developed and piloted a method for developing a taxonomy of practice-driven implementation strategies, collaborating with five community-based health centers in the Southeast US. Through document review and qualitative interviews with implementers at each site (N = 30), we employed an inductive and iterative cross-case analytic approach to specify and categorize strategies, according to standard implementation science definitions and frameworks.

**Lessons learned:** From an initial matrix of 264 activities, we identified 50 strategies common across sites. The majority (68%, n = 34) did not map onto existing ERIC

strategies and were focused on client-level outcomes. From these, we identified seven novel implementation "clusters" that can be used to extend and enhance the practice-based utility of existing implementation science classifications. Implementers did not use implementation outcome language to describe their efforts, but explained their strategy objectives in terms of common EHE goals, e.g., increase HIV testing rates, identify PrEP candidates, which could be conceptualized as practice-specific "targets of action."

**Conclusions/Next steps:** This project demonstrates the feasibility and utility of this method for developing a practice-driven implementation science vocabulary for HIV prevention. For practitioners, these data provide information about concrete strategies they might consider for their own programs, accelerating the program development process.

For researchers, our practice-driven taxonomy is designed to draw attention to the needs and priorities of implementers as researchers apply implementations science frameworks and methods to achieve EHE goals.

## WEPEE537

### Use of virtual platforms to promote prevention health services amongst key population in a low-income setting, Mozambique

J. Seleme<sup>1</sup>, I. Sathane<sup>1</sup>, V. Mega<sup>1</sup>, A. Couto<sup>1</sup>

<sup>1</sup>Ministry of Health of Mozambique, Department of Public Health, Maputo, Mozambique

**Background:** Key populations are marginalized groups who often have disproportionate access to health information and limited social support and physical safe spaces. As a result, key populations have vibrant online communities, which allow dispersed community members to create virtual peer groups and safe spaces. In 2022-2023 the National HIV Program in Mozambique, developed a virtual campaign for the promotion of HIV prevention services for these key populations.

We highlight below key lessons learned including selection of peer ambassadors.

**Description:** The virtual campaign for promoting HIV prevention services amongst MSM and TG was developed alongside peer focus groups. A social profiling method was designed for targeted populations. Peer ambassadors with considerable followers were identified, as well as non-peer influencers with strong collaboration with at governmental level for the promotion of anti-stigma and discrimination messages. In a period of 1 year, a variety of prevention messages as well as truth or myth questions (HTC, PrEP, condoms, lubricants, GBV and STIs) were posted and boosted for a further reach on a weekly basis. Livestreams and surveys were done, as well as using the direct channel to communicate non-general health messages such as vaccination campaigns to Key Populations.

**Lessons learned:** The right profile ambassadors were identified to reach and promote interaction with the campaign. The focus groups with key populations. was key to a success, making the campaign flexible and allowed for a quick change of dynamics to meet clients' needs. A total of 532 283 were reached. of which 70% were men 18-44 years old, which includes the age group most affected by the HIV epidemic.

**Conclusions/Next steps:** The experience demonstrated the feasibility of using virtual applications to promote health services to this group. This approach creates a virtual positive space to express health concerns and a direct channel to a health specialist. With the support of donors, these campaigns will be scaled up in 2024. Even in low-income settings, key populations tend to have significant internet access and membership. Therefore, social profiling methods in virtual applications are relevant opportunities with significant impact on their health choices.

## WEPEE538

### Empowering girls: a randomized trial on mHealth 'safe spaces' during COVID-19

C. Cullen<sup>1</sup>, B. Motlhobogwa<sup>1</sup>, L. Gaolebe<sup>1</sup>, N. Angrist<sup>2,1</sup>

<sup>1</sup>Youth Impact, Gaborone, Botswana, <sup>2</sup>University of Oxford, Oxford, United Kingdom

**Background:** Adolescents in developing countries encounter barriers to accessing sexual and reproductive health (SRH) services, including stigma and cultural obstacles. Public health crises like COVID-19 exacerbate these challenges. The World Health Organization (WHO) recognizes the potential of mobile health (mHealth) technologies in improving adolescent health outcomes, but there is limited evidence on their impact.

Previous studies on mHealth interventions for women and girls using text messages or interactive voice response (IVR) programs have shown limited or negative effects. This study investigates the impact of a phone-based "safe space" program in Botswana, addressing HIV risk and SRH for adolescent girls during COVID-19 school disruptions.

Conducted by the NGO "Youth Impact" in Botswana, the study adapted an in-school anti-sugar daddy program to a 1-on-1 phone call-based safe space program. The program included four 20-minute weekly calls covering HIV risk, contraception, and healthy relationships, with emotional support and health service referrals.

**Methods:** A randomized control trial with 1200 adolescents aged 14-17 during school disruptions was used to assess knowledge, agency, mental health, pregnancy, and school dropouts. Data collection involved school records and phone surveys conducted in 2020 (baseline) and 2021 (endline). Analysis was using multivariate regression in stata.

**Results:** The program significantly increased knowledge about partner HIV risk (16%pt) and support services (29%pt).

Participants reported improved empowerment and control over their sexual and reproductive health (11%pt) and increased willingness to share sensitive experiences. Six months post-program, there was a significant reduction (3%pt/80% reduction) in school dropouts and pregnancies among the treatment group. These effects were all statistically significant.

**Conclusions:** The program had a positive impact on longer-term behaviors, suggesting that phone-based safe spaces can be an effective tool for behavior change.

Our study provides evidence that phone-based safe spaces can be an effective tool for improving adolescent health outcomes, even during a major public health crisis such as COVID-19. The program we studied was cost-effective and easy to implement, making it a potentially scalable solution for addressing SRH challenges in developing countries.

## WEPEE539

### Equalizing access to Pre-exposure Prophylaxis (PrEP) among key populations through a digital health hub in Central and Copperbelt provinces of Zambia

I. Siluka<sup>1</sup>

<sup>1</sup>USAID JSI DISCOVER Health, Health, Lusaka, Zambia

**Background:** Pre-exposure Prophylaxis (PrEP) reduces HIV transmission by over 90% when taken consistently and correctly. However, access to PrEP among key population groups such as men who have sex with men (MSM), female sex workers (FSW), people who inject drugs (PWID) and transgender people (TG) remains suboptimal due to associated stigma and discrimination despite their disproportionately high risk of HIV acquisition.

To promote PrEP access and uptake among KPs, the USAID DISCOVER-Health project, implemented by JSI, launched the Stealth Virtual Clinic (SVC) in February 2023. The SVC is a digital platform that promotes virtual access to PrEP information, and other health services, and directs clients to in-person services, if required.

**Description:** The SVC provides a convenient platform for KPs to receive PrEP services through safe spaces without stigma and discrimination. The SVC involves the use of technology, including a Quick Response (QR) code and mobile short code to request for PrEP services from a safe space and location is identified by a social network mentors directs services providers to the client. Quantitative data was collected and analysed using Microsoft Excel extracted from the Project PrEP management system called Real-time Information Management System (RIMS) at baseline and endline.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Lessons learned:** In January to March, 2023 first quarter of the financial year, 2023 (FY23 Q1), before the SVC launched, key populations contributed 1531 of the project's overall PrEP clients. In FY23 Q4, July to September 2023, the number of key populations accessing PrEP on the virtual platform significantly increased to 5,809 people.

**Conclusions/Next steps:** The SVC platform increased access to PrEP by all the key population subpopulations. Investing in virtual platforms for PrEP delivery increases uptake among high risk populations which would ultimately reduce HIV incidence rates.

## WEPEE540

Developing social behavior change products using Human-Centered Design to promote the roll out of CAB-LA in Zambia

E. Phiri<sup>1</sup>, L. Chingumbbe<sup>1</sup>, W. Kabwita<sup>1</sup>, K. Mwanda<sup>1</sup>, H. Mushisha<sup>1</sup>, M. Njelesani<sup>2</sup>, M. Phiri<sup>3</sup>, N. Phiri<sup>3,3</sup>, C. Phiri<sup>3</sup>, I. Vuttah<sup>3</sup>

<sup>1</sup>USAID CHEKUP II Activity, Lusaka, Zambia, <sup>2</sup>USAID Discover Health, Lusaka, Zambia, <sup>3</sup>Media 365 Limited, Lusaka, Zambia

**Background:** In Zambia, the adoption of long-acting injectable cabotegravir (CAB-LA) as an innovative HIV pre-exposure prophylaxis (PrEP) marks a significant step in providing continuous protection for individuals facing heightened risks of HIV infection. With the recent endorsement of CAB-LA by the World Health Organization (WHO) as an additional prevention method. USAID CHEKUP II, is mandated to provide injectable PrEP to key populations in Nakonde District in Zambia.

**Methods:** The development process adhered to a human-centered design methodology, focused on enhancing products and services with a user-centric perspective. Employing participatory methods, the team conducted group interviews and in-depth interviews with potential end users' of Injectable PrEP. This methodological choice aimed to go beyond mere data collection by fostering a deeper understanding of the participants' experiences. The approach emphasized placing the target audience at the forefront of SBC interventions to ensure prioritized focus on their needs and preferences.

**Results:** A total of 84 respondents (43 male and 41 female) underwent 11 group interview discussions (GIs) and 10 In-depth Interviews (IDIs), ensuring diverse perspectives. The results reveal several positive aspects of CAB-LA, including

a high level of acceptability across all groups, a notable reduction in pill burden, and the perceived benefits of privacy and confidentiality associated with injectable PrEP. Respondents highlighted the convenience and improved adherence, particularly for female sex workers (FSWs) who found it easier to adhere to treatment with their busy schedules. Common concerns across all groups included the fear of pain at the injection site, reluctance to expose their bodies to healthcare providers, and the apprehension of being labeled as HIV positive, impacting HIV testing. While healthcare workers were seen as champions for PrEP services, there were reservations about potential judgment, lack of confidentiality, and insufficient knowledge about CAB-PrEP.

**Conclusions:** Findings highlighted concerns, influencing the development of tailored SBC strategies for a successful Injectable PrEP rollout. The findings emphasize the necessity of targeted SBC approaches that address awareness, information gaps, cultural considerations, and the perspectives of healthcare providers in the context of introducing CAB-LA.

### WEPEE541

Examining and classifying reasons for missing viral load measurements among adults living with HIV: an extended outcome investigation and ascertainment approach in Western Kenya

H. Adhiambo<sup>1,2</sup>, J. Kulzer<sup>3</sup>, E. Nyagesoa<sup>1</sup>, E. Akama<sup>1,4</sup>, L. Montoya<sup>5</sup>, I.E. Wilson<sup>6</sup>, S. Iguna<sup>1</sup>, E. Nyandieka<sup>1</sup>, D. Mangale<sup>6</sup>, E. Bukusi<sup>1</sup>, L. Abuogi<sup>7</sup>, T. Odeny<sup>8,9</sup>, S. Gimbel<sup>10</sup>, M. Petersen<sup>11</sup>, E. Geng<sup>6</sup>

<sup>1</sup>Kenya Medical Research Institute, Centre for Microbiology Research, Nairobi, Kenya, <sup>2</sup>University of Washington, Child, Family and Population Health Nursing, Seattle, United States, <sup>3</sup>University of California, Obstetrics, Gynecology, and Reproductive Services, San Francisco, United States, <sup>4</sup>University of Washington, Global Health, Seattle, United States, <sup>5</sup>University of North Carolina at Chapel Hill, Biostatistics, Chapel Hill, United States, <sup>6</sup>Washington University in St. Louis, Medicine, St. Louis, United States, <sup>7</sup>University of Colorado, Global Health, Denver, United States, <sup>8</sup>Washington University in St. Louis, Medicine, St. Louis, United States, <sup>9</sup>Kenya Medical Research Institute, Center for Microbiology Research, Nairobi, Kenya, <sup>10</sup>University of Washington, Nursing, Seattle, United States, <sup>11</sup>University of California, Biostatistics and Epidemiology, Berkely, United States

**Background:** Only 5% of people living with HIV in Sub-Saharan African countries account for two-thirds of the countries' total viral load. To address gaps in viral load monitoring, we conducted a study applying an investigation approach to examine and classify reasons for missed viral load measurements among adults living with HIV in Kenya.

**Methods:** We developed an extended outcome investigation tool to examine missingness and reasons for missed on-time routine viral load monitoring measurements among participants enrolled in the Adaptive Strategies for Preventing and Treating Lapses of Retention in HIV care (AdaPT-R Study; NCT#02338739). Viral load measurements among adults is monitored 6 months post ART initiation and thereafter annually.

We defined missed viral load as no viral load measurement results within 9-15 months in the first year of study and between 21-27 months in the study post ART initiation. Data was collected between March 2016 and September 2019.

We used descriptive statistics to determine the prevalence and reasons for missing viral load measurements and generalized linear models to determine the patient-level characteristics associated with missed viral load measurements.

**Results:** Among the 1754 study participants who were investigated using the extended outcome investigation, 66.0% were female. The prevalence of missed viral load in years 1 and 2 was 27.6% and 30.4%. Reasons for missed viral load were being lost to follow-up (51.5% in year 1 and 57.8% in year 2), misinterpretation of viral load guidelines on monitor timing among clinicians (36.7% in year 1 and 32.2% in year 2), unknown reason (10.3% in year 1, and 8.6% in year 2), and viral load requested but no evidence of sample collection (1.5% in year 1 and 1.3% in year 2). Patient characteristics associated with missed viral load monitoring included younger ages < 24 years (RR 2.27, 95% CI: 1.66-3.12), higher SES (RR 1.47, 95% CI: 1.03-1.91), receiving HIV treatment at a rural clinic (RR 1.22, 95% CI: 1.02-1.46), and advanced HIV disease (RR 2.39, 95% CI: 1.52-3.73).

**Conclusions:** Innovative, scalable, and sustainable approaches to strengthen timely patient clinical monitoring in accordance with guidelines are urgently needed to achieve universal viral suppression among patients living with HIV.

### WEPEE542

Identifying core components of a male-specific person-centered care intervention for scale-up in Sub-Saharan Africa and other low-resource settings

K. Holland<sup>1</sup>, M. Mphande<sup>2</sup>, J. Hubbard<sup>3</sup>, I. Robson<sup>2</sup>, E. Chikuse<sup>2</sup>, L. Kamtsendero<sup>2</sup>, C. Leman<sup>2</sup>, J.J. van Oosterhout<sup>4</sup>, M. Ramesh<sup>1</sup>, S. Phiri<sup>2</sup>, K. Dove<sup>3,2</sup>  
<sup>1</sup>UCLA, David Geffen School of Medicine, Los Angeles, United States, <sup>2</sup>Partners in Hope, Science Department, Lilongwe, Malawi, <sup>3</sup>UCLA, Division of Infectious Disease, Los Angeles, United States, <sup>4</sup>Partners in Hope, Department of Medicine, Lilongwe, Malawi

**Background:** Men living with HIV (MLHIV) experience high rates of treatment interruption (TI), resulting in increased morbidity, mortality, and viremia. Person-centered care (PCC) tailored to men can improve men's ART engagement. Identifying locally contextual, core components of PCC counseling is necessary for effective implementation and scale-up. We conducted a qualitative sub-study with MLHIV to identify core components of a male-specific PCC counseling curriculum in Malawi.

**Methods:** Two parent trials (IDEaL and ENGAGE; Clinicaltrials.gov #s NCT05137210/NCT04858243) enrolled MLHIV ≥15 years not currently in care (either never initiated ART or experiencing TI >28 days). The trials aimed to improve six-month retention among men experiencing TI using a male-specific PCC intervention. Of 1,309 men enrolled, a random subset of 97 MLHIV were selected for qualitative in-depth interviews (IDIs) at 3- (n=36) and 9-months (n=61) to assess core components of the intervention. Data were analyzed using thematic and content-based analysis in Atlas.ti v.9.

**Results:** Of 97 MLHIV interviewed, median age was 38, median time since ART initiation 4-months, 89% were actively on ART at interview. Participants identified core service components related to access, quality, and support. Efficient services, undivided healthcare worker (HCW) attention and respect, privacy, and persistent tracing efforts were considered critically impactful for male-PCC. MLHIV wanted to feel that HCWs "never give up on them" as if "they were family".

Some wanted ongoing relationships with HCWs. Men also expressed need for male-tailored HIV messaging which highlights ART's contributions to men's goals and societal roles and acknowledges that lifelong adherence is difficult, requiring self-compassion. Incorporating graphics depicting MLHIV living normal, healthy lives into counseling tools was also impactful for men (Figure).

Figure. Core components of a person-centered counseling intervention targeting men experiencing treatment interruption in Malawi\*.

**Conclusions:** MLHIV need services that prioritize access, quality, and support tailored to their male experiences. Additional research is needed to assess how an intervention with these core components can be taken to scale.

## WEPEE544

Moving towards HIV epidemic control through community and facility-based strategies: findings from ART Surge implementation in Oyo State, Nigeria

O. Olajide<sup>1</sup>, F. Adurogbola<sup>1</sup>, B. Thompson<sup>1</sup>, D. Adetoye<sup>1</sup>, A. Olafare<sup>1</sup>, S. Adeyemi<sup>1</sup>, K. Areola<sup>1</sup>, P. Jwanle<sup>2</sup>, I. Onwuatuolu<sup>2</sup>, J.O. Samuels<sup>2</sup>, P. Okonkwo<sup>2</sup>

<sup>1</sup>APIN Public Health Initiatives, Ibadan, Nigeria, <sup>2</sup>APIN Public Health Initiatives, Abuja, Nigeria

**Background:** In April 2019, the antiretroviral therapy (ART) surge program was launched in nine Nigerian states to rapidly increase the number of people living with HIV receiving ART. Expanded and targeted community HIV testing services (HTS) as well as intensified facility-based HIV services were shown to be effective in identifying people living with HIV as well as initiating and retaining them on treatment.

The success recorded in the program facilitated the scale-up to other states in southwest Nigeria, including Oyo State.

This study examined the ART surge program in the first six months of its implementation and how it has helped Oyo State progressively move towards achieving epidemic control.

**Methods:** A cross-sectional study design was employed. The weekly ART surge performance data from March to September 2021 was generated, analyzed, and compared with six months before the onset of the ART surge (September 2020 to February 2021). Abstracted data from the National Data Repository, including the number of clients tested for HIV and received results, the number of HIV clients who tested positive, linkage rates, interruptions in treatment rates (IIT), viral load coverage, and viral suppression, were analyzed using Microsoft Excel. All clients who received HTS across Oyo State during the period were included in the analysis.

**Results:** A total of **119,959** people were tested for HIV from September 2020 to February 2021. Of those tested, 4,108 (3.4%) tested positive for HIV, with yields of 4.7% and 2.1% in the facility and community, respectively. Comparing the pre-surge and post-surge periods, we observed an increase in HIV testing from **71,450 to 119,959 (68% increase)**. The number of HIV-positive individuals identified increased from **1,250 to 4,108 (a 229% increase)**. Of those newly identified positives during the surge, **99.8% (4099/4108)** were linked to ART, compared to **98.5% (1231/1250)** pre-surge. IIT reduced from **5.4% to 0.8%**, viral load coverage increased from 88% to 94%, and viral suppression improved from **86% to 94.2%**.

**Conclusions:** ART surge implementation with expanded and focused community HIV testing programs, as well as enhanced facility-based HIV services and data-driven decision-making, has led to improvements in HIV case finding, retention, and viral suppression.

## WEPEE545

Telemedicine to improve health equity in two federally qualified health centers in Los Angeles: is telephone the answer?

D. Walker<sup>1</sup>, C. Moucheraud<sup>2</sup>, D. Butler<sup>3</sup>, J. de Vente<sup>4</sup>, K. Tangonan<sup>4</sup>, C. Takayama<sup>4</sup>, T. Horn<sup>3</sup>, S. Shoptaw<sup>1</sup>, J.S. Currier<sup>1</sup>, J. Gladstein<sup>4</sup>, R. Hoffman<sup>1</sup>

<sup>1</sup>David Geffen School of Medicine at UCLA, Los Angeles, United States, <sup>2</sup>New York University, New York, United States, <sup>3</sup>To Help Everyone, Los Angeles, United States, <sup>4</sup>APLA Health, Los Angeles, United States

**Background:** Telemedicine for HIV care has increased in the U.S., but resource-constrained federally qualified health centers (FQHCs) usually offer only telephone visits (versus well-resourced clinics which offer video visits), raising equity concerns. We developed a multi-pronged intervention to improve the offer and uptake of video telemedicine at two FQHCs in Los Angeles.

**Methods:** Between August 2022-October 2023 our inter-

Oral

vention included: (1) a user-friendly platform for video visits (Doximity); (2) clinician and staff training and reminders to offer telemedicine, including the choice of video; (3) an on-site telemedicine navigator; and (4) quarterly quality improvement meetings. We conducted baseline and endline surveys with people living with HIV (PLHIV) with questions on sociodemographics, clinical characteristics, and perceptions of and experiences with telemedicine. We also reviewed charts for visit type (telephone, video, or in-person) and completion rates before and during the intervention.

**Results:** Of 172 PLHIV enrolled, the median age was 52 years (IQR 38-60); 87% spoke English and the remainder Spanish; and 75% (n=129) identified as cisgender men, 20% (n=35) as cisgender women, and 5% (n=8) as transgender women or non-binary. Telemedicine visit volume did not significantly change with the intervention (14% pre-, 18% post-intervention,  $p=0.4$ ) (Figure). Clinicians reported no challenges with telemedicine, but perceived a strong client desire for telephone over video visits, and thus reported not offering video. Telephone visits had the highest visit completion rate (82%), followed by video (64%) and in-person (59%). Viral suppression did not significantly change with introduction of the intervention (79% <40 copies/mL pre-, 84% copies/mL post-intervention,  $p=0.5$ ).

VISITS	Pre-intervention: March 2021 - July 2022	Intervention: August 2022 - October 2023
Total number of all visits (n)	1908	1262
In-person visits (n, % of all visits)	1452 (87)	1032 (82)
Completed (n, % of in-person visits)	979 (55)	610 (55)
Rescheduled	219 (13)	206 (20)
No-show	353 (21)	141 (14)
Other (cancelled or walk out)	101 (6)	75 (7)
Telephone visits (n, % of all visits)	243 (13)	208 (16)
Completed (n, % of telephone visits)	214 (88)	170 (82)
Rescheduled	9 (4)	12 (6)
No-show	13 (3)	19 (9)
Other (cancelled or walk out)	7 (3)	7 (3)
Video visits (n, % of all visits)	8 (<1)	22 (2)
Completed (n, % of video visits)	5 (63)	14 (64)
Rescheduled	1 (12)	3 (14)
No-show	1 (12)	3 (14)
Other (cancelled or walk out)	1 (12)	2 (9)

Figure. Total visits scheduled (by visit type and visit status) during pre-intervention and intervention periods.

**Conclusions:** Telephone remained the predominant modality for telemedicine in these two FQHCs, despite an intervention to improve offer and uptake of video. Telephone visits play an important role in care at FQHCs. The possible end of reimbursement for these visits due to cessation of COVID-19 emergency measures could widen disparities for PLHIV.

## WEPEE546

### Tracing PLHIV lost to follow-up in countries of Eastern Europe and Central Asia (EECA): lessons learned

R. Yorick<sup>1</sup>, J. Rashbass<sup>1</sup>

<sup>1</sup>Elton John AIDS Foundation, London, United Kingdom

**Background:** In EECA, of 1.24 million PLHIV who know their status, 220,000 (18%) are lost to follow-up (LTFU). Since 2020, the Elton John AIDS Foundation has supported 13

community-based projects across 8 countries in the region that included LTFU identification, tracing and return to ART.

**Description:** Project activities included:

1. Outreach to key population communities (people who use drugs, men who have sex with men, transgender people and sex workers) with HIV testing where PLHIV who know their status but not receiving ART have been identified;
2. Home visits by peer counselors together with HIV clinic staff to PLHIV who missed their clinic appointments by more than 28 days; and,
3. Motivational counseling, psychosocial support and peer navigation services to return LTFU PLHIV and (re-)initiate them on ART.

**Lessons learned:** The projects traced almost 49,200 LTFU; 24,047 (48.8%) were traced successfully; and 18,830 (89.3%) were (re-)initiated on ART.

Major challenges included:

1. PLHIV status disclosure by health providers to peer counsellors;
2. Poor success in tracing long-time LTFU;
3. Incorrect information on ART initiation among health providers (CD4 counts) and PLHIV (feeling well) alike;
4. Myths and fears among PLHIV about ART;
5. Barriers to clinic access (travel time and distance, transportation costs, operation hours);
6. Stigma, including self-stigma;
7. Non-disclosure of HIV status to family and lack of support;
8. Active drug use by PLHIV;
9. ART stock-outs and suboptimal treatment regimens with side effects.

Implementing partners resolved these challenges by:

1. Hiring peer counselors as HIV clinic staff and signing non-disclosure agreements;
2. Tracing LTFU as early as possible;
3. Educating health providers and PLHIV;
4. Covering transportation costs to HIV clinic for LTFU and providing other material incentives;
5. Extending clinic working hours into evenings and weekends;
6. Providing individual and group counseling for PLHIV and their family members;
7. Referring PLHIV to drug rehabilitation; and,
8. Optimizing ART regimens, including people who use drugs.

**Conclusions/Next steps:** Implementing partners documented and costed the models of LTFU tracing and (re-)initiating on ART. Immediate next steps are for governments to assume these costs and functions to reach the "third 95" in the EECA region.

### Retention outcomes among Malawian ART clients who are back to care following an interruption in treatment

D. Smith<sup>1,2</sup>, E. Chikuse<sup>3</sup>, T. Banda<sup>3</sup>, J. Njala<sup>3</sup>, J. Lichenya<sup>1</sup>, R. Hoffman<sup>2</sup>, S. Phiri<sup>3,4</sup>, J.J. van Oosterhout<sup>3,2</sup>, M. Chivwara<sup>1</sup>  
<sup>1</sup>Partners in Hope, Monitoring and Evaluation, Lilongwe, Malawi, <sup>2</sup>University of California Los Angeles (UCLA), Department of Medicine, David Geffen School of Medicine, Los Angeles, United States, <sup>3</sup>Partners in Hope, Programs Care and Treatment, Lilongwe, Malawi, <sup>4</sup>Kamuzu University of Health Sciences, School of Global and Public Health, Lilongwe, Malawi

**Background:** Sustained antiretroviral therapy (ART) is critical for optimizing health outcomes and HIV epidemic control. The Malawi Ministry of Health and its HIV clinical partners implement a robust back to care program for clients who have an interruption in treatment (IIT), defined as being >28 days late for an ART refill appointment. However, the effectiveness of these programs for short- and medium-term retention after IIT is uncertain.

**Description:** Partners in Hope (PIH) is a Malawian, non-governmental organization, supporting HIV Care and Treatment across 9 districts in Malawi with PEPFAR/USAID funding. From January 2021, PIH offered a comprehensive package of interventions to clients across 74 health facilities who returned to care after IIT. Pivotal in this package is assignment to an individual Case Manager, a lay cadre staff trained in health education and HIV counseling.

Case Managers provided intensive individual counseling and psychosocial support with a non-judgmental, welcoming approach, appointment reminders and phone and/or house follow-up 7 days after a missed appointment. PIH evaluated aggregated cohort program data to determine client outcomes at 3, 6 and 12 months after return to care from an IIT episode in this program.

Return after IIT (n=32,732)	3-Month Outcomes	6-Month Outcomes	12-Month Outcomes
On ART	27,758 (84.8%)	23,873 (72.9%)	19,616 (59.9%)
Re-interrupted (IIT)	3,509 (10.7%)	6,540 (20.0%)	9,804 (30.0%)
Died	122 (0.4%)	205 (0.6%)	307 (0.9%)
Stopped ART	23 (0.1%)	38 (0.1%)	50 (0.2%)
Transfer Out	1,320 (4.0%)	2,010 (6.1%)	2,825 (8.6%)
Unknown	0 (0.0%)	66 (0.2%)	130 (0.4%)

Table. Aggregated cohort outcomes of clients back to care after IIT from January 2021 to September 2022

**Lessons learned:** From January 2021 to September 2022, 32,732 clients (all ages) returned to care after IIT. Retention on ART was 84.8%, 72.9% and 59.9% at 3, 6 and 12 months respectively. Within one year of returning to care, 30.0% of clients re-interrupted and 1.1% died or stopped treatment.

**Conclusions/Next steps:** Despite comprehensive interventions, a high number of clients fell out of care following re-engagement. Further research is needed to fully understand the characteristics of clients who re-interrupt to design interventions that respond better to their needs and challenges. Meanwhile, screening for and addressing already known risk determinants is taking place, including those related to mental health, gender-based violence, mobility and age- or gender-specific factors.

## WEPEE548

### Roles and experiences of community action workers in a community-based antiretroviral therapy delivery model for people living with HIV in Cambodia: a mixed-methods cross-sectional study

M. Zahari<sup>1</sup>, M. Nagashima-Hayashi<sup>1</sup>, E.L.Y. Yam<sup>1</sup>, P. Chhoun<sup>2</sup>, S. Samreth<sup>3</sup>, Z.Y. Tian<sup>1</sup>, B. Ngauv<sup>3</sup>, V. Ouk<sup>3</sup>, S. Tuot<sup>2,4</sup>, S. Yi<sup>1,2,5</sup>

<sup>1</sup>National University of Singapore, Saw Swee Hock School of Public Health, Singapore, Singapore, <sup>2</sup>KHANA Center for Population Health Research, Phnom Penh, Cambodia, <sup>3</sup>National Center for HIV/AIDS, Dermatology and STD, Phnom Penh, Cambodia, <sup>4</sup>University of Tokyo, Graduate School of Medicine, Department of Community and Global Health, Tokyo, Japan, <sup>5</sup>Touro University California, Center for Global Health Research, Vallejo, CA, United States

**Background:** The Community-Based Antiretroviral Therapy (ART) Delivery (CAD) model incorporates Community Action Workers (CAWs) to enhance care engagement for people living with HIV (PLHIV), thereby alleviating the burden on ART clinics. This study delves into the roles and experiences of CAWs in implementing CAD among stable PLHIV in Cambodia.

**Methods:** This study utilized both quantitative and qualitative data collected in May 2023 to evaluate the effectiveness of the CAD intervention within a quasi-experimental framework. The research spanned the capital city and nine provinces of Cambodia. CAW-related data, encompassing incurred expenses, time allocation, support and satisfaction levels, and perspectives on their roles in program implementation, were analyzed. Descriptive statistics assessed proportional differences in categorical responses, while qualitative data underwent coding and analysis using a thematic analysis framework.

**Results:** Among the 76 participants, 52.6% were male, and 61.8% were married. The mean age was 48.0 years, ranging from 18 to 72 years, with a mean education completion of 8.4 years (ranging from 0 to 16 years).

Most participants (96.1%) utilized motorcycles for travel, spending an average of 5.8 times per month (ranging from 1 to 66) to meet PLHIV. Participants engaged with about 10 PLHIV monthly (ranging from 1 to 35). The major-

ity reported incurring expenses (84.2%), primarily related to food (median 1.35 USD; IQR 0.37-2.45) and travel costs (median 2.45 USD; IQR 1.96-4.90). Participants expressed confidence in their knowledge and resources to support their members (93.4%), and 80.3% perceived their relationship with personnel at the ART clinics as good. Their reported responsibilities included distributing medicines, counseling, and organizing meetings. They deemed their work essential, citing significant contributions to community support, assistance with ART medication accessibility, and patient monitoring.

**Conclusions:** This study highlights the multifaceted responsibilities undertaken by CAWs and emphasizes the pivotal significance of recognizing their roles in augmenting the effectiveness of the CAD model.

As the CAD model assumes a pivotal role in community-based HIV care delivery, these insights make valuable contributions to better understanding and enhancing support for CAWs in Cambodia and similar settings.

## WEPEE549

### Preferences for long-acting antiretroviral therapy among people with HIV in Kenya: a discrete choice experiment

J. Tran<sup>1</sup>, D. Barthold<sup>1</sup>, B. Hauber<sup>1,2</sup>, A. Kaggiah<sup>3</sup>, C. Maina<sup>3</sup>, N. Jekkosgei<sup>3</sup>, E. Mwangi<sup>3</sup>, J. Kinuthia<sup>3</sup>, S.M. Graham<sup>4,5,6</sup>

<sup>1</sup>University of Washington, The Comparative Health Outcomes, Policy, and Economics (CHOICE) Institute, Seattle, United States, <sup>2</sup>Pfizer Inc., New York, United States, <sup>3</sup>Kenyatta National Hospital, Department of Research & Programs, Nairobi, Kenya, <sup>4</sup>University of Washington, Department of Global Health, Seattle, United States, <sup>5</sup>University of Washington, Department of Medicine, Seattle, United States, <sup>6</sup>University of Washington, Department of Epidemiology, Seattle, United States

**Background:** For people with HIV (PWH), long-acting antiretroviral therapies (LA-ART) are promising alternatives to daily oral regimens, with potential to improve adherence and increase viral suppression. Understanding client preferences is crucial for successful implementation and scale up of LA-ART in resource-limited settings such as Kenya. To that end, we are conducting a discrete choice experiment (DCE) to elicit preferences for LA-ART attributes among PWH in Kenya.

**Methods:** We are recruiting 700 PWH from the Kenyatta National Hospital HIV clinic and Sex Workers Outreach Program clinics in Nairobi. In 17 choice scenarios, participants choose between their current daily oral regimen and two hypothetical LA-ART alternatives defined by seven attributes: delivery mode, administration location, frequency, delivery-site pain, pre-treatment viral suppression, pre-treatment negative reaction testing, and late-dose leeway. In preliminary analyses, we used conditional

logistic regressions with interactions between mode and pain to examine the relationship between choices and attributes.

**Results:** As of January 15, 2024, 650 participants had been enrolled, with median age of 35.5 years (range: 18-70); 65% were female, 81% had undetectable viral loads, 55% were sex workers or men who have sex with men, and 6.5% were ART naïve. Participants generally chose the hypothetical LA-ART regimens over their current daily oral ART. The interaction of delivery mode and pain was the most important attribute. Oral LA-ART without pain was the most preferred mode, with 1-year implants with mild pain as the next preferred option. There was preference for administration at clinics and less frequent dosing. Results will be updated upon recruitment completion.

**Conclusions:** Participants favored hypothetical LA-ART alternatives to current daily oral regimens and demonstrated strong preference for oral LA-ART.

Our preliminary findings suggest LA-ART could be acceptable to PWH in Kenya, with client preferences for mode, pain, administration location, and dosing frequency the most important attributes to consider for successful scale up.

## WEPEE550

### Outcomes of Tenofovir, Lamivudine, Dolutegravir-based antiretroviral therapy for adults with HIV - a retrospective subpopulation study at 15 districts in South Africa

D. Mali<sup>1</sup>, C. Oosthuizen<sup>1</sup>, K. Kehoe<sup>1</sup>, L. Seshoka<sup>2</sup>, Z. Mthembu<sup>1</sup>, B. Muzah<sup>1</sup>, T. Molapo<sup>2</sup>

<sup>1</sup>US Agency for International Development, Pretoria, South Africa, <sup>2</sup>National Department of Health, Pretoria, South Africa

**Background:** In 2020, South Africa adopted Tenofovir, Lamivudine, Dolutegravir (TLD) first-line antiretroviral therapy (ART) for people living with HIV. Although clinical evidence shows TLD has superior efficacy, tolerability, and fewer discontinuations, there is limited data on clinical outcomes in non-trial settings.

We demonstrate TLD's variable impact on viral load coverage (VLC), viral load suppression (<1000 copies/ml) (VLS) and interruptions in treatment (IIT) in USAID-supported districts in South Africa.

**Methods:** We retrospectively reviewed routine aggregate data reported for September 2020 through September 2023. We analyzed TLD coverage, VLC, VLS and rates of IIT. Data for clients on ART aged  $\geq 20$  years in 15 South African districts were included. Benchmarks for TLD coverage (85%), VLC (85%), VLS (90%), and IIT (5%) were used to group subpopulations in quadrants and identify groups with undesirable outcomes.

**Results:** By September 2023, 2,125,218 clients were on ART (female:69%, male:31%). TLD coverage was 47% (females:43%, males:56%) in September 2020 and increased by 38% (females:85%, males:86%) to 85% by September 2023. VLC and VLS increased gradually as TLD coverage increased for both males (VLC: 2020:76%, 2023:82%; VLS: 2020:71%, 2023:78%) and females (VLC: 2020:79%, 2023:85%; VLS: 2020:75%, 2023:82%). IIT remained similar over time irrespective of sex (3-6%).

In September 2023, TLD coverage, VLC, and VLS was lower among males 20-34, and females 30-34 years compared to other subpopulations (Figure A/B).

Males 25-34 years experienced the highest IIT (Figure C). Despite having 1-2% higher TLD coverage, young women (20-29 years) had lower VLC and VLS, and higher IIT than other subpopulations (Figure).

**Conclusions:** Overall, increases in TLD coverage had favorable outcomes for ART clients. However, younger males and females of reproductive age experienced lower TLD coverage and worse outcomes.

For sustainable epidemic control, routine analyses at subpopulation levels are critical to identifying remaining gaps and developing targeted interventions.

## WEPEE551

### "Closer to a cure": mixed-methods analysis of reasons for switching to long-acting injectable Cabotegravir + Rilpivirine

S. Paparini<sup>1</sup>, R. Hayes<sup>1</sup>, J. Haviland<sup>2</sup>, Y.L. Wong<sup>2</sup>, V. Apea<sup>1,3</sup>, B. Kasadha<sup>4</sup>, K. Ring<sup>5,3</sup>, J. Fox<sup>6,7</sup>, R. Byrne<sup>8</sup>, A. Clarke<sup>9</sup>, E. Clarke<sup>10</sup>, T.J. Barber<sup>11,12</sup>, C.M. Orkin<sup>5,3</sup>, on behalf of ILANA Study Group [C. Mwendera, J. Hand, N. Halim, S. Ullah, and A. Elias]

<sup>1</sup>Queen Mary University of London, SHARE Collaborative, Wolfson Institute for Population Health, London, United Kingdom, <sup>2</sup>Queen Mary University of London, Pragmatic Clinical Trials Unit, Wolfson Institute for Population Health, London, United Kingdom, <sup>3</sup>Barts Health NHS Trust, Department of Infection and Immunity, London, United Kingdom, <sup>4</sup>University of Oxford, Nuffield Department of Primary Care Health Sciences, Oxford, United Kingdom, <sup>5</sup>Queen Mary University of London, SHARE Collaborative, Blizard Institute, London, United Kingdom, <sup>6</sup>Kings College London, Infectious Diseases, London, United Kingdom, <sup>7</sup>Guy's and St Thomas' NHS Foundation Trust, Infection and Immunity, London, United Kingdom, <sup>8</sup>Chelsea and Westminster Hospital NHS Foundation Trust, London, United Kingdom, <sup>9</sup>University Hospitals Sussex NHS foundation Trust, Royal Sussex County Hospital, Brighton, United Kingdom, <sup>10</sup>Liverpool University Hospitals NHS Foundation Trust, Liverpool, United Kingdom, <sup>11</sup>Royal Free London NHS Foundation Trust, London, United Kingdom, <sup>12</sup>University College London, Institute for Global Health, London, United Kingdom

**Background:** Research into why people choose to switch to long-acting injectable cabotegravir and rilpivirine (LAI CAB+RPV) has mainly produced survey data describing the challenges of oral therapy (e.g., pill fatigue, adherence anxiety, daily reminder of HIV status, inadvertent disclosure).

This study explores motivations and experiences that go beyond avoidance of oral therapy. In-depth attention to patient experience can reveal unanticipated motivations for switching.

**Methods:** ILANA is a 1-yr implementation study exploring acceptability and feasibility of on-label LAI CAB+RPV every 2 months. Inclusive recruitment was conducted throughout 2022 with targets for 50% women, 50% racially minoritised people, and 30% aged >50. ILANA is a mixed-methods longitudinal study, with iterative qualitative-quantitative data collection via quarterly surveys between M0 and M12 and semi-structured interviews with 14 patient participants at M0 and M12. Baseline survey data was summarised using descriptive statistics. Theoretically-informed interview narrative summaries were analysed thematically. Mixed-method data analysis was integrated and iterative. We present analysis of baseline survey and M0 and M12 interview data on motivations for switching to LAI CAB+RPV.

**Results:** 114 participants [53% female, 51% Black, 30% White, 40% >50yrs]. Median of 13 yrs (IQR 8,19) since diagnosis, 11 yrs (IQR 7,16) on ART, with a mean of 3 prior regimens. At baseline, 14% identified wanting to try a new approach as the most important reason for switching. The most common reasons for switching included ease of socialising (61%), wanting to try a new approach (60%), not carrying pills when travelling (57%), convenience (54%), and avoiding inadvertent disclosure (45%) and the daily reminder of HIV (45%).

The interviews revealed that LAI CAB+RPV offered many participants a sense of positive change in the context of living with a chronic condition, with some equating this to progress towards a cure. While pill fatigue characterised most participants' experiences of oral treatment, LAI CAB+RPV also created hope and new possibilities for the future.

**Conclusions:** LAI CAB+RPV can offer positive psychological improvements beyond the reduction of burdensome adherence experiences, with implications for how and to whom it is offered.

Further research is needed to measure longer-term improvements in quality of life that injectables may offer.

### Optimizing viral load coverage using a combination approach for hard-to-reach areas: a case from Chama district in the Eastern Province of Zambia

T.M. Malebe<sup>1</sup>, G. Kibombwe<sup>1</sup>, M. Goma<sup>2</sup>, P. Mutale<sup>2</sup>, M. Mbau<sup>2</sup>, C. Luhana<sup>2</sup>, H. Satti<sup>3</sup>, J. Msofe<sup>3</sup>, D. Carpenter<sup>3</sup>, N. Persaud<sup>3</sup>, O. Chabikuli<sup>4,5</sup>, L. Nyau<sup>6</sup>, M. N'gambi<sup>6</sup>

<sup>1</sup>FHI 360, HIV Department, Lusaka, Zambia,

<sup>2</sup>FHI 360, Technical, Lusaka, Zambia, <sup>3</sup>FHI 360, HIV

Department, Durham, United States, <sup>4</sup>FHI 360,

Technical/Programs, Pretoria, South Africa, <sup>5</sup>Haward

University, Public Health Programs, Graduate School,

Washington DC, United States, <sup>6</sup>Ministry of Health,

Technical, Chipata, Zambia

**Background:** To achieve desirable HIV treatment outcomes and health, people living with HIV (PLHIV) must maintain a sustained viral suppression. Meaningful estimation of viral load suppression (VLS) rates is dependent on higher viral load coverage (VLC) among eligible PLHIV. VLC is also essential for monitoring progress towards HIV epidemic control. In 2022, VLC in Chama district was at 49% of eligible clients compared to the 88% provincial average.

This limited care providers' ability to offer quality monitoring of treatment or conduct meaningful estimation of VLS rates for the district.

The CDC technical assistance project implemented a combination intervention approach to optimize VLC in Chama district to reach 80% by the end of 2023.

**Description:** To close identified gaps in the VL value chain, the project completed the following interventions: between October 2022 to October 2023:

- Trained 33 facility and community-based personnel in community VL sample collection using DBS cards.
- Trained 7 laboratory staff in point of care VL and early infant diagnosis analysis.
- Conducted live, interactive community radio programs on VL monitoring.
- Synchronized pharmacy and VL sample collection appointments.
- Sent clients web-to-SMS reminders for sample collection and conducted follow-ups using case management approach.
- Decentralized sample collection to the community.
- Supported real-time transmission of electronic results, prompt update of results in clients' electronic records, and improved data use.

**Lessons learned:** Following the interventions, overall VLC increased from 49% (baseline) in October 2022 to 91% in October 2023 (endline), resulting in a significant increase of 42% ( $p<0.0001$ ). Stratified data by age group shows lower VLC (82%) among adolescents and young people (AYP) compared to adults (88%), a concern when considering of treatment as prevention in AYPs since actual VLS rates cannot be ascertained. Both males and females had a VLC of 87%, however. Further, scaling up point of care (POC) VL analysis resulted in reduction in result turnaround time from 30 days to 5 days.

**Conclusions/Next steps:** These results demonstrate that implementing a combination of intervention tailored to identified gaps is effective in achieving optimal VLC and potentially VLS in rural settings. We recommend replicating this approach in other resource limited settings to contribute towards HIV epidemic control.

## WEPEE553

### Improving HIV treatment outcomes among alcoholic clients through differentiated service delivery: a case study of 3 facilities in Uasin Gishu County, Kenya

A. Awuor Oyoyo<sup>1</sup>, S. Kimaiyo<sup>1</sup>, E. Leitch<sup>1</sup>

<sup>1</sup>Moi Teaching and Referral Hospital-AMPATH, HIV Care and Treatment, Eldoret, Kenya

**Background:** Alcohol use is a risk factor associated with suboptimal adherence to antiretroviral therapy, decreased healthcare utilization, and poor treatment outcomes among HIV-infected individuals.

Additionally, studies show that heavy alcohol users are four times more likely to have an interruption in treatment (IIT) compared to non-drinkers. Exploring the use of a Differentiated Service Delivery model specific for alcohol users could be an opportunity to enhance HIV treatment outcomes in Uasin Gishu County.

**Methods:** A prospective cohort study was conducted from 2020 to 2022 whereby 58 (14 females and 44 males) heavy alcohol users (> 45 years) were identified through snowballing from 3 facilities in Uasin Gishu County and enrolled into a tailor-made differentiated service delivery model. By use of Self Determination theory of motivation, a team leader-expert client was selected and incentivized with a wristwatch to support the process, and transport money was offered to all participants during psychosocial support groups, this was in consideration of both intrinsic and extrinsic components of the theoretical framework. Furthermore, all participants were given specific health education and advised to take their medications in the morning before using alcohol. Appointment keeping, and morning drug ingestion were followed overtime and both descriptive and inferential statistics were done.

**Results:** Overall, there was a significant improvement from 33 (56%) to 52 (89.6%) on appointment keeping by the end of the period. This was higher in males at 99% compared to 78% in females.

Additionally, there was statistical significant association between morning drug ingestion and viral load suppression at 42 (93.3%) at chi-square p-value 0.001 and 56.4 times likelihood of viral suppression at CI=95% as compared to non-morning ingestion. In that vein, appointment keeping and viral load suppression were associates at 36(80%) a chi-square p- value of 0.011- and 18.2-times likelihood of suppression for clients who kept appointment at CI=95%

**Conclusions:** A tailor-made DSD model for alcoholics leads to better treatment outcomes. Generalizability can be done to other sites with the same geographical and treatment characteristics in the race toward HIV epidemic control.

## WEPEE554

### Updated South African differentiated service delivery guidance improves HIV services

L. Malala<sup>1</sup>, M.R. Manganye<sup>1</sup>, R. Fritz<sup>1</sup>, P.N. Khoza<sup>1</sup>, L. Wilkinson<sup>2,3</sup>, T. Chidarikire<sup>4</sup>

<sup>1</sup>National Department of Health, Pretoria, South Africa,

<sup>2</sup>International AIDS Society, International AIDS Society, Johannesburg, South Africa, <sup>3</sup>University of Cape Town, Centre for Infectious Epidemiology and Research, Cape Town, South Africa, <sup>4</sup>World Health Organization, HIV Prevention, Pretoria, South Africa

**Background:** South Africa has the world's largest HIV burden with an estimated 7.8 million people living with HIV and 5.8 million on antiretroviral treatment (ART) by November 2023. The overwhelming demand on the health system, characterized by congested clinics and frequent visits, contributes to treatment interruptions and disengagement. In 2016, South Africa introduced integrated differentiated service delivery (DSD) for HIV, tuberculosis,

and non-communicable diseases to support treatment adherence and alleviate the burden for recipients of care (ROC) and the health system. In 2023, the guidance was comprehensively updated to further optimize client-centredness. It was fully integrated into the country's ART clinical guidelines, accompanied by supporting standard operating procedures.

**Description:** Notably changes include shifting the first viral load assessment from month six to month three after ART initiation, enabling earlier intervention to support adherence. ROC with a suppressed viral load are immediately eligible for enrolment into their choice of less-intensive DSD models - fast-track facility pick-up points (FAC-PUPs), external pick-up points (EX-PUPs) (primarily via private pharmacies), or adherence clubs (ACs).

These models offer a maximum of two ART refills from a 6-month prescription. Those not eligible may also be given longer refills - including children from 6 months to five years of age, post-natal women, people with concomitant TB, clients with elevated viral loads but clinically stable, and those re-engaging in care.

Recognizing that many people re-engaging after treatment interruption do not need increased clinical management but flexibility, the updated guidance differentiates care based on clinical stability and time since a missed appointment, providing longer refills and continuation or accelerated access to less-intensive DSD models.

**Lessons learned:** The updated guidelines prioritize client-centred optimization resulting in the enrolment of 2,754,483 ROC (including people with controlled hypertension and diabetes) into less-intensive DSD models by November 2023, achieving 88% of the national annual target. This includes 788,995 in FAC-PUPs, 271,1248 in EX-PUPs and 214,458 in ACs.

**Conclusions/Next steps:** Ongoing efforts focus on nationwide implementation of the updated DSD package, emphasizing fidelity to counselling sessions, earlier viral load assessment, enrolment into less-intensive DSD models, longer refills and differentiation at re-engagement.

## WEPEE555

### Challenges and progress in implementing long-acting antiretroviral therapy at an urban community health center

A. Cantor<sup>1</sup>, R. Vail<sup>1</sup>, A. Radix<sup>1,2</sup>

<sup>1</sup>Callen-Lorde Community Health Center, Department of Medicine, New York, United States, <sup>2</sup>Columbia University Mailman School of Public Health, Department of Epidemiology, New York, United States

**Background:** Long-acting injectable ART (LAI-ART) using Cabotegravir/Rilpivirine was approved in the USA in 2021. Benefits include a reduced treatment burden, convenience, and improved adherence, especially for those finding daily oral medication challenging.

Additional advantages relate to social determinants of health, such as reduced HIV stigma and increased medical privacy. Callen-Lorde Community Health Center in New York City, a Ryan-White funded clinic serving over 5000 individuals living with HIV, many facing socioeconomic challenges to successful engagement in care. We report on our successes, challenges, and lessons learned during LAI-ART implementation.

**Description:** The LAI-ART program was launched in January 2021 and required multidisciplinary involvement of clinicians, nursing, finance/billing, and administrative support. As of December 31, 2023, 118 clients are successfully receiving LAI-ART with Cabotegravir/Rilpivirine with 18 more on the waiting list, and an additional 2 on Lenacavir with a waiting list of 8, including clients in the process of outreach and insurance verification. However, 28 clients referred for LAI-ART were unable to initiate due to identified barriers.

**Lessons learned:** Successful metrics include high rates of viral suppression (100%), appointment adherence, client satisfaction and quality of life, retention in care and lack of viral resistance. We recognized numerous systems, client, and provider-level barriers.

At the systems level, insufficient resources for outreach, nursing/staffing shortages post-COVID19, and evolving reimbursement requirements impacted our ability to verify insurances and limited appointment availability.

Provider-level barriers included limited knowledge of LAI-ART and eligibility requirements, as well as a lack of time for in-depth discussions of risks and benefits.

Client-level barriers involved concerns about injection-site reactions, difficulty managing more frequent appointments, and restrictions for individuals with buttock/gluteal fillers and implants. Less frequent issues were related to incorrect contact information, underlying medication resistance, and client readiness.

**Conclusions/Next steps:** Despite structural and institutional-level barriers, there is ongoing demand for LAI-ART, and clients in the program report high satisfaction. Implementing LAI-ART requires building infrastructure and training, addressing cost and access issues with dedicated personnel managing insurance requirements and reimbursement.

Continued monitoring of LAI-ART uptake and persistence at our center, as well as addressing these barriers, will guide our ongoing efforts to scale-up LAI-ART.

## WEPEE556

### Progress towards eliminating vertical transmission of HIV in Mozambique: scaling up access to routine viral load testing for pregnant women living with HIV in Manica province

M. Júlio<sup>1</sup>, J. Saturnino<sup>2</sup>, M. Prieto<sup>2</sup>

<sup>1</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique/Pathfinder International, Maputo, Mozambique, <sup>2</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique, Maputo, Mozambique

**Background:** Mozambique has achieved a 99% coverage rate of antiretroviral treatment (ART) among pregnant women living with HIV, yet the 10% mother-to-child HIV transmission rate remains a significant barrier to eliminating vertical transmission. Viral load (VL) testing identifies women with unsuppressed VL, enabling timely interventions. Manica province struggled with routine VL testing access for pregnant women, reaching only 41% coverage in September 2020. The USAID-funded Efficiencies for Clinical HIV Outcomes (ECHO) project aimed to enhance VL testing among pregnant women living with HIV.

**Description:** ECHO's strategy focused on boosting VL testing coverage among pregnant women living with HIV by increasing testing knowledge among maternal and child health (MCH) nurses and Mentor Mothers, improving VL testing literacy among pregnant women and communities, and providing mentoring and home visits for pregnant women while enhancing monitoring of VL testing results.

ECHO initiated the implementation of its three-pronged approach in February 2021, including training of MCH nurses specializing in antenatal care on VL testing eligibility criteria, educating Mentor Mothers on the importance and scheduling of VL testing for pregnant women living with HIV, integrating VL testing messages into health talks at health facilities and within communities. Mentor Mothers –women living with HIV who adhered to treatment during their own pregnancies– mentored and conducted home visits to pregnant women living with HIV.

Additionally, ECHO implemented a registry book in antenatal care One-Stop entry points to monitor sample collection and results, scheduling VL testing appointments, and making daily updates to electronic databases.

**Lessons learned:** Between September 2020 and September 2023, VL coverage among pregnant women living with HIV surged from 41% to 82%, demonstrating a 100% increase. VL suppression among this group also rose from 81% to 90%.

Continuous training was imperative to counter the risk posed by the rotation of MCH nurses and preserve the achieved results. Effective coordination with the referral laboratory significantly enhanced VL testing logistics.

**Conclusions/Next steps:** The ECHO project's three-pronged approach contributed to doubling VL coverage among pregnant women living with HIV, setting the

stage for sustained, ongoing interventions to uphold the ECHO's project achievements in reducing mother-to-child transmission of HIV.

## WEPEE557

Loss to follow up search & rescue: tracking, engaging & re-linking LTFU to HIV treatment, care & support services through community led interventions

M.O. Haider<sup>1</sup>, A. Satti<sup>1</sup>, U. Tariq<sup>1</sup>

<sup>1</sup>Association of People Living with HIV-Pakistan, Islamabad, Pakistan

**Background:** LTFU in HIV context is usually defined as any PLHIV for whom 6 months have elapsed since their visit to HIV clinic and/or drug pick-up. Loss at each step of the HIV treatment cascade is well documented with an estimated 20,000 LTFU PLHIV across Pakistan who may be contributing to the spread of HIV. With no formal mechanism in place and a limited health infrastructure, community-led interventions to improve retention on HIV treatment is the only viable option to track LTFU cases.

With the financial and technical help of WHO-EMRO a demonstration project was carried out from Sep 2020 to Dec 2021 to track LTFU PLHIV via community led tracking.

**Description:** APLHIV mobilized its Community Support Groups of PLHIV for on ground tracking activities that entail visiting the LTFU PLHIV and through interaction and counseling convincing them to return within the treatment fold. Competent PLHIV were trained as "Peer Trackers" on tracking techniques/confidentiality/reporting. Contact was made with LTFU PLHIV through phone and home visits and via peer to peer interaction/counseling LTFU were re-linked with ART services. Reasons for LTFU were also ascertained. In case of death, details were ascertained from next of kin and transfer outs and any other outcomes were also noted in detail.

**Lessons learned:** In a short span of 1 year and in the face of second and third wave of COVID-19; 2032 LTFU PLHIV (10% of national estimate) were successfully tracked. 1070 (53%) were successfully re-linked, 817 (40%) were expired, 117 (6%) were silent transfers and 28 (1%) had moved abroad. Issues with MIS were faced due to incomplete details however "data mining" was carried out in ART hardcopy records to find address/contact details. 50% of trackers were female PLHIV who were far more successful in re-linkages compared to male counterparts. Distance to ART Centers was the major reason for LTFU and having a "treatment buddy" in form of Peer Trackers led to willingness to re-engage with ART.

**Conclusions/Next steps:** LTFU PLHIV can be successfully re-linked through community led interventions demonstrating need for communities' engagement in all HIV treatment, care & support services in order to ensure continued adherence to ART.

## WEPEE558

Use of peer led community antiretroviral groups to improve retention in care among people living with HIV in West Pokot County, Kenya

D. Gaitho<sup>1</sup>, J. Barasa<sup>1</sup>, V. Wafula<sup>1</sup>, D. Kiptum<sup>1</sup>, S. Ndege<sup>1</sup>, K. Wahome<sup>1</sup>, S. Kimaiyo<sup>1</sup>

<sup>1</sup>AMPATH (Academic Model Providing access to Healthcare), HIV Care and Treatment, Eldoret, Kenya

**Background:** West Pokot County, a diverse and remote region in Kenya, has one of the highest proportions of people living with HIV (PLWH) interrupting treatment in the country, leading to significant morbidity and mortality. This informed establishment of peer led community antiretroviral groups (CARG's) to address challenges affecting retention in care.

**Methods:** We conducted a prospective cohort study by voluntarily enrolling PLWH from Kapenguria hospital in West Pokot County into peer led CARG's based on their geographical location in December 2022. The peer provided psychosocial support to members, coordinated medication refills and viral load sample collection. The community served are migratory and the peer moved together with group members thus supporting continuity in treatment.

Our primary outcome was lost to follow-up (LTFU) after 1 year in the CARG. In the analysis we compared 1 year retention with a random sample of an equal number of PLWH who were active in care in December 2022, not enrolled in a CARG but receiving the standard package of care at the same hospital.

Cumulative incidence of LTFU was calculated by peer led CARG versus non-peer led standard care. Log-binomial regression was used to estimate the relative risk of being LTFU.

**Results:** We enrolled 102 PLWH of whom 51 were in five peer led CARG's and the remainder in non-peer led standard of care. Mean age in both groups was 31.72 years with a median duration of antiretroviral therapy (ART) of 3.12 (IQR 1.97, 4.34) and 2.82 (IQR 1.74, 4.61) years for the peer led CARG's and non-peer led care respectively.

After 1 year of follow-up, cumulative incidence of being LTFU was 0.12 (95% CI 0.04, 0.24) and 0.06 (95% CI 0.01, 0.16) among those in non-peer led care and peer led CARG's respectively.

After adjusting for baseline WHO stage, HIV viral suppression and duration on ART, PLWH provided with standard of care only had a two-fold increased risk of being LTFU compared to those in peer led CARG's (RR 1.99 [95% CI 1.41, 38.31], p-value 0.02).

**Conclusions:** Peer led CARG's as a differentiated care model has significantly better retention outcomes.

## WEPEE559

A comparison of HEP-CAG and P-CAD models on viral load suppression, treatment adherence and retention in care in a community-based differentiated HIV treatment program in Ethiopia

F.S. Tadesse<sup>1</sup>, D.A. Tsegaye<sup>1</sup>, E. Seid<sup>1</sup>, A. Tefera<sup>1</sup>

<sup>1</sup>Project HOPE Ethiopia Country Office, Addis Ababa, Ethiopia

**Background:** Project HOPE in partnership with partners has been supporting the implementation of community-based differentiated service delivery models (cDSDM). The cDSDM is intended to bring benefits for clients and the health systems that include reducing the number of visits, reducing waiting time and increasing access. Currently, two community-based antiretroviral (ART) refill models, i.e., the health extension professional-managed community ART refill group (HEP-CAG) and the peer lead community-based ART distribution (P-CAD) model are implemented in seven PEPFAR-supported regions of Ethiopia.

The HEP-CAG model utilizes health extension professionals who already have roles in HIV testing and other HIV service provision. P-CAD groups are self-forming groups of people living with HIV/AIDS comprising of stable clients living in the same community where members take turns to pick up drugs at the health facility and distribute them in the community.

This study was conducted to compare the effect of HEP-CAG and P-CAD on outcomes of patients.

**Methods:** This study was part of a cross-sectional evaluation survey that was conducted from September - October 2023 in 44 randomly selected health facilities in Addis Ababa, Amhara, Oromia, SNNP, Sidama, Southwest Ethiopia and Gambella regions.

The survey was conducted to evaluate the effect of cDSDM on patients' viral load suppression, treatment adherence and retention in care. Data was collected retrospectively from medical records of 1,377 randomly selected clients between December 2018 and June 2023. SPSS v21 was used for data analysis.

**Results:** During the survey, there were 529 (89.1%) HEP-CAG and 1286 (91.1%) P-CAD groups that were actively working. Viral load suppression with HEP-CAG (100%) was slightly greater than the suppression obtained with P-CAD (99.7%). The evaluation indicated that 85.8% and 79.4% of members in HEP-CAG and P-CAD were tested for viral load. Overall, good treatment adherence was achieved in 99.7% of the patients in HEP-CAG and 98.4% of patients in P-CAD. With regard to retention in care, 99.4% in P-CAD and 99.8% in HEP-CAG were on cDSDM for the 3<sup>rd</sup> most recent measurement.

**Conclusions:** Comparing the two models in terms of treatment adherence, viral load suppression and retention in care, slightly better outcomes were obtained with HEP-CAG.

## WEPEE560

Lessons learnt from supporting the implementation of different types of External Pick up Points in a Central Chronic Medicines Dispensing and Distribution (CCMDD) program in a District in South Africa

C.M. Onaga<sup>1</sup>, E. Okonji<sup>2</sup>, K. Moremi<sup>1</sup>, S. Mulibana<sup>2</sup>,

N. Mahudu<sup>3</sup>, P. Majuba<sup>2</sup>

<sup>1</sup>Right to Care, Nelspruit, South Africa, <sup>2</sup>Right to Care, Centurion, South Africa, <sup>3</sup>Ehlanzeni District- Health, Department of Health, Nelspruit, South Africa

**Background:** The Central Chronic Medicines Dispensing and Distribution (CCMDD), also known as Dablapmeds, is a program of the National Department of Health (NDoH) of South Africa (SA) that provides access to stable communicable and non-communicable diseases (NCD) clients to collect their repeat chronic medications at approved, more convenient sites. A variety of options, or Pick-up Points (PuPs), are available to clients.

**Methods:** Right To Care (RTC), funded by the USAID, supports the CCMDD program and all PuPs in Ehlanzeni District, Mpumalanga Province in South Africa. The district is predominantly semi-urban and rural. Data from Sept 2020 to Dec 2022 at 11 purposively selected, rural and semi-urban CCMDD sites were analysed. The 11 sites all had Corporate Pharmacies (CPs), Department of Health (DoH) facility PuP (FacPuPs), RTC's Collect & Go™ smart lockers ("lockers") as PuP options. The "lockers" are revolutionary ATM-type machines that release pre-packed medications when a unique pin is entered on the computer console. Therefore, "lockers" require no human interaction, unlike the other two PuP options. Descriptive analyses were done, and multivariate logistic regression models explored associations with promptness in medicine parcels collection.

**Results:** A total of 112951 clients were enrolled, 31% and 69% of which were at rural and semi-urban sites respectively. The lockers accounted for 72 % of all enrolments, CPs and FacPuPs were 20% and 8% respectively. Clients aged between 15-24 years were 3% of total, 36% between 25-39 years, 50% between 40-59 years and 11% >60 years. Prompt collection was more likely with users of lockers (aOR 1.86; 95% CI 1.76 - 1.95) and CPs (aOR 1.64; 95% CI 1.76 - 1.95) compared to FacPuPs. Clients in semi-urban PuPs were less likely than rural clients to collect their parcel timeously (aOR 0.88; 95% CI 0.85 - 0.91). There was no significant association between age and parcel collection promptness.

**Conclusions:** External PuPs can reduce CCMDD pateints lost to follow up in rural areas. Clients on FacPuPs and those in more urban sites may need more support to avoid delayed medicine collection. Some PuPs may, comparatively, enhance on-time treatment collection and the reason(s) for this need to be explored further.

### The ART Kindergarten DSD Model for improved viral load suppression among children 0-5 years at Lighthouse Martin Preuss HIV clinic

L. Gabriel Kachere<sup>1</sup>, E. Rambiki<sup>2</sup>, C. Wallrauch<sup>2</sup>, A. Nhlema<sup>2</sup>, J. Huwa<sup>3</sup>, A. Thawani<sup>4</sup>

<sup>1</sup>Lighthouse Trust Malawi, Clinical Programs, Lilongwe, Malawi, <sup>2</sup>Lighthouse Trust, Clinical Programs, Lilongwe, Malawi, <sup>3</sup>Lighthouse Trust, Monitoring & Evaluation and Research Department, Lilongwe, Malawi, <sup>4</sup>Lighthouse Trust, Monitoring, Evaluation & Research Directorate, Lilongwe, Malawi

**Background:** Achieving viral load suppression (VLS) above 85% in children living with HIV (CLHIV) aged 0 to 5 years has been challenging in Malawi despite the roll out of pediatric dolutegravir in 2021. This mostly been attributed to several family social issues, and unfriendly pediatric formulations that affect adherence. To address this gap, Lighthouse established an ART Kindergarten differentiated service delivery (DSD) model for CLHIV 0-5 years and their caregivers to provide holistic approach in HIV management. This model offers individual and group support services to caregivers which include psychosocial counseling, enhanced child friendly environment with play center and intentional programming from clinic mentors. The overall purpose is evaluating whether CLHIV receiving care in kindergarten differentiated care have better retention and viral suppression compared to standard of care.

**Methods:** In this retrospective descriptive analysis, we compared outcomes of CLHIV attending the kindergarten clinic with those receiving treatment during routine clinic services at Martin-Preuss-Center, Lilongwe, Malawi. Retention in care and viral load suppression (VLS) rates from October 2022 to September 2023 were compared between the groups using routinely collected program data from the Electronic Medical Record System (EMRS).

**Results:** In October 2022, 202 CLHIV were enrolled in the ART program; 121(60%) in the kindergarten clinic and 81(40%) in general cohort. Retention at the end of the observation period was 88.4% (95%CI 81.3%-93.5%) in kindergarten and 58.0% (95%CI 46.5% to 68.9%) in general cohort ( $p < 0.0001$ ).

VLS in the kindergarten improved significantly during the year from 77.4% at baseline (95%CI 67.0% to 85.8%) to 90.7% (95%CI 83.1% to 95.7%;  $p=0.0158$ ) while the general cohort, VLS increased from 62.2% (95%CI 44.8% to 77.6%) to 78.4% (95%CI 61.8% to 90.2%); ( $p=0.13$ ). CLHIV in the kindergarten had a higher viral suppression than the general cohort (90.7% vs. 78.4%) although this difference missed statistical significance marginally ( $p = 0.056$ ).

**Conclusions:** The holistic and person-centered care through the ART kindergarten DSD model has proved to improve retention as well as viral suppression among children in our population. ART programs must focus be-

yond the biomedical care to address gaps in social and family dynamics that greatly affect adherence among children.

## WEPEE562

### Service delivery preferences during the first year on ART: lessons from a discrete choice experiment in South Africa and Zambia

A. Morgan<sup>1</sup>, A. Kamanga<sup>2</sup>, T. Makwalu<sup>2</sup>, S. Pascoe<sup>3</sup>, C. Govathson<sup>3</sup>, N. Scott<sup>1</sup>, P. Lumano-Mulenga<sup>4</sup>, P. Haimbe<sup>2</sup>, H. Shakwelele<sup>2</sup>, N. Mutanda<sup>3</sup>, S. Rosen<sup>1</sup>  
<sup>1</sup>Boston University School of Public Health, Department of Global Health, Boston, United States, <sup>2</sup>Clinton Health Access Initiative, Lusaka, Zambia, <sup>3</sup>University of the Witwatersrand, Health Economics and Epidemiology Research Office, Johannesburg, South Africa, <sup>4</sup>Ministry of Health, Lusaka, Zambia

**Background:** Disengagement from antiretroviral therapy (ART) is common during the first year of treatment, particularly prior to eligibility for differentiated service delivery models. The PREFER study conducted a discrete choice experiment (DCE) of service delivery and care preferences to improve early outcomes.

**Methods:** A DCE was conducted in 11 South African and 7 Zambian health facilities from 8/2023-11/2023, enrolling adults ( $\geq 18$ ) who had initiated or re-initiated ART a median of 8 [IQR 6, 11] months prior. Participants were presented with hypothetical scenarios, each containing eight attributes representing specific aspects of HIV service delivery (see Figure) and levels detailing characteristics of each attribute. Each participant was asked to make a total of 9 unique choices between two scenarios. Preferences were analyzed using conditional logistic regression and are reported as odds ratios [95% confidence intervals].

**Results:** We enrolled 129 respondents in Zambia (57% female, median age 33) and 124 in South Africa (SA) (84% female, median age 33). Respondents in both countries preferred receiving services at a clinic (SA 2.0 [1.6, 2.5]; Zambia 4.0 [3.1, 5.0]) or pharmacy (SA 1.7 [1.4, 2.2]; Zambia 1.5 [1.2, 1.9]) compared to in the community. Respondents preferred 6-month dispensing to shorter 1- or 3- month dispensing. Respondents were deterred from accessing services by unfriendly providers (SA 0.77 [0.64, 0.92]; Zambia 0.61 [0.51, 0.73]) and preferred adherence support us-

ing text or phone reminders to counseling at the clinic. Costs to clients and time or day of week available were not considered important.

**Conclusions:** Clients in the first year of treatment expressed strong preference for receiving services in clinics rather than community locations. Many clients favored longer dispensing intervals even during the early treatment period.

Models of care that emphasize facility-based service delivery and less burdensome visit/dispensing schedules should be considered for the early treatment period.

## WEPEE563

### Using a hub and spoke model of telemedicine to reduce interruption in treatment for HIV recipients of care

J. Daka<sup>1</sup>, M. Mwale<sup>2</sup>, B. Siangonya<sup>3</sup>, N. Toppin<sup>3</sup>, D. Mack<sup>3</sup>

<sup>1</sup>Morehouse School of Medicine, Programs, Lusaka, Zambia,

<sup>2</sup>University Teaching Hospital, UTH HIV/AIDS Program,

Lusaka, Zambia, <sup>3</sup>Morehouse School of Medicine, National Center for Primary Care, Atlanta, United States

**Background:** One of the problems with healthcare clients in the HIV and AIDS programs is interruption in therapy (IIT), formerly called lost to follow-up, which leads to poor clinical outcomes. Retaining people living with HIV and AIDS (PLWHA) in care is one of the most crucial pillars of attaining viral suppression and epidemic control. Most healthcare clients experience socio-economical and geographical barriers to accessing quality antiretroviral therapy (ART) in Lusaka district.

The Morehouse School of Medicine collaborated with the Ministry of Health (MoH) to implement an innovative telemedicine initiative aimed at improving the quality of ART services in Lusaka, Zambia, to reduce interruptions in treatment (IIT) and improve healthcare client outcomes.

**Description:** A telemedicine intervention was designed to connect PLWHA to existing clinics and health posts (spoke sites) in their communities with first-level hospitals (FLHs) (hubs) with which those peripheral facilities are associated. At the hub, a telemedicine cart was utilized, and at the spoke sites, portable telemedicine equipment was deployed. Highly skilled health care providers at FLHs provided healthcare services to recipients of care at health centers and health posts through teleconferencing.

From July 2021 to December 2023, the intervention successfully provided telemedicine services to 7011 recipients of care out of 7531 who were scheduled for an ART appointment. The missed appointment rate stood at 6.9%. Additionally, the pooled viral load suppression rate stood at 96%.

**Lessons learned:** The intervention showed that the intervention kept the missed appointment rate below the national target of 10%. The telemedicine showed that telemedicine was an effective tool to increase health-

care client retention. The model assisted in overcoming the distance, accessibility, and equity barriers that most of the HIV recipients of care face. At the start of the intervention, both ART providers and RoCs were reluctant to use the telemedicine platform. Awareness campaigns, combined with the capacity of ART providers, resulted in widespread acceptance.

**Conclusions/Next steps:** Telemedicine could be integrated into the HIV/AIDS program as a way of reaching underserved populations to help overcome barriers to the retention of care.

## WEPEE564

### Enhancing client-centered access to antiretroviral therapy: retention and viral suppression outcomes for clients receiving home ART Distribution in Siaya County, Kenya

S. Momanyi<sup>1</sup>, A. Aoko<sup>2</sup>, J. Kataka<sup>1</sup>, K. Owuor<sup>1</sup>, L. Nyabiage<sup>2</sup>, P. Wekesa<sup>1</sup>

<sup>1</sup>Centre for Health Solutions - Kenya, Nairobi, Kenya, <sup>2</sup>The Center for Global Health, Division of Global HIV & TB, US Centers for Disease Control and Prevention- Nairobi Kenya, Nairobi, Kenya

**Background:** Antiretroviral therapy (ART) must be consistent and unhindered for successful management of HIV/AIDS. However, obstacles, such as disability, debilitating comorbidity, old age, distance, difficulty with transportation, and stigma, can make it difficult for patients to attend medical clinics to pick up drugs. Home antiretroviral medicine delivery is a potential remedy to increase treatment adherence and health outcomes for such patients.

Three outcomes (retention on ART at 12 months, viral load testing uptake, and viral suppression [ $<1000$  copies/mL]) of clients on home-based ART delivery (HB) versus standard care facility-based ART distribution (SC) were compared.

**Methods:** This cross-sectional study included KenyaEMR data of participants receiving HB ( $n=94$ ) and SC ( $n=714$ ) at Akala Health Facility and Ukwala Sub-County Hospital in Siaya County in June 2023 and on their respective models for at least one year. HB care was based on disability, immobility, old age, or some co-morbidity while SC received routine care. Generalized linear log-binomial models with robust variance and adjusting for age, sex, ART regimen line, time on ART, and facility were used to estimate the adjusted Risk Ratios (aRR) of retention, and viral suppression treatment outcomes in HB compared to SC. Chi-square test was done to compare viral load uptakes in HB and SC.

**Results:** HB group had a higher proportion of males compared to SC (46.8% vs. 25.8%). HB had a longer average time on ART, 9.3 vs. 6.8 years. HB and SC had similar proportions on the first-line dolutegravir-based regimen;

81(86.2%) vs. 525(84.1%), respectively. The retention at 12 months in HB ([92 (98%)]) was similar to the retention among clients in SC ([714 (100%)]); aRR = 0.99 (95% CI 0.95-1.03). HB group had a higher viral suppression, 93(98.9%), compared to SC, 540(86.5%); aRR = 1.16(95%CI 1.09-1.22). However, HB had lower viral load uptake compared to SC, 60 (64%) vs. 578 (86%), respectively (p-value <0.001)

**Conclusions:** Viral suppression and retention outcomes for clients receiving HB care are similar or better compared to those receiving SC. HB care may be considered for all clients regardless of stability. Viral load uptake in HB could be improved.

## WEPEE565

'Innovation Fairs': an innovative knowledge sharing approach to facilitate achieving the '95' targets in four provinces of Mozambique

C. Nhanisse<sup>1</sup>, E. Mbalane<sup>1</sup>, J. Moaine<sup>2</sup>, J. Alexandre<sup>2</sup>, J. Saturnino<sup>2</sup>, M. Prieto<sup>2</sup>

<sup>1</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique/Abt Associates, Maputo, Mozambique,

<sup>2</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique, Maputo, Mozambique

**Background:** Achieving 95-95-95 targets for all people living with HIV to end the HIV epidemic requires innovative interventions to respond to specific challenges in the HIV care continuum. Innovation is mainly facilitated through knowledge sharing among co-workers. USAID-funded Efficiencies for Clinical HIV Outcomes (ECHO) project designed a virtual event, named 'Innovation Fairs', aiming to create a virtual space for ECHO teams to periodically meet and exchange experiences/innovative solutions to overcome challenges faced in project implementation. We describe the outcomes and lessons learnt of ECHO's 'Innovation Fairs'.

**Description:** Before the events took place, a specific topic representing a project challenge across all supported provinces was identified as the theme of the fair. Each ECHO provincial team presented innovative local solutions that had already produced positive results or proposed new approaches. ECHO created a panel of judges, comprised of four people from the senior-level technical team, to select the best innovation based on the following criteria: strategic alignment with project goals, feasibility, replicability, and a simple monitoring plan. If the selected innovation was a new approach, it was first tested in one province, and if results were promising, replicated in the others.

**Lessons learned:** Between December 2020 and February 2023, ECHO held five 'Innovation Fairs'. From June 2020, ECHO struggled with routine viral load (VL) testing, prompting a fair focused on enhancing VL sample collection for all eligible clients. An ECHO provincial team presented an innovative approach comprising:

1. Proactively identifying eligible clients through clinical records, phone calls and home visits;
2. Developing new training materials;
3. Daily updating of electronic databases; and,
4. Enhancing demand creation and VL literacy within communities.

This strategy was implemented in all provinces and sustained over time, leading to a 33% increase in VL coverage across all provinces, from 58% in June 2020 to 77% in March 2023.

Close monitoring of results enabled ECHO provincial teams to locally adapt and improve over time the new approaches to boost their performance. Coordinating with local health authorities was crucial to engaging health providers.

**Conclusions/Next steps:** Innovative knowledge sharing practices can enhance collaboration, drive innovation, and contribute to the achievement of institutional goals.

## WEPEE566

Experiences and quality of life with long-acting lenacapavir from people with multidrug-resistant HIV-1 enrolled in the Phase 2/3 CAPELLA study

M.S. Dunbar<sup>1</sup>, J. Fang<sup>2</sup>, A.N. Herbst<sup>2</sup>, O. Boiko<sup>3</sup>, K. Dunn<sup>1</sup>, S. Navadeh<sup>1</sup>, M. Rhee<sup>1</sup>, M. Bogart<sup>1</sup>, B. Gaglio<sup>2</sup>, W.R. Lenderking<sup>2</sup>, L. Temme<sup>1</sup>

<sup>1</sup>Gilead Sciences, Inc., Foster City, United States, <sup>2</sup>Evidera, Bethesda, United States, <sup>3</sup>Evidera, London, United Kingdom

**Background:** Lenacapavir (LEN) is a long-acting HIV-1 capsid inhibitor administered subcutaneously every 6 months. LEN is approved for treating heavily-treatment experienced people with multidrug-resistant HIV-1, combined with other antiretrovirals (ARVs), based on the CAPELLA study. We explored CAPELLA participants' experiences and quality of life (QoL) following LEN initiation.

**Methods:** Out of the 72 CAPELLA participants, 14 cross-sectional surveys and 6 semi-structured telephone interviews were conducted with US-based participants between June–November 2023. Survey and interview domains included: experiences with LEN, QoL, injection site reactions (ISRs), and ARV adherence. Survey data were summarized descriptively; qualitative data were analyzed using ATLAS.ti® software.

**Results:** Overall, survey participants reported positive experiences with LEN regarding ease of integration into treatment regimens, efficacy, tolerability, discreteness of administration, and reduction in pill burden of the complete HIV-1 regimen (Figure).

After taking LEN, 64% (n=9/14) agreed/strongly agreed that their QoL improved and they had fewer negative feelings about their illness; 92% (n=12/13) agreed/strongly agreed that LEN is well tolerated, and 57% (n=8/14) agreed/strongly agreed that they have fewer medical appointments (Figure). ISRs were considered very/extremely

manageable by 71% (n=10/14) of participants, with none wanting to discontinue LEN as a result. Qualitative interview responses supported quantitative surveys, elucidating findings of treatment effectiveness, improved QoL, and more optimistic perceptions of health (Table). Survey participants reported improved adherence to other ARVs, with 71% (n=10/14) never/rarely missing doses pre-LEN initiation versus 100% post initiation.

Figure. Participants' experiences with LEN.

Theme	Relevant quotes
LEN efficacy and tolerability	<p>"I went from [...] having a high viral load that was increasing every [...] time I took a test to having it go to non-detectable. Of course, that's a very positive outcome."</p> <p>"Well, of course, I'm motivated to continue. Based on past results, I'm expecting that those results will continue and so, yes, I'm motivated by the efficacy of the drug."</p> <p>"I like the fact that it's very convenient. It's very effective [...], I experience very few side effects."</p>
QoL	<p>"I think that my quality of life has been better since I've started taking lenacapavir. When your viral load is low or undetectable, you feel better. You don't feel lethargic or you don't feel that you're not getting better. You don't feel like there's no hope for you. Lenacapavir, it's been effective and so it makes my outlook on life more positive [...] making me [...] believe that I have more time to do the things that I want to do. Things that I like to enjoy with family and friends and life expectancy."</p> <p>"It improved my health. It improved my outlook on life."</p>
Management of ISRs	<p>"The only reactions I had were the [...] little, sort of the bumps on either side of my navel where they did the injection, and [...] for a couple of days, some itching."</p> <p>"The first time I had gotten, you know, I'd gotten a little, my stomach got really, really tightened and upset, and then it did then, and it still does now leaves nodes under my skin, but that was it. I - for the stomach problem, I just waited it out about 15 to 20 minutes, and then it went away."</p> <p>"I didn't like the nodules, but I knew that that was just part of it. So, I was okay with it. But I mean, post-injection, there was nothing else other than that, you know?"</p>
Ease of integration into treatment regimens	<p>"I would continue, you know. And so, no, I don't anticipate stopping it. And I'm very compliant with my other [...] two other medications I take on a daily basis. [...] In what, almost three years, I've probably missed taking the medication maybe [...] five times individual days. So, I'm very, very compliant to the new treatment."</p> <p>"There were fewer pills to take, and it was part of the requirement. And so, you know, I was very dutiful about making sure that I didn't miss any doses."</p>
Perceptions of HIV on LEN	<p>"...just the way it's changed the way I feel about my condition. I feel like, you know, my condition is improving now. My condition is improving now and that doesn't - never happen like it's happened now before."</p> <p>"I look at it as a positive sign that I may [...] beat this HIV infection that I have because I've been having it, I've had HIV/AIDS, I've had it since July of 1987 when I tested positive."</p>
Healthcare professional interactions	<p>"I was told what to expect clearly [...] by the physician's assistant who was working with me, and it was all a very [...] good experience. I didn't have any issues at all."</p> <p>"I was scared but the nurses over there, they were very excellent. They were very good with me and, you know, helping me understand the drug and very much helping me get comfortable with everything."</p>

Table.

**Conclusions:** Following LEN initiation, the majority of CAPELLA participants reported positive experiences with LEN, including improved health status and QoL.

## WEPEE567

### Accelerating implementation of multilevel-strategies to Advance Long-Acting Injectables for underserved populations

K. Meyers<sup>1,2</sup>, N. Nguyen<sup>1,2</sup>, J. Zucker<sup>2</sup>, S.A. Golub<sup>3</sup>, J. Burdge<sup>4</sup>, B. Kutner<sup>5</sup>, D. Castor<sup>2</sup>, E. Furuya<sup>3</sup>, A. Muscarella<sup>6</sup>, C. Carnevale<sup>7</sup>, C. Chastain<sup>4</sup>, S. Wiant<sup>2</sup>, C. Hijjiya<sup>1</sup>, B. Lane<sup>2</sup>, ALAI UP Project Team

<sup>1</sup>Aaron Diamond AIDS Research Center, Columbia University Irving Medical Center, New York, United States, <sup>2</sup>Division of Infectious Diseases, Columbia University Irving Medical Center, Department of Medicine, New York, United States, <sup>3</sup>Hunter College of the City University of New York, New York, United States, <sup>4</sup>Division of Infectious Diseases, Vanderbilt University Medical Center, Department of Medicine, Nashville, United States, <sup>5</sup>Albert Einstein College of Medicine, Bronx, United States, <sup>6</sup>Vanderbilt University Medical Center, Department of Pharmacy, Nashville, United States, <sup>7</sup>New York Presbyterian Hospital, New York, United States

**Background:** Accelerating Implementation of Multilevel-strategies to Advance Long Acting Injectables for Underserved Populations (ALAI UP) aims to counteract the pattern of new HIV biomedical interventions exacerbating health disparities. ALAI UP delivers an implementation bundle to support eight diverse clinical sites across the US in building long-acting injectable antiretroviral treatment (LAI ARV) programs that center equity from the beginning, rather than correct for unintentionally generated health disparities later.

**Description:** ALAI UP's implementation bundle was developed by a multidisciplinary team of clinicians, psychologists, implementation scientists, and technical assistance providers and consists of seven components (Table 1). Clinic champions evaluated each component's usefulness on 4-point Likert scales (1=not useful, 4=very useful) and provided feedback as free text, quarterly.

Descriptive statistics (*mean*, *SD*) and key themes from the first nine months of implementation support are reported.

**Lessons learned:** Clinics identified written resources, motivational interviewing training, and in-person convenings as the most useful components. Community listening sessions, technical assistance, and monitoring, evaluation and learning were less highly rated, though still useful.

Although virtual communities of practice were requested by sites, they rated lowest, largely due to scheduling that precluded clinic staff from attending. Technical assistance provided by coaches who could support building out electronic health records functions and navigation of benefits were rated the highest.

Clinics noted that the process of submitting client-level data, while highly manual and labor-intensive, led to insights into their practices and changes to protocols.

**Conclusions/Next steps:** A diverse set of clinics from across the US have used ALAI UP support to build and grow injectable treatment programs that consider equity from their inception. Ongoing assessment of the usefulness of each component of ALAI UP inputs will allow us to identify highest yield components and may inform resource allocation decisions at clinic, project, and policy levels in the future.

Implementation Bundle Component	Description	Usefulness Mean (M), Standard Deviation (SD)
1. Resource Incubator	Access to a resource incubator of tools to support clinics in the development of protocols, staff training, and client education materials.	3.6 (0.4)
2. Motivational Interviewing	Training for clinical and non-clinical staff in the fundamentals of motivational interviewing and ongoing coaching for clients and staff.	3.7 (0.6)
3. In-person Convenings	Two, 2.5 day convenings to (1) introduce ALAI UP components and receive feedback on conceptualization of equity-focused LAI ART initiative and resources; (2) provide clinic teams with dedicated time to make progress on written protocols with their colleagues; (3) provide opportunity for cross-clinic learning and relationship building.	3.6 (0.5)
4. Community Listening Sessions	Space for community members and stakeholders from clinic catchment areas to discuss and share perceived barriers and facilitators to implementation of injectable CAB/RPV to inform program roll out.	3.3 (1.1)
5. Technical Assistance	Targeted support to build capacity to deliver LAI-ART equitably, delivered bimonthly by a designated TA provider.	3.2 (0.7)
6. Monitoring, Evaluation and Learning	Activities to support routine monitoring of implementation process, evaluation of clinical outcomes, and facilitation of learning at the clinic and ALAI UP-project level. Includes clinic capacity building to support sharing of client-level clinical data to inform clinical monitoring and quality improvement.	3.0 (1.0)
7. Virtual Communities of Practice	Opportunity for a facilitated conversation where clinics can learn from each other's successes and challenges.	2.9 (1.0)

Table 1. ALAI UP Implementation Bundle (N=8 clinics)

## WEPEE568

### Paediatric-focused client management approach improves biannual viral load coverage among children living with HIV: implementation outcomes from Southern Nigeria

E. Nwanja<sup>1</sup>, O. Onwah<sup>1</sup>, O. Toyo<sup>1</sup>, M. Unimuke<sup>1</sup>, U. Akpan<sup>1</sup>, C. Okolo<sup>1</sup>, C. Nwangenah<sup>2</sup>, B. Oyawola<sup>3</sup>, O. Igboelina<sup>3</sup>, D. Ogundehin<sup>3</sup>, E. James<sup>3</sup>, C. Obiora-Okafo<sup>3</sup>, A. Idemudia<sup>3</sup>, C. Nwadike<sup>3</sup>, K. Kakanfo<sup>3</sup>, B. Pius<sup>3</sup>, B. Onimode<sup>3</sup>, O. Asaolu<sup>3</sup>, A. Bashorun<sup>4</sup>, A. Gambo<sup>5</sup>, J. Pius<sup>3</sup>, O. Oyelaran<sup>3</sup>, R. Goldstein<sup>3</sup>, O. Onyedinachi<sup>1</sup>, A. Adegboye<sup>1</sup>, A. Eyo<sup>1</sup>

<sup>1</sup>Excellence Community Education Welfare Scheme (ECEWS), Uyo, Nigeria, <sup>2</sup>Family Health International (FHI360), Abuja, Nigeria, <sup>3</sup>Office of HIV/AIDS and TB, United States Agency for International Development, Abuja, Nigeria, <sup>4</sup>National AIDS, Sexually Transmitted Infections Control and Hepatitis Programme (NASCP), Federal Ministry of Health, Abuja, Nigeria, <sup>5</sup>National Agency for the Control of AIDS (NACA), Abuja, Nigeria

**Background:** Challenges with antiretroviral therapy (ART) adherence and monitoring put children living with HIV (CLHIV) at increased risk of treatment failure hence the need for more frequent viral load (VL) testing. ECEWS introduced a Paediatric-focused client-management system (PFCM) to improve VL coverage among CLHIV after Nigeria introduced biannual VL tests in 2022, where children are eligible for VL six months after ART commencement and six-monthly thereafter. This study describes the PFCM strategy and its outcomes among CLHIV in southern Nigeria.

**Description:** Advocacy was conducted to service providers across 153 health facilities in Akwa Ibom and Cross River States, Nigeria to communicate the change in VL testing among CLHIV. Caregivers were sensitized during clinic visits, through phone calls and home visits. VL line lists for eligible CLHIV were developed based on this change and shared with service providers. Appointments for drug pickups and blood sample collection were aligned at differentiated ART service delivery (DSD) points, and VL samples were collected during refills at DSD points, with weekly monitoring using a dedicated paediatric dashboard. This paper assessed VL testing coverage (the proportion of eligible CLHIV who had VL tests done six-monthly). Trends in VL coverage from September 2021 to September 2023 were assessed using logistic regression.

**Lessons learned:** In total, 18,014 CLHIV were eligible for VL test over 24 months, with a median age of 8.0±3.8 years and 50.4% males. The mean duration on ART was 3.1±2.8 years, and 56.2% were on DSD. VL coverage improved from 61.7% (2,319/3761) to 87.6% (3242/3701) between September 2021 to September 2023 (Table-1) (OR:1.48, 95%CI:1.44-1.51) and with increasing age (OR:1.04, 95%CI:1.02-1.07), but was comparable across sexes. Longer duration on ART (OR:0.97, 95%CI:0.96-0.98,) and being on DSD (OR:0.92, 95%CI:0.87-0.99) were associated with lower VL coverage.

	September 2021	March 2022	September 2022	March 2023	September 2023
Eligible CLHIV	3761	4871	4841	4541	3701
CLHIV with VL Done	2319	2812	3795	3596	3242
VL Coverage (%)	61.7	57.7	78.4	79.2	87.6

Table 1: Biannual Viral load (VL) coverage trends among children living with HIV (CLHIV) in southern Nigeria.

**Conclusions/Next steps:** Coverage of biannual VL testing for CLHIV progressively improved using PFCM in this setting. Further interventions targeted at subgroups with lower VL coverage are recommended.

## WEPEE569

Community managed care cascade: community support group of HIV positive pregnant women ensure improved PMTCT programme outcomes. Results from Global Fund supported EMTCT project in 13 states of India

K. Biswas<sup>1</sup>, R. Rana<sup>1</sup>, M Jain<sup>1</sup>, M. Singh<sup>1</sup>, S. Dasgupta<sup>1</sup>, M. Asif<sup>1</sup>  
<sup>1</sup>Plan International (India Chapter), New Delhi, India

**Background:** While India has made a significant progress in arresting and reversing the HIV epidemic, testing coverage among pregnant women remained very low in some states. Evidence suggests access to HIV testing remained low at 36% in the 13 Plan India project states during 2016-17 with an estimated annual pregnancy of 14 million (48% of total in the country) per year.

Complementing Govt. of India's EMTCT of HIV strategy, Plan India has been implementing Ahana project supported by The Global Fund towards attaining Elimination of Mother to Child Transmission in 13 priority states of India.

**Description:** Three staged programme approach was adopted with:

- Capacity building of health care professionals on HIV screening towards supply side strengthening,
- Expansion in PMTCT service access for pregnant women to initiate early testing and linkage to treatment,
- Formation of district level community support groups of HIV positive pregnant women and strengthen capacities to provide care and support for sustainable service delivery to HIV positive pregnant women (PPW) and breast-feeding women for an improved EMTCT outcome.

**Lessons learned:** With expansion in the PMTCT service coverage, HIV testing among pregnant women increased from 36% during 2016-17 to 89% during 2022-23 resulted in increasing identification of HIV positive pregnant women. More than 25,000 pregnant women identified as HIV positive during April-16 to Sept, 23 were linked to ART.

Linkage to ART services improved from 86% during 2016-17 to 99.7% during 22-23. Institutional deliveries among PPW increased from 90% during 2016-17 to more than 94% in April- Dec, 23. While linkages of HIV exposed infants with

EID services improved from 55% during 2016-17 to 90% in 22-23, HIV testing among spouses of PPWs increased from 74% during 2018-19 to 97% during 22-23.

**Conclusions/Next steps:** Though there is further scope for expanding HIV testing to early treatment linkages during in first trimester, results suggest there is improved programme outcomes with focused and intensified service due management and care and support outreach to the HIV positive pregnant women through community support group mechanism at the field. Plan India's PMTCT programme shows the community led service model for better programme outcome towards EMTCT.

## Global and national financing, economic evaluation and sustainability

### WEPEE570

Government readiness in implementing Swakelola Type 3 policies in supporting Civil Society Organizations (CSOs) with a focus on HIV prevention issues in Indonesia

C. Prameswari<sup>1</sup>, O.L. Agusta<sup>1</sup>

<sup>1</sup>Indonesia AIDS Coalition, Finance & Accounting Department, South Jakarta, Indonesia

**Background:** The sustainability of Civil Society Organizations (CSOs) focusing on HIV/AIDS issues is at stake. According to World Bank data, Indonesia's ranking after being down due to the COVID-19 pandemic has returned to being classified as a Middle-Upper-Income Country. Consequently, several international donors are withdrawing their support and redirecting it to other developing countries. The government's new policy called Swakelola Type 3 could be a solution to the current challenges CSOs face. The Indonesia AIDS Coalition (IAC) through its Social Contracting program, researched the Readiness of the Indonesian Government to Support CSOs through the Swakelola Type 3 policy.

**Methods:** Swakelola Type 3 is planned and supervised by the Ministry/Agency/Regional Device and implemented by CSOs. This research focused on Government Organizations (GOs) at the local level in four regions (Yogyakarta City, Bandung City, Denpasar City, and Kediri District). Data collection techniques in this study were carried out through budget studies, literature reviews, focus group discussions (FGD), and interviews.

**Results:** The research result revealed the following facts:

- The understanding and perception of GOs regarding the implementation of Swakelola Type 3 are still minimal.
- There is no adequate Technical Guidance for the implementation process of Swakelola Type 3.
- The government's budget allocation for funds is insufficient, leading CSOs to be sceptical about

cooperating with GOs through Swakelola Type 3. The research found that, on average, only 0.3% of the total budget is allocated for Swakelola Type 3.

- There is still a negative stigma towards CSOs, hindering GOs hesitant to open the way for collaboration.

**Conclusions:** The readiness for implementing Swakelola Type 3 cannot be declared at the Ready Level. In conclusion, the study emphasizes the need for the government to enhance its readiness by fostering a deeper understanding of Swakelola Type 3, developing comprehensive technical guidelines, and allocating sufficient resources. Improving communication channels and addressing budgetary constraints are imperative to establishing effective partnerships and ensuring the successful implementation of Swakelola Type 3 for HIV/AIDS prevention in Indonesia.

## WEPEE571

Domestic resource mobilization for HIV&AIDS: evidence from the application of the 0.1% government budget allocation to HIV Initiative in Uganda

S. Khanakwa Bwayo<sup>1,2</sup>, J. Mbonigaba<sup>2</sup>, T. Maina<sup>3</sup>, G. Karegyeya<sup>3</sup>

<sup>1</sup>Uganda AIDS Commission, Resource Mobilization, Kampala, Uganda, <sup>2</sup>University of KwaZulu-Natal, School of Accounting, Economics, and Finance, Westville Campus, Durban, South Africa, <sup>3</sup>USAID Uganda Health Systems Strengthening (UHSS) Activity, Kampala, Uganda

**Background:** The shrinking donor funding and the need to sustain the provision of antiretroviral treatment (ART) and to reduce new HIV infections and deaths have prompted the Government of Uganda to explore potential innovative domestic resource mobilization strategies. Key among these strategies is the directive to all central government departments and local governments to allocate at least 0.1% of their budget to HIV mainstreaming activities starting the financial year 2018/19. This initiative alone can raise an additional UGX 60 billion (US\$16 million) from the exchequer, annually.

However, little progress has been realized since 2018/19, when the directive's implementation started, mainly due to weak capacity to plan and budget for the 0.1%. The capacity gaps in planning and budgeting were especially glaring at the district level.

To ensure adequate and timely flow of domestic resources earmarked for HIV, dedicated analytics, policy, and policy advocacy efforts, and the capacity to plan and budget are required.

**Description:** Uganda AIDS Commission (UAC) working with USAID Uganda Health System Strengthening Activity provided technical assistance (TA) package that included engagements with district leadership and departments

to create awareness, orientation on the HIV mainstreaming guidelines and capacity building on computation of the 0.1% and costing of HIV interventions using Activity Based Costing approach and linking the same to the budgets.

To facilitate planning and budgeting of the 0.1%, UAC worked with the Ministry of Finance to create a budget output code (000013). The code enables budgeting and tracking of spending of the 0.1% allocated to HIV mainstreaming activities.

**Lessons learned:** Application of the TA package in districts and central government departments enabled mobilization of over UGX 60 billion (USD 16 million) additional funding from central and local governments in financial year 2023/24 which was a major increase from UGX 38 billion (USD10.2 million) reported in 2019/20.

**Conclusions/Next steps:** Mainstreaming HIV financing in government departments has potential to improve domestic resource mobilization for HIV services.

UAC has planned to work with key partners to scale up capacity building efforts on planning, budgeting, and tracking of the implementation of the planned HIV mainstreaming activities as well as appropriation of the allocated funds.

## WEPEE572

Examining sustainable financing of the HIV response in Nigeria

D. Ogbuabor<sup>1</sup>, I. Semini<sup>2</sup>, O. Onwujekwe<sup>1</sup>

<sup>1</sup>University of Nigeria, Department of Health Administration and Management, Enugu, Nigeria, <sup>2</sup>UNAIDS, Equitable Financing Practice, Geneva, Switzerland

**Background:** Countries transitioning out of donor HIV support require financial sustainability planning. This study, therefore, investigated the HIV funding gap, transition readiness, factors affecting sustainable HIV financing, and the benefit-cost ratio of investing in HIV response in Nigeria.

**Methods:** We estimated Nigeria's HIV resource needs, available funds from domestic and donor sources, and funding gap analysis for 2022-2027. We also reviewed documents (n=13) and conducted semi-structured interviews with purposively selected stakeholders (n=35) between December 2021 and January 2022. Qualitative data were analyzed thematically using a health financing framework. We co-created a financial sustainability plan (FSP) with the stakeholders.

We estimated the cost of action /inaction and the benefit-cost ratios of investing in HIV given a baseline (5%), moderate (50%), and aggressive (90%) scale-up of the HIV response using years of life lost (YLL) and percentage of gross domestic product (%GDP) lost due to morbidity and mortality.

**Results:** A \$2.5 billion funding gap exists in Nigeria's HIV response between 2022 and 2027. No clear donor transition plan exists. The FSP addresses low domestic public and private sector HIV financing, including low, unpredictable, and unstable government budgets. A private sector-led HIV Trust Fund, emerging social health insurance, and philanthropy are opportunities for increasing domestic funding. Purchasing interventions focus on inefficiencies due to duplications, ineffective coordination, weak priority-setting, and low use of primary care and private providers. One-stop-shop facilities targeting key and priority populations receive low priority. The costs of action are \$1.2, \$1.5, and \$2.2 billion at baseline, moderate, and aggressive scale-ups. The costs of inaction are \$3.5 billion, \$2.7 billion, and \$2.0 billion at baseline, moderate and aggressive scale-ups. The total %GDP lost is 0.19%, 0.15%, and 0.12% at baseline, moderate and aggressive scale-ups. The benefit-cost ratios (BCR) of investment in HIV control at moderate and aggressive scale-up scenarios are 2.5 and 0.7, respectively.

**Conclusions:** The HIV response funding gap is high. Moderate investment in HIV response is more cost-beneficial than aggressive scale-up. Interventions to improve the financial sustainability of HIV response in Nigeria must incorporate predictable domestic resource mobilization, integration of HIV into universal coverage schemes, and strategic purchasing reforms that reduce inefficiencies.

## WEPEE573

Effects of financial facilitation of community health workers using mobile money services: experience from Teso region, Eastern Uganda, 2017-2023

E. Okech<sup>1</sup>, R. Opito<sup>1</sup>, B. Bakashaba<sup>1</sup>, M. Namulema<sup>1</sup>, Y. Miya<sup>1</sup>, E. Benard Michael<sup>1</sup>, D. Natumanya<sup>2</sup>, K. Mugisha<sup>1</sup>  
<sup>1</sup>The AIDS Support Organization, Programs and Capacity Development, Kampala, Uganda, <sup>2</sup>US Centers for Disease Control and Prevention, Division of Global HIV & TB, Kampala, Uganda

**Background:** Uganda relies upon community health workers (CHWs) to reach the most remote communities with primary health care services such as HIV prevention, care, and treatment services. However, they are not routinely paid salaries and mainly receive monthly stipends, transport facilitation and lunch allowances when engaged in community health activities. These allowances have traditionally been paid using cash-based systems. This has been laborious and risky, especially where bulky cash is involved. The risks associated with bulky cash transactions include theft, fraud, delayed reporting, and non-accountability.

To mitigate these risks in a US Center for Disease Control and Prevention (CDC)-funded health system strengthening project in Teso sub-region during 2017-2023, we intro-

duced mobile money (cashless) payments of CHWs for all activities conducted in facilities and communities which required cash facilitation.

**Description:** To introduce mobile money facilitation of activities, we conducted a baseline sensitization of the beneficiaries on mobile money transactions, encouraged the CHWs to acquire registered mobile money numbers and provided a simplified attendance form to capture both mobile money number and registered names.

The activity lead created a mobile money wallet based on attendance, accompanied with a simplified activity report, for entry into the online mobile money payment system. The online approvals of transactions were done by the project managers simultaneously, transferring the money to the beneficiaries in only a few minutes. The proof of payments and activity reports were generated and stored as part of accountability for the funds.

**Lessons learned:** More than 1,000 CHWs in rural areas were able to receive their monthly payments promptly without moving to banks. The risk of fraud was minimized as there was no physical cash handling. Mobile money minimized complaints from CHWs. The major challenges encountered included inadequate mobile money agents in rural areas, instances of mismatch of registered mobile money names with the actual names of beneficiaries, and high mobile money charges.

**Conclusions/Next steps:** Use of mobile money transactions led to timely financial facilitation of CHWs, simplified instant accountability and reduction in fraud. Consideration could be given to adoption of mobile money transactions to facilitate health workers in similar settings.

## WEPEE574

Unveiling success: a case study of the influence of the integrated food innovation intervention on the well-being of 14 HIV-positive children with high viral load in Dar es Salaam, Tanzania

N. Mallya<sup>1</sup>, A. Exavery<sup>1</sup>, E. Kuhlik<sup>2</sup>, A. Barankena<sup>1</sup>, E. Mhimba<sup>1</sup>, C. Shao<sup>1</sup>, R. Fovo<sup>1</sup>, L. Kikoyo<sup>1</sup>, A. Tarimo<sup>1</sup>  
<sup>1</sup>Pact, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Pact, Washington, United States

**Background:** HIV-positive children with high viral load face multiple risks, including compromised immune systems, susceptibility to infections, and hindered growth and cognitive development, which affect their overall wellbeing. Addressing these challenges is crucial to promote the health and potential of children with living with HIV (CLHIV). The ACHIEVE project provides a comprehensive, household based CLHIV package to address barriers to ART uptake and ensure long term adherence and viral suppression in Tanzania.

**Methods:** Between September and November 2023, the project added specialized food support to 14 CLHIV <18 with high viral load due to food insecurity, including

one month emergency food support and engaging their caregivers in savings groups running income generating activities (IGAs) within food value chains. To ensure continuity of food support, the project provided capacity building on viable business along with seed capital to caregivers for their IGAs.

Data were collected at baseline and follow-up in terms of the core indicators assessed. Data analysis was conducted in Stata 17, examining the difference between baseline and follow-up statistics.

**Results:** The outcomes demonstrated significant health and wellbeing improvements across multiple domains between baseline and follow-up. Monthly ART adherence rates soared by 54.6% from 43.8 to 98.4, contributing to improved health stability and a notable 78.5% reduction in viral load from an average of 67995 to 14628 copies. School attendance increased from an average of 2.9 to 4.5 days per week, accompanied by enhanced academic performance from an average of 26.2 to 40.8.

The project successfully integrated 12 households into savings groups, initiating IGAs and substantially alleviating food insecurity. The caregivers' average savings per week increased by 247% from TZS 4,923 to TZS 17,077, and their CLHIV gained an average of 5.2 kg of body weight: from 54.5 to 59.7kg.

**Conclusions:** This preliminary pilot demonstrated comprehensive success in addressing the diverse needs of CLHIV households. The combined approach of nutritional support, healthcare collaboration, and economic initiatives proved effective in improving HIV and wellbeing outcomes for food insecure CLHIV with a high viral load. Based on the findings, ACHIEVE intends to scale up the approach to all food insecure CLHIV and continue monitoring its effectiveness.

## Costing, cost effectiveness and affordability

Sustaining and growing oral PrEP programming through use of lower costing tenofovir disoproxil fumarate and lamivudine for oral PrEP

C. Obermeyer<sup>1</sup>, A. Frangioni<sup>1</sup>, S. McGovern<sup>1</sup>

<sup>1</sup>The Global Fund to Fight AIDS, Tuberculosis and Malaria, Geneva, Switzerland

**Background:** The World Health Organization (WHO) first recommended oral pre-exposure prophylaxis (PrEP) for HIV prevention in 2012. UNAIDS has established ambitious targets to have PrEP available to 10 million people by 2025. Flatlining budgets for HIV programming demand creative approaches to sustain the gains and continue

scaling PrEP as part of combination HIV prevention. Globally, two products are primarily used for oral PrEP: tenofovir disoproxil fumarate (TDF) + lamivudine (3TC) and TDF + emtricitabine (FTC). The WHO considers these products interchangeable for HIV prevention.

An analysis Global Fund pooled procurement mechanism (PPM) reference pricing and current scale-up figures for oral PrEP in low- and middle-income countries (LMICs) explores savings which may be achieved by procuring the lower priced product.

**Description:** In October 2023, the Global Fund's PPM reference price for 30 tablets of TDF/3TC and TDF/FTC were \$3.20 and \$3.80 respectively ex-works (EXW). Among countries reporting to UNAIDS, there were 2 million people from LMICs who used oral PrEP in 2022. This results in an estimated consumption of 6 million bottles of oral PrEP (assuming each person used three bottles). Using Global Fund PPM reference prices, an EXW procurement of this size would cost \$19.17M and \$22.76M for TDF/3TC and TDF/FTC respectively, with TDF/3TC costing \$3.59M less.

This amount represents the maximum possible savings in 2022 but the likely number is to be less as some countries already use TDF/3TC for oral PrEP. As scale-up continued since 2022, the savings of procuring TDF/3TC instead of TDF/FTC would increase annually.

**Lessons learned:** LMICs and donors procuring TDF/FTC can achieve savings by procuring TDF/3TC for oral PrEP. Global Fund grant cycle 7 development have shown that LMICs can unlock budget efficiencies by planning for TDF/3TC procurement instead of TDF/FTC.

As many countries look to expand the PrEP private market, access to lower priced products may increase the number of people who are able to pay for oral PrEP on their own, reducing government and donor costs and contributing to sustainable private sector markets.

**Conclusions/Next steps:** Countries and donors can create opportunities for more affordable and sustainable oral PrEP programming by registering and procuring the lower priced products.

### WEPEE576

Cost and service utilization of online and in-person HIV services: a comparative analysis between Mali and Nepal

B. Costenbader<sup>1</sup>, S. Noriega Minichiello<sup>2</sup>, R. Homan<sup>1</sup>, B. Shrestha<sup>3</sup>, B. Eveslage<sup>4</sup>

<sup>1</sup>FHI 360, Durham, United States, <sup>2</sup>FHI 360, San Francisco, United States, <sup>3</sup>FHI 360, Kathmandu, Nepal, <sup>4</sup>FHI 360, Mexico City, Mexico

**Background:** Telehealth is rapidly evolving in low- and middle-income countries (LMICS). Arguments that mobile and internet-based approaches cannot be successful in these settings persist. We sought to answer questions about cost and utilization of online services versus in-per-

son interventions in Mali and Nepal to dispel these arguments.

**Methods:** USAID's EpiC project in Mali and Nepal supports online and in-person HIV-related services including outreach and case management. A comparative descriptive analysis of cost, service utilization, and HIV case finding before and after the introduction of online interventions was conducted to quantify set-up, maintenance, and case finding costs.

Teams used activity-based costing to identify set-up costs for online and in-person activities, the resources required to support activities (labor, supplies, equipment), and the unit cost per resource.

Estimated costs were identified by multiplying the unit cost by the quantity of the resource required and then summing across all resources used.

Cost and utilization data were obtained from program records and the proportion of clients using online interventions was obtained from the online reservation and case management application used in each country.

Effectiveness was assessed by combining cost and HIV results data to estimate the cost per new HIV case found.

**Results:** Cost of set-up and new HIV case found are lower while monthly maintenance costs are higher for online services. Online interventions reached a larger proportion of individuals previously unreachable through in-person interventions in the previous 6-months, and a large proportion had never tested for HIV. HIV case finding was higher among those reached online compared to those reached in-person.

	Indicators	Nepal (before, all in-person)	Nepal (after, those reached online)	Mali (before, all in-person)	Mali (after, clients reached online)
Cost	Set up	\$40,020 (over 8 months during rollout)	\$15,122 (over 7 months during rollout)	\$14,890 (over 10 months prior to & during rollout)	\$31,872 (over 15 months prior to rollout)
	Monthly	\$3,728	\$10,881	\$1,450	\$6,018
	Online reach (% of overall clients)	N.A.	13,209 reached online (9.35%)	N.A.	987 online appts (2.6%)
Reach			6,873 online appts		
	Newly reached (Clients who are reached online and were not previously reached in the 6-month reporting period by another approach such as in-person outreach.)	N.A.	Among online appts, 90% newly reached; 81% unknown HIV status	N.A.	Among online appts, 80% newly reached; 47% never tested
Test	HIV case finding	1.9% online vs 0.48% overall program	10.1% online vs 3.6% overall program	10.4% online vs 6.6% overall program	15.6% vs 11.2% overall program
	Cost per new HIV case found	\$1864	\$914	\$1060	\$827

**Conclusions:** This work demonstrates the cost and effectiveness of online HIV services in LMICS. Online services in both locations reached more previously untested individuals and were able to detect a larger number of HIV-positive cases. Online services are an effective way to reach new clients in LMICS.

## WEPEE577

### Assessing the cost, affordability and cost effectiveness of innovative approaches for VMMC programming for improved sustainability in Zimbabwe

E. Smith<sup>1</sup>, K. Vaughan<sup>2</sup>, C. Schütte<sup>2</sup>, P.S.H. Zimbabwe<sup>3</sup>

<sup>1</sup>Genesis Analytics, Health Practice, Hyde Park, Johannesburg, South Africa, <sup>2</sup>Genesis Analytics, Health Practice, Johannesburg, South Africa, <sup>3</sup>Population Solutions for Health, Harare, Zimbabwe

**Background:** Population Services International (PSI), Population Solutions for Health (PSH) and the Ministry of Health (MOH) in Zimbabwe tested several sustainability approaches in the voluntary medical male circumcision (VMMC) programme to transition the programme from partner to MOH-led. This included piloting Shang Ring (SR) device circumcision alongside surgical circumcision and introducing VMMC into MOH quality-based results-based financing (RBF).

This study evaluated upfront and recurring costs and included budget impact and cost-effectiveness analyses (BIA; CEA) of various models implementing these changes.

**Methods:** Retrospective costing in 28 facilities across 8 districts employed ingredients-based and top-down methods to capture direct and indirect, financial and economic costs of surgical and SR circumcisions. These cost estimates were adapted for the BIA and CEA, considering different VMMC coverage and SR scale-up scenarios for 2023-2027, costs associated with introducing RBF and the programme's planned transition to the MOH. The CEA employed the Goals Age-Structured Model to estimate lifetime number of HIV infections and disability-adjusted life years (DALY) averted.

**Results:** We found the incremental cost attributable to the SR procedure to be US\$18.25 compared to surgical VMMC due to more expensive anaesthetics and consumables, including the device itself. Upfront training costs for SR introduction were on average US\$12,761 per district. Due to fiscal savings from the introduction of VMMC into RBF and the transitioning of VMMC roles from partner to MOH, 10% SR uptake results in the lowest fiscal impact, while 40% SR uptake has the highest impact. Based on an average unit cost of US\$ 101.17 per circumcision, 25% SR adoption in all districts from 2024 is the most cost-effective option for SR rollout, with an average cost per DALY averted of US\$492 across all 8 districts. However, in 4 of the 8 districts none of the modelled scenarios are cost-effective when considering a threshold of US\$500 per DALY averted.

**Conclusions:** Despite the higher per-circumcision cost of the SR procedure, limited rollout alongside the introduction of VMMC into RBF and partner transition can be cost saving and cost-effective, depending on various factors. Amid declining funding for VMMC, this combination of interventions can offer a more sustainable way forward.

Cost effectiveness of Zvandiri, a community-based support intervention to reduce virological failure in adolescents with HIV in Zimbabwe: a decision analytical model

C. Mangenah<sup>1,2</sup>, W. Mavhu<sup>1,2</sup>, N. Willis<sup>3,2</sup>, J. Mufuka<sup>1</sup>, S. Bernays<sup>4</sup>, W. Mangezi<sup>5</sup>, T. Apollo<sup>6</sup>, R. Araya<sup>7</sup>, H. A Weiss<sup>8</sup>, A. Palacios<sup>9</sup>, F. Terris-Prestholt<sup>8</sup>, F. M Cowan<sup>1,2</sup>, H. Maheswaran<sup>10</sup>

<sup>1</sup>Centre for Sexual Health and HIV Research in Zimbabwe, Harare, Zimbabwe, <sup>2</sup>Liverpool School of Tropical Medicine, Department of International Public Health, Liverpool, United Kingdom, <sup>3</sup>Africaid, Harare, Zimbabwe, <sup>4</sup>University of Sydney, School of Public Health, Sydney, Australia, <sup>5</sup>University of Zimbabwe College of Health Sciences, Department of Psychiatry, Harare, Zimbabwe, <sup>6</sup>Ministry of Health and Child Care, AIDS and TB Unit, Harare, Zimbabwe, <sup>7</sup>King's College London, Health Services and Population Research Department, London, United Kingdom, <sup>8</sup>London School of Hygiene & Tropical Medicine, London, United Kingdom, <sup>9</sup>University of York, Centre for Health Economics, York, United Kingdom, <sup>10</sup>Imperial College London, London, United Kingdom

**Background:** Improving ART adherence among adolescents living with HIV (ALHIV) improves outcomes but with resource implications. We extrapolate long term costs and benefits of a community-based peer-support intervention (Zvandiri) among adolescents living with HIV (ALHIV) in Zimbabwe.

**Methods:** A multistate Markov decision-analytic model simulates Zvandiri lifetime costs and benefits on viral suppression, death rates, life-years and quality-adjusted-life-years gained 40 years (2019-2058) beyond the cluster-randomised controlled trial (reported elsewhere). Taking the healthcare system perspective (in 2018 US\$) we estimate the incremental cost effectiveness ratio (ICER) per life-year-gained (LYG) and per quality-adjusted-life-year gained (QALY).

We compare the ICER to accepted thresholds for LMIC's of <\$500 and <\$700 per LYG or QALY gained. We explore parameter and decision uncertainty using probabilistic sensitivity analyses.

**Results:** Cohort-microsimulation suggests that after 40 years (up to 2058), under standard of care (SOC), 21% (59/280) of ALHIV have undetectable viral-load (VL), 12% (33/280) have low VL (<1000/ml copies/ml), 10% (27/280) have high VL (≥1000 copies/ml) and 57% (160/280) are dead. With Zvandiri, ART adherence improves, decreasing yearly probability of virologic failure or death. After 40 years 65% (183/280) have undetectable viral load, 23% (65/280) have low VL, 3% (8/280) high VL (table 3) and 9% (24/280) are dead. Zvandiri dominates SOC with 1,345 life-years gained at incremental cost of \$500,587, yielding a discounted ICER of \$372 per LYG. Zvandiri also results in 1,246 QALYs at incremental cost of \$123,645, yielding a dis-

counted ICER of \$99 per QALY. The ICER is highly sensitive to programme costs, health-related utilities, and the discount rate.

	Standard of Care		Zvandiri		Difference	
	Life years	Cost	Life years	Cost	Life years gained	Incremental Costs
Deterministic results – LYG	4,642	\$822,553	5,787	\$1,323,140	1,345	\$500,587
	QALYs	Cost	QALYs	Cost	QALYs Gained	Incremental Costs
Deterministic results – QALYs	3,731	\$822,553	4,977	\$946,198	1,246	\$123,645

Table 1. Cost-effectiveness modelling outputs (Life years and QALYs gained)

**Conclusions:** Zvandiri is highly cost-effective at reducing virological failure and death when compared to commonly accepted cost-effectiveness thresholds. Our cohort microsimulation model likely underestimates cost-effectiveness resulting from higher virological suppression as would be observed in full transmission models.

## WEPEE579

The cost of inaction of failing to meet global Targets to end the AIDS epidemic: looking beyond 2030

E. Lamontagne<sup>1,2</sup>, M. Over<sup>3</sup>, J. Stover<sup>4</sup>, A. Yakusik<sup>5</sup>, B. Ventelou<sup>2</sup>

<sup>1</sup>UNAIDS, Equitable Financing, Johannesburg, South Africa, <sup>2</sup>Aix-Marseille University, CNRS, EHESS, Centrale Marseille, Aix-Marseille School of Economics, Marseille, France, <sup>3</sup>Center for Global Development, Washington, DC, United States, <sup>4</sup>Avenir Health, Glastonbury, United States, <sup>5</sup>UNAIDS, Data for Impact, Nairobi, Kenya

**Background:** For several years, the financing of the HIV response is facing competing priorities and countries are requested to increase their domestic financing. We estimated the cost of inaction, i.e. the human and economic cost of failing to meet the AIDS targets for each of the 114 countries to the 2050 horizon.

**Methods:** We first estimated the incremental costs, benefits, and economic returns (RoI) of a scenario that fulfils the 95-95-95 AIDS Targets, compared to a business-as-usual scenario maintaining coverage of HIV-related services at 2020 levels every year until 2050. The benefits are calculated using the full-income approach, which values both the change in income and mortality.

We estimated the value of the projected reduction in the mortality rate of the HIV programmes as the amount an average person would pay to reduce their risk of death by one in 10,000 for one year to 1.2% of GDP per capita.

We allowed the income-elasticity of the willingness to pay for mortality risk reduction to decline at either 0.8% or 1.2% for every percentage decline of the country's income. We computed the cost of inaction (CoI) as the incremental net foregone benefits in only fulfilling the business-as-usual scenario compared to the 95-95-95 one.

**Results:** Failing to meet the 95-95-95 AIDS targets entails substantial human and economic consequences. The human cost represents 34.9 million new infections and 17.7 AIDS-related deaths between 2021 and 2050. The economic cost of inaction represents US\$ 8,291 [5,821-13,680] per person among all low- and middle-income countries by 2050, with an average cost of inaction per capita of US\$ 670.

Country-specific analysis supports the relevance of considering both the RoI and the CoI in the economic analysis of the AIDS response. For example, South Africa has the CoI, whereas countries like Kenya and Haiti have a higher RoI.

**Conclusions:** The cost-benefit analysis of the AIDS response using a full-income approach enables measuring the return on investment and the cost of inaction of meeting or failing to meet the 95-95-95 AIDS Targets. Failing to meet these targets bears a tremendous human and economic cost. The idle position is not an option.

## WEPEE580

PrEP combined with other prevention measures is saving money within 5 years according to different HIV incidence rates scenarios: a budgetary impact analysis in Ecuador

A. Herdoiza<sup>1</sup>, A. Cevallos-Guerrero<sup>1</sup>, M.E. Acosta<sup>1</sup>, D. De La Torre<sup>2</sup>

<sup>1</sup>Corporación Kimirina, Quito, Ecuador, <sup>2</sup>PUCE, Quito, Ecuador

**Background:** In Ecuador, the HIV epidemic is concentrated in men who have sex with men (MSM) and trans women (TW), being the province of Pichincha the one with the highest prevalence: 18.32% and 28.05% respectively. These populations are more likely to benefit from pre-exposure prophylaxis (PrEP), a highly effective HIV prevention strategy for key populations. To this extent, we analyzed the budgetary impact of adding PrEP to other prevention measures (condoms, lubricant, and health education) according to different HIV incidence rates scenarios within 5 years.

**Methods:** The PrEP needs and cost were estimated with the Pan American Health Organization (PAHO) tool. A budgetary impact analysis (BIA) was developed from the third payer perspective with a 5 years' time horizon. The modeled scenarios were based on the epidemiological characteristics of the population joining the program, intention to use prevention measures including PrEP and availability of resources. The eligible population was 4043 for year 1 and would reach 4291 in year 5. Each scenario was analyzed with an three different annual incidences. Due to the lack of information in Ecuador, regional data was used: 2.6%, 4.3% and 7.35%. The BIA was estimated by imputing the total target population, for each year by the individual costs, in each scenario.

**Results:** Under the lower incidence limit of 2.6% no savings were made within 5 years. A scenario with an incidence of 4.3% generates savings in year 4 (-3% of annual budget) and year 5 (-10%). In the upper limit model of a 7.35% incidence, savings were made from year 2 (-4%) and reached 31% in year 5. The trend of increase budget in the PrEP scenario is 6% between for year 1 and 5, while in the current -without PrEP- scenario it is 59% in the same period.

**Conclusions:** PrEP combined with other prevention measures is saving money within 5 years according to different HIV incidence rates scenarios, different populations groups. It is expected that combined prevention programs for MSM and TW might generate savings for the health system in the medium term.

Early registration of HIV-exposed infants: a strategy to increase uptake of early infant diagnosis in Tanzania from 2022 to 2023

D. Kamugumya<sup>1</sup>, M. Nyamhagatta<sup>2</sup>, L. Fidelis<sup>1</sup>, D. Damian<sup>1</sup>, H. Nasrallah<sup>1</sup>, N. Schaad<sup>1</sup>, E. Machage<sup>1</sup>, I. Kessy<sup>3</sup>, C. Said<sup>3</sup>, L. Katengesha<sup>3</sup>, J. Ndayongeje<sup>3</sup>, C. Mbelwa<sup>4</sup>, J. Mwambona<sup>5</sup>, D. Nicholas<sup>5</sup>, M. Msangi<sup>2</sup>, L. McCormick<sup>6</sup>, M. Swaminathan<sup>1</sup>, G. Mgomella<sup>1</sup>, J.M. Grund<sup>1</sup>, A. Rwebembera<sup>2</sup>, P. Rwehumbiza<sup>1</sup>

<sup>1</sup>US Centers for Disease Control and Prevention, Division of Global HIV & TB, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Government of Tanzania, Ministry of Health, Dodoma, Tanzania, the United Republic of, <sup>3</sup>University of California at San Francisco, Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>U.S. Agency for International Development, Dar es Salaam, Tanzania, the United Republic of, <sup>5</sup>Walter Reed Army Institute of Research, U.S. Department of Defense, Dar es Salaam, Tanzania, the United Republic of, <sup>6</sup>US Centers for Disease Control and Prevention, Division of Global HIV & TB, Atlanta, United States

**Background:** Prior to 2022 in Tanzania, a substantial number of HIV-exposed infants (HEI) remained unidentified and untracked. Most HEI starting at aged 6 weeks were registered on paper-based tools, which was a barrier to accelerating early infant diagnosis (EID) of HIV within 2 months of birth, early access to HIV treatment services, and improved health outcomes. The national 2-month EID coverage was below 80%.

**Description:** We assessed the process flow of pregnant women living with HIV from the first antenatal visit to 18 months post-delivery. The assessment revealed missed

opportunities for testing HEI and inspired policy change discussions in February 2022 that culminated in revised national guidelines in September 2022. The policy change aimed to register all HEI within 7 days of birth by linking HEI registration to the infant's first immunization doses. The policy guidance also renewed emphasis on using the national HEI card for registering HEI and entering data into the national HIV client electronic record system.

We analysed data from over 3,000 facilities that provide services to nearly 80% of all pregnant and breastfeeding women living with HIV to describe trends in early registration and 2-month EID coverage, which is the proportion of blood samples collected among eligible infants at aged 2 months between October 2021 and September 2023.

**Lessons learned:** Registration of HEI within 7 days improved from 7% in July-September 2022 to 66% in July-September 2023 (Figure). During the same period, 2-month EID coverage increased from 82% to 92%.

Figure. HIV-exposed infants' registration and early infant diagnosis coverage at aged 2 months in Tanzania, October 2021 to September 2023.

**Conclusions/Next steps:** Early HEI registration facilitates timely access to diagnostic and treatment services for all HEI and can support individually tailored care and effective monitoring of a HEI's well-being from birth until a final HIV status is ascertained. The process mapping exercise was a catalyst in promoting national policy change.

## WEPEE582

Breaking silos and expanding health system partnerships: an integrated response for the prevention of Hepatitis B through vaccination as a part of routine ART care, Andhra Pradesh, India-2023

R. Allam<sup>1</sup>, K. Prasad<sup>2</sup>, J.K. Kurada<sup>3</sup>, N. Chava<sup>3</sup>, P.K. Ragi<sup>3</sup>, V. Yeldandi<sup>3</sup>, R. Ganti<sup>3</sup>, R. Prasad<sup>3</sup>, N. Surapaneni<sup>4</sup>, P. Turka<sup>3</sup>, A. Rao<sup>3</sup>, R. Agarwal<sup>1</sup>, M. Nyendak<sup>1</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention (CDC), DGHT, New Delhi, India, <sup>2</sup>Andhra Pradesh State AIDS Control Society, Vijayawada, India, <sup>3</sup>Society for Health Allied Research & Education India (SHARE INDIA), Hyderabad, India, <sup>4</sup>Nodal Officer, Viral Hepatitis Control Program, Vijayawada, India

**Background:** The Government of Andhra Pradesh (GoAP) adopted the National AIDS Control Program's (NACP) principles to break the silos and build synergies. In December 2022, GoAP initiated a systematic process to integrate hepatitis B vaccination as a part of routine care at Antiretroviral Therapy (ART) clinics.

**Methods:** In collaboration with the GoAP, we identified stakeholders from National Viral Hepatitis Control Program, immunization program, NACP, hospital administrators and ART clinic staff from state and district levels. We developed; Information Education and Communication (IEC) materials to promote vaccine uptake; messages on vaccine hesitancy; standard operating procedures (SOP) for patient flow; and a real-time monitoring tool on vaccination status for 54 ART clinics and 26 districts. We conducted site-feasibility assessments, trained the health care staff, and strategized uninterrupted supplies including cold chain. People living with HIV (PLHIV) were screened for hepatitis B antibodies and if found negative, were vaccinated.

**Results:** In January 2023, we trained 184 health care staff from 54 ART clinics on the SOP, injection safety and patient flow for hepatitis B vaccination and disseminated IEC. During November 2021-November 2023, we screened 210,273 (44.8% male, 54.9% female, 0.3% transgender) PLHIV for hepatitis B and 3,702 (1.8%) were positive. During February-November 2023, we vaccinated 87.6% of the 206,571 who tested negative (38.6% male, 48.7% female, 0.3% transgender) with the first dose (Figure-1).

Figure. Hepatitis B vaccination coverage among PLHIV at ART centres, Andhra Pradesh, India - 2023.

We conducted 44 decentralized events to increase vaccine access for both children and key populations. In the first 90 days, we provided 100,000 vaccinations [mean: 1342 vaccinations/day across the state; 25 vaccinations/ART center/day] and observed no interruption in stocks or cold chain.

**Conclusions:** Integrated collaborative partnerships from concept to implementation resulted in rapid uptake and saturation of hepatitis B vaccination among PLHIV in AP. Real time monitoring supported seamless supply chain management and enhancing reach by site.

## WEPEE583

### Barriers to viral suppression in young children on dolutegravir-based antiretroviral therapy in Malawi, a mixed-methods study

K. Phiri<sup>1</sup>, C. Hagstrom<sup>2</sup>, E. Lungu<sup>1</sup>, K. Balakasi<sup>1</sup>, J. Songo<sup>1</sup>, A. Makwaya<sup>1</sup>, D. Smith<sup>1,2</sup>, S. Phiri<sup>1</sup>, K. Dovel<sup>2</sup>, R. Hoffman<sup>2</sup>, J. van Oosterhout<sup>1,2</sup>

<sup>1</sup>Partners in Hope, Lilongwe, Malawi, <sup>2</sup>University of California Los Angeles, Department of Medicine, David Geffen School of Medicine, Los Angeles, United States

**Background:** Implementation of pediatric dolutegravir has improved viral load (VL) suppression of young children, though many still present with high VL (HVL) with limited insight about factors contributing to continued HVL in eastern and southern Africa. We sought to understand factors associated with HVL and barriers to adherence among Malawian children aged <10 years, using mixed-methods.

**Methods:** Between April-July 2023, we performed a retrospective observational cohort study, using medical records at 30 health-facilities in Malawi. We enrolled all children who were aged <10 years, on dolutegravir-based ART >12 months, and had a routinely collected VL test-result between January-December 2022 that was high ( $\geq 1,000$  copies/mL), or suppressed (VL <200 copies/mL). We used logistic regression, adjusting for age, sex, duration on current regimen and health-facility, to determine factors associated with HVL. To assess adherence barriers, we conducted in-depth interviews (IDIs) with caregivers of a random sub-set of children with HVL and with health-care-workers providing HIV care at study facilities. We used constant comparison methods to analyze qualitative data.

**Results:** We enrolled 538 children: 222-HVL and 316-suppressed. Being younger than 4-years and having treatment interruption (>28days) within a year prior to VL sample collection (Table) was significantly associated with HVL. We analyzed 54 IDIs (30-caregivers, 24-health-care-workers). Participants reported particular challenges with adherence for young children, as they transition from infancy to early childhood and assert independence. Major challenges included children resisting daily medi-

cation and difficulty managing multiple pills at once, lack of food, and fear that young children may unintentionally disclose their status by mentioning medication to others.

Variable (n=538)	Children with suppressed VL (<200 copies/mL) % (n = 316)	Children with HVL ( $\geq 1000$ copies/mL) % (n = 222)	OR	95% CI	aOR <sup>a</sup>	95% CI

Table. Factors associated with high viral load among children aged <10 years at 30 health facilities in Malawi.

**Conclusions:** The youngest children and those experiencing treatment interruption are at increased risk of HVL in Malawi. Several challenges were identified explaining the underlying insufficient adherence, mostly related to developmental/behavioral, psychosocial and socio-economic factors. Interventions targeting these challenges are needed to improve young Malawian children's virological ART outcomes.

## WEPEE584

### Taking a proactive approach to quality: a case study of the National Microbiology Reference Laboratory HIV DTS proficiency testing programme

A. Juru<sup>1</sup>, R. Magadu<sup>2</sup>, S. Mupandasekwa<sup>1</sup>, R. Simbi<sup>3</sup>, L. Sisya<sup>1</sup>

<sup>1</sup>National Microbiology Reference Laboratory, Laboratory, Harare, Zimbabwe, <sup>2</sup>Biomedical Research and Training Institute, Harare, Zimbabwe, <sup>3</sup>Directorate of Laboratory Services, Harare, Zimbabwe

**Background:** Provision of proficiency testing (PT) schemes for all tests is a requirement in ensuring quality testing for our population. The Ministry of Health and Childcare (MoHCC) has decentralised and task shifted rapid HIV testing services to all districts in Zimbabwe. It is therefore imperative that laboratory ensures quality results are being produced at all levels. The NMRL has introduced a PT scheme for rapid HIV testing using Dried Tube Specimens (DTS) to assess tester competencies and ensure quality testing.

**Description:** The NMRL produces DTS panels for distribution to HIV testers across the country using blood from the national blood bank. Panels are sent to testers in various districts using the existing sample transportation system. Reconstitution instructions and result sheets are also provided for standardisation. Results are entered into the ePT system by district data officers. NMRL analyses results and generate reports. Corrective action is done for testers who do not pass the proficiency testing cycle to close identified gaps.

**Lessons learned:** The number of testers assessed under the programme has increased from 300 in 2017 to 4000 in 2023. Tester pass-rates have increased to over 90% in

2023 from 42% in 2017. Programme coverage increased to 43 Districts nationwide in 2023 from Harare metropolitan only in 2017. Survey turnaround time has increased from over 6 months to a 3 month-complete-cycle since inception. There is increased supervision of HIV testing services through introduction of the HIV rapid district focal persons. There has been increased gap identification through the targeted Corrective Action Preventive Action (CAPA) model which provides tailor made trainings for testers that do not meet the pass mark.

**Conclusions/Next steps:** The NMRL-coordinated PT scheme has proved to be a sustainable solution in the provision of HIV PT services as every CAPA cycle has numerous tester specific trainings to close identified gaps during programme implementation. The model can be and adapted to ensure quality of other task shifted tests such as hepatitis and syphilis.

Technology advancements can also be embraced to make the programme more effective by using automated systems for panel production and data management. ISO 17043 accreditation of the PT scheme must be prioritised.

## WEPEE585

The realities of community led monitoring:  
our experience from Zimbabwe so far!

M. Chinoona<sup>1</sup>

<sup>1</sup>Family AIDS Caring Trust, Health and Wellbeing, Mutare, Zimbabwe

**Background:** People centeredness and putting communities in the lead for HIV and AIDS have been buzzwords in recent times. Community led monitoring (CLM) has offered an entry point for communities' participation and leadership in strengthening community health systems, enhancing community participation and fostering accountability in HIV and AIDS services delivery.

In this backdrop Family AIDS Caring Trust (FACT) Zimbabwe with financial support from the Global Fund to fight AIDS, Tuberculosis and Malaria through United Nations Development Program (UNDP) is among the spearheads of CLM in Zimbabwe since 2021.

**Description:** Since 2021 FACT implemented CLM in 20 districts of Zimbabwe, targeting 200 facilities through 600 community volunteers including people living with HIV and sex workers. Data collection, analysis and dissemination are done quarterly at facility and district levels. Policy issues are shared with the National Steering Committee for escalation. Objective is to monitor accessibility, availability, affordability, acceptability and appropriateness of HIV services.

**Lessons learned:** We noted attitudes changes as reduced stigma and discrimination was reported across districts. CLM is closing information gaps between facilities and communities through volunteers. Volunteers

are re-connecting antiretroviral therapy defaulters. CLM also brought out general health improvements issues like shortage of nurses to the attention of duty bearers.

We observed that CLM is effective where health authorities are responsive. Variations are notable across districts and are correlated to how CLM was embraced locally. Healthcare workers have been apprehensive of CLM as it was misconstrued as policing their work. Thus, CLM is not yet fully embraced in Zimbabwe resulting in low prioritization and resistance. Community capacities on CLM also plays a major factor on its effectiveness. However, the greatest controversy remains around definition of communities.

**Conclusions/Next steps:** CLM is generating undeniable evidence for policy advocacy to enhance access to HIV response services. It gives power to communities to influence HIV/AIDS response but only if duty bearers are responsive and communities are capacitated. Increased investments are required to build strong communities. We also ought to expand the definition of communities to place equal emphasis on prevention as with treatment and care for total epidemic control. The foregoing calls for revisiting the definitions of communities.

## WEPEE586

Prevent stockouts of HIV medicines and related commodities by using interactive decision-making tools

E. Barillas<sup>1</sup>, C. Valdez<sup>2</sup>, M. Thormann<sup>3</sup>, O. Garcia<sup>4</sup>, D. Lee<sup>5</sup>, A. De la Cruz<sup>5</sup>, N. Diaz<sup>6</sup>, H. Espinoza<sup>7</sup>

<sup>1</sup>SCMS USAID's Project, Washington, United States, <sup>2</sup>SCMS USAID's Project, Santo Domingo, Dominican Republic, the, <sup>3</sup>Ministry of Health, DIGECITSS, Santo Domingo, Dominican Republic, the, <sup>4</sup>Servicio Nacional de Salud, DMI, Santo Domingo, Dominican Republic, the, <sup>5</sup>USAID-DR, Health, Santo Domingo, Dominican Republic, the, <sup>6</sup>LHSS USAID's Project, Santo Domingo, Dominican Republic, the, <sup>7</sup>SCMS USAID's Project, Lima, Peru

**Background:** Although the Dominican Republic (DR) manages an efficient unified pharmaceutical supply system (SUGEMI, Spanish acronym), during 2020-2021 antiretroviral (ARV) stockouts have been attributed to international delivery delays and local logistics distribution difficulties due to the COVID-19 pandemic. The limited information and evidence available on these topics and the lack of coordination among decision makers: the Ministry of Health's (MoH) HIV Program and procurement department, and the network of health care providers (SNS, Spanish acronym) prevented local actors from anticipating the situation in time to perform rapid analysis and take effective actions to prevent stockouts.

**Description:** To avoid similar crises, in 2021 projects funded by the United States Agency for International Development (USAID) in the Dominican Republic supported the

MoH and SNS to develop a dashboard to analyze the availability of ARVs and HIV-related commodities to prevent stockouts. Primary data from SUGEMI information systems serve as the source for this dashboard.

A sequence of graphics displays availability and consumption information for ARVs and other HIV-related commodities at health facilities, and regional and central warehouses and tracks the procurement of products from international providers.

**Lessons learned:** From 2022 to date January 2024, this dashboard and the meetings organized for its analysis and decision-making have made it possible to prevent stockouts at the central warehouse, nine regional warehouses, and 101 facilities.

This analysis routine has also served to provide positive feedback to all SUGEMI operators to improve the timeliness and quality of primary data, its entry into databases, and the processing and presentation of supply indicators. The dashboard has allowed the government to make decisions based on evidence and redistribute 18 thousands ARV units and supplies between regional warehouses and facilities, advance purchase orders, and request emergency purchases.

**Conclusions/Next steps:** The periodic analysis of the information provided by the interactive logistics dashboard was included as a permanent routine in the health institutions responsible for managing HIV supplies in the Dominican Republic.

## WEPEE587

### Sustaining meaningful community involvement: strengths and vulnerabilities within network structures for a HIV collaboration

D. Chamberlain<sup>1</sup>, G. Brown<sup>1</sup>, C. Gallagher<sup>2</sup>, C. Webster<sup>3</sup>, J. Doyle<sup>4,5</sup>, R. Keast<sup>6</sup>, P. Higgs<sup>4</sup>, M. Stooze<sup>4</sup>, M. Holt<sup>7</sup>, M. Hellard<sup>4</sup>, A. Shiell<sup>8</sup>

<sup>1</sup>La Trobe University, Australian Research Centre in Sex, Health and Society, Melbourne, Australia, <sup>2</sup>University of Melbourne, Melbourne, Australia, <sup>3</sup>Macquarie University, Macquarie Business School, Sydney, Australia, <sup>4</sup>Burnet Institute, Melbourne, Australia, <sup>5</sup>Monash University, Melbourne, Australia, <sup>6</sup>Southern Cross University, Faculty of Business, Law and Arts, Goldcoast, Australia, <sup>7</sup>University of New South Wales, Centre for Social Research in Health, Sydney, Australia, <sup>8</sup>La Trobe University, Department of Public Health, Melbourne, Australia

**Background:** The Australian response to HIV has been characterised by collaboration and partnership. This includes a network of community organisations (established by people living with HIV, gay and bisexual men, people who inject drugs, sex workers) working with health services, government, and researchers. In the pursuit of elimination of HIV transmission and stigma, the network is needing to adapt to rapidly changing epidemiolog-

ical, policy, community and health technology contexts. During this time, we investigated the inter-organisational structures of this network to identify the strengths, weaknesses, and sustainability issues as the network responds to future challenges and opportunities.

**Methods:** Two rounds of the study were conducted in 2018 (n=27) and in 2022 (n=26), examining relationships between 48 government, health, research, and community organisations involved in Victoria's (a State of Australia) HIV and Hepatitis C response. We asked organisations about their sharing of information or advice, sharing resources, engaging in joint initiatives, and collaborating on advocacy, with other organisations in the network.

The data collected were analysed using exponential random graph models (ERGMs), identifying significant network characteristics and the social processes which produced the observed structure.

**Results:** Networks at both time points were most dense around the sharing of information, and least dense around collaborating on advocacy. Organisations were well connected to organisations of all other types (e.g. research organisations were connected with government, community, and health organisations). Smaller organisations (fewer than 11 staff members) were significantly more likely to nominate others across all relationships, indicating that small organisations had greater engagement in network relationships than their larger counterparts.

**Conclusions:** The results reflect an integrated network. The sharing of insights, joint work and influential community sector involvement were prominent types of engagement between actors. However, this involvement requires a high level of relationship work for small community and peer-led organisations to sustain and the density of relationships may place a barrier for newly emerging priority communities to become integrated within the network. Analysis of whole network structures provides useful new insights into the challenges of sustaining meaningful community participation and partnership within a network over time, identifying key pressure points and vulnerabilities.

### Integration of Early Infant Diagnosis (EID) into routine immunization services increases EID coverage in two Burundi provinces

A. Vrazo<sup>1</sup>, G. Vandebriel<sup>2</sup>, J.J. M'Bea<sup>2</sup>, A. Kavungerwa<sup>3</sup>, A. Johnson<sup>1</sup>, E. Baramperanye<sup>3</sup>, A. Kamariza<sup>3</sup>, R. Bhattacharjee<sup>1</sup>, F. Hatungimana<sup>2</sup>, E. Ntimpirangeza<sup>2</sup>, K. Abuelgasim<sup>1</sup>, B. Nijirazana<sup>2</sup>, H. Nzomwita<sup>4</sup>, A. Ndayizeye<sup>4</sup>, C. Kaze<sup>3</sup>

<sup>1</sup>GHTASC, Credence Management Solutions LLC, supporting USAID Office of HIV/AIDS, Prevention Care and Treatment Division, Washington, United States, <sup>2</sup>ICAP at Columbia University, Mailman School of Public Health, Bujumbura, Burundi, <sup>3</sup>USAID Burundi, Bujumbura, Burundi, <sup>4</sup>Ministry of Health, National AIDS and STI Control Program, Bujumbura, Burundi

**Background:** Integration of early infant diagnosis (EID) services for HIV-exposed infants (HEI) into immunization services can increase EID coverage and expedite timely HIV diagnosis. Burundi has >88% childhood immunization coverage, but variable EID coverage.

We describe findings from an intervention integrating EID into immunization services to improve EID coverage in Burundi.

**Description:** In collaboration with Burundi's national HIV/AIDS program, the USAID/PEPFAR-funded Reaching Impact Saturation and Epidemic Control (RISE) Project identified 56 sites with co-located immunization services in two provinces with the highest number of HEI: Kirundo (n=25 sites) and Gitega (n=31 sites).

Healthcare providers (n=149) from immunization, antenatal care, maternity, and HIV treatment services received a training package and sites received technical assistance (TA) in August-October 2022 (Fiscal Year [FY] 22 Q4 - FY23 Q1) on:

1. Reorganizing clinic flow to integrate EID/immunization;
2. Hands-on EID sample collection training;
3. Identification of HEI needing testing through verifying maternal HIV status in the mother-infant health booklet;
4. Documentation of EID testing via web-based platform to expedite results reporting from laboratory to site and client, and;
5. Ongoing mentorship and monitoring TA.

**Lessons learned:** Pre-implementation (FY22 Q1-Q3), 91/210 (43%) and 142/210 (68%) HEI had a sample collected for EID by <2m and 12m, respectively (Figure 1).

Post-implementation (FY23 Q2-Q4), 121/163 (74%) and 173/163 (106%) HEI had a sample collected by <2m and 12m, respectively, representing a coverage increase of 71% (<2m) and 57% (12m) compared to pre-implementation.

Observed knowledge gaps included the importance of evaluating HEI status at immunization and alignment of EID/immunization schedules.

Figure 1. Number and proportion of HEI with a sample collected for EID by <2 and 12 months, pre-intervention (FY22 Q1-3) and post-intervention (FY23 Q2-4) in two Burundi provinces.

**Conclusions/Next steps:** Training package implementation and TA to integrate EID into immunization services was associated with increased EID coverage and the number of HEI with a sample collected for EID.

Next steps include collaborating with the Burundi National AIDS/STI Control Program to plan sustainable national expansion of the integration approach.

## WEPEE589

### Integrating HIV prevention services for people who use drugs into government hospitals in Bangladesh: a sustainable approach

M.S. Alam<sup>1</sup>, R. Khan<sup>1</sup>, S. Islam<sup>1</sup>, E.I. Chowdhury<sup>1</sup>, M. Islam<sup>1</sup>, S. Sultana<sup>1</sup>, C.A.A. Asif<sup>1</sup>

<sup>1</sup>Save the Children, HIV/AIDS, Dhaka, Bangladesh

**Background:** Traditionally, HIV prevention services for People Who Use Drugs (PUD) in Bangladesh were delivered through drop-in centers (DICs) funded primarily by the Global Fund through Save the Children. These centers, external to public health facilities, addressed PUD needs in a culturally sensitive manner.

Recently, a strategic shift occurred, relocating DICs into public hospitals, supplemented with capacity-building, resources, and supervision from the Global Fund.

**Description:** Under the NFM3 phase (2021-2023) of the Global Fund, 12 out of 42 DICs were relocated to government hospitals. This process involved multiple stages: selecting hospitals based on various criteria, coordinating with the government's nodal body named AIDS/STD Program (ASP) for approvals, allocating space through formal requests, renovating spaces with Global Fund grants, and developing a comprehensive management plan. This plan, created collaboratively with multiple stakeholders, included mechanisms for monitoring and coordination.

Additionally, extensive training and orientation were provided to service providers and PUD for their readiness. Network of PUD were engaged in the whole process.

## Lessons learned:

- Hospital-based service delivery result in a 28% increase in general health service recipients in 2023, compared to the DIC model in 2022.
- Notable reduction in stigma and discrimination towards PUD, with 2,220 PUD got access to free medication which was rare before integration.
- Hospitals managed 248 complicated STI and 295 abcess cases with necessary medication, previously unaddressed in the DIC model.
- Monthly operational (house rent, electricity, water, medical waste disposal, guard, etc.) cost savings of approximately \$800 per DIC were realized.
- Mutual support between hospital authorities and NGO staff was established for efficient service delivery.

**Conclusions/Next steps:** While challenges remain in fully integrating PUD into the public health system, the transition from NGO-led to government-operated services is underway and shows promise for sustainability. Future efforts will focus on enhancing full readiness among both PUD and service providers to ensure seamless integration of HIV prevention services into the public health infrastructure.

## WEPEE590

Building sustainable district-based Quality Improvement (QI) capacity for HIV prevention in public health facilities in Blantyre, Malawi

S. Likumbo<sup>1</sup>, M. Enock<sup>2</sup>, E. Moses<sup>2</sup>, J. Tambala<sup>3</sup>,

C. Mabelekesi<sup>4</sup>, Y. Kamgwira<sup>4</sup>, D. Hoege<sup>5</sup>, S. Allinder<sup>5</sup>,

C. Holmes<sup>5</sup>, J. Mulungu<sup>6</sup>, B. Agins<sup>7</sup>, G. Kawalazi<sup>1</sup>

<sup>1</sup>Blantyre Distric Health and Social Services, Ministry of Health, Blantyre, Malawi, <sup>2</sup>QI Consultant, Lilongwe, Malawi,

<sup>3</sup>Data Manager Consultant, Lilongwe, Malawi, <sup>4</sup>National Aids Commission, Ministry of Health, Lilongwe, Malawi,

<sup>5</sup>Georgetown University, Center for Innovation in Global Health, Georgetown, United States, <sup>6</sup>University of California San Francisco, Healthqual, Harare, Zimbabwe, <sup>7</sup>University of California San Francisco, Healthqual, New York, United States

**Background:** The Malawi Government approved oral PrEP for prevention of HIV infection in 2019. However, at that time only 3 clients had been prescribed PrEP in public sector facilities in Blantyre, the district with the highest HIV prevalence. Through the Blantyre Prevention Strategy, led by the Government of Malawi in partnership with Georgetown University, a Quality Improvement Collaborative (QIC) was launched by the District Health Office to scale-up PrEP in 23 facilities in 2021, including 3 public hospitals and 14 district health centers. QI had not been routinely used as a strategy to improve PrEP uptake. To determine organizational and provider capacity to deliver PrEP services, we conducted a baseline assessment to identify areas for improvement with a follow up assessment after 24 months of implementation to assess change.

**Description:** Standardized tools were used to conduct assessments through interviewing an average of 5 health-care workers per facility focusing on PrEP services, uptake, provider competencies, supply chain management, documentation, and changes made to processes and systems to improve performance. Data were collected on a tablet-based platform and analyzed in Excel.

**Lessons learned:** QIC Implementation contributed to a significant improvement in PrEP uptake in Blantyre public health facilities with the proportion of those offering PrEP increasing from 18% to 100% resulting in the number of clients prescribed PrEP increasing from only 3 at baseline to a cumulative 10,128 after 24 months.

The proportion of facilities with cadres trained in PrEP guidelines increased from 72% to 100%, and 83% of the facilities had integrated PrEP into routine health services with STI, outpatient department (OPD), and ART being common entry points.

Common changes contributing to improved uptake in clinic systems include demand creation for PrEP services throughout the facility, redesign of flow to center on a status-neutral approach, incorporation of community insights from human-centered design (HCD) approaches, and peer-to-peer mobilization.

**Conclusions/Next steps:** QICs are an effective tool to improve PrEP uptake as part of combination HIV prevention. Building sustainable capacity for QICs in low-income settings with regular coaching is a feasible model that can be replicated with context-specific adaptation to increase PrEP uptake and other preventive health services.

## WEPEE591

Impact of the Service Delivery Framework implementation on children and adolescents living with HIV In Nigeria

C. Nwafor<sup>1</sup>, N. Otubu<sup>1</sup>, O. Adewole<sup>1</sup>, E. Etiobho<sup>2</sup>, S. Dowling<sup>3</sup>, J. Drakes<sup>3</sup>, M.-M. Akanmu<sup>1</sup>, F. Lufadeju<sup>1</sup>

<sup>1</sup>Clinton Health Access Initiative, Abuja, Nigeria, <sup>2</sup>National AIDS and STI Control Program, Abuja, Nigeria, <sup>3</sup>Clinton Health Access Initiative, Boston, United States

**Background:** Progress has stalled on the number of children and adolescents living with HIV who have access to lifesaving antiretrovirals (ARVs) despite improvements in childhood formulations and innovative diagnostics. As of 2019 ART coverage and viral suppression for children 0 – 14 years was 36% and 54% respectively, and 41% and 52% for adolescents 15 – 19 years, lagging behind adult ART coverage at 83% and viral suppression at 68%.

To address this, between 2020 and 2022, CHAI supported the National AIDS and STIs Control Programme (NASCP) to adapt the UNICEF Service Delivery Framework (SDF) which recommends age-specific and evidence-based interventions to accelerate progress for children and adolescents across the cascade.

The SDF was incorporated into the National Acceleration Plan (NAP) to provide a policy framework for national implementation.

**Description:** Situational assessments including a review of new infections, MTCT rate, adolescent incidence, and geographic burden were conducted to determine national and 36 state's typologies and prioritize interventions that would have the greatest impact based on a Solutions Matrix.

CHAI supported the capacity building of healthcare workers to implement the SDF, institutionalized the role of pediatric and adolescent HIV focal persons to coordinate SDF implementation, and provided technical assistance for monitoring and scale-up at the national level. Data was collated from national HIV program monitoring tools and NAP assessment surveys.

**Lessons learned:** At the end of 2021, NAP assessment revealed 25 states (70%) with 996 (88%) ART sites reported roll-out of the SDF with index testing (96%), alternate entry point testing (92%) and Differentiated Service Delivery (88%) being the most widely implemented strategies.

This greatly contributed to national pediatric and adolescent ART coverage increase to 48% and 68% respectively. Viral suppression rates also improved to 81% and 85%. The outcomes indicated that scale-up of these high-impact interventions could have the largest contributions to rapidly improving pediatric and adolescent HIV outcomes.

**Conclusions/Next steps:** National adoption of the SDF within the NAP and subsequent scale-up of strategies tailored to local epidemics have proven invaluable in contributing to strengthening Nigeria's pediatric and adolescent HIV response. Optimal implementation by MOH and partners is encouraged in line with the current global alliance.

## WEPEE592

Implementing an integrated community model addressing vulnerabilities affecting HIV epidemic control in Uganda: a case study of Acholi region

A. Lawino<sup>1</sup>, O. Apok<sup>1</sup>, M. Ochwo<sup>1</sup>, J. Calnan<sup>2</sup>, C. Katureebe<sup>3</sup>, T. Nsubuga-Nyombi<sup>2</sup>

<sup>1</sup>The AIDS Support Organization (TASO), Health, Gulu, Uganda, <sup>2</sup>United States Agency for International Development/ Uganda, Health and HIV, Kampala, Uganda, <sup>3</sup>Ministry of Health/Uganda, AIDS Control Program, Kampala, Uganda

**Background:** Uganda has made progress towards achieving the targets for epidemic control. However, gaps persist in the first 95 (80.9%) and the third 95 (92.2%). With a national HIV prevalence of 5.3%, the Ministry of Health rolled out the integrated community service delivery model (ICSDM) to address HIV epidemic control at the community level by addressing the determinants of new

infections and advanced HIV disease. We implemented the ICSDM to address vulnerabilities affecting HIV epidemic control in the Acholi sub-region.

