<sup>1</sup>Tsinghua university, Vanke School of Public Health, Beijing, China, <sup>2</sup>Guangdong Provincial Center for Disease Control and Prevention, Guangzhou, China, <sup>3</sup>Anhui Provincial Center for Disease Control and Prevention, Department of Acute Infectious Diseases Control and Prevention, Hefei, China, <sup>4</sup>Shandong University, Cheeloo College of Medicine, Jinan, China, <sup>5</sup>Zhejiang Provincial Center for Disease Control and Prevention, Hangzhou, China, <sup>6</sup>Beijing Center for Disease Control and Prevention, Department of AIDS/STD Control and Prevention, Beijing, China, <sup>7</sup>Chengdu Center for Disease Control and Prevention, Department of AIDS/STD Control and Prevention, Chengdu, China, <sup>8</sup>Tsinghua University, Institute for Healthy China, Beijing, China

**Background:** The COVID-19 pandemic has significantly impacted the mental health of human beings, especially the young age group and pre-existing marginalized groups such as men who have sex with men (MSM). In addition, the multi-country outbreak of mpox in 2022 also posed a significant stress on the most-affected communities (i.e., MSM).

This study investigated the level of depressive symptoms and its multifaceted associated factors among Chinese young men who have sex with men (YMSM) in this unique dual-threat period.

**Methods:** In September 2022, a large-scale online cross-sectional survey was conducted among YMSM aged 18-29 years across six representative provinces in China. Depressive symptoms were measured by the nine-item Patient Health Questionnaire.

Hierarchical regression analysis was performed to test the various associated factors of depressive symptoms.

**Results:** Among the 2,493 participants, 65.6% (n=1,638) reported mild to severe depressive symptoms. The hierarchical regression analysis identified that depressive symptoms was positively associated with unemployment (b=0.83, p=0.04), having substance use in the past 6 months (b=1.91, p=0.01), a higher level of MSM self-stigma (b=0.33, p<0.001), incompleteness of COVID-19 vaccination (uncompleted vaccination: b=0.95, p<0.01; no vaccination: b=1.87, p<0.01), greater mpox risk perception (b=0.25, p<0.001), and presence of mpox related symptoms (b=2.35, p<0.001).

**Conclusions:** Chinese YMSM faced significant mental health challenges during the concurrent epidemics of COVID-19 and mpox, which was associated with their socio-economic status, risk behaviors, stigma, and multiple diseases-related variables.

Proactive measures may hold promise as effective strategies for mitigating mental distress among marginalized groups during public health crises.

## TUPED427

Multidimensional inequalities among adolescent girls and women living with or at risk of HIV in Nigeria and South Africa

E. Lamontagne<sup>1,2</sup>, M. Kavanagh<sup>3</sup>, Q. Abdool Karim<sup>4,5,6</sup>, M. Oluwatoyin Fodayan<sup>7,8</sup>, The Working Group on Vulnerable Women and Girls in Nigeria and South Africa  
<sup>1</sup>UNAIDS, Equitable Financing, Johannesburg, South Africa, <sup>2</sup>Aix-Marseille University, CNRS, EHESS, Centrale Marseille, Aix-Marseille School of Economics, Marseille, France, <sup>3</sup>Georgetown University, Center for Global Health Policy & Politics, Washington, United States, <sup>4</sup>University of KwaZulu-Natal, Centre for the AIDS Programme of Research in South Africa (CAPRISA), Nelson R Mandela School of Medicine, Durban, South Africa, <sup>5</sup>University of KwaZulu-Natal, Department of Psychology, School of Applied Human Sciences, Durban, South Africa, <sup>6</sup>Columbia University, Mailman School of Public Health, New York, United States, <sup>7</sup>Obafemi Awolowo University, Department of Child Dental Health, Ile-Ife, Nigeria, <sup>8</sup>Nigeria Institute of Medical Research, Yaba, Nigeria

**Background:** Inequality is a pervasive, unjust, and complex societal phenomenon that manifests in various dimensions among individuals and groups.

We aimed to investigate the multiple dimensions of HIV-related inequality that prevent women and girls living with HIV from living the life they want.

**Methods:** Between June and December 2021, two cross-sectional surveys were conducted collaboratively with community-based organisations in Nigeria and South Africa. We adopted Sen's capability approach of inequality and selected relevant measures of inequality in the capabilities of women and girls living with HIV to:

- Live a healthy life,
- Live in physical safety and legal security,
- Be knowledgeable,
- Achieve economic independence,
- Have secure living conditions;
- Enjoy individual, family and social life, and to have self-respect, and;
- Participate in decision-making, have a voice and influence.

We performed descriptive statistical analysis per HIV status and country. We additionally calculated the Gini coefficient, Lorenz curve, location (means) and dispersion (standard deviation) of key markers.

**Results:** We found significant discrepancies across all the dimensions of inequality. Women and girls living with HIV reported lower physical ( $\chi^2(4, n=5350)=148.7$ ,  $p\text{-value}<.000$ ) and mental health ( $\chi^2(3, n=4918)=2.67$ ,  $p\text{-value}<.000$ ), poorer access to HIV ( $\chi^2(1, n=5251)=417.6$ ,  $p\text{-value}<.000$ ) and SRH ( $\chi^2(4, n=5172)=25.6$ ,  $p\text{-value}<.000$ ) services when needed, and capability to meet basic needs ( $\chi^2(1, n=5301)=14.2$ ,  $p\text{-value}<.000$ ). In addition, they had weaker economic independence, lower rates of tertiary education ( $\chi^2(2, n=5385)=60.2$ ,  $p\text{-value}<.000$ ) and faced more housing insecurity ( $\chi^2(2, n=3648)=11.3$ ,  $p\text{-value}=0.003$ ) than HIV-negative vulnerable women and girls.

Furthermore, HIV-positive women and girls were confronted with more sexual and gender-based violence ( $\chi^2(3, n=5028)=30.6$ ,  $p\text{-value}<.000$ ) and suffered from stigma and discrimination ( $M=32.5$ ,  $SD=8.18$ ), particularly among adolescent girls and young women ( $M=34.1$ ,  $SD=7.81$ ).

Ultimately, women living with HIV reported lower life satisfaction ( $M=5.48$ ,  $SD=2.89$ ) compared to their HIV-negative counterparts ( $M=5.77$ ,  $SD=2.84$ ).

**Conclusions:** The multidimensional approach to inequality shows how HIV status amplifies existing inequalities in multiple life dimensions for women and girls in Nigeria and South Africa. It underscores the need for multifaceted interventions to address inequalities in all aspects of the life of African women and girls, with context-specific empowerment programmes increasing their capability to live the life they value.

## TUPED428

### Knowledge of Pre-exposure prophylaxis among adolescent men having sex with men (MSM) and transgender (TG) persons: advocating for Access

J. Pienaar<sup>1</sup>, L. Maja<sup>2</sup>, V. Ncube<sup>1</sup>, M. Chabane<sup>1</sup>

<sup>1</sup>Aurum Institute, Johannesburg, South Africa, <sup>2</sup>University of Cape Town, Cape Town, South Africa

**Background:** South African adolescents are at an increased risk of HIV acquisition due to risky sexual behaviors. Recent studies revealed that HIV prevalence among the adolescents had increased from 3.0% in 2012 to 3.7% in 2019, with a total estimate of 360 582 adolescents HIV positive in 2019.

Among this age group is a subgroup of adolescent men having sex with men (AMSM) and adolescent transgender (ATG) people who are most vulnerable and bear disproportionate burden of HIV.

**Methods:** To inform services aimed at MSM and TGW, Aurum undertook an exploratory assessment across four districts (Ekurhuleni, uMgungundlovu, eThekweni, Ehlanzeni) to assess AMSM and ATG knowledge, attitudes, and perceptions about pre-exposure prophylaxis (PrEP) as a HIV prevention strategy.

Focus group discussions were conducted comprising 32 AMSM and KAP surveys were administered to the same adolescents as part of the quantitative element of the study.

Thematic analysis was employed to explore key themes related to adolescents' knowledge, attitudes and perception about PrEP and barriers to PrEP use.

**Results:** The results of the study revealed that there is good PrEP knowledge (>80%) among the adolescents. However, PrEP knowledge seemed to be influenced by whether they have been sensitized about PrEP from their respective healthcare facilities with some adolescents not knowledgeable at all.

Although PrEP knowledge among the adolescents seemed to be high, the use was relatively low with only 12.5% of the participants using PrEP. Factors such as stigma and low perceived risk of HIV acquisition were cited as reasons for non-PrEP use.

Nonetheless, the adolescents recommended various strategies to upscale PrEP use among their peers such as sensitizing schools, adding PrEP to the existing life orientation (LO) school curriculum, targeting social media platforms and recreational places such as clubs and places of 'groove'.

**Conclusions:** Adolescent key populations are an often-missed demographic in HIV prevention efforts. It is imperative that awareness and uptake of PrEP be improved within this population segment towards improving health outcomes among adolescents.

Integrating peer network analysis improved HIV case identification during the implementation of the enhanced peer outreach approach (EPOA) in Morogoro, Tanzania

H. Kiloya Mohammed<sup>1</sup>, J. Makwandi<sup>2</sup>, V. Daud<sup>3</sup>, B. Ogowang<sup>4</sup>, A. Itaka<sup>5</sup>, G. Mwakapinga<sup>3</sup>, C. Msamba<sup>6</sup>, E. Herman<sup>7</sup>, J. John<sup>8</sup>, D. Boyee<sup>9</sup>, C. Akolo<sup>10</sup>  
<sup>1</sup>Huruma Aids Concern and Care (HACOCA), Community Engagement, Morogoro, Tanzania, the United Republic of, <sup>2</sup>FHI 360, Strategic Information, Morogoro, Tanzania, the United Republic of, <sup>3</sup>FHI 360, Strategic Information, Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>FHI 360, EPIC Tanzania, Dar es Salaam, Tanzania, the United Republic of, <sup>5</sup>FHI 360, EPIC Tanzania, Morogoro, Tanzania, the United Republic of, <sup>6</sup>FHI 360, Community Engagement, Morogoro, Tanzania, the United Republic of, <sup>7</sup>FHI 360, Biomedical, Dar es Salaam, Tanzania, the United Republic of, <sup>8</sup>Huruma Aids Concern and Care (HACOCA), Management, Morogoro, Tanzania, the United Republic of, <sup>9</sup>FHI 360 Tanzania, Strategic Information, Dar es Salaam, Tanzania, the United Republic of, <sup>10</sup>FHI 360, Washington, DC, HIV Programs, Washington, United States

**Background:** In Tanzania, HIV prevalence remains high among female sex workers (26%) and men who have sex with men (25%). The Meeting Targets and Maintaining Epidemic Control (EpiC) project adopted use of the enhanced peer outreach approach (EPOA) to reach key populations (KPs) and offer HIV testing services to those who are typically considered more difficult to reach with traditional testing approaches. We present a data analysis and use approach within EPOA that improved reach of hard-to-reach populations.

**Description:** Initially, EPOA's coupon distribution and tracking were being less targeted in a complex geography and posed challenges. To improve outreach, a data-driven strategy that integrating social network analysis was implemented. 16 peer educators received a one-day training focused on the fundamentals of EPOA coupon distribution to reach their social networks. Data officers were trained in conducting network analysis on demographic and testing results of redeemed coupons using Microsoft PowerBI. Individual peer network analysis (PNA) was incorporated in EPOA from Apr-Jun 2023 and PEs were mentored in using PNA output to target reach. We compared case identification before (Oct 2022-Mar 2023) and after (Apr-Sept 2023) PNA introduction and assessed statistical significance using Chi-squared test.

**Lessons learned:** Before PNA, PEs distributed 909 coupons and identified 59 HIV positive cases (10% positivity rate, 59/590). After introduction of PNA, 815 coupons were distributed, yielding 13% positivity rate, (73/565) (p=0.119). During use of PNA, 77% (435/565) of the clients reached

had never tested or not tested for a year, compared to 51% (304/590) before PNA (p<0.001), see table below. Data interpretation and use by peer educators was crucial for this targeted approach.

Indicator	<6 months	6-12 months	>1 year	Never tested	Total tested clients	P value
Before using PNA	28 (5%)	258 (44%)	167 (28%)	137 (23%)	590	0.0001
After use of PNA	31 (5%)	99 (18%)	211 (37%)	224 (40%)	565	

Table 1: Comparison of clients' reported duration since last HIV test among EPOA coupons redeemed, before and after use of PNA.

**Conclusions/Next steps:** Integrating PNA with EPOA effectively extended HIV services to KPs previously underserved. EPOA's scalability makes it a valuable strategy for identifying HIV cases in hard-to-reach populations.

## TUPED430

Equitable sexual and reproductive healthcare access for GBQ sex workers in Lagos State: unveiling the mental health barriers in HIV service utilization

O. Olajubu<sup>1</sup>, R. Oyeniyi<sup>1</sup>, D. Musibau<sup>2</sup>, V. Thompson<sup>1</sup>  
<sup>1</sup>The Momentum Support Initiative, Meiran, Nigeria,  
<sup>2</sup>The Rainbow Alive Hub Initiative (TRAHI), Ijaiye, Nigeria

**Background:** Gay, Bisexual, Transgender, and Queer (GBQ) sex workers living in Lagos, Nigeria, encounter significant obstacles in accessing critical sexual and reproductive healthcare (SRH) services, including inclusive HIV care, leading to discrimination and barriers that affect their physical, mental, and psychosocial well-being.

This study explores the mental health challenges faced by this community in obtaining inclusive HIV and SRH-related services at community-friendly facilities in Lagos.

**Methods:** Conducted for 3 months in three (3) senatorial districts in Lagos, Nigeria, this qualitative study engaged 257 GBQ sex workers through 9 Focus Group Discussions (FGD) which explored mental health challenges, healthcare barriers, and coping mechanisms. The respondents showcased diverse demographics, with variations in age (18-24: 56.4%, 25-30: 23.7%, 31-40: 10.1%, 41-50: 6.6%, 51+: 3.1%), sexual orientation (Gay: 45.1%, Bisexual: 24.8%, Transgender: 15.2%, Queer: 10.1%, Other: 4.9%), HIV status (HIV Positive: 56.8%, HIV Negative: 33.1%, Unknown/Not Disclosed: 10.1%). Thematic analysis was employed to interpret the FGD recordings.

**Results:** 64.9% of GBQ sex workers (SW) living with HIV reported discrimination while attempting to get their monthly antiretroviral (ARV) medication refills. Attending clinic assistants often used snide remarks and attempted to shame participants due to their choice of job and

the nature of their illness. As a consequence, continuous ARV uptake among GBQ sex workers living with HIV decreased by 59.1%. Equally alarming is the finding that 68% of young participants had been openly criticized, causing them to experience increased anxiety within community clinics.

This underscores the urgent need to address the bias by community healthcare workers and ensure equitable access to healthcare for GBQ sex workers in Lagos state.

**Conclusions:** The study findings reveal a pervasive pattern of discrimination against GBQ sex workers accessing antiretroviral medication (ARV) by clinic assistants, contributing to a 59.1% decline in ARV uptake. 80% of young participants further faced increased anxiety whenever they had to visit community health facilities.

These findings have illustrated the critical importance of inclusive cultural sensitivity workshops for community healthcare workers and targeted advocacy efforts to key stakeholders and policymakers to create a more inclusive healthcare environment for GBQ sex workers and improve their overall health and well-being.

## TUPED431

Are COVID-induced disruptions in HIV service and gender-affirming care associated with negative mental health outcomes among transgender people in South Africa? Insights from a purposive sampling study

C.J. Heck<sup>1,2</sup>, L. Lewis<sup>3</sup>, E. Lamontagne<sup>4,5</sup>, S. Choonara<sup>3,6</sup>, T. Johnson<sup>7</sup>, N. Mkhize<sup>8</sup>, F. Mzungu<sup>9</sup>, D. Castor<sup>1,2</sup>, Q. Abdool Karim<sup>3</sup>

<sup>1</sup>Columbia University Mailman School of Public Health, Department of Epidemiology, New York, United States, <sup>2</sup>Columbia University Irving Medical Center, Division of Infectious Diseases, New York, United States, <sup>3</sup>Centre for the AIDS Programme of Research in South Africa (CAPRISA), Durban, South Africa, <sup>4</sup>UNAIDS, Equitable Financing, Johannesburg, South Africa, <sup>5</sup>Aix Marseille University, CNRS, EHESS, Centrale Marseille, Aix-Marseille School of Economics, Marseille, France, <sup>6</sup>Shakira Choonara Development, Johannesburg, South Africa, <sup>7</sup>African Alliance, Johannesburg, South Africa, <sup>8</sup>AIDS Foundation of South Africa, Durban, South Africa, <sup>9</sup>Youth Health Africa, Johannesburg, South Africa

**Background:** Globally, transgender women and men (TGWM) experience poorer mental health outcomes than the general population, with most evidence originating outside sub-Saharan Africa.

By introducing new stressors, the COVID-19 pandemic further deteriorated mental health; pandemic counter-measures also disrupted access to care, which may affect physical and psychosocial health. We examined the effect of HIV service and gender-affirming care (GAC) disruptions on suicidal ideations (SI) and moderate/severe anxiety and depression symptoms (A&D) among self-identifying TGWM in South Africa.

**Methods:** This secondary analysis uses data from a broader project aiming to understand the impact of COVID-19 on populations (aged 15-65+) with or at high risk for HIV in Gauteng, KwaZulu-Natal, and Eastern and Western Cape. From data collected between September and November 2021, we identified sociodemographic, structural-, and violence-related stressors of SI and A&D using backward elimination ( $\alpha=0.05$ ).

Utilising generalised estimating equations (Poisson regression, robust standard errors) to control for provincial clustering, we calculated adjusted prevalence ratios (aPR) to estimate the effects of disruptions after controlling for observed stressors (Figure 1). Given South Africa's HIV burden, we also performed HIV-stratified analyses to assess if HIV status modified relationships.

**Results:** Overall, approximately one-fourth (N=190) reported SI and two-fifths (N=178) indicated A&D. The only disruption associated with SI related to HIV services (aPR=2.14 [1.19-3.83]). A&D was higher among those reporting disrupted access to HIV services (aPR=1.70 [1.10-2.63]) and gender-affirming therapy/counselling (aPR=1.49 [1.07-2.07]), medications/hormones (aPR=1.50 [1.03-2.18]), and surgeries (aPR=1.60 [1.02-2.50]).

For A&D, HIV-stratified analyses highlighted HIV-negative respondents were primarily affected by disruptions to gender-affirming therapy/counselling (aPR=2.09 [1.18-3.70]), medications/hormones (aPR=2.58 [1.32-5.04]), and surgeries (aPR=2.09 [1.07-4.08]).

For A&D, HIV-stratified analyses highlighted HIV-negative respondents were primarily affected by disruptions to gender-affirming therapy/counselling (aPR=2.09 [1.18-3.70]), medications/hormones (aPR=2.58 [1.32-5.04]), and surgeries (aPR=2.09 [1.07-4.08]).

Figure 1: Stressors of suicidal ideations and moderate/severe anxiety and depression symptoms among South African TGWM, identified using backward elimination

**Conclusions:** In South Africa during COVID-19, A&D was higher among TGWM reporting HIV and GAC disruptions. SI was primarily affected by sociodemographic factors, structural vulnerabilities, and violence experiences (Figure 1). Given their life-saving potential, linkages to HIV services and GAC must be preserved.

### Postpartum HIV care engagement among South African women: results from a prospective cohort study

J. Smit<sup>1</sup>, A. Stanton<sup>2</sup>, N. Mosery<sup>1</sup>, C.A. Bedoya<sup>3</sup>, P. Valente<sup>4</sup>, M. Vangel<sup>3</sup>, L.T. Matthews<sup>5</sup>, J. Haberer<sup>6</sup>, A.M. Rivas<sup>3</sup>, S.A. Safren<sup>7</sup>, C. Psaros<sup>3</sup>

<sup>1</sup>Wits MatCH Research Unit, Durban, South Africa, <sup>2</sup>Boston University, Psychological and Brain Sciences, Boston, United States, <sup>3</sup>Massachusetts General Hospital, Psychiatry, Boston, United States, <sup>4</sup>University of Connecticut, Waterbury, Allied Health, Waterbury, United States, <sup>5</sup>The University of Alabama at Birmingham, Epidemiology, Birmingham, United States, <sup>6</sup>Massachusetts General Hospital, Global Health, Boston, United States, <sup>7</sup>University of Miami, Psychology, Miami, United States

**Background:** KwaZulu-Natal, South Africa (SA) has the highest prevalence of pregnant women with HIV (WWH) in the world. Pregnancy and postpartum (PP) periods offer opportunities to engage women in HIV care, prevent perinatal transmission, and optimise maternal and infant health.

Research suggests PP HIV care engagement is challenging; this prospective cohort study estimates rates of detectable HIV RNA as a proxy for care engagement during the PP period.

**Methods:** 472 pregnant WWH were enrolled from June 2017-March 2020 and completed sociodemographic and psychosocial assessments at baseline (third trimester) and 6, 12, 18, and 24 months PP. HIV-RNA testing was completed at all timepoints; National Health Laboratory Service (NHLS) data were accessed when study HIV-RNA data were unavailable. Detectable HIV-RNA was operationalized as  $\geq 1,000$  copies/mL or absence of a HIV-RNA value from study or in NHLS for  $\geq 1$  year. Time to event analysis was conducted using the Kaplan-Meier method.

**Results:** 26 participants were excluded from analyses due to detectable HIV-RNA at baseline, leaving 446 participants (mean age= 28.92 years, SD= 5.10 years; mean years since diagnosis = 4.30 years, SD=12.19 years). Overall, 31% reported at least part-time employment, and 96% reported being in a relationship with the partner of the index pregnancy at baseline.

There were 297 detectable HIV-RNA events during the observation period (incidence = 0.66): 48 WWH had detectable HIV-RNA, and 249 did not have HIV-RNA value from study or in NHLS for  $\geq 1$  year.

Across participants, follow-up time ranged from 1.6 to 49.1 months, for a total time at risk of 8,432.3 person-months (incidence rate = 35.2 events per 1,000 person-months). Median time to event was 18.1 months (95% confidence interval: 18.0 – 18.2 months).

**Conclusions:** Over half of participants exhibited detectable HIV-RNA, which is likely indicative of disengagement from care. Data must be interpreted in context of the

COVID-19 pandemic, which may have created additional and time-limited barriers to HIV care engagement. Algorithms for identifying which PP women are vulnerable to experiencing PP viremia are needed.

## TUPED433

### Integrating disaster management and HIV care in flood-affected areas of Pakistan

M.D. Abdullah<sup>1</sup>, M.T. Hamid<sup>2</sup>

<sup>1</sup>Al Khidmat Foundation, Public Policy, Islamabad, Pakistan,

<sup>2</sup>LPRI, Public Policy, Lahore, Pakistan

**Background:** This research, using data from Pakistan's Ministry of Health and NIH, examines the experiences of PLHIV during monsoon floods. It blends health data analysis with interviews to understand their challenges in accessing healthcare and maintaining treatment.

The goal is to identify gaps in disaster management for HIV/AIDS care and suggest improvements for policies and practices, focusing on the needs of vulnerable groups like PLHIV during natural disasters.

**Methods:** The study, conducted in monsoon-affected areas of Pakistan, used a mixed-methods approach with quantitative data and qualitative techniques like semi-structured interviews and focused group discussions. It applied grounded theory, using frameworks like the sustainable livelihood and natural hazard research approaches, and health behavior theories. Data from the Ministry of Health and NIH were analyzed to examine HIV management during floods.

Ethical protocols were strictly followed, with informed consent obtained for all participant interactions. The study aimed to uncover patterns in the impact of floods on HIV/AIDS management and behaviors of PLHIV.

**Results:** The study found that PLHIV in Pakistan face significant challenges during monsoon floods, including decreased clinic visits and medication adherence, especially among those above 45 and males. Interviews highlighted increased feelings of isolation and vulnerability and a rise in unsafe behaviors among younger PLHIV.

These findings point to the need for disaster management strategies tailored to the specific needs of PLHIV.

**Conclusions:** The study emphasizes the necessity of integrating HIV services into disaster management, especially for monsoon-prone regions. It shows the impact of natural disasters on healthcare access for PLHIV, highlighting the need for age and gender-specific interventions.

The research advocates for policy changes and a specialized "HIV/AIDS prevention framework" for better HIV management during natural disasters like floods, crucial in South Asian contexts.

## TUPED434

## Moving beyond singular 'key population' categories to inform more nuanced and effective HIV and other health interventions: an intersectional analysis of the 'Mombasa Key Pop Study'

J. Odingo<sup>1</sup>, M. Tamariz<sup>2</sup>, A. Adam<sup>2</sup>, P. Owira<sup>3</sup>, C. Kithinji<sup>2</sup>, I. Japitana<sup>1</sup>, A. Guadarrama<sup>4</sup>, M. Pastrana<sup>4</sup>, G. Mwendar<sup>1</sup>, T. Omarche<sup>5</sup>, M. Kimani<sup>6</sup>, H. Masud<sup>1</sup>, K. Khabala<sup>7</sup>, J.P. Ouamba<sup>7</sup>, I. Ciglenecki<sup>4</sup>, D. Callander<sup>1,8</sup>

<sup>1</sup>Médecins Sans Frontières, Mombasa Project, Mombasa, Kenya, <sup>2</sup>Mombasa County Department of Health, Mombasa, Kenya, <sup>3</sup>International Centre for Reproductive Health, Mombasa, Kenya, <sup>4</sup>Médecins Sans Frontières, Operational Centre Geneva, Geneva, Switzerland, <sup>5</sup>Youth Advisory Champions for Health, Mombasa, Kenya, <sup>6</sup>Kenya Medical Research Institute, Kilifi, Kenya, <sup>7</sup>Médecins Sans Frontières, Kenya Mission, Nairobi, Kenya, <sup>8</sup>University of New South Wales, Kirby Institute, Sydney, Australia

**Background:** HIV 'key populations' typically include sex workers, people who use drugs, and sexual and gender minorities (SOGI). While this framing can help inform health interventions, many programs – and funders – reinforce mutually exclusive categorisation of key populations. To recognise the complexity of human behaviour and identity, an intersectional approach to defining key populations is needed.

**Methods:** The Mombasa Key Pop Study is a repeated cross-sectional survey of key populations in the Kenyan city of Mombasa. The first wave of data was collected in June-September 2023. Participants were asked to self-report identities and behaviours, which were used to classify them as non-exclusive and intersecting key population groups (e.g., sex workers who use drugs).

Between intersectional configurations, bivariable and multivariable analyses compared scale scores on physical health (SRH-7), mental health (PHQ-2), well-being (WHO-5), and general access to healthcare. Where necessary, we controlled for sociodemographic differences between population configurations.

**Results:** 673 people representing key populations participated in Wave 1. Non-mutually, 345 (51.3%) participants reported sex work, 449 (66.7%) drug use, and 326 (48.4%) SOGI. In total, 332 (49.3%) participants reported multiple key population experiences including 94 (14.0%) engaged in sex work and drug use, 182 (27.04%) SOGI who used drugs, 56 (8.3%) SOGI sex workers, and 114 (17.1%) SOGI sex workers who used drugs.

More intersecting key population experiences were associated with poorer outcomes; for example, SRH-7 scores of physical health were 5.05 among just who were SOGI, compared with 4.9 among SOGI sex workers, 4.82 among SOGI who used drugs, and 4.71 among those with all three experiences ( $p < 0.001$ ).

Similarly, 28.0% of just sex workers had indications of depression, compared with 37.9% of sex workers who used drugs, and 41.2% of sex workers who used drugs and were SOGI ( $p < 0.001$ ). Other similar relationships were observed for well-being and general healthcare access.

**Conclusions:** A large proportion of key populations experience multiple identities. Those with intersecting key population experiences had consistently poorer health, healthcare, and well-being outcomes than those with a singular experience. These results support the need for intersectionally grounded interventions to more effectively engage with the diverse experiences of key populations.

## TUPED435

## Developing a community-based HIV status-neutral mobile clinic strategy to improve access to HIV prevention and treatment for people at high risk for or living with HIV in Alameda County

N. Wilson<sup>1</sup>, Y. Hu<sup>2</sup>, D. Humphries<sup>2</sup>, O. Harris<sup>1</sup>, C.-D. Alleyne<sup>3</sup>, A. Kerkhoff<sup>4</sup>, A. Liu<sup>3</sup>

<sup>1</sup>University of California San Francisco, School of Nursing - Community Health Systems, San Francisco, United States, <sup>2</sup>Yale University, New Haven, United States, <sup>3</sup>Bridge HIV, San Francisco Department, San Francisco, United States, <sup>4</sup>University of California San Francisco, School of Medicine, San Francisco, United States

**Background:** The traditional health system poses significant barriers that limit access to HIV prevention and treatment for African-American (AA) people in Alameda County. Mobile health clinics (MHC) offer convenient care that may overcome structural barriers to care engagement which can include medical mistrust, living in "medical deserts," and prior experiences of racism, homophobia, and transphobia.

We sought to develop a mobile clinic model acceptable to the AA community offering integrated status-neutral HIV prevention and care services.

**Methods:** We established a community/academic/public health partnership to develop a mobile clinic model called HOPE (Healthy Outcomes for People Everywhere) to offer services to reduce HIV, STIs, hepatitis C, and COVID-19 response within the AA community in Alameda County. We conducted in-depth interviews with 10 AA community leaders and 7 AA clients to identify key determinants and stakeholder preferences for HOPE following the framework of our logic model. Rapid qualitative analysis was conducted using the Intersectionality-Enhanced Consolidated Framework for Implementation Research (IE-CFIR). Resulting themes using rapid qualitative analysis were discussed among partners for feasibility and presented back to community stakeholders in 3 co-design focus groups for additional feedback to inform the final model. We piloted the intervention in 50 individuals in an encampment in Oakland, CA.

**Results:** Solutions to barriers to care engagement (i.e. medical mistrust, living in "medical deserts," and prior experiences of racism, homophobia, and transphobia) were to have a team of culturally-competent staff and providers that look like the population being served.

Nearly all stakeholders highlighted the importance of community relationship building and establishing trust by having a consistent presence in community. In addition to core services (i.e. HIV/STI testing, PrEP/PEP/Rapid ART, COVID-19 testing/vaccination), housing referrals, mental health, food assistance, and showers were critical services. Stakeholders identified the urgent need for coordination among providers serving AA to maximize the collective impact of these agencies.

HOPE effectively reached vulnerable communities, specifically the homeless, create a safe environment addressing stigma and mistrust, and had ability for telehealth and referrals to CBOs and community providers.

**Conclusions:** Comprehensive person-centered MHC services may improve engagement and access to HIV-syndemic care services to meet EHE goals along the continuum of care.

## TUPED436

Psychologist-trained peers' contribution in reducing HIV transmissions risks in Kyrgyzstan prisons: results of a pilot clinical trial

M. Sabirova<sup>1</sup>, N. Shumskaia<sup>2</sup>, V. Fedorchenko<sup>3</sup>, O. Zeziulin<sup>3</sup>, J. Rozanova<sup>4</sup>

<sup>1</sup>Public Foundation "AFEW", Research, Bishkek, Kyrgyzstan,

<sup>2</sup>Public Foundation "AFEW", Bishkek, Kyrgyzstan, <sup>3</sup>European Institute on Public Health Policy, Kyiv, Ukraine, <sup>4</sup>Yale University School of Medicine, New Haven, United States

**Background:** HIV prevalence in Kyrgyzstan prisons (10,3%) is 50 times higher than in the community; 75% of prisoners have injection drug use history that is comorbid with mental disorders and increases HIV risk.

We explored the feasibility and preliminary effectiveness of an intervention administered by a psychologist and a former prisoner peer to improve prisoners' mental health, thereby reducing HIV risk.

**Methods:** A 12-week intervention was conducted from January-March 2022, in two male prisons, with two comparable prisons serving as control. 98 HIV negative participants with injection drug use history were surveyed at baseline, immediately after the intervention, and at 3- and 12-months follow-up. Mental health assessments included SWLS for life satisfaction, PHQ-9 for depressive symptoms, and BRS for resilience. Data analyses used R Statistical Software (v4.3.1; R Core Team 2023).

**Results:** At baseline, participants' mean age was 43; 53 (54.1%) were from intervention facilities. Mental health indicators were similar between two groups, with controls scoring slightly better: SWLS scores were 20.3 for intervention vs 22.8 for controls ( $p = 0.004$ ), PHQ9 scores 19.0 vs 17.0 ( $p = 0.11$ ), BRS scores 2.9 vs 3.2 ( $p = 0.019$ ). At 12-month follow-up, intervention participants scored better than controls on SWLS (26.1 vs 20.0,  $p = <0.001$ ), PHQ9 (12.5 vs 18.6,  $p = <0.001$ ), and BRS (3.5 vs 2.9,  $p = 0.002$ ) (Table 1).

Per multivariate logistic regression, intervention vs control group was a significant predictor of mean scores for SWLS (beta coefficient 7.5,  $p < 0.001$ ), PHQ9 (beta coefficient -5.4,  $p = 0.003$ ) and BRS (beta coefficient: 0.55,  $p = 0.042$ ).

**Conclusions:** The pilot clinical trial suggests the intervention's potential in improving mental health among prisoners with injection drug use history, furthermore, effects increased overtime. A randomized controlled trial should examine the full intervention effects on improving mental health and reducing HIV risk behaviors among prisoners with injection drug use history.

## TUPED437

Riding the waves of health: achieving HIV viral suppression in Migori county's fisher-folk

E. Ariya<sup>1</sup>, P. Obiero<sup>2</sup>, S. Olala<sup>2</sup>

<sup>1</sup>Nyatike Subcounty, Ministry of Health, Macalder, Kenya,

<sup>2</sup>Ciheb -Kenya, HIV Prevention Program, Migori, Kenya

**Background:** The effective management of HIV through Antiretroviral Therapy (ART) and achieving virological suppression play a pivotal role in reducing morbidity, mortality, and HIV transmission. This compelling case study centers on the fisher-folk community in Migori County, Kenya,

Characteristic	Baseline			Month 1			Month 3			Month 6			Month 12

TUPED436 Table 1. Comparison of intervention and control groups at baseline and at follow-ups <sup>1</sup>CI = Confidence Interval

<sup>2</sup>Welch Two Sample t-test; Wilcoxon rank sum test

a high-risk population with elevated HIV prevalence attributed to factors such as engaging in transactional sex for fish.

**Description:** The intervention implemented a unique fisher-folk model of service delivery, where peer educators from the community, carefully selected and approved by the Ministry of Health and partnered with CIHEB, served as essential allies. Linked to health facilities situated near targeted landing sites, these dedicated educators facilitated unhindered access to HIV care and treatment services for the fisher-folk population.

Comprising adult fisher-folk individuals on first-line ART for varying durations of 6, 12, 24, 36, and ≥48 months, the study employed individual-based viral load (VL) testing to evaluate virologic suppression (VL <1000 copies/mL) and identify potential drug resistance.

**Lessons learned:** Results unveiled a remarkable overall virological suppression rate among fisher-folk, with an astounding 96% (384 of 402) achieving viral suppression. Although these high rates are noteworthy, the study underscores the crucial significance of timely treatment switching and unwavering adherence support to optimize treatment outcomes for this highly mobile population. Additionally, the adoption of pooled VL testing emerges as a potentially cost-effective measure, particularly in resource-limited settings.

**Conclusions/Next steps:** This illuminating case study highlights the paramount importance of HIV viral suppression in promoting healthy longevity within the fisher-folk community in Migori County.

This captivating study underscores the transformative power of empowering the fisher-folk community to achieve optimal HIV viral suppression. By integrating science-driven strategies, fostering community engagement, and recognizing the potential of cost-effective innovations, we unite in our commitment to safeguard the health and longevity of these resilient communities in Migori County, Kenya.

## TUPED438

### Suicidality, forced sex, depression, and alcohol use among young men who have sex with men PrEP users in Vietnam: an urgent call to action

Y. Kongjareon<sup>1</sup>, W. Waratworawan<sup>1,2</sup>, M.C. Clatts<sup>1</sup>, G.M. Le<sup>3</sup>, D. Colby<sup>4</sup>, L.A.T. Do<sup>1,5</sup>, T.E. Guadamuz<sup>1,2,6</sup>

<sup>1</sup>Mahidol University, Center of Excellence in Research on Gender, Sexuality and Health, Faculty of Social

Sciences and Humanities, Nakhon Pathom, Thailand,

<sup>2</sup>Mahidol University, Department of Society and Health,

Faculty of Social Sciences and Humanities, Nakhon Pathom, Thailand, <sup>3</sup>Hanoi Medical University, Center

for Training and Research on Substance Abuse and

HIV, Hanoi, Viet Nam, <sup>4</sup>Center for Applied Research

on Men and Community Health (CARMAH), Ho Chi Minh City, Viet Nam, <sup>5</sup>Pham Ngoc Thach University

of Medicine, Faculty of Public Health, Ho Chi Minh City,

Viet Nam, <sup>6</sup>Mahidol University, Department of

Tropical Hygiene, Faculty of Tropical Medicine, Bangkok, Thailand

**Background:** Young men who have sex with men (YMSM) have higher suicide rates and higher HIV incidence than the general population. According to syndemics and minority stress theories, mental health conditions are also associated with HIV risks.

At the same time, daily PrEP users are often assumed to have access to healthcare more frequently and is more "in the know" than MSM who are not on PrEP. However, this assumption may be wrong.

This study aims to examine suicide-risks, depression, and alcohol use disorders among YMSM PrEP users from Ho Chi Minh City, Vietnam.

**Methods:** Between March and June 2023, 613 YMSM PrEP users aged 16-29 years residing in Ho Chi Minh City were recruited through various social media platforms and local NGO networks. Participants completed self-administered online survey on demographics, first sexual experience, partner seeking, MSM disclosure, depression (CESD-R-10), alcohol use disorders (AUDIT-C), social support and *The-Suicide-Behaviors-Questionnaire-Revised* (SBQ-R) was used to assess suicide-risks. Multivariable logistic regression was used to examine correlates of suicide-risks.

**Results:** Among participants, 111 (17.79%) reported suicide-risks. Independent correlates of suicide-risks included not consenting to having sex for the first time (AOR=3.70, 95% CI: 1.13-13.27), experiencing depression (AOR=3.53, 95% CI: 2.20-5.68), drinkers of alcohol (AOR=2.12, 95% CI: 1.17-3.82 and AOR=2.75, 95% CI: 1.57-4.80, respectively), and having low social support (AOR=1.70, 95% CI: 1.03-4.80).

**Conclusions:** YMSM PrEP users in Vietnam have high suicide-risks. These risks may be associated with trauma from forced first sexual experience, current depression, and alcohol use. A comprehensive and integrated approach to HIV prevention that encompasses mental

## TUPED439

"Alora Centres": youth-led model for accelerating HIV testing and treatment among adolescents, Mizoram India

Z. Hrahse<sup>1</sup>, R. Lalrempuia<sup>2</sup>, C. Lalrindiki<sup>2</sup>, G. Shreenivas<sup>2</sup>, A. Hegde<sup>2</sup>, S. Chawla<sup>3</sup>, U. Sharma<sup>3</sup>, M. Nyendak<sup>3</sup>

<sup>1</sup>Mizoram State AIDS Control Society (MSACS), Aizawl, India,

<sup>2</sup>PATH, New Delhi, India, <sup>3</sup>U.S. Centers for Disease Control

and Prevention, DGHT, New Delhi, India

**Background:** As per national program data, between 2010-2021, India showed 46% decline in newly diagnosed HIV cases, while Mizoram showed 3.5% increase, in which youth (15-30 years), accounted for 40% of new cases. To promote healthy behavior among adolescents, a youth friendly center was initiated. Alora was initiated in March 2023 by MSACS within a government college in Aizawl, funded by PEPFAR/CDC through PATH, aimed to generate interest around HIV testing by promoting integrated comprehensive health services.

**Description:** Between March-September 2023, 84 students were trained as peer volunteers (PV) who promoted the centre on commemorative days significant to AIDS, Hepatitis, drugs and suicide prevention.

This initial outreach for youth engagement was pivotal in designing the centre and disseminating HIV prevention messages. PVs conduct quizzes with college students on HIV and substance use, display standard promotional material on the centre's Instagram page to dispel mis-

conceptions around HIV. Beyond HIV testing, the centre distributes condoms, provides mental health counseling; life-skills education; and blood sugar/hypertension screening.

**Lessons learned:** Incorporation of other health services into Alora served dual-purpose of reducing stigma and attracting youth. PVs felt a sense of ownership while leading promotional activities and participating in group discussions for improving access to health. They acted in an Instagram reel showcasing process to avail services with confidentiality and created a photo gallery at centre presenting their activities. Of the 1,100 students enrolled in college, 465 students (42%; 142 males, 323 females) accessed services during March-September 2023. 87% (404/465) of these were below 24 years. Out of 49 people tested for HIV, two were diagnosed and linked to treatment.

Service	Number (%)
Blood pressure measurement	217 (47%)
Random Blood Sugar	37 (8%)
Blood grouping for blood group	28 (6%)
Mental health counselling	22 (5%)
HIV test	49 (11%)
Only information provided	133 (29%)

Table. Breakup of people access services from Alora centre (March-Sep 2023) n=465.

**Conclusions/Next steps:** Engagement and ownership helped in reaching non-Key Population in Mizoram and enabled youth to talk freely about HIV. The successful implementation was shared with stakeholders in Mizoram and other states to replicate Alora as a person-centric model within universities for awareness; access to integrated HIV and other health services.

## TUPED440

Enhancing HIV testing in female sex workers through co-creation, a social and behavioral change approach

S. Mabouna<sup>1</sup>, C.E. Metuge<sup>1</sup>, G. Fako<sup>1</sup>, S. Fogue<sup>1</sup>, A. Zeh Meka<sup>1</sup>, A. Boupda<sup>1</sup>, Z. Zeh Akiy<sup>2</sup>, J. Tchofa<sup>2</sup>

<sup>1</sup>Care and Health Program, Yaounde, Cameroon, <sup>2</sup>USAID, Yaounde, Cameroon

**Background:** In Cameroon, recommended routine HIV testing every three months for female sex workers (FSWs) faces obstacles, including stigma, discrimination, criminalization, and limited awareness. Moreover, inconsistent commodity supply and low adoption of HIV self-testing further impact testing rates among FSWs.

**Description:** In 2023, as part of the PEPFAR-funded CHILL Project in Cameroon, we collaboratively addressed low HIV testing rates among FSWs. Through focus group discussions with FSWs and community-based organization (CBO) service providers, we evaluated and modified as-

pects of testing uptake, including the program's services and delivery methods, employing a co-creation approach. The proposed solutions were pre-tested, adjusted based on client feedback, and then implemented.

**Lessons learned:** Barriers to HIV testing among FSWs included stigma and limited access to tailored services. FSWs expressed concerns about privacy at hotspots and preferred daytime testing. They also solicited the bundling of HIV testing with services other services like family planning, cervical cancer screening and distribution of sanitary products.

This led to the development of tailored service delivery models, including revised counseling checklists, shortened sensitization sessions, and nighttime sensitization at hotspots followed by daytime testing at the drop-in centers (DIC) where privacy was assured.

Also, HIV testing was bundled with other services like STI screening and management, family planning, mental health screening and management, cervical cancer screening and distribution of sanitary products at the DICs. FSW peer leaders and educators also engaged in community education to reduce stigma related to HIV testing.

HIV testing uptake among FSWs increased from 28% (2,674/9,438) in Q1FY23, 24% (2,729/11,315) in Q2FY23, to 40% (2,882/7,249) when we started the co-creation, 48% (2,178/4,497) in Q4FY23, and now 50% (2,473/4,910) in Q1FY24 when the program has implemented some form of all the proposed solutions. This demonstrates the effectiveness of involving FSWs through a co-creation session in designing services that are more responsive and accessible to their unique needs.

**Conclusions/Next steps:** In conclusion, involving FSWs in designing and tailoring demand creation strategies significantly boosted HIV testing rates. Adjusted counseling techniques, strategic sensitization, and bundling testing with other services proved effective, addressing barriers and emphasizing the value of participatory healthcare interventions for stigmatized groups

## TUPED441

'Dirt just has to come down': body perceptions and lived experiences of female sex workers in Côte d'Ivoire (ANRS 12361 PrEP-CI and ANRS 12381 PRINCESSE projects)

J. Larmarange<sup>1,2</sup>, V. Becquet<sup>2,1</sup>, E. Kissi<sup>3</sup>, M. Plazy<sup>4</sup>, M. Nouaman<sup>3</sup>, P. Coffie<sup>3</sup>, A. Agoua<sup>5</sup>, S. Eholié<sup>3</sup>

<sup>1</sup>Ceped, Université Paris Cité, IRD, Inserm, Paris, France, <sup>2</sup>French Institute for Demographic Studies (Ined), Aubervilliers, France, <sup>3</sup>PAC-CI, Université Félix Houphouët-Boigny, Abidjan, Côte d'Ivoire, <sup>4</sup>University of Bordeaux, INSERM UMR 1219, IRD EMR 273, Bordeaux Population Health Research Center, Bordeaux, France, <sup>5</sup>Aprosam NGO, San Pedro, Côte d'Ivoire

**Background:** Female sex workers' (FSWs) representations of their bodies, situated at the intersection of intimate and professional spheres, can shed light on their perceptions and acceptability of health services, including pre-exposure prophylaxis (PrEP).

This analysis focuses on the body perceptions of FSWs in Côte d'Ivoire.

**Methods:** Qualitative interviews were conducted among FSWs in multiple waves within two successive projects.

The first project was a cross-sectional study conducted in 2016-2017 to assess the relevance of PrEP in Abidjan and San Pedro, which included 22 interviews and 8 focus groups in 2016.

The second project evaluated a comprehensive sexual and reproductive health program, including PrEP, on prostitution sites in the San Pedro region (16 interviews and 4 focus groups in 2019, 5 interviews in 2021, 17 in 2022). On-site observations at prostitution sites supplemented the interviews.

**Results:** The interviews revealed the concept of fluid circulation and its importance in maintaining balance. Some FSWs expressed concerns that health interventions, particularly blood draws, might weaken the body, causing fatigue if not offset by ingesting energizing substances. The high number of blood sample tubes and the absence of snacks were barriers to engagement in care. Fluid circulation was also related to the expulsion of 'dirt', as bodily fluids such as semen or menstrual blood are frequently defined. In cases of condom breakage, FSWs often cleanse their bodies with cola or enemas, which is perceived to be more effective than taking pills for treating sexually transmitted infections (STIs), post-exposure prophylaxis for HIV, or emergency contraception.

FSWs were often reluctant to use contraceptive injections or implants due to concerns about menstrual retention rather than expulsion.

Additionally, some FSWs considered hormones to be impure or harmful to the body.

Although most FSWs expressed interest in PrEP, some considered it 'tiring' and 'unnecessary', as it could upset the balance of a healthy body.

**Conclusions:** FSWs have a different perception of bodily fluids compared to the medical viewpoint on preventing STIs, HIV, and unwanted pregnancies. Their body perceptions offer insights into their reservations about health services, which helps to understand the barriers that prevent them from accessing and remaining in care.

## TUPED442

**Invisible, alone, and forgotten- an exploration into experiences of male sex workers vis-à-vis sexual health services, mental health, and financial stability during COVID-19 lockdown in three Indian cities**

S. Rawat<sup>1</sup>, M. Sivasubramanian<sup>1</sup>, B. Mohan<sup>1</sup>, J. Chaudary<sup>1</sup>, Z. Baghel<sup>1</sup>, V.R. Anand<sup>1</sup>, A. Dange<sup>1</sup>

<sup>1</sup>The Humsafar Trust, Mumbai, India

**Background:** In India, men in sex work (MSWs) faced financial, mental and sexual health challenges during COVID-19 lockdowns that were exacerbated by prevalent social stigma toward same-sex relationships and legalities affecting sex work.

Our abstract presents findings from a qualitative study that explored access to health and support among MSWs during the COVID-19 lockdowns

**Methods:** We conducted six focus group discussions; nine in-depth interviews; and nine key informant interviews in total in Mumbai, Thane, and Delhi in October-December 2022.

Eligibility criteria were:

- Aged 18-45 years and consent;
- Currently living in Mumbai/Thane/Delhi for ≥1 year;
- Self-identified MSW as per Indian HIV interventions criteria and,
- Reporting transactional sex with ≥1 man in last one month.

Maximum variation purposive sampling was used and data was transcribed and thematically analyzed.

**Results:** The mean age of FGD participants (n=40) was 28.3 years; >64% were at-least college educated. Around 78% reported part-time sex work. Most participants shared that while they had stopped seeing clients in early lockdown, financial constraints/mounting debts prompted them to reinstate sex work. Some sustained themselves financially by performing sexual acts on live cams. Participants reported the following sexual health challenges:

- Agreeing to riskier sexual acts/condomless sex for more money
- Not having access to condoms/other prevention
- Avoiding HIV tests due to fear of being shamed/stigmatized
- Not having means to travel for health services.

Most participants shared their ineligibility for government aid/support schemes for sex workers because there was

no understanding/acknowledgement of sex work by men. While most participants lacked support for mental health distress/loneliness, the following were reported as support avenues:

- Local not-for-profits,
- Long-time/regular clients, and,
- Peers.

While majority MSWs reported ever experiencing some form of physical violence, coercion and blackmail by clients threatening to leak the MSWs explicit pictures/videos were more frequent during the lockdown

**Conclusions:** Our findings strongly recommend pandemic preparedness for under-served communities such as MSWs vis-à-vis access to stigma-free sexual health services including availability of provisions such as PrEP/PEP and HIV self-tests, and via dedicated interventions/local programs targeting MSWs exclusively. Social media/other virtual approaches too may be explored for outreaching hidden MSWs.

## TUPED443

**Emerging trends in unsafe sexual behaviors and prevalence of syphilis among HIV-positive MSM in the southern region of Vietnam from 2015 to 2022: need for novel approaches**

T. Quang Le<sup>1</sup>, N. Van Khuu<sup>1</sup>, P. Duy Nguyen<sup>1</sup>, T. Ngoc Le<sup>1</sup>, T. Vu Nhat Nguyen<sup>1</sup>, M. Nguyet Trang<sup>1</sup>, T. Vu Nguyen<sup>1</sup>, H. Phuc Tran<sup>1</sup>, T. Vu Nguyen<sup>1</sup>

<sup>1</sup>Pasteur Institute in Ho Chi Minh City, Department of Disease Control and Prevention, Ho Chi Minh City, Viet Nam

**Background:** Vietnam's southern region (VN\_SR) stands as the nation's HIV epicenter, accounting for 65% of national HIV cases, with men who have sex with men (MSM) representing nearly 60% of the VN\_SR cases as of 2023.

This study investigated trends in unsafe sexual behaviors and the prevalence of syphilis and their associated factors among HIV-positive MSM (H\_MSM) in VN\_SR.

**Methods:** There were 620 H\_MSM being identified through HIV sentinel surveillance in VN\_SR from 2015 to 2022. Unsafe sex was defined as inconsistent condom use when having anal sex with male partners in the past month, and syphilis cases were confirmed by being positive with both rapid plasma reagin and the Treponema pallidum hemagglutination assay.

Multivariable Poisson regression (with robust variance) was used to identify factors associated with infrequent condom use and the prevalence of syphilis in H\_MSM.

**Results:** More than half (53.1%) of H\_MSM aged ≤ 24 years, and 50% of them had a sexual debut at ≤ 19 years old. Approximately 30% had never tested for HIV, and 80% did not have an STI examination in the past 3 months. Among H\_MSM, 52.6% did not consistently use condoms, rising from 41.2% (2015) to 63.2% (2020) (p-trend=0.005)

and slightly decreasing to 50.0% (2022). The prevalence of syphilis was 27.2% (95% CI: 23.7%-30.7%), increasing from 10.7% (2015) to 26.0% (2022) ( $p$ -trend<0.001).

Inconsistent condom use was more likely in H\_MSM who reported having group sex ( $aOR$ =1.34, 95% CI: 1.03-1.75,  $p$ =0.028), and less likely in those being aware of HIV testing centers ( $aOR$ =0.75, 95% CI: 0.61-0.92,  $p$ =0.001).

The prevalence of syphilis was significantly higher in H\_MSM under 30 years old ( $aOR$ =1.50, 95% CI: 1.05-2.15,  $p$ =0.029) but lower in those cohabitating with a male partner ( $aOR$ =0.48, 95% CI: 0.26-0.88,  $p$ =0.018).

**Conclusions:** The study reveals a rapid increase in unsafe sex and the co-occurrence of syphilis among H\_MSM, with a substantial proportion never seeking HIV testing and STI examination. Interventions should focus on HIV/STI screening and treatment, behavior changes communication with novel approaches to minimize the HIV/STI transmission.

## TUPED444

Using male engagement champions to reach male sexual partners of female sex workers with HIV prevention interventions: learnings from a demonstration project in 3 districts in Zimbabwe

F.V. Mutevedzi<sup>1</sup>, S. Zitha<sup>1</sup>, S. Musemburi<sup>1</sup>, P. Matambanadzo<sup>1</sup>

<sup>1</sup>Centre for Sexual Health HIV/AIDS Research Zimbabwe, Key Populations, Harare, Zimbabwe

**Background:** Studies suggest male sexual partners (MSP) of female sex workers (FSW) attending venues with high volumes of sex work are sub-optimally engaged in HIV prevention and care and at high risk of HIV. Reaching MSPs with effective HIV interventions in programs focused on reducing HIV risk among FSWs may leverage resources for improved outcomes among both groups.

We designed a differentiated HIV intervention to improve access, uptake of HIV services of MSPs in three districts in Zimbabwe (Beitbridge, Bulawayo and Gweru) and implemented within a key populations programme serving FSW.

**Description:** We selected MSPs ( $n$ =36) frequenting venues with high volumes of sex workers and trained them as Male Engagement Champions (MEC) to engage individual MSPs and refer them for HIV services. Implementation review with MSPs, MEC and FSWs resulted in context specific service-delivery modifications to address identified service access barriers.

Bulawayo increased frequency of night and weekend community outreach to MSP boosting service uptake by those unable to access services during regular working hours; Gweru engaged eight FSWs as MECs to replace artisanal miners who had been trained as MECs due to high mobility and Beitbridge clinic's location by the border post enabled 100% linkage of referred MSPs to services while they engaged in their regular economic activities.

MECs referred 1,762 MSPs between October 2022 and December 2023. 1524 (86%) of these were linked to clinical services. Uptake of HIV testing was 71% (1080/1524).

Positivity rate was 3.0% with 32/1080 testing HIV positive. 1048 HIV negatives were screened for PrEP, 84% (878/1048) being eligible and offered PrEP an uptake of 72% ( $n$ =752). Additionally, 19,482 condoms were distributed to MSP reached.

**Lessons learned:** MSPs can access health services within a key populations programme with MECs providing health education, creating demand for services. Services for MSPs required context-specific adaptation for increased access. Uptake of HIV prevention options was high, particularly oral PrEP. Services in locations distal from MSP economic activities experience lower service linkage and require additional outreach resources for engagement in services.

**Conclusions/Next steps:** We intend to expand the scale up the intervention to all program sites and further develop and document the model.

## TUPED445

The Safety Network: collectivising sex worker-led self-help groups in Zimbabwe for stigma reduction

J.T. Gandhi<sup>1</sup>, P. Matambanadzo<sup>1</sup>, S. Makarutse<sup>1</sup>,

P. Murungu<sup>2</sup>, T. Kujek<sup>3</sup>, F.M. Cowan<sup>4,5</sup>

<sup>1</sup>Centre for Sexual Health and HIV/AIDS Research (CeSHHAR) Zimbabwe, Key Populations, Harare, Zimbabwe,

<sup>2</sup>Rambawaraira Women Savings and Credit Cooperative,

ERG, Rusape, Zimbabwe, <sup>3</sup>Centre for Sexual Health and

HIV/AIDS Research, Key Populations, Harare, Zimbabwe,

<sup>4</sup>Centre for Sexual Health and HIV/AIDS Research

(CeSHHAR) Zimbabwe, Research, Harare, Zimbabwe,

<sup>5</sup>Liverpool School of Tropical Medicine, Liverpool, United Kingdom

**Background:** Female sex workers (FSW) in Zimbabwe operate in a complex legal and social environment with elevated levels of stigma, discrimination, and associated structural barriers. We have augmented comprehensive HIV services with microplanning FSW and supporting sex worker led self-help groups (SHG) since 2018. The Safety Network (SN) model, to collectivise SHGs for stigma reduction, increased social cohesion, resilience, and empowerment was co-developed with Zimbabwean sex workers and piloted in one district from 2022 - 2023. We documented SN implementation to assess its impact on empowering FSW for stigma reduction.

**Description:** 72 FSW from 10 SHGs constituted The Safety Network. Each SHG nominated two members to form the SN's governing structure known as the Empowerment Resource Group (ERG). ERG members were trained on 7 pre specified topics - stigma and discrimination, conflict management, governance, paralegal support, case care

Oral

Author Index

work and financial literacy. Additional economic strengthening training priorities were identified by the SN. The 10 SHGs leveraged established networks to improve local access to resources.

**Lessons learned:** Support from the local government and traditional leaders significantly reduced FSW stigma in the general community. The SN invoked a strong sense of solidarity and resilience among FSW as they addressed daily challenges, established and scaled up businesses and developed a self-financing mechanism.

The ERG disseminated skills and information, empowering a wider sex worker community for collective action. The benefits of collectivisation included registration with government as a cooperative, opening a bank account and increased individual SHG income levels from an average of USD80 per group per month to USD535.00 per month. Our process evaluation suggested sex workers perceived a favourable shift in how they were viewed by the wider community, a perception endorsed by community stakeholders.

**Conclusions/Next steps:** The integration of the SN into community structures and participation in district and provincial level advocacy activities suggests reduction in stigma. Strengthening and collectivising SHGs empowers sex workers and increases financial resilience. The SN model builds community leadership and ownership for FSW initiatives sustainably. The SN will be replicated in other districts with opportunities for strengthening linkages to HIV services explored.

## TUPED446

Is it possible to recruit and retain participants in the Human Papilloma Virus (HPV) Cohort study among key populations? Challenges, and lessons learnt, in Nairobi Kenya

M. Kung'u<sup>1</sup>, R. Kabuti<sup>1</sup>, M. Okumu<sup>1</sup>, E. Irungu<sup>1</sup>, L. Mckinnon<sup>2</sup>, K.R. Fowke<sup>2</sup>, J. Kimani<sup>1</sup>

<sup>1</sup>Partners for Health and Development in Africa, Nairobi, Kenya, <sup>2</sup>University of Manitoba, Winnipeg, Canada

**Background:** SWOP (Sex Workers Outreach Program) clinics offer services to key populations within Nairobi County. HPV-associated cervical cancer is a major cause of global morbidity and mortality. HPV is now vaccine-preventable but a large number of men and women with HPV may not benefit from the existing vaccines.

Therefore, therapeutic options for HPV management are needed but they are not currently available. In trying to understand how we can fast-track the development of an HPV therapeutic vaccine, we are going to look into some issues affecting recruitment and retention of participants into a prospective cohort.

**Description:** We invited key populations enrolled in SWOP Clinics, aged ≥18-45, willing to give informed consent, complete a questionnaire, donate required biological

samples, healthy but tested positive for HPV at screening, willing to be tested for HPV clearance/ persistence every 2 months for 12 months.

**Lessons learned:** 1968 participants were pre-screened for the study, 1901 met the inclusion criteria and signed the informed consent of which, 701 were enrolled. 670 of the enrolled presented for their month 2 follow-up visits, 609 for month 4, 402 for month 6, 290 for month 8, 11 for month 9, 217 for month 10 and 146 clients had presented for the month 12 follow-up visits. Follow-up is still ongoing.

Challenges experienced included some participants getting pregnant and hence taking a break, participants withdrawing from the study when they felt that the samples were too much every two months, and HPV has no cure.

Others included a frequent change of phone numbers, not honoring appointments, fear of or stigma associated with cervical cancer screening and cryotherapy, fear of results just in case they have HPV or something that could advance to cancer, participants relocating from the study area, and political tension.

Despite the many challenges, mitigation measures included offering psychological support, initiating visit reminders earlier, physical tracing, biweekly meetings with community champions, continuous health education, and engaging a cervical cancer survivor to support sensitization activities.

**Conclusions/Next steps:** Our retention rate seems great despite the challenges experienced. Meaningful community engagement is crucial in the recruitment and retention of participants in a vaccine trial among key populations.

## TUPED447

High rates of discrimination among young Black transgender men and non-binary persons in Brazil: results from the Conectad@s Study

L. Freitas<sup>1</sup>, E. Jalil<sup>1</sup>, C. Jalil<sup>1</sup>, B. Hoagland<sup>1</sup>, S. W. Cardoso<sup>1</sup>, C. Coutinho<sup>1</sup>, M. S. T. Silva<sup>1</sup>, R. Scarparo<sup>1</sup>, V. Veloso<sup>1</sup>, P. M. Luz<sup>1</sup>, E. C. Wilson<sup>2</sup>, W. McFarland<sup>2</sup>, B. Grinsztejn<sup>1</sup>, T. S. Torres<sup>1</sup>, the Conectad@s Study Team

<sup>1</sup>Instituto Nacional de Infectologia Evandro Chagas, Fundação Oswaldo Cruz, Rio de Janeiro, Brazil, <sup>2</sup>Center for Public Health Research, San Francisco Department of Public Health, San Francisco, United States

**Background:** Intersectional discrimination based on race, class, gender, and sexual orientation profoundly impacts the lives of young Brazilians, and is associated with elevated HIV risk. The political identities of young sexual and gender minorities (SGM) are shaped by these intersecting factors, resulting in distinct challenges related to health access, and social visibility. This complex interplay of factors creates significant barriers, impacting the well-being and quality of life of SGM.

We assessed factors associated with discrimination among young (18–24 years) cis/trans men and nonbinary people assigned male sex at birth who have sex with men (YMSM).

**Methods:** We analyzed baseline data from the Conectad@s study, which recruited 409 YMSM through respondent-driven sampling in Rio de Janeiro, Brazil, between November/2021–October/2022.

We used the 18-item Explicit Discrimination Scale [EDS], with scores ranging from 0–54. EDS was developed in Brazil to measure proximal, medial, and distal experiences of discrimination.

Negative binomial regression models assessed associations of discrimination with gender and race, adjusted by age, sexual orientation, education, and income.

**Results:** Median age was 21 years (IQR:20–23); 91% were cis-man, 7% non-binary, 2% trans-man. Most were Black (42%), than *Pardo* (29%) and White (28%); 60% had £secondary education and 71% monthly income per capita of £USD230.

Overall, mean score of discrimination was 9.1 (SD7.3). Black participants had higher mean discrimination scores (13[SD7.9]) compared to *Pardo* (7.6[SD7.0]) and White (7.1[SD5.3]) ( $p<.001$ ) participants. Trans-man also reported higher discrimination scores (20.2[SD12.0]) than non-binary (14.0[SD9.5]) and cis-man (8.4[SD6.5]) ( $p<.001$ ).

In adjusted models, trans-man and non-binary showed increased odds of discrimination compared to cis-man (estimate 0.79 [SD0.24],  $p<0.001$ , and estimate 0.36[SD0.15],  $0=0.020$ , respectively), and Black participants compared to White (estimate 0.48[SD0.09],  $p<0.001$ ).

**Conclusions:** We found high rates of discrimination experienced by young MSM in Brazil compared to the general population (scores 9.1 vs. 2.3, respectively).

Our results demonstrate high rates of discrimination against young Black trans-man and non-binary persons, reflecting the intricate nature of structural and social inequalities in Brazil.

Systemic racism disproportionately affects Black persons, while trans/non-binary persons face violence/discriminations due to societal homophobia/transphobia. Inclusive policies and social interventions that recognize and address the multiple forms of discrimination against these populations are imperative.

## TUPED448

### Connecting Latinos en Pareja: a couples-based HIV prevention intervention for Latino male couples

O. Martinez<sup>1</sup>, A. French<sup>1</sup>, S. Cortese<sup>2</sup>, I. Fernandez<sup>3</sup>, Y. Liu<sup>4</sup>, N. Ortega<sup>1</sup>, C. Yang<sup>4</sup>, E. Wu<sup>5</sup>, M. Johnson<sup>6</sup>

<sup>1</sup>University of Central Florida, College of Medicine, Population Health Sciences, Orlando, United States,

<sup>2</sup>Boombox, Santa Monica, United States, <sup>3</sup>Nova

Southeastern University, Davie, United States,

<sup>4</sup>Rutgers University, School of Public Health, New

Brunswick, United States, <sup>5</sup>Columbia University, School

of Social Work, New York, United States, <sup>6</sup>University

of California, San Francisco, School of Medicine, San

Francisco, United States

**Background:** While recent HIV diagnosis rates for gay and bisexual Black and white men in the United States have decreased, rates for gay and bisexual Latinx men have increased significantly, hence "The Invisible US Hispanic/Latino HIV Crisis."

New interventions are urgently needed to address the various social and structural conditions—e.g. discrimination, stigma, immigration experience, housing conditions, and marginalization—that create a complex vulnerability to HIV among Latinx men who have sex with men (LMSM).

**Description:** *Connecting Latinos en Parejas (CLP)* is a 3-session online intervention for intimate partners that is grounded in Social Cognitive Theory and a Relationship-Oriented Ecological Framework designed to:

1. Provide information and knowledge to promote accurate risk appraisal;
2. Build social and self-regulatory skills through problem solving, role plays, and other cognitive behavioral strategies;
3. Increase self-efficacy to engage in HIV risk reduction;
4. Increase positive outcome expectancies regarding HIV protection strategies; and,
5. Build enduring social support for HIV protection.

**Lessons learned:** As we scale up to a national study, impactful insights gained include:

1. Ensuring the integration of rigorous designs for adaptation, refinement of intervention, and implementation, focusing on appropriate representation of individuals impacted by or living with HIV;
2. Creating comprehensive assessments addressing specific needs of LMSM couples (e.g., the impact of immigration and discrimination on HIV prevention);
3. The importance of cultural and linguistic considerations when engaging community advisory board (CAB) members and future study participants;
4. Engaging with the CAB to center the diverse perspectives and experiences of gay, Latino men; and,
5. Establishing collaborations with prominent HIV/AIDS service organizations (e.g., Latino Commission on AIDS), amplifying our national reach and sustainability, and,

6. Collaborating with for-profit partners (e.g., Boombox and Build Clinical) who can accelerate and leverage the latest technologies and recruitment strategies.

**Conclusions/Next steps:** The forthcoming full efficacy trial—and other studies with LMSM—will benefit from an emphasis on cultural and linguistic considerations, empowerment of LMSM throughout the spectrum of research activities, and authentic engagement with the CAB and future participants on relevant social and structural conditions to end the HIV disparity and epidemic among LMSM.

## TUPED449

### Sexual health risks and wellbeing among migrants in Latin America: a qualitative study

A. Cruz-Bañares<sup>1</sup>, A. Rojas-Carmona<sup>1</sup>, S. Aguilera-Mijeras<sup>1</sup>, D. Cerecero-García<sup>1</sup>, C. Palma<sup>2</sup>, S. Soberanis<sup>2</sup>, S. Lungo<sup>2</sup>, S. Bautista-Arredondo<sup>1</sup>, H. Vermandere<sup>1</sup>

<sup>1</sup>National Institute of Public Health, Center for Evaluation and Surveys Research, Cuernavaca, Mexico, <sup>2</sup>PASMO (Organización Panamericana de Mercadeo Social), Guatemala, Guatemala

**Background:** Migrants encounter numerous problems throughout their journey; however, individuals from the LGBTQ+ community may experience additional challenges. Little is known about LGBTQ+ migrants in transit in Latin America; this study seeks to understand their vulnerability to sexual health risks.

**Methods:** As part of USAID's Prevention Services against HIV project in Central America, 1855 questionnaires were applied among migrants in Honduras, Guatemala and Mexico (2022-2023). Among them, 125 participants identified as LGBTQ+, and a convenient sample, selected based on time availability and willingness-to-participate, was invited for qualitative interviews.

We used a hermeneutic-phenomenological approach to explore participants' health experiences throughout the first stages of migration as proposed by Zimmerman et al.

**Results:** Eight LGBTQ+ migrants were interviewed (four gay men, one bisexual man, three trans women and one trans man).

**Pre-migration:** Participants had endured situations of political, domestic, and sexual violence, often related to their sexual identity, alongside economic challenges that had forced them to migrate. Economic precarity had also pushed some individuals towards involvement in sex work. They shared experiences of depression, anxiety, violence-induced injuries, and, in some cases, an HIV diagnosis (n=4). In certain instances, they reported how their situation had led to suicide attempts.

**Movement:** Participants had confronted food and lodging shortages and violence during their journey. The need to move quickly had often compelled them to endure

health difficulties; those with HIV had carried their medication but had suspended its usage due to a lack of food or theft.

**Arrival:** Participants who arrived in Mexico presented compromised health due to pre-existing conditions and journey challenges while feeling an urgent need to address issues like financial constraints and regularization of immigration status. Mental health symptoms sometimes intensified, and the desperation for economic resources drove some towards sex work. Health services tailored to the LGBTQ+ population were highly appreciated but were perceived as limited, also for those requiring HIV treatment.

**Conclusions:** The journey of LGBTQ+ migrants in Latin America is marked by violence, economic adversity, and mental health struggles, putting their sexual health at risk and making them vulnerable to exploitation. Sexual and mental health services tailored to LGBTQ+ migrants remain insufficient.

## TUPED450

### Sustaining HIV prevention services to stigmatized key populations - a lesson from the east-central region of Uganda before and after the signing of the anti-homosexuality act

A. Kiyimba<sup>1</sup>, S. Kawuma<sup>2</sup>, N. Mugume<sup>3</sup>, S. Malende<sup>3</sup>

<sup>1</sup>Makerere University Joint AIDS Program, HIV Prevention, Kampala, Uganda, <sup>2</sup>Makerere University Joint AIDS Program, Technical, Kampala, Uganda, <sup>3</sup>Makerere University Joint AIDS Program, Monitoring and Evaluation, Kampala, Uganda

**Background:** Uganda has made significant gains towards HIV epidemic control. However, to maintain the gains made with the dwindling HIV funding, the country has embraced precision prevention which involves reaching the right populations with the right interventions.

Local data aligns with the global picture of 50-70% of new HIV infections being among key populations (KPs). This underscores the need for targeting KPs with effective HIV prevention interventions to accelerate progress.

The East Central region of Uganda has been supporting community structures to offer targeted HIV prevention services to KPs. Among these are KP-led civil society organizations (CSO) and non KP-led CSOs which offer services to all categories of KPs. These are facilitated to reach out to highly stigmatized KPs with person-centered HIV prevention services.

**Description:** At the start of the year 2023, Uganda started debating the revised Anti-homosexuality bill criminalizing promotion of homosexuality. Consequently, stigma against KPs increased, affecting access to and utilization of HIV prevention services.

Amidst such an environment the USAID LPHS-EC project continued offering support to the KP-led and non-KP led CSOs.

Around March 2023, six (6) members of a KP-led CSO were arrested by police and kept in remand for four months. This further increased stigma and all the KP-led CSOs closed shop and stopped offering services. However, the non KP-led CSOs continued providing services to the LGBTQ community throughout the year.

**Lessons learned:** Although engagement of KP-led CSOs improves access to HIV prevention services by the highly stigmatized KPs, their ability to reach the marginalized populations drastically drops during unfavorable legal environments. The non-KP led CSOs continued to provide HIV prevention services during the same stigmatizing environment.