**Description:** The pilot implementation of the ICSDM was at 70 public health facilities in 8 districts. Mapped out 3,519 non-suppressed persons living with HIV (PLHIV) with VL  $\geq 1000$  copies/mL by village/parish and sub-county and subsequently mapped 667 Community Health Workers (CHWs) by the same criteria. Attached CHWs to PLHIV by proximity, attaining an average attachment ratio of 1:4 for children ( $<20$ ) and 1:10 for adults. Mapped CSOs and distributed directories for linkage to social services.

Oriented CHWs on the basic integrated service package, including assessment of determinants of vulnerabilities, HIV testing, linkage and combination prevention, advanced HIV disease screening, linkage to social support, client literacy, and Directly Observed Treatment Support (DOTS). CHWs provided integrated package services at every household visit.

**Lessons learned:** Between September 2022 and November 2023, there were 3,683 (98.8%) biological children and siblings of unsuppressed PLHIV offered HIV testing services (HTS), and 139 (3.8%) were tested positive.

Similarly, 1,399 (96.1%) partners of unsuppressed PLHIV ( $>20$  years) were offered HTS, and 176 (28.5%) were tested positive and initiated treatment. Reached 61.8% (2174) of unsuppressed PLHIV with CD4 testing for advanced HIV disease screening, and 92.8% of unsuppressed CALHIV eligible for social services were identified and linked.

Among the 846 ( $<20$  years) unsuppressed CALHIV who received DOTS, 86% achieved VLS after 90 days. Improved VLS among CALHIV ( $<20$ ) from 67% to 76% in the same period.

**Conclusions/Next steps:** The ICSDM provides a holistic human perspective of client care and improves the optimization of CHWs in integrated HIV service delivery. The integrated differentiation in the community allows multi-stakeholder engagement in addressing client needs and vulnerabilities affecting epidemic control and could be explored in similar settings.

## WEPEE593

Strengthening national monitoring and evaluation systems for community HIV prevention in Zimbabwe

C. Goshu<sup>1</sup>, M. Zhou<sup>1</sup>, L. Munangaidzwa<sup>1</sup>, S. Huwa<sup>1</sup>, A. Mpofu<sup>1</sup>, B. Madzima<sup>2</sup>, R. Matavire<sup>3</sup>

<sup>1</sup>National AIDS Council, Monitoring and Evaluation, Harare, Zimbabwe, <sup>2</sup>National AIDS Council, CEO, Harare, Zimbabwe, <sup>3</sup>University of Oslo, Programming, Oslo, Norway

**Background:** The Zimbabwe National AIDS Council (NAC) coordinates the multisectoral response to HIV and AIDS and manages One country level M&E system. In this regard, a generic Demographic Health Information System

(DHIS2) was developed to collect, analyze and report real time data on AGYW and KPs HIV prevention interventions from community level.

**Description:** In 2019 NAC in partnership with Oslo University sought to strengthen a community focused monitoring and evaluation system embedded within DHIS2.

A unique interfacing DHIS2 tracker was customized for Zimbabwe to capture data on mobile devices for eight HIV prevention models viz, Sista2Sista, Brotha2Brotha, Peer Led, DREAMS, Key Populations, SASA, CATS and CATFs across Zimbabwe. The system was developed through analysis of various source documents and communications from system conceptualization through to production.

These include data collection forms, risk assessment forms, HIV service referral booklets, programmes implementation manuals, meetings with project staff, marking transitions in the process of development.

Testing was done iteratively to get user acceptance and the system was piloted in two Provinces, urban and rural to test performance and acceptability.

**Lessons learned:** DHIS2 offers expanded monitoring and evaluation utility for the National HIV prevention program in Zimbabwe, facilitating access to data across the HIV cascades for decision making at community, district, provincial and national levels.

The DHIS2 generates a unique identifier for each individual client to maintain confidentiality. Community Peer Volunteers enroll peers into DHIS2 using a mobile tablet as they provide community-based HIV/SRHR services.

The system allows client registration, calculating risk levels for targeted HIV prevention interventions, capturing data on specific HIV prevention session conducted with peers and facilitates for linkage to differentiated HIV prevention and treatment services.

**Conclusions/Next steps:** While DHIS2 customization offers viable solutions to optimizing monitoring and evaluation for community focused HIV prevention interventions, there is need to strengthen harmonization and interoperability of all DHIS2 user platforms.

Routine training of community peers that collect data should be embedded in local technical experts for program sustainability.

There is need for improved device management strategies for the 5000+ mobile devices deployed in an environment with power challenges, erratic internet connectivity and high risk of data and device loss.

## WEPEE594

### Building local capacity for improved HIV treatment safety in Mozambique

M. Mussá<sup>1</sup>, T.V. Sitoie<sup>1</sup>, T. Hafner<sup>2</sup>, L. Namburete<sup>1</sup>, I. Gaspar<sup>3</sup>, A. Couto<sup>3</sup>, E.D. Seni<sup>4</sup>, J.M. Paulino<sup>1</sup>, A. Lemos<sup>1</sup>, S. Vilanculos<sup>1</sup>, A. Stergachis<sup>5</sup>

<sup>1</sup>ANARME, IP, Maputo, Mozambique, <sup>2</sup>Management Sciences for Health/USAID MTaPS Program, Arlington, United States,

<sup>3</sup>National HIV/AIDS Program, Maputo, Mozambique,

<sup>4</sup>Management Sciences for Health/USAID MTaPS Program, Maputo, Mozambique, <sup>5</sup>University of Washington, Seattle, United States

**Background:** More than 2 million people in Mozambique are living with HIV, about 60% of them women. In 2018, Mozambique adopted the WHO-recommended Tenofovir/Lamivudine/Dolutegravir (TLD) regimen as first line HIV treatment. However, the country's national medicines regulatory authority, the Autoridade Nacional Reguladora de Medicamentos, Instituto Publico (ANARME, IP) did not have an active surveillance system to carry out the WHO-recommended safety monitoring for adverse events (AEs).

**Description:** ANARME, IP and the HIV program in collaboration with the USAID Medicines, Technologies, and Pharmaceutical Services (MTaPS) Program designed and implemented an active surveillance system to study TLD's safety profile.

This included the adaptation and deployment of the online Pharmacovigilance Monitoring System (PViMS) tool for patient enrollment, and data collection and analysis to support active surveillance at nine study sites. Support also included strengthening healthcare workers' capacity to conduct active surveillance and use PViMS.

**Lessons learned:** The successful implementation of the active surveillance for TLD underscored the critical importance of fostering local ownership. This experience allowed Mozambique to extend its achievements to initiating active surveillance for other new treatment regimens. The collaboration with ANARME, IP and the public health programs facilitated strengthening partners' capacity to conduct active surveillance.

Facility staff may not have the bandwidth to assume the additional tasks involved, so it is essential to engage sufficient human resources. Regular supervision, conducted by ANARME, IP, the Provincial Directorate of Health and Ministry of Health with MTaPS technical support helped to ensure compliance with the protocol, and was also important to identify and troubleshoot challenges, validate data quality, and strengthen compliance with established procedures at the facility level.

**Conclusions/Next steps:** Mozambique now has locally relevant data to assess the overall safety of the TLD regimen and demonstrated experience implementing an active surveillance program. The findings will inform country clinical guidance and help to identify TDL-associated AEs

in patients. The government may also consider leveraging the PV experience with TLD to benefit patients outside of the HIV program.

## WEPEE595

South African Department of Health applies a systems approach to quality improvement to address systems challenges in the HIV programme

T. Chidarikire<sup>1</sup>, R. Morewane<sup>2</sup>, N. Khoza<sup>2</sup>, M. Manganye<sup>2</sup>, L. De Kock<sup>3</sup>, R. Fritz<sup>4</sup>, A. Mumbauer<sup>4</sup>, S. Wilson<sup>4</sup>

<sup>1</sup>WHO-South Africa, HIV Prevention, Pretoria, South Africa, <sup>2</sup>National Department of Health - South Africa, HIV/AIDS and STI, Pretoria, South Africa, <sup>3</sup>The Aurum Institute, Continuous Quality Improvement and Training, Johannesburg, South Africa, <sup>4</sup>National Department of Health - South Africa, HIV/AIDS and STI Operation Phuthuma, Pretoria, South Africa

**Background:** The HIV/AIDS epidemic and weaknesses in the health system in South Africa, paired with the global focus on ending AIDS as a public health threat by 2030, drove the National Department of Health to move away from vertical programming to a systems level improvement strategy.

The Nerve Centre Approach (NCA) guides health care workers at all levels of the health system to improve service delivery through the adoption of standardised, problem-focused and improvement-driven platforms and tools.

**Methods:** Nerve Centres are uniquely adapted structures, equipped with tools and activities centred on using data and teamwork to identify and drive change for all health care managers. The Operation Phuthuma team, a project management and technical support structure of the national HIV programme, facilitated implementation of the NCA across the country. Early in implementation, we recognised that introducing all components of the approach across multiple programmatic areas was too complex for management structures to implement at all facilities simultaneously.

Instead, we defined a phased approach starting with 100 priority facilities that could yield results, provide an opportunity to implement the approach at a smaller scale, and leverage lessons at the most local level to prepare for future scale up and expansion to additional program areas.

**Results:** In provinces where the NCA was widely rolled out, including Gauteng, Eastern Cape, North West, and Free State provinces, the number of people on ART increased by a greater proportion than the national average. For example, between March 2022 and October 2023, the number of people on ART increased by 7% in Gauteng Province, compared to a growth of 5% nationally. At the 100 priority facilities, the number of people on ART increased by 2,216 from 693,064 to 695,280 in a single month.

Province	NCA Start Date	Increase in # on ART	% Increase on ART	National Growth (Same period)
Gauteng	February 2022	79,328	7%	5%
Free State	May 2022	13,744	4%	4%
Eastern Cape	June 2022	37,253	7%	4%
North West	June 2022	16,542	5%	4%

**Conclusions:** The approach has been widely endorsed, accepted, and acknowledged as a South African data driven Quality Improvement approach that is showing significant outcomes in the achievement of the number of people on ART at provincial level.

## WEPEE596

Incidence of loss to follow-up and its predictors among persons receiving HIV treatment in private mine hospitals and clinics in Copperbelt Province, Zambia

L. Goma<sup>1</sup>, J. Bwembya<sup>1</sup>, D. Mulemena<sup>1</sup>, N. Hanene<sup>1</sup>, Y. Mumba<sup>2</sup>, C. Siwale<sup>3</sup>, J. Mapulanga<sup>2</sup>, O. Sinadaza<sup>3</sup>, J. Simukoko<sup>4</sup>, L. Munthali<sup>4</sup>, M. Musumali<sup>4</sup>, A. Austin<sup>5</sup>, M. Chanda<sup>6</sup>, M. Chaila<sup>1</sup>, K. Poer<sup>1</sup>, M. Bwembya<sup>1</sup>

<sup>1</sup>USAID Zambia Accessible Markets for Health Project, Lusaka, Zambia, <sup>2</sup>Malcom Watson Mine Hospital, Mufulira, Zambia, <sup>3</sup>Wuzakile Mine Hospital, Kitwe, Zambia, <sup>4</sup>USAID Zambia, Lusaka, Zambia, <sup>5</sup>John Snow Inc, Boston, United States, <sup>6</sup>John Snow Health Zambia, Lusaka, Zambia

**Background:** The private sector is a key participant in the fight against HIV/AIDS worldwide. However, information on the incidence of loss to follow-up (LTFU) among persons receiving treatment in private health facilities is scarce.

We report the 10-year LTFU rates for persons initiating antiretroviral therapy (ART) at privately owned mine hospitals and clinics supported by the USAID Zambia Accessible Markets for Health Project in Copperbelt Province, Zambia.

**Methods:** This was a retrospective cohort study of persons who initiated ART between 2005 and 2013 at five project-supported mine hospitals and clinics in Copperbelt Province, Zambia. Kaplan-Meier survival analysis was performed to compare the LTFU of various client groups. The Cox proportional hazards model was used to identify factors influencing LTFU rates.

**Results:** Of the 7,533 persons who initiated ART, 58% (n=4,427) were female, the median age was 35 years, and the baseline median CD4 count was 483 cells per cubic millimeter (interquartile range, 332). Ten years after ART initiation, 5,397 (72%) persons were alive in care, 379 (5%) were dead, 885 (12%) were lost to follow-up, and 872 (11%) had transferred to other facilities.

The overall incidence rate of LTFU was 2.0 per 1,000 person-years of observations (95% CI=1.7 - 2.3). Characteristics associated with higher risk of LTFU were ages 15-24

years (AHR=1.3, 95% CI=1.1-1.7), and 25-34 years (AHR=1.2, 95% CI=1.1-1.4), compared to those aged 35 years and above, and WHO stages one (AHR=3.0, 95% CI=1.2-7.1) and two (AHR=2.9, 95% CI=1.1-7.7), compared to those in WHO stage III/IV.

**Conclusions:** The incidence of LTFU among persons receiving ART in private health facilities was lower than that in the public sector. Clients younger than 35 and those in WHO stages I and II were at an elevated risk of LTFU. Interventions to prevent LTFU among ART clients in private health facilities should address these predictors

## WEPEE597

**PUTTING PEOPLE FIRST: 24 years of implementing the Total Control of the Epidemic (TCE) model. People at the heart of changing the course of the epidemic**

M. Lichtenberg<sup>1</sup>, S. Mabaso<sup>2</sup>, A. Machaya<sup>3</sup>, A.D. Hoejrup<sup>3</sup>, M. Andersen<sup>4</sup>, R. Gray<sup>2</sup>

<sup>1</sup>Planet Aid, Inc., Global Partnerships, Elkridge, United States, <sup>2</sup>Planet Aid, Inc., Elkridge, United States, <sup>3</sup>DAPP Zambia, Lusaka, Zambia, <sup>4</sup>Humana People to People Federation, Shamva, Zimbabwe

**Background:** As HIV spread in Sub Saharan Africa (SSA) in the 1990s, the Humana People to People (HPP) Federation – a network of local organizations in 46 countries – developed its flagship Total Control of the Epidemic (TCE) model. Funded by PEPFAR, Global Fund, and others over 24 years, TCE has been implemented in 12 countries in SSA, working with communities to co-create a locally-led HIV response putting **people first**.

**Description:** Rooted in the understanding that ‘Only the people can liberate themselves from the epidemic,’ locally recruited Field Officers build knowledge and ownership among PLHIV and key populations to take charge of their health, break down stigma and discrimination, and reduce barriers to health services.

**Lessons learned:** Since 2000, TCE has reached 22 million people across 12 countries. While TCE originally focused on total mobilization of whole communities to address epidemic needs, the model was quickly adapted to the evolving epidemiology, adding targeted services, strengthening community-facility integration, and addressing the 95-95-95 targets. TCE’s impacts are evident in many countries.

In **Zambia** – where TCE is implemented by local NGO DAPP in four of Zambia’s ten provinces with funding from PEPFAR/CDC and US Department of Defense – TCE has demonstrated a **31% HIV positivity rate in index testing in Lusaka** and a **99.5% ART initiation rate** among PLHIV (2021).

In **Namibia**, DAPP has implemented TCE for more than a decade with CDC support. Results include **100%** of babies born HIV free from HIV-positive mothers (2021) and sup-

porting the country to nearly surpass the UNAIDS 95-95-95 goals in 2022, with **94%** of PLHIV knowing their status, **97%** of those on treatment, and **93%** of those achieving VL suppression.

In **DRC**, TCE is implemented by local NGO HPP-Congo in Kinshasa with PEPFAR/CDC support. Between 2019-2023, the TCE model has supported identification of **32,000 PLHIV** with **98%** linked to ART.

**Conclusions/Next steps:** For 24 years, TCE, with the people-to-people principle at its core, has been utilized as an **evidence-based, scalable, and sustainable model** to attain epidemic control. As countries achieve epidemic control, TCE is being adapted to address broader primary health care needs and support countries to move towards universal health care.

## WEPEE598

**Improving ART recipients of care satisfaction and healthcare providers' efficiency through Community Score Card (CSC)**

K. Makwenda<sup>1</sup>, E. Kayimba<sup>1</sup>

<sup>1</sup>Malawi Network of AIDS Service Organizations (MANASO), Program Management, Lilongwe, Malawi

**Background:** Recipient of care (ROC) satisfaction is a significant factor in whether people living with HIV adhere to treatment and therefore directly affects their health outcomes. So is health care providers' efficiency. Late opening and early closing of ART clinics, is one of the markers in service satisfaction and provider efficiency.

**Description:** Community Score Card, a two-way, ongoing participatory tool for the assessment, planning, monitoring and evaluation of services has been instrumental globally.

In Malawi, the community-led ART service CSC activities – bring together the ART demand side (“service users”) and the supply side (“service providers”), advocating to improve the service to facility, district or national authorities. Focus group discussions with the users and the providers were undertaken by trained community members.

Generated issues, were scored by both sides before interface meetings where providers gave commitments which were then followed up by community members.

**Lessons learned:** CSC has proven to improve ROCs' ART service satisfaction, specifically- clinic opening and closing time. This has led to an increase in clinic use, and ensured adherence to ART, with expected improved health outcomes. The providers also felt empowered, when prior to CSC, their behaviours and efficiency were not satisfying the ROCs.

From April 2023 to date, the satisfaction of ROCs at 15 of the 40 ART clinics where CSC was done, improved significantly. In the November 2023 follow-up, after the interface meetings, ROCs reported that the clinics were opening

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

and closing at the right time in 13 of the 15 facilities that had the mentioned issue. A repeated follow-up is planned for February 2024.

**Conclusions/Next steps:** CSC can support improve health care providers' efficiency and in turn improve ROC satisfaction with expected consequent improvements of ROCs' health over time.

## HIV and development synergies

### WEPEE599

Private-public partnership supporting sexually exploited minors and young women selling sex to launch microenterprises: lessons learned from Enhanced economic strengthening implementation within DREAMS in Zimbabwe

J. Ncube<sup>1</sup>, P. Moyo<sup>2</sup>, S. Nyakuwa<sup>2</sup>, T. Matandirotya<sup>3</sup>, R. Mashapa<sup>4</sup>, L. Sibanda<sup>4</sup>, G. Gonese<sup>4</sup>, J. Murungu<sup>2</sup>, I. Mahaka<sup>2</sup>, B. Makunike<sup>4</sup>, T. Sola<sup>5</sup>, G. Ncube<sup>5</sup>, T. Mharadze<sup>6</sup>, R. Malaba<sup>6</sup>, A.K. Korn<sup>7</sup>, K.A. Thomson<sup>7</sup>, S. Wiktor<sup>7</sup>

<sup>1</sup>Pangea Zimbabwe Aids Trust, DREAMS, Binga, Zimbabwe, <sup>2</sup>Pangea Zimbabwe Aids Trust, DREAMS, Harare, Zimbabwe, <sup>3</sup>Pangea Zimbabwe Aids Trust, DREAMS, Bulawayo, Zimbabwe, <sup>4</sup>Zimbabwe Technical Assistance, Training & Education Center for Health, DREAMS, Harare, Zimbabwe, <sup>5</sup>Ministry of Health and Child Care, HIV and TB Unit, Harare, Zimbabwe, <sup>6</sup>Division of Global HIV & TB (DGHT), U.S. Centers for Disease Control and Prevention, Division of Global HIV & TB (DGHT), Harare, Zimbabwe, <sup>7</sup>University of Washington, International Training and Education Center for Health, Seattle, United States

**Background:** The Determined, Resilient, Empowered, AIDS free, Mentored and Safe (DREAMS) program aims to reduce new HIV infections among sexually exploited minors (SEM) and young women selling sex (YWSS) aged 15 to 24 years. YWSS/SEM received need-based-integrated technical skills trainings to alleviate poverty which exposes YWSS/SEM to HIV as they transact sex for income.

**Description:** In July 2021 a vulnerability assessment tool was used to identify YWSS/SEM eligible for enhanced economic strengthening (EES) based on economic vulnerability and willingness to participate in long term EES projects. Ministries of women affairs, youth, agriculture, and social development were approached to conduct two days skills trainings for YWSS/SEM on projects that were deemed viable through community engagement.

Trained YWSS/SEM received \$100 each as a starter-up pack to start, improve or enhanced their businesses. Supported skills in this program included making liquid-laundry soap and petroleum jelly, poultry breeding, crop pro-

duction, bookkeeping, hairdressing, and catering. To ensure project sustainability support and mentorship visits were conducted by DREAMS and related ministry officials. YWSS/SEM participating in EES projects were linked to markets through synergies between public and private partnerships.

**Lessons learned:** This multi-sectorial approach resulted in relevant training, mentoring, and support that enabled YWSS/SEM to launch business. Private-public synergies enabled resource mobilization to supplement DREAMS efforts. Need-based-integrated technical skills transfer economically empowered YWSS/SEM leading to an increase in disposable income and reduced reliance on transactional sex.

Continued support, mentorship and look and learn visits for YWSS/SEM impacted hands-on knowledge and eagerness to continue with businesses. YWSS/SEM showcased handmade products at international fairs, opening doors for long-term business opportunities. Starter-up packs enabled YWSS/SEM to build and own businesses.

Economically supported YWSS/SEM verbalized reduced dependency on transactional sex as time was spent on business management, significantly reducing chances for new HIV infections.

**Conclusions/Next steps:** DREAMS and other district stakeholders will continue supporting YWSS/SEM to showcase products at local and regional business market fairs. YWSS/SEM will be encouraged to engage in Internal-Savings-And-Lending-Scheme for access to sustainable financing, to boost their business.

Business diversification will help expand YWSS/SEM product market. YWSS/SEM to mentor and problem-solve with other entrepreneurs.

### WEPEE600

Strengthening primary health care systems to respond effectively to post violence care

C. Hoffmann<sup>1</sup>, N. Mabena<sup>1</sup>, V. Skiti<sup>1</sup>, S. Hobbs<sup>1</sup>

<sup>1</sup>NACOSA, Cape Town, South Africa

**Background:** In South Africa, the Gender-based Violence and Femicide (GBVF) pandemic is a national crisis. Survivors of GBV access post violence care services (PVCS) through Thuthuzela Care Centres (TCC) that are one-stop facilities that provide comprehensive support for victims of GBV. With notoriously high rates of GBV the current number of TCCs (63) are not enough. Poverty, inequality, geographic location and vastness, impact the ability to access timely services at TCCs.

Inaccessibility of GBV services can result in HIV or STI infection, pregnancy, symptoms of stress, anxiety, depression, risky behaviour, substance abuse and mental health challenges. Integrating comprehensive PVCS at primary and community health care facilities improves accessibility of services for vulnerable and hard to reach communities.

**Description:** NACOSA's GBV programme worked to integrate PVCS into primary and community healthcare facilities in 5 provinces in South Africa through:

1. Training healthcare providers to render the minimum package of clinical PVCS;
2. Providing mentoring support for clinicians;
3. Developing case management guidelines and algorithms for effective PVCS;
4. Placing social workers and linkage officers at facilities for psycho-social support and to support improved health outcomes;
5. Deploy GBV Ambassadors in communities to support pathways into PVCS;
6. Training community stakeholders and healthcare providers in receiving and responding to disclosures of GBV, using the World Health Organisation's LIVES model.

**Lessons learned:** Trained 110 clinicians and 25 Health Department operational management staff in PVCS; 132 community leaders and 116 GBV frontline brigades trained in the LIVES model. Facilities capacitated on PVCS increased from 84 in 2020 to 116 in 2023.

As a result, the programme noticed a 98,5% increase in survivors accessing PVC services – from 146 72 in 2020 to 29 117 in 2023. In 2020, 6928 survivors were Young Women between the ages of 10-24 years, this increased to 13 904 in 2023 (101%).

**Conclusions/Next steps:** There is continued need for expansion of the integration of PVCS in primary and community health care settings to make PVCS more accessible at community level. Timely PVCS significantly improve health outcomes for survivors of GBV.

## WEPEE601

Enhancing economic resilience as an HIV prevention strategy for adolescent girls and young women: lessons from private sector engagement in DREAMS

W.K. Khondowe<sup>1</sup>, C. Siame<sup>1</sup>, M. Musheke<sup>1</sup>, M. Mwaba<sup>1</sup>, B. Mushiki<sup>1</sup>, F. Mwape<sup>1</sup>, B. Siamasuku<sup>2</sup>, A. Phiri<sup>3</sup>, C. Kanene<sup>3</sup>  
<sup>1</sup>Centre for Infectious Disease Research in Zambia, Programs, Lusaka, Zambia, <sup>2</sup>Young Women Christian Association, Programs, Lusaka, Zambia, <sup>3</sup>United States Agency for International Development, USAID/Zambia, Lusaka, Zambia

**Background:** In Zambia, HIV prevalence among women aged 20-24 is four times higher (5.9%) than males (1.8%) in the same age group<sup>[1]</sup>. This is because women are more susceptible to HIV compared to men in the same age group.

To address vulnerability of Adolescent Girls and Young Women (AGYW), Zambia, through the USAID funded DREAMS (Determined, Resilient, Empowered AIDS-free, Mentored, and Safe) program is addressing dimensions of vulnerability through economic strengthening activi-

ties targeting AGYW aged 15-24 and linking them with the private sector.

[1] Zambia Population Based HIV Impact Assessment (ZAMPHIA), December 2021

**Description:** The USAID Controlling HIV Epidemic for Key and Underserved Populations (CHEKUP) I Project is implementing economic strengthening activities aimed at reducing vulnerability of AGYW to acquiring HIV infection in seven (7) districts of Zambia.

The project has been providing economic strengthening interventions such as advanced financial literacy, digital literacy and training in savings skills targeting AGYW aged 15-24 since October 2021. Further, the project partnered with private sector to provide business start-up kits, internship, and employment to AGYW.

**Lessons learned:** Empowering AGYW through economic support is very crucial towards building their economic resilience, for long-term prevention of HIV. From October 2022 to September 2023, 11,103 AGYW were provided with economic strengthening services.

In partnership with the private sector, 174 AGYW were provided with vocational skills training; 162 were offered internships and employment; and 3,561 started their own businesses. Local entrepreneurs provided business mentorship to the AGYW running their small businesses; private sector entities were periodically engaged to identify internship and employment opportunities; and vocational skills training institutions provided enrolment spaces for AGYW.

**Conclusions/Next steps:** Empowering AGYW economically by creating synergies between the DREAMS program and the private sector can foster resilience and building a future where young women can navigate life's challenges and reduce their vulnerability to HIV infection.

Creating synergies with the private sector requires strong and constant engagements and creating win-win situations.

## WEPEE602

Taking best practices to scale: implementing national clinical and policy guidelines for Intimate Partner Violence in HIV/STI settings in Trinidad and Tobago

N. Lyons<sup>1</sup>, M. Olivier<sup>2</sup>, A. Mohammed<sup>1</sup>, P. Lee Wah Cooper<sup>1</sup>, S. Clement<sup>1</sup>, S. Soyer<sup>1</sup>, J. Edwards<sup>1</sup>

<sup>1</sup>Medical Research Foundation of Trinidad and Tobago, Port of Spain, Trinidad and Tobago, <sup>2</sup>Queens Park Counselling Centre and Clinic, Port of Spain, Trinidad and Tobago

**Background:** Intimate partner violence (IPV) may deter engagement and retention in HIV/STI prevention, care and treatment. On May 21 2022, the Government of Trinidad and Tobago adopted the World Health Organization (WHO) practice recommendations and launched its

Oral abstracts

first National Clinical and Policy Guidelines documenting quality standards in care for IPV and Sexual Violence. The Guidelines outlined steps in the pathway of care to include,

1. Identification of violence;
2. Immediate care;
3. Additional care, and
4. Referrals.

Routine clinical inquiry is recommended only as part of HIV testing and counselling and antenatal care for women. There is a lack of discussion on implementing quality standards in care for IPV in HIV/STI settings in Trinidad and Tobago.

**Description:** We aimed to identify gaps in current practices and barriers to implementing quality standards in care for IPV in HIV/STI settings. Using an Implementation Science approach, key evidence-based recommendations for IPV were included in a six-week consultation process with a multidisciplinary team of 14 healthcare workers from HIV/STI sites across the country.

The process included an overview of the Implementations Science approach, a review of data on the prevalence and health impact of IPV, and progress toward implementing quality standards in care for IPV.

Barriers to implementation were identified to include, inadequate attention to clients with elevated risks for IPV to include those with history of treatment interruptions; virally unsuppressed, LGBTQI+ individuals; youths; migrants; and persons with mental health disorders.

There was also lack of established protocols and systematic documentation of IPV cases resulting in under-reporting of IPV. Inadequate training of healthcare and lay workers also hindered effective IPV case identification.

**Lessons learned:** Using Implementation Science to assess progress and barriers to implementing quality standards in care for clients at elevated risks for IPV has the potential to translate evidence-based recommendations in routine practice and hence its adoption in HIV/STI care settings.

**Conclusions/Next steps:** Healthcare practitioners in HIV/STI settings should be meaningfully engaged in the design of appropriate, sustainable IPV protocols. receive training to strengthen IPV case identification, immediate and additional care, and the referral pathway for IPV, hence improving retention on treatment and health outcomes for IPV survivors.

## Integration of HIV services with other health and support services

### WEPEE603

Navigating facilitators and barriers to establishing chemsex services in Thailand – qualitative findings from the CLYMAX study

A. Hiransuthikul<sup>1,2</sup>, C. Phongsinghwithaya<sup>1</sup>, J. Siriphan<sup>3</sup>, T. Chayaananchot<sup>1</sup>, A. Tangmunkongvorakul<sup>4</sup>, T. Sripathanasakul<sup>1</sup>, P. Khomshuk<sup>1</sup>, P. Hongchookiat<sup>1</sup>, S. Nonenoy<sup>1</sup>, J. Boonruang<sup>1</sup>, N. Phanuphak<sup>1</sup>, CLYMAX study team

<sup>1</sup>Institute of HIV Research and Innovation (IHRI), Bangkok, Thailand, <sup>2</sup>Chulalongkorn University, Department of Preventive and Social Medicine, Faculty of Medicine, Bangkok, Thailand, <sup>3</sup>Foundation for AIDS Rights (FAR), Bangkok, Thailand, <sup>4</sup>Research Institute for Health Sciences, Chiang Mai University, Chiang Mai, Thailand

**Background:** Despite the growing prevalence of chemsex, there remains a lack of dedicated services for people who use chemsex and those involved in chemsex use in Thailand.

We explored facilitators and barriers to establishing and accessing comprehensive chemsex services encompassing physical, mental, and social health aspects for men who have sex with men (MSM) in Thailand.

**Methods:** Semi-structured, in-depth interviews were conducted with 60 key informants, comprising 40 MSM aged 16-35 who use chemsex, 10 peers/family members, and 10 healthcare providers. Interviews were conducted in person, recorded, and transcribed verbatim.

A codebook was developed integrating a priori themes from the interview guide and emergent themes identified from transcripts. Analyses were conducted using Dedoose software.

**Results:** All informants highlighted stigmatization, discrimination, and the uncertainty of law enforcement practices related to chemsex as key barriers to establishing or accessing comprehensive chemsex services.

The feeling of intersectional stigma – being a person who use drug, a gender minority, and, for some, living with HIV – along with anticipated discrimination in healthcare settings, legal uncertainties, and fear of arrest were reasons why people who use chemsex may hesitate to access chemsex services.

For healthcare providers, barriers included a lack of knowledge and confidence in providing care, particularly due to the variety of substances used and multifaceted chemsex-related harms, and competing priorities within health centers.

Disparities in views on harm reduction between informants and the country's policy, which focuses on abstinence, were another crucial barrier. Facilitators included integrating technology for online-based services and

public campaigns to destigmatize chemsex. People who use chemsex and peers/family members emphasized the benefits of including former users in consulting sessions and the importance of legal services and protection to make clients feel safe accessing services.

Healthcare providers expressed a strong willingness to move forward with the services, highlighting the need for well-established training and specialist consultation to build confidence in providing chemsex services to their clients.

**Conclusions:** Establishing comprehensive chemsex services presents a challenging yet crucial task to improve the health of people who use chemsex. Addressing identified barriers is essential to enhance and expand chemsex services tailored to the needs of this population.

## WEPEE604

**Integrating non-communicable disease screening and treatment into HIV services: programmatic results on hypertension and diabetes mellitus screening and care within HIV clinics in Littoral and South regions of Cameroon, 2023**

T. Dijkeussi<sup>1</sup>, P. Epee<sup>1</sup>, E. Epoh<sup>1</sup>, D. Nintcheu<sup>1</sup>, T. Nguenpenjang<sup>1</sup>, D. Kesseng<sup>1</sup>, A. Aboubakar<sup>1</sup>, E. Shu<sup>1</sup>, J. Simen<sup>1</sup>, F. Bogni<sup>1</sup>, J.S. Sinkot<sup>1</sup>, Y. Moussa Fadi<sup>1</sup>, R. Kana<sup>1</sup>, R. Adjeh<sup>3</sup>, E. Takem<sup>2</sup>, J. Shang<sup>2</sup>, Z. Bissemou<sup>1</sup>, C.B. Ndongmo<sup>2</sup>, G. Ndayisaba<sup>1</sup>, M. Jalloh<sup>2</sup>, J. Ditekemena<sup>4</sup>, P. Tchendjou<sup>1</sup>, B. Tchounga<sup>5</sup>, A. Yemane Berhan<sup>6</sup>, A. Tiam<sup>6</sup>

<sup>1</sup>Elizabeth Glaser Pediatric Aids Foundation, Yaounde, Cameroon, <sup>2</sup>Center for Disease Control and Prevention, Yaounde, Cameroon, <sup>3</sup>National AIDS Control Council, Ministry of Health, Yaounde, Cameroon, <sup>4</sup>Elizabeth Glaser Pediatric Aids Foundation, Research and Evaluation, Kinshasa, Congo, the Democratic Republic of the, <sup>5</sup>Elizabeth Glaser Pediatric Aids Foundation, Program, Yaounde, Cameroon, <sup>6</sup>Elizabeth Glaser Pediatric Aids Foundation, Washington DC, United States

**Background:** Integrating non-communicable diseases (NCD) services into HIV clinics is among the new strategies to improve patient-centered care and reduce mortality among people living with HIV (PLHIV).

We report the experience of integrating hypertension and diabetes mellitus (DM) screening into HIV program in Cameroon.

**Description:** We analyzed program data from selected high-volume hospitals integrating Hypertension and DM screening from April to September 2023. Integration strategy included refresher trainings on blood pressure measurement (BPM) and capillary glycemia check, adapting the client's flow, providing glucometers, tensiometers and reagents. Hypertension and DM were defined as two consecutive abnormal blood pressure (>140/90mmHg) and

glycemia (>1.26g/dl if fasting or >200mg/dl random blood glucose) measures. We described screening and treatment cascades using frequencies and percentages and identified gaps.

**Lessons learned:** Overall, 120 healthcare workers were trained during 14 theoretical and practical sessions in seven HIV clinics. Of the 18,220 PLHIV enrolled, 8,713 (47.8%) were screened and had a first BPM, including 386 (4.4%) with chronic hypertension and 8,327 (95.6%) unaware of their status; 2,403/8,327 (28.9%) had a high BPM; 561/2,403 (23.3%) returned for second BPM, and 310/561 (55.3%) were diagnosed with hypertension, of whom 230 (74.2%) classified mild, 54 (17.4%) moderate, and 26 (8.4%) severe.

Among the 386 with history of hypertension, 138 (35.8%) classified mild, 81 (21.0%) moderate, 63 (16.3%) severe, and 104 (26.9%) had a normal BPM. Treatment documentation was available for 217 of 696 known/newly diagnosed hypertension, including 139 (64.1%) receiving anti-hypertensive drugs.

Of the 8,990 PLHIV screened, 7,859 (87.4%) had glycemia measurement, including 150 (1.9%) with chronic DM and 7,709 (98.1%) unaware of their status. Among them, 193/7,709 (2.5%) had high glycemia, of whom 49/193 (25.4%) returned for second measurement, 11/49 (22.4%) were diagnosed with DM.

Additional workload for healthcare workers, stock out of reagents and low return for second measurements due to long waiting time and transportation fees are among the challenges identified during integration.

**Conclusions/Next steps:** While NCD service integration into HIV clinics increased access to hypertension and DM diagnosis, there is a need to address low return for blood pressure controls or glycemia check, to reduce the missed opportunities for diagnosis and treatment.

## WEPEE605

**Integrating mental health into HIV programmes using collaborative, stepped-care, task-sharing approaches and telemedicine**

A.I. Ibe<sup>1</sup>, T. Iheanacho<sup>2</sup>, C. Nwogwugwu<sup>3</sup>, A.U. Madukwe<sup>1</sup>, W. Egejuru<sup>4</sup>, C. Ugwuezumbe<sup>5</sup>, C.M. Inechi<sup>6</sup>

mental health gap action plan-intervention guide (mhGAP-IG) a validated, widely used tool to scale up mental health services into no-specialist setting.

**Methods:** We used *mixed-method* and *hybrid type 1* implementation research design to implemented mhGAP-IG training for non-specialists to assess, diagnose, and treat mental disorders in HIV clinics; and make referrals and consultations to collaborating specialists as clinically indicated using VULA telemedicine app in Imo State, Nigeria.

**Results:** 27 clinicians from 10 HIV clinics completed the WHO's mhGAP-IG 5-day training with modules on *essential care and practice, depression, psychosis, substance use disorders and suicide prevention*. Paired sample t-test of pre and post knowledge test scores showed significant knowledge improvement in knowledge (Table 1 and Table 2). BRAVE was successfully rolled out in the 10 HIV clinics.

4 weeks post rollout, 72 PLWHA have been screened for depression, psychosis and anxiety using the PHQ-9 and BPRS. 15% had moderate depression, 10% had moderate rating on the BPRS. A 100% received psychosocial support, and/or pharmacological treatments. 2% were referred to specialists.

Qualitative interviews with stakeholders (n=20) elicited barriers, facilitators, and opportunities for mental health integration of mental health into HIV clinics (Table 3).

Variable	Characteristics	n	%
Gender	Male	8	29.63
	Female	19	70.37
Age	Median	45 years	
	Mean	43.4 years	
Marital Status	Married	20	74.07

Table 1. Trainee HIV clinicians sociodemographics.

mhGAP Module	% Mean Pretest Score	% Mean Posttest Score	P-value
Essential Care & Practice	45.13	66.92	0.0000008
Psychoses	57.64	74.36	0.0002
Disorder due to Substance Use	70.83	69.55	0.417
Self-harm/ Suicide	68.27	84.13	0.00005
Depression	70.0	85.38	0.000251

Table 2. Pre-post knowledge test scores.

Theme	Sub-Themes	Summary
Opportunities/need for integration of mental health care into HIV	High perceived need	Stakeholders perceive high and increasing prevalence of mental illness and substance use disorders in the society in context of high stress and poverty and insecurity. Additional impact for people living with HIV due to stigma
	Clinician awareness	High levels of awareness among stakeholders about co-existence and relationship of mental illness and HIV
	System/Agency support	State health agencies support integration of mental health into HIV clinics. Administrators are aware of benefits of integration
Barriers to integration of mental health into HIV clinics	Paucity of mental health specialists/services	Very few mental specialists relative to the population HIV clinics have no formal access to mental health specialists No outpatient services within health centers where HIV clinics located. Referrals sent to specialist centers in and out of state
	HIV clinicians not trained to manage mental illness	Though they can identify some mental and substance use disorders, HIV clinicians have not had formal training to treat them.
	Stigma/lack of awareness by patients/families	High levels of stigma and negative attitudes in the population about mental illness leading to low detection and low treatment.
	Potential impact of mhGAP-IG intervention integrating MH into HIV clinics	Capacity building An improved knowledge of mental illness, and common treatments among clinicians They can treat patients and referred difficult or complex cases to specialists
Clinical impact on patients	Clinical impact on patients	Patients can have 'better' recovery for both HIV and mental disorders Patients can 'fully' function in society
	Research evidence	Knowing how best to treat patients with mental illness in HIV clinics. Gathering real life research evidence

Table 3. Themes from the qualitative interviews with key stakeholders on integration of mental health into HIV clinics in Imo State, Nigeria.

**Conclusions:** Integration of mental health into HIV clinics in resource-limited settings like Nigeria is feasible.

## WEPEE606

**Integrative health: a unified approach to cardiovascular diseases, hypertension, diabetes, and HIV services at Anti-Retroviral Treatment Center in Delhi, India**

S. Anuradha<sup>1</sup>, M. Goyal<sup>2</sup>, S. Singh<sup>2</sup>, S. Katario<sup>3</sup>

<sup>1</sup>Maulana Azad Medical College, Department of Medicine, Delhi, India, <sup>2</sup>UW International Training and Educational Center for Health (ITECH-India), Delhi, India, <sup>3</sup>ART Center, Lok Nayak Hospital, Delhi, India

**Background:** Anti-retroviral therapy (ART) has transitioned HIV into a chronic condition, coinciding with a global rise in longevity for people living with HIV (PLHIV) and increased susceptibility to comorbidities. These include cardiovascular diseases (CVDs), depression, cancers, and metabolic conditions like diabetes. The escalating prevalence of non-communicable diseases (NCDs) among PLHIV results from factors like aging, heightened traditional NCD risk, direct HIV-related effects, and exposure to specific antiretrovirals.

Our project aims to seamlessly integrate and evaluate CVD risk factors, hypertension, and diabetes prevalence while estimating the 10-year CVD risk among PLHIV under routine programmatic settings.

**Description:** Initiated in November-2023, this ongoing initiative screens all adult PLHIV aged ≥ 18 years at the ART center. An expert committee established a screening pro-

tolocol aligned with prevailing national guidelines, and ART center staff received specialized training for streamlining participant flow. PLHIV are screened for CVD risk factors—tobacco use, alcohol consumption, physical inactivity as well as measurements of weight, height, blood pressure, blood glucose, and lipid levels.

Utilizing this data, PLHIV are categorized into risk groups using the Framingham risk score, facilitating targeted intervention strategies.

**Lessons learned:** Between November-2023 and January-2024, 1,500 adult PLHIV underwent screening. The mean age was 43 ( $\pm 11$ ) years, with 45.2% belonging to the 30–45 age group; majority being males (64%). Prevalence rates among PLHIV were 37.8% (567/1500) for obesity, 17.8% (266/1500) for hypertension, 10.7% (160/1500) for diabetes, and 55.5% (667/1500) for dyslipidemia. The 10-year CVD risk estimates revealed 69.2% (1026/1482) at low risk, 19.7% (292/1482) at moderate risk, and 11.1% (164/1482) at high risk.

Due to this screening initiative, 64.3% (171/266) of hypertensive cases and 22% (35/160) of diabetic cases were newly identified. Age, gender, BMI, alcohol, tobacco, duration of disease were identified as factors significantly associated with an elevated risk for CVD event ( $p < 0.5$ ).

**Conclusions/Next steps:** Our observations indicate that integration of HIV and NCD services is feasible and enhances accessibility to timely screening and management, potentially reducing mortality in PLHIV.

Facilitating integration across national programs and service levels is pivotal for advancing this objective. The results support the inclusion of risk assessments in routine HIV programs, ensuring a comprehensive healthcare approach for PLHIV.

## WEPEE607

### Strengthening integrated HIV/STD testing services among MSM in China: qualitative findings from co-creation groups

L. Zhang<sup>1</sup>, D. Luo<sup>1</sup>, K. Li<sup>2</sup>, G. Marley<sup>1</sup>, R. Tan<sup>3</sup>, Z. Zhu<sup>1</sup>, Y. Liu<sup>1</sup>, T. Wang<sup>1</sup>, Q. Tang<sup>1</sup>, M. Sun<sup>1</sup>, D. van Duin<sup>4</sup>, D. Wu<sup>5</sup>, S. Sylvia<sup>4</sup>, K. Gray<sup>4</sup>, C. Wang<sup>6</sup>, L. Yang<sup>6</sup>, H. Zheng<sup>6</sup>, R. Ramaswamy<sup>7</sup>, W. Tang<sup>4</sup>, J. Tucker<sup>4,8</sup>

<sup>1</sup>UNC Project-China, Guangzhou, China, <sup>2</sup>University of California, Los Angeles, Los Angeles, United States,

<sup>3</sup>National University of Singapore, Singapore, Singapore,

<sup>4</sup>University of North Carolina at Chapel Hill, Chapel Hill,

United States, <sup>5</sup>Nanjing Medical University, Nanjing, China,

<sup>6</sup>Dermatology Hospital, Southern Medical University,

Guangzhou, China, <sup>7</sup>Cincinnati Children's Hospital Medical

Center, Cincinnati, United States, <sup>8</sup>London School of

Hygiene and Tropical Medicine, London, United Kingdom

**Background:** Despite the need for integrated HIV and other sexually transmitted disease (STD) testing services, many clinical services remain siloed. Co-creation is a par-

ticipatory research method that brings community perspectives into public health research. We used co-creation involving different stakeholders involved in sexual health and HIV prevention of men who have sex with men (MSM) to promote integrated chlamydia (CT) and gonorrhea (NG) testing services within existing HIV testing services at community-based organizations (CBOs) in Guangdong Province, China.

**Methods:** We conducted formative research for a cluster randomized trial to promote STD testing among MSM. From August 2021 to August 2023, we held 10 one-hour co-creation sessions involving 2 doctors and 15 MSM community members, including 5 CBO representatives.

The purposes of FGDs were to:

1. Understand their experiences of integrating CT/NG testing within existing HIV testing services and;
2. Explore barriers and facilitators of HIV/STD integrated service delivery.

All co-creation sessions were conducted in Mandarin and documented through audio recordings or written meeting notes. Qualitative data were analyzed through rapid inductive thematic analysis.

**Results:** The co-creation sessions elicited three key themes related to integrated services: lack of integrated testing, limited knowledge of STDs other than HIV, and the need for policy advocacy.

1. The limited availability of CT/NG self-testing options complicates HIV/STD services integration. Co-creation participants iterated that decentralized testing options like HIV/syphilis self-testing and CT/NG self-sampling could facilitate service integration.
2. Most MSM presenting for testing had limited knowledge of CT/NG compared to HIV. CBO representatives highlighted the need for developing educational materials that emphasize the relationship between CT/NG acquisition and HIV risk to promote HIV/STD awareness.
3. Without research funding, CBOs and the government lacked CT/NG testing funds as it is not a national priority area. It was suggested that researchers should advocate for including CT/NG in the national STD screening guidelines for MSM.

**Conclusions:** Our study revealed through co-creation that lack of access, education, promotion, and policy advocacy hampered the development of integrated HIV/STD testing. Further research and development of interventions to address these areas are warranted.

Nachalwe<sup>2</sup>, O. Mweemba<sup>4</sup>, F. Masiye<sup>6</sup>, J. Edwards<sup>7</sup>, J. Pry<sup>2,8</sup>, M. Vinikoor<sup>2,9</sup>, M. Herce<sup>2,10</sup>

<sup>1</sup>University of Zambia, School of Public Health, Department of Health Policy and Management, Lusaka, Zambia, <sup>2</sup>Centre for Infectious Disease Research in Zambia (CIDRZ), Lusaka, Zambia, <sup>3</sup>University of Ghana, School of Public Health, Department of Biostatistics, Accra, Ghana, <sup>4</sup>University of Zambia, School of Public Health, Department of Health Promotion and Education, Lusaka, Zambia, <sup>5</sup>University Teaching Hospital, Department of Medicine, Lusaka, Zambia, <sup>6</sup>University of Zambia, School of Public Health, Department of Health Economics, Lusaka, Zambia, <sup>7</sup>University of North Carolina at Chapel Hill, Department of Epidemiology, Chapel Hill, United States, <sup>8</sup>University of California at Davis, Department of Public Health, Davis, United States, <sup>9</sup>University of Alabama at Birmingham, Division of Infectious Diseases, Department of Medicine, Birmingham, United States, <sup>10</sup>University of North Carolina at Chapel Hill, Institute for Global Health and Infectious Diseases, Chapel Hill, United States

**Background:** Despite increasing hypertension, diabetes, and dyslipidemia prevalence among people living with HIV (PLHIV) in sub-Saharan Africa, health system capacity to address these cardiometabolic non-communicable diseases (NCDs) is limited. We developed an evidence-based intervention using the WHO Package of Essential NCD interventions, coined 'TASKPEN,' that applies a multi-faceted implementation strategy to integrate HIV and cardiometabolic NCD care through task-sharing, practice facilitation, and health system resourcing. We conducted a pilot, 'mini' cross-sectional stepped-wedge trial to estimate preliminary TASKPEN effects on clinical outcomes(#NCT05005130).

**Methods:** We performed serial surveys among PLHIV ≥18 years accessing routine HIV services at two PEPFAR-supported clinics between 1 March 2022–23 December 2022. Surveys were conducted ~3 months apart at baseline, midline, and endline to estimate cardiometabolic NCD prevalence and our primary outcome—'dual control' of both HIV and blood pressure according to WHO-recommended thresholds.

We introduced TASKPEN in a stepwise fashion, first at site A following the baseline survey and then site B following the midline survey; both sites continued TASKPEN implementation through the endline survey. We compared the

proportion of participants with dual control between intervention and control periods using Pearson's chi-square test.

**Results:** We enrolled 1,090 participants, of whom 25.7% and 3.2% had a history of hypertension or diabetes, respectively (Table 1).

The proportion of participants with dual control was significantly higher after (60.1%) versus before (51.6%) the TASKPEN intervention(p=0.005), with improvement in dual control underpinned by increases in both viral suppression and blood pressure control (Table 2).

Average hemoglobin A1c decreased after the intervention for participants with elevated random or fasting blood glucose.

Characteristic	Control (N=634) n (%)	Intervention (TASKPEN) (N=456) n (%)	Total (N=1,090) n (%)	p-value
Age (Year), median [interquartile range]	46 [38, 53]	45 [38, 52]	45 [38, 53]	0.853
Sex				
-Male	166 (26.2)	136 (29.8)	302 (27.7)	0.185
-Female	468 (73.8)	320 (70.2)	788 (72.3)	
Body Mass Index (kg/m <sup>2</sup> )				
-Underweight (<18.5)	53 (8.4)	41 (9.1)	94 (8.7)	<0.001
-Normal weight (18.5-<25)	257 (40.5)	246 (54.7)	503 (46.4)	
-Overweight (≥25-<30)	178 (28.1)	107 (23.8)	285 (26.3)	
-Obesity (≥30)	146 (23.0)	56 (12.4)	202 (18.6)	
History of Hypertension				
-No	483 (76.2)	327 (71.7)	810 (74.3)	0.095
-Yes	151 (23.8)	129 (28.3)	280 (25.7)	
History of Diabetes				
-No	610 (96.2)	445 (97.6)	1,055 (96.8)	0.205
-Yes	24 (3.8)	11 (2.4)	35 (3.2)	
Time on Antiretroviral Therapy (years)				
<1	26 (4.1)	17 (3.7)	43 (3.9)	0.661
1 - <5	113 (17.8)	70 (15.4)	183 (16.8)	
5 - <10	141 (22.2)	111 (24.3)	252 (23.1)	
≥10	354 (55.8)	258 (56.6)	612 (56.1)	

Table 1. Background sociodemographic and clinical characteristics of participants (N=1,090).

Outcome	Control (N=634) n (%)	Intervention (TASKPEN) (N=456) n (%)	p-value*
Dual control <sup>1</sup>	327 (51.6)	274 (60.1)	0.005
HIV control <sup>2</sup>	542 (85.5)	406 (89.0)	0.086
Blood pressure control <sup>3</sup>	395 (62.3)	311 (68.2)	0.044
Hemoglobin A1c, n; mean% (SD) <sup>4</sup>	48; 7.3% (2.6)	23; 6.1% (2.1)	0.055

<sup>1</sup>Dual control defined as HIV control (i.e., viral load <1,000 copies/ml for those with a documented viral + evidence of 6-month multi-month dispensing for those with a missing viral load) + Blood pressure control (systolic blood pressure <140 mmHg AND diastolic blood pressure <90 mmHg);

<sup>2</sup>HIV control (i.e., viral load <1,000 copies/ml for those with a documented viral + imputed viral load for stable clients with documented evidence of receipt of 6-month multi-month dispensing);

<sup>3</sup>Blood pressure control (systolic blood pressure <140 mmHg AND diastolic blood pressure <90 mmHg);

<sup>4</sup>Hemoglobin A1c measured for participants with an elevated screening random (≥11.1 mmol/L) or fasting blood glucose (≥7.0 mmol/L).

\*Pearson's chi-square for categorical variables, Student t-test for continuous variables SD= standard deviation

Table 2. Comparison of primary and secondary clinical outcomes between control and intervention periods (Intention-to-Treat Population, N=1,090).

**Conclusions:** Our preliminary findings suggest an integrated, task-shifted WHO-endorsed service package can improve control of both HIV and blood pressure for PLHIV.

## WEPEE609

Horizontal integration of mental health and psychosocial support services (MHPSS) into HIV care for key populations (KP) among USAID projects in Myanmar

Z. Minn Oo<sup>1</sup>, T. Hnin Aye<sup>1</sup>, K. Phyo Naing<sup>2</sup>, L. Htet<sup>1</sup>, H. Yusan<sup>3</sup>, T. Thi Win<sup>4</sup>, T. Soe<sup>3</sup>, M. Kyaw Kyaw<sup>3</sup>, Y. Min Thaung<sup>4</sup>, L. Aung Thu<sup>3</sup>, S. Lone Tip<sup>5</sup>

<sup>1</sup>Community Partners International, USAID HIV/TB

Agency Information & Services, Yangon City, Myanmar,

<sup>2</sup>Community Partners International, Community Partners

International, Yangon, Myanmar, <sup>3</sup>Community Partners International, USAID HIV/TB Agency Information & Services,

Yangon, Myanmar, <sup>4</sup>Community Partners International, USAID Agency Information & Services, Yangon, Myanmar,

<sup>5</sup>United State Agency for International Development, Office of Public Health, Yangon, Myanmar

**Background:** Despite challenges in obtaining mental health data among KPs in Myanmar, the figures published in **BMC Public Health (2020)** and the **Asian Journal of Psychiatry (2021)** reported that Mental distress ranges from **18.0% to 27.2%** of depressive symptoms and a rate of **9.4% in suicidal ideation**.

This indirectly indicates the importance of integrating MH assessment and treatment into HIV service in Myanmar since the complex relationship between HIV and Mental Health can hinder both individuals' adherence to treatment and the overall well-being of their families.

**Description:** With the support of **USAID**, the AIS project works to assess the alarming mental health signs and symptoms among KPs in Myanmar while reaching out and providing HIV prevention services through trained community workers using **Psychological First Aid (PFA)** techniques. They then refer and link the clients with suspected signs and symptoms to the nearest service centers (KPSC) where trained MOs and counselors provide relevant and evidence-informed intervention: **Problem Management Plus (PM+)**. **Safety planning and suicidal prevention** plans are also incorporated at all levels of care for both beneficiaries and service providers by **outsourcing psychiatric care**.

**Lessons learned:** From 2022 to 2023, the project succeeded in equipping multiple skill training to 101 healthcare workers for PFA support in the community setting and PM+ service provision in the KPSCs. A total of **243 KPs received PFA support** in the community HIV prevention setting during 2023 August and September, and the support is increasing over time. In the meantime, at the facility HIV care setting, a total of **922 PWIDs** were screened using **PHQ 4**, and **526 clients were indicated for further assess-**

**ment**. Of these, **17 KPs were diagnosed with Psychosis, 14 with Depression, and the remaining 505** clients did not require any interventions.

### Conclusions/Next steps:

The task shifting and stepped interventions of the MH-PSS integrated care model prove to enhance the quality of life for individuals living with HIV and mental health conditions. Ensuring the **biannual screening, promoting MHPSS awareness, and strengthening integrated care** with a **robust referral system** will contribute to improving the HIV outcome by identifying MH concerns early and enhancing adherence to HIV treatments.

## WEPEE610

Integrated HIV/HTN care model improves individual level blood pressure reduction among adults with HIV in Uganda

Uganda, <sup>7</sup>University of California Berkeley, Berkeley, United

States, <sup>8</sup>Infectious Diseases Research Collaboration/

Makerere University, Kampala, Uganda

**Background:** Globally, the prevalence of hypertension (HTN) among people with HIV has increased dramatically over the last decade. In a cluster randomized trial (NCT04624061), we demonstrated that a multicomponent, integrated HIV/HTN care intervention model improved uptake of HTN screening by 55% over the standard-of-care. Within the intervention arm, we evaluated longitudinal changes in blood pressure (BP) control.

**Methods:** The integrated HIV/HTN trial enrolled adults (≥18years) with HIV from 52 health centres in 26 districts of rural Southwestern Uganda. The intervention included: 1. Health-worker training on integrating HTN care into HIV services, 2. Promoting HTN screening and treatment; 3) improving records, 4. Availing essential equipment and consumables; and 5. WhatsApp messages for coordination among providers.

Among participants with hypertension at baseline, we measured change in proportion with BP control (<140/90mmHg) from baseline to 12-months of follow-up, overall and by subgroup, and the proportion with improved systolic BP by ≥10mmHg.

Author Index

**Results:** Of the 1200 HTN participants enrolled from the 26 intervention health centres 60% were female, of median age 49 years. At baseline, only 3.6% of participants showed BP control but after 12-months of the intervention, 36.7% had achieved control, corresponding to an absolute increase of 33.1% (95%CI: 25.3-41.0%;  $p<0.001$ ). Significant increases in BP control were observed within subgroups of age, sex and level of health centre (Figure). In addition, 70% of all participants had reduced their BP by  $\geq 10$ mmHg, including 54% of participants who never achieved WHO-level control. Among these; 74% had WHO Stage-2 HTN (160/100mmHG) and 79% had WHO Stage-3 HTN (180/110mmHg).

**Conclusions:** The integrated HIV/HTN care model improved long-term BP control by ~30% overall in both men and women, older and younger persons. Most participants in WHO stages 2 and 3 achieved more than 10mmHg reduction in systolic blood pressure.

## WEPEE611

Qualitative assessment of client and provider experiences with an integrated HIV-Hypertension intervention to improve screening and care for persons with HIV in southwestern Uganda

C. Akatukwasa<sup>1</sup>, A. Byamukama<sup>1</sup>, M. Atukunda<sup>1</sup>, G. Mutungi<sup>2</sup>, B. Twinamatsiko<sup>1</sup>, A. Mutabazi<sup>1</sup>, J. Tumusiime<sup>1</sup>, M. Ayebare<sup>1</sup>, A. Asiimwe<sup>1</sup>, E. Arinitwe<sup>3</sup>, J. Nangendo<sup>4</sup>, S.B. Shade<sup>5</sup>, E.D. Charlebois<sup>5</sup>, L.B. Balzer<sup>6</sup>, S. Kapiga<sup>7</sup>, E. Okello<sup>3</sup>, M.R. Kamyaga<sup>8</sup>, J. Kabami<sup>1</sup>

<sup>1</sup>Infectious Diseases Research Collaboration, Kampala, Uganda, <sup>2</sup>Ministry of Health, Uganda, Kampala, Uganda, <sup>3</sup>Uganda Heart Institute, Kampala, Uganda, <sup>4</sup>Makerere University, Kampala, Uganda, <sup>5</sup>University of California, San Francisco, California, United States, <sup>6</sup>University of California, Berkeley, California, United States, <sup>7</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>8</sup>Makerere University, College of Health Sciences, Kampala, Uganda

**Background:** Integrating hypertension (HTN) screening and care into HIV care services presents a unique opportunity for improved treatment outcomes among people with HIV (PWH). We introduced a multi-component inte-

grated HTN/HIV intervention in HIV care services in public health facilities to address barriers to HTN screening and care. We assessed client and provider perspectives and experiences of HTN screening and care following the integrated HTN/HIV intervention.

**Methods:** This descriptive qualitative study was conducted among PWH and providers in 10 intervention facilities in southwestern Uganda (INTEGRATED HIV/HTN; NCT04624061). We conducted in-depth interviews with 20 PWH and 15 providers from January to February 2023. Interview audio recordings were transcribed verbatim and translated to English for thematic analysis using Dedoose software.

**Results:** Providers revealed that integrated HTN screening and care services resulted in;

1. Optimization of time, finances, and other resources;
  2. Increased HTN screening, and early detection and management of HTN;
  3. Increased knowledge of HTN and HTN screening, including interpretation of blood pressure readings.
- For PWH, including HTN in client-provider interactions, enabled adoption of lifestyle modification practices and increased desire to control or prevent HTN.

The availability of HTN services within HIV care clinics plus inclusion at lower Health center IIIs, where HIV care services already existed cut down the cost of multiple clinic visits for PWH. Intervention success was attributable to provider experiences with training, enhancing peer educator support amidst health work force challenges, and bolstering drug supplies to reduce the gap of drug shortages. Persistent obstacles included intermittent distribution of HTN drugs, clients' unmet need for screening diabetes, and poor utilization of data collection tools due to insufficient provider training and workload.

**Conclusions:** Routinizing HTN screening within HIV care settings serves as an opportunity for reducing the burden of comorbidities among PWH. For this to be successful, it would require well-aligned policies and guidelines. Leveraging peer educators could potentially promote continuity of services amidst healthcare workforce challenges.

## WEPEE612

Building out from the HIV response to drive broad-based health gains: six country case studies

M. Isbell<sup>1</sup>, A. Achrekar<sup>2</sup>, C. Stegling<sup>2</sup>, C. Collins<sup>3</sup>, M. Mugabe<sup>4</sup>

<sup>1</sup>Independent Consultant, New York, United States, <sup>2</sup>UNAIDS, Geneva, Switzerland, <sup>3</sup>Friends of the Global Fight Against AIDS, TB and Malaria, Washington, United States, <sup>4</sup>UNAIDS, Pretoria, South Africa

**Background:** The HIV response is a pathfinder in global health equity, helping to advance progress towards Universal Health Coverage. This study looks at how diverse countries and communities are innovating to "build out" from the HIV response to build stronger health and com-

munity systems that are capable of expanding access to integrated, people-centred care, and sustainable care, community-led and reach the most vulnerable, to respond to broader health and development threats.

**Description:** Friends of the Global Fight and UNAIDS partnered to do six case studies in Colombia, Côte d'Ivoire, Jamaica, South Africa, Thailand and Uganda.

The case studies are based on a desk review and key informant interviews. They identify commonalities and unique experiences in building out from HIV programming with the simultaneous goals of ending the HIV epidemic and advancing toward Universal Health Coverage.

**Lessons learned:** In diverse settings, substantial progress is being made to build out from HIV investments to strengthen health systems. HIV platforms are being used for the delivery of integrated, holistic, people-centred care for people living with HIV and others. HIV infrastructure, such as laboratories, diagnostics, human resources and other services are being utilized in broader health services.

The community services infrastructure built through HIV investments is yielding wide health benefits, particularly for key population groups. The resilience, flexibility and community engagement in HIV platforms makes them useful in broader health.

**Conclusions/Next steps:** Policy makers should be more purposeful in leveraging HIV platforms in order to create win-win scenarios for broader health systems.

Greater flexibility in use of donor funds should be considered. Building out from HIV services must be done carefully to identify synergies and strengthen HIV responses themselves.

The HIV ethos of community-led response, reaching the most vulnerable and access for all should be incorporated into broader health and community systems and policy.

## WEPEE613

### Feasibility and early outcomes of the SEARCH multi-disease population-level community health worker-led intervention for integrated HIV and severe hypertension services in rural East Africa

M.D. Hickey<sup>1</sup>, A. Owaraganise<sup>2</sup>, S. Ogachi<sup>3</sup>, V. Nahurira<sup>2</sup>, C. Aoko<sup>3</sup>, N. Sang<sup>3</sup>, G. Agengo<sup>3</sup>, J. Kabami<sup>2</sup>, E. Kakande<sup>2</sup>, W.E. Mugoma<sup>3</sup>, J. Schwab<sup>4</sup>, N. Sutter<sup>1</sup>, G. Chamie<sup>1</sup>, M.L. Petersen<sup>4</sup>, L.B. Balzer<sup>4</sup>, E.A. Bukusi<sup>3</sup>, D.V. Havlir<sup>1</sup>, M.R. Kamya<sup>2</sup>, J. Ayieko<sup>3</sup>

<sup>1</sup>University of California San Francisco, San Francisco, United States, <sup>2</sup>Infectious Diseases Research Collaboration, Kampala, Uganda, <sup>3</sup>Kenya Medical Research Institute, Nairobi, Kenya, <sup>4</sup>University of California Berkeley, Berkeley, United States

**Background:** We previously demonstrated that person-centered multi-disease community health campaigns improved hypertension control and reduced mortality at a population level, with greatest benefit among those with severe hypertension. Because health campaigns require additional resources, we sought to determine if existing community health workers (CHWs) could be leveraged to improve hypertension cascade outcomes among persons with severe hypertension in rural Kenya and Uganda, using an integrated community-based hypertension/HIV service model.

**Methods:** In an ongoing cluster randomized trial of a population-level hypertension/HIV intervention, the hypertension intervention includes blood pressure (BP) screening by CHWs and clinic referral for BP  $\geq 140/90$  mmHg (three-measure average).

Following initial clinic-based evaluation, persons  $\geq 40$  years with severe hypertension ( $\geq 160/100$  mmHg) are offered clinic-based or telehealth (CHW home visit with clinician telehealth evaluation and medication delivery) follow-up care.

We conducted case-based CHW training on BP measurement with quality assessment and used smartphone app to facilitate screening and workflow. The app syncs with electronic clinic records, prompts follow-up visits/default-tracing, and facilitates clinician telehealth assessment/medication prescribing.

We report intervention-arm hypertension care cascade outcomes, estimating cumulative incidence of hypertension control ( $<140/90$  mmHg) with Kaplan-Meier and using log-rank to compare hypertension control by follow-up location choice.

**Results:** Across eight rural communities in Kenya and Uganda, 198 CHWs conducted hypertension screening among 36,484 of 40,701 adults  $\geq 18$  years (90%).

Among adults screened, 55% were female and 11% were living with HIV ( $n=4,000$ ). Of 14,046 adults  $\geq 40$  years, 1,267 (9%) had severe hypertension; of these, 996 (79%) linked to clinic, and 876 had persistent hypertension and enrolled in the study.

At enrollment, 69% (n=607) selected telehealth and 31% (n=267) clinic-based follow-up. During early follow-up (median 196 days; 90% range 89-246 days), 93% received  $\geq 1$  antihypertensive medication. Cumulative incidence of hypertension control (<140/90mmHg) 90-days post-enrollment was 57% (95%CI 54-60%) overall, 65% (95%CI 53-74%) among people with HIV (n=91), and higher among those choosing telehealth follow-up (61% telehealth vs 50% clinic, log-rank p=0.0001).

**Conclusions:** Within the context of large-scale multi-disease HIV status-neutral population-level screening (n=36,484), CHW screening and treatment support can effectively extend the health system to improve hypertension cascade outcomes among individuals with severe hypertension and is feasible at scale.

## WEPEE614

### Non-communicable diseases service integration with a community-based HIV care and treatment activity in Ethiopia

E.S. Ebrahim<sup>1</sup>, D.(. Abraham Tsegaye<sup>2</sup>, G.A. Biks (Prof.)<sup>3</sup>, F. Shiferie<sup>4</sup>, A. Tekeste<sup>5</sup>, A. Hayes<sup>6</sup>, L. Wogayehu<sup>7</sup>, L.A. Mekuria<sup>8</sup>, E. Liddell<sup>6</sup>, A.(. Negash<sup>9</sup>

<sup>1</sup>Project HOPE Ethiopia, M&E and Quality Improvement Advisor, Addis Ababa, Ethiopia, <sup>2</sup>Project HOPE Ethiopia, CR & Chief of Parity, Addis Ababa, Ethiopia, <sup>3</sup>Project HOPE Ethiopia, Senior Research and Implementation sciences Advisor, Addis Ababa, Ethiopia, <sup>4</sup>Project HOPE Ethiopia, M&E Department, Addis Ababa, Ethiopia, <sup>5</sup>Project HOPE Ethiopia, Program Implementation Directorate, Addis Ababa, Ethiopia, <sup>6</sup>Project HOPE USA, Program Office, Africa, Washington DC, United States, <sup>7</sup>Project HOPE Ethiopia, Care & Treatment, Addis Ababa, Ethiopia, <sup>8</sup>Project HOPE Ethiopia, MERL & Quality Directorate, Addis Ababa, Ethiopia, <sup>9</sup>USAID, AOR, Addis Ababa, Ethiopia

**Background:** Non-communicable diseases (NCDs) pose an increasing health challenge to people living with HIV (PLHIV) in developing countries. Despite PLHIV have a higher risk of developing NCDs, clinical follow-up visits are often limited due to the use of differentiated ART refilling models.

In Ethiopia, the USAID-funded Community-based HIV Care & Treatment (CHCT) activity integrated NCD services to provide an innovative and cost-effective approach to early detection and mitigation of NCDs among PLHIVs. We analyzed the pilot integration services with CHCT activity in community settings.

**Description:** Project HOPE trained the community health-care workers (CHWs), provided technical assistance to local implementing partners, and distributed NCD screening kits. Between January 2023 to January 2024, CHWs provided risk screening to PLHIVs during home visits, service provision, group sessions and community ART refills.

Clients identified with NCD risk factors were enrolled into community NCD service package and clients had High BP & BS level were referred to HF for NCD diagnosis.

Client-level data were collected using CommCare and descriptive analysis was conducted using SPSS software version-21.

**Lessons learned:** A total of 9,674 PLHIV were screened for NCD risk factors, of which, 946 (10%) were positive. The mean age was 41.7 years(SD=9.9) and 76% were female.

Almost all (895/946; 95%) were enrolled into the NCD service package. Of which, 178 clients (19%; 95% CI: 18.1-19.5) had high blood pressure (HBP) and/or high blood sugar (HBS). Among these, 82% had HBP, 11% had HBS, and 7% had both.

The proportion of PLHIV with HBP and/or HBS increased to 10%, 22%, and 50%, for age groups 18-39, 30-49, and 50+, respectively.

Majority, (139/178, 78%) were referred to HFs for NCD diagnosis and treatment where 85% were confirmed for hypertension, 12% for diabetes mellitus, and 3% for both.

**Conclusions/Next steps:** The combination of screening for NCD risk factors, taking BP, and testing BS levels was a feasible and accurate strategy to identify NCDs. The approach was cost effective, increased access for prevention, early detection and community level NCD service provision. We recommend the scaleup of the NCDs service integration with the CHCT activity to improve health outcomes and retention in care among PLHIV in Ethiopia.

## WEPEE615

### Stepping Stones: a content analysis exploring beneficiaries and implementers perceived effectiveness of the 13-week HIV education program in Zambia

A. Kashyap<sup>1</sup>, K. Stoebe<sup>1</sup>, M. Mwamba<sup>2</sup>, M. Mwale<sup>3</sup>, C. Maambo<sup>3</sup>, G. Muchanga<sup>3</sup>, S. Toussaint<sup>1</sup>, M.A. Peralta<sup>1</sup>, C. Baumhart<sup>4,5</sup>, L. K Mwango<sup>2</sup>, C. Muleya<sup>6</sup>, A. Mwila<sup>6</sup>, C.W. Claassen<sup>3,4,5</sup>

<sup>1</sup>University of Maryland College Park, Department of Behavioral and Community Health, College Park, United States, <sup>2</sup>Ciheb Zambia, Lusaka, Zambia, <sup>3</sup>Maryland Global Initiatives Corporation Zambia, Lusaka, Zambia, <sup>4</sup>University of Maryland School of Medicine, Center for International Health, Education, and Biosecurity, Baltimore, United States, <sup>5</sup>University of Maryland School of Medicine, Institute of Human Virology, Baltimore, United States, <sup>6</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Lusaka, Zambia

**Background:** Adolescent girls and young women (AGYW) in Zambia are at high risk of acquiring HIV due to gender-inequitable relationships, compounded by social, cultural, and economic factors that increase susceptibility to early and unprotected sexual activity. Stepping Stones, the DREAMS initiative's 13-week HIV education package,

provides safe spaces for AGYW to explore gender norms, relationships, sexual health, and life skills. This abstract presents the perceived effectiveness of Stepping Stones among DREAMS beneficiaries and implementers.

**Methods:** Between March and July 2023, semi-structured interviews, focus groups and community/program observations were conducted with DREAMS beneficiaries (n=55) and other AGYW (n=11) ages 16-21, and program implementers (n=51) across three purposively selected sites in three DREAMS districts.

We used content analysis to identify preferences, perceived effectiveness, and implementation challenges of Stepping Stones. Data were analyzed using Atlas.ti (Version 23).

**Results:** Stepping Stones was generally well-received by beneficiaries who highlighted it provided needed sexual and reproductive health (SRH) information (e.g., HIV, pregnancy prevention); exposed them to content not learned elsewhere in the community (e.g. safer sex, gender-based violence); helped build communication skills, and plan for their future.

Beneficiaries found the modules Planning My Future, Gender Based Violence, and Let's Communicate most helpful. Implementers resoundingly felt that Stepping Stones improved beneficiary's SRH knowledge, and helped beneficiaries open up to implementers, thus allowing them to be connected to other needed services.

Beneficiaries who could not relate the content to their life, already knew the content, or felt that the services were not needed were less attentive or appreciative of Stepping Stones.

Implementers reported challenges with delivering content on contraception and sexuality to younger girls, and fear of being accused of teaching younger kids about "adult topics." Implementers recommended boys would also benefit from this program, as it would help them, and improve the impact for AGYW.

**Conclusions:** Stepping Stones was perceived to be an effective package in improving SRH knowledge and skills; as it prepared AGYW to self-identify what is right for them and for their future.

Looking ahead, implementers suggested the overall benefit would be more sustainable if Stepping Stones also included boys and young men.

## WEPEE616

### Enhancing HIV care: insights from integrating mental health into HIV care in Nepal

K. Adhikari<sup>1</sup>, Y. Sapkota<sup>1</sup>, P. Khatriwoda<sup>1</sup>, D. Bhandari<sup>1</sup>, R. Khandal<sup>1</sup>, P.K. Thakur<sup>2</sup>, M. Cassell<sup>2</sup>, C. Casalini<sup>2</sup>, S. Chaudhary<sup>3</sup>, P. Thapa<sup>4</sup>, A. Ansari<sup>5</sup>, I. Lohar<sup>6</sup>, T. Weldegebreab<sup>6</sup>

<sup>1</sup>FHI 360, Kathmandu, Nepal, <sup>2</sup>FHI 360, Durham, United States, <sup>3</sup>Nepal National Social Welfare Association, Dhangadhi, Nepal, <sup>4</sup>STD/AIDS Counseling and Training Services, Kathmandu, Nepal, <sup>5</sup>Cruiseaids, Nepal, Kathmandu, Nepal, <sup>6</sup>USAID, Kathmandu, Nepal

**Background:** People living with HIV (PLHIV) experience higher rates of mental health disorders than the general population. The 2019-2020 WHO Nepal mental health (MH) assessment reported that 3.6% had major depressive disorder and 4.2% had alcohol use disorder.

To address this, the Meeting Targets and Maintaining Epidemic Control (EpiC) project, supported by the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) and the United States Agency for International Development (USAID), implemented mental health services for key populations (KPs) and PLHIV in Nepal.

**Description:** Trained peer outreach workers used the locally adapted Kessler scale (K6) to identify psychological distress during HIV education in the community. Clients with severe psychological distress were referred to the facility for further assessment using the Patient Health Questionnaire-9 (PHQ-9) for depression and Alcohol Use Disorders Identification Test - Concise (AUDIT-C) for harmful alcohol use. Those with high scores ( $\geq 15$  in PHQ-9 and  $\geq 3$  in AUDIT-C) received psychosocial interventions, counseling, and psychiatrist referrals.

**Lessons learned:** From July 2022 to November 2023, we conducted 30,382 K6 assessments. Of these, 15,437 (51%) were males at birth, 20,734 (68%) were KPs, and 9,648 (32%) were PLHIV. Among those screened, 1% (291) had severe psychological distress, 85% (173/202) exhibited some level of depression (mild, moderate, severe), and 71.2% (62/87) showed harmful alcohol use.

Among those with depression, 46% (80/173) required treatment, and 87% (70/80) received it. Major challenges included low case detection, inadequate awareness, and high staff workload.

**Conclusions/Next steps:** Our study shows a small proportion of clients with severe psychological distress, possibly due to community venues not being conducive for screening, and inadequate post-training monitoring of outreach workers. Recommendations include conducting a formative assessment to understand clients' needs and preferences for MH service, evaluating service delivery experiences of outreach workers, identifying inclusive screening tools before integration, and emphasizing awareness programs and staff motivation for successful integration.

Moreover, a higher proportion of clients reported mild to severe depression and harmful alcohol use compared to the national survey, though our analysis included a smaller sample of clients already reporting severe psychological distress. Hence, we recommend reviewing the MH service delivery model to reach more clients.

## WEPEE617

### Considerations for integrating community HIV and Non-communicable disease care within microfinance groups in western Kenya

J. Wachira<sup>1</sup>, C. Kafu<sup>2</sup>, M. Wilson-Barthes<sup>3</sup>, T. Tran<sup>4</sup>, J. AbdulKadir Said<sup>5</sup>, R. Vedanthan<sup>6</sup>, S. Pastakia<sup>7</sup>, S. Goodrich<sup>8</sup>, P. Braitstein<sup>9</sup>, O. Galárraga<sup>3</sup>, B. Lynn Genberg<sup>10</sup>

<sup>1</sup>Moi University, Mental Health and Behavioral Sciences, Eldoret, Kenya, <sup>2</sup>AMPATH, Eldoret, Kenya, <sup>3</sup>Brown University, Providence, United States, <sup>4</sup>Temple University, Philadelphia, Kenya, <sup>5</sup>Moi University, Eldoret, Kenya, <sup>6</sup>New York University, New York, United States, <sup>7</sup>Purdue University, Indiana, United States, <sup>8</sup>Indiana University, Indianapolis, United States, <sup>9</sup>University of Toronto, Ontario, Canada, <sup>10</sup>John Hopkins University, Baltimore, United States

**Background:** Integrated HIV and non-communicable disease (NCD) facilitates more comprehensive care to people living with HIV (PLWH) with comorbidities. Microfinance groups have been shown to be effective in promoting better care outcomes by addressing the economic challenges PLWH face, engaging in care and maintaining adherence with treatment. Delivering integrated HIV+NCD care within existing microfinance groups may be an efficient approach to providing care at the community level.

We explored considerations for implementing this multi-level approach under real-world scenarios using the consolidated framework for implementation research (CFIR).

**Methods:** We conducted a qualitative study (March-May 2023) among PLWH enrolled in the Harambee cluster randomized trial in western Kenya. Trial participants were adult patients receiving care through the Academic Model Providing Access to Healthcare program and actively engaged in a microfinance group. Convenience sampling identified a sub-sample of 40 trial participants (24 PLWH and 16 PLWH with diabetes and/or hypertension) for in-depth interviews. A thematic analysis focusing on the CFIR implementation process domain was conducted using Nvivo software.

**Results:** Six implementation process constructs emerged as important considerations for integrating HIV+NCD care within microfinance groups:

**1) Teaming:** a) Strong cohesion among microfinance group members, primarily PLWH, b) Efficient financial management by group members, c) Clear conflict resolution mechanisms;

**2) Assessing needs:** Determine contextual needs for community-based integrated HIV+NCD care.

**3) Assessing context:** a) Delivering integrated care to existing and stable microfinance groups, b) Linking community-based services to facility support.

**4) Planning:** a) Provider training in community HIV+NCD care b) Mechanisms for proper packaging and delivery of HIV+NCD medication and tests, c) Accurate capture and integration of patient data across electronic care systems,

**5) Tailoring strategies:** a) Frequency of HIV+NCD care monitoring in line with care protocols, b) Better alignment of microfinance group meeting and care schedules.

**6) Engaging:** a) Sustaining individual provider-patient relationships within group settings, b) Maintaining confidentiality when delivering community HIV+NCD care with a group setting.

**Conclusions:** Our study identified six implementation process constructs needed to successfully integrate HIV+NCD care within microfinance groups at the community level. The opinions and support of key stakeholders is therefore fundamental to identifying the appropriate implementation process.

## WEPEE618

### Community contribution to Hypertension screening through lay cadres: lessons from a programming perspective in Zimbabwe

K.C. Takarinda<sup>1</sup>, T. Bepe<sup>1</sup>, E. Dhodho<sup>1</sup>, M. Hove<sup>1</sup>, K. Masiye<sup>1</sup>, P. Chimberengwa<sup>1,2</sup>

<sup>1</sup>Organization for Public Health Interventions & Development (OPHID), Harare, Zimbabwe, <sup>2</sup>National University of Science and Technology, Faculty of Medicine, Department of Community Medicine, Bulawayo, Zimbabwe

**Background:** Over the years, Zimbabwe expanded HIV treatment and care services beyond facility-based testing to the community in efforts towards reaching the UNAIDS 95-95-95 goals. This has been through recruitment of lay-cadres (community outreach agents, COAs) who work in partnership with community health nurses (CHNs) and have been trained to screen for HIV, track and trace defaulter clients and mobilise PLHIV for various due HIV services.

Given the demographic shift towards older ages among people living with HIV, there has been growing concern of non-communicable diseases (NCDs) such as hypertension.

**Description:** As part of hypertension screening programme in two urban districts of Chitungwiza and Bulawayo, a 150 high performing community outreach agents (COAs) were trained on integration of hypertension screening among PLHIV and at-risk adults from the general population. Screening was based on a decision-aid

screening tool administered through a DHIS-2 application on mobile electronic gadgets. This was coupled with deployment of digital blood pressure machines to COAs and to health facilities.

Hypertension screening involved 3 measurements taken 1 minute apart including weight, height measurement; risk assessment screening for alcohol use, smoking, physical activity and dietary patterns

**Lessons learned:** Between January -December 2023, 121,628 adult (>40 years) clients were screened of whom 44% were PLHIV. Overall 36% (n=43,858) were screened by COAs of whom 85% (n=37,503) had blood pressure reading taken and 38% were hypertensive with prevalence being higher among PLHIV in ART care (43.1%) versus the general population (36.7%).

Overall, there were 53,622 hypertension clients diagnosed of whom 27% (n=14,569) were diagnosed through COAs in the community.

**Conclusions/Next steps:** Community NCD screening approaches are vital in diagnosis and referral of clients with hypertension who may potentially be missed at the health facilities. Training coupled with the use of an electronic decision-aid screening tool ensures standardized screening through lay cadres resulting in increased community contribution towards diagnosis of NCDs.

## Innovations in data collection, monitoring and evaluation

### WEPEE619

Time matters: leveraging longitudinal, person-centered data to understand interruptions and re-engagement in HIV treatment in Malawi from January 2020 to September 2023

K. Norwood<sup>1,2</sup>, A. Ruth<sup>2</sup>, L. Mattocks<sup>3,2</sup>, C. Godfrey<sup>3,2</sup>, A. Wang<sup>1</sup>, A. Jahn<sup>4,5</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV & TB, Lilongwe, Malawi, <sup>2</sup>U.S. State Department, Bureau of Global Health Security and Diplomacy, Washington D.C., United States, <sup>3</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV & TB, Atlanta, United States, <sup>4</sup>Malawi Ministry of Health, Department of HIV/AIDS, Lilongwe, Malawi, <sup>5</sup>International Training and Education Centre for Health (I-TECH), University of Washington, Department for Global Health, Seattle, United States

**Background:** Interruptions in HIV treatment (IIT) pose a critical threat to individual and public health. Electronic medical record (EMR) data from Malawi's Ministry of Health can be leveraged to conduct analyses using its national central data repository (CDR) which integrates

individual-level data from EMR systems. The CDR includes over 750 antiretroviral therapy (ART) facilities covering 98% of individuals on HIV treatment in Malawi.

**Methods:** Data was extracted for 1,146,215 individuals attending clinic between January 2020 through September 2023. IIT was defined as ≥28 days between expected and actual visit dates. This analysis focuses on the first re-engagement visit, even if the individual had multiple occurrences of IIT. The estimation of IIT assumes appropriate scheduling of the next appointments based on newly dispensed and remaining tablets at each visit.

**Results:** Over sixty percent (60.4%) of all individuals experienced at least one IIT episode during the study period, of which 562,678 (81.3%) re-engaged in care.

Of those who re-engaged, 82.4% re-engaged within six months; 12.9% re-engaged after six months and up to one year; 3.9% re-engaged after one year and up to two years; 0.9% re-engaged after two years.

**Conclusions:** Over 80% of individuals identified as IIT returned to the ART clinic within six months of their missed appointment, consistent with the Malawi national HIV treatment program efforts to support re-engagement. Measurement of successful re-engagement outcomes will allow for further refinement of re-engagement interventions and will permit a more targeted approach to individuals who have interrupted therapy to mitigate consequences of viral non-suppression.

### WEPEE620

Aging out of reported cohorts for the national HIV program in Mozambique

O. Tiberi<sup>1</sup>, J. Mondlane<sup>1</sup>, I. Sathane<sup>1</sup>, H. Magaia<sup>1</sup>, M. da Cunha<sup>1</sup>, I. Gaspar<sup>1</sup>, A. Couto<sup>1</sup>

<sup>1</sup>Ministry of Health, National STI-HIV/AIDS Control Program, Maputo, Mozambique

**Background:** The National STI-HIV/AIDS Control Program is responsible for the continuous monitoring and program implementation of the prevention and care of people living with HIV/AIDS in Mozambique. To do this the NACP relies on data from the over 1,700 national health facilities that report monthly HIV data into the local DHIS2 platform, SIS-MA. The quality of data reporting is important for tailored monitoring and implementation strategies that impact HIV care delivery nationally.

**Description:** From July to October of 2023, the ninth round of data quality assessment (DQA) was conducted in the country, with the aim of better understanding the chal-

Author Index

lenges and impact of data quality. One of the numerous analyses that were conducted was the comparison of the reported HIV data in the national system, of which the counting is done manually, with the same report generated in the OpenMRS Electronic Patient Tracking System (EPTS) disaggregated by <15 and 15+.

When comparing across the two age groups, there is a clear challenge in the aging out of <15 beneficiaries for the older cohorts.

Overall, in the 51 health facilities where the analysis was conducted, there was a 6% difference between the electronic and manual report for 15+. However, for the <15 numbers, that difference was 26%, approximating that ¼ of the total children on ART in the national system are incorrectly reported.

**Lessons learned:** When designed, the HIV treatment instruments included a component of monthly register cleaning and recount. If implemented with fidelity, the missed opportunity of aging out children into older cohorts would be resolved on a continual basis. In addition to the record cleaning, the use of EPTS for national reporting could improve these data.

**Conclusions/Next steps:** A round of register cleaning and recounting is planned to finish by the end of February. Using the standardized national tools, health facilities are expected to review and correct their monthly report with justifications if needed.

The next round of DQA is planned to start in March, 2024 where the same analysis will be conducted, and it will be possible to see the impact of this cleaning and better understand the reasons behind remaining differences.

## WEPEE621

Using Large Language Models (LLM) to generate insights from unstructured datasets and reports for HIV Community Lead Monitoring (CLM) programs

J. Friedman<sup>1</sup>, A. Mishra<sup>2</sup>

<sup>1</sup>Palladium Group, Nairobi, Kenya, <sup>2</sup>Palladium Group, Washington DC, United States

**Background:** One method to ensure HIV local accountability within HIV programs involves community-led monitoring (CLM). Local, community-based organizations lead and execute CLM and methodically gather both qualitative and quantitative information about HIV service provision.

However, given the qualitative-dominant nature of that data, extracting insights from CLM data is a labor-intensive process. To automate this work, we created a Retrieval Augmented Generation (RAG) model using open-source large language models (LLM).

This model has the advantage of analyzing different types of data, such as images, text, and tabular data, and can produce a more holistic evaluation of HIV programs.

**Methods:** LLMs present a great opportunity to extract insights from disparate, unstructured data such as text, audio, and images, and RAG is a key method for getting LLMs to answer questions over a user's own data. User queries trigger information retrieval by searching user-provided collections of documents for passages or documents that are likely to contain useful information.

Next, text responses are generated using open-source LLM augmented with the information retrieved in the previous step. For this, we built a pipeline using the Llamaindex Python framework to embed, store, retrieve, and submit data to an LLM.

We chose OpenAI's GPT-3.5-turbo to take advantage of OpenAI's agents, which use LLMs to perform tasks like segmenting complex questions into sub-questions for sequential response generation, generating comparisons between activities, or analyzing a given activity over time.

**Results:** We created a web-based application where users can interact with the back-end RAG model. Users can ask questions about HIV programs, and the model generates responses based on the CLM-specific documents we have integrated with the RAG. The model tracks key metrics for HIV programs such as what is effective, what isn't, and areas needing enhancement, offering specific recommendations for actions to better outcomes.

**Conclusions:** Generative AI holds immense potential for public health programs by allowing us to combine disparate non-traditional data in our routine analytics and provide more holistic insights.

Customizing open-source LLMs to work with program-specific documents and datasets through a RAG pipeline is the way to use these powerful technologies and automate manual qualitative analyses.

## WEPEE622

Using Citizen Journalism to explore real-time challenges of Recipient of Care in accessing HIV and AIDS services in South Africa and Malawi

R. Ng'ong'ola Zolowere<sup>1</sup>, K. Zokwana<sup>1</sup>, J. Harries<sup>2</sup>, L. Donald<sup>1</sup>, J. Bozinovski<sup>1</sup>, K. Lauer<sup>1</sup>, S. Baptise<sup>1</sup>

<sup>1</sup>International Treatment Preparedness Coalition ITPC, Watch What Matter Pillar, Johannesburg, South Africa, <sup>2</sup>University of Cape Town, Center for Social Science Research, Cape Town, South Africa

**Background:** As the global HIV response moves increasingly toward reaching the "last mile" of Recipients of Care (ROC), qualitative research approaches are required to pinpoint the specific factors that hinder access to quality HIV services. ROC have a critical role in exploring and documenting the real time barriers and challenges they face, and use to influence positive change through advocacy, policy, and program change. The purpose of this research project is to empower ROC to document their lived experiences; identify key themes in the barriers that

hinder their access to HIV services; and offer an advocacy platform to share their truth with a broader audience, including policymakers.

**Methods:** Citizen Science Life Maps (CS-LM) is a three-year qualitative, longitudinal project in South Africa and Malawi. It employed a collaborative and participatory research method utilizing digital storytelling to document peoples' daily lives. Thirty-nine participants, including people living with HIV, key populations and youth were recruited in 2022. The participants were given mobile phones and training to document barriers to HIV services. Data was analyzed using thematic analysis approach.

This abstract will report on stigma and discrimination and experiences of privacy and confidentiality.

**Results:** Themes like mental health, food insecurity, water and sanitation, privacy and confidentiality and stigma and discrimination were key barriers that were reported. However, a key theme that emerged was stigma and discrimination;

65% of participants reported different forms of stigma and discrimination in health facilities attributed to their HIV status. Intersectional stigma at health facilities was exacerbated for individuals of the LGBTQI community.

58% reported stigma and discrimination at health facilities was deemed difficult due to overworked staff and unwillingness to change.

67% reported unpleasant experiences related to privacy violation including being rude, disrespectful and breaching confidentiality when accessing ARVs. Through these lived experiences participants were afraid to access HIV services at healthcare facilities.

**Conclusions:** This research study provides nuance and in-depth insight into communities and brings to light the real-time barriers to access of HIV services. Photos and narratives are a powerful form of visual communication and should be better integrated with quantitative community data for more effective advocacy.

## WEPEE623

### Using mystery client surveys to assess the effectiveness of a comprehensive program to improve person-centered care in HIV clinical settings in Haiti

L. Murphy<sup>1</sup>, R. Emilien<sup>1</sup>, S. Jean<sup>2</sup>, S. Leguerre<sup>2</sup>, S. Galbaud<sup>3</sup>  
<sup>1</sup>Management Sciences for Health, Arlington, United States, <sup>2</sup>Fondation SEROVie, Port-au-Prince, Haiti, <sup>3</sup>United States Agency for International Development Haiti, Port-au-Prince, United States

**Background:** Clients seeking HIV services, including testing, prevention, and treatment, often experience stigma and discrimination in places they should feel safest: healthcare settings. USAID-supported RISE-Haiti SPOTLIGHT implemented several anti-stigma interventions to improve care in 124 HIV clinics in five departments in Haiti. These included training healthcare staff in person-centered care, on-site mentorship, supportive site evaluations, and waiting room improvements.

We conducted two rounds of mystery client surveys (MCS) to evaluate the interventions' effect on the client experience in HIV clinics in Haiti.

**Methods:** The first round of MCS was conducted in July 2022, prior to the start of RISE interventions to improve care. 80 MCS visits were conducted in 31 sites in five departments of Haiti. RISE-supported interventions, including provider training and mentorship visits, commenced in September 2022. The second MCS round was conducted in July 2023. 108 visits were conducted in 36 HIV facilities across the same five departments.

The mystery clients (MC) evaluated the site on environmental comforts, client education, staff courtesy, and discriminatory or stigmatizing behaviors via a survey completed immediately after the visit. The two surveys were compared and analyzed with a two-proportion t-test

**Results:** Results were compared across several areas of client-provider interaction. Counsellor-initiated dialogue about HIV risk and prevention increased from 68% in 2022 to 81% in 2023 ( $p=0.08$ ). In 2023, 95% of clients reported that lab technicians responded to them respectfully, up from 80% in 2022 ( $p=0.009$ ), and 96% of clients received referrals to direct clinical care compared to 68% in 2022 ( $p=0.004$ ). The percentage of waiting rooms that had protection from the sun and rain increased from 21% in 2022 to 85% in 2023 ( $p<0.001$ ).

**Conclusions:** Overall, clients reported more respectful attitudes from staff, more respectful attitudes from staff, and more referrals to care after the RISE-Haiti SPOTLIGHT training and mentorship program. The RISE-Haiti SPOTLIGHT interventions contributed to improved person-centered care on multiple levels, from environmental considerations to client-provider interactions.

### Mapping the way towards zero new HIV infections: an interactive tool to guide HIV prevention and care in the Netherlands

V. Jongen<sup>1,2</sup>, R. van Zoest<sup>3</sup>, A. van Sighem<sup>1</sup>, M. Verhagen<sup>3</sup>, C. Smit<sup>1</sup>, A. Boyd<sup>1,2</sup>, B. van Benthem<sup>4</sup>, E. Op de Coul<sup>4</sup>, F. Wit<sup>1,5</sup>, M. van der Valk<sup>1,5</sup>, ATHENA National Observational HIV Cohort

<sup>1</sup>Stichting HIV Monitoring, Amsterdam, Netherlands, the, <sup>2</sup>Public Health Service Amsterdam, Department of Infectious Diseases, Amsterdam, Netherlands, the, <sup>3</sup>Amsterdam Health & Technology Institute, Amsterdam, Netherlands, the, <sup>4</sup>National Institute for Public Health and the Environment (RIVM), Center for Infectious Diseases Prevention and Control, Bilthoven, Netherlands, the, <sup>5</sup>Amsterdam University Medical Centers, University of Amsterdam, Department of Infectious Diseases, Amsterdam Infection & Immunity Institute, Amsterdam, Netherlands, the

**Background:** The Netherlands aims to end HIV transmission within the country by 2027. Although significant progress has been made, new innovative approaches are needed to reach this goal. We present an online, interactive tool that was developed using an existing research platform and allowed a low threshold, workable interface for use in HIV prevention and care.

**Description:** We built an online dashboard using data from the ATHENA cohort, an ongoing observational nationwide HIV cohort in the Netherlands (Figure). We generated yearly statistics on the number of people with HIV, number of new HIV diagnoses, disease stage, number of people at each step of the HIV care continuum conform UNAIDS definitions, prevalence of chronic hepatitis B and C virus infection and prior PrEP use.

All statistics can be stratified by region and key population (e.g., women, men who have sex with men), and viewed over time from 2010 to 2022. The dashboard was developed in collaboration with the Amsterdam Health & Technology Institute using R shiny.

The first version of the dashboard was made available online in November 2023 (<https://www.hiv-monitoring.nl/nl/resources/hiv-dashboard>).

Figure. Screenshot of dashboard.

**Lessons learned:** The current dashboard provides national and regional insight into the evolution of the HIV epidemic in the Netherlands, and supports health care providers and community groups in more appropriate assessment of HIV elimination goals in key populations in their region or city.

**Conclusions/Next steps:** With the goal of ending the HIV epidemic in mind, this dashboard could support regions in evaluating existing and developing new strategies for prevention and care and strengthen more collaborative prevention strategies.

More in-depth information on socio-demographic and -economic factors will be added to further inform gaps in HIV prevention and treatment.

The dashboard will be further developed and updated regularly in close collaboration with stakeholders in HIV prevention and care.

## WEPEE625

### ZAZIC consortium at 10 years: do mature voluntary medical male circumcision programs maintain client safety?

V. Museqa<sup>1</sup>, L.C.T. Masimba<sup>2</sup>, F. Gwenzi<sup>3</sup>, J. Gavhera<sup>4</sup>, B.C. Makunike<sup>5</sup>, P. Gonouya<sup>5</sup>, M.M. Holec<sup>6</sup>, S. Barnhart<sup>7</sup>, C. Feldacker<sup>8</sup>, S. Xaba<sup>9</sup>, T. Madoda<sup>10</sup>

<sup>1</sup>Africa University, Health Sciences, Mutare, Zimbabwe,

<sup>2</sup>Africa University, Social Sciences, Mutare, Zimbabwe,

<sup>3</sup>Midlands Sta, Social Sciences, Gweru, Zimbabwe,

<sup>4</sup>Midlands State University, Development Studies, Harare, Zimbabwe,

<sup>5</sup>University of Zimbabwe, Medicine, Harare, Zimbabwe,

<sup>6</sup>University of Washington, Global Health, Seattle, United States,

<sup>7</sup>University of Washington, Public Health and Community Medicine, Seattle, United States,

<sup>8</sup>University of North Carolina, Public Health, Wilmington, United States,

<sup>9</sup>National University Of Science and Technology, Development Studies, Bulawayo, Zimbabwe,

<sup>10</sup>Zimbabwe Open University, Nursing Sciences, Harare, Zimbabwe

**Background:** Voluntary Medical Male Circumcision (VMMC) for HIV prevention reached over 29 million males in 15 countries in Eastern and Southern Africa by 2022. VMMC is safe with reported adverse events (AE) rates of <1% from routine programs at scale. However, AE rates of 2% are expected within high quality VMMC programs, indicating that complications are identified, managed, and treated.

Prior studies suggest that reliance on passive surveillance alone is insufficient. The ZAZIC consortium in Zimbabwe employed active AE surveillance to help ensure client safety.

**Description:** ZAZIC proactively identifies, treats, and manages AEs as part of routine quality assurance (QA) efforts. From October 2021 to March 2023, ZAZIC implemented three additional approaches for AE surveillance.

First, as part of productivity verification, ZAZIC contacted VMMC clients via phone or home visit to assess VMMC status and complications. Across 17 sites (412 males), one additional severe AE (bleeding) was identified for an AE rate of 0.24%.

Second, tandem reviews paired an expert ZAZIC clinician with a site-based clinician to jointly conduct post-operative visits 7 days post VMMC. Across four sites, 41 clients were reviewed with no AEs reported.

Third, ZAZIC implemented two-way texting (2wT) follow-up for VMMC clients with mobile phones, communicating over the first 14 post-operative days. Among the 31,000 males followed-up by 2wT, 0.04% had a documented AE.

**Lessons learned:** ZAZIC employs multiple QA approaches for AE identification across its national program, including verification, tandem reviews, and 2wT. These routine interventions serve as a proxy for AE active surveillance, strongly suggesting a safe VMMC program.

However, continued low ascertainment of AEs, with observed AE rates below the expected 2% threshold, suggests that additional ZAZIC vigilance is warranted. Although costly, increased investment to ensure safety of VMMC services are essential for safe services.

**Conclusions/Next steps:** Given the continued low reported AE rates, it is important to maintain investment in rigorous program evaluation, including QA activities and active AE surveillance, to ensure VMMC program safety. With follow-up rates less than 100%, and the limitations of passive surveillance for AEs, combinations of active surveillance activities should be required for VMMC programs at scale.

## WEPEE626

### Assessing HIV prevention effective use in routine service settings: a methodology using self-report at last sex

C.E. Martin<sup>1</sup>, H. Ramatsoma<sup>1</sup>, G. Chidumwa<sup>1</sup>, S. Mullick<sup>1</sup>

<sup>1</sup>University of the Witwatersrand, Wits RHI, Johannesburg, South Africa

**Background:** Daily pill taking during periods of exposure is required for oral PrEP to be effective in preventing HIV acquisition. However, oral PrEP use may be cyclical, used during periods of risk. Other prevention methods such as condoms may be effectively used to prevent HIV acquisition, in addition to expanding options of new PrEP methods.

We propose a simple method of assessing HIV prevention effective use, that could be used in routine services.

**Methods:** We analysed self-reported data on PrEP and condom use at last sex, from a cohort of participants enrolled in a PrEP implementation science study, accessing prevention services and using oral PrEP, who attended follow-up visits between August and November 2023. Us-

ing our proposed methodology, we determined whether their last sex act was protected by PrEP, condoms, or both. Condom protection was defined as having used a condom at last vaginal and/or anal sex; Oral PrEP protection was defined as having taken PrEP for seven days prior, on the day of, and 7 days after sex (or if sex was  $\leq 7$  days ago, every day since last sex).

**Results:** Data for 272 follow-up visits, among 241 oral PrEP users were analysed, after excluding observations among participants missing a recorded date of last sex ( $n=64$ , 18.6%), for whom type of sex at last encounter was missing ( $n=1$ , 0.3%) or who reported only oral sex ( $n=8$ , 2.3%). Participants with missing data on PrEP use ( $n=39$ , 14.3%) or condom use ( $n=1$ , 0.4%) were classified as not effectively using PrEP or condoms respectively. Of 272 sex acts reported, 21.0% ( $n=57$ ) were protected by condoms and PrEP, 53.3% ( $n=145$ ) by PrEP only, 9.6% ( $n=26$ ) by condoms only and 16.2% ( $n=44$ ) were not protected.

**Conclusions:** With the availability of multiple HIV prevention options, self-reported PrEP and condom use at last sex may serve a useful indicator of effective prevention use in routine service settings. In our setting, participant recall of date of last sex, condom and PrEP use was high, although not complete.

Going forward, adaptation to this method to calculate effective dapivirine ring and cabotegravir use, by sex type, will be made and evaluated.

## WEPEE627

### Predictors of waiting time at public health facilities in South Africa: evidence from Ritshidze's community-led monitoring

N. Rambau<sup>1</sup>, B. Setshogelo<sup>1</sup>, M. Nyathi<sup>1</sup>, L. Rutter<sup>2</sup>, S. Senn<sup>3</sup>, E. Lankiewicz<sup>3</sup>, A. Yawa<sup>4</sup>

<sup>1</sup>Ritshidze Community-led Monitoring Programme, Johannesburg, South Africa, <sup>2</sup>Health GAP, Johannesburg, South Africa, <sup>3</sup>amfAR, The Foundation for AIDS Research, Washington, DC, United States,

<sup>4</sup>Treatment Action Campaign, Johannesburg, South Africa

**Background:** In South Africa, critical gaps persist in retaining individuals at risk for or living with HIV in care. Extensive wait times at public health facilities are an essential contributing factor to dissatisfaction with services. Better understanding challenges and facility characteristics related to wait time presents opportunities for tailored responses aimed at improving quality of care related to HIV services.

**Methods:** The Ritshidze Community-Led Monitoring Programme collected electronic survey data at public health facilities in eight provinces from October 2022 - September 2023. Descriptive statistics were calculated for indicators related to wait time. A multivariate linear regression model predicting wait time was built, incorporating indi-

Oral  
abstracts

Author Index

cators hypothesized to impact wait time and fixed effects for time and facility. Likelihood-ratio tests were used to assess model fit.

**Results:** Surveys from 62,040 health service users at 456 public health facilities were included in the sample. Median wait time was 180 minutes (IQR 120-240). 19% (n=12,026) of service users reported there were never enough staff at the facility, 8% (n=4,998) reported the appointment system was never functional, and 26% (n=16,177) reported that the facility is not open for enough time.

In a multivariate model including facility-level and temporal effects, never having enough staff was associated with, on average, a 16 minute increase in wait-time compared to always enough staff ( $p<0.001$ ).

Service users reporting a non-functional appointment system relative to a functional one was associated with, on average, a 24 minute increase in wait-time ( $p<0.001$ ). Service users reporting facilities were not open enough hours was associated with, on average, a 9 minute increase in wait-time ( $p<0.001$ ).

**Conclusions:** Wait times at public health facilities remain long, and non-functional appointment systems represent a particular area that may be of use to target with interventions. Community-led monitoring data provides key insights into day to day experiences and of health service users in South Africa.

## WEPEE628

Self-care digital solutions for improved HIV prevention programming: evidence from a voluntary medical male circumcision program in a low resource setting

M. Munjoma<sup>1</sup>, H. Choi<sup>2</sup>, J. Mavudze<sup>1</sup>, A. Dhliwayo<sup>1</sup>, L. Bidi<sup>1</sup>, L. Mufema<sup>1</sup>, M. Dhodho<sup>1</sup>, N. Nhando<sup>1</sup>, A. Sheets<sup>3</sup>, T. Moga<sup>1</sup>, B. Maponga<sup>1</sup>, B. Mutede<sup>1</sup>, S. Leuschner<sup>3</sup>, N. Tarubekera<sup>1</sup>

<sup>1</sup>Population Solutions for Health, Harare, Zimbabwe,

<sup>2</sup>Princeton University, New Jersey, United States,

<sup>3</sup>Population Services International, Harare, Zimbabwe

**Background:** Client self-care using digital innovations is increasingly becoming important in health service delivery to reduce care burden. Population Solutions for Health (PSH) and Population Services International (PSI) in collaboration with the Ministry of Health and Childcare (MoHCC) are implementing the Workforce App (WFA); a fully configurable progressive web application (PWA) for post-circumcision wound self-management.

We evaluated the feasibility and acceptability of this innovation to inform scale-up by validating post-circumcision outcomes reported by the client via WFA with those reported in person by the same client in the study.

**Methods:** A mixed methods study was conducted in May 2023 with recipients of care (RoC) opting in for WFA between March 2022 to May 2023 in the five biggest districts

of Zimbabwe. Data sources were from program data (38,384 circumcised RoC), survey data (286), key informant interviews (10 clinicians) and 6 focus group discussions with RoC. Quantitative data were collected using Survey ToGo and analyzed in STATA. Qualitative data were tape-recorded and analyzed using N-VIVO.

Point estimates for individuals reporting "feeling ok" via WFA were compared with routine program outcomes for the same individuals and statistical differences between proportions were plotted at 95% confidence levels.

**Results:** Since WFA introduction, from 2021 to May 2023, 66% (25,335/38384) of all circumcised individuals opted into WFA. Out of the 286 respondents recruited in the study, 87.3% (95% CI: 81.4-91.9) reported feeling ok at physical post-procedure follow-up compared to 85.1% (95% CI: 83.5-86.6) reported via WFA. Scale-up of WFA was supported by most service providers as they observed a reduced workload at the health facility since most individuals opted for self-care via WFA.

Additionally, the occurrence of adverse events (severe and moderate cases) reduced from 16/10,000 (95% CI: 9-26) persons for the period before WFA introduction to 1/10,000 (95% CI: 1-2) persons after WFA deployment.

**Conclusions:** Person-centered digital innovations have shown to be effective in post-circumcision self-wound management as outcomes reported via the application were validated. Healthcare providers and VMMC RoCs showed high acceptability of this innovation and the post-WFA period was associated with fewer occurrences of adverse events. This digital innovation should therefore be scaled up.

## WEPEE629

Using natural language processing and audio-based machine learning models to characterize youth-friendly HIV prevention services to adolescent girls and young women in Tanzania

C. Chiu<sup>1</sup>, A. Abdel Latif<sup>2,3</sup>, L.A. Sheira<sup>4,1</sup>, S.I. McCoy<sup>4</sup>, A. Mnyippembe<sup>5</sup>, J. Msasa<sup>5</sup>, J. Allan<sup>5</sup>, L. Richard<sup>5</sup>, A. Sabasaba<sup>5</sup>, L.J. Packel<sup>1</sup>, J.X. Liu<sup>1</sup>

<sup>1</sup>University of California San Francisco, Institute for Health & Aging, San Francisco, United States, <sup>2</sup>University of California San Francisco, Center for AIDS Research, San Francisco, United States, <sup>3</sup>University of California San Francisco, AIDS Research Institute, San Francisco, United States, <sup>4</sup>University of California Berkeley, Epidemiology, Berkeley, United States, <sup>5</sup>Health for a Prosperous Nation, Dar es Salaam, Tanzania, the United Republic of

**Background:** Understanding of the nature and experience of youth-friendly HIV prevention services is limited, hampering interventions, such as HIV testing and pre-exposure prophylaxis, that would otherwise be generally efficacious. Objectively measuring quality of care is diffi-

cult – provider assessments or aggregate measures on service uptake neglect subjective user experiences and include only those undeterred from seeking care.

**Methods:** We used natural language processing (NLP) and audio-based machine learning to identify features of youth-friendly HIV services, leveraging data from mystery client visits conducted to assess the fidelity of a girl-friendly drug shop intervention among shops enrolled in a cluster-randomized trial (NCT05357144).

Trained actors following a standardized script sought HIV self-testing and contraception and audio-recorded the interactions, which were transcribed and translated into English.

We conducted classical NLP pre-processing techniques:

- Generating regularized expressions from text;
- Tokenizing and extracting stems of words; and,
- Generating embeddings using Term Frequency-Inverse Document Frequency (TF-IDF).

We then estimated unsupervised learning models including k-means and spectral clustering using the embeddings. To account for additional non-text features (pauses, intonation, and interruptions), we analyzed recordings in Swahili directly using spectrograms and Mel-frequency Cepstral Coefficients (MFCC).

**Results:** From N=44 interactions, k-means with 2 clusters successfully distinguished the shopkeeper from the actor based on the TF-IDF vector embeddings of key terms from the transcripts, validating the unsupervised model against a known truth.

We successfully extracted features directly from the audio recordings to capture information that is exclusive only to the audio signal (Figure 1).

Figure 1A (left) shows a 2-D visual representation of the spectrogram generated directly from audio recordings of the interactions using Fast Fourier Transforms. Figure 1B (right) shows k-means clustering of the audio recordings from 27 patient-provider interactions based on Mel-frequency Cepstral Coefficients (MFCCs). Both figures are examples of features that are extracted from the audio data to complement our understanding of the interactions from the text transcripts.

**Conclusions:** Novel machine learning techniques have the potential to identify new aspects of youth-friendly HIV service provision and generate ideas for future implementation research.

Ongoing analysis will advance natural language processing using a custom GPT to take advantage of existing large language models and include supervised learning techniques using customer-reported and/or expert-coded service quality as target parameters.

## WEPEE630

### Qualitative results from a pilot study of an automated directly observed therapy intervention using artificial intelligence with conditional economic incentives among young adults with HIV

L.D. Wagner<sup>1</sup>, M.C. Stoner<sup>1</sup>, N. Mancuso<sup>2</sup>, L. Smith<sup>3</sup>, K. Ming<sup>3</sup>, H. Patani<sup>4</sup>, A. Sukhija-Cohen<sup>5</sup>, Y. Granados<sup>4</sup>, M.O. Johnson<sup>3</sup>, S. Napierala<sup>1</sup>, T.B. Neilands<sup>3</sup>, P. Saberi<sup>3</sup>  
<sup>1</sup>RTI International, Women's Global Health Imperative, Berkeley, United States, <sup>2</sup>RTI International, Women's Global Health Imperative, Atlanta, United States, <sup>3</sup>University of California, San Francisco, Department of Medicine, San Francisco, United States, <sup>4</sup>AIDS Healthcare Foundation, Los Angeles, United States, <sup>5</sup>Palo Alto Medical Foundation Research Institute, Sutter Health, Sacramento, United States

**Background:** Antiretroviral therapy (ART) adherence challenges are common among youth with HIV (YWH), increasing drug resistance and poor clinical outcomes. Monitoring and supporting ART adherence is a promising strategy for enhancing ART adherence. We implemented an innovative mobile app-based intervention that included automated directly observed therapy (aDOT) using artificial intelligence, dose tracking, medication reminders, and conditional economic incentives (CEIs) to improve ART adherence and viral suppression among YWH. This intervention used facial recognition to track and record daily adherence and CEIs were given based on confirmed daily adherence.

**Methods:** A pilot study was conducted among YWH (18–29) of the aDOT-CEI intervention, informed by the operant framework of Key Principles in Contingency Management Implementation. We recruited virally unsuppressed YWH from AIDS Healthcare Foundation clinics in California and Florida, who used the aDOT+CEI app for 3 months.

We report qualitative feedback from 13 participants and 5 providers regarding motivators and deterrents of the use of the app and the helpfulness of the aDOT-CEI intervention.

**Results:** Overall, the intervention was found to be helpful by participants and providers in improving adherence. Participants found the CEIs facilitated adherence; however, most participants did not find the incentive amount sufficient to substantially motivate behavior, and desired more reassurance and explanation around app privacy features. The primary motivator for the participants to use the app consistently was to improve their health, and the reminders from the app were the most helpful component to improving adherence. Providers said they would recommend the app and suggested incorporating the app into counseling for newly diagnosed patients to help facilitate adherence at ART initiation.

**Conclusions:** Participants found the intervention helpful in reminding them of and tracking their ART adherence. They suggested refinements that may further improve

adherence and the app, including increasing the incentive amount and providing more details about app privacy features. Providers suggested incorporating the app into counseling for newly diagnosed patients to facilitate adherence at the start of treatment. Additional research is recommended to test the efficacy of a refined aDOT-CEI intervention to improve viral suppression in a larger sample.

## WEPEE631

Community-led monitoring (CLM) contributed to improving HIV and related services for people living with HIV (PLHIV) and key populations (KP), in Cambodia

C. Rang<sup>1</sup>, D. Nhim<sup>1</sup>, S. Seng<sup>2</sup>, V. Tim<sup>3</sup>, S. Seum<sup>4</sup>, R. Khun<sup>3</sup>, S. Ouk<sup>5</sup>, T. Ouk<sup>6</sup>, B. Kong<sup>7</sup>

<sup>1</sup>FHI360, Strategic Information Unit, Phnom Penh, Cambodia, <sup>2</sup>FHI360, Country Representative, Phnom Penh, Cambodia, <sup>3</sup>Health Action Coordinating Committee (HACC), Phnom Penh, Cambodia, <sup>4</sup>Forum of People Living with HIV and Most At-Risk Population (FONPAM), PHLIV Representative, Phnom Penh, Cambodia, <sup>5</sup>Forum of People Living with HIV and Most At-Risk Population (FONPAM), Representative of Female Entertainment Worker (FEW), Phnom Penh, Cambodia, <sup>6</sup>Forum of People Living with HIV and Most At-Risk Population (FONPAM), Representative of Drug User, Phnom Penh, Cambodia, <sup>7</sup>Forum of People Living with HIV and Most At-Risk Population (FONPAM), Representative of TGW-MSM, Phnom Penh, Cambodia

**Background:** Gathering evidence from Key Populations (KP)/ People Living with HIV (PLHIV) communities about service gaps that can be used to lobby government and key stakeholders for better services remains challenging. Limited capacity, tools, and resources for KP/PLHIV representatives to collect and analyze data from communities are constraints.

**Description:** To address this need, an online Community-Led Monitoring (CLM) system led by KP/PLHIV networks was established that serves as a community-friendly data collection tool. KP/PLHIV communities meet and provide their feedback systematically every quarter in seven HIV high-burden provinces with large KP populations. Data is automatically incorporated into dynamic dashboard (PowerBI) available for network representatives to lobby/advocate for service strengthening. The CLM tool has seven thematic areas, including Prevention and HIV Testing; Pre-exposure Prophylaxis; Sexually Transmitted Infections; Social Protection; Care and Treatment; Gender-based Violence; and Stigma and Discrimination.

**Lessons learned:** Provincial Fora of People Living with HIV and most at-risk Population and District Fora of People Living with HIV and most at-risk Population were established in 2011 but were refunctioned in 2021 by HACC with financial and technical support from UNAIDS, National

Center for HIV/AIDS, Dermatology and STD and FHI 360. The CLM system collects feedback and challenges from KP/PLHIV, and the results compiled and presented to Provincial AIDS Authority and other partners quarterly. In 2023, approximately 3,100 KP/PLHIV CLM respondents provided feedback, far exceeding expectations. KP/PLHIV representatives used the CLM dashboard to present results in several key fora in the country to advocate for better health and non-health services for KP/PLHIV.

CLM advocacy around social protections to the National AIDS Authority resulted in the Royal Government of Cambodia providing universal health insurance coverage for PLHIV and KPs. The Global Fund, impressed by CLM results, approved the request to expand CLM activities from seven to 12 provinces in 2024-2026.

**Conclusions/Next steps:** CLM is an effective tool to collect feedback from KP/PLHIV systematically and produce friendly, dynamic, and convincing dashboards that allow KP/PLHIV representatives to use their data to inform agencies and stakeholders of their needs and necessary quality improvements of both health and non-health services for KP/PLHIV. The CLM system should be scaled up to 25 provinces.

## WEPEE632

Deduplication of patient data in the electronic medical records in Uganda June - November 2022: a comparison of three classification algorithms

A. Mirugwe<sup>1</sup>, A. Fitzmaurice<sup>2</sup>, E. Bichetero<sup>1</sup>, A. Namale<sup>1</sup>, E. Akello<sup>1</sup>, M. Kaye<sup>1</sup>, S. Lubwana<sup>1</sup>, J. Mpango<sup>1</sup>, C. Ashaba<sup>1</sup>, P. Mbaka<sup>3</sup>, E. Sande<sup>2</sup>, K. Musenge<sup>2</sup>

<sup>1</sup>Makerere University, School of Public Health, Kampala, Uganda, <sup>2</sup>US Centers for Disease Control and Prevention, Global Health Center, Division of Global HIV & TB, Kampala, Uganda, <sup>3</sup>Ministry of Health, Division of Health Information, Kampala, Uganda

**Background:** Duplicate patient records pose a significant challenge to healthcare registries and electronic medical record systems (EMR) in Uganda, primarily due to the absence of a national unique patient identifier. This can lead to issues like unnecessary testing of clients previously diagnosed with HIV or overestimating the population receiving antiretroviral therapy.

This research aims to improve the accuracy of health data to uniquely identify clients, thereby aiding in epidemic control and service delivery. It explores different algorithms for matching patient records to reduce duplications.

**Methods:** We used a dataset from UgandaEMR from 15 health facilities across six districts in Rwenzori Region to train three algorithms. Due to the absence of a ground truth dataset, we used synthetic test dataset for evaluation [dataset]. Variables included names, sex, age, birth-date, address, and phone number.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

After data pre-processing, the indexed records were compared to each other using Jaro-Winkler and Levenshtein methods to calculate similarity scores, which were then classified. Three classification algorithms were used—a threshold-based algorithm (TBA), a weighted average score-based (WASB) algorithm, and a decision tree (DT) algorithm—to classify scores as matches, potential matches, and non-matches.

TBA aggregates similarity scores, while WASB assigns varying weights to similarity scores of different variables before aggregating.

We evaluated algorithms using sensitivity, specificity, and F-score metrics. Finally, we applied the best algorithm on the facility dataset to estimate duplicates.

**Results:** The WASB algorithm exhibited superior performance on the synthetic test dataset (99.0% sensitivity, 98.8% specificity, 98.9% F-score). TBA demonstrated slightly lower metrics (95.3% sensitivity, 89.1% specificity, 92.1% F-score), while DT had 92.3% sensitivity, 93.9% specificity, and 93.1% F-score. The facility dataset included 44,717 records, including 28,619 (64%) females.

When applied back to the facility dataset, the WASB algorithm categorized 2,594 (5.8%) of records as duplicates and 4,472 (10%) as potential duplicates.

**Conclusions:** The study establishes the WASB as the most effective method for matching and deduplicating UgandaEMR patient records compared to TBA and DT algorithms. Its adoption could improve accuracy and reliability of UgandaEMR, improving data for action and enhancing the healthcare service quality.

Future initiatives might refine these algorithms by expanding the dataset to include more regions.

## WEPEE633

[Demonstrating the success of a case management information system in large-scale, longitudinal client-level data management for efficient, HIV-sensitive case management for orphans and vulnerable children in Zimbabwe](#)

T. Tapera<sup>1</sup>, J. Mwanza<sup>2</sup>, T. Chidenge<sup>3</sup>, C. Marawanyika<sup>1</sup>, G. Nyahuma<sup>1</sup>, E. Ramirez<sup>2</sup>, S. Miner<sup>1,4</sup>

<sup>1</sup>United States Agency for International Development, Harare, Zimbabwe, <sup>2</sup>Palladium, Washington, United States,

<sup>3</sup>Family AIDS Caring Trust Zimbabwe, Mutare, Zimbabwe,

<sup>4</sup>International Business & Technical Consultants, Inc., Vienna, United States

**Background:** The PEPFAR/Zimbabwe OVC program delivers family-based and child-centered comprehensive community case management to children and households affected by HIV. Under the OVC program, four implementing partners support children living with HIV (CLHIV) and their caregivers to access and adhere to antiretroviral therapy (ART) and to partake in education, protection, and economic strengthening services to en-

sure continuity of treatment, retention in care, viral load suppression (VLS), and enhanced quality of life. Previously, these partners relied on disparate and paper-based systems to record, track, and report OVC data, resulting in service delivery gaps and data inconsistencies.

**Description:** The United States Agency for International Development (USAID) Mission in Zimbabwe, through the Data for Implementation (Data.FI) project, successfully developed an OVC case management information system (OVC MIS) using the District Health Information Software version 2 (DHIS2)'s Tracker to manage individual-level client data for OVC populations.

The system tracks OVC eligibility, enrollment, case management, and graduation for over 120,000 beneficiaries, as well as referral to (and completion of) 90 OVC services. The system also longitudinally monitors HIV status, VLS, and early infant diagnosis of HIV.

**Lessons learned:** The OVC MIS is an integral part of monitoring, evaluation, learning, reporting, and adaptation in Zimbabwe's OVC program. Program managers use OVC MIS data to determine when households are due for case management visits and assessment and when individual CLHIV need viral load testing.

Following rollout of the OVC MIS and increased access to real-time data, local partners achieved 97% of the service delivery target of 192,000 beneficiaries, reached 95% of enrolled children with risk assessment or HIV testing and, as of September 30, 2023, 97% of the nearly 19,000 CLHIV who received a test were virally suppressed.

**Conclusions/Next steps:** The OVC MIS provides a platform for evidence-based decision-making that complements community-based support services to enhance the effectiveness of the country's HIV response.

As Zimbabwe seeks to achieve epidemic control across all age groups and populations, OVC programs provide crucial assistance to the most vulnerable and hard to reach, helping children adhere to treatment and achieve viral load suppression.

Metrics that matter: developing quality standards to measure friendliness of integrated key populations focused HIV service delivery in the public health sector in Zimbabwe

H.M. Ndondo<sup>1</sup>, R. Bako<sup>1</sup>, B. Madzima<sup>1</sup>, R. Yekeye<sup>1</sup>, A. Mpofu<sup>1</sup>, C. Goshu<sup>1</sup>, G. Ncube<sup>2</sup>, O. Mugurungi<sup>2</sup>, U. Tenga<sup>2</sup>, B. Mutede<sup>3</sup>, J. Mavudze<sup>3</sup>, N. Taruberekera<sup>3</sup>, T. Sola<sup>4</sup>

<sup>1</sup>National AIDS Council, Harare, Zimbabwe, <sup>2</sup>Ministry of Health and Child Care, Harare, Zimbabwe, <sup>3</sup>Population Solutions for Health, Harare, Zimbabwe, <sup>4</sup>Zimbabwe Technical Assistance, Training and Education Center, Harare, Zimbabwe

**Background:** Zimbabwe has reached epidemic control, surpassing the UNAIDS 95-95-95 targets among the general adult population. Key populations in Zimbabwe, however, perform dismally against these targets and contend with disparate health equity gaps that preclude access to friendly, and comprehensive HIV services. With a paucity of programmatic monitoring and evaluation tools to measure the impact of structural barriers to HIV service access, we set out to develop a KP friendliness tool and to determine domains that measure facility KP friendliness in the public sector.

**Description:** We developed a KP friendliness tool anchored in the World Health Organizations' quality standards including accessibility, community participation and linkages, provision of an appropriate package of services, provider competencies, facility characteristics, equity, data and non-discrimination.

We piloted the tool across 10 public sector facilities among men who have sex with men, sex workers, and transgender persons in Mutare, Masvingo, Bulawayo, Chitungwiza and Gweru districts in Zimbabwe.

The tool was administered with 10-15 members of health facility monitoring committees (HFMC) from each of the sites. Each rating was discussed, in instances where members were in discord, an average percentage score was applied.

Overall facility performance was scored as bronze (<60%), silver (60-79%), gold (80-94%) and platinum (95-100%).

**Lessons learned:** The KP friendliness tool was successful in eliciting reliable facility ratings on critical friendliness domains and facilitated robust discussions to identify areas of improvement.

This methodology provided opportunities to nuance performance ratings with experiential evidence from community led monitoring (CLM) data. The tool was digitalized and scaled from 10 to 53 health care facilities.

Quarterly implementation of the tool and annual reviews provided opportunities to iterate and nuance relevance, importance, measurability, and improvability of domains, tracking of progress and use of results to improve the KP program.

**Conclusions/Next steps:** This tool provides reliable measures to monitor "KP friendliness". Its domains are critical in improving quality of care and provides a yardstick for incremental progress in addressing structural barriers to equitable access to differentiated HIV services for KPs in the public health sector. Triaging data from the KP friendliness tool with KP CLM feedback provides rich data for evidence informed quality improvement efforts.

## WEPEE635

Utilizing generative artificial intelligence -Gen AI (ChatGPT-4) for exploratory and advanced data analysis for clients currently on HIV/AIDS treatment in ten highest volume treatment facilities in Nigeria

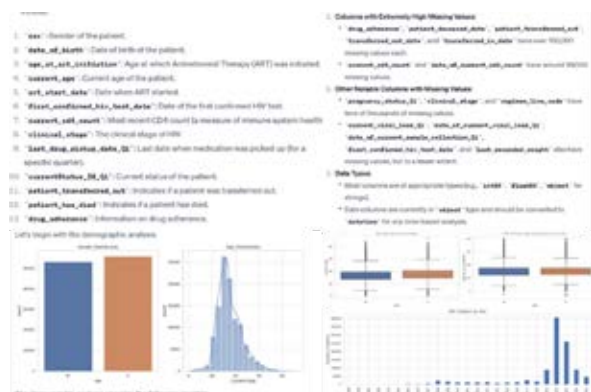

K. Kakanfo<sup>1,2</sup>, D. Onime<sup>1</sup>, A. Bashorun<sup>3</sup>, O. Dirisu<sup>4</sup>, I. Yusuf<sup>5</sup>, C. Obiora-Okafo<sup>1</sup>, K. Balogun<sup>6</sup>, U. Akpan<sup>7</sup>, A. Idemudia<sup>1</sup>, C. Nwadike<sup>1</sup>, O. Ashaolu<sup>1</sup>, B. Oyawola<sup>1</sup>, B. Onimode<sup>1</sup>, B. Plus<sup>1</sup>, A. Raji<sup>8</sup>, B. Kagniniwa<sup>9</sup>, O. Oyelaran<sup>10</sup>

<sup>1</sup>United States Agency for International Development (USAID), Strategic Information, Office of HIV/AIDS & TB, Abuja, Nigeria, <sup>2</sup>Research Hub Africa, Abuja, Nigeria, <sup>3</sup>Federal Ministry of Health Abuja, National HIV/AIDS and STI Control Program, Abuja, Nigeria, <sup>4</sup>Policy Innovation Centre, Nigeria Economic Summit Group, Abuja, Nigeria, <sup>5</sup>Paladium International, Abuja, Nigeria, <sup>6</sup>Public Health Information, Surveillance Solutions, and Systems, Abuja, Nigeria, <sup>7</sup>Excellence Community Education Welfare Scheme, Uyo, Nigeria, <sup>8</sup>United States Agency for International Development (USAID), Nigeria, Office of HIV/AIDS & TB, Washington USA, Washington, United States, <sup>9</sup>United States Agency for International Development (USAID), Office of HIV/AIDS & TB, Washington, United States, <sup>10</sup>United States Agency for International Development (USAID), Office of HIV/AIDS & TB, Abuja, Nigeria

**Background:** In HIV/AIDS treatment, data-driven decision-making is critical for improving client outcomes. Nigeria, with significant HIV burden, requires innovative approaches to analyze complex datasets related to treatment efficacy. This abstract explores the ability and application of Gen AI, specifically ChatGPT-4, for exploratory and advanced data analysis (EDA). The National Health Research Ethics Committee of Nigeria (NHREC) exemption approval was sought and received with anonymized and de-identified line list of client treatment records across ten highest volume facilities culled from the National Data Repository (NDR) and used for this analysis and study based on exploring the advanced data analytics features.

**Description:** ChatGPT-4, an advanced language model used to conduct EDA on a comprehensive dataset encompassing demographic, clinical, and treatment data of HIV/AIDS clients. The model was tasked with identifying patterns, anomalies, and correlations that traditional

analysis methods might overlook. Special emphasis was placed on descriptive analysis and treatment outcomes. The AI's capacity to process and interpret large datasets efficiently was leveraged to generate novel insights and hypotheses in a few minutes. With snapshot of the outputs below:

**Lessons learned:** GPT-4's analysis revealed nuanced patterns in descriptive, trend, correlation analysis, and treatment efficacy related to age, gender, and treatment outcomes. Notably, it identified previously unreported ART initiation and age distribution by gender and suggested potential areas for targeted interventions. These insights were validated against existing research and expert opinion, demonstrating the model's accuracy and reliability.

**Conclusions/Next steps:** The utilization of GPT-4 in EDA offers a novel approach to HIV/AIDS treatment analysis. Its ability to rapidly process vast datasets and uncover hidden patterns provides a valuable tool for researchers and policymakers. This could lead to more personalized treatment plans, efficient resource allocation, and ultimately, improved client outcomes.

Future research should focus on responsible and ethical use of Generative AI and expanding the use in other aspects of HIV/AIDS programming.

## WEPEE636

Responding to STI in key population: integration of key population classification into national routine STI services in Mozambique, 2023

I. Sathane<sup>1</sup>, M. da Cunha<sup>1</sup>, H. Magaia<sup>1</sup>, J. Seleme<sup>1</sup>

<sup>1</sup>Ministry of Health, Public Health, Maputo, Mozambique

**Background:** Key populations (KP) are disproportionately affected by viral hepatitis and STI. Implementation of STI services in Mozambique with provision of KP-specific care has created an opportunity to collect timely national program data on KP, specifically for sex workers (SW), men who have sex with men (MSM), people who inject drugs (PWID), transgender people (TG) and prisoners. In Mozambique no national level data was available on STI among KP.

**Description:** In August 2022, the Ministry of Health updated STI data tools to enable collection of key population status at all public facilities in Mozambique (n = 1,634).

All providers who screen, diagnose, and treat STI were trained with the new package that included a risk behavior classification algorithm to identify and record KP status on STI paper-based forms, which are aggregated at the clinic level and digitized into a national database

**Lessons learned:** STI routine program data from January to December 2023 demonstrated 895,185 STI cases diagnosed and treated, of those 22,529 (3%) were identified as KP (57% were female and 43% male); 13,378 (59%) were SW; 2,160 (10%) MSM; 1,803 (8%) were PWID; 3,938 (17%) were prisoners and 1,252 (6%) were TG.

Among SW more female (10,379) was diagnosed with STI compared with men (3,080); also, more TG female (719) compared with TG men (614). Among PWID more men (1,151) were diagnosed compared with female (733) and more men (3,070) in Prisoners compared with female (940).

Data confirm the feasibility of capturing KP data in ITS services, furthermore, KP disaggregated data plays an important role in controlling the HIV epidemic

**Conclusions/Next steps:** In high HIV prevalence country, the diagnose and treatment for STIs in KP is central to the elimination of diseases as public health threats. Additionally, this evaluation provides a first time STI programmatic data among KP in Mozambique.

The granular level and timely information on KP at facility and national level can provide essential information for optimal prevention and treatment resources appropriately, programmatic decisions-making, and contribute to the body of knowledge on KP in the region

<sup>10</sup>Joint United Nations Programme on AIDS (UNAIDS), Country Office, Yaounde, Cameroon,

<sup>11</sup>World Health Organization, Country Office, Yaounde, Cameroon,

<sup>12</sup>United Nations Children's Fund (UNICEF), Country Office, Yaoundé, Cameroon,

<sup>13</sup>Faculty of Medicine and Biomedical Sciences, University of Yaoundé I, Yaoundé, Cameroon,

<sup>14</sup>Africa Centres for Disease Control and Prevention, Addis Ababa, Ethiopia,

<sup>15</sup>Institute of Human Virology, University of Maryland School of Medicine, MD, United States

**Background:** Background: Monitoring early warning indicators of HIV drug resistance (EWI-HIVDR) in low-and middle-income countries (LMICs) is recommended by the World Health Organization (WHO). This relatively inexpensive, non-laboratory method for large-scale program monitoring is critical in preventing HIVDR emergence, ensuring the effectiveness of antiretroviral therapy (ART) programs, and achieving HIV epidemic control. This study aimed at evaluating the EWI-HIVDR in Cameroon.

**Methods:** Following WHO-methodology, a retrospective study was conducted in 69 ART sites from all 10 regions of Cameroon from January-December 2022. ART-sites were selected following a systematic-sampling (region, urban/rural, public/private), and seven HIVDR-EWI were collected: (EWI-1) total-attribution to ART; (EWI-2) viral-suppression (VS); (EWI-3) viral-load (VL) coverage; (EWI-4) appropriate second VL-testing; (EWI-5) drug-stockouts; (EWI-6) on-time drug pick-up; (EWI-7) appropriate switch to second-line

ART. Targets for each EWI was classified as poor-, moderate- or good-performance. Data were analyzed using Excel 2016.

**Results:** A total of 173,271 ART-experienced patients were enrolled. ART-attribution (EWI-1) was 5.7%, ranging from 3.6 to 9.6%, far within the target of <15%. VS rate (EWI-2) was 92.3% (110,672/119,904), with 30% of regions (Northwest, West, Southwest) reaching the 95% target (96.7%; 96.1%, 95.8% respectively). Regarding VL-coverage (EWI-3), the performance was 69.2% (n=119,904), ranging from 50.8-88.1%, below the expected 95% target.

Performance for second VL-testing (EWI-4) was just 39% (24.9-52.8%), mainly due to delayed prescription (>6months) of the second VL-testing after an unsuppressed VL. All (100%) ART-sites experienced at least one ARV drug-stockout (EWI-5) during the 12-months reporting-period, ranging from 58.3-100% months.

Timely ARV pick-up (EWI-6) was 68.4% (43-97%), with only the North-region having performance (97.0%) above 90%. Only 0.69% (0.00-2.38%) of patients with confirmed unsuppressed-VL (EWI-7) were switched to second-line ART within 6 months.

**Conclusions:** In Cameroon, EWI-HIVDR highlights acceptable performances for ART-retention and VS. Performances for VL-coverage, second VL-testing, ARV drug stockout, timely ARV pick-up and appropriate switch to second-line ART were very-poor. The findings suggest a need for optimizing ART procurement and supply-chain, increasing VL-testing coverage and strengthening the capacity to HIV clinicians for timely switch from failing-regimens. In LMICs sharing similar programmatic-challenges, such public-health actions will contribute in HIVDR-prevention, and ultimately in achieving HIV epidemic control.

## WEPEE638

### Improving decision making by minimizing non-response bias in HIV/AIDS health studies

L. Busang<sup>1</sup>, K. Seipone<sup>1</sup>

<sup>1</sup>African Comprehensive HIV/AIDS Partnerships (ACHAP, Programmes, Gaborone, Botswana

**Background:** Quality of Health interventions design, implementation and outcomes depend on quality of data. Study sample statistics should therefore be representative of estimated parameters. Non-response becomes critical when response rates fall below 70% (30% non-response). Ideally response should be 80% or more. However, this is difficult to achieve in practice. In Botswana, the main HIV response population-based survey, Botswana AIDS Impact Survey (BAIS) recorded a non-response as high as 34% in HIV Testing.

During its OVC Essential Survey Indicators to assess progress towards achievement of Essential Indicators ACHAP led field work for a study to obtain baseline measures with a minimal response rate.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Methods:** ACHAP collaborated with community structures and actors, co conduct a descriptive quantitative cross-sectional study using Simple Random Sampling design to select households' primary data respondents. The sample size was powered to test the difference between baseline and endline values of the selected indicators of the OVC Essential Survey in Botswana's.

To manage non-response, community structures such as the tribal leadership, village development committees and the civil society organizations working with the target population were engaged and sensitized on the project prior to the fieldwork. They engaged the general community with particular attention to the target population to sensitize them on the value on the study.

This engagement made consenting easier as target population already had sufficient information for making informed consent in advance. Research assistants training emphasized boosting response rate.

**Results:** A total of 303 households were physically contacted and of these 297 of them had been interviewed following a successful consent process, making this 90.5% of the targeted sample of 328. The non-response is therefore 9.5% which is way less than the 34.4% nonresponse rate provided for in the sample size calculation.

Some of the contributing factors to the none response was mainly due to households not known by the collaborating Community Structures or Service Providers collaborated with, these constituted 65% (17/26) of the not interviewed households.

**Conclusions:** Collaborating with community structures for both data collection for studies can positively contribute to improved response rate.

### Political and legal factors affecting people living with, vulnerable to and affected by HIV

#### WEPEF639

##### No U-turns allowed: a roadmap to challenge criminalisation of HIV in Aotearoa New Zealand

B.M. Hollingshead<sup>1,2</sup>, M. Fisher<sup>3</sup>, R. Olin German<sup>1,4</sup>, J. Bruning<sup>5</sup>, B. Beebe<sup>1</sup>, S. Saini<sup>1</sup>, R. Lake<sup>1</sup>, J. Rich<sup>1</sup>

<sup>1</sup>Burnett Foundation Aotearoa, Auckland, New Zealand,

<sup>2</sup>Australian Research Centre in Sex, Health and Society, La

Trobe University, Melbourne, Australia, <sup>3</sup>Body Positive Inc.,

Auckland, New Zealand, <sup>4</sup>GNP+, Amsterdam, Netherlands,

the, <sup>5</sup>Positive Women Inc., Auckland, New Zealand

**Background:** Aotearoa New Zealand (NZ) has one of the highest rates of HIV criminalisation per capita. HIV transmission, exposure, and non-disclosure during sex (if not using a condom) is prosecuted under the Crimes Act 1961 under charges of 'criminal nuisance', 'wounding with intent', 'wilfully infecting with a disease', and 'duty of persons in charge of dangerous things'.

There is no legal precedent to acknowledge U=U and PrEP, however a case being progressed would pose significant distress to the person being charged. U=U also places the burden on people living with HIV to prove they were undetectable at the time of sex. Community-based organisations explored what advocacy pathways might exist.

**Description:** Given HIV is criminalised under general law, decriminalisation cannot be done through a change in legislation, as the laws are not HIV-specific. We reviewed international best practice and tangible tools we could apply to NZ.

**Lessons learned:** Community-based organisations must continue to advocate strongly to police, corrections, lawyers, and media to prevent HIV cases from reaching the judicial system and raise greater awareness of the public health pathways for risk management. Strong relationships and targeted workforce education with police and corrections have been essential to manage cases as they arise. We will expand this work to the wider judicial system.

Close relationships with the media have allowed for some improved reporting of cases, but this requires vigilance and media guidelines. HIV-specific prosecutorial guidelines would establish what circumstances criminal charges could be brought forward and standardise practices on charging decisions.

We could also lobby for targeted reform of legislation to remove HIV from falling within the definition of grievous bodily harm.

**Conclusions/Next steps:** Criminal law is often applied inconsistently and overstates the burden of disease and risk of HIV transmission in the context of U=U. Application of criminal law should reflect a greater understanding of modern HIV science to limit unjust prosecutions and stigmatising practices.

A multi-pronged approach of targeted workforce education, lobbying, and advocacy is needed to lift the burden of criminalisation faced by people living with HIV, prevent cases from reaching the judicial system, and increasingly acknowledge the role of public health.

#### WEPEF640

##### The impact of criminal liability for HIV transmission on people living with HIV in Kazakhstan

N. Sidorenko<sup>1</sup>

<sup>1</sup>Eurasian Women's Network on AIDS, Almaty, Kazakhstan

**Background:** Article 118 of the Criminal Code of the Republic of Kazakhstan mandates people living with HIV to disclose their diagnosis to every sexual partner. Consequently, people with HIV seeking treatment at the AIDS Center must sign a document acknowledging their awareness of Article 118.

While only 18 people in Kazakhstan have faced criminal convictions under Article 118, no study has examined the impact of this law on the lives of people living with HIV in the country.

**Methods:** In August 2023, the HIV community in Kazakhstan initiated a study to explore strategies chosen by people living with HIV in response to the legal obligations outlined in Article 118. An online survey was administered to 101 people living with HIV, comprising 58 women and 43 men. The sample was middle-aged, with women averaging 42.5 years and men 38.1 years. A majority (60.4%) had been living with HIV for more than 5 years.

**Results:** The study identified three primary strategies adopted by people with HIV who were officially informed about Article 118. Only 28.8% openly revealed their HIV status, with 5% documenting the disclosure (e.g., disclosing in the presence of witnesses or taking screenshots of correspondence). The largest group (45.5%) shared their HIV status with a small circle of trusted people (e.g., spouses, parents).

One in four participants (25.7%) chose to conceal their status from everyone, with 9.9% opting to abstain from any romantic or sexual relationships.

Common reasons for not disclosing their HIV diagnosis included the fear of violence and blackmail, concerns about relationship breakup, and fear of criminal conviction.

**Conclusions:** Despite the limited number of convictions under Article 118, the criminalization of HIV transmission had a detrimental impact on the quality of life for people living with HIV in Kazakhstan. It instilled fear and a sizable proportion of participants discontinued their romantic or

sexual lives - an especially noteworthy and novel finding. The study results offer support for community-based advocacy aimed at reforming legislation that needlessly criminalizes a medical diagnosis. Treating intentional HIV transmission as part of regular criminal offenses offers a more sensible and justice-oriented legal approach.

## WEPEF641

### Exploring the Regulatory Landscape on HIV prevention and control in Uzbekistan – a Migrant-centered Perspective

G. Isamukhamedova<sup>1</sup>, C. Ito<sup>2</sup>, U. Wagner<sup>3</sup>, C. Maksudova<sup>3</sup>, G. Adilova<sup>3</sup>, B. Kurbanov<sup>4</sup>

<sup>1</sup>IOM Uzbekistan, Migration Health, Tashkent, Uzbekistan,

<sup>2</sup>IOM Regional Office for South-Eastern Europe, Eastern Europe and Central Asia, Migration Health, Vienna, Austria,

<sup>3</sup>UNAIDS Uzbekistan, Tashkent, Uzbekistan, <sup>4</sup>Ministry of Health, Committee for Sanitary-Epidemiological Welfare and Public Health Service, Tashkent, Uzbekistan

**Background:** The Republican AIDS Center of Uzbekistan notes 48,418 people living with HIV being registered in Uzbekistan. The HIV epidemic is in a concentrated stage, with sexual transmission accounting for the majority of cases. Apart from key populations, migrant workers are of concern, as HIV prevalence has been gradually increasing since 2011 to 4.1% in 2022 (compared to 0.1% in the general population).

It is therefore important to understand how the population mobility is considered in the HIV related legislative and policy framework in Uzbekistan and countries of destination.

**Methods:** UNAIDS and IOM in Uzbekistan conducted a desk review of the existing legislative and policy framework on HIV and migration in Uzbekistan and major countries of destination such as the Russian Federation in August-December 2023 aimed at identifying and improving key government HIV strategies with a migrant-inclusive approach.

**Results:** The desk review revealed several gaps in the Uzbek legislative and policy framework regulating HIV prevention and service provision, compared to international standards. While the government has recognised Uzbek migrant workers as priority for effective HIV control and foresees increased coverage of migrant workers with voluntary HIV testing as well as awareness raising, legislation is insufficiently developed due to the absence of an effective migration law. As for regulations in the Russian Federation, the issue of deportation was highlighted as one of the key barriers for people living with HIV.

**Conclusions:** Based on the gaps revealed by this desk review, key recommendations for Uzbekistan are to:

1. Include HIV prevention measures targeting migrants in the basic law,

2. Develop roadmaps for future HIV prevention interventions and treatment access for migrants, and  
3. Develop standard operating procedures by the Republican AIDS Center and specialized non-governmental organizations for remote services (online registration, testing services, provision of antiretroviral therapy) to migrants living with HIV and their families.

International cooperation between the country of origin and the country of destination is also key for effective HIV c. In particular, the solution to the issue of deportation of migrants with HIV depends on changes in the legislation of the receiving country.

## WEPEF642

### TRIPS-plus provisions in bilateral agreements and national laws and their impact on access to HIV treatment: a review of the legislative framework in some EECA countries

M. Shibaeva<sup>1</sup>, S. Golovin<sup>2</sup>

<sup>1</sup>St. Petersburg Economic University, Saint Petersburg, Russian Federation, the, <sup>2</sup>Yaroslav-the-Wise Novgorod State University, Velikiy Novgorod, Russian Federation, the

**Background:** TRIPS-plus provisions exceed the required WTO standards and have a negative impact on medicine availability. The percentage of HIV-positive healthcare clients in the Eurasian Economic Union receiving antiretroviral therapy of those knowing their status is still less than 90%, one of the reasons being high prices for key drugs, such as dolutegravir, caused by patent monopolies. Regular monitoring of TRIPS-plus provisions in the national regulatory frameworks and assessment of their impact on public health is required to ensure adequate treatment access.

We analyzed the national and the EEU regulatory framework to assess the scope of limitations imposed by specific TRIPS-plus measures on access to antiretrovirals and other drugs. These measures include patent linkage, data exclusivity, strict patentability criteria, and supplementary protection certificates.

**Methods:** For analysis, we used international regulatory framework (TRIPS Agreement and Doha Declaration); official national and regional legal databases (<https://online.zakon.kz/>; <http://cbd.minjust.gov.kg/>; <https://pravo.by/>; <https://www.aipa.am/hy/>; <https://eec.eaeunion.org/>); texts of Enhanced Partnership and Cooperation Agreements with the EU (Armenia, Kazakhstan).

The Russian and Armenian equivalents and variations of the following key words and combinations were used: indications of patents and licenses in drug registration applications, ban on original clinical trial data use for generic registration dossiers, ban on generic drug registration, patentability criteria, and extending the validity period of a patent for an invention.

Late-breaker  
abstracts

Author  
Index

**Results:** Our analysis identified all four categories of the TRIPS-plus provisions referred to in Background in EEU country laws. The results are presented in Table 1.

Country	Data, Registration and Market Exclusivity	Patent Linkage in Drug Registration Application	Patentability Criteria	Extending the validity of patent
Armenia	8 years of data exclusivity; 10 years of market exclusivity	-	- molecule - composition - method of obtaining - mode of application	up to 5 years
Belarus	4 years of data exclusivity	- list of patents - guarantee of non-infringement	- molecule - composition - method of obtaining - mode of application	up to 5 years
Kazakhstan	6 years of data exclusivity	- list of patents and license agreements - guarantee of reliability of information and non-infringement of rights	- molecule - composition - method of obtaining - mode of application	up to 5 years
Kyrgyzstan	-	-	- molecule - composition - method of obtaining - mode of application	-
Russia	6 years of data exclusivity; 4 years of registration exclusivity	-	- molecule - composition - method of obtaining - mode of application - method of treatment	up to 5 years
Eurasian Economic Union Regulation	-	- list of patents - guarantee of non-infringement	- molecule - composition - method of obtaining - mode of application - method of treatment	up to 5 years

Table 1.

**Conclusions:** TRIPS-plus provisions are present in the legal framework of Armenia, Belarus, Kazakhstan, Kyrgyzstan and Russia, which limits opportunities for emergency country responses to closing treatment access gaps.

Of note are data and registration exclusivity provisions, soft patentability criteria, and Supplementary Protection Certificates. Some of the TRIPS-plus provisions have been imposed by Enhanced Cooperation and Partnership Agreements with the EU.

Countries are recommended to revise their regulatory frameworks and remove TRIPS-plus regulations, recognizing them as jeopardizing access to medical products.

## WEPEF643

**Building Resilience and Reducing Risk: sustaining safe and supportive community health outreaches among the key population (MSM) in a polarized security and transitional context**

R.N. Josphine<sup>1</sup>, S.O. Rading<sup>1</sup>, D.K. Mbacho<sup>1</sup>, D. Mutheu<sup>1,2</sup>, G. Marenje<sup>3</sup>

<sup>1</sup>USAID Stawisha Pwani, LVCT Health, Prevention and Key Population Program, Kilifi, Kenya, <sup>2</sup>Department of Health, Kilifi County, HTS Provider / Counsellor, Kilifi, Kenya, <sup>3</sup>Department of Health, Kilifi County, Clinical Officer, KP program, Kilifi, Kenya

**Background:** In regions facing a polarized security and transitional context, stigma, discrimination, and violence against the Key Population (MSM) contribute to heightened risks of acquiring HIV and mental health issues. The

ruling by the Kenya supreme court in February of 2023 sparked an anti-LGBTIQ campaigns which resulted in protests, violent assaults, displacement, and the closure of community-led Drop-in-Centers, disrupting outreach and service delivery.

To mitigate risks, the Stawisha Pwani program transitioned from a Drop-In-Centre to a community outreach model, addressing challenges posed by security threats, doxing, and interrupted care services.

**Description:** The Stawisha Pwani program facilitated in participatory community consultations and risk assessments. Short-term strategies included leveraging peer educators, collaborating with local organizations to respond to emergency situations, and integrating services into public health systems.

Long-term measures focused on transitioning the program team and volunteers under Human Resources for Health, designing a community outreach model, and developing a comprehensive crisis and risk mitigation strategy.

The service delivery strategy prioritized a community health outreach model, ensuring continuity with minimal security exposure, and facilitating a seamless transition.

**Lessons learned:** Between April and October 2023, the program engaged 40 trained peer educators, extending HIV prevention and testing services to 2778 MSM. Of these, 240 (8.6%) were first-time participants, leading to the identification of 6 new KPLHIV (yield 2.50%). Additionally, 399 MSM enrolled in PrEP, with 255 actively on PrEP by October 2023.

However, challenges included the absence of a crisis and risk mitigation strategy, insufficient resources for remote work, and the need for a comprehensive violence response plan.

Slow response rates and suboptimal community resource connections hindered program adaptation, emphasizing the importance of continuous monitoring and paralegal engagement for participant safety.

**Conclusions/Next steps:** In navigating a hostile environment, the Stawisha Pwani program showcased resilience by transitioning to a community-based approach, sustaining essential services for the Key Population.

Despite challenges and ongoing threats, the lessons learned emphasize the imperative need for a crisis and risk mitigation strategy, resource optimization, and strengthened connections with community networks to ensure sustained support and resilience.

## WEPEF644

### Constitutional challenge of Canadian laws criminalizing sex work: community-led litigation as a necessary step to reach 10-10-10 goals

S. Wesley<sup>1</sup>, J. Clamen<sup>1</sup>

<sup>1</sup>*Stella, l'amie de Maimie, Montreal, Canada*

**Background:** The current regime criminalizing sex work in Canada makes sex work a crime since 2014 despite a Supreme Court decision invalidating previous laws.

Sex worker and allies spent 6 years educating and advocating for the government to uphold sex workers' Charter rights to no avail. In March 2021, after years of inaction from Parliament to repeal the current sex work offences, sex workers were forced to go to court to challenge these laws to have their human rights protected under the banner of the Canadian Alliance for Sex Work Law Reform (CASWLR). The case, CASWLR v. Canada, is currently at the Appeal level.

**Description:** CASWLR v. Canada is led by an alliance of 23 groups, primarily by and for sex workers, as well as 6 co-applicants, supported by 7 fact witnesses speaking about the realities of sex workers, 7 researchers, and 10 intervenors representing a wide variety of groups, including related to HIV and sexual health, women, migrant, trans and queer, and Black communities.

This mobilization allowed sex workers to put forward arguments that went beyond basic health and security (i.e. the right to not be raped or murdered and to not be exposed to HIV) to include nuanced discussions of bodily autonomy and consent, as well as discrimination from an intersectional perspective.

This type of broad mobilization is the result of decades of work to build allyship, resist prohibitionist discourse and intrusions within movements such as HIV and meaningful engagement of sex workers through sex worker-led service provision and advocacy.

**Lessons learned:** For the purpose of this presentation, we will focus on

- methodology for constitutional challenges and the challenges encountered.
- how allies within HIV movements can take action towards 10-10-10 objectives.
- major threats to sex workers' rights, including anti-trafficking initiatives, lack of solidarity from intersecting movements.

**Conclusions/Next steps:** This presentation will provide concrete information to help criminalized communities engage with litigation and to help allies, especially those who can serve as experts, consider how they can support communities, consider future litigation needs when determining research priorities and connect litigation work as actions towards the 10-10-10 UNAIDS objectives.

## WEPEF645

### Assessing the impact of pharmaceutical patents on access to antiretroviral treatment in Africa: a review from 1990-2020

M. Okereke<sup>1</sup>

<sup>1</sup>*University of Ilorin, Faculty of Pharmaceutical Sciences, Ilorin, Nigeria*

**Background:** Globally, Africa bears the greatest burden of HIV/AIDS. Approximately 69% (23.5 million) of the 34 million people living with HIV worldwide, are located in Africa. Despite this, access to antiretroviral treatment (ART) in the continent for people living with HIV/AIDS (PLWHA) remains a significant challenge. One major factor contributing to this challenge is the issue of pharmaceutical patents, which limits the production and distribution of generic antiretrovirals in the continent.

This review was to assess the impact of pharmaceutical patents on access to ART in Africa from 1990-2020.

**Methods:** A comprehensive review of literature was carried out by searching databases such as PubMed, Google Scholar, and Cochrane with keywords: "pharmaceutical patents", "antiretrovirals", "Africa", "HIV/AIDS", and "people living with HIV/AIDS".

Supplemental data were also obtained from official directories of the International Federation of Pharmaceutical Manufacturers' Association and the World Health Organization.

Only papers published between 1990 and 2020 and those that reported country-specific evidence of the impact of pharmaceutical patents on access to ART were selected. Qualitative content analysis was then carried out on the resultant data extracted.

**Results:** Of 517 studies identified in the search, 201 reported country-specific cases. We found that between 1990 and 2020, cases where pharmaceutical patents significantly impacted the availability of and access to ART were reported in Botswana, Burkina Faso, Ethiopia, Ghana, Kenya, Liberia, Malawi, Mozambique, Nigeria, Rwanda, Senegal, South Africa, Tanzania, and Uganda.

Evidence from our study revealed that when these countries attempted to import or manufacture generic versions of antiretrovirals that will be affordable for PLWHA, legal charges and lawsuits were filed against them by pharmaceutical companies that held patents on the drugs.

**Conclusions:** This study has important implications for policymakers and stakeholders seeking to improve access to antiretroviral treatment in Africa. Our results suggest that the relaxation of patents on antiretrovirals could improve access to ART for PLWHA in the continent.

Furthermore, greater attention to the enactment of policies and flexibilities in international trade laws, such as compulsory licensing, to bypass pharmaceutical patents and produce or import generic versions of antiretrovirals at lower costs could improve access to ART for PLWHA.

### Janssen renounced patents for tuberculosis life-saving drug within the territory of Ukraine

V. Kochubei<sup>1</sup>

<sup>1</sup>CO "100% Life" (formerly the All-Ukrainian Network of PLWH), Advocacy Department, Kyiv, Ukraine

**Background:** The most common co-infection for people living with HIV is tuberculosis. The primary patent on BDQ, a life-saving TB drug, expired in July 2023. Janssen, a subsidiary of Johnson & Johnson, held multiple patents on BDQ in Ukraine - a practice called evergreening, which allows patent holders to extend their monopolies even when the primary patent on an active pharmaceutical ingredient has expired.

On 13th July 2023, the GDF and Johnson & Johnson announced a deal that would enable 44 LMICs to access affordable generic versions of BDQ, but the deal excluded many of the countries that are most in need of this drug, including Ukraine, the country in the war.

**Description:** An estimated 31,000 people live with TB in Ukraine, making it one of the highest disease-burden countries in Europe. Johnson & Johnson's global announcement to not enforce secondary patents on BDQ came amid growing discontent among civil society and governments about the exclusion of Ukraine and many other high-burden countries from the voluntary license and follows negotiations between Johnson & Johnson's and Janssen's patent attorneys and 100% LIFE's lawyer.

These negotiations were held to settle two lawsuits that 100% LIFE launched in August 2023 against Janssen, to invalidate secondary patents on BDQ and their term extensions in Ukraine. As a consequence, Janssen renounced all challenged patents within the territory of Ukraine.

**Lessons learned:** The synergy of civil society, in particular within the Make Medicines Affordable campaign, in terms of jointly opposing BDQ secondary patents in different countries, has forced the big pharmaceutical player to meet the requirements of the patient community.

Internal and external policies of big pharmaceutical companies concerning life-saving drugs remain subject to potential changes at any time. Therefore, renouncing secondary patents is the only reliable resolution mechanism in this case.

**Conclusions/Next steps:** Experts estimate a generic version could be mass-produced for \$48 to \$102 per treatment course. As a result of the renouncing of BDQ patents, the Ukrainian market is guaranteed to be open for affordable generic versions of BDQ, which makes BDQ more accessible to all patients who rely on this treatment.

## WEPEF647

### Curbing sexual gender based violence among the key population

J. Mteri Kitumbuk<sup>1</sup>, K. Mwendwa<sup>2</sup>, F. Ligare<sup>2</sup>

<sup>1</sup>HAPA Kenya, Education, Mombasa, Kenya, <sup>2</sup>HAPA Kenya, Health, Mombasa, Kenya

**Background:** In disturbing trends of violence against the LGBTQ community in Kenya, activists Joash Mosoti, Sheila Lumumba, and Edwin Chiloba, were brutally murdered between May 2021 and January 2023, triggering widespread homophobic sentiments online and offline. This surge in hatred coincided with a conservative government aligned with religious leaders, fuelling anti-LGBTIQ discourse. Kenya saw proposals for anti-LGBTIQ legislation, endorsed by politicians and religious figures.

The situation reached tipping point when an MP sought to introduce the legislation, posing a threat to LGBTQ individuals, organizations, and healthcare programs.

Despite this, the Supreme Court delivered a ruling that LGBTQ communities reserved a right to form NGOs by right of association challenging discriminatory practices against the community.

**Description:** In March 2023, leaders from Key-population-led organizations in Kenya's coast region convened to address escalating challenges amidst anti-LGBTIQ campaigns. Issues discussed included anti-LGBTIQ rhetoric, legal resource gaps, evictions, violence, crisis response inefficiencies, and mental health concerns. To counteract these challenges, interventions such as engaging sensitized religious leaders, mapping legal advisors, establishing safe spaces, conducting community sensitization, and developing a coordinated crisis response framework were proposed. Additionally, strategies for mental health support, addressing evictions, and providing asylum information were outlined.

**Lessons learned:** Despite security risks from anti-LGBTIQ campaigns, critical services like ARV and PrEP uptake continued through innovative care models. Tele-consultation, online psychological aid, remote work, and door-to-door service delivery ensured continuity. Community-led programs activated grassroots paralegal, violence response mechanisms by monitoring campaigns. Limited emergency support from long-term donors hindered individual organizations. Absence of regional mitigation plans and limited financial pool delayed coordinated responses. Engagements with police, motorists, religious leaders, and health officials at regional levels provided opportunities for sensitization. Challenges included inadequate funding for emergency support and structural interventions. Nonetheless, relationships with law enforcement, motorists, bar/restaurant owners, and health committees were strengthened through collaboration.

**Conclusions/Next steps:** In many conversations with stakeholders, community leaders noted knowledge gaps and understanding of key-population, increased violence

and HIV scourge occasioning protests against funding key-population-led programs. Support and funding for community-led organizations to engage stakeholders, challenges the anti-right narrative and advocacy for inclusion are key determinants of sustainability of HIV response.

## WEPEF648

**Breaking barriers: success stories in access to medicines through strategic intellectual property advocacy a case study of make medicines affordable campaign**

M. Ahmar<sup>1</sup>, S. Kondratyuk<sup>1</sup>, D. Peeler<sup>1</sup>, O. Mellouk<sup>1</sup>

<sup>1</sup>International Treatment Preparedness Coalition, Johannesburg, South Africa

**Background:** Patents and other intellectual property (IP) rights constitute a major barrier for access to medicines. TRIPS agreement provides allowances for countries to adopt measures that can facilitate access to medicines. However, this is still under-used. The Make Medicines Affordable consortium (MMA) works across 17 countries to overcome IP barriers using different strategies.

The case study provides examples of successes related to bedaquiline (BDQ), dolutegravir (DTG) and tenofovir alafenamide/emtricitabine (TAF/FTC).

**Description:** BDQ, developed by Johnson and Johnson (J&J) to treat TB. As the patent expiry approached, J&J attempted to maintain the monopoly through evergreening patents. MMA launched 18 patent oppositions (POs) in countries including Belarus, Brazil, India, Kazakhstan, Kyrgyzstan, Moldova, Thailand, Ukraine, and Vietnam. Notably, three of these POs, in Brazil and Thailand, have already achieved success.

Fundación GEP in Argentina successfully opposed Gilead's patent application for tenofovir alafenamide/emtricitabine (TAF/FTC). This triumph enabled early access to affordable generic versions, marking a significant advancement in HIV prevention and treatment.

The ViiV/Medicines Patent Pool (MPP) voluntary license (VL) for dolutegravir (DTG), a WHO-recommended antiretroviral for HIV, initially excluded many LMICs, resulting in higher prices. MMA partners conducted campaigns advocating for compulsory licenses (CLs) in Algeria, Belarus, Kazakhstan, Libya, and Morocco. This strategic effort led to inclusion in the VL, expanding access to generic versions of DTG.

**Lessons learned:** MMA civil society partners initiated and implemented successfully a multifaceted approach that combines legal strategies, public awareness, and collaboration with various stakeholders. The consortium's, created significant savings in health budgets, enabling countries to increase coverage. In 2022, total price reductions for DTG in Belarus and Kazakhstan reached an estimated US\$ 43.4 million. Coordinating national interven-

tions through the consortium has had global impact: the 18 POs on BDQ contributed to J & J's decision in 2023 to stop enforcing BDQ patents in 134 LMICs.

**Conclusions/Next steps:** Sustained advocacy efforts can contribute significantly to creating an environment that prioritizes public health over strict intellectual property protection.

Total savings generated from the Project are being calculated and expected to increase in the coming months as POs currently examined become successful, indicating relevance of long-term approaches.

## WEPEF649

**Assessing the adoption of WHO TB prevention therapy (TPT) and TB-LAM in national guidelines in sub-Saharan Africa**

S. Lynch<sup>1</sup>, A. Sharma<sup>1</sup>, V. Srivatsan<sup>1</sup>, A. Banda<sup>1</sup>, M. Kavanagh<sup>1</sup>, A. Kayongo<sup>1</sup>

<sup>1</sup>Center for Global Health Policy and Politics, O'Neill Institute for National and Global Health Law, Georgetown University, Washington DC, United States

**Background:** TB remains the largest killer among people living with HIV/AIDS (PLWHA), claiming 167000 in 2022. Urine lipoarabinomannan (TB-LAM) and tuberculosis prevention therapy (TPT) are key medical tools for screening, diagnosing and preventing TB/HIV coinfection.

TPT involves using one or more antitubercular drugs to prevent progression to active TB disease. 2020 WHO guidelines recommend TPT for PLHIV who test negative for TB and specify preferred TPT regimens: isoniazid preventive therapy (IPT) and rifamycin-based shorter regimes.

TB-LAM is the only point-of-care rapid test for diagnosing TB among PLWHA. WHO guidelines recommend TB-LAM in inpatient settings for PLWHA with TB signs/symptoms, severe illness, or CD4<200 cells/mm<sup>3</sup>. In outpatient settings, administer TB-LAM for those with TB signs, serious illness, or CD4<100 cells/mm<sup>3</sup>.

We evaluate the adoption status of TB-LAM and TPT in SSA by examining the national HIV and TB guidelines in sub-Saharan Africa (SSA), home to 22/30 high-burden TB/HIV countries (HBCs).

**Methods:** To identify the adoption status of TPT and TB-LAM recommendations in sub-Saharan Africa (SSA), we reviewed the most recent national strategic plans for HIV and TB, guidelines, and other relevant national documents and updates via desktop reviews or the document repository of the HIV Policy Lab ([www.hivpolicylab.org](http://www.hivpolicylab.org)). We analyzed where national policies aligned with WHO TB-LAM and TPT for recommendations for PLWHA.

**Results:** TB-LAM: Relevant guidelines were found for 45/48 countries. Among the 22 HBCs, at least 9 have adopted WHO TB-LAM recommendations in national guidelines. Of the remaining 23 countries in SSA not designated as HBC, only Rwanda has adopted optimal policies.

TPT: Relevant guidelines were found for 43/48 countries in SSA. 37 countries provide TPT to children living with HIV and 27 countries offer TPT for PLHIV. Further, 29 countries include only IPT while 13 include shorter regimens. For 22 HBCs in SSA, at least 7 countries have adopted rifamycin-based regimes in national guidelines.

**Conclusions:** Despite the proven effectiveness of TB-LAM and TPT as screening, diagnosing and prevention strategy for TB/HIV coinfection, significant policy gaps remain that should be addressed to improve TB-related outcomes among PLWHA.

## WEPEF650

### HIV pre-exposure prophylaxis policies worldwide

M. Kavanagh<sup>1</sup>, I. Katz<sup>2</sup>, A. Sharp<sup>1</sup>, V. Dubula<sup>3</sup>, V. Srivatsan<sup>1</sup>, M. Warren<sup>4</sup>

<sup>1</sup>Center for Global Health Policy and Politics, O'Neill Institute for National and Global Health Law, Georgetown University, Washington DC, United States, <sup>2</sup>Bureau of Global Health Security and Diplomacy, PEPFAR, Washington DC, United States, <sup>3</sup>The Global Fund to Fight AIDS, Tuberculosis and Malaria, Geneva, Switzerland, <sup>4</sup>AVAC, New York, United States

**Background:** Pre-exposure prophylaxis (PrEP) serves as a preventive measure to reduce the risk of HIV infection among vulnerable populations. PrEP is a highly effective prevention technology, and despite its success in countries with widespread PrEP usage and coverage, most countries still fall short of uptake targets. National policies may help explain why.

**Methods:** The HIV Policy Lab is a public dataset and visualization tool tracking 33 key indicators of HIV-related law and policy in 194 countries. HIV policies are identified and analyzed during a legal review of policy documents and a global survey of government officials, and benchmarked against global norms. A composite index measuring countries' alignment to international guidance was constructed that evaluates alignment with World Health Organization normative guidance on:

- Population-specific eligibility and;
- Regulatory approvals for PrEP technologies.

**Results:** As of 2023, 82 countries had adopted national policies that

- Confer PrEP eligibility to all populations at substantive risk for HIV, and;
- Have issued regulatory approval for at least one PrEP technology.

This is an increase from 2017, when only 19 countries had a WHO aligned PrEP eligibility-criteria and had at least one registered PrEP technology. Prior to 2015, many countries limited PrEP eligibility to specific high-risk groups such as serodiscordant couples (SD) or men who have sex with men (MSM). As of 2023, MSM were eligible for PrEP in 94% of countries with a PrEP policy, SD in 92%, and sex workers in

82%; PrEP was available upon request in 58% of countries with a policy. In 2017, only 26 countries had registered a PrEP product; by 2023, the number had increased to 105. This analysis will show the association between Prep uptake, controlling for population and HIV rate, and the robustness and alignment of prep policies compared with WHO guidelines.

**Conclusions:** Most countries have adopted a PrEP policy, yet variation exists in access to an approved PrEP technology. Despite widespread eligibility for MSM, just six out of 10 countries have adopted PrEP upon request for all at risk. Early PrEP policies qualified specific populations, which may have restricted enrollment and stigmatized the technology.

## Political drivers and policy contexts of HIV

### WEPEF651

#### Ryan White CARE Act collaborative governance and HIV/AIDS financing in the U.S.A.

J. Agbodzakey<sup>1</sup>

<sup>1</sup>University of North Texas at Dallas, SERCH/Public Leadership, Dallas, United States

**Background:** The Ryan White Comprehensive AIDS Resources Emergency (CARE) Act of 1990 represents proactive approach to combating HIV/AIDS. The legislation enables health services planning councils in areas disproportionately impacted termed Eligible Metropolitan Areas (EMAs) to make implementation decisions using collaborative governance to promote care and treatment of infected and affected populations. The Health Resources and Services Administration (HRSA) which is a U.S. government agency is responsible for the Ryan White Program and doing so by working with EMAs. This research examines 30 years of HIV/AIDS financing to ascertain impact on care and treatment of target populations.

**Methods:** The study uses qualitative approach, specifically, content analysis of essential documents from 1990-2020 to buttress its argument. Sample compiled documents of HRSA such as 15 allocation priorities/budgets, 15 comprehensive/strategic plans, 15 needs assessment reports and 15 client utilization reports of the 24 EMAs are analyzed using ATLAS software for non-numeric data and Excel Spreadsheet software for numeric data. The data is coded and categorized into concepts, themes, service categories etc. in compliance with qualitative research protocols to enable reliable findings and interpretation

**Results:** The preliminary results indicate imperfect logic or inconsistent trend of allocation priorities to core medical services with observed changes in some categories.

Most of the allocations are associated with core categories such as outpatient/ambulatory health, aids pharmaceutical assistance, oral health care and medical case management.

Support service categories such as outreach, food bank/home delivered meals, legal services, transportation, non-medical case management appear inconsistent relative to allocation priorities.

About 500,000 target populations benefit from services each year, and over \$600 million out of \$2.39 billion in 2020 HIV/AIDS funding allocated for Part A alone.

**Conclusions:** The findings highlight relentless support for care and treatment of uninsured and/or underinsured PLWAs for the past 30 years with emphasis on core medical and support services despite variations in allocation priorities for categories.

Influential stakeholders such as grantees, council chairs, committee chairs and members including PLWAs drive collaborative governance. Local efforts via EMAs represent the frontline and lifeline of U.S. HIV/AIDS strategy and implementation actions for societal benefits.

## WEPEF652

### Communities taking the lead to mitigate against the impact of Cyclone Freddy on HIV service delivery for transgender and other sexual and gender minority groups in Malawi

P.M. Juao<sup>1</sup>, G. Kachimanga<sup>2</sup>

<sup>1</sup>Centre for The Development of People, Advocacy Coordinator, Lilongwe, Malawi, <sup>2</sup>Social Justice Foundation, Executive Director, Blantyre, Malawi

**Background:** Transgender individuals and other members of sexual and gender minority groups are at a significantly higher risk of experiencing violence and discrimination. In Malawi, such groups face numerous obstacles in obtaining basic human rights, including access to healthcare. People who identify as LGBTIQ are commonly stigmatized and discriminated against, leading to further marginalization and exclusion.

Disasters can exacerbate the vulnerabilities of key populations, who often face widespread abuse from members of the community in everyday life.

**Description:** In Malawi, Trans Initiative Group, an informal transgender group, conducted a study on the effects of Cyclone Freddy on the lives of transgender and sexual and gender minority groups in highly impacted districts of Mangochi, Blantyre, and Phalombe.

The group established the following 487 transgender individuals were affected by floods, resulting in 10 deaths and 477 displacements, with 177 in camps and 300 in damaged homes.

Among those displaced, 150 were barred from safety camps, exposing them to waterborne diseases due to poor sanitation.

Of the displaced, 192 were HIV-positive and receiving treatment, while 285 were negative, with 145 on PrEP. The floods washed away medication and hindered access to HIV services due to inaccessible roads.

**Lessons learned:** The group collaborated with the Ministry of Health to assist 154 HIV-positive transgender individuals with ART refills and reintroduced Oral PrEP to 130 HIV-negative individuals. They also distributed 1,000 HIV self-test kits, 10,000 condoms, and lubricants.

A documentary capturing the challenges faced by transgender and sexual minorities served as a resource for humanitarian aid mobilization. This effort enabled fundraising and material support for transgender individuals in camps and homes.

**Conclusions/Next steps:** Transgender individuals and sexual minority groups faced heightened vulnerabilities during Cyclone Freddy in Malawi. These challenges persist in various crises, yet these groups often are afraid to voice out.

Humanitarian organizations have overlooked the unique requirements of transgender individuals in such situations, potentially due to lack of information and deliberate invisibility by marginalized groups for survival.

Advocacy is crucial to include these communities in disaster and pandemic prevention preparedness and response efforts.

## WEPEF653

### Criminalization costs lives, harm reduction – saves: community-based assessment on criminalization costs in Central and Eastern Europe, and Central Asia region

E. Kurcevič<sup>1</sup>, A. Dovbakh<sup>1</sup>, M. Plotko<sup>1</sup>

<sup>1</sup>Eurasian Harm Reduction Association (EHRA), Vilnius, Lithuania

**Background:** Criminalization of people who use drugs in the Central and Eastern Europe, and Central Asia (CEECA) region does not deter people from the use of drugs; mostly, negatively affects the health and permanent socio-economic status of people who use drugs, increases the financial and social burden on the states.

This community-based assessment aimed to evaluate and compare costs of incarceration versus costs of health and social services for people who use drugs; as well, to analyse how incarceration and health costs changed in a few years (same assessment was conducted in 2019 and 2021).

**Methods:** Assessment was done in 2023, in 29 countries of CEECA region. Desk research was conducted, followed by verification of data with national partners, working in the harm reduction field. The cost of incarceration was calculated by multiplying 365 days to the cost of maintenance of one prisoner/per day. This sum doesn't include law enforcement work, court proceedings and lost taxes,

Oral abstracts

Poster exhibition

E-posters

Author Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

which person cannot pay, because of the incarceration. The costs of health and social services included the cost of needle and syringe exchange services, opioid agonist therapy and unemployment benefit for one person per year.

**Results:** In most of countries of CEECA region, incarceration costs are 1,2 to even 15 times more than health and social services. The biggest difference of costs is assessed in Ukraine (15 times), Georgia (14 times), Romania (10 times), Albania (8 times).

Meanwhile the lowest difference of costs is assessed in countries, which has numerous and gross human rights violations in prisons - Belarus, Bulgaria, Kazakhstan, and Tajikistan. In comparison with 2021, few countries made improvements in increasing unit costs for health and social support: Croatia, Czechia, Estonia, North Macedonia, Slovakia.

**Conclusions:** Instead of investing into people health, governments are still applying repressive drug policies towards people who use drugs, by incarcerating them. Instead of providing social and health support, people who use drugs are left behind and punished for their health conditions or personal choices.

Assessment reveals missed opportunities for governments to reallocate money from policing, prosecuting, and incarceration of people who use drugs to community harm reduction and health services.

## WEPEF654

Resilience of HIV testing and treatment service availability in Ukrainian regions between April – September 2022: comparing availability and adaptations to sustain services in conflict-affected regions with community-led monitoring instruments

I. Gryshayeva<sup>1</sup>, O. Voskresenska<sup>2</sup>, A. Bondarenko<sup>2</sup>, V. Kurpita<sup>1</sup>, C. Todd<sup>3</sup>, A. Radetsky<sup>4</sup>, A. Zhuk<sup>4</sup>, I. Kuzmenko<sup>4</sup>, I. Tereshchuk<sup>4</sup>, L. Shevchenko<sup>4</sup>, N. Abdulkadyrova<sup>4</sup>, O. Negovska<sup>4</sup>, O. Kvitkovskii<sup>4</sup>, O. Kvitkovskii<sup>4</sup>, O. Sorokin<sup>4</sup>, O. Piven<sup>4</sup>, V. Malikov<sup>4</sup>, V. Parkhomenko<sup>4</sup>, V. Melentii<sup>4</sup>, Y. Stemkovska<sup>4</sup>, Y. Kniaziuk<sup>4</sup>, Y. Kogan<sup>4</sup>, Y. Nizhnichenko<sup>4</sup>

<sup>1</sup>Pact, Kyiv, Ukraine, <sup>2</sup>AWEW -Ukraine, Kyiv, Ukraine,

<sup>3</sup>Pact, Washington DC, United States, <sup>4</sup>USAID/PEPFAR Community Action for HIV Control Project, Kyiv, Ukraine

**Background:** Since February 2022, armed conflict has challenged the Ukrainian health system to sustain delivery of HIV and related services. Through the USAID/PEPFAR-funded Community Action for HIV Control project, community-led monitoring (CLM) measures service availability and quality for key populations (KP).

We assessed the availability of four services against the number of conflict events to identify factors related to service resilience.

**Description:** We retrospectively compared CLM data for HIV testing services, pre-exposure prophylaxis (PrEP), antiretroviral therapy, and medication-assisted treatment (MAT) availability with the number of air and drone strikes, armed clashes, and shelling attacks from the Armed Conflict Location & Event Data Project in Kyiv city and 12 regions between April - September 2022. Community monitors recorded service availability reported by five or more clients each month, which was verified with other informants or service sites.

Generally, each region has monitors representing each KP community. Service availability was graded as available, available with barriers, or unavailable and color-coded on a CLM dashboard for rapid visual representation.

**Lessons learned:** Overall, regions with few or no armed conflict events (Cherkasy, Poltava, Ivano-Frankivska) had limited to no service interruptions. Of conflict-affected regions, Mykolaiv, Zaporizhia, and Dnipro had the fewest service interruptions or barriers. MAT and PrEP were services most frequently impacted in conflict-affected regions.

Service interruption patterns varied within specific regions (e.g., Donetsk), related to proximity to conflict and type of events (i.e., greater reported disruption with armed clashes).

Some regions (e.g., Lviv, Ternopil) with few events experienced barriers to or lack of services, partly attributed to internally displaced persons creating unexpected higher client flow. In conflict-affected regions, service availability was typically restored within one to two months of the highest conflict event numbers.

CLM data were shared with the Centre for Public Health (CPH), who coordinated a rapid response to supply chain and human resource issues across partners to restore services.

**Conclusions/Next steps:** While conflict-affected regions had more reported service interruptions or barriers, secondary effects of conflict, like displacement, created service disruptions in regions with fewer conflict events. Service availability recovered quickly due to CPH response to notifications from monitors and KP community members, including through social media.

## WEPEF655

Rights violations and health disparities of people who use drugs living with HIV in CEECA

M. Plotko<sup>1</sup>

<sup>1</sup>Eurasian Harm Reduction Association, Vilnius, Lithuania

**Background:** In 2021 countries adopted 10-10-10 targets, pledging action to remove punitive and discriminatory laws, policies and practices that undermine HIV responses. As recognized in the report by the OHCHR, drug policy has had a significant impact on the enjoyment of human rights.

This abstract explores the multifaceted rights violations experienced by individuals who use drugs and are living with HIV across CEECA region drawing insights from consultations with civil society and community advocates.

**Description:** In 2022, UN CESCR initiated work on a new General comment on the "impacts of drug policies on economic, social and cultural rights." Considering CESCR's initiative, Drug Policy Consortium for the General Comment on the Impact of Drug Policies on Economic, Social and Cultural Rights was created. Within the framework of this project 9 consultations with representatives from 20 countries of CEECA took place.

**Lessons learned:** The denial of treatment due to geographical and structural barriers, as well as stigma emerges as a significant concern, exemplified by restricted access to ART and OAT for those incarcerated with drug use disorders. Disproportional sentencing for drug-related offenses not only impedes access to treatment but also hinders HIV and Hepatitis C prevention efforts.

Reproductive rights violations further compound the challenges faced by women who use drugs, with forced abortions, limitation of parental rights, limited access to contraceptive services, and various barriers to essential reproductive health services prevailing in many CEECA countries. Moreover, Tajikistan and Uzbekistan mandate forced HIV and drug tests before marriage, infringing upon the right to privacy and autonomy.

The region's prohibition of specific professions for PLHIV exacerbates social and economic inequalities, while mandatory HIV testing during job applications in Kazakhstan further compromises privacy and perpetuates discrimination.

The imposition of higher insurance prices in Ukraine based on drug use or HIV status creates additional barriers to comprehensive healthcare coverage.

**Conclusions/Next steps:** This abstract underscores the urgent need for policy reforms and advocacy to address the systemic rights violations faced by people who use drugs living with HIV in the CEECA region. It calls for collaborative efforts to ensure the realization of the right to health, family life, and overall well-being.

## WEPEF656

### Advancing Nigeria's HIV sustainability: domestic production of generic ARVs as catalysts

C.C. Aneke<sup>1</sup>

<sup>1</sup>National Agency for the Control of AIDS, (NACA), Policy, Planning and Stakeholders Coordination, Abuja, Nigeria

**Background:** Nigeria currently manufactures less than 2% of its medicines, importing approximately 70% at a significant annual cost. The HIV and AIDS response in Nigeria has long been donor-driven, relying on Western and Asian pharmaceutical industries for 90% of drugs and commodities.

This import-dependent model, compounded by inadequate local production capacity, poses challenges to pharmaceutical sustainability, particularly in the context of HIV and TB services. This study explores the role of domestic production of generic ARVs in achieving Nigeria's HIV Sustainability Agenda. The pharmaceutical industry in Africa, notably in countries like Nigeria, South Africa, and Ghana, is rapidly growing. Leveraging on AfCFTA, Nigeria has a unique opportunity to boost intra-regional trade in pharmaceuticals, fostering local manufacturing, especially of ARVs.

**Methods:** The situational analysis reveals Nigeria's heavy reliance on foreign supplies, accounting for 70% of local drug consumption, with 90% of ARV needs imported. The COVID-19 pandemic has underscored the risks of this dependency, emphasizing the urgency for domestic production to achieve pharmaceutical self-sufficiency.

However, policy clarity and cohesive regulations across pharmaceutical regulators remain lacking, hindering the National Drug Policy's strategic intent.

**Results:** The selected problem highlights the vulnerability Nigeria faces due to its "pharma-dependent" status, risking out-of-pocket expenditures and weak health indices. The result emphasizes the importance of addressing access to essential medicines, as outlined in the Sustainable Development Goals. Policy options are proposed to commence domestic ARV production, aligning with AfCFTA provisions and the vision for sustainability in the HIV response.

Engaging pharmaceutical entities, financial institutions, and relevant stakeholders is crucial, with recommendations emphasizing a national strategic agenda, regulatory capacity enhancement, infrastructural development, and broad stakeholder involvement.

**Conclusions:** Achieving sustainability requires a clear strategic agenda, coordination framework, and enhanced regulatory capacity. The presentation highlights ongoing engagements by the government with stakeholders, who have shown interest in domestic ARV production.

The suggested actions emphasize the significance of fostering partnerships, facilitating technology transfer, and adopting a comprehensive approach that engages all stakeholders to promote domestic production of medicines, vaccines, and generic ARVs in Nigeria.

## WEPEF657

Digital dilemma: navigating the intersection of national digital IDs and access to HIV services for key populations in sub-Saharan Africa

K. Esom<sup>1</sup>, A. Maleche<sup>2</sup>

<sup>1</sup>University of Warwick, Coventry, United Kingdom, <sup>2</sup>KELIN, Nairobi, Kenya

**Background:** The adoption of national digital identity systems in sub-Saharan Africa has surged, with a majority of countries implementing these systems to streamline service delivery, including healthcare. However, this technological advancement coincides with the persistence of legal frameworks in several African nations that criminalize key populations (KPs). These populations are also disproportionately affected by HIV/AIDS.

Recent studies indicate that a lack of robust regulatory frameworks for digital IDs leads to "function creep," where data originally collected for identification purposes or healthcare service delivery are used for surveillance or law enforcement, exacerbating the vulnerability of KPs and potentially hindering their access to critical healthcare and HIV services.

**Description:** This abstract is based on literature review from an on-going study on the implications of national digital IDs for KPs' access to healthcare. It analyzes the current landscape of national digital IDs in sub-Saharan Africa and their intersection with healthcare access for KPs. It contrasts the growing number of African countries adopting national digital IDs as the single tool for accessing essential services including healthcare with those enforcing laws criminalizing KPs.

The analysis is grounded in recent studies and data, highlighting the absence of adequate regulatory frameworks to prevent misuse of digital ID data in most of the countries adopting these digital ID systems, and the resulting aversion to healthcare services by KPs due to fear of prosecution or discrimination.

The work of KELIN Kenya and others working with KP groups to raise awareness on the need for effective human rights and ethical guardrails to forestall further marginalising populations who have suffered the brunt of the HIV epidemic.

**Lessons learned:** Preliminary findings suggest a significant correlation between the adoption of national digital ID systems, the lack of data protection laws and reluctance among KPs to access healthcare services.

### Conclusions/Next steps:

The study underscores the need for a delicate balance between the use of technology in healthcare and the protection of human rights. It advocates for the centring of marginalised groups as well as collaborative efforts involving governments, international organizations, civil society, and KPs themselves designing inclusive digital ID systems that facilitate rather than hinder access to healthcare services.

## WEPEF658

Focused HIV Interventions among incarcerated population in prisons has influenced increased health outcomes: learning from prison intervention under National AIDS Control Program (NACP) in India

P.K. Patra<sup>1</sup>, R.S. Pandey<sup>1</sup>, S. Rajan<sup>1</sup>

<sup>1</sup>National AIDS Control Organisation, Ministry of Health & Family Welfare, New Delhi, India

**Background:** Inmates in prison are covered as one of the key population groups under NACP Phase V. The HIV Sentinel Survey Plus 2021 indicates that the HIV sero-positivity among prison population is around 1.93%, which is higher than the HIV sero positivity found among Female Sex Workers (FSW). During FY 2022-23, a total of 1260 prisons are covered and around more than 1.4 million populations are provided HIV Testing and Prevention services.

**Description:** A package of services is provided to the prison inmates which includes free HIV testing and counselling services, linkages to Antiretroviral Therapy (ART), management of Tuberculosis and referrals for accessing other health and social services. The distribution of year-wise program coverage of prison population through HIV testing and linkage to ART is placed below in the table:

Indicators	2020 - 21		2021 - 22		2022 - 23	
	Number	%	Number	%	Number	%
Inmates Admitted	22,61,780		18,89,531		21,25,147	
Inmates Covered	9,06,806	40.09	7,08,544	37.50	14,24,763	67.04
HIV Test	4,79,880	52.92	6,56,749	92.69	12,45,209	87.40
HIV Positive	2,122	0.44	2,886	0.44	5,894	0.47
Linked to ART	1,814	85.49	2,362	81.84	5,001	84.85

Coverage of inmates through interpersonal or behaviour change communication has increased from 0.9 million to 1.4 million. Simultaneously HIV testing coverage has increased from 52.92% in FY 2020-21 to 87.4% in FY 2022-23. The sero-positivity number has increased by 1.7 times in last three years. Linkages to ART of all identified cases has increased in the range between 81% - 85%.

**Lessons learned:** Building inter-departmental synergy, advocacy and sustained engagement has resulted rapid scale-up of interventions. Trained Prison Health Care Providers were instrumental in motivating inmates for HCTS testing and initiation and adherence to ART. Shortage of prison guards for escorting to services, unscheduled release and difficulty in tracing post-released inmates led to linkage loss.

Efforts are required to ensure 100% linkages of identified cases to ART to ensure adherence and prevent further infections.

**Conclusions/Next steps:** HIV AIDS Act, 2017 defines the right of incarcerated population towards HIV Prevention and Treatment service. Strengthening collaboration between NACO – MoHFW and Ministry of Home Affairs (MoHA) will further enhance health outcomes.

## WEPEF659

How the 13 states of Appalachia spend their opioid settlement dollars: a political process that must engage community stakeholders in order to impact the HIV epidemic

L. Storrow<sup>1</sup>, T. Christensen<sup>1</sup>, R. Martinson<sup>1</sup>, A.T. Young<sup>1</sup>, M. Reynolds<sup>2</sup>, P. Landes<sup>1</sup>

<sup>1</sup>Community Education Group, Lost River, United States, <sup>2</sup>West Virginia University, Morgantown, United States

**Background:** The top 10 U.S. counties most at risk of an HIV outbreak are all in Central Appalachia, and of the 220 counties identified in Van Handel's 2016 study, 159 (72%) are in Appalachian states. The Appalachian region continues to be the location ripest for a repeat of the 2015 Scott County HIV outbreak, which is inextricably linked to the region's deeply entrenched opioid addiction crisis.

A series of settlements have been reached to resolve opioid-related litigation brought against pharmaceutical distributors, manufacturers, and retailers for their role in perpetuating the crisis, and the "pot" exceeds \$54 billion. Most of these funds must be spent on "opioid remediation," but this nebulous term means different things to various stakeholders.

**Description:** Community Education Group (CEG) has been investigating how the 13 states of Appalachia manage and spend their opioid settlement funds and sharing information to community serving organizations (CSOs) so they can access and/or advocate for funds to be used for evidence-based public health interventions.

CEG manages the Appalachia Opioid Remediation list-serve and spending database to assist in these efforts.

**Lessons learned:** CEG's investigation has revealed:

- Each state has a unique process for managing opioid settlement dollars and operates on independent timelines.
- Many CSOs do not have the time nor resources to work through required processes to access funds, and in some states there are few opportunities for public input.
- Many barriers exist to learning about/accessing settlement funds in Appalachia: lack of broadband for conducting research; lack of publicly accessible meeting minutes and recordings; local government websites are not updated or are defunct; local journalistic coverage of government meetings lack enough information for action by advocates; among other barriers.

**Conclusions/Next steps:**

- Funds can and should be spent on evidence-based public health initiatives including HIV prevention and treatment.
- CSOs need support to access settlement information and acquire funds for public health initiatives.
- Governments distributing settlement funds should create robust public engagement processes, widely advertised, for public input on fund prioritization.
- A system of community-led monitoring is needed to track how funds are spent and hold decision makers accountable.

## WEPEF660

Plans of safety and security for civil society organizations working on HIV in three countries in Latin America and the Caribbean

A. Mejía<sup>1</sup>, R. Gonzalez<sup>1</sup>, A. Luna<sup>1</sup>, M.L. Martín<sup>1</sup>, M. Corral<sup>1</sup>

<sup>1</sup>Vía Libre, LAC Platform, Lima, Peru

**Background:** In LAC, violence and rights violations not only affect key populations, but also people, organizations and HIV programs. It's necessary to strengthen the capabilities of organizations to improve security and protect implementers and programs.

**Description:** In 2023, Guatemala, Dominican Republic and Belize begin a process to evaluate risks and develop security plans. The evaluation included documentary review, application of instruments, field visits and interviews. Threats were identified in three categories, structural: stigma and discrimination, violence, organized crime, machismo, impunity and hate crimes; community: night activities in unsafe and difficult to access areas, harassment, raids and extortion by the police, sexual harassment of beneficiaries, theft of phones and work items, alcohol consumption and drug trafficking, presence of criminal gangs; and digital: vulnerability of information, lack of guarantee of confidentiality, cyber harassment; added to the naturalization of violence by implementers.

**Lessons learned:** Workshops were developed for the formulation of security plans, basic concepts and evaluation results were discussed and plans were developed for each organization. 110 leaders participated in the three countries. Currently, the participating organizations are implementing their plans that included security protocols, training, incident registration, mapping of risk areas, care of caregivers, alliances with key actors, uniforms and identifiers, security cameras, life insurances, computer security of social networks. The lessons learned highlight that security plans are an investment and a priority in the programs, they must be in all phases of implementation, they require the participation of field personnel, donors must be sensitive and guarantee resources for risk management, its development has a therapeutic effect on the participants, strengthens networking and denatures violence.

**Conclusions/Next steps:** Making visible the vulnerability of people and organizations that implement HIV projects highlights the need to guarantee their safety and has a positive impact on the implementation of programs. Organizations and their staff have benefited, minimized risks and are able to handle emergencies.

Recommendations to improve safety and security conditions for HIV organizations, donors and decision makers were formulated. As next steps, the implementation of the plans and measurement of the impact on the reduction of security risks are considered.

## Human rights and responses to HIV

### WEPEF661

Human rights violations and barriers to HIV services among key populations in Uganda

N. Ssali<sup>1</sup>

<sup>1</sup>Uganda Network of Young People Living With HIV& AIDS, OUTREACH, Kampala, Uganda

**Background:** Key populations including men who have sex with men, transgender people, and people living with HIV are affected by HIV and face numerous human rights violations that cripple their access to HIV prevention, testing, treatment, and care services.

This study aimed to document the types and extent of human rights violations faced by key populations in Uganda and to navigate how these violations affect their utilization of HIV services.

**Methods:** The study mixed quantitative and qualitative methods to examine the human rights and HIV service issues of key populations from four regions in Uganda. It surveyed 1200 key population members and interviewed 48 of them and 12 service providers. It analyzed the data on human rights violations and HIV service access and quality.

The interviews and discussions explored the experiences and perceptions of human rights violations and their impact on HIV service access and quality.

**Results:** The cross sectional survey revealed that human rights violations were very common and widespread among key populations in Uganda. The most common violations were verbal abuse (82%), physical assault (58%), sexual violence (42%), arbitrary arrest (38), and extortion (36). The main perpetrators were police officers, local authorities, community members, and intimate partners. These violations negatively affected the physical, mental, and social wellbeing of key population members including their access to and retention in HIV services. The qualitative data showed that key populations faced barriers to HIV services. These include:

- Lack of confidentiality, privacy and informed consent.
- Denial of services or provision of low standard services
- Harassment and mistreatment by service providers.
- Lack of tailored and friendly services that meet their specific needs and preferences.

**Conclusions:** The study shows the challenges and needs of key populations in Uganda regarding HIV services and human rights.

It urges the government to stop criminalisation of key populations but instead uphold their rights. It also calls for HIV service providers to respect and cater to the diversity of key populations.

It also advocates for the empowerment and participation of key population communities in HIV response in-order to hold the duty bearers accountable.

### WEPEF662

Rights of people living with HIV and key populations in Lesotho

M. Matamane<sup>1</sup>

<sup>1</sup>SADC Parliamentary Forum, Maseru, Lesotho

**Background:** Lesotho has one of the highest HIV prevalence rates in the world, with 22.7% of adults living with HIV. The epidemic disproportionately affects women, who have a prevalence of 27.4%, compared to 17.8% for men. Lesotho faces challenges in addressing the human rights and health needs of key populations affected by HIV. These groups face stigma, discrimination, and violence, as well as barriers to accessing HIV services.

With funding from Sweden, in October 2019 SADC Parliamentary Forum introduced SRHR, HIV and Governance project in Lesotho with the vision to increase access to integrated SRHR and HIV/AIDS services and related rights, including improved health and respect for human rights.

**Description:** Working in partnership with the National Working Group, existing policy gaps were identified, and Parliamentarians capacitated to come up with legislative interventions required to be made to comprehensively address the national SRHR and HIV/AIDS issues.

Parliamentarians were equipped with SRHR evidence-based information to escalate at the Parliamentary level, pass motions, ask questions in Parliament, advocate for amendments of laws and pass SRHR and HIV/AIDS related bills.

**Lessons learned:** Through to February 2020, motion to consider legislation on abortion in Lesotho was passed, March 2021 counter domestic violence bill was tabled in Parliament with more than 80% support from members of parliament, and in October 2022 this bill became law. This law affords equal protection and access to justice for all. In 2022, for the first time in Lesotho a transgender man was allowed to run for constituency elections. LGBTI and Abortion issues are now being discussed in Parliament

and the Parliament is considering amendment of Penal code to address issues of abortion and Child Protection and Welfare Act of 2011 to incorporate the rights of inter-sex children.

**Conclusions/Next steps:** Parliamentarians have a role in the promotion and protection of human rights, owing to its primary role in law-making, Parliament is best placed to give effect to human rights, take practical measures to prevent abuses and to ensure that law provides practical means through which remedies may be sought for alleged violations.

With the right information, Parliamentarians can execute their functions well and bring desired results.

## WEPEF663

### Unseen chains: human right violations fueling new HIV infections among key population In Nigeria

T. Adebisi<sup>1</sup>, C. Emeagi<sup>2</sup>, E. Clement<sup>1</sup>

<sup>1</sup>National Agency for the Control of AIDS, Performance Management & Resource Mobilisation, Abuja, Nigeria,

<sup>2</sup>University Of Port Harcourt, Public Health, Port Harcourt, Nigeria

**Background:** People living with HIV/AIDS confront pervasive discrimination and human rights breaches, including job loss, healthcare denial, and social discrimination. The Nigerian government has put in place legal guidelines and policies to protect the rights and dignity of its over 1.9 million HIV-positive citizens.

This study examined current control measures used by Nigerian authorities to address ongoing human rights violations against HIV/AIDS patients. The Integrated Biological and Behavioral Surveillance Survey (IBBSS) 2020 in Nigeria unveiled that among 1.9 million PLHIV, 3.4% are key populations, constituting 32% of new infections. In Nigeria, individuals with HIV/AIDS endure systemic human rights abuses, with disparities in prevalence among key populations such as Men who have Sex with Men (MSM), People Who Inject Drugs (PWID), Transgender people (TG), and Female Sex Workers (FSWs).

This abstract evaluates governmental interventions and human rights violations concerning Carriers with HIV/AIDS in Nigeria.

**Methods:** Retrospective data from the 2020 IBBSS in 12 Nigerian states informed this study, encompassing Abia, Anambra, Akwa Ibom, Rivers, Benue, Lagos, Oyo, Nasarawa, Kano, Kaduna, Gombe, and Taraba. A descriptive cross-sectional approach selected participants: MSM (4397), TG (4190), FSW (4974), and PWID (4414) across these states.

Also, key informant interviews with stakeholders in the arena of policies and programs regarding SRH/HIV-related issues facing key populations as well as legal experts, and leaders of community-based HIV advocacy groups were included.

**Results:** Respondents believed that existing laws and government control regulations did not support the young people living with HIV, as well as those engaged in same-sex behaviors, sex work, and injectable drug use. Stigma and discrimination rates were significant against FSW (46.8%), PWID (46.7%), MSM (48%), and TG (50.2%). Additionally, 16.6% of FSW, PWID, MSM, and TG reported harassment by law enforcement agencies.

**Conclusions:** The findings underscore widespread human rights violations against key populations in Nigeria living with HIV/AIDS, emphasizing the urgent need for targeted interventions and policy reforms to address systemic discrimination and enhance human rights protections for these vulnerable groups. The legal mechanisms for addressing HIV/AIDS discrimination in Nigeria should be enforced.

### HIV-related knowledge, stigma attitudes, and intent to discriminate in healthcare settings among medical and nursing students: a cross-sectional study in Bangkok

W. Maneesriwongul<sup>1</sup>, R. Lolekha<sup>2</sup>, O. Prajankett<sup>3</sup>,

P. Piyaaraj<sup>4</sup>, R. R. Maude<sup>5</sup>, S. Karuchit<sup>2</sup>, S. Muktier<sup>2</sup>,

S. Northbrook<sup>3</sup>, D. Rosa<sup>6</sup>, P. Janepanish Visudtibhan<sup>1</sup>

<sup>1</sup>Ramathibodi School of Nursing, Faculty of Medicine

Ramathibodi Hospital, Bangkok, Thailand, <sup>2</sup>Division of

Global HIV and TB, U.S. Centers for Disease Control and

Prevention, Nonthaburi, Thailand, <sup>3</sup>The Royal Thai Army

Nursing College, Phramongkutklao Hospital, Bangkok,

Thailand, <sup>4</sup>Department of Parasitology, Phramongkutklao

College of Medicine, Bangkok, Thailand, <sup>5</sup>Division of

Infectious Diseases, Faculty of Medicine Ramathibodi

Hospital, Bangkok, Thailand, <sup>6</sup>Division of AIDS and STIs,

Department of Disease Control, Ministry of Public Health,

Nonthaburi, Thailand

**Background:** People living with HIV (PLHIV) globally report experiencing discrimination by healthcare providers. We assessed HIV-related knowledge, stigma attitudes (worries about getting HIV infection), and intent to discriminate (intent to modify behavior in unnecessary ways) among medical and nursing students in Bangkok.

**Methods:** A convenience sample was chosen to enroll 4<sup>th</sup> to 6<sup>th</sup> year medical and 3<sup>rd</sup> and 4<sup>th</sup> year nursing students from 2 institutions during a 24-week period in 2022/2023. Enrolled participants completed an online questionnaire using Google Form and Moodle after providing informed consent. Differences between nursing and medical students were assessed by Chi-square for categorical variables (attitudes and intent to discriminate) and independent t-test for continuous variables (knowledge scores) using R.

**Results:** The survey enrolled 570 students, comprising 204 (35.8%) medical and 366 (64.2%) nursing students. Overall, the median age was 21 years and 76% were female.

Fifty-seven percent of medical students and 20.2% of nursing students had ever contacted/taken care of PLHIV ( $p<.001$ ). Of these, nursing students were more likely to use double gloves when caring for PLHIV than medical students (71.6% vs. 55.1%,  $p=.022$ ).

No significant difference in scores on HIV transmission knowledge (6.2/9 vs. 6.3/9,  $p=.12$ ) was observed by type of provider-in-training. Nursing students scored higher on standard precaution knowledge than medical students (8.8/11 vs. 8.4/11,  $p<.0001$ ).

Both groups reported that following standard precautions is very important. Most students (90%) in both provider-in-training groups reported not being worried or a little worried when performing non-invasive procedures (i.e., measuring blood pressure).

Eighty percent of the participants reported feeling a little or somewhat worried when performing invasive procedures and 85% reported having the intention to discriminate while performing such procedures (i.e., taking unnecessary precautions or avoiding physical contact).

No significant differences in stigma attitudes or intent to discriminate when providing care for PLHIV were found.

**Conclusions:** Medical and nursing students had moderate knowledge of HIV transmission and good standard precautions knowledge. Some students lacked experience in caring for PLHIV and showed intention to discriminate.

Future interventions for medical and nursing students are necessary to reduce stigma and discriminatory behavior when providing care to PLHIV in Bangkok.

## WEPEF665

Empowering transgender sex workers living with HIV: community-led legal advocacy in northeast China through support and workshops to evade punishment under the HIV transmission laws

Y. Liu<sup>1,2</sup>, S. Liu<sup>3</sup>

<sup>1</sup>Asia Pacific Network of Queer Sex Workers, Shenzhen, China, <sup>2</sup>Northeast Transgender Support Network, Shenyang, China, <sup>3</sup>Star Language Empowerment Center, Guangzhou, China

**Background:** This community-led initiative aimed to empower transgender sex workers living with HIV in northeast China. Resulting from collaborative efforts led by a trans-led community group, actively involving sister groups across different parts of China, the overarching goal was to mitigate the impact of punitive HIV transmission laws on this vulnerable population through legal advocacy, support, and workshops.

It sought to create a supportive environment fostering awareness, resilience, and legal literacy among transgender individuals facing the dual challenges of HIV and stigmatizing legal frameworks.

**Description:** Executed over 24 months, the program reached 200 transgender sex workers with HIV across urban and rural areas in northeast China and Guangdong province (for migrant trans sex workers). The initiative employed community-led legal advocacy, delivered tailored support services, and conducted 12 workshops.

Activities included providing legal counseling to 40 individuals, executing awareness campaigns reaching 5,000 people, and facilitating capacity-building workshops to equip participants with the knowledge and skills essential for navigating the complex legal landscape surrounding HIV transmission.

**Lessons learned:** The program yielded valuable insights into the intersection of legal frameworks and the lives of transgender sex workers with HIV. Findings indicated an increased awareness of legal rights among participants, leading to improved self-advocacy and reduced instances of unjust legal repercussions.

The community-led approach proved effective in fostering a sense of solidarity, resilience, and legal empowerment. Best practices included integrating legal literacy within broader community support structures, ensuring sustained impact beyond the program period.

**Conclusions/Next steps:** The findings underscored the critical role of community-led initiatives in addressing the unique challenges faced by transgender sex workers living with HIV. As punitive legal measures continued to impact this community disproportionately, the program highlighted the need for broader policy reform and advocacy efforts.

The success of the initiative emphasized the potential for similar interventions globally. Moving forward, scaling up this model and advocating for systemic change in legal frameworks would be crucial to advancing HIV prevention, treatment, and support for transgender populations.

The program's outcomes offered valuable insights for future initiatives aimed at mitigating the adverse effects of legal barriers on marginalized communities affected by HIV.

## WEPEF666

Navigating the shadows: delivering HIV/AIDS services to vulnerable women under the Taliban regime in Afghanistan

N. Rahimi<sup>1</sup>

<sup>1</sup>Madawa Healthcare and Addiction Organisation, Kabul, Afghanistan

**Background:** This comprehensive study addresses the formidable challenges and human rights issues in providing HIV/AIDS services to a highly vulnerable population: sex workers, women who use drugs, and women living with HIV in Taliban-ruled Afghanistan. It focuses on the

intersection of gender, healthcare access, human rights, and the unique difficulties faced by these marginalized groups.

**Description:** Over a period of two years in Taliban-governed regions of Afghanistan, the study engaged with 15 grass root healthcare providers and interviewed 400 women, including sex workers and women who use drugs, living with HIV.

The research utilized a mixed-method approach, combining quantitative data from healthcare services with qualitative insights from the target groups. It delved into the intricacies of healthcare provision in a clandestine environment, examining strategies for delivering services amidst severe restrictions.

**Lessons learned:** Key findings revealed that sex workers and women who use drugs experienced a 75% higher rate of barriers to healthcare access compared to other women. In response, our grassroots organization developed covert methods, such as hidden mobile site and discreet home visits, resulting in a 50% improvement in healthcare access for these groups. The use of encrypted communication channels led to a 60% increase in remote consultation and medication delivery.

Despite these efforts, 80% of the participants reported discrimination and violence, underscoring the critical need for enhanced protection and support mechanisms.

**Conclusions/Next steps:** This research underscores the vital role of innovative, rights-based healthcare delivery in environments hostile to women and marginalized populations. It advocates for international interventions to empower underground networks and enhance community resilience.

Future initiatives must focus on secure and accessible healthcare methodologies for high-risk groups in regions where human rights are grossly violated.

This study offers crucial insights into the complexities of providing healthcare in oppressive contexts, highlighting the necessity of global collaboration and creative advocacy in the realm of human rights and healthcare.

**Description:** We created Enabling environment for community through Stigma and discrimination reduction, Sensitization of Health care providers, Sensitization of lawmaker & Law enforcement, Legal literacy for community, Legal service for community, Monitoring of discrimination Law, reducing HIV related gender. Each district we work we have an infrastructure

1. Paralegal that providing legal assistance, information about legal & rights, sensitize mainstream people.
2. Community Based Monitoring Officer, who monitored logistic stock availability at healthcare service and liaison from community to healthcare provider.
3. Advocacy Officer that work for a macro issue in districts; monitoring the law/policy, advocacy to stakeholder.
4. District Taskforce, a community and government (multi stake holder) platform to meet each other to address the district issue, to clarify and support to provide mechanism of key population to public services.
5. The outreach worker conduct HIV screening required to carry out GBV screening.

**Lessons learned:** By this program, During 2022 – 2023 we working with National Human Rights Commission, 897++ Transgender get Identity card, 635 cases of (Discrimination, GBV, Human rights violation) documented in healthcare and public, then 54% follow up to legal redress, Community respond for ARV stockout immediately in districts, 23 Districts of health care monitored by community, 414 Health care sensitized by human rights and gender, Certified paralegals in Districts intervention, 84.195 Sex Workers were screening by Intimate partner Violence tools.

**Conclusions/Next steps:** At the national level, it is crucial to establish collaboration with governmental ministries and other agencies that are responsible for taking actions on gender and HIV concerns.

This collaboration should aspire to facilitate a more comprehensive understanding of the unique needs of people living with HIV and key populations, and to promote corresponding policies and initiatives.

Access to justice and access to redress: training peers and paralegals in Kyrgyzstan, Indonesia, the Democratic Republic of the Congo, and Ukraine

M. Golichenko<sup>1</sup>, N. Sun<sup>2</sup>, A. Bolotbayeva<sup>3</sup>, M. McLemore<sup>4</sup>, R. Ningsih<sup>5</sup>, D. Lohman<sup>6</sup>, J. Mabilat<sup>7</sup>, P. Chibatamoto<sup>8</sup>, Y. Kononchuk<sup>9</sup>, J. Amon<sup>10</sup>

<sup>1</sup>HIV Legal Network, Toronto, Canada, <sup>2</sup>Consultant, Durham, United States, <sup>3</sup>Consultant, Bishkek, Kyrgyzstan, <sup>4</sup>Consultant, Jacksonville, United States, <sup>5</sup>Consultant, Jakarta, Indonesia, <sup>6</sup>Consultant, New York, United States, <sup>7</sup>Consultant, Frankfurt, Germany, <sup>8</sup>Consultant, Gaborone, Botswana, <sup>9</sup>Consultant, Kyiv, Ukraine, <sup>10</sup>Drexel University, Office of Global Health, Philadelphia, United States

**Background:** The Global Fund's 2023-2028 Strategy recognizes that ending the HIV, TB and malaria epidemics requires scaling-up programs to remove human rights-related barriers to health services. Aligned with this goal, the "Breaking Down Barriers" (BDB) initiative has funded programs to address structural barriers to HIV, TB and malaria services in 20 countries, including support to community-led paralegals and other interventions for increasing access to justice.

**Description:** Progress assessments were conducted in 2023 and key themes were identified across national contexts. Access to justice programming took a step forward in multiple countries due to the training and deployment of peer educators and paralegals representing key populations.

**Lessons learned:** In Kyrgyzstan, Indonesia and the Democratic Republic of the Congo, paralegals and peer educators have played important roles in resolving issues through mediation. Kyrgyzstan developed a comprehensive certification course tailored for paralegals, in which over 40 paralegals – including those from key populations – enrolled in 2022.

Key populations reported feeling equipped with legal knowledge and skills to counter police harassment in a rapidly changing legal environment. In Indonesia, peer educators were trained in legal literacy and a notable area of impact for human rights programming was found in the integration of legal literacy and access to justice programs with HIV prevention programs for sex workers. Paralegal certification has also increased the ability to identify, refer and assist the sex worker community in resolving human rights violations perpetrated by clients, the police and intimate partners.

In the Democratic Republic of the Congo, peer educators and paralegals have played key roles to empower key populations on their rights. Legal clinics have provided legal, psychosocial and medical counseling to vulnerable groups since 2013, and have implemented awareness-raising and capacity-building activities on human rights related to HIV, gender, sexual violence and sexual and reproductive health. In Ukraine, the public legal aid

service complemented paralegal programming and facilitated sustainability of access to justice for key populations.

**Conclusions/Next steps:** Expanding access to peer educators and paralegals can increase legal literacy and empower key populations.

## WEPEF669

The role of faith-based organizations in combating HIV and tuberculosis stigma in Jamaica, Côte d'Ivoire and Ukraine

J. Amon<sup>1</sup>, M. McLemore<sup>2</sup>, C. Narcisse<sup>3</sup>, C. Tshimbalanga<sup>4</sup>, D. Lohman<sup>5</sup>, Y. Kononchuk<sup>6</sup>, J.M. Masumbuko<sup>7</sup>

<sup>1</sup>Drexel University, Office of Global Health, Philadelphia, United States, <sup>2</sup>Consultant, Jacksonville, United States, <sup>3</sup>Consultant, Kingston, Jamaica, <sup>4</sup>Consultant, Johannesburg, South Africa, <sup>5</sup>Consultant, New York, United States, <sup>6</sup>Consultant, Kyiv, Ukraine, <sup>7</sup>Consultant, Abidjan, Côte d'Ivoire

**Background:** The Global Fund's 2023-2028 Strategy recognizes that ending the HIV, TB and malaria epidemics requires scaling-up programs to remove human rights-related barriers to health services. Aligned with this goal, the "Breaking Down Barriers" (BDB) initiative has funded programs to address structural barriers to HIV, TB and malaria services in 20 countries, including support to faith-based organizations for reducing stigmatizing attitudes toward PLHIV and key populations.

**Description:** Progress assessments were conducted in 2023 and key themes were identified across national contexts. Despite a complex relationship between faith-based organizations and key populations in many countries, those organizations demonstrated potential to play a significant role in combating HIV stigma.

**Lessons learned:** In Jamaica, the Jamaica Council of Churches (JCC) conducted a survey of attitudes toward HIV and key populations among church congregants and found high levels of misinformation and stigmatizing attitudes.

This led them to sponsor sensitization and education sessions challenging harmful myths and work with the AIDS Healthcare Foundation to develop policies to reduce stigma related to HIV and key populations for member churches. In Côte d'Ivoire, a "faith and communities initiative" involving religious communities was assembled to be actively involved in the fight against stigmatization. Caritas created a project titled GRAIL (Galvanizing Religious Actors for Better Identification and Linkage to Pediatric HIV), which mobilized priests and other religious leaders as "religious guides" to encourage families to seek testing and treatment for HIV-positive children.

A third coalition called ARSIP (Alliance des Religieux pour la Santé Intégrale et la Promotion de la Personne Humaine), mobilized religious organizations and leaders to promote

HIV-related health and services. In Ukraine, systematic work is ongoing with all the country's major faith groups, including the Orthodox Church, the Greek Catholic Church, Muslim communities, and Protestant churches, to raise awareness and support for HIV-vulnerable groups.

**Conclusions/Next steps:** Faith-based organizations can play an important role in national efforts to combat stigmatization and promote access to human-rights based interventions for HIV.

## WEPEF670

Breaking barriers: addressing stigma and discrimination in the MSM/TG population through the Importance of community-based ART services

R. Lama<sup>1</sup>

<sup>1</sup>Sudur Paschim Samaj, Programme, Dhangadhi, Nepal

**Background:** MSM and transgender individuals face pervasive stigma, extending from family and society to healthcare barriers. Despite constitutional safeguards in Articles 12, 18, and 42 protecting their rights, grassroots implementation challenges persist. This deters MSM/TG PLHIV individuals from seeking services at ART Centers due to counselor unawareness about their issues.

Consequently, many MSM/TG individuals are lost to follow-up or not enrolled in ART programs. Community-based ART Services emerge as a crucial intervention, countering discrimination and enhancing accessibility and treatment adherence for these marginalized groups in Nepal.

**Description:** Sudur Paschim Samaj is implementing the ARV Dispensing Center focus on MSM/TG aims to mitigate pervasive stigma and discrimination faced by MSM/TG individuals at traditional ART Centers. The center has notably enhanced accessibility, providing ARV medications to 40 MSM/TG People Living with HIV, fostering increased checkups, and utilization of crucial services, including viral load monitoring and Mental Health Services. Challenges persist as enrollment in the dispensing center necessitates disclosing sexuality and gender at the ART Center, deterring some due to the fear of dual discrimination.

Consequently, only 40 out of over 100 MSM/TG individuals in community care have accessed services at the dispensing sites, underscoring the urgent need to address these barriers for comprehensive healthcare access in the MSM/TG community.

**Lessons learned:** MSM/TG PLHIV face challenges in accessing services at ART centers due to stigma and discrimination, leading to loss to follow-up or non-enrollment after diagnosis. Community-based ART becomes crucial for their enrollment, with ARV dispensing centers dedicated to MSM/TG showcasing improved service delivery. The most effective approach KP led CB-ART, demonstrating significant strides in enhancing services for MSM/TG PLHIV.

**Conclusions/Next steps:** In conclusion, the necessity for the Nepalese government to implement CB ART for MSM / transgender populations is evident.

This not only addresses their unique healthcare needs but also dismantles barriers to treatment access. Simultaneously, proactive measures, including reducing stigma and discrimination, must be taken within the general population and among healthcare providers.

Sensitizing authoritative bodies about the LGBTQIA+ community is vital for fostering inclusivity. By integrating targeted healthcare initiatives with broader societal awareness campaigns, Nepal can work towards creating an equitable and affirming landscape for all citizens.

## WEPEF671

Stigma and discrimination faced by people living with HIV in Portugal: what changed since 2013 (comparative analysis using Stigma index)

A. Duarte<sup>1</sup>, J. Brito<sup>2</sup>, J. Bettencourt<sup>3</sup>, A. Subtil<sup>4</sup>, S. Dias<sup>4</sup>

<sup>1</sup>Ser+, Portuguese Association for AIDS Challenge and Prevention, Executive Commission, Cascais, Portugal,

<sup>2</sup>GAT - Portuguese Activist Group on Treatments, Lisboa, Portugal, <sup>3</sup>Directorate General of Health, National Program for Sexually Transmitted Infections and HIV Infection, Lisboa, Portugal, <sup>4</sup>NOVA National School of Public Health, Public Health Research Centre, Lisboa, Portugal

**Background:** People Living with HIV Stigma Index is an international project that measures stigma and discrimination (S&D) experienced by people living with HIV (PLHIV). It was implemented in Portugal in 2013 and 2021/22, allowing to evaluate evolutionary trends.

**Methods:** *Stigma Index* was applied to 1062 PLHIV in 2013, and 1095 in 2021/22. Although the restructuring of questionnaire didn't allow the comparison of all items between data from 2013 and 2021/22, comparative analysis of the questions that were similar was made using hypothesis tests (Chi-square test and Fisher's exact test) with significance level of 5%.

**Results:** *S&D experiences:* Decreased (7% to 0.9%) people who were denied/dismissed from work, and those that experienced changes in functions (21.3% to 0.6%) in last 12m. Discrimination against family members dropped from 7.9% to 1.1%. In other experiences of social S&D (exclusion from social/religious/family activities, being verbally/physically assaulted) there were no differences.

*Internalized S&D:* Decreased people who avoided social events (19.3% to 8.7%), going to healthcare services (16.5% to 8.0%), applying for a job (12.6% to 8.1%), and that isolated from family/friends (25.0% to 14.8%). Also decreased guilt (55.5% to 30.5%) and shame (40.4% to 27.2%) for having HIV. There are no changes in % of people that decided not to have sex because of HIV.

**Interaction with healthcare services:** Decreased the denial of healthcare services in last 12m (8,6% to 3,4%) as S&D related to pregnancy, childbirth, and breastfeeding. People tested without their knowledge increased (22% to 30%) as the respondents who state that their medical records are not kept confidential (from 5.3% to 9.5%).

**Human rights and effective change:** The percentage of people whose rights were violated (last 12m) decreased (6.2% to 1%), but fewer took action to seek justice (32% to 19%).

**Conclusions:** Comparing with 2013, there seems to be a favorable evolution in S&D in the workplace, in healthcare services, and internalized S&D. Other areas like social S&D, test without knowledge, confidentiality of medical records, and taking action when rights are violated seems to be the same or worse.

## WEPEF672

### Stigma and Discrimination Index 2.0 for people living with HIV in Peru

A.F. Cisneros Davila<sup>1</sup>

<sup>1</sup>Latin American and Caribbean Network of People living with HIV, Lima, Lima, Peru

**Background:** Studying the problem of stigma and discrimination towards people with HIV allows us to better understand its characteristics, facilitating the design of more effective interventions and addressing the various determinants that affect people with HIV and key populations.

Specific objectives

1. To understand the experiences of stigma and discrimination among people living with HIV, including specific populations.
2. To provide information to guide the development and implementation of national policies that protect the rights of people living with HIV.

**Methods:** The study is based on a quantitative and qualitative, descriptive and cross-sectional methodology. Data were collected between July 2022 and January 2023. Five cities were considered: Lima, Callao, Arequipa, Piura and Iquitos.

The participants were people with HIV with more than one year of diagnosis. The populations considered were: Men, Women, MSM/Homosexuals/Bisexuals, Trans Women, Sex Workers and drug users. The sample was 812 persons. Place-based sampling (75%) and reference sampling (25%) were considered. For the qualitative component, six focus groups and 72 interviews were conducted.

**Results:** 90% of people claim to have experienced internal stigma. Thirty-seven percent experience feelings of guilt. Internally displaced persons have a higher percentage of internal stigma, (94%), followed by those belonging to an "indigenous community" and young people between 18 and 29 years of age, with 81% in each case.

52% reported having suffered external stigma. 33% reported self-exclusion behaviors, the most recurrent being distancing themselves from friends and family (17%).

In HIV services, 32% of PLHIV have experienced discrimination, with a higher proportion among cis women (37%). 30% of trans women experienced some psychological problem in the last year. 18% mentioned having felt that their human rights had been violated.

**Conclusions:** Develop and implement programs to address the impact of stigma and discrimination on the mental health of PLHIV and key populations.

Review and update the HIV law to include the needs of PLHIV from a human rights approach.

Include in the national human rights policy multisectoral actions to address stigma, discrimination towards PLHIV and key populations.

Measure the different interventions related to the reduction of stigma and discrimination, through a multisectoral body such as CONACOD.

## WEPEF673

### Role of crisis management volunteers' team in preventing violence against vulnerable transgender communities in India

M. Mhaske<sup>1</sup>, S. Latad<sup>1,2</sup>, A. Siroya<sup>1,2</sup>, V. Anand<sup>3</sup>, M. Sivasubramanian<sup>3</sup>

<sup>1</sup>The Humsafar Trust, Advocacy, Mumbai, India, <sup>2</sup>Yaariyan, Youth Initiative of The Humsafar Trust, Mumbai, India, <sup>3</sup>The Humsafar Trust, Mumbai, India

**Background:** Even with progressive judgements and acts, Indian LGBTQ+ community, especially trans-persons, continue to face crisis situations, identity-based discrimination and violence. These crisis situations include social, emotional, physical, sexual and financial harassment, academic bullying, life-threatening hate crimes leading to mental health crisis and death by suicide.

**Description:** The Humsafar Trust's (HST), as a part of its crisis response & management formulated and built capacities of a crisis management volunteer team in 2022 representing the Pan-India PLHIV & LGBTQ+ community using a module developed to guide the use of a comprehensive processes.

These crisis management efforts using a multi-pronged approach empower the LGBTQ+ community to be able to fight for their rights.

#### Lessons learned:

- Collaborate with local LGBTQ+ organizations, health services and legal-aid providers, and other community groups to enhance the resources available to the support group and persons in need.
- Crisis response volunteers should have cultural competence to create an inclusive atmosphere.
- Enhanced legal literacy offers transgender persons in sex work an equitable platform to voice their rights.

- Public-Private partnerships for legal aid strengthens support provided to survivors.
- Owing to health disparity among the community, collaboration with queer-affirmative healthcare providers builds access to risk-reduction emergency health services such as PEP.
- Capacity Building on psycho-social care and mental health of crisis responders were important to sustain this community-led voluntary initiative.
- Empower participants with information that can help them make informed decisions about their safety and well-being.

**Conclusions/Next steps:** Empowerment and community-led approach is crucial to tackle the crisis and violence against the Indian LGBTQ+ community.

Although there are resources and services available for the community, but the community is reluctant to access them due to fear of further harassment.

However, support group formation among the community can lead to sustainable community-driven solutions for health and legal crisis management.

## WEPEF674

### The bottleneck of HIV responses in Indonesia: a study of media monitoring and documentation

N. Puspitasari<sup>1</sup>

<sup>1</sup>Lembaga Bantuan Hukum Masyarakat (LBHM), Research and Project Officer, Jakarta, Indonesia

**Background:** The failure of Indonesia to achieve the 90-90-90 target by 2020, in which only 69.5% of people living with HIV know their status and 33.7% are on ARV treatment, is contributed by the major factor of the absence of an enabling environment. This study aims to look at and document various violations against people living with HIV and key populations.

**Methods:** News monitoring was carried out based on internet media in the period January 2021-September 2022. News searches using relevant keywords were carried out by enumerators. The news found would be classified based on predetermined variables, such as forms and patterns of violations, regions, perpetrators, victims, media reporting, and news sources, and analyzed.

**Results:** This study found that during January 2021-September 2022 there were 109 news reports with 187 cases of human rights violations consisting of 65 cases of stigma, 94 cases of discrimination, and 28 cases of hate speech. These violations are normalized in four forms which then hinder to creating an enabling environment.

First, raids perpetuated by the law with the main motive in the name of public order with its various law enforcement problems.

Second, the onslaught against LGBTQI+ and key populations through discriminatory policies ranging from the level of laws, local regulations, to rules in ministries/institutions.

Third, restrictions on the right to freedom of assembly of LGBTQI+ and key populations that echo classic narratives, exaggerating the threats to Pancasila (Indonesia's ideology), morality, and the nation's generation.

Fourth, discrimination on the right to education due to the failure to understand HIV in the context of human rights and public health as well as the wave of homophobia, transphobia, and biphobia in the education space.

The estuary of all these is that AIDS elimination in Indonesia not being carried out on the right track.

**Conclusions:** This study demonstrates the need for educating the public about HIV and human rights both in the form of reports and campaigns. Findings of this report became one of the sources of a report written by the Indonesian National Human Rights Commission on stigma and discrimination against people living with HIV and key populations.

## WEPEF675

### Investigating human rights violations against people who use drugs in Johannesburg Health District amidst and post the COVID-19 pandemic

A.E. Manyuchi<sup>1,2</sup>, J.A. McIntyre<sup>1,3</sup>, J. Daniels<sup>4</sup>, M. Mbambo<sup>1</sup>, N. Zuma<sup>1</sup>, M. Mabitsi<sup>1</sup>, L. Li<sup>5</sup>, H. Struthers<sup>1,6</sup>

<sup>1</sup>Anova Health Institute, Programs, Johannesburg,

South Africa, <sup>2</sup>University of the Witwatersrand, Global Change Institute, University Corner, Johannesburg,

South Africa, <sup>3</sup>University of Cape Town, School of Public Health & Family Medicine, Cape Town, South Africa,

<sup>4</sup>Arizona State University, Edson College of Nursing and Health Innovation, Phoenix, United States, <sup>5</sup>University of California, Los Angeles, Department of Psychiatry and

Biobehavioral Sciences, Semel Institute for Neuroscience and Human Behavior, David Geffen School of Medicine, Los Angeles, United States, <sup>6</sup>University of Cape Town, Division of Infectious Diseases & HIV Medicine, Department of Medicine, Cape Town, South Africa

**Background:** Although South Africa has a progressive constitution, violations of the rights of people who use drugs (PWUDs) by public officials and others are common. To combat human rights violations, it is crucial to comprehend their nature and scope. In Johannesburg Health District, violations of PWUDs' rights have been recorded during and post the pandemic—from April 2020 to December 2023.

**Description:** We conducted PWUDs rights sensitization discussions with PWUDs, shelters, community leaders, community influencers and public officials, especially police and health workers and distributed information, education, and communication (IEC) materials.

With a systematic approach of detecting, investigating, analyzing information, responding, and reporting human rights violations, 803 cases were recorded during the COVID-19 pandemic period between April 2020 and March

2022. Among them, 4% were refused services; 21% assaulted; 23% humiliated, 2% sexually assaulted, 32% had needles confiscated, 3% abused by public officials, 2% arrested without charge, 1% refused legal counsel, 1% forced to pay a fine, 10% unlawfully arrested and 1% case reported but no action taken by police.

In total, 969 cases were recorded after the pandemic between April 2022 and December 2023, of which 4% were refused services; 30% assaulted; 3% humiliated, 17% sexually assaulted, 41% had needles confiscated, 1% abused by public officials, 1% arrested without charge, 3% unlawfully arrested.

**Lessons learned:** A broad spectrum of issues and actions falls within the scope of human rights violations. Reported percentage of cases of confiscation of needles and assault remained high during and after the pandemic.

Targeted interventions reduced the percentage of PWUDs being humiliated, abused by public officials, and unlawfully arrested. But percentage of reported sexual assault cases were higher after the pandemic. The different types of cases reported necessitate effective sensitization of diverse actors.

Human rights violations, particularly refusing services, affect PWUDs engagement on treatment and care and ultimately the health outcomes of PWUDs. Hence, human rights monitoring must be integrated into harm reduction programs.

**Conclusions/Next steps:** Human rights violations and crimes against PWUDs are widespread. A resilient system of monitoring these is imperative. A focused advocacy team that addresses human rights violations is essential.

## WEPEF676

Lessons learned on addressing the psychosocial needs of human rights defenders

M.D. Digashu<sup>1</sup>, D.B. Fortuin<sup>1</sup>

<sup>1</sup>*Southern Africa Litigation Centre, Johannesburg, South Africa*

**Background:** Human rights defenders (HRD) often face stress, trauma, security threats, and persecution, leading to psychological challenges such as anxiety, depression, and burnout.

This is even worse for HRD who work with communities that are criminalised due to status, such as LGBTIQ+ persons and People Living with HIV.

The constant risk of violence contributes to stress and trauma, and the type of community and advocacy work they engage in results in stigma, isolation, harassment, and threats.

**Description:** Over the past three years, SALC assisted human rights defenders with psychosocial support in Botswana, Eswatini, Malawi and Namibia, who either worked with criminalised communities or identified as a member of a criminalised group.

**Lessons learned:** Through our work it was apparent that psychosocial support and an understanding of mental health issues are equally important as they are underfunded. Many state-run institutions fuel the stigmatisation of marginalised communities, mainly due to the criminalisation of such persons, which has led to the community having little to no faith in these institutions. Private institutions prove to be inaccessible due to the financial tag that they come with.

This becomes problematic as there are not many donors who solely fund mental health or psychosocial support. Grassroots HRDs play a pivotal role, and supporting their initiatives ensures a more profound impact and empowering local communities to advocate for their rights fosters sustainable change.

To ensure an all-inclusive psychosocial support system for human rights defenders, governments are encouraged to abolish colonial anti-LGBTIQ+ laws to serve people equally and offer equal protection.

**Conclusions/Next steps:** There is a need to recognise the diversity of challenges faced by those on the forefront of human rights advocacy by reforming laws, policies and practices that result in leaving human rights defenders with trauma, anxiety and stress. There is a dire need for dedicated psychosocial support funding for HRDs.

## WEPEF677

*'We are treated as criminals, not as sick': insights from a thematic analysis of human rights violations in accessing HIV services from using Rights-Evidence-ACTION (REACT) in Lebanon*

L. Chamaa<sup>1</sup>, N. Badran<sup>1</sup>

<sup>1</sup>*Society for Inclusion and Development in Communities and Care for All (SIDC), Sin El Fil, Lebanon*

**Background:** Lesbian, gay, bisexual, transgender, and intersex (LGBTI+) individuals, prisoners, refugees, people living with HIV (PLHIV), people who use drugs, and sex workers are among the populations most vulnerable to HIV acquisition and disease. Structural barriers, including stigma, discrimination and criminalization prevent them from fulfilling their human rights and achieving their full potential. Rights-Evidence-ACTION ('REACT') is a human rights monitoring and response tool developed by Frontline AIDS, to support community-led documentation of human rights barriers to health, including gender-related rights violations. Generated data are used to inform rights-centered HIV programming and advocacy.

**Methods:** SIDC trained Lebanese AIDS Network Association (LANA) members to use REACT. Between July 2020 and December 2021, 150 cases of human rights violations were documented, many involving compound incidents. An additional 23 cases were reported between July and November 2023. A total of 164 clients were registered. The cases were thematically analyzed for recurrent patterns.

**Results:** Demographically, 62% of registered clients were aged between 19-35 and 79% identified as males. Furthermore, 55% identified as LGBTI+ (including 48 men who have sex with men (MSM)), 20% were former/current prisoners, 20% engaged in sex work, 18% were persons who use drugs, and 10% were PLHIV.

Overall, the most reported incidents were harassment, intimidation, and bullying, followed by assault, and discrimination based on sexual orientation. Perpetrators included 'police/law' (62 cases); 'state representative' (52 cases); and 'other perpetrator', including family (51), private employer (26), and private healthcare professional (14). Several cases involved multiple instances and/or perpetrators.

Population-based analysis found that male prisoners faced inadequate medical care, financial constraints, and bullying. Female sex workers and prisoners experienced poverty, sexual violence, and medical neglect. LGBTI individuals, especially MSM, faced homelessness, rejection, coercion, and workplace discrimination. PLHIV encountered healthcare accessibility challenges, stigma, and housing instability.

REAct enabled immediate responses including mental health support and emotional/psychological counseling, condoms and lubricants, and disclosure and stigma support.

**Conclusions:** Recommendations span legislative bodies, urging reviews of discriminatory laws, while governmental bodies are called to establish coherent policies addressing stigma. Ministries such as Interior, Public Health, Labor, Information, and Justice are specifically advised on implementing targeted measures.

## WEPEF678

### Exploring sexual health disparities: a Rwandan study on adolescents with and without disabilities

A. Ishimwe<sup>1</sup>, L. Gutabarwa Twahirwa<sup>2</sup>, D. Ndatimana<sup>3</sup>, R. Kalisa<sup>2</sup>, V. Mutarabayire<sup>4</sup>, G. Ntirenghanya<sup>4</sup>, F.X. Karangwa<sup>5</sup>

<sup>1</sup>Health Development Initiative, Community Outreach, Kigali, Rwanda, <sup>2</sup>Health Development Initiative, Kigali, Rwanda, <sup>3</sup>Health Development Initiative, Research, Kigali, Rwanda, <sup>4</sup>UNFPA Rwanda, Kigali, Rwanda, <sup>5</sup>Umbrella of Organizations of Persons with Disabilities in the fight against HIV/AIDS, and Health Promotion, Kigali, Rwanda

**Background:** The study addresses the challenges faced by adolescents with disabilities in Rwanda in accessing and using sexual and reproductive health (SRH) services. While Rwanda has made progress in SRH for the general youth population, the specific needs of disabled adolescents remain under-addressed. This research evaluated their access to SRH services and information, highlighting a critical area in public health that requires more attention to ensure inclusive SRH programs.

**Methods:** We used mixed methods to collect and analyze the data. Both quantitative and qualitative data were collected from adolescents, with and without disabilities. The quantitative analysis included descriptive statistics, chi-square tests, and logistic regression; the qualitative analysis included thematic content analysis. Variables with  $p < 0.05$  were considered significant.

**Results:** The study found that 41.1% (444/1081) of adolescents had engaged in sexual activities, 31.9% (53/444) had hearing, visual, or speech disabilities, and 38.8% (170/444) had physical disabilities. 51.7% reported not using protection at their first sex, 55.9% (26/53) of those with physical disabilities, and 59.1% (80/170) of those with hearing, visual, or speech disabilities. 9.7% (105/1081) of all adolescents began childbearing, with 9.6% (42/438) among those with physical disabilities and 6.6% (11/166) among those with hearing, visual, or speech disabilities.

Among those who started childbearing, a high percentage of unintended pregnancies were reported: 72.7% (8/11) for adolescents with hearing, visual, or speech disabilities and 73.8% (31/42) for those with physical disabilities. STI prevalence was 11.1% (64/604) among those with disabilities, 2.4% (14/604) among those with hearing, visual, or speech disabilities, and 9.6% (58/604) among those with physical disabilities.

Only 19.9% (33/166) of adolescents with hearing, visual, or speech disabilities used SRH services, compared to 25.1% (110/438) of those with physical disabilities. Adolescents with disabilities reported barriers including distance to health facilities, inappropriate health infrastructure, unfriendly health care providers, self-marginalization, fear of judgment, and a lack of appropriate information.

**Conclusions:** The study identified challenges faced by adolescents with disabilities regarding Adolescent Sexual and Reproductive Health (ASRH). It revealed disparities in ASRH service access between adolescents with and without disabilities. This underscores the urgent need for tailored policies and programs for disabled adolescents in Rwanda.

## WEPEF679

### Rights for key populations? Mixed and decreased public opinion support for the basic rights of people living with HIV, MSM and trans women from 2016 to 2023 in Central America

A. Cabrera<sup>1</sup>, C. Palma<sup>1</sup>, S. Lungo<sup>1</sup>

<sup>1</sup>Pan American Social Marketing Organization (PASMO), Guatemala City, Guatemala

**Background:** In 2023 and in the context of the Prevention Services against HIV project implemented in Central America by the Pan American Social Marketing Organization (PASMO) with funds from the United States Agency for International Development (USAID), PASMO hired the CID Gallup Research Agency to conduct a fourth round of

a public opinion poll in Guatemala, El Salvador, Honduras, and Panama with ten questions regarding stigma and discrimination towards men who have sex with men (MSM), transgender women and people living with HIV (PHIV) and their human rights.

**Methods:** Quantitative opinion poll with a representative sample of 1,200 face-to-face surveys conducted per country and with adult citizens over the age of 18 in Guatemala, El Salvador, Honduras, and Panama in September 2023. Margin of error +/- 2.8 (p=0.5). Statements were rated on a scale of strongly agree, agree, disagree, strongly disagree.

**Results:** "People living with HIV should have access to public spaces": strongly agree/agree 79% in 2016, 76% in 2019 and 2021, and 72% in 2023; "Women living with HIV have the right to pregnancy": strongly agree/agree 41% in 2016, 34% in 2019, 30% in 2021 and 2023; "A gay friend can live in my home": strongly agree/agree 63% in 2016, 60% in 2019, 59% in 2021, 54% in 2023; "Trans women have the right to documents that identify them as women": strongly agree/agree 43% in 2016, 41% in 2019, 38% in 2021, 36% in 2023; "People have the right to assault a trans person for who they are": strong disagree/disagree 89% in 2016, 85% in 2019, 86% in 2021, 89% in 2023.

**Conclusions:** Several stigmatizing public opinions towards MSM, trans women and PHIV have increased 2016 to 2023 in Central America, especially in aspects related to human rights (access to public spaces, pregnancy, ID, and non-violence).

With stigma and discrimination presenting important barriers to HIV prevention and treatment access among KPs, programs and partners working in the region should consider implementing human rights promotion activities and campaigns targeting the general population.

## WEPEF680

Navigating stigma and discrimination among key populations in Nigeria: a comprehensive analysis of challenges faced by men who have sex with men

A.E. Andrew<sup>1</sup>, A. Adesina<sup>2</sup>, R. Aguolu<sup>1</sup>

<sup>1</sup>National Agency for the Control of AIDS, Research, Monitoring and Evaluation, Abuja, Nigeria, <sup>2</sup>West African Centre for Public Health and Development, Abuja, Nigeria

**Background:** Despite advancements in the global discourse on sexual and gender diversity, men who have sex with men (MSM) in Nigeria face enduring challenges, including stigma, discrimination, and mental health issues like depression. This is reflected in the disproportionately high HIV prevalence among this group, which increased from 13.5% in 2007 to 25% in 2020.

There is a need to identify contributing factors associated with experiences of stigma and discrimination faced by MSM.

**Methods:** This study conducted a secondary analysis of the Nigeria Stigma Index Report 2.0, encompassing 17 states across the six geo-political zones in Nigeria. Employing a cross-sectional descriptive approach, the study utilized both quantitative and qualitative data collection methods. Qualitative data were obtained through semi-structured Focus Group Discussions (FGD) to capture the experiences of stigma among MSM.

The quantitative aspect involved using the structured and standardized Stigma Index Survey 2.0 tool to interview the MSM respondents.

**Results:** The study involved 81 participants, with 35% aged between 25-34 years. Within the 12 months preceding the study, 14% reported experiencing physical harassment, while 11% faced blackmail due to gender identity. Additionally, 10% avoided seeking health services because of disclosure concerns. Verbal harassment was reported by 20% of respondents, and 9% felt excluded from family activities during the same period.

**Conclusions:** The pervasive obstacles of stigma, discrimination, and social marginalization significantly hinder the health and well-being of MSM in Nigeria.

The study emphasizes the imperative for increased collaboration among stakeholders to implement targeted interventions that challenge discriminatory norms, promote inclusivity, and ultimately create a more welcoming environment for Men who have sex with Men in Nigeria.

## WEPEF681

The intersection between migrant women living with HIV and gender-based violence, and the need for culture and gender specific legal services

A. Ogdenovski<sup>1</sup>

<sup>1</sup>HIV/AIDS Legal Centre, Sydney, Australia

**Background:** Women living with HIV (WLHIV) face disproportionate rates of violence, including sexual abuse and partner infidelity. Migrant WLHIV who are currently experiencing, or have experienced, gender-based violence (GBV) have unique legal issues due to the intersection of their HIV status and experiences of violence, both of which can impact their visa outcomes. As all visas to Australia have a Health Criteria, there are only certain permanent visas available for PLHIV.

Given the uncertainty surrounding a migrant's visa status, WLHIV may fear accessing services if it will impact their visa outcomes, or if there are no specialist women legal services.

**Description:** From a limited funding grant, the HIV/AIDS Legal Centre, with support from Positive Life NSW (peer body), were able to have a female Solicitor dedicate a portion of her caseload to assisting WLHIV in NSW. From this, a monthly drop-in legal clinic was established that was a safe place for WLHIV to access legal advice, with

interpreter service available on call, and which operated outside standard work hours to accommodate for carer responsibilities.

**Lessons learned:** The majority of migrant WLHIV who sought assistance through the service were seeking advice to remain in Australia permanently, and all migrant WLHIV who accessed the drop-in legal clinic were currently experiencing, or had previously experienced, GBV. All migrant WLHIV who used the drop-in legal service were also from a culturally and linguistically diverse background.

It was found that many of the women were unaware of the Family Violence Provisions in the *Migration Act 1958* and how it may be applicable to their situation, as well as how their experience of being a WLHIV and victim/survivor of GBV may be a basis for seeking permanent protection in Australia.

**Conclusions/Next steps:** The drop-in service revealed that migrant WLHIV are experiencing disproportionate rates of violence compared to non-migrant WLHIV, and that they currently lack legal literacy as to their visa options, and how GBV may intersect.

As the service was advertised and tailored towards WLHIV, it meant that this uniquely stigmatised population felt comfortable to access it, and uncloaks the necessity for more culturally sensitive, women orientated legal services.

## Ethics and HIV

### WEPEF682

Barriers and facilitators to researcher-adolescent participant relationship building: perspectives from Kenyan children and adolescents living with HIV, their caregivers and subject matter experts

A. Chory<sup>1</sup>, A. Boal<sup>1</sup>, W. Nyandiko<sup>2,3</sup>, J. Aluoch<sup>3</sup>, M. Scanlon<sup>4</sup>, E. Gillette<sup>1</sup>, H. Koros<sup>3</sup>, C. Ashimosi<sup>3</sup>, W. Beigon<sup>3</sup>, D. Munyoro<sup>3</sup>, J. Lidweye<sup>3</sup>, J. Nyagaya<sup>3</sup>, A. DeLong<sup>5</sup>, R. Kantor<sup>5</sup>, V. Naanyu<sup>3</sup>, R. Vreeman<sup>1,3</sup>

<sup>1</sup>Icahn School of Medicine at Mount Sinai, New York City, United States, <sup>2</sup>Moi University College of Health Sciences, Eldoret, Kenya, <sup>3</sup>Academic Model Providing Access to Healthcare (AMPATH), Eldoret, Kenya, <sup>4</sup>Indiana University Center for Global Health, Indianapolis, United States, <sup>5</sup>Brown University, Providence, United States

**Background:** Health research with children and adolescents living with HIV (CALWH) is critical to improving clinical outcomes, particularly in high-burden countries. Unique vulnerabilities of this group, including their age, HIV status, and social contexts, raise bioethical considerations, including the ways in which CALWH build trusting relationships with research teams, especially in research

conducted over long periods. We evaluated perspectives on barriers and facilitators to researcher-participant relationship building.

**Methods:** In-depth, semi-structured interviews were conducted with Kenyan CALWH [ages 10-24 years, enrolled at Academic Model Providing Access to Healthcare (AMPATH) in western Kenya], caregivers of CALWH, and subject matter experts (SMEs). Thematic analyses were conducted to identify preliminary codes and themes.

**Results:** Interviews were conducted with 99 participants (53% male): 40 CALWH [median age 17.5 years, (range 11-24), 50% female], 20 caregivers (70% female), and 39 SMEs (33% female; 46% community leaders, 26% healthcare providers, 15% clinical researchers, 8% social scientists, 3% international research experts, 2% laboratory experts).

All groups indicated trust could be broken and built through research processes. CALWH and SMEs viewed participant identification and study recruitment through medical records as a violation of trust, indicating that their HIV status and other health information should remain confidential between themselves and their clinical team.

All three groups suggested ethical recruitment may instead occur through existing clinician-adolescent relationships, emphasizing the importance of privacy and confidentiality. Losses of confidentiality, and mistakes in sample collection that require participants to attend additional, unnecessary research visits or provide additional biological samples, were identified by all groups as additional barriers to relationship building.

CALWH and caregivers discussed researcher characteristics that support relationship building, with particular focus on the importance of a positive demeanor, without stigmatizing behavior. CALWH and SMEs discussed operational needs that foster relationship building, like ensuring proper communication of study procedures, results reliably reported to participants, and future benefits being received.

**Conclusions:** Researcher-participant relationships play an important role in conducting research with CALWH and should be considered a critical component in the development and success of research infrastructure. Perspectives from Kenyan CALWH, their Caregivers and SMEs highlighted opportunities to improve such relationships.

## WEPEF683

HIV care provider awareness, attitudes, and willingness to support client outreach efforts for HIV cure-directed research in Philadelphia, Pennsylvania

S. Meanley<sup>1</sup>, W. Carter<sup>2</sup>, W. Short<sup>3</sup>, D.S. Metzger<sup>4</sup>, A. Onorato<sup>4</sup>, D.M. Campbell<sup>2</sup>, C. Danaway<sup>2</sup>, R. Hayes<sup>2</sup>, M. Hill<sup>2</sup>, B. Hix<sup>2</sup>, S. Johnson<sup>2</sup>, R. Maddox<sup>2</sup>, K. Mathis<sup>2</sup>, J. Murdock<sup>2</sup>, D. Robinson<sup>2</sup>, L.J. Montaner<sup>5</sup>, J.L. Riley<sup>6</sup>, B. Peterson<sup>5</sup>, K. Dubé<sup>7</sup>

<sup>1</sup>University of Pennsylvania School of Nursing, Family and Community Health, Philadelphia, United States, <sup>2</sup>BEAT-HIV Community Advisory Board, Philadelphia, United States, <sup>3</sup>University of Pennsylvania Perelman School of Medicine, Infectious Diseases, Philadelphia, United States, <sup>4</sup>University of Pennsylvania Perelman School of Medicine, Psychiatry, Philadelphia, United States, <sup>5</sup>University of Pennsylvania Perelman School of Medicine, Wistar Institute, Philadelphia, United States, <sup>6</sup>University of Pennsylvania Perelman School of Medicine, Microbiology, Philadelphia, United States, <sup>7</sup>University of California, San Diego School of Medicine, Infectious Diseases and Global Health, San Diego, United States

**Background:** Clinical trials are underway to develop HIV cure-directed strategies. Prior studies have shown high willingness among persons with HIV (PWH) to participate in HIV cure-directed trials. In recent surveillance of PWH in Philadelphia, PWH indicated that they were most likely to trust their medical provider to discuss participation in HIV cure-directed research. Providers are critical partners in supporting HIV cure-directed trials as participation may require analytical treatment interruptions (ATIs).

Our objectives were to:

1. Evaluate HIV providers' awareness, attitudes, and willingness to conduct client outreach for HIV cure-directed research; and,
2. Identify providers' preferences for HIV cure-related education.

**Methods:** The current study is a collaboration between the BEAT-HIV Delaney Collaboratory Community Engagement Group and the BEAT-HIV Community Advisory Board. We enrolled N=64 HIV providers (i.e., physicians, physician assistants, and nurses) across nine Philadelphia clinics and healthcare systems to complete a one-time web-based survey (2022–2023).

Providers self-reported their awareness of the current strategies towards HIV-1 cure, HIV cure education preferences, and attitudes and willingness to support client outreach for HIV cure-directed research.

**Results:** Most (84.4%) providers reported HIV cure-directed research awareness. Familiarity with HIV cure strategies ranged from 10–55%. Over 90% of providers reported that it was important for clinicians to assist with client outreach and that they were likely to recommend PWH to participate in HIV cure-directed research.

However, 51.6% of providers indicated less willingness to discuss HIV cure-directed research with their clients if ATIs were required. Client outreach willingness was positively correlated with research experience ( $r=0.31$ ), outreach experience ( $r=0.43$ ), and outreach self-efficacy ( $r=0.27$ ). Preferred resources (>70%) for HIV cure education were peer-reviewed publications and webinars with continuing education credit.

**Conclusions:** Client outreach is critical for ensuring diverse representation in HIV cure-directed trials. All-the-while, providers must maintain high-quality medical support for trial participants. Providers' willingness to assist with client outreach for HIV cure-directed research was diminished if ATIs were required.

Provider interventions should address ethical concerns regarding:

1. The necessity of ATIs in HIV cure-directed research;
2. Client outreach that maximizes individual autonomy and self-determination; and,
3. Ways to support PWH who participate in these studies and their sex partners.

## WEPEF684

Adolescent perspectives on HIV clinical research participation rules during pregnancy

H. Baron<sup>1</sup>, A. Mussa<sup>2,3</sup>, R. Rajeshmohan<sup>2,4</sup>, A. Hagan-Bezgin<sup>2,5</sup>, A. Thom<sup>6</sup>, M. Bapabi<sup>2</sup>, K. Ramontshonyana<sup>2</sup>, P. Mmodzi<sup>6</sup>, P. Winner<sup>6</sup>, M. Kasule<sup>2</sup>, A. Bula<sup>6</sup>, C. Morroni<sup>2,7</sup>, A.D. Lyerly<sup>1</sup>, S. Day<sup>8</sup>

<sup>1</sup>University of North Carolina at Chapel Hill, Center for Bioethics, Social Medicine, Chapel Hill, United States, <sup>2</sup>Botswana Harvard AIDS Institute Partnership, Gaborone, Botswana, <sup>3</sup>Usher Institute, University of Edinburgh, Edinburgh, United Kingdom, <sup>4</sup>University of California, Berkeley, School of Public Health, Berkeley, United States, <sup>5</sup>University of Liverpool Liverpool, School of Medicine, Liverpool, United Kingdom, <sup>6</sup>UNC Project Malawi, Lilongwe, Malawi, <sup>7</sup>MRC Centre for Reproductive Health, University of Edinburgh, Edinburgh, United Kingdom, <sup>8</sup>University of North Carolina at Chapel Hill, Division of Infectious Diseases, Department of Medicine, Chapel Hill, United States

**Background:** Relative to pregnant adults, pregnant adolescents face increased risk of HIV acquisition, vertical transmission, and poor pregnancy outcomes. Addressing the ethical and regulatory barriers to HIV research with pregnant adolescents is crucial to providing safe and effective prevention/treatment.

We examined adolescent decision-making related to clinical HIV research participation during pregnancy to help develop ethical guidance for responsible inclusion of pregnant adolescents in clinical research.

**Methods:** Eighty in-depth interviews were conducted with ever pregnant adolescents (40 living with HIV, 40 at-risk) recruited from local clinics in Botswana and Malawi.

Questions in the semi-structured guide explored adolescents' views on study participation during pregnancy with reference to three common rules governing adolescent inclusion in clinical research:

1. Parental and non-gestational parental consent,
2. Disclosure of abuse, and
3. Two required forms of birth control (BC). Interviews were transcribed, translated to English and coded using NVivo, and emergent themes were identified.

**Results:** Thematic analysis revealed mixed support for the three common rules, with adolescents describing both risks and benefits. Although most adolescents expressed parental consent was a right/responsibility that could provide protection, some also noted that it could limit access to beneficial research. Some adolescents felt that pregnant individuals under 18 can provide independent consent.

Conversely, most adolescents were against non-gestational parental consent requirements because it infringes on adolescents' decision-making autonomy. Most favored disclosure of abuse, citing protection for the adolescent or fetus by authorities; however, some also noted this rule could increase risks for research participants. Some adolescents felt that tangible support (e.g. counseling) should also be provided when abuse is discovered.

Finally, supporters of the BC requirement indicated it provides contraception access and pregnancy prevention but noted that some may decline study participation if BC is required, due to side effects.

**Conclusions:** Adolescents identified advantages and disadvantages of common clinical research rules that would impact inclusion of pregnant adolescents in research, highlighting concerns specific to their social contexts and family dynamics.

These findings underscore the need to advance the interests of adolescent research participants in developing guidance for their ethical inclusion during pregnancy.

## Policy development, implementation and analysis

### WEPEF686

#### Analysis of HIV/AIDS patients switching to medical insurance ART: a cross-sectional study in six Chinese provinces

J. Hu<sup>1</sup>, P. Xu<sup>1</sup>, W. Kang<sup>2</sup>, J. Guo<sup>1</sup>, J. Xu<sup>1</sup>, H. Tang<sup>1</sup>, D. Zhao<sup>1</sup>, X. Wang<sup>2</sup>, F. Lyu<sup>1</sup>, G. Zhang<sup>1</sup>

<sup>1</sup>Chinese Center for Disease Control and Prevention, National Center for STD/AIDS Control and Prevention, Beijing, China, <sup>2</sup>Chinese Association of STD/AIDS Prevention and Control, Beijing, China

**Background:** Antiretroviral therapy (ART) security policy in China has entered a new stage of diversification, and there are free ART, medical insurance ART, self-funded ART. In recent years, some HIV/AIDS patients have switched to medical insurance ART from free ART.

Therefore, this study analyzed the information of those HIV/AIDS patients to provide reference for improving ART security policy in China.

**Methods:** A cross-sectional survey was used to collect the general characteristics, economic status, and ART status of 1371 HIV/AIDS patients from 18 cities in 6 provinces. The Chi-square test was used to analyse whether the differences between HIV/AIDS patients who switched to medical insurance ART and those who did not were statistically significant. Multivariable logistic regression was used to analyse the factors associated with switching to medical insurance ART.

**Results:** Among the 1371 participants, 17.3% switched to medical insurance ART. The differences between HIV/AIDS patients who switched to medical insurance ART and those who did not were statistically significant ( $p < 0.05$ ) in education, occupation, type of basic medical insurance, average annual income of family members, personal annual income, changes in personal annual income, whether is the government medical aid recipient or households registered as living under the poverty line, year of initiating ART, level of ART hospital, distance to ART hospital, and whether adverse medicine reactions occur.

Government agency/public institution/state-owned enterprise employees (aOR=2.34, 95% CI: 1.29-4.26), basic medical insurance for urban employed (aOR=1.93, 95% CI: 1.28-2.90), average annual income of family members were  $\geq$  \$13,972 (aOR=2.12, 95% CI: 1.27-3.54), personal annual income were  $\geq$  \$13,972 (aOR=2.39, 95% CI: 1.43-4.00), initiated ART before 2012 (aOR=1.67, 95% CI: 1.02-2.75), provincial hospitals (aOR=2.00, 95% CI: 1.30-3.09) were factors associated with switching to medical insurance ART.

**Conclusions:** 17.3% HIV/AIDS patients switched to medical insurance ART, indicating the attractiveness of medical insurance ART. The characteristics of HIV/AIDS patients who switched to medical insurance ART and the factors asso-

ciated with switching should be fully considered, so as to provide targeted ART services and improve ART security policy in China.

## WEPEF687

Enhancing sustainability in the leadership and coordination of the national HIV response: a focus on transitioning state agencies for the control of AIDS (SACA) in the 36+1 States of Nigeria

E.T. Ikomi<sup>1</sup>, A. Ogwola<sup>2</sup>, C. Aneke<sup>1</sup>, Y.A. Falola-Anemouah<sup>1</sup>, G.G. Aliyu<sup>3</sup>

<sup>1</sup>National Agency for the Control of AIDS (NACA), Policy, Planning and Stakeholder Coordination, Abuja, Nigeria,

<sup>2</sup>National Agency for the Control of AIDS (NACA), Community Prevention and Care Services, Abuja, Nigeria,

<sup>3</sup>National Agency for the Control of AIDS (NACA), Abuja, Nigeria

**Background:** The National Alignment Program, structured as a tripartite model involving the Global Fund, PEP-FAR, and the Government of Nigeria, aimed to enhance collaboration and efficiency in the national HIV response. Despite substantial investments from international donors, multilateral, and bilateral organizations, challenges such as limited coordination in states with multiple donors and data gaps persist.

The National Alignment 2.0 Programme, outlined in the New HIV Business Plan (NBM), seeks to establish an effective and locally-led HIV response in line with the Paris Declaration 2005.

**Description:** A three-day orientation and onboarding meeting, conducted in partnership with the Global Fund, World Health Organization (WHO), and State Agencies for the Control of AIDS (SACA), engaged participants from HIV/AIDS programs, Monitoring and Evaluation, Finance, and Procurement across 36+1 states.

The meeting assessed institutional and technical capacities, fostering agreement on coordination mechanisms for Grant Cycle 7 (GC7) through group work, brainstorming, and plenary sessions.

**Lessons learned:** The orientation reached 226 participants, providing insights into Global Fund project implementation processes. It facilitated the distribution of commodities for the 2023 World AIDS Day, disseminated the National HIV/AIDS Strategic Plan (NSP 2023-2027), and shared updates on the new business model for sustaining Nigeria's HIV response.

Preliminary reports on the assessment of SACA's institutional capacity were also presented.

**Conclusions/Next steps:** Conducting orientation meetings for key State HIV/AIDS program staff is crucial for optimizing available resources toward achieving the 2030 epidemic control goals. However, further actions are necessary, including training on policy brief development,

Global Fund guidelines for activity implementation, issuance of Terms of Reference for capacity building, and Electronic Reporting capacity enhancement.

## WEPEF688

Antiretroviral prices in light of international generics: how to ensure sustainable and universal access to dolutegravir in Brazil?

L. de Melo Nunes Lopes<sup>1</sup>, C. Thays Scopel<sup>1</sup>, R. Campos Hallal<sup>1</sup>, G. Luís Meffe Andreoli<sup>1</sup>, E. Malheiros<sup>1</sup>, R. Diquique<sup>1</sup>, M. Vieira Freire<sup>1</sup>, F. Álisson Paula De França<sup>1</sup>, B. Brittes Kamiensky<sup>1</sup>, T. Huana De Souza Nascimento<sup>1</sup>, R. Do Socorro Marques De Oliveira<sup>1</sup>, M.C. Gianna Garcia Ribeiro<sup>1</sup>

<sup>1</sup>Brazilian Ministry of Health, Department of HIV/AIDS, Tuberculosis, Viral Hepatitis and STI (DATHI), Brasília, Brazil

**Background:** Since 1996, Brazil has had a federal law ensuring universal access to antiretroviral therapy (ART). Dolutegravir (DTG) is currently used by more than 580,000 people in the country, but its price can be a barrier to access.

This study aimed to analyze DTG public procurement in Brazil and compare prices with international generics in order to discuss access and sustainability.

**Methods:** This is a case study from 2017 to 2023 that investigated annual procurement of DTG 50 mg from the Brazilian government to identify: USD and BRL unit prices, volume of tablets purchased and donated, BRL unit price adjusted for inflation and percentage of the ART public budget consumed by DTG.

The Clinton Health Access Initiative's annual HIV market reports were used to compare prices of internationally available generics.

**Results:** From 2017 to 2021, GSK was the only supplier of DTG 50 mg in Brazil. GSK's unit prices were USD 1.50 in 2017, USD 1.17 in 2018 and USD 1.15 in 2019, 2020 and 2021, while the amount of purchased tablets increased continuously. From 2018 to 2021, GSK's donated tablets progressively diluted their price (USD 0.89 in 2021). In 2022, Brazilian public generic manufacturers Lafepe (USD 0.74) and Farman-guinhos (USD 0.98) were responsible for DTG supply.

However, due to legal issues, Farmanguinhos became the only supplier of DTG in 2023 (USD 0.83), when DTG consumed 51% of the ART public budget. BRL prices adjusted for inflation showed that the highest price drop happened in 2018. In 2021, DTG reached its highest price, despite the amount of tablets purchased (160,500,000).

Brazilian prices were 4.4 (2018) to 11.9 (2023) times higher than international generic prices during the period. The difference between Brazilian and international generic prices has grown since 2020.

**Conclusions:** Prices have an important impact on ensuring sustainable access to ART in Brazil and guaranteeing new ARV incorporation. Investigating factors that deter-

mine price variations, including costs of production, is key to understanding price differences between Brazilian and international generics.

## WEPEF689

Ensuring an engagement of women living with HIV in global fund is still HARD ROCK

S. Banjade Shahi<sup>1</sup>, S. Thapa Magar<sup>2</sup>

<sup>1</sup>ICWAP, HIV, Kathmandu, Nepal, <sup>2</sup>ICWAP, Kathmandu, Nepal

**Background:** Having specific objective to better understand on the GC7 process and how it supports women and girls living with HIV at the country level in Cambodia, India and Viet Nam. Through the support of UNAIDS and technical support team, ICWAP provided support on the enhancing knowledge, and engagement of women living with HIV in GF in-country processes including country dialogues, concept note developments and grant making to integrate women-led activities in the final Global Fund proposal and to influence to increase funding to support to women and girls with fact data after the assessment conducted in countries by and for women and girls.

**Description:** Activities included a survey targeted to women living with HIV to understand their involvement in Global fund Cycle 7 processes and focus-group discussions and key informant interviews in all three countries. 60 women responded to the survey from 3 countries. The survey questions focused on what are the emerging needs of WLHIV; what works for women in terms of interventions; how can they be scaled up and where would resource come from and what are the challenges in accessing the resources at country level for women led networks.

**Lessons learned:** Women urgently need their own space to talk about issues from violence against women to sexual and reproductive health and rights. Support ongoing collaboration between women's regional networks to provide specific technical support to networks of women living with HIV in countries. Review Global Fund grants to integrate specific gender sensitive activities into the programme along with disaggregated data collection. Create mechanisms and systems to better support meaningful and robust participation of women to participate in the Global Fund processes from concept note development, country dialogue, priority settings and proposal development stage at national level.

**Conclusions/Next steps:** Invest in medium to long term core funding for women living with HIV networks to enable them to hire skilled staff for programme management and resource mobilization, which in turn will lead to better functioning and long-term sustainability. UNAIDS and global/regional networks to develop a monitoring system for women's meaningful engagement and outcomes in the Global Fund process are essential to ensure gender equality.

## WEPEF690

The situation of children with HIV in Indonesia: analysis of policies, programs, and child rights protection

E.P. Kavarera<sup>1</sup>

<sup>1</sup>Indonesia AIDS Coalition, Jakarta, Indonesia

**Background:** This research examines the situation of Children Living with HIV in Indonesia. It focuses on the evaluation and effectiveness of policies, ongoing work, and the rights protection. It aims to gain profound understanding of challenges and strengths that are faced by Children Living with HIV. This will involve analyzing policies, implementation, and rights protection.

**Description:** This research spans four months (June-October) focusing on Children Living with HIV. This will include 18 different areas in Indonesia. Combining quantitative and qualitative, It evaluates policy effectiveness and involve key activities such as surveys, document analysis, and group discussion.

This research examines the current situation of Children Living with HIV in Indonesia. The scope encompasses a thorough evaluation of policies, ongoing efforts, and rights protection measures.

**Lessons learned:** This research emphasizes the inadequate protection for Indonesia's Children Living with HIV, citing challenges such as conflicting school schedules, financial constraints, and children's expulsion due to parental HIV-related fears. Varied responses from school leaders, some favoring relocation and others stressing enhanced HIV education, exacerbate the situation. Engaging discussions with various groups reveal a conspicuous gap in preventing violence against Children Living with HIV, leading to student leaving their school and hiding their HIV status. Best Practices, like the "Hebat" program in Bandung and collaborative efforts in Medan, address HIV/AIDS issues.

Another best practice is new regulations in North Sumatra focus on testing, government-sponsored nutritional support, and delineating HIV-related responsibilities. In Surakarta, an orphanage's dialogues with schools aim to retain expelled children.

The findings emphasize the need for comprehensive measures, improved regulations, inter-ministerial collaboration, and targeted support to address the multifaceted needs of Children Living with HIV in Indonesia.

**Conclusions/Next steps:** This research suggests enhancing the protection of children with HIV in Indonesia through structured, holistic, and systematic approaches. Recommendations include a comprehensive child protection roadmap, ensuring healthcare and medication quality, robust education programs, and collaboration with national and international organizations.

It emphasizes improved regulations, inter-ministerial collaboration, and reliable data collection for successful interventions. The research highlights the critical impor-

tance of addressing the multifaceted needs of Children Living with HIV in Indonesia through comprehensive and collaborative efforts.

## WEPEF691

Sustainability of health systems and services in EECA by building capacities for emergency preparedness with a focus on health service continuity in the face of ongoing instability

G. Soselia<sup>1</sup>

<sup>1</sup>Social Equation Hub, Tbilisi, Georgia

**Background:** Public health emergencies, including pandemics and conflicts, pose significant threats to health systems. The Eastern Europe and Central Asia (EECA) region faces challenges in sustaining essential HIV services, exacerbated by weaknesses in health system functions and reduced financing. COVID-19 and the war in Ukraine further compound these challenges, affecting HIV responses and hindering access.

The purpose of the project was to build capacity for preparedness with a focus on health service continuity planning, in harness with emergency planning, in support of transitioning health systems for sustainability and resilience.

**Description:** Project focused on building capacity for emergency preparedness, specifically in Health Service Continuity Planning was initiated. Regional workshops were organized, involving stakeholders from nine countries.

The objective was to integrate continuity planning into the regional agenda and enhance its application in national HIV responses. Technical assistance was provided to strengthen health authorities and service providers.

**Lessons learned:** Project highlighted the need for a paradigm shift in sustainability, emphasizing preparedness, continuity, and recovery over a sole focus on transitioning to domestic funding. The "Triangle Framework" was introduced, advocating for a comprehensive approach addressing core sustainability pillars and critical enablers.

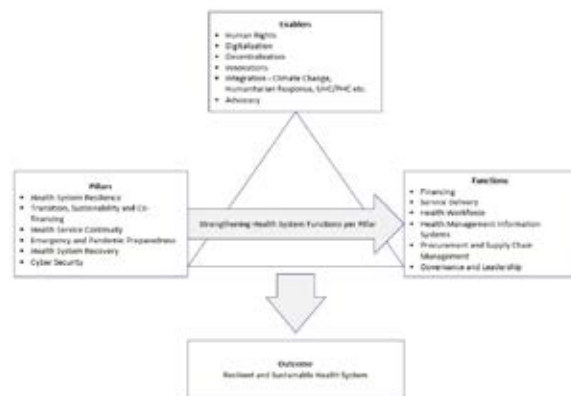

Figure. HIV-related health systems sustainability and resilience triangle framework.

**Conclusions/Next steps:** Identified challenges underscore the necessity for a comprehensive approach to enhance health system sustainability. The negative impacts of crises, coupled with reductions in funding, COVID-19 and war, emphasize the urgency of strategic interventions.

### Next Steps:

- Integrated Approaches: Incorporate health service continuity planning into the regional agenda, aligning with the evolving context.
- Technical Assistance and Capacity Building: Continue targeted assistance to strengthen health facilities and HIV service providers, focusing on robust health services and continuity systems.
- Paradigm Shift in Sustainability: Encourage a shift from a sole emphasis on transition to domestic funding to building resilient health systems.
- Adoption of the Triangle Framework: Implement the Triangle Framework as a guiding model for sustainable and resilient HIV-related health systems.

## WEPEF692

Harm reduction process implementation to decrease the occurrence of new infections in the people who inject drugs (PWID) population in Chiang Rai, Thailand

S. Ma-yare<sup>1</sup>

<sup>1</sup>People For Change Group, Non Government Organization, Maung, Thailand

**Background:** Harm reduction is applied in various contexts, including ending AIDS in People Who Inject Drugs (PWID), preventing the spread of bloodborne infections such as HIV and HCV, and reducing overdose deaths. PCG is a local organization in Chiang Rai that focuses on overcoming the challenges associated with connecting with PWID. The organization promotes behavior change in PWID to encourage safe drug use and reduce overall drug use. This includes facilitating methadone treatment at the PCG community methadone clinic.

**Methods:** PCG has set up 5 community methadone clinics. PCG outreach staff engage and recruit PWID clients in the community, healthcare services, methadone therapy, provision of needles set, condoms, and ongoing support, HIV screening tests. If HIV, STIs, or HCV yields reactive results, the clients will be referred to the hospital to confirm and for ARV Treatment, including TB prevention, psychosocial care, methadone therapy, and all with a harm reduction approach. The Community-Led Monitoring process is used to monitor and evaluate the client to measure behavioral changes before and after ingesting methadone.

**Results:** Currently, PCG recruited 1,168 PWID, with 243 cases receiving methadone treatment. The client data reveals that 141 continued drug use during methadone treatment, but in reduced doses, while 24 cases rely on metha-

done only. 91 cases reduced needle usage frequency and 54 cases reported no needle use. It also shows 31 cases showing a decrease in injection usage after treatment. Before starting methadone, 43 cases used drugs through both injection and smoking, which reduced to 16 cases after methadone treatment, indicating a reduction in both injection and smoking behaviors. Those who received methadone undergo health screening for HIV, HCV/HBV, sexually transmitted infections, and TB. After taking methadone, the clients say that their lives changed for the better, and improved their quality of life.

**Conclusions:** By integrating the Harm Reduction process to end AIDS, community methadone clinics are run by community outreach and NGOs. This effort helps prevent infections, ensures access to healthcare, and contributes to the overall goal of ending AIDS by reducing new HIV infections and lowering infection rates. As well as to improve the quality of life.

## WEPEF693

Forging consensus: advancing HIV person-centred care in Australia. Lessons learned, challenges addressed, and future directions

B. Clifton<sup>1</sup>, B. Riley<sup>2</sup>, L. Stackpool-Moore<sup>3</sup>, B. Allan<sup>4</sup>, H. Badge<sup>4</sup>

<sup>1</sup>National Association of People With HIV Australia (NAPWHA), Sydney, Australia, <sup>2</sup>Australasian Society for HIV, Viral Hepatitis and Sexual Health Medicine (ASHM), Sydney, Australia, <sup>3</sup>Watipa, Sydney, Australia, <sup>4</sup>QThink Consulting, Melbourne, Australia

**Background:** A high-level national roundtable conducted on August 28, 2022, by Australia's leading HIV community peak bodies, aimed to establish consensus on person-centred care (PCC). The objectives were to define, discuss best practices, and address challenges related to PCC, contributing to national and state-level advocacy, policy, and strategy development.

**Description:** The roundtable gathered clinicians, community members, government officials, researchers, and industry representatives from across Australia. Presentations from experts on PCC covered health systems, patient-reported outcomes, and community perspectives. Group discussions built on the presentations, identified themes including addressing barriers, partnerships, quality of life, stigma, and peer support, as well as moving beyond traditional disease-centric approaches to a holistic, person-centred paradigm. Following the roundtable, a Consensus Statement was developed that incorporated findings from the day. The draft statement was circulated to participants to review and feedback before consensus was reached on a final version.

**Lessons learned:** Key findings included the need to view HIV as a social phenomenon, incorporate diverse approaches, and recognise the role of peers. Results indi-

cated that PCC involves enabling people with HIV to articulate health priorities, necessitating cooperative decision-making between individuals and healthcare providers. The Consensus Statement highlighted that building a shared understanding of PCC is possible with diverse stakeholders. The Consensus Statement provides a foundation for advocacy, policy, and strategy development, and has informed significant shifts in Australia's HIV policy frameworks. A recent review of the National HIV Strategy drew on the Consensus Statement to support the prioritisation of person-centred approaches.

This included the importance of comprehensive, multidisciplinary, and non-stigmatising approaches to care that centre autonomy and life experiences and supporting the expansion of peer-led services.

**Conclusions/Next steps:** The diversity of stakeholders in the roundtable has helped ensured broad support for the Statement's principles. These outcomes demonstrate that consensus-building approaches with multi-sector stakeholders can support meaningful policy change to improve quality of life for people with HIV by envisioning a healthcare landscape that respects individual needs and fosters diversity and inclusion in the provision of quality person-centred healthcare by responding to community leadership in policy formulation processes.

## WEPEF694

Frequent visits and viral load timing delay differentiated service delivery enrolment and increase burden during the first year of HIV treatment: a policy review of 15 countries

L. Wilkinson<sup>1,2</sup>, L. Golob<sup>3</sup>, A. Grimsrud<sup>4</sup>

<sup>1</sup>University of Cape Town, Centre for Infectious

Epidemiology and Research, Cape Town, South Africa,

<sup>2</sup>International AIDS Society, Johannesburg, South

Africa, <sup>3</sup>International AIDS Society, Geneva, Switzerland,

<sup>4</sup>International AIDS Society, Cape Town, South Africa

**Background:** The initial year of antiretroviral therapy (ART) involves frequent health facility visits increasing disengagement risk. With the adoption of dolutegravir-based regimens, the World Health Organization (WHO) recommends reviewing the first viral load result by month six after treatment initiation and reduced the "time on ART" eligibility criteria for less-intensive differentiated service delivery (DSD) to six months.

We conducted a comprehensive review of current national HIV policies in East, South, Central and West Africa to assess visit burden in the first year and the impact of visit frequency and viral load timing on access to less-intensive DSD.

**Methods:** The policy review covered HIV clinical and DSD guidance from 15 countries. Extracted data included:

a. The visit schedule for clinically stable individuals (clinical, ART refill only, and ART-only visits in DSD models),

Oral  
abstracts

Poster  
exhibition

Author Index

b. Visits with routine viral load testing, and;  
c. The visit enrolment in less-intensive DSD models could occur based on "time on ART" and viral load suppression eligibility. Where guidance lacked explicit DSD assessment timing, we assumed this occurred after viral load result availability.

**Results:** Among the fifteen countries, ten require 6-7 visits, and five require 10-13 visits in the first ART year (Figure 1).

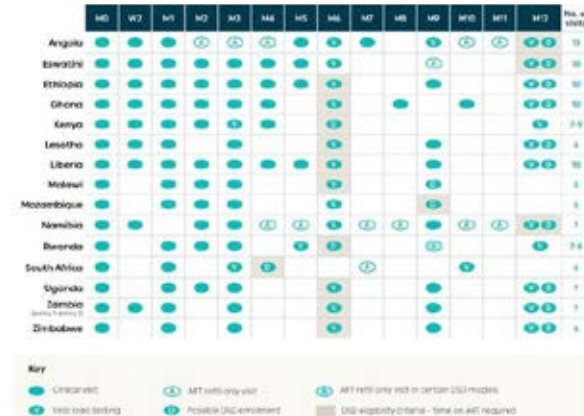

Figure 1. ART care visit schedules in the first year of treatment according to national policies.

In 12 countries, viral load is taken at month six. Access to less-intensive DSD models is feasible only from month 12 in ten countries. Kenya, Rwanda and South Africa, with earlier viral load assessment, enable less-intensive DSD model access by month six.

**Conclusions:** Despite treatment retention challenges, most countries delay viral load assessment and mandate frequent clinical visits in the first ART year.

Considering high rates of early disengagement and WHO guidance for earlier viral load and access to less-intensive DSD models, countries should consider shifting viral load assessment earlier and actively reducing the visit burden in the initial ART year.

## WEPEF695

### The expansion of supervised consumption services in Canada: progress and challenges

C. Kazatchkine<sup>1</sup>, S. Ka Hon Chu<sup>1</sup>

<sup>1</sup>HIV Legal Network, Toronto, Canada

**Background:** Canada has been experiencing a relentless overdose crisis since 2016. One response is increased access to supervised consumption services (SCS). In 2019, the HIV Legal Network (LN) published a report on SCS in Canada and concluded that there was an urgent need to remove legal and political barriers that prevented their expansion.

In 2023, the LN took stock of the progress made in the past four years and remaining challenges.

**Description:** Literature review supplemented by 11 interviews with key informants. An advisory committee of three Canadian experts in SCS reviewed the report.

**Lessons learned:** Canada is the country with the most SCS in the world. SCS have expanded rapidly in recent years, going from 2 sites in 2016 to more than 80 supervised consumption and overdose prevention sites by 2023 in 9 of the 13 provinces and territories. SCS take many forms: permanent or temporary services, and dedicated sites or integrated services.

The range of services offered at sites has also diversified with greater access to peer assisted injection and drug testing services, for example. But access to SCS remains limited to certain provinces and urban centers and does not meet the crying need for supervised inhalation services.

While the expansion of SCS has been facilitated by more flexibility by the federal government in providing authorizations for SCS (which offer protection against criminal prosecutions under drug-related legislation), new and restrictive provincial policies and legislation as well as lack of funding threaten and even prevent their implementation.

**Conclusions/Next steps:** Access to harm reduction remains largely dependent on the political context in Canada. Reforms and funding are needed at all levels of government to safeguard the gains made and meet the needs of people who use drugs. The Federal government must take measures to remove case-by-case exemptions for SCS, including through the decriminalization of activities related to personal drug use. Provincial authorities must refrain from imposing over stringent conditions for licensing and/or funding SCS.

Increased support for comprehensive and innovative programs that address the toxicity of the drug supply as well as for mental health, treatment and housing is also urgently needed.

## WEPEF696

### Beyond borders: Mercosur unified approach to quality control in HIV, syphilis, and hepatitis C rapid diagnostic tests

A. Bigolin<sup>1</sup>, A.C. Philippus<sup>1</sup>, A.F. Kolling<sup>1</sup>, T. Silva Estrela<sup>1</sup>, R.C. Messoros Rudolf<sup>2</sup>, M.L. Bazzo<sup>2</sup>

<sup>1</sup>Brazilian Ministry of Health, Brasília, Brazil, <sup>2</sup>Universidade Federal de Santa Catarina, Florianópolis, Brazil

**Background:** The Mercosur Intergovernmental HIV Commission (CIHIV) recognized an opportunity for member countries - Argentina, Brazil, Paraguay, and Uruguay - to share experiences in the External Quality Assessment (EQA) of diagnostic tests for syphilis, HIV and HCV infection. This collaborative effort aimed to facilitate knowledge exchange and expertise, specifically focusing on generating panels for EQA of rapid diagnostic tests (RDT) using the Dried Tube Specimens (DTS) methodology. Brazil's Ministry of Health (MoH) initiated the National Program of EQA-RDT in 2011, overseeing the quality of RDT ex-

ecution for HIV, Syphilis, and, in 2018, Hepatitis C. Despite the high performance of RDTs, inaccuracies can arise if procedures are not executed accurately, leading to false results, emphasizing the need for a shared methodology to ensure RDT quality.

**Description:** In Brazil, EQA-RDT rounds provide DTS panels to be tested in real life for more than 3 thousand health-care professionals. Financial support and program management from the Brazilian MoH have sustained EQA-RDT for 12 years. Argentina conducts annual EQA-RDT rounds in 23 health services. Argentina and Brazil took the lead, supporting the implementation of this methodology in Paraguay and Uruguay.

To standardize quality control in Mercosur countries, a protocol for DTS panels was created based on the protocol developed by Parekh et al (2010). The protocol covers biosafety standards, materials, sample selection, staining, packaging, storage, and result recording.

**Lessons learned:** During Brazil's pro tempore presidency in Mercosur, the unique protocol for DTS panels was finalized to guide the preparation of panels for quality control of RDTs. It was possible to establish a unique protocol, considering the differences in reagents and instruments available in each country.

This joint work process demonstrated the need to develop a unified system to record the results of the EQA-RDT, also work on standardizing the production of panels for other tests (such as the CD4+ test) and have moments to share evidence that supports the definition of diagnostic and monitoring algorithms for STIs.

**Conclusions/Next steps:** It is believed that the protocol and the joint work strategy can be shared and used in other countries, taking advantage of already available evidence, and avoiding unnecessary work.

## WEPEF697

Data-driven research to support ART optimization and «Undetectable Equals Untransmittable» (U=U) campaign in Tajikistan

U. Talbov<sup>1</sup>, S. Orbelyan<sup>2</sup>, M. Trofymenko<sup>2</sup>

<sup>1</sup>Republican AIDS Center, Dushanbe, Tajikistan, <sup>2</sup>UNDP Tajikistan, Dushanbe, Tajikistan

**Background:** In October-November 2022 UNDP supported assessment of ART optimization plan in Tajikistan by the experts of the Center of Excellence for Health, Immunity and Infections (CHIP). The research aimed at identifying existing gaps and providing recommendations for further improvement of HIV treatment for adults and children in Tajikistan with the ultimate goal of supporting the Republican AIDS Center in updating the national HIV Clinical Protocol.

The report was also focused on providing scientific evidence behind the «U=U» campaign to create enabling environment for HIV treatment and care in the country.

**Methods:** The first stage of the study was a desk review, covering both publicly available data and documents requested from UNDP Tajikistan and Republican AIDS Center. The in-country mission took place from October 24, 2022, to November 4, 2022, and included interviews with the key informants and health professionals, as well as on-site review of the primary documents.

The mission visited regional and city/district AIDS centers, NGOs, hospitals, narcology clinics and poly clinics in all regions of Tajikistan (except remote GBAO region).

**Results:** The final report was presented to key stakeholders in the country on December 16, 2022. It analyzes in detail the HIV epidemic in the country, summarizes the findings and provides 45 recommendations classified to aspects of ART optimization, such as treatment regimens, clinical management of adults and children living with HIV, opportunistic diseases and cancers, prevention of mother-to-child transmission and HIV testing approaches.

**Conclusions:** Report recommendations and evidence-based data, underlying them, were included to the updated HIV Clinical Protocol approved by the Ministry of Health on June 2, 2023.

Moreover, the updated protocol arguments in support of U=U campaign were subsequently used for the advocacy for the decriminalization of HIV risk exposure in Tajikistan. This resulted in the adoption on December 26, 2023 the Resolution of Supreme Court of Tajikistan acknowledging that people living with HIV with undetectable viral load do not pose a risk of HIV transmission to their sexual partners.

## WEPEF698

Enhancing access and accountability: the role of a policy table in addressing drug pricing disparities in Brazil

C.T. Scopel<sup>1</sup>, S. Rodrigues Cavalcanti van der Ploeg<sup>1</sup>, V. Terto Junior<sup>1</sup>

<sup>1</sup>Brazilian Interdisciplinary Aids Association (Abia), Rio de Janeiro, Brazil

**Background:** The trend of increasing drug prices compromises a significant portion of public and private budgets in Brazil. Patented medicines further accentuate these expenses, because their prices reflect the pricing power of the pharmaceutical industry and the buyer's willingness to pay. This is particularly important for several antiretroviral (ARV) drugs, which are or have been under patent protection. This study aims to develop a policy table as an analytical and strategic instrument for monitoring ARV drug prices in Brazil.

**Methods:** The treatment schemes and dosages were taken from the Brazilian HIV treatment guideline, the national prices and their suppliers were taken from a document received from the Ministry of Health through the Access to

Community and civil society involvement in reporting cases of violence against LGBTQI+ populations in Mali: the case of the Anti-AIDS Coalition

A.K. Traore<sup>1</sup>

<sup>1</sup>Coalition Anti Sida CAS, Gestion de Programme, Bamako, Mali

**Background:** Discrimination, harassment, persecution and denigration of the LGBTQI+ community have reached high levels in Africa in general, and in Mali in particular. LGBTQI+ have been forcibly evicted from their homes, arbitrarily arrested by the police, and/or imprisoned on suspicion of having had homosexual relations or because of their gender identity. According to the 2019 biobehavioral study in Mali, 24.5% of men who have sex with men (MSM) have experienced stigma, discrimination or violence (IBBS2019).

The Coalition Anti-Sida (CAS) is committed to promoting and defending the rights of LGBTQI+ communities despite a highly homophobic environment, through awareness-raising activities among LGBTQI+ members, reporting cases of human rights violations, and managing cases of violence.

**Description:** We conducted a descriptive, cross-sectional analysis of CAS's programmatic data on violence from January to October 2023. The aim was to demonstrate the effectiveness of CAS's interventions with LGBTQI+ members through the collection and analysis of cases of violence identified during educational talks and by denouncing them directly to peer educators.

**Lessons learned:** A total of 367 LGBTQI+ members were victims of violence, 49% (180/367) of whom were transgender, 25% (92/367) bisexual, 23% (84/367) gay and 3% (11/367) other members of the LGBTQI+ community. A total of 137 LGBTQI+ members were under the age of 25 (37%). Perpetrators of violence were dominated by neighborhood youth involved in 176 cases and family members involved in 75 cases or 48% and 20% respectively. All survivors received post-violence care.

**Conclusions/Next steps:** These results demonstrate the need to pursue our efforts in an environment of insecurity and multidimensional crisis that encourages acts of human rights abuse.

Also, programs in Africa should systematically ask questions about the types of violence suffered by their populations in order to provide supportive care and better monitor and control the growing number of human rights violations against LGBTQI+ people that we see in the region. **Keywords:** LGBTQI+, violence, CAS.

### WEPEF701

Entering a new normal: redefining HIV advocacy in a hostile political landscape

K. Coester<sup>1,2</sup>, S. Kellman<sup>3,2</sup>, S. Madoori<sup>4,2</sup>

<sup>1</sup>Elizabeth Glaser Pediatric AIDS Foundation, Washington, United States, <sup>2</sup>Global AIDS Policy Partnership, New York, United States, <sup>3</sup>Friends of the Global Fight, Washington, United States, <sup>4</sup>AVAC, New York, United States

**Background:** In September of 2023, the five year authorization of the President's Emergency Plan for AIDS Relief (PEPFAR) was set to expire. Typically, PEPFAR's U.S. legislative reauthorization is a "check the box" formality.

However, in the spring of 2023, there was a shift in the political discourse surrounding the program as U.S.-based right wing think tanks began a campaign disingenuously accusing PEPFAR of funding abortions. This put both U.S. and global HIV advocacy agendas at significant risk.

**Description:** Even as a few vocal decision makers broke from long-standing bipartisan support for PEPFAR, the community of champions and advocates stood unified in its defense. This diverse coalition – reproductive rights groups, LGBTQ activists, technical implementers, and faith-based organizations – along with key U.S. Congressional staff worked to counter the false narrative. Strict message discipline and aggressive media outreach began in the late Spring. In mid-September, the community launched an aggressive digital campaign, with a unifying theme of "Proud of PEPFAR."

Campaign assets included videos and messages lifting up the voices of individuals and groups in PEPFAR partner countries. The campaign yielded significant awareness including 580,000 impressions from paid advertising and over 1,300 uses of hashtag in a single week.

**Lessons learned:** There remains broad support for PEPFAR among the U.S. political class. However, the program is now open to more frequent attacks rife with misinformation. The only way to counter the combative environment is for advocates to maintain a disciplined, unified voice and conduct outreach using cohesive tools and messages over a prolonged period of time.

**Conclusions/Next steps:** The advocacy community must adapt to a new political environment where PEPFAR no longer benefits from its "special status" within the political class, who have previously been willing to support the program at all costs.

Though traditionally a "big tent" comfortable with diverging objectives, the newly combative environment requires PEPFAR advocacy to adhere to a greater alignment and closer collaboration.

Advancing human rights to break the cycle of  
violence against PWIDs and TG in DRC

M. Aaron Clevis<sup>1</sup>, K. Huguette<sup>1</sup>

<sup>1</sup>*Repro Justice Congo, Goma, Congo, the Democratic  
Republic of the*

**Background:** Over the course of two years, Repro Justice Congo spearheaded a comprehensive initiative to dismantle human rights barriers hindering access to essential HIV services for two key population groups including people who inject drugs (PWIDs) and transgender individuals (TG) in the East of the Democratic Republic of Congo (DRC).

The primary focus was on ensuring these groups could adequately access stigma-free HIV prevention and treatment services, as well as facilitating their access to justice.

**Description:** Implemented in the Province of North-Kivu from January 2021 to December 2023, this initiative targeted key populations, namely PWIDs and TGs, recognized as pivotal contributors to the national response against HIV. The project focused on empowering paralegals, democratically elected from, within PWIDs and TGs communities, equipping them with knowledge on the collection, documentation, and reporting of human rights violation cases. Simultaneously, police officers, prosecutors, and lawyers, were provided with information essential to understanding the rights of PWIDs and TGs concerning access to HIV services. Weekly meetings between paralegals and human rights lawyers facilitated the discussion and screening of documented cases as well as evidences for further legal actions in courts.

**Lessons learned:** Over two years, the project documented and submitted 239 human rights violation cases, leading to 67 court submissions. Eight healthcare providers were found guilty of discrimination against PWIDs and TGs, resulting in compensation for two PWIDs and one TG. With 47 cases pending, the initiative prompted a positive shift in healthcare providers' attitudes, fostering the establishment of complaint boxes in five health facilities. A crucial lesson emerged, revealing disparities in understanding key populations' rights between trained prosecutors and non-trained judges.

**Conclusions/Next steps:** The project's outcomes are profoundly significant for HIV prevention, treatment, and care. Addressing 67 violation cases against key populations, especially PWIDs and TGs, the initiative not only rectified discrimination but affirmed the importance of safeguarding rights for effective HIV care. Prosecuting healthcare providers for discrimination highlights tangible impact on accountability. The establishment of complaint boxes signals a proactive approach within health facilities, fostering a supportive environment.

Lessons learned, especially the differing perspectives of lawyers and judges, underscore the ongoing need for further engagement with judges.

## Genetic determinants of HIV-1 subtype C Nef-mediated SERINC3 down-regulation

N. Samlall<sup>1</sup>, T. Ndung'u<sup>1,2,3,4</sup>, J.K. Mann<sup>1</sup>

<sup>1</sup>HIV Pathogenesis Programme, The Doris Duke Medical Research Institute, University of KwaZulu-Natal, Durban, South Africa, <sup>2</sup>African Health Research Institute, Durban, South Africa, <sup>3</sup>Ragon Institute of Massachusetts General Hospital, Massachusetts Institute of Technology and Harvard University, Cambridge, United States, <sup>4</sup>Division of Infection and Immunity, University College London, London, United Kingdom

**Background:** HIV-1 Nef is a small accessory protein that performs numerous functions contributing to viral pathogenesis, making it an attractive antiviral target. Nef-mediated down-regulation of the host restriction factors SERINC3 and SERINC5 is an important mechanism by which Nef enhances virion infectivity, however SERINC3 down-regulation is less well-studied than SERINC5 down-regulation, especially in HIV-1 subtype C.

This study therefore aimed to identify amino acids required for optimal SERINC3 down-regulation by subtype C Nef. In addition, the contribution of SERINC3 down-regulation activity to overall Nef function was investigated using Nef fitness model-derived E values as a proxy for overall Nef function *in vivo*.

**Methods:** SERINC3 down-regulation activity of 107 previously constructed patient-derived Nef clones was measured using a flow cytometry-based assay in a CD4+ T cell line. Specific Nef amino acids associated with a significant increase or decrease in SERINC3 down-regulation activity were identified using codon-by-codon Mann-Whitney U tests. A univariate linear regression was used to assess the contribution of SERINC3 down-regulation activity to dE0 and dE90 E values that were predicted for each Nef clone using Ising and Potts models of Nef fitness, respectively.

Since Nef-mediated CD4 and HLA down-regulation ability, alteration of TCR signalling ability, and SERINC5 down-regulation ability were previously measured *in vitro* for the same Nef clones, a multivariate quantile regression with all standardized Nef functions was performed to adjust for multiple Nef functions.

**Results:** Statistical analysis of sequences and functional data identified 30 amino acid variants associated with either increased (3G, 5W, 8S, 9S, 10I, 11V, 12G, 20I, 32A, 38D, 51T, 64G, 81F, 101V, 108E, 116H, 205D) or decreased (3N, 10K, 8R, 12E, 20M, 32T, 49P, 51N, 81Y, 108D, 116N, 188L, 205N) Nef-mediated ability to down-regulate SERINC3 ( $p < 0.05$  and  $q < 0.3$ ), with 63% in the N-terminal domain. SERINC3 down-reg-

ulation activity ( $p < 0.0001$ ) was a significant predictor of E values in univariate analyses and remained significant in multivariate analyses adjusting for other Nef functions ( $p < 0.02$ ).

**Conclusions:** The results suggest that SERINC3 down-regulation is a significant contributor to overall Nef function and identify amino acids associated with differential SERINC3 down-regulation ability, which may have relevance for therapeutic designs targeting Nef.

## THPEA002

## Comparison of HIV-specific broadly neutralising antibodies resistance prediction using plasma RNA, blood, and gut tissue HIV proviral sequences

P. Zacharopoulou<sup>1</sup>, M.J. Lee<sup>2</sup>, M. Fumagalli<sup>3</sup>, C. Bittar<sup>3</sup>, M.A. Ansari<sup>1</sup>, S. Fidler<sup>2</sup>, J. Frater<sup>1</sup>, the RIO Study Group  
<sup>1</sup>University of Oxford, Oxford, United Kingdom, <sup>2</sup>Imperial College London, London, United Kingdom, <sup>3</sup>Rockefeller University, New York City, United States

**Background:** HIV-specific broadly neutralising antibodies (bNAbs) such as 3BNC117 and 10-1074 have demonstrated long-term viral control, without anti-retroviral therapy. Screening potential participants for bNAAb resistance is common in clinical trials, however the optimal strategy to determine viral sensitivity, and whether plasma virus or proviral samples can be used is yet to be defined.

**Methods:** We analysed samples (PBMC-derived HIV DNA sequences and rebound plasma envelope sequences ( $n=17$ ), paired[SFI] baseline rectal biopsies ( $n=4$ )) from participants in the unblinded placebo arm of the RIO trial (RCT of 3BNC117-LS and 10-1074-LS in primary HIV infection; NCT04319367).

Single envelope sequences were amplified from proviral DNA (mean 18 sequences per person, range: 2-43) or from cDNA reverse transcribed from rebound plasma RNA (mean 6 sequences per person, range: 1-26). bNAAb resistance was predicted through bNAAb-rep (<https://github.com/RedaRawi/bNAAb-ReP/tree/master>) and an in-house algorithm (developed at Rockefeller University). Maximum likelihood trees with x1000 bootstraps were generated using R.

**Results:** Very similar sensitivity predictions were obtained from sequences from either plasma virus or provirus DNA using the Rockefeller algorithm (94.4%). Likewise, the mean difference in neutralisation probabilities between baseline and rebound sequences were -0.001 and -0.008 for 10-1074 and 3BNC117, respectively ( $p$ -value=0.35). All but one participant had baseline proviral sequences predicted as sensitive to both bNAAbs.

Of four participants with available baseline rectal proviral sequences, two individuals had rebound viruses that were more closely related to the rectal proviral sequences compared to PBMCs potentially supporting a gut source for the rebound virus. Median minimum pairwise distanc-

es (mMinPD) between rebound viraemia, and baseline blood or gut samples were small (PBMC mMinPD=0.001, range: 0 – 0.011; gut mMinPD=0.00097, range: 0 – 0.0027).

**Conclusions:** HIV-1 envelope sequence-based bNAb resistance screening using proviral DNA from PBMC was consistent with predicted viral sensitivities from plasma virus at time of rebound.

This has implications for sample choice for bNAb screening. The study findings are limited by small numbers, and to participants with proviral sequences predicted as sensitive at baseline.

## THPEA003

Phenotypic characterization of subtype A and AC recombinant transmitted/founder viruses from a Rwandan heterosexual transmission cohort

L. Yue<sup>1</sup>, R. Xu<sup>1</sup>, S. McNally<sup>1</sup>, Q. Qin<sup>1</sup>, J. Rhodes<sup>1</sup>, E. Muok<sup>2</sup>, G. Umviligihozo<sup>2</sup>, K. Brooks<sup>1</sup>, M. Price<sup>3</sup>, S. Allen<sup>4</sup>, E. Karita<sup>2</sup>, E. Hunter<sup>4,1</sup>

<sup>1</sup>Emory University, Emory Vaccine Center, Emory National Primate Research Center, Atlanta, United States, <sup>2</sup>Centre for Family Health Research, Kigali, Rwanda, <sup>3</sup>IAVI, New York, United States, <sup>4</sup>Emory University, Pathology and Laboratory Medicine, Atlanta, United States

**Background:** Understanding HIV-1 transmission and early infection is key to successful approaches to prevent HIV-1 transmission. HIV-1 subtypes have distinct geographical distributions, with subtypes A, C, D, and inter-subtype recombinants circulating in sub-Saharan Africa. Subtype differences in disease progression have been observed in the IAVI early infection cohort (Protocol C), with individuals who had acquired subtype A viruses exhibiting slower CD4 decline and progression to AIDS diagnosis, as well as lower viral loads approximately two years post seroconversion. Despite this, there are few authentic infectious molecular clones (IMC) of subtype A and AC recombinant transmitted founder (TF) viruses.

**Methods:** We previously performed single genome amplification and sequencing of viruses isolated from the acutely infected Rwandan Protocol C cohort participants. In this study, 20 infectious molecular clones, derived from 16 subtype A1 and 4 AC unique recombinant TF sequences, were constructed using high efficiency strategies described previously. We have characterized these viruses phenotypically by performing in vitro replication assays in healthy donor CD4+ T cells. All viruses were characterized with regard to their sensitivity to neutralization by the broadly neutralizing antibodies VRC01, N6, PG16, PGT128 and 10E8.

**Results:** The replicative capacity of the viruses derived from the IMC in CD4+ T cells varied over 50-fold, as we have observed for subtype C TF viruses, and key amino acids linked to replicative capacity were identified. The replicative capacity of these viruses when compared with that

of subtype C TF viruses and was not significantly different. In neutralization assays, the CD4 binding-site directed N6 bNAb showed the most potent and broad neutralization of this panel of TF viruses, while 10E8 exhibited breadth but lower potency.

All viruses were inhibited by maraviroc but not AMD-3100, consistent with CCR5 tropism.

**Conclusions:** The lack of a difference in replicative capacity between subtype A and C TF viruses suggests that this is not the basis for differences in transmission and pathogenesis between these subgroups. This panel of well characterized authentic full-length subtype A and AC IMC will be critical for further experiments aimed at understanding the role of virus subtype in HIV-1 transmission and pathogenesis.

## THPEA004

Characterisation of foreskin tissue primary myeloid cells after ex vivo Subtype C and D HIV-1 infection

C. Sookram<sup>1,2</sup>, S. Dzanibe<sup>3</sup>, B. Nleya<sup>4</sup>, N. Chigorimbo-Murefu<sup>2</sup>

<sup>1</sup>University of Cape Town, Medical Virology, Cape Town, South Africa, <sup>2</sup>International Center for Genetic Engineering and Biotechnology, Infectious Diseases, Cape Town, South Africa, <sup>3</sup>University of Cape Town, Immunology, Cape Town, South Africa, <sup>4</sup>University of Alabama, Hematology and Oncology, Birmingham, United States

**Background:** Despite subtype C accounting for more than 50% of global HIV infections and subtype D being associated with faster disease progression, there is little information describing the modes of subtype C and D mucosal transmission and the role of myeloid cells in HIV-1 infection. We therefore used primary foreskin cells to assess the susceptibility of myeloid cells to HIV-1 subtype C and D infections.

**Methods:** Foreskins were obtained from 15 HIV negative South African men, aged between 18-45, undergoing medical circumcision. Primary foreskin cells were harvested using previously established methods, followed by 24hr infection with virions generated from infectious molecular clones representing clinical isolates of HIV-1 subtype B, C and D at an MOI of 0.05. A 28-colour multiparameter flow cytometry panel was used to immunophenotype HIV-1 infected cells, identified as those expressing p24. Supernatants from infected cells were collected on 4- and 6-days post infection (dpi) to measure the amount of secreted nanoluciferase, indicative of infection and further confirmed by RT-qPCR.

**Results:** Median of 116 million (range: 80-150 million) foreskin cells with a viability of 60-70% were isolated. The median frequency of myeloid cells (CD14<sup>+</sup>CD11c<sup>+</sup>) was 9.5% (ranged: 1-15%) and T cells (CD45<sup>+</sup>CD3<sup>+</sup>) 2.3% (range: 1.5-5%) of the total number of foreskin cells. Using our mul-

tiparameter flow cytometry panel, we identified macrophages (CD206<sup>+</sup>CD68<sup>+</sup>CD163<sup>+</sup>), dendritic cells (CD209<sup>+</sup>CD141<sup>+</sup>CD83<sup>+</sup>), Langerhans cells (CD207<sup>+</sup>CD1a<sup>+</sup>), CD4<sup>+</sup> and CD8<sup>+</sup> T cells in the foreskin tissue. Preliminary data shows on average, 1% of myeloid cells (CD14<sup>+</sup>CD11c<sup>+</sup>p24<sup>+</sup>) and 2% T cells (CD45<sup>+</sup>CD3<sup>+</sup>p24<sup>+</sup>) were infected with subtype B. After 4dpi, subtype C secreted nanoluciferase activity was 12,1- fold more than subtype B and 3,2-fold more subtype D. Nanoluciferase detection decreased on 6 dpi in both subtype C (0,5-fold) and D (0,9-fold) whereas a 1,6- fold increase was detected in subtype B supernatants, compared to 4 dpi.

**Conclusions:** These findings suggest that primary foreskin cells are differentially susceptible to HIV-1 infection. Our data suggest subtype differences in ex vivo cellular infection of foreskin cells, the site of predominant heterosexual HIV acquisition. Understanding the immunological niche within the foreskin will lead to a more holistic understanding HIV-1 acquisition in the male genital mucosa.

Biosciences, Fremont, United States, <sup>6</sup>Germans Trias i Pujol

Research Institute (IGTP), Badalona, Spain, <sup>7</sup>CIBERINFEC,

Instituto de Salud Carlos III (ISCIII), Madrid, Spain

**Background:** The prevalence of age-related comorbidities is higher among people with HIV (PWH) on antiretroviral therapy (ART) than among uninfected individuals. We conducted a comprehensive analysis of T- B-, NK cells, and monocytes to evaluate age-associated immune defects in older PWH and HIV-negative individuals.

**Methods:** We included 29 PWH (OVER50 cohort, 85% males, median age 72 IQR [70-75] years) on suppressive-ART for a median of 16 IQR [8-20] years, and 24 age-matched HIV-negative controls (HNC). We characterize subset distribution, activation, senescence, exhaustion and telomeric size on T-cells by flow-FISH full-spectrum cytometry and studied monocytes, B- and NK cells by conventional flow cytometry.

**Results:** Several comorbidities were increased in the PWH (median of total comorbidities PWH 3.6 IQR [2-5] Vs HNC 3.25 IQR [2-5]), being only dyslipidemia significantly higher. Within the T-cell compartment, PWH exhibited a reduce frequency of CD4 T cells and a higher proportion of CD8 T cells compared to the HNC group (all p<0.01), but similar CD4 and CD8 T-cell subset distribution.

No differences were observed in the frequency of senescent T-cells between groups, but PWH showed shorter relative telomere length in the central (p=0.03) and transitional (p=0.05) CD8 memory T-cell subsets. PWH show a persistent activation across most CD4 and CD8 T-cell subsets and increased exhaustion in CD4 memory cells (p<0.01).

Regarding monocytes, we observed a similar distribution of subpopulations between groups. Surprisingly, CD14<sup>+</sup>CD16<sup>-</sup> subset from PWH showed lower expression of siglec-1 compared to HNC (p=0.01), suggesting a desensitization to Type-I IFN-signaling. As for NK cells, PWH had a higher proportion of the dysfunctional subset CD56<sup>-</sup>CD16<sup>bright</sup>, increased coexpression of NKG2C<sup>+</sup>CD57<sup>+</sup> (p<0.01) and Tim-3 (p=0.01) in total NK cells.

Finally, we found the B-cell compartment of PWH was enriched in CD27-IgD<sup>+</sup>Naïve (p=0.01) and mature (p=0.03) B cells in detriment of the IgD<sup>+</sup>CD27<sup>+</sup>Marginal Zone-like B and resting memory cells (p<0.001).

**Conclusions:** Despite long suppressive ART, older PWH have several distinct immune dysfunctions across cell types associated with HIV replication that do not totally resolve after ART initiation (HIV effect). Other well-described immune differences are not found to be significant in our study groups, suggesting that some dysfunctions equalize over time (age effect).

**Conclusions:** Despite long suppressive ART, older PWH have several distinct immune dysfunctions across cell types associated with HIV replication that do not totally resolve after ART initiation (HIV effect). with systemic inflammation and peripheral HIV reservoirs. Here, we investigated the dynamics of plasma galectins through the course of SIV disease and ART suppression in relation to gut microbial and viral patterns.

**Methods:** Nine rhesus macaques (RM)s were CD8-depleted and inoculated with SIVmac251. ART was administered starting at week 2 and discontinued (ATI) at week 14. From weeks 2 to 23, rhesus macaques received infusions of anti- $\alpha 4\beta 7$  mAb (n=5) or IgG (n=4) every three weeks.

Gal-1, -3, and -9 were measured in plasma (Luminex), and 16S sequencing and short-chain fatty acids (SCFA; liquid chromatography-tandem mass spectrometry) quantitation was performed in stool at baseline (weeks -3 to -1), peak viremia (week 2), ART suppression (week 14), and ATI (week 23).

DNA and RNA were isolated in the duodenum and ascending colon and quantified for SIV (ddPCR and qPCR, respectively). Longitudinal differences and associations were determined by adjusted mixed-effects modeling and Kendall rank correlations, respectively.

**Results:** Plasma Gal-9 was elevated during peak viremia, ART suppression, and ATI compared to pre-infection, while Gal-3 was elevated during viremia but lower during ART (all  $p < 0.05$ ). Higher Gal-3 levels correlated with changes in bacterial relative abundances, lower diversity (Simpson, Simpson Evenness, and Shannon indices; all  $\tau > .64, p < .012$ ), and higher levels of total SCFA, acetate, and propionate (all  $\tau > .64, p < .022$ ) during ART.

Notably, higher Gal-9 levels measured at viremia, ART suppression, ATI, and necropsy all positively correlated with increased SIVgag DNA levels in the ascending colon (all  $\tau > .56, p < .018$ ). No differences were found between groups in the above measures, and all differences and correlations were irrespective of infusion treatment.

**Conclusions:** Our data demonstrates whereas circulating Galectin-3 is linked to alterations in the gut microbiota, Galectin-9 consistently serves as a proxy for colonic SIV reservoir burden. Our findings potentially identify novel biomarkers of clinical relevance and warrant determining whether these disturbances are reflected in PWH.

## THPEA007

### Intracellular expression of Tat second exon in a T-cell *in vitro* model induces a global DNA hypomethylation

A. Rodríguez-Agustín<sup>1</sup>, V. Casanova<sup>1</sup>, R. Ayala-Suárez<sup>1</sup>, M.J. Maleno<sup>1</sup>, F. Díaz Fuertes<sup>2</sup>, I. de Villasante<sup>3</sup>, A. Merkel<sup>3</sup>, M. Coiras<sup>2</sup>, J. Mallolas<sup>4</sup>, J. Alcami<sup>2</sup>, N. Climent<sup>5</sup>

<sup>1</sup>Fundació de Recerca Clínic Barcelona-IDIBAPS, Barcelona, Spain, <sup>2</sup>Instituto de Salud Carlos III, Madrid, Spain, <sup>3</sup>Josep Carreras Research Institute, Barcelona, Spain, <sup>4</sup>Hospital Clínic de Barcelona, Barcelona, Spain, <sup>5</sup>Hospital Clínic de Barcelona-CIBER, Barcelona, Spain

**Background:** Different cohort studies have consistently shown that persons with HIV, have an increased risk of developing comorbidities even when virological suppression is achieved. HIV acquisition leads to epigenetic changes in immune cells that may trigger accelerated aging, but the underlying mechanism is currently unknown. The regulatory protein TAT (Transactivator of transcription) increases viral RNA elongation and transcription.