**Conclusions/Next steps:** A mix of KP-led and non-KP led CSOs is recommended in regions/countries with punitive laws. This mix ensures sustainability of HIV prevention services to stigmatized KPs targeted by these legal structures.

## TUPED451

### The role of sensitisation and testing in tackling the gender disparity in HIV in Ghana

A. Ziblim<sup>1,2</sup>, A.-H.S. Inusah<sup>3,2</sup>, E. Mordzah<sup>4,2</sup>,  
N. Simms-Golo<sup>5,2</sup>, E. Ahorlu<sup>6</sup>

<sup>1</sup>University for Development Studies, School of Public Health, Department of Health Policy Planning, Management, Economics, Tamale, Ghana, <sup>2</sup>Inclusive Health for Africa, Tamale, Ghana, <sup>3</sup>Upper East Regional Hospital, Department of Internal Medicine and Therapeutics, Bolgatanga, Ghana, <sup>4</sup>University of Ghana, Department of Psychology, Accra, Ghana, <sup>5</sup>University for Development Studies, School of Medicine, Tamale, Ghana, <sup>6</sup>Pentecost Hospital, Department of Paediatrics and Child Health, Accra, Ghana

**Background:** Young girls are considered a vulnerable population when it comes to HIV. Out of the 352,927 persons living with HIV (PLWH) in Ghana, 40,497 people are aged 15-24. In 2019, 79% of new HIV infections among young people were females.

In Sub-Saharan Africa, young girls are disproportionately affected because of biological, socio-economic, and gender-associated factors.

Poorer young girls are at a heightened risk because they may have to exchange (often unprotected) sex for money. Inclusive Health for Africa in partnership with Ghana AIDS Commission conceived a project that aimed to pay

greater attention to the specific needs of young girls in order to arm them with the right resources to protect themselves.

**Description:** The project focused on education and voluntary testing of young girls in senior high schools in the Tamale Metropolis, which is located within the poorest part of Ghana, between August and November of 2023. Its objectives were to educate young females aged 15-24 about HIV, its transmission modes, ways of protecting oneself, and resources to seek information or help. There was counselling and voluntary testing, and the required follow-ups were made.

**Lessons learned:** The project reached 1,158 young girls and women. Out of this number, 875 underwent testing, and 18 were referred for follow-up. Engagements were held with the participants, and it was discovered that issues such as period poverty, gender-based violence, ignorance, and peer pressure were some of the factors that prevented the girls who were sexually active from protecting themselves. A hotline was provided to them so that they could reach out concerning any SRHR issues they faced.

**Conclusions/Next steps:** Of every 3 people that are living with HIV, 2 of them are female. This is alarming on many different levels, and part of the problem is the lack of information some of these young people possess.

Addressing issues of poverty in deprived regions such as the Northern Region might give more power to young ladies, but it is also vital that they are given the right resources to protect themselves and be protected against stigma if they live with the disease.

## TUPED452

### Socio-demographic and behavioral patterns associated with HIV positivity among incarcerated population shows the importance of customized service provisions in prisons: results from Plan India's Prison intervention in 13 Indian states

K. Biswas<sup>1</sup>, R. Rana<sup>1</sup>, A. Rawat<sup>1</sup>, B. Borah<sup>1</sup>, M. Asif<sup>1</sup>

<sup>1</sup>Plan International (India Chapter), New Delhi, India

**Background:** Though estimated national adult prevalence remained low in India 0.20% (0.17-0.25%) in 2022, the observed HIV prevalence among inmates in central jails remained very high. 1.93% (95% CI: 1.75-2.12). Complementing Govt. of India's effort to end AIDS by 2030, Plan India is implementing Prison and Other Close Settings (OCS) intervention in 13 priority Indian states through an integrated HIV prevention project funded by The Global Fund.

**Description:** Plan India in collaboration with state and central Govt., has introduced an Integrated HIV prevention service along with STI, Hep-B, Hep-C and TB for the incarcerated population in 357 prisons and 218 Other Closed Settings since September, 22 with a focus to undertriads.

The project targeted to:

- A. Mapping all the prison and OCS in project states,
- B. Based on the HIV testing service availability customize service package,
- C. Capacitate Prison Peer Volunteers (PPVs) among prison inmates towards sustainability.

Project data for the period of September, 22 to September, 23 has been analyzed using SPSS-26.

**Lessons learned:** Out of the total received HIV testing ( $n = 320,825$ ), 87% remained undertrial inmates during the period of September, 22 to September, 23. Total 1,479 inmates identified as HIV positive while positivity varied widely within the project states 0.44% (0.1-4.97). 60% of the total registered inmates comes with an injecting drug use background. HIV positivity remained significantly higher among PWID compared to other (OR=2.761; CI: 1.935 – 3.939) inmates, and even higher with those using Pharmaceutical drug (OR=9.989; CI: 4.723 – 21.125) when compared to non-Pharmaceutical drug users. HIV positivity remained higher among the illiterate and primary educated inmates (OR=1.607; CI: 1.156 – 2.236) compared to inmates educated with higher education. Inmates identified as Self-employed showed higher positivity (OR=1.580; CI: 1.141 – 2.187), compared to rest groups.

**Conclusions/Next steps:** The result suggests that HIV positivity varies along the socio demographic and behavioral profile of inmates in the prison. While Plan India's Prison intervention has paved the pathways to expand and saturate the incarcerated population with integrated HIV and other priority screening services; it suggests the importance of customized service package for the incarcerated population based on the specific need associated with the client's profile.

## TUPED453

### A qualitative study to understand migrant men's use of HIV services in Johannesburg, South Africa

M.F. Nardell<sup>1</sup>, C. Govathson<sup>2</sup>, S. Fend<sup>3</sup>, A. Fata<sup>4</sup>, S. Mngadi<sup>2</sup>, E. Dacunha<sup>4</sup>, L. Taule<sup>5</sup>, P. Nkonyane<sup>6</sup>, L. Long<sup>7</sup>, M. Lurie<sup>8</sup>, L. Butler<sup>9</sup>, S. Pascoe<sup>2</sup>, I.T. Katz<sup>1</sup>

<sup>1</sup>Brigham and Women's Hospital, Medicine, Boston, United States, <sup>2</sup>Health Economics and Epidemiology Research Institute, Johannesburg, South Africa, <sup>3</sup>Harvard College, Cambridge, United States, <sup>4</sup>Brigham and Women's Hospital, Boston, United States, <sup>5</sup>TellUsMor Research, Johannesburg, South Africa, <sup>6</sup>Brand ID, Cape Town, South Africa, <sup>7</sup>Boston University School of Public Health, Boston, United States, <sup>8</sup>Brown University School of Public Health, Providence, United States, <sup>9</sup>Queen's University, Kingston, Canada

**Background:** Johannesburg, South Africa is a major destination for men coming from within (internal migrants) and outside (international migrants) the country. Migrant

men face challenges across the HIV care continuum. We used qualitative methods to explore factors influencing migrant men's use of HIV prevention and care services.

**Methods:** From March to May 2023, we recruited 29 migrant men  $\geq 18$  years old in community sites in Johannesburg (workplaces, public parks) for in-depth qualitative interviews, and 12 healthcare providers who care for migrants for two focus groups.

We purposively sampled 9 international migrants and 9 men living with HIV. Semi-structured guides explored factors influencing HIV prevention and care for migrant men. Interviews and focus groups were recorded, transcribed, and, if necessary, translated to English from isiZulu, Sesotho or isiXhosa. We used inductive and deductive thematic analysis to generate codes and identify themes.

**Results:** Migrant men participants had a median age of 34 (range 22-56). Our data revealed barriers to HIV care related to masculinity (e.g., perceived stigma toward men in clinics, masculine social norms discouraging care seeking), barriers related to migrant status (e.g., perceived stigma toward foreigners in clinics, language barriers, unfamiliarity with local services, documentation required for services), and barriers compounded for migrant men (frequent travel needs, opportunity costs of seeking care, lack of resources).

Healthcare providers also identified challenges in providing care to migrants, including resource constraints and provider burnout.

We ultimately identified nine HIV service characteristics important to migrant men, including:

1. Spoken and
2. Written service languages,
3. The need to report and
4. Provide documentation of migrant status,
5. The friendliness of providers,
6. The ease of inter-clinic mobility,
7. The frequency of medication collection,
8. The ability to have someone else collect medications on one's behalf, and;
9. Peer support.

**Conclusions:** Initiatives to increase migrant men's use of HIV services must account for barriers to care relating to masculinity and migration status, as well as provide resources and support to healthcare providers.

These data will inform attributes for a discrete choice experiment to elicit user preferences for the design of HIV services for migrant men.

## TUPED454

### Beyond Borders: lessons learned and best practices in addressing human rights barriers for illegal immigrant sex workers - Insights from WAPCAS human rights Global Fund GC6 intervention 2021-2023 in Ghana

M.Y. Gyesi-Addo<sup>1</sup>, C. Asamoah-Adu<sup>2</sup>, K. Owusu-Anane<sup>3</sup>, K.M. Diaba<sup>1</sup>, E.O. Adade<sup>4</sup>

<sup>1</sup>Ghana-West Africa Program to Combat AIDS & STI (WAPCAS), Programmes, Cantonments-Accra, Ghana,

<sup>2</sup>Ghana-West Africa Program to Combat AIDS & STI (WAPCAS), Executive Director, Accra, Ghana, <sup>3</sup>Ghana-West Africa Program to Combat AIDS & STI (WAPCAS), Administration and Human Resources, Cantonments-Accra, Ghana, <sup>4</sup>Ghana-West Africa Program to Combat AIDS & STI (WAPCAS), Finance, Cantonments-Accra, Ghana

**Background:** Illegal immigrant sex workers (IISW) in Ghana face compounded challenges, including discrimination, limited access to healthcare, gender-based violence and legal vulnerabilities, intensifying their risks for HIV/AIDS. IISW are nationals of other West African countries who usually do not need visa to enter Ghana but have overstayed the legal period without visas.

This abstract explores the lessons learned and best practices from WAPCAS in addressing human rights barriers among this marginalized population in Ghana.

**Description:** The WAPCAS program provided HIV and other human rights-related services to sex workers across 53 districts of Ghana. The program extended its reach to IISW who faced unique challenges. Experienced Peer Educators, trained as Peer Paralegals, offered legal literacy education to these IISW. Additionally, they provided legal support in cases where the sex workers experienced gender-based violence (GBV) or police abuses.

The project, in collaboration with pro bono lawyers and Legal Aid Officers, organized various empowerment activities, including community engagement and community dialogues. These initiatives aimed to address the legal needs and challenges faced by sex workers. Furthermore, concerted efforts were made to assist the IISW in regularizing their stay in Ghana legally. The program worked towards creating a comprehensive support system, combining legal education, advocacy, and practical assistance to enhance the well-being and rights of sex workers in the targeted districts.

**Lessons learned:** There was a positive shift in awareness, access to healthcare, and a reduction in instances of discrimination among IISW. The success of the intervention is attributed to community-led strategies, collaborative partnerships, and nuanced advocacy efforts targeting legal and policy reforms.

It was also observed that integrating comprehensive healthcare services, including sexual and reproductive health, mental health, and substance abuse support, is crucial in addressing the diverse needs of IISW.

Empowering sex workers with knowledge on their rights and legal literacy enhances their resilience against human rights violations.

**Conclusions/Next steps:** The insights from WAPCAS' intervention provide valuable guidance for organizations and policymakers working to address human rights barriers among IISW. By understanding the nuanced dynamics of this population, interventions can be tailored to effectively enhance their rights, well-being, and access to essential services.

## TUPED455

### The Aya Circle of care: creating a sustainable model for a primary healthcare HIV clinic for African Caribbean and Black (ACB) communities in Toronto, Canada

N. Massaquoi<sup>1</sup>, B. Girmay<sup>1</sup>, T. Nyoni<sup>2</sup>, O. Ezeika<sup>3</sup>, L. Mbuagba<sup>4</sup>, L. Gebremikael<sup>5</sup>, H. Addisalem<sup>1</sup>, R. Ahmed<sup>1</sup>, S. Adolphe<sup>1</sup>, P. Crichtlow<sup>1</sup>, O. Jamal<sup>1</sup>, A. Ouedraogo<sup>1</sup>

<sup>1</sup>University of Toronto, Health and Society, Toronto, Canada, <sup>2</sup>Dalhousie University, Social Work, Halifax, Canada, <sup>3</sup>Western University, School of Health Studies, London, Canada, <sup>4</sup>McMaster University, Department of Health Research Methods, Evidence and Impact, Hamilton, Canada, <sup>5</sup>TAIBU Community Health Centre, Scarborough, Canada

**Background:** The Greater Toronto Area (GTA) is the epicenter of the African, Caribbean, Black (ACB) HIV epidemic in Canada. The GTA alone accounted for 60% of the HIV diagnoses among ACB people. Despite this, we have limited access to culturally and racially effective HIV primary healthcare services to improve health and well-being and reduce HIV acquisition.

Within this context, the Aya Circle of Care program located at TAIBU Community Health Centre has been created as the first intensive HIV case management primary healthcare program for ACB communities in Canada.

**Methods:** Our objective is to understand the necessary core components required for implementing an intensive HIV case management program within a primary healthcare clinic for ACB community members. We conducted a descriptive qualitative study using face-to-face semi-structured key informant interviews (N=20) with policymakers, researchers, service providers, and healthcare providers with expertise in HIV and ACB communities. A majority of the informants identified as living with HIV (55%). Data was analyzed using conventional content analysis.

**Results:** Informants proposed key themes for the foundation of the program. The program should centralize the social determinants of health and address health disparities experienced by ACB populations. The program should develop effective pathways to increase the timeliness of linking to primary healthcare, retention in care, adher-

ence to treatment and maintaining viral suppression. The program should be geographically focused, grounded in Africentric principles, and focus on navigating the effects of structural anti-Black racism. Services should be led by Black providers within Black-focused organizations, address HIV stigma, provide services for family units and support those at risk for HIV.

**Conclusions:** The Aya Circle of Care is positioned for success in its development as the first primary healthcare clinic for ACB community members living with HIV in Canada. Locating these services within an existing primary healthcare clinic that serves ACB communities ensures intensive HIV case management services are supported and surrounded by an environment of trust, expertise and accessibility.

Access to intensive case management and primary healthcare services that are comprehensive and culturally, and racially appropriate is crucial for improving health and well-being among ACB communities living in the Canadian context.

## TUPED457

### Factors influencing sexualized drug use during condomless anal sex among Brazilian transgender women

E.M. Peixoto<sup>1</sup>, E. Jalil<sup>1</sup>, C. Jalil<sup>1</sup>, M.S. Silva<sup>1</sup>, M. Ramos<sup>1</sup>, R. Friedman<sup>1</sup>, L. Velasque<sup>1</sup>, C. Castro<sup>1</sup>, M.D. Pedrosa<sup>1</sup>, B. Fernandes<sup>1</sup>, V. Carvalho<sup>1</sup>, L. Monteiro<sup>1</sup>, B. Hoagland<sup>1</sup>, S.W. Cardoso<sup>1</sup>, V.G. Veloso<sup>1</sup>, B. Grinsztejn<sup>1</sup>, C. Coutinho<sup>1</sup>  
<sup>1</sup>Oswaldo Cruz Foundation, INI/Lapclin-AIDS, Rio de Janeiro, Brazil

**Background:** The prevalence of sexualized drug use (SDU) has gained recognition as a significant factor in the HIV epidemic, contributing to a higher risk of intoxication and overdose, especially among vulnerable populations.

We aimed to assess SDU prevalence before/during condomless anal sex and identify its associated factors among Brazilian transgender women (TGW).

**Methods:** We analyzed baseline data from Transcendendo, an ongoing, clinic-based cohort of TGW aged 18 and above in Rio de Janeiro, Brazil. The cohort includes individuals either living with HIV or at risk for HIV. Participants undergo structured interviews and perform laboratory testing annually. Positive depression screening was defined as scores  $\geq 10$  (CES-10, score range: 3-27). SDU was characterized by the use of any substance, including alcohol, before or during condomless anal sex in the prior six months. Multivariate logistic regression (stepwise) was utilized to identify potential associations with SDU (significance level: 5%).

**Results:** Of the 925 TGW enrolled from July 2015 to December 2023, median age was 29 years (IQR: 24-37), 44.1% and 29.6% self-identified as Pardo or Black, respectively, and 54.2% were living with HIV.

Overall, 36% reported condomless anal sex in the prior 6 months, 89.4% exhibited positive depression screening, and 27.8% reported previous suicide attempt. The prevalence of SDU was 12%. Higher odds of SDU were linked with self-identification as Black or Pardo (aOR: 2.31[95%CI: 1.26-4.59]), positive depression screening (aOR: 3.98[95%CI: 1.41-16.68]), and binge drinking (aOR: 2.63[95%CI: 1.69-4.08]). Those living with HIV showed reduced odds of SDU (aOR: 0.58[95%CI: 0.37-0.89]).

Variables	Levels	No condom	Condom	OR (univariable)	OR (multivariable)
Age	<=	50 (21.88)	27 (21.81)	0.87 (0.55-1.39)	-
	>=	294 (89.2)	86 (82.8)	-	-
Over 8 years of education	Yes	331 (87.6)	75 (82.4)	1.16 (0.77-1.76)	-
	No	214 (92.4)	27 (7.4)	-	-
Race	Black/Pardo	586 (85.5)	85 (81.7)	2.00 (1.18-3.34)	2.31 (1.26-4.59)
	Mo	501 (88.0)	88 (82.0)	-	-
Current resource	Yes	302 (87.3)	89 (82.5)	1.05 (0.69-1.57)	-
	No	457 (89.6)	53 (30.4)	-	-
Binge Drinking	Yes	170 (74.4)	52 (23.4)	2.64 (1.73-4.22)	2.63 (1.69-4.08)
	No	31 (24.6)	3 (3.2)	-	-
Depression Screening	Yes	686 (86.7)	105 (13.3)	4.94 (3.73-19.13)	3.98 (1.41-16.68)
	No	594 (89.6)	60 (30.4)	-	-
suicide Attempt	Yes	215 (85.5)	42 (38.5)	1.70 (1.12-2.56)	-
	No	411 (89.0)	51 (31.0)	-	-
suicide ideation	Yes	384 (87.0)	59 (31.0)	1.20 (0.81-1.80)	-
	Negative	342 (89.4)	62 (34.6)	-	-
HIV status	Positive	433 (90.4)	48 (9.6)	0.62 (0.42-0.92)	0.58 (0.37-0.89)

Figure 1. Logistic model for associated factors of sexualized drug use during condomless anal sex among Brazilian transgender women, Brazil.

**Conclusions:** The intricate interactions among demographics factors, mental health issues, and HIV-negative status concerning SDU underscores the complexity of substance use during sexual activity. This accentuates the critical need for comprehensive, multifaceted intervention strategies that are culturally sensitive and specifically designed to address the sexual health needs of TGW. It emphasizes the urgency for targeted harm reduction initiatives.

## TUPED458

### Access to health services by travestis and transgender women living with HIV or at risk for HIV

C. Castro<sup>1</sup>, B. Fernandes<sup>1</sup>, C. Coutinho<sup>1</sup>, E. Peixoto<sup>1</sup>, M. Ramos<sup>1</sup>, C. Nogueira<sup>1</sup>, R. Friedman<sup>1</sup>, M. Derrico<sup>1</sup>, S. Cardoso<sup>1</sup>, L. Monteiro<sup>1</sup>, V. Veloso<sup>1</sup>, B. Grinsztejn<sup>1</sup>, E. Jalil<sup>1</sup>

<sup>1</sup>Oswaldo Cruz Foundation, Evandro Chagas National Institute of Infectious Diseases, Rio de Janeiro, Brazil

**Background:** Travestis and transgender women (TGW) face significant socioeconomic challenges and health vulnerabilities, contributing to elevated rates of HIV infection rates and other sexually transmitted infections (STIs). We aimed to estimate the prevalence of, and factors associated with access to health services among TGW in Brazil.

**Methods:** Transcender is a prospective cohort study on TGW aged 18+ years, either living with HIV (LWH) or at risk for HIV infection.

The study was conducted at a major HIV prevention and care referral center in Rio de Janeiro/Brazil. We analyzed baseline data collected from July 2015 to August 2021. Participants were categorized based on their self-reported HIV status (LWH, negative, or unknown).

Access to health services was evaluated through the question, "Has the participant been evaluated by a health professional in the past 6 months?".

Analysis was performed using generalized binomial linear models, with separate models for LWH participants and those with negative or unknown HIV status. Multivariate models adopted a 5% level of significance ( $p \leq 0.05$ ), and those with a lower Akaike information criterion were elected.

**Results:** Overall, 527 TGW were enrolled, 57.7% of whom self-reported as LWH. Prevalence of accessing health services was 72.7% among LWH and 64.4% among those with negative or unknown serological status.

Factors associated with increased access to health services among HIV-negative/unknown status participants included being 25 years or older ( $aOR: 2.04 [95\%CI: 1.05-3.99]; p=0.036$ ), and awareness of PrEP ( $aOR: 3.49 [95\%CI: 1.83-6.73]; p=0.001$ ). Decreased odds of accessing health services were noted among those reporting unprotected anal sex in the last 6 months ( $aOR: 0.40 [95\%CI: 0.21-0.77]; p=0.006$ ).

Among TGW LWH, those engaging in non-sex work-related activities ( $aOR: 2.34 [95\%CI: 1.20-4.78]; p=0.015$ ) were more likely to access health services, whereas engagement in sex work-related activities was associated with lower access ( $aOR: 0.42 [95\%CI: 0.23-0.76]; p=0.004$ ).

**Conclusions:** The study highlights the intricate interplay between social determinants and health service accessibility among TGW in Brazil. Efforts to disseminate health information outside traditional healthcare settings are essential to reach those currently underserved.

Additionally, implementing flexible service hours may further enhance access to health care for this highly vulnerable population.

## TUPED459

### Assessing the impact of climate disasters on HIV service delivery: lessons from cyclone Freddy in Malawi

B. Chiwandira<sup>1</sup>, B. Afirima<sup>2</sup>, J. Nkhonjera<sup>1</sup>, T. Chimbandule<sup>1</sup>

<sup>1</sup>Ministry of Health, Malawi Government, Directorate of HIV, STIs and Hepatitis, Lilongwe, Malawi, <sup>2</sup>National AIDS Commission, Lilongwe, Malawi

**Background:** In March 2023, Cyclone Freddy hit the southern part of Malawi, the region with the highest HIV burden. The impact was catastrophic, with loss of lives, livelihood, and destruction of the already fragile and vulner-

able health infrastructures. The health system suffered a severe setback, with widespread disruption of health services, limiting the access and uptake of HIV services such as delivery of life-saving antiretroviral drugs.

This study aims at evaluating the impact of cyclone Freddy on the utilization of HIV services.

**Description:** A cross-sectional study deploying the Mann-Whitney test was conducted to evaluate the impact of cyclone Freddy on health service utilization. This non-parametric approach analysed service usage data six months pre- and post-cyclone, focusing on HIV testing, Sexually Transmitted Infection (STI) cases, Antenatal care (ANC) cases, and Alive on anti-retroviral (ART) services using Malawi's routine program data from 7 health facilities and 4 most affected districts.

**Lessons learned:** The study found no significant change in HIV testing and ART services ( $p = 0.716$  for both), indicating stability post-cyclone. In contrast, STI services showed significant disruption ( $p = 0.029$ ), and ANC services exhibited a marginally significant decline ( $p = 0.064$ ), underscoring the cyclone's varied impact on healthcare services

Service	Pre_Mean	Pre_SD	Post_Mean	Post_SD	Z	P_Value
Total HIV Tests	117.39	232.40	110.21	201.22	0.36	0.7161
Total STI Clients	19.99	57.85	11.49	30.35	2.19	0.0286
ANC Attendance	25.69	51.90	17.91	41.21	1.85	0.0642
Alive on ART	157.64	603.30	177.90	595.29	-0.36	0.7160

**Conclusions/Next steps:** With the widespread destruction of healthcare infrastructure and disruption of Health Services, we anticipated a significant impact on the HIV program. However, the study found that while HIV testing and Antiretroviral therapy (ART) services remained stable post-cyclone, STI and Antenatal service uptake declined significantly.

These findings demonstrate the resilience and adaptability of the HIV program to disaster; and underscores the differentiated level of adaptability of the various health intervention to climate crises.

Using culture-centered, sex-positive qualitative formative research to design a PrEP campaign for Black gay, bisexual, queer, same gender-loving, and other men who have sex with men

K.T. Bond<sup>1</sup>, P.M. Williams<sup>1</sup>, M.Q. Paige<sup>2</sup>, L. Chen<sup>1</sup>, F. Jainab<sup>1</sup>, K. Hart<sup>1</sup>, D. Matthews<sup>1</sup>, E. Koffler<sup>3</sup>, H. Zhang<sup>4</sup>, E.A. Kelvin<sup>5</sup>, V. Frye<sup>2</sup>, D.T. Duncan<sup>6</sup>

<sup>1</sup>CUNY School of Medicine, Community Health and Social Medicine, New York, United States, <sup>2</sup>Columbia School of Social Work, New York, United States, <sup>3</sup>CAMBA, Brooklyn, United States, <sup>4</sup>Kentucky University College of Public Health, Department of Biostatistics, Lexington, United States, <sup>5</sup>CUNY Graduate School of Public Health and Health Policy, Department of Epidemiology and Biostatistics, New York, United States, <sup>6</sup>Columbia Mailman School of Public Health, Epidemiology, New York, United States

**Background:** Disparities in HIV incidence, pre-exposure prophylaxis (PrEP) uptake, and interventions designed for Black gay, bisexual, queer, same gender-loving, and other men who have sex with men (Black SGL/MSM) suggest the need to develop stigma reducing PrEP social marketing initiatives that support engagement in the HIV status-neutral care continuum.

**Methods:** To inform the development of a community-level PrEP campaign as part of a larger study focused on improving PEP/PrEP use and HIV self-testing, we conducted four focus group discussions with Black SGL/MSM (n=20) residing in New York City from February to June 2023.

The focus groups inquired about individuals' articulation of sexuality and race, experiences with HIV preventions methods including PrEP, attitudes and awareness of past HIV prevention campaigns, the suitability of messaging, and the utilization of social marketing channels for distribution to inform the development stigma reducing PrEP campaign.

The data analysis procedure employed the grounded theory approach to identify emerging themes.

**Results:** Analysis of the qualitative data revealed how racialization processes intersect with sexuality to inform sexual decision-making including engagement in the HIV care continuum. Most participants demonstrated knowledge of PrEP and expressed a willingness to utilize. However, they also encountered barriers that were influenced by the overlapping inequalities related to race, sexuality, and socioeconomic status. They were consistently subjected to pop-up adverts on applications and billboards that operationalized "culture" by tailoring surface features of health messages.

Participants expressed that the messages would benefit from including further details regarding PrEP administration preference, PrEP efficacy, and supplementary educational resources to improve their credibility and relevance. The participants expressed a preference for using a va-

riety of images that promote a positive attitude towards Black men and sexuality with a focus on Black SGL/MSM-centered messaging to reduce stigma. Recommendations for campaign dissemination combined multiple modalities that included highlighting individual stories, building relationships with community members, and engagement on social media platforms.

**Conclusions:** The findings highlight the potential of culture-centered, sex positive PrEP marketing to address different levels of stigma encountered by Black SGL/MSM. Understanding the sociocultural context for sexuality beyond HIV among Black SGL/MSM is crucial for developing effective PrEP messaging with a sex-positive lens.

## TUPED461

Accelerating HIV prevention through KP-led community-based PrEP intervention: what to do and how to do it right in a rural setting

F. Akporhe<sup>1,2</sup>, M. Odo<sup>3</sup>, M. Paul<sup>4</sup>, J. Toomey<sup>5</sup>

<sup>1</sup>Delta State University, Abraka, English and Literary Studies, Abraka, Nigeria, <sup>2</sup>Liberia Equality Network (LEN), Programs/ Administration, Sanniquellie, Liberia, <sup>3</sup>National Aids/STI Control Program, Technical Advisor - NACP, Monrovia, Liberia, <sup>4</sup>Liberia Equality Network (LEN), Administration, Monrovia, Liberia, <sup>5</sup>Global Reach II - Jhpiego, Programs, Sinkor, Liberia

**Background:** In Liberia, the HIV epidemic is driven by key populations (KPs) and at-risk individuals, facing challenges in accessing services, particularly oral pre-exposure prophylaxis (PrEP). The Global Reach II Project in Nimba County targets KPs—sex workers, men who have sex with men, people who inject drugs, and transgender. To overcome persistent barriers, the project introduces community-based oral PrEP, emphasizing joint prevention, resource availability, and heightened HIV case finding.

**Description:** Advocacy efforts engaged the National AIDS Control Program (NACP), community gatekeepers, and Civil Society Organizations, establishing a multi-stakeholder group and locally adapted roadmap. Key populations were linked to KP-friendly health facilities through community-based organizations, ensuring coordinated demand creation and safe service delivery. A monitoring team ensured quality assurance, conducting regular visits, while peer-to-peer community-based services provided invaluable support. Quarterly Technical Working Group meetings facilitated experience collation and discussions on program improvement approaches. This targeted initiative addresses specific challenges KPs face, enhancing overall HIV prevention.

From June 15 to September 30, 2023, 1092 clients were screened for oral PrEP. 1065 were eligible, and 559 started PrEP (373 daily, 186 event-driven). 27 were ineligible (2.5%

HIV positive), linked to treatment. 58 had acute HIV infection. 479 eligible clients couldn't start PrEP due to commodity shortages. 343 clients returned for refills (61.3%) with zero Sero-conversion.

#### Lessons learned: Effective Strategies for KPs on PrEP:

Peer-led approach: Recruit Peer Educators based on KP type and location.

Community-based approach: Engage existing structures and individuals as allies.

PrEP champions and Hotspots engagement.

Supply Chain Management.

Learning Exchange with Sierra Leone.

#### Guidance for Future HIV Programs:

Prioritize KP-led grassroots organizations.

Ensure educated, empowered KP Peer Educators.

Strategize PEs' assignments, and set weekly targets.

Implement flexible Data Management.

Collaborate with existing community and health structures.

**Conclusions/Next steps:** Successful advocacy and stakeholder engagement facilitated the implementation of PrEP services, addressing HIV prevention in rural Liberia. The initiative not only prevented HIV transmission but also identified new cases.

## TUPED462

### Mobility, sex work, and intersectional HIV vulnerabilities: qualitative insights from Venezuelan migrants in Lima, Peru

A. Perez-Brumer<sup>1,2</sup>, K. Solari<sup>2</sup>, J.C. Ramirez Trovar<sup>2</sup>, D.F. Leon<sup>2</sup>, J. Batista<sup>2</sup>, M. Castro Arteaga<sup>1</sup>, J. Brisson<sup>1</sup>, K.A. Konda<sup>2,3</sup>, A. Silva-Santisteban<sup>2</sup>

<sup>1</sup>Dalla School of Public Health, University of Toronto, Toronto, Canada, <sup>2</sup>Center for Interdisciplinary Research in Sexuality, AIDS and Society. Universidad Peruana Cayetano Heredia, Lima, Peru, <sup>3</sup>University of Southern California, Department of Population and Public Health Sciences, Keck School of Medicine, Los Angeles, United States

**Background:** Latin America is facing its largest recorded mass migration with over 7.4 million displaced Venezuelans. Lima, Peru, hosts the largest Venezuelan population outside Venezuela. Venezuelan migrants who engage in sex work (VSW) face unique HIV needs, yet this population remains understudied.

**Methods:** From April 2023-December 2023, we conducted in-depth interviews with 69 VSM who engage in sex work, reside in Lima, Peru, and are: cisgender men who identified as gay, bisexual and other men who have sex with men (GBMSM), cisgender women (CW), or transgender women (TW).

Interview guide queried: migration and sex-work related vulnerabilities (e.g., informal labor structure, violence, precarity, documentation), HIV prevention and care

needs, and relocation strategies (e.g., resource sharing, connectedness). Analyses included inductive and iterative processes.

**Results:** Among 69 participants, median age was 31 years, 20% self-identified as a transgender woman, 49% as a cisgender woman, and 31% a cisgender man. Intersectional HIV vulnerabilities were described across three axes:

1. Mobility patterns: Routes of migration and frequency, targeted violence;
2. Labor conditions: descriptions of physical (e.g., streets, brothels) and virtual spaces (whatsapp, Facebook), security, and client factors (alcohol, drugs);
3. Access to health services: Economic, knowledge, and legal barriers heightened by intersectional stigmas (xenophobia, transphobia, and sex-work discrimination). Increased violence (repressive policing), substance use, and high-risk sexual behaviors were described with street-based versus online client recruitment. CW and TW frequently described street/venue-based sex work and increased precarious labor (limited client negotiations and increased xenophobia). For CW discussions of HIV prevention and care frequently included description of reproductive health needs.

**Conclusions:** VSW described intersecting forms of socio-structural disadvantage that negatively impact their health—precarious employment, xenophobia and material deprivation— and heighten known HIV vulnerabilities. HIV prevention and treatment guidelines and interventions in Peru are needed to mitigate HIV vulnerability among migrant sex workers, including keen attention to the relationship between gender, sex, sexuality, and gender identity, intersecting stigmas, and ongoing social and health inequities.

Is perceived provider sex approval associated with HIV and STI testing uptake among adolescents? The effects of sexual and gender minority status

S. Khreizat<sup>1</sup>, D. Cordova<sup>1</sup>, J. Bauermeister<sup>2</sup>, J. Delva<sup>3</sup>, T. Neilands<sup>4</sup>, S. Warner<sup>5</sup>, M.A. Cano<sup>6</sup>, C. Boyer<sup>4</sup>  
<sup>1</sup>University of Michigan, School of Social Work, Ann Arbor, United States, <sup>2</sup>University of Pennsylvania, School of Nursing, Philadelphia, United States, <sup>3</sup>Boston University, School of Social Work, Boston, United States, <sup>4</sup>University of California, School of Medicine, San Francisco, United States, <sup>5</sup>University of Michigan, School of Public Health, Ann Arbor, United States, <sup>6</sup>University of Texas Southwestern, School of Public Health, Dallas, United States

**Background:** In the United States, adolescents and young adults (AYAs) are disproportionately impacted by HIV/AIDS. Despite the significance of HIV and STI testing in curbing transmission rates, testing among AYAs remains suboptimal.

Although perceived stigma and provider mistrust are barriers to testing, the influence that perceived provider approval of sexual behaviors has on HIV and STI testing among AYAs, particularly among sexual/gender minorities, is not well understood.

**Methods:** This study analyzed baseline data from two randomized controlled trials focusing on HIV/AIDS prevention in AYAs. A total of 150 participants, averaging 19.27 years of age (SD=1.82, range=13-21), were recruited from a youth-centric health clinic in Southeast Michigan.

Among them, 42.7% identified as sexual or gender minorities, and 45% identified as non-Hispanic White, 39.6% African American, 10.1% multiple race/ethnicity, and 3.4% Hispanic or Latino.

Additionally, 71.1% identified as female, 14.1% male, 8.1% trans male, and 2% trans female. Data were analyzed using logistic regression analysis in SPSS 28.0.1.0.

**Results:** Descriptive statistics revealed that 70.5% and 74.7% of participants had undergone lifetime HIV and STI testing, respectively. Perceived provider approval ranged from 1 to 5 (1 = youth perceives provider strongly disapproves of having sex, 5 = youth perceives provider strongly approves of having sex), with a mean score of 3.39 (SD=0.80). Logistic regression analysis showed a one-unit increase in perceived provider approval of sex was associated with increased odds of lifetime HIV testing (OR=2.42, 95%CI [1.27, 4.58], p=.007) and STI testing (OR = 2.39, 95% CI [1.26 to 4.54], p=.008) for heterosexual youth, but not for sexual/gender minorities.

**Conclusions:** Study findings highlight significant effects of sexual/gender minority status on the relationship between perceived provider sexual behavior approval and

HIV and STI testing. Specifically for heterosexual AYAs, this perception notably influences their testing behaviors. These findings demonstrate the complex dynamics of provider-client interactions and their impact on sexual health behaviors in diverse AYA populations. Findings have implications for provider training interventions.

## TUPED464

Sexual risk behavior among people living with HIV not virally suppressed in Lesotho

A. Greenleaf<sup>1</sup>, L. Blakely<sup>2</sup>, F. Ndagije<sup>3</sup>, C.-H. Shrader<sup>4,5</sup>, D. Reed<sup>5</sup>, S. Saito<sup>1</sup>  
<sup>1</sup>ICAP at Columbia University, New York, United States, <sup>2</sup>Columbia University Mailman School of Public Health, Department of Population and Family Health, New York, United States, <sup>3</sup>ICAP at Columbia - Lesotho, Maseru, Lesotho, <sup>4</sup>Arizona State University, College of Nursing and Health Innovation, Tempe, United States, <sup>5</sup>Columbia University Mailman School of Public Health, Department of Epidemiology, New York, United States

**Background:** As more people living with HIV (PLHIV) take antiretrovirals (ARVs), new HIV acquisitions may increasingly stem from PLHIV who are on ARVs but not virally suppressed or unaware of their status. We compared sexual behaviors among PLHIV on ARVs who are virally suppressed and unsuppressed, as well as PLHIV unaware of their status in Lesotho.

**Methods:** We used data from the Lesotho Population-based HIV Impact Assessment, a population-based, nationally representative HIV survey conducted from December 2019 to March 2020.

Among the 15,349 respondents, 3,686 PLHIV were included in the analysis and divided into three groups: PLHIV who were virally suppressed (PLHIV-VS), PLHIV who were not virally suppressed but aware of their status during the survey (PLHIV-nVS), and PLHIV who were not virally suppressed because they were unaware of their status during the survey (PLHIV-unaware).

All analyses were weighted to account for complex survey design.

**Results:** Overall, 81 percent of PLHIV were virally suppressed (N=3,039), 9.5% were PLHIV-nVS (N= 332) and 9.5% were PLHIV-unaware (N= 315). Fifteen percent of PLHIV-VS had two or more sexual partners outside the household in the past 12 months, compared to 20% PLHIV-nVS and 22% of PLHIV-unaware (Figure 1).

Among PLHIV-VS, 70% used a condom with a non-marital partner in the past 12 months, PLHIV-nVS 65% and PLHIV-unaware 52%. Among those 25-34 years old, 68% of PLHIV-VS used a condom with a non-marital partner in the last 12 months, 59% PLHIV-nVS and 39% of PLHIV-unaware. Condom use with a non-marital partner did not differ by group among those ages 15-24 and 34-44.

Figure. Sexual risk behavior in the past 12 months among PLHIV in Lesotho by viral load suppression and status awareness.

**Conclusions:** In Lesotho, PLHIV-nVS exhibit high risk behaviors compared to PLHIV-VS, calling urgency to enhancing prevention with PLHIV, especially those nVS. Those unaware of their status exhibit highest risk behavior. Wide-ranging prevention and testing strategies are needed to prevent and rapidly identify incident HIV acquisition.

Mitigating the effects of gender-based violence on the HIV clinical cascade: a literature-informed framework to inform interventions

M. Cain<sup>1</sup>, J. Hegle<sup>1</sup>, L. Denhard<sup>1</sup>, V. Thorsen<sup>1</sup>, A. Laterra<sup>1</sup>, B. Adewumi<sup>2</sup>, S. Dahal<sup>1</sup>, U. Kanagasabai<sup>1</sup>, J. Logan<sup>1</sup>

<sup>1</sup>Centers for Disease Control and Prevention, Atlanta, United States, <sup>2</sup>Centers for Disease Control and Prevention, Abuja, Nigeria

**Background:** Gender-based violence (GBV), including intimate partner violence and sexual violence, is negatively associated with each component of the HIV clinical cascade (i.e., testing, treatment, and viral load suppression [VLS]). Understanding how GBV intersects with these components can help inform interventions. We sought to develop a framework that examined the relationship between GBV and these components and assess inclusion of those relationships within GBV-HIV interventions to inform future efforts.

**Methods:** First, we conducted literature reviews (1) to identify associations between GBV and HIV clinical cascade components, including mediators and moderators collapsed into themes, and (2) to assess which associations have been included in recent GBV-HIV interventions. We searched publications between 2017-2022 using terms including "violence", "HIV testing", "HIV care", and "interventions." Non-HIV interventions were excluded. Then, we developed a framework that (1) illustrates complex pathways between GBV and each HIV cascade component and (2) mapped interventions to cascade components, mediators, and moderators addressed (Figure).

**Results:** From 1,665 unique publications, we identified

52 studies that provided evidence on relationships between GBV and HIV (n= 46) or were interventions (n=6). Pathways were identified between GBV and all cascade components, and numerous mediators and moderators. Although interventions mapped to each component and mediators (health behaviors and effects, alcohol/substance use, mental health, internalized stigma, compounding trauma), coverage varied (testing = 3, treatment = 5, VLS = 2) or aspects not included (e.g., moderators of time on treatment and food insecurity; pathway between alcohol/substance use and testing).

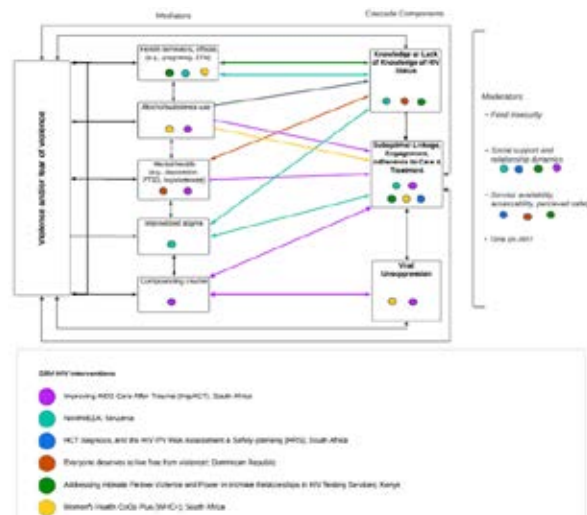

Figure 1. Mitigating the effects of gender-based violence on the HIV clinical cascade: A literature informed framework to inform interventions.

**Conclusions:** Despite the documented association between GBV and HIV, there are limited published interventions mitigating GBV effects on the HIV clinical cascade. Our framework illustrates numerous and complex GBV-HIV pathways that serve as barriers to ending HIV as a public health threat. Expansion of GBV interventions that support a person-centered approach may positively impact the entire HIV cascade.

## TUPED466

Enhancing visibility and shifting perspectives: lessons from the 'we are alike' TikTok campaign for trans communities in the HIV/AIDS context

K. Sobko<sup>1</sup>, S. Kelgembalova<sup>1</sup>

<sup>1</sup>ECOM – Eurasian Coalition for Health, Rights, Gender and Sexual Diversity (NGO), Tallinn, Estonia

**Background:** The 'We Are Alike' TikTok campaign, initiated by trans people in the EECA region, received support and implementation from the ECOM, addressed the heightened vulnerability of trans people to HIV/AIDS. In the context of the EECA region, trans communities were notably absent from targeted prevention programs. The campaign aimed to bridge this gap by increasing visibility and fostering positive attitudes towards trans individuals.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Description:** Launched in 2023, the second wave of campaign exclusively featured content created by trans people, sharing personal experiences and insights. Targeting cisgender women aged 18-35, the primary goal was to transform neutral or uninformed attitudes into positive ones. The TikTok campaign became a pivotal platform for communication, with 20 curated videos engaging users in a meaningful discourse.

**Lessons learned:** The campaign's unprecedented success included 5 million views and 3.2 million unique users. The TikTok platform facilitated over 14,000 comments, creating a space for dialogue. Lessons learned include the effectiveness of user-generated content in challenging stereotypes and the importance of ongoing engagement in changing perceptions. The campaign not only increased visibility but also initiated constructive conversations, establishing itself as a valuable resource for information dissemination.

**Conclusions/Next steps:** The findings underscore the significance of utilizing social media for advocacy and awareness in HIV/AIDS prevention, particularly for marginalized communities. The campaign's success in challenging perceptions and fostering dialogue highlights its potential as a model for future initiatives. Moving forward, sustaining the TikTok platform as an ongoing space for interaction is crucial for continued impact. The 'We Are Alike' campaign sets a precedent for leveraging social media in the broader context of public health campaigns, emphasizing the importance of user-driven narratives in promoting inclusivity and understanding.

## TUPED467

Predictors of adolescent fatherhood in Kenya: a retrospective study using the Kenya demographic health surveys

A. Chory<sup>1,2,3</sup>, K. Bond<sup>3,4,5</sup>, N. Chukwueme<sup>3</sup>, E. Apondi<sup>6,7</sup>, K. Knapp<sup>3</sup>

<sup>1</sup>Arnold Institute for Global Health, New York, United States, <sup>2</sup>Icahn School of Medicine at Mount Sinai, New York City, United States, <sup>3</sup>New York Medical College, Valhalla, United States, <sup>4</sup>City University of New York School of Medicine, New York, United States, <sup>5</sup>Yale University School of Public Health, New Haven, United States, <sup>6</sup>Moi Teaching and Referral Hospital, Eldoret, Kenya, <sup>7</sup>Academic Model Providing Access to Healthcare (AMPATH), Eldoret, Kenya

**Background:** Sexual debut in adolescence presents new challenges and risks of pregnancy and STIs and is associated with the highest HIV risk burden among all age groups globally. While adolescent pregnancy and motherhood have been heavily explored, there remains a critical gap in understanding the circumstances and risk factors for adolescent fatherhood, especially in the context of African countries where the burden of adolescent HIV infection is highest.

**Methods:** This study utilized an observational cross-sectional analysis using deidentified data from the 2022 Kenya Demographic Surveys (KDHS) to identify the predictors of early fatherhood among Kenyan males. Participants were included in this analysis if they self-identified as male, had a biological child by the time they were 24 years old, and were 25 years old or younger at the time of the survey.

The study employed descriptive, bivariate, and multivariate analyses to explore the trends and patterns of adolescent fatherhood, with specific responsiveness to demographic, knowledge, behavior, and household structure domains.

**Results:** The prevalence of adolescent fatherhood in the KDHS sample was 3%, of which 7.5% reported living with HIV. Adolescent fathers (n=439) mostly commonly lived in rural settings (63%), had primary (36%) or secondary (45%) education and held manual labor jobs (45%). Bivariate analysis show a statistically significant relationship between adolescent fatherhood and experiences of emotional (p=0.03) and physical violence (p<0.00) and living with or being married to your sexual partner (p<0.00). Multinomial logistic regression revealed that adolescent fathers were more likely to have good contraception knowledge (OR=1.89, p=0.058), to have three or more lifetime sexual partners (OR=2.52, p=0.008), and to have previously tested for HIV (OR=3.4, p<0.00); they were less likely to have a female head of household (OR=0.46, p=0.034) or to have used a condom during their last sexual encounter (OR=0.32, p<0.00).

**Conclusions:** These findings emphasize the importance of providing comprehensive services that are tailored to the needs of young people, especially in terms of integrating HIV and other sexual and reproductive health care for this vulnerable population.

## TUPED468

Sexual behaviors and vulnerability to HIV among adolescent girls and young women in Cameroon

J.J. Ndenkeh<sup>1</sup>, Z. Ni<sup>2</sup>

<sup>1</sup>Yale University, School of Nursing, New Haven, United States, <sup>2</sup>Yale University, Center for Interdisciplinary Research on AIDS (CIRA), New Haven, United States

**Background:** Adolescent girls and young women (AGYW) are one of the population groups most affected by HIV in Cameroon, emphasizing the necessity for context-specific and targeted preventive strategies. Therefore, this study aimed to assess sexual behaviors and their social determinants among AGYW in Cameroon.

**Methods:** A cross-sectional study was conducted among 637 AGYW in Yaounde, Cameroon, from February through June 2023. An online survey was utilized to collect AGYW's sexual behaviors and vulnerability to HIV as well as their history of sexually transmitted infection (STI) diagnosis,

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

HIV testing history, and awareness of pre-exposure prophylaxis (PrEP). Data were analyzed using R software, employing descriptive statistics and logistic regression.

**Results:** The mean age of participants was 22 ( $\pm 3$ ) years, of whom 84.9% had received secondary education or above and 6% identified as sexual minorities, such as bisexual and lesbian. Among the 637 AGYW surveyed, 25.3% reported the likelihood of having condomless sex with multiple partners in the next 12 months, 43.8% reported the likelihood of condomless sex with someone of unknown HIV status, and 22.4% reported the likelihood of condomless sex with someone known to be HIV positive but with unknown treatment status.

Additionally, the percentages of participants who reported having been diagnosed with the following STIs within the past six months were: chlamydia (15.7%), gonorrhoea (3.3%), syphilis (5.7%), hepatitis B (15.9%) and hepatitis C (8.2%). Furthermore, 32.8% of AGYW reported having tested for HIV within the past 12 months and 19% had heard of PrEP.

Vulnerability to HIV was more likely among AGYW who identified as bisexual or lesbian ( $aOR=2.04$ , 95% CI=1.05–3.98), those with primary or no education ( $aOR=1.87$ , 95% CI=1.08–2.65) and those who were employed ( $aOR=1.63$ , 95% CI=1.09–2.42).

**Conclusions:** The study findings highlight the vulnerability of AGYW to HIV in Cameroon. There is a critical need to initiate sexual education and innovative interventions focusing on promoting condom use and PrEP uptake among AGYW, particularly among sexual minorities and individuals with lower education.

## TUPED469

### Male sex workers: a neglected community in HIV intervention programs

M. Benjwal<sup>1</sup>, S. Negi<sup>1</sup>, L. Lankesh<sup>1</sup>

<sup>1</sup>The Humsafar Trust, Advocacy and Health, Mumbai, India

**Background:** India's national HIV response has not adequately included Male Sex Workers (MSW) as a key population requiring special attention. The HIV burden among these sex worker groups is increasing, and the COVID-19 pandemic has possibly increased their vulnerability. MSWs are extremely diverse populations across India, there is little research and understanding available about their way of working, social environment, and mental wellbeing, including their HIV vulnerability and livelihood challenges.

The learnings are gathered from evidence from an innovative virtual HIV intervention project in India - 'NETREACH', implemented by The Humsafar Trust, Mumbai.

**Description:** MSWs offer sex to most men and women, regardless of their sexual orientation. Because of their involvement with both men and women, they are at higher risk. Also, when comparing the inclusion of FSWs in the HIV

response programs, MSWs are not adequately represented. Understanding their needs is essential at a policy level to assess health, especially Sexual health and social welfare-related services. Project NETREACH functions in virtual spaces such as Dating Apps, Social media groups, and WhatsApp groups. Over 500 MSWs have been reached across India and were provided with HIV-related information which motivated them to access HIV-related services.

#### Lessons learned:

- Sex workers in India continue to be a marginalized group and are subjected to stigma and discrimination, which acts as a barrier to accessing health care services.
- Through a specialized targeted approach, we have been able to connect with the MSW's operation in online spaces.
- It is important to work around the issues of mental health and self-acceptance so that the intervention can be strengthened.

**Conclusions/Next steps:** The current National program should be strengthened to incorporate the specific needs of the Male sex worker community.

## TUPED470

### "Adolescents will always be adolescents": nurses' experiences of adolescent engagement in HIV healthcare in South Africa

J. Kelly<sup>1</sup>, M. Low<sup>1</sup>, C.D. Glinski<sup>1</sup>, C. Laurenzi<sup>1,2</sup>, L. Gittings<sup>3,1</sup>, P. Myende<sup>4</sup>, R. Joska<sup>4</sup>, H. Mangqalaza<sup>1</sup>, B. Gqaleni-Ntozonke<sup>5</sup>, B. Taleni<sup>5</sup>, Z. Marikeni<sup>5</sup>, L. Sidloyi<sup>5</sup>, B. Saliwe<sup>5</sup>, E. Toska<sup>1,6</sup>

<sup>1</sup>University of Cape Town, Centre for Social Science Research, Cape Town, South Africa, <sup>2</sup>University of Stellenbosch, Institute for Life Course Health Research, Stellenbosch, South Africa, <sup>3</sup>University of Western Ontario, School of Health Studies, London, Canada, <sup>4</sup>University of Cape Town, Department of Psychology, Cape Town, South Africa, <sup>5</sup>Oxford Research South Africa, East London, South Africa, <sup>6</sup>University of Oxford, Department of Social Policy and Intervention, Oxford, United Kingdom

**Background:** Nurses' interactions with adolescents and young people (AYP) can shape their health behaviours, including their willingness to access and engage with HIV and sexual and reproductive (SRH) health services. There has been little research from low- and middle-income contexts exploring nurses' firsthand perspectives regarding their relationships with AYP in this setting.

This study focused on the perspectives, experiences, and strategies of nurses working with AYP in government health facilities of the Eastern Cape province of South Africa.

**Methods:** Semi-structured interviews were conducted with n=20 nurses (16 women, 4 men) providing HIV and SRH-related services to AYP based at public health fa-

Oral  
abstracts

exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

cilities in urban, peri-urban, and rural areas in a health district of the Eastern Cape. Interviews took place in mid-2022 and data were analysed using an inductive thematic approach.

**Results:** While many nurses described the challenges of AYP in an empathic way and expressed a desire to engage with them productively, they found it "difficult to break through [to] them".

Nurses linked this difficulty to the shame that AYP feel when discussing HIV concerns, noting that the "stigma [is] still there", but also to AYP having "attitude", being "impatient", and "not listening".

Nurses also expressed gendered views on adolescent boys' and girls' engagement with HIV-related services, expressing that "boys are shells" and avoid coming to the clinic, while girls will come to the clinic but "don't listen".

Findings highlight that while nurses care about providing quality services to AYP, they may be influenced by societal stigma and internal biases that impact their willingness to support AYP within the context of HIV and SRH-related service provision.

**Conclusions:** Nurse-adolescent engagements within HIV and SRH-related healthcare provision are complex. They call for a holistic approach that acknowledges the need to address historically neglected systemic and structural challenges within the health sector, as well as the need to strengthen interpersonal relationships to create a more responsive healthcare environment for AYP.

Findings highlighted several opportunities for improving the delivery of HIV and SRH-related health services. Age and context-specific interventions, confidential service provision, and support programmes for nurses focused on compassionate care are needed.

## TUPED471

Changes in young women's relationships with male partners during the Chak a Chaka economic empowerment project in Western Kenya

J. Farley<sup>1</sup>, O.-M. Daniel<sup>2</sup>, M. Buyu<sup>2</sup>, P. Osumba<sup>2</sup>, A. Scott<sup>1</sup>, L. Mueller Scott<sup>1</sup>

<sup>1</sup>PATH, Seattle, United States, <sup>2</sup>PATH, Nairobi, Kenya

**Background:** Over a 30-month period from 2021-2023, the PATH-led Chak a Chaka program supported 1,225 DREAMS-graduated young women in western Kenya to form savings groups and build financial capability to address structural barriers that increase vulnerability to HIV among young women, while concurrently facilitating health education and services.

**Description:** The program conducted 5 focus group discussions (FGDs) among 60 young women participants to understand the program's impact on participants' relationships with male partners, gender-based violence (GBV), health self-efficacy in relationships, and perceived roles in their relationships as related to their gender.

**Lessons learned:** FGD participants highlighted positive changes in their relationships with male partners and increased gender equity as their financial independence increased. Prior to Chak a Chaka, many participants noted being shut out of household decision-making.

As their personal financial power grew, many reported openly sharing their finances, joint expense planning, and making financial and other household decisions with their partners. Most FGD participants said quarrels with male partners had decreased. Women with partners said that with increased financial independence, they could speak up about male partner behavior that they found unacceptable.

One participant shared: "Once a man realizes you depend on him on everything, he can come back home anytime he wants. I have a voice to stop this behavior of coming home late and this is because he respects me."

Single women or women with multiple partners no longer had to engage with multiple sexual partners to obtain money or lines of credit, and could be more selective with men whom they were romantically/sexually involved with.

Through Chak a Chaka health sessions, participants also learned about negotiating pre-exposure prophylaxis (PrEP) and condom use in relationships and gained accurate information about previously held misconceptions, such as not being able to use PrEP as a married couple.

**Conclusions/Next steps:** Increased financial independence enabled more autonomy and decision-making power in relationships among young women, and the ability to negotiate for safer sex practices, including PrEP and condom use, monogamy, and less transactional sex. Economic empowerment initiatives among adolescents and young women can contribute to positive dynamics in relationships that can combat HIV transmission.

## TUPED472

Evaluating change in sexual behaviors and characteristics among adolescent girls and young women receiving peer-delivered pre-exposure prophylaxis and other sexual health services in Kisumu, Kenya

L. Ochieng<sup>1</sup>, V. Omollo<sup>1</sup>, B. Rono<sup>1</sup>, K. Oware<sup>1</sup>, L. Garrison<sup>2</sup>, J. Haberer<sup>2,3</sup>, E.A. Bukusi<sup>1,4</sup>

<sup>1</sup>Kenya Medical Research Institute, Centre for Microbiology Research, Kisumu, Kenya, <sup>2</sup>Massachusetts General Hospital, Boston, United States, <sup>3</sup>Harvard Medical School, Boston, United States, <sup>4</sup>University of Washington, Seattle, United States

**Background:** Adolescent girls and young women (AGYW) contributed about 27% of new HIV acquisition in Kenya in 2021. Understanding their sexual behaviors and characteristics is important for developing strategies to reduce HIV transmission and promote their sexual health. We

assessed change in sexual behaviors and characteristics among AGYW receiving community-based, peer-delivered PrEP and other sexual health services.

**Methods:** AGYW aged 16-24 who initiated PrEP in two public clinics in Kisumu Kenya were offered peer-delivery of PrEP refills, testing for sexually transmitted diseases, and contraceptive options. Participants completed surveys at baseline and Month 6, assessing their demographic and sexual behavioral characteristics. We compared these factors by paired t-tests.

**Results:** Seventy-five AGYW participated with a median age of 21.6 years (IQR 20.7, 23.1) and a median year of completed education of 12 (IQR 12, 14). The majority were students (55% [41/75]) and had moderate or severe depression symptoms (56% [42/75]). Comparing baseline to Month 6, decreases were seen in the following behaviors: alcohol use (21% [16/75] vs 8% [6/71],  $p=0.03$ ), transactional sex (64% [48/75] vs 18% [13/71],  $p<0.001$ ), partners of unknown HIV status (76% [57/75] vs 27% [19/71],  $p<0.001$ ), median number of sexual partners IQR (2(1,3) vs 1(1,2),  $p<0.001$ ). There was no significant change in proportion of contraceptive users ([25/71]36% vs [33/71] 46%,  $p=0.1701$ ) and in condom use with both main and casual partners ( $p=0.89$ ) and ( $p=0.20$ ) respectively.

Factors	Baseline	Month 6	p-value
N	75	71	
Number of sex partners, median (IQR)	2.0 (1.0, 3.0)	1.0 (1.0, 2.0)	<b>&lt;0.001</b>
Casual partner, median (IQR)	1.0 (0.0, 2.0)	0.0 (0.0, 1.0)	<b>&lt;0.001</b>
Sexual partners of unknown HIV status	57(76%)	19(26%)	<b>&lt;0.001</b>
Contraceptive use	25(33%)	33(46%)	<b>0.1701</b>
Alcohol use	16 (21%)	6 (8%)	<b>0.030</b>
Transactional sex	48 (64%)	13 (18%)	<b>&lt;0.001</b>
<b>Condom use with main partner</b>			<b>0.89</b>
All the time	6 (11%)	5 (11%)	
Not at all	27 (51%)	22 (47%)	
Sometimes	20 (38%)	20 (43%)	
<b>Condom use with casual partners</b>			<b>0.20</b>
All the time	6 (18%)	6 (29%)	
Not at all	10 (29%)	2 (10%)	
Sometimes	18 (53%)	13 (62%)	

Table 1. Sexual behaviours and characteristics at baseline and month 6.

**Conclusions:** These findings indicate that the delivery model has the potential to positively impact the sexual behaviors and characteristics among AGYW and can be used in promoting safer choices among this demographic, ultimately contributing to improved overall health outcomes. Future studies should explore the long-term impact of the model and whether it may have broader health benefits to optimize its effectiveness while also assessing if the positive effects are sustainable.

## TUPED473

### Sex work, drug use, and HIV among adolescent girls in fishing communities: intersectionality and social determinants

E. Adiibokah<sup>1</sup>, H. Tagoe<sup>1</sup>, Y.A. Abdul Rahman<sup>1</sup>, H. Nagai<sup>1</sup>

<sup>1</sup>JSI, Takoradi, Ghana

**Background:** Adolescent girls aged 15 to 19 who engage in sex work and drug use in the fishing communities of the Western region, Ghana, face multiple and intersecting forms of vulnerability that increase their risk of HIV infection. Poverty, migration, violence, stigma, and lack of access to health and social services are some of the factors that shape their lives and health outcomes.

This study explores the nexus between sex work and drug use adolescent girls aged 15 to 19 in the fishing communities of the Western region, Ghana.

**Methods:** This study used a qualitative approach informed by the theories of intersectionality and the social determinants of health to explore the nexus between sex work and drug use among adolescent girls in the fishing communities of Ghana.

The study employed purposive sampling to select four fishing communities with a high prevalence of sex work and drug use among adolescent girls. Data were collected from 10 gatekeepers and from 13 adolescent girls through in-depth interviews. The data were analyzed using thematic content analysis with NVivo 12 software.

**Results:** The study found that adolescent girls started sex work around the age of 13, influenced by peer pressure and poverty. Drug use was prevalent, with participants transitioning from cigarettes and alcohol to harder drugs like marijuana and opioids. Drug use often led to risky sexual behaviors and hindered their ability to negotiate safe sex practices, including condom use.

**Conclusions:** This abstract explores how sex work and drug use affect the vulnerability to HIV among adolescent girls in the fishing communities of Ghana. Using qualitative methods and the theories of intersectionality and the social determinants of health, the study finds that adolescent girls face multiple and intersecting forms of vulnerability, such as poverty, migration, violence, stigma, and lack of access to health and social services.

The study recommends targeted interventions for adolescent girls within an intersectoral approach involving the Ministry of Gender, Children, and Social Protection and the National AIDS response. The paper also suggests more research on this topic in different settings and contexts.

## Sexualities and sexual cultures: Meanings, identities, norms and communities

### TUPED474

'This is not really Filipino terminology': who are  
men who have sex with men in the Philippines?

B.M. Hollingshead<sup>21</sup>, G. Dowsett<sup>21</sup>, A. Bourne<sup>22</sup>

<sup>1</sup>Australian Research Centre in Sex, Health and Society, La  
Trobe University, Melbourne, Australia, <sup>2</sup>Burnett Foundation  
Aotearoa, Auckland, New Zealand, <sup>3</sup>UNSW Australia, Centre  
for Social Research in Health, Sydney, Australia, <sup>4</sup>UNSW  
Australia, Kirby Institute, Sydney, Australia

**Background:** The HIV epidemic in the Philippines has been  
expanding over the last fifteen years, and men who have  
sex with men (MSM) account for most new diagnoses.  
Globally, use of the term MSM has intended to be more  
inclusive, shift the focus to sexual behaviour, be less cul-  
turally defined, and incorporate men who do not identify  
with any sexual category in relation to their sexual activi-  
ties but have sex with men. Yet, the term has also avoided  
engaging with diverse local understandings of and terms  
for sex between men.

While contentions with the term are not new, this current  
epidemiological moment in the Philippines necessitates  
revisiting conceptualisations of MSM, examining how this  
epidemiological category has been deployed, interpret-  
ed and used to produce knowledge about the HIV epi-  
demic.

**Methods:** Research was conducted in Manila, the Philip-  
pines, from July 2018 to April 2019. Twenty key-informant  
interviews with healthcare workers, researchers and pol-  
icymakers were conducted, alongside three focus group  
discussions with seventeen participants from communi-  
ty-based HIV organisations.

These explored understandings of:

1. Those whom participants regarded as vulnerable to  
HIV;
2. The social contexts that influence HIV transmission; and
3. How these have influenced who is targeted for health  
promotion and policy.

**Results:** Risk category terms such as MSM were argued  
to be 'not really Filipino terminology', and participants in  
this study still reported discomfort with its use. MSM was  
adopted by some as an identity; however, the term was  
actively rejected by others.

Often the use of the term included trans women and  
others assigned male at birth. Some participants viewed  
MSM as a single homogeneous risk group, an imagined  
community of 'discreet' men, or an unknowable popula-  
tion dispersed in the general population.

**Conclusions:** The ways in which the term MSM was used  
were varied and imprecise, impacting on who was under-  
stood to be vulnerable to HIV, and how health promotion

was targeted. While this imprecision created confusion,  
there was also value in 'targeting' MSM in a variety of  
ways to reach a population that is diverse in its vulnera-  
bilities, and acknowledge the different social contexts in  
which MSM pursue sex and manage risk.

### TUPED475

Strategic implementation of proactive  
interventions for enhancing HIV screening  
utilizing Oral Fluid Testing (OFT) kits among  
substance-using female sex workers in Yala  
Province, Thailand

N. Kanerat<sup>1</sup>

<sup>1</sup>APASS Thailand, Sathorn, Thailand

**Background:** The APASS team's engagement with drug  
users in the three southern border provinces revealed a  
significant gap in HIV testing among female sex workers  
who use drugs. The intersection of drug use and sex work  
poses dual risks, compounded by a lack of awareness re-  
garding government service limitations and pervasive  
stigmas. These challenges deter service utilization and  
contribute to societal and community discrimination,  
particularly in the predominantly Thai and Muslim popu-  
lation of the southern border area.

This study aims to extract valuable insights from the im-  
plementation of HIV testing and harm reduction strat-  
egies among female sex workers engaged in drug use  
within the three southern border provinces of Thailand.

**Description:** Since 2021, APASS Thailand has been deliver-  
ing mobile clinic services through a collaborative effort  
between government and non-governmental organiza-  
tions. The service management model includes health  
examinations and the provision of HIV screening using  
Oral Fluid Testing (OFT) Ash IV test kits at the workplace or  
designated appointments.

This approach ensures flexibility for service personnel, ad-  
dressing concerns related to service times and providing  
preliminary screening and psychological counseling for  
interested individuals.

**Lessons learned:** Between 2021 and 2023, APASS success-  
fully reached 346 female sex workers, with 92.77% (321 in-  
dividuals) undergoing HIV screening using the OFT test kit.  
Of these, 0.62% (2 individuals) exhibited a reaction and  
were promptly referred for treatment. Both cases were  
confirmed as HIV-positive, leading to referrals for antiret-  
roviral medication and continuous follow-up. All 346 cases  
received ongoing support, including information on harm  
reduction, HIV prevention, and mental health counseling.

#### Conclusions/Next steps:

The proactive provision of mobile clinics for HIV screen-  
ing, employing OFT test kits, has proven instrumental in  
overcoming barriers faced by female sex workers who use  
drugs. By creating a safe and friendly environment, free  
from stigma and discrimination, this approach ensures

consistent, timely, and lifestyle-compatible services. The comprehensive support, including peer-to-peer services, distribution of protective equipment, and continuous follow-up, constitutes an important and effective strategy tailored to the specific needs of women engaged in substance use.

## TUPED476

### Emerging virtual sexual networks and implications for implementation of online HIV prevention interventions: a qualitative study among transgender women in India

V. Loganathan<sup>1</sup>, R. Nelson<sup>1</sup>, S. Sayyed<sup>1</sup>, R. Chhetri<sup>1</sup>, M. Shunmugam<sup>1</sup>, V. Chakrapani<sup>1</sup>, S. Rawat<sup>2</sup>, A.K. Srikrishnan<sup>3</sup>, P. Saha<sup>4</sup>, S. Panda<sup>4</sup>, J. Mukherjee<sup>4</sup>, S. ul Hadi<sup>4</sup>, K. Ondeng'e<sup>5</sup>, Y.W. Machira<sup>5</sup>, A. Sebastian<sup>6</sup>

<sup>1</sup>Centre for Sexuality and Health Research and Policy (C-SHARP), Chennai, India, <sup>2</sup>The Humsafar Trust, Mumbai, India, <sup>3</sup>YRG CARE, Chennai, India, <sup>4</sup>IAVI, Gurugram, India, <sup>5</sup>IAVI, Nairobi, Kenya, <sup>6</sup>National Institute of Advanced Studies (NIAS), Bengaluru, India

**Background:** Few studies from India have investigated how virtual platforms are used by key populations, especially transgender women (TGW), for socialization and finding partners. These virtual networks can be potential platform for introducing HIV prevention interventions as current interventions are based on traditional physical outreach.

We aimed to understand the nature, characteristics and dynamics of emerging virtual sexual networks.

**Methods:** We conducted a qualitative study between January and June 2023 among TGW in three metropolitan cities in India: Chennai, Mumbai and Delhi. Twelve focus group discussions (FGDs) and 12 in-depth interviews (IDIs) among TGW and 6 key informant interviews (KIs) were conducted among community agency leaders and project managers.

A purposive sample of TGW (e.g., sex workers, those who use both physical and virtual platforms, those who exclusively use virtual platforms) were recruited through partner agencies and peers.

Transgender women's familiarity with and access to and use of digital networking spaces and associated risk and protective behaviors were explored. Thematic analysis was conducted.

**Results:** The mean age of FGD and IDI participants (n=96) was 26 years (D 4.8) and 8% reported as living with HIV. The self-identifications included: transgender women-39% and other ethnic identities (*Thirunangai*-31%, *Hijra*-26% and *Kinnar*-4%).

More than 90% of participants used virtual platforms for sexual networking and received money for having sex. Virtual platforms such as dating apps (Grindr, Blued,

etc.) and Facebook were used, especially by the younger and techno-savvy TGW, to reach paying partners during COVID-19 pandemic as offline clients decreased. Reported advantages of virtual platforms were: confidentiality, client screening/filtering and better payment negotiation and advanced payment.

However, virtual platforms posed risks as well: for example, sextortion and verbal harassment. Further, certain TGW (middle/upper socioeconomic status) use only online platforms and lack access to traditional physical outreach-based HIV interventions. TGW found the idea of introducing smartphone-based online HIV prevention interventions through WhatsApp and short videos as appealing and feasible.

**Conclusions:** HIV prevention interventions among TGW should be extended to online platforms, potentially through smartphones, and tailored to the specific needs of the diversity among TGW in terms of sex work engagement, age group, tech savviness and literacy level.

## TUPED477

### The voice within: engaging guardian riders to challenge harmful gender practices, norms and sexual violence among boda boda riders in Siaya county, Kenya

H. Ngeso<sup>1</sup>, E. Atieno<sup>1</sup>, D. Menya<sup>1</sup>, W. Otieno<sup>1</sup>

<sup>1</sup>Catholic Medical Mission Board, Siaya, Kenya

**Background:** Sexual and gender-based violence (SGBV) continues to adversely affect women in their diversities. Motorcycles (*Boda bodas*) have emerged as the preferred transport option especially in the rural areas owing to their lower fares and ability to access narrow routes.

However, their exponential increase in numbers has had associated social effects including SGBV. Various study respondents have grossly cited male *boda boda* riders among perpetrators of SGBV in their local communities. CMMB operationalized working with champion *boda boda* riders (guardian riders) to influence attitudes and practices of their colleagues.