In addition, the full-length TAT, can alter host gene expression. Recent studies report that a general DNA hypomethylation process occurs during aging. Therefore, we aim to determine whether TAT may be altering the DNA methylation patterns, resulting in accelerated aging and to elucidate the role of TAT second exon.

**Methods:** Jurkat cells stably transfected with either full-length TAT (TAT<sub>101</sub>), the first exon (TAT<sub>72</sub>), or an empty vector (TEToff) were used. Changes in DNA methylation were analysed on bisulfite-converted DNAs using a MethylationE-PIC BeadChip microarray. We also identified genes both differentially methylated and expressed with transcriptomic data from RNA-seq.

Finally, the activity and abundance of DNMT proteins, which are responsible for adding methyl groups to DNA, were analysed.

**Results:** Methylation analysis showed 50 differentially methylated genes in TAT<sub>101</sub> expressing cells while only 1 were in TAT<sub>72</sub> when compared to TEToff. Overall, TAT<sub>101</sub> DNA was more hypomethylated than TAT<sub>72</sub> and TEToff DNA. A correlation between methylation and transcription was observed in 207 genes like CDK6, CD3D and RAB27A in TAT<sub>101</sub> but only 8 in TAT<sub>72</sub> when comparing with TEToff line. Functional analysis showed that changes in methylation pattern in the presence of TAT<sub>101</sub> correlated with modifications in pathways like T-cell activation and differentiation or lipid antigen binding. DNMT activity, was lower in TAT<sub>101</sub> (7,25 OD/h/mg) compared to TEToff (11,84) and was also compared to TAT<sub>72</sub> (9,11) (mean n=3), compatible with the hypomethylated DNA observed in TAT<sub>101</sub>.

**Conclusions:** These findings suggest that HIV-TAT protein, and specifically the full-length isoform, can induce changes in relevant biological pathways through epigenetic mechanisms. This may contribute to the observed accelerated aging in persons with HIV that can also be mea-

sured by some epigenetic clocks. Therefore, these results help to understand the mechanism by which accelerated aging occur, serving as a potential anti-aging target.

## THPEA008

### Characterization of proviral/human DNA crosstalk in the context of clonal cell expansion in chronic HIV-1 infection

L. Brauckmann<sup>1</sup>, U. Lange<sup>1,2,3</sup>, E. Tolosa<sup>4</sup>, M. Spohn<sup>5</sup>

<sup>1</sup>Leibniz Institute for Virology (LIV), Genomics of Retroviral Infection, Hamburg, Germany, <sup>2</sup>University Medical Center, Hamburg-Eppendorf, Institute for Infection Research and Vaccine Development, Hamburg, Germany, <sup>3</sup>German Center for Infection Research (DZIF), partner site Hamburg, Hamburg, Germany, <sup>4</sup>University Medical Center Hamburg Eppendorf, Institute for Diagnostics and Immunology, Hamburg, Germany, <sup>5</sup>University Medical Center Hamburg-Eppendorf, Hamburg, Germany

**Background:** The site of proviral integration within the human genome plays a principal role in crosstalk between proviral and human DNA. In acute infection, integration site choice is determined by genetic, epigenetic and mechanistic factors. However, during chronic infection, selective pressure can alter the initial integration site bias.

As a result, individuals with chronic HIV infection exhibit genomic hotspots or recurrently-detected integration genes (RdIGs) where proviral-derived sequences are preferentially located.

The general objective of this project is to examine the impact of proviral integration in chronic HIV-1 infection on the genome of target cells, and to explore a way to leverage this knowledge to improve clinical management for people living with HIV.

**Methods:** Published HIV integration sites from PLWH were collected and analyzed in silico and gene loci of interest for generation of chimeric transcripts were selected. PBMC samples from a cohort of PLWH on ART were obtained (source German Center of Infection Research) for screening of expression of candidate chimeric transcripts by RT-qPCR assays. Lentiviral expression vectors for chimeric transcripts were generated to assess functional impact of transcripts in primary CD4+ T cells. Downstream effects were assessed using transcriptome analysis, functional assays and FACS-based immune phenotyping.

**Results:** By meta-analysis of proviral integration sites in chronic HIV-1 infection, we identified RdIGs where proviral integration could lead to aberrant integration gene expression through LTR exaptation and chimeric transcription in chronic infection. Cohort PBMC samples were tested for detection of chimeric transcripts from these prime candidate loci, using ddPCR-based RT qPCR. We furthermore show that for a subset of candidates alternative start codons can give rise to proteins derived from

chimeric transcripts. We demonstrate the effect of chimeric transcript overexpression in primary CD4+ T cells using proliferation assays and immune cell phenotyping.

**Conclusions:** By identifying candidate genes, characterizing chimeric proviral/human transcription events, and analyzing how these events might impact on HIV-1 target cell physiology, this project aims to provide new insights into chronic HIV-1 infection that could lead to new parameters for disease monitoring and novel targets for therapeutic approaches.

## THPEA009

### Plasma markers of gastrointestinal mucosal barrier dysfunction in PLWH receiving cART

V. Artusa<sup>1,2</sup>, R. Zamarato<sup>2</sup>, A. De Nicolò<sup>3</sup>, A. D'Avolio<sup>3</sup>, L. Benedetti<sup>4</sup>, M. Compagno<sup>4</sup>, V. Malagnino<sup>4</sup>, M. Iannetta<sup>4</sup>, L. Duca<sup>5</sup>, F. Ceccherini Silberstein<sup>5</sup>, M. Biasin<sup>2</sup>, D. Trabattini<sup>2</sup>, M.S. Clerici<sup>1,6</sup>

<sup>1</sup>University of Milan, Department of Pathophysiology and Transplantation, Milan, Italy, <sup>2</sup>University of Milan, Department of Biomedical and Clinical Sciences, Milan, Italy, <sup>3</sup>University of Turin, Department of Medical Sciences, Turin, Italy, <sup>4</sup>Tor Vergata University, Department of System Medicine, Rome, Italy, <sup>5</sup>Tor Vergata University, Department of Experimental Medicine, Rome, Italy, <sup>6</sup>IRCCS Don Carlo Gnocchi Foundation, Milan, Italy

**Background:** Despite effective cART people living with HIV (PLWH) still encounter elevated rates of morbidity and mortality. HIV-1 replication in the gastrointestinal (GI) tract leads to CD4 depletion and epithelial barrier disruption resulting in inflammation. The invasiveness of gut biopsies emphasizes the need for validated non-invasive plasma biomarkers to measure GI damage.

We analyzed possible links between structural and immune-related gene expression in colon mucosa with plasma biomarkers indicative of gut dysfunction and microbial translocation in cART treated PLWH.

**Methods:** Colonic mucosal biopsies and plasma from 40 cART responder patients were analyzed. Expression of 14 structural genes (*TJP1*, *TJP2*, *TJP3*, *OCLN*, *CLDN1*, *CLDN2*, *CLDN3*, *CLDN4*, *CLDN7*, *CLDN15*, *MMP3*, *MMP9*, *F11R*, *MYLK*) and 14 immune-related genes (*MAPK3*, *STAT3*, *STAT6*, *TGF-β1*, *IFN-γ*, *IL-1β*, *IL-6*, *IL-13*, *IL-17A*, *IL-22*, *TNF*, *SLPI*, *β-DEF1*, *β-DEF2*) was assessed by RT-PCR. Plasma biomarkers of intestinal damage (I-FABP, zonulin, OCLN, E-cadherin, REG3α, and TFF3), microbial translocation and systemic inflammation (LPS, LBP, sCD14, and IL-6) were measured by ELISA. Correlation analyses and multiple linear regression models were applied to verify possible associations between colonic and plasmatic markers.

**Results:** Spearman correlation analysis showed that:

1. Plasma OCLN positively correlates with *CLDN4* ( $r=0.362$ ,  $p=0.022$ ), *β-DEF2* ( $r=0.313$ ,  $p=0.049$ ), *IL-17A* ( $r=0.425$ ,  $p=0.006$ ), and *STAT3* ( $r=0.391$ ,  $p=0.012$ ) expression in biopsies, and

with I-FABP ( $r=0.312$ ,  $p=0.050$ ), E-cadherin ( $r=0.902$ ,  $p<0.001$ ), TFF3 ( $r=0.347$ ,  $p=0.028$ ) and IL-6 ( $r=0.346$ ,  $p=0.029$ ) detection in plasma;

2. Plasma E-cadherin positively correlates with *CLDN4* ( $r=0.431$ ,  $p=0.006$ ), *IL-17A* ( $r=0.390$ ,  $p=0.013$ ), *STAT3* ( $r=0.515$ ,  $p=0.001$ ) and *STAT6* ( $r=0.314$ ,  $p=0.049$ ) expression in biopsies, and with OCLN plasma levels ( $r=0.902$ ,  $p<0.001$ );

3. Plasma IL-6 negatively correlates with *CLDN3* ( $r=-0.323$ ,  $p=0.042$ ), *CLDN15* ( $r=-0.480$ ,  $p=0.002$ ), *F11R* ( $r=-0.373$ ,  $p=0.018$ ), *OCLN* ( $r=-0.333$ ,  $p=0.036$ ), *TJP1* ( $r=-0.375$ ,  $p=0.017$ ), and *TJP2* ( $r=-0.330$ ,  $p=0.038$ ) expression in biopsies while positively correlate with plasmatic OCLN ( $r=0.346$ ,  $p=0.029$ ) and TFF3 ( $r=0.629$ ,  $p<0.001$ ).

Adjusted R square of multiple linear regression models showed a strong linear association between OCLN and E-cadherin (0.991).

**Conclusions:** Measuring OCLN, E-cadherin and IL-6 in plasma offers an indirect evaluation of gut barrier function. These results could help in developing non-invasive diagnostic strategies to assess GI integrity in virologically suppressed PLWH and might be useful to identify risk biomarkers for non-AIDS comorbidities.

## THPEA010

Quantification of HIV-1 RNA in purified plasmatic extracellular vesicles may inform on immune dysfunction in people living with HIV-1

J. Boucher<sup>1</sup>, W.W. Bazié<sup>1</sup>, B. Goyer<sup>1</sup>, C. Gilbert<sup>1</sup>

<sup>1</sup>Université Laval, Québec, Canada

**Background:** HIV-1 infection causes an immune system dysfunction marked by its constant activation. Antiretroviral therapy (ART) suppresses viral replication in most people living with HIV-1 (PLWH), but the damages to the immune system are not fully restored despite many years on treatment. The mechanisms underlying the dysfunction are not yet elucidated, and identifying new biomarkers will help understand this phenomenon. Recent studies reported that extracellular vesicles (EVs) and their microRNA-155 content are biomarkers of immune activation and viral replication in PLWH.

Further analysis in a humanized mice model revealed the enrichment of HIV-1 RNA in plasma two EV subtypes, large and small EVs.

**Methods:** Our objective was to measure the distribution of HIV-1 RNA in large and small EVs purified from the plasma of ART-naïve and ART-treated PLWH. We also determined the value of EV-associated HIV-1 RNA as a biomarker of immune activation and viral replication in PLWH. Large EVs were purified from the plasma by centrifugation at 17,000  $\times g$ , and small EVs by precipitation with ExoQuick.

**Results:** Overall, large and small EVs contained a similar amount of HIV-1 RNA. In ART-naïve PLWH, large EVs contained more viral RNA than small EV. Plasma viral load had a stronger correlation with the large EVs viral RNA.

Small EVs viral load positively correlated with CD4/CD8 T cell ratio. In ART-treated PLWH, small EVs viral RNA was negatively correlated with microRNA-155 contents of EV. In ART-naïve PLWH, large EVs viral load was positively correlated with EV-associated microRNA-155.

**Conclusions:** In summary, a higher concentration of HIV-1 RNA in large EVs was associated with known biomarkers of viral replication and immune activation. HIV-1 RNA small EVs appears to be linked to immune restoration in PLWH receiving ART.

## THPEA011

Gut dysbiosis and systemic inflammation as obstacles for CD4 recovery in undetectable patients with HIV

G. Castillo<sup>1</sup>, H. Alvarez<sup>2</sup>, F. Tempio<sup>2</sup>, J. Aldridge<sup>2</sup>, C. Merino<sup>1</sup>, M. Navarrete<sup>2</sup>, M.N. Lopez<sup>1</sup>, R. Soto-Rifo<sup>1</sup>, A. Soto<sup>1</sup>, E. Rubilar<sup>1</sup>, C.P. Cortes<sup>1</sup>

<sup>1</sup>University of Chile, Santiago, Chile, <sup>2</sup>Universidad de Magallanes, Punta Arenas, Chile

**Background:** A group of patients living with HIV (PLWH) fail to restore CD4 T cell count despite successful antiretroviral therapy (ART). We hypothesized that an altered gut bacteriome composition-driven pro-inflammatory state might hinder immune reconstitution following ART initiation.

**Methods:** We conducted a pilot cross-sectional study. Undetectable patients under medical surveillance at two HIV clinic centers in Santiago (Chile), and HIV-negative volunteers (HV) were invited to participate. Patients under treatment were divided into 2 groups: immune responders (IR) and immune non-responders (INR), according to their absolute CD4 count and to their CD4 count increase following 12 months of ART initiation. Gut bacteriome composition was analyzed using rectal swabbing to perform 16S rRNA gene sequencing. PBMCs were isolated from blood samples and CD4 T lymphocytes activation profiles were assessed by flow cytometry. Plasma cytokines and microbial translocation-associated markers were measured using a Luminex® kit.

**Results:** 21 IRs, 12 INRs and 20 HV were enrolled. Most of them were male (89%) and MSM (79%). HV were younger (28.5 vs 45 and 50 years,  $p<0.0001$ ), had lower BMI and consumed more alcohol and marijuana than PLWH. We found elevated pro-inflammatory cytokines (IL-1 $\beta$ , IL-6, IL-18) among PLWH, as well as elevated markers of gut dysfunction (MMP-7) and microbial translocation (soluble CD163), with no difference between IRs and INRs.

Also, we found increased abundance of IFN- $\gamma$ <sup>+</sup> CD8<sup>+</sup> T cells and activated CD4<sup>+</sup> T cells in INRs in comparison to the other two groups. Finally, when compared INR and IRs, an increased relative abundance of *Prevotellaceae* (16.5 vs 12.8%), *Oscillospiraceae* (12.7 vs 7.7%) and *Lachnospiraceae* (12.7 vs 8.4%) was seen, as well as decreased abun-

dance of *Peptoniphilaceae* (10.9 vs 17.6%). However, we did not find significant differences in alpha- and beta diversity among the groups.

**Conclusions:** Despite elevated proinflammatory cytokines, markers of microbial translocation and elevated IFN- $\gamma$ <sup>+</sup> CD8<sup>+</sup> and CD4<sup>+</sup> T cells, we did not find a relevant difference in gut bacteriome compositions of PLWH and HV. Some uncontrolled variables might explain this result (BMI, substance consumption, rectal douching). Further research is warranted to elucidate the role of dysbiosis as a driver for immune activation and inflammation.

Recognition of a conserved HLA-C\*07 restricted CTL epitope in Nef is associated with lower CD4-counts in HIV-1+ individuals

N. Boehmer<sup>1</sup>, J.K. Etschel<sup>2</sup>, K.G. Schmidt<sup>2</sup>, E.G. Harter<sup>2</sup>, S. Bergmann<sup>2</sup>, S.M. Müller-Schmucker<sup>3</sup>, M. Schmiedeberg<sup>3</sup>, V. Schönau<sup>4</sup>, B. Spriewald<sup>5</sup>, K. Nganou-Makamdop<sup>3</sup>, T. Harter<sup>6</sup>

<sup>1</sup>Universitätsklinikum Erlangen, Infectious Diseases and Immunodeficiency Section/ Institute of Clinical and Molecular Virology, Erlangen, Germany,

<sup>2</sup>Universitätsklinikum Erlangen, Infectious Diseases Section - Department of Internal Medicine 3, Erlangen, Germany, <sup>3</sup>Universitätsklinikum Erlangen, Institute of Clinical and Molecular Virology, Erlangen, Germany,

<sup>4</sup>Universitätsklinikum Erlangen, Department of Internal Medicine 3 - Rheumatology and Immunology, Erlangen, Germany, <sup>5</sup>Universitätsklinikum Erlangen, Department of Medicine 5, Erlangen, Germany, <sup>6</sup>Universitätsklinikum Erlangen and Friedrich-Alexander-Universität (FAU) Erlangen-Nürnberg, Infectious Diseases Section - Department of Internal Medicine 3, Erlangen, Germany

**Background:** HIV-1 can evade from HIV-1-specific cytotoxic T-cells (CTLs) by Nef-mediated downregulation of HLA-A and HLA-B. As HLA-C is not downregulated by Nef, HLA-C-restricted CTLs could play an important role in the control of HIV-1. The conserved HLA-C\*07-restricted Nef epitope RQDILDWIY (RY10) overlaps with the HLA-B\*13-epitope RQDILDWL which is associated with a better control of HIV-1.

To assess whether recognition of RY10 has a beneficial effect, we investigated recognition of RY10 in HLA-C\*07+ individuals living with HIV.

**Methods:** Recognition of RY10 was analyzed in 65 HLA-C\*07+ individuals living with HIV. All were on antiretroviral therapy (ART) for a median time of 163 months (range 1-403). The median CD4 count was 661/ $\mu$ l (range

23-1549). The median viral load was <20 copies/ml (range <20-720, suppression <20 copies/ml in 34/65, low-level viremia in 31). 10\*10<sup>6</sup> peripheral blood mononuclear cells (PBMCs) were stimulated with peptide RY10 and outgrowing cells were tested for peptide recognition in an IFN- $\gamma$  ELISpot assay.

**Results:** RY10 was recognized by 19 of 65 (29.2%) of the HLA-C\*07+ individuals. In univariate analyses (Spearman correlation, Man-Whitney-U-Test) recognition of RY10 was significantly associated with shorter time on antiviral therapy, lower CD4+ T-cell counts and lower percentages of CD16+ NK-cells, but not with lower viral loads or lower rate of low level viremia. Current CD4 counts correlated to higher pre-ART CD4 counts, lower pre-ART viral loads, longer treatment duration and higher current CD8 counts. Multivariate linear regression analysis adjusting for current CD4 counts, RY10-recognition, viral loads and treatment duration (confounders) demonstrated a significant association of lower CD4-counts with recognition of RY10 independent of treatment duration and viral loads. C7 homozygosity (10 subjects) showed no significant correlation to either parameter except for higher pre-ART viral loads.

**Conclusions:** Nef-RY10-specific T-cell responses could be detected in a subset of HLA-C\*07+ HIV-1+ individuals on ART. They were associated with lower CD4 counts, but not with a more efficient viral suppression.

Further studies are needed to investigate whether lower CD4 counts in individuals on ART with recognition of RY10 could be due to higher residual viral replication in lymphatic tissue despite viral control in peripheral blood.

### The impact of antiretroviral timing on the metabolic dynamics of NK cells in females living with HIV-1 subtype C infection

K.K. Naidoo<sup>1,2</sup>, R. Sewbachan<sup>2</sup>, Z. Mncube<sup>2</sup>, N. Ismail<sup>2</sup>, K.L. Dong<sup>3,4,5</sup>, M.J. Bunders<sup>1,6</sup>, M. Altfeld<sup>1,7</sup>, T. Ndung'u<sup>2,8,9</sup>

<sup>1</sup>Leibniz Institute of Virology, Department of Virus Immunology, Hamburg, Germany, <sup>2</sup>HIV Pathogenesis Programme, University of KwaZulu-Natal, Durban, South Africa, <sup>3</sup>Ragon Institute of Massachusetts General Hospital, Massachusetts Institute of Technology and Harvard University, Cambridge, United States, <sup>4</sup>Massachusetts General Hospital, Division of Infectious Diseases, Boston, United States, <sup>5</sup>Harvard Medical School, Boston, United States, <sup>6</sup>University Medical Center Hamburg-Eppendorf, III Department of Medicine, Hamburg, Germany, <sup>7</sup>German Center for Infection Disease (DZIF), Partner Site Hamburg-Lübeck-Borstel-Riems, Germany, <sup>8</sup>Africa Health Research Institute, Durban, South Africa, <sup>9</sup>University College London, Division of Infection and Immunity, London, United Kingdom

**Background:** HIV-1 infection is characterized by generalized immune dysfunction, which in the natural killer (NK) cell compartment manifests in the accumulation of a functionally impaired CD56<sup>neg</sup> NK cell subset. Immunological damage is partially corrected by antiretroviral therapy (ART) and the timing of ART initiation may influence the restoration of optimal immune mechanisms. Although the specific mechanisms underlying differential immune reconstitution following ART are not well understood, emerging evidence suggests the role of immunometabolism as a critical determinant of antiviral immunity. We assessed the impact of HIV-1 and ART timing on the metabolic functions of NK cells.

**Methods:** Participants were 18–27-year-old females living with HIV-1 subtype C infection from Durban, South Africa who initiated ART either during hyperacute (before peak viremia; HHI) or chronic (CHI) infection. Nutrient uptake by NK cells was longitudinally assessed in PBMCs by flow cytometry using fluorescently labelled metabolite analogues.

**Results:** Viral suppression and CD4+ T cell recovery occurred rapidly in HHI-treated individuals but was comparatively slower in CHI-treated individuals. The NK cell compartment expanded during HHI and thereafter normalized following ART initiation in both HHI- and CHI-treated individuals. Significantly higher frequencies of the anergic CD56<sup>neg</sup> NK cell subset, accompanied by a decline of CD56<sup>dim</sup> NK cells, was observed in CHI and these perturbations in subset distribution persisted in CHI-treated individuals up to 12 months post-ART initiation. No significant changes to NK cell subset distributions were observed in HHI-treated individuals in comparison to uninfected individuals. The expanded CD56<sup>neg</sup> NK cell subset in CHI displayed a tendency for lower glucose

uptake compared to CD56<sup>dim</sup> NK cells prior to ART and up to 12 months post-ART initiation. In contrast, no evident changes in fatty acid and amino acid uptake were detected in CD56<sup>neg</sup> NK cells compared to CD56<sup>dim</sup> NK cells in CHI-treated individuals.

**Conclusions:** Glucose uptake by NK cells is reduced during untreated HIV-1 infection, primarily in the expanded CD56<sup>neg</sup> subset, and this impairment in CD56<sup>neg</sup> NK subset cells persists for at least 12 months in individuals initiating ART during chronic HIV-1 infection.

Importantly, initiating ART early during HIV-1 infection largely prevented the accumulation of CD56<sup>neg</sup> cells with altered glucose metabolism.

## THPEA014

### Early treated subjects who acquired HIV perinatally preserve ADCC activity similar to healthy controls: preliminary results from the LEUKOHIV cohort

A. Rotili<sup>1,2</sup>, C. Pighi<sup>2</sup>, A. Neri<sup>1,2</sup>, E. Morrocchi<sup>2</sup>, N. Cotugno<sup>2,1</sup>, B. Bone<sup>3</sup>, M. Lichterfeld<sup>3</sup>, P. Palma<sup>2,1</sup>

<sup>1</sup>University of Rome "Tor Vergata", Systems Medicine, Rome, Italy, <sup>2</sup>Bambino Gesù Children's Hospital, Research Unit of Clinical Immunology and Vaccinology, Rome, Italy, <sup>3</sup>Ragon Institute of MGH, MIT and Harvard, Cambridge, MA, United States

**Background:** Immunological characterization of long-term antiretroviral therapy (ART)-treated subjects is pivotal to understand the role of immune system once HIV reactivates. Here, we aimed at defining the innate immunological features of a selected group of 9 vertically acquired people living with HIV (PLWH) (age: 11.6–28.2 y) who initiated ART within the first year of life (age at ART start: 0.26–9.04 mo) with a history of suppressive ART > 2 years. This unique cohort of early treated subjects, named LEUKOHIV, has been deeply characterized for the viral reservoir, on large numbers of peripheral blood mononuclear cells (PBMCs) collected by leukapheresis, through Full Length Individual Provirus sequencing (FLIP-seq), Quantitative Viral Outgrowth Assays (QVOA) and Matched Integration site and Proviral sequencing (MIP-seq).

**Methods:** Antibody dependent NK cell activation (ADCC) assays were performed by measuring surface CD107a expression in PBMCs, used as effectors against HIV-1 infected 8E5/LAV targets cells in the presence or absence of heat inactivated HIV+ heterologous plasma. Moreover, in the same experimental condition, infected cell elimination assays were set up, being the % of killing calculated as loss of HIV p24+ cells.

**Results:** When compared with no plasma condition, the cohort demonstrated a significant ( $p = 0.0039$ ) ADCC response, with 7 out of 9 individuals displaying a 1.69-fold increase (fi)  $\pm 0.34$  SD in the frequency of CD107a+ NK, similarly to a control group of 7 healthy donors ( $p = 0.0156$ ,

Oral  
abstracts

exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

1.70-fi  $\pm$  0.63 SD). Likewise, 8 subjects exhibited a significant ( $p=0.0078$ ) responsiveness in infected cell elimination assays, having a % of killing mean value of 18.46-fi  $\pm$  9.96 SD. Overall, 6 PLWH showed a positive response in both assays, despite their heterogeneity in terms of ART initiation age (range 0.26-6 mo), presence of antibodies specific for 10 HIV antigens summarized in a Western Blot score (range 0-4.5) and TILDA outcome (3 detectable/3 undetectable).

**Conclusions:** These results suggest that the innate system of these early treated PLWH, that successfully controlled the virus, is able to mount an effective response upon rechallenge with HIV, as might occurs in case of viral rebound due to loss of ART adherence or ART treatment interruption.

<sup>1</sup>Instituto de Salud Carlos III, Immunopathology Unit, National Center of Microbiology, Madrid, Spain, <sup>2</sup>Infectious Diseases Service, Hospital Carlos III, Madrid, Spain, <sup>3</sup>Instituto de Salud Carlos III, Immunopathology Unit, National Center of Microbiology, Madrid, Spain, <sup>4</sup>Internal Medicine Service, Hospital Universitario Severo Ochoa, Madrid, Spain, <sup>5</sup>Faculty of Biomedical and Health Sciences, Universidad Europea de Madrid, Madrid, Spain, <sup>6</sup>Instituto de Salud Carlos III, Madrid, Spain

**Background:** People with HIV (PWH) present disrupted immune surveillance of tumor antigens producing more susceptibility to develop cancer. We evaluated the impact of anticancer treatment on HIV-1 reservoir and antiviral response in PWH.

**Methods:** PWH diagnosed with cancer (PWHC) (n=11) were recruited for this longitudinal study and followed-up for 6 months. PWH free of cancer (n=5) were recruited as controls. Blood samples were collected before starting anticancer treatment, 3 and 6 months after. HIV-1 reservoir size was measured by ddPCR. Proviral reactivation (p24-Gag) and pSAMHD1 were analyzed in isolated CD4 cells. Release of IFN $\gamma$ , TNF $\alpha$ , and Granzyme B (GZB) was determined in response to HIV-1 peptide pool. Cytotoxic activity was determined in HIV-1-infected TZM bl cells co-cultured with PBMCs from the participants.

**Results:** 1. Table 1 shows baseline clinical and sociodemographic characteristics of all participants. 2. Proviral reactivation was increased in CD4 from PWHC ( $p=0.001$ ), and levels of pSAMHD1 were higher in TEM and TEMRA subsets, in comparison with PWH.

- PWHC showed higher levels of CD8 with higher capacity to release IFN $\gamma$  ( $p=0.0019$ ), TNF $\alpha$  ( $p=0.038$ ), and GZB. Despite CD4 cytopenia six months after treatment ( $p<0.001$ ), IFN $\gamma$  and TNF $\alpha$  production ( $p=0.0275$ ) was also enhanced.
- Levels of NK cells with higher capacity to produce IFN $\gamma$  ( $p=0.0273$ ) were increased in PWHC. NKT-like cells expressed more IFN $\gamma$  ( $p=0.0015$ ) and GZB ( $p=0.0007$ ).
- Despite the high cytotoxic response, antiviral activity was reduced in PBMCs from PWHC six months after starting treatment ( $p=0.001$ ).
- Proviral reservoir size increased 1.7-fold in PWHC six months after starting treatment ( $p=0.0391$ ).

	PWHC			PWH

Table 1. Participant demographic and baseline characteristics.

**Conclusions:** Anticancer treatment induced proviral reactivation and high levels of cytotoxic cells. However, antiviral response was impaired after six months of treatment, causing an increase in the proviral reservoir size. Monitoring of HIV-1 reservoir in PWHC is necessary during cancer treatment and more studies are necessary to determine the clinical impact.

## THPEA016

Analysis of ADCC responses against HIV Env and Tat proteins: implications for HIV vaccine development

M. Martino<sup>1</sup>, A. Cafaro<sup>2</sup>, E. Torreggiani<sup>1</sup>, A. Caputo<sup>1</sup>, A. Tripiciano<sup>2</sup>, B. Dallan<sup>1</sup>, D. Proietto<sup>1</sup>, M. De Laurentis<sup>1</sup>, E. Tassani<sup>1</sup>, V. Francavilla<sup>2</sup>, F. Mancini<sup>2</sup>, M. Campagna<sup>2</sup>, P. Monini<sup>2</sup>, R. Gavioli<sup>1</sup>, F. Nicolì<sup>1</sup>, B. Ensoli<sup>2</sup>

<sup>1</sup>University of Ferrara, Ferrara, Italy, <sup>2</sup>CNAIDS-ISS, Roma, Italy

**Background:** Proper activation of the immune system and induction of cytotoxic responses are key for selective killing of infected cells to control viral infections. Antibody-dependent cell-mediated cytotoxicity (ADCC), which exploits the effector activity of macrophages, neutrophils, and, especially, natural killer lymphocytes, is important in HIV infection. In particular, ADCC against the HIV envelope was found to correlate with protection from infection in the RV144 Thai trial. However, the role of ADCC against HIV-1 Tat, which forms a complex with oligomeric Env and contributes to HIV acquisition and disease progression, is unclear.

Late-breaker abstracts

Author Index

**Methods:** The capacity of antibodies against Env or Tat to mediate ADCC was assessed using the Rapid Fluorometric assessment of ADCC (RFADCC) assay, using peripheral blood mononuclear cells (PBMCs) from healthy donors as effectors and CEM NK<sub>CCR5</sub><sup>+</sup>, pulsed with Env or Tat and opsonized by specific antibodies, as target cells.

**Results:** We observed high ADCC activity (>40% killing) in target cells pulsed with the Tat protein and incubated with a hyperimmune serum from a rabbit immunized with Tat or with human sera positive for anti-Tat antibodies.

In parallel experiments, ADCC was measured in cells pulsed with a monomeric gp120 protein from clade B SF162, JR-CSF, or MN strain or with one clade C trimeric Env protein devoid of the V2 loop (DV2-TV1), and incubated with two monoclonal antibodies (17b or 48d) directed against the CD4-induced binding site or with a gp140-specific polyclonal rabbit serum. In ELISA assay, 17b bound to the three monomeric proteins better than 48d. However, of them, only SF162 was efficiently targeted by 17b in ADCC. In contrast, neither monoclonal antibody mediated ADCC against DV2-TV1.

Conversely, the anti-gp140 polyclonal rabbit serum bound both monomeric and trimeric Env and mediated the highest ADCC activity.

**Conclusions:** Overall, this study demonstrates, for the first time, that human anti-Tat antibodies mediate ADCC. In addition, while confirming Env-induced ADCC, the data show that different forms (monomeric versus trimeric) of the Env protein induce different levels of ADCC activity. These observations may have important implications for the development of novel effective HIV vaccines based on Env and/or Tat and to monitor correlates of protection.

Armenteros-Yeguas<sup>5</sup>, V. Estrada<sup>2,3</sup>, M. Torres<sup>1,3</sup>, M. Coiras<sup>1,3</sup>

<sup>1</sup>Instituto de Salud Carlos III, Immunopathology Unit, Majadahonda, Spain, <sup>2</sup>Hospital Universitario Clínico San Carlos, Internal Medicine Service, Madrid, Spain,

<sup>3</sup>Instituto de Salud Carlos III, Biomedical Research Center Network in Infectious Diseases (CIBERINFEC), Madrid, Spain,

<sup>4</sup>Universidad de Alcalá, Faculty of Sciences, Madrid, Spain,

<sup>5</sup>Hospital Universitario Clínico San Carlos, Centro Sanitario Sandoval, Madrid, Spain

**Background:** Since May 2022, an outbreak of mpox was reported in several countries, including Spain. Although the outbreak was rapidly controlled, vaccination post-

and pre-exposition was recommended in people with HIV and PrEP users. However, cases of mpox have been reported in people previously vaccinated. We analyzed the immune response developed after vaccination in comparison with mpox infection.

**Methods:** People infected with mpox (mpox+) (n=30), people vaccinated against mpox (n=24; 4 of which were also previously vaccinated against smallpox), and people who were not in contact with mpox or smallpox (naïve) (n=38) were recruited for this study. Mpox peptides were used to stimulate CD4 and CD8+ T cells. Analyses were performed by flow cytometry.

### Results:

1) People mpox+ was infected a median of 258 days ago (IQR 255-285); people vaccinated against mpox was vaccinated a median of 341 days ago (IQR 283-352). People-mpox+ were 39 years-old (IQR 34.3-45.7), vaccinated people were 37 years-old (IQR 35-41), and naïve participants were 35 years old (IQR 28-46). All participants were male. There were 26 people with HIV (PWH) mpox+ (86.7%), 4 PWH vaccinated against mpox (16.7%), and 11 PWH naïve to mpox (28.9%).

2) Stimulation of CD4+ T cells with mpox peptides induced 1.5-fold more activation (CD25+) in mpox+ than in people vaccinated (p=0.0447) and naïve (p=0.0232). CD4 expressed 1.4-fold higher levels of IL-2 in mpox+ than vaccinated (p=0.0418) and naïve (p=0.0391) in response to mpox peptides.

3) Naïve CD4+ T cells from mpox+ expressed higher levels of IL-4 (1.7-fold; p=0.0234) and IFN $\gamma$  (2.0-fold; p=0.0025) in comparison with vaccinated individuals.

4) CD4+ TCM cells proliferated 2.1- (p=0.0003) and 2.8-fold (p=0.0013) more in people mpox+ in comparison with vaccinated and naïve, respectively.

5) CD8+ T cells stimulated with mpox peptides expressed 1.7-fold more IFN $\gamma$  and 2.5-fold more TNF $\alpha$  than vaccinated (p=0.0002; p=0.0026, respectively) and naïve (p=0.0033; p=0.0012, respectively).

6) We found no differences between responses in people infected with HIV and PrEP users.

**Conclusions:** People infected with mpox developed a potent and long-lasting immune response based on CD4 and CD8 that efficiently responded to mpox peptides. However, vaccination against mpox did not produce significant changes in the capacity to respond to mpox.

#### Incident primary HIV infection during chronic treatment with imatinib: effect on reservoir dynamics

G. Bozzi<sup>1</sup>, M. Centazzo<sup>2,3</sup>, S. Scaglioni<sup>2,3</sup>, G.M. Butta<sup>1,2</sup>, P. Saltini<sup>1,2</sup>, A. Liparoti<sup>1,2</sup>, M. Tornese<sup>4</sup>, D. Prati<sup>5</sup>, A. Gori<sup>1,2</sup>, A. Bandera<sup>1,2</sup>, L. Manganaro<sup>2,3</sup>

<sup>1</sup>IRCCS Ospedale Maggiore Policlinico Ca' Granda, Infectious Disease Unit, Milan, Italy, <sup>2</sup>University of Milan, UNIMI, Milan, Italy, <sup>3</sup>INGM, National Institute of Molecular Genetics, Romeo ed Enrica Invernizzi, Milan, Italy, <sup>4</sup>IRCCS Ospedale Maggiore Policlinico Ca' Granda, Clinical Pathology, Milan, Italy, <sup>5</sup>IRCCS Ospedale Maggiore Policlinico Ca' Granda, Department of Transfusion Medicine and Hematology, Milan, Italy

**Background:** International guidelines advocate early cART initiation to reduce the HIV-1 viral load set-point and diminish the reservoir size. Tyrosine kinase inhibitors (TKIs), used for blood malignancies and able to interfere with T-cell activation and homeostatic proliferation, may aid in reservoir reduction. Ex vivo, TKIs dasatinib and ponatinib inhibit SAMHD1 phosphorylation, a key regulator of HIV-1 replication.

We report the case of a 37-year-old man acquiring primary HIV infection while on imatinib.

**Methods:** Through the GR-2018-12365699 study, enrolling ART-naïve patients with primary HIV infection in Milan, Italy, we were able to characterize the clinical evolution and quantitate HIV-1 DNA content in cells via digital droplet PCR targeting HIV-1 gag and human CCR5 as a control. In vitro assays for P-SAMHD1 were conducted additionally.

**Results:** The participant was treated with imatinib since February 2019 at 100 mg/day for a myeloproliferative neoplasm. In January 2022, he experienced acute retroviral syndrome and tested positive for HIV (Fiebig stage 5), with exceptionally high viremia at diagnosis ( $>10^7$  copies/ml, while median viremia for cohort participants with Fiebig stage 5 infection was 58400 copies/ml, IQR 26842– 931250); cART was started 7 days after diagnosis.

Viral load was  $10^2$  at 1 month from cART start, and reached undetectable levels by six months. HIV DNA levels in CD4 T cells dropped from  $3.7 \times 10^4$  to  $6.6 \times 10^2$  copies/ $10^6$  cells after one year of ART.

In vitro assays revealed that imatinib at 5  $\mu$ M concentration mimicking the standard 400mg/day dose, significantly decreased P-SAMHD1 levels in CD4 T cells stimulated with gc-cytokines, and impaired in vitro HIV infection.

However, imatinib at the 1.25  $\mu$ M concentration, which mimics the 100 mg/day dose, failed to significantly inhibit HIV replication.

**Conclusions:** To our knowledge, this is the first reported case of an individual contracting primary HIV infection under TKI therapy. These results suggest that the imatinib regimen administered may not have been enough to exert a noteworthy HIV resistance.

Nevertheless, exploring the use of tyrosine kinase inhibitors in conjunction with antiretroviral treatment presents a potential strategy to control CD4+ T cell activation, potentially mitigating the formation of viral reservoirs and enhancing the overall management of HIV-1 infection.

#### Delineating the role of transcription factor BRD9 in HIV-1 latency reactivation

T.Y. Luk<sup>1</sup>, L.Y. Yim<sup>1</sup>, R. Zhou<sup>1</sup>, H. Huang<sup>1</sup>, Y. Mo<sup>1</sup>, M. Zhao<sup>1</sup>, H. Chu<sup>2</sup>, Z. Chen<sup>1</sup>

<sup>1</sup>AIDS Institute, Department of Microbiology, School of Clinical Medicine, Li Ka Shing Faculty of Medicine, The University of Hong Kong, Hong Kong, Hong Kong, SAR of China, <sup>2</sup>The University of Hong Kong, Department of Microbiology, Hong Kong, Hong Kong, SAR of China

**Background:** AIDS remains incurable owing to the HIV-1 latent reservoir in infected immune cells, especially in resting memory CD4+ T cells. The "Shock and Kill" strategy combines the administration of latency reversal agent (LRA) and anti-retroviral treatment (ART) to induce HIV-1 reactivation from infected cells and stimulate immune response against them. Since current LRA treatments in clinical trials are suboptimal, drug screening for novel LRA remains a promising strategy to eliminate HIV-1 latent reservoirs.

This study aims to reveal the potential of epigenetic drugs as new LRA specifically applicable in CD4+T cells.

**Methods:** We screened an epigenetic drug library consisting of 280 compounds using the latent HIV-1-infected T cell line and ranked the drugs according to their HIV-1 reactivation effects. Selected drug candidates were tested in different cell models. Measurements included qPCR, HIV-1 p24 ELISA and flow cytometry to identify the changes in HIV-1 production. Gene knockout experiment was utilized to elucidate the effect of losing the target genes in controlling HIV-1 gene expression. ChIP-qPCR experiment was used for identifying the DNA-binding regions of target proteins to confirm their interactions with HIV-1 genome. Cut&Run DNA sequencing and RNA sequencing experiments were performed to discover the gene sets under control of target proteins.

**Results:** We found the inhibitor of transcription factor BRD9, namely I-BRD9, was an encouraging LRA candidate. BRD9 belongs to the BET protein family that consists of BRD4 which is known to mediate HIV-1 gene expression. I-BRD9 could reactivate HIV-1 production in ACH2 T cells, infected resting memory CD4+ T cells and PBMC isolated from HIV-1 patients undergoing ART treatment. Further-

more, knocking down BRD9 gene in ACH2 T cells increased HIV-1 production. ChIP-qPCR experiment demonstrated that BRD9 protein could bind to LTR and Gag gene region of HIV-1 genome, which integrated into host cellular genome. Cut&Run DNA sequencing and RNA sequencing experiments identified genes under direct control of BRD9 and their promising HIV-1 latency reactivation ability were reflected after respective drug treatment.

**Conclusions:** Our results demonstrated that I-BRD9 could become novel HIV-1 LRA in human CD4+ T cells and transcription factor BRD9 could suppress HIV-1 gene transcription via direct interaction with HIV-1 genome.

<sup>2</sup>University of KwaZulu-Natal, Durban, South Africa, <sup>3</sup>Africa Health Research Institute, Durban, South Africa

**Background:** Despite the transformative success of combination antiretroviral therapy (cART) in managing HIV-1, a cure remains elusive, particularly in sub-Saharan Africa where treatment disparities persist. The pursuit of strategies leading to an HIV-1 cure hinges on the precise quantification of latent viral reservoirs, necessitating robust and scalable assays. This study introduces the Specific Quantification of Inducible HIV-1 by LAMP (SQuHIVLa), a novel assay utilizing the sensitivity of RT-LAMP to detect and quantify cells expressing Tat/Rev mRNA upon activation. Addressing the need for high-throughput and scalable tools, SQuHIVLa offers a unique approach for quantifying the inducible HIV-1 reservoir in individuals with diverse HIV-1 subtypes under combination antiretroviral therapy (cART).

**Methods:** The study included 34 individuals living with HIV-1, comprising subtypes B and C, all under fully suppressive cART. The SQuHIVLa assay, designed to quantify the inducible HIV-1 reservoir, underwent validation using in vitro transcripts, J-Lat 11.1 cells, and clinical samples, in order to demonstrate its specificity and applicability in reservoir quantification. The comprehensive methodology was further complemented with the comparison of SQuHIVLa with additional assays, including TILDA, IPDA, and total HIV-1 DNA quantification.

**Results:** RT-LAMP exhibited high sensitivity, detecting as few as 50 copies of Tat/Rev mRNA within 30.46 minutes, with a Limit of Detection-95% at 31 copies, using in vitro transcribed RNA. Subsequent experiments demonstrated the selective amplification of Tat/Rev mRNA, excluding intron-containing genomic DNA, and highlighted the robustness of RT-LAMP for rapid, sensitive, and specific de-

tection. Furthermore, SQuHIVLa exhibited accurate and reproducible quantification of the frequency of Tat/Rev mRNA expressing cells for a range of participants living with HIV-1 subtypes B and C with various clinical characteristics.

Additionally, SQuHIVLa demonstrated positive correlations with TILDA, total HIV-1 DNA copies, and intact HIV-1 DNA copies, with the latter exhibiting a significantly strong association.

**Conclusions:** The findings of this study hold significant implications for HIV prevention, treatment, and care, particularly in resource-constrained settings such as Sub-Saharan Africa. The development of the RT-LAMP assay, with its high sensitivity, cost-effectiveness, and user-friendly nature, addresses the critical need for reliable and scalable assays to assess intervention efficacy in clearing the viral reservoir.

**Background:** The HIV-1 reservoir, measured as total HIV-1 DNA, was recently shown to be increasing in >25% of people with HIV (PWH) over years on efficient antiretroviral therapy (ART). Reasons and potential clinical implications of this HIV-1 reservoir increase remain unclear.

In this study, we aimed to characterize the proviral landscape in four distinct groups of PWH, presenting either an increase or decrease of the HIV-1 reservoir over 10 years on ART and additionally experiencing or not experiencing intermittent viremia, to find potential differences explaining the contrasting long-term dynamics of the HIV-1 reservoir.

**Methods:** Near full-length HIV-1 proviral NGS in bulk was applied to four longitudinal PBMC samples from 40 well characterized participants enrolled in the Swiss HIV Cohort Study (SHCS). After removing hypermutated reads, genetic distances and diversities were calculated and drug resistance mutations were assessed. Intact HIV-1 DNA and HIV-1 transcripts were quantified using digital PCR.

**Results:** A decrease of intact proviruses was observed independent of HIV-1 reservoir size dynamics. Genetic distances and diversities of individuals' proviral sequences did not increase over time in any group. While some non APOBEC-induced drug resistance mutations (DRMs) could be observed in proviral DNA of individuals in all groups, numbers were not significantly different among the groups. Low numbers of unspliced and multiply spliced RNA were detected at low levels in all groups.

**Conclusions:** Our results show no evidence of evolution of the HIV-1 reservoir, regardless of HIV-1 reservoir size dynamics and intermittent viremia over a follow-up period of 10 years on ART.

These findings suggest that the increase of the HIV-1 reservoir size, measured as total HIV-1 DNA and observed in a substantial fraction of individuals is driven by an increase of defective proviruses, and that not low-level replication but other mechanisms, e.g. clonal expansion, are more likely responsible for the HIV-1 reservoir increase, largely independent of intermittent viremia.

**Background:** While ART effectively controls HIV-1 acquisition, viral persistence in long-lived reservoirs (CD4+T cells and macrophages) prevents eradication. CPSF6 is a 3'-RNA cleavage and polyadenylation factor that interacts with HIV-1 capsid to facilitate the pre-integration complex nuclear import and proviral integration. Dasatinib, a tyrosine kinase inhibitor, interferes with HIV-1 acquisition in CD4+T cells by preserving SAMHD1 activity.

Our objective was to determine if dasatinib interferes with HIV-1 acquisition in macrophages via SAMHD1 and/or CPSF6, which regulates HIV-1 nuclear import in macrophages.

**Methods:** 15 ART-treated PWH were recruited for this study. CD14+ cells were isolated from PBMCs, differentiated to MDMs and infected in vitro with JR\_FL\_Renilla and DHIV3-GFP strains in the presence/absence of dasatinib 75nM. SAMHD1 phosphorylation at T592 and expression of p24-gag were analyzed by flow cytometry after HIV-1 acquisition.

Reverse transcription (RT), 2-LTR circles, and proviral integration were determined by ddPCR. Expression levels and subcellular localization of CPSF6 was determined by confocal microscopy.

#### Results:

- 1) HIV-1 acquisition was reduced 2.7-fold ( $p=0.0001$ ) in MDMs from PWH after treatment with dasatinib.
- 2) In correlation, dasatinib reduced 1.8-fold ( $p<0.0001$ ) SAMHD1 phosphorylation in MDMs.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

3) Time-lapse microscopy in living, dasatinib treated-MDMs infected with DHIV3-GFP virus showed an averaged 22-hour delay in the detection of GFP expression, which was nearly undetectable ( $p=0.0032$ ).

4) MDMs pre-treated with or without dasatinib exhibited no differences in the formation of early and late RT 5 hours after infection with pJR-FL\_Renilla. However, dasatinib reduced 3.9-fold ( $p=0.0259$ ) the formation of 2-LTR circles in MDMs during the first 48 hours of infection, and the proviral integration was 1.6-fold ( $p=0.0467$ ) lower in MDMs pre-treated with dasatinib.

5) In dasatinib-treated cells, CPSF6 showed a predominant cytoplasmic localization, with reduced levels in the perinuclear region.

**Conclusions:** Dasatinib disrupted HIV-1 proviral integration in macrophages, but not as efficiently as in CD4+T cells after short-treatment, likely due to MDMs presenting higher basal levels of pSAMHD1 than resting CD4+T cells. Changes in CPSF6 expression and subcellular localization by dasatinib may impair the nuclear import of HIV-1 capsid, despite RT levels.

More studies are necessary to validate the use of dasatinib in combination with ART to impede reservoir formation and maintenance in both CD4+T cells and macrophages.

## THPEA023

Targeting Ikaros and Aiolos with pomalidomide increased expression of stress ligands on HIV-infected cells but did not induce apoptosis or reverse HIV latency

R.D. Pascoe<sup>1,2,3</sup>, Y. Kim<sup>1</sup>, J. Ong<sup>1</sup>, C. Tumpach<sup>1</sup>, C. Gubser<sup>1</sup>, J.J. Chang<sup>1</sup>, J.H. McMahon<sup>4</sup>, S.R. Lewin<sup>1,4,5</sup>, T.A. Rasmussen<sup>1,3</sup>

<sup>1</sup>The University of Melbourne, at the Peter Doherty Institute for Infection and Immunity, Department of Infectious Diseases, Melbourne, Australia, <sup>2</sup>The University of Melbourne, at the Peter Doherty Institute for Infection and Immunity, Department of Microbiology and Immunology, Melbourne, Australia, <sup>3</sup>Aarhus University Hospital, Department of Infectious Diseases, Aarhus, Denmark, <sup>4</sup>Alfred Hospital and Monash University, Department of Infectious Diseases, Melbourne, Australia, <sup>5</sup>Royal Melbourne Hospital at the Peter Doherty Institute for Infection and Immunity, Victorian Infectious Diseases Service, Melbourne, Australia

**Background:** HIV persists in people living with HIV (PLHIV) on antiretroviral therapy (ART) in long-lived and proliferating latently infected CD4+ T-cells. The Zinc finger proteins, Ikaros (IKZF1) and Aiolos (IKZF3), are transcriptional repressors and have recently been implicated in maintaining HIV latency and are over-expressed in both the latent and active reservoir.

In this study, we investigated whether pomalidomide, an immunomodulatory drug that induces the degradation

of Ikaros and Aiolos, could sensitise HIV-infected cells to immune-mediated clearance, apoptosis and/or reverse HIV latency.

**Methods:** CD4+ T-cells were infected with a green fluorescent protein (GFP) expression virus and treated with pomalidomide at concentrations that are therapeutic *in vivo* (0.25 $\mu$ M) or DMSO control for 5 days. Expression of surface and intracellular markers on GFP+ and GFP- cells was quantified by flow cytometry. HIV-infected CD4+ T-cells were also treated with DMSO or pomalidomide, and the frequency of productively-infected (GFP+) cells was quantified following co-culture with the NK cell line, KHYG1. Finally, peripheral blood mononuclear cells from ART-suppressed PLHIV were treated with pomalidomide or DMSO *ex vivo*, and HIV transcription and frequency of intact HIV DNA (IPDA) were quantified by qPCR. The proliferation of CD4+ T-cells was measured using CellTrace Violet, and activation quantified using flow cytometry.

**Results:** Pomalidomide increased the expression of the stress ligands, CD155 and ULBP, on productively-infected (GFP+) cells, but there was no significant decrease in GFP+ cells following co-culture with the NK cell line, KHYG1. Pomalidomide did not change the expression of active caspases-3,-7, and -8 in productively-infected CD4+ T-cells. In contrast, we noted an increased expression of the pro-survival protein, B cell lymphoma (BCL)-2. Pomalidomide *ex vivo* increased expression of the activation marker HLA-DR but did not induce CD4+ T-cell proliferation. Finally, in CD4+ T-cells from ART-suppressed PLHIV, the addition of pomalidomide *ex vivo* did not lead to a change in the cell-associated unspliced or multiply-spliced HIV RNA, nor a reduction in IPDA.

**Conclusions:** In conclusion, despite increasing stress protein expression on HIV-infected cells, we found no evidence that pomalidomide *ex vivo* directly promoted apoptosis, latency reversal or impacted the latent HIV reservoir and may enhance HIV persistence through increased expression of BCL-2.

<sup>1</sup>University of Alberta, Departments Medical Microbiology & Immunology and Medicine (Neurology), Edmonton, Canada, <sup>2</sup>Université du Québec à Montréal, Department of Biological Sciences, Montreal, Canada, <sup>3</sup>McGill University, Division of Pathology, Montreal, Canada, <sup>4</sup>McGill University, Department of Family Medicine, Faculty of Medicine & Health Sciences, Montréal, Canada, <sup>5</sup>McGill University, Department of Medicine and Division of Infectious Diseases and Chronic Viral Illness Service, Montréal, Canada

**Background:** HIV-1 RNA, DNA, and proteins persist in the brains of persons living with HIV (PWH) despite ART. The intact provirus accounts for 10-15.5% of proviral genomes in the brain. However, the replication status of these proviruses is uncertain. HIV has been recovered from the brains of ART-treated PWH after exposure to latency-reversing agents. It is crucial to determine if the brain's HIV reservoir is capable of activation by cytokines present in the brain, prompting viral replication and dissemination.

**Methods:** We isolated autopsied microglia from the brain of a PWH who was on suppressive ART. Microglia were harvested from different brain regions by mechanical and enzymatic dissociation followed by density gradient cell isolation. Microglial cultures were exposed to TNF- $\alpha$ , and the supernatants were collected 3-, 5-, and 7-days post-exposure.

Healthy PBMCs were co-cultured with microglia-derived supernatants and viral titer was determined using ddPCR and p24 ELISA. HIV-1 RNA and total DNA were measured in each brain region by ddPCR.

**Results:** Viral RNA and DNA quantities were higher in the gray matter compared to white matter. Gray matter from the striatum had the highest quantities of viral RNA, followed by the cerebellum, occipital, and frontal lobes ( $1.2 \times 10^5$ ,  $1.1 \times 10^5$ ,  $0.92 \times 10^5$ , and  $0.7 \times 10^5$  copies/gram of tissue, respectively). Viral RNA copy numbers were similar throughout the white matter (mean-  $0.3 \times 10^5$  copies/gram of tissue). HIV total DNA was highest in striatum at  $0.8 \times 10^5$  copies/gram of tissue, which was on average 4-fold higher than total DNA from gray matter in other regions. The HIV-1 RNA from striatal microglia at 3 days post-TNF-exposure was highest compared to the frontal lobe and cerebellum at  $5 \times 10^3$  copies/ml. ELISA detected viral p24 from the supernatant of TNF-exposed striatal microglia after being co-cultured with healthy PMBCs. *De novo* infection of PBMCs and attempts to passage the recovered virus resulted in loss of the viral replication.

**Conclusions:** Absence of viral production without cytokine stimulation underscored the notion that the HIV brain reservoir is latent. Thus, in the absence of a brain-associated cytokine, this reservoir remains dormant. Cytokine exposure induced viral production from microglia highlighting the potential for viral persistence in the brain.

**Background:** Integrase strand transfer inhibitors (INSTIs) are the cornerstone of current HIV therapies, but their oral dosing options are limited to daily administration. Herein we describe the nonclinical pharmacology profile of GS-1720, a potent and selective investigational INSTI with Phase 1 data supportive of once-weekly oral dosing.

**Methods:** Inhibition of integrase strand transfer activity was evaluated using a biochemical assay. Anti-HIV-1 activity was determined in primary immune cells. Cytotoxicity was assessed in human cell lines and primary cells. Antiretroviral 2-drug combinations and drug resistance by dose escalation selections were assessed in HIV-1-infected MT-2 cells. Safety pharmacology and toxicology profiles were evaluated in nonclinical species following oral administration.

**Results:** GS-1720 inhibited recombinant HIV-1 integrase strand transfer activity with an  $IC_{50}$  of 6.2 nM and HIV-1 replication in primary human CD4<sup>+</sup> T-lymphocytes and monocyte-derived macrophages with mean  $EC_{50}$  and  $CC_{50}$  values of 0.8 nM and  $>10 \mu M$ , respectively. In human PBMCs, GS-1720 was 7-fold more potent than bicitegravir against a multiclude panel of HIV-1 clinical isolates. GS-

1720 maintained full antiviral potency against a panel of HIV-1 mutants resistant to other antiretroviral classes. When tested against a panel of INSTI-resistant HIV-1 mutants, the EC<sub>50</sub> fold-change range relative to wild-type virus for GS-1720, bictegravir, and elvitegravir was 0.9 to 8.5, 0.6 to 4.0, and 5.1 to >86, respectively.

Similarly, in vitro resistance selections with GS-1720 progressed at a rate comparable to bictegravir and significantly slower than elvitegravir, without emergence of primary INSTI resistance-associated mutations after 16 passages (>300 days) in culture. GS-1720 demonstrated no antiviral antagonism when combined with other antiretrovirals, including lenacapavir, and showed no activity against HBV, HCV, HSV-2 or SARS-CoV-2 and low cytotoxicity in all tested human cell types. In nonclinical safety studies, GS-1720 was nongenotoxic, showed minimal off-target effects potential, and the in vivo no-observed-adverse-effect-levels were established at the highest doses tested.

**Conclusions:** GS-1720 is a novel oral INSTI with significantly improved antiviral potency compared to bictegravir and a similar nonclinical virology, pharmacology and safety profile. Overall, these data support the ongoing clinical development of GS-1720 as a component of a novel once-weekly oral regimen for HIV-1 treatment.

### Induction of Autologous Tier 2 HIV-neutralizing Antibodies in Rabbits by Heterologous Combinations of the Viral Vector VSV-GP and Next-generation Native-like Trimers

F. Radvan<sup>1</sup>, S. Wilmschen-Tober<sup>1</sup>, A. Hauser<sup>2</sup>, L.-Y. Lin<sup>3,4</sup>, M. Schaber<sup>1</sup>, D. Peterhoff<sup>2,5</sup>, L. Riepler<sup>1</sup>, N. Mendrzyk<sup>1</sup>, A. Beierfuß<sup>6</sup>, C. Speth<sup>7</sup>, B. Asbach<sup>2</sup>, C. Moog<sup>3,4</sup>, D. von Laer<sup>1</sup>, R. Wagner<sup>2,5</sup>, J. Kimpel<sup>1</sup>

<sup>1</sup>Medical University of Innsbruck / Institute of Virology, Innsbruck, Austria, <sup>2</sup>University of Regensburg / Institute of Medical Microbiology and Hygiene, Molecular Microbiology (Virology), Regensburg, Germany, <sup>3</sup>University of Strasbourg, Inserm U1109 / Institute of Hematology and Immunology, Strasbourg, France, <sup>4</sup>Vaccine Research Institute (VRI), Paris, France, <sup>5</sup>University Hospital Regensburg / Institute of Clinical Microbiology and Hygiene, Regensburg, Germany, <sup>6</sup>Medical University of Innsbruck / Central Laboratory Animal Facility, Innsbruck, Austria, <sup>7</sup>Medical University of Innsbruck / Institute of Hygiene and Medical Microbiology, Innsbruck, Austria

**Background:** So far, an effective HIV vaccine could not be developed, mostly because it has been extremely difficult to induce antibodies that can broadly neutralize the wide range of human immunodeficiency virus (HIV) variants. Next-generation antigens resembling the HIV envelope (Env) glycoprotein in a native-like trimer closed conformation offer hope to evoke such antibodies.

The objective of this study was to evaluate the immunogenicity of a chimeric vesicular-stomatitis-virus-based vector, VSV-GP, encoding clade C membrane-tethered native-like trimeric Env.

**Methods:** Cells were infected with VSV-GP-Env and characterized regarding cell surface expression and antigenicity of Env. Incorporation of Env into VSV-GP particles was assessed. Finally, immunogenicity of VSV-GP-Env was assessed in mice and rabbits in heterologous prime/boost combinations with the autologous protein.

**Results:** Cells infected with VSV-GP-Env vectors expressed high amounts of native-like trimers on the surface in a favourable conformation and native-like trimers were efficiently incorporated into VSV-GP particles. Heterologous vector/protein immunizations induced high titers of Env-specific binding antibodies in mice and rabbits and were superior to four homologous vector immunizations. The order of vector and protein administration in the heterologous combinations did neither influence titers nor quality of Env-specific antibody responses. In rabbits, tier 1 and autologous tier 2 neutralizing antibodies were induced. Tier 2 neutralization was limited to the pseudoviruses matching the engineered Env immunogen with sera failing to neutralize pseudoviruses displaying the parental Env.

**Conclusions:** In conclusion, VSV-GP is well suited to display native-like Env trimers on virus and cell membranes. Thus, recombinant VSV-GP-Env vectors qualify as promising vaccine candidates in prime-boost vaccination schedules against HIV.

## THPEA027

### Effect of hypoxia on the potency of antiretroviral drugs

S. Folami<sup>1,2</sup>, R. Schwarzer<sup>1</sup>

<sup>1</sup>Institute for the Research on HIV and AIDS-Associated Diseases, Essen, Germany, <sup>2</sup>Uppsala University, Uppsala, Sweden

**Background:** Antiretroviral drugs (ART) have been effective in delaying the progression of HIV to AIDS. However, cellular proteins such as multidrug-resistance-protein 1 (MRP1) and P-glycoprotein, can confer resistance to ART treatment. Some of these proteins are regulated by hypoxia, which suggests that hypoxia may affect the potency of ART by altering cellular proteins involved in ART drug transport and metabolism.

Therefore, we aimed to study the effect of hypoxia on the expression of putative host modulator of ART activity, and on the potency of different ART drugs.

**Methods:** We first investigated the effect of hypoxia on the expression of hypoxia response genes, and genes involved in the homeostasis and metabolism of ART drugs. To that aim, Jurkat-E6, C20 microglia, and primary CD4<sup>+</sup>T cells, were treated with a hypoxic-mimetic agent (DMOG)

for 72 hours, collecting samples in 24-hour intervals. Then, mRNA levels of Glucose-transporter-1 (GLUT1), Prolyl-hydroxylase-2 (PHD2), Multidrug-resistance-protein-1 (MRP1), and Cathepsin-A (CTSA), were measured using qPCR. Additionally, the potency of Tenofovir and Dolutegravir was evaluated, following *in-vitro* spinoculation of Jurkat-E6 cells with a HIV-1-GFP reporter virus under hypoxic conditions, by analyzing the cellular GFP expression using flow cytometry.

**Results:** In response to hypoxia, Jurkat-E6 cells exhibited a rapid upregulation of the canonical hypoxia response gene; GLUT1 within 24 hours, followed by a decrease in expression over the remaining time course. A similar pattern was observed for PHD2 expression.

However, MRP1 expression increased in microglia after 48 hours and in primary CD4<sup>+</sup>T cells after 72 hours of hypoxic induction ( $p < 0.01$ ), while it remained suppressed in Jurkat-E6 cells throughout the time course.

To assess the potency of the ART drugs under study, we monitored Tenofovir's half-maximal inhibitory concentration ( $IC_{50}$ ), which was significantly reduced ( $p < 0.05$ ) in hypoxic Jurkat-E6 cells compared to normoxic controls, while the potency of Dolutegravir remained unchanged under the same hypoxic conditions.

**Conclusions:** Our study provides first glimpses in differential potency of various ART drugs at hypoxic conditions. Our preliminary data indicate that Tenofovir is more susceptible to the effects of hypoxia than Dolutegravir. Therefore, targeting hypoxia may be a potential strategy to overcome resistance mediated by MRP1.

## THPEA028

LS-variant anti-CCR5 monoclonal antibody provides long-lasting protection against intrarectal SHIV acquisition in rhesus macaques

H. Wu<sup>1</sup>, J. Zikos<sup>2</sup>, C. Waytakshek<sup>1</sup>, C. Boyle<sup>1</sup>, J. Hwang<sup>1</sup>, H. Fisher<sup>1</sup>, A. McCullen<sup>1</sup>, C. Shriver-Munsch<sup>1</sup>, K. Armantrout<sup>1</sup>, H. Crank<sup>1</sup>, M. Fischer<sup>1</sup>, J. Smedley<sup>1</sup>, M. Axthelm<sup>1</sup>, D. Magnani<sup>2</sup>, J. Sacha<sup>1</sup>

<sup>1</sup>Oregon Health & Science University, Beaverton, United States, <sup>2</sup>University of Massachusetts Medical School, Boston, United States

**Background:** Development of pre-exposure prophylaxis (PrEP) agents that provide long-acting, effective protection from HIV acquisition is a promising approach to bolster PrEP usage and adherence and slow the HIV epidemic. Anti-CCR5 monoclonal antibody Leronlimab blocks CCR5-mediated HIV entry, and has previously been shown to be an effective agent for HIV suppression in PLWH and for SHIV suppression and PrEP when administered to rhesus macaques weekly or biweekly. Here, we tested the ability of a long-acting variant of anti-CCR5 blocking antibody Leronlimab to protect against intrarectal SHIV acquisition in rhesus macaques.

**Methods:** A macaque-ized, long-acting, Fc-silenced, and heavy-chain-stabilized version of anti-CCR5 monoclonal antibody Leronlimab, termed "macLS Leronlimab", was developed by exchanging the human IgG4 Fc portion for rhesus IgG4 Fc and adding M428L and N434S (LS), L234A and L235A (LALA), and S131C (SC) mutations. Rhesus macaques received either a single ( $n=6$ ) or double ( $n=6$ ) 10 mg/kg subcutaneous dose of macLS Leronlimab, or served as untreated controls ( $n=10$ ).

One week after the last macLS dosing, all 22 macaques underwent weekly intrarectal SHIVsf162p3 challenges until infection was confirmed in all study animals. Macaques were monitored for Leronlimab CCR5 receptor occupancy on blood CD4<sup>+</sup> T cells, Leronlimab concentrations in plasma, Leronlimab-directed antibody drug antibodies (ADAs), and SHIV plasma viral loads.

**Results:** Three macLS-dosed macaques (2/6 single-dosed, 1/6 double-dosed) developed Leronlimab-directed ADAs, resulting in incomplete CCR5 occupancy on blood CD4<sup>+</sup> T cells, clearance of plasma Leronlimab, and subsequent SHIV acquisition. The remaining 9 macLS-dosed macaques retained complete blood CD4<sup>+</sup> T cell CCR5 blockade for 12-18 weeks and detectable plasma Leronlimab for 10-22 weeks after dosing. SHIV acquisition was significantly delayed for macLS Leronlimab-dosed macaques ( $p=0.0142$ , log-rank test), with a median of 11 weekly challenges until viral acquisition in dosed macaques compared to 2.5 weekly challenges in control macaques. While there was a trend toward enhanced protection in the double-dosed versus single-dosed macLS Leronlimab groups (median 13 versus 7.5 weekly challenges), this did not reach statistical significance ( $p=0.5641$ , log-rank test).

**Conclusions:** These data demonstrate the ability of LS-variant Leronlimab to provide long-term protection against intrarectal SHIV acquisition and support development of long-acting CCR5 blockade for HIV PrEP.

Hospital, Boston, United States

**Background:** Antibody-mediated prevention of HIV-1 acquisition will require combinations of broadly neutralizing monoclonal antibodies (mAbs) to optimize efficacy against circulating strains. Characterizing engineered mAbs for such combinations is a high priority.

**Methods:** During November 2020 to October 2021, Phase 1 HVTN 136/HPTN 092 study assessed safety, pharmacokinetics (binding antibody multiplex assay) and neutralization activities (TZM-bl assay) of first-in-human administration of PGT121.414.LS alone and in combination with VRC07-523LS among adults without HIV.

Single intravenous (IV) or subcutaneous (SC) dose-escalation infusions of PGT121.414.LS were assessed in four groups: 3 mg/kg IV (n=3), 10 mg/kg IV (n=4), 30 mg/kg IV (n=3) and 5 mg/kg SC (n=3). Then, repeated combination administrations with VRC07-523LS were given via IV (20 mg/kg each; n=10) and SC (5 mg/kg each; n=10) at days 0, 112 and 224.

**Results:** Median participant age was 31 years (range 22-48); 52% were assigned female sex at birth, and 82% were White. Median weight was 76 kg (range 46-109). IV and SC infusions were safe and well-tolerated, without serious adverse events. Dose escalation of PGT121.414.LS from 3 mg/kg to 30 mg/kg demonstrated a linear increase in serum concentration.

Estimated elimination half-life was 71 days (95% CI: 66-75) for PGT121.414.LS and 53 days (95% CI: 49-58) for VRC07-523LS. Relative to IV, SC bioavailabilities of PGT121.414.LS and VRC07-523LS were 86.1% (95% CI: 64.0-95.5) and 61.9% (95% CI: 45.5%-75.9%), respectively. Neutralization coverage against a multiclade panel of 12 Env pseudoviruses was greater in higher-dose and dual-combination IV groups. Predicted prevention efficacy based on predicted ID80 titer of 16-weekly PGT121/414/LS+VRC07.523LS (IV 20 mg/kg each) infusion was 90% and 84% against clade B and C circulating viruses, respectively.

Observed serum concentrations of PGT121.414.LS with 90% prediction interval from the population PK model. Observed (symbol) and predicted (line) serum concentrations of PGT121.414.LS are shown for each of the six treatment groups. Filled circles indicate observed concentrations from participants who received all intended study product administrations. Open triangles indicate subsequently observed concentrations from participants who missed the prior study product administration; crosses indicate concentrations that were excluded from the population PK modeling based on pre-specified model diagnosis rules.

**Conclusions:** First-in-human IV or SC infusions of PGT121.414.LS were safe and well-tolerated, alone or in combination with VRC07-523LS. These findings support additional evaluations of PGT121.414.LS in combination with other mAbs for HIV-1 prevention.

**Potential novel vaccine adjuvant to enhance ADCC-mediated NK cells in the HIV preventive vaccines**

N. Liyanage<sup>1</sup>, M. Alles<sup>1</sup>, M. Gunasena<sup>2</sup>

<sup>1</sup>The Ohio State University, Columbus, United States, <sup>2</sup>The Ohio State University, College of Medicine, Columbus, United States

**Background:** The RV144 trial, with ALVAC-HIV and alum-adsorbed AIDSVAX B/E gp120, remains the only HIV vaccine providing partial protection. Notably, correlations between V2-specific antibodies and Natural killer (NK) mediated antibody-dependent cytotoxicity (ADCC) emerged as significant immune correlates of protection. NK cells play a pivotal role as primary mediators of ADCC against HIV-infected cells. Augmenting ADCC becomes crucial for enhancing vaccine efficacy. Aryl hydrocarbon receptor (AHR) is a ligand-activated transcription factor, and its signaling shapes the immune responses of NK cells.

**Methods:** C57BL/6 mice were categorized into two groups and administered either ALVAC-SIV+gp120 alone (n=6) or the vaccine with daily oral administration of indol-3-car-

binol (I3C) (n=6), a naturally occurring AHR agonist. Immune signatures were compared using high-dimensional flow cytometry. Bulk RNA-sequencing of splenocytes was used to compare changes in the transcriptome. Data were compared using Wilcoxon rank-sum test.

**Results:** The expression of KLRG1, known to enhance ADCC in NK cells, increased in NK cells from the spleen, blood, bone marrow, and lung in mice that received ALVAC-SIV and alum-adjuvanted gp120, together with I3C. When comparing KLRG1+ and KLRG1- splenic NK cells in the vaccine+ I3C group, we observed heightened expression of Ly6C (facilitating effective and robust responses to infection) and CD11b (indicating mature cytolytic activity) in the KLRG1+ subset.

Furthermore, IL1 $\beta$  and TNF $\alpha$ , crucial for the lytic mechanism during ADCC, were produced at increased levels in this subset. Transcriptomics revealed an upregulation of fcgr3, which encodes for FC $\gamma$ RIII in NK cells and is essential for ADCC, in the vaccine+I3C group ( $p < 0.05$  for all).

**Conclusions:** The findings suggest that I3C modulates NK cells to enhance ADCC, indicating its potential as an adjuvant in HIV vaccine platforms such as RV144, with the capacity to improve HIV vaccine efficacy.

#### Impact of dolutegravir with tenofovir and emtricitabine on maternal metabolism in pregnant C57BL/6J mice

H. Mohan<sup>1</sup>, I. Hsieh<sup>1</sup>, J. Jao<sup>2</sup>, R. Zash<sup>3</sup>, N. Greene<sup>4</sup>, A. Copp<sup>4</sup>, L. Serghides<sup>1</sup>

<sup>1</sup>University Health Network, Toronto, Canada,

<sup>2</sup>Northwestern University Feinberg School of Medicine, Departments of Pediatrics and Medicine, Chicago, United States, <sup>3</sup>Beth Israel Deaconess Medical Center, Boston, United States, <sup>4</sup>University College London, London, United Kingdom

**Background:** As dolutegravir (DTG) has been associated with metabolic complications that could potentially influence birth outcomes, our study examined the impact of DTG on maternal metabolism during pregnancy and its potential effects on fetal development.

We report on metabolite changes in maternal plasma and liver with DTG-based treatment in mice.

**Methods:** Pregnant C57BL/6J mice were divided into control (water, N=10), 1x-DTG (2.5mg/kg, N=10, therapeutic dose), and 5x-DTG (12.5mg/kg, N=11, supratherapeutic dose), with DTG administered alongside 50mg/kg tenofovir disoproxil fumarate and 33.3mg/kg emtricitabine (TDF/

FTC). Metabolic analytes were measured in plasma and liver using liquid chromatography-mass spectrometry, with Welch's t-test identifying significant biochemical differences between groups.

**Results:** Compared to control plasma from 1xDTG+TDF/FTC group had 73 (24 upregulated, 49 downregulated) and from the 5xDTG+TDF/FTC group 385 (264 upregulated, 121 downregulated) metabolite differences. Liver from the 1xDTG+TDF/FTC group had 80 (22 upregulated, 58 downregulated) and from the 5xDTG+TDF/FTC group 315 (74 upregulated, 241 downregulated) metabolite differences. In the one carbon metabolic pathway we observed higher plasma choline phosphate, betaine, adenosylhomocysteine, and cysteine levels, while choline phosphate, betaine, and cystathionine levels were lower in the liver in the 5xDTG+TDF/FTC group versus control. In carbohydrate and energy metabolic pathways, plasma glucose and pyruvate levels were significantly higher in the 5xDTG+TDF/FTC group versus control, while fructose 6-phosphate, dihydroxyacetone phosphate, and pyruvate were higher in liver of the 1xDTG+TDF/FTC group versus control. In lipid metabolic pathway, phosphatidylethanolamine levels were higher while free fatty acids were lower in the 5xDTG+TDF/FTC plasma and liver versus control. Dicarboxylate fatty acids were lower in the liver of both DTG groups, but higher in the plasma of the 5xDTG+TDF/FTC group versus control. Markers of microbial metabolic pathways were also altered; ferulic acid 4-sulfate was significantly higher in the plasma and liver of both DTG groups, whereas indoleacetate, 4-hydroxycinnamate sulfate, and 3-indoxyl sulfate were significantly higher in plasma and liver of the 5xDTG+TDF/FTC group only compared to control.

**Conclusions:** Plasma and liver from pregnant mice receiving DTG demonstrated dose-response alterations to metabolic pathways associated with one carbon, carbohydrate and energy, lipid and microbial metabolism. Further studies are warranted to understand the clinical significance of these differences.

Interplay between plasma endocannabinoidome and fecal microbiome in people with HIV (PWH) under antiretroviral therapy with subclinical coronary artery disease: results of the Canadian HIV and Aging Cohort Study

R.-S. Mboumba Bouassa<sup>1,2</sup>, G. Giorgini<sup>3</sup>, C. Silvestri<sup>3</sup>, C. Muller<sup>3</sup>, N. Nallabelli<sup>3</sup>, Y. Alexandrova<sup>1</sup>, M. Durand<sup>4</sup>, C. Tremblay<sup>4</sup>, C. Chartrand-Lefebvre<sup>4</sup>, M. El-Far<sup>4</sup>, M. Messier-Peet<sup>4</sup>, S. Margolese<sup>5</sup>, N. Flamand<sup>3</sup>, C.T. Costiniuk<sup>2</sup>, V. Di Marzo<sup>3</sup>, M.-A. Jenabian<sup>1</sup>

<sup>1</sup>Université du Québec à Montréal (UQAM), Department of Biological Sciences, Montreal, Canada, <sup>2</sup>Research Institute of the McGill University Health Centre, Medicine, Montreal, Canada, <sup>3</sup>Canada Excellence Research Chair on the Microbiome-Endocannabinoidome Axis in Metabolic Health, Centre de Recherche de l'UICPQ, Université Laval, Quebec City, Canada, <sup>4</sup>Centre de Recherche du CHUM, Faculté de Médecine, Université de Montréal, Montreal, Canada, <sup>5</sup>CIHR Canadian HIV Trials Network, Vancouver, Canada

**Background:** HIV acquisition is associated with accelerated coronary artery disease (CAD) due to chronic inflammation. Lipid mediators from the expanded endocannabinoid system (endocannabinoidome; eCBome) and gut microbiota modulate each other and are key regulators of cardiovascular functions and inflammation.

We thus investigated the plasma eCBome and gut microbiota in PWH with subclinical CAD.

**Methods:** Antiretroviral therapy (ART)-treated HIV+CAD+ (n=87), HIV+CAD- (n=69), HIV-CAD+ (n=22) and HIV-CAD- (n=30) individuals were enrolled. CAD was assessed using cardiac computed tomography angiography. Plasma levels of endocannabinoids and their congeners were quantified using liquid chromatography coupled to tandem mass spectrometry. Bacterial composition of stools from n=107 participants was assessed by 16S rDNA sequencing and amplicon sequence variants identified to determine relative abundances of bacterial taxa and community diversity.

**Results:** The endocannabinoid *N*-arachidonylethanolamine (AEA), and its *N*-acylethanolamine (NAE) congeners, *N*-eicosapentaenylethanolamine (EPEA), *N*-linoleylethanolamine (LEA), *N*-docosahexaenylethanolamine (DHEA), and *N*-docosapentaenylethanolamine (DPEA) (n=6), were significantly lower in PWH compared to HIV-participants.

EPEA, DHEA and *N*-palmitoylethanolamine (PEA) were significantly reduced in HIV+CAD+ compared to HIV+CAD- individuals, while HIV-CAD- individuals had higher plasma levels of AEA, EPEA, LEA, DHEA, and DPEA(n=6) than HIV+CAD+. Plasma levels of monoacylglycerols (MAGs), including 2-eicosapentaenoylglycerol, 2-linoleoylglycerol, 2-docosapentaenoylglycerol, and 2-oleoylglycerol (2-OG), were significantly elevated in PWH compared to HIV- con-

trols. Moreover, the endocannabinoid 2-arachidonoylglycerol, and 2-docosahexaenoylglycerol, were increased in PWH compared to HIV- controls. While trends for increased relative abundance for several bacterial families in the faeces of HIV-CAD+ vs. controls were observed, only *Marinifilacea* was significantly increased ( $p=0.02$ ), and no such changes were observed in HIV+ individuals.

Likewise, many alterations in genera abundances in CAD+ individuals without HIV were absent in HIV+ individuals. However, some genera were found to be altered only when both CAD and HIV were present, and others by HIV alone.

**Conclusions:** Plasma eCBome is perturbed in PWH. Inverse associations between the CAD and HIV status with NAEs or MAGs point to these mediators as biomarkers of CAD in PWH. CAD-associated taxonomic alterations in faecal bacterial were not found in PWH.

## THPEA033

Differential effects of TAF, TDF and 3TC on murine weight, body composition and adipocyte differentiation

P. García-Martínez<sup>1</sup>, L. Gisbert-Ferrández<sup>1</sup>, A. Blas-García<sup>2,3,4</sup>, Á. Álvarez<sup>1,3</sup>, J.V. Esplagues<sup>1,3,4</sup>

<sup>1</sup>Universitat de València, Farmacología, Valencia, Spain,

<sup>2</sup>Universitat de València, Fisiología, Valencia, Spain,

<sup>3</sup>CIBERehd (Centro de Investigación Biomédica en Red de Enfermedades Hepáticas y Digestivas), Valencia, Spain,

<sup>4</sup>FISABIO (Fundación para el Fomento de la Investigación Sanitaria y Biomédica de la Comunidad Valenciana), Valencia, Spain

**Background:** Studies report moderate weight gain in PLWH starting antiretroviral therapy with tenofovir alafenamide (TAF), particularly when switching from tenofovir disoproxil fumarate (TDF)-containing regimens. However, the underlying mechanisms remain unclear. We evaluated the effects of TAF and TDF on weight and body composition *in vivo*, and the impact of these drugs and 3TC on adipocyte differentiation *in vitro*.

**Methods:** TDF (50mg/kg), TAF (5mg/kg), or vehicle (Vh) were orally administered to C57BL/6J mice for 16 weeks (17/group). Doses were calculated by allometric scaling and were equivalent to those used in humans. Weight gain was monitored weekly, and body composition assessed using a DXA analyzer. *In vitro*, murine 3T3-L1 preadipocytes underwent standard 7-day differentiation protocol and were treated with TDF, TAF (0.5-5μM), 3TC (1-20μM), or Vh throughout. Differentiation was characterized by assessing intracellular lipid accumulation with Oil Red O staining, mRNA expression analysis of differentiation markers (RT-qPCR) (days 3, 5, 7), and morphological analysis of cell populations by size and granularity (flow cytometer, day 7). Statistical analysis (n≥5) was performed by one-way ANOVA.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Index

**Results:** TDF-treated mice exhibited significantly lower weight gain area under curve (AUC) than Vh or TAF groups ( $Vh_{AUC}=1824\pm10.76$ ,  $TAF_{AUC}=1818\pm11$ ,  $TDF_{AUC}=1793\pm10.19$  [week-weight gain];  $p<0.0001$ ), a slight decrease in bone density and an increase in body fat percentage relative to Vh ( $Vh_{\%FAT}=14.41\pm2.63$ ,  $TAF_{\%FAT}=14.79\pm3.23$ ,  $TDF_{\%FAT}=16.85\pm2.58$ ;  $p=0.0462$ ).

*In vitro*, TAF significantly reduced lipid accumulation in 3T3-L1 cells from day 5 ( $28\pm7\%$  less than Vh;  $p<0.01$ ) until the end of differentiation ( $43.5\pm6\%$  less than Vh;  $p=0.01$ ); neither 3TC nor TDF altered this parameter. TAF's inhibitory effect was accompanied by a reduced expression of genes associated with adipocyte differentiation at days 3, 5, and 7, affecting both early (*Ppar $\gamma$* , *Fabp4*) and mature (*Lpl*, *Adipoq*) adipocyte markers. Similarly, on day 7, TAF treatment exhibited higher percentage of cells with morphology resembling undifferentiated preadipocytes.

**Conclusions:** Our findings indicate that sustained TDF administration affects body composition and weight gain in mice, whereas TAF, but not TDF nor 3TC, inhibits preadipocyte differentiation *in vitro*. These distinctive effects of these prodrugs may be involved in the weight differences observed in clinical practice, providing insights to improve HIV treatment.

## THPEA034

Differences between integrase strand transfer inhibitors on glucose tolerance: a role for mitochondrial stress

L. Gisbert-Ferrández<sup>1</sup>, P. García-Martínez<sup>1</sup>, Á. Álvarez<sup>1,1</sup>, J.V. Esplugues<sup>2,1,4</sup>, A. Blas-García<sup>3,1,4</sup>

<sup>1</sup>Universitat de València, Farmacología, Valencia, Spain,

<sup>2</sup>CIBERehd (Centro de Investigación Biomédica en Red de Enfermedades Hepáticas y Digestivas, Valencia, Spain,

<sup>3</sup>FISABIO (Fundación para el Fomento de la Investigación Sanitaria y Biomédica de la Comunidad Valenciana),

Valencia, Spain, <sup>4</sup>Universitat de València, Fisiología, Valencia, Spain

**Background:** An association between integrase strand transfer inhibitors and metabolic alterations has been suggested. This study assesses the impact of these drugs on glucose metabolism *in vitro* and *in vivo* and evaluates mitochondrial stress as a plausible underlying mechanism.

**Methods:** C57BL/6J mice received 16-week oral treatment, with doses equivalent to those used in humans, of dolutegravir (DTG, 10mg/kg), bictegravir (BIC, 10mg/kg), or vehicle (Vh), and glucose tolerance tests (GTT) were performed thereafter. RNA-seq was conducted on mice liver samples, and the enrichment analysis was carried out using bioinformatics. *In vitro* studies were conducted with the human hepatoma cell line Hep3B exposed to clinically relevant concentrations (1, 10, 20  $\mu$ M) of DTG or BIC for 48 hours.

The assessments included glucose uptake, gene expression of enzymes related to glucose homeostasis (RT-qPCR), viability (mitochondrial dehydrogenase activity, acid phosphatase assay), and mitochondrial stress (membrane potential, ROS production; by flow cytometry). Statistical analysis used one-way ANOVA ( $n\geq5$ ).

**Results:** Mice treated with BIC exhibited higher glucose levels and a slower decrease of glucose during GTT compared to DTG-treated mice or vehicle ( $AUC_{BIC}=20857\pm2957$  versus  $AUC_{DTG}=15185\pm2463$ ; or  $AUC_{Vh}=16538\pm2877$  min-mg/dL;  $p=0.001$ ). In the Gene Ontology pathway analysis of mouse liver samples, both drugs affected metabolism-related processes.

However, only BIC altered insulin cellular response ( $p=0.0009$ ), linked to changes in the expression of *Pdk4*, *Sgk1*, *Lpin1*, *Pck1*, *Cish*, *Cpeb2*, and *Pcsk9*. *In vitro*, BIC induced a significant concentration-dependent reduction in hepatocyte glucose uptake, both in basal conditions ( $48\pm4.6\%$  less;  $p<0.0001$ ) and post-insulin stimulation ( $33\pm5.0\%$  less;  $p=0.0015$ ), while DTG induced no significant changes. BIC-treated Hep3B exhibited significant alterations in mRNA expression of enzymes related to glucose metabolism (*G6PC1*, *GKC*, *GLYS2*), whereas DTG only down-regulated *GKC*. Both drugs reduced mitochondrial dehydrogenase activity, without affecting lysosomal acid phosphatase activity. BIC, but not DTG, increased ROS generation, mitochondrial membrane potential, and cellular granularity, indicating mitochondrial stress.

**Conclusions:** Sustained administration of BIC induces gene alterations in the cellular response mechanism to insulin and impairs glucose tolerance in mice. Furthermore, it also exerts a more significant influence than DTG on glucose metabolism and mitochondrial function in hepatocytes *in vitro*. These results may help clarify clinical reports associating BIC with changes in glucose metabolism.

## THPEA035

Bictegravir and Dolutegravir modify leukocyte and endothelial cell adhesion molecules

S. Fernández-Rodríguez<sup>1</sup>, V. Collado-Díaz<sup>1</sup>, A. Blas-García<sup>2,3</sup>, J.V. Esplugues<sup>1,3,4</sup>, Á. Álvarez<sup>1,3</sup>

<sup>1</sup>Universitat de València, Departamento de Farmacología, Valencia, Spain, <sup>2</sup>Universitat de València, Departamento de Fisiología, Valencia, Spain, <sup>3</sup>Centro de Investigación Biomédica en Red de Enfermedades Hepáticas y Digestivas, Valencia, Spain, <sup>4</sup>Fundación para el Fomento de la Investigación Sanitaria y Biomédica de la Comunidad Valenciana, Valenciaspains, Spain

**Background:** Clinical data suggest an association between integrase strand transfer inhibitors (INSTIs) and cardiovascular diseases, but the underlying mechanism is unclear. The interaction of endothelial cells with leukocytes, which is mediated by adhesion molecules, is impli-

Oral  
abstracts

cated in vascular inflammatory and thrombotic processes. This study analyzed the effects of four INSTIs [dolutegravir (DTG), bicittegravir (BIC), raltegravir (RAL) and cabotegravir (CAB)], a non-nucleoside reverse transcriptase inhibitor (NNRTI) doravirine (DOR) and a nucleoside reverse transcriptase inhibitor (NRTI) abacavir (ABC, known to produce cardiovascular toxicity) on the expression of leukocyte and endothelial cell adhesion molecules.

**Methods:** Whole blood (4h) or umbilical vein endothelial cells (HUVEC, 24h) obtained from healthy human donors (n<sup>35</sup>) were treated with vehicle or clinically relevant concentrations (2.5–20mM) of DTG, BIC, RAL, CAB, DOR or ABC. Flow cytometry was employed to compare the effect of each drug with that of the vehicle on the expression of the two subunits of the integrin Mac-1 (CD11b and CD18) in neutrophils and of P-selectin and ICAM-1 in HUVEC.

**Results:** BIC and ABC, but not DTG, induced a significant increase of CD11b and CD18 in neutrophils. DTG, BIC and ABC enhanced the expression of ICAM-1 and P-selectin in HUVEC (Table 1). DOR produced a slight rise in the expression of ICAM-1. None of the other drugs evaluated had effect on the adhesion molecules appraised.

Cell type	Molecule	DTG 20μM	BIC 20μM	RAL 20μM	CAB 20μM	DOR 5μM	ABC 20μM
	CD11b	105.0 ±6.7	145.9 ±11.3****	98.4 ±8.1	103.7 ±6.3	89.9 ±9.0	131.5 ±7.4****
Neutrophils	CD18	101.4 ±4.7	123.9 ±7.4**	94.1 ±5.7	111.5 ±7.9	105.4 ±4.8	117.4 ±10.1*
HUVEC	ICAM-1	118.2 ±3.9**	123.3 ±7.7*	99.5 ±5.6	104.7 ±5.1	113.8 ±4.1*	114.9 ±3.4**
HUVEC	P-selectin	119.9 ±2.8***	117.9 ±6.3*	105.6 ±2.6	98.8 ±2.4	107.0 ±4.4	109.7 ±3.3*

Table 1. Effects of different antiretrovirals on the expression of adhesion molecules in HUVEC and leukocytes.

Data are represented as mean ± SEM of the percentage of the median fluorescence intensity of each molecule vs vehicle (100%). Data were analyzed using a Kruskal-Wallis test. \*p<0.05, \*\*p<0.01, \*\*\*\*p<0.0001 vs. vehicle.

**Conclusions:** The abovementioned actions of DTG and BIC are compatible with the inflammatory vascular environment that precedes cardiovascular issues, which has been described in PLWH treated with either drug, as reported for ABC. However, it is not an effect that can be attributed to the entire INSTI family.

## THPEA036

HIV subtypes seroprevalence and their association on occurrence of Ois among the PLHIV who are on HIV-1 ART treatment regime in Njombe and Dar es Salaam, Tanzania

H.O. Kigumi<sup>1,2,3</sup>, V. John-Marry<sup>4</sup>, B.T. Mmbaga<sup>5</sup>, W. Olomi<sup>6</sup>, E.N. Nyanda<sup>7</sup>

<sup>1</sup>The Nelson Mandela African Institution of Scieces and Technology, Health and Biomedical Engeeneering, Arusha, Tanzania, the United Republic of, <sup>2</sup>Tanzania Community Health Strengthening Organization, Health, Arusha, Tanzania, the United Republic of, <sup>3</sup>Local Government Training Instituite, Health Services, Dodoma, Tanzania, the United Republic of, <sup>4</sup>The Nelson Mandela African Institution of Sciences and Technology, Health and Biomedical Sciences, Arusha, Tanzania, the United Republic of, <sup>5</sup>Kilimanjaro Clinical Research Institute, Reserach, Moshi, Tanzania, the United Republic of, <sup>6</sup>National Institute for Medical Research, Mbeya Medical Research Centre, Statistics, Mbeya, Tanzania, the United Republic of, <sup>7</sup>National Institute for Medical Research, Mbeya Medical Research Centre, HIV, Mbeya, Tanzania, the United Republic of

**Background:** HIV-1 and HIV-2 is globally known HIV types with 55% genetic differences that resulted to difference in ART treatment clinical outcomes. HIV-1 is worldwide spread compared to HIV-2 that dominated partly in Europe, USA and west Africa. Current studies shown spreads of HIV-2 to other countries due to immigration and social economic activities interactions.

This study was aimed to determine Seroprevalence of HIV-1, HIV-2 and HIV1+2 dual infection and their impacts on occurrence Opportunistic Infections (OIs) among the PLHIV who are on HIV-1 ART treatment regimen in Njombe and Dares salaam, Tanzania.

**Methods:** A retrospective cross sectional study was conducted from January 2020 to December 2021 at eight HIV Care and Treatment Centers in Njombe and Dares salaam regions Tanzania. A total of 300 participants who are on ART treatments from 2017 to 2019 were randomly selected and re-tested for HIV to determine their HIV types The patient history of OIs were taken through interview. SPSS version 26.0 were used for analysis whereby Percentages, Odds ratios (OR), 95% confidence intervals (CIs), and p-values of ≤0.001 were used for interpretation. Ethical clearance was sought from KNCHRE. All participants were provided with informed consent

**Results:** The mean age of the participants were 35.0 (SD ± 0.24) year. The general prevalence was 69%,for HIV-1 . 15% for HIV- 2 and 16% for HIV-1+2 . In stratification by region the prevalence of 25(17%) HIV-2 and HIV 1+2 dual infection 26(17%) was high in Njombe compared to Dares Salaam 23(15%) p=0.64.Tuberculosis, PCP and Esophageal candidiasis were common OIs to PLHIV with HIV-1+2 (p<0.001, 0.02, 0.02). PLHIV with HIV-2 and HIV1+2 had two times higher

risks to OIs. [(RR: 1.69, 95% CI, 1.39 - 2.07),  $P < 0.001$ , (RR: 1.78: 95%CI, 1.51-2.10  $P < 0.001$ . The study confirmed the presence of HIV-2 and HIV 1+2 infections which previously not found in Tanzania. Also the study show high risks of occurrence OIs among the PLHIV with HIV-2 and HIV1+2 infections.

**Conclusions:** Therefore the urgent intervention on initiation of HIV-2 ART regimen in Tanzania should be in-place to reduce risks of poor clinical treatment outcomes of PLHIV with HIV-2 and HIV 1+2 infections.

Risk of SARS-CoV-2 infection in association with HLA-I type and recognition of common cold coronaviruses cross-reactive T-cell epitopes in SARS-CoV-2 replicase in HIV-1 positive individuals

K.G. Schmidt<sup>1</sup>, P. Geißler<sup>1</sup>, E.-M. Schuster<sup>2</sup>, C. Schüle<sup>3</sup>, E.G. Harrer<sup>1</sup>, V. Schönau<sup>3</sup>, M. Luber<sup>4</sup>, B. Spriewald<sup>4</sup>, P. Steininger<sup>5</sup>, S. Bergmann<sup>1</sup>, A. Ensser<sup>5</sup>, K. Schober<sup>2</sup>, K. Nganou-Makamdop<sup>5</sup>, T. Harrer<sup>1</sup>

<sup>1</sup>Universitätsklinikum Erlangen and Friedrich-Alexander-Universität Erlangen-Nürnberg, Infectious Diseases and Immunodeficiency Section, Department of Internal Medicine 3, Erlangen, Germany, <sup>2</sup>Universitätsklinikum Erlangen and Friedrich-Alexander-Universität Erlangen-Nürnberg, Mikrobiologisches Institut – Klinische Mikrobiologie, Immunologie und Hygiene, Erlangen, Germany, <sup>3</sup>Universitätsklinikum Erlangen and Friedrich-Alexander-Universität Erlangen-Nürnberg, Department of Internal Medicine 3, Erlangen, Germany, <sup>4</sup>Universitätsklinikum Erlangen and Friedrich-Alexander-Universität Erlangen-Nürnberg, Department of Medicine 5, Erlangen, Germany, <sup>5</sup>Universitätsklinikum Erlangen and Friedrich-Alexander-Universität Erlangen-Nürnberg, Institute of Clinical and Molecular Virology, Erlangen, Germany

**Background:** T-cells with cross-reactivity between SARS-CoV-2 and common cold coronaviruses (CCoVs) may influence the susceptibility to SARS-CoV-2. As the SARS-CoV-2 replicase 1ab contains sequence areas with homology to CCoVs, we analyzed recognition of potential cross-reactive epitopes in a large cohort of HLA-I-typed HIV-1-positive individuals.

**Methods:** T-cell recognition of 21 homologous peptides with a length of 11 to 22 amino acids from the SARS-CoV-2 replicase 1ab sequence was analyzed in 177 HIV-1+ donors. PBMCs from 133 subjects without prior and from 44 subjects with prior SARS-CoV-2 infection were stimulated with

four peptide pools containing 5-6 peptides each. Outgrowing cells were tested for peptide recognition in an IFN- $\gamma$  ELISpot assay. Fine mapping of epitopes was performed using truncated peptides.

**Results:** A T-cell response to at least one peptide pool was observed in 84 of the 133 (63%) SARS-CoV-2 nucleocapsid antibody negative donors and in 32 of 44 (73%) donors with a prior SARS-CoV-2 infection. We could define several cross-reactive epitopes within those SARS-CoV-2 replicase peptides. The B\*35:03 restricted epitope CoV-YL8 and the C\*07-restricted peptide CoV-NM20 could be identified in donors without prior SARS-CoV-2 infection. In COVID-19 convalescent donors four additional HLA-I-restricted T-cell epitopes could be defined. Cloning of a CoV-YL8 specific TCR and the validation of its functionality in-vitro after orthotopic TCR replacement revealed better recognition of CoV-YL8 on HLA-B\*35:03 positive cells than on HLA-B\*35:01 positive cells. CoV-YL8-specific T-cells could be observed in HLA-B\*35:03+ subjects but not in HLA-B\*35:01+ donors. Analysis of the association of HLA-I alleles with the occurrence of SARS-CoV-2 infections revealed that the alleles HLA-B\*35:01 and HLA-C\*04 correlated significantly with a higher rate of SARS-CoV-2 infection, while HLA-B\*35:03 was significantly overrepresented in the SARS-CoV-2 uninfected group.

**Conclusions:** The high prevalence of SARS-CoV-2/CCoV replicase cross-reactive T-cells in our study suggests an important role of cross-reactive T-cells in SARS-CoV-2 immunity. Although HLA-B\*35:01 and HLA-B\*35:03 differ only by one amino acid, they were associated with opposing effects on the risk for SARS-CoV-2 infection. Further studies are needed to delineate whether the different effects of HLA-B\*35:03 and HLA-B\*35:01 can be explained by differences in the recognition of cross-reactive SARS-CoV-2 T-cell epitopes.

People living with and without HIV show similar polyfunctional T-cell responses to spike after vaccination with the mRNA-1273 COVID-19 vaccine

S. Khuzwayo<sup>1</sup>, F. Laher Omar<sup>1</sup>, B. Zhang<sup>2</sup>, J. Hu<sup>2</sup>, E. Smit<sup>1</sup>, K.V. Schwedhelm<sup>2</sup>, V. Voillet<sup>1</sup>, Z. Euler<sup>1</sup>, O.B. Dintwe<sup>1,2</sup>, J. Hural<sup>2</sup>, A. Tapley<sup>2,3</sup>, M. Villaran<sup>2</sup>, M. Yacovone<sup>4</sup>, N. Garrett<sup>5,6</sup>, S. Dadabhai<sup>7</sup>, P. Kotze<sup>8</sup>, N. Mgodini<sup>9</sup>, S.C. De Rosa<sup>2</sup>, M.J. McElrath<sup>2,3</sup>, Y. Huang<sup>2</sup>, E. Andersen-Nissen<sup>1,2</sup>, CoVPN 3008 Ubuntu Study Team  
<sup>1</sup>Cape Town HVTN Immunology Laboratory, Hutchinson Centre Research Institute of South Africa, Cape Town, South Africa, <sup>2</sup>Vaccine and Infectious Disease Division, Fred Hutchinson Cancer Center, Seattle, United States, <sup>3</sup>University of Washington, School of Medicine, Seattle, United States, <sup>4</sup>National Institute of Allergy and Infectious Diseases, National Institutes of Health, Bethesda, United States, <sup>5</sup>Centre for the AIDS Programme of Research in South Africa, University of KwaZulu-Natal, Durban, South Africa, <sup>6</sup>Discipline of Public Health Medicine, School of Nursing and Public Health, University of KwaZulu-Natal, Durban, South Africa, <sup>7</sup>Johns Hopkins Research Project, Blantyre, Malawi, <sup>8</sup>Qhaka Mbokodo Research Clinic, Ladysmith, South Africa, <sup>9</sup>Clinical Trials Research Centre, University of Zimbabwe, Harare, Zimbabwe

**Background:** Cellular responses to COVID-19 vaccination in people living with HIV (PLWH) are understudied in large vaccine trials. CoVPN 3008/Ubuntu, an efficacy study of the mRNA-1273 vaccine, enrolled 14,237 people living with and without HIV (PWoH) in seven African countries during the Omicron BA.4/5 wave. An immunogenicity subset of 300 volunteers (150 PLWH) provided specimens to assess cellular responses. Among the PLWH in this subset, 75% had an HIV viral load <50 copies/mL and the median CD4 count was 647 cells/mm<sup>3</sup>.

**Methods:** Participants were divided into six groups defined by SARS-CoV-2 prior acquisition status, HIV status and receipt of one/two doses of mRNA-1273 one month apart. T-cell responses to ancestral and BA.4/5-matched spike peptide pools were characterised at baseline and one-month post-vaccination by validated 27-color intracellular cytokine staining. A pre-specified covariate-adjusted comparison of T-cell response magnitudes based on IFN- $\gamma$  and/or IL-2 expression was performed. Polyfunctionality was evaluated on the expression of eight functional markers.

**Results:** Response magnitudes were higher in CD4+ than in CD8+ T-cells. Among PLWH, T-cell responses to ancestral spike in SARS-CoV-2-negative (SARS2-) individuals after two vaccinations were similar to those in SARS2+ individuals after one vaccination. A second vaccination in SARS2+ individuals elicited higher CD4+ responses than one vaccination (0.1%; 95% CI [0.05%,0.17%]). Among PWoH, SARS2-individuals with two vaccinations showed higher CD4+ responses than SARS2+ individuals with one vaccination

(0.08%; [0.04%,0.15%]); a second dose in SARS2+ individuals increased CD4+ responses (0.07%; [0.01%,0.12%]). In both SARS2- and SARS2+ individuals, similar CD4+ response magnitudes were observed between PLWH and PWoH after two vaccinations. CD8+ responses to BA.4/5 spike were marginally higher in SARS2+ PWoH after one dose (0.04%; [0%,0.09%]) than PLWH. CD4+ polyfunctionality scores were higher in SARS2+ volunteers at baseline before any doses (FDR<0.05) and increased to similar levels across all groups after vaccination.

**Conclusions:** mRNA-1273 vaccination elicited similar spike-specific CD4+ T-cell responses in PLWH as in PWoH. Differences in CD8+ T-cell responses were BA.4/5 driven and likely due to exposure to the circulating strain at the time of enrolment. These findings enhance our understanding of T-cell responses to mRNA-based COVID-19 vaccines in PLWH and PWoH.

## THPEA039

Impaired BlyS/APRIL pathway in people with dysautonomia associated to post-COVID cCondition

J. Bartolomé<sup>1,2</sup>, A. Simón-Rueda<sup>1,3</sup>, C. Sánchez-Menéndez<sup>1,4</sup>, L. Lemus-Aguilar<sup>1</sup>, E. Mateos<sup>1,5</sup>, M.A. Murciano-Antón<sup>6</sup>, A. <sup>1</sup>Instituto de Salud Carlos III, Immunopathology and Viral Reservoir Unit, National Center of Microbiology, Madrid, Spain, <sup>2</sup>Universidad Complutense de Madrid, Faculty of Science, Madrid, Spain, <sup>3</sup>Hospital Universitario Clínico San Carlos, Internal Medicine Service, Madrid, Spain, <sup>4</sup>Instituto Ramón y Cajal de Investigación Sanitaria (IRYCIS), Hematology and Hemotherapy Service, Madrid, Spain, <sup>5</sup>Instituto de Salud Carlos III, Biomedical Research Center Network in Infectious Diseases (CIBERINFEC), Madrid, Spain, <sup>6</sup>Centro de Salud Doctor Pedro Laín Entralgo, Alcorcón, Spain, <sup>7</sup>Hospital Universitario Quironsalud Madrid, Servicio de Investigación y Docencia, Madrid, Spain, <sup>8</sup>Hospital Universitario Quironsalud Madrid, Servicio de Medicina Interna, Madrid, Spain

**Background:** Dysautonomia is a clinical term used to describe several conditions that cause malfunction of the Autonomic Nervous System (ANS). Diverse origins have been described for dysautonomic alterations and has been observed that Post COVID-19 condition (PCC) is responsible for triggering dysautonomic manifestations closely related to Systemic Lupus Erythematosus (SLE), involving alterations in the immune system and, particularly, in the humoral immune response and BlyS/APRIL pathway that activates B cells.

We analysed immunological parameters associated with SLE-related changes in the humoral response to unravel possible similarities in molecular basis underlying dysautonomia in PCC.

**Methods:** Comparative, observational and transversal study involving 26 participants with PCC and dysautonomy symptoms, and 11 healthy donors. Plasma cytokine levels were analysed by Luminex and total IgG and antiphospholipid antibodies were determined by ELISA. PB-MCs were analysed by flow cytometry.

**Results:**

1) Median age of PCC participants with dysautonomia was 47 years-old (IQR 45-52), and 90% were female. Median age of healthy donors was 28 years-old (IQR 25-40), and 80% were female.

2) Although CD19+ cells were 1.6-fold ( $p=0.0395$ ) higher in dysautonomic PCC participants than healthy donors, total IgGs levels were lower in these individuals (-1.8-fold,  $p=0.0026$ ).

3) Accordingly, levels of B-Lymphocyte Stimulator (BLyS) and A-Proliferation-Inducing Ligand (APRIL) were also lower in dysautonomic PCC (-1.2-fold;  $p=0.0287$ ; and -1.2-fold;  $p=0.0342$ , respectively). Therefore, CD19-APRIL+ cells were 2.0-fold lower in dysautonomic PCC ( $p=0.0014$ ).

4) On the other hand, the levels of CXCL10, which are generally increased in people with inflammatory and autoimmune diseases such as SLE, were 1.5-fold ( $p=0.0469$ ) higher in dysautonomic participants than healthy individuals. CXCL10 has a significant role in inflammation.

5) Two participants of PCC with dysautonomia were positive for anti-phospholipid antibodies.

**Conclusions:** Dysautonomia is characteristic in people with SLE, in which the BLyS/BAFF/APRIL pathway is usually enhanced. Although some parameters in PCC with dysautonomia resembled SLE, the humoral response was generally impaired by through downregulation of BLyS/APRIL pathway. These results counters the hypothesis about the autoimmune origin of PCC.

### Longitudinal assessment of SARS-CoV-2 immunogenicity in people with HIV stratified by CD4+ T-cell count: a two-year follow-up study

M.J. Jongkees<sup>1</sup>, S. Bogers<sup>2</sup>, R.D. de Vries<sup>2</sup>,

C.H. GeurtsvanKessel<sup>2</sup>, P. Miranda Afonso<sup>3</sup>, B.J. Rijnders<sup>1</sup>, K. Brinkman<sup>4</sup>, C. Rokx<sup>1</sup>, A.H. Roukens<sup>5</sup>

<sup>1</sup>Erasmus University Medical Center, Department of Internal Medicine, Section Infectious Diseases, and Department of Medical Microbiology and Infectious Diseases, Rotterdam, Netherlands, the, <sup>2</sup>Erasmus University Medical Center, Department of Viroscience, Rotterdam, Netherlands, the, <sup>3</sup>Erasmus University Medical Center, Department of Epidemiology and Biostatistics, Rotterdam, Netherlands, the, <sup>4</sup>OLVG Hospital, Department of Internal Medicine and Infectious Diseases, Amsterdam, Netherlands, the, <sup>5</sup>Leiden University Medical Center, Department of Infectious Diseases, Leiden, the Netherlands

**Background:** We hypothesized that people with HIV (PWH) with low CD4+ T-cells have lower SARS-CoV-2 antibody responses over time compared to PWH with normal CD4+ T-cells.

**Methods:** The primary endpoint was the SARS-CoV-2 S1-specific antibody level in PWH with baseline CD4+ T-cell counts  $\leq 350$  versus  $>350$ . We used a mixed-effects model to compare the longitudinal evolution over two years between these groups. The secondary endpoint was the incidence of self-reported breakthrough infections, confirmed by a positive PCR or rapid antigen test.

Longitudinal dynamics of S1-specific antibodies in PWH with CD4+ T-cells  $\leq 350$  ( $N=35$ ) versus  $>350$  ( $N=137$ ), by using mixed-effects regression. Shading indicates the 95% confidence interval and the median time points of the first, second, and third SARS-CoV-2 booster vaccinations are graphically indicated.

**Results:** In total, 175 PWH were included, of whom 38 had CD4+ T-cells  $\leq 350$ . Sex and age were comparable between both groups; PWH were predominantly male (89%) with a median age of 58 years (IQR 49-66). In the  $\leq 350$  CD4+ T-cells group, most recent and nadir CD4+ T-cells were 260 (IQR 189-295) and 50 (IQR 19-115), respectively, with plasma HIV-RNA  $<50$ copies/mL in 89%. In the  $>350$  CD4+ T-cells group, most recent and nadir CD4+ T-cells were 780 (IQR 560-980) and 230 (IQR 150-345), respectively, with plasma HIV-RNA  $<50$ copies/mL in 97%. The breakthrough infection rate was 57% in PWH with CD4+ T-cells  $\leq 350$  and 53% in those with CD4+ T-cells  $>350$ . Over the two-year follow-up,

both groups received a median of four vaccinations (IQR 4–5). Although PWH with CD4+ T-cells  $\leq 350$  exhibited lower S1-specific antibodies one month after primary vaccination ( $p=0.006$ ), this difference disappeared at month six, when most participants had received a first booster vaccination. Between six months and two years after primary vaccination, dynamics of S1-specific antibodies were comparable between PWH with CD4+ T-cells  $\leq 350$  and  $>350$ .

**Conclusions:** Although PWH with CD4+ T-cells  $\leq 350$  showed diminished antibody responses one month after primary vaccination in comparison to PWH with CD4+ T-cells  $>350$ , this difference disappeared over time, leading to a similar humoral response from six months onwards.

## THPEB041

## Cause specific mortality incidence in the Thai National AIDS Program: 2008-2023

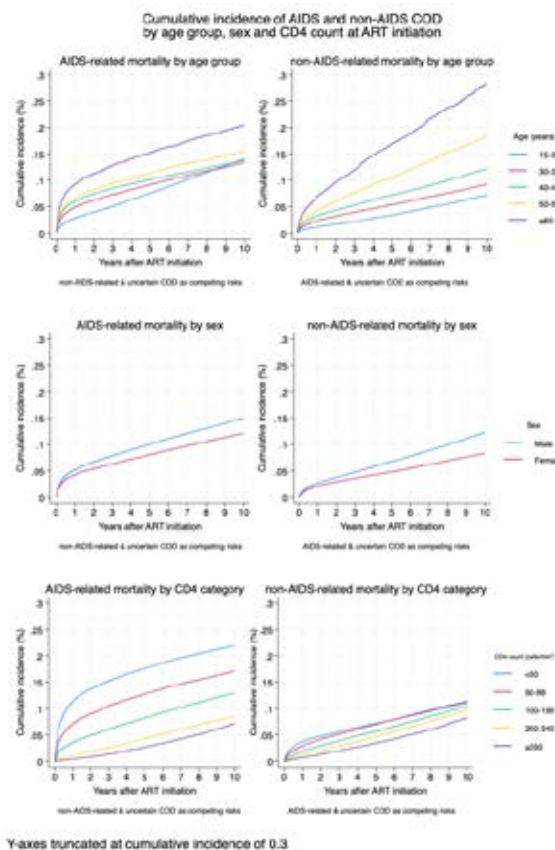

C. Lertpiriyasuwat<sup>1</sup>, S.J. Kerr<sup>2,3,4</sup>, S. Noknoy<sup>1</sup>, P. Namahoot<sup>5</sup>, T. Apornpong<sup>2</sup>, N. Punsuwan<sup>1</sup>, O. Pucharoen<sup>6</sup>, P. Chetchotisakd<sup>7</sup>, A. Avihingsanon<sup>2,8</sup>, C. Bowonwatanuwong<sup>9</sup>, K. Ruxrungtham<sup>10,11</sup>  
<sup>1</sup>Ministry of Public Health, Division of AIDS and STIs, Nonthaburi, Thailand, <sup>2</sup>HIV-NAT, Thai Red Cross AIDS Research Centre, Bangkok, Thailand, <sup>3</sup>Chulalongkorn University, Biostatistics Excellence Centre, Faculty of Medicine, Bangkok, Thailand, <sup>4</sup>The Kirby Institute, UNSW, Sydney, Australia, <sup>5</sup>National Health Security Office, Nonthaburi, Thailand, <sup>6</sup>Chulalongkorn University, Division of Infectious Diseases, Department of Medicine, Faculty of Medicine, Bangkok, Thailand, <sup>7</sup>Srinagarind Hospital, Khon Kaen University, Department of Medicine, Faculty of Medicine, Khon Kaen, Thailand, <sup>8</sup>Chulalongkorn University, Center of Excellence in Tuberculosis, Faculty of Medicine, Bangkok, Thailand, <sup>9</sup>Chonburi Hospital, Chonburi, Thailand, <sup>10</sup>Chula Vaccine Research Center, Bangkok, Thailand, <sup>11</sup>Chulalongkorn University, School of Global Health, Faculty of Medicine, Bangkok, Thailand

**Background:** Access to antiretroviral therapy (ART) changed cause of death (COD) in people living with HIV (PLH). We assessed cause specific mortality incidence in PLH who started treatment under the Thai National Universal Treatment program.

**Methods:** PLH aged ≥15 years starting antiretroviral therapy (ART) in the Thai National Treatment program from January 2008 – December 2021 were studied. Data was censored in January 2023. COD was broadly categorised as AIDS-related, non-AIDS-related or uncertain. Competing risk models were used to calculate the cumulative incidence (CI) of each COD, with other COD as competing risks.

**Results:** 385,344 PLH (63% male, 37% female, median (10<sup>th</sup> – 90<sup>th</sup> percentile) age 36 (23-50) years initiated ART. Median (Interquartile range ([IQR]) follow-up duration was 5.1 (1.9 – 8.8); years. Baseline CD4 counts were the closest in a window 1 year before to 45 days after ART start. Although guidelines recommended initiating ART at any CD4 count from 2014, >25% of participants in most subsequent years started ART with CD4 <100 cells/mm<sup>3</sup>. Over 2,145,488 person years, 72,225 people died: 40,338 (55.85%) from AIDS-related, 29,000 (40.15%) from AIDS-unrelated and 2,887 (4%) from uncertain COD. The 3 most common AIDS-unrelated COD were infectious (8.5%), cardiovascular disease (6.3%) and non-AIDS-related cancers (6.5%). Both AIDS- and non-AIDS COD increased with lower baseline CD4 counts

(Figure). The 10 year CI of AIDS-, non-AIDS- and uncertain COD were 13.8%, 10.6% and 1.0%, respectively. Men had a higher 10 year CI of AIDS (15 vs 12.1%) and non-AIDS (12.3 vs 8.4%) COD than women. Like non-AIDS COD, AIDS-related COD initially highly correlated with increasing age, but the AIDS-related CI in adults aged 15-29 rapidly increased and became similar with that of adults aged 30-49 after 7 years.

**Conclusions:** Further efforts are necessary to reach PLH in Thailand who continue to present late for treatment, with adverse impacts on survival.

## THPEB042

## A long-term follow-up of 36 HIV elite controllers not on ART- A single institutional experience

T. Gilada<sup>1</sup>, P. Gilada<sup>1</sup>, L. Singh<sup>1</sup>, S. Chougale<sup>1</sup>, I. Gilada<sup>1</sup>

<sup>1</sup>Unison Medicare and Research Centre, Mumbai, India

**Background:** HIV elite controllers naturally have undetectable viral loads and show lack of infection progression over extended periods. Use of ART in these individuals is subject of controversy. Test and treat strategy without baseline viral loads misses elite controllers.

While recent data indicates ART might reduce immune activation and risk of complications, its benefit on clinical outcomes has not demonstrated. Long-term follow-up of elite controllers not on ART can help answer these questions.

**Methods:** Baseline viral loads were available for 2125/4030 persons living with HIV in our prospectively maintained database of 4030 individuals enrolled for care at our comprehensive HIV clinic in Mumbai from January 2001 through December 2023. 36/2125 (1.7%) were elite controllers and had annual follow-up for at least 5 years. We did retrospective analysis of medical records with respect to clinical and laboratory parameters at three time-points: HIV diagnosis/baseline, 5 years follow-up and last follow-up visit.

**Results:** 32/36 (89%) had HIV-1 while 4/36 had HIV-2. 77% were females(n=28). The median age at diagnosis was 32 years (range:7-62 years). The mean duration of follow-up was 15 years 2 months (range: 5 years 2 months to 22 years 8 months). The reason for HIV testing were partner or parental notification (24/36), pre-surgical testing (8/36) and self-suspicion (4/36); none for clinical signs or symptoms. The mode of transmission was sexual in 30, MTCT in 4 and infected blood products in 2. The mean CD4 levels were 719 at baseline (range: 352-1217), 708 at 5 years (range: 444-1534) and 811 at last follow-up visit (range: 453-1288). All participants were alive and without OI or STI, apart from one participant with pulmonary tuberculosis. There was one pregnancy each in three participants without MTCT, despite not receiving ART. 4/36 (11%) were eventually initiated on ART (table).

Gender/Age in years at diagnosis	Duration from diagnosis to ART initiation	Reason for initiation	CD4 at ART initiation	VL at ART initiation (copies/ml)
Female / 32	11 years	Immune thrombocytopenia	713	<400
Female / 7	7 years	Viremia	930	22,700
Male / 29	6 years	Pulmonary tuberculosis	427	<34
Female / 25	9 years	Pregnancy	618	<400

**Conclusions:** There was a relatively higher percentage of elite controllers (1.7%), with a striking female preponderance. Infrequent long term complications, relatively high CD4 counts and no MTCT in this cohort indicate a distinctive immunology that needs to be further evaluated. Presence of elite controllers, although uncommon, makes it pertinent to do baseline viral load testing to identify them and reassess need for ART.

## THPEB043

### An analysis of outcomes of Uganda's response to Advanced HIV Disease (AHD) in selected health facilities in Central Uganda

C.M. Ngonzi<sup>1</sup>, D. Kajjumba<sup>1</sup>, J. Nampijja<sup>1</sup>

<sup>1</sup>Makerere University School of Public Health, Kampala, Uganda

**Background:** An estimated 1,400,000 million people in Uganda live with HIV/AIDS. Of these 15%-25% of present with Advanced HIV Disease (AHD) upon diagnosis or re-engagement in HIV care. One in three people with AHD die on hospitalization or after discharge within a year, even after starting ART. Common AHD-related conditions include TB, cryptococcal meningitis (CM) & and cancers. A national AHD response was set up in 2017. Package of care includes:

- (i) PoC screening for CD4 counts, TB & CM,
- (ii) rapid ART initiation,
- (iii) updated prevention/treatment protocols for AHD, and
- (iv) enhanced adherence counseling.

AHD is defined as living with HIV and CD4 cell count of <200 cells/mm<sup>3</sup> or WHO stage 3 or 4 in adults and adolescents, and all children living with HIV younger than 5 years.

The goal of the national AHD program was to reduce morbidity and mortality related to AHD among People Living with HIV (PLHIV). We present an analysis of Uganda's AHD program in selected health facilities in Uganda between 2020-2023.

**Methods:** Data was extracted from the District Health Information Software (DHIS)2 for 15 selected health sites in Central Uganda. We analyzed secondary data for 11,572 ART clients between 2020-2023. For this analysis we included all clients including children and adults on ART.

**Results:** We noted Improvements in screening for AHD from 15 in 2020 to 73% in 2023 and there was a reduced percentage of HIV-positive clients with AHD from 27% in 2020 to 18% in 2023. The percentage of Serum Cryptococcal Antigen (CrAg)-positive clients initiated on fluconazole improved from 84% in 2020 to 91% in 2022. TB-LAM screening improved from 57% in 2020 to 73% in 2023 with a Positivity yield of 19% while TB-LAM positive clients initiated on TB treatment improved from 83% in 2020 to 91% in 2023.

**Conclusions:** There is awareness and implementation of screening protocols for AHD in health facilities. There is need to ensure consistent availability of commodities and supplies for AHD care. Conduct data-driven initiatives at the facility level to continuously monitor AHD trends, identify emerging challenges, and inform tailored interventions.

### THPEB044

#### Factors associated with viral load suppression in pregnant and postpartum women living with HIV in Rwanda: an open-observational cohort study

A. Munyaneza<sup>1</sup>, K. Hae-Young<sup>2</sup>, S. Qiuhu<sup>3</sup>, E. Brazier<sup>4</sup>, J. Ross<sup>5</sup>, B. Muhoza<sup>1</sup>, F. Kanyabwishi<sup>1</sup>, G. Kubwimana<sup>1</sup>, G. Murenzi<sup>1</sup>, D. Nash<sup>4</sup>, K. Anastos<sup>5</sup>, M. Yotebieng<sup>5</sup>

<sup>1</sup>Research for Development (RD Rwanda), Einstein Rwanda Research and Capacity Building Program, Kigali, Rwanda,

<sup>2</sup>Institutional Centers for Clinical and Translational Research, Boston Children's Hospital, Boston, United States, <sup>3</sup>Department of Public Health, New York Medical College, Valhalla, New York, United States, <sup>4</sup>Institute for Implementation Science in Population Health, City University of New York, Graduate School of Public Health and Health Policy, New York, United States, <sup>5</sup>Division of General Internal Medicine, Albert Einstein College of Medicine/Montefiore Medical Center, Bronx, New York, United States

**Background:** Ensuring HIV viral load suppression (VLS) in pregnant and postpartum women living with HIV (WLHIV) is crucial for their health and preventing mother-to-child transmission (PMTCT). Despite a scale-up in viral load (VL) testing in Sub Sahara Africa, there are limited data on VL monitoring among pregnant WLHIV.

This study aimed to assess VLS prevalence and associated factors among pregnant and postpartum Rwandan WLHIV by 12 months following registration in antenatal care (ANC).

**Methods:** We designed an open observation cohort study, utilizing clinical data from ten Rwandan HIV clinics in the Central Africa International epidemiology Databases to Evaluate AIDS (CA-leDEA). We extracted information from WLHIV on antiretroviral therapy (ART) who became pregnant and were referred to PMTCT services at leDEA sites between 2012 and 2020.

We examined the proportions of WLHIV with at least one available VL result, and the proportion achieving VLS (<1000 copies/mL), within 12 months of pregnancy documentation. Logistic regression models were fitted to assess associations between socio-demographic, HIV-related, and obstetrical factors and VLS.

**Results:** Out of the 1002 eligible WLWH, 53% (532) with documented viral load (VL) results were analyzed. Among them, 60% were aged 25-34, and 21% were ≤ 24 years. The majority (84%) were primigravida, and 67% had initiated ART before pregnancy. About 90% were in WHO stages 1 or 2, with 57% having a CD4 count ≥500 cells/uL.

At 12 months after pregnancy registration, 92% achieved VL <1000 copies/mL. WHO stage 3 or 4 was associated with lower odds of VLS at thresholds of <1000 copies/mL (aOR 0.43 95% CI: 0.19, 0.98) compared with WHO stage 1 or

2. Similarly, CD4 counts <200 (aOR: 0.26, 95% CI: 0.08, 0.82), and CD4 counts between 200 and <500 (aOR: 0.42, 95% CI: 0.21, 0.86) compared to CD4 counts ≥ 500.

**Conclusions:** Nearly half of pregnant and postpartum WLHIV in the CA-leDEA HIV clinics in Rwanda lacked recorded VL results from 12 months post-ANC registration. Among those with results, nine out of ten achieved VLS, but advanced disease stages were linked to lower VLS odds, underscoring the need for targeted monitoring.

### THPEB045

#### Use of "client services Audit tools" to promote patient centered monitoring for provision of all HIV services. A case of 130 public health facilities in Ankole region, Uganda

A. Kwiseera<sup>1</sup>, M. Kidega<sup>1</sup>, A. Nkoyoyo<sup>1</sup>

<sup>1</sup>The AIDS Support Organisation, USAID LPHS Ankole, Kampala, Uganda

**Background:** WHO Consolidated Guidelines 2022 on person centered strategic Information defines person-centered monitoring refers to a shift from monitoring measuring services (e.g., the number of HIV tests or people on treatment) to monitoring people at the center of their access to linked HIV and health services.

In essence, this marks a shift to better support the clients accessing services by focusing more on their individual health outcomes.

USAID Local Partner HIV Services - Ankole worked with 130 public health facilities to optimize use of "Client services Audit tool", focusing on ensuring that no client misses services they are eligible to receive during their routine clinic visits

**Description:** Using audit tools, held pre-clinic micro-planning meetings to review clients who are on scheduled appointment at ART clinics by retrieving files and flagging the services that are missed using a masking tape and there after attach a Community Health Workers who take record of all the services their clients are due for and updates the details on file and removes the mark

Figure. All services provision trends for different categories.

**Lessons learned:** Adult clients 20+ years that receive all services that they are meant to receive at each clinic visit in Ankole region improved from 32% (Feb 2023) to 70%

Oral  
abstracts

Poster  
exhibition

E-posters

(Nov 2023), Children living with HIV (CALHIV) getting all services they are meant to receive improved from 31% (Feb 23) to 67% (Nov 23) whereas PMTCT pregnant and lactating mothers receiving all services improved from 9% (Feb 23) to 49% (Nov 23)

#### Conclusions/Next steps:

- Patient level monitoring using "Audit tools" helps to track provision of all services to clients comprehensively with focus on children, adults and PMTCT separately
- Optimization of audit tools helps clinic staff to focus on each individual client.
- Micro-planning at clients helped teams to identify clients who missed services during routine clinic visits

Pietermaritzburg, South Africa, <sup>4</sup>University of the

Witwatersrand, Johannesburg, South Africa, <sup>5</sup>Swiss

Tropical and Public Health Institute, Allschwil, Switzerland,

<sup>6</sup>University of Basel, Basel, Switzerland

**Background:** People with advanced HIV disease (AHD) (CD4 <200 cells/ $\mu$ L or World Health Organization stage III/IV conditions in those >5 years) have high mortality. CD4 testing is needed to implement the AHD care package. VISITECT® CD4 Advanced Disease (VISITECT; AccuBio Limited, UK) is a semi-quantitative test showing a CD4 result of  $\leq$ 200 cells/ $\mu$ L or >200 cells/ $\mu$ L. VISITECT had a 95% (95%CI 92-97%) sensitivity and 85% (95%CI 83-86%) specificity when tested on venous blood in laboratory conditions. We assessed VISITECT's diagnostic accuracy compared to Alere PIMA CD4 (PIMA, Abbott, US), during pragmatic implementation at point-of-care, within the AHD care package.

**Methods:** During community-based active tuberculosis case-finding trial (TB TRIAGE+ TRIAL, NCT05526885), we are testing a subset of PLHIV in South Africa with PIMA (reference test, gives exact CD4 count) and VISITECT (index test, requires visual comparison of test line to 200-reference line) (recruitment ongoing until sample size of 611). Nurses performing clinical evaluations and TB triage tests, also perform the two CD4 tests on the same venous blood sample, and if PIMA indicates a CD4 $\leq$ 200cells/ $\mu$ L, urine tuberculosis lipoarabinomannan and cryptococcal antigen testing.

**Results:** Between August 2023 and January 2024, 163 PLHIV had a VISITECT and PIMA result (Table).

Variable	Category	n	%	PIMA CD4 $\leq$ 200 cells/ $\mu$ L (n, %)	PIMA CD4>200 cells/ $\mu$ L (n, %)	p-value
Gender	Ambiguous / intersex	1	0,6%	0	0,0%	1
	Female	107	66,0%	0	0,0%	107
	Male	54	33,3%	5	9,3%	49
Median age (years) [IQR]		42	[35-50]	42	[35-50]	43
HIV status	Known positive on ART	155	95,7%	3	1,9%	152
	Not on ART	7	4,3%	2	28,6%	5
VISITECT	CD4 $\leq$ 200	41	25,2%	5	12,2%	36
Result (cells/ $\mu$ L)	CD4>200	122	74,8%	122	100,0%	0

p-values: Fisher's exact or Wilcoxon rank sum test\*. IQR=interquartile range, PIMA= Alere PIMA CD4, VISITECT= VISITECT CD4 Advanced Disease

Table.

Among them, 3.1% (5/163, 95%CI 1.0-7.0%) had a CD4 $\leq$ 200 cells/ $\mu$ L on PIMA and 25.2% (41/163, 95%CI 18.7-32.5%) on VISITECT. Compared to PIMA, the sensitivity of VISITECT was 100.0% (5/5, 95%CI 47.8-100), the specificity 77.2% (122/158, 95%CI 69.9-83.5%), the positive and negative predictive value 12.2% (5/41, 95%CI 4.1-26.2%) and 100.0% (122/122, 95%CI 97.0-100.0%), respectively. VISITECT misclassified 22.1% (36/163, 95%CI 16.0-29.2) of tests as CD4 $\leq$ 200 cells/ $\mu$ L (median CD4 585 (IQR: 435-747 cells/ $\mu$ L)).

**Conclusions:** During pragmatic implementation, VISITECT's sensitivity was optimal, but specificity was low compared to PIMA. Thus, the cheap and instrument-free VISITECT could be considered as CD4 triage test before using other CD4 tests.

## THPEB047

**Implementing a multipronged approach helped improved viral load testing coverage in Nepal**

D.P. Bhandari<sup>1</sup>, R. Khanal<sup>1</sup>, N. Sedhain<sup>1</sup>, S. Pandit<sup>1</sup>,

P. Khatiwada<sup>1</sup>, K. Adhikari<sup>1</sup>, Y.R. Sapkota<sup>1</sup>, M. Kariuki<sup>2</sup>,

P.K. Thakur<sup>2</sup>, D.T. Weldegebreal<sup>3</sup>, I. Lohar<sup>3</sup>

<sup>1</sup>FHI 360 Nepal, Kathmandu, Nepal, <sup>2</sup>FHI 360, Washington

D.C., United States, <sup>3</sup>USAID Nepal, Kathmandu, Nepal

**Background:** At the end of 2020, in Nepal viral load (VL) sample collection was not systemic, eligible PLHIV were not followed individually, machine maintenance and supply related challenges were present and test results were not reported timely. As the result, only half of the eligible people living with HIV (PLHIV) on treatment had documented VL test result.

The objective of the abstract is to share the lessons learned from the implementation of multipronged approach to improve VL coverage.

**Description:** In Dec 2020, EpiC Nepal project developed a case management guide with defined responsibilities of staff; trained the case management team and provide supports virtually. In Oct-Dec 2021, the project prioritized 12 of 56 sites with high patient load (85% of total on treatment) but low VL testing coverage using color-coded

tracker and monitoring the progress against fixed weekly targets for sample collection. Machines maintenance, reagents supply, sample transfer and reporting were strengthened. In Oct-Dec 2022, viral load surge activities were implemented strengthening previous interventions by supporting at the national, facility and in the community level for improving VL coverage.

**Lessons learned:** With introduction of case management guide, training, and virtual call support increased VL coverage from 54% to 76%. Prioritization of VL sample collection sites with color coded tracker, monitoring the progress, improving supply and maintenance increase overall coverage to 80% and implementing viral load surge activities increased the viral load coverage to 89%. Positive correlation and statistically significant relationship were observed between reporting year and viral load uptake ( $P < 0.001$ ) with correlation coefficient of 0.857. For details see Figure 1.

Figure 1.

**Conclusions/Next steps:** Multipronged approach with use of case management guidelines, color coded tracker and comprehensive surge activities contributed to rapid increase in VL coverage. These interventions can be replicated in other projects.

## THPEB048

### Evaluation of tubular renal parameters and of a panel of biomarkers of tubular injury in people living with HIV

S. Vidal Garcia<sup>1</sup>, I. Garcia Soriano<sup>2</sup>, I. Izuzquiza<sup>3</sup>, A.I. Pelaez<sup>1</sup>, M. Menacho<sup>4</sup>, A. Guillen<sup>2</sup>, J.A. Ros Betancourt<sup>5</sup>, A. Abad<sup>3</sup>, E. Morcillo<sup>1</sup>, C. Santiuste<sup>4</sup>, J.M. Del Rey<sup>4</sup>, J.L. Casado<sup>3</sup>

<sup>1</sup>Hospital Rafael Mendez, Lorca, Spain, <sup>2</sup>Hospital Universitario, Internal Medicine, Elda, Spain, <sup>3</sup>Hospital Ramón y Cajal, Infectious Diseases, Madrid, Spain, <sup>4</sup>Hospital Ramón y Cajal, Biochemistry, Madrid, Spain, <sup>5</sup>Hospital General Universitario, Elche, Spain

**Background:** There are scarce data about the role of different tubular renal parameters and renal biomarkers in people living with HIV (PLWH), and the expected changes after combination antiretroviral therapy (ART) including tenofovir disoproxil fumarate (TDF).

**Methods:** Prospective cohort study of 284 PLWH (19% females) who had sequential urine samples after inclusion for evaluating changes in the estimated glomerular filtration rate (serum creatinine -eGFR-scr-), 5 tubular parameters (proteinuria, albuminuria, phosphaturia, uricosuria, glycosuria) and 4 urinary biomarkers (low weight molecular proteins, LWMPs) of tubular dysfunction ( $\beta$ -2 microglobulin -  $\beta$ 2M, retinol binding protein -RBP-, urinary cystatin C -uCysC-, N-acetyl- $\beta$ -d-glucosaminidase -NAG).

**Results:** Median age was 47 yrs (range, 23-74). HCV coinfection, HBP and diabetes were observed in 30%, 9% and 3%, respectively. Nadir CD4+ count was 257/mm<sup>3</sup> (IQR, 150-365). After 59.8 months on TDF, despite a significant decrease (-4.5 ml/min/1.73m<sup>2</sup>,  $p < 0.01$ ), median GFR-scr was 91 ml/min (CKD 5%), tubular parameters alteration was correlated and it was frequently observed (proteinuria  $\geq 100$  mg/g in 40%, microalbuminuria in 6%, phosphaturia  $\geq 20\%$  in 52%, uricosuria  $\geq 10\%$  in 19%, glucosuria 8%) and tubular dysfunction ( $\geq 2$  abnormalities) was present in 30%. LWMP were closely correlated ( $\rho = 0.973$ ;  $p < 0.01$  B2M and uCysC), directly correlated with tubular parameters, and inversely correlated with eGFR-scr ( $p < 0.01$ ). Importantly, LWMP were not associated with nadir or current CD4+ count but were mildly correlated with age. In a ROC analysis, LWMP were increased in those PLWH with concomitant tubular dysfunction (B2M 0.73) or CKD (B2M 0.77; RBP and uCysC 0.71), and they were predictive of tubular dysfunction (NAG 0.73) and CKD (B2M 0.77; NAG 0.7) in a sequential evaluation after 9.2 months (4-13).

**Conclusions:** This is the first study showing the usefulness of different biomarkers of TDF-associated toxicity, such as uCysC or NAG. Specifically, these LWMP were correlated with changes in tubular parameters, and were associated with further tubular dysfunction and eGFR decrease. Thus, this study confirms that LWMPs in urine could be used as non-invasive biomarkers for the detection of renal toxicity associated with TDF.

(ISF), Geneva, Switzerland, <sup>12</sup>Ministère de la Santé et du Développement Social, Bamako, Mali, <sup>13</sup>National AIDS and STI Control Council (NASCO), Nairobi, Kenya, <sup>14</sup>Programme National de Lutte contre le VIH/SIFA et IST, Kinshasa, Congo, the Democratic Republic of the

**Background:** WHO recommends countries use a verified testing strategy whereby only three consecutive reactive results are used to provide a positive diagnosis. Verifying algorithms are critical as it identifies risks shared false reactivity between tests which is known to contribute to misdiagnosis.

We present results from 9 country-led verification studies, as well as their impact on national policy decisions.

**Methods:** Between 2020 and 2023, WHO, in partnership with countries, implemented 9prospective cross-sectional studies using characterized venous blood samples. HIV-negative samples were selected and tested on two lots of HIV rapid diagnostic tests (RDTs) which were pre-selected by countries.

Anonymized results were pooled and analyzed to investigate shared false reactivity between tests and the rate of false reactive (FR) per RDT. We further assessed national policy changes as of January 17 2024.

**Results:** The number of samples per country ranged from 100 to 300. The number of RDTs examined ranged from 4 to 13 (median=8), depending on the country, with a total of 18 different RDTs examined. The number of countries examining the same RDT varied from 2 to 6, depending on the RDT. Across all countries, a total of 1,6174 RDT results were included in the analysis. The total number of FR was 139, and the proportion of FR per RDT ranged from 0% to 4%. Only one RDT, in one country, showed an FR > 5%.

Among RDTs examined, 3 countries showed no shared FR. Among the remaining 6 countries, between 1 and 4 samples showed FR on at least 2, and up to 6, tests.

All 9 countries used these data to update existing testing algorithms. Of the 6 countries using RDTs prior to the study, two-thirds (4/6) reported that they introduced at least one new test.

**Conclusions:** FR rates, as well as shared false reactivity between tests, vary from country to country. Verification studies are important for delivering accurate HIV testing services and can also help countries update national testing algorithms and accelerate market entry for new products .

## THPEB050

### Long acting Cabotegravir/Rilpivirin therapy resulting in insufficient drug levels with the risk of resistance development observed in routine laboratory analysis

R. Ehret<sup>1</sup>, B. Krüdwagen<sup>1</sup>, M. Obermeier<sup>1</sup>

<sup>1</sup>Medizinisches Infektiologiezentrum Berlin, Laboratory Medicine, Berlin, Germany

**Background:** The relatively new therapy form of injectable drugs (cabotegravir and rilpivirine, CAB and RPV) is enjoying increasing popularity. It is especially aimed at people living with HIV for whom regular daily administration is difficult or burdensome. To improve adherence to therapy in these cases this new treatment form is seen as particularly advantageous.

We have investigated the plasma drug levels of individuals on long acting therapy.

**Methods:** We measured the plasma levels of 68 adjusted clients by LC/MS/MS based on physician requests. At a dosage of 1x600 mg CAB every 2 months, a trough level (Ctau) of approx. 1600 ng/ml should be reached. For the injection of RPV every 2 months at a dosage of 900 mg, the Ctau target is 65.6 ng/ml ([www.hiv-druginteractions.org/prescribing\\_resources/hiv-pk-cabotegravir-im;SmPC](http://www.hiv-druginteractions.org/prescribing_resources/hiv-pk-cabotegravir-im;SmPC)). Sequencing was performed with the Sentosa® SQ HIV Resistance NGS-Assay, Vela diagnostics, Singapore.

**Results:** Of 68 measurements, 45 were diagnosed with a value below the target trough level for RPV; in addition, no RPV was detectable in the plasma of five clients (detection level 25 ng/ml). 23 samples showed CAB levels below the target level; 16 of them also had reduced RPV levels. In four clients with low drug levels, HIV-1 viral load could be detected in parallel; for one client, resistance to both drugs was detected: Integrase L74I, S119P, G140AG, Q148R and Reverse Transcriptase E138K in an HIV-1 subtype A6.

This client should not have been treated with CAB according to the recommendations. In another client with low RPV levels and suppressed viral load, proviral analysis revealed an emerging Y181C mutation alongside the wild type, apparently an evolving resistance to RPV.

The integrase was still wild-type and showed no L74I mutation in an A1 subtype. In a third sample with low RPV-levels and low VL no resistance-relevant mutation could be detected in a subtype B virus.

**Conclusions:** We strongly recommend checking drug levels when administering long-acting therapies to avoid clients with insufficient levels. But what are inadequate drug levels, do we have the right limits, and how long will this therapy tolerate lowered levels before resistance develops? Questions that need urgent clarification for the benefit of clients.

## THPEB051

Use of Tuberculosis Lipoarabinomannan (TB-LAM) to improve management and avert mortalities among newly diagnosed people living with HIV (PLHIV) with advanced HIV disease (AHD): findings from Kakamega County, Kenya

L.W. Nyukuri<sup>1</sup>, S. Walata<sup>2</sup>, H. Alwang'a<sup>1</sup>, R. Muinde<sup>3</sup>, D. Canagasabay<sup>4</sup>, I. Thior<sup>4</sup>, J. Thoya<sup>3</sup>

<sup>1</sup>PATH Kenya, Kakamega, Kenya, <sup>2</sup>Ministry of Health, Kakamega, Kenya, <sup>3</sup>PATH Kenya, Homabay, Kenya, <sup>4</sup>PATH, Washington, United States

**Background:** Mortality among PLHIV newly initiated on antiretroviral treatment (ART), due to Immune Reconstitution Inflammatory Syndrome (IRIS), remains a major concern in managing AHD. Pre-existing latent opportunistic infection with a high antigenic burden increase the risk and severity of IRIS. Deliberately delaying ART initiation among newly-diagnosed PLHIV with AHD based on results from additional clinical/laboratory testing is a promising strategy to reduce early mortality (within three months of ART initiation).

PATH, through the USAID/Nuru ya Mtoto project, tested this strategy to assess whether use of TB-LAM as part of clinical decision-making to delay ART initiation was effective at averting early mortality among PLHIV with AHD in Kakamega County.

**Description:** Due to an average 14-day turnaround time for CD4 and GeneXpert testing and frequent commodity shortages, clinical teams relied on World Health Organization (WHO) staging to determine whether to delay in ART initiation among newly diagnosed PLHIV to prevent IRIS-related mortality.

With the availability of TB-LAM in western Kenya beginning October 2022, clinic teams used TB-LAM results (coupled with WHO staging) to enable timelier decision-making in delaying ART initiation.

Duration of ART delay was between two and five weeks. We collected and analyzed data from 11 facilities in Kakamega County to understand if use of TB-LAM results in clinical decision-making for delayed ART initiation led to decreased mortality among PLHIV with AHD 100 days after ART initiation.

**Lessons learned:** Between October 2022 and September 2023, 777 newly diagnosed PLHIV were recorded at these facilities, 214 (28%) of whom were classified WHO stage 3 or 4 and presumed to have AHD. 105 (49%) received TB-LAM testing, with 63 (60%) receiving a positive TB-LAM result. ART initiation was delayed at least 2 weeks for 57 (90%) of PLHIV with a positive TB-LAM result, among whom 52 (91%) were still alive 100 days following ART initiation.

**Conclusions/Next steps:** Use of TB-LAM to delay ART initiation was effective at preventing IRIS-related mortality among PLHIV with AHD. This strategy should be further tested and expanded to improve clinical management and prevent mortality among PLHIV with AHD, particularly in HIV/TB endemic areas with poor CD4 and GeneXpert capabilities and as TB-LAM is available.

## THPEB052

Achieving and sustaining HIV viral load suppression among children 0-9 years: a case study of Mbarara Regional Referral Hospital, South Western Uganda

N. Sunday Atwine<sup>1</sup>, D. Nansera<sup>2</sup>, W. Muyindike<sup>3</sup>, C. Barigye<sup>1</sup>

<sup>1</sup>Mbarara Regional Referral Hospital, Administration, Mbarara, Uganda, <sup>2</sup>Mbarara Regional Referral Hospital, Department of Pediatrics, Mbarara, Uganda, <sup>3</sup>Mbarara Regional Referral Hospital, Department of Internal Medicine, Mbarara, Uganda

**Background:** Reducing morbidity and mortality among children living with HIV (CLHIV) is hinged on achieving and sustaining a suppressed viral load. In Uganda, this has not been optimally achieved and remains a challenge with viral load suppression (VLS) in children 0-14 years at 82.8% by 2020 (UNICEF-VLS-Trends-ESA-2023). In 2020, only 92% of the CLHIV attending Mbarara Regional Referral Hospital (MRRH) had a suppressed VL which is below the 95% UNAIDS target.

The major gaps identified included missed appointments as result of separate appointments for the child and the care giver; We report the interventions implemented to address this gap and the observed impact on the overall VLS rates among CLHIV.

**Description:** HIV care and treatment at MRRH follows the ministry of health guidelines for HIV prevention and treatment. The hospital applies continuous quality improvement principles to address performance gaps.

We conducted a case-study and a historical audit in MRRH in South-Western Uganda in a cohort of 760 active CLHIV who had been on ART for a minimum of 6 months. We documented the interventions implemented to improve and sustain VLS in this cohort of CLHIV and analysed the VLS rates across quarters from 2020 to 2023.

**Lessons learned:** The interventions implemented were: synchronizing the child's visit with the care taker's on a family clinic day; providing non-clinic day psychosocial

peer support in small group meetings; purposefully befriending children to enable them open up about their barriers to adherence and general care; involving the youth peer leaders in health education and promotion; deliberately engaging with the difficult care-givers physically or by phone call and introducing a male figure for the male children; intensifying adherence counselling for all children with VL <400C/ml (low viremia); creating a counsellor-parent-school nurse relationship; collaborating with OVC partners (USAID and non-USAID); and utilization of data to monitor performance. The ranges of VLS rates by year were; 91-92%, 91.4-95.0%, 95.6-97.8%, and 96.1-96.6% in 2020, 2021, 2022 and 2023 respectively.

**Conclusions/Next steps:** Achieving and sustaining VLS among CLHIV requires a mix of age tailored interventions which synergize each other to address co-existing adherence barriers.

### THPEB053

Study of the effectiveness of HCV treatment among PLHIV in Tajikistan

U. Talbov<sup>1</sup>, S. Sattorov<sup>1</sup>, D. Abbasova<sup>2</sup>, F. Ilmazarov<sup>2</sup>

<sup>1</sup>Republican AIDS Center, Dushanbe, Tajikistan, <sup>2</sup>UNDP Tajikistan, Dushanbe, Tajikistan

**Background:** According to the latest Republican AIDS Center data around 18-20% of PLHIV are living with HCV in Tajikistan. The hepatitis C is the second biggest (after TB) cause of mortality among PLHIV accounting to about 10,1% of deaths. This underscores the importance of access to early diagnostics and treatment of HCV among PLHIV.

To reduce burden of HCV, in 2021-2022 UNDP Tajikistan on the request of Republican AIDS Center supported PCR testing and treatment of HCV among PLHIV.

**Methods:** All PLHIV over 18 years old on ART with HCV underwent PCR diagnostics for HCV viral load to determine further treatment tactics. As a result, 1198 PCR tests were performed, of which 851 people began antiviral treatment of HCV with Sofosbuvir/Velpatasvir (400/100 mg). Among 347 people not receiving treatment 210 people had an undetectable viral load, which is not an indication for treatment and 137 people with a detectable HCV viral load did not appear for receiving treatment due to various reasons (e.g., migration).

Data regarding the implementation of antiviral therapy for HCV among PLHIV on ART in the period 2021-2022 was analyzed based on medical records and data from the HIV electronic case management system.

**Results:** The results of the treatment were as follows:

	Total	Below 350 cells/ml	351-500 cells/ml	Above 500 cells/ml
CD4 before treatment	851	296	221	334
HCV-treatment was interrupted (death and other reasons)	27	9	7	11
Achieved complete viral suppression HCV (among 824 people who completed treatment)	779 (94,5%)	267 (93,0%)	202 (94,4%)	310 (96,0%)
Have not achieved complete viral suppression (among 824 people who completed treatment)	45	20	12	13

Table. CD4 indicators in people treated for HCV

	Total	Below 1000 copies/ml	Above 1000 copies/ml
HIV VL before starting HCV treatment	851	776	75
HCV-treatment was interrupted (death and other)	27	22	5
Achieved complete viral suppression HCV (among 824 people who completed treatment)	779 (94,5%)	723 (95,9%)	56 (80,0%)
Have not achieved complete viral suppression (among 824 people who completed treatment)	45 (5,5%)	31 (4,1%)	14 (20,0%)

Table. HIV VL rates in people treated for HCV

**Conclusions:** Antiviral therapy for HCV among PLHIV can be effective regardless of the level of CD4 cells and HIV viral load. The effectiveness of HCV treatment among PLHIV was 94.5% (779 out of 824 who received the full course of treatment).

Based on this, it is necessary to continue expanding access to timely and high-quality testing of PLHIV for HCV and provide antiviral therapy for those with confirmed HCV.

### THPEB054

Prevalence of TB infection and factors associated with indeterminate values of QuantiFERON TB Gold Plus test in PWH in Northern Italy

C. Maci<sup>1</sup>, S. Diotallevi<sup>2</sup>, A.R. Raccagni<sup>1</sup>, R. Lolatto<sup>2</sup>, E. Messina<sup>2</sup>, S. Nozza<sup>1,2</sup>, E. Bruzzesi<sup>1</sup>, V. <sup>1</sup>Vita-Salute University, Milan, Italy, <sup>2</sup>IRCCS San Raffaele Scientific Institute, Milan, Italy

**Background:** In recent years, the progress in containing tuberculosis (TB)/HIV coinfection in Europe has come to a halt. Our study aims to assess the current prevalence of TB infection in people with HIV (PWH) in Northern Italy and to evaluate differences between positive (PQ) and negative (NQ) versus indeterminate (IQ) values of QuantiFERON TB Gold Plus tests (QFT).

**Methods:** Prospective study including PWH tested with QFT between December 2021 and December 2023 at the Infectious Diseases Unit of San Raffaele Scientific Institute, Milan, Italy. QFT determination includes two antigenic tests: TB1 and TB2. QFT values were defined as PQ if

History of HCV	80 (7.6%)	1 (2.3%)	79 (7.5%)	1.000
Years from HIV diagnosis	10.1 (0.42-27.7)	11.7 (0.71-28.0)	10.1 (0.42-27.7)	0.001
Notes	50 (4.7%)	9 (20.0%)	50 (4.7%)	0.002
Years of ART regimen ongoing	15.0 (0.00-34.7)	18.0 (0.00-35.0)	15.7 (0.18-34.3)	0.020
Previous ART diagnosis	208 (19.1%)	10 (23.0%)	198 (18.4%)	0.000
HIV-RNA (copies/mL)	0.30 (0.00-1.9)	0.30 (0.00-2.0)	0.30 (0.00-1.9)	0.000
CD4+ (cells/mm <sup>3</sup> )	722 (607-960)	688 (308-896)	728 (502-971)	0.003
CD4+%	33.7 (25.4-41.1)	28.2 (19.0-35.7)	33.8 (25.7-41.2)	0.006
CD8+ (cells/mm <sup>3</sup> )	819 (594-1100)	799 (500-1270)	860 (590-1140)	0.000
CD8+%	29.5 (21.0-40.0)	41.5 (25.0-61.0)	29.4 (21.7-40.0)	0.107
CD4+/CD8+	0.87 (0.58-1.28)	0.74 (0.37-0.95)	0.87 (0.57-1.28)	0.016

Table 1. Characteristics of PWH with indeterminate QuantiFERON (IQ) versus positive/negative QuantiFERON (PQ/NQ), CD4+ and CD8+ T-cells and HIV-RNA were tested simultaneously with QFT.

**Conclusions:** In our cohort of PWH in Northern Italy, prevalence of TB disease and TB infection were 1.9% and 5.3%, respectively. 3.9% subjects had indeterminate QFT value. IQ was associated with a more frequent history of AIDS and lower CD4+% and CD4+/CD8+ ratio, suggesting functional immune system impairment despite current CD4+ values.

## THPEB055

Immunological and virological outcomes of integrase inhibitors based regimens for people with tuberculosis and HIV coinfection: a real-life study in Brazil

B. Brittes Kamiensky<sup>1</sup>, R.E. Gonçalves Pinho<sup>2</sup>, R.d.S. Marques de Oliveira<sup>1</sup>, R. Campos Hallal<sup>1</sup>, T.H. de Sousa Nascimento<sup>1</sup>, J.N. de Barros Silva Junior<sup>1</sup>, L.H. Arroyo<sup>1</sup>, D.M. Pelissari<sup>1</sup>, P.C. dos Santos<sup>2</sup>, R. de Almeida Coelho<sup>1</sup>, A. Olhovetchi Kalichman<sup>1</sup>, D. Barreira<sup>1</sup>, A.R. Pati Pascom<sup>1</sup>

<sup>1</sup>Ministry of Health of Brazil, Department Of Surveillance of HIV, Tuberculosis, Viral Hepatitis and Sexually Transmitted Infections, Brasília, Brazil, <sup>2</sup>Ministry of Health of Brazil, Brasília, Brazil

**Background:** In recent years, a twice-daily dolutegravir (TD-DTG) based regimen has emerged as a promising approach for people living with HIV/AIDS (PLWH) and tuberculosis coinfection (HIV/TB-CI). In Brazil, lamivudine and tenofovir as a backbone (3TC+TDF) plus TD-DTG is the preferential regimen recommended for HIV/TB. This study aims to compare the hazard ratios (HR) to HIV viral load

suppression (VLS) and CD4 cell count recovery after ART initiation with TD-DTG, dolutegravir (DTG), raltegravir (RAL) and efavirenz (EFZ) based regimens among TB/HIV-CI.

**Methods:** We conducted a retrospective cohort analysis of ART naïve TB/HIV-CI aged 18+, who initiated ARV treatment (ART) between January/2019 and December/2022. Programmatic data were extracted from national systems which gather information related to: HIV/AIDS and TB cases notification; results of CD4 and viral load exams; and ART dispensation. We included individuals who started ART using 3TC+TDF associated with TD-DTG, DTG, EFZ, or RAL; had at least 90 days of treatment; and had at least two VL and two CD4 - at baseline (up to -180 days), and up to a year after treatment initiation. Cox regressions were used to estimate HR for VLS (VL<50copies/mL) and CD4 count recovery (increase up to 100%), controlling for baseline exams results.