**Description:** The guardian rider initiative aimed to change the narrative about *boda boda* riders and SGBV by placing them at the center of advocacy efforts against SGBV. Twelve guardian riders (11 male, 1 female) from 12 local bases were selected based on a structured criteria including being of good conduct, an official of their base and being part of the base disciplinary committee. They underwent training on HIV, human rights and the law, gender-based violence (GBV), and reporting mechanisms. Thereafter, they were to advocate against harmful gender norms including those exacerbating SGBV. They were to report SGBV cases perpetrated by their colleagues and were incorporated into the local violence prevention and response teams. Similarly, they facilitated transport for SGBV survivors to access post violence care services.

Author Index

**Lessons learned:** For nine months, the 12 guardian riders organized for a sensitization session for their base mates of about 15 - 20 members per base on various aspects of HIV and GBV and the law. They linked their bases to community paralegals to aid in follow up and reporting of GBV cases and reported three defilement cases by their members. The alleged perpetrators were excommunicated from the bases and their particulars shared with other bases. The base members cooperated with the police in tracking of their colleague perpetrators who disappeared to evade arrest. The base disciplinary committees assisted the survivors to report the matters to the police.

**Conclusions/Next steps:** The guardian rider's initiative is a catalytic inward looking industry solution to enhance self-regulation among *boda boda* riders on harmful gender norms and practices including SGBV committed by their members.

## Implementation science and scale up of HIV testing

### TUPEE478

Enforcing non-discriminatory codes by  
HIV/STI prevention service provider  
organizations contributes to HIV/STI service  
uptake by Trans, Gender Non-conforming,  
WSW and MSM living with HIV In Uganda:  
a midterm report 2018-2023

T. Muyunga-Mukasa<sup>1,2,3,4,5,6</sup>

<sup>1</sup>Advocacy Network Africa (AdNetA), TB/HIV/Malaria/  
Hepatitis/Long COVID-19 Prevention Focal Point, Nairobi,  
Kenya, <sup>2</sup>MIGRANANA DBA Africa Associations Against AIDS  
in the Americas (AAAAA), Newcomer Self-Determination  
and Life Planning Skills Support Desk, Washington DC,  
United States, <sup>3</sup>Most At Risk Populations' Society in  
Uganda (MARPS In Uganda), Transgender, Gender  
Non-Conforming, WSW and MSM Quality Health  
Outcomes, Kampala, Uganda, <sup>4</sup>Ngalo Southern Africa  
Healthcare And Development Organization, HIV/TB Co-  
Morbidity Surveillance Among Women, Young Girls,  
Adolescents and Children, Pretoria, South Africa, <sup>5</sup>Regis  
College, College of Health Science, Lawrence, United  
States, <sup>6</sup>Public Health Steering Team-Uganda, Response  
to AIDS Epidemic Eradication Through Knowledge Hubs  
And Inclusivity (RAKAI), Kampala, Uganda

**Background:** The Anti-Homosexuality Act, 2023 (AHA), prohibits aiding and abetting Transgender (TG), Gender-Non Conforming (GNC), Women-who-have-sex-with-women (WSW) and Men-who-have-sex-with-men (MSM) living with HIV and the newly infected in seeking care. Longitudinal HIV sero-conversion and viral suppression studies integrating STI prevention led by institutions enforcing non discrimination promote heterogeneity among health seekers and CBOs enhancing bonding, providing strategic wellness pedagogy, social-economic transformative opportunities catalyze participation in the uptake of HIV/STI services. AHA disrupts early ART initiation. Yet, early ART initiation contributes to breaking the progression and transmission of HIV; reduced morbidity and mortality. Our study examined the benefits of allies in navigating the restrictive anti-gay socio-cultural-politico-legal contexts in Uganda; factors associated with joining Viable CBOs; early ART initiation targeting TG, GNC, WSW and MSM with HIV in Central and Southern Uganda. This mixed cross-sectional study involved 600 adults living with HIV between March 2018-November 2023.

**Methods:** Qualitative and quantitative data were collected using interviewer-administered questionnaires and desk reviews using a data extraction tool. A binary logistic

regression using a hierarchical modelling technique was used at the multivariable level to determine associations at a 95% confidence interval and  $p < 0.05$  using SPSS Statistics software version 23.0.

Overall, 600 participants were enrolled in the study but only 573 remained because they met the criteria of proximity within Masaka Sub-region. The other 27 were attached to another arm of the study in Acholi Sub-region.

**Results:** There is an association between being part of the Viable Support CBOs, linkage to care, early ART initiation, adherence and keeping HIV clinic appointments. The results revealed similar outcomes:

Membership to support groups ( $aOR = 10.85$ , 95% CI: 3.04–32.08); linkage to the HIV clinic the same day HIV test was conducted ( $aOR = 10.85$ , 95% CI: 3.04–32.08); early ART initiation ( $aOR = 10.82$ , 95% CI: 3.04–32.08); adherence to HIV clinic appointments ( $aOR = 10.72$ , 95% CI: 3.04–32.08).

**Conclusions:** Early ART initiation, motivation to engage in the HIVAIDS programming and scaling up same-day ART initiation policy contribute to better outcomes.

Systems, structures and organizations enforcing non-discriminatory codes countering social-cultural barriers contribute to uptake of HIV/STI services.

Peer-to-Peer key population-led organizational  
capacity building to scale differentiated HIV  
service delivery in Asia

A. Arunmanakul<sup>1</sup>, S. Mills<sup>1</sup>, T. Sattayapanich<sup>1</sup>,  
K. Samitpol<sup>2</sup>, P. Patpeerapong<sup>3</sup>, T. Prasarnpim<sup>4</sup>,  
P. Rattakittvijun Na Nakorn<sup>5</sup>

<sup>1</sup>FHI 360, EpiC Thailand, Bangkok, Thailand, <sup>2</sup>Institute of  
HIV Research and Innovation, Tangerine Clinic, Bangkok,  
Thailand, <sup>3</sup>MPLUS Foundation, Chiang Mai, Thailand,  
<sup>4</sup>Rainbow Sky Association of Thailand, Bangkok, Thailand,  
<sup>5</sup>United States Agency for International Development,  
Bangkok, Thailand

**Background:** HIV biomedical or behavioral innovations are typically introduced by international organizations that provide capacity building. We introduced an alternative by supporting experienced local key-population (KP)-led health service (KPLHS) organizations in Thailand to provide capacity building to organizations on HIV innovations in multiple countries in Asia.

**Description:** Using a continuous quality improvement approach, four organizations in Thailand— the Institute of HIV Research and Innovation (IHRI), MPLUS, Rainbow Sky Association of Thailand (RSAT), and Service Workers in Group Foundation (SWING)— transferred knowledge and skills in innovations related to pre-exposure prophylaxis (PrEP), transgender-competent care, integration of substance use and mental health services, and use of electronic mapping systems to identify hotspots to several organizations throughout Asia.

**Lessons learned:** Since 2020, this peer-to-peer organizational collaboration across Asia has facilitated HIV service scaling, with more than 1,262 service providers and community health workers capacitated together with multiple measurable outcomes. For example:

1. In Laos, collaborative efforts among IHRI, MPLUS, and organizations in Laos launched PrEP services in 2021, incorporating national guidelines and, importantly, virtual telehealth trainings during the COVID-19 pandemic. MPLUS specifically partnered with CHIs, resulting in targeted online demand generation for PrEP and enrolling 1,197 clients since the launch. Additionally, RSAT supported CHIs to expand its outreach program to key populations engaging in chemsex.

2. SWING collaborated with PEDA in Laos to develop the PEDA Spot electronic mapping tool in FY22, facilitating routine mapping updates and identifying 968 additional female sex workers in 153 hot spots for HIV testing.

3. In Burma, virtual technical assistance during COVID-19 from IHRI to Lan Pya Kyel (LPK) enabled the establishment of two transgender-specific clinics, Ma Baydar and Daisy, through a consultative process with the transgender community to design their own services.

These clinics now conduct HIV testing for more than 2,000 transgender women annually.

**Conclusions/Next steps:** South-to-south collaboration among Asian KPLHS organizations and other implementers can efficiently boost HIV innovation scale-up in culturally and socially similar countries. This approach enables both provider and recipient organizations to collaboratively identify shared barriers and issues, devise solutions and key strategies, and continuously engage to monitor quality and scale-up.

## TUPEE480

Improving access to ANC and PMTCT services in Osun State, Southwest Nigeria: the community PMTCT approach

D. Adetoye<sup>1</sup>, O. Ogunsola<sup>1</sup>, O. Elujide<sup>2</sup>, J. Dada<sup>1</sup>, O. Olajide<sup>1</sup>, O. Ajayi<sup>2</sup>, I. Onwuatuolu<sup>2</sup>, J.O. Samuels<sup>2</sup>, P. Okonkwo<sup>2</sup>

<sup>1</sup>APIN Public Health Initiatives, Ibadan, Nigeria, <sup>2</sup>APIN Public Health Initiatives, Abuja, Nigeria

**Background:** Vertical transmission is almost completely preventable through the prevention of mother-to-child transmission (PMTCT). According to UNAIDS, 26.9% of all cases of MTCT of HIV in the world happen in Nigeria. Antenatal Care (ANC) and PMTCT coverage in Osun State is 27% and 26%, respectively.

Unfriendly attitudes of some healthcare workers, user fees, long waiting times, and cultural and religious beliefs are some barriers to accessing ANC services at orthodox hospitals. APIN Public Health Initiatives implemented the community PMTCT (cPMTCT) program to reach pregnant women wherever they choose.

**Description:** We assessed 40 potential community sites for service readiness to provide cPMTCT based on human resources, physical facilities, equipment, clientele, and services provided. They were categorized into three: CAT 1 is Traditional Birth Attendants (TBAs) manned by healthcare workers;

CAT 2 is TBAs manned by non-healthcare workers; and CAT 3 is Faith-Based Organizations (FBO).

Ten sites from the assessment in five local government areas were selected for the first phase of activation, made up of 4 CAT-1 and 6 CAT-2.

Using the hub-and-spoke model, we supported PMTCT services, including ANC and referral (linkage) services. We trained the TBAs and engaged roving nurses, HTS providers, and monitoring and evaluation officers. Commodities flow from the hubs to the spokes through the pull system. Data reporting is done through the National Data Repository Lite (NDR Lite), a national reporting platform similar to the NDR.

**Lessons learned:** A total of 8,978 pregnant women were reached through the cPMTCT between October 2021 and September 2022; 8,971 were tested for HIV, and 23 positives were identified. Sixteen are newly diagnosed, while seven were previously known. There was 100% linkage to antiretroviral therapy (ART). These contributed 49.8% of the new ANC attendees who knew their HIV status (PMTCT\_STAT) and 7% of the diagnosed HIV-positive pregnant women who commenced ART (PMTCT\_ART) achievements in Osun State.

**Conclusions/Next steps:** cPMTCT is a tool to improve access to and coverage of ANC and PMTCT. Good documentation will help monitor progress and inform planning. We recommend that the Federal Ministry of Health and state ministries consider adopting and scaling up this model of service provision.

## TUPEE481

Peer cyber-educators-led social media platforms strengthen case finding and ART initiation among Haitian migrants and individuals of Haitian descent in the Dominican Republic

M. Goggin-Kehm<sup>1</sup>, J. Rodriguez<sup>1</sup>, J. Michel<sup>1</sup>, A. Soto<sup>1</sup>, E. Baez<sup>2</sup>, M. Venezuela<sup>3</sup>, J. Aubourg<sup>3</sup>, C. Casalini<sup>4</sup>

<sup>1</sup>FHI360, Santo Domingo, Dominican Republic, the, <sup>2</sup>USAID, Santo Domingo, Dominican Republic, the, <sup>3</sup>Aid for AIDS, Santo Domingo, Dominican Republic, the, <sup>4</sup>FHI360, Washington DC, United States

**Background:** The Dominican Republic's national strategy aims to reach Haitian migrants and individuals of Haitian descent — defined as priority population (PP) members — with HIV services. Currently, 76% of PP living with HIV know their serological status and 54% are on treatment (PEPFAR COP21), far from the UNAIDS 95 goals. The HIV Services and System Strengthening (HS3) project and the Enhanced

HIV Services for Epidemic Control (EHSEC) project, funded by the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) through the United States Agency for International Development (USAID), offers HIV testing and treatment services to PP.

**Description:** Between October 2019 and September 2021, HS3 identified 4,399 PP living with HIV, with 5% case finding and 83% treatment initiation. Hence, HS3 consulted with PP to design innovative strategies to increase case finding and treatment initiation. Social media was selected to strengthen PP engagement in HIV services, which resulted in training and engaging 13 peer cyber educators (PCE) to identify PP through Facebook, Instagram, WhatsApp, and dating applications. Beginning in October 2021, Creole- and Spanish-speaking PCE identified PP on social media through keywords related to the Haitian community. Once the connection was established, PCE used specific messages to engage PP in HIV services, virtually navigated PP to testing sites, and provided treatment initiation support after a counselor offered HIV rapid testing.

**Lessons learned:** We analyzed retrospective clients' records from October 2021 to September 2023 using routinely collected, aggregated program data for PP ages 15 and older who received an HIV test and its result. Overall, the projects tested 78,857 PP, with 6% case finding and 96% treatment initiation. The non-social media strategy reported 6% (4,768/77,571) case finding and 96% (4,586/4,768) treatment initiation; the social media strategy reported 11% (145/1,286) case finding and 99% (144/145) treatment initiation.

**Conclusions/Next steps:** The social media strategy contributed to increasing overall case finding and treatment initiation, and it reported a case finding higher than the non-social media testing strategy.

Our study shows that the engagement of PP through social media strategies is feasible and effective in closing the gap of UNAIDS 95 goals in the Dominican Republic.

## TUPEE482

Improving early infant diagnosis testing coverage with a comprehensive quality improvement strategy in Malawi

J. Njala<sup>1</sup>, H. Chimbaka<sup>1</sup>, G. Kakwesa<sup>1</sup>, T. Banda<sup>1</sup>, H. Kanise<sup>1</sup>, M. Sanena<sup>1</sup>, D. Smith<sup>1</sup>, M. Chivwara<sup>1</sup>, J.J. Van Oosterhout<sup>1</sup>, S. Phiri<sup>1</sup>

<sup>1</sup>Partners In Hope, Lilongwe, Malawi

**Background:** The introduction of Option B+ in 2011 revolutionized HIV Prevention of Mother to Child Transmission (PMTCT), with a 7-fold increase in the number of PBFW starting ART per quarter in Malawi. However, a decade later, important challenges remain in PMTCT, including missing testing milestones in early infant diagnosis (EID). Partners in Hope (PIH) is a Malawian non-governmental organization supporting HIV care and treatment with

PEPFAR/USAID funding. During March-September 2022, the rates for EID testing in nine PIH-supported districts were insufficient with 91%, 89% and 82% at 2, 12 and 24 months post-partum milestones respectively.

**Description:** In order to increase testing coverage at EID milestones, PIH developed a comprehensive EID action plan for 9 districts. This was based on lessons from health facility-based EID quality improvement projects in Mulanje and Chikwawa districts that had demonstrated improvements after addressing specific health systems gaps.

The plan included appointment of EID focal persons at each health facility, registration of all newly-born HIV-exposed infants with their testing milestones, pre-appointment phone reminders, weekly review of individual HIV-exposed infant medical charts, advance flagging of scheduled mother-infant pair visits when EID testing is due, community tracing of infants who missed appointment within 48 hours and targeted mentoring by district and central teams.

We describe our experiences and lessons after 12 months of implementation of this intervention.

**Lessons learned:** EID testing improved across all testing milestones, in particular at 12 and 24 months (Figure 1). Frequent chart reviews, assigning a focal person and conducting targeted follow up within 48 hours of identifying children missing appointments were the main factors contributing to improved performance.

**Conclusions/Next steps:** Targeted program-wide initiatives based on lessons learnt from health facility-based quality improvement projects have the potential to improve overall program performance. Implementation of this strategy beyond EID as part of standard practice will provide further benefits.

## TUPEE483

Human centered design during war: case study of the CASI-Plus mHealth tool to optimize HIV index testing in Ukraine

N. Puttkammer<sup>1</sup>, M. Germanovich<sup>2</sup>, B. Dunbar<sup>1</sup>, A. Hubashova<sup>2</sup>, R. Melnychuk<sup>2</sup>, M. Golden<sup>3</sup>, J. Flowers<sup>4</sup>, L. Hetman<sup>2</sup>, L. Legkostup<sup>2</sup>, A. Namaya<sup>1</sup>, O. Nesterova<sup>2</sup>

<sup>1</sup>University of Washington, Department of Global Health, Seattle, United States, <sup>2</sup>Ministry of Health of Ukraine, Public Health Center, Kyiv, Ukraine, <sup>3</sup>University of Washington, Department of Medicine, Seattle, United States, <sup>4</sup>University of Washington, School of Nursing, Seattle, United States

**Background:** There are approximately 200,000 persons living with HIV (PLWH) in government-controlled territories of Ukraine, of whom only three in four know their HIV status. HIV index testing (HIT) can increase HIV case finding, but barriers include stigma in naming partners and health worker (HW) lack of time to deliver HIT services. CASI-Plus is a mHealth tool with a standardized, non-judg-

Late-breaker abstracts

Author Index

mental questionnaire through which PLWH clients can learn about HIT and identify partners for partner notification and testing.

**Methods:** This formative mHealth study took place in 2023 in two regions of wartime Ukraine. It included virtual workshops with health workers (HW) and in-person in-depth interviews with clients from vulnerable key population groups. Qualitative human-centered design methods included HIT workflow mapping, discussion of barriers to HIV testing, brainstorming CASI-Plus design features, a features prioritization game, and feedback on the design of the questionnaire and script.

**Results:** Participants included 22 HW in 3 workshops and 10 clients (6 persons who inject drugs and 4 men who have sex with men). Both HW and clients had a favorable perception of CASI-Plus, feeling it would help clients to discuss their partnerships with reduced shame: "Patients are sometimes embarrassed to admit to the doctor how many partners they have... when it's on the tablet, we won't look them in the eye, and maybe they will open up" (HW).

Clients expressed willingness to use CASI-Plus on a tablet within the clinic, and all but one expressed a preference for using CASI-Plus rather than naming partners to a HW. Clients were comfortable with encrypted SMS messaging for on-going communication with HW about partner notification and testing.

HW prioritized features centered on partner elicitation. They expressed concern about using the tool for SMS messaging with clients, additional data entry burden, and physical security of tablet devices. They favored summary displays of information about partners as reported by index clients, and expressed interest in using the summaries for their required data entry into the national HIV data system.

**Conclusions:** Our formative study yielded valuable recommendations from clients and health workers to ensure CASI-Plus is acceptable and feasible to implement in wartime Ukraine.

## TUPEE484

### Lessons learned on implementation of training, support, and mental health services for key populations in Southern, Eastern and Western Provinces of Zambia

E. Silomba<sup>1</sup>, P. Olowski<sup>2</sup>, A.O. Adebayo<sup>2</sup>, C. Baumhart<sup>3,4</sup>, T. Lascko<sup>3,4</sup>, J. Chipukuma<sup>1</sup>, L. Mwango<sup>1</sup>, K. Nkwemu<sup>5</sup>, C.W. Claassen<sup>2,3,4</sup>

<sup>1</sup>CIHEB Zambia, Lusaka, Zambia, <sup>2</sup>Maryland Global Initiatives Corporation Zambia, Lusaka, Zambia, <sup>3</sup>Center for International Health, Education, and Biosecurity, University of Maryland School of Medicine, Baltimore, United States, <sup>4</sup>Institute of Human Virology, University of Maryland School of Medicine, Baltimore, United States, <sup>5</sup>The U.S. Center for Disease Control and Prevention, Division of Global HIV and TB, Lusaka, Zambia

**Background:** Key populations (KP) in Zambia face significant marginalization due to the legal environment and fear of criminalization, which can impact their mental health (MH). The discrimination KPs encounter at health-care facilities leads to fear of, and challenges with, accessing quality and equitable care, including MH services. As part of the comprehensive wellness package, the Community Impact to Reach Key and Underserved Individuals for Treatment and Support (CIRKUIITS) project implemented a MH intervention in KP wellness centers for clients accessing HIV services in three provinces of Zambia.

**Description:** Beginning October 2021, CIRKUIITS implemented the KP Investment Fund model to support KPs in Eastern, Western, and Southern provinces through KP-led initiatives. Between October 2022 and June 2023, we mapped MH nurses, psychologists, and clinicians, to develop a referral directory and network of MH service providers. We conducted technical orientation and trained 61 HIV providers in KP sensitivity, safety, and security, along with . conducting routine MH screenings using standardized tools (PHQ-4 for depression, GAD-7 for anxiety, and CAGE for hazardous alcohol use).

All screening results were documented, and each client was classified based on the score they received- or level of severity - on the screening tools. All KP clients who were identified at the KP safe spaces as requiring additional MH services were referred to trained MH providers at the health facilities.

**Lessons learned:** Overall, 364 KPs were screened for anxiety and/or depression and 236 KPs were screened for hazardous alcohol use. Equipping healthcare workers with skills for routine MH screenings is crucial for successful implementation and referral of KPs to necessary services. Sensitivity trainings for MH service providers foster an inclusive and supportive environment for KPs to access services without discrimination and fear.

Furthermore, establishing a network of MH professionals ensures KPs have access to specialized care, creating a comprehensive support system.

**Conclusions/Next steps:** High-quality mentorship and training for providers on mental health and screening creates a friendly environment to reduce stigma and discrimination.

Collaboration with diverse stakeholders is essential for adapting MH initiatives into local contexts and broadening the positive impact on the health of KPs.

## TUPEE485

### Benefits of assisted partner notification programming in the fight of HIV and AIDS in the informal settlements of Nairobi, Kenya

P. Mokaya<sup>1,2</sup>, N. Wambua<sup>2</sup>, M. Mwangi<sup>3</sup>, H. Gabriella<sup>4</sup>

<sup>1</sup>University of Pecs, Health Sciences, Pecs, Hungary, <sup>2</sup>U-Tena Youth Organization, Management, Nairobi, Kenya, <sup>3</sup>U-Tena Youth Organization, Programming, Nairobi, Kenya,

<sup>4</sup>University of Pecs, Faculty of Health Sciences Institute of Physiotherapy and Sport Sciences, Pecs, Hungary

**Background:** Several efforts have been put in place to fight HIV and AIDS in Kenya. Several scientific studies have contributed to this fight. Sustainable financing of HIV and AIDS programming has remained a big challenge since a huge amount of money funding HIV and AIDS programs comes from international donors.

Assisted partner notification programming (aPNS) has proved to be not only efficient but also effective in identifying new testers and unknown reactive individuals. The economic and programming benefits are yet to be quantified.

**Description:** In 2023 U-Tena Youth Organization partnered with AHF Kenya to implement the Imarisha Maisha project that was implemented in the informal settlements of Nairobi Kenya. This is a one-year renewable project. Within the Rapid Testing Programme and Rapid result initiatives, assisted partner notification service (aPNS) approaches were used to reach and serve clients. HIV Testing Service providers were placed in six health care facilities where they targeted general outpatients and Antenatal care, clients.

**Lessons learned:** By the end of 2023 U-Tena achieved the following: Tested 17079 clients, identified 400 (2.34%) seropositive clients, and linked 395 (99%) reactive clients to treatment and care. In this project a total of 183 clients were followed through assisted partner notification of which 170 of them were reactive (93%) and were all successfully linked to care and treatment.

Working with the Ministry of Health ensures proper coordination and sustainability, evidence-based intervention that has robust monitoring, evaluation, and learning framework gives a clear picture of the efficiency and effectiveness of HIV programming.

In quest to carry out targeted testing and identification on new reactivities, the Assisted Partner Notification approach boosts HIV prevention and treatment efforts.

**Conclusions/Next steps:** In the era of limited resources, an assisted partner notification system forms an evidence-based (targeted) intervention in the fight of HIV programming and should be embraced within the ethics of fighting HIV and AIDS.

When offered to newly diagnosed HIV reactive client, aPNS, which involves locating and recommending HIV testing to partners of HIV-reactive clients in an ethically safe environment is an effective treatment option in a limited-resourced health care system.

## TUPEE486

### PrEP at your doorstep: revolutionizing HIV prevention for MSM and TGW with courier delivery and a mobile app for seamless access to priority medication

J. Pienaar<sup>1</sup>, S. Cooper<sup>2</sup>, S. Morris<sup>2</sup>, D. Rech<sup>2</sup>, R. Rawlinson<sup>3</sup>, V. Ncube<sup>1</sup>, M. Sibanyoni<sup>1</sup>, B. Ramashala<sup>1</sup>

<sup>1</sup>Aurum Institute, Johannesburg, South Africa, <sup>2</sup>Audere, Seattle, United States, <sup>3</sup>Careworks, Cape Town, South Africa

**Background:** Men who have sex with men (MSM) and transgender women (TGW) are at increased risk of HIV acquisition. Although Pre-exposure prophylaxis (PrEP) is effective to mitigate the disparate HIV burden among these populations, there are factors that hinder the use and uptake of this HIV prevention medication among MSM and TGW.

These factors include stigma, high costs associated with excessive travel costs for individuals, lack of privacy and confidentiality at testing centers discrimination and potentially being "outed" at clinic centers.

**Description:** To mitigate such factors, Aurum in collaboration with Audere and Careworks developed a smartphone mobile application (APP), *Silapha*, which MSM and TGW can use to request their PrEP medication refills. MSM and TGW conduct an HIV-self test in the comfort of their own spaces and upload their test result on the *Silapha* App.

Once the HIV test results have been verified to be negative by the App within seconds, clients are engaged via Careworks for the courier-based delivery of their PrEP to their preferred location. The use of the *Silapha* App resolved the need for clients to present for HTS at clinics, and facilitated their persistence on PrEP.

**Lessons learned:** The integration of an AI-powered self-testing app, telehealth counseling, and a nationwide courier service has revealed that this approach empowers clients, allowing them to take control of their HIV testing and prevention journey with confidence.

By placing a strong emphasis on accessibility, user-friendliness, and client-centricity, the initiative has made significant strides in breaking down barriers to HIV prevention. Guiding clients through the self-testing process and fa-

cilitating result-sharing with their care team ensures a streamlined and consistent access to PrEP. Moreover, the introduction of AI for result confirmations adds a layer of accuracy, reducing the chances of misinterpretation and enabling continuity of PrEP without clinic visits.

**Conclusions/Next steps:** The commitment to a stigma-free, human-centered app and result delivery system has contributed to increased usability and acceptability, fostering a positive user experience. Looking forward, the potential integration of Large Language Models (LLMs) for counseling services holds promise for further advancements, marking a continuous journey of innovation in HIV prevention strategies.

## TUPEE487

**Increasing access to HIV self-testing and sexual and reproductive health products among adolescent girls and young women by harnessing pro-sociality among drug shopkeepers in Tanzania**

C. Chiu<sup>1</sup>, L.A. Sheira<sup>2,1</sup>, E. Anderson<sup>2</sup>, C.A. Solorzano-Barrera<sup>1</sup>, A. Mnyippembe<sup>3</sup>, A. Sabasaba<sup>3</sup>, L.J. Packel<sup>1</sup>, J.X. Liu<sup>1</sup>

<sup>1</sup>University of California San Francisco, Institute for Health & Aging, San Francisco, United States, <sup>2</sup>University of California Berkeley, Epidemiology, Berkeley, United States,

<sup>3</sup>Health for a Prosperous Nation, Dar es Salaam, Tanzania, the United Republic of

**Background:** Private drug shops are convenient, one-stop shops for adolescent girls and young women (AGYW) to get HIV and sexual and reproductive health (SRH) services. In Tanzania, shopkeepers' provision of free HIV self-testing (HIVST) to AGYW conferred reputational status as health provider with no direct profit-making. Using behavioral economics insights, we tested a novel intervention harnessing shopkeepers' pro-sociality towards AGYW to encourage their distribution of free HIVST and SRH products.

**Methods:** From July 2022-July 2024, we tested the effectiveness of this intervention by cross-randomizing 158 drug shopkeepers in Shinyanga and Mwanza enrolled in a cluster-randomized trial of an intervention designed to increase the girl-friendliness of drug shops (NCT05357144). Specifically, we gave shopkeepers monthly summary reports of feedback from AGYW customers anonymously collected through post-purchase USSD-based surveys. Reports were designed to stimulate performance by appealing to pro-social motivations for helping AGYW and giving areas for improvement (*Private*). In a subset of shops, we additionally gave publicly displayed certificates of ratings and held awards ceremonies for high performers every 6 months (*Public*). In log-linear models, we examined how *Private* and *Public* feedback each affected monthly shop sales of HIVST and SRH products among AGYW, measured using electronic sales records, relative to shops receiving no feedback.

**Results:** We report preliminary results from 5,502 anonymous AGYW surveys from 103 shops. Shops receiving *Private* feedback did not increase HIVST sales (0.94, 95% CI: 0.79, 1.12), but increased SRH product sales by 50% (95% CI: 1.12, 2.02), notably pregnancy tests (39%, 95% CI: 1.10, 1.77). Shops receiving *Public* feedback did not increase HIVST sales (1.02, 95% CI: 0.86, 1.21), but increased sales to AGYW by 32% (95% CI: 1.03, 1.69), notably oral contraception (2.24, 95% CI: 1.37, 3.66), emergency contraception (1.61, 95% CI: 1.04, 2.50) and condoms (1.49, 95% CI: 1.07, 2.07).

**Conclusions:** Introducing HIVST through drug shops may increase sales of adjacent SRH products when low-cost behavioral interventions are used to harness shopkeepers' pro-sociality towards AGYW.

Future analysis from the entire study period and interviews with shopkeepers will home in on underlying intervention mechanisms to understand how to optimize HIV/ SRH integrated delivery from drug shops.

## TUPEE488

**HIV self-testing as an entry point to HIV status-neutral approach services for transgender women: experiences from real-world implementation at the Tangerine Clinic in Thailand**

P. Serkpookiaw<sup>1</sup>, R. Janamnuysook<sup>1,2</sup>, K. Samitpol<sup>1,2</sup>, K. Termvanich<sup>1</sup>, T. Amatsombat<sup>1</sup>, A. Chancham<sup>1</sup>, V. Sripoonbun<sup>1</sup>, P. Sittisatid<sup>1</sup>, K. Boontho<sup>1</sup>, N. Watthanakittikul<sup>1</sup>, K. Suttanan<sup>1</sup>, S. Jittjang<sup>3</sup>, A. Arunmanakul<sup>3</sup>, S. Mills<sup>3</sup>, N. Phanuphak<sup>1,2</sup>

<sup>1</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>2</sup>Chulalongkorn University, Center for Excellence in Transgender Health, Bangkok, Thailand, <sup>3</sup>FHI 360, Bangkok, Thailand

**Background:** HIV self-testing (HIVST) has become available through Thailand's Universal Health Coverage since October 2022 as one key strategy in controlling HIV epidemic. There was limited experience on how to integrate HIVST into existing sexual health services for transgender women.

We described HIVST service uptake and linkages to antiretroviral treatment (ART) or pre-exposure prophylaxis (PrEP) among transgender women clients of the Tangerine Clinic, a transgender-led gender-affirming sexual health clinic in Thailand.

**Methods:** From May 2022-September 2023, HIVST kits were offered to transgender women at the Tangerine Clinic and via Tangerine's telehealth instant-messaging (IM) service. Clinic-based HIVST clients received HIVST kits, pre-test counseling and a demonstration video provided by transgender peer counselors prior to performing self-test at home. Telehealth HIVST clients received HIVST kits via postal delivery. Pre-test counseling, demonstration video and self-administered behavioral risk assessment were provided via IM by transgender peer counselors.

Test-result follow-up contacts were made at one week after the clients received the kits. Clients had an option to share visual HIVST result with IM administrators for further support and linkage.

Non-reactive testers were offered PrEP via telehealth service.

Reactive testers were offered HIV confirmatory testing and ART initiation at the Tangerine Clinic or referrals to their nearest community-led clinics or registered health facilities.

**Results:** Of 262 transgender women who received HIVST kits (16% clinic-based, 84% telehealth), median (IQR) age was 26 (15-53) years, 35% were HIV first-time testers, 24% engaged in sex work.

Among those receiving kits, 185 (71%) shared their test results and 22/185 (12%) reporting reactive results. Among those with reactive results, 17 (77%) received HIV confirmatory testing and 12 (77%) had HIV infection confirmed. All 12 initiated ART, five within the same day of diagnosis. Median (IQR) CD4 count was 223 (203-330) cells/ul.

Of 163/185 (88%) non-reactive testers, 46/163 (28%) received PrEP via telehealth (80% PrEP initiation, 15% PrEP restart, and 5% PrEP continuation).

**Conclusions:** HIVST is an effective entry point to HIV status-neutral approach services for transgender women. HIVST could facilitate not only new HIV diagnosis and ART initiation but also PrEP uptake, restart, and continuation among transgender women, including those who were HIV first-time testers.

## TUPEE489

Index testing contributes escalating HIV case-finding in AIS project: a successful HIV case finding model in Myanmar

M. Kyaw Kyaw<sup>1</sup>, T.T. Win<sup>1</sup>, L. Htet<sup>1</sup>, L. Aung Thu<sup>1</sup>, K. Phyo Naing<sup>1</sup>, Y. Min Thang<sup>1</sup>, S. Lone Tip<sup>2</sup>

<sup>1</sup>Community Partners International, AIS, Yangon, Myanmar, <sup>2</sup>USAID, Yangon, Myanmar

**Background:** Myanmar is one of 35 fast track priority countries that account for 90% of new HIV transmission globally. In 2022, 270,000 people are estimated to be living with HIV in Myanmar, representing 0.9% prevalence.

The HIV epidemic in Myanmar is concentrated in Key Populations with high positivity rates in people who inject drugs (PWID), men who have sex with men (MSM), female sex workers (FSW) with HIV positive rates of 34.9% (2017), 8.8% (2019) and 8.3% (2019) by IBBS survey data.

Many of the KPs and their partners still have barriers to access HIV testing services due to stigma, discrimination, socio-economic conditions, conflicts and displacement.

To expand the reaching and testing of those people with undiagnosed HIV transmission, USADf funded AIS project implemented the Index Testing and partner notification services in Myanmar in 2021.

**Description:** Index testing is integrated in 29 HIV testing sites of AIS in 4 State and Regions of Myanmar at the end of FY23. The outcome of Index testing is analyzed by its contribution in testing population, positivity rates and case finding in 2-year AIS project implementation.

**Lessons learned:** The overall positivity rate of index testing was significantly higher in index testing (26%) than that of other model case findings (table 1). The contribution of HIV case finding by index testing increases from 8% (314/4124) in FY22 to 17% (822/4775) in FY23.

Testing modality	HIV tests	Positive results	Positive Yield
Voluntary Counseling and testing	57,779	5,492	10%
Provider Initiated testing	4,259	240	6%
Mobile testing	31,609	2,014	6%
Index testing	4,294	1,136	26%
Social Network Strategy	106	7	7%
Others	348	10	3%

Table 1: HIV Test done from October 2021 to September 2023.

**Conclusions/Next steps:** Index testing demonstrated the significant HIV case finding by attaining a high HIV positive yield in AIS project of Myanmar. The index testing is a successful HIV case-finding strategy and should be scaled up nationwide to reach the goal of 95% of people living with HIV are aware of their HIV status in Myanmar.

## TUPEE490

Addressing inequality in access to HIV testing services; and care and treatment of HIV infected patient: a case study of Bayelsa State, Nigeria

O. Ogungbade<sup>1</sup>, O. Majekodunmi<sup>2</sup>, O. Kalu-Oji<sup>3</sup>, N. Agboola<sup>3</sup>, G. Omubo<sup>4</sup>, A. Ezeadikwa<sup>5</sup>, C. Umeh<sup>2</sup>, O. Chigbundu<sup>3</sup>, B. Ochonye<sup>6</sup>, D. Ogundehin<sup>7</sup>, O. Igboelina<sup>7</sup>, O. Adegbite<sup>3</sup>

<sup>1</sup>West Africa Center for Public Health and Development (WACPHD), Strategic Information, Ikeja, Nigeria,

<sup>2</sup>Heartland Alliance Limited by Guarantee (HALG), Programs, Ikeja, Nigeria, <sup>3</sup>Heartland Alliance Limited by Guarantee (HALG), Strategic Information, Ikeja, Nigeria, <sup>4</sup>Heartland Alliance Limited by Guarantee (HALG), Strategic Information, Yenegoa, Nigeria,

<sup>5</sup>Heartland Alliance Limited by Guarantee (HALG), Programs, Yenegoa, Nigeria, <sup>6</sup>Heartland Alliance Limited by Guarantee (HALG), Programs, Abuja, Nigeria, <sup>7</sup>United State Agency for International Development, Programs, Abuja, Nigeria

**Background:** Nigeria's HIV prevalence is 1.4% with an estimated HIV burden of 1.9 million people in 2019, the fourth largest globally. Bayelsa State figures are a prevalence of 1.7%, people living with HIV (PLHIV) population of 31840, and antiretroviral therapy (ART) coverage of 18%, with 73% of ART coverage in Yenegoa.

Oral

The aim of this study is to showcase the experience in addressing inequality in ART coverage through the US-AID-funded project Accelerating Control of HIV/AIDS Epidemic (ACE) in Nigeria, cluster 6 (ACE 6).

**Methods:** Deploying the effective coverage strategies of program science, a package of interventions was rolled out, including iterative deployment of community testers using prevalence data, daily routine data reporting, and daily situation room meetings. Using Arc GIS and QGIS software, the testing volume, yield, and enrolment spread across Bayelsa State were identified for the period under review.

**Results:** Of the 183,345 clients tested across the state, 2% ( $n = 3958$ ) were diagnosed with HIV and 100% ( $n = 3958$ ) were initiated on ART. A sharp trend of HIV case identification per month from 131 at baseline (January 2022) to a peak of 745 in August 2022 and then declined to 223 in November 2022 as flooding affected activities.

Of the 3958 new cases identified, 2687 (67.8%) were identified outside Yenagoa, and the state's unmet need was reduced from 31,840 to 27,225 (14.4%). All newly infected HIV patients (100%) were linked to ART.

Furthermore, the viral load testing coverage increased from 81% (Baseline Q1, 2022) to 94% (Q2, 2022).

**Conclusions:** Providing ART services in the communities is critical to achieving epidemic control which the ACE 6 project has demonstrated. To fast-track the attainment of UNAIDS 95-95-95 goals, the strategy deployed in this study should be adapted and scaled up in every resource constrain areas.

## TUPEE491

### Leveraging client HIV testing services classifications to identify factors associated with HIV re-diagnosis and antiretroviral treatment interruption in western Kenya

J. Onsomu<sup>1</sup>, R. Muinde<sup>1</sup>, G. Otieno<sup>1</sup>, C. Bodo<sup>1</sup>,  
D. Canagasabay<sup>2</sup>, J. Thoya<sup>1</sup>

<sup>1</sup>PATH, Nairobi, Kenya, <sup>2</sup>PATH, Washington DC, United States

**Background:** To strengthen provision of differentiated care better tailored to HIV diagnosis and clinical needs of people vulnerable to HIV, the Kenyan Ministry of Health introduced a classification system for HTS outcomes—HIV negative, HIV positive/Re-diagnosis, and HIV positive/ART interruption—with clinicians providing tailored ART initiation, ART re-engagement, and/or HIV prevention packages based on client classification. PATH, through the USAID/Nuru ya Mtoto project, leveraged these HTS classifications to understand the magnitude of and factors associated with HIV re-diagnosis and ART interruption in four counties of western Kenya.

**Methods:** We used an Open Data Kit tool to compile HTS data from October to December 2023 from facility HIV testing registers.

We used Stata 15.1 to analyze data to:

- Compare characteristics of clients newly diagnosed with HIV against those previously diagnosed using descriptive statistics; and,
- Identify factors associated with HIV re-diagnosis and ART interruption/re-engagement using univariable logistic regression.

Data was gathered from 170 facilities across Kisumu, Kakamega, Nyamira and Vihiga counties in western Kenya.

**Results:** Among the 101,353 clients in our analysis, 1,460 (1.4%) received an HIV positive diagnosis. Among the 1,233 (84.5%) with a classified HTS outcome, 65 clients (5.3%) had been previously diagnosed and 36 (55%) were enrolled on ART but subsequently experienced ART interruption. Clients classified as re-diagnosed or interrupted were more likely to be 35 years or older (61.5% vs. 43.6%) and divorced/widowed (27.7% vs. 17.4%) compared to newly diagnosed HIV-positive clients ( $p=.024$ ,  $p=.048$ ). Previous HIV diagnosis was not associated with sex, occupation, and county of residence. Divorced/widowed clients were 2.6 times more likely to be re-diagnosed HIV positive (odds ratio (OR): 2.62; 95% confidence interval (CI): 1.18-5.78). There was a 3% increase in being previously diagnosed HIV positive for every one-year increase in age (OR: 1.03; 95% CI: 1.01-1.05).

**Conclusions:** Our study highlighted marital status and age as key factors associated with HIV diagnosis and ART interruption, with divorced/widowed clients and those 35 years or older at greater risk for re-diagnosis and/or ART interruption. Clinicians should account for these variables in determining provided HIV care to ensure the provision of optimal support packages to strengthen ART enrollment and continuity.

### Piloting interventions to increase uptake of HIV self-testing and linkage to post-services among tertiary education students in Zimbabwe

M.K. Tumushime<sup>1</sup>, A. Takaruzza<sup>2</sup>, N. Ruhode<sup>2</sup>,  
K. Chidhanguro<sup>2</sup>, F. Masiyambiri<sup>2</sup>, L. Mancitshana<sup>2</sup>,  
S. Munhenzva<sup>2</sup>, F.M. Cowan<sup>2,3</sup>, E.L. Sibanda<sup>2,3</sup>

<sup>1</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>2</sup>Centre for Sexual Health and HIV/AIDS Research (CeSHHAR) Zimbabwe, Harare, Zimbabwe, <sup>3</sup>Liverpool School of Tropical Medicine, Liverpool, United Kingdom

**Background:** Young people have poor uptake of HIV testing. To assess feasibility, we piloted two HIV self-testing (HIVST) distribution models among college/university students.

**Methods:** At two colleges/universities, peer-distributors distributed HIVST kits (peer-led distribution); at three colleges/universities students collected kits from campus or nearby clinics/pharmacies (static distribution). HIVST was promoted using posters and e-flyers.

Distribution lasted one-month. Distribution was captured using an online mobile health (mHealth) tool which sent students SMS-invitations to complete online questionnaires about their uptake/experience of self-testing, one-month after distribution.

Audio-diaries and in-depth interviews among distributors, and in-depth interviews among students explored views and experiences of the program. Descriptive analysis was used for survey data, thematic analysis for qualitative studies.

**Results:** From December/2020–December/2021, 1,463 kits were distributed; 1,051 by 16 peer-distributors, 412 kits at static sites. COVID-19 affected HIVST-uptake (Table). Only 131 (8.9%) completed online questionnaires.

Institution type (in order of implementation)	Distribution model	Enrollment	Number of kits distributed (HIVST uptake)
Technical college	Static	110	80 (72.7%)
Teachers' college	Peer-led	700	643 (91.9%)
Polytechnic	Peer-led	1,200	408 (34.0%)
Industrial training college	Static	440	110 (25.0%)
University	Static	1,500	222 (14.8%)

Twenty-three distributors were interviewed (12 female; 16 peer-distributors). Twelve peer-distributors kept audio-diaries (8 female). Twenty students were interviewed (12 female, 8 from sites with peer-distributors).

Distributors and students felt HIVST was novel, private and confidential as well as empowering and user-friendly. Disclosure of HIVST-negative results to distributors and/or peers after testing together, was common. Students were pleased to share their HIV-negative results however distributors thought some felt obligated to disclose. Distributors acknowledged risks of unintended or forced dis-

closure of HIV-positive results following group self-testing. Distributors appreciated being selected though many reported busy schedules. Some felt demand generation worked well; others felt students ignored posters. Students' busy schedules, low risk-perception and doubt about the test's accuracy limited HIVST-uptake.

Peer-distributors kept flexible distribution schedules; for others, distribution was limited to clinic/pharmacy operating hours. The mHealth tool was easy-to-use but affected by poor internet connectivity.

**Conclusions:** Provision of HIVST services using mHealth technology at colleges/universities is feasible, with high uptake achieved before COVID-19. To optimize implementation ahead of a trial comparing the distribution models, we developed an offline distribution tool and improved the design of HIVST promotional materials.

## Implementation science and scale up of prevention

### TUPEE493

#### Bringing PrEP to people living with mental illness: a foundational study to meet the unique needs of a key population for HIV Pre-Exposure Prophylaxis (PrEP) scale-up interventions

S. Bunting<sup>1</sup>, B. Feinstein<sup>2</sup>, A. Wilson<sup>3</sup>, J. Rivera<sup>4</sup>,  
A. Butler-Cordova<sup>4</sup>, E. Gonzalez Molina<sup>4</sup>, D. Ehsani<sup>1</sup>,  
A. Hazra<sup>3</sup>

<sup>1</sup>University of Chicago, Psychiatry & Behavioral Neuroscience, Chicago, United States, <sup>2</sup>Rosalind Franklin University of Medicine and Science, Department of Psychology, North Chicago, United States, <sup>3</sup>University of Chicago, Section of Infectious Diseases & Global Health, Department of Medicine, Chicago, United States, <sup>4</sup>Howard Brown Health, Center for Education, Research, & Advocacy, Chicago, United States

**Background:** People living with mental illness (PLWMI) experience disproportionately high HIV incidence and prevalence, while simultaneously experiencing numerous barriers to care. As such, PLWMI, including those with co-morbid substance use disorder (SUD), are designated as key populations in multiple international HIV prevention strategies. There is an urgent need for research on perceived HIV vulnerability, prevention preferences, and attitudes towards pre-exposure prophylaxis (PrEP) for HIV prevention among PLWMI to understand how best to reduce HIV in this population.

**Methods:** We conducted a mixed-methods study of PLWMI receiving outpatient psychiatric care in Chicago, Illinois, USA. This is one of the U.S. Ending the HIV Epidemic priority jurisdictions due to an excess of new diagnoses.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author

PLWMI were eligible for participation if they were sexually active and/or injected drugs, were HIV-negative, and were at least 18 years old. PLWMI were surveyed about their perceived HIV-vulnerability, previous experiences with PrEP, interest in PrEP, and perspectives on integrating PrEP into psychiatric care.

**Results:** Overall, 346 PLWMI participated (47.3% women, 16.8% gender minorities, 57.5% sexual minorities, 49.7% people of color). Regarding diagnosis, 31.8% were diagnosed with a traditionally defined serious mental illness (SMI; e.g., schizophrenia, bipolar disorder, schizoaffective disorder) and 16.8% had at least one SUD. A majority (73.4%) were aware of PrEP and 15.6% had taken PrEP. Of those who had taken PrEP, 38.9% had an SMI diagnosis and 38.9% had an SUD.

For those who indicated interest in taking PrEP (70.0%), 53.4% indicated that daily PrEP dosing was an acceptable modality, 53.2% indicated that LAI PrEP was acceptable, and 38.2% indicated that intermittent dosing was acceptable. Of those who were not interested in PrEP, 66.3% indicated they did not believe they were at high HIV risk. Finally, 48.3% of patients indicated a psychiatrist was an acceptable provider for PrEP prescription including 40.9% of patients with SMI and 53.4% of patients with SUD.

**Conclusions:** In this foundational study, we found that most psychiatric patients were interested in PrEP and that psychiatrists were generally considered acceptable prescribers. Considering the well-documented vulnerability to HIV among PLWMI, integration of PrEP prescription into existing psychiatric care should be pursued.

## TUPEE495

An implementation science approach to understanding determinants of oral HIV pre-exposure prophylaxis use in high-income countries with publicly-funded healthcare systems: a scoping review

T. Arapali<sup>1</sup>, S. Warzywoda<sup>1,2</sup>, M. Holt<sup>3</sup>, N. Taylor<sup>4</sup>, C. Chan<sup>1</sup>, D. Fraser<sup>1</sup>, P. Keen<sup>1</sup>, C. Mac Phail<sup>5</sup>, S. Clackett<sup>6</sup>, R. Varma<sup>7,1</sup>, J. Costello<sup>8</sup>, T. Broady<sup>3</sup>, A.E. Grulich<sup>1</sup>, B.R. Bavinton<sup>1</sup>, on behalf of the NSW HIV PRISM Partnership

<sup>1</sup>Kirby Institute, Sydney, Australia, <sup>2</sup>University of Queensland, Brisbane, Australia, <sup>3</sup>Centre for Social Research in Health, Sydney, Australia, <sup>4</sup>University of New South Wales, Sydney, Australia, <sup>5</sup>University of Wollongong, Wollongong, Australia, <sup>6</sup>New South Wales Ministry of Health, Sydney, Australia, <sup>7</sup>South Eastern Sydney Local Health District, Sydney Sexual Health Centre, Sydney, Australia, <sup>8</sup>Positive Life New South Wales, Sydney, Australia

**Background:** Barriers to oral HIV pre-exposure prophylaxis (PrEP) initiation, continuation, and prescribing limit its impact on HIV acquisitions. We aimed to gain a holistic understanding of PrEP-use barriers and facilitators (determinants), to inform effective PrEP implementation.

**Methods:** We searched PubMed, Scopus, and Web of Science for peer-reviewed articles published from Jan 2018-Feb 2023 exploring determinants of PrEP use in high-income countries with publicly-funded public healthcare systems (Australia, New Zealand, Canada, and Western Europe). Determinants were extracted, counted, and categorised into 'initiation' and 'continuation' (consumer determinants), and 'prescribing' (provider determinants). Synthesised category determinants were mapped to adapted Consolidated Framework for Implementation Research (CFIR) domains (outer setting, clinical context, innovation, provider factors, and consumer factors).

**Results:** Of the 127 included articles, most (n=96, 75.6%) focused on men who have sex with men, and healthcare providers (n=22, 17.3%). Disaggregated data from intersecting/marginalised populations (e.g. First Nations, trans and gender diverse, migrants) were limited. Most articles studied 'initiation' determinants (n=91, 71.7%), followed by 'continuation' (n=52, 40.9%) and 'prescribing' (n=16, 12.6%). 118 determinants were identified, reported 562 times (see Figure).

The most frequently reported barriers were cost (n=26, 28.6%), change in perceived risk (n=13, 25.0%), and lack of PrEP knowledge (n=4, 25.0%), for initiation, continuation, and prescribing, respectively. The most frequently reported facilitators were perceived risk of HIV acquisition (n=27, 29.7%), dosing regimen flexibility (n=7, 13.5%), and clinical guidelines (n=5, 31.3%) for initiation, continuation, and prescribing, respectively. Most studies were observational, and did not explore direct links between determinants and implementation or PrEP-use outcomes.

**Conclusions:** Our review identified determinants that PrEP implementers should consider when designing interventions to maximise PrEP use. These determinants may facilitate effective PrEP implementation, however, additional research is needed to assess underlying drivers of outcomes. Future research should also explore determinants affecting PrEP discontinuation and prescribing as well as those affecting intersecting and marginalised populations.

### Development and delivery of an online HIV pre-exposure prophylaxis (PrEP) training for community pharmacists for the implementation of pharmacy-based PrEP service in the Klang Valley, Malaysia

Y.N. Gan<sup>1,2</sup>, S.A. Hafidzar<sup>3</sup>, K.C. Koh<sup>4</sup>, M. Ahmad Nizaruddin<sup>5</sup>, R. Mohd Noh<sup>6</sup>, K.E. Khalid<sup>7</sup>, A. Yap<sup>8</sup>, R. Ahmad Zaki<sup>1,9</sup>, S.H. Lim<sup>1,3</sup>, F. Altice<sup>3,10,11,12</sup>, I. Azwa<sup>3,13</sup>

<sup>1</sup>Universiti Malaya, Department of Social & Preventive Medicine, Kuala Lumpur, Malaysia, <sup>2</sup>Ministry of Health Malaysia, Malaysian Health Technology Assessment Section (MaHTAS), Putrajaya, Malaysia, <sup>3</sup>Universiti Malaya, Centre of Excellence for Research in AIDS (CERiA), Kuala Lumpur, Malaysia, <sup>4</sup>International Medical University, School of Medicine, Department of Internal Medicine, Kuala Lumpur, Malaysia, <sup>5</sup>University of Cyberjaya, Faculty of Pharmacy, Department of Community & Pharmacy Practice, Cyberjaya, Malaysia, <sup>6</sup>Universiti Teknologi MARA, Faculty of Medicine, Department of Medicine, Sungai Buloh, Malaysia, <sup>7</sup>Hospital Kuala Lumpur, Department of Medicine, Kuala Lumpur, Malaysia, <sup>8</sup>The Red Clinic, Petaling Jaya, Malaysia, <sup>9</sup>Universiti Malaya, Centre for Epidemiology and Evidence-based Practice (CEBP), Kuala Lumpur, Malaysia, <sup>10</sup>Yale School of Medicine, Section of Infectious Diseases, Department of Internal Medicine, New Haven, United States, <sup>11</sup>Yale School of Public Health, Department of Epidemiology of Microbial Diseases, New Haven, United States, <sup>12</sup>Yale University, Center for Interdisciplinary Research on AIDS (CIRA), New Haven, United States, <sup>13</sup>Universiti Malaya, Infectious Diseases Unit, Department of Medicine, Kuala Lumpur, Malaysia

**Background:** Study has shown some key population members in Malaysia prefer to access HIV pre-exposure prophylaxis (PrEP) through pharmacies. We piloted a novel PrEP service delivery via community pharmacies in Malaysia.

In this study, we developed an online self-paced PrEP training program for community pharmacists to equip them with the knowledge required to provide pharmacy-based PrEP service in the Klang Valley, Malaysia; and evaluated the program effectiveness.

**Methods:** In May 2023, a PrEP training committee of 5 experts from professional societies and academia developed an online self-paced training program covering the PrEP fundamentals, including efficacy, safety, eligibility criteria, initial assessment, HIV testing and other baseline tests, prescribing PrEP, and what-if situations; based on current best evidence.

In June 2023, 18 community pharmacists completed the online training via Edpuzzle over 2 weeks. Program effectiveness evaluation was done via pre- and post-training knowledge tests, followed by post-training feedback form. Both tests comprised 20 questions each, with correct answers scoring 5 points and a maximum score of

100 points. The tests were pilot tested with 5 pharmacists and passing mark was determined as 55% based on pre-test median score. Paired t-test was performed to determine the difference between pre- and post-training knowledge scores (significance level of  $p < 0.05$ ).

**Results:** The mean age of the participants was 32 years, with 77.8% females and average 7.9 years of work experience. All participants surpassed the 55% passing mark for post-test. The mean pre- and post-training evaluation scores were 64.72% and 78.89%, respectively. The mean difference was 23.61% ( $p < 0.001$ ). Based on the feedback form, most pharmacists agreed that the training covered the expected content; the content was organized, easy to follow and easy to understand; the duration of training was appropriate; the additional resources were helpful; overall they were satisfied with the training; the training will be useful for their work; and they would recommend to others.

**Conclusions:** The novel approach of using an online self-paced training program to train community pharmacists for PrEP service delivery is an effective tool to increase the community pharmacists' knowledge of PrEP, which can be expanded nationwide to provide greater accessibility to PrEP in Malaysia.

## TUPEE497

### Assessing loss to follow-up among sexual minority men in a mobile health randomized controlled trial in Atlanta, Detroit, and New York City

N. Mancuso<sup>1,2</sup>, G. Mansergh<sup>3</sup>, R. Stephenson<sup>4</sup>, S. Hirshfield<sup>5</sup>, P. Sullivan<sup>1</sup>

<sup>1</sup>Rollins School of Public Health, Emory University,

Department of Epidemiology, Atlanta, United States,

<sup>2</sup>Queer Health Collaborative, Atlanta, United States,

<sup>3</sup>Centers for Disease Control and Prevention, Division of HIV Prevention, Atlanta, United States, <sup>4</sup>University of Michigan, The Center for Sexuality and Health Disparities, Ann Arbor, United States, <sup>5</sup>SUNY Downstate Health Sciences University, STAR Program, Department of Medicine, Brooklyn, United States

**Background:** Loss-to-follow-up (LTFU) is a concern for mobile health (mHealth) interventions, especially those focused on sexual health promotion with online engagement. To the extent that factors associated with vulnerability to HIV are related to LTFU, those at higher risk of acquisition may be less likely to persist with an intervention. The Mobile Messaging for Men (M-cubed) app is an mHealth intervention proven to be efficacious in improving HIV testing and PrEP use in a randomized control trial of sexual minority men.

We sought to analyze LTFU in the trial to better understand how to optimize engagement and health impact during future implementation.

**Methods:** Data from 1,226 men in the M-Cubed app trial in Atlanta, Detroit, and New York City were analyzed. LTFU was defined as disengagement with the app before the end of the nine-month study. Potential predictors of LTFU included baseline (age, education, employment status, race/ethnicity, testing history) and time-varying (alcohol and drug use, mental health, number of partners) variables. Single- and multivariable Cox regression models were used to assess associations with LTFU and differential LTFU by study arm.

**Results:** Average retention was 251 days (sd = 67 days). LTFU was similar in intervention (17%) and control (18%) arms. Less education, lower income, and greater alcohol use were associated with more LTFU ( $p < 0.05$ ). In multivariable models (Figure 1), education, employment, HIV testing history, and alcohol use were differentially associated with LTFU by study arm ( $p < 0.05$ ).

**Figure 1.** Multivariable Cox regression curves of retention in the M-Cubed app study in Atlanta, Detroit, and New York City. (A) Retention by education level at baseline, showing increasingly higher retention as education level increases and consistently better retention in the intervention arm than the control group. (B) Retention by employment status at baseline, showing that participants who were unemployed in the intervention arm had lower retention in the study than participants who were unemployed in the control group. (C) Retention by 3-month HIV testing history, showing that participants who had not tested in the past 3 months and were assigned to the control group had higher retention than participants who had not tested in the past 3 months and were assigned to the intervention group. (D) Retention by time-varying alcohol use, showing decreasing retention with increasing drinking frequency and that those who typically only had 3-4 drinks in the intervention group had higher retention than other groups.

**Conclusions:** Key variables related to HIV vulnerability were associated with LTFU in the M-Cube app trial, highlighting potential concerns for implementation. Reducing intervention burden and concurrently addressing sexual behavior and substance use may be important areas to improve engagement.

Understanding factors that influence LTFU in mHealth studies can guide implementation strategies and enable us to capitalize on the full potential of mHealth to bridge gaps in HIV prevention.

## TUPEE498

### Early learnings from 2 pilots delivering decentralised HIV services to adolescents and young people (AYP) in Kenya

L. Hayden<sup>1</sup>, L.F. Garcia Espinal<sup>1</sup>

<sup>1</sup>Elton John AIDS Foundation, Grants, New York, United States

**Background:** Due to the ineffectiveness of traditional AYP HIV services, the Elton John AIDS Foundation has funded several pilot decentralised care models in Kenya that use digital platforms to deliver information, care, and products directly to AYP.

**Description:** The Foundation financed Tiko, a digital platform in Mombasa County, linking demand mobilizers with health care providers. Once enrolled, AYP can access clinic services while the platform monitors their user journey. AYP are nudged to return for appointments and receive redeemable points. Platform peers may see AYP's service ratings. EJAF also funds Zipline and AMPATH which setup pop-up events at unconventional locations, enabling AYP to meet healthcare professionals and request SRH/HIV products. These products arrive via drone within 15 minutes of a request, and clients can request refills at various locations.

**Lessons learned:** While appetite for services/products is exceeding targets, decentralized care targeting AYP in both instances appear to be facing the same challenges:

- Shortage of HIV preventive commodities, especially self-tests, as county projections and national budgets do not prioritise them. Zipline helped Mombasa and Nyamira Counties enhance forecast by leveraging their programmatic data on AYP demand from events
- Counties are operating with poor data systems, affecting forecasting and tracking those in HIV care. Third parties cannot currently hold client HIV data. Tiko circumvented this by integrating their platform into public sector facilities, while Zipline developed with counties a process to track clients through anonymous IDs.
- AYP cannot start PrEP or refill ART outside of clinics under current national rules. In addition, PrEP initiation profiling restricts AYP eligibility for PrEP and is not applied uniformly. Zipline has worked with Kisumu County to craft an SOP for PrEP refill deliveries in the field, requiring counties to make changes on how they apply NASCOP Policy.

**Conclusions/Next steps:** By working in partnership with County and national government bodies to adapt policies and clinical guidelines there is an opportunity to capitalise upon the unprecedented demand AYP demonstrated for decentralised services where they can direct their own care journey.

adaptation of clinic workflows for same-day PrEP (*Inner Setting: Readiness for Implementation*); Leadership buy-in (*Inner Setting: Implementation Climate*) and; 3. Additional factors impacting success included Inter-community relationships with organizations (*Outer Setting: Cosmopolitanism and External Policies*) and Formal evaluation (*Process: Reflecting and Evaluation*).

Theme	Subtheme	Quote	Domain	Construct
Factors necessary and required for same-day PrEP programs	Medical expansion status is a resource for same-day PrEP implementation, but is not required for same-day PrEP programs	"Medical expansion absolutely been a facilitator for my patients receiving PrEP services. I would say a majority of my patients are Medicaid recipients or enrollees, so it's not like we have Medicaid but it's not like we have it. If Medicaid did not, then I would think it'd run into a lot more issues with getting coverage, and I think it would be a lot more challenging for the PrEP managers to navigate PrEP access for them. (FGHC, Medicaid expansion state) ... If they don't have insurance, we do a PAP for them and make sure that they get it right away. (CBO, non-Medicaid expansion state)"	Outer Setting	Patient Needs
	Diversification of funding sources	"... but if we don't have the funding to pay for labs, then we can't do. There are programs that would help us, like the state has a program where we can send samples for STIs for free screenings for that (CBO, non-Medicaid expansion state). We have sample packs on hand, and the pharmaceutical companies, all we have to do is call a rep and say, 'They need some more samples.' The provider signs for the samples, and then we're able to give those samples to them (CBO, non-Medicaid expansion state). Our LabCorp bill, 100 percent comes out of 3400 revenue right now, and I suddenly we don't have that anymore, we would probably have to create a lot of our services for a little while as we figure out another way to pay for them. (CBO, non-Medicaid expansion state) One of the biggest things we've based on for same-day PrEP is sample packs. We've got a really good relationship with our Decoy rep, and she keeps us stocked with these packs, because she knows what we're doing with them. With that, I wish they'd bring back sample packs of Truvada, because that will help us cover everybody else. Right now, our men have a lot of the better coverage, versus women both in and out of HIV, then obviously, they need PrEP. They're lacking in resources for being able to start same-day PrEP like we do. (CBO, non-Medicaid expansion state) Right now we do receive an ending the Epidemic CDC grant, and that is actually what we primarily use to fund our clinic. That grant covers the salaries for our coordinator, our prevention specialist, and our nurse practitioner, who all work in the clinic providing PrEP services. Right now that funding is one of the primary ways that allows us to provide our services at no cost. (CBO, non-Medicaid expansion state)"	Inner Setting	Readiness for Implementation
	Optimization and adaptation of clinic workflows for same-day PrEP	"What we have here is we do a free STI testing, pregnancy testing, morning after pill, so people know us as a place they can come and get tested for free and get tested for free for their STIs. What we did was we took the concept and then came up with the idea that we were gonna offer every single person who comes in for PrEP, and we were gonna offer them same-day PrEP with the thought that if they think they're at risk to get HIV, then obviously, they need PrEP. So they actually have to opt out of same-day PrEP (CBO, Non-Medicaid expansion state)"	Inner Setting	Readiness for Implementation
	Leadership buy-in	"I think you definitely have to have supportive leadership. I think everyone—I think I can safely say that everyone in leadership at CHC is extremely supportive of same-day PrEP services. You have to have those gatekeepers, those champions, to be able to implement these programs. (FGHC, Medicaid expansion state)"	Inner Setting	Implementation Climate
	Intercommunity relationships with organizations	"Once a lot of our partners, especially the partners that don't have their own clinics, they don't about it, they want us to come and bring the PrEP and set up, or they want us bring their patients in. Especially for our partners that are like residential rehab facilities and things like that, they have us come in, they'll get everything tested for STIs, for Hep C, and have us offer PrEP to all of their patients, because most of them have realized the importance of PrEP as well. (FGHC, Medicaid expansion state) No, I would say SOGO we have a lot of our patients do come from the 'bad' center next door. (CBO, non-Medicaid expansion state) I think it's really, really important and vital that we maintain those partnerships because this discussion alone has no thinking. 'Wow, I actually receive a lot of patients from those community organizations that are being referred to us.' I think maintaining those partnerships is fairly crucial to making sure that we can continue to receive patients who might benefit from PrEP services. (FGHC, Medicaid expansion state)"	Outer Setting	Cosmopolitanism and External Policies
Identification of additional factors impacting success	Formal evaluation	"I think we'd be interested in creating a better way to pull that information. We are actually working with the clinic on a way to build reports. (CBO, Medicaid expansion state) I think that retaining patients, patients who are still on PrEP six months, one year later that would still benefit and looking at patients who benefit from PrEP who stay on it. I think that also looking at whether or not the demographics of the patients starting on PrEP are representative of our community. I think that that would also be very successful. (CBO, non-Medicaid expansion state)"	Process	Reflecting and Evaluation

**Conclusions:** Same-day oral PrEP is being provided; however, broader implementation, sustainability, and expansion into same-day LAI PrEP requires new insurance-related policies, continued partnerships clinical, public health, and governmental agencies, and greater transferability of implementation strategies into other settings.

## TUPEE501

### Strengthening the HIV prevention and accountability framework through the community-led monitoring process

A. Sarkar<sup>1</sup>, R. Dua<sup>2</sup>, H. Rosenara<sup>3</sup>, L. Pillay<sup>4</sup>

<sup>1</sup>India HIV/AIDS Alliance, Sexuality, Gender and Rights, New Delhi, India, <sup>2</sup>India HIV/AIDS Alliance, Chief Executive, New Delhi, India, <sup>3</sup>India HIV/AIDS Alliance, Programmes, New Delhi, India, <sup>4</sup>Frontline AIDS, HIV Prevention Advocacy, Brighton, United Kingdom

**Background:** With the 2025 HIV Prevention Road Map, the countries of the Global HIV Prevention Coalition (GPC), including India, agreed to finalise country-specific HIV prevention Road Maps. A community-led coalition, convened by Alliance India and supported by Frontline AIDS, consisting of civil society organisations and community networks, works together to assess the country's progress against the 10 Actions outlined in the Road Map. This was done by reviewing key documents, agreeing on collective assessments and gathering inputs from bilateral agencies, government stakeholders and implementing partners. In December 2023, with Frontline AIDS, this data was published as the HIV Prevention and Accountability Report: A Community Perspective 2023 ([https://frontlineaids.org/wp-content/uploads/2023/11/India\\_Shadow-Report\\_DIGITALMASTER.pdf](https://frontlineaids.org/wp-content/uploads/2023/11/India_Shadow-Report_DIGITALMASTER.pdf)).

**Description:** Since 2022, the coalition, convened by Alliance India, collected data with the civil society and community networks, documenting their priorities and perspectives of the HIV prevention landscape. The HIV Prevention and Accountability report is, therefore, a community perspective, and recommendations demonstrate community priorities for the government to consider.

**Lessons learned:** This report cited important findings for the HIV prevention landscape in India. It demonstrates that India has made significant strides in improving HIV data collection and has nearly accurate population size estimates (PSEs) for all the key population groups. This better supports the development of data-driven programmes. The report did, however, highlight that more focus and investment are needed to address and mitigate gender-based violence (GBV) effectively. The report also highlighted that the criminalisation of drugs and personal possession should be reviewed. Basic rights for communities living with and affected by HIV should be enacted to create an enabling environment. Sharing information and meaningfully engaging communities and key populations to monitor and track progress on HIV prevention is a crucial step that India must take urgently.

**Conclusions/Next steps:** The 2025 Prevention Road Map tabled ten essential country-level actions towards a more data-driven, specific, community-centred, scaled, innovative prevention response. This report and its Community Led Monitoring approach helped reveal critical facts and

figures for HIV prevention – to support better what the country should prioritise. Other countries should use this approach to document community-led data collection and perspectives on HIV prevention.

## TUPEE502

### HIV Pre-Exposure Prophylaxis adherence among men who have sex with men in Hanoi, Vietnam 2023

Q.L. Pham<sup>1,2</sup>, H. Bui<sup>1</sup>, T. Nguyen<sup>1</sup>, P. Sullivan<sup>3</sup>, A. Gilmore<sup>4,5</sup>, A. Kalokhe<sup>3,6</sup>, G. Le<sup>1,2</sup>

<sup>1</sup>Center for Training and Research on Substance Abuse – HIV, Hanoi Medical University, Hanoi, Viet Nam, <sup>2</sup>School of Preventive Medicine and Public Health, Hanoi Medical University, Epidemiology, Hanoi, Viet Nam, <sup>3</sup>Rollins School of Public Health, Emory University, Atlanta, United States, <sup>4</sup>School of Public Health, Georgia State University, Department of Health Policy & Behavioral Sciences, Atlanta, United States, <sup>5</sup>National Center for Sexual Violence Prevention, Mark Chaffin Center for Healthy Development, Atlanta, United States, <sup>6</sup>School of Medicine, Emory University, Atlanta, United States

**Background:** Effectiveness of HIV Pre-exposure Prophylaxis (PrEP) depends on levels of adherence. However, optimal adherence ranged from 30% to 70% among men who have sex with men (MSM), the sexual minority group is disproportionately impacted by HIV.

We conduct this study to assess factors associated with PrEP optimal adherence among MSM in Hanoi, Vietnam.

**Methods:** A cross-sectional study was conducted at an MSM-friendly sexual health clinic in March to May 2023. Eligible participants were aged 18 or older, on daily oral PrEP, and had a male sex partner or male lover in the past year. Data collection included age, education (university or higher/high school or lower), employment (yes/no), number of sexual partners in past 12 months, condom use in past 12 month (always/not always), PrEP self-efficacy (measured by a 9-item scale), depression (measured by PHQ-2), and months on PrEP (<3 months, 4-12 months, and > 12 months).

PrEP adherence was measured by self-reporting; Optimal adherence was defined as not missing any pill on any day within the last 7 days. Multivariable logistic regression was used to identify factors associated with optimal adherence.

**Results:** Among 309 respondents, most (63%, 194 participants) reported optimal adherence. The majority were older than 24 years old (64%), graduated university or higher (58%), and employed (87%).

In the adjusted model, PrEP self-efficacy was positively associated with optimal adherence (aOR = 1.15, 95% CI: 1.00 – 1.32). Twenty-four years old or younger (aOR = 0.49, 95% CI: 0.27 – 0.88) and having more sexual partners (2-5 partners vs ≤ 1 partner: aOR = 0.30, 95% CI: 0.13 – 0.68; ≥ 5 partners vs.

≤ 1 partner: aOR = 0.25, 95% CI: 0.10 – 0.59) were negatively associated with optimal adherence. Other factors were not statistically associated with optimal adherence.

**Conclusions:** There is a moderate proportion of PrEP optimal adherence among MSM in Hanoi, Vietnam. To improve effectiveness of HIV PrEP program, tailored interventions needed to address multiple factors, such as improving users' self-efficacy as well as reducing the number of sexual partners.

According to our data, younger MSM should be prioritized for adherence intervention. Further research should explore IPV prevalence in diverse settings.

## TUPEE503

### "I had not fully understood how it works:" key influences on adolescent girls and young women's decisions to decline or delay daily oral PrEP initiation in Western Kenya

K. Beima-sofie<sup>1</sup>, S. Urusaro<sup>1</sup>, M. Auwor<sup>2</sup>, W. Atieno<sup>2</sup>, A. Dollah<sup>2</sup>, D. Matemo<sup>2</sup>, A. Lee<sup>1</sup>, V. Kemunto<sup>2</sup>, C. Wandera<sup>2</sup>, J. Kinuthia<sup>1,2</sup>, J.F. Morton<sup>1</sup>, K.K. Mugwanya<sup>1,3</sup>, for the FP Plus Project Team

<sup>1</sup>University of Washington, Department of Global Health, Seattle, United States, <sup>2</sup>Kenyatta National Hospital, Department of Research and Programs, Nairobi, Kenya, <sup>3</sup>University of Washington, Department of Epidemiology, Seattle, United States

**Background:** Adolescent girls and young women (AGYW) have high HIV incidence and are a priority population for ending the HIV epidemic. While daily oral PrEP is an effective HIV prevention strategy, uptake among AGYW has been limited. Better understanding why high-risk AGYW delay rather than decline PrEP initiation may identify strategies for overcoming initial barriers to uptake among this key population.

**Methods:** Within an ongoing programmatic trial evaluating PrEP integration into family planning (FP) clinics in Western Kenya (FP Plus project), we conducted semi-structured individual interviews (IDIs) with AGYW who declined or delayed PrEP initiation. IDIs were conducted at two FP clinics between Sept-Nov 2023 by trained Kenyan social scientists and were audio recorded, translated, and transcribed.

We conducted a thematic analysis of IDI summaries and a subset of full transcripts to explore and compare experiences, beliefs, and rationale between AGYW who delayed versus declined PrEP.

**Results:** Twenty AGYW completed IDIs, including 10 who declined PrEP use and 10 who delayed PrEP initiation. AGYW were a median of 23 years (IQR 20-24) and the majority were single/never married (55%). All AGYW noted that alternative PrEP modalities, such as long-acting injectables or vaginal rings would improve PrEP utilization. Most described having insufficient information on PrEP

after receiving initial counseling, leading them to feel unprepared to accept PrEP and fear side effects, including infertility. AGYW also noted concerns about pill size, conflation of PrEP pills with ART and fear of stigma as key influences on initial decisions to decline.

For AGYW who never initiated PrEP, concerns about negative partner reactions, inability to conceal PrEP pills, and daily pill burden were primary reasons for declining use. AGYW who delayed initiation sought support from peers, partners, and family members, and searched for additional information, before deciding to initiate.

Among delayed initiators, HIV risk perceptions and a desire to remain HIV negative overcame pill-taking concerns and contributed towards PrEP acceptance.

**Conclusions:** Community support opportunities and improved access to information could improve uptake of oral PrEP among AGYW who perceive themselves at higher HIV risk, while additional PrEP options may improve overall PrEP initiation.

## TUPEE504

Laboratory and patient acceptability and feasibility of self-collected capillary blood samples for plasma cabotegravir drug-level measurements to support safe discontinuation of long-acting injectable PrEP

K. Wang<sup>1</sup>, C. Hijiya<sup>2</sup>, C. Sturla<sup>3</sup>, M. Saylor<sup>4</sup>, B. Gray<sup>5</sup>, A. Pazmino<sup>5</sup>, A. Cantos<sup>5</sup>, C. Carnevale<sup>6</sup>, S. Olender<sup>5</sup>, J. Zucker<sup>5</sup>, N. Nguyen<sup>2</sup>, S. Cremers<sup>7</sup>, M. Yin<sup>5</sup>, A. Lyashchenko<sup>7</sup>, K. Meyers<sup>2,5</sup>

<sup>1</sup>Columbia University, Vagelos College of Physicians and Surgeons, New York, United States, <sup>2</sup>Columbia University Irving Medical Center, Aaron Diamond AIDS Research Center, New York, United States, <sup>3</sup>Columbia University, Mailman School of Public Health, New York, United States, <sup>4</sup>NewYork-Presbyterian Hospital, Comprehensive Health Program, New York, United States, <sup>5</sup>Columbia University Irving Medical Center, Division of Infectious Diseases, New York, United States, <sup>6</sup>NewYork-Presbyterian Hospital, HIV Prevention Program, New York, United States, <sup>7</sup>Columbia University Irving Medical Center, Department of Pathology and Cell Biology, New York, United States

**Background:** One implementation challenge of long-acting injectable cabotegravir (CAB-LA) for pre-exposure prophylaxis (PrEP) is its long, variable "tail" period post-discontinuation, where subtherapeutic drug levels could select for antiretroviral resistance if HIV is acquired. Current recommendations advise oral PrEP coverage for at least one year post-discontinuation, but variations in individual drug clearance and sexual behavior may warrant differing coverage periods. Timely drug-level information could support HIV prevention counseling for safer CAB-LA discontinuation.

**Methods:** We assessed the acceptability and feasibility of novel blood sampling approaches to measure plasma cabotegravir levels. We recruited adult patients at NewYork-Presbyterian Hospital (8/2023-1/2024) who received cabotegravir-containing injections within one year. Participants provided samples via three methods: phlebotomist-collected venous blood (VB), and self-collected capillary blood via dried blood spot (DBS) from fingerstick and a blood lancet device (BLD) used on the upper arm.

Patient acceptability and feasibility were surveyed using the Acceptability of Intervention Measure (AIM) and Feasibility of Intervention Measure (FIM) (5-point Likert scale; 3=neutral, 5=strongly positive). Laboratory feasibility was based on sufficient sample collected for assay administration, and temperature- and time-based stability testing. Laboratory acceptability was assessed by concentration correlation between DBS and BLD versus VB (reference).

**Results:** Thirty participants provided 44 VB, 41 DBS, and 41 BLD samples. Twenty-six were surveyed (57% male, 37% Hispanic, 67% Black, median age 43 years). Mean AIM and FIM scores were higher for BLD (4.1) vs. DBS (3.3) ( $p=0.01$ ). More participants found BLD acceptable (mean AIM $\geq 4$ ; 77% vs. 42%,  $p=0.01$ ) and feasible (mean FIM $\geq 4$ ; 81% vs. 58%,  $p=0.07$ ) than DBS. No meaningful differences were found by sex, ethnicity, race, age, or duration of injectable medication use.

In laboratory testing, concentrations from VB and BLD samples were highly correlated ( $R^2=0.98$ ), demonstrating acceptability. During stability testing, BLD samples maintained measured concentrations after storage for seven days (room temperature) or 24 hours (40°C), demonstrating feasibility. DBS sampling was not feasible; 18/41 (44%) samples did not yield sufficient blood.

**Conclusions:** BLD sampling, but not DBS sampling, for cabotegravir monitoring was acceptable and feasible from laboratory and patient perspectives. These findings support developing a personalized drug level-informed HIV prevention counseling intervention for safer CAB-LA discontinuation.

## TUPEE505

### In-person pick-up versus postal delivery: PrEP service and its association with adherence and retention among Chinese MSM

C. Li<sup>1,2</sup>, Z. Yin<sup>1</sup>, Q. Li<sup>3</sup>, L. Li<sup>3</sup>, S. Wu<sup>4</sup>, K. Liang<sup>4</sup>, G. Marley<sup>1</sup>, C. Fan<sup>1</sup>, Y. Dai<sup>1</sup>, H. Huang<sup>5</sup>, A. Hazra<sup>6</sup>, J. Lio<sup>6</sup>, W. Tang<sup>1,7</sup>, R. Sherer<sup>6</sup>, J.D. Tucker<sup>7,8</sup>

<sup>1</sup>University of North Carolina Project China, Guangzhou, China, <sup>2</sup>The University of Tokyo, Tokyo College, Tokyo, Japan, <sup>3</sup>Guangzhou Eighth People's Hospital, Guangzhou, China, <sup>4</sup>Zhongnan Hospital of Wuhan University, Wuhan, China, <sup>5</sup>Wuhan Tongxing LGBT Center, Wuhan, China, <sup>6</sup>University of Chicago, Department of Medicine, Chicago, United States, <sup>7</sup>University of North Carolina at Chapel Hill, Institute for Global Health and Infectious Diseases, Chapel Hill, United States, <sup>8</sup>London School of Hygiene and Tropical Medicine, Faculty of Infectious and Tropical Diseases, London, United Kingdom

**Background:** Differentiated services are critical for scaling up PrEP in diverse settings. Postal delivery of PrEP drugs could help people who are doing well and do not need an in-person encounter.

We conducted a demonstration study to compare the effects of in-person pick-up and post-mail delivery on facilitating PrEP retention and adherence among Chinese MSM.

**Methods:** MSM in Wuhan and Guangzhou, China were recruited by online ads, clinic flyers, and community referrals to a PrEP demonstration trial to start a 12-month TDF/FTC as oral PrEP. Behavioral data were collected at baseline and quarterly follow-ups over 12 months. At each follow-up, participants were allowed to refill the medication either by in-person pick-up at the study hospital or by post-mail.

Generalized linear models were used to assess key outcomes (self-reported good adherence [primary definition: <60% vs. 60% to almost 100% compliance with PrEP dosing schedule in last 30 days], loss to follow-up [LTF], and usage of postal PrEP), adjusting for age, sexual orientation, employment status, monthly income, and PrEP dosing strategies. We defined LTF as either voluntary withdrawal or not completing the survey within 4 reminders of scheduled follow-up.

**Results:** By September 8th 2023, 945 MSM (mean age=28.2, IQR 24.1-31.4) were enrolled and should have reached their 6-month follow-up. A quarter (n=199) of participants were LTF before six months. About 54.4% of the participants used only in-person PrEP pick-up, 19.6% only used postal PrEP, and 26.0% used both delivery methods during follow-up. No sociodemographic characteristics were found significantly associated with postal PrEP usage.

In multivariable-adjusted models, participants who ever used postal delivery (aOR=0.17, 95% CI=0.11-0.27), had lower monthly income (<715 USD versus >1430 USD, aOR=0.55, 95% CI=0.31-0.97), and of younger age (aOR=0.92, 95%

CI=0.88-0.95) were less likely lost to follow up. Self-reported good adherence to PrEP was not different among those who used postal PrEP and in-person PrEP (aOR=0.63, 95% CI=0.30-1.31).

**Conclusions:** Postal PrEP delivery is feasible and well-accepted among Chinese MSM and has the potential to increase PrEP persistence by increasing accessibility. Future research into diversifying PrEP provision models outside of traditional clinical settings while maintaining high adherence and quality of care is needed.

## TUPEE506

### Event-driven PrEP: a panacea for high PrEP continuation among men who have sex with other men (MSM). Evidence from a low-resource setting

M. Munjoma<sup>1</sup>, H. Choi<sup>2</sup>, J. Mavudze<sup>1</sup>, M. Dhodho<sup>1</sup>, N. Zimuto<sup>1</sup>, I. Moyo<sup>1</sup>, N. Shoko<sup>1</sup>, N. Nhando<sup>1</sup>, T. Moga<sup>1</sup>, B. Maponga<sup>1</sup>, B. Mutede<sup>1</sup>, S. Leuschner<sup>3</sup>, N. Taruberekera<sup>1</sup>

<sup>1</sup>Population Solutions for Health, Harare, Zimbabwe,

<sup>2</sup>Princeton University, New Jersey, United States,

<sup>3</sup>Population Services International, Harare, Zimbabwe

**Background:** Pre-exposure prophylaxis (PrEP) is a feasible HIV prevention option worldwide. Since PrEP inception in 2015, Zimbabwe has reached its annual targets. However, PrEP continuation rates have been low, especially among men who have sex with other men (MSM), at around 30% at 3 months follow-up. Pill burden has been cited as one of the biggest barriers to continued PrEP use. WHO approved event-driven PrEP in 2019, and Population Solutions for Health (PSH), Population Services International (PSI), and the Ministry of Health and Child Care conducted a study to measure the impact of event-driven PrEP on continuation in comparison to oral PrEP.

**Methods:** We employed a two-arm, open-label, prospective pilot in two urban districts of Zimbabwe (Harare and Bulawayo), among adult MSM aged 18-54 years. We recruited 789 participants with 396 in the PrEP daily arm and 393 in the event-driven PrEP arm. The groups were comparable by age, education level, employment status, and engagement in transactional sex or sexual roles. Participants were followed at one-, two- and three-month periods from initiation date.

Further, we conducted qualitative in-depth interviews with purposively selected MSM to assess barriers and motivations as well as the benefits of event-driven over oral PrEP.

**Results:** The event-driven PrEP cohort's continuation rates were significantly higher compared to the oral PrEP cohort. From qualitative interviews, most participants preferred event-driven PrEP as it had no pill fatigue and fewer side effects.

Participants also reported correct and consistent taking of the drugs as instructed. Only 2 out of the 393 event-driven PrEP participants had seroconverted after 3 months.

Figure. Continuation rates by PrEP method and follow up period.

**Conclusions:** Event-driven PrEP is a solution to low PrEP continuation, especially among key populations who are less motivated for daily medication uptake without feeling ill. Scale-up ensures continuous protection against HIV seroconversion especially in low-resource settings where pill dispensing can be regulated to save funds.

## TUPEE507

A quality improvement tool to advance person-centered care delivery among ART provision teams: evidence from HIV treatment settings in Ghana and Zambia

A. Casella<sup>1</sup>, J. Posner<sup>2</sup>, H. Tagoe<sup>3</sup>, H. Nagai<sup>3</sup>, Y. Ahmed Abdul Rahman<sup>3</sup>, A. Paxon Ndhlovu<sup>4</sup>, L. Kawanga<sup>4</sup>, J. Mushika Musangulule<sup>4</sup>, C. Madevu-Matson<sup>1</sup>  
<sup>1</sup>JSI, Boston, United States, <sup>2</sup>JSI, Washington DC, United States, <sup>3</sup>JSI, Accra, Ghana, <sup>4</sup>JSI, Lusaka, Zambia

**Background:** Person-centered care (PCC) is a best practice in serving the needs of persons living with HIV and ending HIV as an individual wellbeing and public health threat. Despite emerging evidence, there is scarce information on how to systematically measure and assess it. JSI developed a PCC assessment tool (PCC-AT) to strengthen health facilities' ability to operationalize PCC in HIV treatment settings. The PCC-AT measures health facility PCC service delivery using a benchmarking approach across 3 domains (staffing, service provision, direct client support) and 12 subdomains.

**Methods:** JSI piloted the PCC-AT among health facilities in Ghana (n=5) and Zambia (n=30) between May and September 2023. Antiretroviral treatment (ART) provision teams implemented the PCC-AT and used subdomain scores (ranging from 1=standard never met to 4=standard always met) to facilitate action planning that identified PCC-strengthening activities for action and reassessment as part of continuous quality improvement. The study team conducted descriptive analyses on PCC-AT scores and thematic analysis on action plan data using descriptive coding.

**Results:** Median PCC-AT performance was highest in the staffing domain (Ghana=3.0; Zambia=3.0), followed by service provision (Ghana=2.5; Zambia=2.5) and direct

client support (Ghana=2.0; Zambia=2.5). Analysis of action plans elucidated major themes in areas for improvement and recommended action that were common across country contexts, with most relating to the higher-scoring staffing and service provision domains (Table 1).

Domain	Improvement Area (subdomain)	Action Theme(s)
Staffing	Staff composition	Training and/or compensation for supportive peer positions
	Staff competency	Stigma and/or client rights training for all staff
	Client feedback mechanisms	Make feedback channels more user-friendly; establish system to track, review and use feedback; seek routine/formal input from community groups
Service provision	Service efficiency and integration	Establish system to track and reduce client wait-times
	Digital health worker support tools	Incorporate digital tools that improve information exchange between service providers and/or provide clinical decision support
Direct client support	Client agency	Adapt information, education and communication (IEC) materials to local language and/or include pictures, videos, radio to support diverse clients

Table 1. Common Action Plan Themes by Improvement Area.

**Conclusions:** PCC-strengthening actions prioritized by ART provision teams in Ghana and Zambia did not necessarily correspond with low-scoring PCC-AT subdomains, but rather, areas perceived most within their control or feasible to address with limited resources. Findings also identified areas perceived as outside staff control, requiring administrative advocacy and strategic community partnerships.

This study is a critical step toward providing service providers a quality improvement tool to assess, measure, and advance their delivery of PCC to increase engagement and retention in ART services.

## TUPEE508

### Mortality analysis among children with advanced HIV disease in Eastern Province, Zambia

G. Kiibombwe<sup>1</sup>, P. Makelele<sup>1</sup>, M. Goma<sup>1</sup>, T. Malebe<sup>1</sup>, E. Oladele<sup>2</sup>, J. Msofe<sup>3</sup>, H. Satti<sup>4</sup>, D. Carpenter<sup>4</sup>, N. Persaud<sup>5</sup>, L. Nyau<sup>6</sup>, C. Lushangu<sup>6</sup>, M. Ngámbi<sup>7</sup>, O. Chabikuli<sup>8,9</sup>

<sup>1</sup>FHI 360, Technical, Lusaka, Zambia, <sup>2</sup>FHI 360, Program Management, Lusaka, Zambia, <sup>3</sup>FHI 360, Strategic Information, Pretoria, South Africa, <sup>4</sup>FHI 360, Technical, Durham, United States, <sup>5</sup>FHI 360, Strategic Information, Durham, United States, <sup>6</sup>Eastern Province Health Office, Technical, Chipata, Zambia, <sup>7</sup>Eastern Province Health Office, Program Management, Chipata, Zambia, <sup>8</sup>FHI 360, Program Management, Pretoria, South Africa, <sup>9</sup>Howard University, Public Health Program, Graduate School, Washington, United States

**Background:** In 2022, Zambia's infant mortality rate was 40 per 1,000 live births. HIV positive status increases the likelihood of death before infants' first birthday, particularly in the absence of antiretroviral therapy (ART). Determining final status of HIV-exposed infants (HEIs) at 24 months or six weeks after cessation of breastfeeding remains challenging.

The FHI 360-led technical assistance project funded by PEPFAR through CDC analyzed routinely collected surveillance data from Eastern Province to explore the rates of mortality and causes of death, and survival periods among pediatric clients diagnosed with HIV.

**Description:** We conducted a retrospective analysis of routine data reported in the mortality surveillance system and registers to assess infant mortality rates within the pediatric population affected by advanced HIV disease (AHD). In addition to these data, we reviewed routine mortality data obtained from medical records and health worker accountability trackers.

Our retrospective analysis aimed to quantify the mortality rate in infants with AHD and compare them to the national infant mortality rate overall.

**Lessons learned:** From January 2021 through November 2023, a total of 156 HEIs were confirmed HIV positive within 12 months of birth. Eleven died within the year of birth, translating to 70.5 deaths per 1,000 infants among positive HEIs. This is significantly higher when compared to 40.6 deaths per live birth overall ( $p=0.044$ ).

However, the number and proportion of HEIs with documented HIV status at 24 months improved each year as follows: 1,943/2,303 (84%) in 2021; 2,112/2,326 (91%) in 2022, and 2,280/2,383 (96%) in 2023. Overall HIV positivity among HEI by year was 2% in 2021 and 1% in subsequent years. The annual mortality rate averaged 1% each year.

**Conclusions/Next steps:** Infant mortality is significantly high in Eastern Province among HEIs despite the early ART initiation policy. We recommend improvements in the diagnosis and management of communicable diseases in infants and strengthening systems for integrated care, as

providing ART appears insufficient to prevent premature deaths. Our results also demonstrate that it is possible to improve the number of HEIs with final HIV status outcome at 24 months and reduce transmission rates through accountability.

## TUPEE509

### Community pharmacy initiated and management of oral pre-exposure prophylaxis (PrEP) among men and women at substantial risk HIV acquisition in South Africa: interim results

A. Tembo<sup>1</sup>, T. Nyamuzihwa<sup>1</sup>, S. Lalla-Edward<sup>1</sup>, E. Edem<sup>1</sup>, N. Martyn<sup>1</sup>, M. Mkansi<sup>1</sup>, S. Tinzi<sup>1</sup>, T. Wonderlink<sup>1</sup>, L. Makola<sup>1</sup>, E. Kelechi<sup>1</sup>, A. Nyatela<sup>1</sup>, W.D.F. Venter<sup>1</sup>

<sup>1</sup>Ezintsha, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa

**Background:** South Africa has over 3,500 community pharmacies offering an array of sexual and reproductive services. In a country with a high burden of HIV acquisition, daily oral HIV pre-exposure prophylaxis (PrEP) is mostly available in clinical settings. Pharmacies present an opportunity to provide PrEP in a non-clinical setting.

The PPREP-SA project is currently being implemented in three metropolitan cities in South Africa with the aim to evaluate the acceptability and feasibility of pharmacy initiated and management of PrEP. We provide a report on interim results after 6 months of implementation.

**Methods:** Trained health care providers at 10 community pharmacies screen men and women ( $\geq 18$  years) for HIV risk, conduct HIV testing, baseline investigations as per National PrEP guidelines, consent if eligible and dispense PrEP with telemedicine support.

Routine project data for the period July 2023 and January 2024 were analysed using STATA/SE 18.0 to determine uptake and continuation.

**Results:** A total of 745 participants were screened with 87% (653) initiating on PrEP. Most (91%, 594) were PrEP naive. From the 653 that initiated, the mean age was 29 and 51% (329) were female. In terms of socio-demographic characteristics, 87% (329) were unmarried, 96% (626) were black, 57% were employed and 53% (342) had a personal income of less than \$261 per month.

All participants completed a risk assessment questionnaire; 76% (494) reported inconsistent condom use, 47%, (304) did not know their partners' HIV status, 39% (256) have sex under the influence of alcohol and drugs, 27% (175) have multiple partners, 24% (154) are in an age disparate relationship and 8% (53) were recently diagnosed with an STI/recurrent STI. PrEP continuation at month 1 was 42% (275) and 6% (39) at month 4.

**Conclusions:** A program that links high-risk PrEP-candidates, identified within well-prepared local pharmacies can potentially expand South Africa's PrEP coverage among women and men at substantial risk of contract-

ing HIV. Pharmacy delivered PrEP has the potential to reach populations that do not access clinical facilities and should be considered as options for PrEP differentiated service delivery.

## TUPEE510

Advanced HIV disease screening for clients with low viremia (viral load 500 To 999 Copies) at a rural HIV clinic in south west Uganda

R. Kusemererwa<sup>1</sup>, A. Nakayenga<sup>1</sup>, H. Asiimire<sup>1</sup>, D. Nansera<sup>1</sup>, N.S. Atwiine<sup>1</sup>, W. Muyindike<sup>1</sup>

<sup>1</sup>Mbarara Regional Referral Hospital, ART Clinic, Mbarara, Uganda

**Background:** Advanced HIV disease(AHD) places people living with HIV at high risk of opportunistic infections. Despite efforts to diagnose and treat in HIV programs, AHD still remains a challenge especially in sub-Saharan Africa. WHO recommends people with Advanced HIV are given priority for clinical assessment and treatment initiation. In Uganda, program reports indicate AHD ~25,000 PLHIV in care acquire AHD annually with 30% of non-suppressed contributing to this number. Screening is recommended for all People Living with HIV who have high level viremia (viral load result >1000 copies/ml). At Mbarara Regional Referral Hospital (MRRH), we conducted screening for AHD among PLHIV with low level viremia (VL 500-999 copies/ml) to understand its prevalence in this population.

**Description:** The goal of AHD screening in the Uganda HIV program is early identification to ensure timely provision of beneficial interventions and care, reducing unwanted morbidity and early mortality hence contributing to the HIV epidemic control.

To contribute to this goal, MRRH listed PLHIV with low level viremia (defined as 500-999 copies/ml for purposes of this project), placed phone call for clinic appointment reminders, provided intensive adherence counselling, monthly psychosocial support and screened and treated them for AHD from September 2022 to January 2024. Results of screening were obtained through routine laboratory testing.

**Lessons learned:** Of the 70 PLHIV listed and screened, 15/70 (21%) PLHIV had a CD4 less than 200 cells/mm<sup>3</sup>, 7/15(47%) of these were positive for TB urine Lam and received treatment for Tuberculosis but were negative for Serum CrAG. These PLHIV despite having low viremia, had similar psychosocial challenges like those with high level viremia and needed the same approach to their management.

**Conclusions/Next steps:** PLHIV with low level viremia need to be considered for AHD screening to ensure early identification and management. There is need for more research to understand the prevalence of AHD in the Uganda context in this population.

## TUPEE511

Bridging hard-to-reach gay and bisexual men who have sex with men (MSM) in a criminalized setting like Bangladesh with HIV testing and STI treatment through peer-led virtual platforms

M.N.M. Khan<sup>1</sup>, A.M. Torfa<sup>1</sup>, J.I. Imran<sup>1</sup>, G. Sarwar<sup>1</sup>, S.I. Khan<sup>1</sup>

<sup>1</sup>International Centre for Diarrheal Disease Research, Bangladesh, Programme for HIV and AIDS, Dhaka, Bangladesh

**Background:** The HIV epidemic presented a public health challenge among gay and bisexual Men who have Sex with Men (MSM) in Bangladesh, due to healthcare inequities emerging from legal repercussions and associated stigma.

This abstract highlights a pilot intervention that leverages peer-led virtual platforms to increase HIV testing and STI treatment among hard-to-reach gay and bisexual MSM in Bangladesh.

**Description:** A holistic intervention was conceptualized and implemented by programmatic experts and gay community members amid the context of criminalization and associated socio-structural challenges experienced by these populations.

This intervention reaches these populations through virtual platforms, i.e., social media (Facebook, Messenger, Whatsapp) and dating apps (Grindr, Tinder, etc). A total of 5874 participants were reached via 471 gay groups in four divisional cities from January 2023 to December 2023. Self-identified gay virtual peer educators from the target community have been trained in delivering information, administering online counseling, anonymous HIV testing (using self-testing kits) and STI treatment services.

**Lessons learned:** Fifty percent of the target population were aged 15-25 years. Around 91.2% of the participants tested their HIV status through oral fluid-based self-testing during the last year, of which 0.62% positive cases were identified, 83.7% were enrolled in ART. Moreover, 9.2% reported at least one STI symptom and received telehealth treatment. Sixty-five participants were enrolled in PrEP. Around 150,000 condoms and 20,000 lubricants were distributed via courier.

Preliminary results indicated a significant increase in participants reached through virtual platforms, who would not have been reachable through conventional HIV interventions. This peer-led intervention approach created trust within the hidden MSM/gay community, reduced stigma, and encouraged uptake of HIV testing and STI treatment services. Telehealth consultations opened avenues for confidential discussions, thus invoking trust, ensuring privacy for participants seeking healthcare.

**Conclusions/Next steps:** Integrating virtual platforms and peer-led approaches was shown as a promising approach for overcoming HIV prevention, testing and treatment barriers among these populations in Bangladesh. This approach demonstrates the potential for virtual in-

novations to address healthcare disparities in marginalized communities. Future efforts should emphasize scale-up, continuous improvement in programming through implementation science, and dialogue with stakeholders to ensure long-standing impact in the fight against the HIV epidemic.

## TUPEE512

### PrEP telematic services from community-based services

M. Alava<sup>1</sup>

<sup>1</sup>Corporación Kimirina, Quito, Ecuador

**Background:** Kimirina, in coordination with the Ministry of Public Health, initiated the PrEP program in Ecuador in August 2019. Initially, in-person medical services were offered, which were obviously suspended during the lockdown in Covid-19 pandemic. During this period, a telematic scheduling and PrEP service system was developed, allowing users to access the service through a computer or a mobile phone. Between August 2019 and July 2023, a total of 1,338 individuals, including MSM, transfeminine, sex workers, and serodiscordant, have accessed PrEP.

#### Description:

Kimirina's telematic system employs three types of tools:

1. A social network through which scheduling is established, and the user opens their file;
2. Interactive telemedicine through video calls using a web platform;
3. Digital health records developed in compliance with standard care requirements, incorporating the specificity of PrEP care. These records are stored to ensure the confidentiality and integrity of information;
4. The use of a widely used social network for receiving examination requests and prescriptions.

The telematic system is supported by Kimirina's network of community centers.

**Lessons learned:** During the analysis period, there is a clear upward trend in the number of individuals accessing the PrEP program each year. In 2019, 93 individuals were served, which increased to 555 in 2021 and 819 until July 2023 through the telematic system. It is worth noting that Kimirina provides in-person services, but these are rarely requested by PrEP users. Through the telematic system, users from 22 out of 24 provinces in Ecuador have been attended to.

**Conclusions/Next steps:** The potential to utilize technological systems enables greater access to combined prevention mechanisms and contributes to achieving the goal of ending the AIDS epidemic by 2030. Kimirina's telematic system is well-received by users as it reduces waiting times and facilitates access to complementary services, such as in-person HIV screening and laboratory testing.

## TUPEE513

### Provider preferences on injectable PrEP Scale-up in Malawi: a qualitative study

D. Hoege<sup>1</sup>, N. Jere<sup>2</sup>, R. Chilongosi<sup>3</sup>, F. Saidi<sup>2</sup>, K. Murombedzi<sup>4</sup>, L. Hill<sup>5</sup>, M. Hosseinipour<sup>5</sup>, S. Schwartz<sup>6</sup>, B. Afirima<sup>7</sup>, R.L. West<sup>8</sup>, R. Nyirenda<sup>9</sup>, Y. Kamgwira<sup>7</sup>, J. Nkhonjera<sup>9</sup>, W. Ozituosauka<sup>9</sup>, G. Kaur<sup>8</sup>, C. Holmes<sup>1</sup>, A. Bula<sup>2</sup>

<sup>1</sup>Georgetown University, Washington, DC, United States, <sup>2</sup>UNC Project-Malawi, Lilongwe, Malawi, <sup>3</sup>Family Health Services, Lilongwe, Malawi, <sup>4</sup>Population Services International, Blantyre, Malawi, <sup>5</sup>University of North Carolina, Chapel Hill, United States, <sup>6</sup>Johns Hopkins University, Baltimore, United States, <sup>7</sup>National AIDS Commission, Lilongwe, Malawi, <sup>8</sup>Ipsos, London, United Kingdom, <sup>9</sup>Department of HIV and AIDS and Viral Hepatitis, Lilongwe, Malawi

**Background:** Injectable PrEP has the potential to substantially impact HIV incidence in Malawi, however, its rapid and efficient scale-up is dependent on identifying issues that may facilitate or hinder effective service delivery and demand creation.

This paper examines and describes health care worker preferences, perceived challenges, and enablers in delivering and scaling up injectable PrEP in Malawi.

**Methods:** From May-December 2023, we conducted 20 in-depth interviews with healthcare workers providing oral PrEP as part of a pre-implementation mixed methods study to assess preferences for injectable PrEP delivery. The interview guide included questions to explore providers' experiences with oral PrEP and how that can be used to facilitate scale-up of injectable PrEP, as well as any anticipated barriers and facilitators.

Interviews were translated and transcribed into English, followed by a rapid analysis of interview summaries. Data were then coded and analysed using NVivo 1.7.

**Results:** Respondents felt that injectable PrEP had a relative advantage compared to oral PrEP, including reducing pill burden, promoting adherence, ensuring privacy, and reducing stigma toward users.

All but one provider was willing to recommend injectable PrEP to clients, suggesting high acceptability of injectable PrEP.

Respondents believed that injectable PrEP could be easily introduced and built from the experience of oral PrEP integration with other services, including family planning, ante/postnatal care, STI clinics and drop-in centres.

Respondents did not recommend integration with ART and OPD services due to concerns that these channels may promote stigma.

Despite indicating high feasibility, providers also noted potential barriers to injectable PrEP delivery and scale-up, including increased workload, overcrowding at clinics, and expressed the need for additional training and client education.

**Conclusions:** Despite barriers remaining to be addressed, injectable PrEP was found to be more acceptable and feasible to integrate with other services, including oral PrEP. Injectable PrEP can leverage a strong existing platform for rapid scale-up in Malawi.

## TUPEE514

Pre exposure prophylaxis for special categories; a multi-faceted approach to improve PrEP uptake among pregnant and breastfeeding women in Ankole sub-region, Uganda

N. Mwanja<sup>1</sup>, A. Kwiseera<sup>1</sup>, M. Kidega<sup>1</sup>, A. Nkoyoyo<sup>1</sup>

<sup>1</sup>The AIDS Support Organisation, USAID LPHS Ankole, Kampala, Uganda

**Background:** Pregnant and breastfeeding women experience heightened risk of acquiring HIV, increases the risk for vertical HIV transmission. Pre-exposure prophylaxis (PrEP), as part of a combination prevention package, Despite PrEP implementation progressing nationally, PrEP implementation for pregnant and postpartum women significantly lags behind other populations, inadvertently affecting realization of HIV epidemic control by 2030.

Bottlenecks to effective PrEP enrollment Uganda include declining PrEP stigma towards taking PrEP in society, feared side effects to the unborn child, lack of behavioral risk screening in MCH settings, has been sub-optimal, and lack of integration of PrEP services at MCH services points. Using a collaborative QI approach, we set out to improve PrEP enrollment among Pregnant and Breastfeeding women in the region.

**Description:** Held an onsite skills training to integrate PrEP eligibility screening, risk-based counseling and establish systems for client literacy at ANC and PNC service points with follow up for initiation focusing on MCH staff, mentor mothers and linkage facilitators.

Integrating PrEP talking points during group education and individual counselling at MCH, task shifting behavioral risk screening to mentor mothers and G-ANC peers and CLFs, establishment of a one stop shop PrEP service point at MCH, identified and attached G-ANC peers and KP peers at designated entry MCH points as change agent to provide peer counseling, experience sharing, follow up mothers for PrEP initiation.

**Lessons learned:** Screening of mothers at ANC and PNC, improved from 29% Nov 2022 to 93% August 2023, a total of 143 mothers were enrolled on PrEP over the same period. PrEP acceptance and Enrollment improved from 40% Nov 2022 to 100% September 2023 at 10 PrEP high volume collaborative sites.

**Conclusions/Next steps:** Utilizing a multifaceted approach that capitalized on addressing access barriers, Peer led demand creation, improving risk-based counseling and is effective in improving uptake of PrEP services among PBFW.

Figure.

## TUPEE515

Online delivery of HIV prophylaxis services in Kenya: results from the ePrEP Kenya pilot study

C. Kiptinness<sup>1</sup>, P. Naik<sup>2</sup>, T. Kareithi<sup>1</sup>, N.B. Thuo<sup>1</sup>, M. Rafferty<sup>3</sup>, E. Jomo<sup>3</sup>, N. Nyamasyo<sup>3</sup>, S. Abdurashid<sup>3</sup>, T. Pintye<sup>6</sup>, A. Stergachis<sup>2,7</sup>, D. Were<sup>8</sup>, M.L. Mugambi<sup>2</sup>, M. Sharma<sup>2</sup>, K. Ngure<sup>19</sup>, K.F. Ortblad<sup>5</sup>

<sup>1</sup>Partners in Health and Research Development, Thika, Kenya, <sup>2</sup>University of Washington, Department of Global Health, Seattle, United States, <sup>3</sup>MYDAWA, Nairobi, Kenya, <sup>4</sup>Audere, Seattle, United States, <sup>5</sup>Fred Hutchinson Cancer Center, Public Health Science Division, Seattle, United States, <sup>6</sup>University of Washington, Department of Biobehavioral Nursing and Health Informatics, Seattle, United States, <sup>7</sup>University of Washington, Department of Pharmacy, Seattle, United States, <sup>8</sup>Jhpiego, Nairobi, Kenya, <sup>9</sup>Jomo Kenyatta University of Agriculture and Technology, School of Public Health, Nairobi, Kenya

**Background:** In many African settings, access to smartphones and supporting applications is on the rise and could be leveraged to reach new populations with HIV pre-exposure and post-exposure prophylaxis (PrEP/PEP) services. Licensed online pharmacies are a novel platform for PrEP/PEP service delivery and overcome barriers to clinic-delivered PrEP/PEP services, including stigma and long travel times. In collaboration with MYDAWA, a private online pharmacy in Kenya, we pilot- tested this new delivery approach.

**Methods:** In the ePrEP Kenya Pilot, PrEP/PEP services were advertised in Nairobi and Mombasa counties via the MYDAWA website and outreach events. Interested clients completed a telehealth visit to assess PrEP/PEP eligibility (i.e., ≥18 years, no medical contraindications); those eligible were delivered HIV self-tests (HIVST) or counselor-conducted rapid diagnostic tests (RDT) for a respective \$3 or \$2 USD fee. Clients' whose HIV-negative status was confirmed (via uploaded images of used tests) were delivered a 30-day PrEP/PEP supply for a \$1 USD delivery fee at a location of their choice.

Clients interested in continuing PrEP services one month following initiation received a 90-day PrEP supply once their continued eligibility was confirmed.

**Results:** From October 2022–December 2023, 2,257 MYDAWA clients were assessed; 63% (1428/2257) were men, 80% (1796/2257) never married, and 72% (1631/2257) were  $\geq$  25 years. Most (77%, 1808/2357) were determined PEP eligible (HIV exposure in  $<$ 72 hours) and 12% (268/2357) were PrEP eligible.

Most PrEP/PEP eligible clients (93%, 1926/2076) ordered an HIV test (HIVST: 83%, 1723/2076; RDT: 10%, 203/2076); among those who ordered HIVSTs, 90% (1551/1723) uploaded an image of their test. Most PEP-eligible clients (87%, 1569/1808) received PEP via MYDAWA; one month later, 6% (89/1569) of them transitioned to PrEP. Most PrEP-eligible clients (76%, 205/268) also received PrEP via MYDAWA. PrEP continuation did not differ between those who initially received PrEP (205) and those who transitioned from PEP (89) and was as follows for months one (43%, 122/286), four (17%, 35/205), and seven (16%, 19/119).

**Conclusions:** We found that online PrEP/PEP service delivery was feasible in Kenya and might best serve clients with acute HIV prevention needs. More implementation strategies are needed to engage online clients in ongoing HIV prevention.

## TUPEE516

*IFE4Her pilot study findings: participation and perceptions of a Mobile Medical Unit Intervention offering HIV pre-exposure prophylaxis provider consultations to southern women in low-income communities in the United States (US)*

C. Golin<sup>1,2</sup>, L. Hill<sup>3</sup>, O. Allison<sup>3</sup>, S. Ayangeakaa<sup>4</sup>, H. Keshishian<sup>3</sup>, T. Michele<sup>5</sup>, A. Pulliam<sup>3</sup>, A. Woodley<sup>3</sup>, J. Frye<sup>6</sup>, C. Burnes<sup>6</sup>, M. McKellar<sup>6</sup>, Y. Choi<sup>4</sup>, I. Navarro<sup>4</sup>

<sup>1</sup>Carol E Golin, Chapel Hill, United States, <sup>2</sup>University of North Carolina at Chapel Hill, Medicine and Health Behavior, Chapel Hill, United States, <sup>3</sup>University of North Carolina at Chapel Hill, Health Behavior, Chapel Hill, United States, <sup>4</sup>Duke University, Population Health Sciences, Durham, United States, <sup>5</sup>North Carolina Central University, Biological Sciences, Durham, United States, <sup>6</sup>Duke University, Medicine, Durham, United States

**Background:** Women in low-income southern US neighborhoods have increase HIV risk, but few use pre-exposure prophylaxis (PrEP) due largely to nonawareness and inequitable access.

We pilot-tested the feasibility and acceptability of *I'm-Fully-Empowered (IFE) 4Her*, a community-based intervention integrating PrEP awareness messaging, peer networkers, and mobile medical unit (MMU) for women in low-income communities in North Carolina.

**Methods:** A PrEP MMU was offered in four pilot communities (one visit/week) 4/17/23 to 11/28/23. Services included PrEP consultation (labs and prescription if PrEP elected), blood pressure (BP) checks, fingerstick glucose monitoring and rapid HIV tests. The MMU and PrEP were publicized

in pilot communities through posters, door-to-door informational flyers, and peer-to-peer communication. Services delivered were tracked. Participant satisfaction surveys were collected.

**Results:** Out of 78 interested women (reached via phone, email, and in-person), 34 (84% African-American, 13% White) elected to receive MMU services and 31 of these completed a satisfaction survey. Of these, 68% found the MMU facilitated easier access. Twenty (65%) underwent PrEP consultation, 27 (87%) BP check, 23 (74%) glucose monitoring, and 14 (45%) HIV testing. Seven women who received PrEP consultation wanted to start PrEP during the study but none could due to challenges conducting field-based laboratory tests (six) and elevated creatinine (one). Notwithstanding, 84% of the 20 women undergoing PrEP consultation rated their overall satisfaction as excellent/very good. Satisfaction was high for time spent with provider (80%), comfort with van environment (75%), and information received (85%). Of those who received HIV-related services, 90% expressed comfort doing so in their neighborhood. Among women declining a PrEP consultation, reasons included: no interest in PrEP (55%); dislike taking medicine (27%); side effects (18%); accessing follow-up (18%); ability to pay (18%); no chance of getting HIV (9%), condom use (9%), and perceptions that PrEP is more for men (18%). Competing peer networker demands, weather, mechanical constraints, and lack of a consistent van schedule presented challenges to service delivery.

**Conclusions:** Women were satisfied with *IFE4Her* mobile services; fewer than expected accessed the unit despite robust awareness-raising. One fifth of those receiving PrEP consultation wanted to initiate PrEP but were thwarted by challenges to prescribing it in the field.

## TUPEE517

*Male sexual partners' preparedness to embrace the Dapivirine Vaginal Ring (DVR) as new biomedical HIV prevention technology. CHEDRA's experience with high risk men in fishing communities of Masaka, Uganda.*

M. Kigozi<sup>1</sup>, N. Georgina<sup>1</sup>

<sup>1</sup>Community Health Empowerment Development and Relief Agency, Research and Advocacy, Masaka, Uganda

**Background:** Although the Dapivirine Vaginal Ring is designed to be a female-initiated option to reduce the risk of HIV infection, male partner influence has been identified as one of the most significant factors impacting women's willingness and ability to use it. With support from the International Partnership for Microbicides (IPM), Community Health, Empowerment, Development and Relief Agency (CHEDRA) popularized the Dapivirine vaginal ring among high risk men within fishing communities to assess preparedness to embrace their sexual partners uptake of the DVR.

**Description:** With the Village Health Team, we conducted mobilization for integrated health outreaches in fishing communities targeting men in male friendly places such as bars, cinema halls, discotheques, play stations, and gathered at community venues. We delivered integrated HIV prevention packages including HIV testing, male circumcision, STI management, condom and lubricant distribution, counseling. Trained staff conducted health education, intensified awareness and advocacy for choice in HIV prevention. The DVR was introduced as a new female initiated HIV prevention option and demonstration on how to use it was done using a prototype of the vaginal ring, two penis models, a fabric model of a vagina (vulva puppet) as well as vaginal ring demonstration videos acquired from IPM. During outreaches, we conducted 14 men only FGDs following a semi-structured guide. Men were asked to discuss their perceived ring's impact on sexual engagement with the ring inserted in the woman. Interviews were facilitated by trained male social scientists in local language, together with a note take, interviews were audio-recorded, translated into English, and analyzed thematically.

**Lessons learned:** In total, 66 men participated in FGDs. 29 (44%) reported perceived incorrect ring insertion, 53(81%) expressed that ring use was partners a shared responsibility, 33 (50%) expressed concern that the ring may pose trust issues. All men expressed high HIV risk perception, only 8 (12%) had knowledge about the DVR.

Misconceptions, attitudes and perceptions towards the DVR impacted on their willingness to allow their partners to use it. All the men were happy that DVR could reduce HIV risk.

**Conclusions/Next steps:** DVR uptake can only be effective with active engagement of male sexual partners.

## TUPEE518

**Breaking barriers: harnessing artificial intelligence for precision in HIV risk assessment and reporting in South Africa**

C. Govathson<sup>1</sup>, L. Long<sup>2</sup>, R. Greener<sup>1</sup>, C. Chetty-Makkan<sup>1</sup>, Y. Richard<sup>3</sup>, B. Li<sup>3</sup>, R. Liang<sup>3</sup>, N. Maricich<sup>4</sup>, S. Morris<sup>3</sup>, D. Rech<sup>3</sup>, S. Pascoe<sup>1</sup>

<sup>1</sup>Health Economics and Epidemiology Research Office, University of Witwatersrand, Faculty of Health Sciences, Johannesburg, South Africa, <sup>2</sup>Boston University School of Public Health, Department of Global Health, Boston, United States, <sup>3</sup>Audere, Seattle, United States, <sup>4</sup>Audere Africa, Johannesburg, South Africa

**Background:** Gathering comprehensive sexual histories from clients to determine HIV risk can be hindered by stigma and discrimination, resulting in incomplete or inaccurate information. We co-designed and evaluated, with potential clients, a prototype of a Large Language Model (LLM)-powered app, "Your Choice". This app gathers de-

mographic and behavioural data to estimate HIV risk for clients and provides efficient summaries for the health-care provider.

**Methods:** We used a mixed-method approach to inform the design and key attributes of the "Your Choice" app. Participants were allocated between experiences powered by different underlying LLM models, GPT 3.5 or Claude Instant 1, for hypothetical (i.e., data not used for clinical care) HIV risk screening. Subsequently, clients completed three scales; Acceptability of Intervention Measure (AIM); Intervention Appropriateness Measure (IAM); and System Usability Scale (SUS). Twenty-five participants were purposively selected and interviewed. Qualitative data were thematically analysed.

**Results:** Enrolled 100 clients between August-November 2023 (58% male, 46% aged 25-34 years, 21% with > one sexual partner; 51 % used Claude Instant 1). Surveys revealed that participants found the app to be an acceptable and appropriate intervention for HIV risk screening. Over 90% of clients rated the app "strongly agree" on all measures of acceptability and appropriateness and the mean SUS score indicated excellent usability for the GPT 3.5 (82.19; SD=10.75) and Claude Instant 1 (79.75; SD=7.05) respectively. Qualitative analysis showed that the app provided a confidential space for honest discussions, offering empathetic and judgment-free information on sex, sexuality, and sexual health. It changed participants' knowledge about PrEP. Shortcomings included failure to contextualise, incorrect terminology and language and outdated information, impacting viability. Participants who struggled with literacy struggled at times and requested audio/voice interaction.

**Conclusions:** An AI-powered app with tuned prompts and guardrails, like "Your Choice", shows potential as a tool for private, stigma-free counseling which may encourage at-risk individuals to pursue HIV prevention methods such as PrEP. This can help providers direct care appropriately and efficiently when resources are limited. While promising, there remain significant gaps in the evidence. Further technology investments are also needed before integration into HIV clinical care.

## TUPEE519

### Experiences of health providers using standard national tools for classifying clients into key population groups in Manica province, Mozambique

J. Alexandre<sup>1</sup>, C. Cande<sup>2</sup>, J. Saturnino<sup>1</sup>, H. Malate<sup>2</sup>, J. Seleme<sup>3</sup>, J. Moiane<sup>1</sup>, M. Prieto<sup>1</sup>

<sup>1</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique, Maputo, Mozambique, <sup>2</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique/Abt Associates, Maputo, Mozambique, <sup>3</sup>Mozambican Ministry of Health, Maputo, Mozambique

**Background:** Members of key populations (KP) encompass sex workers, men who have sex with men, transgender individuals, people who inject drugs, and individuals in prisons and other confined settings. Globally, over half of the estimated new HIV infections among adults (15–49 years) occur among KP and their partners.

Healthcare providers play a vital role in identifying clients as KP members, facilitating the provision of tailored HIV prevention and care services. The USAID-funded Efficiencies for Clinical HIV Outcomes (ECHO) project conducted a survey to explore Mozambican healthcare providers' experiences using standard national tools to classify clients into KP groups to provide them tailored services.

**Methods:** ECHO conducted an anonymous paper-survey among doctors, clinical officers, nurses, and psychologists who provide healthcare services at various entry points in 49 health facilities in Manica province. Survey questions focused on three areas:

1. Collecting sociodemographic information;
2. Understanding healthcare provider's experiences discussing sensitive topics such as sexual health, non-heterosexual identities, exchange of money or goods for sexual services, and substance use; and,
3. Exploring the influence of religious beliefs when addressing these sensitive topics.

**Results:** Among the 88 healthcare providers surveyed, 51% were male, with a median age of 29 years (IQR: 26–34). This group comprised 68% clinical officers, 18% psychologists, 9% nurses, and 5% doctors. The majority (61%) had worked in HIV programs for 1–4 years, and 53% reported receiving specific training on KP topics. 34% of respondents experienced some discomfort when discussing sexual health, non-heterosexual identities, or the exchange of money or goods for sexual services. This discomfort reached 49% when specifically discussing sexual practices. The majority (94%) felt comfortable asking clients about substance use. While 60% of respondents had no issues providing services to KPs, 31% believed specialized healthcare providers (psychologists or others) should attend to members of this group. For the majority (82%), religious beliefs did not interfere when providing services to KPs.

**Conclusions:** Most healthcare providers surveyed in Man-

ica province, Mozambique, did not report major issues using national standard tools for classifying clients into KP groups. However, one-third respondents expressed some level of discomfort, highlighting the need for further qualitative research.

## Implementation science and scale up of treatment

## TUPEE520

### Mechanism for remote registration with AIDS Center for Kyrgyz citizens who find out about their HIV status abroad to facilitate immediate ART initiation

D. Masalimova<sup>1</sup>, A. Bekbolotov<sup>2</sup>

<sup>1</sup>AFEW-Kyrgyzstan (NGO), Bishkek, Kyrgyzstan, <sup>2</sup>Kyrgyz Republican Center for Blood-Borne Viral Hepatitis and HIV Control, Bishkek, Kyrgyzstan

**Background:** Migration affects more than 20% of the population in Kyrgyzstan. HIV trends are also affected: 30%–40% of newly diagnosed PLHIV self-report recent migration experience. The major migration destinations in the region are Russia and Kazakhstan, where ART is not available for foreigners. Many migrants return home with advanced HIV stages. To tackle this, the Kyrgyz Ministry of Health piloted a groundbreaking mechanism for remote registration and immediate treatment initiation for Kyrgyz PLHIV diagnosed abroad without returning home.

**Description:** Approved on June 27, 2022, the mechanism specifically caters to the unique needs of Kyrgyz PLHIV diagnosed abroad, who are unable to return to their home country for ART initiation. The mechanism leverages telemedicine technologies and facilitates remote doctor counseling and recognition of prescribed test results (VL, CD4, etc) made in the migrant's current residence. With online counseling, examinations, and ART prescriptions, the mechanism enables a seamless journey from diagnosis to treatment, eliminating the need for migrants to physically return to Kyrgyzstan. Migrants can delegate trusted individuals to collect medications and send them to their destination countries. This flexibility empowers migrants to access crucial healthcare services remotely, ensuring prompt care irrespective of their geographical location.

**Lessons learned:** As of the end of 2023, 31 migrants used the mechanism, 29 started ART with medications sent to their destination countries from Kyrgyzstan. 12 of them returned home and continued treatment, 17 continue receiving treatment remotely, and 2 lost to follow-up. Viral suppression is confirmed in 17 clients. Collaboration with NGOs in both migrant-sending and receiving countries

is crucial to the successful implementation of the mechanism. NGOs play a pivotal role in raising awareness of migrants about HIV, providing testing, informing PLHIV about the remote registration with the AIDS Center, aiding document collection, coordinating required tests, sending ARVs, and facilitating adherence support.

**Conclusions/Next steps:** The mechanism's success has prompted its extension to Tajikistan and current consideration in Uzbekistan. As major migrant-sending countries in Central Asia, they stand to benefit from this highly effective approach. The mechanism is the sole means for migrants to receive HIV treatment in Russia and Kazakhstan. Widespread adoption across the region could substantially reduce AIDS-related deaths.

## TUPEE521

**A Combo Pack (pill pack, alarm clock, and water bottle) for improved antiretroviral therapy adherence among adolescents and young people living with HIV in Kisumu County, Kenya?**

P. Anyango<sup>1</sup>

<sup>1</sup>The Hamptons Hospital Limited, Kakamega, Kenya

**Background:** Adherence is critical for antiretroviral therapy (ART) treatment success and long-term viral suppression. Adolescents and young people living with HIV (AYPLWH) face challenges in ART adherence which leads to viral replication, increased risk of HIV transmission, disease progression, drug resistance and preventable HIV-related deaths. Commonly cited factors of poor adherence include stigma, pill burden and poor medication time keeping. Promoting strategies such as using alarms, calendars and pillboxes are individually effective in facilitating ART adherence but we do not know their combined effect.

**Methods:** We employed a randomized trial design, with improved ART adherence as the primary outcome. We enrolled AYPLWH aged 15-24 years with documented high viral loads (>1000 copies/ml), enrolled in care in 3 public health facilities in Kisumu County, Kenya. We randomized half to intervention arm and half to control arm. Participants in the intervention arm received a combo package consisting of an Ankara print bag with enough space for a water bottle, pills and an alarm clock. Participants in the control arm received the standard of care from the health facility. We abstracted data on pill count from participating facilities and Viral Load from the Ministry of Health data base.

**Results:** We enrolled 202 participants and randomized them 1:1 to two study arms. Mean age was 17.9 years and 51.5% were females. The proportion of AYPLWH reporting missed clinic visits in the intervention arm declined by 8.0%, compared to the control arm, where the proportion increased by 1.6%. Forgetfulness, which was cited as the major reason for missing pills, declined in the intervention group by 20.7% as well as in the control arm by 15.3%. In-

terms of pill count, a comparable proportion, 37.0% in the intervention arm and 37.3% in the control arm, achieved good adherence. Regarding VL; participants with VL >300 c/ml declined by 1.0% in the intervention arm compared to control arm where the proportion declined by 3.9%.

**Conclusions:** The intervention showed minimal impact on ART adherence when assessed using both pre-post intervention and control designs.

Further research may be needed to understand factors influencing adherence and to explore additional interventions or modifications to the combo pack to enhance its effectiveness.

## TUPEE522

**Multisite validation of the Visitect point-of-care CD4 platform among persons with advanced HIV disease**

E. Nalintya<sup>1</sup>, P. Sekar<sup>2</sup>, O.L. Namakula<sup>1</sup>, K.K. Tadeo<sup>1</sup>, R. Kwizera<sup>1</sup>, L. Apeduno<sup>1</sup>, P. Kavuma<sup>1</sup>, V. Kasone<sup>3</sup>, A. Fieberg<sup>4</sup>, P. Nerima<sup>1</sup>, B. Dai<sup>4</sup>, D.B. Meyya<sup>5</sup>, D.R. Boulware<sup>6</sup>, R. Rajasingham<sup>6</sup>

<sup>1</sup>Infectious Diseases Institute, College of Health Sciences, Makerere University, Kampala, Uganda, <sup>2</sup>University of Minnesota, Medical School, Minneapolis, United States, <sup>3</sup>National Health Laboratory and Diagnostic Services, Ministry of Health, Kampala, Uganda, <sup>4</sup>Division of Biostatistics and Health Data Science, University of Minnesota, Minneapolis, United States, <sup>5</sup>Department of Medicine, School of Medicine, College of Health Sciences, Makerere University, Kampala, Uganda, <sup>6</sup>Division of Infectious Diseases and International Medicine, Department of Medicine, University of Minnesota, Minneapolis, United States

**Background:** The Visitect CD4 test (AccuBio, Alva, United Kingdom) is a rapid, semi-quantitative assay that estimates CD4 results above or below 200 cells/mL. In many resource-limited settings, the Visitect assay is being rolled out as the primary method of CD4 testing. We evaluated the performance of the Visitect CD4 assay in semi-urban laboratories in Uganda.

**Methods:** We performed a pragmatic laboratory validation of the Visitect CD4 platform in four routine HIV clinics in Uganda, nested within a cluster randomized trial evaluating an enhanced package of screening and treatment for persons with advanced HIV disease (NCT05085171). As part of the clinical trial, samples run on the Visitect CD4 platform were confirmed using another CD4 testing method. Confirmatory testing was performed using flow cytometry, Alere PIMA, or BD FACSPresto. Both the Visitect and confirmatory CD4 tests were run on venous blood per the manufacturers' instructions. We compared the diagnostic performance of the Visitect CD4 platform against the confirmatory method by evaluating the sensitivity, specificity, positive and negative predictive values.

**Results:** From May 5, 2022 to October 5, 2023 we collected 1495 venous blood samples that were run both by the Visitect CD4 test and another confirmatory CD4 platform at four peri-urban clinics surrounding Kampala, Uganda. The specificity of the Visitect test was 81% (95% CI: 79% to 84%) and the positive predictive value was 69% (95% CI: 66% to 73%). There were no samples for which the Visitect test was >200 and confirmatory test was ≤200 cells/mL, resulting in a sensitivity and negative predictive value of 100% with no variability around these estimates to report. Among those Visitect CD4 tests read as ≤200 cells/mL, with confirmatory results >200 cells/mL, median confirmatory CD4 cell count was 397 cells/mL (IQR, 281 to 590 cells/mL). Among persons with true advanced HIV disease (confirmatory CD4 ≤200 cells/mL), all were accurately classified as ≤200 by the Visitect CD4 platform. By clinic, specificity varied from 63% to 99%.

**Conclusions:** Given imperfect specificity of the Visitect CD4 platform, implementation science studies to understand which settings would be most appropriate for Visitect testing are needed to guide rollout.

## TUPEE523

### Improved CD4 access through scaling CD4 testing using device free CD4 test kits (VISITECT) in East Central, Uganda

J. Nambozo<sup>1</sup>

<sup>1</sup>Makerere University Joint AIDS Program, Laboratory, Jinja, Uganda

**Background:** Uganda adopted the World Health Organization (WHO) recommendation of use of Visitect as an alternative to the existing CD4 platforms that require machines and extra technical expertise, to increase CD4 access among eligible persons living with HIV (PLHIV). VISITECT is an instrument free point of care kit, that estimates CD4 quantities within 45 minutes.

In January 2022, only 28.6% (37/129) ART sites in East Central Uganda had functional CD4 machines (Pima and BD FAC presto machines), with 92/129 sites relying on sample referrals to hub laboratories. The frequent CD4 cartridges stock-outs, machines breakdown and long turnaround time (TAT) for results exacerbated access to CD4 testing in the region.

Consequently, only 31% of new HIV clients and 6% of non-suppressing clients accessed CD4 testing which is below the MoH target of 95%.

**Description:** USAID's Local Partner Health Services in East Central (LPHS-EC) collaborating with MoH-ACP trained health providers on CD4 testing using Visitect. The trainings were phased starting with regional trainers who cascaded to facilities, training and activating 92 facilities in a staggered approach depending on kits availability. The mechanism collaborated with Central Public Health Laboratories to provide kits, post training mentorships

to facilities on quality assurance, data quality, reporting and ordering through National Medical Stores and stock management.

Weekly internal review meetings were held to track CD4 access, followed by line listing and follow up of eligible clients for testing through community activities for those who missed the service.

**Lessons learned:** Access to CD4 testing improved from 31% to 80% among new persons living with HIV and from 6% to 75% among the non-suppressing PLHIVs comparing FY22Q4 and FY23Q3. Due to the short TAT, PLHIVs with advanced HIV disease (AHD) were screened for Tuberculosis (TB) and Cryptococcosis. A total of 413 TB and 91 Cryptococcosis PLHIVs were identified in FY23, all initiated on life saving treatment, averting AHD-related deaths.

**Conclusions/Next steps:** The activation of sites on CD4 testing using Visitect which is point of care test requiring no additional equipment, easy to use any trained personnel within the health facility including lay workers greatly improved the CD4 access within the East central region.

## TUPEE524

### Effect of community-based adherence support group on treatment outcome among people living with HIV/AIDS in Addis Ababa

A. Haji<sup>1,2</sup>, A. Alemayehu<sup>3,1</sup>, S. Ayalew<sup>3,1</sup>, A. Negash<sup>4</sup>, W.E. Endale<sup>3,1</sup>, S. Fekadu<sup>3,1</sup>

<sup>1</sup>Mekdim Ethiopia National Association, Addis Ababa, Ethiopia, <sup>2</sup>USAID\_Family Focused HIV Prevention Care and Treatment, Addis Ababa, Ethiopia, <sup>3</sup>USAID\_Family Focused HIV Prevention Care and Treatment Activity, Addis Ababa, Ethiopia, <sup>4</sup>USAID/Ethiopia, Health Office, Care & Support, Addis Ababa, Ethiopia

**Background:** A community-based adherence support group in HIV care and support for people living with HIV (PLHIV) in Ethiopia is a new intervention to improve adherence to care and ultimately contribute to viral suppression. A community-based adherence support group is a group-based case management intervention involving 15-20 PLHIV to discuss their antiretroviral therapy (ART) adherence and their socioeconomic issues in a community setting.

This study assessed the effect of community adherence support groups on viral load suppression among PLHIV in Addis Ababa, Ethiopia.

**Methods:** A community-based cross-sectional study design was conducted on 379 PLHIV enrolled into the community adherence support group in care and support in Addis Ababa. Study participants who were in the community adherence support group from 2021 to 2023 were selected using a systematic random sampling technique. Sociodemographic characteristics, enrollment status, psychological support, adherence support group and current viral load data were extracted from electronic

medical records and entered into SPSS 26. Descriptive and multivariate logistic regression analysis was conducted to test the main hypothesis at a 95% CI with a  $P < 0.05$ .

**Results:** Overall, 379 PLHIV with a mean age of 35 years with a standard deviation of 10 years were included in this study. Of these, most (310=81.79%) were female, and 152(40.1%) were enrolled in the community-based adherence support group. Ninety percent of the study participants achieved viral suppression (96.05% in the support group vs 83.59% not in the support group). The adherence support group was also associated with higher odds of viral load suppression (less than 50 copies/ml) with (AOR 4.23, 95% CI 1.67-10.73  $p=0.002$ ) but there was no significant difference in psychosocial support, sex, enrollment status and routine adherence with ( $p=0.16$ , 0.30, 0.199 and 0.122) respectively.

**Conclusions:** The results of this study suggest enrollment in the community adherence support group is associated with viral load suppression. However, intervention research is needed to determine the extent to which enrollment in community adherence support group is causally associated with improved viral suppression and to identify the most effective policies and programs to improve treatment outcomes.

## TUPEE525

Are health facilities prepared to provide care for people with HIV with advanced disease? A global survey

F. Fonseca<sup>1</sup>, V. Avelino-Silva<sup>2,3</sup>, W. Odoke<sup>1</sup>, J. van den Hombergh<sup>1</sup>, A. Benzaken<sup>1</sup>, AHF Bureau Quality Team

<sup>1</sup>Aids Healthcare Foundation, Global Quality Team, Los Angeles, United States, <sup>2</sup>Aids Healthcare Foundation, Global Quality Medical Team, Los Angeles, United States, <sup>3</sup>Faculdade de Medicina da Universidade de São Paulo, Department of Infectious and Parasitic Diseases, São Paulo, Brazil

**Background:** Advanced HIV/Aids is a public health problem. We investigated the availability of supplies/infrastructure required to provide care for this population in healthcare facilities, exploring correlations with local demands.

**Methods:** Aids Healthcare Foundation's partner facilities were invited to respond to a survey addressing the availability of services to support clients with advanced HIV. We present results per continent using percentages and confidence intervals (95%CI). We generated country-level scores taking the average percentage of facilities with available resources on 10 key items.

We used Spearman correlation to investigate relationships between country scores and local demands, depicted by the percentages of PWH newly enrolled in care with CD4  $< 200/\text{mm}^3$  in 2022.

**Results:** 643 facilities from 37 countries responded the survey (September-December/2021). Services requiring more costly equipment/supplies were less frequently available. Among European facilities, availability was  $> 90\%$  for all items, except for tuberculosis molecular tests and cryptococcal antigen. Facilities in Africa, Asia, and Latin America/Caribbean had lower availability of diagnostic and therapeutic resources (Table 1).

Although availability of services correlates with local demands across 33 countries (Figure 1), 19 (58%) had scores  $< 60\%$  despite having  $> 20\%$  of newly enrolled PWH with CD4  $< 200/\text{mm}^3$ .

	Africa 330 facilities	Asia 163 facilities	Europe 44 facilities	Latin America/ Caribbean 106 facilities
CD4 test available and performed within the facility*	56% (50-61)	56% (48-63)	93% (81-99)	58% (48-67)
Tuberculosis symptoms screening done for most clients with advanced HIV	100% (98-100)	96% (92-99)	100 (92-100)	92% (86-97)
Sputum microscopy exam available	81% (77-86)	88% (82-92)	95% (85-99)	67% (57-76)
Molecular test for tuberculosis available	53% (48-59)	76% (69-82)	57% (41-72)	55% (45-64)
Cryptococcal antigen test available	52% (47-58)	33% (26-41)	48% (32-63)	25% (18-35)
Lumbar puncture can be performed routinely at the facility	17% (13-22)	53% (45-61)	73% (57-85)	36% (27-46)
Urgent tomography referral available	60% (54-65)	80% (73-86)	100% (92-100)	58% (49-68)
Chest x-ray available at the facility	23% (19-28)	89% (83-93)	98% (88-100)	73% (63-81)
Oral fluconazole/ cotrimoxazole available	82% (77-86)/ 84% (80-88)	91% (85-95)/ 88% (81-92)	98% (88-100)/ 100% (92-100)	92% (84-96)/ 82% (73-89)

Table 1. Service availability to support clients with advanced HIV [percentages(95%CI)].

**Conclusions:** We found that essential healthcare services to support clients with advanced HIV are often unavailable, despite high local demands.

## TUPEE526

Shout it from the rooftops: evolving Undetectable = Untransmittable (U=U) and Status Neutral concepts for a celebratory biomedical HIV paradigm to empower key populations and resolve HIV-related stigma

A. Nguyen<sup>1</sup>, D.D. Do<sup>2</sup>, P.A. Nguyen<sup>3</sup>, S.H. Vo<sup>4</sup>, T.H. Do<sup>4,4</sup>, T.M. Nguyen<sup>4</sup>, T.T. Tran<sup>4</sup>, T.N. Hoang<sup>1</sup>, Y.N. Le<sup>1</sup>, P.T. Nguyen<sup>5</sup>, N.N.T. Vo<sup>5</sup>, T. Pollack<sup>5</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Hanoi, Viet Nam, <sup>2</sup>Vietnam Network of People Living with HIV, Hanoi, Viet Nam, <sup>3</sup>Vietnam Network of People Living with HIV, Ho Chi Minh City, Viet Nam, <sup>4</sup>Vietnam Ministry of Health, Vietnam Authority for AIDS Control, Hanoi, Viet Nam, <sup>5</sup>The Partnership for Health Advancement in Vietnam, Beth Israel Deaconess Medical Center, Hanoi, Viet Nam

**Background:** Vietnam was the first PEPFAR and South-east Asian country to adopt U=U as a primary strategy to reach epidemic control. The Ministry of Health (MOH) released U=U guidelines in 2019, promoting the versatility of the message for key populations (KP), health providers, and program managers throughout the HIV cascade and for the public for stigma elimination.

Although viral suppression rates increased from 94% in 2018 to 97% in 2022, persistent stigma challenged the ability of people with HIV (PLHIV) to reach the '4th 90'- quality of life. To address rising infections among young men who have sex with men (MSM), the MOH also committed to scaling up PrEP in 2020.

**Description:** Vietnam evolved the U=U concept into Status Neutral-Biomedical HIV prevention messaging to address changing program needs. National campaigns from 2018-2021 promoted anti-retroviral medication as an easy, effective method for HIV prevention.

The campaigns promoted sex-positive, destigmatizing, and celebratory messaging to transform conceptions of HIV from a 'death sentence' to 'Live, love. Like everyone else.'

An accompanying viral load literacy initiative focused on PLHIV education through facility-level interventions to empower clients with U=U knowledge. In 2020, PEPFAR launched status-neutral "One-Stop Shop" clinics providing tailored services to MSM.

**Lessons learned:** MOH and community collaboration ensured endorsement and effective messaging. An LGBTQI+ commercial firm led creative direction and brought in influencers and commercial brands to reach a younger, wider, and more diverse audience.

The 2021 Status Neutral 'Love is Hard, HIV Prevention is Easy' campaign reached 32 million social media users—1/3 of the Vietnamese population- with 6.2 million engagements and 79% brand recall. In intervention sites, viral load literacy began to approximate undetectable levels

(94%). Twenty-three One-Stop Shops accounted for 72% of PrEP users, and Vietnam reported a 59% increase in PrEP users in 2022 compared to 2021.

**Conclusions/Next steps:** The versatility of U=U and Status Neutral can help HIV programs reach KP. Broader interventions to change public perceptions of HIV can resolve the intersectional stigma faced by MSM and PLHIV. In 2023, Vietnam signed the U=U Multi-National Call to Action to institutionalize U=U and Status Neutral to resolve equity gaps in reaching epidemic control.

## TUPEE527

Community ART groups transforming HIV care in Kirwara sub-county hospital, Murang'a County, Kenya

J. Kisio<sup>1</sup>, S. Ngugi<sup>2</sup>, V. Irungu<sup>2</sup>, E. Wangeci<sup>2</sup>, D.G. Kinyanjui<sup>1</sup>

<sup>1</sup>Murang'a County Government, Health Department, Murang'a, Kenya, <sup>2</sup>LVCT, Dhibiti Project, Murang'a, Kenya

**Background:** Kenya's HIV Prevention, Care, and Treatment Guidelines recommend differentiated service delivery (DSD) models, including Community ART groups (CAGs) for established HIV-positive clients on Antiretroviral Therapy (ART). However, in Murang'a County, stigma remains a significant barrier to acceptance of CAGs.

To overcome these challenges, client-centric CAGs were introduced at Kirwara Sub-County Hospital in April 2022 to enhance HIV care, combat stigma, decongest the clinic, reduce missed appointments, and offer more personalized care to clients.

This study describes the implementation of CAGs, service uptake, and client outcomes in a high HIV stigma setting.

**Methods:** The formation process involved identifying clients established on ART per national guidelines and those with high missed appointment rates. Through well-structured individualized health education; clients were informed about the purpose and functioning of the groups, emphasizing that participation was voluntary. The first group meetings were held in July 2022 where CAGs norms and terms of reference were explained.

**Results:** Daily health talks led to a steady increase in interested clients and currently, 363 out of 950 clients are now participating in 19 groups from diverse areas. The adherence and retention rates among these clients are above 95% with an improved viral suppression rate of 98% (viral loads of < 50 copies/MLS) from 82% as of December 2023. The missed appointment rates have also been reduced from 5% to <1% with 90% of the clients in the CAGs expressing a sense of belonging.

**Conclusions:** Implementing Community ART Distribution Groups at Kirwara Sub-County Hospital has yielded numerous advantages for persons living with HIV. These groups encourage viral suppression, provide individualized care, reduce missed appointments, and alleviate the burden on healthcare systems.

The clients' feedback highlights the sense of belonging and time-saving benefits experienced within these groups. Overall, CAGs serve as a successful model for enhancing HIV care and empowering persons living with HIV in the Murang'a community.

## TUPEE528

Improving accuracy of reporting people living with HIV actively on treatment in a high HIV burden setting relying on a paper-based data collecting system: lessons from Zimbabwe program implementation 2023

M. Mhangara<sup>1</sup>, S. Mukungunugwa<sup>1</sup>, T. Tapera<sup>1</sup>, K. Nyathi<sup>2</sup>, T. Nyamundaya<sup>2</sup>

<sup>1</sup>USAID, Health, Population and Nutrition, Harare, Zimbabwe, <sup>2</sup>Zimbabwe Health Intervention, Harare, Zimbabwe

**Background:** Zimbabwe, like most low to middle income countries, relies mainly on paper-based data collection systems to capture and report HIV program data at site level. Paper-based systems are more laborious and less efficient in counting the number of persons active on treatment than electronic systems. To mitigate human resource challenges and to increase efficiency, many sites in Zimbabwe use a cohort adjustment method wherein the previously reported number of persons active on treatment is adjusted by adding new initiations, transfers in, and reinitiation, and subtracting losses through transfers out, interruption of treatment, and deaths.