**Results:** We included 3,864 individuals who was diagnosed with HIV/TB in 2019-2022; 2,062(53%) initiated ART using TD-DTG, 646(17%) RAL, 609(16%) DTG, and 547(14%) EFZ. Cox regression showed that the HR for VLS were 1.454(IC95%:1.296-1.631) among TB/HIV-CI who initiated ART using TD-DTG, 1.170(IC95%:1.014-1.350) using RAL, when compared to who started using EFZ. The HR for CD4 recovery were 1.299(IC95%:1.124-1.501) among those who initiated ART using TD-DTG, and 1.504(IC95%:1.273-1.776) using RAL, when compared to who started with EFZ. DTG were not statistically different from EFZ for both VLS and CD4 recovery.

**Conclusions:** TB is the leading cause of death among PLWH. Our study showed that TD-DTG and RAL presented better immunological and virological response when compared to EFZ among ART naïve TB/HIV-CI. Furthermore, 80% of them started ART with TD-DTG or RAL based regimens. The expansion of the use of integrase inhibitor can contribute to ART adherence, reduce adverse events, ARV resistance, and HIV/TB related mortality.

### HIV and Hepatitis C co-infection among people who inject drugs in Unguja, Zanzibar, 2023

C. Said<sup>1</sup>, M. Khamisi<sup>2</sup>, J. Ndayongeje<sup>3</sup>, M. Mtoro<sup>3</sup>, A. Kailembo<sup>4</sup>, S. Welty<sup>1</sup>, A. Jahzum<sup>2</sup>, I. Maulid<sup>2</sup>, S. Porter<sup>4</sup>, H. Solomon<sup>5</sup>, A. Msanga<sup>4</sup>, W. McFarland<sup>6</sup>, G. Mgomella<sup>4</sup>

<sup>1</sup>University of California, San Francisco, United States,

<sup>2</sup>Zanzibar Integrated HIV, Hepatitis, TB, and Leprosy Programme, Unguja, Tanzania, the United Republic of,

<sup>3</sup>Global Programs, Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Dar es Salaam, Tanzania, the United Republic of, <sup>5</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States, <sup>6</sup>San Francisco Department of Public Health, San Francisco, United States

**Background:** People who inject drugs (PWID) are at higher risk of hepatitis C virus (HCV) acquisition due to needle or syringe sharing. We conducted a bio-behavioural survey to assess HCV antibody prevalence, chronic HCV acquisition, and HIV-HCV co-infection among PWID in Unguja Island, Zanzibar, in 2023.

**Methods:** We used respondent-driven sampling (RDS) to recruit individuals aged ≥15 years who had lived in Unguja for ≥3 months and injected drugs in the past 3 months. Participant information was collected through an interviewer-administered questionnaire, and HIV testing was offered on site per national testing guidelines. HCV status was assessed using a rapid antibody test, and reactive specimens were tested for HCV Ribonucleic acid (RNA) levels. Current or prior diagnosis was defined as a positive antibody result, and current diagnosis was defined as a positive antibody result and detectable HCV RNA.

We produced weighted point estimates, reported as percentages with 95% confidence intervals (95%CI). The F-test was used to test differences in adjusted proportions with  $P < .05$  considered significant.

**Results:** We surveyed 455 PWID with a median age of 38 years (interquartile range: 32–45 years). Among all PWID, 43.5% (95%CI: 38.2–48.4) had ever shared a needle/syringe whereby 43.5% (95%CI: 35.7–49.5) of them shared a needle/syringe in the past month. HCV antibody prevalence was 30.3% (95%CI: 25.6–35.1) and 72.5% (95%CI: 64.8–80.2) of them had detectable HCV RNA.

Among all PWID, 22.0% (95%CI: 17.9–26.2) had detectable HCV RNA. HIV prevalence among all PWID was 9.3% (95%CI: 6.1–12.5) and 5.8% (95%CI: 3.6–8.1) of PWID were both HCV-antibody positive and HIV positive. Among HIV-positive PWID, 63.1% (95%CI: 48.5–76.8) had HCV antibodies compared to 27.0% (95%CI: 22.4–31.7) of HIV-negative PWID ( $P < .001$ ).

Among HIV-positive PWID with HCV antibodies, 60.7% (95%CI: 45.0–76.6) had detectable HCV RNA compared to 75.4% (95%CI: 66.4–84.9) of HIV-negative PWID with HCV antibodies ( $P = .05$ ).

**Conclusions:** We identified high levels of HCV exposure and current HCV diagnosis among PWID. HCV exposure level among HIV-positive PWID is significantly higher than among HIV-negative PWID. These findings indicate a need for routine HCV screening among PWID especially those living with HIV, harm reduction services and HCV treatment among PWID in Zanzibar.

## THPEB057

### Risk factors for and patterns of oral shedding of Kaposi's sarcoma-associated herpesvirus – a systematic review

M. Nakanwagi<sup>1,2</sup>, S. Sturrock<sup>2,1</sup>, R. Newton<sup>3,1</sup>, K. Sabourin<sup>4,1</sup>

<sup>1</sup>Medical Research Council, Uganda, Research, Entebbe, Uganda, <sup>2</sup>St. George's, University of London, Infection and Immunity, London, United Kingdom, <sup>3</sup>University of York, Research, York, United Kingdom, <sup>4</sup>University of Colorado, Immunology and Microbiology, Aurora, United States

**Background:** Despite improved access to antiretroviral therapy, Kaposi's sarcoma (KS) remains a major public health concern in high HIV prevalence populations. KS is AIDS defining and is associated with high mortality. Kaposi's sarcoma-associated herpesvirus (KSHV) is the underlying necessary cause of KS. Identifying the risk factors for KSHV DNA detection in saliva (oral shedding) is critical to stem transmission since saliva is the primary route of transmission for KSHV. We conducted a systematic review delineating risk factors for, and shedding patterns of KSHV in the oral cavity.

**Methods:** This systematic review was based on Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines. We systematically searched PubMed, Embase and Cochrane databases using a specified inclusion criterion to identify risk factors for and patterns of oral shedding of KSHV. We applied a stepwise title, abstract and full text review process to select the final articles that were included in the qualitative synthesis.

**Results:** We included 33 studies in the quantitative synthesis. Sixty one percent of the studies were conducted in countries outside of Africa, 79% were among adults and 52% were cross-sectional. Sample size of studies ranged from 14 to 5092 participants with 60% having less than 100 participants. 73% studies focused solely on identification of risk factors for KSHV shedding in saliva. Despite considerable heterogeneity of results among studies regarding risk factors, there was consensus on association between male sex and between younger age and increased probabilities of oral KSHV shedding. Notably, all studies on shedding patterns (21% of all studies) determined KSHV shedding in the oral cavity to be intermittent in all sub-population groups and across geographical regions.

**Conclusions:** There was heterogeneity of the studies by populations, study design, and geography. There was discordance in associations of identified risk factors for

KSHV oral shedding but consensus on the lack of a shedding pattern in saliva. This highlights the need for larger context specific research on risk factors for KSHV shedding in saliva. This will inform potential tailored intervention strategies for the control of KSHV transmission.

## THPEB058

Life After Mpox (LAMP): post-mpox clinical sequelae with associated psychosocial sequelae persisting >10 months after mpox at two U.S. sites

P. Chollí<sup>1</sup>, J. Zucker<sup>2</sup>, K. Vigil<sup>3</sup>, P. Weidle<sup>1</sup>, M. Taylor<sup>1</sup>, A. Rao<sup>4</sup>, D. Haberling<sup>4</sup>, B. Gray<sup>2</sup>, A. Cantos<sup>2</sup>, R. Klaff<sup>3</sup>, S. Guagliardo<sup>5</sup>, F. Minhaj<sup>4</sup>, M. Flanagan<sup>2</sup>, S. O'Connor<sup>1</sup>, on behalf of the LAMP Study Team (P Chollí, J Zucker, and K Vigil contributed equally as first authors)

<sup>1</sup>Centers for Disease Control and Prevention, Division of HIV Prevention, Atlanta, United States, <sup>2</sup>Columbia University Irving Medical Center, Division of Infectious Diseases, Department of Medicine, New York, United States,

<sup>3</sup>McGovern Medical School at University of Texas Health Houston, Division of Infectious Diseases, Department of Medicine, Houston, United States, <sup>4</sup>Centers for Disease Control and Prevention, Division of High-Consequence Pathogens and Pathology, Atlanta, United States, <sup>5</sup>Centers for Disease Control and Prevention, Division of Vectorborne Diseases, Atlanta, United States

**Background:** Monkeypox virus is the only orthopoxvirus that commonly causes human disease in the United States. We sought to characterize post-mpox sequelae with risk factors and social/functional impact following the 2022 outbreak.

**Methods:** Adults in New York City and Houston completed self-assessments and clinician exams >10 months after symptomatic probable or confirmed mpox diagnosed 5/17/2022–1/15/2023. We assessed associations between HIV status or sociodemographic factors at mpox diagnosis and clinician-documented post-mpox sequelae (chi-square tests).

**Results:** LAMP assessed 154 adults aged 20–57 (median 35) years at 11–18 (median 15) months after mpox, self-identifying as Black/African American (34%), White (31%), and/or Hispanic/Latino (49%); and as male gender (89%; 88% reporting male-to-male sexual contact), female gender (3%) or transgender (3%). At diagnosis, 66% were living with HIV. During mpox, 47% had ≥10 lesions and 51% received tecovirimat. Clinicians identified ≥1 mpox-related persisting sequela in 53%, including skin lesions or tissue loss (49%) and anorectal (7%) or urinary (4%) dysfunction but ≤2% frequency of any other deficit (e.g., neurologic, range of motion); 10% had ≥10 scars or chronic skin color changes. Most dermatologic sequelae/tissue loss affected the upper extremities (22%); groin, perineum, external anus, or buttocks (21%); face (15%); torso (14%); or genitalia (13%). Nearly half (48%) reported ongoing negative im-

pact of mpox on social (45%) or sexual interactions (18%). Some experienced mpox-related job discrimination (18%). Persistent clinical/functional sequelae were associated with ≥10 acute mpox lesions ( $p=0.003$ ) (Table).

There was no association between persisting clinical/functional sequelae and race/ethnicity or tecovirimat receipt. HIV viral load (VL) ≥200 copies/ml at mpox diagnosis was associated with persistent skin lesions ( $p=0.04$ ). Anorectal dysfunction ( $p=0.003$ ) and any clinical/functional sequelae ( $p<0.001$ ) were associated with ongoing negative social or sexual impact.

Mpox-related condition	HIV status at time of mpox diagnosis (n=153, missing VL for 1)		Tecovirimat received (n=153, missing for 1)		Post-mpox social or sexual impact (n=154)	
	HIV uncontrolled, VL ≥200 copies/mL (n=22)	HIV-negative or HIV well-controlled, VL <200 copies/mL (n=131)	Yes (n=78)	No (n=75)	Yes (n=74)	No (n=80)
Any persistent sequelae <sup>a</sup>	15 (68%)	67 (51%)	40 (51%)	41 (55%)	51 (69%)*	31 (39%)
≥10 persistent skin changes <sup>b</sup>	5 (23%)*	11 (8%)	7 (9%)	8 (12%)	15 (20%)*	1 (1%)
Urinary dysfunction <sup>c</sup>	1 (5%)	5 (4%)	5 (6%)	1 (1%)	4 (5%)	2 (3%)
Anorectal dysfunction <sup>d</sup>	2 (9%)	9 (7%)	6 (8%)	5 (7%)	10 (14%)*	1 (1%)
Any health services needed <sup>e</sup>	2 (9%)	2 (2%)	2 (3%)	2 (3%)	4 (5%)*	0 (0%)
Negative social or sexual impact <sup>f</sup>	15 (68%)*	55 (44%)	39 (50%)	35 (47%)	---	---

\* $p<0.05$ ; VL = HIV viral load; <sup>a</sup>Skin, clinical, functional; <sup>b</sup>Scars/feloids or color change; <sup>c</sup>Urinary stricture-related difficulty/hesitancy urinating, incontinence; <sup>d</sup>Difficulty defecating from anorectal narrowing/incontinence; <sup>e</sup>Physical/occupational/speech therapy, nursing, other assistance.

**Table.** Relationship of persisting mpox clinical or functional sequelae to HIV status at mpox diagnosis or tecovirimat receipt during mpox, with ongoing impact on social or sexual interactions after >10 months.

**Conclusions:** Many participants had persistent clinical, functional and/or psychosocial post-mpox sequelae. Results demonstrate the need for awareness of ongoing mpox impact and long-term support.

## THPEB059

Prevalence of disseminated histoplasmosis and invasive aspergillosis among advanced HIV disease patients in Uganda: implications for AHD programming in Uganda

V. Kasone<sup>1</sup>, P. Namuwenge<sup>2</sup>, J. Kyokushaba<sup>1</sup>, I. Sewanyanna<sup>1</sup>, S. Nabadda<sup>1</sup>, D. Meya<sup>3</sup>, P. Semanda<sup>1</sup>, C. Makoha<sup>1</sup>

<sup>1</sup>Ministry of Health, National Health and Diagnostic Services, Kampala, Uganda, <sup>2</sup>Ministry of Health, AIDS Control Program, Kampala, Uganda, <sup>3</sup>Makerere University, Infectious Diseases Institute, Kampala, Uganda

**Background:** Histoplasmosis and Aspergillosis are a major cause of mortality in persons with advanced HIV disease (CD4<200 cells/mL) in endemic areas, and areas of endemicity are evolving. Presenting symptoms of histoplasmosis and Aspergillosis may overlap with those of tuberculosis (TB). The true burden of histoplasmosis and Aspergillosis remains unknown in persons with advanced HIV disease. WHO guidelines recommend screening for Histoplasmosis and Aspergillosis in AHD patients and has

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

also approved the use of rapid diagnostic tests for histoplasmosis and aspergillosis. We sought to determine the prevalence of histoplasmosis and aspergillosis among AHD patients in Uganda.

**Methods:** This prospective study was conducted by the Ministry of Health to ascertain the burden of Aspergillosis and Histoplasmosis among AHD patients. Urine and serum samples were obtained from participants at the time of enrollment. *Histoplasma* galactomannan enzyme immunoassay (EIA), and the sōna Galactomannan LFA for the Aspergillus (Immy, Norman OK) were run per the manufacturer's instructions.

We obtained baseline characteristics, symptoms, laboratory values including TB and cryptococcal antigenemia, and calculated the prevalence of histoplasmosis and Aspergillosis using EIA and LFA results.

**Results:** We tested 334 urine and serum samples among participants with advanced HIV disease. 115 samples were positive for Aspergillus antigen (34.4%) (95% CI: 29.4-39.9) while 8 samples were positive for *Histoplasma* antigen (2.4%) (95%CI: 1.1-4.7). The median CD4 was highest among Aspergillosis-positive patients at 77.5 cells/ml<sup>3</sup>. Overall positivity for serum Cryptococcus (IMMY diagnostics, Norman USA) and Tuberculosis TB urine lipoarabinomannan (LAM, AlereLAM, Abbott, Palatine, IL, USA) was 9.6% (31/322) and 28.8% (92/319) respectively.

The highest co-infection observed among AHD patients was between Aspergillosis and Tuberculosis, 25/115 (21.7%). All 25 patients reported symptoms of cough, weight loss, and weakness.

**Conclusions:** Among AHD patients in Uganda *Histoplasma* antigen prevalence is 2.4% while *Aspergillus* antigen prevalence was 34.5%. The highest co-infection was between TB and Aspergillosis and the implications of the co-infection may have poor clinical outcomes for HIV/ TB patients who start TB treatment without starting Antifungal treatment since the diagnosis was not made. The findings from this study underscore the need for the adoption of routine Aspergillosis screening in AHD patients especially in high TB/HIV endemic countries.

## THPEB060

Can artificial intelligence (AI) chatbots assist clinicians in managing HIV-related opportunistic infections? A comparative evaluation of accuracy and readability of ChatGPT 3.5, BARD, and Microsoft Copilot

R.X. Ng<sup>1,2</sup>, S.S.L. Goh<sup>3</sup>, A. Kukreja<sup>1,2</sup>, S.F. Syed Omar<sup>1,2</sup>, R.I.S. Raja Azwa<sup>1,2</sup>

<sup>1</sup>Universiti Malaya, Division of Infectious Diseases, Department of Medicine, Kuala Lumpur, Malaysia,

<sup>2</sup>Universiti Malaya, Centre of Excellence for Research in AIDS (CERiA), Faculty of Medicine, Kuala Lumpur, Malaysia,

<sup>3</sup>Universiti Malaya, Department of Medicine, Faculty of Medicine, Kuala Lumpur, Malaysia

**Background:** Managing opportunistic infections (OIs) in people living with HIV (PLHIV) can be challenging. Clinicians require readily accessible and accurate guidance. Chatbots, powered by Large Language Models (LLMs), are an emerging reference tool due to their interactive nature.

We aimed to evaluate the potential of three LLM-powered chatbots, namely ChatGPT 3.5, Bard, Microsoft Copilot as support tools for junior doctors by assessing their concordance with US Department of Health and Human Services (DHHS) guidelines on OIs (ClinicalInfo.HIV.gov: Guidelines for the Prevention and Treatment of OIs in Adults and Adolescents with HIV) and their readability.

**Methods:** Two independent reviewers evaluated LLM responses to eight questions covering the management of four common OIs - cerebral toxoplasmosis, Pneumocystis jiroveci pneumonia, Cytomegalovirus retinitis, and Cryptococcal meningitis and optimal antiretroviral therapy (ART) initiation timing. The responses for concordance to DHHS guidelines were rated on a scale of 1 (least concordance) to 5 (most concordance) based on Likert scale. Readability was evaluated by the Flesch Reading Ease Score and Flesch-Kincaid Grade Level.

**Results:** Bard demonstrated the highest concordance with DHHS guidelines (mean score=3.7), followed by Microsoft Copilot (mean score=3.5) and ChatGPT 3.5 (mean score=3.6). While all LLMs could offer recommendations, details varied, particularly in medication specifics, treatment duration, and chronic maintenance therapy. Notably, ChatGPT deviated from guidelines regarding the timing of ART for cryptococcal meningitis. Microsoft Copilot achieved the highest readability scores (Flesch Reading Ease=17.75 and Flesch-Kincaid Grade=15.15). All LLMs required medical graduate-level understanding. While Bard and Microsoft Copilot cited references, all emphasized that they could not provide medical advice and recommended consulting healthcare professionals.

**Conclusions:** The concordance of LLM responses with DHHS guidelines varied, with Bard demonstrating the highest concordance and Microsoft Copilot having the highest readability scores. LLMs may support self-direct-

ed learning and provide valuable clinical decision support for junior doctors, but they should only be used as a supplement to established guidelines and expert consultation. Managing OIs in PLHIV still requires a personalized human touch and adherence to ethical standards, including patient privacy, information accuracy, and transparency. While chatbots have potential in infectious disease management, continual training, development, and updates are crucial to ensure reliable guidance.

## THPEB061

### Fighting a twin enemy: a descriptive evaluation of HIV and syphilis testing among pregnant women in Liberia

A. Forleh<sup>1</sup>, J. Flomo<sup>1</sup>, C.B. Paye<sup>1</sup>, T.D. Nyanplu<sup>1</sup>, B. Gibson<sup>1</sup>, E. Honore<sup>1</sup>, S. Conteh<sup>1</sup>, A.F. Sie<sup>1</sup>, E. Williams<sup>1</sup>, S. Korvah<sup>1</sup>, V. Sonie<sup>1</sup>, W. Fassah<sup>1</sup>, E. Zackpah<sup>1</sup>, N. Wordsworth<sup>1</sup>, M. Odo<sup>2</sup>

<sup>1</sup>National AIDS Control Program, Prevention and STI Unit, Monrovia, Liberia, <sup>2</sup>FHI 360, Technical, Monrovia, Liberia

**Background:** HIV and syphilis are a twin tragedy for exposed babies around the globe, with one million new syphilis and 1.5 million new HIV infections occurring in pregnant women every year. The prevalence of both infections among pregnant women accessing antenatal clinics (ANC) in Liberia is 1.6 and 1.3 % respectively WHO recommends simultaneous dual testing for both infections to maximize access and efficiency.

The National AIDS Control Program partnered with stakeholders to introduce dual testing in 2021 across selected antenatal clinics. We share our national experience and provide a descriptive evaluation of the women tested for both infections.

**Description:** stakeholder engagements, advocacy, and sensitization with staff of ANC clinics, between April 2021 and March 2022 led to the design of a road map adapted to country context. Guidelines and job aids were developed to support the training of providers. 124 master trainers were trained across the 15 counties to cascade training to staff of 563 health facilities.

Data collection and monitoring tools were updated to collect data and to track dual testing. We evaluated the program for the period of January to December 2022.

**Lessons learned:** Of the 187,667 pregnant women tested for HIV, 1,878(1.0%) were HIV positive and were linked to ART. 111,799 (60%) were screened for syphilis with 1,652 (1.5%) testing positive and started on Benzathine penicillin.

The other women (40%) were tested for HIV alone from peripheral clinics without stock of HIV/Syphilis dual test. The proportion of women tested positive for HIV (1.8%) and syphilis (2.3%) was highest for women 10-14 years than women 15years and above (0.9 and 1.5% respectively)

Age (Years)	Tested for Syphilis	Tested Positive for Syphilis	Tested for HIV	Tested Positive for HIV
10 - 14	914	21 (2.3%)	1286	23 (1.8%)
15 – 25+	110,885	1,631 (1.5%)	186, 381	1,855 (0.9%)
Total	111799	1652 (1.5%)	187667	1878 (1.0%)

Table: Pregnant women tested for Syphilis and HIV - January - December 2022 (Source: Country DHIS2)

**Conclusions/Next steps:** Dual HIV and syphilis testing is feasible in Liberia. Supply chain support should be enhanced to assure commodity supply to include peripheral clinics. The comparatively higher prevalence of syphilis and HIV among pregnant women younger than 15 needs to be investigated.

## THPEB062

### Shorter TB preventive treatment using 3HP improves uptake and completion among PLHIV in Tanzania

A. Lwilla<sup>1</sup>, C. Mangu<sup>1</sup>, W. Olomi<sup>2</sup>, D. Pamba<sup>3</sup>, L.T. Minja<sup>1</sup>, I. Sabi<sup>1</sup>, R. Kisonga<sup>4</sup>, E. Matechi<sup>4</sup>, I. Jerry<sup>5</sup>, P. Neema<sup>4</sup>, A. Rwebembera<sup>5</sup>, S. Aboud<sup>6</sup>, N. Ntinginya<sup>7</sup>

<sup>1</sup>National Institute for Medical Research, Mbeya Center, TB and Emerging Diseases, Mbeya, Tanzania, the United Republic of, <sup>2</sup>National Institute for Medical Research, Mbeya Center, Data Management Unit, Mbeya, Tanzania, the United Republic of, <sup>3</sup>National Institute for Medical Research, Mbeya Center, Social Engagement, Mbeya, Tanzania, the United Republic of, <sup>4</sup>National Tuberculosis and Leprosy Programme, Dodoma, Tanzania, the United Republic of, <sup>5</sup>National AIDS, STIs & Hepatitis Control Programme, Dodoma, Tanzania, the United Republic of, <sup>6</sup>National Institute for Medical Research, Dar es Salaam, Tanzania, the United Republic of, <sup>7</sup>National Institute for Medical Research, Mbeya Center, Mbeya, Tanzania, the United Republic of

**Background:** In 2021, 10.6 million people globally fell ill with TB disease. Of these, 8% were people living with HIV (PLHIV). PLHIV are about 20 times more likely to develop TB disease compared to the rest of the population. For years, 6 months Isoniazid (6H) has been the main stay regimen for TB Preventive Treatment (TPT). Pill burden, long duration on treatment and adverse events are common reasons for sub-optimal completion of 6H.

Recently, rifamycin based regimens that offer shorter duration, less pill burden and are better tolerated have been adopted for TPT. In 2021, only 72% of PLHIV in Tanzania were initiated on TPT with completion of only 78%.

**Methods:** We conducted an implementation cohort study in 6 regions of Tanzania. We introduced 3 months isoniazid and rifapentine (3HP) in 12 clinics. We compared the uptake and completion of TPT among a cohort of PLHIV initiated on 3HP to those initiated on 6H. We used propor-

tions and corresponding confidence intervals to compare uptake and completion. Logistic regression was used to assess other factors associated with completion.

**Results:** A total of 1866 PLHIV were followed up. Of these, 1117 (59.8%) were enrolled in HIV care between Jan-Jun 2022 where 6H was the regimen of choice while 749 (40.2%) were enrolled between Apr-Oct 2023 where 3HP was introduced as the regimen of choice. Median age was 33 years [IQR 26-42] and majority were female (65.1%). Treatment uptake was higher with 3HP, 87.4% (CI 85.0-89.8) than 6H 80.7% (CI 78.4-83.0)  $p<0.0001$ . The proportion of those that completed at least 80% of the doses was 76.5% versus 86.5% in 6H and 3HP respectively (AOR 2.01, 95%CI 1.55-2.66). There were no differences in treatment completion by age, gender, marital status, and presence of a treatment supporter.

**Conclusions:** Use of shorter TPT regimen such as 3HP showed a significant improvement in both uptake and completion of TB preventive treatment among PLHIV in routine programmatic settings of Tanzania. We recommend adequate preparation in terms of training, data capturing tools, strengthening of supply chain and monitoring and reporting of safety events before and during large scale rollout within the countries.

## THPEB063

Optimizing the WHO four symptoms screening to improve the presumptive yield and the diagnosis of tuberculosis among persons living with HIV in military hospitals in Nigeria

N. Ifechineke<sup>1</sup>, I. Lawal<sup>1</sup>, P.A. Agaba<sup>2,3</sup>, Y. Adamu<sup>1</sup>, K. Aribisala<sup>1</sup>, A. Olarinoye<sup>1</sup>, F. Nnadiwa<sup>4</sup>, E.-U. Ima-obong<sup>4</sup>, H. Meri<sup>1</sup>

<sup>1</sup>U.S. Military HIV Research Program, Walter Reed Army Institute of Research-Africa, Abuja, Nigeria, <sup>2</sup>The Henry M. Jackson Foundation for the Advancement of Military Medicine, Inc., Bethesda, United States, <sup>3</sup>U.S. Military HIV Research Program, CIDR, Walter Reed Army Institute of Research, Silver Spring, United States, <sup>4</sup>Nigerian Ministry of Defense-Health Implementation Program, Abuja, Nigeria

**Background:** Tuberculosis (TB) co-infection in people living with HIV (PLHIV) remains a leading cause of morbidity and mortality. The World Health Organization (WHO) recommends a four-symptom screening (W4SS) for PLHIV at every encounter to facilitate early detection of TB.

This study sought to review the effectiveness of W4SS in the identification of presumptive TB cases and subsequent diagnosis of TB in Nigeria's Military HIV program.

**Methods:** This was a three-year retrospective study from October 2020 to September 2023, analyzing data from TB screening to TB diagnosis and treatment. The study data were from 6 military healthcare facilities supported by the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) located across 5 states in Nigeria that provide

care and treatment services to PLHIV. The W4SS questions include *Cough, Fever, Weight Loss, and Night Sweats*. The 6 facilities were provided with hands-on training on TB screening, diagnosis, and treatment with ongoing virtual and in-person mentorship. Facility performance was also routinely reviewed through high frequency reporting to ensure adequate implementation of screening, diagnosis, and treatment.

**Results:** Over the 3 years, a total of 4,183 PLHIV were screened for TB and 297 (7%) screened positive, higher than the previous value of <2% and the country's average of <3% over the same period. These presumptive TB cases were followed through the cascade; 177 of whom were able to produce high-quality sputum for GeneXpert testing. Of those, 45 (25%) were diagnosed with TB and started TB treatment. Other diagnostic modalities used, and those diagnosed with TB were 12, 11, 27 and 1, 2, 2 for AFB, LF-LAM and CXR respectively.

**Conclusions:** Symptom screening can be improved and active TB case finding among PLHIV can be done using the W4SS if effectively and properly implemented. There is a need to ensure constant training and mentorship of healthcare workers to ensure they are conducting W4SS correctly.

## THPEB064

Single dose of MVA produces a potent immune response to MPox in PLWH from RIVER trial

M. Khan<sup>1</sup>, S. Jones<sup>2</sup>, J. Frater<sup>3</sup>, S. Fidler<sup>4</sup>, T. Hanke<sup>3</sup>, A. Otter<sup>2</sup>, J. Thornhill<sup>5</sup>, C. Orkin<sup>5</sup>

<sup>1</sup>Queen Mary, University of London, Immunobiology, The Blizard Institute, London, United Kingdom, <sup>2</sup>UK Health Security Agency, Emerging Pathogen Serology, Porton Down, Salisbury, United Arab Emirates, the, <sup>3</sup>University of Oxford, Nuffield Department of Medicine, Oxford, United Kingdom, <sup>4</sup>Imperial College London & Imperial College NIHR BRC, Department of Infectious Disease, London, United Kingdom, <sup>5</sup>Queen Mary, University of London, Immunobiology, The Blizard Institute, London, United Kingdom

**Background:** Third generation non-replicating modified vaccinia virus Ankara (MVA) was used during the 2022/3 mpox outbreak to protect against infection. It's efficacy and longevity of protection in people living with HIV (PLWH) is unclear. We evaluated Orthopox serological responses to MVA in participants from RIVER study, which used MVA as a vaccine vector for the HIVconsv gene (ChAdV63) in treatment arm.

**Methods:** RIVER participants were aged 18-60, within six months of HIV diagnosis and all initiated ART within one month. Participants were randomised to treatment cohort (TC) (ART+ChAdV63+Vorinostat) or control cohort (CC) (ART alone). Plasma samples from TC (n=21) (median age=35 IQR=28-44) and CC (n=13) (median age=30, IQR=30-

Oral

38) were analysed at enrolment, week 8, week 12 and week 16. Serological responses to mpox were measured using Luminex with 9 MPXV (A5L, A27L, A29L, A35R, B2R, B6R, E8L, H3L, M1R) and 3 Vaccinia virus (VACV) (A27L, A33R, B5R) recombinant antigens and reported as mean fluorescent intensity (MFI).

**Results:** TC: median MFI was significantly higher ( $p < 0.05$ ) in response to four MPXV (A35, E8L, H3L, M1R) and 1 VACV (M1R) antigens at week 12 and week 16 compared to enrolment. This difference was not observed in CC. MFI for E8L significantly increased ( $p < 0.05$ ) at week 12 (median=1147, IQR=535-2160) and week 16 (median=640, IQR=193-1135) compared to enrolment (median=34.4, IQR=25-55) in TC whereas MFI remained below cut-off ( $< 101.3$ ) in CC at all time points. Similarly, TC responses to M1R significantly increased at week 12 (median=406, IQR=177-1756) and week 16 (median=179, IQR=91.5-883) and MFI remained below cut-off ( $< 32.8$ ) in CC at all time points. Notably, MFI declined ( $p < 0.05$ ) for E8L and M1R at week 16 (E8L median=640, IQR=189-1136 M1R median=179, IQR=914-883) in comparison to week 12 (E8L median=1147, IQR=521-2160, M1R median=406, IQR=177-3096). Five individuals in treatment arm produced no response to any antigens.

**Conclusions:** At single dose, MVA produces a potent serological response to Orthopox antigens up to week 16 post-vaccination in comparison to controls in PLWH. The slight reduction at week 16 and its potential effect on long-lasting protection against mpox needs to be investigated further.

## THPEB065

### Determinants of high-risk human papillomavirus positivity among Rwandan women with human immunodeficiency virus

G. Murenzi<sup>1</sup>, M. Demarco<sup>2</sup>, F. Kanyabwisha<sup>1</sup>, B. Muhoza<sup>1</sup>, A. Munyaneza<sup>1</sup>, A. Murangwa<sup>3</sup>, G. Kubwimana<sup>1</sup>, T. Rurangwa<sup>4</sup>, L. Mutesa<sup>5</sup>, K. Anastos<sup>6</sup>, P. Castle<sup>7</sup>

<sup>1</sup>Research for Development (RD Rwanda), Einstein-Rwanda Research and Capacity Building Program, Kigali, Rwanda, <sup>2</sup>National Cancer Institute, Division of Cancer Epidemiology and Genetics, Bethesda, United States, <sup>3</sup>Rwanda Military Hospital, Pathology Laboratory, Kigali, Rwanda, <sup>4</sup>Rwanda Military Hospital, Obstetrics and Gynecology, Kigali, Rwanda, <sup>5</sup>University of Rwanda, Center for Human Genetics, Kigali, Rwanda, <sup>6</sup>Albert Einstein College of Medicine, Epidemiology and Population Health, Bronx, United States, <sup>7</sup>National Cancer Institute, Divisions of Cancer Prevention and Cancer Epidemiology and Genetics, Bethesda, United States

**Background:** High-risk human papillomavirus (hrHPV) causes virtually all cervical cancer, the fourth most common cause of cancer morbidity and mortality among women globally. Cervical cancer, an AIDS-defining malignancy, is the most common cancer and cause of cancer

deaths in most of sub-Saharan Africa (SSA) which also carries the heaviest HIV burden. There is limited data on the prevalence of hrHPV and its determinants among women with HIV (WWH) in SSA. We aimed to assess determinants of hrHPV positivity among Rwandan WWH.

**Methods:** We conducted a study of ~5,000 WWH aged 30-54 years and living in Kigali, Rwanda who were screened for cervical cancer between 2016-2020 using HPV-DNA testing and visual inspection with acetic acid (VIA). Screen-positive women had colposcopy and a four-quadrant biopsy protocol with treatment of biopsy-confirmed disease. A nurse-administered questionnaire collected data on demographics, HPV/cervical cancer risk factors and HPV-DNA testing was performed using the Xpert assay.

**Results:** Women with HIV (N=4,956) with valid HPV results were included in this analysis and their mean age was 40.3±6.5 years. The overall hrHPV prevalence was 26.6% and VIA positivity was 10.2%. The prevalence of HPV16, HPV18/45, HPV31/33/35/52/58, HPV 51/59 and HPV 39/56/66/68 was 6%, 5.5%, 14%, 3.6%, and 6.2%, respectively. Over 98% were on ART and 60.8% had a CD4 count of  $\geq 500$ . The prevalence of hrHPV decreased by increasing age ( $p < 0.001$ ) and it was higher for women who had their first sex before 16 years and who had their first child before 18 years ( $p < 0.001$  for both) and it was also higher with higher number of sexual partners, lifetime and in the past six-months ( $p < 0.001$  for both), for current smokers ( $p = 0.014$ ), oral contraceptive users ( $p = 0.006$ ), women with VIA positive results ( $p < 0.001$ ) and lower CD4 cell count ( $p < 0.001$ ).

**Conclusions:** Our findings highlight the role of HIV control with ART and improved immunity on hrHPV infection, which could potentially impact cervical cancer control among this high-risk population. Multiple factors might also contribute to hrHPV infection and persistence. Raising awareness on those factors coupled with integrating HPV and cervical cancer awareness in HIV care could help control this double burden of disease.

## THPEB066

### Challenges in the prevention and management of tuberculosis in people living with HIV in Santa Fe, Argentina

F. Biasutti<sup>1</sup>, G. Perafan<sup>2</sup>, F. Bagilet<sup>1</sup>, N. Haag<sup>1</sup>, M. Pedrola<sup>1</sup>

<sup>1</sup>AIDS Healthcare Foundation, Buenos Aires, Argentina,

<sup>2</sup>Programa Provincial de VIH, Santa Fe, Argentina

**Background:** In Argentina, preventive treatment for latent tuberculosis in patients newly diagnosed with HIV is rarely prescribed, despite the existence of national guidelines supporting its adoption. Here, we describe the incidence of tuberculosis in people living with HIV (PLWH) in 2021 at Santa Fe province, a region of moderate tuberculosis endemicity in Argentina.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Methods:** We used data from the National Health Surveillance System (SNVS 2.0), the HIV Patient Administration System (SVIH), and the Primary Care Centers Information System (SICAP) to identify patients with tuberculosis and HIV-tuberculosis coinfection registered between 01/01/2021 and 12/31/2021.

**Results:** The rate of HIV-tuberculosis co-infection was 648/100,000 PLHIV, while the rate in the general population in Santa Fe on the same period was 16/100,000 inhabitants. More than 80% of the HIV-tuberculosis co-infection cases were not on antiretroviral treatment when tuberculosis was diagnosed. The T-CD4 count was <200 cells/mm<sup>3</sup> in 90% of the patients; only 15% were virologically suppressed (<20 copies/mL).

Among PLWH with undetectable viral load, tuberculosis detection was 2.7 times higher than in the general population.

Remarkably, mortality was 30% in PLHIV with tuberculosis coinfection, whereas in the general population with tuberculosis mortality estimates were 5%.

**Conclusions:** This study reveals concerning estimates from a province in Argentina with moderate endemicity for tuberculosis and very low adherence to recommendations for latent tuberculosis diagnosis and treatment in PLWH. We found that, compared to the general population, PLHIV had more than 40 times higher rate of tuberculosis diagnosis and 6 times higher mortality rate.

Our findings underscore the urgent need for interventions such as the widespread implementation of latent tuberculosis diagnostic and treatment resources and training for healthcare providers to improve adherence to national and international HIV-tuberculosis management guidelines.

## THPEB067

Prioritizing children: decentralized diagnostics and child-friendly approaches transform childhood TB management in Zambia

J. Mzyece<sup>1</sup>, G. Samungole<sup>2</sup>, C. Kasapo<sup>2</sup>, A. Mubanga<sup>2</sup>, L. Mwiinga<sup>3</sup>, J. Chama<sup>2,4</sup>

<sup>1</sup>Ministry of Health, Clinical Care and Diagnostic Services, Lusaka, Zambia, <sup>2</sup>National TB and Leprosy Program, Ministry of Health, Public Health, Lusaka, Zambia, <sup>3</sup>Centers for Disease Control and Prevention (CDC), Division of Global HIV and Tuberculosis (DGHT), Lusaka, Zambia, <sup>4</sup>Zambia Field Epidemiology Training Program, ZNPHI, Field Epidemiology Training Program, Lusaka, Zambia

**Background:** Diagnosing tuberculosis in young children, particularly those under five, is hindered by challenges in impractical sputum specimen collection methods, leading to discomfort. In 2015, only two out of 528 facilities could perform alternative procedures.

Further there was a decrease in the proportion of children with tuberculosis from 8.2% in 2011 to 6.2% in 2015, sug-

gesting possible under-diagnosis and under-reporting. As a result, there was a need to decentralize and scaling up of child-friendly diagnostic tools.

**Description:** In 2018, the program introduced urine LAM testing to 15 tertiary facilities, subsequently scaling up to other care levels. By 2020, sputum induction and lavage sets were procured for 10 health facilities, with each province having one supported hospital for increased coverage. Stool testing for Xpert was adopted in December 2020, rolled out to all GeneXpert facilities. Childhood TB was prioritized through continuous monitoring, mentorship, quality improvement activities, and targeted training of healthcare staff and paediatricians.

**Lessons learned:** A total of 22 pediatricians were trained and an additional 45 health workers were trained in childhood TB management. Each provincial hospital (10 in total) was equipped with sputum induction machines, NPA sets, and staff was trained in the use of the machines. This led to an increase in the proportion of childhood TB notification to 11% in 2022. The acceptance of Nasopharyngeal Aspirate (NPA) as a sample type for GeneXpert contributed to a 33% rise in bacteriologically confirmed TB cases in children. The rollout of LAM testing and stool to facilities resulted in 30% improvement in childhood TB notifications, reversing the previous downward trend.

The lessons learnt are that the integrated approach yields results and employing a flexible testing methods enhance case detection. This is evidenced by the increase in the number of bacteriological confirmation and overall notifications.

**Conclusions/Next steps:** The mixed approach of decentralized service delivery coupled with the adoption and implementation of child-friendly testing methods, staff capacity building on childhood TB led to improved childhood TB diagnosis, bacteriological confirmation, and overall notifications. Sustaining these efforts is likely to improve childhood TB diagnosis in future.

## THPEB068

### Treatment response in children with presumptive pulmonary tuberculosis over six months in the UMOYA cohort in Cape Town, South Africa

E. Wijstma<sup>1</sup>, V. Jongen<sup>1,2</sup>, C. McKenzie<sup>3</sup>, I. Dewandel<sup>3</sup>, R. Dunbar<sup>3</sup>, A. Boyd<sup>1,2,4,5</sup>, M. van Niekerk<sup>3</sup>, M. van der Zalm<sup>6</sup>

<sup>1</sup>Public Health Service of Amsterdam, Department of Infectious Diseases, Amsterdam, Netherlands, the, <sup>2</sup>Stichting HIV Monitoring, Amsterdam, Netherlands, the, <sup>3</sup>Desmond Tutu TB Centre, Department of Paediatrics and Child Health, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa, <sup>4</sup>Amsterdam Institute for Infection & Immunity (AII), Amsterdam, Netherlands, the, <sup>5</sup>Amsterdam UMC Location University of Amsterdam, Department of Infectious Diseases, Amsterdam, Netherlands, the, <sup>6</sup>Desmond Tutu TB Centre, Department of Paediatrics and Child Health, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa

**Background:** Classification of pediatric tuberculosis (TB) may include response to treatment, but the dynamics of TB-related symptoms in children remain understudied. We examined determinants of resolution and recurrence of TB-related symptoms over six months among children with presumptive pulmonary TB.

**Methods:** UMOYA is a prospective cohort study in children (0-13 years) presenting with presumptive pulmonary TB in Cape Town, South Africa (recruitment 2017-present). Children with TB-related symptoms were classified as confirmed TB case, unconfirmed TB case or symptomatic control based on microbiology and clinical presentation. TB cases received anti-TB treatment, controls did not. Follow-up at week 0,2,8,16 and 24 after starting treatment included assessment of TB-related symptoms (cough, wheeze, fever, low appetite, reduced activity, weight loss, tachycardia, tachypnea, lymphadenopathy, hemoptysis).

We examined factors associated with symptom resolution (i.e., becoming asymptomatic for all TB-related symptoms) and recurrence (i.e., becoming symptomatic for  $\geq 1$  TB-related symptom after symptom resolution) over 24 weeks using Markov switch modelling. We report adjusted hazard ratio's (aHRs) and 95% CIs.

**Results:** 288 children (n=53 confirmed TB, n=70 unconfirmed TB, n=165 symptomatic controls; median (IQR) age: 24(11-53) months, n=23 with HIV, n=48 with severe abnormal chest X-ray) were included. Prevalence of any TB-related symptom was 100% at baseline and 49% at week 24. Estimated mean time to symptom resolution was 30 days; estimated mean time to symptom recurrence was 39 days.

Compared to symptomatic controls, TB cases had higher rates of symptom resolution (confirmed TB: aHR=3.58[1.45-8.82]; unconfirmed TB: aHR=33.45[1.19-943.44]) and symptom recurrence (confirmed TB: aHR=4.18[1.47-11.85]; uncon-

firmed TB: aHR=43.31[1.48-1265.83]). Children under 2 years had lower rates of symptom resolution (aHR=0.35[0.14-0.85]) and recurrence (aHR=0.35[0.13-0.97]) than children over 5.

Household smoking exposure (resolution: aHR= 4.18[2.01-8.69], recurrence: aHR= 5.45[2.41-12.35] and family unemployment (resolution: aHR=3.69[1.26-10.83], recurrence: aHR= 4.43[1.35-14.59]) were associated with higher rates of symptom resolution and recurrence. Chest X-ray severity and HIV status were not associated with symptom resolution or recurrence.

**Conclusions:** TB cases receiving anti-TB treatment resolved TB-related symptoms faster than symptomatic controls, but also had faster symptom recurrence. Moreover, resolution and recurrence were associated with environmental exposures and socioeconomic status. Further research on the usefulness of treatment response to diagnose pediatric TB is needed.

### Co-morbidities and clinical complications of HIV and antiretroviral therapy

## THPEB069

### Characterizing weight trajectory in a diverse ambulatory population of people with HIV after switching from their first antiretroviral regimen (WEIGH-IN SWITCH)

A. Tseng<sup>1,2</sup>, L. Lovblom<sup>3</sup>, S. Walmsley<sup>1,4</sup>

<sup>1</sup>Toronto General Hospital, Immunodeficiency Clinic, Toronto, Canada, <sup>2</sup>University of Toronto, Leslie Dan Faculty of Pharmacy, Toronto, Canada, <sup>3</sup>University Health Network, Biostatistics Department, Toronto, Canada, <sup>4</sup>University of Toronto, Dept of Medicine, Toronto, Canada

**Background:** Weight gain with integrase inhibitors (INSTI) and/or tenofovir alafenamide (TAF) may be progressive beyond normal aging/return-to-health, but the course after switching antiretroviral therapy (ART) is not fully elucidated. We aimed to characterize weight trajectory in a diverse population of persons with HIV after switching from their first ART.

**Methods:** Single-centre, retrospective cohort study using data from a research registry database of a Canadian tertiary care HIV clinic. Inclusion: adults starting first ART for  $\geq 1$  year from 01/01/2010-30/09/2022, then switched to a second ART for  $\geq 1$  year with  $\geq 2$  weights recorded. The primary outcome was change in weight (kg/year) during the switch period. Participant-level regression was used to define change; the models used piecewise linear slopes with a knot at the time of switch.

Participants were categorized into stable weight (slope within  $\pm 1$  kg/year), increased weight ( $>1$  kg/year), and decreased weight ( $<-1$  kg/year).

**Results:** 144 participants (83% male, 47% white, 55% born outside Canada, median age 42 years, CD4 326/mm<sup>3</sup>, weight 75.0 kg, BMI 24.8 kg/m<sup>2</sup>) started first ART (47% NNRTI/34% INSTI/19% PI with 90% TDF/2% TAF) for a median follow-up of 3.8 years. Participants switched to 12% NNRTI/84% INSTI/1% PI with 22% TDF/48% TAF for a median 4.5 years. During this period, weight remained stable (41%), increased (39%) or decreased (20%). Among those switched to TAF, 55% increased, 28% were stable and 17% decreased ( $p=0.006$  compared to switches without TAF). The proportion who switched to bictegravir/dolutegravir+TAF who increased weight was higher than those who switched to bictegravir/dolutegravir without TAF or to other regimens [9/11 (82%) vs. 12/45 (27%) and 35/88 (40%), respectively;  $p=0.02$ ; Figure 1].

Figure 1. Boxplot of weight change after switching from first antiretroviral regimen.

**Conclusions:** In a contemporary cohort of people, those who switched to TAF were more likely to experience weight gain. Significant weight gain was less frequent in those switching to other regimens including bictegravir/dolutegravir without TAF.

## THPEB070

Prevalence of osteoporosis and risk factors associated with decreased bone density in Korean males living with HIV receiving ART

Y.-S. Kim<sup>1</sup>, H. Jeong<sup>1</sup>, S. Cheon<sup>1</sup>

<sup>1</sup>Chungnam National University School of Medicine, Daejeon, Korea, the Republic of

**Background:** People living with HIV have a decreased bone density due to many factors such as osteoporosis-related and HIV-related factors. We aimed to evaluate its prevalence and risk factors in Korean males living with HIV receiving ART.

**Methods:** This study included 200 men who underwent dual energy X-ray absorptiometry in a tertiary care hospital. Osteoporosis was defined as a Z score  $<-2.0$  according

to International Society for Clinical Densitometry for men aged  $<50$  years and a T score  $<-2.5$  in men aged 50 or more years according to WHO criteria.

We analyzed the prevalence of osteoporosis and conducted multivariate logistic regression to evaluate the associated risk factors.

**Results:** The prevalence of osteoporosis was 16.95% (20 of 118) in males aged  $<50$  years and 25.6% (21 of 82) in males aged 50 or more years. Low body mass index (BMI) (odds ratio [OR], 0.762; 95% confidence interval [CI], 0.630 to 0.923;  $p=0.005$ ) and the use of tenofovir disoproxil fumarate (TDF) (OR, 1.039; 95% CI, 1.007 to 1.072;  $p=0.017$ ) were the independent risk factors for osteoporosis in males living with HIV aged  $<50$  years.

Osteoporosis in males aged 50 or more years was significantly associated with low BMI (OR, 0.732; 95% CI, 0.577 to 0.929;  $p=0.010$ ) and decreased amount of exercise (OR, 5.611; 95% CI, 1.102 to 28.575;  $p=0.038$ ).

**Conclusions:** Osteoporosis is highly prevalent in Korean HIV-infected males. Bone mass density needs to be measured for HIV-infected males even below 50 years with low BMI or receiving ART including TDF.

## THPEB071

Diabetes mellitus control in people living with HIV at a specialist HIV referral clinic in Zimbabwe: a cross sectional analysis

C. Chimbetete<sup>1</sup>, V. Moyo<sup>1</sup>, A. Mandiriri<sup>1,2</sup>

<sup>1</sup>Newlands Clinic, Clinic, Harare, Zimbabwe, <sup>2</sup>University of Bern, Institute of Social and Preventive Medicine, Bern, Switzerland

**Background:** Optimum blood sugar control is as important as HIV control to ensure a reduction in morbidity and mortality among diabetic people living with HIV (PLHIV). We assessed and compared blood sugar and HIV control in a PLHIV with comorbid DM receiving care at a specialist HIV referral clinic in Zimbabwe.

**Methods:** We conducted a descriptive cross-sectional analysis of adult participants ( $\geq 40$  years) as of 31 December 2023 using routine clinic records. DM control was defined as an HBA1C of  $< 7\%$ . HIV control was defined as a viral load of  $<1000$  copies/ml. We compared the percentage of disease control (HIV vs diabetes) in participants living with both HIV and diabetes.

**Results:** We reviewed 4857 records (1694, 39% males, overall median age 51 years, IQR 46–47). Most participants (91%, with 65% females) were on a dolutegravir based regimen with a median of 14 years on antiretroviral therapy (IQR:9–17). Prevalence of DM was 7% ( $n=330$ , 95%CI 6.1–7.5) with no difference by gender (8% males and 6% females,  $p=0.08$ ). Amongst these diabetic patients, glycemic control was 59% (190/323) and did not significantly differ by gender (62%, 95%CI; 53–70 males vs 58%, 95%CI; 50–64 females). The proportion of HIV virologic control ( $<1000$ copies/ml)

was 98% (95%CI; 96-99) with no differences by gender. Overall, participants were more likely to achieve HIV virologic control (98%) than glycemic control (59%).

Figure 1. Glycaemic and HIV disease control among diabetic patients.

**Conclusions:** We show a high percentage of HIV virologic suppression which is in line with the global UNAIDS target. However, the proportion of patients with good glycaemic control was significantly lower.

Within integrated HIV care programs, health care workers need to help patients understand the equal importance of glycaemic control.

Lessons learnt from HIV treatment programs should be used to help optimise control of comorbidities. Future research may be useful in understanding perceptions of PLHIV regarding the importance of comorbidities.

## THPEB072

### Changes in the disease spectrums of hospitalized HIV infected patients: a 12-year study from a population in eastern China

Y. Xiong<sup>1</sup>, B. Zhu<sup>1,2,3,4</sup>

<sup>1</sup>The Department of Infectious Diseases, the First Affiliated Hospital, Zhejiang University School of Medicine, Hangzhou, China, <sup>2</sup>National Medical Center for Infectious Diseases, Hangzhou, China, <sup>3</sup>National Clinical Research Center for Infectious Diseases, Hangzhou, China, <sup>4</sup>State Key Laboratory of Diagnosis and Treatment of Infectious Diseases, Hangzhou, China

**Background:** Acquired immunodeficiency syndrome (AIDS) caused by human immunodeficiency virus (HIV) remains a serious public health problem. Opportunistic infections and malignancies are the main causes of morbidity and mortality in people living with HIV.

This study investigated hospitalized patients diagnosed with HIV over the past 12 years, to determine the composition and changing trends of the disease spectrum of HIV/AIDS patients, and the related factors of mortality in eastern China.

**Methods:** A total of 2140 people living with HIV were enrolled between January 2010 and December 2021. Demographic, clinical and laboratory data, opportunistic infections, malignancies and in-hospital outcomes were collected and analyzed.

**Results:** A total of 1292 patients (60.4%) developed opportunistic infections. Among them, 537 developed one type and 755 had two or more types of opportunistic infections; 104 cases were assigned to AIDS-defining cancers (ADCs), and 172 cases were non-AIDS-defining cancers (NADCs). Community acquired pneumonia and cytomegalovirus were the main types of opportunistic infections. In ADCs and NADCs, diffuse large B-cell lymphoma and lung cancer were the most common types, respectively. The overall in-hospital mortality rate was 8.1%.

Opportunistic infections and tumors accounted for the majority of in-hospital mortality. Opportunistic infections, malignancies and CD4<sup>+</sup>T cell count were independent predictors for in-hospital mortality.

**Conclusions:** Our study provided a comprehensive description of the disease characteristics of HIV inpatients in eastern China over the past 12 years. We explored the changes in hospitalized patients, disease spectrums and causes of death. AIDS-defining illness is still the main cause of hospitalization and in-hospital mortality. Therefore, efforts are still needed to develop a greater number of successful HIV management strategies.

Meneses Cisneros<sup>7</sup>, S. Triana González<sup>1</sup>, A.L. Cano Díaz<sup>1</sup>, L. Barragán Huerta<sup>8</sup>, P. Nogueira<sup>9</sup>, J.E. Gaytan Martínez<sup>1</sup>

<sup>1</sup>Hospital de Infectología Centro Medico Nacional La Raza Instituto Mexicano del Seguro Social, Infectious Diseases Department, Ciudad de Mexico, Mexico, <sup>2</sup>Hospital de Especialidades "La Raza" National Medical Center, Instituto Mexicano del Seguro Social, Internal Medicine, Ciudad de Mexico, Mexico, <sup>3</sup>Instituto Politécnico Nacional, Departamento de posgrados, Ciudad de México, Mexico, <sup>4</sup>Hospital de Infectología "La Raza" National Medical Center, Instituto Mexicano del Seguro Social, Imagenology Department, Mexico City, Mexico, <sup>5</sup>Hospital de Infectología Centro Medico Nacional La Raza Instituto Mexicano del Seguro Social, Nutrition Department, Ciudad de Mexico, Mexico, <sup>6</sup>Hospital de Infectología Centro Medico Nacional La Raza Instituto Mexicano del Seguro Social, Research Unit, Ciudad de Mexico, Mexico, <sup>7</sup>Hospital de Infectología Centro Medico Nacional La Raza Instituto Mexicano del Seguro Social, Electrocardiography Department, Ciudad de Mexico, Mexico, <sup>8</sup>Universidad Autónoma Metropolitana, Campus Xochimilco, Biological Science and Health Department, Mexico City, Mexico, <sup>9</sup>Universidad Nacional Autonoma de México, Medicine School, Mexico City, Mexico

**Background:** Evidence suggests that people living with HIV (PLHIV) starting an INSTI regimen are more likely to experience weight gain and metabolic syndrome (MetS) than those on other antiretroviral regimens.

The aim of the study was to identify the incidence of MetS at 48 weeks for ATP III score in PLHIV who started antiretroviral therapy (ART) with Dolutegravir based-regimen compared with Bictegravir based-regimen.

**Methods:** A randomized open clinical trial was developed in men PLHIV who started ART randomized to BIC/FTC/TAF or DTG/3TC/ABC. Weight, blood pressure and waist circumference were measured during routine clinical care; in addition, bioelectrical impedance was done; repeated measures were done at baseline, 24 and 48 weeks. Laboratory tests were done at the same time.

**Results:** A total of 311 PLHIV were randomized, 155 (49.9%) to DTG/ABC/3TC and 156 (50.1%) to BIC/TAF/FTC. At current analysis, 203 had completed 48 weeks of follow-up. Median age is 26 years old (IQR 22-30), and a viral load of 26,403 copies/mL (IQR 7513-85674). A significant increase in CD4+ T cell count was observed in the DTG/ABC/3TC group (P=0.007). The total incidence of MetS was 10 cases (4.9%); 5 (5%) in the BIC/TAF/FTC group and 5 (4.8%) in the DTG/ABC/3TC group (p=0.129). Weight gain was +1.7 kg (IQR

0.3-3.4) with BIC/TAF/FTC and +1.5 kg (IQR 1-5.5) with DTG/ABC/3TC (p =0.591). The incidence of hypertriglyceridemia was 14 cases (14%) in BIC/TAF/FTC and 12 (11.6%) in DTG/ABC/3TC (p=0.315). In BIC/TAF/FTC group, weight gain >5% was found in 16 patients (16%) and weight gain >10% in 7 patients (7%); in the DTG/ABC/3TC group, weight gain >5% was found in 17 patients (16.5%) and weight gain > 10% in 9 (8.7%); p=0.374 and p=0.938 respectively.

Measurements	BIC/TAF/FTC (n=100)	DTG/ABC/3TC (n=103)	P value
Weight gain, median (IQR), kg	+ 1.7 (0.3-3.4)	+ 1.5 (1-5.5)	0.591
Incidence of Hypertriglyceridemia, n (%)	14 (14)	12 (11.6)	0.315
Incidence of Metabolic Syndrome, n (%)	5 (5)	5 (4.8)	0.129
RNA HIV Viral load, Log, median (IQR)	<1.6 (<1.6-1.6)	<1.6 (<1.6-1.6)	0.936
CD4+ count cell, median (IQR), cells/mm <sup>3</sup>	645 (543-833)	603 (505-895)	0.007
Visceral adipose tissue, median (IQR), cm	3.4 (2.6-3.8)	3.5 (3.0-4.3)	0.082
Subcutaneous adipose tissue, median (IQR), cm	1.5 (1.1-2.2)	1.6 (0.9-2.2)	0.896

Table 1. Comparison between groups of 48 weeks results.

**Conclusions:** This Mexican trial shows that the incidence of MetS was similar in both groups. Second generation INSTI-based regimens were effective and tolerated in our population.

## THPEB074

### Prevalence of elevated blood pressure in people with self-reported substance use accessing care in region F, Johannesburg

A. Nyatela<sup>1</sup>, S. Nonyukela<sup>1</sup>, R. Mohale<sup>1</sup>, S.T. Lalla-Edward<sup>1</sup>, S. Gumede<sup>1</sup>

<sup>1</sup>Ezintsha, University of the Witwatersrand, Faculty of Health Sciences, Johannesburg, South Africa

**Background:** Hypertension, a risk for cardiovascular disease, is the leading cause of death in sub-Saharan Africa. Substance use is one of many risk factors for elevated blood pressure (BP) and hypertension.

Here, we explore the prevalence of elevated BP and associated risk factors among individuals who self-reported substance use.

**Methods:** This was a cross-sectional study, using secondary data analysis. Data for 2199 participants who self-reported substance use between August 2022 - December 2023 were extracted from iHEART-SA (ethics reference M211160) - an HIV/hypertension integration study conducted in nine public health facilities in Johannesburg. HIV status, age, and sex were assessed as covariates of elevated BP amongst substance users. Elevated BP was defined as two consecutive systolic blood pressure /diastolic blood pressure exceeding 140/85 mmHg. Analysis was completed using with STATA version 17 software.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Results:** The prevalence of elevated BP among participants ( $n=2199$ ) was 39% ( $n=849$ ). In the test of association analyses, elevated BP was associated with substance use ( $p<0.001$ ), with almost two-thirds of the participants with elevated BP self-reporting alcohol use ( $n=543$ , 64.0%). As expected, more older participants ( $\geq 50$  years) had elevated BP than younger participants (18-29 years) ( $n=234$ , 28% versus  $n=86$ , 10%,  $p<0.001$ ).

In the multivariable analyses, participants aged 40-49 years ( $aOR=2.03$ , 95% CI=1.34-3.09) and  $\geq 50$  years ( $aOR=3.53$ , 95% CI=2.23-5.59) were more likely to have elevated BP than younger participants (18-29 years).

More males were associated with elevated BP than females ( $n=526$ , 62% versus  $n=323$ , 38%,  $p<0.001$ ). Elevated BP was associated with HIV, with negative participants ( $aOR=2.66$ , 95% CI=2.00-3.54) and those with unknown HIV status ( $aOR=2.26$ , 95% CI=1.11-4.61) more likely to have elevated BP than PLHIV ( $p<0.001$ ).

In multivariable analysis stratified by substance use, the same relationships were seen in the group who reported alcohol use compared to other substances.

**Conclusions:** There is an association between elevated BP and substance use, particularly alcohol usage. This study highlights a need for future research into the substance use associations with the development of hypertension, as well as the design of health interventions giving consideration to alcohol use on elevated BP and hypertension.

TLD and at least one month post TLD initiation, to evaluate the difference in eGFR. A paired t-test was conducted to determine whether DTG was associated with a change in eGFR. Bivariate and multivariate logistic regression was used to identify risk factors for an eGFR decrease of more than 20%.

**Results:** Among 814 clients who switched from TLE to TLD, the mean eGFR decrease was 16mL/min/1.73m<sup>2</sup> (13.6%) ( $p<0.001$ ) at an average of 49 weeks post TLD switch (14mL/min/1.73m<sup>2</sup> (12.3%) for males and 16.7mL/min/1.73m<sup>2</sup> (14%) for females). There were 219 clients (27%) with an eGFR decrease of more than 20%. The mean eGFR decrease in this group was 29.32%. On bivariate logistic regression, risk factors for a decline of over 20% included increased time on TLE (OR 1.08, 95%CI 1.04, 1.13) female sex (OR 1.7, 95%CI 1.2, 2.5), increasing age (OR 1.02, 95%CI 1.01, 1.04), an underweight body mass index (BMI) (OR 2.1, 95%CI 1.3, 3.2), and an obese BMI (1.9 OR, 95%CI 1.2, 2.8). On multivariate analysis, the risk factors were similar, with the exception that obesity was no longer associated with a decline in the eGFR of over 20%.

**Conclusions:** After switching to TLD, the mean change in eGFR observed in Eswatini aligns with published reports. This post-marketing data is reassuring and confirms observations from clinical trials. Identifying risk factors for a greater than expected change in eGFR can help clinicians to better monitor those who might be at higher risk for larger than average reductions in eGFR.

## THPEB075

Factors associated with an above average decline in estimated glomerular filtration rate following substitution with DTG among people living with HIV in Eswatini

S. Ndabezitha<sup>1</sup>, M. Carey<sup>2,1</sup>, A. Kay<sup>3,1</sup>, S. Dlamini<sup>3,1</sup>, C. Nyapokoto<sup>4</sup>, M. Abadie<sup>3,1</sup>

<sup>1</sup>Baylor College of Medicine, Houston, United States, <sup>2</sup>Texas Children's Hospital, Houston, United States, <sup>3</sup>Baylor College of Medicine Children's Foundation Eswatini, Mbabane, Eswatini, <sup>4</sup>Eswatini Ministry of Health, Eswatini National AIDS Program, Mbabane, Eswatini

**Background:** Dolutegravir is known to result in a physiologic decrease in estimated glomerular filtration rate (eGFR) of 16-19mL/min/1.73m<sup>2</sup> due to inhibition of tubular creatinine secretion. This analysis evaluated adults in Eswatini transitioning from TDF/3TC/EFV (TLE) to TDF/3TC/DTG (TLD) to determine whether observed reduction in eGFR is aligned with published literature and to identify risk factors for eGFR reductions of greater than 20%.

**Methods:** This is a retrospective observational cohort study of electronic medical record data at Baylor College of Medicine Children's Foundation-Eswatini among adults living with HIV who were on TLE prior to a transition to TLD. We calculated eGFR using the 2021 CKD-EPI equation pre-

## THPEB076

Factors associated with cervical cancer screening uptake among women 25-49 years living with HIV in Botswana, 2021

Lekone<sup>1</sup>, A. Namageyo-Funa<sup>3</sup>, T. Kgaswanyane<sup>4</sup>, S. Bodika<sup>3</sup>, R. L. Laws<sup>3</sup>, K. Stafford<sup>5</sup>, M. Montandon<sup>3</sup>, M. Alogeng<sup>1</sup>

<sup>1</sup>CDC Botswana, DGHT, Gaborone, Botswana, <sup>2</sup>Ministry of Health, Gaborone, Botswana, <sup>3</sup>CDC Atlanta, DGHT, Atlanta, United States, <sup>4</sup>Bumphi, Gaborone, Botswana, <sup>5</sup>UMB, Ciheb, Maryland, United States

**Background:** Cervical cancer morbidity and mortality remain high in Botswana, especially among women living with HIV (WLHIV). Although the Botswana Ministry of Health has established cervical cancer screening and treatment initiatives, uptake remains low. The study investigated factors associated with cervical cancer screening among WLHIV in Botswana.

**Methods:** Secondary analysis was performed using data from the 5<sup>th</sup> Botswana AIDS Impact Survey, a nationally representative, cross-sectional household survey using a two-stage cluster design, conducted in 2021. Women who were aged 25-49 years, confirmed HIV-positive via

Oral abstracts

Author Index

household-based testing, and responded that they had or had not been screened for cervical cancer screening were included in the analysis. All results were weighted to account for sample selection probabilities. The cervical cancer screening rate and confidence intervals was calculated using jackknife method of estimation. Weighted logistic regression models were used to determine the association with cervical cancer screening using Adjusted Odds Ratios (AORs) with 95% CIs for demographic (age, place of residence) and socioeconomic (education level, wealth quintile) variables using STATA 16.

**Results:** Overall, 1,692 women in the study were confirmed HIV-positive and had cervical cancer screening status. More than half (63.9%, 95%CI 61.6-66.2) of the respondents had been screened for cervical cancer.

Median age was 40 years with an interquartile range of 35-44 years. Women aged 35-44 years (AOR=2.06, 95%CI 1.48-2.86); 45-49 years (AOR=3.07, 95%CI 1.96-4.80) had higher odds of being screened for cervical cancer compared to women aged 25-34 years.

Women who attained secondary education (AOR=3.16, 95%CI 1.72-5.79) and tertiary (AOR=3.88, 95%CI 1.77-8.50) had higher odds of being screened compared to those with no education. Women who lived in urban areas (AOR=1.32, 95%CI 1.01-1.75) had higher odds of being screened compared to rural residents.

**Conclusions:** WLHIV in Botswana who are 25-34 years, with health inequalities of no education, and living in rural areas, were less likely to get screened for cervical cancer. HIV programs could increase cervical cancer screening rates by focusing on improving clinical services and community outreach for WLHIV for younger women and those who are less educated and live in rural areas.

### Switching strategies in older adults with HIV: comparing 2-Drug and 3-Drug Regimens

F. Brañas<sup>1</sup>, M.J. Galindo<sup>2</sup>, M. Torralba<sup>3</sup>, A. Antela<sup>4</sup>, M.L. Montes<sup>5</sup>, M. Bustinduy<sup>6</sup>, N. Cabello<sup>7</sup>, A. Cabello<sup>8</sup>, M. Ramírez<sup>9</sup>, P. Ryan<sup>10</sup>, F. Dronda<sup>11</sup>, I. Machuca<sup>12</sup>, M. Sánchez-Conde<sup>13</sup>

<sup>1</sup>Hospital Infanta Leonor, Universidad Complutense, Geriatrics, Madrid, Spain, <sup>2</sup>Hospital Clínico Universitario, Valencia, Spain, <sup>3</sup>Hospital Universitario de Guadalajara, Guadalajara, Spain, <sup>4</sup>Hospital Clínico Universitario de Santiago de Compostela, Universidad de Santiago de Compostela, Santiago de Compostela, Spain, <sup>5</sup>Hospital Universitario La Paz, IdiPAZ, Madrid, Spain, <sup>6</sup>Hospital de Donostia, San Sebastián, Spain, <sup>7</sup>Hospital Clínico Universitario San Carlos, Madrid, Spain, <sup>8</sup>Fundación Jiménez Díaz, Madrid, Spain, <sup>9</sup>Hospital General Universitario Gregorio Marañón, Madrid, Spain, <sup>10</sup>Hospital Universitario Infanta Leonor, Universidad Complutense, Madrid, Spain, <sup>11</sup>Hospital Universitario Ramón y Cajal, Madrid, Spain, <sup>12</sup>Hospital Reina Sofía, Córdoba, Spain, <sup>13</sup>Hospital Ramón y Cajal, IRYCIS, Ciberinfec, Infectious Diseases, Madrid, Spain

**Background:** Background: Although single-tablet second-generation integrase inhibitors, such as the 2-drug regimen (2DR) dolutegravir/lamivudine and the 3-drug regimen (3DR) bictegravir/emtricitabine/tenofovir alafenamide, are highly recommended as switch strategies, data from older adults with HIV (OAH) remain limited.

Our primary objective was to understand the reasons for switching to either a 3DR or a 2DR in OAH, and to investigate the onset of new comorbidities post-treatment switch.

**Methods:** Methods: A descriptive analysis was conducted on a cohort of 656 virologically suppressed older adults with HIV >=50 years old on antiretroviral therapy, focusing on those who switched their treatment to a 3DR (bictegravir/emtricitabine/tenofovir alafenamide) or 2DR (dolutegravir/lamivudine). We compared the reasons for this change and the incidence of new metabolic or cardiovascular comorbidities.

**Results:** Results: Out of the 656 OAH analyzed, 137 (20.9%) switched to a 2DR and 147 (22.4%) to a 3DR. No differences were found between groups in the baseline characteristics, including age. The majority of participants switched from integrase inhibitor-based regimens (57.7% 2DR vs. 59.9% 3DR), while 12.9% and 4.4% of switched from protease inhibitor-based regimens, respectively (p=0.011). The initiative for the change was made by the treating physician in 96.4% and 86.4%, respectively (p=0.012). The main reason for the change was simplification (74.5% and 47.6%, respectively p<0.0001). 6.6% and 17.7% switched to avoid drug interactions, respectively (p=0.004), while 8.2% of those who switched to 3DR did so for high genetic barrier, with no changes for this reason in the 2DR (p=0.0006).

There were no significant differences in other reasons for switch: adverse effects, toxicity, treatment failure, or weight gain. We found no differences between the two groups in new metabolic or cardiovascular comorbidities (hypertension, diabetes mellitus, dyslipidemia and stroke).

**Conclusions:** Conclusions: We found no significant differences in baseline characteristics or in emergence of new comorbidities among OAH who switch to either a 2DR or a 3DR. Those OAH switching to a 3DR did so more frequently for its higher genetic barrier and to avoid drug interactions.

## THPEB078

### Impact of concurrent initiation of Depo-Provera and TDF-containing ART on bone loss in young women in the BONE: CARE Study

F.K. Matovu<sup>1</sup>, M. Nabwana<sup>2</sup>, J. Pettifor<sup>3</sup>, T. Brown<sup>4</sup>, M. Beksinska<sup>5</sup>, BONE: CARE Study

<sup>1</sup>MU-JHU Research Collaboration, Research, Kampala, Uganda, <sup>2</sup>MU-JHU Research Collaboration, Kampala, Uganda, <sup>3</sup>SAMRC/Wits Developmental Pathways for Health Research Unit, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, Uganda, <sup>4</sup>Johns Hopkins University School of Medicine, Baltimore, United States, <sup>5</sup>Maternal Adolescent & Child Health Research Unit, University of the Witwatersrand, Faculty of Health Sciences, Johannesburg, South Africa

**Background:** We previously demonstrated a doubling of bone mineral density (BMD) loss over a two period among prevalent users of the three-monthly contraceptive, depot medroxyprogesterone acetate (DMPA, Depo Provera) who were initiating tenofovir disoproxil fumarate (TDF)-containing antiretroviral therapy (ART). It is however not known how timing of initiation of these two agents affects BMD loss. We assessed the combined BMD effects of initiating TDF in new users compared to current users of DMPA.

**Methods:** We recruited women with and without HIV from health facilities around Kampala, Uganda and classified based on their combination of HIV status, TDF use, and DMPA use. All HIV+ women were ART-naïve at baseline. BMD assessments of the lumbar spine (LS), total hip (TH) and femoral neck (FN) were done using dual energy x-ray absorptiometry at 6-monthly intervals over 2 years. BMD Z-scores were generated using data for the HIV negative group as the reference population. We used repeated measures analysis to compare rate of change among new and current users of DMPA, calculated as percent (%) change in BMD Z-score per year adjusting for age, and BMI.

**Results:** We present data for 213 WLWH initiating TDF-ART, which included 106 new DMPA-IM users and 107 current users. The mean age was 26.1 years (SD, 4.2). The annualized

rates of loss in BMD Z-scores were significantly higher in current DMPA users compared to new DMPA users at the TH: -0.29 (-0.56, -0.03; p=0.032), Figure. Marginal differences were observed at the FN: -0.01 (-0.31, 0.29; p=0.959), and no differences were seen at the LS: and -0.26 (-0.53, 0.01; p=0.056).

HIV+/DMPA+/TDF+ (i) – Used DMPA in last two years.  
HIV+/DMPA+/TDF+ (ii) – No DMPA use in last two years.  
HIV+/DMPA-/TDF+ – New DMPA users – no DMPA exposure in the last 2 years.

Figure 1. Mean BMD Z-scores among women in the BONE: CARE Study.

**Conclusions:** Concurrent initiation of DMPA in young women initiating TDF-containing ART was associated with higher BMD loss at the TH compared to TDF initiation in current DMPA users. Bone sparing contraceptive options need to be considered for women initiating TDF ART.

### Comorbidity control outcomes and equity among sexual minority men engaged in HIV care in a multicenter prospective study

S. Haberlen<sup>1</sup>, M. Friedman<sup>2</sup>, D. Ware<sup>3</sup>, S. Meanley<sup>4</sup>, D. Siconolfi<sup>5</sup>, M. Brennan-Ing<sup>6</sup>, J. Egan<sup>7</sup>, F. Palella<sup>8</sup>, M. Witt<sup>9</sup>, T. Brown<sup>10</sup>, M. Plankey<sup>3</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology, Baltimore, United States, <sup>2</sup>Rutgers School of Public Health, Department of Urban-Global Public Health, Newark, United States, <sup>3</sup>Georgetown University Medical Center, Division of General Internal Medicine, Washington, United States, <sup>4</sup>University of Pennsylvania School of Nursing, Department of Family and Community Health, Philadelphia, United States, <sup>5</sup>RAND Corporation, Pittsburgh, United States, <sup>6</sup>Hunter College, Brookdale Center for Healthy Aging, New York City, United States, <sup>7</sup>University of Pittsburgh, Department of Behavioral and Community Health Sciences, Pittsburgh, United States, <sup>8</sup>Northwestern University Feinberg School of Medicine, Department of Internal Medicine, Chicago, United States, <sup>9</sup>The Lundquist Institute at Harbor-UCLA Medical Center, Torrance, United States, <sup>10</sup>Johns Hopkins University, Department of Medicine, Baltimore, United States

**Background:** Cardiometabolic comorbidities are common among people with HIV. Few studies have evaluated whether their hypertension or diabetes management outcomes differ from counterparts without HIV.

We assessed comorbidity management prevalence and equity by race/ethnicity among a mixed HIV serostatus cohort of sexual minority men.

**Methods:** Data were collected semiannually (2016-2019) from gay and bisexual cisgender men in the Multicenter AIDS Cohort Study (MACS) Healthy Aging Study with and without HIV, aged  $\geq 40$  years, in four U.S. metropolitan areas. Prevalence ratios were estimated using multivariable Poisson regression with generalized estimating equations for two outcomes: hypertension control ( $<130$  systolic /  $<80$  diastolic) and glycemic control (hemoglobin A1c  $<7.5\%$ ). Equity was assessed using prevalence ratios of control for Hispanic and Black men, relative to White men and compared by HIV status.

**Results:** There were 892 men (3,994 person-visits) with hypertension and 221 men (993 person-visits) with diabetes; 188 with both. The mean age was  $61 \pm 8$  years; 48% with HIV (94% taking antiretroviral therapy; 79% virally suppressed); 71% White, 21% Black, and 8% Hispanic/other race. Hypertension and glycemic control were lowest among Hispanic (23%/43%) and Black (22%/58%) men without HIV, and highest among White men with HIV (33%/82%); control was similar for White men without and Black men with HIV (~30%/76%). Men with HIV had a 19% and 11% higher prevalence of achieving hypertension and glycemic control than men without HIV, adjusting for age,

race, site, education, substance use, and BMI. The ratio of comorbidity control by race/ethnicity was more equitable among men in HIV care than men without HIV, but not statistically significantly different. Healthcare satisfaction was higher among men with, versus without, HIV ( $p < 0.001$ ), but it was not significantly associated with comorbidity control.

**Conclusions:** Sexual minority men in HIV care with hypertension and/or diabetes were significantly more satisfied with their quality of care and achieved levels of comorbidity control equivalent to or greater than men without HIV. Successful elements of hypertension and diabetes management in HIV care should be evaluated for translation to other healthcare settings and to other comorbidities, and further evaluation is needed to optimize factors to reduce disparities in successful comorbidity management.

## HIV and ageing

### Differences in cognitive trajectories between sexes among aging virologically suppressed Thai people living with HIV

A. Hiransuthikul<sup>1,2</sup>, S. Kerr<sup>1,3,4</sup>, T. Apornpong<sup>1</sup>, W.M. Han<sup>1,3</sup>, H.M.S. Lwin<sup>1</sup>, S. Gatechompol<sup>1,5</sup>, S. Ubolyam<sup>1</sup>, A. Avihingsanon<sup>1,5</sup>, HIV-NAT 006 and 207 study team <sup>1</sup>HIV-NAT, Thai Red Cross AIDS Research Centre, Bangkok, Thailand, <sup>2</sup>Chulalongkorn University, Department of Preventive and Social Medicine, Faculty of Medicine, Bangkok, Thailand, <sup>3</sup>Kirby Institute, UNSW Sydney, Sydney, Australia, <sup>4</sup>Chulalongkorn University, Biostatistics Excellence Centre, Faculty of Medicine, Bangkok, Thailand, <sup>5</sup>Chulalongkorn University, Center of Excellence in Tuberculosis, Department of Medicine, Faculty of Medicine, Bangkok, Thailand

**Background:** Due to the disparities in biopsychosocial factors experienced by men and women, the impact of HIV on cognitive performance may differ between sexes. We aimed to determine the differences in cognitive trajectories between men and women in an aging people living with HIV (PLWH) cohort in Thailand.

**Methods:** Virologically suppressed Thai PLWH aged  $\geq 50$  years in the HIV-NAT 006 cohort were enrolled during 2015-2017 to evaluate cognitive performance using the Thai-validated Montreal Cognitive Assessment (MoCA), with the second assessments conducted since 2021.

A multivariate linear mixed-effects model, with an interaction term between sex and age, was utilized to estimate for sex differences in cognitive trajectories with aging.

**Results:** Among 224 PWH included, median (IQR) age was 54.5 (51.9–59.7) years, 39.3% were women, 73.2% had >6 years of education, median duration of HIV infection was 17.9 (14.2–20.8) years, and median MoCA score was 24 (21–26), with 57.1% having cognitive impairment at baseline. Women were less likely to have >6 years of education (52.3% vs. 86.8%,  $p<0.001$ ) and had lower MoCA score (23 [18–25] vs. 25 [22.5–26],  $p<0.001$ ) than men. After adjusting for baseline MoCA, body mass index, education, smoking, alcohol consumption, diabetes, hypertension, and depression, men showed a greater decline in cognitive performance with increasing age than women (Figure). After adding HIV-related factors to the model, the greater decline in cognitive performance in men persisted (23.8 [95%CI 23.0–24.7] to 21.1 [95%CI 20.0–22.2] in men vs. 23.0 [95%CI 21.9–24.2] to 21.5 [95%CI 20.2–22.9] in women from age 50 to 70 years).

Figure 1. Modeled cognitive trajectories for MoCA scores, with 95% confidence intervals, as a function of age from 50 to 70 years for men and women.

**Conclusions:** Despite higher cognitive performance at the earlier stage, men living with HIV demonstrated a greater cognitive decline compared to their women counterparts. These findings underscore the importance of further investigation in sex differences for cognitive decline in aging individuals living with HIV.

## THPEB081

### Geriatric syndromes and quality of life in older adults living with HIV in Brazil

J.L. Castilho<sup>1</sup>, P. Ranadive<sup>2</sup>, B.E. Shepherd<sup>2</sup>, C. Brites<sup>3</sup>, T. Cordeiro<sup>3</sup>, S. Amaral<sup>3</sup>, R.S. Nogueira<sup>4</sup>, A.C.C. Iglessias<sup>4</sup>, M.B. Antonio<sup>5</sup>, V.I. Avelino-Silva<sup>5,6</sup>, S.W. Cardoso<sup>7</sup>, T.S. Torres<sup>7</sup>, B. Grinsztejn<sup>7</sup>, on behalf of ELEA-Brasil

<sup>1</sup>Vanderbilt University Medical Center, Division of Infectious Diseases, Nashville, United States, <sup>2</sup>Vanderbilt University Medical Center, Department of Biostatistics, Nashville, United States, <sup>3</sup>Hospital Universitário Professor Edgard Santos, Laboratório de Pesquisa em Infectologia, Salvador, Brazil, <sup>4</sup>CRT-DST/AIDS-SP (STD/Aids-SP Reference and Training Center), São Paulo, Brazil, <sup>5</sup>Faculdade de Medicina da Universidade de São Paulo, Department of Infectious and Parasitic Diseases, São Paulo, Brazil, <sup>6</sup>Vitalant Research Institute, San Francisco, United States, <sup>7</sup>Instituto Nacional de Infectologia Evandro Chagas-Fiocruz, Rio de Janeiro, Brazil

**Background:** Older people living with HIV (OPLWH) are a growing population globally. Understanding of the epidemiology and consequences of geriatric syndromes in diverse settings is urgently needed. We examined the association of geriatric syndromes and quality of life (QOL) among OPLWH in Brazil.

**Methods:** We enrolled OPLWH aged  $\geq 50$  years on antiretroviral therapy from clinics in three Brazilian cities for standardized collection of geriatric syndromes, medical history, and sociodemographic information. Geriatric syndromes included frailty (Fried phenotype), polypharmacy ( $\geq 5$  daily medications), cognitive impairment (Montreal Cognitive Assessment score  $< 26$  adjusted for education), activities of daily living (ADL) dependency (Barthel scale  $< 96$ ), instrumental ADL dependency (Lawton scale  $< 26$ ), sarcopenia (Short Physical Performance Battery score  $< 10$ ), depression (PHQ-9 score  $\geq 10$ ), and any falls in the past year. QOL was measured using the EQ-5D-5L, which accounts for dimensions of mobility, self-care, usual activities, pain/discomfort, and anxiety/depression. We described the association of none/one or multiple prevalent geriatric syndromes with QOL composite index and QOL dimensions (no problems to extreme problems).

**Results:** The median age of the 703 OPLWH enrolled was 62 years; 63% cis-gender men and 35% cis-gender women; median CD4 count 731 cells/ $\mu$ L; 88% undetectable HIV-RNA; and 21% had  $< 8$  years of education. Polypharmacy (77%) and any cognitive impairment (72%) were the most prevalent geriatric syndromes. Among all, sarcopenia was present in 40%, pre-frailty in 49%, and frailty 6%. Overall, 244 (35%) OPLWH had none/one geriatric syndrome, 195 (28%) two, 147 (21%) three, and 117 (17%)  $\geq 4$  geriatric syndromes. Greater number of geriatric syndromes was associated with lower QOL index (Figure A) and more severe problems for every QOL dimension (Figure B,  $p<0.001$  for all).

Oral abstracts

Poster exhibition

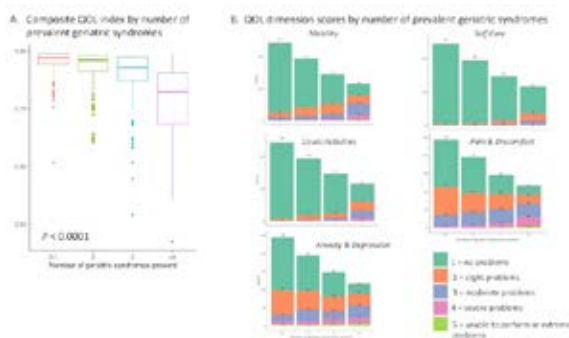

E-posters

Late-breaker abstracts

Author Index

**Conclusions:** Geriatric syndromes were prevalent among OPLWH in Brazil, and higher burden of geriatric syndromes was associated with worse QOL. Improved screening for geriatric syndromes in OPLWH may improve health outcomes in this growing population.

## THPEB082

HIV-related stigma among older adults living with HIV in Brazil: association with poor perception of aging

M.B. Antonio<sup>1</sup>, T.S. Torres<sup>2</sup>, M.J.R. Aliberti<sup>3</sup>, E.G. Kallás<sup>1</sup>, P.M. Luz<sup>2</sup>, B. Grinsztejn<sup>2</sup>, C. Brites<sup>4</sup>, E. Luz<sup>4</sup>, R.S. Nogueira<sup>5</sup>, L.R. Ramos<sup>5</sup>, J.L. Castilho<sup>6</sup>, V. Avelino-Silva<sup>1,7,8</sup>, ELEA-Brazil  
<sup>1</sup>University of Sao Paulo, Department of Infectious and Parasitic Diseases, Faculdade de Medicina, Sao Paulo, Brazil, <sup>2</sup>Instituto Nacional de Infectologia Evandro Chagas - Fiocruz, Rio de Janeiro, Brazil, <sup>3</sup>University of Sao Paulo, Laboratorio de Investigacao Medica em Envelhecimento (LIM-66), Servico de Geriatria, Hospital das Clinicas HCFMUSP, Faculdade de Medicina, Sao Paulo, Brazil, <sup>4</sup>Hospital Universitario Professor Edgard Santos (HUPES), Laboratorio de Pesquisa em Infectologia, Salvador, Brazil, <sup>5</sup>CRT-DST/AIDS-SP (STD/Aids-SP Reference and Training Center), Sao Paulo, Brazil, <sup>6</sup>Vanderbilt University Medical Center, Nashville, United States, <sup>7</sup>University of California San Francisco, Department of Epidemiology and Biostatistics, San Francisco, United States, <sup>8</sup>Vitalant Research Institute, San Francisco, United States

**Background:** Older adults' perceptions of aging may be influenced by contextual and subjective factors. Among older people living with HIV (OPLWH), HIV-related stigma (HRS) may play a key role in aging expectations and perceptions.

**Methods:** OPLWH ≥50 years old receiving antiretroviral treatment in three Brazilian cities were enrolled for detailed collection of clinical, social, and demographic data related to aging. We investigated the relationship between HRS (12-item Short HIV Stigma Scale) and perception of aging (Expectations Regarding Aging [ERA-12] score) using linear regression model adjusted for age, gender, time since HIV diagnosis, race (white; non-white), sexual orientation (heterosexual; non-heterosexual), substance use (daily alcohol/tobacco/cannabis or any use of

other illicit substances), depression (PHQ-9; no depression; mild; moderate; moderately severe/severe depression), and education (<8; 8-11; ≥12 years). Higher HRS and lower ERA-12 scores reflect greater HIV and aging stigma, respectively.

**Results:** We included 686 OPLWH with a median age of 62 years; 63% were cis-gender men. Percentages with no depression, mild, moderate, and moderately severe/severe depression were 58%, 26%, 9%, and 7%, respectively. Median HRS score was 30, with quartiles defined at ≤25; 26-30; 31-34; and ≥35. The median ERA-12 score was 36 (range 22-47). In the multivariable analysis, higher HIV stigma score quartiles and depressive symptoms were significantly associated with lower ERA-12 scores (Figure 1).

Women and participants with higher schooling had more positive perceptions of aging compared to men and participants with lower schooling, although differences failed to reach statistical significance.

**Conclusions:** HRS may negatively impact numerous health outcomes among OPLWH. Here, we found that higher HRS scores and depression were associated with poorer perception of aging.

Further studies are needed to understand if interventions to mitigate HRS and appropriate management of depression could improve aging expectations and perceptions among OPLWH.

### Prevalence of high blood pressure among people living with HIV on antiretroviral therapy in Botswana, April-June 2023

M. Montebatsi<sup>1</sup>, L. Okui<sup>1</sup>, N. Blanco Herrera<sup>2</sup>, J. Kabengele<sup>1</sup>, K. Sebina<sup>1</sup>, B. Tlhaloganyang<sup>1</sup>, J. Mangope<sup>1</sup>, P. Motshome<sup>3</sup>, A. Ketlogetswe<sup>3</sup>, D. Makwepa<sup>3</sup>, M. Kapanda<sup>4</sup>, K. Stafford<sup>3</sup>, N. Ndwapi<sup>1</sup>

<sup>1</sup>Bummmhi, Gaborone, Botswana, <sup>2</sup>Center for International Health, Education, and Biosecurity (Ciheb), University of Maryland School of Medicine, Baltimore, Maryland, USA, Baltimore, United States, <sup>3</sup>Center for Disease Control and Prevention, Gaborone, Botswana, <sup>4</sup>Ministry of Health, Gaborone, Botswana

**Background:** Twenty years after rolling out a public antiretroviral (ART) program, Botswana is experiencing a rapid shift in the age distribution of people living with HIV (PLHIV). Approximately 35% of PLHIV in Botswana today are aged 50 years or older. In Botswana, high blood pressure (BP) was reported affecting up to a quarter of all PLHIV. The extent of BP screening and its documentation on the electronic medical records (EMR) within HIV clinics remains unclear.

We evaluated completeness of BP measurement documentation, determined the prevalence of hypertension, and the prevalence of antihypertensive medication prescription among PLHIV receiving ART in Botswana.

**Methods:** We used retrospective analysis of EMR data from PLHIV on ART from April through June 2023 (FY23Q3) at 52 facilities in Botswana. Hypertension was defined as diastolic  $\geq 90$  mmHg and or systolic  $\geq 140$  mmHg. Proportion of clients with documented BP measurement, hypertension diagnosis, and on antihypertensive medication was calculated.

**Results:** A total of 122,951 clients were on ART of whom 65% (80,349) had ever had BP measurement recorded. Of these, 29% (23,552) had a recorded BP in FY23Q3. Prevalence of hypertension during FY23Q3 was 26% (6228/23552). Among individuals with hypertension, 51% were 50 years or older, 32% aged 40-49, 58% were women. Prevalence of hypertension was 31% (2602/8376) vs 24% (3626/15176) among men and women respectively and 38% (3165/8389) among PLHIV aged 50 years or older.

Out of the 122951 PLHIV on ART at the end of FY23Q3 11% (14411) had ever received antihypertensive medications, while 1915 (2%) clients had documentation of antihypertensive medications within the quarter.

**Conclusions:** A third of PLHIV on ART had no documentation of BP measurements in the EMR. Among PLHIV with a recorded BP measurements, individuals aged 50 years and above had higher prevalence and accounted for more than 50% with hypertension.

Despite a high burden of hypertension few PLHIV diagnosed with hypertension have documented prescription of antihypertensive medications. Enhanced BP screening,

documentation of BP in the EMR and use of antihypertensive medications are needed to address hypertension given the increasingly aging PLHIV population on ART.

## THPEB084

### Frailty and multimorbidity in mid-aged and older adults living with HIV: a cross-sectional study in Zimbabwe

A.M. Manyara<sup>1</sup>, T. Manyanga<sup>2</sup>, A. Burton<sup>1</sup>, H. Wilson<sup>1</sup>, J. Chipanga<sup>2</sup>, T. Bandason<sup>2</sup>, R.A. Ferrand<sup>2,3</sup>, C.L. Gregson<sup>4,2</sup>

<sup>1</sup>University of Bristol, Global Health and Ageing Research Unit, Bristol, United Kingdom, <sup>2</sup>Biomedical Research and Training Institute, The Health Research Unit Zimbabwe, Harare, Zimbabwe, <sup>3</sup>London School of Hygiene and Tropical Medicine, Clinical Research Department, London, United Kingdom, <sup>4</sup>University of Bristol, Global Health and Ageing Research Unit, Bristol, United Kingdom

**Background:** We aimed to determine the prevalence and factors associated with frailty and multimorbidity in people living with HIV (PLWH).

**Methods:** This population-based cross-sectional study recruited, by GIS-mapped household sampling, men and women aged  $\geq 40$  years in Harare, Zimbabwe. Data were collected using researcher-administered questionnaires, physical assessments (e.g., handgrip strength) and blood tests (including HIV status, if consenting).

Frailty was defined using the five Fried criteria: unintentional weight loss, exhaustion, low physical activity, low gait speed, low handgrip strength. Presence of  $\geq 3$  criteria defined frailty, 1-2 pre-frailty, and absence (0) robust. Long-term conditions defining multimorbidity were based on self-reported diagnosis or diagnosis based on measurements (e.g., blood pressure/glucose). Adjusted regression models were used to analyse data.

**Results:** The 1109 participants had mean(SD) age of 62.5(14.1) years, 51.6% female. Of 1034(93.2%) with HIV status data, 21.6% (n=223) were living with HIV: 6.4% were newly diagnosed; 96.2% of those who knew their status were on antiretroviral treatment (ART), whilst 89.7% of those on ART had a viral load  $<50$  copies/mL. The prevalence of frailty, prefrailty and robust in PLWH was 3.6%, 61.4%, and 35% respectively.

In addition to HIV, 32.7% were living with  $\geq 2$  conditions, 36.3% with one condition and 30.9% with only HIV. Time since HIV diagnosis and treatment duration were both independently associated with frailty, but not multimorbidity: independent of age and ART duration, living with HIV was associated with pre-frailty or frailty (adjusted odds ratio [aOR]=2.03 (95%CI 1.03-4.13), for each 5-years lived with HIV) while, independent of age and years lived with HIV, ART duration was protective, 0.39 (0.19-0.78) for each 5-years on ART. PLWH had higher odds of prior tuberculosis (7.92 (4.32-15.05)) and comorbid cancer (2.74 (0.77-9.08)), albeit marginally, compared with people without HIV.

Frailty and multimorbidity were associated with a lower health-related quality of life in PLWH, although the associations were similar in people without HIV.

**Conclusions:** Sixty-five percent of PLWH aged 40-83 years were frail or pre-frail, while 33% were living with 2 or more long-term conditions necessitating interventions to prevent or manage frailty and multimorbidity. Early ART initiation and good viral suppression are interventions that could protect against frailty.

## THPEB085

Health related quality of life of people ageing with HIV in a low resource setting: the Newlands Clinic cohort, Harare Zimbabwe

C. Taderera<sup>1</sup>, S. Lowe<sup>2,3</sup>, C. Gregson<sup>4,5</sup>

<sup>5</sup>University of Bristol, Global Health and Ageing Research Unit, Bristol, United Kingdom

**Background:** Antiretroviral therapy (ART) has increased life expectancy for people living with HIV (PLHIV). However, associated multimorbidity and geriatric syndromes can limit health-related quality of life (HRQoL).

We assessed HRQoL in older people routinely attending an HIV-geriatric clinic in Zimbabwe.

**Methods:** In this cross-sectional study, clients ≥65 years who attended the Newlands HIV-geriatric clinic from Oct-2022 to Dec-2023 had HRQoL evaluated using the Euro-QoL-5 dimensions questionnaire (EQ-5D-5L).

This assesses mobility, selfcare, usual activities, pain, anxiety/depression and includes a visual analogue scale (EQ-VAS). Each dimension has 5 levels, from 1 (no problems) to 5 (extreme problems), EQ-VAS ranges from 0 (worst imaginable health) to 100 (best imaginable health).

Analyses used logistic regression. Low HRQoL was defined as a dimension sum<12, impaired physical function as short physical performance battery ≤9, depression as PHQ-9 ≥5, anxiety as GAD-7 ≥5, malnutrition as mini nutritional assessment score ≤11.

**Results:** Of 148 attendees, most were female 102(69%), median age 69 (IQR 67-72) years.

Viral suppression was common at 93% (<50 copies/ml). Median (IQR) EQ-VAS was 77.5 (60-90) for women and 80 (70-90) men. Only 10(6.6%) reported no problems in any dimension, whilst 15 (10%) reported problems in all dimensions (Table-1).

Most reported no problems with selfcare (82%). The most frequent problems were pain/discomfort (80%) and anxiety/depression (73%).

Low HRQoL was associated with impaired physical function (OR 4.42 [95%CI 1.86-10.5], p=0.001), depression

(5.85[1.77-19.2], p=0.004), anxiety (6.20[2.51-15.3], p<0.001) and malnutrition (4.76[2.14-10.6],p<0.001). Comorbidities and medications were independent of HRQoL.

Level	Mobility	Self-care	Usual Activities	Pain / Discomfort	Anxiety/ Depression
1 n (%) (no problems)	64 (43%)	121 (82%)	76 (51%)	30 (20%)	40 (27%)
Male	29	40	26	19	15
Female	35	81	50	11	25
2 n (%)	17 (11%)	10 (7%)	30 (20%)	47 (32%)	39 (26%)
Male	4	1	10	14	15
Female	13	9	20	33	24
3 n (%)	50 (34%)	11 (7%)	31 (21%)	53 (36%)	46 (31%)
Male	9	3	8	9	10
Female	41	8	23	44	36
4 n (%)	16 (11%)	5 (3%)	8 (5%)	14 (9%)	16 (11%)
Male	3	1	1	3	5
Female	13	4	7	11	11
5 n (%) (severe problems)	1 (1%)	1 (1%)	3 (2%)	4 (3%)	7 (5%)
Male	1	1	1	1	1
Female	0	0	2	3	6
Total	148	148	148	148	148
No. reporting any problems* (scores 2-5)	84 (57%)	27 (18%)	72 (49%)	118 (80%)	108 (73%)

Table 1. Frequency by dimensions of HRQoL indicators in older people living with HIV in Zimbabwe

**Conclusions:** Most older PLHIV reported a deficit in at least one HRQoL dimension, with >50% reporting problems in four of five dimensions. Comprehensive HIV care should incorporate assessment and management of these domains to support healthy ageing.

## THPEB086

Noninferior efficacy, reduced weight gain, and improved lipid metabolism of switch to ainoovirine- versus boosted elvitegravir-based regimen in virologically suppressed people living with HIV-1: 48-week results of the SPRINT trial

F. Zhang<sup>1</sup>, H. Wu<sup>2</sup>, P. Ma<sup>3</sup>, Q. Zhao<sup>4</sup>, H. Wei<sup>5</sup>, H. Lu<sup>6</sup>, H. Wang<sup>6</sup>, S. He<sup>7</sup>, Z. Chen<sup>7</sup>, Y. Chen<sup>8</sup>, M. Wang<sup>9</sup>, W. Cai<sup>10</sup>  
<sup>1</sup>Beijing Ditan Hospital Affiliated to Capital Medical University, Clinical and Research Center for Infectious Diseases, Beijing, China, <sup>2</sup>Beijing Youan Hospital Affiliated to Capital Medical University, Clinical and Research Center for Infectious Diseases, Beijing, China, <sup>3</sup>Tianjin Municipal Second People's Hospital, Department of Infectious Diseases, Tianjin, China, <sup>4</sup>Zhengzhou Municipal Sixth People's Hospital and Infectious Disease Hospital of Henan Province, Department of Infectious Diseases, Zhengzhou, China, <sup>5</sup>Nanjing Municipal Second Hospital and Nanjing Hospital Affiliated to Nanjing University of Chinese Medicine, Department of Infectious Diseases, Nanjing, China, <sup>6</sup>Shenzhen Municipal Third Hospital, Department of Infectious Diseases, Shenzhen, China, <sup>7</sup>Chengdu Municipal Public Health Clinical Center, Department of Infectious Diseases, Chengdu, China, <sup>8</sup>Chongqing Municipal Public Health Medical Center, Department of Infectious Diseases, Chongqing, China, <sup>9</sup>Changsha Municipal First Hospital and Changsha Hospital Affiliated to Central South University Yale School of Medicine, Department of Infectious Diseases and Immunology, Changsha, China, <sup>10</sup>Guangzhou Municipal Eighth People's Hospital Affiliated to Guangzhou Medical University, Department of Infectious Diseases, Guangzhou, China

**Background:** Safety concerns arise from integrase strand transfer inhibitor (INSTI)-based regimen due to weight gain and metabolic complications. An alternative antiretroviral (ARV) switch therapy may be warranted for virologically suppressed people living with HIV-1 (PLWH).

**Methods:** This is a phase 3, randomized, double-blind, non-inferiority study. Eligible participants must have maintained plasma HIV-1 RNA below 50 copies per mL. Participants were randomly assigned to receive ANV 150 mg, lamivudine (3TC) 300 mg and tenofovir disoproxil fumarate (TDF) 300 mg or cobicistat (Cobi) 150 mg boosted EVG, emtricitabine (FTC) 200 mg and tenofovir alafenamide (TAF) 10 mg. Both arms received ARV in STR once daily.

The primary efficacy endpoint was the proportion of participants with HIV-1 RNA at 50 copies per mL or above at week 48. Non-inferiority was prespecified with a 4% margin. This trial is registered at Chinese Clinical Trial Registry, ChiCTR2100051605.

**Results:** Analysis included 762 patients (381 ANV/3TC/TDF; 381 EVG/Cobi/FTC/TAF). At week 48, 7 (1.8%) participants on ANV/3TC/TDF and 6 (1.6%) participants on EVG/Cobi/FTC/TAF had plasma HIV-1 RNA at 50 copies per mL or above (estimated treatment difference [ETD], 0.3%, 95%CI -1.6 to 2.1). At week 48, the participants on ANV/3TC/TDF showed less weight gain compared to those on EVG/Cobi/FTC/TAF (least square mean, 1.16 versus 2.05 kg, -0.90 kg, -1.43 to -0.37), and the ETDs were -0.39 mmol per L [-0.47;-0.32] for low-density lipoprotein cholesterol, -0.69 mmol per L [-0.77;-0.60] for non-high-density lipoprotein cholesterol, -0.84 mmol per L [-0.92;-0.75] for total cholesterol, and -0.98 mmol per L [-1.18;-0.78] for triglyceride, respectively. A small proportion of participants discontinued study drug due to AE (0.3% versus 0.3%), and serious AEs (SAEs) were similar (2.9% versus 2.4%).

**Figure 1: Proportions of PLWH experiencing dyslipidemia AE (MedDRA) by severity and changes from baseline in fasting serum lipid concentration over 48-week treatment**  
 Serum lipids concentration as determined by local pathology laboratories. Severity of dyslipidemia AE as determined by the investigator in reference to the Division of AIDS (DAIDS) Table for Grading the Severity of Adult and Pediatric Adverse Events >2.1. CFB data are presented in least square mean±standard error. AE=adverse event; ANV/3TC/TDF=ainoovirine/lamivudine/tenofovir disoproxil fumarate; E/C/F/TAF=elvitegravir/cobicistat/emtricitabine/tenofovir alafenamide; HDL-C=high-density lipoprotein cholesterol; LDL-C=low-density lipoprotein cholesterol; MedDRA=Medical Dictionary for Regulatory Activities; non-HDL-C=non-high-density lipoprotein cholesterol; PLWH=people living with HIV; TC=total cholesterol; TG=triglyceride. \*ANV/3TC/TDF versus E/C/F/TAF at week 48 by mixed model for repeated measures analysis.

**Conclusions:** In virologically suppressed PLWH, switch to ANV-based regimen resulted in less weight gain and improved lipid metabolism while maintaining virological suppression non-inferior to that to boosted EVG-based regimen.

lation to better understand the implications for management with emerging switch options for optimization of care.

**Methods:** Retrospective study using EMR (Trio Health HIV Network) and genotypic resistance data (Labcorp). Population: PWH age  $\geq 18$ , initiating a VSTE regimen after 01/01/2016,  $\geq 6$  months on regimen,  $\geq 1$  years of follow-up,  $\geq 1$  prior antiretrovirals (ARVs) and VS (viral load [VL]  $< 200$  copies/mL) at index date.

VSTE regimen criteria: complex ARV regimen **OR** prior exposure to 2 core classes **OR** resistant to 2 ARV classes (NNRTIs, INSTIs, NRTIs, PIs), Table.

Outcomes: virologic failure (VF): VL  $\geq 500$  copies/mL or 2 consecutive VLs  $\geq 200$  copies/mL; viral blip (VB): VL 200-1000 copies/mL with subsequent suppression ( $< 200$  copies/mL); drug class resistance: intermediate/high resistance to  $\geq 1$  class agent.

**Results:** Of 42,536 PWH with prescriptions after 01/01/2016, 5,763 (14%) were categorized as VSTE based on: prior class exposure (71%), complex regimen (44%), resistance (7%), Table; 21% qualified on multiple criteria. Regimens included INSTIs (76%), PI (35%) and NNRTI (17%); 19% included  $> 2$  core classes, 20%  $> 3$  ARVs, 33% multi-tablet.

Thirty-three percent of PWH had baseline genotype tests, of them 73%  $< 3$  years prior to VSTE qualification. Of PWH with results within 3 years, 78% had  $\geq 1$  major mutation (48% NRTIs, 44% NNRTIs, 26% PIs, 11% INSTIs); 44%  $\geq 2$  class resistance; most common mutations: M184VI (34%); A62V (33%); K103NS (22%).

During follow-up (median 2.8 years), 5% had  $\geq 1$  VB and 6% had VF (more common on regimens  $> 2$  core classes, 9% vs 5%  $p < 0.001$ ).

Description of VSTE Regimen Characteristics	Number of PWH Meeting Criterion	Meets at least 1 other Criterion	2 ARV Classes in regimen (NNRTI, PI, INSTI, NRTI)	With Baseline Resistance Test Result (within 3 years)	Resistant to 2 ARV classes of those with results	With Viral Failure on regimen
VSTE Regimen Criteria						
Complex ARV Regimen†	2,563 (44%)	1,117 (44%)	1,481 (58%)	474 (18%)	136 (29%)	197 (8%)
Prior exposure to 2 core classes (NNRTI, PI, INSTI)	4,068 (71%)	1,089 (27%)	3,478 (85%)	628 (15%)	105 (17%)	226 (6%)
Resistance to 2 ARV classes (NNRTI, PI, INSTI, NRTI)	393 (7%)	241 (61%)	297 (76%)	313 (80%)	313 (100%)	36 (9%)
VSTE Regimen						
2 Core ARV Classes	4,681 (81%)			787 (17%)	239 (30%)	247 (5%)
$> 2$ Core ARV Classes	1,082 (19%)			243 (22%)	74 (30%)	93 (9%)

VSTE: virologically suppressed treatment experienced; ARV: antiretroviral; HTE: heavily treatment experienced; STR: single tablet regimen;  
Core regimen classes: non-nucleoside reverse transcriptase inhibitors [NNRTIs], integrase inhibitors [INSTIs], nucleoside/nucleotide reverse transcriptase inhibitors [NRTIs], protease inhibitors [PIs].  
†Complex regimen: 2 out of 3 core classes (NNRTI, PI, INSTI), darunavir/cobicistat/emtricitabine/tenofovir alafenamide (D/C/F/TAF) or tenofovir disoproxil fumarate (TDF), multi-dosing per day, complex multi-pill regimen (excluding regimens reflecting available single-tablet regimens). Regimens with ARVs indicative of HTE population were excluded: ibalizumab [IBA], enfuvirtide [T20], fostemsavir [FTR], lenacapavir [LEN].

Table.

**Conclusions:** VSTE comprised 14% of PWH in treatment. The majority were able to remain suppressed during follow-up despite high rates of underlying resistance. Rates of VF were higher for more complex regimens and for those with prior resistance. Improved simplification strategies with new classes and increased genotypic surveillance of current regimens could improve outcomes.

## THPEB088

Evaluation of safety and tolerability of switching to the B/F/TAF or DTG/3TC regimen in virologically suppressed people living with HIV aged  $> 40$  years: a real-world observational study

Y. Wang<sup>1</sup>, J. Shi<sup>1</sup>, J. Yu<sup>1</sup>

<sup>1</sup>Affiliated Hangzhou Xixi Hospital, Zhejiang University of Traditional Chinese Medicine, Department of Infection, Hangzhou, China

**Background:** Both bictegravir/emtricitabine/tenofovir alafenamide (B/F/TAF) and dolutegravir/lamivudine (DTG/3TC) are recommended in treatment guidelines for switch therapy in people living with HIV (PLWH). This study aimed to evaluate the safety and tolerability of these two switched regimens in a real-world setting among middle-aged and old-aged PLWH previously treated with efavirenz (EFV)/tenofovir disoproxil fumarate (TDF)/3TC.

**Methods:** This retrospective single-center cohort study in Hangzhou included 220 virally suppressed PLWH who switched from EFV/TDF/3TC to DTG/3TC or B/F/TAF between January 1, 2020 and October 30, 2023. All participants were followed for 12 months to examine changes in body mass index, glucose levels, lipid profiles (total cholesterol (TC), low-density lipoprotein cholesterol (LDL-C), high-density lipoprotein cholesterol (HDL-C), and triglyceride (TG)), and markers of liver and renal function.

**Results:** The mean age of included participants was  $> 50$  years. During the 12-month follow-up, the HIV RNA level was below the lower limit of detection ( $< 20$  copies/mL), and no solicited adverse reactions were observed among all participants. The switch to DTG/3TC or B/F/TAF therapy was associated with significant improvement in LDL-C, glucose levels, and liver and renal function (all  $P < 0.05$ ), while other biochemical indexes did not change significantly. Furthermore, except for liver function parameters (ALT:  $P = 0.009$ , AST:  $P = 0.001$ ), no significant differences in other biochemical indices were observed between the DTG/3TC and B/F/TAF groups. For old-aged PLWH (age  $\geq 60$  years), TC and ALT levels declined in the B/F/TAF group, while BMI and ALT levels dropped in the DTG/3TC group (all  $P < 0.05$ ).

**Conclusions:** The switch to either B/F/TAF or DTG/3TC treatment is safe and well tolerated for PLWH in this real-world study, even among old-aged PLWH. Metabolic indices did not differ significantly for the two regimens.

**THPEB089**

Efficacy, safety and tolerability of switching to dolutegravir/lamivudine in virologically suppressed adults living with HIV on bicitegravir/emtricitabine/tenofovir alafenamide-48-week results from the DYAD study

C.-P. Rolle<sup>1,2</sup>, J. Castano<sup>1</sup>, V. Nguyen<sup>1</sup>, F. Hinestrosa<sup>1,3</sup>, E. DeJesus<sup>1,3</sup>

<sup>1</sup>Orlando Immunology Center, Orlando, United States,

<sup>2</sup>Emory University Rollins School of Public Health, Global Health, Atlanta, United States, <sup>3</sup>University of Central Florida College of Medicine, Orlando, United States

**Background:** We previously demonstrated noninferior efficacy of switching to dolutegravir/lamivudine (DTG/3TC) vs. continuing bicitegravir/emtricitabine/tenofovir alafenamide (B/F/TAF) among stably suppressed adults through Week (W) 24 in the DYAD study.

Here, we present updated 48-week efficacy and safety results.

**Methods:** DYAD (NCT04585737) is an open-label clinical trial that randomized adults with HIV-1 RNA<50 copies/mL and no prior virologic failure (2:1) to switch to once-daily fixed-dose DTG/3TC or remain on B/F/TAF. Primary endpoint is the proportion with HIV-1 RNA≥50 c/mL at W48 (FDA snapshot algorithm, ITT-E population, 6% noninferiority margin). Clinical safety and changes in renal and metabolic parameters were also evaluated.

**Results:** Overall, 222 adults (16% women; 51% aged ≥50 years; 28% Black, 30% Hispanic/Latinx ethnicity) were randomized. At W48, 6 (4%) participants on DTG/3TC and 5 (7%) on B/F/TAF had HIV-1 RNA≥50 c/mL (adjusted treatment difference -2.8%, 95% confidence interval [-11.4%, 3.1%]) meeting noninferiority criteria. At W24, 7 participants (4 on DTG/3TC, 3 on B/F/TAF) met confirmed virologic withdrawal (CVW) criteria, and 2/7 had treatment-emergent resistance. One B/F/TAF CVW developed M184M/I and G140G/S at W12, and one DTG/3TC CVW had M184V at W12. At W48, there were no new cases of treatment emergent resistance among 11 (8 on DTG/3TC, 3 on B/F/TAF) additional participants meeting CVW criteria. One non-CVW DTG/3TC participant developed M184V and K65R at W12 (genotype inadvertently collected at first episode of unconfirmed viremia). Drug-related adverse events (AEs) and withdrawals due to AEs occurred in 31 (21%) and 6 (4%) participants with DTG/3TC and 2 (3%) and 0 participants with B/F/TAF, respectively. Between W24-W48, no additional drug-related AEs and withdrawals due to AEs occurred in the DTG/3TC arm. There were no significant differences in mean change from baseline in creatinine, lipid parameters, weight, BMI and waist circumference between treatment groups at W48.

**Conclusions:** Switching to DTG/3TC was noninferior to continuing B/F/TAF among virologically suppressed adults at W48. Drug-related AEs-and-withdrawals were high-

er in the DTG/3TC arm which is likely consistent with the open-label nature of this switch study. These data reinforce findings from TANGO and support use of DTG/3TC as a switch option from contemporary 3-drug integrase inhibitor-based regimens.

Effectiveness and durability of dolutegravir/rilpivirine in older people with HIV from the Veterans Aging Cohort Study (VACS)

L. Yan<sup>1,2</sup>, C. Henegar<sup>3</sup>, V. Marconi<sup>4,5</sup>, C. Hicks<sup>3</sup>, V. Vannappagari<sup>3</sup>, A. Justice<sup>1,2</sup>, M. Aslan<sup>1,2</sup>

<sup>1</sup>Veterans Affairs (VA) Cooperative Studies Program Clinical Epidemiology Research Center (CSP-CERC), VA Connecticut Healthcare System, West Haven, CT, United States, <sup>2</sup>Yale University, New Haven, CT, United States, <sup>3</sup>ViiV Healthcare, Research Triangle Park, NC, United States, <sup>4</sup>Atlanta VA Medical Center, Atlanta, GA, United States, <sup>5</sup>Emory University, Atlanta, GA, United States

**Background:** Dolutegravir/rilpivirine (DTG/RPV) is a 2-drug antiretroviral regimen efficacious as a switch therapy in clinical trials. Data on real-world use of DTG/RPV among older people with HIV (PWH) remains limited.

**Methods:** Treatment-experienced, virologically suppressed [viral load (VL) <50 copies/mL] PWH enrolled in the Veterans Aging Cohort Study (VACS), ≥50 years old and switching to DTG/RPV, DTG- or bicitegravir (BIC)-based standard 3-drug regimens (3DRs) 01JAN2014 – 30SEP2022 were included. Virologic suppression [VS; VL <50 copies/mL], low-level viremia (LLV; VL ≥50 and <200 copies/mL), and regimen discontinuation were compared 6- and 12-month post-regimen initiation (baseline). Virologic failure (VF; 2 consecutive VLs ≥200 copies/mL, or 1VL ≥200 copies/mL followed by regimen discontinuation) was evaluated over 12 months. Change in CD4 cell count from baseline was assessed at 6 months. Outcomes were compared using inverse probability of treatment weighted logistic or linear regression.

**Results:** Of 9,933 treatment-experienced, suppressed older PWH (97% male, 8% Hispanic, 47% Black), PWH who switched to DTG/RPV (n=682) compared to those switching to DTG-3DRs (n=4,793) or BIC-3DRs (n=4,458) were older (52% ≥65 years vs. 35% on DTG-3DRs and 39% on BIC-3DRs). VS was statistically comparable at 6 (94% DTG/RPV vs. 92% DTG-3DR and 93% BIC-3DR) and 12 months (94% DTG/RPV vs. 92% DTG-3DR and 92% BIC-3DR). LLV at 6 and 12 months was also comparable between regimens. VF was uncommon (0.5% DTG/RPV vs. 0.9% DTG-3DR and 0.5% BIC-3DR). Mean CD4 decreased over 6 months for DTG/RPV but increased for DTG-3DR and BIC-3DR, although the magnitude of differences was small.

Discontinuations were similar between DTG/RPV and DTG-3DR. BIC-3DR showed fewer discontinuations at 6 (BIC-3DR: 4% vs. DTG/RPV: 9%) and 12 months (7% vs. 15%).

\* Odds ratios and confidence intervals were calculated from inverse-probability weighted models, which adjusted for age, sex, race and/or ethnicity, region, smoking, alcohol use disorder, drug use and dependence, homelessness, baseline low-density lipoprotein, baseline CD4 count, baseline viral load, baseline VACS 2.0 index, and years on ART regimen. \*, \*\*, and \*\*\* indicate significance at the 10%, 5%, and 1% levels. Abbreviations: DTG3: dolutegravir-based 3-drug regimen; BIC3: bictegravir-based 3-drug regimen; DTG/RPV: dolutegravir/rilpivirine (JULUCA); ART: antiretroviral therapy; PWH: people with HIV; OR: adjusted odds ratio; CI: confidence interval; VACS: the Veterans Aging Cohort Study; CD4: clusters of differentiation 4

Figure 1. Treatment outcomes for those receiving DTG- and BIC-based 3-drug regimens compared to those receiving DTG/RPV among ART-experienced PWH<sup>1</sup>.

**Conclusions:** Among older PWH, DTG/RPV demonstrated high levels of virologic effectiveness comparable to DTG- or BIC-based 3-drug regimens, but with smaller immune responses. DTG/RPV was discontinued more frequently than BIC 3-DRs.

## THPEB091

High plasma concentration of tenofovir alafenamide in people living with HIV with ABCB1 genetic variants

K. Tsuchiya<sup>1</sup>, H.T. Tran<sup>1</sup>, A. Kawashima<sup>1</sup>, K. Watanabe<sup>1</sup>, A. Hamada<sup>2</sup>, S. Oka<sup>1</sup>, H. Gatanaga<sup>1</sup>

<sup>1</sup>National Center for Global Health and Medicine, AIDS Clinical Center, Tokyo, Japan, <sup>2</sup>National Cancer Center Research Institute, Division of Molecular Pharmacology, Tokyo, Japan

**Background:** The ATP-binding cassette transporter B1 (ABCB1) and G2 (ABCG2) are both expressed in the intestines, which are efflux transporters of drugs. We aimed to analyze the relationships between single nucleotide polymorphisms in the ABCB1 and ABCG2 genes and plasma concentrations of tenofovir alafenamide (TAF), tenofovir (TFV), and emtricitabine (FTC).

**Methods:** We recruited 10 people living with HIV receiving once-daily treatment with a single tablet containing TAF (25 mg), FTC (200 mg), and bictegravir (50 mg) at least 4 weeks after switching at the AIDS Clinical Center, National Center for Global Health and Medicine (NCGM), Tokyo,

Japan. The Ethics Committee at the NCGM approved this study (NCGM-G-003058-03) and all participants provided written informed consent. Peripheral blood samples were withdrawn into heparinized tubes at 0, 1, 2, 3, 4, 6, 8, 12, and 24 h after administration. Plasma and peripheral blood mononuclear cells (PBMCs) were separated and stored at -80°C. Plasma concentrations of TAF, TFV, and FTC were quantified using liquid chromatography-tandem mass spectrometry. Genomic DNA was isolated from PBMCs. Genotyping for allelic variants of ABCB1, including 1236 C>T (rs1128503), 2677 G>T/A (rs2032582), 3435 C>T (rs1045642), 4036 A>G (rs3842) and ABCG2 421 C>A (rs2231142), was performed using TaqMan Drug Metabolism Assays.

**Results:** None of the genotypes for ABCB1 1236 C>T, 2677 G>T/A, 3435 C>T, and ABCG2 421 C>A exhibited correlations with plasma concentrations of TAF, TFV, and FTC. In contrast, individuals with the ABCB1 4036 AG genotype (188.7 ng/mL, n=3) exhibited a significantly higher mean peak plasma concentration of TAF than those with the ABCB1 4036 AA genotype (67.7 ng/mL, n=7) ( $p=0.0167$ , Mann-Whitney U test). Similarly, individuals with the ABCG2 421 AA genotype (235.0 ng/mL, n=1) exhibited a higher peak plasma concentration of TAF than those with the ABCG2 421 CC/CA genotypes (89.4 ng/mL, n=9). However, those genotypes did not affect the elimination of terminal half-lives of TAF.

**Conclusions:** The allelic variant ABCB1 4036 A>G is associated with low expression. Individuals with this genetic variant exhibited significantly higher peak plasma concentrations of TAF, potentially explained by reduced expression of efflux transporters in the intestines associated with these genetic variants.

## THPEB092

Switch to dolutegravir/lamivudine (DTG/3TC) in people living with HIV-1 suppressed on bictegravir/emtricitabine/tenofovir alafenamide (B/F/TAF): 96-week final analysis from the SOUND study

J. Slim<sup>1,2</sup>, A. Shafiq<sup>3</sup>, W. Abouzeid<sup>1,2</sup>, H. Fadoju-Oloyede<sup>2</sup>, A. Muhanna<sup>1,2</sup>, S. Pati<sup>2</sup>, R. Borsi<sup>3</sup>, J. Fallon<sup>2</sup>

<sup>1</sup>New York Medical College, Valhalla, United States, <sup>2</sup>Saint Michael's Medical Center, Newark, United States, <sup>3</sup>ViiV Healthcare, Durham, United States

**Background:** DTG/3TC is approved for antiretroviral therapy-naïve or virologically suppressed people living with HIV-1 with no prior virologic failure or resistance to DTG/3TC. In the SOUND study, virologically suppressed participants who switched from B/F/TAF to DTG/3TC with unknown resistance history maintained high rates of virologic suppression at Week 48. Here, we present the 96-week final analysis from SOUND.

**Methods:** SOUND is an open-label, single-center, pilot study of people living with HIV-1 who were on B/F/TAF for >24 weeks, with viral load <50 c/mL for >6 months (≥12

months if prior history of virologic failure), no prior genotypic or phenotypic resistance testing, and negative hepatitis B surface antigen.

Week 96 endpoints included virologic and immunologic outcomes, safety, and retrospective proviral DNA resistance testing of baseline samples.

**Results:** Of 40 individuals enrolled, 18 (45%) identified as female and 23 (58%) as Black; median (range) time on B/F/TAF was 2.5 (1-3.6) years. At Week 96, 37 (93%) participants maintained virologic suppression (HIV-1 RNA <50 c/mL). The remaining 3 participants withdrew from the study while virologically suppressed, with no new discontinuations since the 48-week analysis.

Serious adverse events were observed in 5 participants (none related to DTG/3TC). No participants discontinued due to laboratory abnormalities. Median (range) change from baseline in CD4+ cell count at Week 96 was 38 (–388, +276) cells/mm<sup>3</sup>.

Among the 32 baseline samples available for retrospective proviral DNA resistance testing, 6 (19%) had NRTI resistance-associated mutations (RAMs), all with M184V or M184M/V conferring resistance to 3TC. Two (6%) participants had INSTI RAMs at baseline (S147S/G and Q148R/R); neither conferred resistance to DTG. Baseline NNRTI and PI RAMs were observed in 8 (25%) and 3 (9%) participants, respectively.

RAMs, n (%)	Participants with available baseline samples (N=32) <sup>b</sup>
NRTI	6 (19) <sup>c</sup>
T69N	1 (3)
M184M/V	5 (16)
M184V	1 (3)
NNRTI	8 (25) <sup>d</sup>
K101Q	1 (3)
K103K/N	6 (19)
K103N	1 (3)
V106I	1 (3)
Y188Y/H	1 (3)
INSTI	2 (6) <sup>e</sup>
S147S/G	1 (3)
Q148Q/R	1 (3)
PI	3 (9) <sup>f</sup>
D30D/N	2 (6)
L33L/I	1 (3)
M46M/V	1 (3)
I47I/V	1 (3)
N88S	1 (3)
N88N/S	1 (3)

<sup>a</sup>Mutations are not mutually exclusive, and participants could have >1 mutation.

<sup>b</sup>Samples were not available for 8 participants due to participant withdrawal (n=3), sample tubes cracking in transport (n=2), samples unable to be located (n=2), and samples unable to be analyzed (n=1). <sup>c</sup>RAMs were associated with resistance to lamivudine and emtricitabine (n=6). <sup>d</sup>RAMs were associated with resistance to efavirenz and nevirapine (n=8). <sup>e</sup>RAMs were associated with resistance to elvitegravir (n=1) and elvitegravir and raltegravir (n=1). <sup>f</sup>RAMs were associated with resistance to neftinavir (n=3).

*Table. Retrospective Proviral DNA Resistance Analysis on Baseline Samples<sup>a</sup>*

**Conclusions:** Final results from SOUND support the efficacy and safety of switching to DTG/3TC for people living with HIV-1 who are virologically suppressed on B/F/TAF with unknown resistance history. Retrospective proviral DNA sequencing did not predict outcomes.

## THPEB093

## Clinical pharmacokinetics and safety of orally administered VH4004280 (VH-280), a novel HIV-1 capsid inhibitor, in Adults Without HIV

R. Griesel<sup>1</sup>, A. Pierce<sup>2</sup>, N. Thakkar<sup>3</sup>, V. Bainbridge<sup>4</sup>,  
B. Shepherd<sup>4</sup>, K. Angelis<sup>4</sup>, A. Tomlinson<sup>4</sup>, Y. Gandhi<sup>3</sup>,  
D. Brimhall<sup>5</sup>, D. Anderson<sup>2</sup>, S. Andrews<sup>6</sup>, C. Acuiip<sup>1</sup>,  
C. McCoig<sup>7</sup>, M. Baker<sup>8</sup>, M. Lataillade<sup>9</sup>, P. Benn<sup>1</sup>

<sup>1</sup>ViiV Healthcare, Brentford, United Kingdom, <sup>2</sup>ViiV Healthcare, Durham, United States, <sup>3</sup>GSK, Collegeville, United States, <sup>4</sup>GSK, Brentford, United Kingdom, <sup>5</sup>PPD-Thermo Fisher Scientific, Las Vegas, United States, <sup>6</sup>GSK, Durham, United States, <sup>7</sup>ViiV Healthcare, Madrid, Spain, <sup>8</sup>ViiV Healthcare, Nyon, Switzerland, <sup>9</sup>ViiV Healthcare, Branford, United States

**Background:** VH4011280 (VH-280) is a novel HIV-1 capsid inhibitor that demonstrated potent in vitro antiviral activity against a wide spectrum of HIV-1 strains and clinical isolates. We present the pharmacokinetics, drug interaction potential, and safety of VH-280 in a first-time-in-human study.

**Methods:** This double-blind, randomized, placebo-controlled, phase 1 study evaluated oral VH-280 in healthy adults administered as single ascending doses as powder-in-bottle (PiB) and tablet (parts 1 and 3, respectively) and as multiple ascending doses as PiB for 14 days with or without midazolam (part 2), evaluating VH-280 inhibition/induction of CYP3A4.

**Results:** 73 participants were included (placebo, n=16; VH-280, n=57); 98% and 100% were male, 40% and 58% identified as Black or African American, and median age was 33 and 36 years in parts 1 and 3 and part 2, respectively. VH-280 plasma exposures (C<sub>max</sub> and AUC) were broadly dose proportional, with median t<sub>max</sub> of 9 to 10 hours (PiB and tablet). Geometric mean of the terminal half-life was >6 days, ranging from 146 to 208 hours, leading to maintenance of VH-280 above the therapeutic target (21.0 ng/mL; Figure).

Figure. Mean plasma VH-280 concentration-time plots in (A) parts 1 and 3 and (B) part 2 (semi-logarithmic scale).

Tablet administration led to 45% to 57% less exposure compared with PiB. Midazolam exposures were unchanged. Frequency of adverse events (AEs) was compa-

Index

orable between placebo and VH-280 groups. VH-280-related AEs were predominantly grade 1. No serious AEs, AEs leading to withdrawal, or deaths were observed. There were no trends in vital signs, electrocardiograms, or laboratory hematology or chemistry parameters, except for a possible trend of increased total and low-density-lipoprotein cholesterol at exposures anticipated to exceed therapeutic exposures.

**Conclusions:** VH-280 was well tolerated, does not inhibit/induce CYP3A4, and exposures exceeded the anticipated therapeutic target across a range of single and multiple oral doses. These early data support further development of VH-280 as a long-acting antiretroviral for the treatment of HIV-1.

PAIRED - PATient Reported Experiences and perceived benefit of treatment with dolutegravir/lamivudine - qualitative interviews: diverse group of people with HIV-1 (PWH) reflect on life and health

J. Slim<sup>1</sup>, A.P. Brogan<sup>2</sup>, G. Harper<sup>3</sup>, K. Mycock<sup>3</sup>, A. McMillan<sup>3</sup>, D. Merrill<sup>2</sup>, G. Verdier<sup>4</sup>

<sup>1</sup>New York Medical College, Valhalla, NY, United States,

<sup>2</sup>ViiV Healthcare, Durham, NC, United States, <sup>3</sup>Adelphi

Real World, Bollington, United Kingdom, <sup>4</sup>ViiV Healthcare, Montreal, Canada

**Background:** Understanding the real-world experiences of people with HIV-1 (PWH) is essential to successful HIV treatment.

**Methods:** PAIRED comprised a cross-sectional survey and in-depth qualitative interviews of stable-switch PWH ≥18 years, receiving dolutegravir/lamivudine for ≥3 months in the US. A mixed recruitment methodology (site-led and community outreach) was employed. Interview participants were selected to provide diverse representation among PWH who completed the survey. Qualitative data was collected from 20 PWH via 60-minute semi-structured, in-depth telephone interviews. Thematic analysis methodology (Figure 1) using Atlas.ti version 22.0 software was used.

**Results:** The qualitative interview portion of PAIRED included a diverse sample (50% female sex at birth, 45% non-White, and 70% ≥50 years). Six distinct themes were identified via thematic analysis:

1. Having a reduced number of medicines in HIV treatment is important to PWH due to its associated reduction in long-term drug exposure and PWH perception that their regimen has less risk of toxicities;
2. Overall, there was very high satisfaction with dolutegravir/lamivudine, largely due to PWH expectations being met regarding safety and efficacy;
3. Dolutegravir/lamivudine offers simplicity and is a convenient treatment which has enabled PWH to have more

freedom and autonomy in their daily life compared to prior ART;

4. Advancement in treatment (including dolutegravir/lamivudine) has led to HIV no longer being a 'death sentence' and for many people this gives them peace of mind when managing their HIV;

5. HIV is no longer the main health concern and dolutegravir/lamivudine complements the management of other diagnosed health conditions, enabling PWH to better focus on their overall health;

6. There remain few unmet treatment needs short of a cure in the HIV space at present.

Figure 1. Thematic analysis methodology.

**Conclusions:** A diverse group of PWH reflected on their experiences and the current reality of living with HIV. Dolutegravir/lamivudine fits well with this new reality.

## THPEB095

5 years of DoDo: experience with doravirine and dolutegravir as an alternative antiretroviral 2-drug regimen

S. Sammet<sup>1</sup>, V. Touzeau-Römer<sup>2</sup>, E. Wolf<sup>3</sup>, C. Boesecke<sup>4</sup>, S. Scholten<sup>5</sup>, S. Schneeweiss<sup>5</sup>, U. Kastenbauer<sup>6</sup>, B. Schlenvoigt<sup>7</sup>, E. Gersbacher<sup>3</sup>, J. Rockstroh<sup>4</sup>, K. Grabmeier-Pfistershammer<sup>2</sup>, S. Esser<sup>1</sup>, J.R. Bogner<sup>8</sup>, J. Roeder<sup>8</sup>, U. Seybold<sup>8</sup>

<sup>1</sup>Universitätsklinikum Essen, Klinik für Dermatologie und Venerologie, Essen, Germany, <sup>2</sup>Medizinische Universität Wien, Universitätsklinik für Dermatologie, Vienna, Austria, <sup>3</sup>MUC Research GmbH, Munich, Germany,

<sup>4</sup>Universitätsklinikum Bonn, Medizinische Klinik und Poliklinik I, Bonn, Germany, <sup>5</sup>Praxis Hohenstaufenring, Cologne, Germany, <sup>6</sup>Infektiologie Schwabing, Munich, Germany,

<sup>7</sup>Universitätsklinikum Jena, Institut für Infektionsmedizin und Krankenhaushygiene, Jena, Germany, <sup>8</sup>LMU Klinikum Munich, Zentrum für Klinische Infektiologie (KLIK), Division of Infectious Diseases, Med. Klinik und Poliklinik IV, Munich, Germany

**Background:** Current antiretroviral two-drug regimens (2DR) combining dolutegravir (DTG) with either lamivudine (3TC) or rilpivirine (RPV) may be limited by drug resistance or drug-drug-interactions (DDI). The combination of the next-generation NNRTI doravirine (DOR) with DTG could be an attractive alternative, but evidence with respect to durability remains scarce and pharmacokinetic interaction data are conflicting.

**Methods:** Descriptive analysis of DOR+DTG (DoDo) as a 2DR in a real-life setting at hospital clinics and private practices in Germany and Austria since February 2019.

**Results:** Through January 2024 93 people with HIV are followed. At switch to DoDo median age was 58 years (range 19-81), female/male ratio was 21/72. A history of HIV-associated/AIDS-defining conditions was present in 66%, median CD4-nadir was 167/ $\mu$ l (range 0-922). Median time on ART before switch was 21 years (0-34) with a median of 6 prior regimens (1-22). Main reasons for DoDo were DDI (32%), tolerability (24%), and cardiovascular risk (20%). Eighty-one participants (87%) have remained on DoDo for a median of 35 months (1-60), including 4 using DoDo a second time. Twelve persons (13%) permanently switched off DoDo after a median of 337 days (20-1390), including 2 for persisting low-level viremia. All others had a VL<50 cp/ml at the last follow-up. Five persons died due to non-AIDS comorbidities. Changes of CD4-count and weight before and during DoDo varied considerably between participants but on average were limited. Drug levels are available for 24 participants (26%) (figure).

In 2/24 (8%) dolutegravir was below the target level of 1100 ng/ml, in 1 other person (4%) doravirine was undetectable. There was notable variability of dolutegravir levels. VL was fully suppressed in these 24 participants at all timepoints; there were no signs or symptoms of toxicity.

**Conclusions:** DOR+DTG (DoDo) can be a valuable long-term 2DR option with no apparent mutual DDI-issues. More data on this 2DR are needed.

## THPEB096

### Weight and blood lipid outcomes among treatment-naïve and treatment-experienced people living with HIV initiating bicitgravir/emtricitabine/tenofovir alafenamide (BIC/FTC/TAF)

A. Liu<sup>1</sup>, H. Zhang<sup>1</sup>, J. Li<sup>1</sup>, X. Wang<sup>1</sup>, R.E. Wu<sup>2</sup>, W. Lyu<sup>3</sup>, Y. Shao<sup>1</sup>, A. Li<sup>1</sup>, J. Ye<sup>1</sup>, Z. Li<sup>1</sup>, L. Sun<sup>1,4</sup>

<sup>1</sup>Beijing Youan Hospital, Capital Medical University, Beijing, China, <sup>2</sup>Harvard School of Dental Medicine, Boston, United States, <sup>3</sup>Peking Union Medical College Hospital, Beijing, China, <sup>4</sup>Chinese Association of STD and AIDS Prevention and Control, Beijing, China

**Background:** This study aims to compare the changes in weight and blood lipids at week 48 to baseline among treatment-naïve people living with HIV initiating ART with BIC/FTC/TAF (treatment-naïve group, TN) and those who switched to BIC/FTC/TAF regimens (treatment-experienced group, TE).

**Methods:** A retrospective study was conducted at the STD/AIDS clinic of Beijing Youan Hospital, Capital Medical University from January 2020 to December 2021. Demographic, clinical, and laboratory data were collected for both the TN and TE groups.

The t-test or Wilcoxon rank-sum test was utilized to compare the changes in weight and lipid profiles, including HDL-C, LDL-C, TG, and TC, at baseline and after 48 weeks of treatment between the two groups.

**Results:** The study included a total of 1,253 people living with HIV : 538 were treatment-naïve and began BIC/FTC/TAF therapy, while 715 were treatment-experienced and switched to this regimen.

The median ages were 32.0 years (IQR: 27.0-39.0) for the TN group and 31.0 years (IQR: 26.0-36.0) for the TE group. In the TE group, 433 (60.5%) had previously used ART regimens that contained TDF. For the TN group, there were significant differences in weight ( $P=0.031$ ), HDL-C ( $P=0.001$ ), and LDL-C ( $P=0.033$ ) when comparing baseline values to those at week 48 of ART.

Conversely, in the TE group, there were no significant changes in weight ( $P=0.374$ ), HDL-C ( $P=0.877$ ), or LDL-C ( $P=0.635$ ) over the same period.

**Conclusions:** Treatment-naïve people living with HIV initiating ART with BIC/FTC/TAF experienced significant changes in weight, HDL-C, and LDL-C at week 48 compared to baseline.

However, no significant changes were observed in the treatment-experienced individuals who switched to this regimen. During antiviral treatment, it is important to closely monitor metabolic changes and address any issues in a timely manner.

<sup>1</sup>Universityhospital Frankfurt, Infectious Diseases, Frankfurt am Main, Germany, <sup>2</sup>Hospital Universitario Fundacion Jimenez Diaz, Infectious Diseases, Madrid, Spain, <sup>3</sup>Hospital Clínico Universitario Lozano Blesa, Infectious Diseases, Zaragoza, Spain, <sup>4</sup>Hospital Universitario Virgen de las Nieves, Infectious Diseases, Granada, Spain, <sup>5</sup>Hospital Universitario Gregorio Marañon, Infectious Diseases, Madrid, Spain, <sup>6</sup>Hospital Universitario La Paz, Infectious Diseases, Madrid, Spain, <sup>7</sup>Hospital Universitario 12 de Octubre, Infectious Diseases, Madrid, Spain, <sup>8</sup>Hospital Universitario Germans Trias i Pujol, Infectious Diseases, Barcelona, Spain, <sup>9</sup>MVZ am Goetheplatz, Infectious Diseases, Munich, Germany, <sup>10</sup>Hospital Universitario Getafe, Infectious Diseases, Madrid, Spain, <sup>11</sup>Centro Hospitalar de S. João, Infectious Diseases, Porto, Portugal, <sup>12</sup>Hospital Universitario Guadalajara, Infectious Diseases, Guadalajara, Spain

**Background:** Opportunistic infections and/or low CD4+T-cell counts are exclusion criteria in most clinical trials. People living with HIV (PLWH) and late diagnosis are inadequately represented in studies assessing efficacy of antiretroviral treatment (ART) regimens. Real-world data is of high importance in this vulnerable subset of PLWH.

There are currently no data from European studies focusing on virologic outcomes in treatment naïve PLWH with baseline CD4 count  $\leq 200/\mu\text{l}$  comparing dolutegravir/lamivudin (DTG/3TC) and bictegravir/tenofovir alafenamid/emtricitabine (BIC/TAF/FTC).

Aim of the study was to obtain information on effectiveness and tolerability/safety of DTG/3TC in treatment naïve PLWH with a CD4 cell count  $\leq 200/\mu\text{l}$ . Results were compared with data from treatment naïve patients with a CD4 cell count  $<200/\mu\text{l}$  treated with BIC/TAF/FTC.

**Methods:** Retrospective, multicentre, multinational study with 12 investigational sites in Germany, Spain and Portugal. Primary objective was effectiveness of initial ART with DTG/3TC compared to BIC/TAF/FTC in patients with low CD4 counts at baseline ( $<200/\mu\text{l}$ ). Primary endpoint was proportion of PLWH with  $<50$  copies/ml treated with DTG/3TC and BIC/TAF/FTC after 48 weeks after treatment initiation.

PLWH with  $\text{CD4}<200/\mu\text{l}$  and/or an AIDS defining disease who started first line ART with DTG/3TC or BIC/TAF/FTC between July 2019 and September 2022 were included and matched by age, gender, CDC stadium and baseline CD4 count and HI-viral load. Virologic response was analyzed using FDA snapshot analysis at week 48  $\pm 6$  wks.

**Results:** 82 PLWH were included in the study, 4.8% women, with a mean (SD) baseline CD4  $96/\mu\text{l}$  (78). 41 PLWH were started on 2DR DTG/3TC and 41 on 3DR BIC/TAF/FTC. 95.1% and 85.3% of PLWH on 2DR and 3DR, respectively, had a viral load  $<50$  copies/ml at week 48. Discontinuation rates were 5.9% in the 2DR and 2.7% in the 3DR group.

**Conclusions:** In a European cohort of PLWH and late diagnosis starting first line ART with DTG/3TC or BIC/TAF/FTC, there were no significant differences in discontinuation rates or virologic response rates at week 48. Our results indicate, that the choice between ART 2DR and ART 3DR can be made on an individual basis. Future research will focus on identifying factors associated with regimen selection in this cohort.

## THPEB098

### Enhancing HIV care: rapid antiretroviral therapy initiation in a community-based organization clinic in Kuala Lumpur, Malaysia

S. Basri<sup>1,2</sup>, M.H. Mohamad Fauzi<sup>3</sup>, S. Mohamad Salim<sup>3</sup>, R. Tai<sup>3</sup>, R.I.S. Raja Azwa<sup>4,2</sup>

<sup>1</sup>Universiti Malaya Medical Centre, Department of Medicine, Kuala Lumpur, Malaysia, <sup>2</sup>Centre of Excellence for Research in AIDS (CERIA), Universiti Malaya, 59100, Malaysia, <sup>3</sup>Community HealthCare Clinic, PT Foundation, Kuala Lumpur, Malaysia, <sup>4</sup>Universiti Malaya, Department of Medicine, Kuala Lumpur, Malaysia

**Background:** In Malaysia, Community HealthCare Clinic (CHCC) of the PT Foundation is a leading Community-based organization (CBO), has provided HIV care and sexual health services based on social entrepreneurship service delivery model since late 2018.

This study aimed to assess the feasibility of rapid antiretroviral therapy (ART) initiation for newly diagnosed patients in this CBO-led clinic.

**Methods:** CHCC is a one-stop centre for STI/HIV screening, treatment and prevention, led by the community, is equipped with near patient point of care diagnostics including in-house PIMA CD4 analyser and GeneXpert for HIV viral load determination, facilitating rapid ART initiation. A

descriptive single-center study included all patients newly diagnosed at CHCC or referred to the clinic from January 2019 to December 2023. Data on socio-demographics, clinical characteristics and ART initiation outcomes were collected. Rapid ART initiation was defined as ART within 7 days of the first clinic visit upon diagnosis, while delayed initiation was after 7 days.

**Results:** Among 293 newly diagnosed HIV patients, 92.8% were men (70.1% MSM), 5.1% were women, and 2% were transgender. The median age at diagnosis was 32 (IQR 27–39) years, with a median nadir CD4 count of 304 (IQR 201–430) cell/mm<sup>3</sup>. The median time from the first clinic visit to ART initiation was 7 (IQR 2–15) days. The majority, 96.9% initiated TDF/FTC/EFV, in line with our national guideline. Of the patients, 16% started ART at same day, 19.5% had rapid ART initiation, 41.6% experienced delayed ART initiation while 22.9% were referred to government facilities without ART initiated, primarily due to cost and logistic issues (51.6%). Delayed initiation was mainly attributed to clinic structural barriers (63.3%) such as delayed appointment following confirmatory tests; followed by Bactrim initiation before ART (19.3%), and patient-related factors (8.3%), including denial and unreadiness to start ART.

**Conclusions:** The study demonstrates the feasibility of rapid ART initiation through a CBO-led clinic in Malaysia. Efforts to enhance clinic services are warranted to improve timely ART initiation, aligning with updated WHO guidelines including Bactrim and ART initiation on same time, and providing financial assistance for rapid ART initiation before referring to government facilities.

## THPEB099

### Clinical outcomes at month 12 after initiation of cabotegravir and rilpivirine long acting (CAB+RPV LA) in an observational real-world study (BEYOND)

S. Schneider<sup>1</sup>, M. Sension<sup>2</sup>, A. Dretler<sup>3</sup>, S. Lalla-Reddy<sup>4</sup>, C. Schubert<sup>5</sup>, D. Merrill<sup>5</sup>, D. Richardson<sup>6</sup>, B. Sherif<sup>6</sup>, L. Zografos<sup>6</sup>, C. Garris<sup>5</sup>

<sup>1</sup>Infectious Disease Specialists of Long Beach, Long Beach, United States, <sup>2</sup>Community AIDS Network (CAN) Community Health, Sarasota, United States, <sup>3</sup>Infectious Disease Specialists of Atlanta, Decatur, United States, <sup>4</sup>Lalla-Reddy Medical Corporation, Fountain View, United States, <sup>5</sup>ViiV Healthcare, Durham, United States, <sup>6</sup>RTI Health Solutions, Research Triangle Park, United States

**Background:** CAB+RPV LA is the first complete long-acting regimen for virologically suppressed people with HIV (PWH) administered by a healthcare provider (HCP). The BEYOND real-world study describes the month 12 (M12) clinical outcomes of patients initiating CAB+RPV LA in the United States.

**Methods:** BEYOND is a 2-year observational study of utilization, outcomes, and experience of PWH initiating CAB+RPV LA (monthly or every 2 months) across 30 US sites.

HCPs completed an electronic case report form (eCRF) at baseline, M6, and M12 to capture demographics, medical and treatment history, and clinical outcomes.

**Results:** A total of 308 PWH were enrolled between Sep 2021-Jul 2022 and initiated CAB+RPV LA. Mean age of participants was 46 years, 39% were ≥50 years, 13% were female assigned at birth, with 44% White, 33% Black, and 23% other races. By M6, 36/308 (12%) participants discontinued the study. This M12 analysis (data cutoff Sep 2023) included 272 PWH: 245 remained on treatment at M12, 8 (3%) additional PWH were reported as having discontinued CAB+RPV LA since M6, and 19 (7%) had unknown treatment status.

The most common reason for discontinuation was medication cost/access issues (3/8 PWH). At M12, 97% were receiving CAB+RPV LA every 2 months and 3% were on monthly dosing. Of PWH with viral load <50 c/mL at baseline, 97% (181/187) had a most recent viral load of <50 c/mL at M12 (Table 1).

Confirmed virologic failure (CVF) with resistance was reported in 1/272 (0.4%) PWH between M6 and M12.

Virologic Outcomes	Month 6 (N=308)	Month 12 (N=272)
Participants with viral load <50 c/mL at baseline*	248	187
Viral load <50 c/mL	235 (94.8%)	181 (96.8%)
Viral load ≥50 c/mL	13 (5.2%)	6 (3.2%)
Participants with viral load >50 c/mL at baseline*	18	13
Viral load <50 c/mL	17 (94.4%)	13 (100%)
Viral load ≥50 c/mL	1 (5.6%)	0
Confirmed virologic failure**	6 (1.9%)	1 (0.4%)

\*Number with available viral load at baseline AND respective time point.  
\*\*Confirmed virologic failure was defined as 2 consecutive HIV-1 RNA viral loads ≥200 c/mL or 1 HIV-1 RNA viral load ≥200 c/mL followed by regimen discontinuation within 3 months of viral load ≥200 c/mL.

Table 1. Clinical outcomes at M12.

**Conclusions:** The M12 results from real-world initiation of CAB+RPV LA in the United States are consistent with the phase 3/3b clinical trials with high rates of virologic suppression, low rates of CVFs with treatment emergent resistance, and no new discontinuations due to intolerance.

## THPEB100

### Three-year effectiveness of bictegravir/emtricitabine/tenofovir-alafenamide as switch strategy in the real-world experience

A. de Gea Grela<sup>1</sup>, R. Micán<sup>1</sup>, L. Serrano<sup>1</sup>, R. de Miguel<sup>1</sup>, M.d.M. Arcos<sup>1</sup>, L. Ramos Ruperto<sup>1</sup>, R. Montejano<sup>1</sup>, E. Valencia<sup>1</sup>, J.I. Bernardino<sup>1</sup>, C. Busca<sup>1</sup>, M.L. Montes<sup>1</sup>, J. González García<sup>1</sup>, J.R. Arribas<sup>1</sup>, L. Martín Carbonero<sup>1</sup>

<sup>1</sup>Hospital Universitario la Paz, Medicina Interna, Madrid, Spain

**Background:** We previously described the effectiveness of bictegravir/emtricitabine/tenofovir (B/F/TAF) as a switch strategy in people living with HIV (PLWH) in the real life. At 48 weeks of follow-up, 83% and 94.4% of participants had HIV-RNA < 50 copies/ml in the intention to treat (ITT) and per protocol (PP) analysis.

No differences were seen between PLWH with or without previous nucleoside reverse transcriptase inhibitor (NRTI) resistance associated mutations (RAMs) (Mican et al; AIDS;2022). Herein we describe the results after three years of follow-up.

**Methods:** Retrospective review of treatment-experienced PLWH initiating B/F/TAF between April-2019 and February-2020. HIV-RNA less than 50 copies/ml was analyzed at 92 and 144 weeks of follow-up in an intention-to-treat (ITT) analysis (missing=failure) and per-protocol (PP) analysis (participants with missing data or changes for reasons other than virological failure were excluded). RAMs were analyzed by Sanger RNA sequencing and included in the HIV Drug Resistance Database (Stanford University).

**Results:** 506 PWH were included: 16.2% women, median age (IQR) 52.3 (43.5-57.8) years, median duration of HIV infection 18.9 years, 13.6% with documented pre-existing NRTI-RAMs (Table1), 86.6% with viral load below 50 copies/mL.

At 96 weeks in the ITT and PP analyses, 73.1% and 95.4%, respectively had HIV-RNA< 50 copies/ml. At 144 weeks, these figures were 68.2% and 94% respectively. We observed no statistically significant differences between PLWH with and without previous NRTI-RAMs (Table2).

22 PLWH had detectable HIV-RNA at week 144, but only 13 had HIV-RNA higher than 200 copies/ml. Only in 5 cases treatment was changed. The remaining persons were encouraged to reinforce adherence or were considered as low level viraemia situations. Resistance testing was performed in seven participants, but RAMs were detected in only two, always before 48-week follow-up (M184V *de novo* and re-emerging M41I-D67N, K70R-M184V-T215F-K219Q).

RAMs	Number
Only M184V/I	27
K65R + M184V/I	2
M184V/I + ≥2 TAMS	19
M184V/I + others	9
K65R	1
≥2 TAMS	8
Other	3

Table 1: Preexisting NRTI-RAMs.

	No NRTI resistance (N=437)	NRTI resistance (N=69)	All (N=506)
HIV viral load <50 copies/ml	295 (67.6%)	50 (72.5%)	345 (68.2%)
HIV viral load >50 copies/ml	19 (4.3%)	3 (4.3%)	22 (4.3%)
No data	123 (28.1%)	16 (23.2%)	139 (27.5%)
Missing	39 (8.9%)	7 (10.2%)	46 (9.1%)
Toxicity	29 (6.6%)	3 (4.3%)	32 (6.3%)
Deaths	15 (3.4%)	5 (7.3%)	20 (4%)
Switch to double-therapy	34 (7.8%)	0	34 (6.7%)
Other reasons	6 (1.4%)	1 (1.4%)	7 (1.4%)

Table 2: Virological outcome at month 36.

**Conclusions:** Through 3 years of follow-up, switching to B/F/TAF maintained high rates of virological suppression in long-term PLWH. These results are seen even in persons with pre-existing NRTI-RAMs.

## THPEB101

### Improving viral load suppression in children receiving antiretroviral therapy in Bauchi State, Nigeria: a quality improvement approach

<sup>1</sup>Georgetown Global Health Nigeria, Abuja, Nigeria, <sup>2</sup>Office of HIV/AIDS and TB, United States Agency for International Development (USAID), Abuja, Nigeria, <sup>3</sup>Office of HIV/AIDS, United States Agency for International Development (USAID), Washington DC, United States, <sup>4</sup>National AIDS, Sexually Transmitted Infections Control and Hepatitis Programme (NASCP), Federal Ministry of Health, Abuja, Nigeria, <sup>5</sup>National Agency for the Control of AIDS (NACA), Abuja, Nigeria

**Background:** Despite the availability of more efficacious regimens, viral load (VL) suppression rates among children on antiretroviral therapy (ART) in Nigeria have continued to trail those of the adult population. This work highlights the results of a quality improvement initiative for VL suppression among children in the Bauchi state Accelerating Control of the HIV Epidemic in Nigeria -Cluster 2 (ACE2) project.

**Description:** In March 2023, the Retention and Audit Determination Tool (RADET) line lists were used to calculate and compare the viral suppression rates for the <15 and ≥15 years age categories of clients on ART in Bauchi State. Facilities with the poorest VL suppression rates in the under-15 years category were prioritized and supported to address identified root causes such as incorrect regimens, suboptimal dosing for weight and age, frequent treatment interruptions, poor adherence, and poor treatment literacy of caregivers. Over 6 months, these root causes were addressed through ART regimen optimization, provision of dosing guides, enhanced adherence counseling, individualized care plan, and appointment reminders. VL suppression rates were monitored monthly using the RADET line lists.

**Lessons learned:** The VL suppression rate in children younger than fifteen years improved from 92% to 97% within 6 months of the initiative, catching up with the adults and exceeding the UNAIDS target.

This shows that simple strategies targeted at children and their caregivers, healthcare providers, and health systems can significantly improve VL suppression in a short period.

**Conclusions/Next steps:** While there are cross-cutting challenges to effective ART between adults and children, the <15 require special attention to address their unique barriers. It's crucial to tailor interventions to individual needs and understand caregivers' significant contributions to ART's success in children.

Further evaluations would be necessary to determine the effect of each intervention on individual clients' outcomes and overall suppression rates.

**Background:** Key populations (KP) stand higher risks of acquiring HIV-infection than any other targets; with men having sex with men (MSM) being the most vulnerable sub-population. Thus, ensuring an effective treatment re-

sponse among MSM in low and middle-income countries (LMICs) would contribute substantially in achieving HIV global elimination goals. We thus aimed at evaluating the virological response and acquired HIV drug resistance (HIVDR) patterns among MSM in Cameroon.

**Methods:** A facility-based study was conducted from August-2022 to February-2023 among ART-experienced MSM receiving at Humanity First Plus (Community Based Organization; CBO) in Yaounde-Cameroon. Viral load (VL) was measured using Abbott *m2000rt*, and VL<50 copies/mL was considered as undetectable while all VL<1000 copies/mL was considered as suppressed viremia. Cases of confirmed unsuppressed viremia were enrolled for HIV genotypic resistance testing using the Sanger-sequencing. HIV drug resistance (HIVDR) was interpreted using the Stanford HIVdb v9.4, and molecular phylogeny was used for HIV subtyping.

**Results:** Of the 95 ART-experienced MSM at the CBO during the study period, 82 (86.3%) provided informed consent for participation. Their median [IQR] age was 27 [21-37] years and 75/82 (91%) reported having multiple sexual partners. Regarding ART history, median [IQR] duration on ART was 4 [2-5] years and most prescribed ART regimens were TD-F+3TC+DTG (95%; 78/82); TDF+3TC+EFV (2.4%; 2/82) and ATV/r+3TC+TDF (2.4%; 2/82). Virological response revealed an overall rate of 97.6% (80/82) viral suppression, indicating a high level of HIV prevention among MSM receiving ART. A rate of 70.7% (58/82) MSM achieved an undetectable viremia (VL<50 copies/mL), indicating an optimal prevention of HIVDR emergence. Following enhanced adherence council sessions, only 2 cases remained unsuppressed (64,109 and 104,440 copies/mL), and HIV-1 sequencing revealed one case harboring drug resistance mutations (G190GE, L210W), indicating an overall rate of 1.2% (1/82) HIVDR at the facility-level. Phylogenetic analysis indicated the presence of the HIV-1 subtypes A1 and CRF02\_AG.

**Conclusions:** Among ART-experienced MSM in Yaounde, receiving predominantly DTG-containing regimens, viral suppression rate is above the 95% target, indicating prevention of HIV transmission among this KP. Furthermore, the low rate of HIVDR underscores the high effectiveness of current ART regimens used among KP in similar LMICs.

## THPEB103

### Injection site reactions with subcutaneous lenacapavir administration at alternate injection sites

G. Saunders<sup>1</sup>, E. Mortensen<sup>2</sup>, G. Shen<sup>2</sup>, A. Kim<sup>2</sup>

<sup>1</sup>Gilead Sciences, Inc., Cambridge, United Kingdom, <sup>2</sup>Gilead Sciences, Inc., Foster City, United States

**Background:** Lenacapavir (LEN) is a first-in-class, long-acting capsid inhibitor, indicated, in combination with other antiretrovirals, for the treatment of multidrug-resistant HIV-1 infection in heavily treatment-experienced people,

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

and is also under investigation as a single agent for HIV-1 prevention. LEN is administered by subcutaneous (SC) injection in the abdomen. We report injection site reactions (ISRs) occurring with SC LEN administration at alternate injection sites.

**Methods:** This Phase 1 open-label study enrolled healthy adults into four cohorts, each with a unique injection site: thigh, upper arm, gluteal region, and abdomen (reference). Participants received a single SC LEN dose (927 mg as two 1.5 mL injections) on Day (D) 1. The primary endpoint was pharmacokinetic exposure, with no clinically significant difference between injection sites observed (IDWeek 2023; Abstract 1542). Secondary endpoints included safety parameters; injection sites were examined daily during D1-10 and at subsequent visits (weekly-monthly) until study end (D270). ISRs were coded by MedDRA preferred term and graded 1-5 for severity.

**Results:** Forty participants (n=10/cohort) received SC LEN; median age was 46 years, and 50% of participants were male. One Grade 3 ISR was observed (erythema in the upper arm) which resolved without treatment (duration, 5 days); all other ISRs were Grade 1/2. The most common ISRs ( $\geq 15\%$  of total participants) were pain, erythema, induration, nodule, and swelling (**Table**). Swelling, erythema, and pain typically resolved within days (median duration,  $\leq 7$  days). Across all cohorts, median duration of induration ranged from 6 to 25 days; nodule, observed in the thigh and abdomen cohorts only, had a median duration of 20 and 9 days, respectively.

Most common ISRs ( $\geq 15\%$ of total participants)	Thigh (n=10)	Upper arm (n=10)	Gluteal region (n=10)	Abdomen (reference) (n=10)
	n Median (range) duration, days			
Pain	9 4 (1-8)	8 1 (1-14)	9 3 (2-7)	10 2 (2-6)
Induration	8 6 (2-168)	10 25 (2-271)	3 8 (6-9)	8 19 (8-192)
Erythema	9 3 (2-8)	8 7 (3-14)	5 5 (3-7)	6 4 (2-7)
Nodule	4 20 (8-61)	0 -	0 -	2 9 (8-45)
Swelling	0 -	1 2 (2-2)	1 7 (7-7)	4 2 (2-3)

n numbers = number of participants. ISR, injection site reaction.

**Table.** Frequency and median duration of most common ISRs by injection site cohort (N=40).

**Conclusions:** The frequency and duration of ISRs were generally similar between the alternate injection sites and the abdomen. This study supports further investigation of these alternate injection sites for SC LEN administration.

## THPEB104

One-year outcomes of long-acting cabotegravir and rilpivirine in people living with HIV and a long exposure to antiretroviral therapy: data from the SCohoLART Study

C. Muccini<sup>1</sup>, N. Gianotti<sup>1</sup>, S. Diotallevi<sup>1</sup>, R. Lolatto<sup>1</sup>, V. Spagnuolo<sup>1</sup>, D. Canetti<sup>1</sup>, S. Bagaglio<sup>1</sup>, V. Gordo Perez<sup>1</sup>, T. Clemente<sup>2</sup>, M. Bottanelli<sup>2</sup>, C. Candela<sup>2</sup>, S. Nozza<sup>1,2</sup>, A. Castagna<sup>1,2</sup>

<sup>1</sup>IRCCS San Raffaele Scientific Institute, Department of Infectious Diseases, Milan, Italy; <sup>2</sup>Vita-Salute San Raffaele University, Milan, Italy

**Background:** Aim of the study was to evaluate the 9- and 12-month cumulative probabilities of treatment discontinuation (TD) in people living with HIV (PLWH) and a long exposure to antiretroviral therapy (ART) switching to long-acting (LA) drugs.

**Methods:** SCohoLART (NCT05663580) is a single-center, prospective, cohort study designed to collect both samples and clinical data of PLWH on virological suppression who switched to bimonthly LA cabotegravir and rilpivirine.

Participants were followed-up in accordance with national guidelines.

TD occurred at switch to another regimen for any reason including virological failure (VF); VF was defined as HIV-RNA $\geq 50$  copies/mL at two consecutive measurements or a single HIV-RNA $\geq 1000$  copies/mL.

Participants' characteristics were reported as median (interquartile range, IQR) or frequency (%). Cumulative probabilities of TD were estimated by Kaplan-Meier curve.

**Results:** We evaluated 504 participants: 453 (89.9%) were male and median age was 49.0 (40.0-56.4). Median years from HIV diagnosis and of ART were 14.4 (9.0-21.2) and 11.5 (8.2-17.8), respectively; 175 (34.7%) were on dual therapy. During a median study follow-up of 9.4 (6.4-11.4) months, 48 PLWH experienced TDs (9.5%), including 4 (0.8%) for VF, whose characteristics are shown in Figure 1.

Participant	Year of HIV diagnosis	Body mass index	Pre-switching therapy regimen	Pre-switching viral load	First long-acting therapy regimen	First long-acting viral load	VF at follow-up	Subtype	Pre-A11 genotypic resistance test	Genotypic resistance test at follow-up
Male, 50 years old	2003	22.2	DTG + ABC + 3TC	171 copies/mL	DTG + ABC + 3TC	108 copies/mL after 4 weeks	Yes	CR	Not available	CR
Male, 42 years old	2003	25.7	DTG + ABC	1440 copies/mL	DTG + ABC + 3TC	108 copies/mL after 32 weeks	Yes	CR	Not available	CR
Male, 56 years old	2002	24.8	DTG + ABC + 3TC	128 copies/mL	DTG + ABC + 3TC	108 copies/mL after 32 weeks	Yes	CR	Not available	CR
Male, 57 years old	2008	25.3	DTG + ABC + 3TC	128 copies/mL	DTG + ABC + 3TC	108 copies/mL after 32 weeks	Yes	CR	Not available	CR

**Figure 1.** Characteristics of participants experiencing virological failure.

The 9- and 12-month cumulative probabilities of TD were 10% (95%CI: 7%-12%) and 12% (95%CI: 9%-16%), respectively (Figure 2). Main cause of TD was injection site reaction (ISR; 10, 20.8%).

Figure 2. Cumulative probabilities of treatment discontinuation.

**Conclusions:** The 9- and 12-month cumulative probabilities of TD with cabotegravir and rilpivirine were low, with few VFs, in this cohort of ART-experienced PLWH. ISR is the leading cause of TD.

## THPEB105

The relationship of smoking and unhealthy alcohol use to HIV care retention and viral control: findings from a multi-site cohort study

D. D. Satri<sup>1</sup>, V. Sarovar<sup>2</sup>, T. Levine<sup>2</sup>, A. Lea<sup>2</sup>, S. Sterling<sup>2</sup>, A. Justice<sup>3</sup>, J. A. C. Sterne<sup>4</sup>, S. M. Ingle<sup>4</sup>, A. Trickey<sup>4</sup>, M. Cavassini<sup>5</sup>, M. Saag<sup>6</sup>, H. Crane<sup>7</sup>, E. Girardi<sup>8</sup>, I. Jarrin<sup>9</sup>, J. Gill<sup>10</sup>, L. Wittkop<sup>11</sup>, M. van der Valk<sup>12</sup>, R. Kouyos<sup>13</sup>, R. Zangerle<sup>14</sup>, M. Silverberg<sup>2</sup>

<sup>1</sup>University of California, San Francisco, Psychiatry And Behavioral Sciences, San Francisco, United States, <sup>2</sup>Kaiser Permanente Northern California, Oakland, United States, <sup>3</sup>Yale University and Veterans Administration Healthcare System, New Haven, United States, <sup>4</sup>University of Bristol, Bristol, United Kingdom, <sup>5</sup>Lausanne University Hospital, Lausanne, Switzerland, <sup>6</sup>University of Alabama, Birmingham, United States, <sup>7</sup>University of Washington, Seattle, United States, <sup>8</sup>Istituto Nazionale per le Malattie Infettive L. Spallanzani, Rome, Italy, <sup>9</sup>Carlos III Health Institute, Madrid, Spain, <sup>10</sup>Sheldon M Chumir Health Centre, Calgary, Canada, <sup>11</sup>University of Bordeaux, Bordeaux, France, <sup>12</sup>Amsterdam University Medical Center, Amsterdam, Netherlands, the, <sup>13</sup>University of Zurich, Zurich, Switzerland, <sup>14</sup>Medical University of Innsbruck, Innsbruck, Austria

**Background:** Tobacco smoking and unhealthy alcohol use may negatively influence HIV care continuum outcomes, but associations have not been examined across international cohorts.

**Methods:** People with HIV (PWH) were included from 11 Antiretroviral Therapy Cohort Collaboration (ART-CC) cohorts; 5 North American and 6 European. Exposures were harmonized measures of smoking and alcohol use from

electronic health records (2010-2018). Retention in care was defined as having at least two HIV care visits 60 days apart within 12 months of the alcohol measurement date; HIV RNA failure was defined as >200 copies/mL. Adjusted prevalence ratios (PRs) were obtained from separate logistic regression models for each outcome; with covariates of age, sex, race, and HIV acquisition mode. We calculated a pooled effect estimate by fitting a random-effect meta-analysis.

**Results:** There were 83,102 PWH with available outcome data; mostly male (87.4%). The sample was 46.1% white, 28.1% Black, 6.4% Hispanic, 1.7% Asian, 0.3% indigenous, and 17.4% other/unknown. Almost half (48.6%) were non-drinkers, 44.5% were low/moderate drinkers, and 6.9% were heavy drinkers. Around 43.7% were current smokers, while 56.3% reported never or former smokers. Compared with those with low/moderate drinking, those with heavy drinking had higher risk of not being retained in care (pooled PR [95% CI]=1.13 [1.03-1.25]), with heterogeneity of  $I^2=7.8\%$ .

Current smokers had a higher risk of not being retained in care compared with former or never smokers (pooled PR [95% CI]=1.12 [1.08-1.16]), with heterogeneity of  $I^2=18.1\%$ . PWH reporting heavy drinking had higher risk of viral failure versus low/moderate use (pooled PR [95% CI]=1.18 [1.02-1.37]), with heterogeneity of  $I^2=68.9\%$ .

There was no evidence of lower risk of viral failure among those who were non-drinkers compared with low/moderate drinking (pooled PR [95% CI]=0.98 [0.84-1.14]), with heterogeneity of  $I^2=85.9\%$ .

Current smokers were at higher risk of viral failure than non-smokers (pooled PR [95% CI]=1.44 [1.25-1.67]), with high heterogeneity across cohorts ( $I^2=90.6\%$ ).

**Conclusions:** In this large international sample of PWH, smoking and unhealthy alcohol use were associated with worse HIV care retention and viral control, with variability observed between cohorts.

## THPEB106

Gender-related differences in cabotegravir/rilpivirine long-acting therapy in a real world cohort of HIV patients

A. Moreno<sup>1</sup>, S. del Campo<sup>1</sup>, M.J. Vivancos<sup>1</sup>, M. Vélez<sup>2</sup>, J.L. Casado<sup>1</sup>, F. Dronda<sup>1</sup>, J. Martinez<sup>1</sup>, A. García<sup>1</sup>, C. Fernandez-Chica<sup>1</sup>, M.A. Amezcua-Segovia<sup>1</sup>, S. Martín-Colmenarejo<sup>1</sup>, E.B. Ruiz-Romero<sup>1</sup>, P. López-Guzmán<sup>1</sup>, S. Moreno<sup>1</sup>, M.J. Pérez-Eliás<sup>1</sup>

<sup>1</sup>Hospital Ramón y Cajal, Infectious Diseases, Madrid, Spain, <sup>2</sup>Hospital Ramón y Cajal, Pharmacy, Madrid, Spain

**Background:** Long-acting (LA) Cabotegravir/Rilpivirine (C/R) is a new antiretroviral therapy (ART) for the maintenance of viral suppression in HIV-patients. There is scant information on outcomes in women excluding those reported from clinical trials.

**Methods:** Ongoing, prospective, single center cohort analyzed to assess potential gender-related differences in baseline features, safety and efficacy of C/R outside clinical trials in the first year of implementation in a monographic HIV outpatient clinic at a tertiary center in Madrid, Spain.

**Results:** Between Jan-2023/Jan 2024 270 patients started C/R (8% of patients on ART), 13% were women (N=35). Table-1 shows our main results.

	Women (N=35)	Men (N=235)	P
Age (y, mean,IQR)	51.7±11	44.6±12	P=0.001
Main route of HIV infection	74% HETEROSEXUAL	86% MSM	P=0.0001
Spanish European origin	62.9%	48.9%	0.15
BMI (mean±SD)	25.8 ± 5.0	25.7 ± 3.7	NS
HIV subtype B (N=97)	66.7%	94%	0.028
Baseline undetectable HIV RNA (N, %)	34 (97%)	233 (99%)	NS
Cd4 cell count (cells/ml; mean±SD)	782 ± 339	775 ± 309	NS
Time on ART (months; mean±SD)	190±112	132±96	0.001
Number of previous ART lines (mean±SD)	6.9 ± 4.5	4.1 ± 3.4	0.001
AIDS	25.7%	14.5%	0.79
CDC-A	42.9%	71.5	0.002
Comorbidities (%)	68.6%	46.4%	0.018
NNRTI resistance	2 (5.7%)	2 (0.85%)	NS
Adherence with injections	100%	100%	NS
Maintenance of HIV suppression	97%	99%	NS
ISR (any degree)	2 (5.7%)	9 (3.8%)	NS
Treatment interruption	2 (5.7%)	5 (2.1%)	NS

**Conclusions:** In this real world cohort, C/R showed equal safety and efficacy outcomes regardless gender, despite women being older, with more advanced disease, longer and more ART exposure, more comorbidities and less HIV subtype B.

## THPEB107

Evolution of inflammatory biomarkers and HIV-DNA in people with HIV switching to long acting cabotegravir/rilpivirine from either dual or triple therapy: results from a prospective cohort study

M. Mazzitelli<sup>1</sup>, M.R. Petrara<sup>2</sup>, C. Cozzolino<sup>3</sup>, L. Sasset<sup>1</sup>, L. Davide<sup>1</sup>, S. Gardin<sup>1</sup>, B. Bragato<sup>1</sup>, A. Panese<sup>1</sup>, V. Baldo<sup>3</sup>, A. De Rossi<sup>3</sup>, S. Parisi<sup>3</sup>, A. Cattelan<sup>3</sup>

<sup>1</sup>Padua University Hospital, Padua, Italy, <sup>2</sup>Istituto Oncologico Veneto, Padua, Italy, <sup>3</sup>Padua University, Padua, Italy

**Background:** We assessed impact of switching to long acting cabotegravir/rilpivirine (LACR) on inflammatory parameters and HIV-DNA levels in real-life setting cohort of people with HIV (PLWH) switching to LACR from either dual or triple therapy.

**Methods:** This is a prospective study including all consecutive PLWH with HIV-RNA<50 copies who started LACR, who remained with HIV-RNA<50 copies/ml and who did not develop any intercurrent infectious event during the follow-up. We assessed HIV-DNA levels, ultra-sensitive C-reactive protein (hsCRP), CD4/CD8 ratio, neutrophil/lymphocytes ratio (NLR), platelet/lymphocyte ratio (PLR) assessed at the baseline, 4, 12 and 24 weeks after the switch (M0, M1, M3, and M6, respectively). Participants were divided into two groups: coming from triple and dual therapy. Repeated measures ANOVA was employed to assess differences in inflammatory outcomes over time and between groups, adjusting for time effect.

**Results:** We included 60 PLWH, 75% males, median age 48 (IQR: 43-57) years, 60% with multimorbidity, median age with HIV and CD4+T-cell count of 11 (IQR:6-17) and 725 (IQR: 569-948) cell/mm<sup>3</sup>, respectively. 58.1% PLWH were in triple group and 41.7% in the dual group. Evolution of the study parameters overall and by groups is depicted in Figure 1. From M0 to M6, we did not detect any significant change in any biomarker. By considering treatment group, we detected a significant increase in the CD4/CD8 ratio and a signal of HIV-DNA increase (despite not significant) in the dual group, however these differences were lost by time-effect.

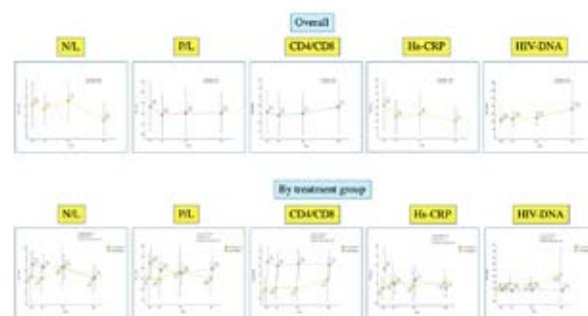

Figure 1.

**Conclusions:** Preliminarily, switching to LACR either from dual or triple therapy seems to have not a significant impact on inflammatory biomarkers or HIV-DNA. Further studies (with longer follow-up, larger number of PLWH, and taking into account HIV-DNA variability) are needed to investigate the impact of a third-antiretroviral removal on HIV-DNA and inflammation levels in people receiving LACR.

**THPEB108**

Improving adherence to antiretroviral treatment in Peruvian Amazon: a study of growth group programs in 2022

M. Muñoz<sup>1</sup>, L. Navarro<sup>1</sup>, S. Soto<sup>1</sup>, T. Garvich<sup>1</sup>,  
M. Caballero<sup>1</sup>, A. Posadas<sup>2</sup>, A. Schwartz Benzaken<sup>3</sup>,  
M. Pedrola<sup>3</sup>, J.L. Sebastian<sup>1</sup>

<sup>1</sup>AIDS Healthcare Foundation, Lima, Peru, <sup>2</sup>Universidad Autónoma de Madrid, Madrid, Spain, <sup>3</sup>AIDS Healthcare Foundation, Los Angeles, United States

**Background:** Retention and adherence to HIV treatment are important to achieve the 95-95-95 goals. AHF Peru, with the objective of improving retention and adherence to antiretroviral (ARV) treatment, developed two programs focused on people who are starting their treatment and those who have abandoned it.

**Methods:** During 2022, growth groups (GG) were launched in Lima and Iquitos (Peruvian Amazon) for those starting their treatment (SGG) and for those who had abandoned their treatments (AGG).

The SGG holds a meeting a month after starting treatment while the AGG holds 6 meetings. In these meetings, HIV, ARV treatment, physical and psychological care, problem-solving tools, reduction of risk practices, stigma and discrimination are discussed.

**Results:** In 2022, 14 groups were formed with a total of 88 participants (SGG=43; AGG=45). 91% SGG and 82% AGG of clients adhered to treatment within one year.

Of the adherent clients whose viral load could be measured (SGG= 36; AGG=31), 97% of the SGG and 81% of the AGG had an undetectable viral load.

Of the 7 clients (SGG= 4; AGG= 3) who abandoned treatment, five of them were drug users and suffered from mental disorders. One case reported gender violence and in the remaining case no information could be collected.

**Conclusions:** Alternatives must be sought to ensure adherence to ARV treatments. We understand that these types of programs must be based on the social determinants of each population. Our patients' work schedules and difficulties such as transportation prevented some patients from participating in these programs.

The results analyzed stimulate us to continue advancing in this type of community-based programs.

## Antiretroviral therapies and clinical issues in adolescents and young adults

**THPEB109**

Adolescents and young adults with HIV using long-acting injectable cabotegravir/rilpivirine as a standard of care: outcomes of the observational cohort at 26 months

T. Williams<sup>1</sup>, L. Anderson<sup>1,2</sup>, J. Unternaher<sup>1</sup>, W.L.A. Koay<sup>3</sup>,  
K. Bright<sup>1</sup>, J. Mareuil<sup>1</sup>, N. Rakhmanina<sup>1,2,4</sup>

<sup>1</sup>Children's National Hospital, Division of Infectious Diseases, Washington, D.C., United States, <sup>2</sup>The George Washington University School of Medicine, Department of Pediatrics, Washington, D.C., United States, <sup>3</sup>Medical University of South Carolina, Department of Pediatrics, Division of Infectious Diseases, Charleston, United States, <sup>4</sup>Elizabeth Glaser Pediatric AIDS Foundation, Technical Strategies and Innovation, Washington, D.C., United States

**Background:** Long-acting injectable (LAI) cabotegravir/rilpivirine (CAB/RPV) can improve antiretroviral treatment (ART) adherence and outcomes among adolescents and youth with HIV (AYHIV). Current data on LAI CAB/RPV in AYHIV are limited to clinical trials.

We evaluated the outcomes of LAI CAB/RPV among AYHIV in care at Children's National Hospital, Washington, DC.

**Methods:** We analyzed an observational cohort of AYHIV ≥12-<25 years of age who initiated LAI CAB/RPV between October 2021 and December 2023 as a standard of clinical care. Data included demographics (age, race, ethnicity, and sex at birth), HIV transmission mode, body mass index (BMI), prior ART, self-reported injection site pain, adverse events, HIV RNA, ART resistance, CAB/RPV dosing and retention in care.

**Results:** Nineteen AYHIV (53% male; median age=19.2 years [14.9-23.6 years]; 84.2% African-American; 63.2% with perinatally-acquired HIV; median BMI=25.8 kg/m<sup>2</sup> [18.6-57.9 kg/m<sup>2</sup>]) transitioned from oral ART to monthly LAI CAB/RPV with longest LAI duration of 26 months. Most AYHIV (94.7%) were virally suppressed ≥6 months on prior ART and transitioned (89.5%) from one daily pill with two NRTIs plus one INSTI.

Two AYHIV (10.5%) experienced ≥1 viral blips ≥200 copies/mL [207-1,100 copies/mL] and one AYHIV (5.3%) experienced ≥1 viral blips <200 copies/mL when transitioning to bimonthly injections during the first 12 months on LAI CAB/RPV. These viral blips did not result in the development of resistance to CAB and/or RPV. Most AYHIV (89.5%) switched to bimonthly LAI CAB/RPV after maintaining HIV RNA <20 copies/mL for 3-6 months on monthly injections.

All AYHIV on LAI CAB/RPV were virally suppressed at the end of the study period. Injection-associated pain/discomfort ranged from mild to moderate, lasted 0.5-1 days and improved with physical activity. Two AYHIV (10.5%) with perinatally-acquired HIV developed one-time im-

mediate post-injection adverse reactions (malaise and pain) which self-resolved within 20 minutes. There were zero missed or delayed injections.

**Conclusions:** Despite challenges (e.g., viral blips and selected AYHIV with high BMI), we report 100% engagement in care and viral suppression among 19 AYHIV on LAI CAB/RPV at  $\leq 26$  months follow-up. More data are needed to evaluate the long-term outcomes and sustainability of LAI CAB/RPV used in clinical care by AYHIV.

## THPEB110

Protease inhibitor stock-out in Sub Saharan Africa: real-world implications of single-drug substitutions to dolutegravir in treatment experienced clients

S. Perry<sup>1,2</sup>, J. Petrus<sup>1,2</sup>, M. Abadie<sup>1,2</sup>, A. Seegar<sup>3</sup>, C. Nyapokoto<sup>4</sup>, N. Mthethwa<sup>4</sup>, S. Dlamini<sup>1,2</sup>, F. Anabwani-Richter<sup>2</sup>, A. Kay<sup>3,2</sup>  
<sup>1</sup>Baylor College of Medicine, Pediatrics/Texas Children's Global Health, Houston, United States, <sup>2</sup>Baylor Children's Foundation Eswatini, Mbabane, Eswatini, <sup>3</sup>Baylor College of Medicine, Pediatrics/Global TB, Houston, United States, <sup>4</sup>Eswatini National AIDS Program (SNAP), Mbabane, Eswatini

**Background:** In October 2020, the Eswatini National AIDS Program (SNAP) faced a complete Protease Inhibitor (PI) stock-out. Those suppressed ( $< 1000$  copies/ml) on a PI were substituted to dolutegravir (DTG). The long-term outcomes of treatment experienced clients on PIs, following single drug DTG substitutions is uncertain.

This abstract follows rates of viral detection ( $\geq 50$  copies/ml) and non-suppression ( $\geq 1000$  copies/ml) over 96-weeks.

**Methods:** Data was abstracted from the electronic medical record in all clients on second-line, PI-based, antiretroviral therapy (ART) registered at Baylor Children's Foundation-Eswatini who had a single drug substitution of DTG for a PI (N = 450). Time to event analysis to detect risk factors for viral detection after substitution was performed with Cox regression modeling.

Overall viral suppression at 48 and 96 weeks, in clients maintained on DTG, was evaluated descriptively and risk factors for non-suppression after those thresholds were assessed by logistic regression.

**Results:** The median age at time of DTG substitution was 22 (IQR 16, 33) years, 57% (259/450) were female, and 13% (60/450) had a CD4 of  $< 200$  cells/ml. All had viral suppression at substitution and 393/450 (87.3%) were undetectable.

Multivariate cox regression analysis demonstrated a reduced risk of a detectable viral load in adults (HR 0.57, 95% CI 0.37, 0.88), with tenofovir backbones (HR 0.61, 95%CI 0.41, 0.90), with undetectable VLs in the year prior to substitution (HR 0.43, 95%CI 0.29, 0.64), and an undetectable VL at DTG substitution (HR 0.45, 95%CI 0.28, 0.70). In cross-sectional analysis, among clients retained on DTG for over

48 weeks, 94% (95%CI 91, 96%) were suppressed and 85% (95%CI 81, 88%) were undetectable (n=408), these rates were unchanged at 96 weeks (n=383).

The only factors that predicted an unsuppressed viral load at both 48 and 96 weeks were low level viremia (VL 50-1000 copies/mL) at DTG substitution and being an adolescent or young adult (15-24 years).

**Conclusions:** 96-week VL suppression rates nearing UNAIDS targets can be achieved after DTG substitutions in many treatment-experienced clients. However, we have identified risk factors for viral non-suppression after one drug substitution that represent high-risk populations for treatment failure and future INSTI resistance.

## THPEB111

In the mismatch: viral suppression despite low tenofovir diphosphate in dried blood spots (DBS) in the multicenter AIDS cohort study/women's interagency HIV study combined cohort (MWCCS)

<sup>14</sup>Albert Einstein College of Medicine, Bronx, United States

**Background:** Tenofovir-diphosphate (TFV-DP) in DBS is an objective adherence measure predictive of future viremia in virally-suppressed persons with HIV (PWH) on TFV-based ART. Individuals with a viral load (VL):TFV-DP mismatch (suppressed HIV-1 RNA VL despite low TFV-DP concentrations) are at increased risk of future viremia and treatment failure. Black race, male sex, and high BMI were associated with lower TFV-DP concentrations after controlling for adherence in directly-observed therapy (DOT) trials, but VL:TFV-DP mismatch rates in real-world settings are unknown.

**Methods:** DBS samples were obtained from MWCCS-enrolled PWH receiving tenofovir alafenamide (TAF)-based ART. TFV-DP was quantified using validated LC-MS/MS.

Mismatch was defined as having VL<200 cps/mL and TFV-DP<1800 fmol/punches, the latter conservative threshold based on a previous DOT study in PWH and ≥85% adherence (NCT04065347).

**Results:** DBS was measured in a 356-sample subset of mostly female (71%) PWH receiving TAF for ≥3 months and median age 54 [47, 61] (Figure 1).

TFV-DP in DBS for VL<200 cps/mL and VL≥200 cps/mL was 1989 [1274, 2974] and 264 [54, 597] fmol/punches, respectively. No participant experienced VL≥200 cps/mL and TFV-DP>1800 fmol/punches (Figure 2).

The mismatch rate was 44%/37% for females/males with rates of 46%/58%, 51%/48%, 36%/33%, and 41%/33% for those with black race, BMI>30 kg/m<sup>2</sup>, INSTI-based ART, and self-reported adherence ≥95%, respectively.

	Female		Male	
	Mismatch (n = 111)	No mismatch (n = 143)	Mismatch (n = 30)	No mismatch (n = 64)
Age at visit (years)	51 (47-62)	57 (52-63)	58 (57-67)	55 (44-66)
Race (2010 NIH definition)				
Black/African American	83 (74.8%)	98 (68.5%)	23 (60.5%)	87 (56.6%)
White/Caucasian	5 (4.5%)	65 (45.5%)	19 (50.3%)	37 (57.8%)
All other	23 (20.7%)	29 (20.3%)	4 (10.5%)	89 (56.6%)
Body mass index				
≥ 30 kg/m <sup>2</sup>	73 (65.8%)	70 (49%)	16 (42.1%)	87 (56.6%)
CD4+ helper cells (per mm <sup>3</sup> )	811 (567-1017)	693 (472-916)	754 (564-912)	700 (454-887)

BoostedPI/Medicaid	36 (32.2%)	27 (18.9%)	19 (48.7%)	11 (17.2%)
Other	0 (0%)	1 (0.7%)	0 (0%)	0 (0%)
Adherence (past 6 months)				
95-100%	90 (81.1%)	127 (88.8%)	29 (74.6%)	59 (92.2%)
75-94%	17 (15.3%)	9 (6.3%)	7 (17.5%)	4 (6.2%)
< 75%	3 (2.7%)	4 (2.8%)	1 (2.6%)	1 (1.6%)

Note: Missing values - race 1 (0.3%), body mass index 17 (4.8%), CD4+ cells 3 (0.8%), adherence 4 (1.1%).

Figure 1.

Figure 2.

**Conclusions:** VL:TFV-DP mismatch may identify individuals requiring an adherence intervention to prevent future viremia and treatment failure. Using a conservative PK-based TFV-DP threshold, we observed a high rate of mismatch. Future studies to establish an optimal clinically relevant threshold are required.

### Assessing mental health in youth with successfully treated perinatal HIV in southern India: insights from the I'mPossible Fellowship Program

B. Seenappa<sup>1</sup>, A. Sharma<sup>2</sup>, M. Raj<sup>1</sup>, S. Rajanna<sup>1</sup>, P. Laxmikanth<sup>1</sup>, S. Sannigrahi<sup>3</sup>, K. Filian<sup>3</sup>, E. Nobbay<sup>4</sup>, L. Ganapathi<sup>2</sup>, A. Shet<sup>3</sup>

<sup>1</sup>RISHI Foundation, Program, Bangalore, India, <sup>2</sup>Harvard Medical School, Division of Pediatric Global Health, Boston, United States, <sup>3</sup>Johns Hopkins Bloomberg School of Public Health, Department of International Health, Baltimore, United States, <sup>4</sup>Father Muller Medical College Hospital, Mangalore, India

**Background:** Despite literature indicating the high risk of mental health disorders among adolescents and young adults (AYA) with HIV, robust studies are limited in India. We screened for the prevalence of depression, generalized anxiety disorder (GAD), and experiences of stigma among participants of the I'mPossible Fellowship, a peer-led mentorship intervention in India empowering AYA with HIV through a comprehensive approach to health and psychosocial support, education, and vocational training.

**Methods:** Between March-June 2023, (approximately 1 year after the I'mPossible intervention rollout), 185 AYA with perinatally-acquired HIV were enrolled across 5 districts in the southern Indian state of Karnataka. Incorporating principles of community-based participatory research, peer mentors administered screening tools for depression (PHQ-9), and anxiety (GAD-7), and an abbreviated 4-item HIV Stigma Scale to participants.

**Results:** Participants' mean age was 18.6 years (SD 3.5y), and 117 (63.2%) identified as male. 91.9% experienced the loss of one or both parents in early childhood, and 43.2% lived in group care homes. Their mean ART duration was 9.7 years (SD 4.0y). Notably, 90.4% were virally suppressed (VL<150). A high proportion exhibited positive screens for at least one mental health condition (62.7%), depression alone (25.9%), anxiety alone (7%), or both conditions (29.7%).

Prevalence of perceived stigma, including disclosure concerns (81.1%) and worries about public attitudes (74.6%), was high. In the multivariate regression models, orphan status (loss of both parents) was linked to increased odds of a positive GAD screen (aOR 2.10, 95%CI 1.07-4.09).

**Conclusions:** The high prevalence of positive screens for depression and anxiety among AYA with HIV in India, despite high viral suppression, necessitates the incorporation of mental health interventions to promote sustained HIV care retention. Integration of mental health interventions into existing peer-support models can enhance AYA's overall health, and contribute towards achieving the global targets to end the HIV epidemic.

### Prevalence of depression and Suicidal Ideation among adolescents living with HIV on antiretroviral therapy in Kenya and Tanzania

P.A. Agaba<sup>1,2</sup>, I. Tsikhutsu<sup>3,4</sup>, E. Bahemana<sup>5</sup>, N. Dear<sup>1,2</sup>, S.A. Khamadi<sup>5</sup>, P. Desai<sup>1,2</sup>, R. Mrina<sup>1,2</sup>, A. Onovo<sup>1,2</sup>, T. Mebrahtu<sup>1,2</sup>, S. Schech<sup>1,2</sup>, E.H. Lee<sup>6</sup>, P.W. Hickey<sup>6</sup>

<sup>1</sup>The Henry M. Jackson Foundation for the Advancement of Military Medicine, Inc., Bethesda, United States, <sup>2</sup>U.S. Military HIV Research Program, CIDR, Walter Reed Army Institute of Research, Silver Spring, United States, <sup>3</sup>HJF Medical Research International, Kericho, Kenya, <sup>4</sup>U.S. Military HIV Research Program, Walter Reed Army Institute of Research-Africa, Nairobi, Kenya, <sup>5</sup>HJF Medical Research International, Mbeya, Tanzania, the United Republic of, <sup>6</sup>The Uniformed Services University of the Health Sciences, Bethesda, United States

**Background:** Depression and suicidal ideation (SI) are important comorbidities among adolescents living with HIV (ALHIV) and have been associated with poor quality of life, suboptimal adherence to antiretroviral therapy (ART) and treatment discontinuation.

We sought to determine the prevalence of depression and SI and explore associated risk factors among ALHIV receiving ART in Kenya and Tanzania.

**Methods:** This analyses pooled data from a larger cross-sectional study and includes ALHIV (10-19 years) on ART for  $\geq 6$  months at 27 PEPFAR-supported clinics in the U.S. Military HIV Research Program in Kenya and Tanzania between 2018-2022. Patient Health Questionnaire (PHQ)-9 was used to assess the presence (score  $\geq 5$ ) and severity of depression. PHQ item #9 was used to assess risk for SI and thoughts of self-harm. Any response  $>0$  to item #9 was considered a positive screen for SI. Multivariate logistic regression was used to identify correlates of depression and SI.

**Results:** Among 1,135 ALHIV, 617 (54.4%) were aged 10-14 years, 592 (52.1%) were females, 647 (57.0%) were Kenyans, 1049 (92.4%) had been on ART for  $>24$  months and 929 (81.9%) were virally suppressed ( $<1000$ copies/mL). Moderate to severe depression was present in 21 (1.9%, 95% CI: 1.21-2.81%) and 6 (0.53%, 95% CI: 0.24-1.15%) had SI or thoughts of self-harm.

In multivariate analysis, ALHIV aged 15-19 years, compared to 10-14 years, and those missing  $\geq 3$  ART doses in the past month, compared to no missed doses, had higher odds of depression: aOR 2.67 (95% CI: 1.00-7.06;  $p=0.04$ ) and aOR 3.47 (95% CI: 1.08-11.07;  $p=0.03$ ), respectively.

Similarly, ALHIV missing  $\geq 3$  ART doses in the past month, compared to no missed doses, had higher odds of SI (aOR 7.47, 95% CI: 1.17-47.6;  $p=0.03$ ), while having no malnutrition, compared to moderate/severe malnutrition, was inversely associated with SI (aOR 0.16, 95% CI: 0.02-0.93;  $p=0.04$ ).

**Conclusions:** In this ART-experienced cohort of ALHIV, we found low prevalence of depression and SI. Older adolescence, missing doses of ART, and nutritional status were

associated with depression and SI. ALHIV with adherence challenges should be screened for depression and other mental health challenges and referred for additional support and treatment to optimize their health and well-being.

## THPEB114

### Exploring phenotypes of neurocognitive impairment and risk in Ugandan adolescents with perinatally acquired HIV (PHIV)

C. Kirsch<sup>1</sup>, M. Tan<sup>1</sup>, D. Tsapalas<sup>1</sup>, C.M. Ferraris<sup>1</sup>, J.L. Gumikiriza-Onoria<sup>2</sup>, A. Nanteza<sup>3</sup>, M. Nguyen<sup>4</sup>, J. Liu<sup>1</sup>, C. Dolezal<sup>1</sup>, V. Musiime<sup>5</sup>, S. Dirajlal-Fargo<sup>6</sup>, R.N. Robbins<sup>1</sup>  
<sup>1</sup>HIV Center for Clinical and Behavioral Studies at the New York State Psychiatric Institute and Columbia University, New York, United States, <sup>2</sup>Makerere University College of Health Sciences, School of Medicine, Department of Psychiatry, Kampala, Uganda, <sup>3</sup>Butabika National Referral Mental Hospital, Kampala, Uganda, <sup>4</sup>Fordham University, New York, United States, <sup>5</sup>The Joint Clinical Research Centre, Kampala, Uganda, <sup>6</sup>Ann & Robert H. Lurie Children's Hospital of Chicago, Division of Infectious Diseases, Chicago, United States

**Background:** Neurocognitive impairment (NCI) in adolescents with virally-suppressed PHIV is not well understood due to its heterogeneity (i.e., domains of NCI differ across adolescents) and numerous HIV (e.g., ART timing and legacy effects) and non-HIV (e.g., trauma and poverty) risk factors.

Differentiating unique NCI phenotypes may help identify the most salient risk factors for adolescents with NCI. We examined NCI phenotypes and risk factors in a sample of Ugandan adolescents with PHIV (APHIV).

**Methods:** K-means clustering across 12 neurocognitive tests of motor speed, working memory, learning, memory, attention, processing speed, and executive functioning among 48 virally-suppressed Ugandan APHIV (Mage = 16.16 years, SD = 2.07; male = 52%) was conducted. Sociodemographic (i.e., extreme poverty, hunger, low education), HIV (i.e., age at ART initiation, nadir CD4 count), and psychosocial (i.e., depressive symptoms, adverse experiences) risk factors were compared across clusters.

**Results:** Three clusters/phenotypes were identified: (1) No NCI ( $n = 17$ ), (2) Motor speed NCI ( $n = 19$ ), and (3) Multi-domain NCI (i.e., impairment in all domains except motor speed;  $n = 12$ ). Phenotypes did not differ by age or gender, however, they did differ by mean years of education ( $p = .017$ ); phenotype (1)'s mean was consistent with age-expected years in school, whereas phenotypes (2) and (3) were 2-3 years behind expectation.

There were no differences across phenotypes in poverty, HIV, and psychosocial factors, though there was a trend towards phenotype (2) experiencing more hunger ( $p = .08$ ).

**Conclusions:** Distinct neurocognitive phenotypes may exist in APHIV which may be driven by different combinations of risk factors. Less education may be a risk factor for and/or result of NCI.

Further research is needed to validate these phenotypes and their risk factors in larger samples. This knowledge may inform targeted interventions for NCI, such as educational support or food assistance.

## THPEB115

**Virologic outcome and retention in care among people with low-level viremia during antiretroviral treatment in Ethiopia: a retrospective cohort study**

I.J. Abdulahi<sup>1,2</sup>, P. Bjorkman<sup>1,3</sup>, A. Reepalu<sup>1,3</sup>, P. Medstrand<sup>1</sup>, A. Abdissa<sup>4</sup>, O. Elvstam<sup>1,5</sup>

<sup>1</sup>Lund University, Department of Translational Medicine, Malmö, Sweden, <sup>2</sup>Lund University, Agenda 2030 Graduate School, Lund, Sweden, <sup>3</sup>Skåne University Hospital, Department of Infectious Diseases, Malmö, Sweden, <sup>4</sup>Armauer Hansen Research Institute, Addis Ababa, Ethiopia, <sup>5</sup>Växjö Central Hospital, Department of Infectious Diseases, Växjö, Sweden

**Background:** A proportion of people with HIV (PWH) receiving antiretroviral treatment (ART) have detectable HIV RNA in plasma below the threshold commonly used to define virologic failure, a condition called low-level viremia (LLV). Previous studies, mainly from high-income countries, have found LLV to be associated with inferior treatment outcome.

We explored the association between LLV and unfavourable treatment outcome in an Ethiopian setting with recent rollout of Dolutegravir.

**Methods:** We categorized PWH receiving ART at public health facilities with  $\geq 1$  available viral load (VL) result June 2019-June 2020 for viremia status. PWH with virologic non-suppression (VL  $>1000$  copies/mL) during study inclusion were excluded. We assessed incidence of virologic non-suppression (VL  $>1000$  copies/mL on 1 occasion) and non-retention in care (death or loss to follow-up) during three years after initial viremia categorization, comparing participants with LLV (VL 151-1000 copies/mL) and par-

ticipants with virologic suppression (VL  $\leq 150$  copies/mL), using multivariable logistic regression adjusting for age, sex, ART regimen, type of health facility, and duration of ART before study inclusion.

**Results:** Among 18,152 persons receiving ART, VL results were available from 12,524 (69%). Among 12,165 ART recipients with documented VL  $\leq 1000$  copies/mL, 206 (1.7%) had LLV and 11,959 (98.3%) had virologic suppression. The majority (64.2%) of participants were female. The average duration of ART before study inclusion was 7.9 years. Most participants (89%) received tenofovir/lamivudine/dolutegravir at the time of inclusion.

Over three years of follow-up, 264 (2.2%) of virologically suppressed and 22 (11.3%) with LLV had virologic non-suppression. LLV was associated with both virologic non-suppression (adjusted odds ratio [AOR] 3.7; 95% confidence interval [95% CI] 2.2-6.2) and non-retention in care (AOR 3.4; 95% CI 1.7-6.6).

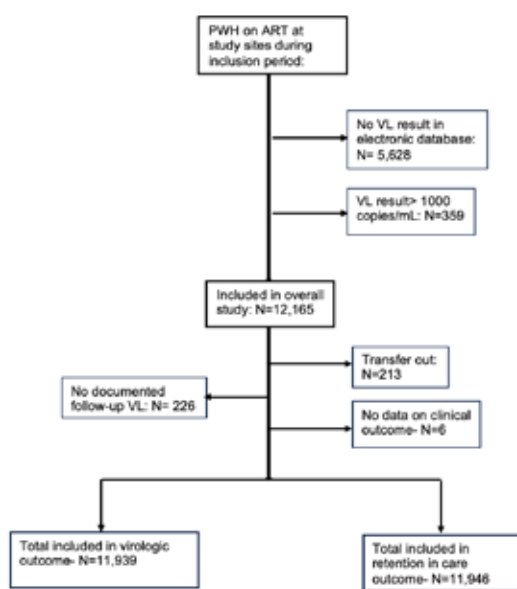

Figure 1. Flow chart of study inclusion and exclusion. Abbreviations: PWH, People with HIV; ART, antiretroviral therapy; VL, Viral load.

**Conclusions:** Among PWH receiving ART at Ethiopian facilities, LLV was associated with inferior virologic outcome and retention in care. LLV may serve as a predictor for adverse ART outcomes.

## THPEB116

**Improving viral suppression among adolescents Kenya through target peer led groups at a rural facility in Homabay**

W.A. Oluoch<sup>1</sup>, C. Okal<sup>1</sup>

<sup>1</sup>Ministry of Health, Health Sciences, Homabay, Kenya

**Background:** Kenya has an estimated 180,000 adolescents living with HIV (ALH) and a suppression of 63% Homa Bay County which has the highest national HIV prevalence of 19.6% has 54,000 AYPs and a viral suppres-

sion of 59% among AYP according to NACC estimates 2022. This is much lower compared to other ages. Group therapies and interpersonal psychotherapy have been documented to help address mental challenges affecting adherence.

Nyagoro health centre has 86 adolescent on ART. Viral suppression and retention was at 76% and 80% respectively in 2021. We implemented a group and interpersonal psychotherapies to address adherence issues.

**Methods:** We implemented a CQI project at Nyagoro Health Centre to address viral suppression. Some of the root causes of poor adherences identified were schooling schedule, violence, sibling squabbles, communication problems between them and their parents and non-disclosure. We held group and interpersonal psychotherapies with the adolescents. The clinic had groups of 10 adolescents meeting in a 30 - 45 minute session. The group's sessions involve sharing of experiences and concerns and coming up with solutions to support clients. The groups also employed a treatment buddy system. Some more personal issues were addressed through one to one session with adherence counselors.

**Results:** We formed 9 groups and each group had 1 Mentor and 10 adolescents. The mentor would identify key issues raised by the adolescents and then they as a group find the solutions alone. Some of the issues included: roles disputes, interpersonal shortcomings, life stage transitions, relational conflict, grief, and other attachment issues or loss. The viral suppression for the adolescents in the groups is at 89% by June 2023 from a previous 76% in 2021. Retention has also improved to 90% from a previous 80% in 2021.

**Conclusions:** Mentor led groups are a sustainable and effective in addressing adherences challenges amongst adolescents and young people.

6, and 18 months. Brain ultrasound was performed in all newborns at birth to rule out central nervous system abnormalities.

**Results:** The study population includes 568 HIV-exposed uninfected children born between November 2000 and September 2022 and followed up at the Pediatric Infectious Diseases unit of Luigi Sacco Hospital (Milan, Italy). At birth, neuropsychiatric abnormalities were present in 12% of assessed children, and they appeared to be gradually decreasing across time reaching the minimal frequency of 2,3% at 12 months. Most of these newborns had normal neuropsychiatric assessments in the following months, indeed.

We tried to study the effect of four antiretroviral drugs, dolutegravir, efavirenz, atazanavir, and didanosine, which are known to have more impact on neurodevelopment. Exposure to atazanavir occurred in 77 subjects, and an increased proportion of neurodevelopmental abnormalities (50% vs 18,9 % without atazanavir) was found at assessments after 12 months.

The number of children exposed to atazanavir during pregnancy who underwent neurodevelopmental assessments after 12 months of age was little (only 8 children), but, importantly, neurodevelopmental abnormalities in this group were all related to language impairment.

**Conclusions:** This work comprehensively describes outcomes and complications in a group of HEU children born between the years 2000 and 2022.

Given these initial results, more focus should be put on HEU children; large prospective studies monitoring over time specific neurodevelopmental disorders using clinical neuropsychiatric assessments and general neurologic development and cognitive functioning using more precise scoring systems should be put in place.

## THPEB117

### 20-year review of neurological outcomes in HIV-exposed uninfected children in a pediatric HIV referral center

M. Stracuzzi<sup>1</sup>, F. Musto<sup>1</sup>, C. Coppola<sup>1</sup>, A. Cargnelutti<sup>1</sup>, G. Meraviglia<sup>1</sup>, A. Dighera<sup>1</sup>, V. Giacometti<sup>1</sup>

<sup>1</sup>Università degli studi di Milano, Luigi Sacco Hospital, Pediatric Infectious Diseases, Milan, Italy

**Background:** Children born to HIV-infected mothers have unique and potentially dangerous exposures during pregnancy. HEU children vary in terms of exposure to both HIV and ART. We therefore performed a retrospective study to describe neurological outcomes of children who were exposed to HIV during pregnancy.

**Methods:** Participants included in the study were all children born to HIV-positive mothers. Child neuropsychiatry assessments were routinely performed to all children at birth, 3, and 12 months, with some additional visits at 1,

### THPEB118

Characteristics and management of tuberculosis preventive therapy (TPT) among new clients receiving ART at lighthouse supported clinics in Lilongwe, Malawi

P.P. Tembo<sup>1,2</sup>, A.G. Kudzala<sup>1</sup>, S. Mfungwe<sup>1</sup>, T. Satumba<sup>1</sup>, A. Thawani<sup>1</sup>

<sup>1</sup>Lighthouse Trust, Lilongwe, Malawi, Monitoring, Evaluation and Research, Lilongwe, Malawi, <sup>2</sup>Kamuzu University of Health Sciences, Department of Community and Environmental Health, Blantyre, Malawi

**Background:** Tuberculosis (TB) is the leading cause of mortality and morbidity in HIV positive individuals. HIV positive clients have a high risk of developing active Tuberculosis (TB), however, TB prevention therapy (TPT) significantly reduces the risk of developing active TB in HIV positive individuals.

We aimed to describe the characteristics and outcomes of clients newly enrolled on TPT and ART at ten Lighthouse supported clinics in Lilongwe, Malawi using program data after scaling up TPT nationwide.

**Description:** This was a retrospective cohort analysis conducted between October 2022 and September 2023. Data from program was abstracted from TPT medical record registers and treatment cards from ten Lighthouse supported clinics in Lilongwe, Malawi. Demographic characteristics, TB screening, TPT initiation, and completion rates of TPT were assessed using descriptive statistics conducted in STATA 18.

**Lessons learned:** The study included 4335 clients enrolled on ART at ten Lighthouse supported clinics with mean age of 32±11 years and 61% (2648) females. They were 3782 (87%) clients screened TB negative and 3006 (79%) were eligible for TPT initiation. A total of 2940 (98%) eligible clients were started on TPT. A total of 2307 (79%) were expected to complete TPT and 1756 (76%) completed. The common reasons for ineligibility were Confirmed TB or on TB treatment 257 (6%) and 854 (20%) were pregnant or <3 months postpartum.

However, the major reasons for clients not completing TPT included development of active TB 19 (0.6%), 247 (8%) were lost to follow-up, 318 (11%) were transferred out and 5 (0.2%) had adverse reactions. The best practice implemented was that every new ART client newly initiated on ART and TPT were being contacted by short messaging services (SMS) and phone calls three days before and after missing an appointment.

Complete documentation also helped to track presumptive TB cases to properly follow them whether were eligible for TPT or TB treatment. There were less than 1% who developed active TB during the course of TPT period.

**Conclusions/Next steps:** The program data showed that TPT reduced development of active TB among new clients initiated on ART.

Understanding the factors influencing TPT initiation, adherence, and completion rates is vital in optimizing TB prevention strategies among person living with HIV.

### THPEB119

Low-level viremia leads to increased risk for virologic failure in children and adolescents living with HIV on antiretroviral therapy in sub-Saharan Africa (CLOVES): a multicenter, retrospective cohort study

K.P. McKenzie<sup>1,2,3</sup>, D.T. Nguyen<sup>4</sup>, M. Chodota<sup>3</sup>, A. Kayabu<sup>5</sup>, B. Mayalla<sup>3</sup>

<sup>1</sup>Baylor College of Medicine, Houston, United States,

Tanzania, the United Republic of, <sup>4</sup>Baylor College of

Medicine, Department of Pediatrics, Houston,

United States, <sup>5</sup>Baylor College of Medicine Children's

Foundation - Tanzania, Mwanza, Tanzania, the United

Republic of

**Background:** Viral load (VL) of 1000 copies/mL marks the cutoff for defining virologic failure (VF) in children and adolescents living with HIV (CALHIV) in many low and middle-income countries.

However, evidence in adults suggests that low-level viremia (LLV), or VL between 50-999 copies/mL, increases risk of later VF. There are fewer studies that address LLV in CALHIV.

**Methods:** A retrospective chart review was performed on data collected from October 2004 to December 2022 from the Baylor College of Medicine Children's Foundation - Tanzania sites in Mbeya and Mwanza. CALHIV (0-19 years of age) on antiretroviral therapy (ART) for ≥6 months with at least one VL <50 copies/mL plus ≥2 subsequent VLs were included. Data analysis was performed with two VF categories, VL ≥1000 copies/mL and ≥200 copies/mL.

Multivariable Cox regression modeling was performed to evaluate the association between LLV and VF; hazard ratios (HR) with 95% confidence intervals (CI) are presented.

**Results:** A total of 2618 CALHIV were included in the outcome analysis with a median age of 13.2 (IQR 9.7, 16.7), and 52.5% were female.

Most participants (81.9%) were on 1<sup>st</sup> line dolutegravir (DTG)-based regimens. LLV was found in 40.5%. When defining VF as ≥1000 copies/mL, those with a history of LLV had a HR of 1.63 (1.38, 1.91) for VF.

When stratifying by LLV (50-199, 200-399, and 400-999), all levels were associated with an increased risk for VF with HR of 1.39 (1.13, 1.69), 1.69 (1.33, 2.16), and 2.03 (1.63, 2.53), respec-

tively. When defining VF as  $\geq 200$  copies/mL, HRs for VF rose to 3.85 (3.33, 4.46) for any LLV and 1.41 (1.15, 1.72), 7.99 (6.68, 9.57), and 9.37 (7.85, 11.18) for LLV of 50-199, 200-399, and 400-999, respectively.

Figure 1. Kaplan-Meier plot showing incidence of virologic failure (VL  $\geq 1000$  copies/mL) by low-level viremia category.

**Conclusions:** LLV in CALHIV is associated with a greater risk of VF that increases with higher levels of LLV.

## THPEB120

In utero exposure to atazanavir-based antiretroviral regimens in a mouse model shows differential long-term motor and cognitive deficits dependent on the NRTI-backbone

S. Dhume<sup>1</sup>, K. Balogun<sup>2</sup>, A. Sarkar<sup>1</sup>, S. Acosta<sup>1</sup>, H. Mount<sup>3</sup>, L. Cahill<sup>4</sup>, J. Sled<sup>3</sup>, L. Serghides<sup>1</sup>

<sup>1</sup>University Health Network, Toronto, Canada, <sup>2</sup>Montefiore Medical Center and Albert Einstein College of Medicine, New York, United States, <sup>3</sup>University of Toronto, Toronto, Canada, <sup>4</sup>Memorial University, St. John's, Canada

**Background:** Combination antiretroviral therapy (ART) use in pregnancy has been pivotal in improving maternal health and reducing perinatal HIV transmission. However, children born HIV exposed uninfected fall behind their unexposed peers in several areas including neurodevelopment. The contribution of in utero ART exposure to these deficits is not clear. Here we present our findings of neurocognitive outcomes in adult mice exposed in utero to ART.

**Methods:** Dams were treated with a combination of ritonavir-boosted atazanavir with either abacavir plus lamivudine (ABC/3TC+ATV/r) or tenofovir disoproxil fumarate plus emtricitabine (TDF/FTC+ATV/r), or water as a control, administered daily from day of plug detection to birth. Offspring underwent a battery of behavioral tests that investigated motor performance and cognition starting at 6-weeks of age and ending at 8 months. Changes in brain structure were assessed using magnetic resonance imaging and immunohistochemistry. Expression of genes involved in neural circuitry and synaptic transmission were assessed in the hippocampus, a region strongly associated with memory formation, using qPCR.

**Results:** Pups exposed to TDF/FTC+ATV/r showed in-

creased motor activity and exploratory drive, and deficits in hippocampal-dependent working memory and social interaction, while pups exposed to ABC/3TC+ATV/r showed increasing grooming, and deficits in working memory and in female pups social interaction. Significant volumetric changes in the brain were seen only in the ABC/3TC+ATV/r group and were associated with reduced neuronal counts in the hippocampus. Altered neurotransmitter receptor mRNA expression as well as changes in expression of the neurotrophic factor BDNF and its receptors were observed in both ART-exposed groups in a sex-dependent manner.

**Conclusions:** In our murine model, in utero ART exposure had long-term effects on brain development and cognitive and motor outcomes in adulthood. Our data show that neurological outcomes can be influenced by the type of nucleoside reverse transcriptase inhibitor backbone of the regimen and not just the base drug, and display sex differences.

## THPEB121

Early childhood growth outcomes in periurban South Africa: unravelling the complex interplay of exposure to maternal HIV as well as placental insufficiency

H. Muloi<sup>1,2</sup>, F. Wenhold<sup>3,2</sup>, S. Nel<sup>3,2</sup>, U. Feucht<sup>1,2</sup>

<sup>1</sup>University of Pretoria, Paediatrics, Pretoria, South Africa,

<sup>2</sup>University of Pretoria, Research Centre for Maternal, Fetal, Newborn and Child Health Care Strategies, Pretoria, South Africa, <sup>3</sup>University of Pretoria, Human Nutrition, Pretoria, South Africa

**Background:** The first 1000 days of life lay the foundations for subsequent growth. This ambidirectional study, including prenatal, perinatal, and postnatal factors, aimed to identify exposure variables affecting body size and composition and corresponding Z-score outcomes in 18 month-old infants born to low-risk mothers in periurban South Africa. An estimated 30.0% of pregnant women in South Africa are living with HIV, with majority receiving antiretroviral therapy during pregnancy, hence their infants are HIV-exposed-but-uninfected, possibly resulting in poorer outcomes due to intrauterine exposure to maternal HIV infection, antiretroviral therapy, or both.

**Methods:** This study included 249 mother-infant pairs with anthropometry outcomes, and body composition outcomes available in 205 infants. Prenatal factors (maternal age, HIV status, anthropometry, parity, food insecurity, and umbilical artery resistance index Z-score (UmA-RIAZ) as a measure of placental function, whereby higher Uma-RIAZ indicates poorer placental function); perinatal outcomes (infant sex, gestational age, birth anthropometry); and postnatal factors (infant feeding) were included as exposure variables to examine their effect on infant anthropometry and body composition

outcomes at 18 months. Univariate analysis was used to investigate associations between exposure variables and infant outcomes, with variables with  $P < 0.05$  included in multivariate analyses.

**Results:** Twenty percent of study mothers were living with HIV, most were multiparous (73.9%), and 48.2% had low/very low household food security.

Multivariate analysis showed that maternal HIV infection and higher UmA-RIAZ predicted reduced 18-month infant length [-1.1cm (95%CI: -2.1,0.0) and -0.8cm (95%CI: -1.3,-0.3), respectively] and infant length-for-age Z-score [-0.38 (95%CI: -0.76,0.00) and -0.24 (95%CI: -0.42,-0.07), respectively]. Higher UmA-RIAZ also predicted lower birthweight [-0.11 (95%CI: -0.17,-0.04)] and birthweight-for-age Z-score [-0.23 (95%CI: -0.38,-0.08)]. Furthermore, household food insecurity predicted reduced infant fat-free mass-for-age Z-score at 18 months (-0.26: 95%CI: -0.51,-0.02).

**Conclusions:** Maternal HIV infection is one important factor in the first 1000 days of an infant's life that lays the foundations for subsequent growth. Additionally, infant anthropometry and body composition outcomes are greatly affected by other pre- and postnatal nutrition-related factors, such as placental insufficiency *in utero* and household food insecurity, with long-term consequences such as stunting, which impact the individual, future generations and society.

## THPEB122

*In utero exposure to HIV-1 increases cytomegalovirus (CMV) affliction and reduces binding capacity of antibodies to respiratory syntactical virus (RSV) in infants below 6 months in Yaounde, Cameroon*

F. Esemu Livo<sup>1,2,3</sup>, M.R. Ngamaleu<sup>3,4,5</sup>, R.B. Djounda<sup>1,3,4</sup>, M. Tsague<sup>4,1</sup>, H. Awanakam<sup>1,3,4</sup>, K. Tchamda<sup>4,1</sup>, M. Schmiedeberg<sup>6</sup>, E. Gutenkunst<sup>6</sup>, J. Bigoga<sup>3,4</sup>, R. Leke<sup>3</sup>, C. Kouanfack<sup>1</sup>, M. Besong<sup>3</sup>, K. Nganou-Makamdop<sup>6</sup>  
<sup>1</sup>Centre for Research on Emerging and Reemerging Diseases, Fundamental Virology Laboratory, Yaounde, Cameroon, <sup>2</sup>University of Buea, Biomedical Sciences, Buea, Cameroon, <sup>3</sup>University of Yaounde I, Biotechnology Centre, Yaounde, Cameroon, <sup>4</sup>University of Yaounde I, Biochemistry, Yaounde, Cameroon, <sup>5</sup>Catholic University of Central Africa, Immunology, Yaounde, Cameroon, <sup>6</sup>Universitätsklinikum Erlangen, Institute of Clinical and Molecular Virology, Erlangen, Germany

**Background:** The advent of the Prevention of Mother-to-Child Transmission (PMTCT) program has led to a growing population of HIV-exposed unafflicted (HEU) children. Although not afflicted, reports on the severity of affliction, affliction-related hospitalizations, vaccine response and death in HEU compared to HIV unexposed unafflicted (HUU) infants remain conflicting. In this study, we aim to determine the effects of *in utero* exposure to HIV in the

acquisition of transmissible childhood etiologies such as malaria, Rotavirus, Rhinovirus, Influenza A and B viruses, Respiratory syncytial virus (RSV), Cytomegalovirus (CMV), as well as their response to Tetanus toxoid (TT) and Hepatitis B (Hep-B) vaccines during their first six month of life.

**Methods:** We sampled 77 HEU and 45 HUU during their 3 (M3) and 6 months' (M6) routine vaccination visits. Malaria, Rotavirus, CMV, RSV, Rhinovirus, and Influenza A and B were diagnosed and quantified by real-time quantitative PCR. Exposure to RSV and response to Tetanus toxoid (TT) and Hepatitis B (Hep-B) vaccines were measured in samples in both groups at 6 months using Enzyme Linked Immuno-Sorbent Assay (ELISA).  $P < 0.05$  was considered significant.

**Results:** Although episodes of RSV, Influenza A and B as well as Rotaviruses were not diagnosed in these children, we found similar proportions of CMV (40% vs 40% M3; 55% vs 43% M6), malaria (0% vs 2% M3; 3% vs 2%) and rhinovirus (51% vs 59% M3; 36% vs 41% M6) infections between our HEU and HUU groups at both time points. HEU experienced a higher CMV viral load compared to HUU at M3 ( $P=0.04$ ) and M6( $P=0.01$ ). Even though RSV was not diagnosed in both groups, HEU children had RSV antibodies with a lower neutralizing capacity compared to HUU children ( $P=0.0065$ ). Response to TT and Hep-B vaccines were similar in both groups ( $P=0.08$  and  $P=0.38$  respectively).

**Conclusions:** This study depicts the need for persistent monitoring of transmissible etiologies and responses to childhood vaccines in HEU. The underlying causes of the increased susceptibility to CMV and poor response to RSV warrant further investigation.

## THPEB123

*Doubling up efforts to reduce vertical transmission(Emtct) at Entebbe Regional Referral Hospital, a six months' project*

A. Syson<sup>1</sup>, N. Jennipher<sup>1</sup>

<sup>1</sup>Entebbe Regional Referral Hospital, Community Health Department, Entebbe, Uganda

**Background:** Vertical transmission of HIV accounts for up to 18% of all new infections in Uganda and for up to 90% of infections among children. Current evidence shows that with effective interventions, including use of antiretroviral therapy, the rate of transmission could be reduced to less than 5% in a breastfeeding setting like in Uganda. At Entebbe Regional Referral Hospital, MOH/PEPFAR requires reduction of the transmission rate to  $< 2\%$ . However, in March 2023, our reports showed that vertical transmission rate was 15%. A quality improvement project was initiate to mitigate associated factors.

**Description:** Maternal Child Health meetings were held to identify and analyze the reasons for the high vertical transmission. File audits for the HIV positive babies were done and the team identified late ART initiation close to

delivery or in postnatal, delivery from home, nonadherence, inadequate maternal Retesting especially in Private Facilities, mixed feeding as the factors associated and agreed on improvement changes . A six months project was initiated. CME on EMTCT to all health workers in MNCAH was done.

A counselor was assigned to conduct weekly phone call health education and adherence support on newly initiated mothers on ART, late ANC/ post-natal care ART initiated mothers and those with non-suppressed viral load as mothers at high risk of vertical transmission.

A tester was assigned to ANC, Maternity, PNC, YCC(EPI) to identify all mothers due for retesting and timely identification of those who seroconvert for early intervention. Weekly performance review meetings were agreed on. community sensitization and support supervision to private facilities was done.

**Lessons learned:** The transmission rate reduced from 15% in March 2023 to 0% by 30th September 2023.

Adequate health education, adherence counselling, timely maternal Retesting, community sensitization, support supervision to lower facilities, safe obstetric practices can reduce the risk of vertical transmission.

Month	Transmission Rate(%)
March	15
April	0
May	0
June	4.17
July	0
August	0
September	0

**Conclusions/Next steps:** Virtual elimination can be achieved in Uganda as evidenced by rate of transmission reducing to 0% (< 5%) in a breastfeeding setting like in Entebbe.

## Clinical issues specific to key populations

### THPEB124

Efficacy and safety of B/F/TAF in Hispanic/Latine adults with HIV-1 initiating first-line therapy: 5-year follow-up from two Phase 3 studies

C. Martorell<sup>1</sup>, O. Osiyemi<sup>2</sup>, M. Berhe<sup>3</sup>, L. Santiago<sup>4</sup>, C. Rosero<sup>7</sup>, F. Fang<sup>7</sup>, N. Unger<sup>7</sup>, J.T. Hindman<sup>7</sup>, M. Ramgopal<sup>5</sup>  
<sup>1</sup>The Research Institute, Springfield, United States, <sup>2</sup>Triple O Research Institute, West Palm Beach, United States, <sup>3</sup>North Texas Infectious Diseases Consultants, Dallas, United States, <sup>4</sup>HOPE Clinical Research, San Juan, Puerto Rico, <sup>5</sup>Gilead Sciences, Inc., Foster City, United States, <sup>6</sup>Midway Immunology and Research Center, Fort Pierce, United States

**Background:** Hispanic/Latine people are disproportionately affected by HIV-1 and may have a greater risk of comorbidities compared with non-Hispanic/Latine people with HIV (PWH). However, this population has historically been underrepresented in HIV clinical studies.

Here we assess the efficacy and safety of first-line therapy with bicitgravir/emtricitabine/tenofovir alafenamide (B/F/TAF) over 5 years in Hispanic/Latine PWH.

**Methods:** Studies 1489 (NCT02607930; B/F/TAF vs. dolutegravir/abacavir/lamivudine [DTG/ABC/3TC]) and 1490 (NCT02607956; B/F/TAF vs. DTG+F/TAF) were randomized, double-blind, multicenter Phase 3 studies in adult PWH initiating first-line therapy.

We present a pooled analysis of participants who received B/F/TAF in the 144-week (W) randomization phase and in the 96W open-label extension.

Outcomes were compared between Hispanic/Latine and non-Hispanic/Latine participants. Baseline demographics and clinical characteristics, proportion of participants with HIV-1 RNA <50 copies/mL (missing=excluded), change in CD4 cell count, changes in metabolic parameters, adherence and treatment-emergent adverse events (TEAEs) are presented.

**Results:** In total, 155 (24.5%) Hispanic/Latine and 477 (75.5%) non-Hispanic/Latine participants (61.9% and 68.1% from the U.S., respectively) received B/F/TAF over 240W. At baseline, median age was 30 and 33 years, 89.0% and 89.1% were male at birth, 11.6% and 21.2% had HIV-1 RNA >100,000 copies/mL, 10.3% and 13.4% had CD4 <200 cells/μL, and 4.5%/12.9%/10.3% and 6.5%/16.4%/14.7% had a history of diabetes mellitus/hypertension/hyperlipidemia, respectively. Outcomes are shown in the Table. At W240, 100.0% of Hispanic/Latine participants and 98.1% of non-Hispanic/Latine participants had HIV-1 RNA <50 copies/mL. Change in CD4 count, changes in metabolic parameters including body weight and estimated glomerular filtration rate, adherence rate and TEAEs were similar between groups.

\*Baseline value was defined as the last non-missing value obtained on or prior to the first dose of B/TAF. \*\*By Cochran-Gaith equation. †Based on pill count for B/TAF only. ‡The denominator is the number of participants who returned at least one tablet and had calculable drug adherence. B/TAF, bicittegravir/emtricitabine/tenofovir; TC, total cholesterol; HDL, high-density lipoprotein; SD, standard deviation; TE, treatment-emergent; TEAE, treatment-emergent adverse event; Q, quartile.

Table. Outcomes at week 240.

**Conclusions:** Through 5 years of follow-up in Hispanic/Latine PWH, B/F/TAF maintained high rates of virologic suppression and was well tolerated, with similar metabolic (including treatment-emergent diabetes/hypertension) and safety outcomes compared with non-Hispanic/Latine PWH.

These results demonstrate the durability and safety of B/F/TAF in Hispanic/Latine PWH.

## THPEB125

Associations between sexual stigma, COVID-19 economic stressors, psychosocial syndemic conditions, and condom use among men who have sex with men in India

R. Nelson<sup>1</sup>, A. Sebastian<sup>2</sup>, J. Kaur<sup>3</sup>, M. Shunmugam<sup>1</sup>, J.G. Annamalai<sup>4</sup>, S. Kuppan<sup>4</sup>, S. Prasath<sup>4</sup>, V. Chakrapani<sup>1</sup>

<sup>1</sup>Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, <sup>2</sup>National Institute of Advanced Studies (NIAS), Bangalore, India, <sup>3</sup>Postgraduate Institute of Medical Education and Research (PGIMER), Chandigarh, India, <sup>4</sup>Sahodaran, Chennai, India

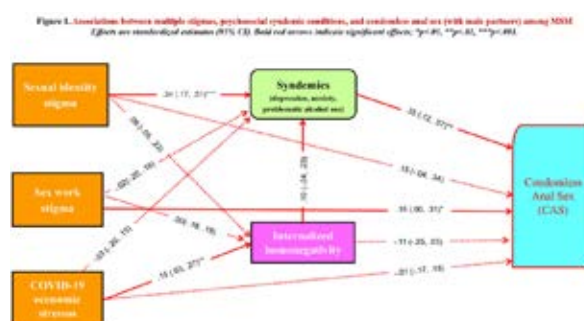

**Background:** Men who have sex with men (MSM) are at an elevated risk for HIV. Limited data show that sexual stigma and psychosocial problems are associated with HIV-related sexual risk behaviors among them. Amid COVID-19, we hypothesized that COVID-19 economic stressors could influence HIV risk as well. Using minority stress and syndemic theories, we explored whether sexual and sex work stigmas and COVID-19 economic stressors are associated with condomless anal sex (CAS) via psychosocial syndemics and internalised homonegativity (IHN).

**Methods:** We conducted mediational analyses in *Mplus*8 using cross-sectional survey data collected through hybrid-mode surveys (September-December 2022) among 250 MSM in South India. The binary outcome measure was CAS (past 2 months) with male partners.

Standardized scales were used to measure psychosocial conditions such as depression (PHQ-2), anxiety (GAD-2), and problematic alcohol use (AUDIT-C), and sexual and sex work stigmas. Covariates included were: education, marital status, and sexual identity.

**Results:** The participants' mean age was 29 years (SD 6.8). Nearly three-fifths (62%) had completed a college degree, 29% reported engagement in sex work, and 49% reported CAS. The prevalence of depression (past 2-week), anxiety (past 2-week), problematic alcohol use (past 3-month), and psychosocial syndemics (co-occurrence of two or more psychosocial conditions) was 19%, 55%, 12% and 22%, respectively. Significant direct effects were observed from sexual stigma to syndemics, syndemics to CAS, and COVID-19 economic stressors to IHN (Figure 1).

The total effect of sexual stigma on CAS was significant ( $\beta=.25$ ; 95% CI .08, .42;  $p=.004$ ), with syndemics as the significant mediator ( $\beta=.12$ ; 95% CI .02, .21;  $p=.02$ ).

**Conclusions:** Sexual stigma indirectly contribute to HIV risk through psychosocial syndemics. Strategies to reduce sexual stigma and address psychosocial syndemic conditions could reduce HIV risk among MSM. The role of economic stressors on mental health needs to be further explored.

## THPEB126

Switch to bicittegravir/emtricitabine/tenofovir alafenamide (B/F/TAF) among vulnerable people living with HIV: evidence for long-term efficacy

S. Yi<sup>1</sup>, B. Conway<sup>1</sup>, S. Beitari<sup>1</sup>

<sup>1</sup>Vancouver Infectious Diseases Center, Vancouver, Canada

**Background:** While multi-tablet antiretroviral (ARV) therapy combinations have proven effective historically, single tablet regimens (STRs) are associated with higher rates of sustained virological suppression and patient satisfaction.

This is especially true of STRs including unboosted integrase strand transfer inhibitors (INSTIs) with an increased barrier to resistance, better tolerability, and fewer drug interactions.

This may be particularly beneficial for marginalized patient populations, with challenges of decreased adherence (including unplanned treatment interruptions) and lower tolerance for side effects.

We have previously demonstrated sustained virologic suppression over 18 months among 41/43 HIV-infected active injection drug users following a switch of prior ARV therapy to the STR bicittegravir/emtricitabine/teno-

fovir alafenamide (B/F/TAF) in the setting of prior transient viremia. We sought to evaluate whether this benefit would be maintained over an additional 24 months of follow-up.

**Methods:** The inception cohort consisted of 43 individuals who were followed up after having received B/F/TAF for 18 months. They remained enrolled in a multi-disciplinary program, with B/F/TAF provided with enhanced adherence support, allowing daily observed therapy.

The end point of analysis was the rate of virologic suppression after an additional 24 months of follow up, for a total of 42 months after initiating B/F/TAF therapy.

**Results:** 43 subjects were included in this analysis: median age 54 (34–66) years, 11.1% female, 20% indigenous, 37.8% men who have sex with men, and all were active drug users, with 91.1% being fentanyl users. At 18 months of follow up, we noted median CD4 count 612 cells/mm<sup>3</sup>.

All 43 remained on B/F/TAF for the 24 months of follow up, with no long-term disengagement. 41/43 had maximal virologic suppression, including both participants with detectable HIV RNA at month 18.

Two cases of detectable HIV RNA (1520 & 3000 copies/mL) were documented at month 42. In both cases, virologic suppression was achieved after resumption of B/F/TAF.

**Conclusions:** Among a group HIV-infected injection drug users experiencing transient viremia, switching to B/F/TAF remains effective in the long-term. Its efficacy (even in the setting of its resumption after extended treatment interruptions) and its tolerability make it a particularly useful therapeutic option in this vulnerable population.

### Efficacy of Dolutegravir based single tablet regimen in people with HIV who inject drugs

E. Alvarez<sup>1</sup>, W. Tinago<sup>1</sup>, S. Savinelli<sup>2</sup>, A.G. Cotter<sup>3</sup>, T. McGinty<sup>3</sup>, E. Muldoon<sup>3</sup>, E. Feeney<sup>2</sup>, J.S. Lambert<sup>3</sup>, P. McGettrick<sup>1</sup>,

G. McCarthy<sup>4</sup>, J.M. Llibre<sup>5</sup>, P. Doran<sup>6</sup>, P.W. Mallon<sup>1</sup>

<sup>1</sup>University College Dublin, Centre for Experimental Pathogen Host Research, Dublin, Ireland, <sup>2</sup>St. Vincent's University Hospital, Department of Infectious Diseases, Dublin, Ireland, <sup>3</sup>Mater Misericordiae University Hospital, Department of Infectious Diseases, Dublin, Ireland, <sup>4</sup>Mater Misericordiae University Hospital, Department of Rheumatology, Dublin, Ireland, <sup>5</sup>University Hospital Germans Trias i Pujol, Department of Infectious Diseases, Barcelona, Spain, <sup>6</sup>University College Dublin, School of Medicine, Dublin, Ireland

**Background:** People with HIV who inject drugs (PWHID) often experience unscheduled antiretroviral therapy (ART) interruptions (USTI) and increasing risk of ART resistance but are underrepresented in clinical trials. Dolutegravir (DTG) has a high genetic barrier to resistance and is available as a single tablet regimen (STR) with abacavir

(ABC) and lamivudine (3TC). This study aims to assess the efficacy, tolerability of, and adherence to ABC/3TC/DTG in PWHID.

**Methods:** In a prospective, single-arm, open label 96-week trial, adult PWHID (injection drug use (IDU) as HIV acquisition risk or current/recent IDU), were switched to ABC/3TC/DTG STR and attended 11 study visits. Primary endpoints: percentage of participants with HIV viral load (VL) <40 copies/mL (cps/mL) and adherence as medication possession ratio (MPR) at week 48 (W48), USTI over 96 weeks and safety. MPR: total number of ART doses dispensed divided by the number of days between visits; MPR ≥0.8 considered adequate adherence. Intent to treat (ITT) analysis included participants who received ≥1 dose of ABC/3TC/DTG.

**Results:** Of 45 participants enrolled, 33 contributed to the analysis (8 screen failure, 4 lost after screening). All were Caucasian, 73% male, median (IQR) age 43 (40, 47) years. Active IDU was reported in 64% participants. Median (IQR) time since HIV diagnosis was 10 (4, 13) years. At baseline (BL), 94% were ART experienced (97% protease inhibitors) and 59% had VL<40 cps/mL. The proportion of participants with VL<40 cps/mL increased to 75% W48 (p=0.03) and persisted to W96 (82%). Of 59% suppressed at BL, 58% remained suppressed at W48 and 52% at W96. Of 41% not suppressed at BL, 16% became suppressed at W48 and 29% at W96.

Mean MPR over W48 was 0.84 (95%CI. 0.75, 0.93). USTI of a median (IQR) 12 (5, 33) weeks duration occurred in 20 (61%) participants, with 12 /15 who re-initiated ART achieving VL<40 cps/mL.

Of 25 (76%) participants reporting drug related AEs, 5 (15%) led to USTI. There were 13 SAE's reported of which only 1 (3%) was related to ABC/3TC/DTG.

**Conclusions:** In this trial of PWHID, switch to ABC/3TC/DTG STR improved rates of viral suppression, demonstrated adequate adherence and remained effective after USTI.

## THPEB128

### Prevalence and associated factors of depressive symptoms among travestis and transgender women in Rio de Janeiro, Brazil

Index

creased risk of depressive symptoms. This study assessed the prevalence of depressive symptoms and identified associated factors within this vulnerable population.

**Methods:** A cross-sectional analysis of the *Transcendendo* cohort (Jan 2015-Dec 2023) was conducted, utilizing base-line data from *travestis* and transgender women aged >18 in Rio de Janeiro, Brazil. Depressive symptoms were evaluated using the 10-item *Center for Epidemiologic Studies Depression* scale (CES-10) (cutoff=10). Factors associated with depressive symptoms were identified using stepwise logistic regression.

**Results:** 885 participants were included, with a median age of 29 (IQR:24-38). The majority identified as Black or Parda (74.34%) with secondary education (65.88%) and earned <\$200/month (59.77%) (**Table 1**). 89.4% screened positive for depressive symptoms, and 54.1% of them were living with HIV. Participants screening positive for depressive symptoms, compared to those screening negative, showed higher rates of chemsex in the previous six months (13.27%vs.3.19%), lifetime sexual assault (43.33%vs.29.79), and use of tobacco (58.03%vs.43.62%) and marijuana (46.17%vs.36.17%). Conversely, they had lower proportions of current gender-affirming hormone use (46.14%vs.60.64%) and stable partnerships (15.5%vs.26.09%) ( $p<0.03$  for all comparisons). Multivariable analysis revealed that chemsex ( $\alpha\text{OR}=4.23[95\%\text{CI}:1.53-17.55]$ ,  $p=0.016$ ) and sexual assault ( $\alpha\text{OR}=1.86[95\%\text{CI}:1.16-3.06]$ ,  $p=0.012$ ) increased the odds of depressive symptoms, while gender-affirming hormone use ( $\alpha\text{OR}=0.61[95\%\text{CI}:0.39-0.95]$ ,  $p=0.030$ ) and having a stable partner ( $\alpha\text{OR}=0.50[95\%\text{CI}:0.30-0.84]$ ,  $p=0.008$ ) reduced the odds. There was a nonsignificant association between depressive symptoms and HIV, tobacco, or marijuana use.

Characteristic	Overall (N=885)	No depressive symptoms (N=88)	Depressive symptoms (N=797)	p-value
Age (median, IQR)	29 (24-38)	30 (23-38)	29 (24-38)	0.8

No	298 (33.6%)	42 (47.7%)	256 (32.1%)	0.029
<1 month	390 (44.0%)	34 (38.6%)	356 (44.6%)	
1-12 months	197 (22.3%)	12 (13.6%)	185 (23.3%)	

IQR, Interquartile range; Income calculations in this study were based on a currency conversion rate of 1 US dollar (USD) being equivalent to 5 Brazilian Reals (R\$).

**Conclusions:** The study revealed a high prevalence of depressive symptoms among *travestis* and transgender women in Brazil, underscoring the necessity for tailored gender-specific care and expanded access to mental health services. These services should encompass com-

prehensive social support and adopt a harm reduction approach to substance use, addressing the challenges of this vulnerable community.

## THPEB129

Discrepancies among the self-reported symptoms versus laboratory-based diagnosis of STIs (active Syphilis/NG/CT) among female sex workers (FSW) in Jashore, Bangladesh

S. Islam Khan<sup>1</sup>, M. Reza<sup>1</sup>, Z.I. Khan<sup>1</sup>, S.D. Irfan<sup>1</sup>, M.N. Morshed Khan<sup>1</sup>, G. Sarwar<sup>1</sup>, M. Rahman<sup>1</sup>, M.S.A. Imran<sup>1</sup>, S.J. Hossain<sup>1</sup>, S. Sarker<sup>2</sup>, M. Alam<sup>2</sup>, M. Rahman<sup>2</sup>, AKMM. Rana<sup>1</sup>

<sup>1</sup>International Centre for Diarrhoeal Diseases Research, Bangladesh, Program for HIV and AIDS, Health Systems and Population Studies Division, Dhaka, Bangladesh,

<sup>2</sup>International Centre for Diarrhoeal Diseases Research, Bangladesh, Virology Laboratory, Infectious Diseases Division, Dhaka, Bangladesh

**Background:** STIs are a global public health concern affecting female sex workers (FSW). However, studies indicated that self-reported STI symptoms differ from lab diagnoses. This study aims to understand the prevalence and correlates of active Syphilis, Neisseria gonorrhoeae (NG), Chlamydia trachomatis (CT), and self-reported STI symptoms among FSW in Jashore, Bangladesh.

**Methods:** A cross-sectional survey was conducted via two-stage time-location sampling among 327 FSW in Jashore, Bangladesh from September 2022 to March 2023. Information on demographics, sexual behaviors, and STI symptoms were collected through face-to-face interviews. Cervical and blood samples were collected to detect STIs (active Syphilis/NG/CT). Bivariate and multivariate analyses explored the correlates of self-reported STI symptoms and lab-based diagnoses.

**Results:** Over the past year, 70.6% reported any STI symptoms, of whom only 16.0% were tested positive. The prevalence of any STI was 16.5%. Most FSW who reported symptoms were street-based (42.4%), aged 25-35 years (48.5%), sold sex for >6 years (42.4%), living with intimate partners (45.9%), 15-19 years old at first marriage (93.6%), had income ≤91 USD (66.7%), had non-transactional sex within a year (71.9%), used condoms during last transactional sex (68.4%), forced sex during their lifetime (32.5%), and during the last 12 months, reported forced sex (8.2%), physical violence (16.5%), drug-induced sex (20.8%), self-reported mental health problems (76.6%), suicidal attempts (37.7%) and self-harm attempts (18.6%). Reported STI symptoms were significantly associated with hotel-based sex work (AOR: 4.0, 95%CI: 1.4-11.4,  $p=0.010$ ), age 15-24 years (AOR: 3.3, 95%CI: 1.2-9.6,  $p=0.026$ ) or 25-35 years (AOR: 1.9, 95%CI: 1.1-3.4  $p=0.021$ ), first marital age ≥20 years (AOR: 5.5, 95%CI: 1.2-25.6,  $p=0.032$ ) and non-transactional sex (AOR: 2.1, 95%CI: 1.2-3.6,  $p=0.007$ ).

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author

**Conclusions:** The analysis showed that reported STI symptoms mostly did not align with lab diagnoses. Those who reported STI symptoms were more likely to be young, poor, sell sex on the streets, and possess several SRHR-related complexities. Self-reported STI symptoms were significantly associated with work settings, age (including onset of marriage), and having sex with non-transactional sex partners. Therefore, regular STI screening through laboratory diagnosis and appropriate STI management and prevention services need to be targeted and strengthened.

Intersection of chemsex, mental health, and substance use: findings from the Conectad@s study in Rio de Janeiro

C. Coutinho<sup>1</sup>, E. Jalil<sup>1</sup>, C. Jalil<sup>1</sup>, B. Hoagland<sup>1</sup>, S. Wagner Cardoso<sup>1</sup>, M. St Silva<sup>1</sup>, R. Sacarparo<sup>1</sup>, V. Veloso<sup>1</sup>, E. Wilson<sup>2</sup>, W. McFarland<sup>2</sup>, B. Grinsztejn<sup>1</sup>, T. S. Torres<sup>1</sup>, the Conectad@s Study Team

<sup>1</sup>Instituto Nacional de Infectologia Evandro Chagas, Rio de Janeiro, Brazil, <sup>2</sup>Center for Public Health Research, San Francisco Department of Public Health, San Francisco, United States

**Background:** The increasing prevalence of substance use and chemsex (sexualized drug use) among young (18-24 years) cis/trans men and nonbinary people assigned male sex at birth who have sex with men (YMSM) presents significant public health concerns. Chemsex is linked to condomless sex, increasing the risk for HIV or other sexually transmitted infections.

This study aimed to evaluate substance use and chemsex among YMSM and factors associated with chemsex.

**Methods:** The Conectad@s was a respondent-driven sampling study that enrolled YMSM in Rio de Janeiro/Brazil (November 2021–October 2022). We examined the prevalence of substance use (prior six months), chemsex (any substance use before/during sex, excluding tobacco and alcohol, in the previous three months) and the risk of problematic substance use (assessed by ASSIST).

A logistic regression model investigated potential associations with chemsex, adjusting for age, race, education, and income.

**Results:** Among 409 participants (median age: 21 years, 90.5% cis-MSM), 71.3% self-identified as Black/Pardo, 71.1% reported ≤USD240 monthly income per capita, and 9.8% were living with HIV. The majority (69.2%) reported recent substance use (other than alcohol/tobacco), with marijuana (64.8%), ecstasy (24.2%), inhalants (17.4%), and MDMA (14.4%) being the most reported. No participant reported the use of crack (or paste), and only four reported methamphetamine use. Overall, 37.2% reported engaging in chemsex (Figure). Factors associated with higher odds of chemsex were higher number of sexual partners

(aOR:1.03[95%CI:1.01-1.05], p-value:0.006), condomless receptive anal sex (aOR:2.16[95%CI:1.06-4.52], p-value:0.037), ever attempting suicide (aOR:1.86[95%CI:1.00-3.47], p-value:0.050), alcohol use before/during sex (aOR:3.68[95%CI:2.05-6.75], p-value:0.001), and moderate/high risk of substance use (aOR:22.55[95%CI:12.38-43.54], p-value:0.001).

	Descriptive Analysis				Adjusted Logistic Model		
	Overall (n=409)	No chemsex (n=297)	Chemsex (n=112)	p-value	aOR	95% CI	p-value
Age, years - Median (IQR)	21 (20-21)	21 (20-21)	21 (20-21)	0.808	1.00	0.96-1.03	0.204
Race (Black or Pardo [ref. white/Asian])	291 (71.1)	184 (71.7)	107 (95.4)	0.749	0.75	0.40-1.40	0.365
Schooling: Higher than secondary [ref. Secondary or lower]	247 (60.4)	155 (52.2)	92 (82.3)	0.004	0.59	0.35-0.97	0.032
Monthly per capita income: ≤1.50 (ref. >1.50)	290 (71.1)	190 (73.7)	100 (89.2)	0.007	0.55	0.30-0.98	0.032
Ever tested for HIV (%)	300 (73.4)	189 (63.6)	111 (98.2)	<0.001	1.03	1.01-1.05	0.006
N sexual partners - Median (IQR)	5 (1-11)	5 (1-11)	9 (4-15)	<0.001	1.03	1.01-1.05	0.006
Condomless receptive anal sex (%)	282 (69.1)	157 (52.5)	125 (111.4)	0.007	2.16	1.06-4.52	0.037
Ever attempted suicide (%)	182 (44.5)	51 (17.2)	131 (117.8)	0.002	1.86	1.00-3.47	0.050
Alcohol use before/during sex in prior 3 months (%)	250 (61.1)	128 (43.1)	122 (108.9)	<0.001	3.68	2.05-6.75	0.001
High risk of substance use (%)	181 (44.3)	117 (39.4)	64 (56.7)	0.002	22.55	12.38-43.54	0.001
Moderate/high risk for any drug (%)	282 (69.1)	157 (52.5)	125 (111.4)	<0.001	22.55	12.38-43.54	0.001

Table 1. Descriptive analysis and adjusted logistic model for chemsex among YMSM enrolled in the Conectad@s Study, Rio de Janeiro, Brazil, 2022.

**Conclusions:** We observed elevated substance use and chemsex rates among YMSM from Brazil. Our findings affirm the link between chemsex and engaging in HIV-related sexual risk behavior, reinforcing the importance of offering PrEP and doxycycline-PEP in a harm reduction framework for YMSM. An integrated approach to HIV prevention among youth should address broader health concerns, including mental health and problematic substance use.

Correlation coefficient of MUAC and BMI in the identification of acute malnutrition among PLHIV and TB clients in Djibouti

G. Giordana<sup>1</sup>, I. Omondi<sup>1</sup>

<sup>1</sup>World Food Programme, Nairobi, Kenya

**Background:** Detection of malnutrition and the monitoring of the effectiveness of rehabilitative interventions is important among people living with HIV (PLHIV) and Tuberculosis (TB) clients. A 2021 study conducted by the World Food Programme, the Ministry of Health and the Ministry of Social Affairs and Solidarity highlights the existing correlations in the use of Body Mass Index (BMI) and Mid-Upper Arm Circumference (MUAC) to detect malnutrition in Djibouti.

**Methods:** This quantitative cross-sectional study involved 1080 PLHIV selected from 9 selected Antiretroviral Therapy (ART) and TB clinics in Djibouti Ville. Sampling utilized a probability proportional to size model. Trained social workers collected data through structured question-

naires and anthropometric assessments, including MUAC and BMI. Descriptive analysis, stratified into three categories (ART clients, TB DOTS clients, and HIV/TB co-infected, was performed using SPSS. Malnutrition was indicated by MUAC < 24.00 cm and BMI < 18.5 kg/m<sup>2</sup>.

**Results:** From the 1080 study respondents evaluated in the analysis, the mean weight was: 60.54±12.90 kg; height: 1.65±0.09 m; BMI: 22.19±4.59 kg/m<sup>2</sup>; MUAC: 26.88±4.33 cm; age: 40.64±12.01. A strong correlation exists between MUAC and BMI among PLHIV/TB with a Pearson correlation value of 0.573. The prevalence of malnutrition was found to be 23.3% (n=250) with MUAC and 19.6% (n=210) with BMI. Of the 534 females, 125 (23.4%) and 86 (16.1%) were malnourished using MUAC and BMI respectively. The prevalence of malnutrition remained the same among males at 23.0% (n=125) for both BMI and MUAC.

**Conclusions:** In Djibouti Ville, MUAC positively correlates with BMI among PLHIV and TB clients. MUAC measurements of below 24.0 cm correlate with a BMI of <18.5 kg/m<sup>2</sup>, especially among males. The use of MUAC tapes can hence be considered as a valid alternative to BMI, particularly where health protocol requires minimal physical contact of where adequate BMI tools cannot be found or are not fit for purpose. Application of MUAC screening for malnutrition among PLHIV and TB clients where BMI is not possible is encouraged.

### Excision of HIV proviral DNA - From bench to bedside

M. Voges<sup>1</sup>, N. Beschoner<sup>1</sup>, I. Hauber<sup>1</sup>, F. Buchholz<sup>2,1</sup>, O. Degen<sup>3</sup>, N. Kröger<sup>3</sup>, H. Bönig<sup>4</sup>, J. Schulze zur Wiesch<sup>3</sup>, O. Ahnfeld<sup>1</sup>, J. Chemnitz<sup>1,5</sup>, J. Hauber<sup>1</sup>

<sup>1</sup>PROVIREX Genome Editing Therapies GmbH, Hamburg, Germany, <sup>2</sup>TU Dresden, Department of Medical Systems Biology, Dresden, Germany, <sup>3</sup>University Medical Center Hamburg-Eppendorf, Hamburg, Germany, <sup>4</sup>German Red Cross Blood Donor Service Baden-Wuerttemberg - Hessen, Frankfurt, Germany, <sup>5</sup>Leibniz Institute of Virology, Hamburg, Germany

**Background:** PROVIREX employs *in vitro* engineered Brec1, a site-specific recombinase-based genome surgery technology to precisely excise chromosomally integrated viral genomes (i.e. proviruses). Brec1 excises the provirus of most HIV-1 strains and subtypes with high specificity. Elaborate non-clinical studies demonstrated that Brec1 acts precisely without apparent cytopathic, cytotoxic or genotoxic effects. The first-in-human Brec1 gene therapy trial is expected to start in Q3/2024 as phase Ib/IIa clinical trial, which is fully financed by public funds from BMBF, BWFG and Else Kröner-Fresenius-Stiftung (EKFS).

**Methods:** The completion of Brec1 preclinical analyses allowed successful funding of a first-in-human Brec1 gene therapy trial. Here, people living with HIV will be treated

by autologous transfer of genetically modified CD34+ hematopoietic stem cells (HSC) harbouring Brec1. CD34+ HSC will be harvested after mobilization with G-CSF and *ex vivo* transduced with lentiviral vector containing Brec1 expression cassette under LTR promotor control. All study participants will continue to receive suppressive cART. Close follow-up monitoring of the study participants will be performed for at least 2 years, including analysis of immune (e.g. HIV-specific T cell responses) and cellular parameters, viral load, viral reservoir size and cell-associated total viral DNA.

**Results:** All preclinical studies have been finalised, LV-Brec1 has been produced and approved for treatment. Also, the GMP transduction technology at DRK Frankfurt has been successfully transferred and is fully established including all validation runs. The manufacturing licence has been applied for by the authorities. First patient in for the clinical trial HIVcure is expected to be in Q3/2024. Upon HSC engraftment, it is expected that the hematolymphoid system of the study participants will be continuously supplied with cells that are HIV-1 resistant by precisely excising the proviral DNA. Study endpoints will include safety of transfusion of gene-modified HSC, detection of gene-modified peripheral blood cells, and, in selected cases, antiviral effects due to provirus excision.

**Conclusions:** The HIVcure clinical trial for the first in patient testing of the Brec1 recombinase is expected to start in Q3/2024.

All preclinical studies, the production of the lentiviral vector and the transfer of the technology to the DRK Blood Donor Service in Frankfurt have been successfully completed.

**Background:** Argentina, like other Latin American countries, has reported moderate to high levels of transmitted drug resistance (TDR) in people with HIV (PWH), primarily towards non-nucleoside reverse transcriptase inhibitors (NNRTIs). Updated surveys are essential to monitor the prevalence of resistance-associated mutations (RAMs) to reverse transcriptase and protease inhibitors (PIs) in treatment-naïve populations.

**Methods:** A cross-sectional study was undertaken utilizing samples from antiretroviral therapy (ART)-naïve PWH collected between 2017-2021 as routine clinical practice at two reference HIV clinics in Buenos Aires, Argentina. Samples were analyzed for RAMs using the World Health Organization (WHO) mutation list ([hivdb.org/s/who](http://hivdb.org/s/who)). Mutations to rilpivirine (RPV) and to doravirine (DOR) were assessed according to the Stanford algorithm ([hivdb.org/s/nnrtinotes](http://hivdb.org/s/nnrtinotes)). Susceptibility to NNRTIs was evaluated using the HIVdb Program (<https://hivdb.stanford.edu/hivalg/by-patterns/>) with Stanford and ANRS criteria. Sequences classified as "susceptible" and "potential low-level resistance" were grouped as "susceptible".

**Results:** Samples from 1667 individuals were analyzed: 81.2% were male; 52.6% identifying as men who have sex with men. According to the WHO list, the overall TDR was 12.1% (n= 203). The prevalence of RAMs was 10.1% (170/1667) for NNRTIs, 4% (67/1667) for nucleoside reverse transcriptase inhibitors (NRTIs), and 1.7% (30/1667) for PIs. The most frequent NNRTI mutations were K103N (5.6%), G190A (0.89%), K103S (0.77%), and Y188L (0.53%). RPV and DOR RAMs were observed in 6% and 1.3% of the samples, being the most common E138A polymorphism (3.8%) and Y188L (0.53%), respectively. Susceptibility to DOR, RPV, efavirenz, and nevirapine with Stanford algorithm was 97.4%, 92%, 91.4%, and 90.4%, respectively. The ANRS criteria yielded susceptibility rates of 98.3%, 93.3%, 92.3%, and 90.8%. Regarding NRTIs, thymidine analog mutations (including T215 revertants) were the most frequent RAMs observed in 3.3% of cases followed by M184V (0.17%) and K65R (0.11%). Among PIs, the most prevalent RAMs were M46L (0.47%) and V82A (0.35%).

**Conclusions:** Despite decreasing prescription of first-generation NNRTIs to treatment-naïve PWH in Argentina, our study demonstrates persistence of overall moderate to high levels of drug resistance to these drugs. TDR was moderate for RPV and low for DOR. TDR to NRTIs (particularly lamivudine and tenofovir) and PIs remains low. Surveillance of TDR remains critical for recommendations of ART initiation.

## THPEB134

### Evaluation of dried tube specimens for quality assurance of HIV drug resistance genotyping

L.I. Guerrero<sup>1</sup>, G. Zhang<sup>1</sup>, J. Devos<sup>1</sup>, H. Alexander<sup>1</sup>, C. Zeh<sup>1</sup>

<sup>1</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, International Laboratory Branch, Atlanta, United States

**Background:** By 2023, over 29.8 million people living with HIV were receiving antiretroviral therapy globally. Quality HIV drug resistance (HIVDR) testing is crucial for treatment monitoring. Traditional HIVDR testing of plasma requires cold chain for storage and shipment, posing challenges in resource-limited settings. To overcome these challenges,

we developed Dried Tube Specimens (DTS) as a safe, and globally accessible alternative for HIVDR proficiency testing (PT) programs, paving the way for improved HIVDR monitoring worldwide.

**Methods:** Five-member DTS panels were produced by adding viral isolates of known viral load to a diluent of Phosphate Buffered Saline (PBS) and 2% green food dye. The specimens were dried overnight in a biosafety cabinet at ambient temperature then stored at -80°C. Viability and robustness were tested for two types of DTS: DTS-A, wherein samples were left dry throughout the storage time and reconstituted in PBS immediately prior to testing, and DTS-B, wherein samples were reconstituted with Zymo DNA/RNA Shield (DRS) (Zymo Research) and PBS in a 1:1 ratio prior to storage and tested at a later date. DTS samples were tested as if they were plasma using the ABI HIV-1 Genotyping Kit (Thermo-Fisher Scientific).

**Results:** DTS-B exposed to ambient temperature (22-26°C) for 15 and 30 days were successfully amplified for Protease, Reverse Transcriptase (PRRT) and Integrase (IN) in 5 of 5 samples. DTS-B exposed to 37°C for 15 days amplified the PRRT and IN regions successfully in 4 of 5 samples. DTS-B transported to a sub-Saharan African country without cold chain had a successful amplification rate of 19 of 20 and 20 of 20 samples for PR/RT and IN, respectively. DTS-A, when exposed to ambient temperature for 15 days, had a PRRT amplification success of 5 of 10 and an IN success of 7 of 10 samples. After 30 days of ambient temperature exposure, the DTS-A samples had an amplification success rate of 4 of 10 samples for both PRRT and IN.

**Conclusions:** Using DTS reconstituted with Zymo DNA/RNA could be a promising tool for use in global PT schemas for HIVDR genotyping. Additional stability tests under varying time and temperature conditions are ongoing.

## THPEB135

### Evaluation of viremic people living with HIV presenting with dolutegravir resistance in Western Kenya

J. Wagude<sup>1</sup>, F. Makokha<sup>2</sup>, C. Mburu<sup>3</sup>, C. Mwangi<sup>4</sup>, L. King'wara<sup>5</sup>

<sup>1</sup>Siaya County Referral Hospital, Department of Health, Siaya County Government, Siaya, Kenya, <sup>2</sup>Bungoma County Referral Hospital, Department of Health, Bungoma County Government, Bungoma, Kenya, <sup>3</sup>Elizabeth Glaser Paediatric AIDS Foundation - Kenya, Technical Advisor, Paediatric and Adolescent Services, Nairobi, Kenya, <sup>4</sup>National AIDS and STI Control Program, Care and Treatment Section Head, Nairobi, Kenya, <sup>5</sup>National Public Health Laboratory Services, HIV Drug Resistance Section Head, Nairobi, Kenya

**Background:** Dolutegravir (DTG) was introduced in Kenya in 2017 for use in people living with HIV (PLHIV). HIV drug resistance (HIVDR) data is limited in such PLHIV failing on

DTG-based regimens outside of clinical studies. We describe characteristics of PLHIV with DTG HIV drug resistance (HIVDR) mutations from ten high prevalence counties in Western Kenya.

**Methods:** All results from PLHIV failing DTG-based regimens i.e. documented viral load (VL) >1,000 copies/mL submitted for HIVDR testing after approval from the NyaWest Regional Technical Working Group were reviewed in October 2023. Client plasma samples were amplified before genotyping at NPHL from July 2020 to July 2023 with Thermo-Fisher Sanger pro/RT/int sequencing for >200 copies/mL and Drug Resistance Mutations (DRMs) identified using Stanford HIVdb. Clinical and demographic data on treatment history for clients with DTG resistance were abstracted from case summaries.

**Results:** Out of 184 client samples received at NPHL, 84 (46%) had HIV-1 VL >200 cp/mL and were successfully genotyped with only 18 (10%) having major INSTI DRMs. 16 (89%) with INSTI resistance were treatment experienced PLHIV with multiple DRMs while 2 (11%) were on 1st line TD-F/3TC/DTG and only had 1 DRM each after 17 – 38 months on therapy. 10 of 18 (56%) were male with the age range of 13 – 61 years. Mean CD4 count was 255.9 cells/uL; 7 (39%) were on treatment for tuberculosis co-morbidity while 13 (72%) had never suppressed on DTG before the HIVDR testing. After switch decisions, 9 of 18 (50%) have viral suppression below 50 cp/mL while 7 (44%) have VLs >1,000 and 2 have died (11%).

**Conclusions:** Most (90%) PLHIV with high VLs on DTG-based ART did not have DRMs and can re-suppress with adherence support. Higher frequency of major INSTI DRMs (89%) was noted in ART-experienced clients compared to ART naïve clients on DTG-based ART, suggesting that adherence support in PLHIV failing DTG-based regimens should target those with prior treatment failure, viral non-suppression or TB-HIV co-morbidity. Our data shows that DTG resistance is likely to increase and may impact the usefulness of long-acting cabotegravir, making the case for continued HIVDR monitoring in Kenya.

## THPEB136

### Specific clusters of non-integrase mutations emerge during raltegravir and dolutegravir selection

P. Solis-Reyes<sup>1</sup>, E. Ndashimye<sup>1,2</sup>, M. Avino<sup>1</sup>, B. Lubega<sup>2</sup>, A. Ghafoor<sup>1</sup>, K. Huang<sup>1</sup>, F. Kyeyune<sup>2</sup>, I. Nankya<sup>2</sup>, E. Arts<sup>1,2</sup>

<sup>1</sup>Western University, Microbiology & Immunology, London, Canada, <sup>2</sup>Joint Clinical Research Centre, Kampala, Uganda

**Background:** NNRTI-based regimen failures typically see frequency of genotypic resistance >70%, but studies of INSTI failures consistently see <50% incidence of genotypic resistance within integrase. This implies that several mechanisms of INSTI resistance have not yet been uncovered.

**Methods:** We generated diverse HIV integrase chimeras: 5 subtype A, 3 subtype D, and 2 subtype B integrase-containing viruses within a subtype B background. These 10 viruses were serially passaged, in duplicate (2x10 viruses), with increasing concentrations of either raltegravir (RAL), dolutegravir (DTG), or no drug, for >20 passages (>200 days of drug exposure). To track virus evolution, full genomes of each virus were sequenced by Miseq (Illumina) every 3 passages.

**Results:** Majority (16/20) of the viruses in the RAL escalation and almost half (9/20) of the viruses in the DTG escalation evolved ability to productively replicate above 100X the RAL IC50 or 40X the DTG IC50, respectively. E138K/Q148R was the most common pathway of RAL resistance (6/20); this was associated with >10-fold increase in RAL IC50. R263K was the most common integrase mutation during DTG selection in subtype B and D viruses (1/4 and 3/6, respectively), but was not selected in subtype A viruses (0/10). We observed greater DTG resistance, and greater loss of fitness, in subtype B vs D R263K mutants. In addition to *env* mutations that accumulated in both drug groups and the no drug control, novel integrase mutations and distinct mutation clusters outside of integrase were observed during both RAL and DTG selection. We noted a high frequency of reverse transcriptase mutations (12/20 viruses) accumulate during RAL selection. Several of these mutations occur at resistance-associated positions. During DTG selection, we found a high frequency of nucleocapsid mutations (12/20) and 5' LTR mutations near the PBS (4/20). Notably, reverse transcriptase mutations T69N, M184I, and F214L that emerged during RAL selection were significantly more frequent in our established cohort of Ugandan DTG failures (pending publication; n=810) compared to naïve individuals.

**Conclusions:** As the DTG scale-up continues, we here uncover several novel RAL/DTG-associated mutations that appear to contribute to INSTI resistance, including several non-integrase mutations that may be overlooked or undetected by traditional genotypic testing.

### The impact of conflict on HIV testing and treatment service delivery in Ethiopia

M.O. Douglas<sup>1</sup>, M. Dessie<sup>1</sup>, L. Baraki<sup>1</sup>, K. Srikanth<sup>1</sup>, S. Santos-DaSilva<sup>1</sup>, K. Belete<sup>2</sup>, S. Mehrete<sup>2</sup>, B. Kasdan<sup>3</sup>  
<sup>1</sup>The United States Agency for International Development, Bureau of Global Health, Office of HIV and AIDS, Washington, United States, <sup>2</sup>The United States Agency for International Development, Health Team, Addis Ababa, Ethiopia, <sup>3</sup>U.S. State Department, PEPFAR Coordination Office, Addis Ababa, Ethiopia

**Background:** Since November 2020, Ethiopia has grappled with conflict, particularly in the Tigray and Amhara regions. The conflict caused widespread displacement, food shortages, and human rights abuses. It disrupted health services, damaged health facilities, and limited access to medical care, including HIV services.

Ceasefire in Tigray was declared in November 2022, but access to health services remains limited while violence continues in Amhara and Oromia. Together, Amhara and Oromia account for 60% of the PEPFAR-supported treatment cohort.

**Methods:** Using PEPFAR's Monitoring, Evaluation and Reporting (MER) program data and other reports, we analyzed the impact of conflict on HIV services in Ethiopia's Tigray and Amhara regions. MER data from fiscal year October 2019 to October 2022 were reviewed to assess trends in HIV testing services; the number of people living with HIV (PLHIV) on antiretroviral therapy (ART), and those newly initiated on ART before, during, and post-conflict.

**Results:** Before the conflict, over 42,000 PLHIV were on ART in Tigray. In October 2023, only 87 PLHIV were reported. A preliminary PEPFAR site visit report estimates that 34,000 patients returned to treatment in January 2024.

The number of PLHIV newly initiated on ART fluctuated between 400–600 per quarter before the conflict; post-conflict trend shows that only 15 or fewer were initiated quarterly. HIV testing services never returned to the pre-conflict levels of between 60,000–110,00, hovering at only a few hundred per quarter.

Over 146,000 PLHIV were on ART in Amhara before the conflict expanded at which point over 20,000 PLHIV on ART were lost. Nine months later, most patients have returned to treatment. However, conflict resumed in Amhara in July 2023 and its impact on health and HIV services resumed.

**Conclusions:** The health system and service delivery collapsed in war-affected areas. Post-recovery plans should prioritize recovery of lost patients and provision of services for those newly infected.

As infrastructure is rebuilt, focusing on restoring supply chains for timely delivery of ART and HIV testing supplies everywhere is critical. As conflicts surge globally and 12

### Cigarette dependence associated with COVID-19 vaccine attitudes and risk appraisal among people with HIV who smoke

L. Westphal<sup>1</sup>, G. White<sup>2</sup>, S. McKetchnie<sup>3</sup>, J. Lee<sup>3</sup>, E. Braunewell<sup>3</sup>, H. Albrecht<sup>4</sup>, L. Gulbicki<sup>3</sup>, M. Zvolensky<sup>4</sup>, J. Smits<sup>5</sup>, T. Giordano<sup>6</sup>, D. Rosenfield<sup>7</sup>, C. O'Cleirigh<sup>3</sup>  
<sup>1</sup>The Fenway Institute, Behavioral Science Research Program, Boston, United States, <sup>2</sup>Baylor College of Medicine, Section of Infectious Diseases, Houston, United States, <sup>3</sup>Massachusetts General Hospital, Psychiatry, Boston, United States, <sup>4</sup>University of Houston, Department of Psychology, Houston, United States, <sup>5</sup>University of Texas at Austin, Department of Psychology, Austin, United States, <sup>6</sup>Baylor College of Medicine, Infectious Disease, Houston, United States, <sup>7</sup>Southern Methodist University, Department of Psychology, Dallas, United States

**Background:** HIV is related to higher COVID-19 mortality rates, and smokers have worse COVID-19 outcomes than non-smokers. People with HIV (PWH) are twice as likely as HIV-negative peers to smoke and less likely to quit. COVID-19 vaccination reduces severe illness, but low vaccine trust and low COVID risk appraisal limit vaccination rates. This preliminary analysis assesses the association between cigarette dependence, vaccine trust, and COVID-19 risk appraisal among PWH who were recruited to a trial intervention addressing anxiety, depression, and smoking.

**Methods:** We recruited  $N = 136$  PWH who smoke from clinics in Massachusetts and Texas. Self-report measures assessed anxiety (GAD7), depression (PHQ8), cigarette dependence (Fagerstrom Test for Nicotine Dependence), cigarettes per day (dichotomized), vaccine trust, and COVID-19 risk appraisal. Linear regression analyses assessed relationships between vaccine trust total score or COVID risk appraisal as dependent variables, and cigarette dependence or cigarettes per day as independent variables. Recruitment site, anxiety, and depression scores were included covariates.

**Results:** We examined the effect of study site on vaccine trust; participants enrolled in Texas had significantly worse vaccine trust than those in Massachusetts ( $b = 3.82$ ,  $p < .001$ ). As such, site was retained as a covariate, along with depression and anxiety. With respect to cigarettes, smoking more than the sample's average cigarettes per day was associated with greater vaccine trust when controlling for site, depression, and anxiety ( $b = 2.06$ ,  $p = .026$ ). Lastly, there was a statistical trend for lower cigarette dependence being associated with greater perceived risk of COVID-19 when controlling for site, depression, and anxiety ( $b = -1.54$ ,  $p = .063$ ).

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Conclusions:** Perceptions of COVID-19 risk and vaccine trust are complex and likely influenced by factors beyond anxiety and depression. Participants were probably exposed to different COVID-19 messaging based on the geopolitical environment of their site.

PWH smoking more cigarettes per day may rely on their vaccines to protect them from illness rather than changing their behavior.

Additionally, those with lower cigarette dependence may be consciously improving their health and relatedly, more aware of their COVID-19 risk.

Future research should examine these associations alongside medical trust and care engagement.

## THPEB139

### Low prevalence of nirmatrelvir-ritonavir resistance-associated mutations in SARS-CoV-2 lineages from Botswana (2020-2023)

W.T. Choga<sup>1,2</sup>, O.T. Bareng<sup>3,1</sup>, N.O. Moraka<sup>2,1</sup>, D. Maruapula<sup>2</sup>, N.S. Ndlovu<sup>2</sup>, B.J. Zuze<sup>3</sup>, P.C. Motshosi<sup>2</sup>, K.B. Lockman<sup>2,7,8,9</sup>, R. Shapiro<sup>2</sup>, J. Makhema<sup>2,8</sup>, S. Gaseitswe<sup>3,8</sup>, S. Moyo<sup>2</sup>

<sup>1</sup>University of Botswana, Medical Sciences, Gaborone, Botswana, <sup>2</sup>Botswana Harvard Health Institute Partnership, Gaborone, Botswana, <sup>3</sup>Botswana Harvard Health Partnership, Botswana., Gaborone, Botswana, <sup>4</sup>Botswana-Baylor Children's Clinical Centre of Excellence, Gaborone, Botswana, <sup>5</sup>Baylor College of Medicine, Department of Pediatrics, HoustonUnUn, United States, <sup>6</sup>University of Botswana, Department of Internal Medicine, Gaborone, Botswana, <sup>7</sup>Brigham & Women's Hospital, Division of Infectious Diseases, Botson, United States, <sup>8</sup>Harvard T.H. Chan School of Public Health, Immunology and Infectious DiseasesUSAUni, United States, <sup>9</sup>Harvard Medical School, Botson, United States

**Background:** Nirmatrelvir-ritonavir (NTV/r) is a SARS-CoV-2 protease inhibitor and treatment option for high-risk patients with COVID-19. We evaluated naturally occurring nirmatrelvir-ritonavir (NTV/r) resistance-associated mutations (RAMs) among SARS-CoV-2 strains from Botswana, a country with no NTV/r use to date, in order to recommend the usage of the agent for high-risk patients with COVID-19.

**Methods:** We conducted a retrospective analysis using 5,254 complete SARS-CoV-2 sequences from Botswana (September 2020 – September 2023). We evaluated the mutational landscape of the SARS-CoV-2 3-Chymotrypsin-like protease (3CLpro; refereed to as nsp5 gene) relative to the highlighted list of RAMs provided by the FDA emergency use authorisation in 2023. Relatedness of participants with RAMs was evaluated using phylogenetic analysis.

**Results:** The sequenced 5,254 samples included Beta (N=323), Delta (N=1314), and Omicron (N=3354) variants of concern (VOC). Overall, 77.8% of the sequences exhibited at-least one polymorphism within 76/306 amino acid positions in the nsp5 gene. NTV/r RAMs were identified in 34/5,254 (0.7%, 95%CI:0.4%-0.87%), and occurred at five distinct positions. Amongst the NTV/r RAMs detected, A191V was the most prevalent (24/34; 70.6%). Notably, T21I mutation had a prevalence of 20.6% (7/34) and co-existed with either K90R (n=3) polymorphism in Beta sequences with RAMs or P132H (n=3) polymorphism for Omicron sequences with RAMs.

Other NTV/r RAMs detected include P108S with prevalence of 5.9% (2/34) and L50F prevalence of 2.9% (1/34). NTV/r RAMs were significantly higher (p<0.001) in Delta (24/35) compared to either Beta (4/34) or Omicron (6/34) sequences. Phylogenetic analysis indicates that several sequences with NTV/r RAMs cluster together, suggesting a higher likelihood of transmission-based RAMs rather than acquired ones.

**Conclusions:** The frequency of NTV/r RAMs in Botswana was low. Higher rates were observed in Delta VOC variants compared to in Omicron and Beta VOC. Our findings recommend the potential use of NTV/r in Botswana, especially during the current epidemic wave driven by Omicron VOC. However, as NTV/r use expands globally, continuous surveillance for drug-resistant variants is essential.

## THPEB140

### Resilient viral load suppression in an acutely-treated cohort of people with HIV during the COVID-19 pandemic in Bangkok, Thailand

N. Chomchey<sup>1</sup>, C. Saccalan<sup>1,2</sup>, T. Hamby<sup>3,4</sup>, J. Tonze<sup>1,3,4</sup>, E. Kroon<sup>1</sup>, F. Ocampo<sup>1</sup>, P. Promsena<sup>1</sup>, P. Prueksakaew<sup>1</sup>, S. Sriplienchan<sup>1</sup>, N. Phanuphak<sup>5</sup>, L. Trautmann<sup>3,4</sup>, S. Vasan<sup>3,4</sup>, T. Crowell<sup>3,4</sup>, RV254/SEARCH010 Study Group  
<sup>1</sup>SEARCH Research Foundation, Bangkok, Thailand, <sup>2</sup>Chulalongkorn University, Research Affairs, Bangkok, Thailand, <sup>3</sup>U.S. Military HIV Research Program, Walter Reed Army Institute of Research, Silver Spring, United States, <sup>4</sup>Henry M. Jackson Foundation for the Advancement of Military Medicine, Inc., Bethesda, United States, <sup>5</sup>Institute of HIV Research and Innovation, Bangkok, Thailand

**Background:** Measures to reduce the spread of SARS-CoV-2 had the potential to compromise HIV treatment. We studied viral load (VL) outcomes in acutely-treated people with HIV before and during the COVID-19 pandemic in Bangkok, Thailand. Targeted and scheduled VL monitoring, adherence support and adapted service delivery methods (telemedicine, ART home delivery) were implemented to help maintain viral suppression.

**Methods:** We analyzed differences in VL measurements among adults with acute HIV in the RV254/SEARCH010 cohort from January 2018 to October 2023 based on COVID

restrictions— (1)Pre-COVID: 1/1/2018-3/15/2020, (2)First Lockdown: 3/16/2020-5/03/2020, (3)None: 5/4/2020-4/30/2021, (4)Second Lockdown: 5/1/2021-6/6/2021, and (5)None: 6/7/2021-9/30/2023. Outcomes included number of VL tests per person-year (PY) and proportion of suppressed tests with VL <1,000 copies/ml (VS). Associations between COVID restrictions and number of VL measurements over time were modeled using Poisson regression with generalized estimation equations (GEE). Factors associated with VLS were evaluated using logistic regression with GEE and adjusted for treatment regimen, age in 10-year increments, sex, and years on ART. Adjusted odds ratios (aOR) and 95% confidence intervals (95%CI) were reported.

**Results:** 9,643 samples from 622 participants comprised of 584 males (98%) with mean (SD) age of 30.80(7.85) were analyzed. VL measurements significantly declined from pre-COVID (4.28/PY [95%CI 4.16-4.41]) to subsequent periods, especially first (0.73/PY [95%CI 0.50-1.06]) and second (0.36/PY [95%CI 0.24-0.56]) lockdowns (Figure1). VS rates remained >98% during pre-COVID and non-lockdown periods; VS rates were 95% and 80% in the first and second lockdowns. The second lockdown decline was statistically significant after controlling for other factors (aOR 0.04 [95%CI 0.01-0.32]). VS rates did not differ by the other periods, age, sex, regimen, or duration on ART.

Figure 1. Viral load measures per person years and viral load suppression during the COVID-19 pandemic in RV254/SEARCH010 Cohort.

**Conclusions:** VL monitoring decreased during COVID-19 lockdowns. VS decrease in lockdown may be affected by targeted VL monitoring. We did not find evidence of longer-lasting reduction in VS, indicating resilience despite COVID-related barriers to care.

### Effect of cyclone Freddy on HIV treatment services in Zambézia Province, Mozambique

J. Tique<sup>1</sup>, T. Ntasis<sup>2</sup>, C. De Schacht<sup>3</sup>, E. Graves<sup>4</sup>, J. Matsimbe<sup>5</sup>, C. Verissimo<sup>6</sup>, I. Pathmanathan<sup>7</sup>, I. Benech<sup>7</sup>, L. Dique<sup>7</sup>, C.W. Wester<sup>4,8</sup>

<sup>1</sup>Friends in Global Health (FGH), Clinical Department, Maputo, Mozambique, <sup>2</sup>Friends in Global Health (FGH), Maputo, Mozambique, <sup>3</sup>Friends in Global Health (FGH), Evaluations Department, Maputo, Mozambique, <sup>4</sup>Vanderbilt University Medical Center, Institute for Global Health (VIGH), Nashville, United States, <sup>5</sup>Friends in Global Health (FGH), Clinical Department, Quelimane, Mozambique, <sup>6</sup>Ministry of Health, Provincial Health Directorate of Zambézia, Quelimane, Mozambique, <sup>7</sup>Centers for Disease Control and Prevention, Division of Global HIV & TB, Maputo, Mozambique, <sup>8</sup>Vanderbilt University Medical Center, Department of Medicine, Division of Infectious Diseases, Nashville, United States

**Background:** Between January 2021-March 2023, nine cyclones made landfall in Mozambique. Cyclone Freddy made its second landfall on March 11<sup>th</sup>, 2023, impacting 1.1 million persons. In Zambézia Province, 22,116 people sought refuge in accommodation centers and approximately 2,000 houses were destroyed/damaged.

We describe response efforts to mitigate Cyclone Freddy's effect on HIV service continuity for 378,350 people living with HIV (PLHIV) on antiretroviral therapy (ART) in Zambézia.

**Description:** Mitigation interventions initiated two days post-landfall extended through September 2023, including i) performing assessments evaluating service disruption and damage, categorizing districts as directly-affected (directly hit), flood-affected (not directly hit but flooded), and unaffected (not directly hit or flooded); ii) executing 63,744 community ART distributions; iii) conducting 128 re-integration campaigns whereby clinical teams provided services to 5,971 PLHIV; iv) repairing 37 health facility roofs, and v) re-establishing electronic medical record systems interrupted due to infrastructure damage. We analyzed aggregated clinical data from October 2022-September 2023, assessing trends in interruptions in treatment (IIT, i.e., >28 days since last expected clinical contact or ART pick-up) among PLHIV on ART comparing directly-affected, flood-affected, and unaffected districts.

**Lessons learned:** In April 2023, 8.6% and 10.6% of all PLHIV on ART in directly- and flood-affected districts respectively, experienced IIT, compared to 4.6% in unaffected districts. Flood-affected districts returned to their pre-cyclone IIT levels (average 2.3% between October 2022-January 2023) faster (within 3 months) compared to directly-affected (within 6 months). By September 2023, 3.1% and 2.6% of PLHIV on ART in directly- and flood-affected districts, respectively, experienced IIT, similar to 3.0% in unaffected districts.

Figure 1. Trends in interruption in treatment (ITT) in Zambezia province (february-September 2023).

**Conclusions/Next steps:** Findings highlight the immediate increase in IIT among PLHIV on ART residing in cyclone-affected areas. Given the frequency of cyclones affecting Mozambique, these results underscore the need for programming adaptation responding to climate-related emergencies, and for emergency response preparedness ensuring continuity of HIV services.

## THPEB142

### Mitigating the impact of climate disasters on continuity of HIV service delivery: lessons from Cyclone Freddy in Malawi

B. Afirima<sup>1</sup>, B. Chiwandira<sup>2</sup>, J. Nkhonjera<sup>2</sup>, T. Chimbandule<sup>2</sup>  
<sup>1</sup>National AIDS Commission, HIV Prevention and Management, Lilongwe, Malawi, <sup>2</sup>Ministry of Health, Malawi Government, Directorate of HIV, STIs and Hepatitis, Lilongwe, Malawi

**Background:** Malawi is a high HIV burden country and highly susceptible to extreme weather-related hazards. In March 2023, Cyclone Freddy struck Malawi, leaving in its wake catastrophic consequences ranging from loss of lives to widespread destruction of health infrastructures, and disruption of health systems, particularly HIV-related services. HIV service continuation is crucial to optimizing treatment outcomes, including viral suppression. The disruption of HIV services poses a threat to sustaining the gains of epidemic control and the UNAIDS 95 95 95 fast track targets. We aim to describe measures deployed to mitigate the impact of cyclone Freddy and ensure continued HIV service delivery in Malawi.

**Description:** Malawi leveraged on existing multisectoral and interagency collaboration with community structures as the bedrock to the national response. The department of disaster management set up camps with mobile clinics for displaced persons. Building on the lessons learnt from adapting HIV systems for COVID-19 response, the Ministry of Health took the following proactive measures: issued an emergency policy protocol that allows dispensing of ARV to every person that self-identify as living with HIV on treatment without demanding for any supporting documentation, integration of HIV services into the camp

clinics, deployment of surge staff, optimising multi-month dispensing, decentralized ARV dispensing points, activated emergency supplies of ARVs, and leverage peer-led mechanism to facilitate ARV delivery especially among Key populations were effective in ensuring continuity of care.

**Lessons learned:** The study found no significant change in HIV testing and ART services ( $p = 0.716$  for both), indicating stability post-cyclone.

Service	Pre_Mean	Pre_SD	Post_Mean	Post_SD	Z	P_Value
Total HIV Tests	117.39	232.40	110.21	201.22	0.36	0.7161
Alive on ART	157.64	603.30	177.90	595.29	-0.36	0.7160

**Conclusions/Next steps:** The impact of climate disasters on continuity of HIV service delivery can be catastrophic, particularly in highly vulnerable countries like Malawi. The response efforts deployed to mitigate the impact of cyclone Freddy in Malawi demonstrate the importance of emergency preparedness and adaptability of health systems in ensuring service continuity for People Living with HIV.

Epidemiological trajectory and machine learning models: charting a course to combat HIV/AIDS in Ethiopia's 19-year journey (2000-2018)

A. Adimasu Taddese<sup>1</sup>, M.A. Yimer<sup>2</sup>, B. Abebe Alemu<sup>3</sup>, T. Eshetu<sup>4</sup>

<sup>1</sup>University of Gondar, Health Informatics, Epidemiology and Biostatistics, Gondar, Ethiopia, <sup>2</sup>University of Gondar, Pediatrics and Child Health, Gondar, Ethiopia, <sup>3</sup>University of Gondar, Pathology, Gondar, Ethiopia, <sup>4</sup>University of Gondar, Medical Parasitology, Gondar, Ethiopia

**Background:** This research aimed to comprehensively understand the evolving epidemiological patterns and dynamics of HIV/AIDS in Ethiopia over a 19-year period (2000-2018). The primary objectives were to assess the overall HIV prevalence, identify regional disparities, and explore knowledge gaps among pregnant women regarding HIV/AIDS and mother-to-child transmission (MTCT).

**Methods:** The study conducted a retrospective analysis of secondary data obtained from nationwide community-based surveys conducted between 2000 and 2018. The sample included 21,014 adults aged 15-49 tested for HIV across 79 zones in Ethiopia. Additionally, data from the 2016 Ethiopia Demographic Health Survey, comprising 7,193 pregnant women, were analyzed to evaluate knowledge levels about MTCT.

The study employed advanced analytics, including temporal analysis, regional comparisons, hot spot mapping, age-stratified analysis, and machine learning models.

**Results:** Nationally, the study revealed a notable 47% decline in the number of people living with HIV between 2000 and 2018, with a sustained downward trajectory and an average yearly percentage change of -3.45%. However, specific regions, including Benishangul-Gumuz, Gambella, and Harari, exhibited concerning upward trends. Variations in HIV prevalence was observed among regions, with Amhara, Oromia, and Addis Ababa consistently reporting high rates but showing gradual reductions over time. Southern Nations, Nationalities, and Peoples (SNNP), Tigray, Somalia, and Afar regions displayed relatively stable patterns.

Age-stratified analysis revealed the highest HIV burden among the 25-29 and 30-34 age groups in most regions, with elevated prevalence in the 35-39 and 40-44 age groups. Concerning knowledge gaps, the study highlighted that 85% of pregnant women lacked comprehensive knowledge about HIV/AIDS, and 66% demonstrated inadequate understanding of MTCT. Logistic regression analy-

sis identified significant influencers, including HIV testing, wealth index, media exposure, and educational attainment.

**Conclusions:** The findings of this study hold critical implications for HIV prevention, treatment, and care in Ethiopia. While national trends indicate progress, regional variations and persistent knowledge gaps underscore the need for tailored interventions. Leveraging advanced analytics and tailoring interventions to specific regions, demographic groups, and risk factors can accelerate the decline of HIV prevalence.

The study calls for a commitment to evidence-based policymaking, innovative interventions, and comprehensive healthcare access to secure a healthier, HIV-free future for Ethiopia.

#### THPEC144

Evolution of HIV transmission networks in rural South Africa

D. Cuadros<sup>1</sup>, S. Kemp<sup>2</sup>, P. Mee<sup>3</sup>, K. Tram<sup>4</sup>, A. Dobra<sup>4</sup>, M. Inghels<sup>3</sup>, A. Tomita<sup>5</sup>, H.-Y. Kim<sup>6</sup>, T. Mathenjwa<sup>5</sup>, R. Gupta<sup>7</sup>, F. Tanser<sup>8</sup>

<sup>1</sup>University of Cincinnati, Digital Epidemiology Laboratory, Cincinnati, United States, <sup>2</sup>University of Oxford, Oxford, United Kingdom, <sup>3</sup>University of Lincoln, Lincoln, United Kingdom, <sup>4</sup>University of Washington, Seattle, United States, <sup>5</sup>University of KwaZulu-Natal, Durban, South Africa, <sup>6</sup>New York University, New York, United States, <sup>7</sup>University of Cambridge, Cambridge, United Kingdom, <sup>8</sup>Stellenbosch University, Stellenbosch, South Africa

**Background:** This study provides a comparative analysis of the evolution and dynamics of HIV transmission networks in a rural South African community. The objective is to highlight the changes in the HIV transmission network over time, reflecting the impact of public health interventions and sociodemographic shifts.

**Methods:** Utilizing demographic surveillance data collected in the uMkhanyakude district, KwaZulu-Natal, South Africa from 2014 and 2019 we constructed HIV transmission networks in this rural community. Phylogenetic analysis identified transmission clusters from HIV-1 Pol sequences. Geospatial mapping linking these sequences to specific locations was used to reveal the spatial distribution of transmission. A grid representing the area of the study was generated to aggregate nodes of connection without geographical references to uphold participant confidentiality, and to conduct network analysis focused on comparisons among connectivity and key nodes within the networks generated.

**Results:** The transmission network generated using data from 2014 (map in the left) demonstrated a central, highly connected HIV transmission cluster in a peri-urban area, acting as a hub within the network. This cluster had substantial connectivity to smaller, peripheral nodes, indicat-

ing a centralized network structure. In contrast, the network generated using data from 2019 (map in the right) revealed a more decentralized transmission network, with clustering in peripheral and rural areas. This shift indicates a spread of HIV transmission beyond the central peri-urban cluster identified in 2014.

**Conclusions:** The comparison between the two time points underscores the dynamic nature of HIV transmission networks. The shift from a highly centralized structure to a more dispersed network in 2019 might suggest the influence of various factors, including public health interventions, societal changes, and population mobility, on the evolution of HIV transmission patterns. These findings emphasize the need for adaptable public health strategies that can respond to the evolving epidemiological landscape of HIV transmission.

## THPEC145

Perceived risk of unintended pregnancy among young people aged 13-24 years during COVID-19-related lockdowns in peri-urban Cape Town, South Africa: a cross-sectional study

F.G. Wongnaah<sup>1</sup>

<sup>1</sup>Karolinska Institutet, Department of Global Public Health, Stockholm, Sweden

**Background:** The COVID-19 pandemic and its related lockdowns may predispose girls and young women to greater risk of unintended pregnancy.

The aim was to assess the perceived risk of unintended pregnancy among young people (13-24) in relation to COVID-19 lockdowns and to determine its association with access to family planning, after adjusting for individual, structural and socio-behavioral factors.

**Methods:** Data were drawn from a baseline survey of the longitudinal Bidirectional, Upbeat communication and Differentiated, Distance care for Young People (BUD-DY) project, conducted in February-September 2021. The study included a sample of 477 young people living with and without HIV. Multivariable logistic regression models

were used to assess the adjusted odds ratio of perceiving a greater risk of unintended pregnancy in relation to family planning access, individual, structural and socio-behavioral factors.

**Results:** Most participants (89.4% women and 88.4% men) did not perceive that their risk of unintended pregnancy had increased because of COVID-19-related lockdowns, with no difference by gender. In adjusted models, family planning access was associated with lower odds of perceiving a greater risk of unintended pregnancy (AOR= 0.17; 95%CI =0.07-0.43). Perceiving a greater risk of unintended pregnancy decreases with education level (AOR= 0.24, 95%CI =0.07-0.83). Participants living without HIV (AOR= 3.0, 95%CI =1.26-7.22) and those who reported past-month smoking (AOR= 3.86, 95%CI =1.47-10.14) were more likely to perceive a greater risk of unintended pregnancy.

**Conclusions:** Young people in peri-urban townships in Cape Town did not perceive a greater risk of unintended pregnancy due to the COVID-19 pandemic lockdowns. During public health crises such as the COVID-19 pandemic, the health care system should remain resilient in order to meet the sexual and reproductive health needs of young people.

## THPEC146

Are violence, poor mental health, and harmful alcohol and other substance use associated with cortisol levels among female sex workers in Nairobi, Kenya?

M. Panneh<sup>1</sup>, Q. Ding<sup>2</sup>, R. Kabuti<sup>3</sup>,

T. Maisha Fiti study champions<sup>3</sup>, J. Bradley<sup>4</sup>, P. Ngurukiri<sup>3</sup>, M. Kungu<sup>3</sup>, T. Abramsky<sup>1</sup>, J. Pollock<sup>5</sup>, A. Beksinska<sup>1</sup>, P. <sup>2</sup>Robarts Research Institute, Schulich School of Medicine and Dentistry, Western University, London, Canada,

<sup>3</sup>Partners for Health and Development in Africa, Nairobi, Kenya, <sup>4</sup>MRC International Statistics and Epidemiology Group, Department for Infectious Disease Epidemiology, London, United Kingdom, <sup>5</sup>University of Toronto, Department of Immunology, Toronto, Canada, <sup>6</sup>University of Toronto, Department of Medicine, Toronto, Canada

**Background:** Violence, mental health problems and harmful alcohol and other substance use, are commonly experienced by female sex workers (FSWs) in sub-Saharan Africa, all of which are associated with increased risk of HIV acquisition. In this study, we aim to investigate the stress-response system as a potential pathway linking the experiences of these stressors, with increased risks of infections, including HIV, through dysregulated cortisol levels, which have been linked with immune function impairment.

**Methods:** We used the baseline behavioural and laboratory data of the *Maisha Fiti* longitudinal study of FSWs in Nairobi, Kenya (study period: 2019-2021). Participants reported recent violence experiences (past 6 months), recent mental health problems and harmful use of alcohol and other substances (past 3 months). Hair samples proximal to the scalp were collected to measure cortisol levels determined using an ELISA technique.

We analyzed hair samples ( $\geq 2\text{cm}$ ) of HIV-negative respondents. We ran multivariable linear regression models to determine whether violence, poor mental health and the harmful use of substances were independently associated with hair cortisol concentration (HCC).

**Results:** 425 HIV-negative respondents provided at least 2cm of hair samples. The mean HCC was 331.20 (95% CI: 294.7 to 372.2). The prevalence of recent violence was 89.3% (physical 54.6%; sexual 49.4%; emotional 77.0%; financial 66.5%) and 29.1% had been arrested by the police because of their sex work. 23.7% of women reported moderate/severe depression, 11.6% moderate/severe anxiety, 13.5% PTSD and 10.8% recent suicidal thoughts/attempts. 48.8% of participants reported harmful alcohol and/or other substance use (34.3% alcohol; 36.5% other substances).

In multivariable regression:

- (i) recent physical and/or sexual violence (adjusted geometric mean ratio =1.28; 95% CI: 1.01 to 1.62;  $p=0.044$ ) and;
- (ii) harmful alcohol and/or other substance use (adjusted geometric mean ratio =1.31; 95% CI: 1.03 to 1.65;  $p=0.025$ ) were positively and independently associated with increased mean HCC.

**Conclusions:** Exposure to violence and harmful alcohol/substance use may distort the functioning of the hypothalamic-pituitary-adrenal axis (cortisol levels), potentially representing a physiological pathway for increased vulnerability to infections such as HIV.

## THPEC147

### Initiation of injection drug use by gay, bisexual and other men who have sex with men in Canada's three largest cities (2017-2023)

J. Cox<sup>1</sup>, H. Apelian<sup>2</sup>, A. Fourmigue<sup>2</sup>, M. Dvorakova<sup>2</sup>, I. Marbaniang<sup>1</sup>, N.J. Lachowsky<sup>3</sup>, D. Grace<sup>4</sup>, D.M. Moore<sup>5</sup>, A. Gormezano<sup>3</sup>, T.A. Hart<sup>6</sup>, A. Lall<sup>5</sup>, T. Zhang<sup>6</sup>, G. Lambert<sup>7</sup>  
<sup>1</sup>McGill University, Department of Epidemiology, Biostatistics and Occupational Health, Montréal, Canada, <sup>2</sup>Research Institute of the McGill University Health Centre, Montréal, Canada, <sup>3</sup>University of Victoria, School of Public Health and Social Policy, Victoria, Canada, <sup>4</sup>University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, <sup>5</sup>British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada, <sup>6</sup>Toronto Metropolitan University, Department of Psychology, Toronto, Canada, <sup>7</sup>Direction Régionale de Santé Publique de Montréal, Montréal, Canada

**Background:** Gay, bisexual, and other men who have sex with men (GBM) who inject drugs are at risk of acquiring HIV and HCV. Addressing injection drug use (IDU) by GBM is important for HIV and HCV elimination; approaches may differ compared to others who inject.

We examined IDU initiation in a cohort of GBM, identifying determinants.

**Methods:** The Engage study recruited sexually-active GBM, aged  $\geq 16$  years, using respondent-driven-sampling (RDS) in Montreal, Toronto, and Vancouver. Participants completed a self-administered questionnaire at enrollment and every 6-12 months; data from 2017-2023 were used. Proportion of recent IDU at cohort entry was determined using reported past six-month (P6M) IDU of amphetamines (including crystal methamphetamine), cocaine, or opioids. Incidence of first IDU was estimated among participants with no lifetime history of injection. Rate ratios (RR) were estimated using three-city/pooled data, time-lagged (i.e., most recent prior visit) variables (e.g., sociodemographic, P6M sexual and substance use behaviours, psychosocial, and health-related), and Poisson regression (accounting for time of exposure, study city).

We selected the most parsimonious predictive multivariable model using lowest Akaike information criterion. Estimates were adjusted using RDS-II and inverse-probability-of-censoring weights.

**Results:** Of 2449 participants, the adjusted proportion of recent IDU at cohort entry was 5.1% (95% confidence interval (CI): 4.2-6.2). Among 2210 GBM with no IDU history (6861 years follow-up), first IDU was reported by 33 participants, a rate of 0.7 per 100 person-years (95%CI: 0.5-1.0). Factors predictive of IDU initiation in the multivariable model included: non-injection crystal methamphetamine use (RR: 14.6; 95% CI: 6.3-33.7), attendance at party-and-play events (2.4; 1.1-5.3),  $\geq 6$  (vs  $\leq 5$ ) male sexual partners (3.3; 1.4-7.8), and being a person of colour (POC; 1.7; 1.0-3.4).

**Conclusions:** Factors unique to GBM (number of sexual partners, sexualized substance use) were important for identifying those at risk of IDU initiation. HIV and HCV prevention through appropriate harm reduction for non-injection drug use, GBM attending group sex events, and those transitioning to IDU, may be key for elimination. Why POC appear more likely to initiate IDU requires further exploration.

## THPEC148

### HIV and HCV cascade, RNA prevalence and new diagnoses in opioid agonist therapy (OAT) patients from the SAMMSU-cohort, Switzerland

A. Bregenzer<sup>1</sup>, P. Bruggmann<sup>2</sup>, E. Castro<sup>3</sup>, P. Della Santa<sup>4</sup>, K. Hensel-Koch<sup>5</sup>, A. Moriggia<sup>6,7</sup>, C. Scheidegger<sup>8</sup>

<sup>1</sup>Department of Infectious Diseases and Infection

Prevention, Cantonal Hospital Aarau, Aarau, Switzerland,

<sup>2</sup>Arud Centre for Addiction Medicine, Zurich, Switzerland,

<sup>3</sup>Private Practice, Lausanne, Switzerland, <sup>4</sup>Fondation

Phénix, Geneva, Switzerland, <sup>5</sup>Stiftung Suchthilfe, St. Gallen,

Switzerland, <sup>6</sup>Ingrado Servizi per le Dipendenze, Lugano,

Switzerland, <sup>7</sup>Epatocentro Ticino SA, Lugano, Switzerland,

<sup>8</sup>Independent, Basel, Switzerland

**Background:** To end the HIV/AIDS-epidemic by 2030, until 2025, 95% of all people who live with HIV (PWLH) should be diagnosed, thereof 95% on antiretroviral treatment (ART) and thereof 95% virologically suppressed ("95-95-95"-targets of UNAIDS). To reach HCV-elimination by 2030, the WHO aims at 90% of chronic hepatitis C (CHC) patients diagnosed and 80% treated. We wanted to describe the current state of HIV and HCV elimination among patients of the Swiss Association for the Medical Management in Substance Users (SAMMSU)-cohort.

**Methods:** The SAMMSU-cohort is an open cohort with yearly follow-up, enrolling >18-year-old patients with current or previous OAT in eight different centers throughout Switzerland since 2014.

**Results:** Between 2014 and 02/01/2024, 1390 patients have been enrolled (76% male, median age: 44 years, 75% ever intravenous drug use). HIV-serostatus was known for 99.8% (1387): 9.9% (137/1387) HIV-antibody-positive. 98.5% (135/137) were on ART, and thereof 99.3% (134) fully suppressed. HIV-RNA-prevalence was 2.2% (3/137) in PWLH and 0.2% (3/1390) in the whole cohort. The number of HIV first diagnoses dropped from 37 in the five-year-period 1999-2003 to zero in 2019-2023 (last HIV first diagnosis in 2015).

The HCV-serostatus was known for 99.7% (1386/1390) and HCV-RNA available for 97.4% (826/848) of the HCV-antibody-positive patients. HCV-antibody-prevalence was 57.5% in HIV-negative and 94.9% in HIV-positive patients ( $p < 0.001$ ). In PWLH, chronification was more frequent (86.2% versus 77.2%,  $p = 0.022$ ), while treatment-uptake was lower (78.6% versus 87.9%,  $p = 0.009$ ). With direct-act-

ing antivirals, cure rates were 97%, irrespective of HIV-serostatus. Accordingly, HCV-RNA prevalence was higher in HIV-positive compared to HIV-negative patients, i.e. 11.7% (16/137) versus 5.4% (68/1250),  $p = 0.004$ ; overall: 6.0% (84/1390). The number of HCV first diagnoses dropped from 155 in the five-year-period 2009-2013 to 38 in 2019-2023 (32/38 diagnosed at or before enrolment).

**Conclusions:** The "95-95-95"-HIV-targets are already met in OAT patients from the SAMMSU-cohort. There were no new HIV diagnoses since eight years.

With CHC diagnosis and cure rate at >95%, and treatment-uptake of 90% for HIV-negative and nearly 80% for HIV-positive people, WHO targets are reached within the SAMMSU-cohort.

However, ongoing enrolment of patients with newly diagnosed HCV demonstrates that micro-elimination, but not yet macro-elimination is achieved.

## THPEC149

### Prevalence of naturally occurring lenacapavir-related drug resistance mutations in antiretroviral therapy-naïve and experienced individuals in Taiwan: an in-silico analysis

N.-Y. Chen<sup>1</sup>, C.-Y. Cheng<sup>2</sup>, C.-J. Yang<sup>3</sup>, S.-H. Lo<sup>4</sup>, P.-L. Lu<sup>4</sup>, H.-C. Tsai<sup>5</sup>, T.-S. Wu<sup>1</sup>, C.-Y. Tseng<sup>6</sup>, Z.-H. Liu<sup>1</sup>, S.W.-W. Ku<sup>7</sup>

Province of China, <sup>2</sup>Taoyuan General Hospital, Taoyuan,

Taiwan, Province of China, <sup>3</sup>Far Eastern Memorial Hospital,

New Taipei City, Taiwan, Province of China, <sup>4</sup>Kaohsiung

Medical University Chung-Ho Memorial Hospital,

Kaohsiung, Taiwan, Province of China, <sup>5</sup>Veterans General

Hospital, Kaohsiung, Taiwan, Province of China, <sup>6</sup>Mackay

Memorial Hospital, Hsinchu, Taiwan, Province of China,

<sup>7</sup>Taipei City Hospital Ren-Ai Branch, Taipei, Taiwan, Province of China

**Background:** Previous genotypic analysis of 1,500 clinical samples from a population of People with HIV (PWH) indicated an absence of naturally occurring resistance mutations to the capsid inhibitor Lenacapavir. This finding is noteworthy as the conventional HIV genotyping does not include the CA region, resulting in limited surveillance data.

Prior to the expanded clinical use of Lenacapavir and its introduction in Taiwan, it is crucial to gain a comprehensive understanding of the prevalence of naturally occurring Lenacapavir-related drug resistance mutations (DRMs).

**Methods:** Since 2017, clinical specimens submitted for HIV-1 genotyping to the Infection Department Laboratory at Chang Gung Memorial Hospital in Taiwan have been sequenced using near-full length next-generation sequencing, forming a local HIV-1 sequence database. In this study, we retrospectively screened the database for CA mutations potentially associated with resistance to

abstracts

Author  
Index

Lenacapavir, specifically at positions L56, N57, M66, Q67, K70, N74, and T107. Variants with a population exceeding 1% were selected for analysis.

**Results:** The database contained a total of 278 CA sequences from clinical HIV-1 RNA samples, including 152 from antiretroviral therapy (ART)- naïve and 126 from ART-experienced individuals. Mutations at the 7 sites were rare, occurring in 3.3% (5/152) of ART-naïve and 5.6% (7/126) of ART-experienced cases, with most being either accessory mutations or common polymorphisms (Table). Notably, a Q67H mutation was found in an ART-naïve case with a frequency of 26.8%, and a Q67R mutation with uncertain clinical impact appeared at a low frequency of 2.8% in an ART-experienced case.

## Healthcare challenges and interventions in pre-trial detention centers in Venezuela

M. Comegna<sup>1</sup>, E. El Hage<sup>1</sup>, J. Gonzalez<sup>1</sup>, N. Perez<sup>1</sup>,  
J. Gonzalez<sup>1</sup>, O. Escobar<sup>1</sup>, A. Comegna<sup>1</sup>

<sup>1</sup>Once Trece Foundation, Caracas, Venezuela, Bolivarian Republic of

**Background:** In Venezuela, pre-trial detention centers, originally intended for brief holding periods, often detain individuals far beyond the normative 48 hours, with some awaiting trial for up to 10 years. This prolonged detention, in facilities not designed for long-term occupancy, leads to severe overcrowding and deteriorating physical conditions for detainees. From January 2021 to October 2023, healthcare was provided to 3975 detainees in 60 such centers, focused on providing healthcare to detainees, who were the primary population of interest, without considering other high-risk groups.

**Methods:** This was a cross-sectional, observational study conducted in 60 pre-trial detention centers across 9 Venezuelan states (Miranda, Vargas, Zulia, Bolívar, Nueva Esparta, Carabobo, Aragua, Anzoátegui, Distrito Capital) from January 2021 to October 2023. The study involved 3975 detainees, with the age distribution as follows: <19

(0.69%), 19-25 (24.31%), 26-35 (36.81%), 36-45 (19.1%), and >46 (19.1%), with an average age of 34 years, where 422 women (10.6%), 3550 men (89.3%), and 10 transgender women. HIV screening involved initial 3rd generation rapid tests, followed by confirmatory 4th generation rapid tests. Confirmed HIV-positive individuals underwent viral load testing.

The study also assessed the prevalence of tuberculosis using GeneXpert, along with other common health conditions like scabies, musculoskeletal pain, and skin diseases. Interventions included medical treatment and linkage to local healthcare services for those requiring ongoing care, particularly for HIV and tuberculosis.

**Results:** Out of 3975 detainees, 53 (1.33%) tested HIV positive. The distribution was 3 women (0.71% of the female population), 49 men (1.38% of the male population), and 1 transgender woman. There were 118 TB cases identified, with no HIV-TB. Health issues included scabies (27.5%, 1093 cases), musculoskeletal pain (25.2%), skin diseases (14%, 556 cases), and other STIs (7%). Comprehensive health-care was provided for respiratory symptoms, dermatological conditions, and musculoskeletal pain, along with preventive measures like deworming.

**Conclusions:** This intervention in Venezuelan pre-trial detention centers highlighted significant health challenges, including the prevalence of HIV and TB, under conditions of severe overcrowding and prolonged detention. The study emphasizes the necessity of continuous healthcare provision and highlights the unique healthcare needs of detainees as a key population in HIV epidemiology.

# THPEC151

## Characteristics of sexual assault survivors at Ogun State sexual assault referral center; implication for HIV transmission

A. Gbadebo<sup>1</sup>, E. Jaiyesimi<sup>1</sup>, O. Sholeye<sup>1</sup>, O. Orelaja<sup>2</sup>

<sup>1</sup>Olabisi Onabanjo University Teaching Hospital, Sagamu, Department of Community Medicine and Primary Care, Ogun State, Nigeria; <sup>2</sup>Ministry of Women Affairs, Sexual Assault Referral Center, Abeokuta, Nigeria

**Background:** Despite the high prevalence of sexual assault globally, survivors in the Sub-Saharan Africa rarely present for care, and when they do they come after the 72-hour window period for accessing post exposure prophylaxis (PEP) for HIV, hence increasing the risk of heterosexual transmission of HIV. This study aims to report the characteristics of sexual assault survivors that were managed at the Ogun State Sexual Assault Referral Centre (SARC); and implication for HIV transmission.

**Methods:** This is a retrospective study of survivors of sexual assault that presented at Ogun State SARC between October 2021 and November 2023. Data was retrieved from facility case files and analyzed using SPSS Version 23.0. Informed consent and confidentiality were ensured.

**Results:** A total of 83 sexual assault survivors accessed the services at Ogun State SARC. All survivors in the study were female, and were between the ages of 2 years and 54 years. The mean age was  $18.8 \pm 11.3$  years, and survivors were highest in the age group 11-20 years (53%). The most reported variant of sexual assault was defilement (64%). Sexual act was without protection in 72% of cases, and was committed by more than one perpetrator in 8.4% of cases. Only 56% survivor presented within 72 hours of assault and were able to access HIV PEP.

**Conclusions:** The majority of survivors of sexual assault in this study were adolescents and young female adults with most of them accessing care after the 72-hour window for commencement of PEP. As such, there is a need for increased awareness among this age groups about sexual assault and the activities of SARC in providing care for survivors of such assault in order to minimize the risk of HIV transmission.

## THPEC152

Social determinants of health associated with in-hospital mortality: a cohort study of 13,999 AIDS hospitalizations in low-income individuals in Brazil

P. Pinto<sup>1,2</sup>, A. Silva<sup>1,2</sup>, I. Lua<sup>3</sup>, G. Jesus<sup>1,2</sup>, L. Magno<sup>4</sup>, C. Santos<sup>2</sup>, M.Y. Ichihara<sup>2</sup>, M. Barreto<sup>1,2</sup>, L.E. Souza<sup>1</sup>, J. Macinko<sup>5</sup>, I. Dourado<sup>1</sup>, D. Rasella<sup>6</sup>

<sup>1</sup>Institute of Collective Health, Federal University of Bahia (ISC/UFBA), Salvador, Brazil, <sup>2</sup>Centre for Data and Knowledge Integration for Health (CIDACS), Oswaldo Cruz Foundation (Fiocruz), Salvador, Brazil, <sup>3</sup>State University of Feira de Santana (UEFS), Department of Health, Feira de Santana, Brazil, <sup>4</sup>State University of Bahia (UNEB), Department of Life Sciences, Salvador, Brazil, <sup>5</sup>Fielding School of Public Health of University of California (UCLA), Departments of Health Policy and Management and Community Health Sciences, Los Angeles, United States, <sup>6</sup>Instituto de Salud Global de Barcelona, Barcelona, Spain

**Background:** Social Determinants of Health (SDH) like socioeconomic, household, and geographic factors are significantly associated with AIDS-related outcomes. The aim of this study was to assess the association between different SDH on in-hospital AIDS mortality rate.

**Methods:** In this cohort study we used a sample of the low-income population who applied for government social programs and entered between January 1, 2008 to December 31, 2018 in The 100 Million Brazilian Cohort linked to: nationwide HIV/AIDS hospitalization and mortality records. We performed a multivariable Poisson regression analysis using a hierarchical approach to estimate the relationship between SDH — at the individual and familial level — on in-hospital AIDS mortality rate.