**Description:** According to the UNAIDS HIV estimates 2022, Zimbabwe has achieved the 95-95-95 targets. However, program data showed above 100% treatment coverage in some geographic areas and age and sex bands and plateauing viral load coverage despite improved uptake. To better understand this phenomenon, the program instituted a physical count of clients' files to establish the number of PLHIV currently active on treatment using a standard data quality assessment (DQA) methodology. The activity was conducted in 373 supported sites in two provinces.

**Lessons learned:** The site level review of all available client files revealed that the actual number of clients active on treatment was 10.5% lower than reported (pre-DQA 221,050 vs. post DQA 200,052). Historical losses (from more than a year prior to the DQA) accounted for 48% of the reduction. Viral load coverage increased by 6% from the reported figure (pre-DQA 72% vs post DQA 78%). There was a reduction of the proportion of clients aged 0-24 years from 13.5% to 10.3%. The results of the DQA were shared with relevant stakeholders and corrected in the reporting system.

**Conclusions/Next steps:** This DQA provided an opportunity for a setting relying on a paper-based system to accurately report clients by age and sex. This exercise improved data accuracy in interpreting treatment and viral

load coverage by age and sex. Consequently, resource allocation will be based on real burden and gap. Similar settings should conduct routine total file counts periodically to calibrate the number of clients on HIV treatment for effective programming.

## TUPEE529

Re-thinking 'community' in the implementation of long-acting injectable Cabotegravir and Rilpivirine: qualitative findings from the ILANA study

R. Hayes<sup>1</sup>, S. Paparini<sup>1</sup>, C. Mwendera<sup>2</sup>, C.M. Orkin<sup>3,4</sup>

<sup>1</sup>Queen Mary University of London, SHARE Collaborative, Wolfson Institute for Population Health, London, United Kingdom, <sup>2</sup>University of Liverpool, Clinical Infection, Microbiology & Immunology, Liverpool, United Kingdom, <sup>3</sup>Queen Mary University of London, SHARE Collaborative, Blizard Institute, London, United Kingdom, <sup>4</sup>Barts Health NHS Trust, Department of Infection and Immunity, London, United Kingdom

**Background:** Delivery of long-acting injectable Cabotegravir and Rilpivirine (CAB+RPV) in community settings may increase acceptability and accessibility of treatment, where stigma is a concern.

However, evaluation has so far been minimal. ILANA is the first mixed-methods implementation study examining the acceptability and feasibility of CAB+RPV in six UK clinics and community settings across Brighton, Liverpool and London.

This presentation focuses on the views of community healthcare providers (CHCPs) and people living with HIV regarding delivery of CAB+RPV in community settings.

**Methods:** ILANA patient participants received CAB+RPV in clinic for the first six months of the study and could then choose to switch to their clinic's chosen community setting at month 6, with 23.7% (27/114) opting to do so. Three clinics provided treatment at the patient's home, two offered it at an HIV community-based organisation (CBO), and one offered treatment at a satellite clinic (Fig. 1). Longitudinal semi-structured interviews were conducted with patient participants (n=14) at baseline (Aug-Nov '22), with CHCPs (n=12) at month 8 (June-Aug '23) and with both participant groups at study end (Sept-Nov '23) and analysed thematically.

**Results:** Most patient participants felt comfortable at their clinics and were reluctant to move. Stigma played a nuanced role in influencing patient preferences for treatment setting. For some, treatment at home or a CBO presented differing issues around inadvertent disclosure, confidentiality, and professionalism.

Among those opting for community, many described receiving injections at home as more personalised and discreet, while CBOs offered a more relaxed setting and the opportunity to connect to the HIV community.

The views of CHCP participants on delivery in community settings were mixed, with many highlighting logistical and capacity challenges.

**Conclusions:** Our findings illustrate that the dichotomy of 'clinic versus community' does not reflect the diversity in community settings and the varying barriers or facilitators they present. They also challenge assumptions around who might benefit from community delivery in relation to stigma. Service providers should carefully consider how a particular community setting may help to address challenges for patients and be aware that the offer of a single community setting may be insufficient to increase accessibility overall.

## TUPEE530

### Assessing the impact of multi-month dispensing of antiretroviral therapy on viral load suppression among people living with HIV in Papua New Guinea

P. Nwaokoro<sup>1</sup>, W. Yeka<sup>1</sup>, J. Nankinga<sup>1</sup>, V. Kapus<sup>1</sup>, D. Kunjil<sup>1</sup>, I. Moide<sup>1</sup>, H. Kiromat – Geno<sup>1</sup>, M. Densil<sup>2</sup>, P. Boas<sup>3</sup>, P. Temu<sup>1</sup>  
<sup>1</sup>Family Health International 360 (FHI360), NCD, Papua New Guinea, <sup>2</sup>National Capital District Provincial Health Authority, NCD, Papua New Guinea, <sup>3</sup>National Department of Health, NCD, Papua New Guinea

**Background:** Multi-month dispensing (MMD) decreases clinic visits and enhances HIV treatment outcomes but remains underutilized among people living with HIV (PLHIV). As of 30<sup>th</sup> September 2019, only about 50% of PLHIV receiving antiretroviral treatment (ART) utilized MMD in the National Capital District (NCD). With the advent of COVID-19, the National Department of Health expanded MMD to reduce frequency of clinic visits and decongest facilities. The 11 President's Emergency Plan for AIDS Relief supported sites in NCD then scaled-up MMD and initiated enhanced viral load (VL) activities among PLHIV. We retrospectively examined changes in MMD and viral load suppression (VLS) among PLHIV from 1<sup>st</sup> October 2018 to 30<sup>th</sup> September 2023 using routinely collected program data.

**Description:** We assessed MMD coverage and VLS in PLHIV 2 years and above before and after the intervention. MMD involving ART dispensed for 3+ months, was categorized as 3-5MMD or 6+MMD. VLS was defined as a VL <1,000 copies/ml. We tracked MMD coverage and VLS rates, comparing characteristics of PLHIV with and without MMD using descriptive statistics. During the intervention, we provided technical support, provider mentorship including weekly data reviews, site prioritization and line-listing for eligible PLHIV for both MMD and VL.

**Lessons learned:** The proportion of PLHIV over 2 years receiving MMD increased from 51.91% (422/813; baseline FY19) to 95.23% (2,713/2,849; endline FY23). In FY19, 50.31% (409/813) received 3-5MMD, and 1.60% (13/813) were on 6+MMD. By FY20, 74.56% (1,023/1,372) adopted 3-5MMD,

with 4.01% (55/1,372) utilizing 6+MMD. In FY21, 72.66% (2,025/2,787) opted for 3-5MMD, and 16.00% (446/2,787) for 6+MMD. In FY22, 66.11% (2,218/3,355) adopted 3-5MMD, while 27.84% (934/3,355) utilized 6+MMD. While in FY23, 56.48% (1,609/2,845) opted for 3-5MMD, while 38.75% (1,104/2,845) received 6+MMD. VLS improved from 78.35% (637/813; baseline FY19) to 94.52% (2,675/2,830; endline FY23).

**Conclusions/Next steps:** There was greater improvement in VLS among PLHIV that had higher utilization and adoption of MMD. Expanding eligibility criteria, monitoring ART supplies, analyzing routine data and line-listing eligible clients for MMD and VL positively effected implementation. Further efforts should focus on increasing the adoption of MMD while aligning client ART-refills with VL sample collection to boost intervention effectiveness.

## TUPEE531

### Documentation of HIV care and treatment outcomes: a quality improvement experience in Liberia

J.K. Tonorlah<sup>1</sup>, G. Kamanga<sup>1</sup>, H. Reeves<sup>1</sup>, R. Lyimo<sup>1</sup>, M. Kiazolu<sup>1</sup>, P. Kumar Thakur<sup>2</sup>, M. Odo<sup>1</sup>, D. Darrow de Mora<sup>2</sup>, M. Jackson<sup>3</sup>, N. Fosua Clement<sup>1</sup>, J. Flomo<sup>3</sup>  
<sup>1</sup>FHI 360, EpiC, HIV Programs, Monrovia, Liberia, <sup>2</sup>FHI 360, EpiC, HIV Programs, Washington DC, United States, <sup>3</sup>Ministry of Health, National AIDS and STI Control Program, Monrovia, Liberia

**Background:** The PEPFAR/USAID-funded Meeting Targets and Maintaining Epidemic Control (EpiC) project in Liberia supports the National AIDS Control Program (NACP) to provide comprehensive HIV care and treatment in 21 health facilities. Initially there were notable gaps in meeting key indicators such as linkage to treatment, treatment interruption, viral load testing coverage, viral load suppression rates, and complete documentation of relevant outcomes. The project launched a quality improvement intervention comprised of intensive mentorship in the 21 supported facilities.

**Description:** Between October 2021 and September 2023 EpiC supported 21 facilities to establish quality improvement teams, including dedicated EpiC staff dubbed "shadow director" who provided intensive mentorship to facility staff through in-person meetings, phone calls and WhatsApp messaging to review data and provide feedback to facility directors. The entire clinic team met weekly to review data, discuss gaps, and monitor actionable quality improvement activities to reach 100% linkage, increase VL testing coverage, reduce treatment interruption, and improve overall documentation. Data in the registers for these indicators among all people living with HIV (PLHIV) on treatment were monitored at baseline and at 24 months, extracted from these registers and entered into the District Health Information System 2 (DHIS-2) eTracker.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Lessons learned:** After the quality improvement activity, linkage to treatment improved from 76.8% (1151/1499) to 96.4% (1376/1427), treatment interruption improved from 39.5% (5823/14740) to 8.6% (1583/18436), Viral load coverage improved from 65.7% (7901/12031) to 91.8% (14216/15489), and viral load suppression improved from 81.8% (6465/7901) to 96.7% (13751/14216). Data quality measured as 100% completeness of chart per 100 charts improved from less than 50% to more than 90%.

Indicators	Oct-Dec 2021	Jul-Sep 2023
Linkage to treatment	76.8%	96.4%
Treatment interruption	39.5%	8.6%
Viral load coverage	65.7%	91.8%
Viral load suppression	81.8%	96.7%
Data quality through chart completeness	<50%	>90%

Table: Indicators status at baseline and follow up.

**Conclusions/Next steps:** Intensive mentorship integration, using the approach described above, into ART clinic routine contributes to improved treatment outcomes and documentation. EpiC will continue working with NACP to expand this approach to new facilities and to advocate that the Ministry of Health adopts and implements such intensive mentorship to improve ART service delivery throughout Liberia.

de Zone de Suru Lere, Cotonou, Benin

**Background:** A pediatric dolutegravir formulation (pDTG) became available in late 2021. To inform introduction of this optimal treatment for children living with HIV (CLWH), we evaluated client and parent/caregiver experiences with pDTG, as well as health outcomes.

**Methods:** TORPEDO is a mixed-methods, prospective cohort study of CLWH initiating pDTG at 19 pediatric HIV treatment sites in 3 countries with early access to pDTG: Benin (6 sites), Nigeria (7 sites), and Uganda (6 sites). Data was collected at baseline, 6, and 12 months (except in Benin), including surveys of participants' experiences with pDTG and health record reviews of viral load (VL) results and height/weight data. Weight-for-height and weight-for-age z-scores were calculated using WHO Anthro package. Data were analyzed for trends and differences.

**Results:** 510 CLWH were enrolled from 10/2021 - 06/2022 (105 Benin, 180 Nigeria, 225 Uganda). 52% were male; average age was 5.2 years. Over 86% of participants were treatment experienced, 85% were previously on a lopinavir-ritonavir regimen; 98% of parent/caregiver respondents believed their child preferred pDTG compared to the previous regimen.

Most notably, 'improved taste' (96%) and 'improved ease of administration' (79%) were reported. The two most frequent side effects were increases in appetite (24%) and in energy (16%). Viral suppression (<1000 & <50 copies/mL) increased over the course of the study.

Overall, there was no significant difference in proportion of overweight and obese participants from baseline to endline.

**Conclusions:** In this large prospective study of CLWH initiating pDTG, we found it to be greatly preferred over previous regimens, with no increase in overweight/obese BMIs and higher rates of viral suppression. While longer-term outcomes need to be evaluated, this study provides strong evidence that dolutegravir will finally help HIV-endemic countries to achieve UNAIDS viral suppression targets in CLWH comparable to adult.

## TUPEE533

### Factors associated with unsuppressed viral load among HIV clients on antiretroviral therapy in Eswatini

S. Mazibuko<sup>1</sup>, A. Mafukidze<sup>2</sup>, C. Nyapokoto<sup>3</sup>, V. Williams<sup>2</sup>, F. Khumalo<sup>2</sup>, S. Matse<sup>3</sup>, M. Pasipamire<sup>1</sup>, M. Li<sup>1</sup>, S. Haumba<sup>2</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Mbabane, Eswatini, <sup>2</sup>Georgetown University Centre for Global Health, Mbabane, Eswatini, <sup>3</sup>Ministry of Health, Eswatini National AIDS Program, Mbabane, Eswatini

**Background:** Understanding unsuppressed HIV viral load (VL) and its determinants is critical to reaching and sustaining epidemic control. Unsuppressed VL is associated with increased risk of HIV-related morbidity and mortality, and onward transmission.

**Methods:** Performed a cross-sectional analysis of data from clients currently on antiretroviral therapy (ART) at facilities using the national client-level Electronic Medical Record (EMR). Data were analyzed using STATA® version 18. To assess the magnitude of unsuppressed VL (>1,000 copies/mL) and associated factors, the study used multivariable logistic regression, adjusted odds ratios (AOR), and 95% confidence intervals calculated at a significance level of <0.05.

**Results:** Data from 163,074 ART clients with a recent VL result (<12 months) at the end of June 2023, were analyzed. Females represented 66% of the population. Prevalence of unsuppressed VL was 2.11% (N=3,447).

Study found that males had higher odds of unsuppressed VL (AOR 1.25, CI 1.15-1.37) compared to females. Odds of unsuppressed VL were higher amongst clients on Tenofovir/Lamivudine/Efavirenz (TLE) compared to Tenofovir/Lamivudine/Dolutegravir (TLD) (AOR 2.59, CI 2.18-3.094). Young adults (15-34 years) had higher odds of unsuppressed VL, compared to 35-44-year-olds (15-24 (AOR 2.93, CI 2.58-3.33), 25-34 (AOR 1.52, CI 1.37-1.69)).

Compared to clients on ART for 5-10 years, those on ART <1 year had the highest odds of unsuppressed VL (AOR 2.25 CI 1.93-2.63), while 15-20 years had the lowest (AOR 0.79 CI 0.63-0.99). With regard to differentiated service delivery (DSD) modalities, clients receiving <3 multi-month dispensing (MMD) (AOR 6.16, CI 5.44-6.97), and 3-5MMD (AOR 1.81, CI 1.59-2.04) had higher odds of unsuppressed VL compared to 6MMD.

Compared to "Mainstream Care", all DSD models had lower odds of unsuppressed VL, except "High Viraemia Clinics" (AOR 18.60 CI 13.71-25.24), while "6MMD" (AOR 0.39, CI 0.32-0.46) had lowest odds.

**Conclusions:** Eswatini has low prevalence of unsuppressed VL. Importantly, clients on 6MMD had the lowest odds of unsuppressed VL compared to all other service delivery modalities. Higher odds of unsuppressed VL were noted amongst clients who are male, on non-TLD regi-

mens, and are young adults (15-34 years). Clients in these categories may need interventions tailored to their needs to address unsuppressed VL.

## TUPEE534

### Access to HIV viral load testing services in underserved security prone setting of Taraba State in Nigeria

T.N. Yakubu<sup>1</sup>, C. Ihesiaba<sup>1</sup>, G. Aneke<sup>1</sup>, O. Olude<sup>1</sup>, J. Chigiel<sup>2</sup>, E.E. Okwor<sup>2</sup>, C. Immanuel<sup>1</sup>, U. Omo-Emmanuel<sup>3</sup>, K. Olatunbosun<sup>3</sup>, E. Atuma<sup>2</sup>, A. Akinjeji<sup>1</sup>, R.N. Fayorsey<sup>4</sup>  
<sup>1</sup>ICAP at Columbia University, Abuja, Nigeria, <sup>2</sup>JHPIEGO, Abuja, Nigeria, <sup>3</sup>United States Agency for International Development, Abuja, Nigeria, <sup>4</sup>ICAP at Columbia University, New York, United States

**Background:** The current treatment goal for HIV recipients of care (RoCs) is to achieve viral load (VL) suppression at an undetectable level. Access to VL services is pivotal for monitoring this outcome. However, access to VL services was limited in Taraba State due to the rising spade of generalized insecurity, difficult remote mountainous terrains and border settlements, irregular systems for VL services characterized by inadequate human resources for health (HRH) with inadequate capacity, and poor laboratory infrastructures.

Here we described the outcome of the innovative strategies we implemented to provide access for VL services amidst insecurity.

**Methods:** We conducted a retrospective descriptive study of VL services provided to RoCs on Treatment in 29 Health Facilities (HF) from 1<sup>st</sup> October 2021 to 31<sup>st</sup> March 2023. We engaged stakeholders in the health sector, security operatives, vigilantes, representatives of vulnerable communities, and support groups in co-designing strategies. We formed the VL commandos who provided VL services in a manner that was culturally, linguistically, and socially relevant to eligible RoCs in security prone communities. We augmented and built the capacity of HRH, upgraded existing infrastructures, strengthened the specimen referral, and provided adequate laboratory commodities. We abstracted data from the VL register and EMR, and conducted descriptive and independent samples t-test analyses for viral load coverage (VLC), viral load suppression (VLS), and turnaround time (TAT) at p<0.05 using the SPSS.

**Results:** VL services increased significantly from 11.2% (3,394/30,399) in October 2021 to 93.2% (36,748/39,414) in March 2023 (p<0.05). There was a significant improvement in VLC from 11.2% (3,394/30,399) to 93.2% (36,748/39,414) and VLS from 81% (2,857/3,394) to 97% (35,338/36,478) (p<0.05) within this period. Undetectable viremia, defined as VL<50 copies/ml improved from 64% to 82%, and uptake of post-enhanced adherence counseling VL increased from 0% to 81% (p<0.05). There was also a significant reduction in TAT from 90 days to <10 days (p<0.05).

**Conclusions:** Our collaboration with the applicable stakeholders in health, security outfits, and support groups contributed to significant improvement in the uptake of VL services despite the rising spade of insecurity in Taraba State. Working with existing security structures made it possible to provide services in security-prone communities.

## TUPEE535

The impact of financial incentives on viral suppression among adults initiating HIV treatment in Tanzania: a hybrid effectiveness-implementation trial

P.F. Njau<sup>1</sup>, E. Katabaro<sup>1</sup>, S. Winters<sup>2</sup>, A. Sabasaba<sup>1</sup>, K. Hassan<sup>1</sup>, B. Joseph<sup>1</sup>, H. Maila<sup>1</sup>, J. Msasa<sup>1</sup>, C. Fahey<sup>3</sup>, L. Packer<sup>2</sup>, W.H. Dow<sup>2</sup>, N.P. Jewell<sup>2</sup>, N. Ulenga<sup>4</sup>, N. Mwenda<sup>5</sup>, S.I. McCoy<sup>2</sup>

<sup>1</sup>Health for a Prosperous Nation, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>University of California, Berkeley, United States, <sup>3</sup>University of Washington, Seattle, United States, <sup>4</sup>Management and Development for Health, Dar es Salaam, Tanzania, the United Republic of, <sup>5</sup>Rasello, Dar es Salaam, Tanzania, the United Republic of

**Background:** Small incentives or "nudges" may improve engagement in HIV care. We evaluated the short- and longer-term effects of financial incentives on viral suppression among adults initiating antiretroviral therapy (ART) in Tanzania.

**Methods:** In a Type 1 hybrid effectiveness-implementation study (ClinicalTrials.gov NCT04201353), we randomized 32 HIV primary care clinics in four regions 1:1 to usual care or the intervention (usual care plus ≤6 monthly incentives (22,500 TZS/each), conditional on visit attendance). Adults initiating ART (<30 days) who owned a mobile phone and had no plans to transfer were eligible.

The primary outcome was retention on ART with viral suppression (<1000 cp/ml) at 12 months.

Secondary outcomes included retention on ART with viral suppression at 6 months and viral suppression at 6 and 12 months using a lower threshold (<50 cp/ml). Intent-to-treat analysis was used to evaluate the effect of incentives on outcomes.

**Results:** The study included 1990 participants (n=1059 in intervention, n=931 comparison), enrolled between May 28, 2021 and March 8, 2022. There were no study related adverse events. Overall, 88% and 83% of participants were on ART with viral suppression at 6 and 12 months, respectively. At 6 months, 90% of intervention participants were on ART with viral suppression compared to 86% of comparison participants (adjusted risk difference (RD)=5.1 percentage points (pp), 95% CI 1.1, 9.1).

This effect was statistically similar at 12 months, 6 months after the incentive intervention ended (85% vs. 81%; RD=4.4pp, 95% CI: -1.4, 10.1). The intervention was more ef-

fective when the lower threshold for viral suppression was applied (6 months: RD=8.8pp, 95% CI: 3.9, 13.6; 12 months: RD=5.0pp, 95% CI -0.8, 10.8); with no statistical difference between the 6 and 12 month effects (p=0.10).

**Conclusions:** In this rigorous study, short-term incentives had modest benefits on viral suppression and did not harm retention or viral suppression after discontinuation. These findings suggest the need to understand subgroups who would most benefit from incentives to support engagement in HIV care.

## TUPEE536

Implementing global positioning system (GPS) to improve continuation in HIV treatment for children: lessons from the District Hospital and Urban Clinic in Petauke, Zambia

T. Malebe<sup>1</sup>, G. Kibombwe<sup>1</sup>, D. Mwenya<sup>2</sup>, M. Goma<sup>2</sup>, E. Oladele<sup>1</sup>, P. Makelele<sup>2</sup>, H. Satti<sup>3</sup>, J. Msofe<sup>3</sup>, D. Carpenter<sup>3</sup>, N. Persaud<sup>3</sup>, L. Nyau<sup>4</sup>, M. N'gambi<sup>4</sup>, O. Chabikuli<sup>5,6</sup>

<sup>1</sup>FHI 360, HIV Department, Lusaka, Zambia, <sup>2</sup>FHI 360, Technical, Lusaka, Zambia, <sup>3</sup>FHI 360, HIV Department, Durham, United States, <sup>4</sup>Ministry of Health, Technical, Chipata, Zambia, <sup>5</sup>FHI 360, Technical/Programs, Pretoria, South Africa, <sup>6</sup>Haward University, Public Health Programs, Graduate School, Washington DC, United States

**Background:** Zambia has made considerable progress toward scaling antiretroviral therapy (ART), with 98% of people who know their HIV status on ART. However, this causes increased workload in health facilities amid personnel shortages, adversely affecting continuation in care, particularly for children.

In April 2022, the CDC technical assistance project piloted the use of global positioning system (GPS) technology to improve accuracy of tracking clients with interruption in treatment (IIT).

**Description:** The implementation had a pilot phase conducted at Petauke District Hospital, and scale-up phase which included Petauke Urban Clinic. Steps included:

1. Orienting community health workers on GPS
2. Deploying CHWs to capture coordinates for children active in care.
3. Utilizing MS Excel template to download and store coordinates.
4. Employing clustering and proximity methods in quantum geographic information system (QGIS)
5. Generating shape files and layered maps using QGIS.

The pilot captured 154 pediatric clients active in care: 107 residing within a 20km radius and 47 beyond 20km. Of the 107 residing within a 20km radius, 87 (81%) were mapped.

**Lessons learned:** During pilot phase, 12 pediatric clients or adolescents and young people (AYP) had IIT: eight due for viral load (VL) sample collection and four for ART refill. Utilizing coordinates obtained previously, Google Maps navigation led to all 12 (100%) correct addresses within an

hour. Of the eight clients due for VL, seven were found at home and 100% VL sample collection achieved. The four due for ART refill all received their medication.

During scale-up, an additional 197 children were mapped. Of these, 33 had IIT: 66% (22) missed ART refill appointment and 33% (11) VL sample collection. GPS was successful in tracking all 22 houses for children that missed their appointment within four hours. Outcomes were: 18% (4) re-located and 72% (16) returned to care. All 11 (100%) children due for VL had samples collected.

**Conclusions/Next steps:** GPS technology implemented with real time tracking of appointments quickens the location of clients missing appointments. When implemented and scaled up while incorporated in electronic health medical records systems, it could contribute to improving continuation in treatment and care and attaining HIV epidemic control in Zambia.

## TUPEE537

**Lessons learned from an open-source mobile platform for returning HIV viral load results directly to clients and healthcare providers in Malawi**

R. Haggard<sup>1</sup>, C. Mwase<sup>2</sup>, H. Cooper<sup>1</sup>, B. Klyn<sup>1</sup>, R. Nyirenda<sup>3</sup>, B. Chiwandira<sup>3</sup>, T. Smith<sup>2</sup>, L. Metz<sup>1</sup>, A. Jahn<sup>3</sup>

<sup>1</sup>Cooper/Smith Global, Austin, United States, <sup>2</sup>Cooper/Smith Global, Lilongwe, Malawi, <sup>3</sup>Ministry of Health, Department of HIV and AIDS, Lilongwe, Malawi

**Background:** Malawi has 986,000 people living with HIV. Viral load testing is the gold standard to monitor ART adherence and treatment response. Malawi faces significant delays returning results from laboratories to facilities, resulting in poor client outcomes. We developed an open-source application that leverages technology for mobile phone users (SMS and USSD) to expedite VL results (VLRR) directly to clients and healthcare providers.

**Description:** We piloted VLRR at 4 health facilities from April 2022 to August 2023, scaled to 5 sites in October 2023 and an additional 5 sites in January 2024 in Malawi. VLRR is integrated with the laboratory information management system (LIMS) and specimen transportation system. VLRR sends an SMS to consenting patients when a result is received from LIMS. Clients then securely check their results through a USSD channel which also guides care-seeking behavior.

**Lessons learned:** During the pilot period, clients with feature phones experienced USSD session timeouts. We developed a personal identification number workflow specific to the client to address this. We also had challenges with backend synchronization between databases due to API and server issues, which delayed results return. Upon fixing this, clients received their results in near real-time. Additionally, we implemented a notification system through SMS for healthcare providers to know which results are ready to view.

**Conclusions/Next steps:** Lessons learned through the pilot allowed us to ensure patients receive their results ~24 days faster than standard practice. Clients and health staff can now access results quickly, conveniently, and perpetually. The changes implemented at the four pilot sites have allowed us to see faster uptake of the application at the 10 additional sites, an increased open rate by clients and healthcare providers, and a faster turnaround time of results return. We hope the challenges and lessons here provide a landscape for use in other contexts as the backend architecture will be shared freely to the global community for implementation wherever useful.

<sup>1</sup>Centre for Clinical Care and Clinical Research, Nigeria, Prevention, Care and Treatment, Abuja, Nigeria, <sup>2</sup>Centre for Clinical Care and Clinical Research, Nigeria, Program Management, Abuja, Nigeria, <sup>3</sup>Jhpiego, Prevention Services, Abuja, Nigeria, <sup>4</sup>Jhpiego, Strategic Information, Abuja, Nigeria, <sup>5</sup>Centre for Clinical Care and Clinical Research, Nigeria, Care and Treatment, Ilorin, Nigeria, <sup>6</sup>Centre for Clinical Care and Clinical Research, Nigeria, Care and Treatment, Minna, Nigeria, <sup>7</sup>Association for Reproductive and Family Health (ARFH), TB/HIV, Ilorin, Nigeria, <sup>8</sup>Centre for Clinical Care and Clinical Research, Nigeria, Program Management, Ilorin, Nigeria, <sup>9</sup>Centre for Clinical Care and Clinical Research, Nigeria, Strategic Information, Ilorin, Nigeria, <sup>10</sup>USAID, Office of HIV/AIDS and TB, Abuja, Nigeria

**Background:** In Nigeria, despite increased availability of resources to ensure uninterrupted access to ARVs, retention among children and adolescents living with HIV (CALHIV) has been challenging. Viral load coverage (VLC) and suppression (VLS) rate for children(0-14) were 56% and 53.8% respectively while for adolescents(15-19), 59.6% and 51.7% respectively (FMOH, 2020).

The aim of the study was to evaluate effectiveness of paediatric focused intervention package in improving viral suppression among CALHIV.

**Methods:** Mixed method that collected data of children and adolescents living with HIV from Kwara and Niger states, Nigeria between October, 2022 and September 2023 was employed. Focused group discussion was conducted with randomly selected 8-13 adolescents from each of 4 sites to explore the root-causes of the poor

VLC and VLS with suggestions to address them. Inductive analysis was conducted to construct themes. Based on the findings, we had consultative workshop with key stakeholders across the states and rolled out intervention package - **VEMCLEEP** targeting CALHIV, and they include:

- Paediatric Viraemia clinic targeting all unsuppressed CALHIV
- Extending clinic days/hours to facilitate seamless access to ARVs
- OTZ clubs/Meetings
- Caregivers forum – to engage and provide disclosure, literacy and adherence messages to caregivers
- Link up to OVC program
- Engage dedicated paediatric healthcare providers
- Engage dedicated paediatric case managers
- Paediatric surge team saddled with responsibility to drive and coordinate implementation of the intervention.

Retrospective program data was reviewed and descriptively analysed to evaluate VLC and VLS among CALHIV.

**Results:** Some of the identified causes of suboptimal VLC and VLS include long client wait time, conflicting social engagement, poor treatment literacy, disclosure and difficulty navigating health facilities. The adolescents requested special interventions/support. At the end of Sept. 2023, program data revealed sustained increase in VLC and VLS among CALHIV. The VLC increased from 86% to 95% and 89% to 96% among children and adolescents respectively while the VLS increased 83% to 90% and 86% to 88% among children and adolescents respectively.

**Conclusions:** The study delineates excellent potential for use of client-centric approach in improving HIV/AIDS program quality. It clearly indicates that the interventions are effective in improving VLC and VLS and deserve been adopted among other struggling populations.

## TUPEE539

HealthMPowerment (HMP) Stigma: digital intervention increases undetectable viral load among Young Black and Latinx MSM and Transgender women living with HIV

J. Bauermeister<sup>1</sup>, S.K. Choi<sup>1</sup>, S. Aryal<sup>1</sup>, W. Lin<sup>1</sup>, J. Golinkoff<sup>2</sup>, S. Hirshfield<sup>3</sup>, M. Mulawa<sup>4</sup>, D. Watson<sup>2</sup>, L. Hightow-Weidman<sup>5</sup>, K. Muessig<sup>5</sup>

<sup>1</sup>University of Pennsylvania, Family & Community Health, Philadelphia, United States, <sup>2</sup>University of Pennsylvania, Philadelphia, United States, <sup>3</sup>SUNY Downstate Medical Center, New York, United States, <sup>4</sup>Duke University, Durham, United States, <sup>5</sup>Florida State University, Tallahassee, United States

**Background:** HealthMPowerment Stigma (HMP) is an app-based intervention designed to reduce intersectional stigma and improve HIV-related outcomes among young Black and Latinx men who have sex with men and

transgender women who have sex with men (YBLMT). Our primary goal was to test whether participants randomized to the HMP app reported improvements in HIV prevention and care continuum outcomes compared with an information-only control arm.

**Methods:** We enrolled 750 participants in a 12-month online randomized controlled trial to increase HIV testing and viral suppression. Eligible participants resided in the United States, were 15 to 29 years old, identified as YBLMT, and reported condomless anal sex with men or transgender women. Using an HIV-status stratified, randomized trial design, participants were randomized to one of three HMP conditions: information-only control arm (Arm 1), researcher-created network intervention (Arm 2), or peer-referred network intervention (Arm 3).

We recruited 230 participants living with HIV (PLHIV). 74 (32.2%) were randomized to Arm 1, 75 (32.6%) to Arm 2, and 81 (35.2%) to Arm 3. Successful engagement in care was operationalized as maintaining a consistent undetectable viral load (CUVL).

**Results:** We observed differences between treatment arms in participants' successful engagement in care: 45/74 (60.8%) in Arm 1, 60/75 (80%) in Arm 2, and 60/81 (74.1%) achieved CUVL ( $\chi^2=7.1$ ;  $p=.029$ ).

Comparison Groups	OR	95% CI	p-value
Arm 2 vs Arm 1	2.5	1.2, 5.3	0.011
Arm 3 vs Arm 1	1.8	0.9, 3.6	0.079
Arm 2 vs Arm 3	1.4	0.6, 2.9	0.381
Intervention (Arm 2 and Arm 3) vs Control (Arm 1)	2.1	1.2, 3.9	0.012

Table 1. Odds Ratio and 95% CI for achieving a consistent undetectable viral load among PLHIV.

Participants in Arm 2 were 2.5 (95% CI:1.2-5.3) times more likely to achieve a CUVL as compared to Arm 1. In exploratory analyses, we combined Arms 2 and 3 and compared them to Arm 1. Participants in the combined intervention arm were 2.1 (95% CI:1.2-3.9) times more likely to achieve CUVL than the control arm.

**Conclusions:** YBLMT living with HIV who had access to the HMP intervention were more likely to achieve and maintain viral suppression over a 12-month period. This intervention has the potential to significantly impact the disproportionate burden of HIV among YBLMT in the United States.

## TUPEE540

### Successful implementation of multifaceted approach structured across four pillars to effectively retained people living with HIV in care and treatment in four provinces of Mozambique

M. Cazonda<sup>1</sup>, J. Armazía<sup>1</sup>, J. Moiane<sup>2</sup>, M. Prieto<sup>2</sup>, J. Chacha<sup>3</sup>

<sup>1</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique/Abt Associates, Maputo, Mozambique,

<sup>2</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique, Maputo, Mozambique, <sup>3</sup>ECHO (Efficiencies for Clinical HIV Outcomes) Project, Mozambique, Maputo, Mozambique

**Background:** USAID-funded Efficiencies for Clinical HIV Outcomes (ECHO) project supports the Mozambique Ministry of Health in implementing its national HIV program across four provinces. These provinces vary in HIV prevalence from 7.9% to 13.2% and encompass diverse socio-demographic contexts. This diversity posed a significant challenge in locally adapting and scaling up strategies to retain people living with HIV (PLHIV) in care and treatment (C&T).

We describe the interventions, outcomes and lessons learnt from the period between 2019 and 2023.

**Description:** ECHO adopted a multifaceted approach of interventions to retain PLHIV in C&T, structured across four pillars: reducing treatment interruption, increasing reintegration, involving health providers, and community involvement.

Under pillar one, ECHO implemented SMS reminders for upcoming appointments and preventive home visits during the first six months of treatment, using a 'client tracker tool' developed via the electronic patient tracking system. 3-month dispensing of antiretrovirals was extended to all supported health facilities (148), with 24 facilities initiating 6-month dispensing.

Under pillar two, ECHO expanded the cohort of community health workers for conducting home visits, involving mentor mothers for pregnant and breastfeeding women and their infants. ECHO also outlined and implemented ART community dispensing through health providers for those who missed drug pick-ups.

Under pillar three, ECHO established a WhatsApp network for the daily sharing of outcomes, challenges, and best practices.

Under pillar four, ECHO collaborated with community and faith-based organizations, formed community dialogue groups and supported health committee interventions aiming to improve the quality of services provided by facilities.

**Lessons learned:** Between October 2019 and September 2023, the number of PLHIV active engaged in C&T grew more than doubled, from 207,753 to 417,059. Among these, 73% were adults aged 25-49, 65% were female, and 78% were enrolled in either 3 or 6-multi month dispensing. The percentage of individuals interrupting treat-

ment dropped from 14.1% to 1.9%. Despite this progress, reaching more males, adolescents, and young people remained a challenge.

**Conclusions/Next steps:** Effectively retaining PLHIV in C&T demands a comprehensive approach, involving people-centered-care, collaboration with health providers, and engagement with communities. Tailored interventions for specific population groups are imperative to ensure inclusivity and prevent anyone from being left behind.

## TUPEE541

### Community antiretroviral treatment dispensing by health providers for people living with HIV who missed their drug pick-ups/clinical appointments: lessons learnt after over two years of implementation in four Mozambican provinces

J. Moiane<sup>1</sup>, M. Prieto<sup>1</sup>, M. Cazonda<sup>2</sup>, J. Alexandre<sup>1</sup>, J. Saturnino<sup>1</sup>

<sup>1</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique, Maputo, Mozambique, <sup>2</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique/Abt Associates, Maputo, Mozambique

**Background:** In the context of the COVID-19 epidemic, the USAID-funded Efficiencies for Clinical HIV Outcomes (ECHO) project outlined an intervention for community-based dispensing of antiretroviral treatment by health providers (CDAHP), focused on people living with HIV (PLHIV) who missed their drug pick-up/clinical appointments because of transportation or financial constraints. We describe the outcomes and lessons learnt after over two years of implementation.

**Description:** ECHO initiated CDAHP implementation in June 2020 in 42 health facilities (HFs) in four project-supported provinces and expanded to 149 HFs by the end of December 2022. For expansion, ECHO trained health providers and allocated resources (transportation, airtime, incentives). Eligibility criteria included PLHIV on antiretroviral treatment (ART) aged ≥2 years, excluding pregnant and breastfeeding women, with telephone contact and/or consent to receive home visits.

On a weekly basis, HFs elaborated a list of individuals who missed their drug pick-up/clinical appointments and contacted them via phone calls or home visits to offer CDAHP and schedule the date/location for ART delivery.

All clients were counseled to return to the HF within 30 days to benefit from a less-intensive differentiated service delivery (DSD) model, according to their eligibility. Community health workers provided support for clients' residence location.

**Lessons learned:** From June 2020 to December 2022, 46,536 individuals received ART in their communities. The percentage of PLHIV enrolled in CDAHP in relation to the total number of PLHIV active on ART in the four prov-

inches grew from 4% (9,004/231,299) in June 2020, to 12% (45,870/378,875) in December 2022, corresponding to a percent increase of 200%. CDAHP was well accepted in the communities and facilitated access to ART for those facing challenges to regularly visit HF, and the Ministry of Health included CDAPH in the national guidelines for DSD released in 2023.

However, although CDAHP was not designed as a long-term DSD model, the main challenge was to transition the clients to other DSD models after first ART delivery in the community.

**Conclusions/Next steps:** CDAHP likely helps prevent loss-of-follow-up of individuals on ART who missed their drug pick-up/clinical appointments. Further analysis will be necessary to assess the long-term health outcomes of this intervention.

## TUPEE542

Perspectives on shared decision-making for HIV treatment in the era of long-acting injectable antiretroviral therapy: qualitative interviews with medical and social service providers across six U.S. cities

T. McCrimmon<sup>1</sup>, L.F. Collins<sup>2</sup>, V.A. Shaffer<sup>3</sup>, M.L. Alcaide<sup>4</sup>, M.M. Philbin<sup>5</sup>

<sup>1</sup>Columbia University Mailman School of Public Health, Department of Sociomedical Sciences, New York, United States, <sup>2</sup>Emory University School of Medicine, Department of Medicine, Atlanta, United States, <sup>3</sup>University of Missouri, Department of Psychological Sciences, Columbia, United States, <sup>4</sup>University of Miami Miller School of Medicine, Department of Medicine, Miami, United States, <sup>5</sup>University of California San Francisco, Department of Medicine, San Francisco, United States

**Background:** Long-acting injectable antiretroviral therapy (LAI ART) was approved in the U.S. in 2021, giving people living with HIV (PLWH) an alternative to daily oral ART. HIV providers play key roles in offering and helping PLWH choose between ART modalities.

It is therefore important to understand how providers engage their clients in shared decision-making regarding HIV treatment.

**Methods:** We conducted 38 in-depth interviews with medical and social service providers in HIV clinics across six U.S. cities from 09/2021-03/2022. Providers described their approach to decision-making when initiating or switching a client's ART regimen, including the impacts of recent development and clinical availability of LAI ART. Interviews were recorded, transcribed, and analyzed using thematic analysis.

**Results:** Providers believed that choosing between LAI and oral ART, "will require a lot of joint decision-making" and stressed the need for comprehensive decision support tools to facilitate this process.

Four themes emerged:

1. Providers' time in the field shaped their decision-making approaches: More experienced providers described familiarity with choosing between ART combinations ("*learning [decision-making] on-the-job was easier than it is now*"), whereas newer providers had primarily used first-line once-daily single tablet regimens, lowering their comfort with prescribing other modalities ("*there's so many options that they'll probably just stay away from [LAI]*");
2. Providers endorsed initiating the decision-making process by offering clients a "menu" of ART options based on their clinical profile, and also recognized that clients may ask to change medications, requiring providers to "*work backwards*";
3. Most providers saw PLWH as "*absolutely the final decision makers*," though described heterogeneity by subgroup, often by gender or cultural background ("*females tend to say yes to everything*"); and
4. Providers highlighted external constraints to modality choice including insurance ("*a stronger persuader than I am*") and specific clinical program requirements.

**Conclusions:** The advent of LAI ART requires a new approach to client-provider decision-making regarding ART modality, considering PLWH preferences, eligibility considerations, and structural barriers to potential uptake.

To optimize PLWH informed choice around evolving ART options, innovative decision support tools for provider-client shared decision-making are urgently needed.

## TUPEE543

Client education approaches that enhance equity: benefits, challenges, and early lessons from eight clinics across the United States implementing long-acting injectable antiretroviral therapy

N. Nguyen<sup>1,2</sup>, S.A. Golub<sup>3</sup>, E. Furuya<sup>3</sup>, A. Muscarella<sup>4</sup>, J. Burdge<sup>5</sup>, C. Carnevale<sup>6</sup>, C. Chastain<sup>5</sup>, J. Zucker<sup>2</sup>, D. Castor<sup>2</sup>, S. Wiant<sup>2</sup>, C. Hijiya<sup>1</sup>, B. Kutner<sup>7</sup>, B. Lane<sup>1</sup>, K. Meyers<sup>1,2</sup>, ALAI UP Project Team

<sup>1</sup>Aaron Diamond AIDS Research Center, Columbia University Irving Medical Center, New York, United States, <sup>2</sup>Division of Infectious Diseases, Columbia University Irving Medical Center, Department of Medicine, New York, United States, <sup>3</sup>Hunter College of the City University of New York, New York, United States, <sup>4</sup>Vanderbilt University Medical Center, Department of Pharmacy, Nashville, United States, <sup>5</sup>Division of Infectious Diseases, Vanderbilt University Medical Center, Department of Medicine, Nashville, United States, <sup>6</sup>New York Presbyterian Hospital, New York, United States, <sup>7</sup>Albert Einstein College of Medicine, Bronx, United States

**Background:** Long-acting injectable antiretroviral therapy (LAI ART) can dramatically transform HIV care for those who are not well-served by oral regimens. Programmatic choices regarding which clients are educated about LAI ART can have profound impacts on equity.

**Description:** The ALAI UP Project provides technical assistance and implementation coaching to eight US clinical sites to ensure that the introduction of LAI ARTs does not deepen health disparities, and to accelerate the equitable implementation of LAI ART, starting with injectable cabotegravir/rilpivirine (iCAB/RPV).

We report on early benefits of universal education of iCAB/RPV, challenges, and lessons learned after one year of ALAI UP implementation support as reported by clinics through quarterly surveys and process monitoring calls.

**Lessons learned:** Over the first year of ALAI UP, three clinics changed workflows to educate clients without first assessing their clinical eligibility or insurance coverage. Benefits of universal education include: centering equity as a primary goal, addressing provider's implicit bias, and motivating clients and care teams to work towards viral suppression to enable switching to LAI ART.

Sites that have not adopted this workflow cite the following challenges related to provider buy-in: concern that demand will exceed current capacity, desire to learn from "ideal" clients first, and worry that interested clients will feel disappointed if they are not clinically eligible or cannot afford the regimen.

Clinics used a variety of implementation strategies to increase the reach of their education efforts: passive (n=3) and active education (n=8), group (n=5) and individual education (n=8), and task shifting to train non-clinical staff to conduct education (n=2).

An ongoing challenge among all clinics is documenting education in health records: to date, only two clinics collect data on clients educated.

**Conclusions/Next steps:** Educating all people with HIV about the availability of LAI ARTs – regardless of clinical eligibility, perceived "fit", or outcome of insurance coverage investigation – and documenting who does and does not receive education, is a precursor to equitable delivery of LAI ART. Providing clinics with implementation support (infographics for passive education, training and educational scripts, data support to monitor progress) can increase adoption of universal education strategies.

## TUPEE544

Does integrated clinical/orphans and vulnerable children (OVC) programming improve viral load (VL) outcomes among children and adolescents living with HIV (CALHIV)? Factors impacting VL uptake and suppression in western Kenya

G. Otieno<sup>1</sup>, R. Muinde<sup>1</sup>, N. Odiyo<sup>1</sup>, D. Canagasabay<sup>2</sup>, J. Thoya<sup>1</sup>

<sup>1</sup>PATH-Kenya, Homa Bay, Kenya, <sup>2</sup>PATH, HIV and Tuberculosis, Washington DC, United States

**Background:** In Kenya, only 85% of children living with HIV are on treatment, while 74% of those on treatment are virally suppressed. While many face adherence-re-

lated challenges, CALHIV also have poorer access to and use of comprehensive HIV care further impacting treatment continuity. We analyzed records for CALHIV receiving treatment in four western Kenyan counties to understand factors associated with VL uptake and suppression among CALHIV.

**Methods:** We accessed data for 4522 CALHIV under 18 years enrolled on treatment at 128 health facilities across Kakamega, Kisumu, Nyamira, and Vihiga counties as of November 2023, and triangulated data between facility electronic medical records and the Child Protection Information Management System. We used Stata 15.1 to analyze the data.

We compared characteristics of CALHIV who had viral load tests with those without viral load tests using descriptive statistics and determined if enrolment of CALHIV in the OVC program was associated with viral suppression using univariable Poisson regression.

**Results:** Among the 4,522 CALHIV (2129 males and 2393 females), 4,487 (99.2%) were eligible for VL tests and 3,110 (69.3%) had valid VL results, with 2,795 (89.8%) with VL below 200 copies/ml.

CALHIV without valid VL tests were more likely to be: under five years of age (8.1% vs. 5.9%); not enrolled in the OVC program (37.8% vs. 30.9%); and not on multi-month dispensing (49.8% vs. 39.6%) compared to CALHIV with valid VL ( $p=.007$ ,  $p<.001$ ,  $p<.001$ ).

CALHIV with unsuppressed VL were more likely to be under five years of age (9.9% vs. 5.4%) and not on multi-month dispensing (74.9% vs. 35.6%) compared to CALHIV with suppressed viral load ( $p<.001$ ,  $p<.001$ ). CALHIV enrolled in the OVC program were 10% more likely to achieve viral suppression (unadjusted incident rate ratio: 1.10; 95% confidence interval: 1.05–1.15).

**Conclusions:** Our analysis revealed that enrollment in the OVC program and multi-month dispensing were associated with improved VL uptake and suppression, likely due to specific interventions provided through the OVC program to improve treatment and VL outcomes among CALHIV.

Enhanced collaboration between clinical HIV and OVC programs is essential for improved VL outcomes for CALHIV and supporting Kenya achieve durable HIV epidemic control.

Community-led same day antiretroviral therapy initiation successfully closes linkage to treatment gaps at a sex worker-led clinic in Bangkok, Thailand

A. Phunkron<sup>1</sup>, S. Sumalu<sup>1</sup>, P. Thepawong<sup>1</sup>, A. Wongsat<sup>2</sup>, R. Janamnuysook<sup>2</sup>, K. Sinchai<sup>2</sup>, J. Boonruang<sup>2</sup>, S. Thitipatarakorn<sup>2</sup>, N. Teeratakulpisarn<sup>2</sup>, A. Arunmanakul<sup>3</sup>, S. Mills<sup>3</sup>, N. Phanuphak<sup>2</sup>, S. Janyam<sup>1</sup>, R.A. Ramautarsing<sup>2</sup>  
<sup>1</sup>Service Worker in Group Foundation, Bangkok, Thailand, <sup>2</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>3</sup>FHI 360, Bangkok, Thailand

**Background:** To address low linkage to antiretroviral therapy (ART) services among key populations diagnosed with HIV in community-led clinics in Bangkok, Thailand, the Service Worker in Group (SWING) Foundation, a sex worker-led organization in Bangkok piloted community-led and delivered same day ART (SDART). Here we report the ART-initiation cascade of the first year.

**Description:** Thai nationals who test HIV-positive at SWING, are at least 13 years and have never received ART, are eligible for and offered SDART. If accepted, clients are screened for opportunistic infections (OIs), and referred for OI treatment if indicated, or initiated on ART. After follow-up of 45 days, clients are referred to their long-term ART maintenance facilities. All procedures, including HIV testing, OI screening and ART initiation, are conducted by trained key population lay providers. Data from clients presenting between April 2022-April 2023 were analysed to depict an HIV treatment cascade for this period

**Lessons learned:** A total of 13,747 clients received HIV testing, 475/13,747 (3.5%) were confirmed positive: 440 (92.6%) men who have sex with men, 28 (5.9%) transgender women, 7 (1.5%) female sex workers. 266/475 (56%) were eligible and offered SDART, 266/266 (100%) accepted and 261/266 (98%) initiated ART: 236/261 (90.4%) on the day of HIV diagnosis, 24/261 (9.2%) within 3 days, 1/261 (0.4%) after 7 days. At their long-term ART maintenance facilities, 166/261 (63.6%) underwent viral load testing, 161/166 (97.0%) achieved viral suppression. 5/266 (1.9%) clients who did not initiate SDART showed symptoms of OIs and were referred; all (100%) have initiated ART at their referred hospital. Of 209/475 (44.0%) clients who were not eligible for SDART, 67/209 (32.1%) were non-Thai and were referred to ART migrant support funds, 142/209 (67.9%) were diagnosed out of SDART service hours, and were referred out. All 209 initiated ART at their referred facility.

**Conclusions/Next steps:** Community-led SDART, delivered by trained lay providers is feasible, acceptable and closes linkage to treatment gaps among key populations in Bangkok. Community-led SDART service hours should be extended. National policies should integrate community-led SDART in the health system and to allow non-Thai to receive ART at community-led clinics to ensure equitable health access to all.

## TUPEE546

Enhancing retention strategies for newly-initiated antiretroviral therapy clients in low-resource settings: the impact of an innovative case management program in Malawi

L. Makonokaya<sup>1</sup>, S. Dunga<sup>1</sup>, L. Kalitera<sup>1</sup>, R. Kanyenda<sup>1</sup>, L. Msuku<sup>1</sup>, A. Maida<sup>2</sup>, G. Woelk<sup>3</sup>, T. Maphosa<sup>1</sup>  
<sup>1</sup>Elizabeth Glaser Pediatric AIDS Foundation, Lilongwe, Malawi, <sup>2</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Lilongwe, Malawi, <sup>3</sup>Elizabeth Glaser Pediatric AIDS Foundation, Washington, D.C., United States

**Background:** In Malawi, people living with HIV (PLHIV) encounter several barriers to optimal antiretroviral therapy (ART) adherence, including discontinuation from care. The Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) pioneered a novel case management initiative for PLHIV at risk of discontinuing care. Utilizing a risk assessment tool, the program provided personalized support through psychosocial counselors, adherence support officers, and expert clients. Our evaluation assessed the impact of this initiative on retaining newly initiated ART clients in care.

**Methods:** Our study involved a retrospective analysis of individual-level data extracted from electronic medical records and case management registers across ten EGPAF-supported health facilities in Blantyre and Zomba districts. Employing stratified random sampling (with the primary strata being two districts where the initiative was fully implemented), we tracked PLHIV newly initiated on ART before (January to June 2019) and after (January to June 2021) implementing the intervention program for 12 months. We used descriptive statistics and Cox regression analysis to estimate retention rates over a follow-up period of 12 months. We defined retention as adhering to scheduled treatment refill visits.

**Results:** Among the 1,466 clients, 33.8% (n=496) were from the pre-intervention and 66.2% (n=970) from the post-intervention period. Comparing pre- and post-intervention, we noted an overall increase in retention at six months from 81.2% (n=332) to 90.1% (n=749), respectively, p=0.02. Subgroup analyses exhibited notable improvements in retention rates between pre- and post-intervention periods among males (80.5% versus 93.2%, respectively, p=0.001), children (<15 years) (81.3% versus 100.0%, p=0.04), and clients with WHO clinical stage 3 or 4 (81.0% versus 97.4%, p=0.002).

Additionally, PLHIV starting ART after program implementation showed an increased likelihood of being retained in care over 12 months compared to the pre-intervention cohort [odds ratio (OR) 1.35, 95% confidence interval 1.11-1.61].

**Conclusions:** EGPAF's case management program markedly improved retention rates among newly-initiated ART clients, particularly among populations at higher risk of loss to follow-up, such as men and children.

## TUPEE547

## Effect of Directly-Observed Treatment Support (DOTS) on viral load suppression among children and adolescents: a cross-sectional analysis in Bunyoro Region, mid-western Uganda

L. Shafick<sup>1</sup>, A.G Fitzmaurice<sup>2</sup>, F. Asimwe<sup>1</sup>,P. Nahirya Ntege<sup>1</sup>, A. Ndawula<sup>1</sup>, R.N. Ssebunya<sup>1</sup>,A. Maganda<sup>1</sup>, B. Nsangi<sup>1</sup>, D. Kiragga<sup>1</sup><sup>1</sup>Baylor Uganda, Kampala, Uganda, <sup>2</sup>Division of Global HIV & TB, Centers for Disease Control and Prevention, Kampala, Uganda

**Background:** Literature on antiretroviral therapy directly-observed treatment support (DOTS) among children and adolescents living with HIV (CALHIV) optimised to the dolutegravir (DTG) regimens is scarce.

The overall HIV viral suppression among children and adolescents on ART in Bunyoro region was 80-82% in Jul-Dec 2022 and re-suppression after IAC in Jul-Sept 2022 was 66%, so we implemented DOTS in mid-western Uganda among CALHIV who were on optimised ART regimens to improve adherence and resultant suppression.

**Methods:** During Oct-Dec 2022, 204 CALHIV aged 0-19 years on DTG regimens with  $\geq 2$  consecutive non-suppressed viral load (VL)  $>1,000$  copies/ml were enrolled on DOTS during their first or second intensive adherence counseling (IAC) session from 38 ART sites. Home locations of the CALHIV were mapped and treatment supporters from the same/neighbor village were identified, trained and assigned to the enrolled children.

A total of 100 treatment supporters, mainly expert clients and village health teams (VHTs), each assigned two non-suppressed children, observed daily treatment swallowing, offered adherence counseling, and improved caregivers' ART literacy.

The three months of DOTS were phased; intensive (daily visits in first month), semi-intensive (alternate day visits in the second month) and wean-off (weekly visits during third month).

Facility health workers made weekly follow-up phone calls and two physical home visits (a month apart) to assess whether treatment supporters adhered to the DOTS visit schedules and closing ART literacy gaps among Caregivers. This was through triangulating DOTS observation logs and Caregiver verbal reports of the DOTS visits.

**Results:** Of the 204 CALHIV, 114 (56%) were females, mean age of 11 years (SD=1.1). We excluded 12 (6%) children who dropped out during the intensive month and 6 (3%) whose repeat VL results were never returned to the health facility. The re-suppression rate among CALHIV on DOTS was 77% (143/186).

Of the 43 CALHIV who remained non-suppressed, 16 (37%) were only partially on DOTS due to mobile/multiple caregivers, 12 (28%) had irregular visits from treatment supporters due to long distances, and 12 (28%) had Caregivers who reported HIV-related stigma.

**Conclusions:** DOTS improved re-suppression among CALHIV. Selecting treatment supporters located near the non-suppressing children may potentially improve DOTS effectiveness.

## TUPEE548

## Access to advanced HIV disease interventions and testing outcomes among new and unsuppressed treatment-experienced people living with HIV: observational lessons from Uganda.

R. Kirungij<sup>1</sup>, V. Nabitaka<sup>1</sup>, A. Nuwagira<sup>1</sup>, J. Batusa<sup>1</sup>,L. Kabunga<sup>1</sup>, W. Eigege<sup>2</sup>, I. Amamilo<sup>2</sup>, J. Conroy<sup>2</sup>, C. Amole<sup>2</sup>,P.M. Namuwenge<sup>3</sup>, V. Kasone<sup>3</sup><sup>1</sup>Clinton Health Access Initiative, Kampala, Uganda,<sup>2</sup>Clinton Health Access Initiative, Boston, United States,<sup>3</sup>Ministry of Health, Kampala, Uganda

**Background:** The Ugandan HIV treatment guidelines recommend the Advanced HIV Disease (AHD) package of care (PoC) for all new people living with HIV (PLHIV) diagnosed with HIV and those failing on their antiretroviral treatment (ART).

This analysis compares access to some components of the AHD PoC and the testing outcomes between newly diagnosed and unsuppressed treatment-experienced PLHIV.

**Description:** The Uganda Ministry of Health (MOH) with support from partners scaled-up the AHD PoC in 2021 following initial implementation in focal facilities. The AHD interventions included CD4 testing to identify AHD PLHIV; screening for opportunistic infections (OIs); prophylaxis and treatment for OIs; and rapid ART initiation.

We have analyzed DHIS2 data on AHD service delivery among new and unsuppressed treatment-experienced PLHIV from October 2022 to September 2023 to identify any gaps along the AHD cascade in these two client populations.

**Lessons learned:** As shown in the figure, access to CD4+ testing was higher (84%) among the new PLHIV compared to the unsuppressed treatment-experienced PLHIV (57.3%).

Figure. Comparison of AHD service uptake between new and unsuppressed treatment experienced clients.

While access to TB-LAM testing was also better among the new PLHIV with AHD compared to the failing PLHIV, a greater proportion of the unsuppressed treatment-experienced PLHIV received CrAg testing.

On testing outcomes, AHD prevalence and TB-LAM positivity among new PLHIV was marginally higher than the unsuppressed treatment-experienced PLHIV. However, CrAg positivity was slightly higher among unsuppressed treatment-experienced PLHIV than new PLHIV.

**Conclusions/Next steps:** Our findings showed lower uptake of CD4+ and TB LAM testing among unsuppressed treatment-experienced PLHIV, revealing gaps in AHD screening. This results in missed opportunities to identify and manage life-threatening OIs. Further research is warranted, and it is essential to strengthen AHD interventions for this population to effectively reduce AIDS morbidity and mortality.

## TUPEE549

### Declining ART linkage among people with TB who are HIV-positive in PEPFAR-supported sites, 2020–2023

M. Peterson<sup>1</sup>, R. Briceno-Robaugh<sup>1</sup>, I. Zabsonre<sup>1</sup>, C. D'auvergne<sup>1</sup>, P. Pierre<sup>2</sup>, S. Ahmedov<sup>1</sup>

<sup>1</sup>United States Agency for International Development, Tuberculosis Division, Washington D.C., United States,

<sup>2</sup>Bureau of Global Health Security and Diplomacy, PEPFAR, U.S. Department of State, Washington D.C., United States

**Background:** The U.S. President's Emergency Plan for AIDS Relief (PEPFAR) supports and monitors HIV testing and ART linkage among TB clients in program-supported sites, corresponding to the first two "95's" of the UNAIDS 95-95-95 targets. In 2023, PEPFAR began collecting ART linkage data annually instead of quarterly. Results suggest linkage has fallen below the 95% benchmark.

**Methods:** We analyzed routine age- and sex-stratified data from 2020–2023 that was collected in PEPFAR-supported TB and TB/HIV clinics. We included data on HIV testing, HIV positivity, and ART linkage among people receiving TB treatment. Countries with incomplete data on ART linkage for any year in the study period were excluded.

**Results:** Eighteen countries in Africa were retained for analysis, representing 80% of people with TB recorded during the study period. Within this subset, 94–95% of people knew their HIV status and HIV positivity remained between 34–36%. The absolute number of people with TB and HIV increased 24%, from 180,319 in 2020 to 223,306 in 2023. Annual ART linkage increased from 93% to 96% from 2020–2022, then decreased to 88% in 2023. This change was driven by decreases in eight countries, which accounted for 62% of people with TB reported in 2023. ART linkage was 1–2% lower in males compared to females from 2020–2022; in 2023 this gap widened with 90% linkage in females compared to 87% in males. ART linkage fell among all age groups. In 2023, linkage was highest among those aged 5–14 years (91%), and lowest among those under five years of age (86%).

Figure 1. ART coverage among people on TB treatment who are HIV positive.

**Conclusions:** PEPFAR's most recent data suggest ART linkage has declined in 2023. Changes in data collection practices may account for issues with data quality. Further investigation and continuous monitoring are needed to distinguish factors related to programmatic performance and to confirm potential trends.

## TUPEE550

### Stigma and nondisclosure remain important barriers to early HIV treatment retention during the early treatment period in Zambia and South Africa

A. Morgan<sup>1</sup>, N. Scott<sup>1</sup>, M. Benade<sup>1</sup>, S. Pascoe<sup>2</sup>, K. Radoff<sup>1</sup>, A. Kamanga<sup>3</sup>, P. Lumano-Mulenga<sup>4</sup>, P. Haimbe<sup>3</sup>, H. Shakwelele<sup>3</sup>, S. Rosen<sup>1</sup>

<sup>1</sup>Boston University School of Public Health, Department of Global Health, Boston, United States, <sup>2</sup>University of the Witwatersrand, Health Economics and Epidemiology Research Office, Johannesburg, South Africa, <sup>3</sup>Clinton Health Access Initiative, Lusaka, Zambia, <sup>4</sup>Ministry of Health, Lusaka, Zambia

**Background:** Attrition from HIV treatment is highest during the first six months after antiretroviral therapy (ART) initiation. Despite years of public education and health messaging, early ART clients surveyed in South Africa and Zambia continued to identify stigma and fear of disclosure as important reasons for disengagement. We explored clients' experiences around stigma and disclosure during their first six months after ART initiation or re-initiation.

**Methods:** From 8/2022–6/2023, PREFER conducted a quantitative survey of adults (≥18) who were starting, restarting, or on ART for ≤6 months at 12 facilities in Zambia (ZM) and 18 facilities in South Africa (SA) and conducted focus group discussions with a subset of survey participants up to 12 months later.

**Results:** We enrolled 771 clients in Zambia (median age 32; 67% female) and 1,098 clients in SA (median age 33; 72% female). Among those who had an opportunity to disclose, two thirds in South Africa and half in Zambia had not disclosed their status to anyone (SA 15%, Zambia

10%) or to just 1-2 others (SA 52%, Zambia 42%). Females had lower odds of disclosing their status to their partner/spouse than did males (SA OR 0.57 (IQR 0.40, 0.83); ZM 0.57 (0.46, 0.91)). Key themes around non-disclosure reported by FGD participants (n=226) included fear of not be loved if a partner knew their status, leading to treatment interruption in an effort to conceal their status.

Clients also described a perceived lack of family support, ridicule, and stigmatizing behaviors within households. FGD participants reported a reluctance to visit a clinic due to concerns regarding privacy and confidentiality, seeing familiar faces, and speculation within communities.

Some clients described bypassing their nearest facility and seeking care at distant clinics to avoid stigma, leading to discouragement, financial and opportunity costs, and ultimately inconsistent engagement in care.

**Conclusions:** Twenty years after the launch of national HIV treatment programs in sub-Saharan Africa, stigma and fear of involuntary disclosure remain major barriers to retention on ART. Models of care for clients in the early treatment period should emphasize maintaining privacy and address ongoing, multi-level stigma fears.

## TUPEE551

Understanding client experience and acceptability of a decentralized drug distribution model for antiretrovirals through private pharmacies in Mozambique: a mixed-methods analysis

L. Nishimoto<sup>1</sup>, D. Bidashimwa<sup>2</sup>, A. Maranga<sup>3</sup>, A. Couto<sup>4</sup>, I. Gaspar<sup>4</sup>, D. Filimao<sup>5</sup>, C. Parker<sup>2</sup>, M. Mussá<sup>6</sup>, I. Libombo<sup>6</sup>, N. Mbeve<sup>6</sup>, D. Sacur<sup>3</sup>, M. Bateganya<sup>7</sup>, D. Carpenter<sup>8</sup>

<sup>1</sup>FHI 360, New York, United States, <sup>2</sup>FHI 360, Durham, United States, <sup>3</sup>FHI 360, Maputo, Mozambique, <sup>4</sup>National HIV/STI Control Program, Mozambique, Maputo, Mozambique, <sup>5</sup>United States Agency for International Development, Maputo, Mozambique, <sup>6</sup>Central Medical Stores (CMAM), Mozambique, Maputo, Mozambique, <sup>7</sup>United States Agency for International Development, Dar es Salaam, Tanzania, the United Republic of, <sup>8</sup>FHI 360, Atlanta, United States

**Background:** Evidence on decentralized drug distribution (DDD) models of antiretroviral therapy (ART) is needed to better respond to client needs and increase service uptake.

This study aimed to understand client experience with and acceptability of DDD through private pharmacies in Mozambique, as piloted by Central Medical Stores (CMAM) and the Meeting Targets and Maintaining Epidemic Control (EpiC) project.

**Methods:** We used a cross-sectional, mixed-methods design, conducting 120 surveys and 12 qualitative interviews with pharmacy DDD clients in three provinces from May through June 2023. Eligible clients were adults who had

been using the pharmacy DDD for at least six months. We conducted quantitative descriptive analysis and qualitative thematic analysis to summarize the data.

**Results:** Most survey respondents were female (61%), married or cohabiting (57%), and an average age of 45 years. Enrollment in DDD was generally easy and motivated by perceptions that services would be more confidential (74%), faster (60%), and require less travel time than facility-based services (53%). More than 95% of pharmacies operated for long hours on weekdays, affording clients more flexibility with drug pick-ups than facilities. Only half of pharmacies kept similar schedules on weekends and holidays. Clients reported typical pick-up visits at the pharmacy as simple, quick, and totally confidential. Most respondents (82%) had refilled at least three-quarters of their antiretrovirals (ARVs) at a private pharmacy. Survey data showed increased access to multimonth dispensing, shorter times traveling to and waiting at the pick-up location, and increased perception that private information was more protected since clients had joined DDD.

Overall, pharmacy DDD was highly acceptable owing to multiple advantages clients linked to better ARV continuation, improved access to high-quality and adequate services, and reduced risk of stigma and discrimination. All clients said they would recommend the model to other PLHIV.

**Conclusions:** The pharmacy DDD model appeared highly acceptable among ART clients in Mozambique. Client experience with the model was described as positive overall. Efforts to scale up this model in Mozambique and similar contexts should consider extended hours of operation on weekends and holidays and supporting clients who may occasionally pick up ARVs at a health facility.

## TUPEE552

Index testing as a strategy to reach out to the highest HIV vulnerable population - sexual partner of people living with HIV in India

F. Khan<sup>1</sup>, R. Dua<sup>1</sup>, R. Huidrom<sup>1</sup>, D. Singh<sup>2</sup>, P. Bhatt<sup>1</sup>, H. Aggarwal<sup>1</sup>, B. Chandra<sup>1</sup>

<sup>1</sup>India HIV/AIDS Alliance, Care and Support, Delhi, India,

<sup>2</sup>National AIDS Control Organisation, Care Support and Treatment, Delhi, India

**Background:** In India estimated that people living with HIV are 2.3 million with an adult prevalence 0.21%, out of these 1.6 million PLHIV are under active care as on Dec 2022.

Secondly, India's progress on 95-95-95 targets shows that much more needs to be done to achieve the first 95 target, the achievement reported 74-84-85. India's efforts to identify the most at risk population become very essential to reach on SGD targets. Hence, testing among index partners becomes very essential.

**Description:** Alliance India is implementing nation-wide outreach-based care and support (CSC) programme with the support of GFATM and NACO. During the implementation of the programme, identified 119,551 sexual partners who have not tested or were not aware of their HIV status and 195,171 people as discordant couple. Alliance India through its outreach programme have identified most at-risk population and started working with these population to promote secondary prevention methods such as safe sex practices, using condom, partner notification and testing for HIV periodically.

During April, 21 to Sept, 22 a total 31,732 partners of PLHIV were tested for the first time, among them 2,189 (7%) were detected HIV positive; 21,174 discordant couples were also tested and 324 (2%) tested positive.

**Lessons learned:** The sexual partner of PLHIV are more at a higher risk, both sub groups (first time and repeat testing) shows higher positivity as compared to general adult prevalence, the positivity among first time testing is second highest after PWID in India, whereas positivity among discordant couple was at 2% which is 10 times higher than general population. Several PLHIV are not aware about the status until they come for testing, many of them have not used condoms and unknowingly carry HIV virus their sexual partners.

**Conclusions/Next steps:** Identification of the most at-risk among index and discordant couples is very important; the country needs to prioritise testing for all sexual partners and eligible family members of PLHIV to achieve their SDG goal, especially the first 95% target.

Comparative analysis of the effectiveness of two psychosocial support approaches in enhancing the quality of life of elderly persons living with HIV in Ghana; a quasi experimental study

M. Abdulai<sup>1,2</sup>, M. Wiredu Agyekum<sup>3</sup>, J. Sackey<sup>4</sup>, B. Sarfo<sup>2</sup>, R. Adu Gyamfi<sup>1,5</sup>, A. Ashinyo<sup>1</sup>, K. Kodua Owusu<sup>1</sup>, K. Danso<sup>1</sup>, H. Bonful<sup>2</sup>, S. Ayisi Addo<sup>1</sup>

<sup>1</sup>National AIDS/STI Control Programme, Ghana Health Service, Accra, Ghana, Accra, Ghana, <sup>2</sup>School of Public Health, University of Ghana Legon Accra, Department of Epidemiology and Disease Control, Accra, Ghana,

<sup>3</sup>University of Education, Winneba, Ghana, Institute for Educational Research and Innovation Studies, Accra, Ghana, <sup>4</sup>School of Health Professions Rutgers, The State University of New Jersey, Department of Clinical and Preventive Nutrition Sciences, New Jersey, United States,

<sup>5</sup>School of Public Health, University of Ghana, Legon, Accra, Department of Population, Family and Reproductive Health, Accra, Ghana

**Background:** The introduction of Antiretroviral Treatment (ARTs) has increased the life expectancy of Persons Living with HIV (PLHIV). Ageing with HIV is associated with psy-

chosocial challenges, impacting the quality of life (QoL). Conventionally psychosocial support is delivered in-person during clinical visits. The use of mobile technology in psychosocial support intervention delivery among adolescents has been documented to improve their QoL. This study sought to compare the effectiveness of delivering psychosocial support through the conventional approach to mobile technology in improving the QoL in Elderly Persons Living with HIV (EPLHIV).

**Methods:** The study was conducted in two high burden ART facilities in the Greater Accra region of Ghana from January to December 2023. The facilities were purposively designated to deliver the intervention by the conventional approach (F1) and MTech through Short Voice Messages (SVM)(F2). The study participants were consenting EPLHIV (>50 years) who were on treatment for at least one year in the study facilities.

In addition, participants in F2 were to have mobile phones. Participants in F1 were exposed to a Health worker led EPLHIV specific psychosocial support package for a period of 6 months. While participants in F2 received the psychosocial support package through SVM thrice a week for the same duration. The content of the messages was informed by the WHOQoL domains.