**Results:** We followed-up 13,999 individuals hospitalized due to AIDS, among whom 2,196 (15.69%) experienced in-hospital mortality, resulting in a mortality rate of

6.38/100 persons-years (PY) (95% CI 6.11-6.65). Among those who died from AIDS while hospitalized, 56.23% (1,235/2,196) were men and 79.55% (1,747/2,196) were aged between 20-59 years. The mean length of stay for the hospitalizations was 15.13 days (SD 17.23). Beyond older age, various factors were associated with higher in-hospital AIDS mortality: living in the North Region — the most sparsely populated region in Brazil (RR 1.94; 95% CI 1.38-2.71); lower wealth (RR 1.24; 95% CI 1.02-1.52); lower educational attainment (RR 1.23; 95% CI 1.06-1.42); living in houses built with sub-standard construction materials (RR 1.22; 95% CI 1.04-1.44); Black skin color (RR 1.21; 95% CI 1.02-1.44) and, Pardo (brown/mixed) skin color (RR 1.17; 95% CI 1.03-1.32).

**Conclusions:** In a low-income Brazilian population we found that those with even greater social vulnerability i.e., living in a precarious situation and in remote areas, with extreme poverty, less education, and, Black or Pardo people — highlighting the harmful permanence of racism in the country — had higher in-hospital AIDS mortality. Given this inequity, social policies that have the potential to minimize the effects of SDH, such as conditional cash transfer programs (in addition to early diagnosis and greater access to health and antiretroviral treatment), should be considered important tools for reducing AIDS mortality, especially in low- and middle-income countries.

## Surveillance: Measuring the HIV pandemic

### THPEC154

Can routine antenatal data be used to assess HIV antiretroviral therapy coverage among pregnant women? Evaluating the validity of different data sources in the Western Cape, South Africa

N. Jacob<sup>1</sup>, B. Rice<sup>2</sup>, A. Heekes<sup>1</sup>, L.F. Johnson<sup>1</sup>, S. Brinkmann<sup>3</sup>, T. Kufa<sup>4</sup>, A. Boule<sup>1,3</sup>

<sup>1</sup>University of Cape Town, Public Health, Cape Town, South Africa, <sup>2</sup>University of Sheffield, London, United Kingdom, <sup>3</sup>Western Cape Government: Health and Wellness, Cape Town, South Africa, <sup>4</sup>Center for HIV and STI, National Institute for Communicable Diseases, Cape Town, South Africa

**Background:** Accurate measurement of antenatal antiretroviral treatment (ART) coverage in pregnancy is imperative in tracking progress towards elimination of vertical HIV transmission. In the Western Cape, South Africa, public-sector individual-level routine data are consolidated from multiple sources, enabling the description of temporal changes in population-wide antenatal antiretroviral coverage. We evaluated the validity of different methods for measuring antenatal ART coverage.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Methods:** We compared self-reported ART data from a 2014 antenatal survey with laboratory data from a sub-sample within the survey population. Thereafter, we conducted a retrospective cohort analysis of all pregnancies consolidated in the Provincial Health Data Centre (PHDC) from January 2011 to December 2020. Evidence of antenatal and HIV care from electronic platforms were linked using a unique identifier. ART coverage estimates were triangulated with available antenatal survey estimates, aggregated programmatic data from registers recorded in the District Health Information System (DHIS) and Thembisa modelling estimates.

**Results:** Self-reported ART in the 2014 antenatal survey (n=1434) had high sensitivity (83.5%), specificity (94.5%) and agreement ( $k=0.8$ ) with the gold standard of laboratory analysis of ART. Based on linked routine data, ART coverage by the time of delivery in mothers of live births increased from 67.4% in 2011 to 94.7% by 2019. This pattern of increasing antenatal ART coverage was also seen in the DHIS data, and Thembisa model, but was less consistent in the antenatal survey data. Higher ART coverage before pregnancy was observed in older age groups (Figure 1).

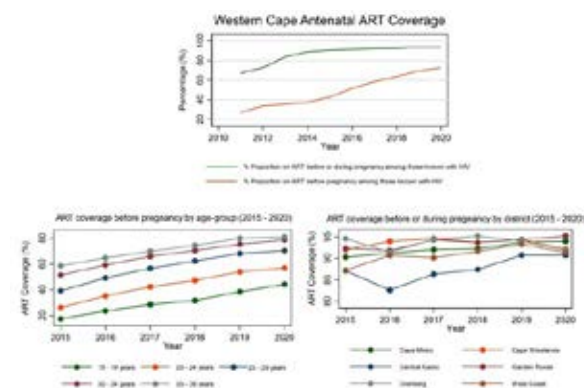

Figure 1. Temporal trends in antenatal ART coverage in the Western Cape by timing, district and age (PHDC).

**Conclusions:** This study is the first in a high-burden HIV setting to compare sentinel ART surveillance data with consolidated individuated administrative data. Although self-report in survey conditions showed high validity, more recent data sources based on self-report and medical records may be uncertain with increasing ART coverage over time. Linked individuated data offers a promising option for ART coverage estimation with greater granularity and efficiency.

## THPEC155

### Estimating the proportion and number of people with indications for HIV pre-exposure prophylaxis (HIV-PrEP) by key population, Canada, 2020

Q. Yang<sup>1</sup>, H.-X. Wu<sup>1</sup>, J. Elliott<sup>1</sup>, A. Williams<sup>1</sup>, L. Campeau<sup>1</sup>, H. Apelian<sup>1</sup>, N. Lachowsky<sup>2</sup>, B. Klassen<sup>2</sup>, M. Wong<sup>1</sup>, M. Gatali<sup>1</sup>, N. Popovic<sup>1</sup>

<sup>1</sup>Public Health Agency of Canada, Ottawa, Canada,

<sup>2</sup>Community Based Research Centre, Vancouver, Canada

**Background:** HIV-PrEP is a highly effective intervention that reduces the risk of acquiring HIV and is recommended for individuals at ongoing and increased HIV risk exposure. In Canada, two key populations most affected by HIV are gay, bisexual, and other men who have sex with men (gbMSM) and people who inject drugs (PWID).

**Methods:** We analyzed national data from surveys (CCHS 2015-2016, Sex Now 2019 and 2021, EMIS 2017, PWID Track 2010-2012, PWID Track 2017-2019) to determine the proportion of gbMSM and PWID with HIV-PrEP indications. Indications were based on Canadian PrEP guidelines (for example: number of sex partners, inject drug use, condom use, STI and etc). We first applied these proportions to the most recent gbMSM and PWID population size estimates developed by PHAC. We then examined the proportion of people with HIV-PrEP indications who were aware of it. Among these, we calculated the proportion of those actually taking it.

**Results:** Approximately 20.0% of gbMSM (81,015, 95% CI: 45,368-133,674) and 12.8% of PWID (11,558, 95% CI: 9,662-13,726) had indications for HIV-PrEP. According to the Sex Now online survey (2019 and 2021), 94% of gbMSM participants with HIV-PrEP indications were aware of it. Among them, 36.6%-44.2% had ever taken it and a further 31.2%-33.1% were taking it at the time of survey. From PWID Tracks 2017-2019 surveys, 10.0% of participants with HIV-PrEP indications knew about it, and of those 10.0% had ever taken it, and none were taking it at the time of survey.

**Conclusions:** The estimated gbMSM and PWID with HIV-PrEP indications far exceeds the number of people (all population) actually taking it in Canada estimated by PHAC from IQVIA database. Given the difference between knowledge and uptake of HIV-PrEP among gbMSM and PWID populations, this illustrates that more must be done to improve access (particularly for PWID).

## THPEC156

### Self-transfers among clients receiving HIV antiretroviral treatment in Zimbabwe, 2013-2023: findings from the national HIV case surveillance of Zimbabwe

T.H. Dinh<sup>1</sup>, K. Milligan<sup>1,2</sup>, M. Muzamhindo<sup>3</sup>, T. Chiguvare<sup>3</sup>, M. Mhangara<sup>4</sup>, J. Dzangare<sup>5</sup>, S. Chaputsira<sup>6</sup>, F. Lee<sup>1</sup>, F. Mutsigiri-Mrewanhema<sup>6</sup>, B. Moyo<sup>5</sup>, T. Apollo<sup>5</sup>, C. Muserere<sup>6</sup>, The National HIV Case Surveillance Technical Working Group of Zimbabwe

<sup>1</sup>US Centers for Disease Control and Prevention/Global Health Center, Division of Global HIV and Tuberculosis, Atlanta, United States, <sup>2</sup>Peraton Inc., Reston, United States, <sup>3</sup>US Centers for Disease Control and Prevention/Global Health Center, Division of Global HIV and Tuberculosis, Harare, Zimbabwe, <sup>4</sup>US Agency for International Development, Harare, Zimbabwe, <sup>5</sup>Zimbabwe Ministry of Health and Child Care, AIDS and TB Unit, Harare, Zimbabwe, <sup>6</sup>Zimbabwe Technical Assistance, Training & Education Center for Health, Harare, Zimbabwe

**Background:** Self-transferring between HIV antiretroviral treatment (ART) clinics among clients with HIV poses challenges for HIV programs, including misclassification of clients in care as lost to follow-up (LTFU). In Zimbabwe, each client enrolled in HIV care-and-treatment is assigned a unique national HIV antiretroviral number (UAN) that should be retained when transferring clinics.

Using the national HIV case surveillance (NCS) data, an individual-level dataset of people living with HIV from diagnosis throughout the continuum of care, we report trends and the extent of self-transferring among newly initiated ART clients (ARTC) in Zimbabwe, 2013-2023.

**Methods:** We analyzed data from clients who initiated ART between 1/1/2013 and 9/30/2023 with at least six-month follow-up from 44 districts across 10 provinces in Zimbabwe.

We defined a transfer as receiving HIV services at multiple clinics, and a self-transfer as a transfer without a documented transfer status and with  $\geq 2$  UANs used.

**Results:** Of 721,044 newly initiated ART, 71,909 (10%) attended  $\geq 2$  clinics with 57,672 (80%) of these identified as self-transfers as defined above.

Among all transfers, the proportion of self-transfers increased from 2013 (65%) to 2019 (86%) but decreased during the COVID-19 pandemic from 74% in 2020 to 66% in 2022 (Figure 1).

Self-transfers primarily moved to clinics within the same province [31% (Mashonaland-East)-85% (Bulawayo)].

The highest proportion of self-transfers moving to clinics in neighboring provinces sharing a border was 40% (Matabeleland South-Matabeleland North), and provinces without common borders was 48% (Bulawayo-Midlands). Of all clients who self-transferred, 71% were female, 41% were 25-34 years of age, and 60% were married/co-habitant ARTCs.

Figure 1. Trends of clinic transferring among patients with HIV receiving HIV antiretroviral treatment, Zimbabwe, 2013-2023.

**Conclusions:** Among those moving out of their initial ART clinics, 80% could be misclassified as LTFU. Prioritizing an online health information exchange system across clinics at each province may help track self-transfers. Additional studies to understand this population might help tailor pre-treatment counselling or service packages to reduce self-transferring.

## THPEC157

### Trends and characteristics of newly diagnosed HIV individuals aged 15 years and older, October 2019 to September 2023: findings from the National HIV Case Surveillance in Zimbabwe

M. Muzamhindo<sup>1</sup>, F. Lee<sup>2</sup>, B. Moyo<sup>3</sup>, S. Chaputsira<sup>4</sup>, J. Dzangare<sup>3</sup>, F. Mutsigiri-Mrewanhema<sup>4</sup>, N. Marimo<sup>3</sup>, T. Chiguvare<sup>1</sup>, C. Muserere<sup>4</sup>, G. Ncube<sup>3</sup>, T.-H. Dinh<sup>2</sup>, The national HIV Case Surveillance Working Group of Zimbabwe

<sup>1</sup>US Centers for Disease Control and Prevention/Global Health Center, Division of Global HIV and Tuberculosis, Harare, Zimbabwe, <sup>2</sup>US Centers for Disease Control and Prevention/Global Health Center, Division of Global HIV and Tuberculosis, Atlanta, United States, <sup>3</sup>Zimbabwe Ministry of Health and Child Care, AIDS and TB Unit, Harare, Zimbabwe, <sup>4</sup>Zimbabwe Technical Assistance, Training & Education Center for Health, Harare, Zimbabwe

**Background:** Characterizing HIV acquisition is crucial to understanding the HIV epidemic and developing effective prevention strategies. We described HIV epidemic trends and estimated time from acquisition to diagnosis (TFATD) of newly diagnosed people living with HIV (NDx-PLWH) aged  $\geq 15$  years reported to the national HIV Case Surveillance (NCS), October 2019 to September 2023.

**Methods:** Of 145,916 PLWH aged  $\geq 15$  years diagnosed during the study period, we excluded 5,691 (4%) on HIV treatment before the diagnosis date. For 7,653 multifacility re-testers (5%), data from the first diagnosis were included. TFATD was estimated by halving the difference between last known HIV-negative test and HIV diagnosis dates.

Binomial logistic regression models were used to estimate the adjusted odds ratio (aOR) and 95% confidence intervals (95%CI) of factors associated with TFITD within six months (TFITD\_6mths).

**Results:** Data from 140,225 NDx-PLWH from 44 districts throughout 10 provinces of Zimbabwe were analyzed. NDx-PLWH decreased from Quarter 3, 2019 to Quarter 3, 2023, with a notable decrease in Quarter 2, 2020 during the COVID-19 pandemic. The female to male ratio (2:1) and the difference by age—highest proportion for 25–34 group (34%)—remained the same across quarters. (Figure 1) Of 32,983 (24%) NDx-PLWH with a last known HIV-negative result, 12,471 (38%) had estimated TFITD-6mths. Females (aOR 1.3; 95%CI 1.2–1.4), NDx-PLWH aged 15–24 (aOR 3.25; 95%CI 2.8–3.8), married/co-habitant NDx-PLWH (aOR 1.2; 95%CI 1.1–1.2), or never married (aOR 1.2; 95%CI 1.1–1.4) had higher odds of having TFATD-6mths compared to reference groups.

Figure 1. Trends of Newly Diagnosed People Living with HIV by Gender and Age Group, Zimbabwe, October 2019 to September 2023

**Conclusions:** The decrease in NDx-PLWH aged  $\geq 15$  from 2019–2023 indicates Zimbabwe is on track towards HIV epidemic control. Further analysis of gender and age differences among NDx-PLWH could help develop prevention strategies to reduce new acquisitions. Additional approaches for estimating HIV incidence among NDx-PLWH without any HIV-negative test results before acquiring HIV could be explored.

## THPEC158

Ten-year trends in the prevalence and incidence of HIV and syphilis among key populations in Vietnam, 2012–2022

D.C. Thanh<sup>1</sup>, P.T.T. Huong<sup>2</sup>, B.H. Duc<sup>2</sup>, D.T. Lo<sup>2</sup>, P.H. Thang<sup>3</sup>, H.T.T. Ha<sup>3</sup>, N.T.T. Ha<sup>3</sup>, K.V. Nghia<sup>4</sup>, T.P. Hau<sup>4</sup>, N.V. Thuong<sup>4</sup>, N.D. Phuc<sup>4</sup>, N.C. Quoc<sup>1</sup>, N.H. Minh<sup>1</sup>, A. Mirzazadeh<sup>5</sup>, W. McFarland<sup>5</sup>, P.D. Manh<sup>2</sup>

<sup>1</sup>US. CDC Vietnam, Division of HIV and TB, Ha Noi, Viet Nam,

<sup>2</sup>Vietnam Administration of HIV/AIDS Control, Ministry of Health, Ha Noi, Viet Nam, <sup>3</sup>National Institute of Hygiene and Epidemiology, Ha Noi, Viet Nam, <sup>4</sup>Pasteur Institute of Ho Chi Minh City, Ho Chi Minh City, Viet Nam, <sup>5</sup>Institute for Global Health Sciences, University of California San Francisco, Epidemiology and Biostatistics, San Francisco, United States

**Background:** The HIV epidemic in Vietnam is concentrated among key populations (KP), including men who have sex with men (MSM), people who inject drugs (PWID), and

female sex workers (FSW). This study aims to describe the magnitude and trends in HIV prevalence and incidence, and syphilis prevalence, among these KP between 2012–2022 to inform future public health programming.

**Methods:** Annual repeated cross-sectional surveys were conducted using venue-based sampling from 2012 to 2022 in 39 provinces of Vietnam. Participants provided blood samples for HIV (using strategy III for confirmation) and active syphilis testing (screening by rapid plasma reagin and confirming by *Treponema pallidum* hemagglutination).

The Osmond's Algorithm was used to estimate HIV incidence rates based on previous self-reported test results and history of risk behaviors. Cochran-Armitage trend test for proportions was used.

**Results:** From 2012 to 2022, 76,707 participants (13,518 MSM; 39,846 male PWID; and 33,121 FSW) participated in the surveys. Among MSM, HIV prevalence increased from 2.4% in 2012 to 12.5% in 2022 (p-value for trend <0.05), and HIV incidence increased from 0.62 to 2.82 per 100 person-years (py) (p < 0.001). Among male PWID, HIV prevalence varied from 10.2% to 14.2% with no significant trend in either direction, whereas HIV incidence decreased from 2.11 to 1.16 per 100 py (p=0.001) over the study period.

Among FSW, HIV prevalence varied between 1.8% and 3.6%, while HIV incidence varied from 0.64 to 0.35 per 100 py with no significant trend in either indicator. Syphilis prevalence increased in all three groups: MSM (0.8% to 8.9%), male PWID (0.8% to 2.0%), and FSW (0.4% to 2.2%) (all p<0.05).

**Conclusions:** The increase in HIV prevalence and incidence among MSM warrant implementation science and operational research to identify the best way to increase the uptake of PrEP and other prevention interventions for this population.

While HIV prevalence remains high among PWID and low and stable among FSW, the observed decline in HIV incidence among PWID and the stable HIV incidence among FSW suggest that existing prevention efforts may be having some impact.

The observed increasing syphilis prevalence highlights the importance of targeted syphilis screening and treatment among all three KP.

## THPEC159

### HIV incidence and risk factors in the era of interventions like oral pre-exposure prophylaxis

S. Kusemererwa<sup>1</sup>, E. Ruzagira<sup>1,2</sup>, S. Kansiime<sup>3</sup>, S. Ssendagire<sup>1</sup>, S. Nabukenya<sup>1</sup>, D.J. Asio<sup>1</sup>, M. Onyango<sup>1</sup>, P. Kaleebu<sup>1,2</sup>, PrEPVacc Study Group

<sup>1</sup>MRC/UVRI and LSHTM Uganda Research Unit, Viral Pathogen Epidemiology and Interventions, Entebbe, Uganda, <sup>2</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>3</sup>MRC/UVRI and LSHTM Uganda Research Unit, Statistics, Entebbe, Uganda

**Background:** Current HIV incidence data is rare and prevention trials have become costly to conduct as HIV combination prevention packages must be provided yet they reduce HIV incidence. We determined HIV incidence and risk factors of acquisition in a HIV vaccine trial preparedness cohort.

**Methods:** Adults (18-45 years) at high risk of HIV acquisition were recruited from sex work venues along the trans-African highway and Lake Victoria fishing communities from July 2018 to October 2022. Consenting individuals were eligible if they tested HIV negative, had a sexually transmitted infection or had had unprotected sex with ≥2 partners or unprotected sex with a new partner in the past 3 months or unprotected sex in exchange for money/goods in the past month. Baseline data collected included demographics, HIV risk and sexual behaviour. Every six months, HIV risk and sexual behaviour was assessed using a standardised questionnaire. HIV counselling and testing (HCT) was provided at baseline and every 3 months. Baseline demographic data was summarised descriptively. HIV incidence was estimated as the number of participants who tested positive for HIV by the person-years (pyr) at risk expressed as per 100 pyr. Univariable and multivariable Poisson regression models were used to assess associations with HIV incidence.

**Results:** Of the 1422 individuals enrolled, 1115 (78.4%) attended ≥1 follow up visit of whom 69% were female, 55% ≤ 24 years of age. A total of 24 individuals acquired HIV during 900.3 person years of observation (PYO), an overall incidence rate (IR) of 2.7 PYO [95% Confidence Interval (CI): 1.8-4.0]. Female gender [adjusted incidence rate ratio (aIRR)=6.84 PYO, 95% CI 1.60-29.30], residing in fishing communities [aIRR=3.04 PYO, 95% CI 1.05-8.78] and use of recreational drugs in the past 3 months [aIRR=3.08 PYO, 95% CI 1.19-7.99] were baseline characteristics associated with incident HIV. During follow up, having sex after consuming alcohol [aIRR= 2.65 PYO, 95% CI 1.11-6.31], an STI diagnosis/treatment in the past 3 months [aIRR=2.52 PYO, 95% CI 1.09-5.80] were associated with HIV acquisition.

**Conclusions:** HIV incidence remains high especially among women despite available interventions like oral PrEP.

## THPEC160

### Development of the South African HIV prevention cascades using a standardized approach across four prevention methods

T. Chidarikire<sup>1</sup>, A. Mumbauer<sup>2</sup>, R. Fritz<sup>2</sup>, N. Khoza<sup>3</sup>

<sup>1</sup>World Health Organisation, Pretoria, South Africa,

<sup>2</sup>National Department of Health Operation Phutuma Team, Pretoria, South Africa,

<sup>3</sup>National Department of Health, Pretoria, South Africa

**Background:** In South Africa, annual HIV transmissions must fall below 40,000 to achieve 2030 global targets. The National Department of Health developed standardized HIV prevention cascades to drive progress towards this target.

**Methods:** We used the UNAIDS prevention cascade approach, with pillars for focus population, coverage, uptake, and consistent use. Seven prevention methods were evaluated for cascade development based on need, suitability, and data availability. Routine government data sources were used whenever possible. Otherwise, national surveys and models were used.

**Results:** Four prevention methods met the evaluation criteria for cascade development at national and provincial levels of people 15 years and older for the period April 2022-March 2023. Of 25,826,383 sexually active people, 14,921,781 were reached with government-distributed condoms, 5,804,573 used condoms at last sex, and 1,631,085 used condoms consistently. Of 8,907,461 people at high risk of acquiring HIV, 1,175,293 ever started oral PrEP and 593,148 were remaining on oral PrEP in March 2023. Oral PrEP cascades were disaggregated for men who have sex with men, female sex workers, transgender women, and adolescent girls and young women. Of 75,701 people who inject drugs, 37,851 had access to opioid substitution therapy (OST), 30,280 were initiated on OST, and 24,224 were on OST for at least six months. Of 6,917,608 HIV negative uncircumcised men, 2,690,950 wanted to be circumcised, 254,019 were circumcised, and 195,595 attended a post-operative visit.

**Conclusions:** To our knowledge, this is the first time national South African cascades for multiple prevention methods were created using a standardized approach and routine data. Our greatest limitation was not being able to use a single routine data source, which resulted

in combining multiple data sources into each cascade. However, discussions with program managers revealed the cascades to be useful tools for planning, advocacy, target setting and understanding gaps across pillars.

## THPEC161

High proportion of recent HIV infections among women, adolescents and young people: an analysis of recency testing data in Zambia

D. Mwamba<sup>1</sup>, L. Cuccio<sup>2</sup>, M. Musonda<sup>1</sup>, A. Ndhlovu<sup>2</sup>, L. Bailey<sup>1</sup>

<sup>1</sup>USAID, Health Office, HIV/TB Division, Lusaka, Zambia,

<sup>2</sup>John Snow Inc, Lusaka, Zambia

**Background:** Recency assays use one or more biomarkers to identify whether HIV infection in a person is recent (usually within a year or less) or longstanding. Recency assays have been used to estimate incidence in representative cross-sectional surveys and in epidemiological studies to better understand the patterns and distributions of new and longstanding HIV infections. In Zambia the recency testing program was launched in 2020 and over 120,000 samples have been tested cumulatively.

We analyzed recency data to better understand the transmission patterns of HIV across geographical areas and subpopulations and to monitor the proportion of the population living with HIV who are diagnosed early versus late in infection.

**Methods:** Recency tests data from 6 provinces in Zambia between 2020 and 2023 was extracted from HIV case based surveillance database. Records that were found to be recent by the screening test but did not have the confirmatory test result were excluded. The PEPFAR Monitoring, Evaluation and Reporting version 2.7 definition was used to assign recency result as binary variable (recent or long-term) after the confirmatory test result came back. We further analyzed results by sex, age category and testing delivery entry point.

**Results:** Recent infections were 1,747 (3.4 %) out of a total 51,749 tests done. Females were found to be having a recent infection in 3.8 % of samples as opposed to males (2.7 %). The entry point with highest percentage was PMTCT (4.6 %) and lowest was index testing (2.9 %). Younger ages were associated with a higher proportion (15-19 years at 8.0 %; 20-24 years at 5.6 %, compared to 40-44 years at 2.2 % and 45-49 years at 1.8 %).

**Conclusions:** This analysis revealed that adolescent and young people and females of reproductive age are found with recent HIV infection in Zambia. This data correlates with findings from the 2021 Population based HIV Impact Assessment that shows high HIV incidence among female, adolescent and young people. While further analyses are needed to better understand social demographic factors linked with HIV transmission in this population, findings from this study justifies the urge to scale up age and population specific HIV prevention.

**Background:** Definitions of retention in HIV care vary substantially. The South African Department of Health defines disengagement as being 90+ days late for antiretroviral treatment pick-up. However, some individuals have brief periods of care disruption that do not meet this threshold. Unique definitions of retention highlight various aspects of care journeys and may be important to the development of cost-efficient engagement interventions.

**Methods:** We extracted health records for individuals initiating HIV care at 6 public health care clinics in KwaZulu-Natal Province, South Africa between March 2021-September 2022. Loss-to-clinic was estimated using three distinct definitions: >14 days, >30 days and >90 days late to an individual's last scheduled appointment on or before the individual's 6-month anniversary of enrolment into care. Descriptive statistics were used to characterize outcomes overall and by clinic.

**Results:** 2,462 individuals were included from 5 urban facilities and 1 rural facility. A majority of individuals were female (n=1528; 62.2%); median age was 32 (IQR: 26-38 years). Approximately 42% of individuals (n=1043; 95% CI: 41.4, 43.4) were >14 days late, 35% (n=863; 95% CI: 34.1, 36.0) >30 days late, and 30% (n=726; 95% CI: 28.6, 30.4) >90 days late in the population overall. Among those who were >14 days late, 17.2% returned by day 30 and 30.4% by day 90. Variability in absolute proportions of lost-to-clinic varied across clinics, but patterns based on definitions were largely similar.

**Conclusions:** Overall, 42% of individuals were >14 days late to care with many returning before day 30. As such, resource-intensive interventions (e.g. tracking and tracing) may be most warranted after 30-day lapses since many people naturally return prior to this. This underscores the importance of leveraging unique retention definitions to inform cost-efficient engagement interventions. Future research should investigate true longitudinal engagement outcomes to further enrich our understanding of this crucial treatment outcome.

Justman<sup>6</sup>, G. Madonsela<sup>2</sup>, C.A. West<sup>5</sup>

<sup>1</sup>US Centers for Disease Control and Prevention, Division of Global HIV and TB, Mbabane, Eswatini, <sup>2</sup>Ministry of Health, Mbabane, Eswatini, <sup>3</sup>ICAP at Columbia University, Mbabane, Eswatini, <sup>4</sup>Central Statistical Office, Mbabane, Eswatini, <sup>5</sup>US Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States, <sup>6</sup>ICAP at Columbia University, New York, United States

**Background:** Antiretroviral therapy (ART) scale-up in the 'test and treat' era has led to a global decline in advanced HIV disease (AHD), defined as CD4 <200 cells/μL. However, early mortality among people living with HIV (PLHIV) with AHD remains an issue in high burden countries in sub-Saharan Africa.

We examined trends in AHD using data from population-based HIV impact assessments in Eswatini (SHIMS2 & 3) conducted in 2016-17 and 2021.

**Methods:** The analysis was restricted to PLHIV aged 15-80 years tested at the household using the national HIV testing algorithm and who had CD4 and qualitative ARV detection results. Awareness and ART status were based on self-report and detectable ARVs. Viral suppression was

defined as <1000 copies/mL. AHD prevalence overall and stratified by demographic and clinical attributes were compared between survey rounds using 95% confidence intervals and Rao-Scott Chi Square tests. Jackknife method with replicate weights were applied.

**Results:** Among the 3000 and 2893 PLHIV from SHIMS2 & 3, AHD declined significantly overall [7.6% (95% CI:6.6-8.6) to 3.8% (95% CI:3.1-4.4)] and by gender [men: 11.4% (95% CI:9.3,13.5) to 5.8% (95% CI:4.3,7.4); women: 5.6% (95% CI:4.6-6.6) to 2.6% (95% CI:1.9-3.3)]. AHD also declined significantly by age (15-54 years), region, marital status, and education as well as among PLHIV aware of their HIV status, on ART, and virally suppressed (p<0.05). No difference in AHD prevalence was found among PLHIV unaware of their HIV status: 13.4% (95% CI:9.6-17.2) to 12.6 (95% CI:7.2-18.1); or those aware and not on ART: 22.3% (95% CI:12.4-32.2) to 16.1% (95% CI:9.7-22.5). The latter was evident among men compared to women [AHD among aware, not on ART, SHIMS2 to SHIMS3: men 21.5% (95% CI: 9.5, 38.0) to 26.0% (95% CI: 9.6, 42.3) versus women 22.7% (95% CI:10.6, 34.7) to 15.3% (95% CI:8.3, 22.3)].

**Conclusions:** Significant declines of AHD prevalence were noted among PLHIV aware of their HIV status, on ART, and virally suppressed, a trend not observed in those not aware of their status, or aware but not on ART, especially among men. Targeted interventions for this group such as active case finding, linkage, and retention in care are warranted.

(Demobase Copperbelt) for Zambia and Democratic Republic of Congo (DRC) where the most recent population censuses were 2 and 40 years ago respectively.

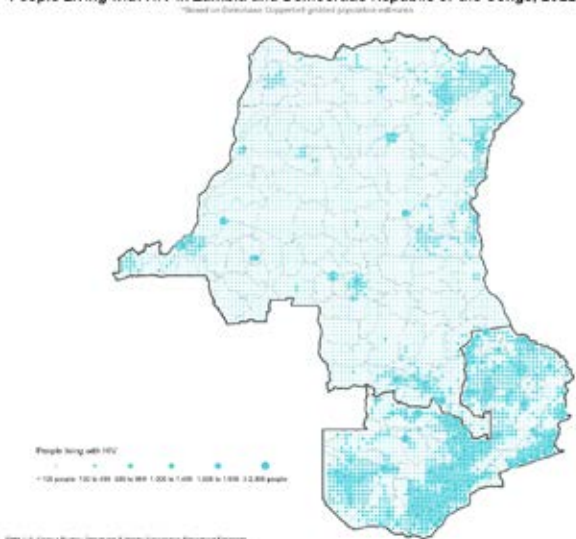

We used these data to derive subnational PLHIV (people living with HIV) for both countries and antiretroviral therapy (ART) coverage estimates for Zambia. We then compared these results to commonly-used data sources, AIDSInfo (national) and Naomi (national and subnational data).

**Methods:** U.S. Census Demobase population and Naomi HIV prevalence estimates were used to derive PLHIV estimates at a 100m<sup>2</sup> resolution for both countries. For Zambia, we used Naomi data to estimate ART coverage by district. We then compared Demobase-derived estimates to Naomi and AIDSInfo PLHIV and ART figures.

**Results:** National Demobase PLHIV estimates were generally lower - and ART coverage estimates higher - than alternative estimates (Naomi/AIDSInfo), though within AIDSInfo estimate bounds. We found congruence between Demobase estimates and alternatives that used a different modeling approach in many, though not all, subnational areas.

		NATIONAL (Estimate [Lower-Upper Bounds])			SUBNATIONAL (Mean [Min-Max])	
		Demobase	Naomi	AIDSInfo	2nd-Order Unit (n)	Demobase Naomi
Zambia	PLHIV (Thousands)	1,375	1,411 [1,367-1,458]	1,400 [1,300-1,500]	District (116)	13 [0.5-383.0] 12 [0.5-275.0]
	ART Coverage (%)	92.3	89.9 [84.6-93.6]	90.0 [86.0-96.0]		92.2 [28.3-190.0] 89.3 [76.3-96.1]
DRC	PLHIV (Thousands)	420	490 [473-511]	490 [400-590]	Health Zone (164)	2 [0.04-42.0] 3 [0.0-95.0]

People Living with HIV in Zambia and Democratic Republic of the Congo, 2022

**Conclusions:** While different population estimation approaches have advantages and disadvantages, the Demobase method is more approachable than some alternatives for countries looking to build internal gridded population estimates. Results between population data alternatives were generally congruent, with implications for utility across countries.

Updated PLHIV and ART coverage figures were respectively lower and higher than Naomi and AIDSInfo estimates for both countries. If accurate, this could indicate that existing PLHIV estimates may need reconsideration in some subnational areas.

**Background:** Viral load suppression (VLS) among people living with HIV (PLHIV), defined as <1,000 copies per milliliter (copies/mL), has been adopted as the routine approach in monitoring the effectiveness of HIV treatment in Tanzania since 2016. However, information on PLHIV with low-level viremia (LLV) and undetectable viral loads is limited.

We analyzed Tanzania HIV Impact Survey (THIS) 2022-2023 data to assess different levels of viral load (VL) to inform HIV programming especially enhancement of treatment adherence among PLHIV in Tanzania.

**Methods:** THIS 2022-2023 was a nationally representative, cross-sectional household survey with stratified, two-stage cluster design. Participants aged ≥15 years were offered rapid HIV testing with subsequent laboratory confirmatory and VL testing. Three VL levels were computed from quantitative results: PLHIV with <50 copies/mL (VL<50); PLHIV with 50-999 copies/mL (LLV); and PLHIV with ≥1000 copies/mL (unsuppressed VL). We report population estimates as percentages (95% confidence interval), overall and by age and sex. The analysis accounted for the complex survey design and survey weights using jackknife estimation.

Oral  
abstracts

Late-breaker  
abstracts

Author  
Index

**Results:** A total of 1,849 PLHIV who had VL result available were included in the analysis. Overall, 62% (59%-65%) of adults aged  $\geq 15$  years had VL<50, 16% (14%-18%) had LLV, and 22% (20%-25%) had unsuppressed VL. Among females, 67% (63%-70%) had VL<50, 14% (12%-17%) had LLV, and 19% (17%-22%) had unsuppressed VL; among males, 53% (48%-59%) had VL<50, 19% (15%-24%) had LLV, and 28% (23%-33%) had unsuppressed VL. Among 15-24 year-olds, 43% (32%-56%) had VL<50, 16% (9%-28%) had LLV, and 40% (30%-52%) had unsuppressed VL; among 25-49 year-olds, 63% (59%-66%) had VL<50, 14% (12%-17%) had LLV, and 23% (20%-26%) had unsuppressed VL; among participants aged  $\geq 50$  years, 66% (61%-70%) had VL<50, 19% (16%-23%) had LLV, and 15% (12%-19%) had unsuppressed VL.

**Conclusions:** Approximately six out of ten PLHIV had VL<50, with a markedly lower proportion reported for young adults and males. The proportion of LLV by age and sex, ranged from 14-19%, underscoring the importance of more refined monitoring of VL<1,000 copies/mL outcomes in clinical settings and programmatic indicators especially targeted treatment enhancement and optimization among young adults and males to improve VLS in Tanzania.

## THPEC166

### Geospatial dynamics of HIV prevalence: a study on the impact of road proximity in rural Rwanda

H.S. Muzungu<sup>1,2</sup>

<sup>1</sup>University of Rwanda, Kigali, Rwanda, <sup>2</sup>Tantine Group, Kigali, Rwanda

**Background:** Despite maintaining a stable overall HIV prevalence of 3% over the past two decades, Rwanda has exhibited significant disparities among subpopulations, characterized by variations across rural and urban settings, gender, and other demographic categories. Efforts to comprehend and address these distinctions have been extensive; however, a notable void persists in understanding the impact of road proximity on HIV prevalence in rural Rwanda.

**Methods:** This study employed data from the Rwanda Demographic and Health Survey 2015, particularly HIV and GIS data. The HIV test results were aggregated at the village level to provide a measure of HIV prevalence. The independent variable was calculated by measuring the distance from the center of the village to the nearest national road. Linear regression analysis was conducted to determine the effect of distance to the national road on HIV prevalence at the village level.

**Results:** This study included rural 379 villages distributed across all the districts of Rwanda. The Average HIV prevalence was 18 cases per 1000 people while the average distance to the national road was 2.8 kilometers. The regression model yielded statistically significant results regarding the influence of distance to the main road on HIV

Prevalence. Notably, the coefficient for the distance to national roads was -1.9438 ( $p < 0.001$ ), indicating a negative association. On average, each one-kilometer increase in distance corresponded to an expected decrease of 1.9438 cases of HIV per 1000 people.

**Conclusions:** This study revealed a significant negative association between the distance to national roads and HIV prevalence in rural Rwandan. The results suggest practical implications for public health interventions, emphasizing the potential effectiveness of strategies targeting remote areas. These findings emphasize the importance of considering spatial factors when designing future interventions.

Los Angeles, United States

**Background:** Postnatal prophylaxis (PNP) and very early neonatal antiretroviral treatment (ART) within the first four weeks of life currently rely on nevirapine-based regimens. The efficacy of prophylactic or therapeutic regimens is potentially limited by viruses with drug resistance mutations (DRMs) acquired from mothers living with HIV (MLWH).

**Methods:** In the LIFE study conducted in Mozambique and Tanzania, we enrolled 6505 MLWH and their 6602 infants at the time of delivery. During the first 12 weeks, we identified 125 infants diagnosed with HIV (1.9%; 95% CI: 1.6, 2.3) who were followed-up until 18 months of age. Genotypic resistance testing (GRT) was performed by Sanger sequencing for nucleot(s)ide (NRTI) and non-nucleotide (NNRTI) reverse transcription inhibitors, protease inhibitors (PI), and integrase strand transfer inhibitors (INSTI).

**Results:** At delivery, 76.4% of MLWH were on a dolutegravir-based ART regimen, 22.1% were on an efavirenz-based regimen, and 1.2% were not on ART. The study neonatal ART regimen consisted of zidovudine, lamivudine, and nevirapine syrups. After attaining one month of age and 3kg weight, infants were initiated on/transitioned to abacavir+lamivudine dispersible tabs, plus lopinavir/ritonavir syrup or granules, and in 29.7% of cases, lopinavir/ritonavir was later switched to dolutegravir.

We performed GRT at baseline for 82 MLWH with HIV-positive infants and for 147 samples collected from 73 infants during the follow-up. Among mothers, DRM against NRTI were detected in 7.3% (mostly M184IV), NNRTI in 40.2% (mostly K103NT, E138AGKQ), and none against PI or IN-

STI. Among infants, we detected DRM against NRTI in 32% (mostly M184IV, L74V), NNRTI in 53.7% (mostly K103NT, E138AGKQ, Y181YCF), PI in 1% (V32I), and INSTI in 2% (S147SC). The proportion of DRMs against NRTI among infants was significantly higher than in mothers ( $p=0.004$ ).

**Conclusions:** We observed high rates of transmitted DRMs against NNRTIs in infants born to MLWH, which may have affected the efficacy of PNP prior to HIV diagnosis and ART in neonates initiating nevirapine-based treatment. Maternally transmitted DRMs and acquired DRMs resulting from ART adherence challenges in neonates and infants, particularly DRMs against NRTIs, may be associated with inefficient treatment response. Optimized PNP and ART regimens for neonates are urgently needed.

## THPEC168

### The added value of electronic readers for HIV-1 rapid testing for recent infection (RTRI): an evaluation panel data analysis from 6 countries

F. Assefa<sup>1</sup>, S. You<sup>1</sup>, S. Nyimbili<sup>1,2</sup>, D. Kaftan<sup>1</sup>, H.-Y. Kim<sup>1</sup>, A. Bershteyn<sup>1</sup>

<sup>1</sup>New York University Grossman School of Medicine, New York City, United States, <sup>2</sup>Centre for Infectious Disease Research in Zambia, Lusaka, Zambia

**Background:** In sub-Saharan Africa (SSA), where HIV incidence is declining, HIV prevention programs need to reach those most-at-risk to remain cost-effective. Some SSA settings administer rapid tests for recent HIV infection (RTRI) upon HIV diagnosis to identify social networks or geographic areas where prevention is needed. Currently, technicians interpret RTRI results by visually inspecting test strips. We investigated how the use of electronic readers may impact RTRI performance.

**Methods:** We used data from the Consortium for the Evaluation and Performance of HIV Incidence Assays (CEPHIA), which enrolled participants in 6 countries (4 in SSA) with known dates of last testing negative and first testing positive for HIV, providing estimated days since detectable infection (EDDI). We calculated sensitivity and specificity of visual versus electronic RTRI read-out (Asante HIV-1 Rapid Recency Assay, Sedia Biosciences, Beaverton, Oregon, USA) for identifying individuals <1 year since EDDI when used according to US Centers for Disease Control and Prevention guidelines.

**Results:** Among 627 participants with available EDDI (52% with EDDI <1 year), visual RTRI had 16.9% sensitivity (95% CI: 14.2-19.5%) and 99.3% specificity (95% CI: 98.9-99.8%) for identifying EDDI <1 year; in SSA ( $n=332$ ), sensitivity was 19.6% (95% CI: 16.0-23.3%) and specificity 98.8% (95% CI: 98.0-99.7%). Electronic read-out in all participants had 34.6% sensitivity (95% CI: 31.2-38.0%) and 97.8% specificity (95% CI: 96.9-98.6%); in SSA, sensitivity was 37.2% (95% CI: 32.7-41.7%) and specificity 96.7% (95% CI: 95.3-98.1%). Compared to visual RTRI, electronic read-out had significantly

higher sensitivity ( $p < 0.001$ ) and lower specificity ( $p < 0.001$ ) in all participants and in SSA. Among non-recent HIV cases, false recency rate (1-specificity) increased from 0.7% with visual read-out (0.8% in men, 0.4% in women) to 2.2% with electronic read-out (2.2% in men, 2.3% in women).

**Conclusions:** Electronic RTRI read-out could double detection of recent HIV acquisitions compared to visual inspection, but could triple false recent results. Electronic readers may provide more value when comprehensive outbreak detection is paramount, such as in HIV elimination efforts, but may offer less value in avoiding "false alarms" under resource constraints. Research is needed to further understand RTRI performance and the added value of electronic readers for detecting recent HIV acquisition.

## THPEC169

### Early lessons learnt from preparing for triple vertical elimination of HIV, syphilis and hepatitis B in Malawi

J. Nkhonjera<sup>1</sup>, A. Mdolo<sup>2</sup>, T. Chimbandule<sup>1</sup>, A. Kapachika<sup>1</sup>, D. Midiani<sup>1</sup>, A. Jahn<sup>1</sup>

<sup>1</sup>Ministry of Health, Department of HIV, STI and Viral Hepatitis, Lilongwe, Malawi, <sup>2</sup>UNICEF, Lilongwe, Malawi

**Background:** Malawi has made tremendous progress towards the elimination of vertical transmission of HIV since the adoption of the Option B+ in 2011. Since 2010, an estimated 124,000 HIV child cases have been averted. The final HIV transmission rate by the end of breastfeeding reached 5.5% in 2023. However, we acknowledge that need for more effort in screening for syphilis and HBV. Malawi aims to eliminate vertical transmission of HIV, Syphilis and Hepatitis B by 2030 and has officially enrolled with the WHO path to triple elimination process. This aims to confirm significant progress towards elimination of the vertical transmission of all 3 disease conditions.

**Description:** Led by MOH, the following preparations were made: established the steering committee; developed the roadmap for the validation process; developed the national guidelines on viral hepatitis prevention and treatment; approval of Hep B birth dose, conducted orientation for all district program coordinators and their management teams; streamlined path to elimination into the national quarterly eMTCT mentorship checklist; completed the country assessment checklist to identify gap in PMTCT programme performance; trained the National Validation Committee facilitated by UNICEF, UNAIDS and WHO.

**Lessons learned:** The results from the routine data tracking of key PMTCT indicators from 2018 to 2023 shows noticeable improvement in all weak performing indicators before start of PTE (Fig 1). Quarterly performance review and facility mentorship were the main drivers behind this

improvement. The program started tracking ANC women tested for Hepatitis B in January 2023, and this improved from 5% in January to 49% in December 2023.

**Conclusions/Next steps:** The Path to Elimination framework has been an effective tool for improved program coordination and targeted mentorship. Through PTE, there is more stakeholder awareness, commitment, and additional resources have been mobilized for syphilis and HBV. Lessons and experiences shared will be valuable to other countries aspiring to achieve similar goals.

## THPEC170

### Strengthening enhanced adherence counselling to people living with HIV with a high viral load and suppression in Northern Cameroon

G. Tayong<sup>1</sup>, P. Enokbonong<sup>2</sup>, G. Ekali<sup>3</sup>, C. Tchokonte<sup>1</sup>, A. Domche<sup>1</sup>, S. Akuro<sup>1</sup>

<sup>1</sup>ICAP Cameroon, Technical, Garoua, Cameroon, <sup>2</sup>ICAP Cameroon, Monitoring and Evaluation, Garoua, Cameroon, <sup>3</sup>ICAP Cameroon, Country Office, Yaounde, Cameroon

**Background:** National guidelines recommend assessing compliance and providing the necessary support to people living with HIV (PLHIV) with an unsuppressed viral load (VL) (>1000 copies/ mL) and repeating the VL test after 3 months of optimal adherence. This requires at least 3 monthly sessions for enhanced adherence counselling. However, there is very little evidence regarding the effect of these three sessions on viral suppression among PLHIV on ARV treatment (ART) in the northern part of Cameroon. This study aims to help fill this gap.

**Methods:** A retrospective cohort study was carried out with a sample consisting of all PLHIV who received a non-suppressed VL result between 2021 and 2023 and who had a control VL result carried out after sessions of enhanced adherence counselling with tips for strengthening adherence.

**Results:** A total of 1,640 PLHIV, followed in 75 health facilities supported by ICAP, of which 67.4% were women; 94.1% were at least 15 years old. The average duration on ART was 4.4 years with a standard deviation of 4.1 years. TDF 3TC DTG was the most common protocol in this group

(76.6%) and secondly TDF 3TC EFV (14.5%). The majority of PLHIV who participated in at least 3 counseling sessions to strengthen compliance were in the majority (96.5%). Viral suppression after counseling sessions was 86.5%. After adjusting for the variables sex, age at initiation, duration on ART and ARV protocol, the viral suppression rate of PLHIV who participated in less than three counseling sessions before the control VL is significantly lower than that of their counterparts who completed at least 3 sessions [Odds ratio (OR)=0.29; p=0.004].

Furthermore, compared to PLHIV who had a VL  $\leq 10,000$  copies/ mL before the counseling sessions, those who had a VL between 10,000 and 99,999 copies/ mL and  $\geq 100,000$  copies/ mL have lower odds of viral suppression (OR=0.56; p=0.004 and OR=0.51; p=0.002).

**Conclusions:** The results of this work reinforce the need to adhere to guidelines for managing high viral loads. PLHIV with very high VL are the most at risk of non-suppression despite counseling sessions. More attention should be paid to this group.

## Modelling the HIV pandemic

### THPEC171

Expanding PrEP coverage with long-acting injectable cabotegravir (CAB-LA) to achieve HIV elimination among men who have sex with men (MSM) in Taiwan: a mathematical modelling study

H. Wu<sup>1</sup>, C. Strong<sup>2</sup>, W.-W. Ku<sup>3,4</sup>, C.-W. Li<sup>5</sup>, P. Huang<sup>6</sup>, C.-T. Fang<sup>7,8,9</sup>

<sup>1</sup>The Kirby Institute, UNSW Sydney, Sydney, Australia,

<sup>2</sup>Department of Public Health, College of Medicine, National Cheng Kung University, Tainan, Taiwan, Province of China, <sup>3</sup>Division of Infectious Diseases, Department of Medicine, Taipei City Hospital Renai Branch, Taipei, Taiwan, Province of China, <sup>4</sup>HIV Education and Research Taiwan (HEART) Association, Taipei, Taiwan, Province of China,

<sup>5</sup>Center for Infection Control and Department of Internal Medicine, National Cheng Kung University Hospital, College of Medicine, National Cheng Kung University, Tainan, Taiwan, Province of China, <sup>6</sup>Institute of Health Behavior and Community Sciences, National Taiwan University, Taipei, Taiwan, Province of China, <sup>7</sup>Institute of Epidemiology and Prevention Medicine, College of Public Health, National Taiwan University, Taipei, Taiwan, Province of China, <sup>8</sup>Division of Infectious Diseases, Department of Internal Medicine, National Taiwan University Hospital, Taipei, Taiwan, Province of China, <sup>9</sup>Ministry of Health and Welfare and National Taiwan University Infectious Disease Research and Education Center, Taipei, Taiwan, Province of China

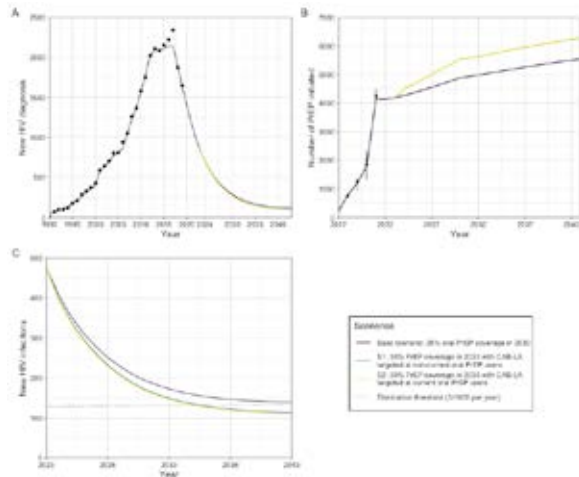

**Background:** The HPTN 083/084 trials demonstrated the superiority of long-acting injectable cabotegravir (CAB-LA) over tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) for HIV pre-exposure prophylaxis (PrEP). For people struggling with adhering to oral PrEP, CAB-LA has a potential to improve overall PrEP effectiveness.

This study aims to evaluate whether introducing CAB-LA to current and non-current oral PrEP users among MSM in Taiwan could reach the target of HIV elimination.

**Methods:** A dynamic mathematical model, incorporating HIV transmission and progression with PrEP use, was calibrated to the Taiwanese MSM HIV epidemic. MSM were stratified by three age groups and two sexual activity levels. Oral PrEP and CAB-LA effectiveness were set at 86% and 91%. Increasing PrEP coverage to 30% in 2030 was modelled by either introducing CAB-LA to non-current oral PrEP users (scenario 1, S1), or 15% of current oral PrEP users switching to CAB-LA which improves oral PrEP effectiveness to 90% (S2).

The impact on the HIV epidemic trajectory was evaluated over 20 years, compared to the base scenario, from an HIV elimination perspective ( $<1$  newly HIV acquisition/1000 MSM per year).

**Results:** In the base scenario, oral PrEP coverage was projected to rise from 18% to 25% among young and high-sexually-active MSM between 2022 and 2030, but could not achieve HIV elimination over 20 years. Conversely, expanding PrEP coverage to 30% by 2030 with CAB-LA averted 10.6% and 12.1% of new HIV acquisition over 20 years among young and high-sexually-active MSM in S1 and S2 and could achieve HIV elimination by 2036 and 2035 in S1 and S2, respectively.

**Conclusions:** By extending PrEP coverage to 30% by 2030 through the use of CAB-LA, it is feasible to achieve HIV elimination within the next two decades. Prioritizing CAB-LA to current oral PrEP users with suboptimal adherence could avert more HIV acquisitions and accelerate HIV elimination among MSM.

## THPEC172

### Real-world adherence of HIV-1 oral pre-exposure prophylaxis regimens in the United States: a group-based trajectory modeling approach

L. Tao<sup>1</sup>, J. Yang<sup>1</sup>, B. Shannon<sup>1</sup>, C. Nguyen<sup>1</sup>, W. Zachry<sup>1</sup>, J. Gruber<sup>1</sup>

<sup>1</sup>Gilead Sciences, Inc., Foster City, United States

**Background:** In people using oral HIV-1 pre-exposure prophylaxis (PrEP), effectiveness depends on adherence. We used group-based trajectory modeling (GBTM) to describe real-world, population-level adherence to oral PrEP regimens.

**Methods:** PrEP-naïve adults (≥18 years) receiving oral F/TDF or F/TAF for HIV-1 PrEP between January 2021–December 2022 were identified from the IQVIA LRx Dx database. Following first prescription, adherence (defined as prescription refill) was observed over seven 30-day windows, with proportion of days covered (PDC) measured every 30 days. As new HIV-1 infections resulted in PrEP discontinuation and disrupted adherence patterns, individuals acquiring HIV-1 during adherence observation windows were excluded; potential for survivor bias was assessed.

GBTM was used to identify PDC-based adherence trajectories. A classification tree model determined driving factors of adherence trajectories from a range of demographic characteristics and baseline conditions.

**Results:** Overall, 76,212 individuals (median age at PrEP initiation: 33 years) were classified into four adherence-trajectory groups: high (37%), medium (26%), early-poor (21%), and delayed-poor (15%) adherence (Figure A).

The primary determinant of adherence trajectories was choice of regimen, with 46% of F/TAF users in high and 12% in early-poor group, and 30% of F/TDF users in high and 19% in early-poor group. Gender (73% importance relative to regimen choice) and race (20%) were also key factors. Among subgroups defined by these factors, most White cisgender men using F/TAF demonstrated high adherence, while most cisgender women using F/TDF had poor adherence (Figure B).

Furthermore, when new HIV-1 infections were observed after adherence observation windows, the early-poor group had significantly higher HIV-1 incidence versus the high adherence group ( $p=0.01$ ). Individuals excluded due to seroconversion (0.9%) had low mean adherence (PDC=0.5), suggesting estimates are conservative.

Figure. (A) Proportion of days covered for oral PrEP adherence-trajectory groups. (B) Individual characteristics by adherence-trajectory groups.

**Conclusions:** GBTM-identified, real-world, population-level adherence patterns to oral PrEP regimens underscore the importance of strategies for increasing adherence in priority populations to reduce HIV-1 transmission.

## THPEC173

### A novel modelling framework to simulate the effects of HIV stigma on HIV transmission dynamics

D. Bisanzio<sup>1</sup>, S.T. Roberts<sup>2</sup>, K.N. McClellan<sup>3</sup>, G. Bobashev<sup>4</sup>, R. Stelmach<sup>1</sup>, J. Adams<sup>4</sup>, K. Karriker-Jaffe<sup>2</sup>, S. Endres-Dighe<sup>4</sup>, K. Saalim<sup>4</sup>, N. Blackburn<sup>4</sup>, L. Nyblade<sup>1</sup>

<sup>1</sup>RTI International, Washington, United States, <sup>2</sup>RTI International, Berkeley, United States, <sup>3</sup>Georgetown University, Washington, United States, <sup>4</sup>RTI International, Research Triangle Park, United States

**Background:** HIV remains a global public health challenge, with social determinants such as stigma influencing transmission dynamics, access to testing, and treatment. HIV-related stigma significantly shapes both indi-

vidual behavior and community responses to HIV. However, modeling approaches have rarely represented the highly complex role of stigma in HIV epidemics. Our study introduces an innovative modeling framework designed to disentangle the intricate interplay between HIV-related stigma and HIV transmission dynamics.

**Methods:** Our model focuses on how anticipated, internalized, and experienced HIV stigma affect HIV testing, antiretroviral treatment initiation, and treatment adherence. We built an individual-based model representing the HIV epidemic (referred to as HIV-IBM) in a USA-like population of 3 million individuals. The HIV-IBM accounted for community demography, same-sex and heterosexual encounters among simulated individuals, healthcare-seeking patterns, drug injection behaviors, healthcare accessibility, and treatment. Stigma parameters were based on a scoping review focused on the prevalence and effects of stigma in people living with and without HIV. The HIV-IBM was used to assess effects of interventions targeting different types of simulated stigma. We tested reductions of stigma by 50% and 100% across the simulated population and performed a sensitivity analysis to identify the effect of each type of stigma on the simulated HIV epidemic.

**Results:** The HIV-IBM without reduced stigma had an annual incidence of 12.6 (95% CI: 9.2-14.4) new cases per 100,000 people. Reducing the overall level of stigma in the population by 50% resulted in an annual incidence of 8.3 (95% CI: 6.3-10.1) new infections per 100,000 people. A 100% reduction in stigma resulted in an annual incidence of just 5.3 (95% CI: 2.3-7.1) new infections per 100,000 people. The sensitivity analysis showed that outcomes resulting from interventions targeting each type of stigma were highly heterogeneous.

**Conclusions:** The result of this study showed that reducing HIV-related stigma could have a large impact on HIV incidence. Our model framework provides a dynamic approach to understanding the role of stigma in HIV transmission. This novel approach could facilitate the exploration of stigma reduction strategies and offer insights to inform evidence-based policies and interventions for reducing stigma and curtailing HIV.

## THPEC174

Starsim: a new agent-based framework for modeling HIV and STI co-transmission

C. Kerr<sup>1</sup>, R. Stuart<sup>1</sup>, A. Alina Muellenmeister<sup>2</sup>, J. Cohen<sup>1</sup>, R. Abeyasuriya<sup>2</sup>, D. Klein<sup>1</sup>

<sup>1</sup>Bill and Melinda Gates Foundation, Institute for Disease Modeling, Seattle, United States, <sup>2</sup>Burnet Institute, Melbourne, Australia

**Background:** Compared to other modeling approaches, agent-based models (ABMs) allow for detailed simulation of specific scenarios, and enable comparison with

a broader range of data. Over the last several years, we developed a suite of ABMs that have seen widespread use for modeling different diseases, including COVID-19 (Covasim), human papillomavirus (HPVsim), and family planning (FPSim).

Recently, we codified the principles and philosophies common across these models into a standalone tool called "Starsim" (<http://starsim.org>). Starsim is capable of simulating co-transmission of HIV with other sexually transmitted infections (STIs), other transmissible diseases (such as TB), and non-communicable diseases.

**Methods:** Starsim is a modeling framework containing modules representing different diseases (including their natural history and transmission), contact networks (including sexual, respiratory, and maternal), demographics, and interventions. It is written in pure Python, allowing for simplicity, flexibility, and high performance.

It is completely free and fully open-source under the MIT license. These choices are intended to maximize ease of use and lower the barrier for adoption and modification by researchers.

**Results:** Since 2020, we have trained over 200 people to use our suite of ABMs. We found that the Starsim approach was simple enough that most users were able to quickly learn these tools, and flexible enough to model users' requested policy scenarios. For example, we were able to rapidly develop and calibrate a lightweight HIV-HPV model that could answer questions about the effectiveness of targeted HPV vaccination.

Starsim can be rapidly adapted to new contexts thanks to its modular structure, array-based computation, parallelization, and pre-loading of commonly used data.

**Conclusions:** Many of the leading HIV models were developed prior to (and helped usher in) the modern era of test-and-treat and 95-95-95 targets. Consequently, these models have typically focused on specific treatment and prevention programs (such as ART and circumcision) and the HIV care continuum. In contrast, the Starsim framework is designed to give users the flexibility to adapt the model to their local epidemic context and policy questions, such as the integration of HIV and non-HIV services, coinfections and comorbidities, and social determinants of health: factors that have become increasingly important considerations for sustainable HIV epidemic control.

## THPEC175

Awareness and willingness to use oral HIV Pre-exposure prophylaxis (PrEP) among HIV-negative women who use non-barrier contraception in Zimbabwe: findings from the Zimbabwe population-based HIV Impact Assessment, 2020

E. Rowlinson<sup>1</sup>, M. Peck<sup>1</sup>, R.L. Laws<sup>1</sup>, A. Namageyo-Funa<sup>1</sup>, J. Mandisarisa<sup>2</sup>, T. Mharadze<sup>2</sup>, M. Mutseta<sup>3</sup>, G. Ncube<sup>3</sup>, H. Cham<sup>2</sup>, R. Bhatia<sup>1</sup>

<sup>1</sup>US Centers for Disease Control and Prevention, Division of Global HIV and Tuberculosis, Global Health Center, Atlanta, United States, <sup>2</sup>US Centers for Disease Control and Prevention, Division of Global HIV and Tuberculosis, Global Health Center, Harare, Zimbabwe, <sup>3</sup>Zimbabwe Ministry of Health, Harare, Zimbabwe

**Background:** In Zimbabwe, HIV incidence is highest among women of reproductive age. PrEP has been prioritized for specific populations, including pregnant and breastfeeding women, but little is known about PrEP awareness and acceptability among reproductive age women accessing contraceptives. We evaluated the association between non-barrier contraception use and awareness of and willingness to use PrEP among non-pregnant women in Zimbabwe.

**Methods:** Using publicly available data from the 2020 Zimbabwe Population-based HIV Impact Assessment survey, we compared awareness of and willingness to use oral PrEP between ever sexually active, HIV-negative, non-pregnant women aged 15-44 currently using vs. not currently using non-barrier contraception (pills, intrauterine device, injectable, or implant) via weighted bivariate logistic regression. We then examined the association between non-barrier contraception use and awareness of and willingness to use PrEP in weighted multivariable regression, controlling for age, marital status, residence (urban/rural), household wealth index, multiple sexual partners, sex work, and reported having a sexual partner with HIV.

**Results:** Among the study population (n=5,147), median age was 28 (IQR 22.3-34.4) and over half reported current use of non-barrier contraception (63.4%; 95% CI 61.6-65.2%). There were no significant differences in awareness of (10.0% vs. 11.5%) or willingness to use (64.7% vs. 63.4%) PrEP between women who did and did not use non-barrier contraception in bivariate analysis. In multivariable analysis, willingness to use PrEP was significantly higher among women using non-barrier contraception compared to women who did not (aOR 1.17; 95% CI 1.01-1.35, p=0.04), while awareness of PrEP did not differ significantly between the two populations (aOR 1.01; 95% CI 0.78-1.29, p=0.97).

**Conclusions:** Willingness to use PrEP was higher among women using non-barrier contraception vs. those who did not when controlling for demographics and HIV risk factors. In this population, willingness to use PrEP may be related to acceptability of biomedical contraception. Ensuring that PrEP is offered at contraception service delivery points could increase access to PrEP among women in Zimbabwe. Given the high contraception use among women of reproductive age and ongoing need for additional HIV prevention choices, these findings help identify potential early adopters and further research opportunities for multipurpose technologies such as the dual prevention pill.

## THPEC176

Impact of changing PrEP regimens on retention among men who have sex with men in Hanoi, Vietnam (2020-2023)

Q.L. Pham<sup>1</sup>, N. Setrakian<sup>2</sup>, H.T. Bui<sup>1</sup>, P. Adamson<sup>3</sup>, T.N. Hoang<sup>4</sup>, L.M. Giang<sup>1</sup>, P.M. Gorbach<sup>5</sup>

<sup>1</sup>Hanoi Medical University, Hanoi, Viet Nam, <sup>2</sup>UCLA Fielding School of Public Health, Department of Epidemiology, Los Angeles, United States, <sup>3</sup>David Geffen School of Medicine at UCLA, Division of Infectious Diseases, Los Angeles, United States, <sup>4</sup>Centers for Disease Control and Prevention, Division of Global HIV & TB (DGHT), Hanoi, Viet Nam, <sup>5</sup>UCLA, Fielding School of Public Health, Department of Epidemiology, Los Angeles, United States

**Background:** Understanding retention patterns among people who use HIV pre-exposure prophylaxis (PrEP) is necessary to achieve its protective benefits. We examined the association of PrEP retention with use of daily, event-driven (ED), or regimen switching reported at last visit among men who have sex with men (MSM) in Hanoi, Vietnam.

**Methods:** Between April 2020 and February 2023, we collected data from PrEP clients at Hanoi Medical University. We restricted analysis to those who were male at birth, identified as male, reported sex with men, and returned for follow-up. The routine follow-up schedule was: 30 days after the initial visit, 60 days after the first revisit, and every 90 days thereafter. Clients were prescribed either ED or daily PrEP at the initial visit; at subsequent visits, clients reported the regimen used since the prior visit. For analyses, we defined three categories of PrEP use: ED-PrEP exclusively, daily PrEP exclusively, and switching between the two. The outcome was time to first discontinuation in the study period, defined as missing a scheduled visit by >30 days. We performed survival analysis using Kaplan-Meier curves.

**Results:** In total, 2,115 people were included; 61.1% (n=1,292) reported using daily PrEP exclusively, 10.5% (n=221) using ED-PrEP exclusively, and 20.7% (n=602) switched PrEP regimens. Among those who switched, 425 (70.6%) switched

once and 177 (29.4%) switched multiple times. Median time to first discontinuation was 105 days [IQR: 80-204] among those reporting ED-PrEP at last visit, 104 days [IQR: 119-411] among those reporting daily PrEP, and 136 days [IQR: 123-386] among those who switched (multi-switchers: 231 days; one-time switchers: 133 days) (Figure 1).

Figure 1. Kaplan-Meier Curves of Time to First PrEP Discontinuation among 2,115 people in a PrEP clinic in Hanoi, Vietnam from April 2020 to February 2023. (a) Time to First PrEP Discontinuation comparing ED-PrEP, Daily PrEP, and Switcher groups and (b) Time to First PrEP Discontinuation comparing one-time switchers and multi-switchers.

**Conclusions:** We provide real-world data from MSM in Vietnam that switching between PrEP regimens is common. Those who switched had longer periods of retention during the study period. This supports offering PrEP clients in global settings an option to switch regimens.

## THPEC177

Empowering prevention: patient-centered self-collection for STI screening and its implications for HIV prevention and new technologies in Kenyan women

M. Nyakambi<sup>1</sup>, A. Waruru<sup>2</sup>

<sup>1</sup>GPRT, Kisumu, Kenya, <sup>2</sup>Public Health Specialist, Epidemiologist, Nairobi, Kenya

**Background:** *Chlamydia trachomatis* poses a significant public health challenge among sexually active women, exacerbated by limited disease awareness. Traditional STI screening methods face barriers due to the intimate nature of the procedure, prompting exploration of innovative approaches. Recognizing the critical link between STIs and heightened HIV risk in women, targeted STI screening and treatment are advocated as integral components of comprehensive HIV prevention efforts. Concurrently, the global approach to HIV testing has embraced increased accessibility through HIV self-testing.

This study delves into the acceptability of self-vaginal swab collection, examining its potential contribution to HIV prevention and alignment with advancing technologies, focusing on Chlamydia.

**Methods:** Conducted at Kisumu County Referral Hospital, Kenya, this cross-sectional study enrolled 385 women who provided informed consent. The study employed the Rapid Diagnostic Kit to detect *Chlamydia trachomatis*, utilizing electronic questionnaires to gauge preferences for self-collection. Practical demonstrations, including video clips and visual charts, familiarized participants with the self-vaginal swab collection process, featuring the Rapid

Diagnostic Kit. Statistical analyses, including descriptive statistics, were employed to quantify participant preferences and experiences.

**Results:** The 90.3% preference for self-vaginal swab collection over health worker collection demonstrated the high acceptability of self-vaginal swab collection for Chlamydia screening. The use of the Rapid Diagnostic Kit played a pivotal role in confirming Chlamydia infection and aligning participant preferences, particularly for privacy and non-invasiveness. Participants valued the confidential nature of self-collection, contributing to a heightened sense of comfort and acceptability.

Practical demonstrations facilitated a better understanding of the self-collection process, and the absence of invalid samples underscored the feasibility and reliability of self-collection.

**Conclusions:** This study, strategically aligning with the global evolution of HIV testing approaches, showcases the acceptability and feasibility of self-vaginal swab collection for Chlamydia screening. The findings emphasize the importance of aligning screening programs with patient preferences, advocating for the integration of innovative diagnostic tools, such as the Rapid Diagnostic Kit, into routine healthcare practices for enhanced effectiveness in sexual health outcomes.

## THPEC178

Control your PrEP, control your status: exploring MSM's awareness and acceptance of event-driven PrEP in South Africa

J. Pienaar<sup>1</sup>, L. Mathibe<sup>1</sup>

<sup>1</sup>Aurum Institute, Johannesburg, South Africa

**Background:** Key populations, particularly men who have sex with men (MSM), face higher HIV acquisition risks, primarily through condomless anal sex (CAS). To reduce HIV transmission in MSM, diverse prevention methods must be readily available, complemented by tailored strategies to boost uptake and correct usage. Event Driven Pre-Exposure Prophylaxis (ED-PrEP) offers a novel, evidence-based solution, addressing barriers hindering the adoption of existing HIV prevention techniques among MSM.

This study aimed to assess MSM knowledge, attitudes, and perceptions regarding ED-PrEP across five districts and to uncover links between socio-demographic factors, sexual risk profiles, and MSM's willingness to use ED-PrEP.

**Methods:** This study utilized a prospective descriptive cross-sectional survey to investigate perceptions, attitudes, and knowledge concerning ED-PrEP among MSM in five diverse South African districts. Participants were recruited from KP-friendly Aurum drop-in clinics.

Using a combination of snowball and convenience sampling methods, the research enrolled 295 participants who completed a comprehensive KAP survey via an online platform from April to June 2023. Data analysis uti-

lized SPSS 29.0, enabling a robust examination through descriptive statistics, chi-square analyses, and logistic regression to derive meaningful insights from the collected information.

**Results:** The knowledge and attitude scale comprised 16 and 9 items respectively. The study found that 72% of the participants had good knowledge about PrEP and ED-PrEP (score of >80%), 24% had fair knowledge (score between 50-79%) and 4% has poor knowledge (score of <50%). The majority of respondents reported a positive attitude towards ED-PrEP (58%), 41% were neutral and 4% reported a greater sense of mistrust about ED-PrEP. There was a significant association between knowledge about ED-PrEP and Attitude with  $\chi^2=11,842$ ,  $df=4$ , at  $p<0.05$ .

**Conclusions:** Despite the current lack of public campaigns about ED-PrEP, MSM demonstrate adequate knowledge about ED-PrEP to use the regimen safely. This study provides evidence that there is understanding of the regimen, and positive sentiment around the use and adoption of ED-PrEP among this target population. These findings highlight the necessity for meticulous and targeted educational campaigns to dispel myths and present ED-PrEP as a safe, alternative HIV prevention method for all men.

## THPEC179

HIV prevention strategies and PrEP uptake among transgender women (TGW) in São Paulo: a qualitative exploration through in-depth interviews

G. Saggese<sup>1</sup>, M.A. Veras<sup>1</sup>, S. Lippman<sup>2</sup>, J. Sevelius<sup>3</sup>

<sup>1</sup>Santa Casa of São Paulo School of Medical Sciences, Collective Health, São Paulo, Brazil, <sup>2</sup>University of California, San Francisco, School of Medicine, San Francisco, Brazil, <sup>3</sup>Columbia University, Department of Psychiatry, New York, United States

**Background:** Transgender Women (TGW) face social and economic marginalization due to multiple layers of stigma, placing them at an increased risk of HIV infection. HIV testing and the use of prevention strategies like pre-exposure prophylaxis (PrEP) are significantly lower in this population compared to other groups with heightened vulnerability.

We developed the Manas por Manas peer navigation (PN) intervention to mitigate intersectional stigma and enhance HIV testing and prevention among TGW in São Paulo, Brazil. This qualitative exploration delves into the experiences of a sub-sample of 20 participants.

**Methods:** We conducted longitudinal in-depth interviews (IDIs) from November 2021 to June 2023, using a semi-structured script to investigate participants' engagement with the project and their uptake of HIV self-testing (HIVST) and prevention strategies, particularly PrEP. IDIs were conducted in the early stages of research

and again at project completion. Interviews were either virtual or in-person, recorded, transcribed, and subjected to thematic analysis.

**Results:** Results indicate that participants significantly enriched their understanding of HIV prevention, particularly of PrEP, through engagement with navigators. All participants were familiar with PrEP during the initial interview, albeit with limited information. Those on PrEP cited multiple sexual partnerships, engagement in sex work, and perception of reduced anxiety about potential infection as primary motivations. Some reported discontinuation due to side effects or perceived lack of necessity. Almost all reported regular testing in health services, but few had tried HIVST, and many expressed doubts about its reliability.

Notably, perceptions and experiences of PrEP and HIVST remained largely unchanged at the second interview.

**Conclusions:** Despite PN's positive impact on knowledge, disappointingly, PrEP and HIVST usage remained relatively low among IDI participants. Restrictive COVID-19 pandemic measures affecting in-person PN sessions and health service availability may have been, at least partially, to blame.

Other factors such as the lack of campaigns promoting PrEP and HIVST uptake among TGW in Brazil, as well as the preference for alternative prevention strategies and regular testing in services may have also played a role.

These findings underscore the need for tailored strategies and policies, acknowledging transgender women's specificities and broadening HIV prevention options for this population.

**Methods:** We conducted a 12-month PrEP demonstration project in Wuhan and Guangzhou, China, using a community-clinic hybrid model for recruitment, participant engagement, and PrEP delivery. The healthcare providers implemented oral PrEP prescribing, medical consultation, and medicine dispensed through clinic visits or mail-delivered PrEP by community-based organizations. PrEP refill was monthly for the first quarter and trimonthly thereafter. PrEP persistence (defined as finishing the follow-up as required) and adherence (defined as self-reported taking more than 4 pills in 7 days for daily and over 75% strict adherence to 2+1+1 for event-driven dosing) information was surveyed quarterly. Enrollment, PrEP persistence, adherence, discontinuation, and adverse events were descriptively summarized.

**Results:** From September 2021 to December 2023, we screened 3649 PrEP-eligible participants. Of those, 1138 participants started oral PrEP, with a median age of 29.1(SD=5.9). Most participants identified as gay or bisexual(1066/1138) and cis-gender men(1134/1138). After initiation, PrEP persistence at 3, 6, 9, and 12 months were 83.7%(947/1131),76.9%(795/1034),68.2%(589/864), and 60.6%(439/724) respectively. At 3-month follow-up, 43.8%(415/947) and 56.2%(532/947) chose the daily and on-demand regimen. In the end, 39.4%(173/439) of participants reported increasing dosing strategies switching, 35.3%(61/173), 40.5%(70/173), 57.8%(100/173), 64.7%(112/173) at each time follow up. Among them 88.4%(153/173) participants had transferred from daily to the on-demand regimen. The self-reported adherence was 75.0%(774/1032),67.8%(637/940),58.6%(469/800), and 50.7%(340/670) at each time point. 285 participants (25.0%,285/1138) discontinued PrEP during the study. 47.6% and 55.4% of subjects reported alcohol use and nitrates at baseline and 12 months. Six participants were seroconverted, resulting in an HIV incidence rate of 0.53 per 100 person-years. ( The absence of PrEP in this population is 5.10 per 100 person-years).

**Conclusions:** The hybrid CBO and clinic-based model proved feasible for reaching and dispensing PrEP among Chinese at-risk populations. On-demand use and mail-order drugs were popular alternatives and one-half of participants engaged in sex using alcohol and nitrates. Long-term PrEP persistence and optimal adherence continuously decreased among Chinese users during the 12 months.

## THPEC181

### A global review of national guidelines of post-exposure prophylaxis for the prevention of HIV

Y. Zhang<sup>1,2</sup>, M. Maisano<sup>1,2</sup>, D. Tran<sup>3</sup>, V. Macdonald<sup>4</sup>, R.C. Baggaley<sup>4</sup>, N. Ford<sup>4</sup>, C.C. Johnson<sup>4</sup>, J.J. Ong<sup>1,2,5</sup>

<sup>1</sup>School of Translational Medicine, Faculty of Medicine, Nursing and Health Sciences, Monash University, Melbourne, Australia, <sup>2</sup>Melbourne Sexual Health Centre, Alfred Health, Melbourne, Australia, <sup>3</sup>Melbourne Medical School, The University of Melbourne, Melbourne, Australia, <sup>4</sup>Global HIV, Hepatitis and STI Programmes, World Health Organization, Geneva, Switzerland, <sup>5</sup>Faculty of Infectious and Tropical Diseases, London School of Hygiene and Tropical Medicine, London, United Kingdom

**Background:** The World Health Organization (WHO) recommends the use of antiretroviral drugs as post-exposure prophylaxis (PEP) for preventing HIV infection for occupational and non-occupational exposures. To inform the development of global WHO recommendations on PEP, we reviewed national guidelines of PEP for their recommendations.

**Methods:** Policies addressing PEP from 38 WHO HIV priority countries were obtained by searching governmental and non-governmental websites and consulting country and regional experts; these countries were selected based on HIV burden, new infections and the number of HIV-associated deaths. We reviewed national guidelines published as of August 2023 to collate data on where PEP can be offered, who can prescribe PEP, PEP eligibility, recommended drug regime, linkage to other interventions, recommended investigations prescribed with PEP, HIV self-test recommendation related to PEP and stopping rules for PEP.

**Results:** In total, 46 guidelines across 36 countries were included, with the majority (70%) of documents published on or after 2020. There was significant variation across guidelines regarding where PEP can be accessed and who can provide or prescribe PEP. Six countries (17%) described being able to access PEP from a primary care facility, four countries (11%) from hospitals and two (6%) from community-based services. Only three countries (8%) specifically considered dispensing PEP by professionals other than doctors (e.g. nurses). None mentioned pharmacists as prescribers. We found a lack of consistency across countries regarding who is eligible for PEP, regimens used, interventions integrated into PEP provision and recommended investigations for PEP users. No country guidance provided considerations on using HIV self-tests for starting or after stopping PEP.

**Conclusions:** Despite PEP being recommended for more than three decades, many national policies were inconsistent or lacking in terms of PEP guidance. The findings from this review underscore the need for a globally unified approach to PEP recommendations that is in line with best practices and the latest evidence. This should include

recommendations for decentralisation and task-sharing to achieve sufficient scale for impact. Improving timely access to PEP among those who need it would contribute to reducing the incidence of HIV globally.

## THPEC182

### Tenofovir douche as HIV pre-exposure prophylaxis for receptive anal intercourse: end user feasibility evaluation of tenofovir rectal microbicide douche

C. Diniz<sup>1</sup>, C. Bagia<sup>2</sup>, R. Giguere<sup>3,4</sup>, L. Wang<sup>2</sup>, S. Abdul Massih<sup>1</sup>, V. Bui<sup>1</sup>, S. Beselman<sup>1</sup>, R. Bakshi<sup>1</sup>, M. Marzinke<sup>1</sup>, E. Fuchs<sup>1</sup>, L. Rohan<sup>2</sup>, C. Hendrix<sup>1</sup>

<sup>1</sup>Johns Hopkins University School of Medicine, Baltimore, United States, <sup>2</sup>University of Pittsburgh, Magee-Womens Research Institute, Pittsburgh, United States, <sup>3</sup>Columbia University and NY State Psychiatric Institute, HIV Center for Clinical and Behavioral Studies, New York, United States, <sup>4</sup>Florida State University College of Medicine, Center for Translational Behavioral Science, Tallahassee, United States

**Background:** Unprotected receptive anal intercourse (RAI) holds the highest sexual HIV transmission risk. The need for diverse pre-exposure prophylaxis (PrEP) options has encouraged the development of on-demand, topical PrEP products for individuals at HIV risk who prefer non-systemic or occasional PrEP use.

We aimed to assess end-users' proficiency in preparing two different douche formulations using two tenofovir (660mg) sachets, either lyophilized or spray-dried, and to evaluate their experience.

**Methods:** Cisgender adult men with a history of RAI-related douching were consented, screened, and enrolled. Twenty-one participants were randomized 1:1 to the order of douche product preparation. Participants received written instructions on how to prepare a douche with the sachet powder.

All participants prepared three enema bottles of each; douche aliquots were analyzed for TFV concentration, osmolality, and pH. User experience and likelihood of future product use were assessed by questionnaire.

**Results:** Most participants reported both products very easy/easy to prepare and very likely/likely to use the product; participants preferred the lyophilized product, with only 19% indicating liking (a little or very much) the spray-dried preparation process. Osmolality specification was met by 90% and 61% of the lyophilized and spray-dried sachets prepared, respectively; TFV content met specifications in 86% and 30% of the lyophilized and spray-dried product, respectively (Figure 1); failures were skewed to values below specifications.

Questionnaires indicated the most common challenges were tearing open the sachet and transferring the spray-dried product, which clung to the sachet and wafted into the air upon opening.

**Figure 1.** End user performance in preparation of the tenofovir (TFV) douche lyophilized powder (blue bars) and spray-dried powder (orange bars) compared to pharmaceutical specifications: tenofovir content 90%–100% of the specified final TFV concentration (5.28 mg/mL), shown here as TFV Content Ratio, actual value of prepared unit dose divided by product specification; osmolality 145 ± 22 mOsm/kg. Acceptable ranges are indicated by the green shaded areas. Histogram height (y-axis) is total number of unit doses prepared by study participants falling within each pharmaceutical category bin (x-axis).

**Conclusions:** Most participants reported the douches were easy to prepare with likely future use. However, participant-prepared spray-dried douches met all pharmaceutical criteria only 30% of the time.

These data informed numerous product modifications intended to improve ease of douche preparation, likelihood of future use, uptake, and adherence in future clinical development.

## THPEC183

### Enhancing ART adherence readiness and disclosure confidence among newly diagnosed HIV-positive healthcare clients: results from assessing the impact of lay counsellors trained in motivational interviewing counselling in Johannesburg, South Africa

T. Sineke<sup>1,2</sup>, I. Mokhele<sup>1</sup>, R.A. Ruiter<sup>2</sup>, M. Vujovic<sup>3</sup>, J. Miot<sup>1</sup>, D. Onoya<sup>1</sup>

<sup>1</sup>Health Economics and Epidemiology Research Office, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, <sup>2</sup>Maastricht University, Faculty of Psychology and Neuroscience, Maastricht, Netherlands, the, <sup>3</sup>ANOVA Health Institute, Johannesburg, South Africa

**Background:** We developed a motivational interviewing (MI) skills training program (The Thusa-Thuso program) for lay counsellors providing HIV counselling and testing services in South Africa (SA).

We report the effects of the Thusa-Thuso intervention on newly diagnosed persons living with HIV (PLHIV) immediately after counselling.

**Methods:** We randomized eight primary healthcare clinics in Johannesburg to either the intervention (n=4 clinics, n=293 healthcare clients) where all enrolled lay counsellors were supported for 12 months before adult (>18 years) PLHIV enrolment or the standard of care (n=4 clinics, n=261 healthcare clients).

PLHIV were recruited via referral from the testing HIV counsellor and interviewed on their confidence in taking medication in public, ART and disclosure concerns and counselling experience. These were analysed using Poisson regression reporting adjusted risk ratios (RR) with 95% confidence intervals (CIs).

**Results:** The participants had a median age of 34 years (IQR 29-41), and 61% were female. More participants at intervention sites (95.1%) reported receiving post-test counselling than controls (89.9%) (aRR 1.2, 95% CI: 0.7-2.2). Compared to control participants, intervention participants were more likely to express confidence to take treatment in public (47.0% vs 28.3%) (aRR 1.4, 95% CI: 1.0-2.0), less likely to report HIV disclosure concerns (50.7% intervention vs 60.5% controls) (aRR 0.7, 95% CI: 0.6-0.9), and less likely to report high concerns about ART (45.7% intervention vs 54.3% control, aRR 0.7 for high vs low-medium concerns, 95% CI: 0.6-0.9).

	Control	Intervention	Crude RR 95% CI	Adjusted RR 95% CI
<b>Sex</b>				
Female	151 (57.9)	187 (61.8)	1	
Male	110 (42.1)	106 (36.2)	0.9 (0.7-1.1)	
<b>Age at study enrolment</b>				
15-24.99	77 (29.5)	79 (27.2)	1	
25-34.99	108 (41.4)	138 (47.1)	1.1 (0.8-1.5)	
35+	76 (29.1)	76 (25.9)	1.0 (0.7-1.3)	
<b>Received post-test counselling</b>				
No	29 (11.1)	14 (4.9)	1	1
Yes	232 (88.9)	274 (95.1)	1.7 (1.0-2.9)	1.2 (0.7-2.2)
<b>Taking medication in the presence of others</b>				
Not confident	52 (20.5)	46 (16)	1	1
Confident	55 (21.7)	44 (15.3)	1.0 (0.6-1.6)	1.0 (0.6-1.5)
Somewhat confident	75 (29.5)	62 (21.6)	1.0 (0.7-1.4)	1.0 (0.7-1.4)
Very confident	72 (28.3)	135 (47)	1.4 (1.0-1.9)	1.4 (1.0-2.0)
<b>HIV status disclosure fears</b>				
Low - Medium	102 (39.5)	142 (50.3)	1	1
High	150 (60.5)	146 (50.7)	0.8 (0.6-0.9)	0.7 (0.4-0.9)
<b>ART concerns</b>				
Low - Medium	178 (68.8)	213 (73.9)	1	1
High	89 (34.2)	78 (26.1)	0.8 (0.6-0.9)	0.7 (0.4-0.9)

**Conclusions:** Findings suggest noteworthy improvements in HIV disclosure and ART adherence preparedness among healthcare clients who underwent MI counselling compared to those receiving the standard counselling approach. The Thusa-Thuso program, integrating MI counselling among lay counsellors, is a promising model for effective healthcare client-centred approaches.

## THPEC184

Awareness and acceptability of HIV pre-exposure prophylaxis among HIV-negative pregnant and breastfeeding women in Zambia: analysis of ZAMPHIA 2021

W. Sichembe<sup>1</sup>, M. Montandon<sup>2</sup>, K. Mwebo<sup>1</sup>, L. Mwiinga<sup>1</sup>, D. Zachary<sup>1</sup>, T. Chisenga<sup>3</sup>, M. Chola<sup>4</sup>, B. Muyunda<sup>1</sup>, O. Chitwuo<sup>1</sup>, N. Kancheya<sup>1</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention, Lusaka, Zambia, <sup>2</sup>U.S. Centers for Disease Control and Prevention, Atlanta, United States, <sup>3</sup>Ministry of Health, Lusaka, Zambia, <sup>4</sup>Maryland Global Initiatives Corporation (MGIC), University of Maryland Baltimore, Lusaka, Zambia

**Background:** Since 2020, Zambia has been scaling-up HIV pre-exposure prophylaxis (PrEP) services in Maternal Newborn Child Health (MNCH) clinics to prevent incident HIV acquisition among pregnant and breastfeeding women (PBFW). We assessed PrEP awareness and acceptability among HIV-negative PBFW in Zambia during this scale-up period.

**Methods:** We analyzed PrEP awareness and acceptability among HIV-negative PBFW aged 15-50 years old using the 2021 Zambia Population-Based HIV/AIDS Impact Assessment (ZAMPHIA). We used descriptive statistics (with chi-square tests) to describe demographic and behavioral characteristics of PrEP awareness and acceptability among PBFWs and age-matched women who were not pregnant/breastfeeding (non-PBFW) and conducted weighted multivariable regression analysis for predictors of PrEP awareness and acceptability among PBFW and non-PBFW. All analyses were weighted to account for complex survey design.

**Results:** Of the 2,132 HIV-negative PBFW, 24.3%(95%CI:21.6-27.2) reported PrEP awareness. Within age groups, 19.6%(95%CI:16.7-22.7) of PBFW aged 15-24 years and 29.1%(95%CI:24.8-33.6) aged 25-34 years reported PrEP awareness. PrEP awareness was significantly higher for urban residents compared to rural( $p<0.001$ ), higher levels of education compared to lower ( $p<0.001$ ), higher wealth quintiles compared to lower( $p<0.001$ ) and having sexual partners living with HIV compared to without ( $p<0.001$ ). PrEP acceptability among PBFW was 68.2%(95%CI:65.1-71.4) and was significantly higher for PBFW with more lifetime sexual partners compared to fewer ( $p<0.007$ ) and one or more sexual partners in the last 12 months compared to none ( $p<0.034$ )

Predictors of PrEP awareness included having tertiary education compared to no education (aOR 3.96 [95%CI:1.93-8.12]; $p<0.001$ ), being of highest wealth quintile compared to lowest (aOR 3.81[95%CI:2.15-6.74]; $p<0.001$ ) and having sexual partners living with HIV compared to without (aOR 9.21[95%CI:2.98-28.48]; $p<0.001$ ). Predictors for PrEP acceptability was having two or more lifetime sexual partners compared to one (aOR 1.54[95%CI:1.21-1.94]; $p<0.001$ ). PrEP awareness (aOR 1.06[95%CI:0.83-1.35]; $p=0.652$ ) and acceptability (aOR 1.09[95%CI:0.95-1.26]; $p=0.205$ ) did not differ comparing PBFW to non-PBFW.

**Conclusions:** Despite considerable PrEP scale-up in MNCH clinics, PrEP awareness among PBFW is low in Zambia and is not significantly different compared to non-PBFW. However, majority of PBFW and non-PBFW are willing to take PrEP to prevent HIV.

Efforts to improve PrEP awareness and uptake among PBFW are needed, that address the identified disparities, to prevent incident maternal HIV acquisition and contribute to eliminating vertical HIV transmission.

## THPEC185

### Impact of Covid-19 pandemic in sexual practices and mental health of men who have sex with men (MSM) – Project Horizonte, Belo Horizonte, Brazil

A.P. Silva<sup>1</sup>, M. Carneiro<sup>2</sup>, M. Greco<sup>1</sup>, F. Magalhães<sup>2</sup>, M.Y. Gomes Bezerra<sup>3</sup>, D. Greco<sup>4</sup>

<sup>1</sup>Federal University of Minas Gerais, Project Horizonte, Belo Horizonte, Brazil, <sup>2</sup>Federal University of Minas Gerais, Institute of Biological Sciences, Department of Parasitology, Belo Horizonte, Brazil, <sup>3</sup>Federal University of Minas Gerais, Postgraduate Program in Rehabilitation Sciences, Department of Physiotherapy, Belo Horizonte, Brazil, <sup>4</sup>Federal University of Minas Gerais, Department of Internal Medicine, Belo Horizonte, Brazil

**Background:** It's known that the Covid pandemic intensified discrimination, sexual risk and difficulties in accessing health services among LGBTQI+ population.

The goal of this study was to describe the impacts of the pandemic on the daily of men who have sex with men (MSM), followed up by Project Horizonte (PH), an open cohort of MSM HIV negative established in 1994 in Belo Horizonte/Brazil.

**Methods:** Nested survey in a cohort of MSM. Variables analyzed were collected from online self-administered questionnaire: sociodemographic, sexual practices, condom use, mental health, economic status. Were performed exploratory analysis of measures/proportions and chisquare test of categorical variables

**Results:** Sample:134 participants. Average age: 44 years, higher education: 66.5%. Most (71.6%) works, (37.3% salaried employees), 65.7% self-identifies as black/brown. Most (57.5%) uses public health service. Analysis showed that 46.3% have fully complied with social distancing and took prevention measures. Among those who feel more vulnerable to Covid (43.3%) are the ones who must go to work daily (35.1%), who uses public transportation (28.4%) and those with chronic illnesses (24.6%). 23.1% reported a decrease in income and only 34.3% have managed to maintain themselves financially during the pandemic. For the majority (68.7%), there weren't significant changes in sexual practices during the pandemic and for 31.3% the main changes were: less sexual relations (19.4%), increase in masturbation (14.9%), 42.3% reported increased use of dating apps. The majority (58.2%) did not report any change in condom use and 69.8% did not feel at risk for HIV. Regarding mental health impacts, the reported symptoms were: sadness, anguish, anxiety, trouble concentrating, apathy. Caught our attention that 25.4% reported increase in use of illicit drugs to deal with stress.

**Conclusions:** The majority did not report significant alterations in sexual practices and perception of risk for HIV/STI during the pandemic. However social distancing has interfered in the sociability context, reflecting in a decrease of sexual relations, increase of masturbation and virtual sex. The impacts observed on mental health showed a

potential risk of psychological distress, social vulnerability and, to some extent, unprotected sex. It is necessary to expand public health policies adapted to the LGBTQI+ community in emergency periods.

## THPEC186

### HIV pre-exposure prophylaxis awareness, willingness, and use among transfeminine persons with high likelihood of HIV in the United States: results from the Transgender Women's Internet Survey and Testing (TWIST)

D. Islek Yaras<sup>1</sup>, T. Sanchez<sup>1</sup>, S. Baral<sup>2</sup>, C. Brown<sup>3</sup>, J.A. Caldwell<sup>1</sup>, J.L. Glick<sup>2</sup>, J. Jones<sup>1</sup>, I. Lucas<sup>1</sup>, L. Ragone<sup>3</sup>, A. de Ruiter<sup>4</sup>, P.S. Sullivan<sup>1</sup>, M. Valentine-Graves<sup>1</sup>, S. Winter<sup>1</sup>, V. Vannappagari<sup>3</sup>

<sup>1</sup>Emory University, Rollins School of Public Health, Epidemiology, Atlanta, United States, <sup>2</sup>Johns Hopkins University, School of Public Health, Baltimore, United States, <sup>3</sup>ViiV Healthcare, Durham, United States, <sup>4</sup>ViiV Healthcare, London, United Kingdom

**Background:** Transfeminine persons (TFP) have a high likelihood of HIV acquisition, yet information about pre-exposure prophylaxis (PrEP) utilization among this population remains scarce. We examined oral PrEP awareness, willingness, and use among a US nationwide sample of TFP.

**Methods:** Sexually active TFP age 15+ were recruited online between April 2022 and June 2023 through social media advertisements. TFP not living with HIV were asked about oral PrEP awareness, willingness, and use. Log-binomial regression modeling examined associations between demographics and oral PrEP use in the past year.

**Table.** Associations between sociodemographic characteristics and oral PrEP use in the past year among Transfeminine persons who have a high likelihood of HIV, The Transgender Women's Internet Survey and Testing (TWIST) project, United States, 2022-23 (n=2736)

**Results:** Of 2736 TFP not living with HIV, 75.1% heard of daily oral PrEP, 11.7% used PrEP in past year and 9.1% were current users. Among 248 current oral PrEP users, 63.3% used TDF/FTC and 33.1% used TAF/FTC. Use duration was  $\leq 6$  months for 43.5%. Among 2417 TFP not living with HIV who had not used oral PrEP in past year, 3.0% reported ever using oral PrEP and 51.2% were willing to use oral PrEP in the future. Non-Hispanic Black TFP were more than twice as likely to have used PrEP in the past year than non-Hispanic White TFP (Table).

TFP 15-29 years were a third less likely to have used PrEP compared to those 40+. TFP living in medium/small and rural areas were half as likely to have used PrEP compared to urban areas. Only those with other/multiple health insurance were more likely to have used PrEP compared to those with private insurance.

**Conclusions:** Despite nearly a decade of oral PrEP recommendations for US TFP, only 9% are current users, with significant usage disparities by age and urbanicity. The higher prevalence of PrEP use among Black TFP is encouraging given the disproportionate HIV burden this group experiences, but more work is needed to ensure equitable access and scale-up to youth and rural persons.

## THPEC187

HIV incidence following pre-exposure prophylaxis (PrEP) initiation among key populations in resource-limited setting: insights from Indonesia

N. Hanum<sup>1,2</sup>, M. Handayani<sup>3</sup>, A. Padmasawitri<sup>1</sup>, Z. Zazuli<sup>1</sup>, M. Pohan<sup>3</sup>, T. Putri<sup>3</sup>, F. Rakhmat<sup>3</sup>, D. Anggiani<sup>4</sup>, N. Afriana<sup>4</sup>, E. Lukitosari<sup>4</sup>, B. Prabowo<sup>5</sup>, R. Wisaksana<sup>3</sup>

<sup>1</sup>Bandung Institute of Technology, Pharmacology and Clinical Pharmacy, Bandung, Indonesia, <sup>2</sup>Bandung Institute of Technology, Biosciences and Biotechnology Research Center, Bandung, Indonesia, <sup>3</sup>Padjadjaran University, Research Center for Care and Control of Infectious Disease, Bandung, Indonesia, <sup>4</sup>Ministry of Health, HIV and STI Working Group of the Directorate of Disease Prevention and Control, Jakarta, Indonesia, <sup>5</sup>The Joint United Nations Programme on HIV/AIDS (UNAIDS), Jakarta, Indonesia

**Background:** As one of the countries in Asia Pacific with the highest number of people with HIV and limited ART coverage, Indonesia launched a PrEP pilot study among key populations, providing important evidence to guide the national rollout. As part of the program, we determined HIV incidence, adherence, and retention among individuals initiating PrEP.

**Methods:** Indonesia PrEP Pilot program (Dec 2021-Dec 2023, rolled out in 21 districts in 10 provinces) was a real-world, non-randomized study among key populations vulnerable to HIV (men who have sex with men [MSM], female sex workers [FSW], 'Waria' (shemale/transgender women), people who inject drugs [PWID] and the serodiscordant partners of people with HIV). Eligible participants

offered same-day oral daily (D) or event-driven (ED) PrEP and completed baseline, month 1, and three-monthly follow-up visits. Poisson regression was used to obtain the HIV incidence rate ratio, adjusted for age (aIRR).

**Results:** 8502 individuals initiated PrEP between 01/2022 and 10/2023 (median age 27 [IQR 23-32]; 86% men; 75% MSM; 65% chose daily PrEP); 3916 had at least one follow-up visit. Among the 3916, 21 seroconverted over 1347 person-years (PYs) of follow-up; overall incidence rate (IR) 1.56 (95% CI 1.02-2.39) per 100 PYs. Of the 21 seroconversions, 19 occurred without good adherence vs. two of good adherence (aIRR 0.04; 0.01-0.21). Men accounted for 100% of HIV incidence (IR 1.72; 1.12-2.65 vs 0; 0-2.88 in women) and MSM had the highest IR (19/21 individuals over 1077 PYs, IR 1.76; 1.12 - 2.77). IR in MSM in this study was 2.6 times lower (~62% reduction) than IR among MSM not using PrEP in another cohort (IR=4.5, personal communications).

No incidence difference between D-PrEP and ED-PrEP users (aIRR, 1.11; 0.44-2.8). In cascade analysis among 2511 people who started PrEP up to 11/2022, 1676/2511 (66.75%) retained at month (M)1, 1152/1676 (68.73%) at M3, 799/1152 69.38% at M6, 561/799 (70.21%) at M9 and 356/561 (63.46%) at M12.

**Conclusions:** Real-world data from limited resources settings suggest lower efficacy compared to what is seen in controlled trials. To ensure success in Indonesia's national PrEP implementation (2024-onward), efforts to enhance monitoring of adherence and retention must be intensified.

## THPEC188

Evaluating the acceptability of long acting injectables as pre-exposure prophylaxis option in key populations in Cameroon

I.I. Nkaanah Fomefret<sup>1,2</sup>, S. Mabouna<sup>3</sup>, C. Amah<sup>1</sup>, L. Nguemo<sup>1</sup>, D. Guebiapi<sup>1</sup>, K. Ekude<sup>1</sup>, R.A. Ajeh<sup>4,2</sup>

<sup>1</sup>Integrated Research and Education Group, Yaounde, Cameroon, <sup>2</sup>Ministry of Public Health, Yaounde, Cameroon, <sup>3</sup>Care and Health Program, Yaounde, Cameroon, <sup>4</sup>National AIDS Control Committee, Yaounde, Cameroon

**Background:** Cameroon has an HIV prevalence of 3.7%, with a disproportionately higher prevalence of up to 22% in key populations (KPs). Cameroon implemented oral pre-exposure prophylaxis (PrEP) as a prevention option for KPs since 2019. However, uptake and adherence to daily oral PrEP has been very challenging (<5%). Long-acting injectable (LAI) PrEP has been associated with increased PrEP uptake and adherence in key populations. We assessed the acceptability of LAI PrEP option for KPs in Cameroon.

**Methods:** This was a cross-sectional study implemented by the Integrated Research Education and Support Group, and the Care and Health Program in community-based organizations (CBOs) across five regions in Cameroon from July to October 2023, using an exhaustive

consecutive sampling technique. Pre-tested, structured tablet-based questionnaires were administered to female sex workers (FSWs) and men who have sex with men (MSM) by trained research assistants based in the CBOs. Data analysis was done using SPSS.

**Results:** 1140 participants were enrolled with female predominance (74.6%). 55.9% of the general population were on PrEP. 50.3% female sex workers (FSWs) were on PrEP, compared to 76.3% in the men who have sex with men (MSM) population. 65.2% skipped medications mainly due to forgetfulness and daily pill burden. 76.3% indicated preference for LAI to oral PrEP. 90.5% of the FSW population preferred the injectable to the vaginal ring form.

Overall, 73.7% of the population were willing to take injectable PrEP with 45.9% willing to pay. 70.9% of PrEP eligible participants who did not enroll in daily oral PrEP indicated willingness to take injectable PrEP.

**Conclusions:** This study shows a high acceptability of LAI long-acting injectable PrEP amongst KPs in Cameroon, including those who refused to take oral PrEP.

These findings suggest the potentials of LAI PrEP to increase uptake and effectiveness of PrEP program in Cameroon.

### Uptake of pre-exposure prophylaxis among Key populations in Unguja, Zanzibar, 2023

A. Jahzum<sup>1</sup>, A. Ussi<sup>2</sup>, F. Khalid<sup>3</sup>, I. Maulid<sup>4</sup>, M. Mtoro<sup>5</sup>, C. Said<sup>6</sup>, H. Solomon<sup>7</sup>, A. Kailembo<sup>8</sup>, S. Porter<sup>9</sup>, G. Rutherford<sup>10</sup>, W. McFarland<sup>11</sup>

<sup>1</sup>Zanzibar Integrated HIV, Hepatitis, TB, and Leprosy Program, Key Population and STI, Unguja, Zanzibar, Tanzania, the United Republic of, <sup>2</sup>Ministry of Health, Unguja, Zanzibar, Zanzibar, Tanzania, the United Republic of, <sup>3</sup>Ministry of Health, Unguja, Zanzibar, Tanzania, the United Republic of, <sup>4</sup>Zanzibar Integrated HIV, Hepatitis, TB and Leprosy Program, Diagnostic services, Unguja, Zanzibar, Tanzania, the United Republic of, <sup>5</sup>Global Programs, Biostatistics, Dares Salaam, Tanzania, the United Republic of, <sup>6</sup>University of California, San Francisco (UCSF), Department of Public Health, San Francisco, United States, <sup>7</sup>Centers for Disease Control and Prevention, Atlanta, United States, <sup>8</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Dar es Salaam, Tanzania, the United Republic of, <sup>9</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Dares Salaam, Tanzania, the United Republic of, <sup>10</sup>University of California, San Francisco (UCSF), San Francisco, United States, <sup>11</sup>San Francisco, Department of Public Health, San Francisco, United States

**Background:** Pre-exposure prophylaxis (PrEP) was introduced to Zanzibar in 2021. In 2023, we assessed awareness and uptake of PrEP among men who have sex with men (MSM), female sex workers/sexually exploited children

(girls <18 years old who are given money or goods for sex) (FSW/SEC), and people who inject drugs (PWID) in Unguja Island, Zanzibar, via an integrated biobehavioral survey.

**Methods:** We recruited MSM (had sex with men in the past 3 months), FSW/SEC (exchanged sexual intercourse for money in the prior month), and PWID (injected illicit drugs in the past 3 months) aged ≥15 years who had lived in Unguja for ≥3 months using respondent-driven sampling. We assessed awareness and uptake of PrEP services and reasons for not using PrEP through an interviewer-administered questionnaire. We produced weighted estimates reported as percentages with 95% confidence intervals (95%CI).

**Results:** We enrolled 485 MSM, 598 FSW/SEC, and 455 PWID. Overall, 27.5% (95%CI: 22.9-32.0) of MSM, 35.1% (95%CI: 31.5-38.7) of FSW/SEC and 19.9% (95%CI: 16.1-23.7) of PWID had ever heard of PrEP. Among them, 13.9% (95%CI: 2.1-25.1) of MSM, 18.8% (95%CI: 12.4-25.4) of FSW/SEC and 11.9% (95%CI: 6.7-17.1) of PWID had ever used PrEP. Among those who had never heard of PrEP, 39.8% (95%CI: 35.5-44.0) of MSM, 51.6% (95%CI: 47.8-55.3) of FSW/SEC, and 31.1% (95%CI: 27.6-34.5) of PWID said they would take PrEP to help prevent HIV infection.

**Conclusions:** Awareness and uptake of PrEP services among KPs in Unguja, Zanzibar, was low. Interest in using PrEP to prevent HIV infection was highest among FSW/SEC but was limited overall. Comprehensive PrEP education and demand creation will be critical to ensure awareness and uptake.

## THPEC190

### The effectiveness of co-created digital intervention to improve PrEP adherence among Chinese men who have sex with men: a stepped-wedge randomized trial in China

C. Li<sup>1,2</sup>, Z. Yin<sup>1</sup>, Q. Li<sup>3</sup>, L. Li<sup>3</sup>, S. Wu<sup>4</sup>, K. Liang<sup>4</sup>, G. Marley<sup>1</sup>, C. Fan<sup>1</sup>, Y. Dai<sup>1</sup>, H. Huang<sup>5</sup>, A. Hazra<sup>6</sup>, J. Lio<sup>6</sup>, J.D. Tucker<sup>7,8</sup>, W. Tang<sup>7,1</sup>, R. Sherer<sup>6</sup>

<sup>1</sup>University of North Carolina Project China, Guangzhou, China, <sup>2</sup>The University of Tokyo, Tokyo College, Tokyo, Japan, <sup>3</sup>Guangzhou Eighth People's Hospital, Guangzhou, China, <sup>4</sup>Zhongnan Hospital of Wuhan University, Wuhan, China, <sup>5</sup>Wuhan Tongxing LGBT Center, Wuhan, China, <sup>6</sup>University of Chicago, Department of Medicine, Chicago, United States, <sup>7</sup>University of North Carolina at Chapel Hill, Institute for Global Health and Infectious Diseases, Chapel Hill, United States, <sup>8</sup>London School of Hygiene and Tropical Medicine, Faculty of Infectious and Tropical Diseases, London, United Kingdom

**Background:** Co-creation – an iterative process where researchers and participants work together in health intervention – is a promising strategy for encouraging behavior change. We conducted a stepped-wedge trial (SWT) to

evaluate the efficacy of co-created digital PrEP adherence messages to facilitate adherence among Chinese MSM PrEP users.

**Methods:** This trial is nested in a PrEP demonstration trial in Guangzhou and Wuhan, China (NCT04754139). Participants were provided TDF/FTC for 12 months and followed up quarterly. MSM were randomly allocated to four sequential groups receiving weekly WeChat-based (a popular Chinese chat media) PrEP adherence messages in a quarterly staggered order. Intervention messages were co-created through open calls and three co-creation rounds with 19 PrEP users in the trial, including short videos, images, and infographics. Generalized linear mixed-effects models were used to assess primary outcomes, including self-reported optimal PrEP adherence (daily users: 6-7 pills/week, on-demand users: full compliance with the 2-1-1 dosing scheme per sex event), self-initiated switching between daily and on-demand dosing strategies, and retention in care (i.e. whether loss to follow-up).

**Results:** From July 2021 to December 2023, 910 MSM (mean age=28.4, IQR=24.1-31.6) completed at least one follow-up survey (i.e. at 3 months). About 24.2% of the participants were college students, and 64.1% had 2 or more sex partners in the past 3 months. SWT cluster sizes at baseline were 251, 272, 280, and 282, respectively. About 25% (n=277) of the participants were lost to follow-up before the 12<sup>th</sup> month, with no significant difference across SWT clusters. Throughout the trial, approximately 60% of the participants reported almost 100% adherence to PrEP, with a non-significant secular trend of declining adherence over time. The co-created PrEP messages intervention marginally improved adherence levels (aOR=1.07, 95%CI: 0.82-1.40), but not statistically significant. On-demand PrEP users (55%) versus once-daily PrEP users (45%) were less likely to report optimal adherence (aOR=90.2, 95%CI: 54.59-148.99). MSM of younger age or with higher income are more likely to report optimal adherence.

**Conclusions:** Co-creating PrEP adherence intervention messages with Chinese MSM has the potential to improve self-reported adherence. Our findings of varied adherence performance among individuals highlight the need for future research into differentiated PrEP interventions.

## THPEC191

### Mapping of HIV-related risks and vulnerabilities among adolescents and youth in Cameroon: the case of Yaounde

E.B. Monthe<sup>1</sup>, R. Ngon Abouem<sup>2</sup>, C.N. Bayiha<sup>3</sup>, L. Sonwa Lontsi<sup>1</sup>

<sup>1</sup>Réseau Camerounais des Adolescents et Jeunes Positifs, Yaoundé, Cameroon, <sup>2</sup>Ministère de la Jeunesse et de l'Éducation Civique, Yaoundé, Cameroon, <sup>3</sup>Project for the Elimination of Mother to Child Transmission of HIV and AIDS, Yaoundé, Cameroon

**Background:** The U-TEST initiative by UNICEF is a programmatic and technological innovation encompassing a range of multiple interventions for adolescents and youth, aimed at reducing the incidence of HIV, identifying HIV+ adolescents, facilitating access to care, and reducing cases of Gender-Based Violence (GBV). In this context, Risk and Vulnerability Mapping (RVM), a process for identifying, assessing, and prioritizing risks, is a crucial step to ensure a targeted approach in the interventions of stakeholders. Hence, the need to map risk areas and service delivery points to enhance the collective understanding of stakeholders and adolescents about their environment.

**Description:** It involved a multisectoral synergy, ranging from the Ministry of Youth to secondary education, through civil society organizations and the municipality. Youth from these organizations targeting various groups (adolescents and youth, adolescents and youth living with HIV, and key populations) residing in the municipality were recruited and trained to cover the entire municipality. They used smartphones with a form containing information such as GPS coordinates, types of populations frequenting the area, and preventive services offered to youth at service points (testing, counseling, viral load monitoring, etc.).

**Lessons learned:** Out of the nine health areas in the Yaoundé 2 municipality, two have been classified as low-risk zones, four health areas as medium-risk zones, and three health areas as high-risk zones. Additionally, we observe that the more service points there are (health facilities, churches, etc.) in an area, the lower the risk. A risk map has been developed and disseminated to various stakeholders (municipalities, ministries, civil society organizations, etc.).

**Conclusions/Next steps:** The RVM provides a better understanding of the environment by identifying the types of risks faced by young people and the level of service offerings available. The youth must have this tool that informs them about the different risk zones and the services available in their environment to address them. Partners, on the other hand, benefit from a tool that guides resources and enables tracking and evaluation of actions taken.

## THPEC192

### Key population's preferences in initiating and continuing PrEP in community- or facility-based settings within three sub-Saharan African Countries

T. Lillie<sup>1</sup>, D. Boyee<sup>1</sup>, V. Ranebennur<sup>1</sup>, P. Kumar Thakur<sup>1</sup>,

A. Amedzi<sup>2</sup>, G. Nunoo<sup>2</sup>, M. Rangoanana<sup>3</sup>, J. Lehloka<sup>3</sup>,

G. Parola<sup>1</sup>, B. Sithole<sup>4</sup>, M. Matsebula<sup>4</sup>

<sup>1</sup>FHI 360, Washington, DC, United States, <sup>2</sup>FHI 360, Accra,

Ghana, <sup>3</sup>FHI 360, Maseru, Lesotho, <sup>4</sup>FHI 360, Mbabane,

Eswatini

**Background:** Client-centered service delivery at both community and facility settings aims to increase access to pre-exposure prophylaxis (PrEP). The PEPFAR- and US-AID-funded Meeting Targets and Maintaining Epidemic Control (EpiC) project in Eswatini, Ghana, and Lesotho implemented PrEP to prevent HIV acquisition among key populations (KPs) [men who have sex with men (MSM), female sex workers (FSWs)], in both settings.

We sought to categorize clients' PrEP initiation and refill preferences by population, age, and country.

**Methods:** We analyzed routine EpiC programmatic data from October 2022 -- June 2023 from three countries to compare PrEP initiation and refills in community vs facility sites. The two settings were reviewed at initiation, and at first, second, and third refill visits. We used Chi-squared to determine if there were differences by site stratified by KP type, age, and country. We calculated the odds of refills in the community as compared to the facility for the three visits.

**Results:** Overall, 83.6% of KP initiated in the community (95% CI: 82.5% - 84.6%) and 16.4% initiated in the facility (95% CI: 15.4% - 17.5%). There was slight variation in proportion among MSM and FSW (Table 1).

		% initiated in Community n=3913 (%)	% initiated in Facility n=770 (%)	% initiated All (N=4683)	P value
Population	FSW	(86.1)	13.9%	50.7%	p<0.001
	MSM	(81.0%)	19.0%	49.3%	
Age	<=24 yrs.	84.5%	15.5%	45.6%	p=0.113
	25+ yrs.	82.8%	17.2%	54.4%	
	Eswatini	90.7%	9.3%	55.4%	
Country	Ghana	71.9%	28.1%	16.5%	p<0.001
	Lesotho	76.3%	23.7%	28.1%	

Table 1: Comparison of PrEP initiation in community and facility settings.

The odds of returning for first refill was 1.5 times (p<0.001), second refill 1.4 times (p=0.005) and third refill 0.9 (p=.08) when in the community vs facility, with MSM contributing significantly to the results (Table 2).

Service sites	First refill			Second refill			Third refill		
	FSW	MSM	Total	FSW	MSM	Total	FSW	MSM	Total
Facility (n=770)	ref	ref	ref	ref	ref	ref	ref	ref	ref
Community (n=3913)	0.9	2.2	1.5	0.8	2.4	1.4	0.6	0.9	0.9
OR (95% CI)	(0.8-1.2)	(1.8-2.8)*	(1.3-1.8)*	(0.6-1.1)	(1.6-3.4)*	(1.1-1.8)*	(0.5-1.6)	(0.6-1.5)	(0.6-1.3)

Table 2: Odds of PrEP refill by population and service point

\*Significant

**Conclusions:** KPs from the three countries are more likely to access PrEP services in community compared to facilities for initiation and refill visits. Yet, a sizeable number of clients access facility-based settings, so offering differentiated service delivery models is essential to improving initiation and usage overtime.

## THPEC193

### Feasibility and acceptability of daily oral emtricitabine and tenofovir alafenamide fumarate (FTC/TAF) for HIV pre-exposure prophylaxis among opioid-dependent people who inject drugs

K. Gautam<sup>1</sup>, K. Paudel<sup>1</sup>, J. A Wickersham<sup>2</sup>, G. Bellia<sup>3</sup>,

of Medicine, Department of Internal Medicine, Section

of Infectious Diseases, New Haven, United States, <sup>3</sup>Yale

University, Yale School of Public Health, New Haven, United

States

**Background:** People who inject drugs (PWID) remain at substantial risk of HIV acquisition, and pre-exposure prophylaxis (PrEP) is critical for HIV prevention. PrEP's efficacy was demonstrated a decade ago using daily oral tenofovir disoproxil fumarate (TDF) with emtricitabine (FTC). In 2019, co-formulated tenofovir FTC and alafenamide fumarate (TAF) became the second approved daily oral PrEP regimen. However, FTC/TAF is only approved for the prevention of sexually transmitted HIV, excluding individuals at risk of receptive vaginal sex, including PWID. This study explored FTC/TAF feasibility and acceptability for daily oral PrEP among PWID.

**Methods:** This single-arm, observational, open-label study enrolled 100 PWID to receive FTC/TAF for daily oral HIV prevention. Inclusion criteria were: age ≥18, HIV-negative, injection drug use (in the past 6 months), and meeting DSM-V criteria for opioid dependence.

Participants meeting clinical criteria received a 90-day supply of FTC/TAF from a community-based syringe services program (SSP). Behavioral and biomedical data were collected at baseline, 3, and 6 months. Descriptive statistics were used to estimate feasibility, acceptability, side-effects, adherence, and persistence on FTC/TAF.

**Results:** Participants were mostly male (63.0%) and non-Hispanic White (52.0%), with a mean age of 44.4 (SD=9.9). Participants reported injecting drugs at least once per day (37.0%) and engagement in condomless sex (78.0%) in the past 6 months. Prior use of daily oral PrEP was reported by 21% of participants (TDF/FTC: 14.0%; FTC/TAF: 3%; unknown: 4.0%). Although all participants were prescribed FTC/TAF, only 60.0% picked up the drug. Of those, 70% picked up once, 26.7% twice, and only 3.3% at all follow-up visits. Self-reported adherence was high (>90%) across all time points but discordant with urine-based quantification of FTC. Acceptability was high (range: 8-32): 3-months [24.9 (±3.1)]; 6-months [24.4 (±3.4)]. The most frequently reported side effects were tiredness (18.4%) and nausea (17.2%). There were no HIV seroconversions.

**Conclusions:** FTC/TAF PrEP was positively received among opioid-dependent PWID. Implementation through SSP services was feasible and acceptable, suggesting its viability as an HIV prevention tool for this vulnerable group. Poor adherence, as indicated in earlier studies of PWID using TDF/FTC PrEP, emphasizes the need for enhanced adherence counseling specifically tailored for PWID.

## THPEC194

Failure of healthcare providers to discuss PrEP with their Black/African-American healthcare clients may account for an HIV prevention disparity

M. Tate<sup>1</sup>, B. Suprasert<sup>1</sup>, R. Williams<sup>2</sup>, D. Reagan<sup>1,1</sup>, K. McNaughton<sup>1</sup>, J. Anakwenze<sup>1</sup>, J. Francisco<sup>1</sup>, E.C. Wilson<sup>1</sup>, W. McFarland<sup>2</sup>

<sup>1</sup>San Francisco Department of Public Health, San Francisco, United States, <sup>2</sup>University of California, San Francisco, San Francisco, United States

**Background:** A dismaying feature of the HIV epidemic in the USA is the disproportionate burden borne by Black/African-Americans. Black/African-Americans are 14% of people in the USA, yet account for 40% of new HIV diagnoses. Our objective is to quantify disparities in the uptake of PrEP by race/ethnicity in a community-recruited sample of men who have sex with men (MSM).

**Methods:** Data are from National HIV Behavioral Surveillance that tracks HIV prevalence and related behaviors among key populations in the USA. Time-location sampling (TLS) was used to recruit eligible MSM (over 18 years, assigned male or female sex at birth and now identified as men, ever had sex with men, and San Francisco residence) in 2023. HIV testing determined serostatus and face-to-face interviews collected demographics and HIV-related behavior.

**Results:** Of 545 MSM, 8% were Black/African-American. Black/African-American MSM had twice the prevalence of HIV as other race/ethnicities (45% vs. 22%). Black/African-American MSM were as likely as other groups to have health insurance (98% vs. 92%), see a healthcare provider

(93% vs. 89%), and disclose their MSM status (95% vs. 95%). Among HIV-negative MSM, Black/African-Americans were as aware of PrEP as other groups (96% vs. 98%), yet fewer discussed PrEP with a healthcare provider (44% vs. 61%) or used PrEP in the last year (43.5% vs. 57.4%). Of Black/African-American MSM who discussed PrEP with a provider, 100% had used PrEP.

Figure 1. Engagement of men who have sex with men (MSM) with HIV pre-exposure prophylaxis (PrEP) by race/ethnicity, San Francisco, 2023

**Conclusions:** Lower PrEP uptake of Black/African-American MSM in San Francisco may be due to healthcare providers not discussing it with as many Black/African-American healthcare clients as those of other race/ethnicities. Interventions with providers to routinely offer PrEP to all MSM are needed. Also, some Black/African-American MSM may not perceive a need for or desire PrEP due to having none or one main partner. Research is needed to understand and address this disparity in PrEP uptake.

## THPEC195

Preferences for a Pre-exposure Prophylaxis (PrEP) implant among priority populations in the United States: a discrete choice experiment

A. Liu<sup>1,2</sup>, E. Browne<sup>3</sup>, I. Hawley<sup>3</sup>, E. Luecke<sup>3</sup>, N. Mancuso<sup>3</sup>, C.-D. Alleyne<sup>1</sup>, J. Moss<sup>1</sup>, A. Stephens<sup>1</sup>, J. Vinson<sup>1</sup>, N. Walker<sup>1</sup>, E. Montgomery<sup>3,2</sup>

<sup>1</sup>San Francisco Department of Public Health, Bridge HIV, San Francisco, United States, <sup>2</sup>University of California, San Francisco, San Francisco, United States, <sup>3</sup>RTI International, Women's Global Health Imperative, Berkeley, United States

**Background:** HIV prevention implants are a promising approach to overcoming adherence challenges with daily or on-demand PrEP regimens. We aimed to understand preferences for implant attributes among key priority populations to inform development of an extended-release PrEP implant.

**Methods:** We developed a discrete choice experiment (DCE) and surveyed individuals eligible for HIV prevention methods, focused on men-who-have-sex-with-men (MSM), cisgender women (CGW), and transgender women (TGW) in the US. Participants were recruited via online/social media, peer referral, and venue-based outreach and were eligible if self-identified HIV-negative, met PrEP eligibility guidelines, and aged 18 or older. The DCE asked participants to choose between two hypothetical

PrEP implants in a series of ten questions. Implants were described by: dissolvability (does not, takes 3-months, 6-months, 1-year), number of rods (1 or 2), and protection duration (6-months, 1-year, 2-years). Random-parameter logit models estimated preference weights.

**Results:** Between September-December 2023, 850 participants completed the DCE online. Overall, 38% were classified as MSM, 23% CGW, 15% TGW, and 24% with another gender identity. Mean age was 33 (range 18-76), 33% identified as Black/African American and 28% Latino/Hispanic. In the last 6 months, half had  $\geq 5$  sex partners (IQR 3-10) and 21% had a diagnosed STI. For all, duration of protection was the most important feature, with a strong preference for a 2-year vs. 6-month implant ( $p < 0.001$ ). Dissolvability was nearly as important as duration for MSM and TGW, with a preference for an implant that dissolves in 3- or 6-months over an implant that requires removal or takes a year to dissolve. CGW also preferred a quicker dissolving implant, although duration was 3.5 times more important (95% CI 1.7-5.3;  $p < 0.001$ ). Participants preferred one rod over two, but in general this feature was not as influential to choice of implant. If available, 59% of CGW, 66% of TGW, and 81% of MSM said they would be interested in using a 1-year implant for HIV prevention.

**Conclusions:** Key populations in the US preferred an implant providing longer duration of protection, and most preferred a quicker dissolving implant. These preferences can inform development of a PrEP implant that is most attractive to potential users.

## THPEC196

### Impact of substance use on pre-exposure prophylaxis adherence among men who have sex with men and trans women in Latin America: a sub-analysis of the ImPrEP Study

E.H. Vega-Ramirez<sup>1</sup>, C. Coutinho<sup>2</sup>, T.S. Torres<sup>2</sup>, I. Leite<sup>2</sup>, P. Leite<sup>2</sup>, R. Moreira<sup>2</sup>, K.A. Konda<sup>3,4</sup>, B. Hoagland<sup>2</sup>, R. Robles-Garcia<sup>1</sup>, J.V. Guanira<sup>3</sup>, S. Bautista-Arredondo<sup>5</sup>, H. Vermandere<sup>5</sup>, M. Benedetti<sup>2</sup>, C. Pimenta<sup>2</sup>, B. Grinsztajn<sup>2</sup>, C.F. Caceres<sup>3</sup>, V.G. Veloso<sup>2</sup>, ImPrEP Study Group

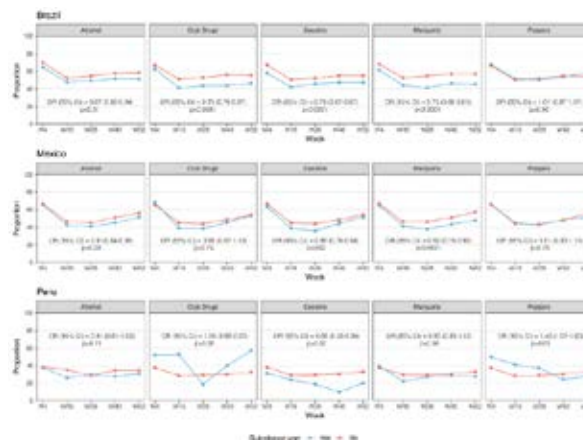

<sup>1</sup>National Institute of Psychiatry Ramon de la Fuente Muñiz, Division of Epidemiology and Psychosocial Research, Mexico City, Mexico, <sup>2</sup>National Institute of Infectiology Evandro Chagas, Fundação Oswaldo Cruz, Rio de Janeiro, Brazil, <sup>3</sup>Universidad Peruana Cayetano Heredia, Center for Interdisciplinary Studies in Sexuality, AIDS and Society, Lima, Peru, <sup>4</sup>USC Keck School of Medicine, Division Disease Prevention, Policy and Global Health, Department of Population and Public Health Sciences, Los Angeles, United States, <sup>5</sup>National Institute of Public Health, Cuernavaca, Mexico

**Background:** Substance use is higher in men who have sex with men (MSM) and trans women (TW) compared to the general population and could increase the risk of ac-

quiring HIV or interfere with adherence to pre-exposure prophylaxis (PrEP). This study aimed to compare self-report PrEP adherence among ImPrEP participants according to reported substance use during follow-up.

**Methods:** ImPrEP was a prospective, single-arm, open-label, multicenter PrEP implementation study that enrolled 9,509 MSM/TW from Brazil, Mexico, and Peru (2018-2021). We included participants who had at least one follow-up visit (4, 16, 28, 40, and 52-weeks) after enrollment and had complete information on substance use. PrEP adherence was defined as having a not missed pills in the past 30 days, and substance use was assessed by asking about any consumption (yes vs. no) in the previous three months at each visit. We used generalized estimating equation logistic regression models for each substance to associate PrEP adherence proportions over follow-up.

**Results:** The sample at the 4-week visit was 8,714 participants (43.2% Brazil, 34.8% Mexico, 22% Peru), and 55.3% of those who attended the 52-week visit. 94.8% were MSM, 72.1% Black/Pardo/Mestizo, and 82.7% had >secondary education. Participants who used cocaine presented lower odds of adhering to PrEP throughout the follow-up period for all countries, while cannabis and alcohol users demonstrated lower adherence only in Brazil and Mexico. Additionally, the use of club drugs in Brazil and *poppers* in Peru were also associated with decreased odds of PrEP adherence (Figure).

**Conclusions:** Substance use decreases PrEP adherence in MSM/TW from Latin America. Different consumption patterns are probably related to the availability and context of each country. HIV prevention among MSM/TW requires assessment of substance use and detection when interfering with PrEP adherence.

Reasons for PrEP discontinuation among women receiving PrEP integrated in public family planning clinics in Kenya

D. Matemo<sup>1</sup>, J. Kinuthia<sup>1,2</sup>, V. Kemunto<sup>1</sup>, C. Wendera<sup>1</sup>, T. Schaafsma<sup>2</sup>, S. Urusaro<sup>2</sup>, A. Lee<sup>2</sup>, D. Owaga<sup>1</sup>, J.F. Morton<sup>2</sup>, K.K. Mugwanya<sup>2,3</sup>, FP Plus Project Team  
<sup>1</sup>Kenyatta National Hospital, Research & Programs, Nairobi, Kenya, <sup>2</sup>University of Washington, Global Health, Seattle, United States, <sup>3</sup>University of Washington, Epidemiology, Seattle, United States

**Background:** A Daily oral pre-exposure prophylaxis (PrEP) is highly efficacious in preventing HIV infections. However, high rates of PrEP discontinuation, can reduce effectiveness and therefore hinder the ability to reduce incident among individuals at high risk.

**Methods:** Data are from a stepped-wedge cluster-randomized project assessing integration of PrEP delivery within 12 public family planning clinics in Kisumu, Kenya. Between 2021 to 2024 we administered a phone structured quantitative surveys to women who initiated but later discontinued taking PrEP to assess factors and reasons for PrEP discontinuation. Univariable logistic model was used to estimate correlates of PrEP discontinuation between women who discontinued within a month versus those who discontinued after a month.

**Results:** Of the 510 study participants who were interviewed, median age was 26.0 (IQR 23.0-31.0), 368 (72%) were married while 159(31%) were breastfeeding. Approximately, half 244 (50%) discontinued PrEP within a month of initiation and median duration of use was 1.5 (IQR 1.0-4.0) month. Overall, 277 (54%) reported that change in risk for HIV (feeling no longer at risk, virally suppressed partner, or no partner) was the primary reason for stopping PrEP. Other less frequently reported factors included individual concerns (side effect, pill burden) (12%), stigma 40 (7.8%), facilities barriers 31(6.1%), opportunity cost 31 (6.1%), relocation 18 (3.5%), run out of pills 14(2.7%), intimate partner violence 11 (2.2%), and partner influence 10 (2.0). compared to those who stopped PrEP within a month, women who had prolonged use of PrEP were likely to be married (OR= 1.90;95% CI 1.28-2.83), breastfeeding (OR= 1.56;95% CI 1.07, 2.28) and more likely to report that it was their own decision to initiate PrEP (OR= 2.89;95% CI 1.80, 4.72) while those who agreed with their providers to initiate PrEP were more likely to discontinue within one month (OR= 0.28;95% CI 0.28-0.67).

**Conclusions:** With a large Kenyan public health PrEP program, a more than half of the women discontinued PrEP within one-month post-initiation primarily due to perceived low risk prompted by change in relationship and life circumstances. However, there is an urgent need to address reasons of those who stopped PrEP not necessary because they were not at risk.

Awareness of Undetectable=Untransmittable (U=U) and its associated factors among Indian men who have sex with men:baseline findings from an m-health based randomised trial, Mumbai, India

N. Mutyala<sup>1</sup>, J. Chaudary<sup>1</sup>, S. Rawat<sup>1</sup>, A. Dange<sup>1</sup>, R.S. Kim<sup>2</sup>, S. Golub<sup>3</sup>, V.R. Anand<sup>1</sup>, J. Arnsten<sup>2</sup>, V.V. Patel<sup>2</sup>  
<sup>1</sup>The Humsafar Trust, Research, Mumbai, India, <sup>2</sup>Albert Einstein College of Medicine/Montefiore Health System, Bronx, New York, United States, <sup>3</sup>Hunter College, City University of New York, New York, United States

**Background:** While U=U is now advocated as a key concept in HIV prevention, little is known about U=U awareness among Indian MSM and its determinants. We investigated factors associated with U=U awareness to inform outreach interventions

**Methods:** We recruited MSM through social media, MSM dating apps, and WhatsApp (April 2022-August 2023). Eligibility included aged ≥18 years; residing/working in Mumbai/Thane, India; fluency in Hindi/English; having anal sex with men in the past year, and not tested for HIV in the past 6-months nor known to be living with HIV. We analysed potential demographic and socio-behavioural determinants of baseline U=U awareness.

Adjusted relative risk (aRR, 95% CI) of U=U awareness was estimated by Poisson regression and robust SE. LASSO penalty were used to build models from a large number of predictors with high auto-collinearity.

**Results:** We enrolled 1005 MSM, median age 27 years, 49% had at least graduate education, 31% reported >20,000INR/month income, 43% enrolled through dating apps, 27% and 27%, were aware of PrEP and PEP respectively. Only 29.1% were aware of U=U, but 50.1% agreed with "people living with HIV who...have an undetectable viral load can have a healthy and long life."

The probability of U=U awareness was associated with easy access to HIV testing (aRR =1.40 [1.02,1.92]; p=0.039), responding in English versus Hindi (aRR=1.97 [1.36, 2.87]; p<0.001), history of online search for sexual-health information (aRR=1.75 [1.26,2.42]; p<0.001), PrEP awareness (aRR=2.28 [1.64,3.18]; p<0.001), PEP awareness (aRR=2.57 [1.41,4.67]; p=0.002), history of STI (aRR=1.83 [1.11,3.03]; p=0.019); and participating in existing MSM focused HIV prevention program (aRR=1.97 [1.18,3.3]; p=0.01).

**Conclusions:** Our study found low awareness of U=U among Indian MSM and that awareness significantly differed by socioeconomic groups. Awareness was also associated with access to HIV prevention information and services (e.g., easy testing, in-person prevention programs, access to online sexual-health information). Campaigns are needed to increase U=U awareness among Indian MSM, and outreach programs (virtual and in-person) should ensure equitable access to this infor-

mation across diverse socioeconomic strata and overcome structural barriers by designing inclusive U=U implementation strategies.

**Background:** Studying the evolution of HIV-prevention behaviors is necessary for understanding how men who have sex with men (MSM) integrate Pre-exposure prophylaxis (PrEP) with HIV-prevention strategies. This analysis aims to identify profiles of HIV protection (PrEP coverage and condom-use) and their evolution.

**Methods:** ANRS-Prévenir—a cohort offering PrEP in Ile-de-France—included 3193 participants May-2017 through September-2022. Clinical and behavioral information was collected quarterly. This analysis was conducted on MSM participants between M3 (entire sample on PrEP) and M24. A latent transition analysis (LTA) using PrEP coverage (optimal/sub-optimal/no-use) and condom-use (yes/no) at last sexual encounter (LSE) permitted: 1/ identification of different profiles (states) of HIV protection and associated factors, 2/ estimation of transition probabilities between profiles and associated factors, notably PrEP regimen (daily/event-driven).

**Results:** Of 2633 participants completing the inclusion questionnaire, 2606 were MSM. At inclusion, median age was 36(IQR:29-43), 86.1% had ≥Secondary education, and 43.5% were naive to PrEP. At M3, 62.6% reported optimal-PrEP, 23.4% condom-use, and 47.9% event-driven PrEP (edPrEP).

The LTA identified three HIV-protection profiles: Exclusive-PrEP (PrEP : 90.3% optimal-PrEP, 4.9% condom-use) constituting 44.6% of participants at M3 and 57.6% at M24, poorly-protected (PP: 30.6% condom-use, 71.2% sub-optimal PrEP; M3-M24 : 41.9%-35.3%), and PrEP&Condom (P&C: 75.6% optimal-PrEP, 69.6% condom-use; M3-

M24: 13.5%-71%). Probability of belonging to PP reduced with: age (OR: 0.99, p<0.05) and perception of risk-taking in sexual life (OR: 0.56, p<0.05). Despite a tendency to stay in the same state (PrEP: >94%, PP: >87%, P&C: >66%), starting at M18, transitions from both protected states towards PP were observed. These transition probabilities from PrEP (3.3%) and P&C (10.3%) are associated with: knowing LSE partner (PrEP OR: 4.9, P&C OR: 2.9; p-value<0.05), and reporting edPrEP (PrEP OR: 3.3, P&C OR : 1.2 ; p-value<0.05). Transitions from P&C are associated with chemsex at LSE (OR: 1.2, p-value<0.05).

**Conclusions:** The low mobility between states highlights the importance of education and counseling, starting at inclusion with renewal at M18, particularly among those who: are younger, use edPrEP, and engage in chemsex. It is critical to explore the role of a potential PrEP-fatigue beginning at M18 and/or an under-estimation of risk.

### In-utero exposure to tenofovir based pre-exposure prophylaxis is not associated with growth faltering in breastfed infants in South Africa: a post hoc analysis of the CAP 016 randomized controlled trial

M. Naidoo<sup>1</sup>, D. Moodley<sup>1,2</sup>, C. Lombard<sup>3,4</sup>, A.C. Desmond<sup>1</sup>,

R. Clark<sup>5</sup>, J.F. Rooney<sup>5</sup>, G. Gray<sup>6</sup>, K.L. Naidoo<sup>7</sup>

<sup>1</sup>Centre for the Program of AIDS Research in South Africa (CAPRISA), Durban, South Africa, <sup>2</sup>University of KwaZulu Natal, Department of Obstetrics and Gynaecology, School of Clinical Medicine, Durban, South Africa, <sup>3</sup>South African Medical Research Council, Biostatistics Unit, Tygerberg, South Africa, <sup>4</sup>University of Stellenbosch, Division of Epidemiology and Biostatistics, Department of Global Health, Tygerberg, South Africa, <sup>5</sup>Gilead Sciences Inc, Foster City, United States, <sup>6</sup>South African Medical Research Council, Cape Town, South Africa, <sup>7</sup>University of KwaZulu Natal, Department of Paediatrics and Child Health, School of Clinical Medicine, Durban, South Africa

**Background:** Oral tenofovir disoproxil fumarate (TDF) based pre-exposure prophylaxis (PrEP) is widely recommended to prevent HIV infection during pregnancy and lactation. While the safety of TDF-based PrEP use in pregnancy is generally reassuring, there is limited evidence of the effect of TDF-based PrEP on infant growth.

We aimed to determine if adverse infant growth outcomes were associated with in-utero exposure to TDF and emtricitabine (TDF/FTC) used as PrEP among pregnant women in a randomized controlled trial in KwaZulu Natal, South Africa.

**Methods:** Infant growth parameters were assessed at birth and at 6, 26, 54 and 74 weeks of age. The World Health Organisation growth standards were used to calculate age and sex appropriate z-scores for weight (W), length (L) and head circumference (HC). Mean WAZ, LAZ, WLZ and HCAZ scores and frequency of adverse infant

growth outcomes (underweight, stunting, wasting, microcephaly) were compared between infants with and without in-utero TDF/FTC exposure.

Stored DBS samples collected before delivery from women receiving PrEP were used to measure tenofovir diphosphate (TFV-DP) levels.

**Results:** A total of 230 infants exposed to in-utero PrEP (TDF/FTC) and 227 infants not exposed to PrEP (TDF/FTC) were evaluated from birth. Of the 230 mother-infant pairs randomized to PrEP (TDF/FTC), 129 (56.1%) women had TFV-DP levels >200 fmol/punch. At 74 weeks, mean (SD) WAZ, LAZ, WLZ and HCAZ scores were 0.71 (1.4), -0.79 (1.8), 1.48 (1.1) and 1.29 (1.4) respectively for infants exposed to TFV-DP >200 fmol/punch versus 0.89 (1.6), -0.82 (1.7), 1.69 (1.6) and 1.31 (1.4) for infants born to women randomized to the non-PrEP arm ( $p > 0.4$  for all parameters).

The most common adverse growth outcome was stunting observed between 6 weeks and 74 weeks and comparable between treatment groups.

Among infants exposed to TFV-DP > 200 fmol/punch versus PrEP unexposed infants, 18.9% vs 20.4% were stunted at 18 months respectively ( $p = 1.000$ ).

**Conclusions:** We provide additional evidence of a lack of association between infant growth restriction and in-utero TDF exposure using an objective assessment of PrEP exposure. In our randomized controlled study, growth parameters remained comparable between PrEP unexposed infants and infants whose mothers had detectable TFV-DP levels >200 fmol/punch.

Adherence strategies to improve uptake of Truvada and Dapivirine vaginal ring among adolescents and young women in Uganda: experience from MTN034 Study, Kampala Mujhu Site

M. Babirye Otim<sup>1</sup>, R. Nakalega<sup>1</sup>, B. Gati Mirembe<sup>1</sup>, C. Nakabiito<sup>1</sup>, J. Nabisere<sup>1</sup>, H. Kalule Nabunya<sup>2</sup>, E. Mulumba<sup>2</sup>, F. Biira<sup>2</sup>, S.C. Nanziri<sup>2</sup>, B. Kamira<sup>1</sup>, C. Agwau Akello<sup>3</sup>, MTN034 (REACH) Study Group

<sup>1</sup>Makerere University-John Hopkins University Research Collaboration, Clinical Division, Kampala, Uganda,

<sup>2</sup>Makerere University-John Hopkins University Research Collaboration, Psychosocial Division, Kampala, Uganda,

<sup>3</sup>FHI 360 -Uganda, Clinical Division, Kampala, Uganda

**Background:** Adolescent girls and young women (AGYW) in sub-Saharan Africa, aged 15-24, are at substantial risk of acquiring HIV and yet they have adherence challenges with daily oral pre-exposure prophylaxis (PrEP). Supporting adherence among AGYW is thus important to ensure high uptake and effective use of PrEP.

In the MTN034 trial, adherence was moderately high, thus we describe the adherence support strategies used at the Kampala site.

**Methods:** MTN-034/REACH was a randomized, open-label, phase 2a crossover trial among HIV-seronegative adolescent girls and young women aged 16-21 years at four clinical research sites in South Africa, Uganda, and Zimbabwe. Participants were randomly assigned to either the dapivirine ring or daily oral PrEP for 6 months, then switched to the other product option for 6 months, followed by a third 6-month period in which participants were given a choice of oral PrEP, the dapivirine ring, or neither. Participants were offered a menu of adherence support options, including digital support (text messages daily or weekly), group support (in-person or WhatsApp group meetings), and individual support (extra counseling sessions or peer buddies).

Counseling was provided when drug concentration results were available to ascertain the needed adherence support. Adherence support choices and outcomes were documented in participants' charts.

**Results:** All 60 participants enrolled in Uganda attended group adherence support meetings, held bi-weekly in groups of 8-15, facilitated by study counselors. Individual sessions were also held for each participant at their follow-up visits and as needed. 73% (44) preferred monthly reminder calls, while 27% (16) preferred weekly phone calls with additional counseling. No WhatsApp group meeting was held because few had smartphones.

Reported challenges addressed by the study counselors and the ring/tablet champions', HIV risk reduction counseling, and sexual and reproductive health education sessions in the waiting room empowered them to reduce potential exposures, resulting in improved adherence and continued use (Table)

STUDY PRODUCT	HIGH ADHERENCE	MODERATE ADHERENCE	LOW ADHERENCE
Truvada (361)	177 (49%)	170 (47%)	14 (4%)
Dapivirine ring (493)	385 (78%)	89 (18%)	19 (4%)

Table. Drug concentration results.

**Conclusions:** Providing a variety of adherence support options is key to improving AGYW's adherence to HIV prevention products.

### Pre-exposure prophylaxis (PrEP) awareness, uptake, willingness and associated factors among adolescent girls and young women in two Ugandan districts: across sectional population based study

A. Daama<sup>1</sup>, G. Nakigozi<sup>1</sup>, S. Mugamba<sup>1</sup>, E. Kyasanku<sup>1</sup>, V. Ofumbi<sup>1</sup>, R. Bulamba<sup>2</sup>, F. Nalugoda<sup>1</sup>, G. Kigozi Nalwoga<sup>1</sup>, G. Kigozi<sup>1</sup>, J. Kagaayi<sup>1</sup>

<sup>1</sup>Africa Medical & Behavioral Sciences Organization, Kampala, Uganda, <sup>2</sup>Africa Medical & Behavioral Sciences Organization, Statistics, Kampala, Uganda

**Background:** Much as Pre-Exposure Prophylaxis (PrEP) is a known HIV biomedical prevention strategy for key and priority populations. Many priority populations for example adolescent girls and young women may not be aware about available PrEP services and therefore less willing to accept PrEP services.

We sought to determine PrEP awareness, uptake, willingness to take PrEP and the associated factors among adolescent girls and young women (AGYW) in two Ugandan districts

**Methods:** We conducted a cross-sectional Population based study through multi-stage sampling, between July 2022 and July 2023, using a semi-structured questionnaire among AGYW aged 13–24 years in Central (Wakiso district) and Western (Hoima City). Variables included; marital status, transactional sex status, occupation, number of sex partners in the past 12 months, circumcision status of the partners of AGYW, condom use and alcohol use. Using a bivariable analysis, we determined the prevalence of PrEP awareness, uptake, and willingness.

A multivariable modified Poisson regression analysis was used to determine predictors of PrEP awareness and willingness respectively, with 95% confidence intervals (CIs).

**Results:** Of 4,217 participants, 54.5% (n = 2,297) were females. The mean age (SD) was 32 (14.1) years and only 21.2% (n = 322) of 1,517 AGYW were aware about PrEP services and only 33.8% were willing to take PrEP. PrEP uptake was only 4.7% (15/320) among AGYW. AGYW with one sexual partner (adj.PR = 2.13; 95%CI: 1.11, 4.08) or AGYW with more than one sexual partner in the past 12 months (adj.PR = 3.04; 95%CI: 1.55, 5.93) and AGYW with tertiary level of education (adj. PR = 3.47; 95%CI: 1.30, 9.30) were more aware about PrEP services. On the other hand, PrEP willingness was more among AGYW who self-reported to be alcohol users (adj. PR = 1.43; 95%CI: 1.04, 1.96) or never married (adj.PR = 1.65; 95%CI: 1.12, 2.41). However, students (adj.PR = 0.50; 95%CI: 0.26, 0.99) were less willing to take PrEP services than AGYW whose occupation was agriculture.

**Conclusions:** These findings suggest that there are low levels of PrEP awareness, uptake and willingness among this priority sub-population. Therefore, there is need for target-specific interventions for AGYW more especially students.

## THPEC203

### A dual prevention pill for HIV and pregnancy prevention: results from a pilot study among adolescent girls and young women in Zimbabwe

B.A. Friedland<sup>1</sup>, M. Plagianos<sup>1</sup>, JB. Burnett-Zieman<sup>1</sup>, S. Mathur<sup>2</sup>, I. Bruce<sup>1</sup>, A. Dandadzi<sup>3</sup>, P. Musara<sup>3</sup>, C. Murombedzi<sup>3</sup>, L.B. Haddad<sup>1</sup>, N.M. Mgodi<sup>3</sup>

<sup>1</sup>Population Council, Center for Biomedical Research, New York, United States, <sup>2</sup>Population Council, SBSR, Washington, DC, United States, <sup>3</sup>University of Zimbabwe, Clinical Trials Research Unit, Harare, Zimbabwe

**Background:** Oral pre-exposure prophylaxis (PrEP) use has been sub-optimal among sub-Saharan African women. A dual prevention pill (DPP) combining PrEP and an oral contraceptive (OC) may be preferable, acceptable and increase adherence vs PrEP alone.

**Methods:** We recruited 16–24-year-old cisgender female OC-users in a 6-month crossover study in Harare, Zimbabwe (Nov 2022–Sep 2023). We randomized participants (1:1) to the order of using an over-encapsulated DPP and 2 pills (PrEP, OC) for three 28-day cycles each. We compared the proportion preferring the DPP vs 2 pills (exact binomial test); adherence to each regimen via self-report and tenofovir diphosphate (TFV-DP) levels in dried blood spots indicative of  $\geq 4$  doses/week ( $\geq 500$  fmol/punch, Month 1;  $\geq 700$  fmol/punch, thereafter), adjusting for randomization sequence (DPP or 2 pills first) and treatment period (generalized estimating equations); and effect of regimen on 4 acceptability domains (e.g., product attributes, ease of use, effect on sex; Wilcoxon signed-rank tests).

**Results:** 26/30 participants (mean age, 19.4 years) finished the study. Approximately half were married (47%). Most (97%) completed secondary school, had  $\geq 1$  child (93%), were worried/very worried about getting HIV (84%), and said avoiding pregnancy was important (93%). More women (64%) preferred the DPP than 2 pills (36%), although the difference was not significant. Self-reported adherence was high (>96%), yet <20% were consistently adherent for 6 months per TFV-DP levels (DPP mean: 392 fmol/punch; 2-pills mean: 384 fmol/punch). There was no difference in adherence by regimen, however, participants were twice as likely to be adherent in treatment period 1 (adjusted odds ratio [AOR] 2.0; 95% confidence interval [CI], 1.23–3.28) and 4 times more likely to be adherent if they were randomized to using the DPP first (AOR 4.28; 95% CI, 1.25–14.6). Most rated both regimens as acceptable, with no differences in any domain.

**Conclusions:** Although we found no significant differences between the DPP and 2 pills in this small study using an over-encapsulated DPP, more women preferred the single pill and adherence was better among those starting with the DPP. Future studies with larger samples using the actual (smaller) co-formulated DPP will better inform the DPP's potential impact on HIV and pregnancy prevention.

### Profiling Shang Ring adverse events among Zimbabwean boys aged 13-16 years

H. Chigijji<sup>1</sup>, N. Nhando<sup>1</sup>, O. Mugurungi<sup>2</sup>, B. Maponga<sup>1</sup>, S. Xaba<sup>2</sup>, N. Tarubekera<sup>1</sup>, K. Hatzhold<sup>3</sup>

<sup>1</sup>Population Solutions for Health, INTEGRATE, Harare, Zimbabwe, <sup>2</sup>Ministry of Health and Child Care, Zimbabwe, AIDS and TB Unit, Harare, Zimbabwe, <sup>3</sup>Population Services International, HIV/AIDS and TB, Cape Town, South Africa

**Background:** In June 2015, WHO prequalified the Shang Ring device for circumcision of adolescents and adult males aged 13 years and older after determining that it meets international standards of quality, safety, and efficacy. However, the safety of the boys undergoing VMMC procedure using the Shang Ring device remains critical. We profiled adverse events among the younger adolescents 13-14-year-olds and the older adolescents 15-16-year-olds. The evidence generated helps the VMMC national program to address the safety concerns as it plans to roll out the Shang Ring to all districts in the country and transition to sustainability.

**Methods:** We conducted implementation science research from 8 June 2022 to 5 January 2024 in 9 districts to inform the sustainability phase of the national voluntary medical male circumcision program in Zimbabwe. Adolescents aged 13-16 years were recruited into the research males and offered the Shang Ring procedure. Participants were followed up on days 7, 14, and 49. Assessments for AEs were done on each review. SurveyTo-Go was used for data collection and SPSS version 20 for analyses to generate frequencies, cross-tabulations, and statistical tests

**Results:** 5 165 boys were recruited into the study, 79% (4 076) were aged 13-14 years, and 1 089 (21%) were aged 15-16 years. 30 mild, moderate, and severe AEs were reported and recorded giving an overall AE rate of 58/10,000. 83% of the AEs occurred between day 0 (the day of device placement) and day 14. AE rates by age were 47/10,000 for 13-14-year-olds and 101/10,000 for 15-16-year-olds. The risk of AEs was 2.1 [95% CI 1.03 - 4.5; p=0.036] times more likely in age group 15-16. The most common type of AE is pain (42%) followed by wound infection (13%) and swelling (10%) for both age groups.

**Conclusions:** Overall, the AE rates for the Shang Ring device were low. Older boys were more likely to experience AEs compared to younger boys. Pain is the most common type of AE in both age groups. Addressing the issue of pain during device removal remains critical

## THPEC205

### Preparing for choice: a review of policies and tools to support informed choice for the dual prevention pill, an innovative multipurpose prevention technology (MPT)

D. Resar<sup>1</sup>, A. Olowu<sup>2</sup>, A. Carmone<sup>3</sup>, S. Jenkins<sup>3</sup>

<sup>1</sup>Clinton Health Access Initiative, Lusaka, Zambia, <sup>2</sup>Clinton Health Access Initiative, Abuja, Nigeria, <sup>3</sup>Clinton Health Access Initiative, Boston, United States

**Background:** Access to oral pre-exposure prophylaxis (PrEP) has increased significantly and novel PrEP methods are entering markets, offering a new era of choice-driven programming. Meanwhile, family planning (FP) has decades of experience delivering multi-product portfolios. The dual prevention pill (DPP) is a novel multipurpose prevention technology (MPT) in development, combining PrEP and contraception as an additional option among growing portfolios of prevention products.

While potentially offering increased convenience for users, the DPP will also introduce new challenges, as providers and users navigate choice across both indications.

**Description:** To support development of an enabling environment for informed choice for the DPP and future MPTs, we conducted an analysis comparing policies and tools that support choice for HIV prevention and contraception, assessing global guidance and handbooks, country policies and guidance (for Kenya, South Africa, and Zimbabwe), and user and provider tools.

This review:

1. Identified documents that inform policy and operationalization of choice,
2. Documented how these policies and tools support choice, and;
3. Assessed opportunities and needs for integrating the DPP.

**Lessons learned:** The infrastructure to support informed choice in FP is more developed than the policies and tools available in HIV prevention. Contraception guidelines include practical information on how programs and providers can support choice. For example, FP documents list the factors that should be described to support informed choice (e.g., effectiveness, safety, side effects, impact on menstruation, clinic visit frequency). In FP, there are also policies to address situations of constrained choice (e.g., "bridging" methods when the method of choice is not available).

While some HIV guidance reference choice, tools do not currently provide direct comparisons, which are widely available for contraception. Neither FP nor HIV prevention have existing tools or policies that clearly and consistently integrate considerations for multiple indications.

**Conclusions/Next steps:** Further research is needed to develop policies and tools to support choice when offering MPTs, including developing effective messaging on key product attributes. Product-specific tools should not

be an end goal as these are likely to overburden providers and limit sustainability and integration. However, developing, testing, and validating product-specific MPT materials is needed to support later-stage integration into contraception and HIV materials.

## THPEC206

Perceived side effects and cost remain barriers to use of HIV pre-exposure prophylaxis amongst men who have sex with men (MSM) in Canada

M. Hull<sup>1,2</sup>, O. Pico-Espinosa<sup>3</sup>, S. Mohammed<sup>2</sup>, K. Woodward<sup>4</sup>, P. MacPherson<sup>5</sup>, W. Zhang<sup>2</sup>, J. Trigg<sup>2</sup>, J. Li<sup>2</sup>, V. Dias Lima<sup>1,2</sup>, N. Lachowsky<sup>6</sup>, D. Grace<sup>7</sup>, D.H. Tan<sup>7,3</sup>

<sup>1</sup>University of British Columbia, Vancouver, Canada, <sup>2</sup>BC

Centre for Excellence in HIV/AIDS, Vancouver, Canada,

<sup>3</sup>St Michael's Hospital, Toronto, Canada, <sup>4</sup>McMaster

University, Hamilton, Canada, <sup>5</sup>University of Ottawa,

Ottawa, Canada, <sup>6</sup>University of Victoria, Victoria, Canada,

<sup>7</sup>University of Toronto, Toronto, Canada

**Background:** Men who have sex with men (MSM) remain at highest risk for HIV acquisition in Canada. Use of HIV pre-exposure prophylaxis (PrEP) is standard of care, yet many MSM remain off PrEP. Understanding barriers to PrEP will guide possible interventions.

**Methods:** We undertook a community-based survey of MSM accessing sexual health services in two Canadian provinces with different PrEP landscapes: British Columbia (BC) where a universal program provides PrEP at no cost to at-risk individuals, and Ontario (ON) where a complex insurance landscape sometimes requires co-payments or private funding. Individuals who were aware of PrEP but PrEP-naïve were classified as 'PrEP contemplative' if they described planning to access PrEP within the following year. Top three reasons for not accessing PrEP were compared between provinces using chi-square analysis.

**Results:** 1705 individuals (53.8% in ON, 52.0% White, median age 34, Q1-Q3=28-41) were surveyed June-October 2022. Individuals reported prior sexually transmitted infections (38.2% gonorrhea, 34.1% Chlamydia, 19.6% syphilis) and 13.4% had HIRI-MSM risk scores >25. Overall 30.9% (n=220/712) in ON were PrEP aware but had never used it vs. 26.5% (n=169/637) in BC (p=0.07) and amongst these respondents 51.3% vs. 66.2% (p=0.01) were contemplating PrEP initiation. The primary reason for not having used PrEP was concern regarding side effects (69.9% ON vs. 66.9% BC, p=0.62). Cost of PrEP was the second most common reason reported in ON (51.3% vs. 0% of BC respondents, p<0.0001).

In univariate analysis reporting cost as a barrier to PrEP was not significantly (p values >0.5 for all) associated with age, ethnicity, income level, prior STI or elevated HIRI-MSM risk score. In BC, self-perceived lower HIV risk status was the second most common reason (64.2%) but listed by only 34.5% in ON (p<0.001).

**Conclusions:** A considerable minority of MSM in two of Canada's largest provinces were PrEP contemplative but had never accessed it. Concern regarding possible side effects was the primary reason for a majority, while cost was a significant barrier for those in ON.

Educational campaigns regarding PrEP safety and advocacy for free access remain vital to enhance PrEP uptake amongst MSM in Canada.

Research Council, Cape Town, South Africa

**Background:** The AMP studies demonstrated that neutralizing antibodies (nAbs) can independently prevent clinical HIV acquisition with susceptible viruses. Evidence suggests that the infant immune system may more readily induce antibodies capable of neutralizing diverse HIV strains compared to adults.

To begin to test this hypothesis, our analysis explored the differences in safety and immune responses to a neutralizing vaccine in both populations.

**Methods:** A CD4 binding site (CD4bs) CH103 low-affinity B cell lineage-engaging HIV Envelope gp120 subunit vaccine adjuvanted with GLA-SE was studied in infants and adults. In the HVTN 135 trial, 18 infants received 20µg CH505TF adjuvanted with GLA-SE (5µg) at Weeks 0 (within 5 days of birth), 8, 16, 32, and 54; 10 received placebo. A separate trial (HVTN 115) included a placebo arm and a similar 5 dose regimen of 20µg CH505TF adjuvanted with GLA-SE (10µg) in 12 adults without HIV.

**Results:** In infants, all solicited adverse events (AEs) were mild or moderate (Grade 2 or less) as well as less frequent and severe compared to adults. In adults and infants, there were no related serious AEs, related Grade 3 unsolicited AEs, or AEs of special interest. Antigen-specific B cell measurements (CH505TF-specific and CD4bs-specific

IgG+ B cells) two weeks post-fifth vaccination were comparable in 14 infants and 9 adults (Figure 1A). In contrast, nAb titers to a tier 1A virus (CH505.w4.3) were higher in infants (Figure 1B).

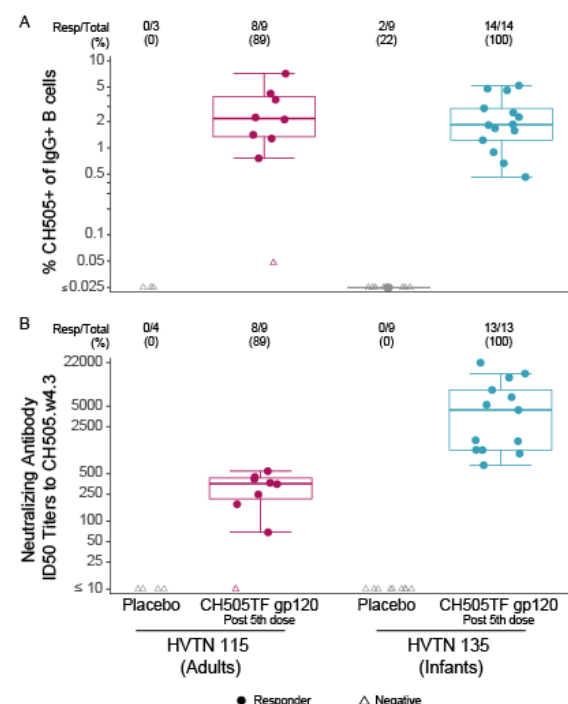

Figure 1A and 1B.

**Conclusions:** HVTN 135, one of few HIV vaccine trials conducted in infants, demonstrated the safety and feasibility of an experimental CD4bs-targeting vaccine in infants. The greater Tier 1a neutralizing antibody titer elicited in infants suggests that there could be differences in response to vaccination with HIV Env and supports further testing the hypothesis that these differences may be more conducive to the development of broadly nAbs.

## THPEC208

Meeting patients where they are: a multimodal approach to HIV prevention

M. Sandling<sup>1</sup>, A. Martin<sup>1</sup>, A. Radix<sup>1</sup>

<sup>1</sup>Callen-Lorde Community Health Center, New York, United States

**Background:** HIV diagnosis remains a significant source of morbidity and mortality in the United States with approximately 1.2 million infected individuals. Campaigns to increase barrier protection use and availability of Pre-Exposure Prophylaxis for HIV have helped to slow the overall rate of new diagnosis.

Although daily oral PrEP has simplified HIV prevention, for many clients this strategy is not ideal due to pill burden, stigma, side effects, and health care access. Long acting injectable cabotegravir (Apretude) for PrEP alleviates some of these barriers.

**Description:** Callen-Lorde cares for over 19,000 clients with 4,500 of those seeking PrEP services. Unfortunately, approximately 25% of clients that initiated oral PrEP in 2023 returned to clinic in the expected timeframe and remained adherent to PrEP. Callen-Lorde's comprehensive multimodal approach to HIV prevention has allowed us to identify individuals who are at risk and to offer a variety of prevention options including LAI for PrEP. Since 2022 Callen-Lorde has utilized a multidisciplinary team to build and rapidly expand a program for LAI cabotegravir. To date we have enrolled 108 clients with a 92.5% retention rate, and zero patients in our LAI program have tested positive for HIV.

The success of our program and the continued adherence of our clients to LAI cabotegravir for PrEP has been driven by a multidisciplinary team of clinicians, nurses, support staff, and patient navigators who have used our electronic medical record and other tools for longitudinal tracking and scheduling of our patients. Multiple redundancies have been integrated into our system to catch patients who miss appointments. This wrap around approach has been integral to client adherence and must be considered when further expanding our program.

**Lessons learned:** Creating a financially sustainable and clinically sound LAI for PrEP program is possible but requires significant organizational investment. When expanding LAI for PrEP programs use of the EMR and longitudinal tracking are essential for ensuring patient adherence and therefore continued HIV prevention with this strategy.

**Conclusions/Next steps:** This presentation will show how a multimodal approach including counseling, patient navigation, and the implementation of LAI for PrEP can improve PrEP adherence and reduce the risk of HIV acquisition.

Correlates of the sexual and reproductive health service utilization among older adults living with HIV in China: a cross-section study

X. Peng<sup>1</sup>, B. Wang<sup>1</sup>, X. Li<sup>1</sup>, Y. Li<sup>1</sup>, Y. Cai<sup>2</sup>, L. Li<sup>3</sup>, L. Ouyang<sup>4</sup>, G. Wu<sup>4</sup>, M. Yu<sup>5</sup>, X. Meng<sup>6</sup>, H. Zou<sup>7</sup>

<sup>1</sup>Sun Yat-sen University, School of Public Health, Shenzhen, China, <sup>2</sup>Shanghai Jiao Tong University, Shanghai, China, <sup>3</sup>Guangzhou Eighth People's Hospital, Guangzhou, China, <sup>4</sup>Chongqing Center for Disease Control and Prevention, Chongqing, China, <sup>5</sup>Tianjin Center for Disease Control and Prevention, Tianjin, China, <sup>6</sup>Wuxi Municipal Center for Disease Control and Prevention, Wuxi, China, <sup>7</sup>Fudan University, Shanghai, China

**Background:** Sexual and reproductive health (SRH) is critical to the overall health of older adults living with HIV (OALHIV). Research on SRH services among OALHIV is limited. We assessed the utilization of SRH services and its correlates among OALHIV in China.

**Methods:** We conducted a cross-sectional study to collect data from OALHIV aged 50 and above in designated HIV/AIDS treatment hospitals in four Chinese cities between June 2020 and December 2022.

An investigator-administered questionnaire including demographic characteristics, sexual health status, and SRH service utilization, was collected. SRH services included reproductive health examination, and seeking advice/solutions to problems in sexual life among sexually active participants. Logistic regression was used to assess correlates of the utilization of SRH service.

**Results:** A total of 680 OALHIV (500 males and 180 females) were enrolled. The mean age was 60.3±7.8 years. 18.2% had a reproductive health examination in the past year. Among 252 sexually active OALHIV, just over 1 in 3 (36.1%) sought advice/solutions to problems in sexual life. Female OALHIV (aOR = 3.13, 95%CI: 1.84–5.31), an annual income of ≥ USD 7500 (3.68, 1.60–8.47), and an educational level of middle school or above (2.33, 1.24–4.33) were more likely to have a reproductive health examination in the past year.

Among sexually active OALHIV, individuals who were bisexual (compared to heterosexual: 3.03, 1.42–6.47), had an educational level of middle school or above (6.37, 2.36–17.20) were more likely to seek advice/solutions to problems in sexual life.

**Conclusions:** The proportion of SRH services utilization among OALHIV was low. Sex, income, and educational level were significantly associated with reproductive health examinations. Sexual orientation and educational level were significantly associated with seeking advice/

solutions to problems in sexual life among OALHIV. SRH messages and services tailored for OALHIV are needed to enhance their utilization of SRH services.

## THPEC210

Willingness and potential barriers to adopting biomedical prevention for sexually-transmitted infections (STIs) among gay, bisexual and other men who have sex with men (GBMSM) in Taiwan: 2023 HEART Survey

C.-W. Li<sup>1</sup>, S.W.W. Ku<sup>2,3</sup>, Y.-J. Chen<sup>4</sup>, P. Huang<sup>5</sup>, H.-J. Wu<sup>6</sup>, T.-H. Wu<sup>3</sup>, A. Bourne<sup>6,7</sup>, C. Strong<sup>4</sup>

<sup>1</sup>Center for Infection Control and Department of Internal Medicine, National Cheng Kung University Hospital, College of Medicine, National Cheng Kung University, Tainan City, Taiwan, Province of China, <sup>2</sup>Taipei City Hospital, Taipei City, Taiwan, Province of China, <sup>3</sup>HIV Education And Research Taiwan, Taipei City, Taiwan, Province of China, <sup>4</sup>Department of Public Health, of Medicine, National Cheng Kung University, Tainan City, Taiwan, Province of China, <sup>5</sup>Institute of Health Behavior and Community Sciences, National Taiwan University, Taipei City, Taiwan, Province of China, <sup>6</sup>Kirby Institute, University of New South Wales, Sydney, Australia, <sup>7</sup>Australian Research Centre in Sex, Health and Society, La Trobe University, Melbourne, Australia

**Background:** Various biomedical interventions have proven effective against STIs, such as vaccines for human papillomavirus (HPV) and mpox, pre-exposure prophylaxis (PrEP) for HIV, and post-exposure prophylaxis with doxycycline (doxy-PEP) for gonorrhea, syphilis and Chlamydia infection.

Whilst these interventions have been introduced successfully among GBMSM in Taiwan, the awareness, current uptake and future willingness to adopt such strategies remain unknown.

**Methods:** Between November 28<sup>th</sup>-December 28<sup>th</sup> 2023, a survey comprising 65 questions was administered online to adult GBMSM using social networking applications in Taiwan. Beyond demographics, HIV serostatus, risk behaviours, current and previous PrEP use, respondents were asked regarding their awareness and actual uptake of the biomedical preventive strategies (HPV and mpox vaccines, doxy-PEP), willingness for future uptake and their potential barriers.

**Results:** In total, 1,656 survey responses were included in this analysis (mean age =34.7 years, SD 8.2). One-fifth (n=328) reported living with HIV (HIV+), 325 reported negative or unknown HIV status and currently on PrEP (HIV-/PrEP+), and 1003 reported no current PrEP use (HIV-/PrEP-). The overall actual uptake for HPV vaccine, mpox vaccine and doxy-PEP was 8.5% (incomplete)/24.8% (complete), 13.0% (incomplete)/43.5% (complete), and 2.9% respectively.

The awareness-willingness-uptake cascades among each of HIV+, HIV-/PrEP+, and HIV-/PrEP- groups for these strategies are shown in Fig, where HIV-/PrEP+ group had highest uptake for all three strategies, followed by HIV+ group and HIV-/PrEP- group. Apart from infrequent sex, the major barriers to future uptake were high cost (46.2%) for HPV vaccine, low self-perceived risk (44.8%) for mpox vaccine, as well as difficult access to medication (43.1%) and inadequate knowledge (41.5%) for doxy-PEP.

**Fig.** The awareness-willingness-uptake cascades of A) HPV vaccine B) mpox vaccine, and C) doxy-PEP among each of HIV+, HIV-/PrEP+, and HIV-/PrEP- groups. Uptake includes incomplete and complete vaccination. NS, \*, \*\*, \*\*\* means nonsignificant or significant at  $p < 0.05$ ,  $0.001$ , or  $0.0001$ , respectively by using the chi-square test.

**Conclusions:** Whilst the highest uptake of biomedical preventions against HPV, mpox and bacterial STIs was observed among HIV negative men on PrEP, our study demonstrated strategy-specific barriers also exist and are needed to be addressed differently and promptly, especially for GBMSM living with HIV.

## THPEC211

### Concerns about the use of doxycycline post-exposure prophylaxis among bathhouse clientele

A. Hazra<sup>1</sup>, L. Rusie<sup>2</sup>, M. Wasz<sup>3</sup>, G. Liegeon<sup>1</sup>, N. Sachdev<sup>4</sup>, I. Tabidze<sup>3</sup>, S. Mehta<sup>5</sup>

<sup>1</sup>University of Chicago Medicine, Section of Infectious

Diseases and Global Health, Chicago, United States,

<sup>2</sup>Rush University Medical Center, Chicago, United States,

<sup>3</sup>Chicago Department of Public Health, Chicago, United

States, <sup>4</sup>Steamworks Chicago, Chicago, United States,

<sup>5</sup>University of Chicago Illinois, Chicago, United States

**Background:** Doxycycline post-exposure prophylaxis (doxyPEP) is a novel biomedical intervention which can decrease bacterial STIs among men who have sex with men (MSM) and transgender women regardless of HIV status.

We examined concerns with doxyPEP use among patrons of Steamworks, a bathhouse and collective sex venue with US and Canadian locations.

**Methods:** An anonymous, web-based survey was sent to the Steamworks newsletter list-serve to assess demographics, self-perceived STI risk/worry, as well as doxyPEP awareness, perceptions, and concerns.

Adjusted incidence rate ratios (aIRR) and 95% confidence intervals (CI) were calculated using multivariable Poisson regression with robust variance estimation to examine factors associated with number of concerns about doxy-PEP.

**Results:** From December 12, 2023 through January 12, 2024, 133 surveys were completed. Participants were 35.3% aged 18-49 years, 78.2% White, 83.5% gay, 13.5% bisexual, 93.2% with some college education or more, 14.3% living with HIV, 69.9% currently taking HIV PrEP. Over two thirds (69.9%) reported STI testing in the past 3 months, of whom 24.7% reported testing positive; 60.9% had heard of Doxy-PEP. Antimicrobial resistance (37.8%), adverse effects on health (36.9%), side effects (35.3%), and difficulty with access (22.6%) were the most frequently listed concerns regarding doxyPEP. Twenty percent of respondents reported four or more concerns regarding doxyPEP; 18.1% did not have any concerns.

Adjusted for age, race/ethnicity, education, and sexual orientation, compared to 18-34 year olds, those aged 35-39, 50-59, and  $\geq 60$  were less likely to have  $\geq 4$  concerns about doxyPEP (aIRR=0.20, 0.15, 0.18 respectively,  $p < 0.05$  each).

Those who reported attending a bathhouse in the past 3 months were less likely to have  $\geq 4$  concerns (aIRR=0.30,  $p < 0.05$ ). Those reporting being moderately or extremely concerned about acquiring an STI in the next 3 months were more likely to have  $\geq 4$  concerns about doxyPEP (aIRR 2.14,  $p < 0.05$ ).

**Conclusions:** Understanding and addressing individual concerns will be critical to successfully implementing doxyPEP. The top three concerns were health related;

messaging that addresses these may have positive impact on doxyPEP uptake or adherence. More work is needed to highlight intersectional and overlapping doxyPEP concerns. These and future results can help adapt city-wide sexual health messaging and services in real-time.

## THPEC212

### Knowledge, use and misuse of self-prescribed doxyPEP in a community-based PrEP service

R. Rossotti<sup>1,2</sup>, E. Caruso<sup>2</sup>, D. Calzavara<sup>2</sup>, P. Vinti<sup>2</sup>, A. Bianchi<sup>2</sup>, A. Tavelli<sup>3</sup>, D. Moschese<sup>4,2</sup>, G. Lapadula<sup>5,2</sup>, C. Muccini<sup>6,2</sup>, A. Soria<sup>5,2</sup>, A. De Bona<sup>7,2</sup>, M. Cernuschi<sup>6,2</sup>, A. d'Arminio Monforte<sup>3,8</sup>

<sup>1</sup>ASST Grande Ospedale Metropolitano Niguarda, Infectious Diseases, Milan, Italy, <sup>2</sup>Milano Checkpoint, Milan, Italy, <sup>3</sup>ICONA Foundation, Milan, Italy, <sup>4</sup>ASST Fatebenefratelli-Sacco, Milan, Italy, <sup>5</sup>San Gerardo Hospital IRCCS, Monza, Italy, <sup>6</sup>San Raffaele Scientific Institute, Milan, Italy, <sup>7</sup>ASST Santi Paolo e Carlo, Milan, Italy, <sup>8</sup>University of Milan, Milan, Italy

**Background:** The lack of national Guidelines on DoxyPEP leaves a gap in STI prevention where individuals with perceived high risk of exposure are informally self-administering doxycycline as PEP. This study aims to describe knowledge, use, temporal trends, and impact of doxyPEP in a cohort of PrEP-clients attending a community-based service.

**Methods:** Milano Checkpoint provides sexual health assistance to the largest cohort of PrEP-users in Italy. At each visit, clients are tested for STIs and fill self-administered behavioral questionnaires, including a survey on doxy-PEP. Descriptive statistics and nonparametric tests were used to describe survey participants from September to December 2023. Temporal trends were assessed with Cochran-Armitage test. Incidence rate (IR) was calculated for syphilis and chlamydia (separately and in combination, S/C), and for gonorrhea. Incidence rate ratios (IRR) were compared using adjusted Poisson models.

**Results:** The analysis included 686 respondents: 188 (27.5%) were aware of doxyPEP but only 52 (7.6%) reported using it. Users were significantly younger (36 versus 38 years), with higher number of overall (20 versus 13) and condomless (12 versus 7) sexual intercourses in the previous 3 months. DoxyPEP information was received mainly from friends (41.0%) and the internet (36.7%), but users discussed doxy-PEP with PrEP providers more often than non-users (32.7% versus 14.0%,  $p=0.006$ ). DoxyPEP was used mostly in case of self-perceived high-risk STI exposure (42.1%), but only 51.7% used the recommended dosing. DoxyPEP awareness and use decreased significantly over time.

Historical STIs IRs between groups were similar, but doxy-PEP users showed a significant increase in chlamydia (IRR 3.07, 95%CI 1.27-8.51,  $p=0.006$ ), S/C (IRR 1.95, 95%CI 0.91-4.46,  $p=0.067$ ), and gonorrhea (IRR 3.91, 95%CI 1.56-11.68,  $p=0.001$ )

incidences compared to the previous visit recorded. Adjusted Poisson models suggest that increasing frequency of doxyPEP use is protective against chlamydia (IRR 0.94) and S/C (IRR 0.92) at the limit of significance.

**Conclusions:** DoxyPEP was used by a limited number of clients and often with inadequate dosing. Users had increased STIs incidence probably for risk compensation issues, but higher doxyPEP frequency suggests protection against chlamydia and S/C. DoxyPEP needs to be implemented within appropriate national guidelines to reduce STIs circulation.

## THPEC213

### Awareness and willingness towards doxycycline post-exposure prophylaxis for bacterial sexually transmitted infections among men who have sex with men

Y.T. Chen<sup>1</sup>, K.-Y. Lin<sup>1,2</sup>, H.-Y. Sun<sup>2</sup>, Y.-S. Huang<sup>2</sup>, W.-D. Liu<sup>2,3</sup>, Y.-C. Chuang<sup>2</sup>, P.-H. Kuo<sup>4</sup>, S.-H. Wu<sup>2</sup>, W.-C. Liu<sup>2</sup>, P.-Y. Wu<sup>1</sup>, Y.-Z. Luo<sup>1</sup>, H.-Y. Chang<sup>1</sup>, L.-Y. Chen<sup>1</sup>, P.-J. Lin<sup>1</sup>, A.-T. Peng<sup>4</sup>, P.-Y. Wang<sup>4</sup>, G.-C. Li<sup>2</sup>, C.-C. Hung<sup>2,5</sup>

<sup>1</sup>National Taiwan University Hospital, Center for Infection Control, Taipei, Taiwan, Province of China, <sup>2</sup>National Taiwan University Hospital, Department of Internal Medicine, Taipei, Taiwan, Province of China, <sup>3</sup>National Taiwan University Cancer Center, Department of Internal Medicine, Taipei, Taiwan, Province of China, <sup>4</sup>National Taiwan University Hospital Hsin-Chu Branch, Department of Internal Medicine, Hsin-chu, Taiwan, Province of China, <sup>5</sup>National Taiwan University Hospital Yunlin Branch, Department of Internal Medicine, Yunlin, Taiwan, Province of China

**Background:** Doxycycline post-exposure prophylaxis (doxy-PEP) has been demonstrated to prevent bacterial sexually transmitted infections (STIs) among men who have sex with men (MSM). This study aimed to investigate the awareness and willingness towards doxy-PEP among MSM in the real-world setting.

**Methods:** From October 2023 to January 2024, we enrolled MSM aged 18 years and greater, including people with HIV (PWH) and pre-exposure prophylaxis (PrEP) users at a university hospital in Taiwan. Participants completed an online self-administered questionnaire interview upon enrollment to obtain information on the sexual behaviors, history of STIs in the past year, and their willingness to use doxy-PEP.

Multivariable logistic regression analysis was conducted to identify the factors associated with both the willingness to use and the prescription of doxy-PEP.

**Results:** A total of 922 participants with a median age of 38 years, including 796 PWH and 153 PrEP users, were enrolled, with 90.9% reporting having been engaged in anal-penile

or oral sex and 38.1% having acquired STIs in the previous year. Overall, 787 participants (85.4%) expressed willingness to use doxy-PEP after unprotected sexual activities. In multivariable analysis, the willingness to use doxy-PEP was associated with having recommendations from health-care providers (adjusted odds ratio [AOR], 1.85; 95% CI, 1.13-3.04). Among participants with fixed partners and those with non-fixed partners, the main reasons for the willingness to use doxy-PEP were the fear of contracting STIs (63.6% vs. 75.6%) and the concern about the spread of acquired STIs to others (62.3% vs. 70.4%), respectively. Of the 787 participants expressing willingness to use doxy-PEP, 329 (41.8%) received both counseling and prescriptions for doxy-PEP. In multivariable analysis, participants' prescriptions of doxy-PEP were associated with having a history of STIs (AOR, 1.64; 95% CI, 1.17-2.31), unprotected sex (AOR, 3.07; 95% CI, 1.39-6.76), and recommendations from healthcare providers (AOR, 1.69; 95% CI, 1.06-2.69), and being informed of clinical trial data (AOR, 1.52; 95% CI, 1.10-2.10).

**Conclusions:** Sexually active MSM in Taiwan exhibited a high willingness to use doxy-PEP, which correlated with their perception of STI risk. Providing information, education, and counseling by the healthcare providers may facilitate the initiation of doxy-PEP among at-risk populations.

"We used to treat a bit blindly: it was a syndromic diagnosis". Physicians' perceptions of comprehensive management of sexually transmitted infections among sex workers in Côte d'Ivoire

N.M. Nouaman<sup>1</sup>, P.A. Coffie<sup>2</sup>, M. Plazy<sup>3</sup>, V. Becquet<sup>4</sup>, S. Eholié<sup>5</sup>, J. Larmarange<sup>6</sup>

<sup>1</sup>Programme PAC-CI/Université Félix Houphouët Boigny, Côte d'Ivoire, Département de Santé Publique, UFR d'Odonto-Stomatologie, Université Félix Houphouët-Boigny, Abidjan, Côte d'Ivoire, <sup>2</sup>Programme PAC-CI, Université Félix Houphouët-Boigny, Côte d'Ivoire, Département de Dermatologie et Infectiologie, UFR des Sciences Médicales, Abidjan, Côte d'Ivoire, <sup>3</sup>University of Bordeaux, INSERM UMR 1219, IRD EMR 273, Bordeaux Population Health Research Center, France, Bordeaux, France, <sup>4</sup>Ined/Université Paris Cité, IRD, Inserm, Centre Population et Développement, Université Paris Cité, IRD, Inserm, Paris, France, <sup>5</sup>Université Félix Houphouët-Boigny, Côte d'Ivoire, Département de Dermatologie et Infectiologie, UFR des Sciences Médicales, Abidjan, Côte d'Ivoire, <sup>6</sup>Université Paris Cité, IRD, Inserm, Centre Population et Développement, Université Paris Cité, IRD, Inserm, Paris, France

**Background:** The ANRS 12381 PRINCESSE project proposed a comprehensive, community-based sexual and reproductive health (SRH) care package, including the man-

agement of sexually transmitted infections (STIs), for female sex workers (FSWs) aged  $\geq 18$  years in the San Pedro area. Our objective was the analysis of physicians' perceptions of the overall management of STIs.

**Methods:** The PRINCESSE health package (November 2019 - June 2023) included quarterly syndromic STI screening, vaginal and anal swabs for annual testing for chlamydia trachomatis and neisseria gonorrhoea, and appropriate free STI treatment. It was offered in both mobile and fixed clinics. At cohort closure in June/July 2023, in-depth individual interviews were conducted with the four physicians involved in the project.

**Results:** The offer of STI screening and treatment was well received by the medical team. For the physicians, the acquisition of new knowledge about STI treatment, the opportunity to carry out laboratory tests directly on site and in a fixed clinic, and the fact that they could provide STI treatment kits directly to clients were an asset of the project and a source of motivation to work in the long term. This has also fostered a relationship of trust between the physicians and FSWs.

However, operational difficulties, including frequent delays in the supply of STI kits and the late return of medical analyses, have at times undermined this relationship of trust and made it difficult to provide timely and appropriate STI treatment and regular follow-up in a context that was already tense due to the high mobility of FSWs. Another limitation was the lack of care for the stable partner(s) of treated FSWs, as this did not allow the chain of contamination to be broken and possible re-acquisition to be avoided. Finally, the inaccessibility of certain sites due to poor road conditions during the rainy season also made STI treatment difficult.

**Conclusions:** STI screening and treatment were seen as an appropriate response to the SRH needs of FSWs. However, both structural and operational barriers have made implementation complex. Point-of-care tools, such as rapid STI testing, could be useful for this particularly mobile population.

## THPEC215

### HIV Pre-exposure prophylaxis (PrEP) outpatient clinic as a prevention tool for sexual transmitted diseases (STDs) and for vaccinations among MSM

L. Labate<sup>1,2</sup>, C. Marelli<sup>1</sup>, A. Limongelli<sup>1,2</sup>, L. Taramasso<sup>1</sup>, F. Centorrino<sup>1</sup>, I. Schiavetti<sup>3</sup>, M. Bassetti<sup>2,1</sup>, A. Di Biagio<sup>2,1</sup>

<sup>1</sup>IRCCS Ospedale Policlinico San Martino, Infectious Disease, Genova, Italy; <sup>2</sup>University of Genoa, Infectious Disease, Department of Health's Sciences, Genova, Italy; <sup>3</sup>University of Genoa, Biostatistics, Department of Health Sciences, Section of Biostatistics, Genoa, Italy

**Background:** Pre-exposure prophylaxis (PrEP) is effective in HIV prevention, despite an increase of sexually transmitted disease (STDs), such as *N. gonorrhoeae* (NG), *C. trachomatis* (CT), *M. genitalium* (MG) and syphilis.

Primary objectives: incidence, prevalence, and predictors of STDs; frequency of vaccination for HAV, HBV and HPV and triple vaccination associated factors.

**Methods:** Retrospective single-center study including men who have sex with men (MSM) aged ≥18 who started PrEP at our clinic (Genoa) between October 2018 and October 2023. We considered the incidence rate per 100 person-years, according to different anatomical sites and PrEP intake mode. The prevalence of STDs was evaluated at T0 (start of PrEP), T1 (six months after T0), and T2 (12 months after T0). Univariate and multivariate analyses were used to assess predictive factors for STDs.

**Results:** Of 137 MSM with a median age of 36 years [inter-quartile range, 30 to 45] 64% were taking PrEP on demand and 36% continuously. The prevalence of genital and extragenital STDs was 4.2% and 5.1% at T0, 0 and 4.7% at T1, 8.3% and 9.4% at T2. The 100 person-years incidence rates were 22.23 (95% confidence interval [CI] 21.41-23.07) for NG, 11.91 (95%CI, 11.21-12.53) for CT, 38.07 (95%CI, 37.00-39.16), for MG and 14.73 (95%CI, 14.12-15.36), for syphilis. Predictive factors for CT were drugs abuse ( $p=.023$ ) and sildenafil use ( $p=.037$ ); for syphilis fisting practice ( $p=.017$ ), popper ( $p=.033$ ), sildenafil use ( $p=.017$ ) and intake errors ( $p=.027$ ); for MG 'continuous' PrEP ( $p=.003$ ), sildenafil use ( $p=.003$ ) and chemsex practice ( $p=.015$ ); for NG drugs abuse ( $p=.007$ ) and 'continuous' PrEP ( $p=.013$ ). 14% of participants were fully vaccinated against HAV, 20% against HBV, and 19% against HPV. 54% received at least one dose of the three vaccines. The only predictor of a lower triple vaccination rate was the lower number of PrEP visits (adjusted odds ratio, aOR = 0.78; 95%CI, 0.67-0.91;  $p=.001$ ).

**Conclusions:** PrEP visits are an opportunity for early recognition of STDs and for free access to vaccinations. The identification of possible predictors of STDs could facilitate heightened focus on individuals exhibiting specific risk factors, making them potential candidates for innovative strategies like doxycycline post-exposure prophylaxis.

## THPEC216

### Cervical cancer rates among women living with HIV in PEPFAR programs by age and country, fiscal years 2018-2023

J. Stephens<sup>1</sup>, A. Chtourou<sup>1,2</sup>, O. Ogunwobi<sup>1,3</sup>, S. Desai<sup>1</sup>, N. Maina<sup>1</sup>, I. Lapidus-Salaiz<sup>1</sup>

<sup>1</sup>United States Agency for International Development, Office of HIV/AIDS, Washington, DC, United States; <sup>2</sup>National Institutes of Health, National Cancer Institute, Rockville, United States; <sup>3</sup>Michigan State University, East Lansing, United States

**Background:** Women living with HIV (WLHIV) have six times the risk of developing cervical cancer compared to women without HIV. In 2023, PEPFAR programs screened over 2.7 million women for cervical cancer using visual inspection with acetic acid (VIA) (5-25% screen positivity expected). We reviewed the percentage of WLHIV who tested positive by VIA screening to assess the performance of PEPFAR programs.

**Methods:** This study focused on eight countries (Botswana, Eswatini, Lesotho, Malawi, Mozambique, Namibia, Zambia, and Zimbabwe). Routine semi-annual monitoring data from fiscal years (FY) 2018-2023 calculated screening positivity proxy by age, country, and outcome. The positivity rate was calculated by dividing the total number of WLHIV (aged 15+) screening positive for high-risk cervical lesions using VIA at a first-time screen, rescreen (after a previous negative result), or follow-up (post-treatment after positive results) by the total number of WLHIV screened for cervical cancer.

**Results:** Positivity rates were 8.0% in FY18Q4 and 6.4% in FY23Q4, with the lowest rate in FY22Q2 (5.3%) and the highest rate in FY19Q2 (8.02%). From FY18Q4 to FY22Q4, follow-up screenings had the highest positivity (7.1% in FY21Q4 to 16.1% in FY19Q2). In FY23Q2, first-time screens had the highest positivity (7.4%), compared to 6.9% for follow-up and 4.4% for rescreened. Among first-time and follow-up screened WLHIV, 8% displayed suggestive pre-cancerous lesions and 1% showed suggestive invasive cervical cancer. Of those rescreened, 5% had suggestive pre-cancerous lesions. Across the period, WLHIV 25-29 years old exhibited the highest positivity rate (7.1%) and WLHIV aged 50+ exhibited the lowest (3.7%). The highest positivity rate was among 30-34 year olds in FY19Q2 (9.2%). Namibia had the highest positivity rate (15.9%), while Malawi had the lowest (2.6%).

**Conclusions:** PEPFAR-supported cervical cancer screening programs are finding 5-8% rates requiring follow-up, aligning with VIA screening expectations. Research is needed to examine disparities in quality, accuracy detection rates, and performance between VIA and HPV testing methodologies for age groups and countries outside this range. Scale-up of HPV as the primary screening modality to allow for less frequent screening should also be considered.

## THPEC217

Doxy-PEP interest and use among US cisgender men who have sex with men, transgender women and non-binary assigned male-sex at birth: results from a national online survey

T.S. Torres<sup>1</sup>, N. Gistand<sup>2</sup>, C. Celum<sup>3</sup>, A. Luetkemeyer<sup>2</sup>, S. Buchbinder<sup>4</sup>, H. Scott<sup>4</sup>

<sup>1</sup>Instituto Nacional de Infectologia Evandro Chagas, Fiocruz, Rio de Janeiro, Brazil, <sup>2</sup>University of California, San Francisco, United States, <sup>3</sup>University of Washington, Seattle, United States, <sup>4</sup>San Francisco Department of Public Health, San Francisco, United States

**Background:** Doxycycline as post-exposure prophylaxis (doxy-PEP) significantly reduces bacterial sexually transmitted infections (STIs) among cisgender men who have sex with men (cis-MSM) and trans-women. In October 2023, the US CDC released proposed guidelines for doxy-PEP, however, information about doxy-PEP use and interest among US cis-MSM, trans-women and non-binary assigned male-sex at birth is limited.

**Methods:** We conducted a national online survey of doxy-PEP use and interest through a social networking application (Grindr) from March-April-2023 with questions about demographics, sexual behavior, HIV/STI history, PrEP use, and doxy-PEP use/interest. We defined doxy-PEP eligibility as having an STI in the past year.

We used a logistic regression model to assess factors associated with doxy-PEP use among those eligible for doxy-PEP.

**Results:** Of 1,428 participants with a median age of 38 years [IQR:30-52], 93.8% were cis-MSM, 3.6% non-binary, 2.6% trans-woman, 49.8% White, 28.5% Latinx, 9.4% Black, with 33% each from the southern and western US. In the last 6 months, participants reported a median of 5 partners (IQR:2-10), 83.4% condomless sex, 49.7% use of poppers, 10.9% binge drinking, 14.1% methamphetamine, and 7.4% cocaine.

Overall, 16.0% were living with HIV and of HIV- participants, 87.4% were aware of PrEP, and 47.8% currently on PrEP. A total of 33.1% (N=471/1422) reported an STI in the past year and considered eligible for doxy-PEP. Among them, only 17.0% (N=80/471) reported ever using doxy-PEP, but most who never used doxy-PEP were interested (93.8%, n=364/388).

Among doxy-PEP users, most reported obtaining it from their health care providers (51.2%) or a sexual health clinic (35.0%); overall, 12.0% reported being denied doxy-PEP by a provider. Doxy-PEP use was associated with number of partners (adjusted Odds Ratio [aOR]: 1.01; 95%CI:1.00-1.03; per 1-point increase), Black race (aOR:3.62; 95%CI:1.18-10.63) and current PrEP use (aOR:3.60; 95%CI:1.53-9.84).

**Conclusions:** A national online survey of social network app users assigned male-sex at birth found high interest but low use of doxy-PEP. Interest was high among those eligible for doxy-PEP, and doxy-PEP use was higher among

Black persons and current PrEP users. Implementation of doxy-PEP will need to ensure equity in access among populations most likely to benefit at individual and community levels.

## THPEC218

Doxycycline for bacterial sexually transmitted infection prevention in British Columbia, Canada

J. Toy<sup>1,2</sup>, R. Espinoza<sup>1</sup>, P. Sereda<sup>1</sup>, P. Phillips<sup>1,3</sup>, V. Lima<sup>1,3</sup>, J. Joy<sup>1,3</sup>, V. Leung<sup>2,3</sup>, R. Barrios<sup>1,3</sup>, J. Montaner<sup>1,3</sup>

<sup>1</sup>BC Centre for Excellence in HIV/AIDS, Vancouver, Canada, <sup>2</sup>St. Paul's Hospital, Vancouver, Canada, <sup>3</sup>University of British Columbia, Vancouver, Canada

**Background:** Bacterial sexually transmitted infections (b-STIs) account for an estimated 374 million new infections per year globally. Doxycycline has demonstrated efficacy in preventing b-STIs amongst gay, bisexual and other men who have sex with men (gbMSM) and trans-women living with HIV, and in those at risk of acquiring HIV on HIV Pre-Exposure Prophylaxis (PrEP).

We describe implementation of a b-STI prevention initiative in British Columbia (BC), in response to continued elevated rates of b-STIs amongst gbMSM.

**Description:** A publicly-funded doxycycline for b-STI prevention initiative was launched 1-Dec-2023 for eligible participants of the centralized BC Centre for Excellence in HIV/AIDS Drug Treatment Programs (DTP). Baseline evaluation confirmed elevated b-STI rates, amongst gbMSM participants of DTP programs.

Evidence-based guidance was developed detailing participant eligibility: HIV treatment or PrEP program participation; gbMSM or transwoman; history of b-STI in the previous 12 months or clinically at risk of b-STIs. Medication distribution and counselling were aligned with the centralized system for DTP programs.

Eligibility and prescribing information were posted publicly, and a communication sent to 1700 DTP (antiretroviral therapy [ART] and PrEP) prescribers.

A program database, and monitoring and evaluation plan were developed, including programmatic and clinical indicators (e.g., uptake, impact, adverse drug reactions, unintended consequences).

**Lessons learned:** Early program uptake (1-Dec-2023 through 22-Jan-2024) included 410 enrollees with median (Q1-Q3) age 35 years (30-42), 99% cis-men, including 43% identifying as White, 13% Latin, 11% East Asian, 7% South Asian, and 82% residing in the Greater Vancouver area. Of enrollees, 51% reported a history of b-STI in the previous year, and 40% had received doxycycline prior to enrolment.

Baseline syphilis rate was 7.5 per 100 person-years in 376 HIV PrEP recipients (1416 person-years of follow-up); and 17.0 per 100 person-years in 34 ART recipients (135 person-years of follow-up).

**Conclusions/Next steps:** We describe the integration of a publicly-funded doxycycline for b-STI prevention initiative targeting ART and PrEP recipients in BC, including the generation of therapeutic guidelines, centralized medication distribution, and planned monitoring and evaluation strategies.

While participants with elevated b-STI risk from both DTP programs have enrolled in this b-STI prevention initiative, early uptake has been particularly brisk among PrEP recipients.

## THPEC219

### Prevalence of depression and determinants among HIV positive pregnant women attending both antenatal and ART clinics in rural Malawi

L. Kasanga<sup>1</sup>, L. Kululanga<sup>2</sup>, E. Musa<sup>2</sup>

<sup>1</sup>Kamuzu University of Health Sciences, Faculty of Community Health Nursing and Ministry of Health, Nkhatabay District Hospital, Nursing Department, Lilongwe, Malawi, <sup>2</sup>Kamuzu University of Health Sciences, Faculty of Nursing, Community Health Department, Lilongwe, Malawi

**Background:** Depression is a widespread mental health concern on a global scale, impacting individuals across the society. World Health Organization (WHO) estimates that 264 million people worldwide grapple with depression. Among people living with HIV, depression is highly prevalent, with global studies estimating its occurrence between 20% and 60%.

In Malawi, prevalence rates range from 9% to 30.3%. For HIV-positive prenatal women, the prevalence of depression is reported between 14% and 55% worldwide, and 23% to 65% in Sub-Saharan Africa.

However, there is a notable gap of the prevalence of depression and its associated risk factors among prenatal women in rural Malawi.

**Methods:** Conducted in Malawi's Nkhata Bay district, our cross-sectional quantitative study utilized randomized systematic sampling for participant recruitment. Data collection employed the validated PHQ9 tool, with analysis conducted using SPSS version 22. The study computed prevalence rates and employed linear multivariable regression to assess determinants of depressive symptoms in HIV-positive antenatal women.

This research, a component of a Master of Science in Community Health Nursing, was approved by College of Medicine Research and Ethics Committee (COMREC), and Nkhatabay District Hospital.

**Results:** Prevalence of depression among prenatal mothers attending both ANC and ART clinics in Nkhata Bay stood at 24%, with 20% having moderate to moderate severe symptoms and 5% with severe depression. In a bivariate analysis depression was associated with poor ART adherence ( $p < 0.0001$ ), alcohol use ( $p = 0.001$ ) and history

of GBV ( $p = 0.018$ ) whilst in a multivariate analysis ART adherence was associated with the reduction in depression symptomatology ( $B = -3.2$ ;  $p < 0.0001$ ).

**Conclusions:** In rural settings, our study revealed significant prevalence of depressive disorders among prenatal women attending both Antenatal Care (ANC) and Antiretroviral Therapy (ART) clinics, aligning with global and Sub-Saharan African estimates. This high prevalence emphasizes the imperative to incorporate mental health, particularly depression care, into ANC and ART services. Notably, the correlation between depression prevalence and factors such as poor ART adherence, alcohol use, and history of gender-based violence underscores the necessity for comprehensive assessments of pregnant women in these clinics. This insight advocates for the implementation of targeted interventions to address the mental health needs this vulnerable population.

## THPEC220

### Transforming family planning access for women living with HIV: the one-stop shop model

E. Maswi<sup>1</sup>, A. Temba<sup>1</sup>, D. Ngerangera<sup>1</sup>, R. Mlange<sup>1</sup>, F. Haraka<sup>2</sup>, R. Van de Ven<sup>2</sup>, C. Alons<sup>3</sup>

<sup>1</sup>EngenderHealth, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Elizabeth Glaser Pediatric AIDS Foundation, Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>Elizabeth Glaser Pediatric AIDS Foundation, Washington DC, United States

**Background:** Integration of family planning (FP) into HIV care is considered a high-impact practice, but integration into antiretroviral therapy (ART) services remains limited. Increasing access to effective contraception among women living with HIV (WLHIV) not only fulfills their reproductive rights but is also key towards elimination of mother-to-child transmission. The USAID Afya Yangu Northern project integrates FP services into 472 HIV care and treatment clinics in five regions in Tanzania. In 267 health facilities, a one-stop-shop model offers the full FP method mix within the HIV clinic. Within these five regions, 33% of women aged 15-49 in the general population use a modern method of FP (TDHS 2022).

This study aimed to assess results of integrated delivery of FP methods within HIV clinics in providing access to FP for WLHIV.

**Methods:** A cross-sectional review of program data was conducted, using the national HIV care and treatment database to analyze the documentation of FP uptake among WLHIV aged 15-49 years, currently on ART by September 2023, across 472 supported facilities.

**Results:** Among the 81,231 WLHIV on ART, 34,793 (43%) currently use a modern FP method, 38,965 (48%) were documented as not using any FP method, and 7,129 (9%) had an unknown FP status. Among all FP users, 51% used condoms, 35% implants, 6% Depo-Provera injectables, 5%

sterilization, 2% intra-uterine contraceptive device, and 1% oral contraception. The uptake of modern FP is higher within the 267 facilities offering the one-stop-shop model: 48% (30,129/60,306) compared to 25% (4,664/18,925) at the other 205 facilities. The uptake of long-acting and reversible contraception (LARC) at the one-stop-shop sites was 42% (12,751/30,129) compared to 36% (1,673/4,664) at the other sites.

**Conclusions:** FP integration through the one-stop-shop model facilitated access to FP among WLHIV, with a higher percentage of WLHIV of reproductive age using FP compared to the general population.

The offer of a method mix within HIV clinics increased the uptake of LARCs. While challenges exist in ensuring proper documentation, the study highlights the importance of integrated service delivery in providing FP access to WLHIV.

## THPEC221

Assessing the impact of an integrated community service delivery approach in improving HIV and Malaria case identification, HIV viral suppression and other health outcomes at Community level

K. Edward<sup>1</sup>, K. Cordelia<sup>1</sup>, H. Balidawa<sup>1</sup>, D.M. Robert<sup>1</sup>

<sup>1</sup>Ministry of Health, AIDS Control Program, Kampala, Uganda

**Background:** HIV epidemic continues to be a public health challenge in Uganda. With 1.4 Million people living with HIV of which 82,000 are non-suppressed. Approaches supporting them are siloed and Uganda continues to get 51,000 new infections.

The Integrated Community Service Delivery Approach (ICSDA) is key in improving treatment outcomes, identifying undiagnosed HIV positives, addressing socio-economic issues and Directly Observed Treatment and Support (DOTS). We assessed its impact on improving health outcomes.

**Description:** A comprehensive analysis was conducted using data collected from 3 sub-regions. This involved mapping virally non-suppressed clients and Community Health Workers (CHW) by village to determine the patient attachment ratio and effectiveness, success of socioeconomic programs and DOTS.

We attached all Non suppressed clients to CHWs/peers within their proximity on a ratio of 1:4, provided them with treatment literacy handbooks and a service package which included DOTS, screening and testing of family members for HIV, TB, Malaria, NCD and linkage of households to social-economic programs. They followed the households for 30 days.

**Lessons learned:** A total of 11,243 unsuppressed clients were attached to 2,955 CHWs during the study. 3,373 Males and 7,870 females. The interventions increased viral load suppression rates by 97%, index testing for the contacts of non-suppressed resulted in 13% yield, referral of 2,430 malaria cases to the facility.

Additionally, Socioeconomic interventions showed varied success, with significant strides in vocational training linkage and kitchen gardens. CHWs identified information fatigue and stigma created from many different program peers who visit households and lack of a supportive environment at home as the major factors for non-suppression.

**Conclusions/Next steps:** This approach has shown promising results in improving viral suppression rates and case identification for HIV and Malaria. It is cost effective, reduces duplication, improves efficiency and if scaled, it can support the country to achieve epidemic control

## THPEC222

Interventions to reduce PrEP interruptions among clients at substantial risk of HIV acquisition in Acholi Sub-region following the enactment of Anti-Homosexuality Act in Uganda

B. Bongonyinge<sup>1</sup>, A. Lawino<sup>1</sup>, H. Nandudu<sup>1</sup>

<sup>1</sup>The AIDS Support Organisation (TASO), Gulu, Uganda

**Background:** The passing of Anti-homosexuality Bill (AHB) and subsequent assent to it by the President into the Anti-homosexuality Act (AHA) fueled increased fears of arrests, victimization, violence, stigma, and discrimination among members of key population (KP) in the Acholi Sub-region. Between March-May 2023(Weeks 13-18), appointment keeping & facility attendance dropped by >45% from a weekly average of 110 to 60. Without any mitigation interventions, the risk of PrEP interruptions for clients at substantial risk of HIV was high. This would exacerbate the risk of HIV acquisition and transmission among this high-risk population further curtailing efforts to attain and sustain HIV epidemic control.

This project aimed at instituting adaptations aimed at minimizing interruptions of PrEP continuity among populations at substantial risk of HIV amidst the AHA in Acholi sub-region.

**Methods:** Working with various stakeholders including KP community members, reviewed the implementation climate amidst AHA and instituted KP program adaptations to reduce PrEP interruptions. These included; orientation

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

of Peer outreach workers (PoWs) and health workers on the AHA and its implications for KP service delivery while emphasizing need for continuity of non-judgmental & non-stigmatizing service delivery; scaled down traditional moon-light outreaches at hotspots due to safety concerns in favor of discrete door to door delivery of refills; Using the Peer attachment records, doubled airtime facilitation for all POWs to enhance proactive tracking of clients using their peer calendars; and deployed a psychotherapist to enhance screening for mental health and management.

**Results:** The Activity did not only mitigate interruptions but increased the number of clients at substantial risk that continued on PrEP from 1,646 in Q1 to 2,395 by end of Q4 2023. Attendance & appointment keeping was restored to pre-AHA levels.

**Conclusions:** Although the KP implementation climate has remained fluid, KP program adaptations such as a shift to discrete door to door delivery of refills can enhance PrEP continuity. Effective HIV prevention is feasible amidst AHA, and members of KP community can be proactively supported to continue on PrEP through intentional KP program adaptations. Engagement of psychotherapists and enhancing PrEP continuity for all clients with ongoing risk should remain a core priority of PrEP programming.

## Population-specific interventions for HIV prevention

### THPEC223

PrEP use, awareness, and interest among women who inject drugs in Seattle, Washington and Minneapolis, Minnesota

L.R. Violette<sup>1,2</sup>, M.A. Corcorran<sup>2</sup>, E.J. Austin<sup>3</sup>, M. Abd El Hadi<sup>4</sup>, E.C. Williams<sup>3</sup>, S.N. Glick<sup>2</sup>, S. Dhanireddy<sup>2</sup>, J. Stewart<sup>5</sup>  
<sup>1</sup>University of Washington, Epidemiology, Seattle, United States, <sup>2</sup>University of Washington, Medicine, Seattle, United States, <sup>3</sup>University of Washington, Health Systems and Population Health, Seattle, United States, <sup>4</sup>Hennepin Healthcare Research Institute, Infectious Diseases, Minneapolis, United States, <sup>5</sup>University of Minnesota, Medicine, Minneapolis, United States

**Background:** Women who inject drugs (WWID) are disproportionately affected by HIV and experience multiple barriers to PrEP use. We explored patterns of utilization, awareness, interest, and perceived barriers to PrEP use among WWID in two U.S. states.

**Methods:** We conducted sexual health surveys among a convenience sample of WWID at 3 sites in Seattle, WA and at 3 sites in Minneapolis, MN from March-December 2023. Participants were ≥18 years, spoke English, identified

as women, had a lifetime history of injecting drugs, and self-reported a negative or unknown HIV status. Participants were considered PrEP candidates if they reported sharing injection equipment in the past 6 months, no condom use at last sex, and/or transactional sex in the past 6 months. To further explore perspectives on PrEP, we conducted semi-structured interviews with 15 WWID from the Seattle sites. Qualitative interviews were professionally transcribed and analyzed using Rapid Assessment Process.

**Results:** Among 51 WWID, 78% were PrEP candidates, of whom 70% had heard about PrEP but only 8% were currently using PrEP. Among 47 WWID not using PrEP, 49% reported interest in daily oral PrEP and over half (57%) reported interest in injectable PrEP. Qualitative data revealed strong positive attitudes towards PrEP but low perceived risk for HIV, and a preference for long acting injectables over daily oral PrEP. Barriers to PrEP use included adherence challenges, limited self-perceived risk, limited or incorrect knowledge about PrEP, and need to prioritize other health issues and safety concerns.

	Minneapolis		Seattle		Total N=51
	Meets PrEP candidacy criteria N=17	Does not meet PrEP candidacy criteria N=5	Meets PrEP candidacy criteria N=23	Does not meet PrEP candidacy criteria N=6	
Injected drugs in past 6 months	13 (76%)	5 (100%)	14 (61%)	2 (33%)	34 (67%)
Shared injection equipment in past 6 months	N=13 5 (38%)	0 (0%)	N=14 4 (29%)	N=2 0 (0%)	N=34 9 (26%)
Median number of sex partners in past 6 months [IQR]	N=15 1 [1-3]	1 [1-2]	10 [2-57]	0 [0-1]	N=49 2 [1-9]
Transactional sex in past 6 months	5 (29%)	0 (0%)	16 (70%)	0 (0%)	21 (41%)
Heard of PrEP	10 (59%)	N=4 3 (75%)	18 (78%)	3 (50%)	N=50 34 (68%)
No history of PrEP use	14 (82%)	N=4 4 (100%)	19 (83%)	6 (100%)	N=50 42 (84%)
Interested in daily oral PrEP (among those not currently on PrEP)	N=16 3 (19%)	N=4 3 (75%)	N=21 13 (62%)	4 (67%)	N=47 23 (49%)
Interested in long acting injectable PrEP	9 (53%)	N=4 3 (75%)	N=22 12 (55%)	4 (67%)	N=49 28 (57%)

Table 1. Study cohort characteristics.

**Conclusions:** Despite high rates of HIV risk factors, PrEP awareness, and interest, few WWID were taking PrEP and many had complex barriers to PrEP use, including low self-perceived risk, challenges with daily medications, and competing survival needs. Our findings highlight the need for increased low-barrier, women-specific interventions to improve uptake and sustained use of PrEP among WWID.

## THPEC224

Enhancing PrEP uptake among MSM and male sex workers: lessons from events-based awareness creation in Nairobi, Kenya

H. Albert<sup>1</sup>, M. Ken<sup>2</sup>, Fahari ya Jamii

<sup>1</sup>HOYMAS Kenya, Clinical, Nairobi, Kenya, <sup>2</sup>Nairobi University, Nairobi, Kenya

**Background:** In Kenya, men who have sex with men (MSM) and male sex workers (MSWs) face a disproportionately high risk of HIV infection. Pre-exposure prophylaxis (PrEP) offers a powerful prevention tool. Since 2017, Health Options for Young Men on HIV/AIDS and STIs (HOYMAS) has been offering community-led HIV prevention and treatment services including PrEP. HOYMAS applied various approaches to scale uptake of PrEP. However, MSM and MSWs still faced limited awareness and access. HOYMAS PrEP champions initiated an events-based PrEP awareness creation program in 2022 to address this gap.

**Description:** Over a 24-month period in Nairobi, Kenya, the events-based PrEP awareness creation program specifically targeted MSM and MSWs. PrEP champions collaborated closely with their peers to develop culturally appropriate messages about PrEP. The initiative featured engaging events such as trivia, skits, and debates infused in outreach activities held at MSM-friendly venues and hotspots. PrEP champions delivered information and facilitated the enrollment of their peers in PrEP services. This innovative model doubled the number of MSM and MSWs enrolled and retained on PrEP.

**Lessons learned:** The findings highlight substantial increase in PrEP uptake among MSM and MSWs. The program effectively engaged the target populations through culturally relevant strategies, dismantling barriers to information access. Interactive events encouraged open dialogue, heightened PrEP knowledge, and mitigated the stigma associated with PrEP use. Community-led approaches involving MSM and MSWs in message development built trust and ensured culturally relevant communication. Peer PrEP champions played a central role in disseminating accurate information, addressing concerns, and facilitating PrEP uptake, resulting in over 2,000 participants signing up for PrEP services. HOYMAS achieved greater program success through collaboration efforts and referral networks that facilitated access to PrEP services.

**Conclusions/Next steps:** The program underscores the efficacy of events-based awareness creation and community-led approaches in significantly increasing PrEP uptake among MSM and MSWs. The success highlights the importance of tailoring interventions to key populations, building trust, addressing stigma through community engagement, and empowering PrEP champions to deliver culturally relevant information. HOYMAS plans to expand this successful program to other counties and advocate for more comprehensive PrEP access through policy initiatives.

## THPEC225

Leveraging digital media and peer-led interventions to enhance HIV prevention and care among young key populations in the Philippines

J. Abenoja<sup>1</sup>, L.B. Norella<sup>1</sup>, M.S. Flores<sup>2</sup>

<sup>1</sup>PSFI, Manila, Philippines, the, <sup>2</sup>Pilipinas Shell Foundation Inc., PROTECTS UPSCALE, Manila, Philippines, the

**Background:** The Philippines has seen a rapid increase in human immunodeficiency virus (HIV) infections, particularly among young key populations (YKPs), including men who have sex with men (MSM), transgender individuals, sex workers, and intravenous drug users. Traditional outreach methods have been insufficient in addressing the unique needs and behaviors of YKPs. This study explores innovative strategies to improve HIV prevention, testing, and treatment services tailored for YKPs.

**Description:** An integrative approach combining digital media campaigns and peer-led interventions was implemented. Social media platforms were utilized to disseminate HIV-related information, aiming to reduce stigma and increase awareness. The program included virtual safe spaces, e-counseling services, and a mobile health app providing discreet access to HIV self-testing kits, pre-exposure prophylaxis (PrEP), and antiretroviral therapy (ART) adherence support. Furthermore, trained YKP peer educators conducted outreach activities, shared personal narratives, and offered mentorship, creating a supportive community to encourage HIV testing and treatment initiation.

**Lessons learned:** The multi-faceted strategy saw significant engagement, with a 45% increase in HIV testing among YKPs. Peer-led interventions were particularly effective, resulting in a 30% rise in PrEP uptake and improved ART adherence rates. Digital campaigns reached a wide audience, but the impact was maximized when coupled with real-world peer interactions. Challenges included mitigating misinformation and ensuring privacy and confidentiality in digital spaces.

**Conclusions/Next steps:** The combination of digital media and peer-led interventions presents a promising model for enhancing HIV preventive and care services among YKPs in the Philippines. Future efforts should focus on scaling up these strategies, incorporating comprehensive sexual education, and continuously adapting to the evolving digital landscape. Collaborations with local health departments, non-profit organizations, and YKP communities will be crucial in sustaining these innovations and ultimately curbing the HIV epidemic among Filipino YKPs.

**THPEC226****Risk factors associated with oral PrEP uptake and discontinuation among adolescent girls and young women (AGYW) in Dar-es-Salaam, Tanzania**

L. Magesa<sup>1</sup>, R. Mpembeni<sup>2</sup>, A. Kibao<sup>3</sup>, O. Machangu<sup>4</sup>, C. Festo<sup>5</sup>

<sup>1</sup>Management and Development for Health Organization, Program, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Muhimbili University of Health and Allied Science, Epidemiology and Biostatistics, Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>Regional Administrative Secretary, Health, Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>Ministry of Health, Prevention, Dar es Salaam, Tanzania, the United Republic of, <sup>5</sup>Management and Development for Health Organization, Strategic Information, Dar es Salaam, Tanzania, the United Republic of

**Background:** In 2021, Sub-Saharan Africa had 67% of people living with HIV globally. Currently, the vast majority (86%) of new HIV infections are among adolescent girls and young women (AGYW) aged 15-19 years. Oral pre-exposure prophylaxis (PrEP) is an effective tool that entails use of antiretroviral drugs to prevent HIV acquisition. An evaluation of early implementation in Dar es Salaam, Tanzania, among AGYW has shown poor PrEP adherence. This study examined oral PrEP uptake, discontinuation rates, and associated factors among AGYW in Dar es Salaam.

**Methods:** We retrospectively analyzed the Tanzania AGYW PrEP registry from January 2022 through June 2022 with 6 months of follow-up. Nine (45%) of 20 facilities offering PrEP in Dar es Salaam were selected using systematic random sampling. Data were analyzed using STATA 18.0. Kaplan-Meier survival analysis was used to explore differences in time on oral PrEP to discontinuation; Cox proportional hazard models were used to determine factors associated with oral PrEP discontinuation.

**Results:** A total of 456 AGYW aged 15-24 years were screened and 395 found to be eligible. Oral PrEP uptake was 87% among eligible AGYW. Median time to first PrEP discontinuation was 2.8 months. Sixty-one percent of AGYW had discontinued PrEP by the end of the 6-months follow-up period at a rate of 182 [95% CI: 161-208] per 1,000 person-months.

Significant risk factors associated with a low discontinuation were aged 20-24 years [adjusted hazards ratio (aHR) = 0.54, 95% CI: 0.38-0.77] compared to aged 15-19 years and residence in Kinondoni Municipal Council [aHR = 0.51, 95% CI: 0.34-0.77] and Ubungu Municipal Council [aHR = 0.45, 95% CI: 0.32-0.64] compared to those in Ilala City, being out of school [aHR = 1.16, 95% CI: 0.67-2.01, ref: in school] and PrEP accessing point ( $P < 0.001$ ).

**Conclusions:** In Dar es Salaam, Tanzania, PrEP uptake and the risk of PrEP discontinuation among AGYW were associated with lower age, being in school, and area of res-

idence. Raised community awareness, improved knowledge of service providers and engaging AGYW peers on adherence groups may facilitate retention of AGYW on PrEP.

**THPEC227****High HIV prevalence among people reporting non-injecting drug use requires a more inclusive approach to HIV prevention**

A. Deryabina<sup>1</sup>, Z. Tatkeyeva<sup>1</sup>, V. Ivakin<sup>1</sup>, M. Sauranbayeva<sup>1</sup>, M. Myrzaly<sup>1</sup>, A. Howard<sup>2</sup>

<sup>1</sup>ICAP at Columbia University, Almaty, Kazakhstan, <sup>2</sup>ICAP at Columbia University, New York, United States

**Background:** People who use drugs continue to drive the HIV epidemic in Kazakhstan. In Almaty, according to the 2022 bio-behavioral survey, the respondent driven sample-weighted HIV prevalence among people reporting injecting drug use (IDU) was 2.6% (95%CI 0.8%-4.5%). Data on HIV prevalence among people with non-injecting drug use (NIDU), use of new psychoactive substances (NPS), and polydrug use are not available. HIV prevention and harm reduction services for people with NIDU are also very limited. ICAP at Columbia University jointly with a non-governmental organization (NGO) Revansh, expands access to voluntary HIV testing services (HTS) for all people who use drugs using a social network-based testing strategy (SNS).

**Description:** SNS is implemented in Almaty, Kazakhstan as part of the "Almaty Model for HIV Epidemic Control" project. Trained NGO providers ask their clients living with HIV and those using drugs to invite individuals in their sexual, drug using or social networks to participate in voluntary HTS.

**Lessons learned:** From September 1, 2021, to December 31, 2023, 2,006 people (1,526 men and 480 women) received HTS as part of SNS, including 1,216 (903 men and 313 women) who reported NIDU and 790 (623 men and 167 women) who reported IDU. Of 1,216 people reporting NIDU, 1,101 used NPS, 56 used a mix of different drugs (polydrug use), 47 misused prescription drugs and 9 did not specify drugs used. Twenty-seven people with NIDU (2.2%, 95%CI 1.5%-3.2%) and 42 with IDU (5.3%, 95%CI 3.96%-7.11%) were confirmed as HIV-positive ( $p = .0002$ ). HIV-positivity was 3.6% (95%CI 0.99%-12.1%) among people reporting non-injecting polydrug use, 2.2% (95%CI 1.5%-3.2%) among people reporting non-injecting use of NPS, and 2.0% (95%CI 0.35%-10.5%) among people with non-injecting misuse of prescription drugs.

**Conclusions/Next steps:** The results of our SNS program demonstrate that HIV prevalence among people reporting NIDU are comparable to that among people injecting drugs, emphasizing the importance of comprehensive prevention and targeted intervention strategies across diverse substance use profiles. A more inclusive approach

to HIV prevention that acknowledges the unique challenges and risk factors associated with various patterns of drug use is needed to address the needs of these heterogeneous populations.

## THPEC228

**SMASH (Social Media and Sexual Health): a feasible approach to boost pre-exposure prophylaxis (PrEP) awareness among Young Black and Latino men through a sex-positive social media campaign**

T. Gonzalez-Argot<sup>1</sup>, A. Chen<sup>2</sup>, W.J. Nazareth Jr.<sup>3</sup>, L.J. Bauman<sup>1,4</sup>, A.E. Radix<sup>3,2</sup>, J.E. Mantell<sup>5</sup>

<sup>1</sup>Albert Einstein College of Medicine, Bronx, United States, <sup>2</sup>Columbia University, Mailman School of Public Health, New York, United States, <sup>3</sup>Callen-Lorde Community Health Center, Brooklyn, United States, <sup>4</sup>Einstein-Rockefeller-CUNY Center for AIDS Research, New York, United States, <sup>5</sup>Columbia University Irving Medical Center, HIV Center for Clinical and Behavioral Studies at the New York State Psychiatric Institute, Department of Psychiatry, New York, United States

**Background:** Young Black and Latino men who have sex with men (YBLMSM) are disproportionately diagnosed with HIV in the US and underutilize PrEP. We developed a campaign that partnered with six local social media influencers to promote PrEP awareness, knowledge, and utilization to their followers using original sex-positive videos.

**Methods:** Through five virtual focus groups with 22 YBLMSM, we identified social media usage patterns to guide the development (casting, messaging, style, approach) of eight full-length video episodes and 28 short promotional clips. We used 321 Qualtrics surveys to confirm that the videos encouraged PrEP engagement. A dedicated website provided PrEP information, hosted the full-length videos, and facilitated linkage to PrEP providers. Social media influencers (all YBLMSM) disseminated the promotional clips on Instagram with links to the website and engaged followers by responding to comments and fostering discussions about PrEP.

We analyzed campaign engagement and reach based on:

1. Views, likes, comments, and shares on the promotional clips on Instagram,
  2. Website clicks using Google Analytics, and;
  3. Views of the full-length videos using YouTube analytics.
- We conducted a content and sentiment analysis of comments on the Instagram postings.

**Results:** Reach and engagement of the promotional clips during the active campaign (March 6 - April 3, 2023) were reflected in 86,379 views, 7,847 likes, 259 comments, and 241 shares from a potential audience of 117,832 followers. The website attracted 245 visitors (22 clicks seeking PrEP

information, 10 clicks identifying a PrEP-prescribing provider). The full-length videos on the website generated 394 views. Post-campaign (April 4 - July 31, 2023), the website had a notable surge in reach and engagement (2,157 visitors, 27 clicks seeking PrEP information, 27 clicks identifying a PrEP-prescribing provider, 246 views of full-length videos). Reactions to the Instagram postings were overwhelmingly positive (*I love this all of this* 🤍🤍🤍; *#getyourselftested*; *U betta educate em boo*; *All the people who died for love are proud that this is even possible, thank u for advocating* 🤍).

**Conclusions:** This study provides evidence that PrEP social media campaigns can reach and engage YBLMSM and showcased the feasibility and acceptability of this strategy for targeted sexual health promotion.

## THPEC229

**High vertical transmission rate among HIV-exposed infants up to 9 months of age born to newly identified breastfeeding women tested at the Well-Child clinic: results from a pilot in Mozambique**

K. Tibana<sup>1</sup>, C. De Schacht<sup>2</sup>, N. da Conceição Eliseu<sup>1</sup>, A. Couto<sup>1</sup>, C. Lucas<sup>2</sup>, I. Gaspar<sup>1</sup>, G. Amane<sup>3</sup>, F. Uaeca<sup>7</sup>, M. Bravo<sup>2</sup>, O. Niyonkuru<sup>8</sup>, D. Bila<sup>8</sup>, M.G. Lain<sup>8</sup>, M. Urso<sup>9</sup>

<sup>1</sup>Ministry of Health, National Directorate of Public Health, HIV Program, Maputo, Mozambique, <sup>2</sup>Friends in Global Health, Maputo, Mozambique, <sup>3</sup>Ministry of Health, National Directorate of Public Health, HIV program, Maputo, Mozambique, <sup>4</sup>Ministry of Health, National Directorate of Public Health, Maputo, Mozambique, <sup>5</sup>US Centers for Disease Control and Prevention, Division of Global HIV & TB, Maputo, Mozambique, <sup>6</sup>US Centers for Disease Control and Prevention, Division of Global HIV & TB, Atlanta, United States, <sup>7</sup>ICAP at Columbia University, Maputo, Mozambique, <sup>8</sup>Fundação Ariel Glaser contra o SIDA Pediátrico, Maputo, Mozambique, <sup>9</sup>United Nations Populations Fund, Maputo, Mozambique

**Background:** HIV retesting of breastfeeding women (BFW) is key to reducing postpartum HIV vertical transmission. In Mozambique, BFW with unknown/undocumented or negative HIV status are tested quarterly up to 9 months postpartum. As part of a broader performance assessment of a new HIV risk screening tool to optimize testing among BFW, we describe herewith the results of women's HIV positivity and the vertical transmission rate among their infants.

**Methods:** Data were collected from August 2022-November 2023, in 48 health facilities of Cabo Delgado, Nampula, and Zambézia provinces. HIV tests results of women, and follow up data of women with HIV and their newly exposed infants were captured in the REDCap™ platform.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author

Positivity rate was defined as the proportion of BFW with a positive HIV rapid diagnostic test result; vertical transmission rate as the proportion of infants of seroconverted mothers having two positive virologic test results. Descriptive analysis was performed using STATA V.15.

**Results:** A total of 70705 HIV tests were performed, of which 90.2% ( $n=63772$ ) had a documented previous HIV negative test result. From all tests performed, 70297 (99.5%) had a negative, 333 (0.5%) a positive, and 75 (0.1%) indeterminate result. Among the positives, 267 (81%) seroconverted after a documented previous HIV negative test result.

Among exposed infants, 279 (83.8%) were linked to Child-at-Risk Clinic and had a virologic HIV test done, of whom 42 (15.1%) tested positive (Figure). Linkage to care was 93% among BFW ( $n=309$ ) and 98% ( $n=41$ ) among infants.

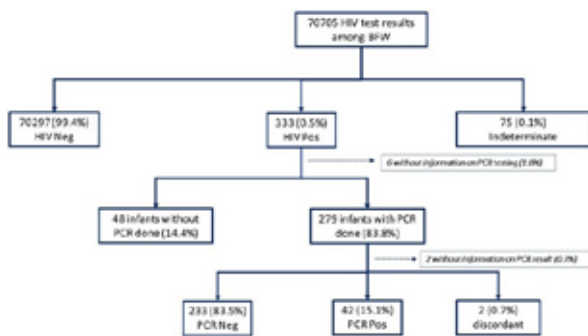

Figure. HIV positivity among retested lactating women, and HIV positivity among tested exposed infants.

**Conclusions:** Despite a relative low proportion of BFW being identified with HIV, the vertical transmission rate among infants up to 9 months of age born to newly-diagnosed women is high.

Results underscore the need for optimized retesting strategies, where a risk screening tool could target on identifying BFW and referral of newly exposed infants as soon as possible.

## THPEC230

Effect of adolescent girls and young women HIV prevention interventions on selected behavioral and biomarker indicators in Uganda

J.K. Matovu<sup>1</sup>, J.B. Bwanika<sup>1</sup>, D. Kasozi<sup>1</sup>, J.B. Ddamulira<sup>1</sup>, I. Murungi<sup>2</sup>, J. Katesi<sup>2</sup>, B. Etukoit<sup>2</sup>, R.K. Wanyenze<sup>1</sup>

<sup>1</sup>Makerere University School of Public Health, Disease Control and Environmental Health, Kampala, Uganda,

<sup>2</sup>The AIDS Support Organization, Kampala, Uganda

**Background:** Despite global reductions in new HIV infections among adolescent girls and young women (AGYW) over the past decade, AGYW continue to be at elevated risk of acquiring HIV.

We assessed the effect of HIV prevention interventions on selected behavioral and biomarker indicators among AGYW aged 10-24 years to inform future scale-up.

**Methods:** We used serial cross-sectional data collected from eight intervention districts and six comparison districts in July 2018 ( $n=8,236$ ) and July 2023 ( $n=5,449$ ). Between 2019 and 2023, AGYW in the intervention districts received skills-based training, enterprise development assistance or educational subsidies, reinforced with social and behavior change communication messages.

We collected data on eight behavioral indicators (sexual debut by age 15; proportion reporting 2+ sexual partners [past 12 months], condom use at last sex, HIV testing uptake [past 12 months], teenage pregnancy, comprehensive HIV knowledge, intimate sexual partner violence and intimate physical partner violence) and obtained blood samples for HIV and syphilis testing.

Exposure to AGYW interventions was defined as participation in or receipt of at least one intervention. Impact was determined using a difference-in-difference approach to determine the net effect of the interventions. Data were analyzed using STATA, version 16.0.

**Results:** In both surveys, half of the AGYW were in school; 60-70% were aged 18-24 years. Overall, intervention coverage increased from 31 to 60% of targeted sub-counties in the intervention districts; however, intervention exposure was moderate (48%,  $n=2,639$ ).

Exposure to the interventions had a marginal effect on almost all (7 of 8) behavioral indicators (net effect: 0.7 to 14%) but weighted HIV prevalence was higher among exposed than unexposed AGYW (1.56% [95%CI: 0.73, 3.34] vs. 0.94% [95%CI: 0.49, 1.78]).

Within the intervention districts, improvements were noted in 3 of 8 behavioral indicators: teenage pregnancy, sexual debut before age 15 and current modern contraceptive use (net effect: 2.0 to 6.8%) but weighted HIV prevalence increased in the intervention and non-intervention districts (by 0.2 to 0.4%).

**Conclusions:** AGYW interventions had a small net effect on the behavioral indicators but did not impact on HIV prevalence.

These findings suggest a need for increased exposure and coverage of AGYW interventions in Uganda.

"If I'm not okay, I won't take the pills": anticipating the effects of depression and PTSD on PrEP use among PrEP naïve pregnant persons in South Africa

A. Stanton<sup>1</sup>, L. Gulbicki<sup>2</sup>, M. Fertig<sup>1</sup>, J. Githaiga<sup>3</sup>, K. Kabel<sup>1</sup>, L. Gwangqa<sup>3</sup>, L. Knight<sup>3</sup>, C. O'Cleirigh<sup>2</sup>, C. Psaros<sup>2</sup>

<sup>1</sup>Boston University, Psychological and Brain Sciences, Boston, United States, <sup>2</sup>Massachusetts General Hospital, Psychiatry, Boston, United States, <sup>3</sup>University of Cape Town, School of Public Health and Family Medicine, Cape Town, South Africa

**Background:** Emerging evidence suggests that mental health (MH) challenges influence uptake of and adherence to PrEP. Risk for HIV acquisition increases during pregnancy and postpartum; therefore, HIV prevention behaviors are particularly important during these periods.

We explored the anticipated impacts of MH on likelihood of PrEP initiation and adherence among pregnant persons (PP) in South Africa, where the HIV prevalence is the highest in the world.

**Methods:** PP completed a survey that investigated MH barriers to PrEP uptake. A subset with likely depression and/or PTSD completed a qualitative interview, which probed MH symptoms and anticipated impacts of symptoms on likelihood of starting and continuing PrEP during pregnancy/postpartum. The data were analyzed via thematic analysis.

**Results:** Twenty-three participants completed 30 interviews (7 were interviewed twice, during pregnancy and post-delivery); on average, they were 25.1 (SD=4.0) years old and had 2.1 (SD=1.0) previous pregnancies. Twelve participants met criteria for probable depression, 2 for PTSD, and 9 for both.

Participants articulated a range of symptoms (e.g., persistent negative emotions, anhedonia, decreased energy/fatigue) that might impact PrEP-related behaviors. Three themes related to anticipated impact of symptoms on likelihood of PrEP uptake and adherence emerged:

1. Intentionally skipping doses due to negative emotions and anhedonia ("I wouldn't take it when stressed because I feel like not doing anything"),
2. Delayed pick up from the clinic/pharmacy due to negative emotions and decreased energy ("I might come late to collect it, maybe I am not feeling alright on that day"), and
3. Forgetfulness due to trauma-related negative emotions ("I am scared and running away from what is happening in this house, so I might forget").

Despite symptoms, some participants anticipated no mental health interference with PrEP use ("I will take it, stressed or not, my stress is controllable").

**Conclusions:** This study offers insights on the ways in which MH symptoms may impact PrEP use during pregnancy and postpartum. Specific strategies that reduce

the impacts of negative emotions, anhedonia, and associated withdrawal/avoidance could help PP who are experiencing symptoms of depression and PTSD uptake and maintain PrEP use during this critical period.

## THPEC232

Empowering futures: the DREAMS program's impact on economic independence and HIV mitigation among adolescent girls and young women in Uganda

J. Ngabirwe<sup>1</sup>, A. Tumusiime<sup>1</sup>, T. Rwegyema<sup>1</sup>, G. Arinaitwe<sup>2</sup>, E. Asiimwe<sup>2</sup>, E. Turesson<sup>3</sup>, T. Hardson<sup>4</sup>, J.N. Akao<sup>4</sup>, M.K. Ssemmanda<sup>1</sup>, D. Bwayo<sup>1</sup>

<sup>1</sup>Uganda URC Project, Department of Defense, Kampala, Uganda, <sup>2</sup>Uganda Peoples Defense Forces (UPDF), Directorate of HIV/AIDS, Kampala, Uganda, <sup>3</sup>University Research Co., LLC, Chave Chase, United States, <sup>4</sup>U.S. Embassy Kampala, Department of Defense, Kampala, Uganda

**Background:** PEPFAR's Determined, Resilient, Empowered, AIDS free, Mentored, and Safe (DREAMS) program was designed to mitigate higher HIV transmission rates among adolescent girls and young women (AGYW) aged 10-24. In many countries, including Uganda, HIV prevalence among young women aged 15-24 years is three times higher (3.3%) than the rate observed in men (0.8%). The DREAMS program offers an evidence-based comprehensive package targeting factors contributing to AGYW vulnerability to HIV: limited economic opportunities, educational barriers, and gender-based violence

**Description:** Two Ugandan military bases, supported by University Research Co., LLC, with funding from the U.S. Department of Defense, enrolled 1,525 AGYW in DREAMS between October 2022 to September 2023 using a peer-led model. Local artisans conducted training on financial literacy and trade skills for a month. AGYW were guided on selecting income generating activities and forming Village Saving and Loan Association (VSLA) groups to create opportunities for income generation. Start-up kits were provided to all AGYW and 57 critically vulnerable AGYW were further provided with vocational skills training as part of the DREAMS package. A qualitative evaluation, conducted two months post-program completion, involved interviews with 289 AGYW using in-depth guides and two focus group discussions. Collected data were transcribed and thematically analyzed using Microsoft Excel to assess the effectiveness and outcomes of economic empowerment initiatives.

**Lessons learned:** Among the 289 AGYW interviewed, 44% (n=127) successfully generated income by acquiring skills in making and selling liquid soap. Seventy-four percent (n=215) initiated small trades, such as retail shops or secondhand clothes, using funds accumulated through VSLA savings. The majority, 87% (n=251), reported achieving a

level of financial independence through the project. Vocational training directly contributed to immediate employment, with four AGYW securing jobs immediately after completing the training.

**Conclusions/Next steps:** The socio-economic strengthening component of the DREAMS program not only fostered entrepreneurial economic opportunities but also led to immediate employment for four AGYW, showcasing the program's ability to increase economic stability and employment for increased family empowerment. These findings stress the importance of programs that address numerous aspects of individuals' lives in order to reduce HIV vulnerability.

## THPEC233

### HIV knowledge, use of HIVST, and PrEP awareness among adolescents in Rwanda

L. Hunter<sup>1</sup>, R. Hémono<sup>1</sup>, T. Bagwaneza<sup>2</sup>, R. Umutohi<sup>2</sup>, N. Mugeni<sup>2</sup>, M. Mugisha<sup>3</sup>, F. Sayinzoga<sup>2</sup>, R. Hope<sup>4</sup>, S. McCoy<sup>1</sup>

<sup>1</sup>University of California, Berkeley, Division of Epidemiology, Berkeley, United States, <sup>2</sup>Youth Development Labs, Rwanda, Kigali, Rwanda, <sup>3</sup>University of Rwanda, Gasabo, Rwanda, <sup>4</sup>Youth Development Labs, Berkeley, United States

**Background:** Ensuring that adolescents have access to highly effective HIV prevention tools is critical to mitigating transmission and achieving UNAIDS' 95-95-95 targets. We assessed HIV knowledge, HIV self-testing (HIVST) use, and awareness of pre-exposure prophylaxis (PrEP) among Rwandan adolescents.

**Methods:** We conducted a cross-sectional analysis of data from a cluster-randomized trial conducted in 60 schools across 8 Rwandan districts. In 2023, 5552 adolescents aged 13-22 years completed in-person surveys on HIV and family planning/reproductive health knowledge and behavior. HIV knowledge was assessed using ten questions on prevention, transmission, and treatment, and calculated as a score (1-10 questions correct);  $\geq 7$  correct answers was classified as 'high' knowledge. Prevalence ratios (PR) and 95% confidence intervals (CI) were estimated using generalized linear models to compare HIV knowledge, HIVST use, PrEP awareness, and interest in using PrEP by sex and sexual activity status.

**Results:** Overall, 71.9% of participants had high HIV knowledge (median score: 7). While more than half (51.6%) had ever tested for HIV and 32.4% had tested in the past year, few participants (1.7%) reported use of HIVST. More sexually active participants had used HIVST than their non-sexually active peers (3.4% vs. 1.1%, PR: 3.01, CI: 2.01-4.53). Most participants (72.3%) had not heard of PrEP. Sexually active participants ( $n=1447$ , 26.6% overall) were significantly more likely to have heard of PrEP (32.4% sexually active vs. 25.9% non-sexually active, PR: 1.23, CI: 1.13-1.35).

After describing PrEP, 53.2% of participants expressed interest in taking it; with more interest from sexually active participants (58.7% sexually active vs. 51.2% non-sexually active, PR: 1.15, CI: 1.09-1.21). There were no significant differences in HIV knowledge, use of HIVST, PrEP awareness, or interest in using PrEP by sex.

**Conclusions:** In one of the largest surveys of Rwandan adolescents to date, we found nearly no use of HIVST and low awareness of PrEP, although many adolescents were interested in using PrEP once informed about it. These findings highlight a need to expand access to HIV prevention products to adolescents who could benefit.

## THPEC234

### "...we are one sided, most boys have not been taught anything": qualitative assessment of the perceived role of boys and young men in the DREAMS program in Zambia

G. Muchanga<sup>1</sup>, K. Stoebebau<sup>2</sup>, C. Maambo<sup>1</sup>, M. Mwale<sup>1</sup>, M. Mwamba<sup>3</sup>, S. Toussaint<sup>2</sup>, A.K. Kashyap<sup>2</sup>, C. Bwalya<sup>2</sup>, C. Baumhart<sup>4,5</sup>, C. Muleya<sup>6</sup>, A. Mwila<sup>6</sup>, C.W. Claassen<sup>1,4,5</sup>

<sup>1</sup>Maryland Global Initiatives Corporation Zambia, Lusaka, Zambia, <sup>2</sup>University of Maryland College Park, College Park, United States, <sup>3</sup>Ciheb Zambia, Lusaka, Zambia, <sup>4</sup>Center for International Health, Education and Biosecurity, University of Maryland, School of Medicine, Baltimore, United States, <sup>5</sup>Institute of Human Virology, University of Maryland School of Medicine, Baltimore, United States, <sup>6</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Lusaka, Zambia

**Background:** Adolescent girls and young women (AGYW) in sub-Saharan Africa countries like Zambia are at high risk of HIV acquisition. The Determined, Resilient, Empowered, AIDS-free, Mentored, and Safe (DREAMS) initiative was developed to mitigate this risk. Combination HIV prevention programs such as DREAMS have demonstrated moderate success in reducing HIV risk among AGYW. However, despite being critical stakeholders, adolescent boys and young men (ABYM) are often left out of such intervention activities, creating an HIV risk knowledge gap between ABYM and AGYW, with implications for program effectiveness. We highlight concerns with omitting ABYM from DREAMS following a qualitative assessment of DREAMS program implementation.

**Methods:** Between April and July 2023, we conducted a three-site qualitative case study assessment of DREAMS in three districts of Zambia. We conducted in-depth interviews and focus groups with program implementers ( $n=51$ ), AGYW beneficiaries and non-beneficiaries aged 16-21 ( $n=66$ ), and interviews with key stakeholders ( $n=6$ ). Gaps in programming to ABYM were addressed by participants, and further incorporating ABYM in DREAMS was a key recommendation. We identified and captured these findings using thematic analysis.

**Results:** There were three sub-themes raised by participants concerning the implications of omitting ABYM from most of the DREAMS programming:

1. ABYM are left with inadequate knowledge on sexual reproductive health and rights (SRH); gender issues, including abuse prevention, and HIV risk behaviours,
2. Perpetuation of gender inequitable relationship norms, and;
3. Concern for ABYM's empowerment and opportunities.

Implementers were the most concerned, but did acknowledge DREAMS ABYM engagement efforts via peer education on SRH, and exposure to some anti-gender-based violence messaging. To safeguard AGYW, implementers suggested providing more comprehensive services to ABYM, including education on SRH, gender issues, and abuse prevention. Some proposed a parallel DREAMS program for ABYM.

**Conclusions:** DREAMS successfully reached large numbers of at-risk AGYW in Zambia with HIV services, demonstrating potential effectiveness and effective implementation. However, implementers suggested that without reaching ABYM, the program benefits to AGYW may remain more muted. They recommended expanding services delivered to ABYM in the community in order to scale-up HIV prevention and elimination, and ultimately create healthier communities in Zambia.

## THPEC235

Missed opportunities for HIV screening and common characteristics among those who screened positive during ED opt-out screening in Philadelphia, PA

D. McBride<sup>1</sup>, N. Aitcheson<sup>1</sup>

<sup>1</sup>University of Pennsylvania, Philadelphia, United States

**Background:** In Philadelphia, the 2022 Surveillance report estimated that there are 18,658 people living with HIV as well as 382 newly diagnosed cases. The ACEP and USPSTF have released guidance to screen routinely in areas where the prevalence of HIV is over 0.1%. Despite this recommendation, screening in the ED setting has remained low. It has been suggested that opt-out ED testing is effective. By examining the characteristics of individuals screening positive in the ED, the hope is to improve outcomes and community health by better screening practices.

**Description:** The study population included 94 people over the age of 18 who tested positive from 2016 – 2022 at three different University of Pennsylvania ED sites. Demographic information, risk factors, linkage to care and the details of the individual's ED visit was examined. Opt-out screening was started at one of the ED sites in 2020 for all people over 15 years old.

**Lessons learned:** An opt-out strategy led to a 400% increase in HIV testing. Of those who tested positive, most were not regularly followed in the primary care setting

and 79.6% had no evidence of seeing a primary care within the last 5 years. Conversely, 49.5% of people had been seen in an ER within 6 months of testing positive. In regards to CD4 counts at ED diagnosis, 20.3% had counts of less than 50 whereas the majority of people had counts between 200-800. Linkage to care for those who tested positive was very successful overall with 61.5% of people making to an appointment with an infectious disease specialist within 2 weeks. At one year, 53.4% were undetectable and 8% had low level viremia.

**Conclusions/Next steps:** The implementation of ED opt-out screening caught a significant number of individuals who may not have been screened otherwise given lack of primary care follow up and traditional risk factors. Linkage to care from the ED setting was very successful and a majority of people are achieving control of their HIV. At least half of this cohort lacked traditional risk factors (MSM, IV drug use) and may not have been screened based on risk alone.

## THPEC236

Programmatic mapping and size estimation of people who inject drugs to plan targeted HIV prevention and harm reduction programs in Iran. A nationwide study

**Background:** The HIV epidemic in Iran has been largely driven by people who inject drugs (PWID). However, despite the implementation of harm reduction services, a

fraction of the PWID remains without access to services. This programmatic mapping aimed to determine the spatial distribution of hotspots of PWID, estimate the number of PWID, the coverage of prevention services and plan the best location placement for maximum coverage of services in Iran.

**Methods:** A cross-sectional key informant-driven mapping and enumeration methodology was used, between August 2020 to March 2021 in 82 selected cities located in 24 provinces in Iran. Data and spatial analysis was done using SPSS and ArcGIS software respectively.

**Results:** We identified a total of 4,270 active hotspots, of which 3,350 were for injecting drug users (78.5%). The estimated total population of PWID was 14,737, comprising 13,593 (92.2%) males, and 1,144 (7.8%) females, with the following age segregation: 261 (1.8%) were <18 years old, 3,643 (24.7%) were 18-29 years old, 10,061 (68.3%) were 30-59 years old, and 775 (5.2%) were >60 years old. This study found widespread drug use in most areas of the country (Figure 1).

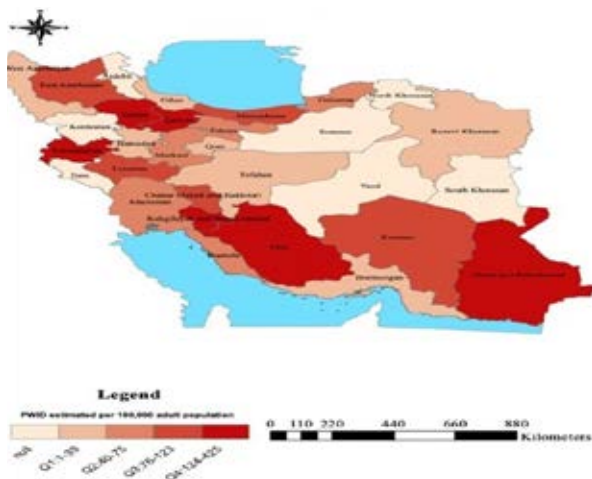

Figure 1.

Only half of the high-risk injection areas have active programs, with 24% service overlap (Fig.2).

Figure 2.

Under resource limitation with a 47% reduction in the centers and a 93% reduction in the independent outreach teams, there will be a 14% decline in services.

**Conclusions:** This study provides valuable insights for optimizing the allocation of limited resources. By targeting these high-impact areas, we can enhance harm reduction efforts in Iran.

## THPEC237

### Factors associated with pre-exposure prophylaxis (PrEP) uptake among female, male and transgender female sex workers in seven provinces in Thailand - a national cross-sectional study

S. Janyam<sup>1</sup>, C. Phaennongyang<sup>1</sup>, S. Sumalu<sup>1</sup>, S. Sukthongsa<sup>1</sup>, A. Somwaeng<sup>1</sup>, C. Manopaiboon<sup>2</sup>, D. Clarke<sup>2</sup>, P. Girault<sup>2</sup>, R. Vannakit<sup>2</sup>

<sup>1</sup>SWING (Service Workers In Group Foundation), Bangrak, Thailand, <sup>2</sup>BIRD (Bangkok Interdisciplinary Research and Development), Phayathai, Thailand

**Background:** Despite Thailand offering free PrEP under Universal Health Coverage since 2019, only 8% of users are sex workers (SW) - males, females, and transgender females (Thailand Ministry of Public Health, 2023). On the basis of these findings, a national PrEP study among SW populations was conducted to investigate PrEP uptake and associated factors.

**Methods:** A cross-sectional study, led by SWING Foundation and BIRD (Bangkok Interdisciplinary Research and Development), was implemented between April and December 2023. The study enrolled Thai male sex workers (MSW), female sex workers (FSW) and transgender female sex workers (TGSW) in hotspots, aged ≥18 years old, HIV-negative, and engaged in sex work in the past three months. To identify factors associated with PrEP uptake, covariates with a p-value <0.20 in the univariable analysis were entered into the full logistic regression model (backward selection). Adjusted odd ratios (AOR) with 95% confidence interval were calculated.

**Results:** A total of 1,511 SW from seven provinces were enrolled: 621(41%) FSW, 452(30%) MSW, and 438(29%) TGSW. FSW were more likely to be older (median age 37 years old) than TGSW (31 years old) and MSW (30 years old). PrEP uptake was low across the SW population (9%). However, TGSW (65 -14.8%) and MSW (63-13.9%) were more likely to report PrEP use than FSW (8-1.3%). In multivariable logistic regression, key factors associated with PrEP uptake (p<0.05) included: metropolitan sites (Bangkok: AOR = 2.34-Pattaya: AOR = 3.67); study populations (MSW: AOR = 8.41-TGSW = 3.81); HIV testing in the last 12 months (AOR = 6.77); sexual violence in the last 12 months (AOR = 2.07); more than 5 clients in the past week (AOR = 2.05); good knowledge of PrEP (AOR = 4.05); and know of peer using PrEP (AOR = 1.76). Reporting any concerns on PrEP was inversely associated with PrEP use (AOR = 0.42).

**Conclusions:** PrEP uptake among SW in studied sites remains low despite free PrEP, reported high-risk behaviors and unsafe work environments. Improving risk awareness, enhancing PrEP knowledge and reinforcing HIV testing are crucial for PrEP scale up among SW. PrEP influencers can be mobilized in support.

## THPEC238

Cascade of care: mother-to-child HIV transmission prevention during COVID-19 pandemic in a reference center in Rio de Janeiro, Brazil

L.H. Santos<sup>1</sup>, G. Faria<sup>1</sup>, V. Vaz<sup>1</sup>, N. Melo<sup>1</sup>, P. Guttman<sup>2</sup>, R.H. de Oliveira<sup>2</sup>, T. Abreu<sup>2</sup>, A.C. Frota<sup>2</sup>, G. Pucarelli<sup>2</sup>, F. Simões<sup>2</sup>, C. Hofer<sup>2</sup>

<sup>1</sup>Universidade Federal do Rio de Janeiro, Infectious Diseases, Rio de Janeiro, Brazil, <sup>2</sup>Instituto de Puericultura e Pediatria Martagão Gesteira, Infectious Diseases, Rio de Janeiro, Brazil

**Background:** In Brazil, the prevention of mother-to-child HIV transmission (PMTCT) program reached several milestones, including several cities already moving towards vertical HIV transmission elimination. In Instituto de Puericultura e Pediatria Martagão Gesteira (IPPMG), reference center for PMTCT in Rio de Janeiro, we observed, since 2020, an increase of 20% of incidence of children living with HIV (HIC).

To understand this increase, we compared the cascade of PMTCT from the HIC born during the COVID-19 pandemic in two cohorts.

**Methods:** We studied two cohorts, both followed up at the IPPMG:

Cohort 1. Comparison between HIC born in the pre pandemic period (HIVPP): 2010 to 2019, and during the pandemic period (DPHIV): 2020-2023.

Cohort 2. Comparisons were performed between children born in the pandemic period, living with HIV (DPHIV) and HIV exposed but not infected (HEU). We used Fisher exact test and Student T-test for the comparisons.

**Results:** Cohort 1: Sixty-four HIC were followed in our Center: 47 HIVPP and 17 DPHIV. Among HIVPP mothers, 25 (61%) had access to antenatal care (Table 1).

Cohort 2: From 2020 to 2023, we followed 177 children: 17 DPHIV and 160 HEU. Three (18%) mothers from DPHIV group and 4 (3%) in HEU group did not have access to antenatal care ( $p<0.01$ ) (Table 1).

**Conclusions:** Comparing the PMTCT cascade of care from HIC born during or before the pandemic, we observed that ARV access improved, as well as neonatal care, since half of PPHIV group were breastfed, and none of the DPHIV. In the cohort 2 comparison, we were able to observe that the access to antenatal care and ARVs during the pandemic period were major determinants of the increased incidence on MTCT in our center.

	DPHIV N=17 (10%)	HEU N=160 (90%)	P-value*	HIVPP N=47 (73%)	P-value**
Antenatal care access	13 (81%)	156 (98%)	0.14	25 (61%)	0.14
Gestational age at Antenatal care initiation (mean)	16	11	0.07	14	0.69
Antiretroviral (ARV) access during pregnancy	8 (53%)	156 (98%)	<0.01	6 (16%)	<0.01
Gestational age at ARV initiation (mean)	21	9	0.01	27	0.44
ARV use during delivery	8 (67%)	67 (56%)	0.49	8 (44%)	0.23
Elective cesarean section	4 (27%)	61 (40%)	0.31	10 (24%)	0.86
Neonate use of ARVs	14 (93%)	132 (96%)	0.68	19 (73%)	0.12
Breastfed	0 (0%)	4 (2%)	0.55	19 (50%)	<0.01

Table 1: Comparison of MTCT Cascade of care between HIVPP, DPHIV and HEU:

\* comparisons between DPHIV and HEU

\*\* comparisons between DPHIV and HIVPP

## THPEC239

Empowering adolescent girls and young women (AGYW): peer-led mobilization for enhanced HIV prevention services in Siaya county, Kenya

W. Otieno<sup>1</sup>, L. Ogutu<sup>1</sup>, H. Ngeso<sup>1</sup>

<sup>1</sup>Catholic Medical Mission Board, Monitoring Evaluation and Learning, Kisumu, Kenya

**Background:** High rates of new HIV acquisition among adolescents and young people, particularly young women, underscore the urgent need for improved access to HIV prevention services and sexual reproductive health knowledge in Kenya. In response, the CMMB, through the Global Fund HIV program, aimed to amplify access and scale up HIV services specifically for adolescent girls and young women (AGYWs) in Siaya County. This study showcases the efficacy of leveraging AGYW peers as peer educators (PEs) to bolster the demand and uptake of HIV-related services among AGYWs.

**Description:** Drawing insights from the program's initial phase (2018-2019), the involvement of AGYW PEs as mobilizers for HIV biomedical and behavioral services emerged as a pivotal lesson. Recognizing that AGYWs congregated in social settings and faced discomfort engaging with community health volunteers (CHVs), the program established a selection criterion and recruited AGYW PEs. These PEs underwent comprehensive training on HIV, gender-based violence, and peer education methodologies, adhering to national guidelines. Their primary task involved sensitizing peers in the community, mobilizing them to access HIV prevention services during community outreaches, and facilitating client flow processes and referrals. Monthly review meetings with the PEs and service

delivery data analysis facilitated comparisons between service access and uptake from 2018/2019 to 2020/2021.

**Lessons learned:** The outcomes in 2020/2021 showcased a remarkable 222.8% surge in access and uptake of HIV prevention services, including a substantial 166.5% increase in access to HIV Testing Services. Screening for additional critical services like STIs, TB, and cervical cancer also notably improved by 93-97%. These findings highlight the potency of AGYWs in strengthening referrals for services among their peers.

**Conclusions/Next steps:** The use of AGYW PEs significantly outperformed CHVs in augmenting the demand and uptake of HIV services among AGYWs, presenting a commendable return on investment. This successful model advocates for further implementation and scale-up to fortify HIV prevention efforts within AGYW communities.

## THPEC240

*PrEP on the Street (PrEP na Rua) in prostitution houses: expanded access to HIV pre-exposure prophylaxis among sex workers in the city of São Paulo*

F. Medeiros Borges Bueno<sup>1</sup>, A. Queiroz da Silva<sup>1</sup>,  
E. Aparecida Sala<sup>1</sup>, M. Aparecida Floriano de Souza<sup>1</sup>,  
C. Aparecida de Paula<sup>1</sup>, M.C. Abbate<sup>1</sup>

<sup>1</sup>Municipal Health Secretariat, STI/AIDS Coordinator of São Paulo city, São Paulo, Brazil

**Background:** Sex workers are one of the population segments with the highest concentration of HIV cases, having an acquisition prevalence of 4.9%. Considering the vulnerability of this population to STIs and Aids, the STI/Aids Coordination of São Paulo instructed and provided support so the Municipal Network Specialized in STI/Aids (RME) could offer pre- (PrEP) and post-exposure (PEP) HIV prophylaxes to prostitution houses through the *PrEP na Rua* project.

The goal was to facilitate access to Rapid Tests (RT) for HIV and syphilis, as well as expand access to PrEP as a form of HIV prevention for women sex workers in São Paulo.

**Description:** From August 2022 to December 2023, 116 testing and prevention activities were carried out in prostitution houses in the city. In all of these activities, PrEP was offered to the workers assisted, along with registration, HIV RTs, point-of-care creatinine exam and distribution of medication on site. In 103 of the activities, syphilis RTs were also carried out. The activities were carried out with reduced teams, of 2 to 4 professionals, aiming to adapt to the environments. The activities were carried out on dates and times planned with the locations, while the businesses were operating or before they opened.

**Lessons learned:** 903 HIV RTs were carried out, with 2 confirmed positive cases, and 720 syphilis RTs, with 88 positive cases, among cisgender women, transexual women and transvestite sex workers. Of the total number of services

provided by the RME in the activities that happened in these professionals' workplaces, approximately 60.5% (547) resulted in the initiation or continuation of the use of PrEP by these women.

**Conclusions/Next steps:** The population assisted showed significant interest in using PrEP as a form of HIV prevention. It became clear that it is necessary to go beyond the conventional care model, in which users go to specialized health units in search of care and prevention. By offering the RME service to this group in their work environment, it is possible to bring sex workers closer to those health services, enabling a comprehensive care for the individual.

## THPEC241

*A cross-sectional assessment of mental health, perceived risks, and actual risks of acquisition of HIV among female sex workers in a Nigerian semi-urban community*

D.O. Ugwu<sup>1,2</sup>, A. Isah<sup>1,2</sup>, J. Onyehalu<sup>1,2</sup>, C. Nwachuya<sup>1,2</sup>,  
B. Eze<sup>1,2</sup>, C. Idabor<sup>1,2</sup>, A. Ugwuja<sup>1,2</sup>, I. Ekwueme<sup>1</sup>, G. Ezenri<sup>1,2</sup>,  
C. Ukwue<sup>1,2</sup>, J. Ugwuani<sup>1</sup>

<sup>1</sup>University of Nigeria, Clinical Pharmacy and Pharmacy Management, Nsukka, Nigeria, <sup>2</sup>University of Nigeria, Person-Centered HIV Research Team, Nsukka, Nigeria

**Background:** Apart from being at a high risk of HIV acquisition, female sex workers (FSW) are exposed to a variety of mental health challenges, especially in low and middle-income countries like Nigeria with a high burden of HIV. This study aimed to assess the mental health status, perceived risks, and actual risks of HIV acquisition among FSWs in Nsukka, Nigeria.

**Methods:** Using a cross-sectional design, a validated 25-item questionnaire was used to seek responses from 98 randomly selected FSW in Nsukka, a sub-urban city in Nigeria. The distribution considered all the clusters of the metropolis where the FSW resided from June-August 2023. While mental health was measured as the presence or absence of depression and anxiety, perceived risk was measured in a 5-likert scale from *extremely unlikely* to *extremely likely*. Appropriate descriptive and inferential statistical analyses were conducted on the collected data using IBM-SPSS (Version-28), with significance level set at  $p < 0.05$ .

**Results:** All the 98 FSW participated in the study: 71(72.5%) of them were aged 19-35 years, with 66(67.3%) identifying as unmarried. Majority of the FSW, [44(44.9%)], reported that they commenced sex work at ages 19-25 years, with 54(55.1%) indicating that they consume psychoactive substances prior to sexual activities. In addition, 54(55.10%) FSW engaged in sex work every day, with 61(62.2%) using condom always. Those that reported being depressed in the last two weeks prior to the study were 44(44.9%); 19(43.18%) FSW experienced depressive symptoms for several days in a week.

FSW that perceived themselves to be at a high risk of acquiring HIV were 87(88.78%), with 61 of such people using condom during their last sexual intercourse ( $p=0.034$ ); 77 had never used pre- or post-exposure prophylaxis ( $p=0.046$ ).

**Conclusions:** There is a high prevalence of depressive symptoms among the FSW in the study area. Majority considered themselves to be at a high risk of HIV acquisition, although more than half of them were not actually at risk, as they reported the frequent use of condom during sex. Health promotional measures such as pre-exposure prophylaxis that would target this category of individuals are hereby recommended, in addition to routine mental health screening.

## THPEC242

Leveraging the strength of stakeholder engagement in increasing uptake for a digital health service for underserved populations in Zambia

N.E. Mulenga<sup>1</sup>

<sup>1</sup>Australian National University, John Curtin School of Medicine, Canberra, Australia

**Background:** Marginalized and underserved populations are one of the recognized drivers of new HIV transmissions in Zambia. The USAID DISCOVER-Health Project, implemented by JSI, is closing the gap by increasing access to healthcare for truck drivers in Zambia, a known underserved population and at risk. These men are often unable to set consistent appointments given the mobile nature of their work, or wait for hours at a busy clinic for drop-in appointments, leading to their health needs not being met.

In 2023, the project launched the Health Hub: *Men on the Move* to provide integrated health services, including HIV prevention and treatment services, to this population through leveraging the strength of stakeholders.

**Description:** The Health Hub is a digital platform for person-centred health service access, supported by mobile health vans that offer service delivery wherever the driver is located while on the move. Between May and June, 2023, the project mapped out the key players, whose buy-in to the Health Hub would prove key to its success. These 120 stakeholders included heads of government departments, the Truckers' Association of Zambia, truck park owners, civic and religious leaders. The project organised in-person and virtual meaningful engagement sessions; addressing concerns and highlighting benefits.

**Lessons learned:** The stakeholder engagements secured their support of the program, and the influence of these trusted and respected figures increased the acceptance and uptake of the Health Hub program by the truck drivers. As a result, between June and November, 2023, 2,575 truck drivers accessed HIV testing services, 2,455 were

linked to PrEP and 23 to ART, 25,885 external condoms were distributed and 216 were seen for general conditions including malaria.

**Conclusions/Next steps:** Thoroughly engaging diverse stakeholders ensured a strong, well-supported program that was tailored to the truck drivers, greatly increasing access to HIV testing, prevention, and treatment services. Stakeholder engagement is an essential step in the successful implementation of new program interventions. Opportunities to expand these lessons to primary health care offerings are promising.

## THPEC243

Optimising access: community-based delivery of PrEP to key populations in 7 districts of Zambia: lessons from the USAID CHEKUP I project

M. Musheke<sup>1</sup>, C. Siame<sup>1</sup>, A. Samona<sup>1</sup>, B. Ngosa<sup>1</sup>, F. Mwape<sup>1</sup>, K. Chiyenu<sup>1</sup>, S. Shebo<sup>1</sup>, M. Zimba<sup>2</sup>, M. Sakala<sup>3</sup>, M. Kabwe<sup>4</sup>, M. Mulenga<sup>5</sup>, C. Kanene<sup>6</sup>, A. Phiri<sup>6</sup>

<sup>1</sup>Centre for Infectious Disease Research in Zambia, Lusaka, Zambia, <sup>2</sup>Key Population Alliance Zambia, Lusaka, Zambia,

<sup>3</sup>Tithandizeni Umoyo Network, Lusaka, Zambia, <sup>4</sup>The Lotus Identity, Lusaka, Zambia, <sup>5</sup>Sustainable Health Advocacy and Dynamic Empowerment Zambia, Solwezi, Zambia,

<sup>6</sup>United States Agency for International Development, Lusaka, Zambia

**Background:** Compared to HIV prevalence in the general population (11%), HIV prevalence among key populations (KP): female sex workers (FSW), gay men and other men who have sex with men (MSM), and transgender persons (TG) is alarmingly high in Zambia. Pre-exposure prophylaxis (PrEP) is efficacious in preventing HIV acquisition among at-risk individuals. We describe the utility of community-based delivery of PrEP to KP and highlight challenges and solutions to PrEP continuation.

**Description:** The USAID-funded Controlling HIV Epidemic for Key and Underserved Populations (CHEKUP) I is implementing a KP HIV prevention, care, and treatment program in 7 districts of Zambia. Community-based KP Wellness Centers linked to government health facilities but managed by key populations civil society organizations (KP CSOs) conduct community mobilization and outreach activities to improve access to PrEP. Clinicians recruited by KP-CSOs provide PrEP in the Wellness Centers and through community outreach. The government health facilities supply the Wellness Centers with HIV testing kits and PrEP drugs whilst government health facilities conduct clinical monitoring of KP on PrEP.

**Lessons learned:** Between December 2021 and September 2023, 25,708 KP - 10108 MSM, 15,182 FSW, 412 TG, and 6 PWID were reached - with 2,959 out of 12,664 (23%) being found to be living with HIV. Out of 9,714 who were not living with HIV, 6,517 (67%) were initiated on PrEP. Overall, PrEP continuation at first refill (at 1 month after PrEP initiation)

stood at 49% (3,165), whilst subsequent PrEP continuation (at 3-month intervals) improved to 62% and 65%, at third and fourth refills, respectively, and then dropped to 44% at fifth refill.

**Conclusions/Next steps:** Community-based delivery of PrEP is crucial in optimizing uptake among hard-to-reach population groups such as KP. However, PrEP continuation fluctuates, often influenced by concerns about stigma, pill burden, and fear of being perceived as already living with HIV. Alternatively, KP opted for other prevention methods such as condoms and lubricants. Therefore, continued efforts to address barriers to PrEP uptake and continuation through sensitization on the benefits of combination HIV prevention, adherence support, KP-peer promoter pairing, and implementation of PrEP support groups are critical to ensure long-term PrEP uptake and continuation.

## THPEC244

Multiple objective adherence measures offer insights into longitudinal changes in PrEP use during pregnancy among South African women who used oral PrEP for HIV prevention during a safer conception study

I. Beesham<sup>1,2</sup>, M. Jaggernath<sup>3</sup>, Y. Kriel<sup>3</sup>, J. Hao<sup>2</sup>, P.M. Smith<sup>2</sup>, J.E. Haberer<sup>4</sup>, C.W. Hendrix<sup>5</sup>, C. Psaros<sup>6</sup>, D.R. Bangsberg<sup>7</sup>, J.A. Smit<sup>3</sup>, L.T. Matthews<sup>2</sup>

<sup>1</sup>Africa Health Research Institute, Mtubatuba, South Africa, <sup>2</sup>University of Alabama at Birmingham, Division of Infectious Diseases, Birmingham, United States, <sup>3</sup>Wits Maternal Adolescent and Child Health Research Unit (WMRU), Durban, South Africa, <sup>4</sup>Harvard Medical School, Department of Medicine, Boston, United States, <sup>5</sup>Johns Hopkins University, Department of Medicine (Clinical Pharmacology), Baltimore, United States, <sup>6</sup>Massachusetts General Hospital, Department of Psychiatry, Boston, United States, <sup>7</sup>Vin University College of Health Sciences, Hanoi, Viet Nam

**Background:** Oral HIV PrEP is safe and recommended for pregnant women vulnerable to HIV. However, PrEP adherence can be challenging. Longitudinal data on drug concentrations, coupled with electronic monitoring of daily dosing (pillcap), among women prior to and during pregnancy are limited.

**Methods:** We conducted a safer conception trial from 2017-2021 to evaluate how the HealthyFamilies PrEP intervention could support PrEP use among women aged 18-35 planning for and with pregnancy in Durban, South Africa. This secondary analysis is restricted to enrolled women who used PrEP, had a pregnancy, and a live birth (n=24). PrEP adherence was assessed using plasma tenofovir (TFV), tenofovir diphosphate (TFV-DP) in dried blood spots (DBS), and electronic pillcaps at quarterly follow-up. Plasma TFV $\leq$ 10ng/mL and TFV-DP $\leq$ 16.6fmol/punch were below detectable limits. Data were analysed descriptive-

ly. Pre-pregnancy refers to the quarter prior to pregnancy, and pregnancy was divided into trimesters.

**Results:** Among 24 women, 63% were aged 18-24 years, 38% were nulliparous, and most (92%) did not know their partner's HIV-serostatus. Median pillcap adherence among 23 women ranged from 57% to 72% and was highest pre-pregnancy (72%, IQR:54%-85%) and during trimester 3 (72%, IQR:30%-94%). Among 22 women, median TFV concentrations were 50.7ng/ml, 10.0ng/ml, 10.0ng/ml and 10.0ng/ml and TFV-DP were 74.0fmol/punch, 38.2fmol/punch, 16.6fmol/punch and 16.6fmol/punch, respectively, during pre-pregnancy, trimesters 1, 2 and 3 (Sample availability per timepoint available in table). Fifty seven percent and 62% of women had detectable concentrations of TFV and TFV-DP pre-pregnancy; however, this declined to 15% of women in trimester 3. Among three women with consistent adherence to >80% of doses by pillcap, one sustained detectable concentrations of TFV and TFV-DP.

Adherence measure#	Pre-pregnancy	Trimester 1	Trimester 2	Trimester 3
Median % of days pillcap opened and IQR	72 (54-85)	57 (22-72)	61 (16-95)	72 (30-94)
Median TFV (ng/ml) and IQR	50.7 (10.0-68.7)	10.0 (10.0-46.6)	10.0 (10.0-10.0)	10.0 (10.0-10.0)
Median TFV-DP (fmol/punch) and IQR	74.0 (56.9-303.0)	38.2 (16.6-99.8)	16.6 (16.6-16.6)	16.6 (16.6-16.6)
% with detectable TFV (>10ng/ml)	57	38	18	15
% with detectable TFV-DP (>16.6fmol/punch)	62	40	19	15

#MEMS data were available for 14, 19, 16 and 11 women during pre-pregnancy, trimester 1, trimester 2 and trimester 3 respectively. Plasma TFV samples available for 14, 21, 17 and 13 and TFV-DP for 13, 20, 16 and 13 women, during pre-pregnancy, trimester 1, trimester 2 and trimester 3 respectively.

**Conclusions:** TFV and TFV-DP concentrations declined during pregnancy with some discrepancies between pillcap measurements and drug concentrations. Physiologic changes during pregnancy and/or behavioural factors such as non-pill ingestion, could contribute to differences in measurement. Gaps exist in determining drug concentrations needed to confer protection to optimize counseling and prevention support.

### Indication for the use of PrEP among middle-aged and older adults in South Africa

M. Marcus<sup>1</sup>, E. Zhang<sup>2</sup>, H. Jones<sup>2</sup>, N. Mahlalela<sup>3</sup>, J. Rohr<sup>4</sup>,  
T. Bärnighausen<sup>5</sup>, J. Manne-Goehler<sup>1</sup>, K. Kahn<sup>3</sup>

<sup>1</sup>Harvard Medical School, Boston, United States, <sup>2</sup>Brigham and Women's Hospital, Boston, United States, <sup>3</sup>University of the Witwatersrand, Johannesburg, South Africa, <sup>4</sup>Harvard Center for Population and Development Studies, Boston, United States, <sup>5</sup>University of Heidelberg, Heidelberg, Germany

**Background:** Pre-exposure prophylaxis (PrEP) is one of the most significant breakthroughs in HIV prevention; however, its uptake in South Africa is limited and 200,000+ people acquire HIV every year. A significant proportion of infections are occurring in middle-aged adults. The objective of this study was to assess PrEP indication among middle-aged and older South Africans.

**Methods:** We estimate PrEP indication in a sample of 40+ year-old, rural South Africans, using Wave 1 and 2 survey data from the community-based cohort "Health and Aging in Africa: A Longitudinal Study in South Africa (HAALSI)". We first identify potential PrEP eligibility based on a negative HIV status and a body weight of 35+ kg. Within this sample, we define the group with an indication for PrEP based on a recent self-reported history of having had sex without a condom, as per *South African Guidelines for the Provision of PrEP to Persons at Substantial Risk of HIV Infection*. We estimate PrEP indication within and across both survey waves, overall and disaggregated by sex and age.

**Results:** Of the 2,096 individuals potentially eligible for PrEP in Wave 2, PrEP indication was 44% (95% CI: 42 - 46) overall, 61% (CI: 58 - 65) in men, and 29% (CI: 27 - 32) in women. By age group, PrEP indication ranged from 69% (CI: 62 - 75) for 40-49 year-olds to 27% (CI: 24 - 30) for those aged 70+. We found that 40% (CI: 38 - 42) were PrEP indicated in both waves and 21% (CI: 20 - 23) in one wave. Further, being male, younger, and married were significantly associated with higher odds of PrEP indication.

Figure 1. Indication for PrEP Use. Among all PrEP eligible HAALSI Wave 2 respondents (HIV negative and 35+kg). Sampling weights applied.

**Conclusions:** We find high rates of PrEP indication among middle-aged and older South Africans – calling for greater attention to be placed on HIV prevention and PrEP targeted specifically towards these age groups.

## THPEC246

### Missed opportunities for HIV and STI prevention among positive Mpox cases in Puerto Rico

E. Santiago-Rodríguez<sup>1</sup>, M.A. Rodríguez Cancel<sup>1</sup>,  
G.M. Carrasquillo- Sánchez<sup>1</sup>, I.M. Otero Cruz<sup>1</sup>,  
L.A. Arroyo- Andújar<sup>1</sup>

<sup>1</sup>University of Puerto Rico, Medical Sciences Campus, School of Public Health, San Juan, Puerto Rico

**Background:** A multi-country outbreak of Mpox (monkeypox) was declared in 2022-2023. Puerto Rico (PR) has documented a total of 211 Mpox cases. Although all populations are at risk for Mpox, most cases were among men who have sex with men (MSM)—a group already disproportionately affected by HIV in PR. During the outbreak, it was evident that the main route of transmission was through close contact, either through sexual activity or direct contact with the virus through saliva or seminal fluid. It presented an opportunity for HIV/STI prevention. We aimed to characterize the experiences of Mpox diagnosis and HIV prevention efforts among individuals diagnosed with PR.

**Methods:** An exploratory qualitative study was conducted with 30 of the confirmed Mpox cases in PR. The semi-structured interview guide addressed sociodemographic characteristics, Mpox knowledge, risk perception, HIV and STI history and engagement in preventive care. Audio files were transcribed and organized in Dedoose for thematic analysis.

**Results:** All (n=30) participants were male, 83% (n=25) identified as gay, and 70% (n=21) had a bachelor's degree or more. Around 66.7% (n=20) had private insurance, and 76.7% (n=23) worked full-time. Participants included people living with HIV and people with a negative or unknown HIV status. Several participants mentioned not receiving a referral for HIV/STI testing: "I was not referred to any [HIV/STI testing] by them [clinic]." Another participant responded: "What are STIs?" when asked if referred to further testing. Another participant shared: "Yes [for HIV/STI test referral] but not because of Mpox. I do it regularly because I use PrEP". Additionally, an HIV-positive person mentioned not being advised on the potential impacts of Mpox on HIV treatment. At the same time, a participant with HIV was told that he did not need to get vaccinated [for Mpox] because he already had the antibodies and did receive other STI test referrals.

**Conclusions:** Individuals with an Mpox diagnosis and not referred to HIV or STI testing represent missed opportunities for HIV/STI prevention. To avoid missed opportuni-

ties for those already accessing care, prevention efforts should include strategies to recognize at risk populations rapidly and engage them in prevention or treatment services.

## HIV testing

Detecting and linking HIV cases among first-time testers using HIV self-testing approach: lessons learned from the STAR Initiative in Cameroon

E.G. Jeremiah<sup>1</sup>, B. Yagai<sup>2</sup>, D.D. Audrey Raissa<sup>2</sup>, M.N. Fatima<sup>3</sup>, A.D. Nka<sup>1</sup>, J. Fokam<sup>1</sup>, T. Gutenberg<sup>4</sup>, A. Socpa<sup>5</sup>, A.A. Rogers<sup>2</sup>, E. Marie Jose<sup>5</sup>, B. Serge Clotaire<sup>5</sup>, H.H. Cherif<sup>2</sup>

<sup>1</sup>Chantal BIYA International Reference Centre for Research on HIV/AIDS Prevention and Management, (CIRCB), Yaounde, Cameroon, <sup>2</sup>Central Technical Group, National AIDS Control Committee, Yaounde, Cameroon, <sup>3</sup>Division of Health Operational Research, Ministry of Public Health, Yaounde, Cameroon, <sup>4</sup>Association Camerounaise pour le Marketing Social (ACMS), Yaounde, Cameroon, <sup>5</sup>University of Yaounde 1, Yaounde, Cameroon

**Background:** The 2023 UNAIDS report indicates that only 86% of people living with HIV/AIDS (PLWHA) know their status; thus, new testing strategies are required to cover the gap. We characterized the profile of HIV first-time testers (FTs) and determined the HIV seropositivity rate using oral HIV self-testing, its effectiveness, and linkage to treatment.

**Methods:** A cross-sectional study was conducted in three regions of Cameroon from April 2021 to August 2022. Oral HIV self-testing kits were distributed using primary and secondary distribution types. The distribution models used were:

- Antenatal care/maternal and child health clinic/postnatal clinic (ANC/MCH/PNC),
- Partners of PLWHA;
- Workplace;
- Community;
- Other health facility-based testing (HTS).

**Results:** A total of 6032 FTs were enrolled; 69.9% were males. Self-testing kits were mainly distributed using primary distribution type (78.1%). Majority of FTs were in the community distribution model (69.6%). About 82% of them were <30 years (<20 years: 26.5%, 20-29 years: 55.7%). Concerning the self-testing result, 97.1%, 2.3%, and 0.6% were respectively non-reactive, reactive, and indeterminate/invalid. Compared to those aged <30 years, reactivity rate was higher among those ≥30 years (1.2% versus 7.0%,  $p<0.001$ ). According to distribution models, reactive test was highest among partners of PLWHA (21.4%), followed

by HTS (5.1%),  $p<0.001$ . Of all the reactive tests ( $n=137$ ), 70.1% came for HIV confirmation following the national algorithm; 54% ( $n=74$ ) of them were confirmed HIV positive. The overall HIV seropositivity rate following national algorithm was 1.2%. In the multivariate model, compared to primary distribution type, secondary distribution type positively predicted HIV seropositivity (aOR [95% CI]: 20.387 [2.473-168.033]).

Also, compared to ANC/MCH/PNC model, seropositivity was positively predicted by partners of PLWHA model (aOR [95% CI]: 15.635 [8.557-28.568]) and workplace model (8.838 [1.206-64.774]).

**Conclusions:** About 7/10 and 8/10 HIV FTs were respectively males and individuals <30 years. HIV seropositivity among FTs was positively predicted by secondary distribution type; and partners of PLWHA and workplace distribution models. Oral HIV-self testing is an effective approach to detect HIV acquisition among FTs and link them to treatment.

### THPEC248

The family approach to reaching children living with HIV: the home-based screening strategy developed by the Bokk Yakaar association in rural Senegal

I. Ba<sup>1</sup>, M. Ka<sup>1</sup>, O. Ndiaye<sup>1</sup>, M. Ndiaye<sup>1</sup>, K. Sarr<sup>2</sup>, E. Senghor<sup>3</sup>

<sup>1</sup>Bokk Yakaar, Fatick, Senegal, <sup>2</sup>District Sanitaire Sokone, Sokone, Senegal, <sup>3</sup>District Sanitaire Gossas, Gossas, Senegal

**Background:** Pediatric care in Senegal is facing difficulties. In 2022, the care cascade for children living with HIV was 43x41x32, far from the targets set in the 90-90-90 period. In Fatick, central Senegal, the Bokk Yakaar association uses the family approach to screen children, monitor them and support them in achieving an undetectable viral load.

PLWHAs say that the lack of means to move children to health centers and the risks of breaching confidentiality are the main reasons for the timidity of screening. Bokk Yakaar is trying to answer these two (02) questions: how can children born to HIV-positive mothers be screened without breaching confidentiality? How can we boost the cascade of children at regional level?

**Description:** To develop its strategy, Bokk Yakaar has set up a system to reassure parents.

Bokk Yakaar invites them to discussion groups on the subject of screening children.

Together with laboratories, the association trains its health mediators in the use of rapid tests. In this way, the mediators tour the villages of PLWHA families and screen the children in complete confidentiality.

Positive tests are sent to the districts for confirmation. The association provides mothers whose tests are reactive with transport to the districts to take their children.

Confirmed positive children are put on ARVs and integrated into a care program.

**Lessons learned:** For 2022, the association organized 8 outings, with 3 to 4 villages per outing. These screenings reached 94 children, including 45 girls and 49 boys. Nine HIV-positive children (5 boys and 4 girls) were identified and put on treatment.

The home testing strategy was effective, given the parents' support.

Thanks to the parents' preparation, there was no breach of confidentiality during outings.

With the follow-up, the association supports 97 children living with HIV. As a result of this follow-up, 68% of the children monitored had a positive HIV test result.

**Conclusions/Next steps:** The family screening strategy and the family approach remain an effective solution. These strategies compensate for the lack of means to move children and are adapted to the management of confidentiality and the weight of stigmatization, which is very high in rural areas.

## THPEC249

### Effective case finding experience from Thailand's national index partner testing program, 2019-2023

J. Danyuttapolchai<sup>1</sup>, S. Jiamsiri<sup>2</sup>, P. Prommal<sup>2</sup>, S. Ongwandee<sup>3</sup>, Y. Srikanjan<sup>2</sup>, K. Lerdtriphop<sup>4</sup>, A. Kanphukiew<sup>1</sup>, S. Ruengchai<sup>2</sup>, J. Favaloro<sup>5</sup>, S. Northbrook<sup>1</sup>, C. Lertpiriyasawat<sup>2</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Nonthaburi, Thailand, <sup>2</sup>Ministry of Public Health, Division of AIDS and STIs, Nonthaburi, Thailand, <sup>3</sup>Ministry of Public Health, Department of Disease Control, Nonthaburi, Thailand, <sup>4</sup>Bangkok Metropolitan Administration, Health Department, Bangkok, Thailand, <sup>5</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States

**Background:** To achieve the first 95 target, the Thailand Ministry of Public Health (MOPH) has implemented Index Partner Testing (IPT) since 2019. We report results of this strategy implemented nationwide from October 2019 to September 2023.

**Description:** MOPH trained health care providers (HCP) and PLHIV network staff to offer IPT to eligible clients seeking services at any of the 107 participating government health facilities in 34 provinces. Eligibility criteria included ≥1 years of age, newly diagnosed PLHIV, PLHIV with unsuppressed viral load, and any PLHIV reporting new partners. Contacts included sexual or injecting drug partners within the past year, and biological children or mothers if child was the index client (IC). HCP offered four referral methods for contact testing: client referral, provider referral, dual referral, or contract referral. Results were recorded in the national electronic monitoring program and summarized using SAS.

**Lessons learned:** Of 19,501 PLHIV offered IPT, 65.4% (12,770/19,501) were eligible and willing to provide contact information. Main reasons for refusal included having no contact information (42.2%) and feeling uncomfortable in sharing (19.4%). Known HIV-positive contacts were excluded from index testing (n= 1,418).

Average index to contact ratio remained constant throughout the years at 1:1. Of 9,190 contacts elicited, 6,358 (69.1%) tested for HIV with a 25.2% (1,607/6,358) HIV-positivity yield.

Of 6,358 IC who selected a referral method for contact testing, client referral (60.7%; 3,862/6,358) was the most popular method, followed by provider referral (22.3%, 1,420/6,358) and dual referral (15.4%, 981/6,358).

Median baseline CD4 among contacts increased from 318 cells/mm<sup>3</sup> in 2020 to 352 cells/mm<sup>3</sup> in 2023. Linkage to ARV services among contacts was 88.2% (1,418/1,607) overall and 91.6% (394/430) in Bangkok. Of HIV-negative contacts, 23.9% (1,135/4,751) started PrEP.

**Conclusions/Next steps:** IPT identified a 2.7-fold increase in HIV-positivity among contacts and a higher median baseline CD4, suggesting that HIV-positive individuals were identified earlier in their course of infection. Additional strategies to improve linkage to PrEP services are urgently needed to prevent onward HIV transmission. Continued efforts to address barriers to IPT services (i.e., improve provider's skill, introduce HIV self-testing) will increase effectiveness of this case finding method.

## THPEC250

### Reaching adolescents and young people: use of HIV self-test kits as an alternate approach to HIV case finding in the South-South region of Nigeria

C. Nwangeneh<sup>1</sup>, E. Nwanja<sup>2</sup>, O. Oghenezuazo<sup>2</sup>, E. Ugobo<sup>3</sup>, O. Toyo<sup>2</sup>, D. Carpenter<sup>4</sup>, G. Etheredge<sup>4</sup>, N. Persaud<sup>4</sup>, D. Ogundehin<sup>5</sup>, E. James<sup>5</sup>, O. Onyedinachi<sup>2</sup>, A. Adegboye<sup>2</sup>, V. Ogbodo<sup>1</sup>, A. Eyo<sup>2</sup>

<sup>1</sup>FHI360, Abuja, Nigeria, <sup>2</sup>Excellence Community Education Welfare Scheme, Uyo, Nigeria, <sup>3</sup>Achieving Health Nigeria Initiative, Abuja, Nigeria, <sup>4</sup>FHI360, Washington DC, United States, <sup>5</sup>USAID, Abuja, Nigeria

**Background:** HIV self-testing (HIVST) is a proven opportunity for adolescents and young people (AYP) to know their HIV status. The U.S. President's Emergency Plan for AIDS Relief (PEPFAR), through the United States Agency for International Development (USAID)-funded Accelerating Control of HIV Epidemic projects, supported distribution of HIVST kits among AYP, in addition to conventional HIV rapid test kits (RTKs). We compared the positivity and linkage rates between HIVST and RTK modalities among AYP in Southern Nigeria.

**Methods:** This retrospective study used program data extracted from the District Health Information System for AYP (10-24 years) tested for HIV using HIVST and RTKs

between August 2022 and September 2023 in 153 health facilities in Akwa Ibom and Cross River states, Nigeria. Adolescent peer supporters distributed HIVST kits directly to their peers. All positive HIVST results were confirmed using RTKs, per national guidelines. Sex, testing outcome, and linkage to treatment of the two modalities were abstracted.

Outcomes assessed included proportion of clients diagnosed positive (positivity rate), positive concordance rate for HIVST with RTK, and linkage rates for the testing modalities. Paired t-test was used to compare the concordance rate, and chi-square the linkage rates between HIVST and RTKs. P values <0.05 were considered significant.

**Results:** Overall, 23,441 HIVST kits were distributed to AYP, and 86 (69 female, 17 male) tested positive, while 274,107 were tested with RTKs, and 2,452 (2,049 female, 403 male) tested positive. The positivity rate was lower for HIVST (0.4%) than for RTK (0.9%). Of the 86 AYP that screened positive through HIVST, a confirmatory RTK test demonstrated a positive concordance rate of 97.7% (84/86) (t=0.45; p=0.66).

	Number of AYP reached for HIV testing		Number of AYP tested positive		Positivity rate (%)		Number linked to treatment		Linkage rate (%)	
	HIVST	RTK	HIVST	RTK	HIVST	RTK	HIVST	RTK	HIVST	RTK
Female	12,232	174,611	69	2,049	0.6%	1.2%	67	2,023	97.1%	98.7%
Male	11,209	99,496	17	403	0.2%	0.4%	17	399	100.0%	99.0%
Total	23,441	274,107	86	2,452	0.4%	0.9%	84	2,422	97.7%	98.8%

Table 1. Comparison of positivity and linkage rates for the two HIV testing modalities

AYP diagnosed using RTK had better linkage rate than those diagnosed via HIVST (98.8% vs 97.7%) [ $\chi^2=0.02$ , p-value=0.89].

**Conclusions:** The conventional testing to AYP case finding proved to be a more efficient approach than HIVST, though the latter is a viable alternate option to improve reach.

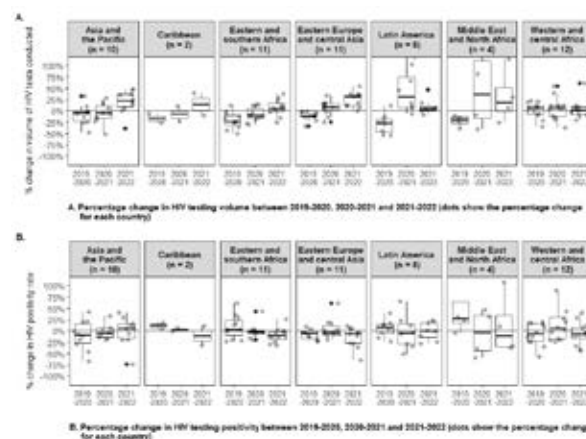

## THPEC251

### Regional variations in HIV testing volume and positivity between 2019-2022: analyses of Global AIDS Monitoring data

O. Edun<sup>1</sup>, M. Barr-DiChiara<sup>2</sup>, C. Lastrucci<sup>2</sup>, B. Msimanga<sup>2</sup>, C. Johnson<sup>2</sup>, M.S. Jamil<sup>3</sup>, M. Beusenbergh<sup>2</sup>, S. Dalal<sup>2</sup>, E.L. Korenromp<sup>4</sup>, M. Mahy<sup>4</sup>, J.W. Imai-Eaton<sup>1,5</sup>, R. Baggaley<sup>2</sup>  
<sup>1</sup>Imperial College London, MRC Centre for Global Infectious Disease Analysis, London, United Kingdom, <sup>2</sup>World Health Organization, HIV, Hepatitis and STI Department, Geneva, Switzerland, <sup>3</sup>World Health Organization, Division of Communicable Disease Control, Regional Office for the Eastern Mediterranean, Cairo, Egypt, <sup>4</sup>Joint United Nations Programme on HIV/AIDS, Data for Impact Department, Geneva, Switzerland, <sup>5</sup>Harvard University, T.H. Chan School of Public Health, Boston, United States

**Background:** Many countries reported decreased HIV testing volumes and HIV diagnoses in 2020, coinciding with restrictions during the coronavirus (COVID-19) pandemic. It is unclear whether these diagnoses reflect less testing or fewer HIV acquisitions due to COVID-19 related restrictions. We assessed country-level changes in HIV testing volumes, positive tests and test positivity rates between 2019-2022.

**Methods:** We analysed data on the number of HIV tests conducted, HIV-positive tests reported (including retests) and proportion of tests with a positive result (test positivity rate) (2019-2022), reported by 58 countries spanning seven UNAIDS regions through Global AIDS Monitoring. Percentage change in HIV testing volumes and HIV-positivity rate for consecutive years between 2019-2022 were calculated within countries and compared across regions. We also examined the relationship between changes in testing volumes and HIV-positivity rate between 2019-2022.

**Results:** Between 2019-2020, across 58 countries, HIV testing volume reduced by a median of 11.5% (interquartile range: -1.2%, -25.5%) and in all regions except in West and central Africa. Between 2019-2020 HIV positivity was unchanged (relative median: -1.1%; IQR: -17.9, +17.7). Testing volumes increased marginally between 2020-2021 (+6.1%;

Late-breaker abstracts

Author Index

-12.8%, +15.5%) but remained below 2019 levels. In countries where testing volumes reduced in 2020 but increased in 2021 (n=27), HIV-positivity reduced slightly (-6.4%; -17.7%, +2.7%). Between 2021-2022, testing volumes increased (+8.8%; +0.5%, +33.2%) to above 2019 levels and testing positivity rates remained relatively unchanged (-5.0%; -24.6%, +8.8%).

**Conclusions:** HIV testing volumes generally recovered following reductions in 2020 and surpassed pre-2020 levels in all regions where decreases were reported. HIV positivity remained relatively constant following increases in testing volumes, suggesting that HIV acquisitions not diagnosed in 2020 may have been diagnosed in 2021-2022. Efforts should be intensified in countries where testing reduced to identify individuals living with HIV who may have been missed.

## THPEC252

High acceptability and linkage to public HIV centers after using an oral HIV self-test among transgender women in Lima, Peru

R.A. Errea<sup>1</sup>, E. Gonzales<sup>1</sup>, C. Rodriguez<sup>1</sup>, L. Ramos<sup>2</sup>, M.A. Tovar<sup>2</sup>, L. Lecca<sup>2</sup>, J. Peinado<sup>2</sup>

<sup>1</sup>Socios En Salud Sucursal Peru, HIV Program, Lima, Peru,

<sup>2</sup>Socios En Salud Sucursal Peru, Lima, Peru

**Background:** In Peru, around 20,000 people with HIV are unaware of their diagnosis. To reduce the diagnostic gap, the complementary use of HIV self-testing is globally recommended, especially in high-risk communities such as transgender women (TW). In Peru, studies have shown optimal acceptability of the hypothetical use of HIV oral self-testing but raised concerns about willingness to be linked to a healthcare facility to continue the HIV care process. We evaluated the acceptability of an oral HIV rapid self-test (second-generation) after its use and the percentage of participants with a positive result linked to a public HIV center for a second rapid test (fourth-generation) as confirmatory testing, among TW in Lima-Peru.

**Methods:** From March-2022 to April-2023, TW were recruited using a prior study database, through peer referrals, or from areas with high concentration of TW (i.e., sex work venues). Demographic information was collected and an oral HIV self-test kit with instructions was provided upon enrollment. Participants were contacted every 48-72h to annotate if they had used the test or refused to use it. Participants sent via WhatsApp a picture of their test result and completed a post-test acceptability questionnaire. TW with a positive result were scheduled an appointment to an HIV center to get the second rapid test, and were followed up to confirm attendance, for rescheduling, or to annotate attendance denial.

**Results:** After excluding two participants who lost their kits, 169 TW were included in the analysis: mean age (32.7 ± 8.2), 66% were sex workers, and 47% had unprotected

sex in the last 6 months. Acceptability variables showed that: 100% used the test, 100% considered it to be easy/very easy to use, 84% trusted the test result, 88% preferred a self-test over non-self-tests, 89% preferred oral self-tests over capillary-blood self-tests, and 85% were willing to perform again an oral self-test if available for free. Seven TW had a positive result and were referred to an HIV center; 100% completed the second testing (positive=6, negative=1).

**Conclusions:** Acceptability of oral HIV self-testing and linkage to public HIV centers were high in this high-risk community. Oral HIV self-testing is appropriate for this TW in Lima, Peru.

## THPEC253

Improving HIV case finding for people living with HIV in South-Eastern Nigeria through the use of spatial data infrastructures

M. Gbuchie<sup>1,2</sup>, B. Ukoaka<sup>1</sup>, K. Ukuoku<sup>1</sup>, E. Ugwuanyi<sup>1</sup>, K. Ajah<sup>1</sup>, F. Daniel<sup>1</sup>

<sup>1</sup>Achieving Health Nigeria Initiative, Prevention, Care and Treatment, Awka, Nigeria, <sup>2</sup>Act4Her Health Initiative, Sexual and Reproductive Health Research, Yenagoa, Nigeria

**Background:** HIV prevalence in Nigeria stands at 2.1% among adults aged 15-49 years. This is partly attributed to challenges in accessing people living with HIV (PLHIV) in geographically isolated regions. Spatial Data Infrastructures are one of the numerous innovations showing promising advancements towards upscaling HIV case identification in unidentified settlements.

The study utilized SDI to understand spatial distribution of HIV cases. By mapping endemic areas, HIV cases were compared between January and July 2023 (when SDI was not used) and between August and November 2023 (when SDI was used).

**Methods:** The study was conducted in Anambra North, South-eastern Nigeria. We utilized SDI, including microplans and local lists of towns, to locate settlements where HTS had not been previously offered. Microplans, developed based on settlement data were used to facilitate settlement coverage. Hotspot maps were created from the HTS geolocation data of testers captured on the Kobocollect App by processing the same data with Kernel Density Estimation. The analysis assisted teams identify areas with a high prevalence of HIV in places where HTS was offered. Data from kobocollect were overlayed on settlement boundaries to determine settlement coverage within the district.

**Results:** Our study showed varying trends across both periods - when SDI tools were utilized and when they were not used - across the various LGAs (Figure 1). Overall, the period when SDI was used recorded relatively higher case identifications than the period prior.

**Conclusions:** The use of SDI tools to facilitate new case identification in the district yielded commendable results. Our analysis revealed twice as many cases identified across the periods compared. This is the first reported study on the use of SDI for HIV case finding in Anambra State and Nigeria. Replicating similar strategies across other states with increased HIV prevalence holds better promise for timely intervention to PLHIV in yet-to-be-identified locations.

## THPEC254

### Impact of alcohol drinking venue characteristics on yield of HIV status-neutral testing in rural East Africa

J. Litunya<sup>1</sup>, B. Beesiga<sup>2</sup>, J.Z. Nakato<sup>3</sup>, J. Mwango<sup>1</sup>, K. Marson<sup>4</sup>, W.E. Mugoma<sup>1</sup>, J. Temple<sup>4</sup>, C.S. Camlin<sup>4</sup>, S.B. Shade<sup>4</sup>, J.A. Hahn<sup>4</sup>, E. Kakande<sup>2</sup>, J. Kabami<sup>2</sup>, M.L. Petersen<sup>3</sup>, D.V. Havlir<sup>4</sup>, M.R. Kamya<sup>2,5</sup>, L.B. Balzer<sup>3</sup>, J. Ayieko<sup>1</sup>, G. Chamie<sup>4</sup>

<sup>1</sup>Kenya Medical Research Institute (KEMRI), Kisumu, Kenya,

<sup>2</sup>Infectious Diseases Research Institute (IDRC), Mbarara, Uganda, <sup>3</sup>University of California, Berkeley, Berkeley, United States, <sup>4</sup>University of California, San Francisco, San Francisco, United States, <sup>5</sup>Makerere University, Kampala, Uganda

**Background:** Drinking venues are high-risk sites for HIV transmission in East Africa. Understanding how venue characteristics impact HIV status-neutral testing yield may guide targeted venue outreach.

**Methods:** We mapped all drinking venues (N=506) in eight rural communities (~10,000 persons each) in Kenya (N=4) and Uganda (N=4), in an ongoing cluster randomized trial of mobilization strategies to promote biomedical HIV prevention uptake. We characterized venues enrolled (N=503 [99%]) and distributed recruitment cards (day and night) inviting patrons and workers ≥18 years for free, clinic-based, status-neutral HIV testing, prevention, and treatment at nearby health clinics. We evaluated if venue characteristics were predictive of yield of a) newly-diagnosed HIV, b) known HIV, out-of-care, and c) self-reported HIV risk, adjusting for age, sex, and country, among persons who came for screening.

**Results:** Staff distributed recruitment cards at 275 venues (Kenya=60, Uganda=215). Most venues were informal dens (242/275 [88%]), offering local and commercial brew (53%) or local brew only (33%) vs commercial alcohol only (14%); 47 venues (17%) had rooms for sex work; 17% offered condoms, and median number of patrons was 10/day. Staff

distributed 4,281 cards: 1574 (37%) to women; 2707 (63%) to men. Of 3,364 (79%) persons who came for screening: median age=34 years (IQR:26-45); 60% were men; HIV positivity was 773/3364 (23%). Among persons without known HIV, yield of newly-diagnosed HIV was 63/2654 (2.4%). Among persons with previously-diagnosed HIV, 34/710 (4.8%) reported being out-of-care.

Of persons who tested HIV negative, 1132/2591 (44%) reported HIV risk. Venues with greater patrons/day and with rooms for sex work were associated with significantly increased yield of newly-diagnosed HIV (Table). Serving commercial alcohol was associated with significantly increased yield of persons reporting HIV risk.

	Formal bar (ref=informal drinking venue) Odds Ratio [OR] (95%CI), p-value	Number patrons per weekday OR (95%CI) for each additional patron, p-value	Presence of rooms for sex work OR (95%CI), p-value	Serve commercial alcohol only (ref=local brew only) OR (95%CI), p-value	Condoms available on-site OR (95%CI), p-value
Newly diagnosed HIV+	0.96 (0.41-2.28), p=0.928	1.04 (1.02-1.07), p=0.001	1.81 (1.00-3.28), p=0.050	1.53 (0.63-3.75), p=0.349	1.46 (0.64-3.33), p=0.370
Known HIV+, out of care	0.30 (0.04-2.15), p=0.231	1.01 (0.98-1.04), p=0.701	1.18 (0.28-5.01), p=0.820	0.90 (0.34-2.35), p=0.825	1.16 (0.35-3.83), p=0.814
Increased HIV risk (HIV-)	1.30 (0.90-1.89), p=0.163	1.02 (1.00-1.04), p=0.122	1.27 (0.89-1.80), p=0.188	1.6 (1.06-2.40), p=0.026	1.50 (1.0-2.26), p=0.052

*Table: Odds of identifying each of the following category of person screened, by venue characteristic.*

**Conclusions:** Over three-quarters of persons at 275 drinking venues linked to HIV screening. Nearly half of persons who tested negative reported HIV risk. Drinking venues with rooms for sex work and more patrons/day were associated with higher yield of persons with newly-diagnosed HIV and those serving commercial alcohol had higher yield of persons reporting HIV risk.

US-Mexico border is a primary corridor for the transshipment of cocaine and heroin destined for the US. However, research on polydrug use and HIV testing on the US-Mexico border is limited.

**Methods:** People who use heroin and crack (N=335), 80% male, were recruited from the cities Ciudad Juarez, Mexico (53%) and El Paso, Texas (47%) located on the US-Mexico border using respondent-driven sampling. Participants answered a cross-sectional survey assessing substance use, demographic characteristics, and history of HIV testing. A two-step cluster analysis was undertaken to identify discrete classes of polydrug use. Type of substance, route of administration, and use frequency were included in the analysis as indicators. Generalized mixed estimating equations were computed with class membership and other variables measured accounting for the nested data structure due to type of sampling used.

**Results:** A three-class solution was selected as the most parsimonious. Group 1 (43% of the sample, 4 substances consumed, was characterized by high crack use, and low use of heroin (injected form), prescription opiates, and cocaine (inhaled form); Group 2 (37.6%, 5 substances consumed, was characterized by high use of heroin and cocaine (injected form), moderate use of prescription opiates, and low use of cocaine (inhaled and injected forms); Group 3 (19.4%, 7 substances consumed, was characterized by high use of crack and heroin (injected and inhaled forms) and moderate use of prescription opiates, cocaine (inhaled and injected) and crystal meth. Significant associations emerged between class membership and age, city of recruitment, housing, history of incarceration, and HIV testing whereby membership in the third class was associated with older age, residing in the USA, being un-housed, history of incarceration, and not testing for HIV compared to membership in the first class ( $p < .05$ ).

**Conclusions:** Investigating patterns of polydrug use in an under resourced, binational, setting is necessary to inform the tailoring of behavioral interventions aimed at promoting HIV testing.

Improving access to HIV services ethically through community-based HIV-Self-Testing with Haiti National AIDS Control Program of MoH to reach the first 95: lessons learned and challenges

M.L. Excellent<sup>1,2</sup>, E. Emmanuel<sup>1</sup>, D. Lauture<sup>1</sup>, J.W. Domercant<sup>1</sup>

<sup>1</sup>Institut pour la Santé, la Population et le Développement (ISPD), Pétion-Ville, Haiti, <sup>2</sup>University of North Carolina at Chapel Hill, Public Health Leadership and Practice (PHLP), Chapel Hill, United States

**Background:** In Haiti, HIV-prevalence is 2% and blood test the primary method to determine HIV-status requires equipments. Given the testing requirements, burden of stigma and needles' fear, many individuals were left out.

Through the lens of health equity, HIV-self-testing (HIVST), which is an oral test was introduced in community settings (CB-HIVST) to improve access to HIV-testing services (HTS).

**Description:** In January 2019, we collaborated with the National AIDS Control Program of the Ministry of Health to develop HIVST guidelines, data reporting tools, the national HIVST algorithm and training package. We designed an HIVST assessment tool to identify high-risk eligible individuals. We trained community health workers (CHWs) in collaboration with Haiti National Public Health Laboratory of the Ministry of Health to ensure that CHWs accurately assist eligible clients perform the HIVST, interpret the results and advise them on follow-up accordingly. Anyone with reactive-HIVST received assistance to freely access HIV-blood test to confirm HIV-status at a facility/mobile clinic. We conducted community-based sensitization sessions targeting priority populations: male/sex workers/public transportation drivers/migrants/homeless/pregnant women without prenatal-care. We partnered with faith-based leaders/Voodoo temples to increase awareness about CB-HIVST and its limitations.

**Lessons learned:** The integration of CB-HIVST into the prevention package helped people become aware of potential HIV-exposure and confirm their HIV-status in stigma-free and confidential environment. We present the data about CB-HIVST over two-fiscal years. In FY21 (October 2020-September 2021), we assisted 1079 clients with HIVST from which 11% ( $n=116/1079$ ) were reactive and accompanied or efficiently referred to receive the HIV blood test per Haiti national guidelines. In FY22 (October 2021-September 2022), 5167 HIVST were reported from which 12% ( $n=618/5167$ ) came back reactive. In both fiscal years, the proportion of reactive HIVST was higher among females 55% ( $n=64/116$ ) in FY21 and 61% ( $n=376/618$ ) in FY22 compared to males. All clients with reactive-HIVST received counseling and support to access HIV-blood test timely with the opt-out option. Clients diagnosed HIV-positive were linked to care for ART-treatment initiation whereas the others were offered PrEP. Despite being a screening oral-test, targeted HIVST outreach increased access to comprehensive healthcare by addressing major barriers: transportation fees, waiting time, stigma, blood test and beliefs particularly for voodoo practitioners/males reluctant to seek preventive services.

**Conclusions/Next steps:** CB-HIVST helped bring services to individuals unaware of HIV-exposure. That strategy is relevant to reaching the 95-95-95-UNAIDS goals. HIVST needs to be readily available at all of our borders crossing points and rural areas nationwide.

### Empowering individuals with choice: online distribution of HIV self-testing to facilitate engagement in PrEP services in Thailand

K. Termvanich<sup>1</sup>, T. Amatsombat<sup>1</sup>, K. Rurkukos<sup>1</sup>, P. Mingkwanrungruang<sup>1</sup>, S. Atsawathumarat<sup>1</sup>, K. Suttanan<sup>1</sup>, P. Serkpookiaw<sup>1</sup>, S. Jittjang<sup>2</sup>, S. Mills<sup>2</sup>, N. Phanuphak<sup>1</sup>, R.A. Ramautarsing<sup>1</sup>

<sup>1</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>2</sup>FHI 360, Bangkok, Thailand

**Background:** HIV self-testing (HIVST) is free for all Thais, but the Pribta-Tangerine Clinic in Bangkok is the only clinic in the country to integrate HIVST in pre-exposure prophylaxis (PrEP) services, allowing the use of a non-reactive HIVST to start or refill PrEP online. We assessed the effects of using HIVST as an entry-point to PrEP engagement and retention.

**Methods:** Demand creation for HIVST started in April 2022, and since May 2022, free blood-based HIVST kits can be ordered through Pribta-Tangerine Clinic's online platform. Clients receive an HIVST package, and are followed up online for test results by clinic counselors. People who voluntarily disclose a non-reactive result are offered PrEP delivered by mail, and those with a reactive result are invited for confirmatory testing and antiretroviral therapy (ART) initiation.

**Results:** From May 2022-September 2023, we distributed 776 HIVST kits to 606 individuals (38.1% men who have sex with men, 36.3% transgender women, 10.6% cisgender women, 6.9% transgender women sex workers, 5.1% cisgender men, 2.0% female sex workers, 1.0% male sex workers). 202/606 (33.3%) were first-time HIV testers, and 451/606 (74.4%) shared test results. Of these, 32/451 (7.1%) were reactive, 24/32 (75.0%) received confirmatory testing, 18/24 (75.0%) were confirmed positive and initiated ART. Of 419 (92.9%) non-reactive clients, 177/419 (42.2%) clients engaged with online PrEP services: 102/177 (56.4%) used a non-reactive HIVST result to initiate PrEP, 53/177 (29.9%) received a PrEP refill, and 22/177 (12.4%) restarted PrEP. Among 177 PrEP clients, 127 (71.8%) choose daily PrEP and 50 (28.2%) event-driven PrEP. 40/102 (22.6%) of those who initiated PrEP returned for follow-up online or in-clinic during this period.

**Conclusions:** HIVST, offered online by our clinic, is an effective tool to engage, re-engage and retain individuals in HIV testing and PrEP services. A wide variety of populations and a high level of first-time testers ordered HIVST online, and almost half of non-reactive clients used the HIVST result to receive PrEP without a visit to the clinic. To leverage the potential of HIVST to increase access to HIV testing and simplify PrEP delivery, widescale online availability of HIVST and integration in PrEP services throughout Thailand is urgently needed.

### Incentives to increase linkage to confirmatory testing after HIV self-testing from community pharmacies among vulnerable adolescent girls and young women in Mwanza, Tanzania

H.P. Saronga<sup>1</sup>, K. Mgunya<sup>2</sup>, P. Njau<sup>2,3</sup>, A. Sabasaba<sup>2</sup>, S.I. McCoy<sup>4</sup>

<sup>1</sup>Muhimbili University of Health Allied Sciences, Behavioral Sciences, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Health for a Prosperous Nation (H-PON), Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>National AIDS Control Program (NACP), Ministry of Health, Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>University of California Berkeley, Berkeley, United States

**Background:** Non-monetary incentives are among strategies that are suggested to promote linkage to care, including confirmatory testing and PrEP, after HIVST among hard-to-reach populations who rarely use conventional health care services.

This study evaluates effectiveness of incentives in increasing linkage to confirmatory testing after HIVST among AGYW in Tanzania.

**Methods:** From December 2022 to May 2023, we conducted a two-arm randomised controlled trial with 360 AGYW enrolled at 8 pharmacies in the Nyamagana and Illemla Districts of Mwanza Region. AGYW were randomized 1:1 into intervention or control arm. Participants in the control arm received:

1. Education on HIV, HIVST and PrEP from trained pharmacists or peer educators at community pharmacies;
2. One HIVST kit; and
3. Encouragement to access further care after HIVST as per national guidelines at one of 6 partner health facilities.

Participants in the intervention arm received the same education, HIVST kit, and referral and also were offered the opportunity to earn a non-monetary incentive upon linking to confirmatory HIV testing at partner health facilities. Participants were followed for up to 2 months. Data were analysed using chi-square analysis and logistic regression accounting for clustering to determine effectiveness of incentives in increasing linkage to confirmatory testing. We estimated HIV positivity rate and PrEP uptake among AGYW who linked to confirmatory HIV testing.

**Results:** The mean age of the AGYW in our study was 20.5 years (range 15 to 24). The majority of AGYW (240=66.7%) presented for confirmatory testing after receiving the HIVST. The proportion attending confirmatory testing after HIVST was 21.5 (95% CI 11.9 to 31.0,  $p=0.000$ ) percentage points higher in the intervention group compared to control group (77.2% vs. 55.7%).

The HIV positivity rate among the 240 AGYW participants that presented for confirmatory testing was 1.3%; all AGYW with HIV were initiated on ART and 18.1% of AGYW who were HIV-negative were initiated on PrEP.

**Conclusions:** Community pharmacies are a promising location to engage AGYW living with and at-risk of HIV with HIV prevention and care. Incentives significantly increased the linkage to confirmatory testing after HIVST which enabled AGYW to access ART and PrEP.