The primary outcome was QoL measured by a questionnaire based on the WHOQoL Bref tool. The data was analysed using STATA version 17.0.

**Results:** A total of 303 participants took part in the study (F1, n=152, F2, n=151). At baseline there, there was no difference in the proportion of clients with good quality of life reported in both arms [F1=41.45% (CI:33.2- 42.4), F2=46.36% (CI: 25.3 - 52.8), P= 0.09]. At endline, participants in F1 had a drop in the proportion with good QoL (36.24% (CI: 26.5 - 38.9) compared to those in the F2 who had an increase in the Proportion with good QoL (78.52% (CI: 66.5 - 82.9), P <0.000.

**Conclusions:** The MTech approach through the SVM significantly improved the QoL of EPLHIV. The National AIDS/STI control Programme should consider integrating SVM as part of Differentiated Service Delivery package to EPLHIV.

## TUPEE554

### Lessons learnt from implementing the hub and spoke differentiated service delivery model for antiretroviral therapy in Cross River, Nigeria

S. Usang<sup>1</sup>, C. Ezissi<sup>2</sup>, K. Odey<sup>2</sup>, P. Agada<sup>1</sup>, O. Omeh<sup>1</sup>, K. Agu<sup>1</sup>, D. Oqua<sup>1</sup>, E. Effiong<sup>1</sup>, J. Umana<sup>2</sup>, E. Effiong<sup>3</sup>, U. Akpan<sup>2</sup>, C. Okolo<sup>2</sup>, E. Nwanja<sup>2</sup>, M. Unimuke<sup>2</sup>, O. Onwah<sup>2</sup>, O. Toyo<sup>2</sup>, D. Ogundehin<sup>4</sup>, E. James<sup>4</sup>, C. Obiora-Okafo<sup>4</sup>, A. Idemudia<sup>4</sup>, C. Nwadike<sup>4</sup>, K. Kakanfo<sup>4</sup>, B. Pius<sup>4</sup>, B. Onimode<sup>4</sup>, A. Raji<sup>5</sup>, B. Oyawola<sup>4</sup>, B. Kagniniwai<sup>5</sup>, O. Asaolu<sup>4</sup>, A. Bashorun<sup>6</sup>, A. Gambo<sup>7</sup>, D. Onime<sup>4</sup>, J. Pius<sup>4</sup>, O. Oyelaran<sup>4</sup>, R. Goldstein<sup>4</sup>, O. Onyedinachi<sup>2</sup>, A. Adegboye<sup>2</sup>, A. Eyo<sup>2</sup>

<sup>1</sup>Howard University Global Initiative Nigeria (HUGIN), Abuja, Nigeria, <sup>2</sup>Excellence Community Education Welfare Scheme (ECEWS), Uyo, Nigeria, <sup>3</sup>Primary Health Care Development Agency, Calabar, Nigeria, <sup>4</sup>Office of HIV/AIDS and TB, United States Agency for International Development, Abuja, Nigeria, <sup>5</sup>Office of HIV/AIDS, United States Agency for International Development (USAID), Washington DC, United States, <sup>6</sup>National AIDS, Sexually Transmitted Infections Control and Hepatitis Programme (NASCP), Federal Ministry of Health, Abuja, Nigeria, <sup>7</sup>National Agency for the Control of AIDS (NACA), Abuja, Nigeria

**Background:** National HIV programs need to be more sustainable and efficient in the context of declining donor funding. The Hub-and-Spoke Differentiated Service Delivery (DSD) model for Antiretroviral Therapy (ART) was introduced in 2021, leveraging primary healthcare facilities (PHFs) to enhance sustainability and efficiency. This paper describes lessons learnt from implementing the model in Cross River State, Nigeria.

**Description:** The implementation involved four steps: a review of program ART data and National policies on ART delivery; identification of barriers to optimal ART service delivery; defining the target population for the hub-and-spoke DSD model; and implementation of the model based on the four building blocks of "What" services will be differentiated, and "When", "Where" services will be provided, and "Who" provides the services.

Pre-implementation activities involved stakeholder engagement, mapping of spoke PHFs to the hub facilities, and baseline assessment of the spokes for basic requirements including audio-visual privacy in service areas, availability of  $\geq 2$  healthcare workers (HCWs), secure storage for antiretroviral medications, and HCWs' willingness to participate. PHFs that met all requirements were activated as spokes, and their HCWs were trained; data capturing/reporting tools were deployed, and willing clients were devolved for ART services.

Continued onsite capacity building and on-the-job training were provided to HCWs at the spokes. The number of spokes providing ART services and the number of clients devolved were assessed as of May 2023.

**Lessons learned:** In total 239 PHFs were assessed: 76% (n=181) had audio-visual privacy, 43% (n=102) had  $\geq 2$  HCWs, 49% (n=118) had secure storage facilities, and 38% (n=91) were willing to participate. Eighty-four (35%) facilities that met all requirements were activated. Forty-six months post-activation, 90% (n=76) of spokes provided ART services with 1,753 devolved clients.

Despite ART being a basic health service <40% of PHFs met the minimum requirements to provide ART services. In addition, >60% of assessed sites were unwilling to participate in integrating ART with existing service delivery.

**Conclusions/Next steps:** The hub-and-spoke DSD model was successfully implemented in this setting and enhanced ART service delivery for recipients of care.

Further investigation of factors affecting HCWs' willingness to participate in implementing this model is recommended.

## TUPEE555

### The impact of changes to South Africa's viral load monitoring guidelines, on progress towards 95-95-95 targets

M.M. Kgokolo<sup>1</sup>, M. Ntloana<sup>1</sup>, M. Manganye<sup>1</sup>, R. Fritz<sup>2</sup>, A. Mumbauer<sup>2</sup>

<sup>1</sup>Ministry of Health: South Africa, National Department of Health, Pretoria, South Africa, <sup>2</sup>Ministry of Health: South Africa, National Department of Health: Operation Phuthuma, Pretoria, South Africa

**Background:** Historically, South Africa has been ahead of the curve in terms of viral load monitoring, introducing 6-monthly viral load testing in 2004, and defining suppression below 50 copies/ml since 2019. However, the country continues to fall short of the third UNAIDS 95-95-95 goal for 95% of people on sustained ART treatment to achieve viral suppression.

We describe progress towards the third 95 following recent changes to how viral load is monitored in the country.

**Description:** A new viral load management algorithm was adopted nationally in April 2023, which stipulates that the first viral load after initiation should be done after three dispensing cycles, or about three months post-initiation. Previously, the first post-initiation viral load was done after six months on ART. This change has several benefits for people on ART, including earlier detection of factors influencing viral suppression and earlier decanting for virally suppressed individuals, which help retain people in care and improve viral load suppression rates.

**Lessons learned:** The District Health Information System (DHIS) data up to September 2023 was analysed. Based on the HIV 95-95-95 cascade performance, the results show that viral load done for adult women and men is 78%, with a viral suppression rate of 93%. Since the introduction of the new ART guidelines, the viral load suppression

sion rate has improved. This provides an opportunity for clients with a viral load lower than 50 copies/ml to be decanted to a Differentiated Model of Care (DMOC) to optimize retention in care and treatment access.

**Conclusions/Next steps:** South African ART programme has introduced a game changer in ensuring that viral load monitoring of PLHIV on ART is implemented earlier after treatment initiation. This achievement takes South Africa further in the quest to close the gap on the 3<sup>rd</sup> 95, to address sub-optimal viral load suppression in the country, while maximising measures to address gaps in viral load monitoring and suppression among all populations.

Onimode<sup>4</sup>, O. Asaolu<sup>4</sup>, A. Bashorun<sup>5</sup>, A. Gambo<sup>4</sup>, J. Pius<sup>4</sup>, O. Oyelaran<sup>4</sup>, R. Goldstein<sup>4</sup>, O. Onyedini<sup>4</sup>, A. Adegboye<sup>1</sup>, A. Eyo<sup>1</sup>

<sup>1</sup>Excellence Community Education Welfare Scheme (ECEWS), Uyo, Nigeria, <sup>2</sup>Family Health International (FHI360), Abuja, Nigeria, <sup>3</sup>Howard University Global Initiative Nigeria (HUGIN), Abuja, Nigeria, <sup>4</sup>Office of HIV/AIDS and TB, United States Agency for International Development, Abuja, Nigeria, <sup>5</sup>National AIDS, Sexually Transmitted Infections Control and Hepatitis Programme (NASCP), Federal Ministry of Health, Abuja, Nigeria, <sup>6</sup>National Agency for the Control of AIDS (NACA), Abuja, Nigeria

**Background:** Women living with HIV (WLHIV) have changing needs, and Differentiated Service Delivery (DSD) of antiretroviral therapy (ART) is a client-centred approach that is responsive to individual needs.

This study described DSD model preferences and assessed treatment outcomes among (WLHIV) devolved to DSD in Southern Nigeria.

**Methods:** This retrospective cohort study utilised data from electronic medical records of WLHIV aged 15-49 years, devolved to DSD models in three 12-month cohorts (October 2019-September 2020 [C1], October 2020-September 2021 [C2] and October 2021-September 2022 [C3]) at 154 health facilities supported by PEPFAR/USAID in Akwa Ibom and Cross River States, Nigeria. Explanatory variables include age, sex, DSD type and date devolved. ART status and viral load (VL) results with dates were outcome variables. DSD was categorised as facility-based (FBM) or community-based (CBM) in line with National guidelines; ART status was "active" if alive and in care, otherwise "inactive".

DSD model preferences were described using proportions, while retention in treatment (proportion active) and viral suppression rates (proportion with VL <1000 copies/ml) were compared across DSD models 12 months post-devolvement within each cohort, using Chi-square on SPSS with significance level at .05.

**Results:** Over the 3 years, 85,011 WLHIV were devolved; 87.6% (74,436/85,011) were aged ≥25 years, and 56.2% (47,797/85,011) were devolved to FBM. In C1, 84.7% (5,547/6,549) were in CBM, while the majority of those devolved in C2 (60.5% [42,539/70,353]) and C3 (52.5% [4,256/8,109]) were in FBM.

Overall retention was 96.4% (81,982/85,011), and out of 78,431 WLHIV who had VL tests 99.3% (77,872/78,431) attained viral suppression.

Retention was comparable across DSD respectively in C1 (FBM:99.1% vs CBM:98.6% [p=0.286]) and C3 (FBM:84.5% vs CBM:85.7% [p=0.143]) cohorts, but better in CBM compared to FBM (CBM:97.0% vs FBM:98.3% [p<0.001]) in C2. VL suppression rates were comparable across DSD models in C1 (FBM:99.7% vs CBM:99.3% [p=0.266]) and C3 (FBM:98.8% vs CBM:99.1% [p=0.290]), but higher in CBM compared to FBM (CBM:99.1% vs CBM:98.8% [p<0.001]) in C2.

**Conclusions:** DSD preferences for WLHIV in our setting moved from CBM to FBM between 2020 and 2022, with comparable treatment outcomes across models.

Investigation of factors influencing DSD model preference among WLHIV is recommended, to support sustained optimal treatment outcomes.

## TUPEE557

### Viral suppression patterns among children on dolutegravir-containing ART in Western Kenya

F. Odhiambo<sup>1</sup>, G. Basha<sup>2</sup>, P. Oyaro<sup>3</sup>, K. Thomas<sup>2</sup>, N. Yongo<sup>4</sup>, S. Hassan<sup>2</sup>, R. Patel<sup>5</sup>

<sup>1</sup>Kenya Medical Research Institute, Centre for Microbiology Research, Nairobi, Kenya, <sup>2</sup>University of Washington, Seattle, United States, <sup>3</sup>LVCT, Nairobi, Kenya, <sup>4</sup>UW Kenya, Nairobi, Kenya, <sup>5</sup>University of Alabama, Alabama, United States

**Background:** Starting in 2019, the WHO recommended dolutegravir (DTG)-containing antiretroviral therapy (ART) as a preferred first-line option for children and adolescents living with HIV (CALHIV).

We sought to characterize patterns in viral suppression after initiating DTG and factors associated with viral failure.

**Methods:** We conducted a prospective cohort analysis of children who participated in the Opt4Kids study in Kisumu County, Kenya (n=704) who transitioned to DTG-containing ART. We included children who had been on DTG for at least 6 months and had at least one viral load (VL) result available while on DTG. We assessed VS patterns descriptively and factors associated with time from initiating

abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

DTG to viral failure (defined as plasma viral load (VL) >200 copies/ ml), via a multivariate Cox proportional hazards model.

**Results:** We identified 479 children who had switched to DTG-containing ART and had at least one VL available for analysis. The median age at study enrollment was 9 years (IQR 7,12), 229 (48%) were female, and the median time on ART was 6 years (IQR 3, 8). Subsequently, 27.1% (130/479) had a VL>200 copies/mL and their median time to first viral failure was 33 months (IQR 27, 41).

Factors associated with time to viral failure included being on a protease inhibitor-containing ART prior to DTG transition (HR 2.40, 95% CI 1.42, 4.00), primary caregiver age < 24 years (HR 3.82, 95% CI 1.57, 9.30), and lacking electricity in the home (HR 1.71, 95% CI 1.17, 2.51). All 130 CALHIV with viral failure had a history of viral failure prior to DTG initiation.

**Conclusions:** A sizeable portion of CALHIV on DTG may have viral failure, which was significant even among our studied cohort which is relatively well-engaged in care. This has direct implications for DTG resistance, which requires further exploration, and durability of DTG-containing regimens for CLHIV.

History of prior viral failure, baseline ART regimen, caregiver age, and household economic status may be important factors for programs to consider utilizing to identify CALHIV at risk for viral failure while on DTG.

## TUPEE558

### Scaling up access to HIV treatment services among children and adolescents enrolled in a PEPFAR Program in Nigeria: lessons and experiences from State Health Insurance Schemes

T.A. Idaboh<sup>1</sup>, O. Odukoya<sup>2</sup>, M. Katbi<sup>3</sup>, A. Idemudia<sup>4</sup>, O. Asaolu<sup>4</sup>, P. Egena<sup>5</sup>, J. Pius<sup>3</sup>, R. Goldstein<sup>3</sup>, C. Obiora-Okafo<sup>1</sup>

<sup>1</sup>USAID, HIV/AIDS & TB Office, Abuja, Nigeria, <sup>2</sup>Lagos University Teaching Hospital, Community Medicine and Public Health, Lagos, Nigeria, <sup>3</sup>USAID, HIV/AIDS & TB, Abuja, Nigeria, <sup>4</sup>USAID, Strategic Information, HIV/AIDS & TB, Abuja, Nigeria, <sup>5</sup>USAID, Health Financing and Private Sector, HIV/AIDS & TB, Abuja, Nigeria

**Background:** Nigeria has poor viral-suppression-rates among children and adolescents (0-19 years) living with HIV (CALHIV). The problem is largely due to inadequate access to treatment and affordable healthcare. Evidence shows access to health insurance improves viral-suppression-rates and health outcomes among adults living with HIV, however the extent to which current health insurance mechanisms affect children and adolescents remains unknown. This study examines the access to health insurance and viral-suppression-rates over time among children and adolescents living with HIV enrolled in Nigeria over a four-year period.

**Description:** The United States Agency for International Development (USAID) funded Orphans and Vulnerable Children Program in Nigeria, through the Integrated Child Health and Social Services Award projects which commenced in December 2019, collaborated with State Contributory Health Management Agencies to enroll children/adolescents and their caregivers in State Health Insurance Schemes in five states namely Adamawa, Bauchi, Bayelsa, Edo and Lagos States.

Beneficiaries were selected for enrollment into Health Insurance Schemes using a standardized program assessment tool. In addition to HIV treatment services, the scheme provided access to general medical services at the health facilities including immunization, nutrition, TB services, which would have been otherwise covered by out-of-pocket expenses.

We analyzed viral-suppression-rates of CALHIV enrolled in health insurance in five participating states, as well as viral-suppression-rates of CALHIV in five other program states without health insurance over the four-year period.

**Lessons learned:** A total of 8,661 (4,449 Females & 4,212 Males) children and adolescents (0-19 years) were enrolled in State Health Insurance Schemes in five States. Of the total enrolled, 5,299 (61%) had a positive-HIV-status. HIV viral-suppression-rates from the five states rose from 64% to 93% over the four-year period. Viral-load-suppression-rates of 6,922 (3,614 Females & 3,308 Males) CALHIV enrolled in five other program states without health-insurance rose from 63% to an average of 90%.

**Conclusions/Next steps:** The implementation of health insurance schemes resulted in increased health access for children and adolescents, which led to improved viral-suppression-rates across participating states, with nearly half achieving rates exceeding 95%, highlighting the potential efficacy of incorporating access to health insurance in policies to enhance HIV treatment outcomes in Nigeria among children and adolescents in Nigeria.

## Global and national financing, economic evaluation and sustainability

### TUPEE559

Measuring sustainability among more than  
50 Department of Defense HIV/AIDS Prevention  
Program (DHAPP) military programs, 2016 – 2022

B. Khuu<sup>1,2</sup>, W. Conquest<sup>1,3</sup>, C. Simpson<sup>1,3</sup>, A.G. Thomas<sup>1,2</sup>

<sup>1</sup>Defense Health Agency, U.S. Department of Defense  
HIV/AIDS Prevention Program, San Diego, United States,

<sup>2</sup>Emerge Solutions Group, LLC, North Bethesda, United  
States, <sup>3</sup>Seneca Solutions, Salamanca, United States

**Background:** As the global HIV/AIDS response shifts from emergency to sustained programming, the U.S. State Department, Bureau of Global Health Security and Diplomacy (GHSD) and the Department of Defense HIV/AIDS Prevention Program (DHAPP) are challenged with equipping partner nations to sustainably ensure ongoing treatment and prevention. In 2016, DHAPP created the Military Sustainability Index Dashboard (MILSID), an adaption from the PEPFAR Sustainability Index Dashboard (SID), to track national sustainability of DHAPP-supported programs and inform strategic planning.

**Description:** The MILSID is a 52-item questionnaire categorized into four domains and thirteen elements scored between 0 (unsustainable) to 10 (sustainable) to measure the sustainability of military HIV programs.

The MILSID is completed annually by a multi-disciplinary team including partner militaries, implementing partners, DHAPP Program Managers, and other relevant stakeholders. This exercise is accompanied by a country discussion about short and long-term objectives to improve program sustainability.

The completed questionnaires are reviewed by DHAPP headquarters to identify trends and shifts along the sustainability continuum utilizing a summary dashboard and Tableau® visualizations.

**Lessons learned:** Since the inception of MILSID, the overall sustainability score for military programs supported by DHAPP has increased from 5.02 in 2016 to 6.05 in 2022, a 20.52% improvement. Three of four domain categories showed positive overall score improvement while Strategic Investment, Efficiency, and Sustainability domain increased slightly.

	Overall Score (2016)	Overall Score (2022)	% Change
Leadership and Accountability	6.24	7.65	22.60%
Military Health System and Service Delivery	4.78	6.22	30.13%
Strategic Information	5.11	5.74	12.33%
Strategic Investment, Efficiency, and Sustainability	3.62	3.66	1.10%

Table.

**Conclusions/Next steps:** The MILSID results successfully demonstrate DHAPP's movement towards building sustainability within military programs globally.

The improvement of overall MILSID scores across time illustrates DHAPP's achievement in reaching over the targeted 15% increase in the sustainability metric, a Defense Health Agency's indicator for the Division.

MILSID results suggest that, while DHAPP-supported countries made progress towards sustainability in programming and policy, there must be a stronger focus on effectively transitioning DHAPP partner militaries to national financial resources to reach and maintain comprehensive HIV program sustainability.

### TUPEE560

Value for money in resource-limited settings:  
improving HIV allocative efficiency in Sri Lanka,  
Mongolia, and Bhutan

P.C. Loh<sup>1</sup>, H. Pan<sup>1</sup>, M. Kusen<sup>1</sup>, A. Bowring<sup>2</sup>, D.T. Brink<sup>2</sup>,  
R. Martin-Hughes<sup>2</sup>, N. Scott<sup>2</sup>, N. Wulan<sup>2</sup>, M. Merrigan<sup>3</sup>,  
F. Young<sup>3</sup>

<sup>1</sup>Health Equity Matters, Bangkok, Thailand, <sup>2</sup>Burnet  
Institute, Melbourne, Australia, <sup>3</sup>Health Equity Matters,  
Sydney, Australia

**Background:** As HIV funding for the Asia-Pacific region gradually shifts away from international donor support, countries face a growing financing gap in their HIV response despite increases in domestic funding. More efficiency is needed in HIV control efforts and allocating limited resources.

The Global Fund-funded SKPA-2 program conducted an allocative efficiency simulation to inform HIV resource allocation in Sri Lanka, Bhutan, and Mongolia.

**Methods:** HIV epidemiological data, program spending, and intervention cost data were collated from each country. The Optima HIV mathematical model was used to:

1. Determine the optimized allocation of HIV prevention and testing spending to reduce new HIV acquisitions and deaths from 2023-2030, and;
2. Estimate reductions in new HIV acquisitions and deaths under different funding scenarios compared to if 2021 baseline spending allocations were continued.

**Results:** The efficiency gain is highly dependent on each country's HIV epidemic, the structure of its response, and HIV program expenditures, ranging from a 2% to 20% reduction in projected cumulative new HIV acquisitions from 2023-2030 with existing spending optimized.

The investments that should be prioritized varied in each context, but generally shifted towards additional resources to community-based interventions, including pre-exposure prophylaxis, tailored to specific key population groups (Figure 1).

In Sri Lanka, testing and treatment targets could be within reach by 2030 if spending on HIV prevention and testing increases by 170% and is targeted toward key populations. In Mongolia and Bhutan, additional impact may be possible by scaling up innovative testing strategies and stigma reduction interventions, respectively. Removing HIV prevention and testing spending could lead to a 20-80% increase in cumulative new HIV acquisitions by 2030.

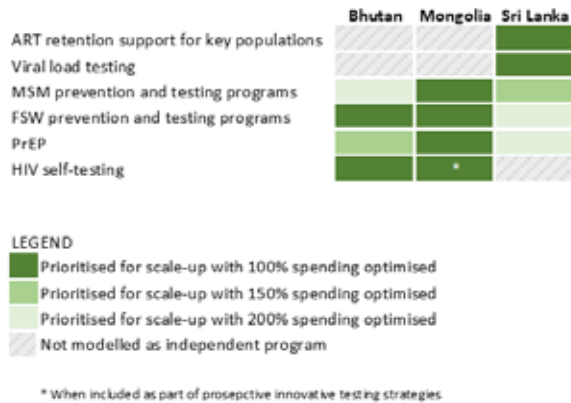

Figure 1. Selected interventions for scale-up at 100%, 150% and 200% HIV prevention and testing spending optimized.

**Conclusions:** To meet national HIV strategic planning targets with the goal of ending AIDS by 2030, it is most cost-effective to tailor HIV services for specific key population groups and prioritize the scale-up of PrEP.

## TUPEE561

Context and circumstance are everything: different pathways to social contracting reform in low HIV-prevalence Asian countries

H. Pan<sup>1</sup>, K. Navaratne<sup>2</sup>, E. Ser-Od<sup>3</sup>, P. Tshering<sup>4</sup>, F. Young<sup>5</sup>

<sup>1</sup>Health Equity Matters, Bangkok, Thailand, <sup>2</sup>Family

Planning Association of Sri Lanka, Colombo, Sri Lanka,

<sup>3</sup>Youth for Health Center, Ulaanbaatar, Mongolia, <sup>4</sup>Save

The Children Bhutan, Thimphu, Bhutan, <sup>5</sup>Health Equity

Matters, Brisbane, Australia

**Background:** Mongolia, Bhutan, and Sri Lanka all have general community HIV prevalence below 1%. Young men who have sex with men, female sex workers, and transgender women are the most affected populations. With financial support from external donors, key population-led organizations (KPOs) are often the primary providers of essential health services and information to peers. Social contracting is promoted as a policy solution to domestically finance KPO programs after external donors exit. However, it takes significant political will and time to implement appropriate foundational policies and domestic resource mobilization initiatives.

**Description:** The Global Fund multi-country grant program titled Sustainability of HIV Services for Key Populations in Asia (SKPA-2) supports Mongolia, Bhutan, and Sri

Lanka to accelerate financial sustainability through social contracting reform. A baseline assessment was done in 2022, and a guiding roadmap was co-drafted with stakeholders. Originally, swift pilot implementation was expected to follow. An in-depth political economy analysis was conducted in each country in 2023 to refine an approach to promote dialogue into action.

**Lessons learned:** Social contracting reform in these countries will be a long road, plagued with:

1. Complex politics,
2. Persistent legal and regulatory barriers,
3. A "head-in-sand" mentality regarding transition, and
4. Operational issues requiring broader systemic change.

In Sri Lanka and Bhutan, there is little prospect within the medium term of domestic budgets replacing external donor assistance to sustain KPO involvement in the HIV response.

It is still feasible in the short term to strengthen the national disease control program's capacity to leverage sophisticated contracts with KPOs to generate results and use them for advocacy in budget decision-making.

This would require coaching in better management practices, establishing good monitoring systems, and, in Bhutan, aligning the provider payment model to domestic public financial management practices.

In Mongolia, given frequent changes in government, the best current option to domestically finance KPO-led programs would be to integrate KPOs into the national health insurance provider network for a limited scope of work.

**Conclusions/Next steps:** Social contracting is not a silver bullet. Sometimes circumstances are only suitable for incremental changes. Contextualized synergistic approaches are the key to achieving results.

## TUPEE562

Meeting 95-95-95 targets in Vietnam: an analysis of decreasing HIV prevalence in Quang Ninh Province over the last decade

H.T. Dang<sup>1</sup>, H.N. Bui<sup>2</sup>, V.T. Nguyen<sup>1</sup>, V.T. Nguyen<sup>2</sup>,

T.H. Nguyen<sup>2</sup>, T.Q. Vu<sup>2</sup>, H.T. Luu<sup>2</sup>, T.A.T. Vuong<sup>1</sup>, H.T.T. Phan<sup>3</sup>,

R.S. Coley<sup>1</sup>, D.M. Levitt<sup>1</sup>

<sup>1</sup>FHI 360 Vietnam, Ha Noi, Viet Nam, <sup>2</sup>Quang Ninh Provincial Center for Diseases Control, Quang Ninh, Viet Nam,

<sup>3</sup>Vietnam Administration for HIV/AIDS Control, Ha Noi, Viet Nam

**Background:** Provincial HIV prevalence and incidence vary considerably in Vietnam, with evidence of emerging and decreasing sub-epidemics. Quang Ninh, a province with previously high HIV prevalence, has made significant progress against the 95-95-95 targets. Incidence dropped from 0.7 per 1,000 population in 2006 to 0.1 per 1,000 population in 2022, and prevalence decreased from 0.67% in 2006 to 0.42% in 2022.

We aim to describe trends in HIV testing, new HIV diagnoses, and enrollment in care and treatment over the past 10 years in Quang Ninh to help characterize the province's progress in epidemic control.

**Methods:** We reviewed de-identified data for newly diagnosed HIV clients from 2013 through 2023 from the provincial case reporting system and data from HIV testing and care and treatment programs. Linear regression analysis was used to assess temporal trends and Chi-square to identify significant differences.

**Results:** From 2013 to 2023, 2,465 individuals were newly diagnosed with HIV, of whom 90.6% (2,233/2,465) started treatment at some stage. The number of new cases decreased significantly over time, with an annual average change (AAC) of -12.7% (95% CI: -22.0% to -3.4%;  $p < 0.05$ ). Statistically significant decreases were found among most subpopulation analyses, with the largest changes among people who inject drugs (AAC -19.3%, 95% CI: -35.7% to -3.1%;  $p < 0.05$ ), individuals 35-44 years (AAC -15.2%, 95% CI: -31.4% to 1.0%;  $p < 0.05$ ), people living with HIV in the province (AAC -11.8%, 95% CI: -22.8% to -0.8%;  $p < 0.05$ ), and those categorized as other key populations (AAC -8.8%, 95% CI: -25.9% to 8.3%;  $p < 0.05$ ).

The number of HIV tests conducted and number of HIV clients on antiretroviral therapy (ART) increased, with AACs of 3.7% and 2.4%, respectively. ART clients maintained a high rate of viral load suppression (five-year average of 98.3%).

**Conclusions:** The decrease in newly diagnosed individuals from 2013 to 2023, coupled with increased coverage of HIV testing and treatment uptake in Quang Ninh province, reflect a potentially positive trend toward epidemic control. Ongoing efforts should concentrate on community-led outreach to determine if risk networks remain untapped, transition to provincially funded community-to-facility models, promote biomedical prevention (pre-exposure prophylaxis), and data-driven resource planning.

## TUPEE563

Strengthening organizational capacity to diversify financing and sustain KP-led CSOs in India

S. Taneja<sup>1</sup>, P. Kandimalla<sup>1</sup>, R. Salvi<sup>1</sup>, A. Mehrotra<sup>2</sup>

<sup>1</sup>FHI 360, HIV Programs, EpiC India, New Delhi, India, <sup>2</sup>FHI 360, HIV Programs - Optimization and Strategic Growth Support, Washington DC, United States

**Background:** Key population-led civil society organizations (CSOs) play a critical role in health care delivery. Many CSOs rely on inconsistent financing and have limited access to capacity strengthening (CS) support for financial diversification. The Meeting Targets and Maintaining Epidemic Control - EpiC India project strengthens organizational systems of local KP-led and KP-serving CSOs to diversify financing to sustain their engagement in the HIV response.

EpiC supported CSOs to develop a CS plan (CSP) to strengthen systems to improve readiness for diversified financing and assessed funding changes after two years.

**Description:** EpiC worked with 32 CSOs in Maharashtra and Telangana from October 2021 to September 2023. EpiC mentors provided targeted CS to CSOs, and after 18 months of mentorship, 87% of CSP goals were achieved. EpiC worked with CSOs on compliance with statutory requirements to improve readiness for different types of funding. CSOs were supported to improve their visibility through website development, promotional materials, and enhanced social media presence. All 32 CSOs received training in proposal development, and 40 proposals were developed, 33 submitted, and 18 approved.

**Lessons learned:** A structured, CSO-led CS process enhanced organizational and resource mobilization systems. In total, 81% of CSOs (increase from 28%) had human resources (HR) policies aligned to Indian HR standards, 81% of CSOs (increase from 13%) had an active website, and 84% (increase from 38%) adopted financial management policies aligned to best practices. CSOs successfully accessed diversified funding. Of 32 partners, 44% ( $n=14$ ) accessed at least two types of funding including social contracting, corporate social responsibility, crowd funding, and social enterprise revenue.

Between July 2022 and September 2023, organizations self-reported **38,984,500 Indian rupees (INR) (US\$475,421)** in grants, **INR3,041,443 (US\$37,091)** in donations, and **INR27,105,148 (US\$330,551)** as revenue from social enterprises. The majority of CSOs increased their annual operating budgets (average growth across CSOs ~25%), with 10 CSOs more than doubling annual operating budgets from 2021 to 2023.

**Conclusions/Next steps:** As funding for HIV programming decreases and priorities shift, CSOs need to identify alternative mechanisms and diversify funding to continue service delivery. Strategic technical assistance projects can successfully support partners in preparing for and accessing diverse funding streams.

## TUPEE564

Building blocks for sustainability: comprehensive preparedness assessments empower local organizations to contract with government entities to advance epidemic control

H.V. Nguyen<sup>1</sup>, N.T. Truong<sup>1</sup>, G.T.C. Pham<sup>1</sup>, P.T.M. Le<sup>2</sup>, R. Coley<sup>2</sup>, H.M. Nguyen<sup>1</sup>, A.T. Duong<sup>3</sup>, L.T. Nguyen<sup>1</sup>, T.M. Ngo<sup>4</sup>, D. Levitt<sup>2</sup>  
<sup>1</sup>FHI 360, Ho Chi Minh City, Viet Nam, <sup>2</sup>FHI 360, Ha Noi, Viet Nam, <sup>3</sup>Vietnam Administration for HIV/AIDS Control, Ha Noi, Viet Nam, <sup>4</sup>USAID/Vietnam, Ha Noi, Viet Nam

**Background:** As Vietnam approaches epidemic control, donors including PEPFAR are discussing phased transition by 2030. Vietnam's social health insurance scheme covers HIV care and treatment including exams, basic lab tests,

antiretrovirals, and viral load testing. It serves as a model for domestic financing, yet gaps remain funding community-based services, hindering achievement of 95-95-95 targets.

**Description:** Vietnam Administration for HIV/AIDS Control is implementing a nine-province social contracting pilot to make the case for local investment in community complementarity to the response. In support, the USAID/PEPFAR-funded projects are assessing civil society organization (CSO) capacities and providing tailored technical assistance.

Since March 2022, 23 CSOs in five provinces in Vietnam completed Community Organizational Sustainability Assessments (COSA) to gauge preparedness for social contracting across five domains. EpiC and Life Centre, a local organization, co-facilitated in-person assessments with CSO representatives by asking open-ended, probing questions to encourage group discussions and reflection. CSOs then scored themselves using a five-part scale with rubrics, and were encouraged to identify gaps and solutions to address them. CSOs jointly developed and implemented capacity strengthening plans and completed reassessments after one year.

**Lessons learned:** Experienced facilitators to guide the process were critical to identifying each CSO's strengths, gaps, and goals. CSO partners' diverse needs depended on their organizational goals and stage of development. Required improvements varied by domain. Twelve CSOs advanced the most in financial management and sustainability, reflecting gains in legal registration (required for social contracting), and/or alignment of financial systems with government bidding regulations.

This is foundational to government funding, and therefore social contracting. Nine CSOs improved the most in communications, which allows for successful online engagement via popular social media platforms and enhanced demand generation skills, both critical to reach clients and meet social contracting targets with limited funding for demand generation.

**Conclusions/Next steps:** The assessment process familiarized CSOs with the complexity of successfully implementing with government-provided funds compared with donor-funds and underscored the urgency to prepare for that transition.

The results informed tailored actions for technical assistance, with annual reassessment allowing for ongoing adaptation of those plans and tracking progress on the pilot and the move towards more sustainable community interventions.

## TUPEE565

### Peer-led social enterprise 'by' and 'for' people living with HIV paves the way for self-sustainability

M. Pardeshi<sup>1</sup>, S. Taneja<sup>2</sup>, H. Agarwal<sup>2</sup>

<sup>1</sup>TAAL+ Complete Health Care, HIV, Hepatitis, Pune, India,

<sup>2</sup>FHI360, HIV, New Delhi, India

**Background:** While there is free antiretroviral treatment available in India, people living with HIV (PLHIV) who can afford to pay, prefer seeking treatment from the private sector due to fear of stigma and discrimination, loss of confidentiality, and challenges in quality of care in government hospital settings due to high patient load.

There was a need for avenues that provided subsidized medications to PLHIV in a community-friendly and stigma-free environment.

Treatment, Adherence, Advocacy and Literacy (TAAL) was conceptualized as a peer-led pharmacy in 2006 by Network of Maharashtra by People Living with HIV (NMP+).

**Description:** Drugs for a month's treatment cost between US \$15 to \$62 at pharmacies. TAAL tapped into the corporate social responsibility programs of pharmaceuticals and received the medications for less than US \$5, passing the benefit to clients.

With USAID support, TAAL grew into TAAL+ an integrated health center (IHC) that offers diagnostics and medication for HIV, coinfections like tuberculosis, hepatitis B & C, HIV associated cancers, renal and bone issues, access to prevention tools like PrEP and PEP, screening, and medication for non-communicable diseases like hypertension and diabetes, as well as mental health services including counseling on U=U, marriage, and pregnancy.

Since October 2022, EpiC has been supporting TAAL+ in business planning, financial modeling, and adoption of newer demand generation strategies, including launch of online sales platform (Website).

**Lessons learned:** With the help of newly launched services and novel demand generation strategies, TAAL+ expanded its client base from 790 in 2022 to 1,200+ in 2023 through sale of PrEP and ARVs. TAAL+ empaneled as a supplier of the State AIDS Control Societies resulting in bulk ARV procurement.

These efforts led to 75% increase in revenue from US \$155,034 in 2022 to US \$328,212 in 2023. With 7-10% profit generated annually, TAAL+ addresses quality of care needs of PLHIV, including 3rd line treatment for few clients. Today, TAAL+ contributes to 16% of the total annual revenue of NMP+.

**Conclusions/Next steps:** Community led pharmacy models are critical in ensuring care and can be made self-sustainable with strategic planning, partnerships, and use of innovative approaches for demand generation.

### Scaling up PrEP and leveraging financing options to end AIDS by 2030 in Vietnam

H.A. Doan<sup>1</sup>, T. Ngo<sup>1</sup>, R. Augustin<sup>1</sup>, K. Frost<sup>1</sup>, D. Nguyen<sup>1</sup>,  
L. Tran<sup>2</sup>, T. Tran<sup>2</sup>, K. Green<sup>2</sup>

<sup>1</sup>United States Agency for International Development,  
Vietnam Office of Health, Hanoi, Viet Nam, <sup>2</sup>PATH, Vietnam  
Country Office, Hanoi, Viet Nam

**Background:** HIV pre-exposure prophylaxis (PrEP) was piloted in Vietnam in 2017 and subsequently scaled-up with 65,500 people currently on PrEP by the end of 2023. The Vietnam National Strategy to End the AIDS Epidemic by 2030 set MSM population PrEP targets at 30% by 2025 and 40% by 2030, but a recent impact analysis estimated that total KP PrEP coverage would need to be 70% to achieve 2030 goals.

We estimated the gap between current PrEP coverage and what is needed under this new scenario and identified possible financing options to cover the gap.

**Methods:** Based on population size estimation studies and recommendations from UNAIDS, the MSM population was estimated at 1% of the adult male population. MSM were likewise estimated to contribute 80% to total PrEP need and to total number of PrEP clients. Coverage targets were set to increase gradually from 25% in 2022 to 70% in 2030.

Free donor-sponsored PrEP was projected to account for over 50% of PrEP services until 2025 and to decrease gradually from 2026, with simultaneous transition to partial subsidy or commercial full fee options until 2030.

**Results:** Seventy percent KP PrEP coverage by 2030 translates into 236,880 individuals, more than three times the number of clients on PrEP in 2023. By 2030, partial subsidies at private clinics and fully commercial PrEP will need to be the two main categories contributing to the PrEP market (40% and 42% respectively, see Figure 1).

Figure 1. Number of clients on PrEP by payment scheme, 2022-2030.

**Conclusions:** Vietnam will need to more than triple the current number of clients on PrEP, in combination with high coverage for ART and other prevention services, to reach the goal of ending AIDS by 2030. A total market ap-

proach is needed to leverage different payment options, especially the private sector and out-of-pocket payments from clients, to optimally address unmet PrEP needs.

## TUPEE567

### Could primary health care be the answer? Sustainability of HIV program through integration into the broader primary health care system: lessons from Zambia's intervention strategy

L. Kawanga<sup>1</sup>, A. Ndhlovu<sup>1</sup>, J. Musangulule<sup>1</sup>, D. Mumba<sup>1</sup>,  
M. Nyumbu<sup>1</sup>, M. Musonda<sup>2</sup>

<sup>1</sup>JSI/USAID DISCOVER-Health, Zambia, Health Department,  
Lusaka, Zambia, <sup>2</sup>USAID, Zambia, Health Department,  
Lusaka, Zambia

**Background:** In the past two decades, global efforts by international donors, including PEPFAR, Global Fund, and World Bank, have significantly funded and addressed the HIV/AIDS epidemic, leading to a substantial scale-up of services. However, recent funding reductions may undermine the gains made thus far, in resource-constrained nations. Therefore, there is a need to establish HIV/AIDS program sustainability and explore efficient strategies to maintain program coverage gains amid financial constraints. The USAID DISCOVER project implemented by JSI structured a strategy of integrating HIV services and systems within the broader primary health care (PHC) platform to sustain HIV program gains in the midst of reduced external support.

**Description:** The study assessed sustainability outcomes of a one-year strategy implemented in pre-existing health posts (HPs) and standalone non-conventional (SNC) facilities supported by the project across eight provinces in Zambia from October 2019 to September 2023. A facility was defined as sustainable if it maintained 98% continuity in antiretroviral treatment, had Ministry of Health PHC-supported staff to provide HIV services, integrated PHC and HIV health system programming, and could operate without project support for at least a year. Facilities were categorized as sustainable, partial, or unsustainable based on meeting all, some, or none of the standards respectively.

**Lessons learned:** In the initial year (October 2019 to September 2020), 114 facilities participated, with 52% deemed sustainable, 47% partial, and 1% unsustainable. Year 2 saw 118 facilities, of which 72% achieved sustainability, 13% were partial, and 15% unsustainable. In the third year, 126 facilities participated, with 75% sustainable, 16% partial, and 8% unsustainable. The final year (October 2022 to September 2023) involved 66 facilities, with 88% achieving sustainability, 12% partial, and 5% unsustainable.

HPs were 1.5 times more likely to be sustainable than SNC ( $p < 0.01$ ). Facilities with people on ART below 1000 were 2.8 times more likely to be sustainable than those serving more than 1000 people ( $p < 0.01$ ).

**Conclusions/Next steps:** Integration of HIV and primary health care services proved to be a viable strategy of sustaining HIV program coverage gains in Zambia. This approach may provide a hopeful glimpse of the HIV program sustainability beyond epidemic control in resource constrained countries.

## TUPEE568

Analyzing mechanisms for HIV, hepatitis, and STI testing programs in Uganda: exploring transitional financing trends (2018-2023) and impact on healthcare

J. Kyokushaba<sup>1,2</sup>, G. Nantege<sup>3</sup>, H. Oundo<sup>4</sup>, No study group  
<sup>1</sup>Judith Kyokushaba, Kampala, Uganda, <sup>2</sup>Ministry of Health, Nation Laboratory Diagnostic service, Kampala, Uganda, <sup>3</sup>Centers for Disease Control and Prevention, Laboratory, Kampala, Uganda, <sup>4</sup>Ministry of Health, Laboratory, Kampala, Uganda

**Background:** Laboratory testing for HIV, Hepatitis, and STIs is pivotal for patient diagnosis and management, playing a crucial role in detecting emerging diseases. The recent outbreaks of Ebola and COVID-19 underscore the importance of laboratory diagnosis. Despite the commitment of African governments to increase health financing through the Abuja declaration, the attainment of this goal remains elusive.

This research investigates transitional financing trends to identify shifts in funding models, government contributions, and international support, aiming to understand the sustainability and effectiveness of testing programs.

**Description:** This study employs a comprehensive approach to examine the financial structures supporting HIV, Hepatitis, and STI testing programs managed by Uganda's AIDs Control Program and the Department of Laboratory and Diagnostic Services in the Ministry of Health. Document reviews, encompassing quantification, supply planning, and procurement reports from 2018 to 2023, were conducted.

The analysis scrutinizes transitional financing models, including donor funding, government allocations, and collaborations with international organizations. Using Microsoft Excel (2021), descriptive analysis summarizes funding commitments, illustrating trends and commodity availability.

The department advocated for funding by presenting gap analysis and stock-out reports to the government and stakeholders.

**Lessons learned:** The study highlights key lessons from transitional financing trends. Funding trends improved from 59% in 2018 to 71% in 2023, resulting in increased commodity stock availability from 48% to 78%. Government funding for lab commodities increased fivefold from 3% in 2018 to 15% in 2023.

These improvements positively impacted on diagnosis and management, emphasizing the importance of program sustainability and considerations for equitable healthcare delivery. Advanced technologies, including Point of Care Testing, are now integral to the department's operations.

**Conclusions/Next steps:** Adequate funding for laboratory commodities is crucial for ensuring quality service delivery. Governments have opportunities to enhance domestic health financing, supporting the transition from donor aid and ensuring financial sustainability for HIV, Hepatitis, and STI testing. To secure adequate government funding, increased domestic investment and the development of a clear framework for donor transition are essential and require ongoing monitoring and implementation.

## TUPEE569

Improving the quality of Global Fund applications and prioritisation of HIV prevention: the effect of a peer-learning network

K. Motlogelwa<sup>1</sup>, K. Mangold<sup>1</sup>, P. Bhattacharjee<sup>2</sup>, G. Oberth<sup>3</sup>  
<sup>1</sup>Genesis Analytics, Health Practice, Johannesburg, South Africa, <sup>2</sup>University of Manitoba, Winnipeg, Canada, <sup>3</sup>University of Cape Town, Center for Social Science Research, Cape Town, South Africa

**Background:** South-South HIV Prevention Learning Network (SSLN), a Global HIV Prevention Coalition (GPC) initiative was founded to support countries to strengthen HIV prevention programmes. Of the 36 GPC countries SSLN currently supports 15 in Africa. SSLN aims to enhance prevention programmes by fostering shared learning and best practices among countries, including strengthening Global Fund (GF) applications. During the GF's grant cycle 6 (GC6) concerns arose regarding the underemphasis on prevention.

We assessed the effect of SSLN on the prioritisation of HIV prevention, comparing budgets and alignment to normative guidance in GF applications.

**Methods:** Among 36 GPC countries eligible for GF funding, 23 (12 SSLN and 11 non-SSLN countries) submitted in windows 1-3 of GC7. To assess the impact of SSLN we undertook a desk based comparative quantitative and qualitative analysis by country and cluster, SSLN vs. non-SSLN. We examined whether HIV prevention budgets increased, whether prevention prioritisation and alignment to normative guidance (quality) improved in GC7 requests compared to GC6. Data was sourced from the GF data explorer.

**Results:** Across the 23 countries studied, there was a \$57,234,423 increase in HIV prevention funding requests in GC7 compared to GC6, increasing the proportion of HIV prevention funding from 13.4% of total HIV allocations in GC6 to 14.8% in GC7. SSLN countries increased the total amount requested for HIV prevention by 11.6% in GC7,

compared to 8.3% among non-SSLN countries. SSLN countries also increased the proportion of funding requested for prevention in GC7 by 12.3%, compared to 6.7% among non-SSLN countries.

Quality of HIV prevention requests improved from 44% in GC6 to 64% in GC7. SSLN- compared to non-SSLN countries had higher quality HIV prevention requests in both GC6 (quality scores: 48% vs. 40%) and GC7 (quality scores: 69% vs. 59%). Additionally, SSLN countries were more likely to set ambitious prevention targets that align to global goals (50% vs. 27%).

**Conclusions:** This study demonstrates a positive effect of a peer-learning network on funding applications. Participation in peer-learning networks may help strengthen budget allocations and programme quality.

## Costing, cost effectiveness and affordability

### TUPEE570

Cost-consequence analysis of demand creation strategies for the Pre-Exposure Prophylaxis (PrEP) use in the most vulnerable population for HIV between 15 and 19 years old

N. Cerchiari<sup>1</sup>, P. Massa<sup>1</sup>, A. Grangeiro<sup>1</sup>, P. Coelho de Soárez<sup>1</sup>

<sup>1</sup>University of São Paulo, Department of Collective Health, São Paulo, Brazil

**Background:** The HIV epidemic affects population groups unequally, with a higher incidence in populations of men who have sex with men, transgender women (TGW) and the Black population, in Brazil. The extent of the coverage of PrEP and the subsequent reduction in HIV transmission rely heavily on Demand Creation Strategies (DCS) designed to inform and facilitate access to services.

The objective of this manuscript is to evaluate the costs and outcomes of DCS for starting PrEP, with focus on the most vulnerable populations aged between 15 and 19 years in Sao Paulo.

**Methods:** A cost-consequence analysis was conducted, comparing six PrEP DCS implemented by PrEP1519 Study. The strategies evaluated were: Amanda Selfie – chatbot, peer-educator recruitment (PER) on dating apps, PER on social media, face-to-face PER, NGO referrals and direct referrals to health centers. The cost analysis included direct costs related to human resources, promotional materials, testing, equipment, services. The outcome assessed was the effectiveness of linking participants to PrEP initiation ("Rate of PrEP Initiation" - RPrEPi).

**Results:** The DCS that showed the highest inclusion of participants aged 15-17 years and individuals of Black ethnicity was face-to-face PER (RPrEPi: 1.03; CI 0.54 – 1.51 and

RPrEPi: 1.51; CI 0.92 – 2.10, respectively). TGW and non-binary people were included in PER mainly via social media strategy (RPrEPi: 0.20; CI 0.12 – 0.68 and RPrEPi:0.13; CI 0.03 – 0.47, respectively). The lowest cost per participant included was presented by direct referrals strategy and the highest, by chatbot (cost per included participant ranging from US\$ 209.52 to US\$ 184,934.30).

**Conclusions:** Despite incurring higher costs, the implementation of complementary and more effective DCS (such as face-to-face and on dating apps) has the potential to reduce HIV transmission within populations facing greater vulnerability. Consequently, this approach could save resources that would otherwise be allocated to the treatment of people living with HIV/AIDS.

## TUPEE571

### The cost of implementing HIV self-testing in India through online platform

S. Sriudomporn<sup>1,2</sup>, M. Salvat<sup>3</sup>, G. Thomas<sup>4</sup>,  
A. Kailasam Ganesh<sup>4</sup>, A. Enugu<sup>3</sup>, S. Chandra Ghosh<sup>4</sup>,  
A. Singh<sup>3</sup>, V. Arumugam<sup>4</sup>, J. Bell<sup>3</sup>, J. Thakker<sup>3</sup>, S. Kaur<sup>5</sup>,  
S. Solomon<sup>3</sup>, B. Patenaude<sup>1,2</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, International Health, Baltimore, United States, <sup>2</sup>Johns Hopkins Bloomberg School of Public Health, International Vaccine Access Center, Baltimore, United States, <sup>3</sup>Johns Hopkins University School of Medicine, Division of Infectious Diseases, Baltimore, United States, <sup>4</sup>YR Gaitonde Centre for AIDS Research and Education, Chennai, India, <sup>5</sup>United States Agency for International Development (USAID), Delhi, India

**Background:** To address barriers such as stigmatization and limited accessibility to HIV testing, the ACCELERATE program, funded by PEPFAR/USAID, has introduced HIV self-testing (HIVST) through the Safe Zindagi initiative webpage. This online platform provides information and services related to HIV testing, prevention, and treatment in India.

Our analysis examines the programmatic costs associated with implementing HIVST across districts in India from 2021 to 2022, which will help guide decision-making, policy formulation, and resource allocation for future program development.

**Methods:** We estimated the total programmatic cost of conducting HIVST via the Safe Zindagi platform from July 2021 to July 2022. Start-up and recurrent costs were captured at the programmatic level, excluding the costs of HIVST kits. Retrospective expenditure data, including personnel, training, operation, supplies/equipment, and travel costs were collected. We retrieved data on the number of HIVST kits ordered online, received, clients screened for HIV, shared results, confirmed HIV positive, and initiated on ART for each district. The per unit cost for each outcome were calculated.

**Results:** Between July 2021 and June 2022, 4,455 HIVST kits were ordered across 27 states in India. Maharashtra accounted for the highest number of kits at 36.3%, followed by Telangana at 21.1% and Delhi at 10.5%. The total programmatic cost of HIVST was estimated at \$64,626.71, with 97.2% attributed to recurrent costs and 2.8% to start-up costs. Personnel costs constituted the highest component of recurrent cost at 55.3%, followed by capital, supplies, and equipment at 30.4%. Of clients receiving HIVST kits, 92.6% conducted the test and reported the results to Safe Zindagi. Among those with a reactive test and confirmed as HIV positive, 80.5% were initiated on ART. The unit cost per PLHIV initiated on ART is estimated at \$627.44.

**Conclusions:** This analysis provides crucial financial data to inform decision-making and policy development, facilitating the expansion and sustainability of HIVST ser-

vices. The findings are valuable for revising budget allocations to ensure the accessibility and affordability of HIV self-testing in India.

**Background:** Economic evaluations of HIV pre-exposure prophylaxis (PrEP) and associated implementation strategies guide policies, programs, and resource allocation. The last decade has seen an evolution in PrEP modalities, implementation strategies, and prioritization of key populations at significant risk of HIV acquisition and transmission, alongside the scale-up of other HIV prevention interventions.

Our systematic review describes the evolving landscape of economic evaluations of PrEP to help identify evidence gaps relevant to the current HIV epidemic and response (PROSPERO: CRD42016038440).

**Methods:** We searched five databases, without language restrictions, for peer-reviewed economic evaluations from inception to December 23, 2021. We describe the following over time: study characteristics (model type, perspective of analysis, region, population); PrEP intervention (modality, implementation strategy); and comparators.

**Results:** We screened 3,877 abstracts and 231 full-texts. Among 87 included studies, 66 were published post 2014, including 58 examining HIV epidemics beyond 2014, 58 utilized transmission dynamics models, and 69 adopted a health system perspective.

The most common regions examined were: Sub-Saharan Africa (N=34), North America (N=25), Europe (N=11). The most common study populations included: gay, bisexual, and other men who have sex with men (N=47), sex workers (N=15), serodifferent partnerships (N=14), persons who inject drugs (N=10). Most studies examined oral, daily PrEP (N=50). Few examined other modalities (oral, on-demand PrEP [N=9], long-acting injectable PrEP [N=5], other [e.g., vaginal ring, topical gel; N=7]). Only two studies compared different PrEP modalities.

One study evaluated the cost-effectiveness of different implementation strategies to increase PrEP uptake, adherence, and persistence. Of the 82 studies that compared PrEP to a combination of other HIV prevention interventions, only 19 scaled up at least one comparator intervention over time.

**Conclusions:** The increasing number of economic evaluations of PrEP have not kept pace with economic evaluation guidelines and the HIV epidemic and response. To support decision-making, future economic evaluations should consider benefits beyond the health system (societal perspective) and use comparators that are more relevant to the current HIV response across regions and populations. The increasing availability of other PrEP modalities provides an opportunity for future studies to evaluate a mix of PrEP modalities and person-centered implementation strategies.

## TUPEE573

### Economic evaluation of a facility-based HIV and STIs self-screening program in northern Thailand

P. Phanthunane<sup>1</sup>, N. Konglumpun<sup>1</sup>, N. Salvadori<sup>2</sup>,  
N. Saebe<sup>1</sup>, A. Chompoopol<sup>1</sup>, S. Chairahaeng<sup>2</sup>, S. Piyaad<sup>2</sup>,  
T. Ponsuntikul<sup>2</sup>, G. Jourdain<sup>2</sup>

<sup>1</sup>Naresuan University, Phitsanulok, Thailand, <sup>2</sup>Chiang Mai University, Chiang Mai, Thailand

**Background:** Since 2023, the World Health Organization (WHO) has recommended HIV self-testing as an additional facility-based option. However, the cost-effectiveness of this approach is unknown. We conducted an economic evaluation of a facility-based HIV and STIs self-screening program in northern Thailand.

**Methods:** Individuals aged ≥15 self-screened for HIV, syphilis and hepatitis B and C using rapid tests in six participating facilities (NCT04585165). Several users could simultaneously self-screen in separate private areas under the supervision of a single healthcare worker connected through a tablet web-based application providing detailed instructions and a series of short videos in addition to HIV/STIs educational content.

Sociodemographic and behavioral data were collected during the waiting time for test results. In case of positive test, blood was sampled for immediate confirmation and personalized advice for referral was provided. The service

was promoted primarily on social media. We estimated the program's cost per new HIV diagnosis and cost per HIV transmission averted in the population of users, and cost per disability-adjusted life year (DALY) averted specifically in men who have sex with men (MSM).

The number of transmissions averted was estimated using the Bernoulli-process model of HIV transmission, and the number of DALYs averted using Markov chain modeling. All costs were converted to US dollars (\$). A 3% discount rate was applied.

**Results:** Between 19 October 2020 and 31 March 2023, 7,916 screenings in 6,047 individual users took place, and the program incurred a total cost of \$348,573. Overall, 105 users previously unaware of their HIV status were newly diagnosed, resulting in a cost per new HIV diagnosis of \$3,320. An estimated 27 HIV transmissions were averted (including 25 MSM), yielding a cost per transmission averted of \$12,859 – below the mean lifetime HIV-related medical care cost per capita (estimated between \$14,654–\$29,803). An estimated 292 DALYs were averted among MSM, with a cost per DALY averted of \$1,344 – far below the WHO cost-effectiveness threshold of one-time gross domestic product per capita (\$7,047).

**Conclusions:** Well-organized facility-based self-tests can be cost-effective for HIV screening and provide opportunities for personalized counseling, referrals, as well as screening for other STIs.

## TUPEE574

## Cost and cost-effectiveness of scaling-up point-of-care very early infant diagnosis in Mozambique and Tanzania

K. Elsbernd<sup>1,2</sup>, I. Sabi<sup>3</sup>, I. Jani<sup>4</sup>, C. Mudenyanga<sup>5</sup>, S. Boniface<sup>3</sup>, J. Lequechane<sup>4</sup>, F. Chale<sup>4</sup>, B. Meggi<sup>4</sup>, A.F. Lwilla<sup>3</sup>, W.C. Buck<sup>6</sup>, M. Hoelscher<sup>1,7,8,9</sup>, T. Baernighausen<sup>10</sup>, N.E. Ntinginya<sup>3</sup>, A. Kroidl<sup>1,7</sup>, S. Kohler<sup>10</sup>

<sup>1</sup>LMU University Hospital, Division of Infectious Diseases and Tropical Medicine, Munich, Germany, <sup>2</sup>LMU Munich, Institute for Medical Information Processing, Biometry, and Epidemiology, Munich, Germany, <sup>3</sup>National Institute for Medical Research, Mbeya Medical Research Center, Mbeya, Tanzania, the United Republic of, <sup>4</sup>Instituto Nacional de Saúde, Maputo, Mozambique, <sup>5</sup>Clinton Health Access Initiative, Maputo, Mozambique, <sup>6</sup>University of California Los Angeles, David Geffen School of Medicine, Los Angeles, United States, <sup>7</sup>German Center for Infection Research (DZIF), Partner site Munich, Munich, Germany, <sup>8</sup>Fraunhofer Institute for Translational Medicine and Pharmacology ITMP, Immunology, Infection and Pandemic Research, Munich, Germany, <sup>9</sup>Helmholtz Center Munich, German Research Center for Environmental Health (HMGU), Unit Global Health, Munich, Germany, <sup>10</sup>Heidelberg University, Heidelberg Institute of Global Health, Heidelberg, Germany

**Background:** Prompt HIV early infant diagnosis (EID) is critical, especially for neonates acquiring HIV *in-utero* who, without treatment, have high mortality rates in the first months of life. Late diagnosis causes delays in access to lifesaving antiretroviral treatment (ART). Point-of-care (PoC) testing at birth offers an opportunity for same-day treatment initiation, however, cost and cost-effectiveness evidence is needed for planning scale-up and assessing sustainability of EID programs.

**Methods:** We estimated the health system cost of birth plus 4-6-week testing (very early infant diagnosis; VEID) compared to standard of care (SoC) at 4-6 weeks only. The study was nested within the cluster-randomized LIFE trial conducted at 28 primary health facilities in Mozambique and Tanzania (7 facilities per arm per country).

We evaluated cost and cost-effectiveness of PoC-VEID using Abbott mPIMA in Mozambique and Cepheid GeneXpert in Tanzania. We report empirical costs during the study, simulate costs scaled to routine demand for EID, and assess cost-effectiveness in terms of age at ART initiation.

**Results:** Estimated cost per PoC-EID test in our study was \$39.12 (95% CI: \$37.69-\$39.99) for VEID versus \$40.57 (\$40.57-\$42.84) for SoC in Mozambique and \$36.23 (\$34.99-\$38.40) for VEID versus \$43.88 (\$41.12-\$45.21) for SoC in Tanzania. Estimated cost per HIV-exposed infant tested and initiating ART was \$126.56 (\$123.06-\$135.68) for VEID versus \$71.48 (\$71.48-\$76.24) for SoC in Mozambique and \$92.16 (\$72.64-\$119.91) for VEID versus \$70.28 (\$52.11-\$128.05) for SoC

in Tanzania. Incremental cost effectiveness ratios for median 3.7 additional weeks on ART in Mozambique and 5.6 in Tanzania (both  $p < 0.0001$ ) were \$673.32 (\$636.74-\$679.82) in Mozambique and \$386.96 (\$366.37-\$397.04) in Tanzania, representing 147% (139%-149%) of GDP per capita in Mozambique but only 35% (33%-36%) in Tanzania.

Scaling costs to routine EID demand reduced the test cost by 20-25% in Mozambique and 10-23% in Tanzania. Utilization of PoC analyzers varied across time and sites, with many sites exhibiting potential to increase cost-effectiveness of PoC analyzers by increasing utilization.

**Conclusions:** Birth PoC-EID is likely to be cost-effective in primary care, sub-Saharan African settings. When considering scale-up of EID programs, multiplexing for cost-sharing across programs or increasing access to testing through hub-and-spoke delivery could further reduce costs, particularly using GeneXpert.

## TUPEE575

## Scale-up of viral load access in Panama: ensuring leadership and high-quality testing delivery

R. Lorenzana<sup>1</sup>, D. Cortes<sup>2</sup>, M. Herrera<sup>2</sup>, A. Ortiz<sup>3</sup>, A. Martinez<sup>3</sup>, C. Vargas<sup>1</sup>, L. Peñalba<sup>1</sup>, R. Mendizabal<sup>1</sup>

<sup>1</sup>ICAP at Columbia University, Latin America Division, Guatemala, Guatemala, <sup>2</sup>Ministry of Health, Panamá, Panamá, <sup>3</sup>Instituto Conmemorativo Gorgas de Estudios en Salud, Genómica y Proteómica, Panamá, Panamá

**Background:** World Health Organization (WHO) strongly recommends HIV-1 Viral Load testing (VL) as the preferred monitoring tool for antiretroviral treatment efficacy measurement. In 2022, 19,000 people living with HIV were receiving ART in Panama, distributed across 16 ART clinics. In 2021, in a joint effort from the Ministry of Health (MoH) and Gorgas Memorial Institute (ICGES), with technical assistance from ICAP and CDC, through PEPFAR funds, a baseline evaluation was performed on the VL network with the purpose to improve performance.

**Description:** Existing molecular biology platforms and potential VL laboratories were mapped. Two instruments were used to measure different standards regarding access to VL testing. For VL laboratories, the HIV-VL and EID Scorecard 3.1, developed by the CDC, was adopted. ICAP adapted a WHO tool for evaluating and strengthening VL testing data for clinics and laboratories that collect and send samples. Field visits were conducted by MoH, ICGES and ICAP teams to apply the tools through staff inter-

views. A national VL technical working group (TWG) was established, with leadership from MoH and ICGES and supported by ICAP. This TWG has led the decision-making and new guidelines based on the mapping results.

**Lessons learned:** The assessment identified, only one of five laboratories using a WHO-recommended VL test and complying with external quality control assessments. As a result, the VL TWG decided on decentralization of VL test in phases.

Phase one was the centralization of VL test back to the ICGES, and the second phase consisted in an organized decentralization to a second laboratory with a WHO-recommended VL platform done in late 2022, with technical assistance from ICAP and ICGES for quality assurance.

**Conclusions/Next steps:** By September 2023, 86% of VL coverage was reported at PEPFAR supported sites, an improvement of 49% and 23% compared to FY20 (37%) and FY21 (73%), respectively. Constant training for health staff to improve VL uptake and quality assurance continues to be done. High levels of leadership and collaboration between MoH, ICGES and PEPFAR partners was crucial to success. Ensuring quality in new laboratories, as well as working with facilities to solve challenges in sample referral is essential to continued success.

## TUPEE576

### Data triangulation for monitoring the Dablapmeds programme in Thabo Mofutsanyane District in the Free State

A. Melamane<sup>1</sup>, S. Mulibana<sup>1</sup>, S. Molefi<sup>1</sup>, P. Majuba<sup>1</sup>, S. Matwasa<sup>1</sup>

<sup>1</sup>Right to Care NPC, APACE, Pharmacy Programme, Bethlehem, South Africa

**Background:** The significance of data quality in programme implementation has increased and is important because it ensures that the information used to make key decisions is reliable, accurate, and complete. The Dablapmeds programme performance is reported on SyNCH (Synchronized National Communication in Health), Tier.net and the Service Provider (Medipost Pharmacy) platforms. Discrepancies and gaps in data were identified that impacted effective management of the programme. Data triangulation was conducted to facilitate validation of data across the three data sources to increase chances for facilities to assess and control some of the factors influencing data quality issues.

**Methods:** Dablapmeds data from January to March 2023 were extracted from SyNCH, Tier.net and the Service Provider reports and analysed by M&E officers. Data triangulation was conducted to test the consistency of findings obtained from data collected using different methods. Data discrepancies were investigated and verified on patient files. SyNCH and Tier.net systems were updated to align the data.

**Results:** There were discrepancies and variations in numbers across the three data systems. Tier.net discrepancies were attributed to challenges with capturing where DMOC was not ticked on the system as well as capturing delays due to network and ongoing electricity supply issues. SyNCH discrepancies were attributed to clinicians not having access to the system, files not captured in the consulting rooms and lack of training on SyNCH.

The Service Provider discrepancies were attributed to transition from the previous service provider to the new service provider who started the Dablapmeds contract in October 2022. After the triangulation, the discrepancies were actioned by the clinicians and data quality mentors and that resulted to a balance in numbers.

**Conclusions:** Data triangulation should be a routine activity and not an ad-hoc one. Triangulation can help M&E and programme managers find meaningful information that can be used to identify gaps, make timely recommendations for programme planning and improvement, and provide useful insights for strategic decision-making.

## TUPEE577

### Sustaining high-quality HIV services through the HIV disease-specific care certification program in Thailand, 2020-2023

C. Fujitnirun<sup>1</sup>, R. Lolekha<sup>2</sup>, W. Munsakul<sup>3</sup>, S. Khusuwan<sup>4</sup>, J. Saiyarin<sup>5</sup>, C. Yukong<sup>6</sup>, C. Nandavisai<sup>2</sup>, S. Srisodsai<sup>7</sup>, P. Limpanyalert<sup>7</sup>, S. Noknoy<sup>8</sup>, S. Northbrook<sup>2</sup>, C. Lertpiriyasawat<sup>8</sup>

<sup>1</sup>Bhumibol Adulyadej Hospital, Directorate of Medical Services, Royal Thai Air Force, Bangkok, Thailand, <sup>2</sup>Division of Global HIV and TB, U.S. Centers for Disease Control and Prevention, Nonthaburi, Thailand, <sup>3</sup>Faculty of Medicine Vajira Hospital, Navamindradhiraj University, Bangkok, Thailand, <sup>4</sup>Chiangrai Prachanukroh Hospital, Chiangrai, Thailand, <sup>5</sup>Klang Hospital, Department of Medicine, Bangkok Metropolitan Administration, Bangkok, Thailand, <sup>6</sup>Ratchaphipat Hospital, Department of Medicine, Bangkok Metropolitan Administration, Bangkok, Thailand, <sup>7</sup>Healthcare Accreditation Institute, Nonthaburi, Thailand, <sup>8</sup>Division of AIDS and STIs, Department of Disease Control, Ministry of Public Health, Nonthaburi, Thailand

**Background:** Thailand Ministry of Public Health, Healthcare Accreditation Institute, and PEPFAR Thailand collaborated to create the HIV Disease-Specific Certification (DSC) program, which includes a standardized approach and certification metrics based on national HIV guidelines, ensuring that hospitals deliver high-quality HIV services. To obtain DSC, hospitals must achieve second and third 95 targets along the HIV cascade and recertify every 3 years.

**Methods:** In 2020, ten hospitals applied for DSC. Participating hospitals established an interprofessional team composed of nurses, physicians, pharmacists, laboratory

technicians, and quality improvement specialists. During 2020-2022, we conducted baseline assessments, DSC standards training, and multiple onsite/virtual coaching sessions at five hospitals in four certification areas: leadership and program management, support system for HIV service delivery (laboratory, pharmacy, infection control, environment, and information system), clinical care delivery (counseling and testing, antiretroviral treatment (ART), opportunistic infections, preventing mother-to-child transmission, and sexual transmitted infections), and performance measurement.

We compared 2020 baseline vs. 2022 certification year vs. 2023 after certification to ensure sustained gains using Chi-square and McNemar's test.

**Results:** Five tertiary care hospitals received DSC certification (one University Hospital, two Bangkok Metropolitan Administration hospitals, one Air Force Hospital, and one regional hospital) in 2022.

Compared to baseline data, % PLHIV receiving ART, initiating rapid ART, on treatment, retained in care, receiving viral load (VL) test, and suppressed significantly increased in 2022. Three indicators increased in 2023 compared to 2022. Two indicators (newly on ART and VL testing) slightly decreased in 2023 but remained >95%.

All certified hospitals reported improved HIV workflow, referrals, consultations, and treatment linkage due to better teamwork, communication, and leadership engagement.

Figure. HIV performance indicators across five HIV DSC-certified hospitals, Thailand 2020 - 2023.

**Conclusions:** HIV DSC promotes multidisciplinary teamwork to improve PLHIV treatment outcomes, increase visibility of HIV program to hospital leadership, and sustain quality after certification. The DSC model could be expanded to other hospitals as a best practice.

## TUPEE578

A comprehensive analysis of the impact of war and external migration on the provision of services to people living with HIV in Ukraine

O. Samsonova<sup>1</sup>, L. Hetman<sup>1</sup>, O. Klymova<sup>1</sup>

<sup>1</sup>Public Health Center of the Ministry of Health of Ukraine, Department of HIV management and counteraction, Kyiv, Ukraine

**Background:** In the backdrop of ongoing conflict post the Russian invasion, Ukraine is witnessing a surge in domestic and international migration. The primary focus of the nation's healthcare system is to ensure uninterrupted medical services, particularly for PLHIV. The need for enhanced statistical data exchange between European and Ukrainian health institutions becomes evident.

As of January 1, 2024, the Ministry of Health's information system reports that 7,943 PLHIV who migrated abroad after February 24, 2022 are undergoing antiretroviral therapy (ART). At the same time 1,908 individuals having returned to Ukraine. The challenge lies in ensuring the continued provision of ART upon their return.

**Methods:** An assessment of the cohort of PLHIV who went abroad since the beginning of the war in Ukraine after February 24, 2022 was carried out by analyzing the data of the electronic health information system "MSSD"

**Results:** The study encompasses 7,943 PLHIV, with 42% falling in the 40-49 age group and 32% in the 30-39 age group.

The majority were women (56.8%), and the median CD4 count was 586 cells/mL, with 89.5% having HIV RNA levels below 40 cop/mL. A notable 98.4% received ART, while 23 had never undergone ART, and 106 had prior ART experience. Dominant regimens included 86.1% on DTG and 92.5% on TDF, with 95.2% adhering to fixed drug doses, primarily 80%-TLD.

	0-17 years	18-24 years	25-29 years	30-39 years	40-49 years	50-59 years	60 or > years	total
female	152	79	263	1498	1827	636	159	4312
male	139	69	204	1051	1502	471	95	3431
total	291	148	467	2549	3329	1107	254	7943

**Conclusions:** The migration of PLHIV poses a substantial challenge to both Ukrainian healthcare and global public health. Procuring antiretroviral drugs (ARVs) in Ukraine demands careful consideration of factors such as PLHIV flows, adherence to national ART standards, risks of resistance due to treatment interruptions, and mental health concerns.

Addressing these challenges is imperative for ensuring the continuity of ART for returning PLHIV, emphasizing the urgent need for international collaboration.

## TUPEE579

### The added value of human-supported digital HIV care

V. Ameli<sup>1</sup>, G. Wong<sup>2</sup>, J. Barlow<sup>1</sup>, L. Sabin<sup>3</sup>, J. Haberer<sup>4</sup>

<sup>1</sup>University of Oxford, Social Policy and Intervention, Oxford, United Kingdom, <sup>2</sup>University of Oxford, Nuffield Department of Primary Care Health Sciences, Oxford, United Kingdom, <sup>3</sup>Boston University School of Public Health, Global Health, Boston, United States, <sup>4</sup>Massachusetts General Hospital, Center for Global Health, Boston, United States

**Background:** The value of digital HIV care is unclear when offered by a human provider, as opposed to automated chatbots, including those operated by generative artificial intelligence (AI). To contextualise the value of human interaction, this systematic review and realist synthesis investigated *how, why, for whom, and in what context* digital care that connects with human providers adds more value than interventions that are automated.

To the best of our knowledge, this is the first systematic review and realist synthesis of evidence on human-supported digital HIV care.

**Methods:** Evidence across multiple databases was assembled via systematic and iterative searching processes, identifying a total of 14056 records, of which 77 documents, including primary studies, key reviews, theoretical literature, and commentaries, contributed to this synthesis. Data was included and synthesised according to realist principles.

An explanatory realist theory was produced that can be empirically tested, refined, confirmed, or refuted across HIV care settings and contexts.

**Results:** The added value of human support appeared within four interconnected domains.

First, engagement with care can improve through tailored content offered by responsive providers.

Second, a therapeutic relationship appears to develop when patients trust and feel cared for by providers.

Third, the digital platform appears to facilitate the safe sharing of concerns in multimedia forms.

Fourth, patients and providers can be empowered to work towards holistic care.

**Conclusions:** Given staff shortages across various global settings and the emerging possibilities to offer care via chatbots, it is crucial to consider when to offer human-supported digital care and when to use AI alternatives.

Using the findings of this synthesis, we provide a checklist of recommendations on when and how to use human support and when and how to emulate aspects of a therapeutic relationship in interactive digital health, in ways to enhance intervention safety, usefulness, and compatibility with holistic care needs.

## TUPEE580

### Optimizing real-time data flow from community outreach to public facility HIV confirmatory testing and treatment for key population clients in Ho Chi Minh City, Vietnam

G.H. Tran<sup>1</sup>, D.M. Levitt<sup>1</sup>, V.T. Nguyen<sup>1</sup>, D.B. Bui<sup>1</sup>, C.T. Nguyen<sup>1</sup>, P.N.N. Tran<sup>1</sup>, B.Q. Luong<sup>2</sup>, D.V. Nguyen<sup>2</sup>, Q.D. Nguyen<sup>3</sup>, P.T. Nguyen<sup>3</sup>

<sup>1</sup>FHI 360 Vietnam, Hanoi, Viet Nam, <sup>2</sup>Ho Chi Minh City Centers for Disease Control and Prevention, Ho Chi Minh City, Viet Nam, <sup>3</sup>USAID/Vietnam, Hanoi, Viet Nam

**Background:** Approximately 6,500 key population (KP) clients are referred annually from community outreach to HIV facilities (HFs) in Ho Chi Minh City (HCMC), Vietnam. Early data management using an offline Excel tool lacked seamless flow between community outreach and facilities, resulting in inaccuracies in client records and suboptimal tracking.

To enhance program management, EpiC collaborated with the Ho Chi Minh City Center for Disease Control (HCDC) to introduce an online platform (KP eLog) in October 2022.

**Methods:** The KP eLog web-based platform enables outreach and facility workers to refer and track KP clients from community testing to confirmatory testing and treatment at HFs. Lay workers input client and HIV screening data using internet-enabled devices. HFs then access individual records online to offer clients tailored services. Prior to KP eLog, testing record crosschecks were conducted manually on Excel. KP eLog employs user interface indicators to notify whether a testing record has mismatched information.

We compared data flow between a 21-month period prior to KP eLog implementation (January 2021–September 2022) and a one-year period after implementation (October 2022–October 2023) in HCMC, Vietnam. We exported databases before and after implementation in JSON format and analyzed the data using Excel and Python.

**Results:** In the period prior to KP eLog, 48.25% of unique IDs from community testing records matched with HF records (89,441 records). Following KP eLog implementation (October 2022–October 2023) alignment increased to 94.1% (234,599 records). Real-time data flow enabled HFs to validate unique IDs assigned to community workers and client data entered during initial contact.

Routine data quality assurance led to improved consistency for key information (i.e., PrEP registration date) between community and HF records – from 25% with the same values prior to implementation, to 80% after. Improvements helped HFs track ART/PrEP referrals with treatment data from the national HIS, enhancing client management across the cascade.

**Conclusions:** Seamless, real-time data flow can strengthen community-facility referrals, promote complementarity and public health response, and improve outcomes. HCDC will expand KP eLog to all community partners and HFs in HCMC, and share lessons with other provinces preparing to roll out KP eLog.

## TUPEE581

Expanding the PrEP program requires finding new approaches to keeping track of client data

N. Ryzhenko<sup>1</sup>, D. Shevchenko<sup>1</sup>, S. Vynohradova<sup>1</sup>

<sup>1</sup>Public Health Center of the MOH of Ukraine, Department of HIV Management and Counteraction, Kyiv, Ukraine

**Background:** In 2017–2018, the introduction of PrEP in Ukraine started with 120 clients MSM. Despite the full-scale invasion of Ukraine by Russia, PrEP services were not stopped (in 2022 – 9075 clients received PrEP, in 2023 – 13147). Data collection and analysis play an essential role in service quality improvement. In Ukraine, data on PrEP are recorded in real-time using a medical information system (IS MSSD).

**Description:** Service providers enter data into the IS MSSD (date of registration, HIV testing, risk behaviour, key population, stopping PrEP). In 2023, new options were added to the IS MSSD to allow for accounting of new forms and modes of PrEP. Medical client's information in the electronic card include the regimen and mode of PrEP (PrEP on demand, daily, injectable). Aggregation of data allows the evaluation of PrEP provision at the regional and national levels, including the distribution of clients by type of key population, regimen, and scheme.

**Lessons learned:** Increasing the number of clients, decentralization of sites, and the use of new models and forms of PrEP require new approaches to data collection. Ana-

lyzing the distribution of clients by PrEP regimens will allow us to estimate demand and calculate the procurement need for PrEP of drugs. Given the large amount of data, to assess the quality of PrEP services, not only additional options for analytical reports and electronic medical card needed, but also the ability to automatically calculate data by generating a reporting form (number of clients who received PrEP, new clients, experience of taking PrEP, HIV testing, cases of seroconversion).

**Conclusions/Next steps:** Further expansion of PrEP programs requires finding new solutions for data recording, which is especially important in the context of military conflict. IS MSSD and automated reports are very convenient for obtaining and evaluating data in real time. However, due to the increase in the number of service providers and the number of clients, there is a need to generate more automated reports with deeper disaggregation on clients receiving PrEP in order to respond quickly to any changes at the regional and national and to make proper management decisions.

## TUPEE582

Re-engaging people living with HIV (PLHIV) back to care and reduction of HIV viremia in communities: a peer-driven community-based approach to PLHIV who are lost to follow up

I. Arinaitwe<sup>1</sup>, C. Bakashaba<sup>1</sup>, M. Musinguzi<sup>1</sup>, R. Musiimenta<sup>1</sup>, S. Namara<sup>1</sup>, D. Katana<sup>1</sup>

<sup>1</sup>Rushere Community Hospital, HIV Clinic, Kiruhura, Uganda

**Background:** Globally, there are commitments to end AIDS by 2030 with championship by the UNAIDS. To realize this commitment, there should be no new HIV infections by keeping the people living with HIV (PLHIV) in care with non-detectable HIV copies in their blood among other strategies. When PLHIV are lost to follow up from their clinics, the HIV viremia increases and this increases the risk of transmitting HIV.

This project aimed at diminishing HIV viremia within southwestern Uganda communities by leveraging the strength of peer support networks to re-engage lost clients into care.

**Description:** Rushere Community Hospital serves 1,710 PLHIV under care in the HIV clinic. By September 2023, 392 PLHIV had been lost to follow up from the HIV clinic. The health workers at the HIV clinic identified PLHIV who were willing to serve as role models to their fellows and offer peer support. These peers had good adherence to HIV care services and had non-detectable viral load for the past three consecutive years. They were adopted to actively participate in health facility activities, and providing essential human resources in the fight against HIV/AIDS. The peers offered crucial psychological support to their fellow community members living with HIV, thereby fostering a holistic and empathetic healthcare environment

to re-engage these lost clients back into care. The follow up of lost clients was done for three months through invitation to the facility and home visits within the communities. Peers delivered the messages on positive living and the risks of non-adherence to treatment.

**Lessons learned:** Within three months, 359 out of the 392 clients were engaged back into care and the other remaining clients were accounted for regarding their locations, whether and where they were getting treatment from. The clients were supported and re-integrated into care for continuity.

**Conclusions/Next steps:** Peer-led interventions reduce the overall burden of HIV by re-engaging and maintaining PLHIV in care. As we seek innovative strategies to address the HIV epidemic, we should harness the transformative impact of peers in the fight against HIV at community level. We thus recommend the integration of peers into healthcare teams to end AIDS by 2030.

## TUPEE583

Scaling up HIV services in Metropolitan Atlanta: a mixed-methods community needs assessment to support the 'Ending the HIV Epidemic' initiative

M. Piske<sup>1</sup>, B. Nosyk<sup>2</sup>, J.C. Smith<sup>3,4</sup>, B. Yeung<sup>1</sup>, B. Enns<sup>1</sup>, X. Zang<sup>5</sup>, P.S. Sullivan<sup>6</sup>, W.S. Armstrong<sup>7,8</sup>, M.A. Thompson<sup>9</sup>, G.A. Daniel<sup>10</sup>, C. del Rio<sup>7,8</sup>

<sup>1</sup>University of British Columbia, Vancouver, Canada,

<sup>2</sup>Simon Fraser University, Burnaby, Canada, <sup>3</sup>Positive Impact Health Centers, Atlanta, United States, <sup>4</sup>Harvard T.H. Chan School of Public Health, Boston, United States,

<sup>5</sup>University of Minnesota, Minneapolis, United States,

<sup>6</sup>Emory University, Department of Epidemiology, Atlanta, United States, <sup>7</sup>Emory University School of Medicine,

Division of Infectious Diseases, Department of Medicine,

Atlanta, United States, <sup>8</sup>Grady Health System, Atlanta,

United States, <sup>9</sup>Thacker & Thompson, MD, Atlanta, United States, <sup>10</sup>Emory University, Nell Hodgson Woodruff School

of Nursing, Atlanta, United States

**Background:** Atlanta, Georgia is among 57 jurisdictions currently prioritized by the United States (US) Ending the HIV Epidemic (EHE) initiative to reduce HIV incidence 90% by 2030. Geographic and racial/ethnic disparities in HIV challenge EHE efforts in the southern US.

We conducted a mixed-methods evaluation to assess community needs, service availability and public health infrastructure to support Atlanta's HIV/AIDS response.

**Methods:** We distributed an online survey to key stakeholders working at major HIV care agencies and community organizations across the 20-county Atlanta eligible metropolitan area (EMA) to assess service availability (including pre-exposure prophylaxis (PrEP) prescribing) and organization infrastructure. The Organizational Readiness for Implementing Change (ORIC) questionnaire assessed organization climate for services in need

of scale-up or implementation. We conducted a thematic content analysis of qualitative responses and identified key themes related to perceived barriers and recommendations for local EHE efforts.

We additionally collected 2021 county-level data from multiple sources on HIV prevalence, new diagnoses and service locations.

**Results:** Survey respondents (N=48; 54% primary care staff, 35% community-based organization staff, 10% state/county public health department/other organization staff) highlighted urgent needs for subsidized HIV testing, sustainable PrEP access, comprehensive HIV prevention, enhanced support and education for non-HIV specialists, meaningful community engagement and flexible funding to better accommodate client needs.

A lower proportion of non-HIV specialist prescribers felt able to determine PrEP indication (75%), and felt comfortable prescribing PrEP (63%), compared to HIV specialists (94%, 94% respectively;  $p<0.05$ ). Respondents recommended expanding drug assistance programs, anti-stigma and anti-racism training across care settings, ensuring adequate living wages for public health staff, Medicaid expansion, and community-driven EHE leadership. ORIC ratings ranged from 33% of respondents indicating organizational readiness for partner services expansion to 96% for HIV self-testing kits expansion.

Five southern EMA counties (not prioritized by EHE) accounted for 16% of the EMA's new diagnoses, but <9% of its 177 testing sites and <7% of its 130 PrEP sites.

**Conclusions:** Reaching EHE goals in Atlanta will require increased resources across all EHE pillars and enhanced structures for leadership driven by community members most affected and care providers. Geographic analysis can support strategies for equitable access to HIV care.

## TUPEE584

### Identifying opportunities to strengthen early infant HIV diagnosis through integration with national infant immunization programs: an analysis of 14 sub-Saharan African countries

A. Vrazo<sup>1</sup>, I. Nchu<sup>2</sup>, D. Patel<sup>1</sup>, M. Salvatore<sup>3</sup>, R. Golin<sup>4</sup>

<sup>1</sup>GHTASC, Credence Management Solutions LLC, Supporting USAID Office of HIV/AIDS, Prevention Care and Treatment Division, Washington, United States, <sup>2</sup>STAR, Public Health Institute, Supporting the United States Agency for International Development (USAID) Office of HIV/AIDS, Division of Prevention Care and Treatment, Washington, United States, <sup>3</sup>Global Health Technical Assistance Mission Support (GH-TAMS), Supporting USAID Office of HIV/AIDS, Division of Prevention Care and Treatment, Washington, United States, <sup>4</sup>USAID Office of HIV/AIDS, Prevention Care and Treatment Division, Washington, United States

**Background:** Despite high national infant immunization rates and global guidance and supporting evidence to integrate early infant HIV diagnosis services (EID) within established immunization programs, EID coverage for infants aged <2 months (<2m) lags global standards.

To identify opportunities for improving EID coverage through better integration, EID data from USAID/PEPFAR-supported country programs and national immunization coverage data were reviewed.

**Methods:** Proxy <2m EID coverage was calculated (*number of infants born to women living with HIV with sample collected <2m of age/number of women living with HIV receiving ANC services*) using routine 2022 data from 14 USAID/PEPFAR programs (Burundi, Democratic Republic of the Congo [DRC], Eswatini, Kenya, Lesotho, Malawi, Mozambique, Nigeria, South Africa, South Sudan, United Republic of Tanzania [Tanzania], Uganda, Zambia, and Zimbabwe). EID coverage >100% was analyzed as 100% (EID coverage >100% indicates infants reported in the numerator but whose mothers were not reported in the denominator). First dose of DTP-containing vaccine (DTP1) coverage estimates from the 2022 WHO/UNICEF Estimates of National Immunization Coverage database were used as a six week (6w) immunization coverage proxy. Quadrant analysis assessed <2m EID vs. DTP1 coverage by country using <90%/≥90% cutoffs.

**Results:** EID <2m coverage averaged 79% across the 14 country programs. Five country programs with <90% EID <2m coverage (Lesotho, Uganda, Tanzania, Burundi and Kenya) operated in settings with ≥90% national DTP1 coverage.

Six country programs had EID <2m coverage <90% in the context of DTP1 coverage <90% (DRC, Malawi, Mozambique, Nigeria, South Sudan, Zambia). Countries with 100% EID <2m coverage included South Africa (DTP1 coverage <90%), Zimbabwe, and Eswatini (DTP1 coverage ≥90%).

**Conclusions:** High DPT1 coverage in the face of lagging EID<2m in Lesotho, Uganda, Tanzania, Burundi and Kenya suggests that integrating EID into the 6w immunization visit may be an important strategy to increase EID <2m coverage in these countries.

Further analysis can identify best practices, feasibility, acceptability, and resource considerations from programs that successfully integrated EID into immunization services. In addition, analysis of birth immunization coverage among countries implementing birth EID services may also reveal opportunities for integration.

## TUPEE585

### Establishing a robust logistics and supply chain system to reach and sustain HIV epidemic control in the Teso region of Uganda

I. Esiru<sup>1</sup>, R. Opito<sup>2</sup>, B. Oryokot<sup>3</sup>, B. Bakashaba<sup>2</sup>, K. Mugisha<sup>4</sup>, S. Alwedo<sup>5</sup>, Y. Miya<sup>6</sup>, E. Benard Micheal<sup>7</sup>, D. Wepukhulu<sup>8</sup>, S. Wasike<sup>9</sup>

<sup>1</sup>The AIDS Support Organization, Kampala, Uganda, <sup>2</sup>Health system strengthening, Soroti City, Uganda, <sup>3</sup>The AIDS Support Organization, Kampala, Uganda, Programs, Soroti City, Uganda, <sup>4</sup>The AIDS Support Organization, Kampala, Uganda, Care and Treatment, Soroti City, Uganda, <sup>5</sup>The AIDS Support Organization, Kampala, Uganda, Programs, Kampala, Uganda, <sup>6</sup>The AIDS Support Organization, Kampala, Uganda, Care and Treatment, Soroti, Uganda, <sup>7</sup>The AIDS Support Organization, Kampala, Uganda, Programs and capacity development, Kampala, Uganda, <sup>8</sup>The AIDS Support Organization, Kampala, Uganda, Executive Director, Kampala, Uganda, <sup>9</sup>Ministry of Health, Kampala, Uganda, Supply Chain, Kampala, Uganda, <sup>9</sup>US Centers for Disease Control and Prevention, Division of Global HIV & TB, Kampala, Uganda

**Background:** A reliable supply chain system is key in ensuring the availability of essential health commodities for accelerating HIV epidemic control. However, late/inadequate ordering of commodities, stock outs and lack of a monitoring system for stock levels are common. Through a CDC-funded health system strengthening project in the Teso Region, Uganda, we identified bottlenecks in logistics and supply chain, with the aim of building a robust and reliable system responsive to the needs of the facilities and surrounding communities.

**Description:** At the start of the project in 2017, there were frequent stockouts of HIV-related commodities, including antiretroviral medicines and HIV test kits. We identified late submission of orders (26.7%) to national warehouses, lack of knowledge in forecasting and lack of a system to visualize stock as common causes of stock-outs.

To address these gaps, in February 2018, we conducted a refresher training in supervision performance assessment and recognition strategy (SPARS) for 35 medicines management supervisors (MMSs) across 10 districts in

Teso, trained 168 health facility stores in-charges and records assistants in Real-time ARV Stock Status (RASS), an online system which uses short message services (SMS) to collect real-time stock status from health facilities to a central dashboard. The MMSs conducted facility-level mentorships and coaching in logistics and supply chain management.

Additionally, we provided airtime and internet bundles to MMSs and facilities to facilitate data entry into electronic systems and created a social media platform (WhatsApp) for quick feedback loops during ordering and reporting RASS. With these interventions, late submission of orders reduced to 0% while stock out of HIV/TB commodities reduced to <2% in 2023.

**Lessons learned:** Monitoring of HIV-related commodities using RASS was sustained during the post project period. Facilitating and building capacity of MMSs in supply chain activities and use of RASS to enhance visibility of HIV/TB commodities resulted in sustained availability of commodities and improved service delivery in the Teso sub-region.

**Conclusions/Next steps:** It is possible to build a robust and sustainable supply chain system for HIV epidemic control which relies on district health systems.

## TUPEE586

### Assessment of social contracting pilot implementation: building the case for expanding publicly financed HIV services in Vietnam

A. Nguyen Thi Cam<sup>1</sup>, D. Nguyen Thi<sup>2</sup>, T.H. Nguyen<sup>2</sup>, T.H. Nguyen<sup>2</sup>, H. Huu Kieu<sup>3</sup>, T. Duc Nguyen<sup>4</sup>, T. Huu Do<sup>5</sup>, T.A. Duong<sup>5</sup>

<sup>1</sup>USAID Vietnam, Office of Health, Hanoi, Viet Nam, <sup>2</sup>Abt Associate, Local Health System Sustainability, Hanoi, Viet Nam, <sup>3</sup>Promedi Vietnam Consulting Company Limited, Hanoi, Viet Nam, <sup>4</sup>Hanoi University of Public Health, Hanoi, Viet Nam, <sup>5</sup>Ministry of Health, Vietnam Administration of AIDS Control, Hanoi, Viet Nam

**Background:** As a part of Vietnam's transition from reliance on donor funding to domestic financing for HIV response, PEPFAR and UNAIDS supported the Ministry of Health (MOH) implementing a social contracting pilot from 2022-2024, with community-based organizations and social enterprises (CBOs/SEs) delivering HIV services through the government contract modality.

A mid-term assessment of the pilot implementation is conducted to identify progress and challenges to be addressed to improve pilot implementation and build the case for future scale-up of social contracting

**Methods:** The assessment was conducted in nine pilot provinces from October 2023 to March 2024 and used mixed methods including secondary data review, 39 in-depth interviews, 22 focus group discussions with key informants from MOH, Departments of Health (DOH), pro-

vincial Centers for Disease Control (CDC), and 13 CBOs/SEs participating in the pilot. Questionnaires were also completed by 36 CBO/SE outreach workers

**Results:** All nine provinces demonstrated improved competencies in the governance, management and coordination of the program, from the national level (MOH) to provincial level (DOH and Provincial CDC) and community level CBOs/SEs.

Within two years of preparation and implementation, the pilot received support from all provincial authorities to enable CDCs to directly contract CBOs/SEs for the delivery of HIV services to nearly 4,000 clients. Results are achieved at ranges from 20- 70% of contract targets, depended on actual contract time for performance.

Trust was built up and pay for performance (P4P) is showed manageable throughout contracting process. Those with proactive engagement from CDC leaderships and well-established partnership between government and CBOs/SEs are far more progressing in contract implementation.

Key challenges identified in low performing provinces include overestimation of targets, and burdensome process of government bidding. Other obstacles included complex case verification required for payment and reimbursement rate is below market prices.

**Conclusions:** The findings indicate that social contracting is a feasible strategy to help Vietnam achieve the sustainable epidemic control by expanding access to HIV services for under-served key populations through CBOs/SEs.

Policy framework for social contracting is under development using the case from the pilot, but challenges on procurement, bidding and reimbursement need to be addressed to enable smooth implementation.

## TUPEE587

### How a targeted community case manager model reduces mother to child transmission (MTCT) of HIV in Central and Copperbelt provinces of Zambia

J. Mwanza<sup>1</sup>, L. Kawanga<sup>1</sup>, A.P. Ndhlovu<sup>1</sup>, M. Nyumbu<sup>1</sup>, M. Musonda<sup>2</sup>

<sup>1</sup>JSI/USAID DISCOVER Health, Lusaka, Zambia, <sup>2</sup>USAID Zambia, Lusaka, Zambia

**Background:** In 2023, children aged 0 to 14 years contributed to 13% of the total new HIV incidence in Zambia (MOH, 2023). Children are vulnerable and perform poorly on the UNAIDS 95 95 95 targets compared to adults.

With the aim of improving maternal, newborn and child health (MNCH) outcomes in HIV services, the USAID DISCOVER-Health project, implemented by JSI, strengthened prevention of mother to child transmission services through the implementation of a dedicated community case manager model at health posts, across different districts in Zambia.

**Description:** In 2019, the project introduced a dedicated community case manager model to improve the quality of care for maternal and breastfeeding women on ART in 66 supported health posts of Central and Copperbelt provinces. The model involves assigning a community health care worker to each pregnant woman living with HIV at the booking stage, as they are considered high risk. The model helps to educate the client about HIV, enhances their adherence to HIV medication, and allows for the timely tracking for viral load monitoring and HIV testing for exposed infants. Data was collected and analyzed at baseline and endline.

**Lessons learned:** From 2017 to 2023, the Project enrolled 25,416 pregnant women on ART. The expected live births were 25,416 and early infant diagnosis (EID) coverage at 12 months was 21,736 (86%) in the same period. The infant HIV incidence reduced from 79/2091 (3.8%) in 2019 to 47/3171 (1.5%) in 2023. There was a 68% reduction in HIV incidence rate among infants in 2023 compared to 2019 (p-value=0.001). Linkage to ART among identified infants in the same period was 45/47 (96%).

**Conclusions/Next steps:** A dedicated community case-manager model, targeting HIV pregnant or breastfeeding women, significantly reduced maternal to child transmission (MTCT) of HIV through optimized treatment literacy. This model may be recommended to improve adherence, timely ART monitoring and EID to eliminate MTCT of HIV and help end AIDS in children by 2030.

## TUPEE588

### From policy to practice: the HIV Care and Treatment Project's experiences in transitioning to an optimized regimen in Honduras

F. Castillo<sup>1</sup>, J. Abdo<sup>1</sup>, I. Escobar<sup>1</sup>, D. Nelson<sup>2</sup>, E. Tumbare<sup>2</sup>, A. Fitzgerald<sup>2</sup>, D. Dobrowolski<sup>2</sup>, R. Soto<sup>3</sup>, D. Murallas<sup>4</sup>  
<sup>1</sup>IntraHealth International, Guatemala, Guatemala city, Guatemala, <sup>2</sup>IntraHealth, North Carolina, United States, <sup>3</sup>USAID-Honduras, Tegucigalpa, Honduras, <sup>4</sup>USAID-Guatemala, Guatemala city, Guatemala

**Background:** Honduras has 60 HIV clinics throughout the country. USAID's HIV Care and Treatment Project, supports 80% of people living with HIV in 10 clinics. Honduras has an integrated health services model to ensure universal health coverage and access. This structure facilitates adherence to standards by promoting coordination among suppliers, efficient management, and implementation of unified protocols. According to 2019 WHO surveillance report, Honduras has resistance to Enfavirenz above 10%; thus, transition to optimized regimens is a priority.

**Description:** Starting in January 2022, the National Secretary of Health (SESAL) developed a national transition plan to Dolutegravir-based regimens covering new and eligible users according to established criteria. This plan ensured inter-institutional coordination at different levels

with international technical cooperation from USAID and CDC implementing partners. The plan categorized active ART users and assigned a transition goal to each clinic. SESAL led monitoring by creating an ARV technical working group comprising expert infectologists to support transition in complicated cases. By creating eligibility criteria and updated norms of ARV care and accessibility, updated training for clinic personnel, and supported local programmatic actions by educating clients on the benefits of optimized regimens.

Despite the challenge of maintaining a balance between previous (non-optimized) stock and procuring newer TLD-based ARVs, the transition resulted in a 60% increase in clients on optimized treatment regimens between Q1FY22-Q4FY23, thus far reaching 80% of persons on treatment.

Figure 1. Optimized treatment regimen transition, Honduras FY22-23. Source: DATIM

**Lessons learned:** Transition of regimens in a dynamic cohort represents a logistical challenge at health system. Considering the integrated health services model in Honduras, the dissemination of the norm under a regulatory framework was successful to promote universal health coverage.

**Conclusions/Next steps:** To guarantee sustainability of global coverage in optimized regimens, it is important to constantly monitor and analyze progress through nominal (name-based) and updated cohort data, as well as comprehensive coordination of key actors.

## TUPEE589

### Enhancing community health: insights from a dynamic public-private partnership in Limpopo, South Africa

I.B. Enggelbrecht<sup>1</sup>, V. Trivella<sup>1</sup>, O. Rammula<sup>1</sup>, C. Sikhakhana<sup>1</sup>, C. Chasela<sup>1</sup>, A. Plowright<sup>2</sup>, S. Tenza<sup>3</sup>  
<sup>1</sup>Right to Care NPC, Privately-Funded Programmes, Centurion, South Africa, <sup>2</sup>Anglo American, London, United Kingdom, <sup>3</sup>Anglo American, Johannesburg, South Africa

**Background:** Public-private partnerships (PPPs), funded through corporate social investment, play a pivotal role in driving public health initiatives and reducing countries' dependence on donors in response to HIV. Anglo American (AA) and Right to Care (RTC), in partnership with the Limpopo Department of Health, implement the Com-

Author Index

munity Health and Wellbeing Programme (CHWP) to enhance health outcomes in peri-mining communities in Limpopo, South Africa.

**Description:** The CHWP, integral to AA's sustainable mining plan and guided by a mixed-method baseline assessment, aligns with SDG3 and WHO targets for ending the HIV epidemic. It comprises three distinct components:

1. Healthcare System Strengthening (HSS): Optimizing primary healthcare services to achieve 80% compliance with national quality assurance requirements.
2. Peer-Navigated HIV Treatment Support (PHTS): Employing a peer-navigated approach to enrol 80% of eligible clients.
3. Treatment Dispensing, Distribution, and Collection Support (TDDCS): Focusing on decentralized dispensing through electronic lockers for medicine collection to align with national strategies and targets.

Commencing in 2022, the CHWP's phased implementation began in June 2023 across twelve facilities in Limpopo.

**Lessons learned:** The CHWP's phased development and implementation have dynamically progressed toward the annual targets across its three components. HSS achieved 50% performance in 6 months, PHTS reached 41% in 3 months, and TDDCS initiated with 23% performance in the first month.

The successes to date underscore the importance of involving stakeholders at all levels, ensuring comprehensive support and effective implementation. Early target determination emerges as a fundamental factor, providing a solid foundation for programme direction and success. The nature of funding for the CHWP presents distinctive challenges tied to market volatility, economic stability, and governance structures. Addressing these challenges necessitates meticulous planning and communication, with a dedicated focus on sustainability and managing expectations.

**Conclusions/Next steps:** The CHWP provides valuable insights into the impact of corporate social investment, through PPPs, on community health outcomes in low- and middle-income countries.

The success criteria, management structures, and initial outcomes underscore effective strategies for strengthening healthcare and bridging access gaps while reducing dependency on external donor funding and fostering shared accountability for community health and wellbeing.

## TUPEE590

### Optimal management of cervical precancerous lesions in a single visit approach by use of thermal ablation among HIV positive women in Kenya

A. Nthusa<sup>1</sup>, P. Njiri<sup>1</sup>, J.P. Bor Malenya<sup>2</sup>, L. Osiro<sup>1</sup>

<sup>1</sup>Clinton Health Access Initiative, Non-Communicable Diseases, Nairobi, Kenya, <sup>2</sup>Ministry of Health - Kenya, Non-Communicable Diseases, Nairobi, Kenya

**Background:** Cervical cancer is a significant public health issue, causing over 340,000 deaths worldwide in 2020. In Kenya, it is the leading cause of cancer-related deaths among women, 9 women die daily. Women living with HIV(WLHIV) face a sixfold higher risk of developing cervical cancer. WHO recommends using HPV DNA as a primary screening test with triage for WLHIV.

Clients with positive screening results are eligible for thermal ablation (TA) on the same visit (the single-visit approach). We present findings and lessons learned from implementation of TA in Kenya.

**Description:** Implementation took place through a collaborative effort involving the National Cervical Cancer Program (NCCP), Clinton Health Access Initiative (CHAI) and county health departments. Training and mentorship was facilitated by a team of master and county-level trainers and attended by a diverse team comprising nurses, clinical officers, and medical officers.

Training covered screening techniques including; HPV testing, Visual Inspection with Acetic Acid (VIA), and cytology and treatment of pre-cancerous lesions by TA.

**Lessons learned:** Currently, over 1000 high-quality, portable thermal ablation (TA) devices including; Liger© (Liger Medical LLC) and Wisap© (Wisap Medical Technologies GmbH) have been disseminated and over 6,000 health-care professionals have been trained on cervical cancer screening and treatment using TA.

The impact of TA on treating precancerous lesions in the focus counties has increased from 0% in January-December 2019 to 43.8% in January-December 2023. Notably, treatment can now be administered at lower-level primary care facilities, including dispensaries and health centers.

**Conclusions/Next steps:** Embracing TA has the potential to enhance cervical cancer screening and treatment within primary care settings.

Nonetheless, ongoing mentorship is vital to ensure sustainability of these interventions, while upholding the quality of the screening program.

## TUPEE591

### Nothing for us without us: strengthening community networks to scale the enrollment of people living with HIV/AIDS in financial protection schemes in South-West Nigeria

C. Ohazurike<sup>1</sup>, B. Olusola-Faleye<sup>1</sup>, O. Fisher<sup>2</sup>, A. Murphy<sup>3</sup>, O. Oyelaran<sup>4</sup>, P. Egena<sup>4</sup>

<sup>1</sup>Abt Associates, International Development Division, Abuja, Nigeria, <sup>2</sup>Lagos State AIDS Control Agency, Lagos, Nigeria, <sup>3</sup>Abt Associates, International Development Division, Rockville, Maryland, Nigeria, <sup>4</sup>USAID, HIV&TB Office, Abuja, Nigeria

**Background:** In Nigeria, the Federal and State Governments subsidize the cost of health insurance premiums through programs such as the Basic Health Care Provision Fund (BHCPF) and State equity funds for vulnerable groups including PLHIV. However, since the inception of these programs in 2018 and 2020 respectively, the uptake of financial protection schemes among PLHIV has been sub-optimal.

In Lagos State, there is a HIV prevalence of 1.3%, with 130,000 Persons Living with HIV (PLHIV) on life-saving Anti-retroviral medication which means there is a need to increase the use of financial protection schemes to improve PLHIV and orphans and vulnerable children's (OVC) ability to access a broad range of health services, reduce out of pocket expenditure for health care and donor dependence, and improve health outcomes for these populations.

In September 2022, USAID's Local Health Systems Sustainability (LHSS) Project instituted an intervention to increase the enrollment of PLHIV in financial protection schemes through the PLHIV community networks.

**Description:** LHSS facilitated stakeholder engagements between PLHIV networks, state HIV/AIDS control agencies-Lagos State AIDS Control Agency (LSACA) & Lagos State AIDS and STI Control Program (LSASCP), the State Health Insurance Agency-Lagos State Health Management Agency (LASHMA) and PEPFAR-implementing partners to identify opportunities within health facilities and communities to support the enrolment of PLHIV in financial protection schemes.

During this process, LHSS strengthened the capacity of PLHIV-led civil society organization, Network of People Living With HIV/AIDS in Nigeria (NEPWHAN) to use context specific vulnerability assessment templates for the identification and targeting of poor and vulnerable PLHIV to increase enrolment.

**Lessons learned:** By strengthening the partnership and collaboration between PLHIV networks, LSACA and LASHMA- 3,400 PLHIV, OVC and members of key populations have been enrolled on health insurance in Lagos State using available government resources through the Basic Health Care Provision Fund and the State Health Equity Fund from September 2022 to December 2023.

**Conclusions/Next steps:** LHSS's interventions have improved representation, engagement, and participation of PLHIV networks and their members in financial protection schemes. This will help in reducing out-of-pocket expenditures for healthcare in low and middle-income settings like Nigeria and ensuring overall well-being of PLHIV.

## TUPEE592

### Digitalizing the adolescent living with HIV (ALHIV) transition process, Homabay County, Kenya

E.C.O. Oka<sup>1</sup>, G. Ochieng<sup>1</sup>, L. Okumu<sup>1</sup>, A. Odongo<sup>1</sup>, F. Raywe<sup>2</sup>, D. Khamala<sup>1</sup>, S. Obunga<sup>1</sup>, T. Kamau<sup>3</sup>, G. Okomo<sup>1</sup>

<sup>1</sup>Ministry of Health, Health, Homabay, Kenya, <sup>2</sup>Ngima Mogen, Health, Homabay, Kenya, <sup>3</sup>KAHISA, Health, Eldoret, Kenya

**Background:** Adolescents living with HIV (ALHIV) transition into the adult clinic is an important step in the continuity of care. Documenting the transition progress is therefore key to improving the transition cascade.

Currently, clinics in Kenya provide transition services but cannot track transition progress. HIV care in Kenya is documented in electronic medical records (EMR). However, ALHIV transition tools comprise job aids, and no specific indicators for transition are included in EMR systems. To address the documentation gaps, we piloted an electronic tool, the "Adolescent Transition Tool (ATT)" at Homabay County Teaching and Referral Hospital (HBCTRH).

**Description:** We implemented a Continuous Quality Improvement (CQI) project at HBCTRH in 2022-2023. The lack of an adolescent transition module in the Electronic Medical Records (EMR) and inadequate health worker knowledge were identified as root causes for documentation gaps. We sensitized clinic staff adolescent champions on transition and developed a standard operating procedure for clinic use.

We also developed Adolescent Transition Tool (ATT) software that uses the local network and existing EMR computers. The tool can capture transition services offered. User rights are needed to access the tool. Staff was sensitized and all transition data were captured in real-time during clinic visits.

**Lessons learned:** HBCTRH hospital has 476 adolescents (10-19 years) and 257 young adults (20 -24 years) who are living with HIV. We transferred all the biodata for all the adolescents and young adults on care to the ATT tool. About 130 client-provider transition sessions have been documented by December 2023. Of the 130 clients' sessions captured in the ATT 93% are fully disclosed, 85% are sexually active, 40% are on a contraceptive and two are pregnant, 49% are enrolled in school and 95% are in support groups. Treatment literacy sessions and transition counseling were 92%.

Health providers reported that the tool is easy to use even though they face challenges during network downtimes.

**Conclusions/Next steps:** Adolescent Transition Tool is a low-cost sustainable transition tool that can help capture transition data and help track performance. We recommend it be integrated into the EMR.

## TUPEE593

### Adapting agency emergency preparedness and response for people living with HIV (PLWH) Post-Hurricane Ida in New Orleans, LA (NOLA)

L. Fidelak<sup>1</sup>, E. Arnold<sup>2</sup>, A. Thompson<sup>2</sup>, V. Chanthala<sup>3</sup>, D. Murdock<sup>3</sup>, B. Agins<sup>2</sup>, W. Steward<sup>2</sup>, G. Rebchook<sup>2</sup>

<sup>1</sup>University of North Carolina, Gillings School of Global Public Health, Health Behavior, Chapel Hill, United States, <sup>2</sup>University of California San Francisco, Medicine, San Francisco, United States, <sup>3</sup>New Orleans Office of Health Policy and AIDS Funding, New Orleans, United States

**Background:** Natural disasters pose significant challenges to healthcare delivery and access. These disruptions are particularly impactful for people living with HIV (PLWH), for whom uninterrupted care and medication supply is crucial for overall health. Jurisdictional HIV public health and healthcare agencies play a vital role during such events, guiding clients to essential resources.

Through a quality improvement collaborative (QIC) focusing on retention led by the NOLA HIV office, we applied QI methods to assess and adapt HIV programs' responsiveness to emergency preparedness following Hurricane Ida in 2021 that included organizational and policy strategies. We describe experiences of healthcare facilities during Hurricane Ida and present QI adaptations addressing identified gaps.

**Methods:** Data on activities during and after Hurricane Ida were collected from twelve agencies participating in three QIC learning sessions from 2021-2023. Nine of twelve agencies engaged in participatory activities outlining disaster-preparedness systems, including process mapping and identifying areas for change. These nine agencies also shared emergency response activities and QI adaptations across sessions. Agency narratives and reports underwent coding and activities were categorized into thematic domains.

**Results:** In preparation for Hurricane Ida, some organizations completed emergency plans with clients, documenting emergency contacts, evacuation procedures, and health information. Eight of nine agencies improved existing disaster communication plans and adopted new policies for patient communication during and after disasters.

Agencies reported QI projects addressing medication supply and access in the weeks following Ida, and adapted to whether PLWH remained in or evacuated. Infrastructure challenges, pharmacy and insurance resistance, technology limitations, and staff capacity were reported

as barriers to disaster-related QI implementation and addressed through policy modifications by participating public health officials across state and city agencies.

**Conclusions:** Hurricanes and natural disasters present challenges to continuity of quality care for PLWH. Agencies serving PLWH play a vital role in ensuring uninterrupted care during such events.

Effective planning and communication between agencies and their clients or patients are integral to healthcare disaster management at all stages.

Recognizing emergency preparedness as a series of processes within a jurisdictional system that can benefit from integration with QIC efforts to better prepare jurisdictions and agencies for rapid responses in their systems.

### We Ask the Y (WAY): the impact of capacity-building in improving young people-led initiatives for the HIV response in Malaysia

N. Chong<sup>1,2</sup>, I. Azwa<sup>2,1</sup>, A. Yee Tan<sup>2,1</sup>, H. Fauzi<sup>3</sup>, A. Lasar<sup>4</sup>, H. Al-Akrra<sup>5</sup>, B. Razali<sup>1</sup>, N. Raman<sup>6</sup>, D. Susai<sup>1</sup>

<sup>1</sup>University of Malaya, Centre of Excellence for Research in AIDS (CERiA), Department of Medicine, Kuala Lumpur, Malaysia, <sup>2</sup>University of Malaya, Department of Medicine, Kuala Lumpur, Malaysia, <sup>3</sup>Community Healthcare Clinic (CHCC), PT Foundation, Kuala Lumpur, Malaysia, <sup>4</sup>Zeph Training Company, Kuala Lumpur, Malaysia, <sup>5</sup>Refugee Emergency Fund (REF), Kuala Lumpur, Malaysia, <sup>6</sup>OXYZ Health and Wellness, Kuala Lumpur, Malaysia

**Background:** Between 2017 and 2022, young key populations (YKP) in Malaysia have among the highest HIV prevalence (15.5%) in the Asia-Pacific region (UNAIDS, 2022). Only 10% of individuals aged 15 to 24 have comprehensive knowledge of HIV and sexual health, while fewer than half of YKP were reached by HIV prevention programs (Malaysia AIDS Monitoring Progress Report, 2023).

We Ask the Y (WAY) trained and challenged young people, especially young key populations in Malaysia, aged 18-30, using participatory approaches and implementation science to develop capacity and tackle root causes within the HIV cascade.

**Description:** From July to December 2023, we trained 30 participants; 53% (n=16) who identified as men who have sex with men, 13% (n=4) refugees, 3% (n=1) other LGBTQIA+ members, 20% (n=6) cisgender heterosexual individuals, and 10% (n=3) who preferred not to disclose. The training covered HIV epidemiology and prevention, sexual and reproductive health, sexual orientation, gender identity,

gender expression, sex characteristics (SOGIESC), stigma, tackling health inequities, and the Theory of Change. Towards the end of the training, participants pitched their HIV-related innovations in groups, competing for a USD1500 seed grant. Participants interested in local community-based organization projects were matched accordingly. HIV screening, linkage to care, and PrEP were offered throughout the training.

We evaluated acceptability, appropriateness, and feasibility using validated scales by Weiner et al. (2017), a 5-point Likert-type scale ranging from strongly disagree (1) to strongly agree (5).

**Lessons learned:** Baseline HIV-related knowledge increased from 77.8% to 84.4%. We improved the proportion of individuals who know their HIV status by 17.6% (n=6), all of which were negative. 23.3% (n=7) of participants were enrolled in an all-expense-paid PrEP service.

The seed grant recipient successfully completed their project and reported on project performance. 53.3% (n=16) showed interest in local community-based organization projects; we achieved a 100% match rate. Mean scores for acceptability, appropriateness, and feasibility exceeded 4.0 out of 5.0.

**Conclusions/Next steps:** Quality triumphs over quantity. Capacity-building training of young people in Malaysia, particularly YKP, has the potential to enhance the HIV response and warrants a larger national and regional scale-up to empower them to take leadership roles and negotiate effectively in decision-making spaces.

## TUPEE595

Outcomes from economic strengthening activities among AGYW (15-24 years) enrolled in the FACT Zimbabwe's USAID-funded DREAMS Program in Manicaland Province, Zimbabwe from 2022-2023

T.D. Mugoni<sup>1</sup>, R. Mundingi<sup>1</sup>, G. Mavhenek<sup>1</sup>, B. Kashiri<sup>2</sup>, T. Takaidza<sup>2</sup>, B. Mukome<sup>1</sup>, G. Shumba<sup>1</sup>, S. Ryce<sup>3</sup>, M. Tshuma<sup>3</sup>, T. Bhatasara<sup>4</sup>, T. Kabai<sup>2</sup>

<sup>1</sup>Family AIDS Caring Trust Zimbabwe, OVC and Sustainable Livelihoods, Mutare, Zimbabwe, <sup>2</sup>Family AIDS Caring Trust Zimbabwe, Strategic Information and Research, Mutare, Zimbabwe, <sup>3</sup>Bantwana Zimbabwe, DREAMS, Harare, Zimbabwe, <sup>4</sup>USAID Zimbabwe, DREAMS, Harare, Zimbabwe

**Background:** Persistent socio-economic vulnerabilities predispose adolescent girls and young women (AGYW) to acquire HIV, early pregnancy, early marriage, and gender-based violence (GBV) with AGYW 5 to 14 times more likely to be infected with HIV than their male peers in Sub-Saharan Africa (Pachena & Musekiwa, 2022).

Among the 47% of young people reported to be unemployed in Zimbabwe, 56% are females disproportionately affected by a lack of education and technical training (ILO, 2019). To address these disparities, Family AIDS Caring Trust (FACT) adopted the Siyakha work-readiness model

in Manicaland Province, Zimbabwe by layering onto the HIV prevention and sexual violence primary package curricula, linkages to clinical services (HTS, STI screening, family planning) and gender-based violence response.

**Description:** FACT Zimbabwe implemented the PEPFAR/USAID funded Support Maintain Advocate reduce Risk and Transform (SMART) Girls Determined, Resilient, Empowered, AIDS-free, Mentored, and Safe (DREAMS) program in Chipinge, Makoni and Mutare districts from COP21-COP22. During the two-year period of intervention, 1022 AGYW with limited- to- no formal education underwent comprehensive technical skills trainings, job-preparedness, social asset building, prevention of sexual abuse in the workplace, financial literacy, and entrepreneurship trainings.

All AGYW were supported with start-up kits and safety equipment relevant to their trade of choice; and 75% of the AGYW took up trades in the typically male dominated fields of auto-electrics, motor mechanics, computer maintenance building, welding, solar & electrical installations, plumbing, tiling, carpentry, and horticulture and 866/1022 (80%) accessed formal internships.

**Lessons learned:** An outcome survey conducted in COP22 on the COP21 cohort indicated that 82% of the AGYW were able to establish viable group and individual enterprises, average income increased from USD \$30.00 to \$67.87, ranging from \$15-\$200 per month.

A decrease in reliance on transactional sex, increased self-awareness and decision-making power in relationships were noted. Mentored vulnerable AGYW in Zimbabwe can break into male dominated fields of their choice in high potential growing sectors of the economy.

**Conclusions/Next steps:** FACT will further include neo-business opportunities like digital marketing and drone flying. FACT will further scale-up and integrate the Siyakha model with community apprenticeship to ensure young mothers can access the services within proximity of their homes.

## TUPEE596

Empowering communities through a multisectoral approach to strengthen reporting and responses to sexual and gender-based violence (SGBV) among adolescents and young people (AYP) in Migori County, Kenya

M. Owiti<sup>1</sup>, F. Ouma<sup>2</sup>, G. Owuor<sup>3</sup>, D. Canagasabey<sup>4</sup>, R. Muinde<sup>3</sup>, J. Thoya<sup>3</sup>

<sup>1</sup>Ministry of Health, Kisumu, Kenya, <sup>2</sup>MOH, Migori, Kenya, <sup>3</sup>PATH, Kisumu, Kenya, <sup>4</sup>PATH, Nairobi, United States

**Background:** SGBV is pervasive in Migori County, manifesting in various forms, including rape, sexual exploitation and abuse, female genital mutilation, domestic violence, forced widow inheritance, and child marriage, and disproportionately affects females and AYP. SGBV is driv-

Author Index

en by practices that foster gender inequality and power imbalances, sociocultural norms that normalize violence, and weak reporting systems.

PATH, through the USAID/Nuru ya Mtoto project, adopted a community-driven, multi-sectoral approach to strengthen SGBV reporting and improve provision of post-violence care among AYP.

**Description:** PATH, in collaboration with the department of health, introduced the approach in Migori County in July 2018 to foster active community involvement to identify and link AYP at risk of SGBV with post-violence services and enhance community awareness of SGBV and harmful sociocultural practices. The approach comprised:

1. Mobilizing community members to report SGBV cases and support affected individuals and survivors access post-violence care services.
2. Holding awareness-raising activities through community events, local radio shows, and targeted school-based dialogue sessions with community leaders, parents, and other stakeholders (e.g., boda-boda rider leaders).
3. Convening county/sub-county/ward-level Gender Technical Working Groups (TWG), with members receiving training in SGBV response and charged with spearheading community campaigns to counter HIV, SGBV, and teenage pregnancies.
4. Organizing 340 ward advisory committee meetings to improve response and reporting at ward level.

**Lessons learned:** This approach led to a four-fold increase reported SGBV cases, from 102 in July 2018 to 427 in June 2023. There was an observed increase in court-referred cases from 19 (2018-2019) period to 31 (2020-2021), signaling enhanced commitment to providing legal support to SGBV survivors, and an increased conviction rate for SGBV cases from 68% (2018) to 86% (2023), attributed to the establishment of functional gender desks at police stations. (KHIS2)

**Conclusions/Next steps:** The use of a community-led, multisectoral approach led to improved reporting and responses to SGBV cases among AYP in Migori County.

While additional work is needed to establish support structures for violence survivors, such as rescue centers and establishing child protection units in police stations and children's courts, maintaining community awareness and involvement in identifying and responding to SGBV is essential to move towards zero tolerance for SGBV.

Feasibility and preliminary results from mobile phone text message screening for symptoms of anxiety and depression among rural adolescents: a pilot trial

P. Kreniske<sup>1</sup>, B.X.J. Chan<sup>2</sup>, O.I. Namuyaba<sup>3</sup>, F.M. Ssewamala<sup>4</sup>, M. Nakisekka<sup>3</sup>, A. Kabarambi<sup>3</sup>, P. Namatovu<sup>3</sup>, C. Najjuuko<sup>3</sup>, R. Kasumba<sup>3</sup>, K.M. Sievwright<sup>5</sup>, G. Wingood<sup>6</sup>, Y. Wei<sup>6</sup>, M. Ybarra<sup>7</sup>, L.W. Chang<sup>8</sup>, J.S. Santelli<sup>9</sup>, C.A. Mellins<sup>5</sup>

<sup>1</sup>City University of New York (CUNY), Community Health and Social Sciences Department and Institute for Implementation Science in Population Health (ISPH), New York, United States, <sup>2</sup>City University of New York (CUNY), Institute for Implementation Science in Population Health (ISPH), New York, United States, <sup>3</sup>Washington University in St. Louis, Washington University School of Medicine, International Center for Child Health and Development (ICHAD), Brown School, Makasa, Uganda, <sup>4</sup>Washington University in St. Louis, Washington University School of Medicine, International Center for Child Health and Development (ICHAD), Brown School, St. Louis, United States, <sup>5</sup>New York State Psychiatric Institute and Columbia University, HIV Center for Clinical and Behavioral Studies, New York, United States, <sup>6</sup>Columbia University Mailman School of Public Health, Department of Sociomedical Sciences, New York, United States, <sup>7</sup>Center for Innovative Public Health Research, San Clemente, United States, <sup>8</sup>Johns Hopkins University School of Medicine, Baltimore, United States, <sup>9</sup>Columbia University Mailman School of Public Health, Heilbrunn Department of Population and Family Health, New York, United States

**Background:** The rise in mobile phone ownership (doubling in past 15 years to 75% in Uganda) has transformed communication especially for adolescents in low-resource settings. To capitalize on this opportunity we developed "Kirabo" (meaning "gift" in Luganda) a mobile phone-based automated text messaging platform to promote screening and linkage for HIV testing and mental health care for adolescents in rural Uganda.

Here we focus on the feasibility and preliminary results of the anxiety and depression text message screeners.

**Methods:** In week 3 of the 5-week HIV prevention and treatment intervention, adolescents (N=100, 15-19 years) recruited through 10 rural schools, were sent texts prompting them to reply to screeners that assessed depression and anxiety.

Before being routed to the full measures, adolescents texted responses to the first 2 questions of the Patient Health Questionnaire (PHQ-9) and the first 2 questions of the 7-item Generalized Anxiety Disorder Questionnaire

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

(GAD-7) respectively. Responses ranged from "not at all" (0), to "nearly every day" (3). Adolescents scoring  $\geq 1$  on the first 2 questions of the PHQ-9 or GAD-7 were then routed to the full measures.

**Results:** Among 100 adolescents (58% female; 69% < 18 years old), 79 successfully responded at least once to Kirabo's automated screening system. The 79 adolescents interacted with 240 text messages (M: 3.0 texts per adolescent, SD=2.6). Then 66 adolescents were routed to the full PHQ-9 and 56 to the full GAD-7. Of the 46 adolescents who completed the PHQ-9, 16 (35%) screened positive for having symptoms consistent with major depression (i.e., 10 or above on PHQ-9) and 13 youth indicated they would like to speak with a counselor.

Of 38 adolescents who completed the GAD-7, 17 (45%) had symptoms consistent with mild anxiety (i.e., GAD-7 score of  $\geq 5$ ), with 13 youth indicating they would to speak with a counselor.

**Conclusions:** A majority of adolescents successfully texted with Kirabo and completed the anxiety and depression screeners. Our approach identified a potential demand for mental health services among Ugandan adolescents. Further research on Kirabo's validity and preliminary efficacy to assist in linking adolescents with HIV testing and PrEP/ART and mental health counseling are needed.

## TUPEE598

Knowledge, practice and barriers to cervical cancer screening among HIV-positive women in Moshi municipality, Kilimanjaro - Tanzania

A. Charles<sup>1,2</sup>, J. Kombo<sup>3</sup>, M. Mahande<sup>2</sup>, M. Charles<sup>4</sup>, J. Kipeleka<sup>2</sup>

<sup>1</sup>Temeke Regional Hospital, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Management and Development for Health, Dar es Salaam, Tanzania, the United Republic of,

<sup>3</sup>University of Nairobi, Molecular Biology and Immunology, Nairobi, Kenya, <sup>4</sup>State University of Zanzibar, Medicine, Zanzibar, Tanzania, the United Republic of

**Background:** Cervical cancer is the fourth most common cancer globally among women in incidence and mortality and one of the most common cancers affecting women in Tanzania. 8% of HIV-Positive women are disproportionately at a higher risk of developing the disease.

The aim of this study was to assess the knowledge, practices and barriers to cervical cancer screening among HIV- Positive women in Moshi Municipality, Kilimanjaro in northern Tanzania

**Methods:** A cross-sectional study was conducted in the Kilimanjaro region among 215 HIV-Positive women attending care and treatment centers (CTC) at Mawenzi regional hospital and KCMC hospital between 8 July and 21 July 2021. A questionnaire was used for data collection using face-to-face interviews. The study population were HIV Positive women aged 18 to 49.

Data were analyzed using SPSS version 20.0. Frequencies and percentages summarized categorical variables and numerical variables summarized using median and inter-quartile range (IQR).

**Results:** 64.1 % of the participants had a good level of knowledge on cervical cancer risk factors. 52.2% women had poor knowledge on the signs and symptoms of the cervical cancer, 69.3% had good level of knowledge on cervical cancer preventive methods.

Over half, 64% of HIV-Positive women in this study had ever screened for cervical cancer. And among these 29.9% had their cervical cancer screening in the past 12 months. HIV status, advice from health care providers and screening campaigns were the reasons for undergoing cervical cancer screening. 85.0% received information on cervical cancer from health professionals and 47.7% from media and 20.1% of them from family/relatives.

Among the barriers to cervical cancer screening, afraid for the bad results was 71.5%, afraid for the test procedure was 59.8%, lack of disease symptoms was 46.7%, no reason for the test was 24.3%, never heard screening was 22% and not prescribed by the doctor was 20.1% of which commonly mentioned by the participants.

**Conclusions:** HIV-positive women demonstrate moderate screening rates, influenced by healthcare advice and campaigns. Health professionals are the primary source of information. Barriers to screening of cervical cancer suggesting a need for focused education and addressing psychological concerns to improve screening rates.

## TUPEE599

Maximising HIV testing uptake: findings from an integrated, youth-friendly, and community-based sexual and reproductive health service in Zimbabwe

L. Larsson<sup>1,2</sup>, C. Dziva Chikwari<sup>2,3</sup>, V. Simms<sup>2,3</sup>, T. Bandason<sup>2</sup>, O. Mugurungi<sup>4</sup>, T. Apollo<sup>4</sup>, E. Dauya<sup>4</sup>, M. Tembo<sup>2,3</sup>, C. Mavodza<sup>2,5</sup>, K. Kranzer<sup>2,1,6</sup>, R. Abbas Ferrand<sup>2,6</sup>

<sup>1</sup>Ludwig Maximilian University Hospital, Division of Infectious Diseases and Tropical Medicine, Munich, Germany, <sup>2</sup>Biomedical Research and Training Institute, The Health Research Unit Zimbabwe (THRUZim), Harare, Zimbabwe, <sup>3</sup>London School of Hygiene and Tropical Medicine, Department of Infectious Disease Epidemiology, London, United Kingdom, <sup>4</sup>Ministry of Health and Child Care, AIDS and TB Unit, Harare, Zimbabwe, <sup>5</sup>London School of Hygiene and Tropical Medicine, Faculty of Public Health and Policy, London, United Kingdom, <sup>6</sup>London School of Hygiene and Tropical Medicine, Department of Clinical Research, London, United Kingdom

**Background:** Young people aged 15-24 years still account for over a quarter of new HIV infections globally. We aimed to understand the uptake of HIV testing and factors associated with not taking up HIV testing offered

as part of community-based, youth-friendly, integrated HIV and sexual and reproductive health (SRH) services for young people in Zimbabwe.

**Methods:** The integrated service (contraception, condoms, menstrual hygiene products, sexually transmitted infections management) was implemented in three provinces in Zimbabwe (Harare, Bulawayo, and Mashonaland East) between 1 April 2019 and 31 March 2022.

A client was considered eligible for provider-delivered HIV testing if they were not known to be HIV positive. Uptake of HIV testing was longitudinally described including the pattern and yield of repeated visits.

Multivariable logistic regression stratified by province was used to assess factors associated with not taking up HIV testing despite being eligible.

**Results:** Overall, 35,446/36,991 (95.8%) of clients were ever eligible for HIV testing. Of these, 29,827/35,446 (84.1%) took up HIV testing, with the majority (27,339/29,827 [91.7%]) taking up testing at their first eligible visit and 2,488/29,827 (7.0%) only taking up HIV testing at a later visit.

The proportion of clients who took up HIV testing at their first visit increased over time. 5,619/35,446 (15.9%) never tested for HIV. HIV testing uptake was higher among those who took up SRH services.

Of the 29,827 clients who took up HIV testing, 4,494 (15.1%) had a repeat test. Clients in all provinces had half the odds of taking up HIV testing (aOR Harare: 2.06, 95% CI: 1.83 – 2.32; aOR Bulawayo: 1.92, 95% CI: 1.73 – 2.14; aOR Mashonaland East: 2.13, 95% CI: 1.72 – 2.63) if they had previously tested outside the integrated service.

**Conclusions:** Providing HIV testing services in a community-based, integrated SRH service is a feasible and attractive way to engage young people in HIV testing. Designing programmes which put young people at the centre and offer confidentiality, support, and a range of services will be central to this.

## TUPEE600

### Understanding multi-stakeholder perspectives on comprehensive chemsex services for young men who have sex with men in Thailand: qualitative findings from the CLYMAX study

A. Hiransuthikul<sup>1,2</sup>, C. Phongsinghwithaya<sup>1</sup>, J. Siriphan<sup>3</sup>, T. Chayaananchot<sup>1</sup>, A. Tangmunkongvorakul<sup>4</sup>, T. Sripitathanasakul<sup>1</sup>, P. Khomshuk<sup>1</sup>, P. Hongchookiat<sup>1</sup>, S. Nonenoy<sup>1</sup>, J. Boonruang<sup>1</sup>, N. Phanuphak<sup>1</sup>, CLYMAX study team

<sup>1</sup>Institute of HIV Research and Innovation (IHRI), Bangkok, Thailand, <sup>2</sup>Chulalongkorn University, Department of Preventive and Social Medicine, Faculty of Medicine, Bangkok, Thailand, <sup>3</sup>Foundation for AIDS Rights (FAR), Bangkok, Thailand, <sup>4</sup>Research Institute for Health Sciences, Chiang Mai University, Chiang Mai, Thailand

**Background:** The increasing visibility of chemsex among men who have sex with men (MSM) in Thailand underscores the urgent need for well-established and comprehensive chemsex services. The lack of knowledge regarding the essential components of comprehensive chemsex services for MSM in Thailand poses a substantial obstacle to the development such services.

We explored perspectives from various stakeholders on the necessary components of comprehensive chemsex services.

**Methods:** Semi-structured, in-depth interviews were conducted in-person with 60 key informants in March 2023: 40 MSM aged 16-35 years who use chemsex, 10 peers/family members, and 10 healthcare providers. Interviews were recorded and transcribed verbatim. A codebook was developed based on a priori themes of the interview guide and emergent themes from transcripts. Analyses were conducted using Dedoose software.

**Results:** We identified four components that should be incorporated into comprehensive chemsex services.

1. Promoting substance use literacy is the top priority. In particular, people who use chemsex value a reliable source of information on chemsex-related harms and mitigating strategies.
2. Mental health counseling from specialists, such as psychologists or psychiatrists, due to relationships between mental health and chemsex use.
3. Sexual health services, including routine sexually transmitted infections screening, and the provision of preventive measures such as PrEP and condoms.
4. Legal consultation and social/family support are crucial in the context of country's punitive laws and common abusive practices towards people who use substances.

Some MSM prefer onsite services for a more professional feel and effective communication, while others prefer online services due to experienced/anticipated stigma and discrimination when receiving in-person services or fears of street-side urine drug tests by the police which could

lead to harassment, bribery, and legal proceedings. Regardless, campaigns to normalize/decriminalize chemsex are critical for people to access healthcare services.

Other suggestions include establishing an emergency hotline, offering mailed tools for safe chemsex use, providing on-site chemsex merchandise, and involving former users in counseling.

**Conclusions:** Chemsex-specific literacy, mental health services, sexual health services, legal consultation, and social/family support were identified as key chemsex service components, and their inclusion in comprehensive chemsex services for MSM in Thailand should be further explored.

## TUPEE601

Integrating cervical cancer screening in state delivered HIV services for women living with HIV (WLHIV): a pilot initiative in Andhra Pradesh, India

M. Periasamy<sup>1</sup>, L. Sridharan<sup>1</sup>, B. Taliseti<sup>1</sup>, M. Suryadevara<sup>1</sup>, M. Faheem<sup>1</sup>, C. Naidu<sup>1</sup>, K. Prasad<sup>2</sup>, R. Prasad<sup>2</sup>, N. Fatima<sup>1</sup>, E.S. Asirvatham<sup>1</sup>, V. Yeldandi<sup>1</sup>, R. Allam<sup>3</sup>, M. Nyendak<sup>3</sup>, S. Upadhyaya<sup>3</sup>

<sup>1</sup>Society for Health Allied Research and Education India (SHARE INDIA), Hyderabad, India, <sup>2</sup>State AIDS Control Society, Andhra Pradesh, Vijayawada, India, <sup>3</sup>US Centers for Disease Control and Prevention, India, New Delhi, India

**Background:** Women living with HIV (WLHIV) are at a six-fold increased risk for cervical cancer which underscores the need for quality-assured screening for early diagnosis and treatment initiation to prevent avoidable morbidity and mortality.

We describe the feasibility and utility of providing cervical cancer screening for WLHIV in a resource-constrained setting in Andhra Pradesh, India.

**Methods:** We implemented a comprehensive cervical cancer screening and treatment referral program in four high-burden HIV districts. The target population was WLHIV, aged >25 years from five state-run antiretroviral treatment (ART) centres. Cervical screening was conducted by visual inspection with acetic acid (VIA). In preparation, we conducted facility readiness assessments that led to addressing the gaps and capacity building of the staff, and NGO/CBO team.

Further, we mobilized the WLHIV through several demand-generation initiatives, including outreach to enrol them for screening, referral, and linkages to treatment. In partnership with the Government and NGO/CBOs, we leveraged the government systems and structures, consistently engaged the community, and undertook regular staff competency assessments, monitoring and review. We collected data using a participant information tool through interviews, clinical examinations, and test results.

**Results:** We enrolled 852 WLHIV between Oct'22 and Sep'23, and 808 underwent VIA screening. The median age was 40 years (IQR:35-45); 66.5% were from rural ar-

reas, 64.5% were separated/divorced/widowed, and 46% were illiterate. All were on ART (Median 8 years; IQR:5-11). Only 22.4% ever heard of cervical cancer; of them, 11% perceived risk and 74% were aware of treatment. The screened (VIA) positivity was 6.8% (55/808). Positivity was relatively higher among those aged 25-40 years (9.9%), rural residents (7.8%), married (8.7%), and with lower (<USD60) income (13.9%). All positives (n=55) were accompanied and referred to higher facilities for confirmation and treatment. Among positives, 21.8% and 5.5% had pre-invasive and invasive carcinoma respectively. Around 99% and 96% were satisfied with counselling and overall service delivery respectively.

**Conclusions:** Integrating person-centric cervical screening in ART clinics through robust referral and linkages can improve the access and uptake of services, who otherwise, are less likely to access these services. Implementing this strategy through the public healthcare system will be sustainable, and feasible for scale-up.

## TUPEE602

Effectiveness of a theory-based guideline dissemination intervention on health worker adherence to hypertension screening for adolescents living with HIV in Ghana: a pragmatic cluster-randomized study

R. Adu-Gyamfi<sup>1,2</sup>, V. Ganu<sup>3</sup>, J. Enos<sup>1</sup>, K. Yeboah<sup>4</sup>, N. Mettle-Nunoo<sup>1</sup>, N.A. Baddoo<sup>5</sup>, K.K. Owusu<sup>2</sup>, M. Ayisi Addo<sup>2</sup>, M. Lartey<sup>3</sup>, V. Shabanova<sup>10</sup>, E. Paintsil<sup>10</sup>, K. Torpey<sup>1</sup>

<sup>1</sup>University of Ghana School of Public Health, Population Family and Reproductive Health, Accra, Ghana, <sup>2</sup>National AIDS/STI Control Programme, Ghana Health Service, Accra, Ghana, <sup>3</sup>Korle Bu Teaching Hospital, Internal Medicine, Accra, Ghana, <sup>4</sup>University of Ghana Medical School, Physiology, Accra, Ghana, <sup>5</sup>University of Ghana Medical School, Community Health, Accra, Ghana, <sup>6</sup>University of Ghana School of Public Health, Epidemiology and Disease Control, Accra, Ghana, <sup>7</sup>WHO Country Office, Ghana, HIV/TB, Hepatitis and STIs, Accra, Ghana, <sup>8</sup>UNICEF Country Office, Health, Accra, Ghana, <sup>9</sup>University of Cape Coast Medical School, Microbiology, Cape Coast, Ghana, <sup>10</sup>Yale School of Public Health, Paediatrics, Yale, United States

**Background:** Due to a high prevalence of hypertension (29%) in adolescents living with HIV (ADLHIV) in Ghana, WHO's recommendation to integrate non-communicable disease care into HIV services was adopted. This was expanded to include checking the blood pressure (BP) of persons living with HIV 3 years and older at each clinical visit. This study aimed to assess the effectiveness of a theory of planned behaviour (TPB)-based guideline dissemination package in addressing the poor adherence to this recommendation for ADLHIV.

**Methods:** A parallel, multicenter cluster-randomized study was conducted between September 2022 and July 2023. The clusters were 20 antiretroviral therapy (ART) sites in the Greater Accra Region of Ghana with the highest burden of adolescent HIV. They were assigned to the two study arms (intervention = 10, control = 10) by a computer-generated randomization list. The control group received the standard dissemination package comprising the distribution of guidelines to facilities, a classroom-based orientation on the updates and one supportive visit by the National AIDS/STI Control staff. In addition to this, the intervention group received a tested multicomponent TPB-based intervention (Table 1).

TPB Construct	Intervention component
Attitude	Orientation of ART staff on hypertension risk among ADLHIV in Ghana
Subjective norm	Monthly feedback and mentorship from a facility opinion leader
Perceived behavioural control	1. Orientation on BP measurement approaches 2. Provision of BP centile charts and pediatric-friendly sphygmomanometers

Table 1: Intervention Package.

The primary outcome was the rate of BP checks, expressed as the proportion of adolescents whose BPs were checked during clinical visits. Blinded investigators assessed this through a clinical records review before and six months after intervention implementation. Analyses were performed using Poisson regression with a random intercept for each cluster.

**Results:** The records of 454 (Intervention n=233, Control n=221) adolescents (56% female) were reviewed. Pre-intervention, there was no difference in the mean proportion of BPs checked during clinical visits (Intervention: 20.7% (95%CI:6.15-35.22); Control: 19.1% (95%CI:3.86-34.30),  $p=0.89$ ). Although both study arms observed a within-group increase in proportions screened, the intervention group had a higher mean proportion at follow-up (73.2% (95%CI:69.1-77.3) compared to the control group (36.3% (95%CI:25.6-47.1),  $p=0.0001$ ).

**Conclusions:** The intervention improved adherence to guidelines for hypertension screening among ADLHIV. Dissemination of such guidelines by Country Programmes should, therefore, be supported by context-specific evidence, continuous mentorship using available human resources and availability of relevant job aids.

**Trial Registration:** PACTR202205641023383

## TUPEE603

Practical lessons learnt in implementing Targeted Universal TB Testing (TUTT) by Anova health Institute Community HIV Testing Services in Johannesburg Health District

N. Tshabalala<sup>1</sup>, A. Kahari<sup>1</sup>, L. Seotsanyana<sup>1</sup>, A. Manyuchi<sup>1</sup>, N. Khanyile<sup>2</sup>, P. Dhliwayo<sup>1</sup>

<sup>1</sup>Anova Health Institute, Health, Johannesburg, South Africa, <sup>2</sup>USAID, Health, Pretoria, South Africa

**Background:** The department of health published the TB screening and testing standard operation procedure in June 2022 to guide quality TB screening and early linkage to care using Targeted Universal TB Testing (TUTT). Anova Health Institute employs a team of Community Health Care Workers (CHCWs) responsible for conducting HIV education and testing with individuals unaware of their HIV status. Part of TUTT entails testing for TB with Xpert ultra among newly diagnosed people living with HIV (PLHIV).

**Description:** From June to October 2023, 20 CHCWs were tasked to collect sputum from all newly diagnosed PLHIV for TB testing, irrespective of symptoms in Johannesburg, South Africa. The CHCWs' HIV testing questionnaire was changed to accommodate the TUTT strategy. The CHCWs were trained on the new approach and equipped with sputum containers and cooler boxes so they could collect client's sputum in the field.

**Lessons learned:** The CHCWs reached 9629 clients and collected sputum from 155 clients for TB testing. 100 (65%) were newly diagnosed with HIV while 53 were re-engaged in ART care, 2 (1%) were found to be TB contacts. 5 (3 226 per 100 000) tested positive for TB and 5 (100%) were initiated on treatment. 3 (60%) TB positive clients were symptomatic, 2 (40%) were asymptomatic.

Combining HIV and TB testing in community settings is a useful strategy for early diagnosis and treatment of TB cases.

**Conclusions/Next steps:** Combining HIV and TB testing in community settings is a useful strategy for early diagnosis and treatment of TB cases. All HTS activities must include TB testing in newly diagnosed HIV positive clients irrespective of symptoms. They must check and test all TB contacts. Sputum collection must be done onsite as clients referred are often lost.

## TUPEE604

### Assessment of FP-HIV Integration under the ART differentiated service delivery models oriented toward self-care in selected regions of Uganda: implications for FP-HIV integration

J.K. Matovu<sup>1</sup>, M. Akulume<sup>1</sup>, D. Bidashimwa<sup>2</sup>, E. Lebetkin<sup>2</sup>, F. Makumbi<sup>3</sup>, R.K. Wanyenze<sup>1</sup>

<sup>1</sup>*Makerere University School of Public Health, Disease Control and Environmental Health, Kampala, Uganda,*

<sup>2</sup>*Family Health International 360, Durham, United States,*

<sup>3</sup>*Makerere University School of Public Health, Epidemiology and Biostatistics, Kampala, Uganda*

**Background:** Self-care-oriented differentiated antiretroviral therapy (ART) service delivery models (SC-DSDMs) can provide a convenient platform for the integration of FP services into HIV care with minimal service interruptions. We explored participants' perspectives on integrating FP into three SC-DSDMs [i.e., fast-track drug refill, community drug distribution points and community client-led ART delivery (CCLAD)] to inform future adjustments in FP-HIV integration in Uganda.

**Methods:** A qualitative study was conducted in 18 health facilities in 17 purposely selected districts in four high HIV prevalence (6.2–8.1%) regions in Uganda. We conducted 80 in-depth interviews with ART clients and health providers [health facility staff, program managers and implementing partner representatives] between September and October 2022. Data were collected on the different forms of FP-HIV integration; client and providers' perspectives on integrating FP into three SC-DSDMs, and barriers to effective integration of FP into the SC-DSDMs. Data were analyzed using Atlas.ti following a thematic framework approach.

**Results:** We found two forms of FP-HIV integration:

- one-stop center (in which ART and FP services were provided at the same service delivery point) and;
- collaboration/referral.

Only three (3) health facilities offered ART and FP services through the one-stop center with the majority offering FP services through referral to the FP clinic, usually on the same health facility compound.

None of the health facilities provided FP services through the CCLAD model, which is organized to have one person retrieve ART refills for the other members. Both clients and providers agreed that the one-stop center would be more convenient and less time-consuming since referral to the FP clinic can result in increased patient waiting time and/or multiple clinic visits if the ART and FP clinics run on separate days. However, staff shortages, stock-outs of short-term FP supplies, shortage of space and lack of integrated registers dampened the enthusiasm for integrating FP into the SC-DSDMs.

**Conclusions:** Despite the potential benefits of integrating FP into the SC-DSDMs, only a handful of health facilities offered FP-HIV integrated services. These findings

call for policy guidance and technical support from the Ministry of Health in integrating FP into the SC-DSDMs in Uganda.

## TUPEE605

### Integration TB and HIV services as an effort to accelerate HIV screening and treatment in Tangerang City

L. Felina<sup>1</sup>, D. Anggraeni<sup>1</sup>, F. Helmy<sup>1</sup>, D.D. Amini<sup>2</sup>, A.F. Amin<sup>3</sup>, T.D. Veronita<sup>1</sup>, F. Dewiyan<sup>1</sup>

<sup>1</sup>*District Health Office, Tangerang City, Indonesia,* <sup>2</sup>*EpiC Indonesia, Tangerang City, Indonesia,* <sup>3</sup>*The Global Fund HIV, Tangerang City, Indonesia*

**Background:** Tuberculosis (TB) is the commonest opportunistic diseases and the main causes HIV-related deaths, with the incidence rate of 8 per 100,000 in Indonesia. In 2022, Tangerang City had 19 CST services, but public preference for integrated services is preferred.

The city's HIV Information System predicts a 28.9% (1.221) HIV screening rate in 2022, prompting The District Health Office (DHO) to accelerate CST services at healthcare facilities.

**Description:** Tangerang City currently has 47 integrated TB-HIV services. Those services are projected as 'one stop service' that provides HIV counseling, TB screening, TB-HIV treatment, provision of TB preventive therapy, TB contact investigation and notification of people living with HIV partners. Strengthening the capacity of health workers continues to be improved, including clinical mentoring and recording & reporting monitoring.

DHO encourages agreement among hospitals to provide TB-HIV integrated services, facilitate regular coordination meeting among TB and HIV program managers and laboratory team as well and also provide suffice logistics in healthcare facilities.

**Lessons learned:** Even though the integrated TB-HIV service is less than a year, the evaluation results show that people with TB who took HIV screening has increased significantly compared to last year.

The achievement of people with TB knowing their HIV status and enroll antiretroviral treatment increased three-fold.

Figure. Integration of HIV and TB services results in Tangerang City, Indonesia.

Year	Gender	HIV screening in people with TB	diagnosed with HIV	Retained in HIV care	receiving ART
2022	male	649	33	22	15
	female	572	12	10	9
	total	1221	45	32	24
2023	male	2018	107	81	67
	female	1402	25	17	14
	total	3420	132	98	81

**Conclusions/Next steps:** Health workers need to be strengthened in advocating for people with TB willing to HIV test. Clients on ART are targeted to reach 95%, the gap of 33.6% from LFU client, advanced diseases cases, and PLHIV clients who died must be minimized. DHO needs to expand CST services in hospitals based and increase efforts to improve other integrated TB-HIV services.

## TUPEE606

Quality improvement strategies to improve uptake of cervical cancer screening and preventive therapy among women living with HIV attending ART Clinics in Nasarawa State, Nigeria

V.O. Popoola<sup>1</sup>, S.N. Otene<sup>2</sup>, B. Ibrahim<sup>3</sup>, J. Ojedokun<sup>3</sup>, T. Popoola<sup>4</sup>, E. Nwabueze<sup>5</sup>, E. Ijezie<sup>5</sup>, L. Buzaalirwa<sup>6</sup>, M. Jkaisamba<sup>7</sup>, P. Iutung<sup>8</sup>

<sup>1</sup>AIDS Healthcare Foundation, Training and Quality Improvement, Abuja, Nigeria, <sup>2</sup>AIDS Healthcare Foundation, Keffi, Nigeria, <sup>3</sup>AIDS Healthcare Foundation, Lafia, Nigeria, <sup>4</sup>University of Newcastle, School of Nursing and Midwifery, Newcastle, Australia, <sup>5</sup>AIDS Healthcare Foundation, Abuja, Nigeria, <sup>6</sup>AIDS Healthcare Foundation, Quality Management, Kampala, Uganda, <sup>7</sup>AIDS Healthcare Foundation, Freetown, Sierra Leone, <sup>8</sup>AIDS Healthcare Foundation, Kampala, Uganda

**Background:** Women living with HIV (WLHIV) are at a higher risk of developing cervical cancer. However, early detection and preventive therapy can help reduce unnecessary morbidity and mortality. This project used quality improvement (QI) strategies to improve the uptake of Cervical Cancer Screening and Preventive Therapy (CCSPT) among WLHIV attending ART clinics in Nasarawa State, Nigeria.

**Description:** Only 20% of eligible WLHIV in 11 AIDS Healthcare Foundation-supported clinics in Nasarawa State accessed CCSPT services in the 1<sup>st</sup> quarter of 2023 and to improve this, a six-month QI project was commissioned to increase access from 20% to 90% among eligible WLHIV attending supported ART clinics by the end of the 4<sup>th</sup> quarter of 2023.

Root-cause analysis was undertaken and change ideas were implemented using Driver diagram and 6 iterations of Plan-Do-Study-Act (PDSA) cycles. The see-and-treat approach using visual inspection with acetic acid and

Iugol's iodine and subsequent treatment of pre-invasive lesion with thermal ablation was adopted as a method to quickly screen and treat eligible clients.

**Lessons learned:** The project increased access to CCSPT from 20% to 92% with 227 clients out of the 247 eligible WLHIV getting screened.

The 1<sup>st</sup> PDSA cycle built the capacity of healthcare workers to conduct screening on the spot and this increased access from 20% to 33%.

The 2<sup>nd</sup> cycle educated clients via health education sessions and one-on-one counseling leading to increased access from 33% to 54%.

The 3<sup>rd</sup> cycle ensured no stockouts of commodities, and this led to an additional increase in access from 54% to 61%.

The 4<sup>th</sup> cycle implemented active tracking activities to ensure no missed opportunities during clinic visits leading to increased access from 61% to 80%.

The 5<sup>th</sup> cycle strengthened chart audits, weekly hurdles, documentation, and team meetings leading to increased access from 80% to 88%.

For the 6<sup>th</sup> cycle, indigent clients were supported with transport fares, leading to increased access from 88% to 92%.

The project identified and treated 10(4%) WLHIV with pre-invasive cervical lesion and referred 1 client suspected to have cancer.

**Conclusions/Next steps:** Quality improvement strategies that are implemented through established QI methods can help healthcare teams analyze gaps relating to access to cervical cancer screening and implement change ideas to address them.

## TUPEE607

Addressing the mental health needs of HIV program beneficiaries: outcomes of two distinct screening approaches in public and private clinics in Vietnam

V.T. Pham<sup>1</sup>, T.T.A. Vuong<sup>1</sup>, H.T. Dang<sup>1</sup>, D.M. Levitt<sup>1</sup>, H.T.T. Phan<sup>2</sup>, N.T. Do<sup>2</sup>, K. Voi<sup>3</sup>

<sup>1</sup>FHI 360, Hanoi, Viet Nam, <sup>2</sup>Vietnam Administration of HIV/AIDS Control, Hanoi, Viet Nam, <sup>3</sup>USAID, Ho Chi Minh City, Viet Nam

**Background:** The COVID-19 pandemic compounded mental health (MH) disorders among people at risk of and people living with HIV (PLHIV). Since June 2022, the Meeting Targets and Maintaining Epidemic Control (EpiC) project integrated MH screening with routine checkups at supported public HIV treatment facilities and key population (KP) led pre-exposure prophylaxis (PrEP) clinics in Vietnam. Clinics implemented either client-administered or counselor-led screening approaches. We sought to compare differences between these approaches in identifying individuals at risk.

**Description:** From June 2022 to March 2023, MH screening was provided for PLHIV and PrEP clients at 21 clinics via self-administered screening at one clinic, and counselor-led screening at the remaining 20. Substantial variation in screening outcomes across clinics was observed, with self-administered screening yielding the highest rates.

After a south-to-south exchange on self-administered screening for four clinics in April 2023, one public HIV and one KP-led PrEP clinic adopted the approach. Data were collected from EpiC's program dashboard and analyzed using Chi-square to demonstrate outcome differences between the periods before and after the exchange.

**Lessons learned:** Between June 2022 and April 2023, 4.7% of clients were identified at risk of depression or anxiety at the public clinic, and 3.7% at the KP-led clinic. From May through September 2023, screening yields increased to 93 (11.7%, p-value <0.01) in the public clinic and 32 (11.4%, p-value < 0.01) in the KP-led clinic after applying the client-administered approach.

Across the other 18 clinics where health staff facilitated screening, 127 of 9,171 clients were at risk of MH disorders during the same period, varying from 0% to 5.8%. During the exchange, providers noted the self-administered approach allowed clients sufficient time to reflect while completing the questionnaires, and that clients felt more comfortable without direct questioning. However, the process was more time-consuming as they had to clarify the forms for clients and then enter client data.

**Conclusions/Next steps:** Client self-administered screening may enhance identification of MH disorders among PLHIV and KP PrEP clients. While tailored, person-centric approaches are critical, sufficient provider training and time commitment are needed to ensure their effectiveness. Clinics should consider self-administered screening for MH disorders.

## TUPEE608

South Africa's 2023 updated clinical guidelines for HIV and TB expand TB diagnostic test eligibility among people with HIV by more than 600%, requiring additional investment in service delivery

C. O'Connor<sup>1</sup>, P. Dhlwayo<sup>1</sup>, K. Rees<sup>1</sup>

<sup>1</sup>Anova Health Institute, Johannesburg, South Africa

**Background:** South Africa is among the countries with the highest incidence of Tuberculosis (185 per 100,000) and a high burden of TB/HIV co-infection. In 2023, South Africa released updated national guidelines for both HIV and TB. These guidelines introduced routine TB diagnostic testing for people living with HIV (PLWH), regardless of whether or not they have TB symptoms.

The new guidelines require routine MTB/Rif Ultra (Xpert) for all clients starting ART, annually for clients continuing on ART alongside their annual viral load test, and for all

pregnant women with HIV. Additional TB investigations are required for symptomatic clients and those with CD4<200.

**Description:** We estimated the number of additional TB diagnostic tests that will be required for PLWH based on the new guidelines, using routine programme data on:

1. New initiations on ART,
2. Annual viral load tests done for those continuing on ART, and;
3. First antenatal visits in PLWH. The analysis includes data from five districts (City of Johannesburg, Sedibeng, City of Cape Town, Capricorn, Mopani) in three South African Provinces (Gauteng, Western Cape, Limpopo) supported by Anova Health Institute.

**Lessons learned:** Between October 2022 and September 2023, 85,362 clients initiated ART, 798,737 had VL testing done, and 32,675 pregnant women with HIV received antenatal care. According to the new guidelines, at least 916,774 PLWH would have been eligible for TB diagnostic testing.

During the period, 126,325 tests were done for clients with HIV. We estimate that in the five districts sampled, at least 790,449 additional TB diagnostic tests would be needed to adhere the new guidelines, an increase of 626%. The cost per Xpert is estimated at 33.50USD.

**Conclusions/Next steps:** Providing hundreds of thousands of additional TB diagnostic tests will likely increase case identification and save many lives.

However, additional testing will increase the samples collected in clinics, processed at laboratories, and will increase numbers on TB treatment.

Lab assays alone will require an additional investment of 26,480,04USD annually within sampled districts. Planning and budgeting processes at the National and Provincial Departments of Health should account for these changes, and additional investment should be made in collaboration with development partners and private sector.

### Trends in HIV testing services and positivity rates among U.S. President's Emergency Plan for AIDS Relief (PEPFAR)-supported tuberculosis clinics in 19 African countries between 2019–2023

R. Briceno-Robaugh<sup>1</sup>, K. Srikanth<sup>2</sup>, M. Peterson<sup>1</sup>, I. Zabsonre<sup>1</sup>, B. Gleason<sup>3</sup>, S. O'Connor<sup>3</sup>, J. Rose<sup>2</sup>, P. Pierre<sup>4</sup>, S. Ahmedov<sup>1</sup>

<sup>1</sup>U.S. Agency for International Development, Global Health Bureau, Office of Infectious Disease, TB Division, Washington D.C., United States, <sup>2</sup>U.S. Agency for International Development, Global Health Bureau, Office of HIV/AIDS, Washington D.C., United States, <sup>3</sup>Division of Global HIV and Tuberculosis, Centers for Disease Control and Prevention, Tuberculosis Branch, Atlanta, United States, <sup>4</sup>Bureau of Global Health Security and Diplomacy - PEPFAR, U.S. Department of State, Washington D.C., United States

**Background:** In 2022, tuberculosis (TB) accounted for 26% of all deaths among people living with HIV (PLHIV) globally. The President's Emergency Plan for AIDS Relief (PEPFAR) supports HIV testing services (HTS) for persons with TB at TB clinics.

**Methods:** We reviewed routinely collected PEPFAR data from U.S. Government fiscal years (FY) 2019–2023 in 19 countries where all relevant data was available.

We calculated annualized age- and sex-stratified metrics for HIV status, testing, and positivity rates among persons with TB in PEPFAR-supported TB clinics, and compared them with HIV positivity rates across 17 other testing modalities.

**Results:** Among 627,637 persons with TB in FY19, 93% had a known HIV status (including previously known and newly tested); this metric has plateaued at 94% since FY22. HIV co-infection among persons with TB decreased from 40% to 35% from FY19–23. During the reviewed period, a greater percentage of persons with TB were male (59%), while the TB/HIV co-infection rate was higher among females (40% versus 34% for males). Co-infection rates were higher among people ≥25 years old (33–50%) than among people <25 years old (13–21%).

Among people tested for HIV in TB clinics, 15% (of 411,445) tested positive in FY19 and 13% (of 486,633) in FY23. For those ≥15 years, HIV positivity was 16% in FY19 and 14% in FY23. HIV positivity was lower for those <15 (6% and 5% in FY19 and FY23, respectively). HTS in TB clinics was the second highest modality for HIV positivity in PEPFAR-supported programs in FY19–22 and surpassed index testing with the highest positivity amongst modalities in FY23. However, over 2.4 million more people were tested via index testing than at TB clinics (Table 1).

**Conclusions:** Among persons with TB, HTS positivity rates are high, and TB/HIV co-infection remains above 30%. Continued collaboration among HIV and TB programs, and integration of case finding efforts, may contribute to efficient diagnosis of HIV among persons with TB.

HTS Modality	FY 19	FY 20	FY 21	FY 22	FY 23
Index testing HIV testing volume	2,095,934	1,948,400	2,457,835	2,714,687	2,893,909
Index testing	16.2%	18%	16%	13.9%	11%
HIV positivity rate					
TB Clinic		369,890			
	411,445		396,678	451,234	487,310
HIV testing volume					
TB Clinic	14.5%	13.2%	13.2%	12.9%	12.9%
HIV positivity rate					

Table 1: HTS volume and positivity by index testing and TB clinic modality in 19 African Countries with PEPFAR-supported Programs, between Fiscal Year 2019–2023.

## TUPEE610

### Key considerations for mobile messages to support reproductive life planning among women living with HIV in Kenya

C. Atieno<sup>1,2,3</sup>, N. Zania<sup>2</sup>, B. Wandika<sup>1</sup>, P. Jaman<sup>2</sup>, J. Dettinger<sup>2</sup>, A. Karingo<sup>1</sup>, J. Kinuthia<sup>1</sup>, J. Unger<sup>4</sup>, A. Drake<sup>2</sup>, K. Beima Sofie<sup>2</sup>

<sup>1</sup>Kenyatta National Hospital, Medical Research, Nairobi, Kenya, <sup>2</sup>University of Washington, Global Health, Seattle, United States, <sup>3</sup>Warren Alpert Medical School of Brown University, Department of Obstetrics and Gynaecology, Boston, United States, <sup>4</sup>Warren Alpert Medical School of Brown University, Department of Obstetrics and Gynaecology, Providence, United States

**Background:** Meeting reproductive health (RH) needs for women living with HIV (WLWH) can improve health outcomes among women and children. Well designed, person centered interventions that provide counseling and support for reproductive life planning can improve informed decision-making and allow women to better achieve RH goals.

We assessed preferences for interactive text messaging RH content with stakeholders to guide intervention development for the Mobile WACH Empower randomized trial.

**Methods:** In October 2022, two workshops were conducted (one in Nairobi and one in Kisumu, Kenya) among three groups: WLWH, healthcare workers (HCWs), and policy makers.

Using semi-structured guides, facilitators led small group discussions stratified by group to solicit feedback on RH text messaging content approach and implementation considerations. Participants were asked to adapt, adopt, or reject messages and clarify rationale for decisions, and also provide guidance on individual message language, structure, and tone. Discussions were audio recorded and transcribed. Thematic analysis of discussion transcripts was used to optimize message content and delivery to fit clients and clinic needs.

**Results:** A total of 60 stakeholders participated, including 26 WLWH, 20 HCWs and 14 policy makers. All participants viewed RH text messages as an effective strategy to improve access to support and information, emphasizing

the value of message content focused on topics related to pregnancy prevention, pregnancy planning, and clarification of contraceptive methods. WLWH and HCWs preferred short personalized messages covering only a single topic that invited women to respond.

All groups expressed concern for potential inadvertent disclosure of HIV status. WLWH and HCWs advocated for protections for people who shared phones and using discrete messaging for those where phone privacy was a concern.

When considering post-trial sustainability, policy makers and HCWs expressed concerns about ensuring alignment of message content with changing guidelines, increasing access to contraception, navigating partner influence, and identifying personalization strategies without increasing provider workload.

**Conclusions:** There was a consensus among WLWH, HCWs and policy makers that text messaging content should be specific, simple and person-centered to reflect WLWH needs. Intervention implementation post-trial will need to consider how text messages integrate into busy clinics and incorporate expanded RH guidelines and diverse needs for contraception.

## TUPEE611

Integration of HIV services through maternal and child health care mobile brigades for people living with HIV in hard-to-reach communities in Caia District, Sofala Province, Mozambique

A. Guilande<sup>1</sup>, J. Alexandre<sup>2</sup>, M. Prieto<sup>2</sup>, J. Chacha<sup>2</sup>

<sup>1</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique/Abt Associates, Maputo, Mozambique,

<sup>2</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique, Maputo, Mozambique

**Background:** Over the last two decades, significant progress has been made towards achieving the 95-95-95 targets for ending the HIV epidemic, primarily through vertical (stand-alone) HIV programs in high-burden countries. Alongside compelling evidence advocating for the integration of HIV services into primary health care, this integration becomes even more critical as funding for the global HIV response declines. Mozambique has been utilizing mobile brigades (MB) since 1979 to deliver maternal and child health (MCH) care services to remote communities.

We describe the experiences and lessons learnt from integrating HIV services into MB efforts in the Caia district of Sofala province, Mozambique.

**Description:** Starting from March 2021, the USAID-funded Efficiencies for Clinical HIV Outcomes (ECHO) project began supporting the integration of HIV services in two communities within the Caia district. These communities, with an estimated population of 9,923 inhabitants and which already received regular MB visits, showed low

treatment retention rates among people living with HIV (PLHIV). Initially, HIV services catered to PLHIV on antiretroviral treatment (ART) displaying risk factors for non-adherence. These services included clinical consultations, psychosocial support, ART dispensing, and viral load (VL) sample collection.

One year later, HIV testing services were incorporated. The clinical staff team in a MB comprised an MCH nurse, psychologist preventive medicine, pharmacy, and laboratory officers. MB visited each community monthly, with a community focal point responsible for mobilizing the population and coordinating with referral health facility focal points to ensure timely ART delivery.

**Lessons learned:** From March 2021 to June 2022, 34 PLHIV received care and treatment services, with 100% of eligible individuals undergoing VL testing, and all (100%) achieving viral suppression.

Additionally, 162 received antenatal care services, 305 women received family planning services, 35 children were vaccinated, and 28 people were screened for tuberculosis. From March 2022 to June 2022, 1,040 people were tested for HIV, resulting in 29 HIV-positive cases, all of whom (100%) initiated ART. However, operationalizing MB posted logistical challenges due to a heavy reliance on implementing partner resources.

**Conclusions/Next steps:** Mobile brigades present an alternative care model that can be leveraged in hard-to-reach communities by mainstreamed HIV services within other health services.

## TUPEE612

Relationship between mental health and unmet need for contraception and method type among women living with HIV in Kenya

A.K. Karume<sup>1</sup>, J. Kinuthia<sup>1</sup>, N. Ngumbao<sup>1</sup>, C. Atieno<sup>1</sup>,

L. Osborn<sup>1</sup>, B. Wandika<sup>1</sup>, E. Nzove<sup>1</sup>, A. Kamau<sup>1</sup>, A. Seth<sup>2</sup>,

J. Dettinger<sup>2</sup>, J. Udren<sup>2</sup>, J. Moraa<sup>1</sup>, B. Richardson<sup>2</sup>,

K. Beima-Sofie<sup>2</sup>, J. Unger<sup>2</sup>, A. Bhatt<sup>2</sup>, A. Drake<sup>2</sup>

<sup>1</sup>Kenyatta National Hospital, Research and Programs, Nairobi, Kenya, <sup>2</sup>University of Washington, Seattle, United States

**Background:** Contraception is foundational to prevent vertical HIV transmission for women living with HIV (WLWH), but use may be impacted by depression and anxiety. Both depression and anxiety are disproportionately higher among WLHIV than women without HIV.

**Methods:** We conducted a cross-sectional survey among 3300 Kenyan WLWH receiving routine HIV care and participating in Mobile WACH Empower, a cluster randomized trial evaluating a reproductive health counselling intervention at 10 HIV clinics.

Study staff administered surveys to 964 participants at time of analysis, evaluating self-reported depression (PHQ-2, PHQ-9), anxiety (GAD-7), stigma and social

support. Participants used a tablet to self-administer a survey on contraceptive use. Data for this analysis was collected at baseline. We utilized univariable and multivariable generalized linear models. Unmet need for contraception was defined as percentage of women who are sexually active and do not desire a pregnancy in the next two years, and are not using any modern method of contraception.

**Results:** Among 964 women eligible and enrolled by the time of this analysis, 10% screened positive (PHQ-9) for at least mild depression only, 14% for at least mild anxiety only (GAD-7), 17% for either depression or anxiety, and 7% screened positive for both.

Overall, 78% of women used a modern method of contraception and 10% had an unmet need for contraception. Prevalence of unmet need was 18% among women who screened positive for depression and 9% among women who did not.

Women with at least mild depression were twice as likely to have unmet need for contraception (prevalence ratio [PR] 1.96 [95% Confidence Interval [CI] 0.95-3.52]; adjusted PR for age, marital status, gravidity, time since HIV diagnosis and disclosure of HIV status 2.32 [95% CI 1.47-3.67]) compared to women without depression. The most commonly used methods of contraception were implants (37%) and injectables (33%). Over one-third (34%) of contraceptive users were using dual methods.

**Conclusions:** Screening WLHIV for depression or anxiety may help identify women who have unique challenges with contraceptive uptake and use, or have particular barriers to using LARC. Future studies should examine strategies for identification and linkage to care for WLHIV with depression or anxiety.

## TUPEE613

Lessons from implementing an evidence-informed, sport-based, community adolescent mental health intervention (MindSKILLZ for Self-Care), integrated for the well-being of adolescents affected by/ living with HIV, in Mombasa, Kenya

E.A. Okoth<sup>1</sup>, R. Kimathi<sup>2</sup>, D. Lee<sup>3</sup>, I. Cohen<sup>4</sup>, A. Kijala<sup>5</sup>, A. Chazara<sup>6</sup>

<sup>1</sup>Grassroot Soccer, Programs, Nairobi, Kenya, <sup>2</sup>LVCT Health, Programs, Nairobi, Kenya, <sup>3</sup>Grassroot Soccer, Research, Cape Town, South Africa, <sup>4</sup>Grassroot Soccer, Programs, Cape Town, South Africa, <sup>5</sup>AMURT AFRICA, Programs, Mombasa, Kenya, <sup>6</sup>LVCT Health, Programs, Mombasa, Kenya

**Background:** Orphans and vulnerable children (OVC) interventions within HIV programs aim to improve the health and social outcomes of children living with and affected by HIV. In 2022, 13.9M children ages 0-17 had lost parents due to AIDS globally, and 68,000 children ages

0-14 were living with HIV in Kenya. OVC are at high risk of poor mental health. Mental health affects other health aspects e.g. people with mental health challenges are 4-10x more at risk of acquiring HIV, and depression is 2-3x more common in people living with HIV. 50% of mental illnesses onset by age 14. The prevalence of depression is 21% among in-school, and 36% among out-of-school adolescents in Nairobi and Coast region, Kenya according to a recent study. Grassroot Soccer (GRS) and LVCT Health integrated mental health in an OVC program to address their mental well-being.

**Description:** GRS and LVCT partnered with AMURT to integrate mental health in a program targeting 1,800 OVC ages 10-14. The GRS 'MindSKILLZ' program utilizes a positive youth development approach focusing on strengths and life skills that promote good mental health. It's delivered by 'Coaches' (near-peer mentors) in a fun, safe, supportive culture during the psychosocial support forums. The MindSKILLZ evidence-based curriculum covers: mental-health basics, coping, emotional regulation, pressure and choices, substance-abuse effects, gender, violence prevention, self-care, goal-setting, and care-seeking. Coaches provide mental health first-aid and facilitate linkages for specialized services as needed. This is part of a bigger pilot reaching +4,050 adolescents 10-14 years in Mombasa and Nairobi.

**Lessons learned:** The OVC participants scored 44% and 65% pre-intervention on mental health literacy and emotional intelligence, with 87% and 96% in post respectively. In post-intervention interviews, participants self-reported reduced stigma, improved school performance, and managing stress and emotions.

Coaches reported being more self-aware, resilient, and improved care-seeking. Collaborations/partnerships are effective ways to address cross-cutting health outcomes.

**Conclusions/Next steps:** Integrating mental health in interventions for persons living with/affected by HIV contributes to improved mental health awareness, emotional well-being, care-seeking, stigma reduction, and improved school outcomes, and therefore should be scaled up.

The program is conducting further evaluation including the intervention's impact on depression, and will share results.

## TUPEE614

### Prevalence of human papillomavirus and associated factors among women with HIV at an urban hospital in central Uganda

D.C. Nabukeera<sup>1</sup>, H. Zamarano<sup>1</sup>, A. Simwogerere<sup>1</sup>, R. Kaganzi<sup>2</sup>, A.M. Mubiru<sup>3</sup>, E.N. Lugolobi<sup>3</sup>, A.G. Fitzmaurice<sup>3</sup>

<sup>1</sup>Uganda Protestant Medical Bureau, Kampala, Uganda,

<sup>2</sup>Mengo Hospital, Kampala, Uganda, <sup>3</sup>US Centers for Disease Control and Prevention, Global Health Center, Division of Global HIV and TB, Kampala, Uganda

**Background:** Infection with high-risk human papillomavirus (hr-HPV) is a major risk factor for developing cervical cancer, the most common malignancy among women in Uganda with mortality rate of 19.9/100,000. The HPV test is recommended for screening, but data on prevalence of hr-HPV and its correlates for routinely-screened women living with HIV (WLHIV) in sub-Saharan Africa are limited. We aimed to determine prevalence, genotype distribution, and factors associated with hr-HPV among WLHIV receiving routine cervical cancer screening at an urban hospital in central Uganda.

**Methods:** At the antiretroviral therapy (ART) clinic, WLHIV are routinely screened for cervical cancer using mainly visual inspection with acetic acid (VIA) or HPV test. Data on behavioral and clinical characteristics, and screening test outcomes were entered into electronic medical records. We reviewed HPV screening program data of 458 WLHIV aged 25-49 receiving ART from Mengo Hospital during August 2022-May 2023.

Genotype testing for hr-HPV 16; 18 and 45 pooled (hr-HPV 18\_45); and other hr-HPV (aggregate for three groups: 31, 33, 35, 52, 58; 51, 59; and 39, 56, 66, 68) was performed using GeneXpert HPV DNA. Missing demographics were collected from clients via phone interview. We analyzed data using descriptive statistics and logistic regression for associated factors.

**Results:** Prevalence of hr-HPV was 27.5% (126/458; 95% CI 23.6-31.8). The predominant genotype was other hr-HPV only (74.6%; 94/126), followed by hr-HPV 16 only (8.7%; 11/126), both hr-HPV 16 and other hr-HPV (6.3%; 8/126).

As a woman's age of sexual debut increased, odds of hr-HPV decreased (adjusted odds ratio, aOR=0.91; 95% CI 0.83-1.00; p=0.044). Women aged over 45 years had lower odds of hr-HPV (aOR=0.53; 95% CI 0.31-0.90; p=0.020).

Women with presence of at least one symptom of sexually-transmitted Infections (STIs) were more likely to have hr-HPV (aOR=2.35; 95% CI 1.03-5.32; p=0.041).

**Conclusions:** Prevalence of hr-HPV among WLHIV was high compared to that reported for HIV negative women, suggesting that hr-HPV screening may be helpful as part of routine care for WLHIV, especially for women below the age of 45 years, women with younger age at sexual debut, and those with STI symptoms during clinic visits.

## TUPEE615

### The relationship between household economic shocks, mental health, and HIV among adolescent girls and young women in rural South Africa

N.L. Bhushan<sup>1</sup>, G.J. Madson<sup>1</sup>, N.K. Kelly<sup>2</sup>, K. Kahn<sup>3</sup>,

F.X. Gomez-Olive<sup>3</sup>, A.E. Aiello<sup>4</sup>, D. Wagner<sup>1</sup>, M.C. Stoner<sup>1</sup>

<sup>1</sup>RTI International, Research Triangle Park, United States,

<sup>2</sup>University of North Carolina at Chapel Hill, Chapel Hill, United States,

<sup>3</sup>University of the Witwatersrand,

Johannesburg, South Africa, <sup>4</sup>Columbia University, New York, United States

**Background:** Common mental health disorders (CMDs) and human immunodeficiency virus (HIV) are two of the largest contributors to the global burden of disease among adolescent girls and young women (AGYW). In South Africa, the high proportion of AGYW experiencing CMDs is suggested to be reflective of adversity in early life, particularly through household economic shocks. Yet, longitudinal evidence for the relationship between household economic shocks, CMDs, and HIV amongst AGYW is limited.

**Methods:** We used data from the HIV Prevention Trials Network (HPTN) 068 study in rural South Africa (2012-2019). AGYW, aged 14-20 at baseline, were followed annually for up to 6 years. Exposures included experience of any shock, type of shock (illness/death, agricultural, wealth), and number of shocks (0, 1, ≥2).

We used GEE log-binomial regression models to calculate risk ratios for the association between exposures and depressive symptoms (Center for Epidemiological Studies Depression-10 (CESD-10) > 16) and ordinal logistic regression models to calculate odds ratios for the association between exposures and stress-related biomarkers (C-reactive protein (CRP), cytomegalovirus (CMV), herpes simplex virus type-1 (HSV-1)), and HIV.

**Results:** Among 1892 AGYW, the baseline median age was 15 (IQR 14-17) and 27% had experienced any shock (illness/death: 16%, agricultural: 8%, wealth: 11%). At endline, 9% of the sample reported depressive symptoms, 25% had increased CRP levels, 27% were CMV positive, 22% were HSV-1 positive, and 14% were HIV positive.

Unadjusted analyses suggested a relationship between experiencing any shock (RR: 1.10, 95% CI: 1.00, 1.22), or a greater number of shocks (RR: 1.05, 95% CI: 1.00, 1.11), and depressive symptoms. In adjusted analyses, there was a positive relationship between experiencing any shock (OR: 1.21, 95% CI: 1.04, 1.34), a greater number of shocks (OR: 1.19, 95% CI: 1.03, 1.38), and wealth specific shocks (OR: 1.20, 95% CI: 1.03, 1.29), with increased CRP. We found no relationship between shocks and HIV acquisition.

**Conclusions:** In South Africa, AGYW who are experience economic adversity in early adolescence are potentially at an increased risk for depressive symptoms and elevated stress biomarker levels during the transition to adulthood, which may lead to other adverse health outcomes.

The role of Community Health Workers on HIV and tuberculosis outcomes: a longitudinal analysis for six low- and middle-income countries (LMICs)

G. Morais<sup>1,2</sup>, L. Magno<sup>3</sup>, I. Dourado<sup>2</sup>, D. Rasella<sup>4</sup>

<sup>1</sup>Federal University of Latin American Integration, Latin American Institute of Economics, Society and Politics, Foz do Iguaçu, Brazil, <sup>2</sup>Federal University of Bahia/Institute of Collective Health, Health Science, Salvador, Brazil, <sup>3</sup>University of the State of Bahia, Life Science Department, Salvador, Brazil, <sup>4</sup>Universitat de Barcelona, ISGlobal, Hospital Clínic, Barcelona, Spain

**Background:** As part of Primary Health Care (PHC) strategies, the Community Health Workers (CHW) play an important role on the practices of care, surveillance, education, and health communication.

We aimed to evaluate the effect of the CHW on the HIV and Tuberculosis (TB) incidence and mortality over the last two decades.

**Methods:** We developed a conceptual framework linking CHW to HIV and TB incidence and mortality, accounted for well-described risk factors pathways, and populated it with data from Global Burden of Disease (GBD) and World Bank data.

We used multivariable regression analyses for panel data with fixed-effects Poisson models to estimate the effect of the CHW on the selected health outcomes over 2000-2019 period for six Low- and Middle-Income Countries (LMICs) with adequate data on CHW. We disaggregated the analysis for subpopulations of women and men of all ages.

**Results:** The increase of 1 CHW (per 1000 population) associated with reductions on the HIV incidence rate by 31.56% [Incidence Rate Ratio (IRR): 0.6844; 95% confidence interval (CI): 0.6774 - 0.6916] and 10.56% (IRR: 0.8944; CI: 0.8840-0.9049) for women and men, respectively, followed by reductions of 29.82% (IRR: 0.7018; CI: 0.6928-0.7109) and 35.3% (IRR: 0.6470; CI: 0.6379-0.6562) of HIV-related mortality rate, respectively.

Moreover, the increased rate of CHW associated with reductions of the TB incidence rate by 13.49% (IRR: 0.8651; CI: 0.8551-0.8752) and by 21.19% (IRR: 0.7881; CI: 0.7793-0.7969) for women and men, respectively, while associated with reductions of 33.87% (IRR: 0.6613; CI: 0.6404-0.6828) and 43.15% (IRR: 0.5685; CI: 0.5554-0.5820) on the TB-related mortality rate for women and men, respectively.

**Conclusions:** Our findings suggest that CHW should be part of any strategy of health policies fighting HIV, TB, among other communicable diseases. We highlight that CHW may qualify the access to health services, treat the inequalities in health, and improve the performance and efficiency of the healthcare system.

Thus, CHW should be considered a tool in the achievement of Sustainable Development Goals, which advocates the end of AIDS and Tuberculosis by 2030.

## Innovations in data collection, monitoring and evaluation

### TUPEE617

Charting the path: a proposed theory of action for enhancing early care for HIV-exposed infants in Malawi

C. Chapuma<sup>1</sup>, P. Bondwe<sup>2</sup>, T. Chiwindo<sup>3</sup>, S. Gondwe<sup>4</sup>, M. Matoga<sup>3</sup>, T. Maphosa<sup>1</sup>

<sup>1</sup>Elizabeth Glaser Paediatric Aids Foundation, Research Department, Lilongwe, Malawi, <sup>2</sup>Elizabeth Glaser Paediatric Aids Foundation, Health Information Systems Department, Lilongwe, Malawi, <sup>3</sup>University North Carolina, Research Department, Lilongwe, Malawi, <sup>4</sup>Malawi Ministry of Health, Data Department, Mzimba, Malawi

**Background:** Initiating and retaining HIV exposed infants (HEI) on antiretroviral therapy (ART) at the critical therapeutic point before 12 weeks of age remains a pressing public health concern in Malawi and other nations in Sub-Saharan Africa. The challenges in order of priority are long turnaround times (TAT) for DNA-PCR results, caregiver perspectives, and healthcare worker barriers.

Consequently, the age group of 0-4 years exhibits the highest mortality rate (5.6%) and dropout rate (54.8%) within the continuum of care. This paper proposes a theory of action, integrating multidimensional methods to reduce the TAT between testing and ART initiation.

**Description:** We conducted two quality improvement (QI) projects for two systems to address delays.

Testing: Guided by the Nolan Model of improvement, we used a quasi-experimental pre- and post-intervention assessment to measure the change in TAT for DNA-PCR tests at Mulanje District Hospital (July 2022 and March 2023). We ran three Plan-Do-Study-Analyse cycles of *Tagging of Care Mastercards to indicate that the results are back*.

Laboratory: Between November 2022 and June 2023 in Lilongwe, we piloted the integration of the individual workflows informing the Malawi National Laboratory Information Management System (NLIMS) workflows. We plotted the results of the two projects on separate run charts and assessed for trends, "too few" or "too many" runs and astronomical points. We then integrated the findings of these two projects.

**Lessons learned:** The integrated NLIMS featured offline capabilities, barcode standardisation and efficient pull orders from all "previously independent" workflows. Electronic result transmission to Electronic Medical Records improved the efficiency of transmitting test statuses online.

The difference in the average TAT (days) before and after the integration was 65 days (77-12 days), with "too many" runs on the run chart. Whilst the Tagging of the Care Mastercards was a change idea with the highest solution impact and lowest implementation effort, the

difference before and after the intervention was 11% (69% – 80%) within 12 weeks of age. In addition, “no runs” were observed.

**Conclusions/Next steps:** The integration of the NLIMS significantly reduced TAT and demonstrated a non-random variation and overall improvement compared to the tagging system alone. Future studies should explore healthcare worker and caregiver barriers.

Sothoane<sup>11</sup>, M. Lehloma<sup>12</sup>, K. Kripke<sup>1</sup>

<sup>1</sup>Avenir Health, Takoma Park, United States, <sup>2</sup>Avenir Health, Seattle, United States, <sup>3</sup>FHI 360, Kampala, Uganda, <sup>4</sup>Uganda Ministry of Health, AIDS Control Program, Kampala, Uganda, <sup>5</sup>Uganda Ministry of Health, Strategic Information Department, Kampala, Uganda, <sup>6</sup>LVCT Health, Nairobi, Kenya, <sup>7</sup>Zimbabwe Ministry of Health and Child Care, Harare, Zimbabwe, <sup>8</sup>PZAT, Harare, Zimbabwe, <sup>9</sup>Wits RHI, Johannesburg, South Africa, <sup>10</sup>South Africa National Department of Health, Pretoria, South Africa, <sup>11</sup>Jhpiego, Maseru, Lesotho, <sup>12</sup>Lesotho Ministry of Health, Maseru, Lesotho

**Background:** The PEPFAR/USAID-funded MOSAIC Consortium proposed *two new indicators* to simplify data collection, improve program planning, measure rollout, and estimate the impact of pre-exposure prophylaxis (PrEP) programs. We attempted to extract the indicators from PrEP records in five countries to assess the feasibility of collecting them from existing data sources and demonstrate their utility.

**Description:** Existing facility-level PrEP data were extracted from 13 sites across Kenya, Lesotho, South Africa, Uganda, and Zimbabwe and databases in Lesotho and Uganda. Data collectors at sites were instructed to collect the proposed indicators PrEP Dispensed (product volume) and PrEP Visits and PEPFAR indicators PrEP\_NEW and PrEP\_CT with available sex, age, and population disaggregations. Data covered one year of oral PrEP service provision from 2021 to 2022.

**Lessons learned:** The national PrEP data collection systems in the five countries are largely fragmented and burdensome, making collection of the proposed indicators less straightforward than expected. PrEP Dispensed and PrEP\_NEW were available through facility records in all five countries. As expected, PrEP Dispensed was generally not associated with client characteristics. PrEP Vis-

its were available by visit type, population, and age/sex, except in South Africa, where they could not be extracted without accessing individual client files. In Uganda, both indicators were available in the national PrEP Tracker database, enabling estimation of national PrEP coverage and impact by population using impact factors and population size estimates from Uganda's PrEP-it target-setting exercise (Table).

Uganda Key or Priority Population	Days of Oral PrEP Dispensed April 2021 – March 2022 in Uganda	Person-Years of PrEP Dispensed (PYP)	Estimated Coverage among Potential PrEP Users	Estimated HIV Infections Averted
Adolescent girls and young women	1,738,346	4,763	2%	12
Female sex workers	9,315,091	25,521	21%	399
Men who have sex with men	913,006	2,501	6%	7
People who inject drugs	606,562	1,662	18%	6
Serodifferent couples	1,697,285	4,650	14%	367
Transgender people	88,465	242	4%	1
Other (incl. fisher folk, migrant workers, clients of sex workers, etc.)	6,959,567	19,067		55
Total	21,318,322	58,406		848

Table.

**Conclusions/Next steps:** By demonstrating how the proposed indicators provide valuable information on PrEP programs, this activity will support improvements to national and global PrEP strategic information.

Following a presentation of preliminary results, the Uganda Ministry of Health decided to add PrEP Dispensed and PrEP Visits as national indicators. Wider adoption of these indicators could reduce the reporting burden at facilities, improve program planning with meaningful data, and enable estimation of the coverage and impact of PrEP programs.

## TUPEE619

Lessons learned from the implementation of suggestion boxes in HIV clinical settings in Haiti to drive person-centered care

L. Murphy<sup>1</sup>, R. Emilien<sup>1</sup>, S. Jean<sup>2</sup>, S. Leguerre<sup>2</sup>, S. Galbaud<sup>3</sup>

<sup>1</sup>Management Sciences for Health, Arlington, United States, <sup>2</sup>Fondation SEROVie, Port-au-Prince, Haiti, <sup>3</sup>United States Agency for International Development Haiti, Port-au-Prince, United States

**Background:** Soliciting feedback on the client experience in healthcare settings is essential to monitor quality and ensure person-centered care. However, in Haiti, methods for securing client feedback in HIV healthcare settings are limited and not standardized.

**Description:** To help HIV clinical sites solicit feedback from clients, the USAID-supported RISE-Haiti SPOTLIGHT program supported 115 sites to implement suggestion boxes. The project developed a protocol providing guidelines on the collection, analysis, management, and follow-up of feedback given by clients.

A form was developed in Creole, utilizing emoticons for those who are illiterate, and was piloted in one clinic before dissemination. RISE-Haiti SPOTLIGHT disseminated the protocol, feedback forms, feedback tally sheet, instructional posters, and suggestion boxes.

An orientation was held for staff to familiarize them with the forms. The protocol calls for three staff members to review the feedback monthly. Project mentors assisted with the analysis and reviewed feedback to identify challenges and successes during site visits.

**Lessons learned:** Though implementation of the suggestion boxes varied by site based on staff availability to review feedback according to the protocol, many improvements were observed. Several sites noted complaints around long wait times, lack of professional courtesy in reception of clients, and environmental discomforts. One site addressed long wait times by training counselors to receive clients in the waiting rooms and moving staff meetings out of clinic hours.

Another clinic addressed long wait times by establishing a ticket service to see clients in order of arrival and additionally addressed a lack of professional courtesy by refresher training and performance improvement plans for staff.

After one month, the number of feedback forms expressing high client satisfaction increased in this facility. Staff in the clinics expressed satisfaction with the boxes.

**Conclusions/Next steps:** Suggestion boxes are a low-cost way to elicit client feedback, giving health facilities the opportunity to make changes with existing resources to deliver high impact on the client experience. As they are easily built and installed, this often-overlooked method of client engagement is an accessible way for clinics to ensure they are delivering person-centered care.

## TUPEE620

Developing a mimplied survey method for HIV, viral hepatitis and STI surveillance among key populations: the BBS-lite among sex workers and people who inject drugs in Uganda

G. Pande<sup>1</sup>, P. Mudiope<sup>1</sup>, P. Kyambadde<sup>1</sup>, D. Byamukama<sup>2</sup>, K. Akhmedov<sup>3</sup>, J. Mubangizi<sup>3</sup>, K. Sabin<sup>4</sup>, B. Mathers<sup>5</sup>, A. Verster<sup>5</sup>, J. Musinguzi<sup>1</sup>

<sup>1</sup>Ministry of Health, Uganda, AIDS Control Program, Kampala, Uganda, <sup>2</sup>Uganda AIDS Commission, Kampala, Uganda, <sup>3</sup>Prevention, Kampala, Uganda, <sup>4</sup>UNAIDS, Programs, Kampala, Uganda, <sup>5</sup>UNAIDS, Strategic Information, Geneva, Switzerland, <sup>6</sup>WHO, Strategic Information, Geneva, Switzerland

**Background:** In countries with high HIV burden, Bio-Behavioural Surveys (BBS) are recommended to be conducted every 3 years to provide critical data to complement routine programmatic data for HIV prevention programming. However, these are technically demanding, resource intensive, and often result in inadequate, and late data availability and use.

This study set out to validate the implementation of a simplified bio-behavioural survey method, the BBS-lite, developed by WHO and UNAIDS.

**Methods:** During February-April 2022, the BBS-lite survey was conducted in three districts (Mbale, Busia, and Toro) in Eastern Uganda. Recruitment and data collection was undertaken by 10 health facilities that provide free-of-cost HIV services.

Convenience samples of people who inject drugs (PWID) and female sex workers (FSW) accessing services at facilities and during community outreach were screened for eligibility and interviewed.

Healthcare staff and peer workers administered a survey questionnaire and collected sero-samples for HIV testing within routine testing services.

**Results:** Overall, 859(96%) of FSW and 417(94%) of PWID clients screened, consented to participate in the survey. The majority (74% FSW, 71% PWID) were recruited through outreach in the community.

Overall, 35% of FSW and 28% of PWID recruited were new to these HIV programs and had not previously accessed services. We noted that the data collection exercise did not add significantly to the programs' workload because this was done alongside routine activities, was well planned, and through screening they were able to target services appropriately.

The additional funding was used for community mobilization and facilitating services providers to conduct more outreach to improve service reach and delivery to the target population.

Using service providers known to clients as data collectors ensured participant trust and improved recruitment. The coupons helped in giving information about the services available and reached many new clients.

**Conclusions:** The BBS-lite survey was successfully employed by local health managers to understand the profiles and level of services uptake among PWID and FSW in close to real time. The BBS-lite provided a low-cost, and less resource intensive opportunity for programmers to understand the profiles and key gaps in service uptake by key population.

**Strengthening recording and reporting of continuity of treatment for people living with HIV on antiretroviral therapy through physical review of paper client records: Manicaland and Midlands provinces of Zimbabwe, 2023**

K. Nyathi<sup>1</sup>, T. Nyamundaya<sup>1</sup>, T.P. Sibanda<sup>1</sup>, T. Tafuma<sup>1</sup>, E. Tachiwenyika<sup>1</sup>, T.M. Samushonga<sup>1</sup>, M. Ndlovu<sup>1</sup>, A. Muchedzi<sup>1</sup>, M. Muzondo<sup>1</sup>, G. Choga<sup>1</sup>, P. Maringe<sup>1</sup>, O. Sibanda<sup>1</sup>, J.P. Mafara<sup>1</sup>, J. Muguse<sup>1</sup>, B. Chindove<sup>1</sup>, N. Ganje<sup>1</sup>, A. Maravanyika<sup>1</sup>, N. Sithole<sup>2</sup>, T. Matare<sup>2</sup>, C. Mupanguri<sup>2</sup>, M. Mukuzunga<sup>2</sup>, M. Muchekeza<sup>2</sup>, M. Mhangara<sup>3</sup>, S. Mukungunugwa<sup>3</sup>

<sup>1</sup>Zimbabwe Health Interventions, Harare, Zimbabwe,

<sup>2</sup>Ministry of Health and Child Care, Harare, Zimbabwe,

<sup>3</sup>USAID, Harare, Zimbabwe

**Background:** Zimbabwe Health Interventions (ZHI) is supporting the government of Zimbabwe to achieve and sustain HIV epidemic control. ZHI used the cohort adjustment method when reporting clients on antiretroviral therapy (ART) i.e., adding new initiations, transfers-in and return-to-care; and subtracting deaths, transfers out, treatment interruptions from number reported in previous month. This method does not verify the previously reported base figure and is therefore prone to errors. Routine data quality assessments (RDQA) conducted in June 2023 in selected sites revealed 16% overreporting of clients on ART in Midlands province, and this prompted the client comprehensive records review.

**Description:** We conducted a physical review of facility-held client records to verify numbers of clients on ART across all ZHI-supported facilities in Manicaland and Midlands provinces. Clients who visited the facility or sent a representative on or within 28 days of appointment day were considered active. Those who missed appointments were followed up for 90 days before declaring outcomes. Standard Operating Procedure (SOP) was used to guide data collection. All paper records of ART clients were reviewed with results recorded on tally sheets. Data were captured, merged and analyzed using Ms Excel. All inactive/lost clients were discounted from treatment continuity number. Assessment was covered by the Medical Research Council of Zimbabwe protocol (MRCZ/E/159).

**Lessons learned:** There was an overall 9.3% (20,569/221,050) reduction in the number of ART clients, 3.9% (4,301/108,938) in Manicaland and 14.5% (16,268/112,112) in Midlands.

About 52% (10,700/20,569) of losses occurred before project inception in October 2021. About 65% of clients lost were not in differentiated service delivery (DSD) models. Contribution of the 0–25 year age groups to ART clients decreased from 13.5% to 10.3%, and for 50 years and above increased from 23.0% to 31.7%. The age group with the highest number of ART clients remained the 40–44 years old (15.8%). The Ministry of Health and Child Care adopted this method.

**Conclusions/Next steps:** Physical review of facility-level client records is a useful Data Quality Assurance (DQA) strategy complementing the cohort adjustment method. We recommend physical review of client's records annually at high-volume sites, and bi-annually at lower-volume sites to accurately report clients on ART.

## TUPEE622

**Beyond the algorithm: decoding the influence of recruitment sources on participant engagement in online intervention studies**

W. Lin<sup>1</sup>, J. Golinkoff<sup>1</sup>, S.K. Choi<sup>1</sup>, L. Hightow-Weidman<sup>2</sup>, S. Hirshfield<sup>3</sup>, M.I. Mulawa<sup>4</sup>, K. Muessig<sup>2</sup>, J. Bauermeister<sup>1</sup>

<sup>1</sup>University of Pennsylvania, Philadelphia, United States,

<sup>2</sup>Florida State University, Tallahassee, United States, <sup>3</sup>SUNY

Downstate Health Sciences University, Brooklyn, United States, <sup>4</sup>Duke University, Durham, United States

**Background:** Compared to studies with in-person components, online studies offer significant advantages: access to geographically hard-to-reach populations, cost-efficiency, and convenience. They are especially useful for engaging with sexual, gender, and racial minority communities in HIV research. However, online studies often face challenges with participant retention and engagement.

Our analysis investigates associations between recruitment sources and study engagement rates to uncover insights for optimizing recruitment and engagement strategies.

**Description:** Between July 2020 and September 2022, we enrolled 750 assigned male at birth (AMAB) participants across the United States for a 12-month randomized controlled online intervention trial to increase HIV testing and viral suppression among 15–29 year old sexual, gender, and racial minority individuals.

Participants were recruited through four channels: ads on dating apps (Grindr, Jack'd, SCRUFF), social media ads (Facebook, Instagram, Twitter), listservs from previous studies, and other methods (e.g., printed flyers, referrals, and in-person recruitment). We tracked study engagement through the completion of follow-up surveys at 3, 6, 9, and 12 months.

**Lessons learned:** Median age was 25 (SD=3.3), with 30.7% living with HIV and 11.2% identifying as a gender minority. 42.4% identified as Hispanic/Latino.

We used multivariate logistic regression to examine the relationship between recruitment sources and high study engagement (completing  $\geq 3$  follow-up surveys). Compared to participants recruited from dating sites, those recruited through social media ads (AOR=2.757; 95% CI=1.381–5.503;  $p=0.004$ ) and study listservs (AOR=2.232; 95% CI=1.081–4.610;  $p=0.028$ ) had greater odds of high study engagement.

Notably, participants living with HIV (AOR=0.619; 95% CI=0.384–0.999;  $p=0.050$ ), aged 20–24 (AOR=0.537; 95% CI=0.334–0.863;  $p=0.010$ ), and identifying as a gender minority (AOR=0.313; 95% CI=0.175–0.559;  $p<0.001$ ) were less likely to demonstrate high engagement irrespective of recruitment source. Hispanic/Latino identity did not significantly impact engagement rates.

**Conclusions/Next steps:** Social media ads and study listservs are effective sources for recruiting highly engaged participants from this population, indicating their value in a comprehensive recruitment strategy.

Observed differences in engagement rates by demographic characteristics (i.e., age, HIV status, and gender identity) suggest the potential need for tailored engagement strategies and further exploration of other factors influencing online intervention retention and engagement.

## TUPEE623

[A machine learning approach to achieve anonymised HIV cascade of care record linkage across health services in Myanmar: the ACCESS-Myanmar project 2018–2023](#)

T. Nguyen<sup>1</sup>, Y.M. Latt<sup>1</sup>, L. Nguyen<sup>1</sup>, D. O’Keefe<sup>1,2</sup>, J. Asselin<sup>1</sup>, N. Watson<sup>1</sup>, V. Polkinghorne<sup>1</sup>, A. Thoma<sup>1</sup>, T.M. Win<sup>1</sup>, H. Htay<sup>1</sup>, S.M. Aung<sup>1</sup>, L. Bell<sup>1,2</sup>, H. Hamidjaja<sup>3</sup>, D. Boyle<sup>3</sup>, X. Grosset<sup>4</sup>, M. Hellard<sup>1,2,5,6</sup>, M. Stoové<sup>1,2</sup>

<sup>1</sup>Burnet Institute, Public Health, Melbourne, Australia,

<sup>2</sup>Monash University, School of Population Health and Preventive Medicine, Melbourne, Australia, <sup>3</sup>University of Melbourne, GRHANITE™ Health Informatics Unit,

Melbourne, Australia, <sup>4</sup>Première Urgence Internationale, Yangon, Myanmar, <sup>5</sup>The Alfred Hospital, Department of Infectious Diseases, Melbourne, Australia, <sup>6</sup>University of Melbourne, Doherty Institute and School of Population and Global Health, Melbourne, Australia

**Background:** Myanmar’s HIV surveillance faces multiple challenges in monitoring people progress across the cascade of care. We describe the development and validation of a prototype record linkage process using a machine learning-based approach to anonymise and link client records in Myanmar.

**Methods:** ACCESS-Myanmar aims to implement and evaluate a pilot automated system to link individual’s HIV testing (at NGO - Première Urgence Internationale (PUI) - testing services) and treatment (at National AIDS

Program (NAP) treatment centres) data across a network of services in Southern Yangon using anonymous ‘hash’ codes constituted from client names and other identifying information. Variations in Myanmar naming conventions were systematically mapped to develop a standardised set of name alternatives and spellings.

Datasets annotated by human experts, derived from probabilistic and deterministic approaches, are considered as gold standards. An extensive training dataset was generated using a rule-based approach, identifying true/false linkages between NAP and PUI services (2018–2023).

These datasets facilitated machine learning for training and evaluating a random forest classifier to identify client linkages. The classifier was subsequently applied to identify linkages between PUI and NAP service episodes.

**Results:** The gold standard datasets included 223 links between PUI and NAP records, with 51% ( $n=120$ ) confirmed as true links by human experts. In the training dataset of 3018 links, 7.5% ( $n=227$ ) were identified as true links using rule-based methods. The random forest classifier, trained on the training dataset, achieved an accuracy of 0.95 (95% CI=0.91–0.97) on the gold standard datasets. Applying the classifier to 1068 PUI clients known to have HIV and could have been sent for treatment, we found 74% ( $n=787$ ) linkages to NAP treatment data.

Notably, 57% ( $n=450$ ) were not classified as referred to NAP. Our preliminary analysis utilised data from only a single NAP referral site, with more linkages likely with the pending inclusion of additional sites.

**Conclusions:** Our study demonstrates the high accuracy of a machine learning data linkage tool to anonymously link HIV diagnoses and treatment records between services, including uncovering unrecorded treatment referrals.

Our approach provides an automated, efficient, and sustainable tool for improving HIV cascade of care surveillance in low-resource settings.

## TUPEE624

### Enhancing same-day ART policy and implementation at a provincial level through a national contest: short-term and long-term results from the Thailand Test and Treat Contest

N. Thammajarak<sup>1</sup>, S. Thongsuksangcharoen<sup>1</sup>, S. Pengnonyang<sup>1</sup>, S. Suriwong<sup>1</sup>, W. Tasomboon<sup>1</sup>, P. Benjarattanaporn<sup>2</sup>, Y. Sirisinsuk<sup>3</sup>, C. Lertpiriyasuwat<sup>4</sup>, S. Noknoy<sup>4</sup>, S. Lumyai<sup>5</sup>, R. Triamvichanon<sup>1</sup>, N. Phanuphak<sup>1</sup>, P. Phanuphak<sup>1</sup>

<sup>1</sup>Institute of HIV Research and Innovation (IHRI), Bangkok, Thailand, <sup>2</sup>Joint United Nations Programme on HIV/AIDS (UNAIDS), Bangkok, Thailand, <sup>3</sup>National Health Security Office (NHSO), Bangkok, Thailand, <sup>4</sup>Division of AIDS and STIs, Department of Disease Control, Ministry of Public Health, Nonthaburi, Thailand, <sup>5</sup>National Institute of Health, Department of Medical Sciences, Ministry of Public Health, Nonthaburi, Thailand

**Background:** Thailand launched its same-day antiretroviral therapy (SDART) guidelines in 2021, with a series of training conducted by the Ministry of Public Health (MOPH). However, the translation of guidelines into practice varied substantially by province and by hospital. The Thailand Test and Treat Contest explored how competition and rewarding system could enhance SDART policy adoption and implementation at a provincial level.

**Methods:** Of 77 provinces in Thailand, 16 applied for the contest; 4 participating exclusively in Phase I (March-September 2022), 3 in Phase II (February-July 2023), and 9 engaging in both phases. HIV diagnosis and ART status were retrieved from the National AIDS Program database. Outcomes were categorized into short-term (single-phase participation) and long-term duration (participation in both phases). Data during the contest phase were compared with those 6 months prior. Statistical analyses evaluated differences of percentages of ART initiation within same-day, 1-7 days, and >7 days after HIV diagnosis.

**Results:** A Provincial Test and Treat Contest kick-off meeting was held across provinces where high-level officers from Provincial Health and Administrative Offices, hospitals, and civil society organizations were brought together to discuss provincial SDART implementation plan. Short-term analysis across 16 provinces found 4,837 individuals newly diagnosed with HIV and 4,615 started ART. Significant improvements in ART initiation rapidness were seen in the contest phase, compared to the pre-contest phase, with percentages of same-day, 1-7 days, and >7 days ART initiation being 14.9%, 25.2%, and 59.9% vs. 13.7%, 23.6%, and 62.7%,  $p=0.033$ . Long-term data from 9 provinces showed 6,730 new HIV diagnoses, with 6,511 ART

initiations. Percentages of same-day, 1-7 days, and >7 days ART initiation improved from 7.0%, 27.5%, and 65.5% pre-contest to 24.1%, 23.9%, and 52.0% during the contest ( $p<0.001$ ).

**Conclusions:** The Thailand Test and Treat Contest successfully boosted up provincial implementation of SDART policy. Actual improvement in ART initiation rapidness was demonstrated as results. The national competition and rewarding system may be useful in scaling up other evidence-based health interventions.

## TUPEE625

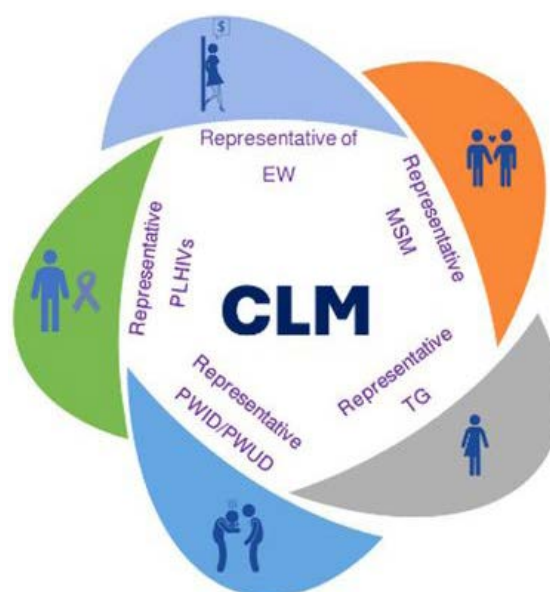

### Community-Led Monitoring (CLM) contributed improving HIV Response In the Cambodia

R. Khun<sup>1</sup>

<sup>1</sup>Forum of Network of PLHIV and MAPRs (FoNPAMs), n/a, Phnom Penh, Cambodia

#### Background:

Learned from the experiences and constrains on limited resources/capacity, tools, systematic, number of respondents from communities as face to face with recording on the paper remains challenging, CLM was initiated and implemented as the innovative on feedback gathering for the evidence based for advocacy which contributed improving HIV program.

**Description:** CLM is an online tool which led and implemented by the Forum of Networks of PLHIV and Most-At Risk Population at national and subnational level (FoNPAM/DFoNPAM) was established that serves as a community-friendly data collection that allows PLHIV/KP to meet and provide feedback systematically in seven priority provinces in Cambodia. Data is automatically analyzed into a dynamic dashboard (PowerBI) available for community to use to advocate for HIV and related service strengthening. CLM cover both HIV and related services.

Oral  
abstracts

### Community-led monitoring approaches and data on PrEP: evidence from South Africa, Haiti, and Zimbabwe

M. Nyathi<sup>1</sup>, S. Policar<sup>2</sup>, L. Chimhanda<sup>3</sup>, G.M. Alfred<sup>4</sup>, A. Yawa<sup>5</sup>, N. Rambau<sup>1</sup>, E.M. Steide<sup>6</sup>, T. Chakanyuka<sup>3</sup>, A. Sharp<sup>7</sup>, E. Lankiewicz<sup>8</sup>  
<sup>1</sup>Ritshidze Community-led Monitoring Programme, Johannesburg, South Africa, <sup>2</sup>Organisation de Développement et de Lutte contre la Pauvreté (ODELPA), Port-au-Prince, Haiti, <sup>3</sup>Zimbabwe PEPFAR CLM, Harare, Zimbabwe, <sup>4</sup>Action Citoyenne pour l'Egalité Sociale en Haïti (ACESH), Dessalines, Haiti, <sup>5</sup>Treatment Action Campaign, Johannesburg, South Africa, <sup>6</sup>Housing Works, Port-au-Prince, Haiti, <sup>7</sup>O'Neill Institute for National and Global Health Law, Washington DC, United States, <sup>8</sup>amfAR, The Foundation for AIDS Research, Washington DC, United States

**Background:** Community-led monitoring (CLM) is a tool for increasing accountability of HIV service delivery stakeholders to health service users. CLM differs from traditional monitoring in that the data and indicators are informed by local priorities and data collection tools are designed and owned by communities.

Little work has been done to compare and contrast CLM indicators from different contexts. Indicators from three countries related to the Pre-exposure prophylaxis (PrEP) continuum demonstrate the different content areas of interest to CLM projects.

**Description:** Community-led monitoring projects in South Africa, Zimbabwe, and Haiti implemented cycles of data collection, analysis, and advocacy in public health facilities and communities from October 1, 2022 – September 30, 2023.

Projects approached monitoring of Pre-exposure prophylaxis (PrEP) in diverse ways including targeting different kinds of survey respondents, measuring different priority areas related to PrEP, and measuring similar priority areas in different ways (Table 1).

**Lessons learned:** All three CLM projects focus on PrEP awareness and uptake as key priorities, with just one focusing on elements of care that may impact retention, like overall satisfaction with PrEP services. Most CLM data are not directly comparable given different question

phrasings and respondent types. Where data indicators are comparable, contextual challenges become more apparent, for example more PrEP stockouts were reported in Zimbabwe as compared to other countries (Figure 1, a-c).

Category	Example Indicators: South Africa	Example indicators: Zimbabwe	Example indicators: Haiti
Awareness <ul style="list-style-type: none"> <li>Promotion</li> <li>Engagement</li> <li>Education</li> </ul>	<p>"Have you heard of pre-exposure prophylaxis?"</p> <p>"Does the facility prioritize offering PrEP to any of the following populations?"</p> <p>"Have you ever been offered PrEP at a public health facility?"</p>	<p>"Do you know what PrEP is?"</p> <p>"Which of the following prevention options have you been offered at the facility?"</p> <p>"Which service users are offered PrEP?"</p>	<p>"Have you ever heard of a medication called PrEP?"</p> <p>"What service users are offered PrEP?"</p>
Uptake <ul style="list-style-type: none"> <li>Initial clinical assessment</li> <li>Counseling</li> <li>Prescribing PrEP</li> </ul>	<p>"Is PrEP offered at the facility?"</p> <p>"Does the facility prioritise offering PrEP to any of the following populations?"</p> <p>"Facility staff reports of medicine shortage(s)?"</p>	<p>"What are the major barriers to putting service recipients on PrEP in this facility?"</p> <p>"In the last three months, have there been stockouts or shortages of any of the following?"</p> <p>"What services does the [clinic] support?"</p> <p>"What prevention services are offered at the facility?"</p>	<p>"Is PrEP offered at this facility?"</p> <p>"Why is PrEP not offered in this facility?"</p> <p>"In the last 2 months have there been stock-outs or shortages of any of the following?"</p>
Adherence and Retention <ul style="list-style-type: none"> <li>Follow-up labs</li> <li>Patient assessment</li> <li>Prescription refills</li> <li>Counseling</li> </ul>	<p>"How satisfied were you with PrEP services at this mobile clinic? If 1 is VERY UNSATISFIED and 5 is VERY SATISFIED."</p>	N/A	N/A

**Conclusions/Next steps:** As CLM evolves as an approach to accountability and improving person-centered HIV service delivery, stakeholders have pushed for comparable CLM data across contexts. These efforts fail to recognize that ownership of CLM survey tools lies with communities

Oral  
abstracts

Poster  
exhibition

and that context specific indicator design is a strength of CLM. CLM projects contribute significant insights to gaps in PrEP services across the entirety of the continuum.

## TUPEE628

*The NIH OAR Data Hub: enhancing transparency and information dissemination of the NIH HIV research portfolio*

M. Herrera<sup>1</sup>, D. Murphy<sup>1</sup>, M. Bhakta<sup>1</sup>, L. Caler<sup>1</sup>, R. Cregg<sup>1</sup>

<sup>1</sup>National Institutes of Health, Office of AIDS Research, Rockville, United States

**Background:** The importance of data transparency in science, particularly in the HIV research field, is reflected by its role in enabling evidence-based decisions in medicine and fostering trust among all members of the HIV research community. Through partner engagement activities, the NIH Office of AIDS Research (OAR) received feedback on the need for a comprehensive tool to explore NIH-funded HIV research, highlighting the importance of data sharing with the public and the need to improve avenues of information dissemination and transparency. In response to community feedback, OAR developed the *NIH OAR Data Hub: Showcasing the NIH HIV Research Portfolio* a publicly available resource to enable greater transparency.

**Description:** This resource consists of data visualization dashboards that summarize specific areas of the NIH HIV research portfolio. It aims to enhance understanding of the funded NIH HIV research landscape and priorities, enable users to identify ongoing projects relevant to their specific interests, make informed decisions regarding future applications, and find funding and networking opportunities. We have published five dashboards to date, mapping the constellation of NIH HIV research priorities and objectives to funded research.

**Lessons learned:** Preliminary feedback from *Data Hub* users indicates that the dashboards are a valuable and informative resource. Its development and launch highlight the importance of reference materials including clear navigation instructions, video tutorials and definitions for proper interpretation of the data displayed. Furthermore, the project emphasizes the crucial role of community input in creating accessible resources for disseminating HIV information to the public and promoting scientific understanding.

**Conclusions/Next steps:** OAR's successful deployment of the NIH OAR Data Hub provides the public with a comprehensive view of funded HIV research at NIH. The resource has been well received and will enable policymakers, researchers, and clinicians to stay informed about areas requiring attention, providing an avenue to conceive new projects that will cover areas in need. Ongoing efforts include gathering user feedback and soliciting input for

new dashboards, ensuring the Data Hub remains a dynamic and responsive tool in the ongoing pursuit of advancing HIV research and dissemination of information to diverse audiences.

## TUPEE629

*Reassessing the first 95: data system audit reveals realities of HIV diagnoses in Jakarta, Indonesia*

S. Sulami<sup>1</sup>, R. Aji Pramono<sup>2</sup>, W. Jumalasari<sup>3</sup>, L. Ferradini<sup>3</sup>, C. Francis<sup>3</sup>, E. Rista Aditya<sup>3</sup>

<sup>1</sup>FHI 360, Strategic Information, Jakarta Selatan, Indonesia,

<sup>2</sup>Provincial Health Office, Jakarta, Jakarta Selatan,

Indonesia, <sup>3</sup>FHI 360, Jakarta Selatan, Indonesia

**Background:** Jakarta's HIV cascade indicated that 74.2% of an estimated 85,927 people living with HIV (PLHIV) had learned their HIV status by December 2022. However, the transition to antiretroviral therapy (ART) was markedly lower at 47.6%, with a subsequent 70.2% of individuals achieving viral suppression.

Suboptimal second 95 performance prompted Jakarta's Provincial Health Office (PHO) and the USAID-funded *Meeting Targets and Maintaining Epidemic Control* (EpiC) project to conduct a detailed examination of the apparent incongruity between diagnosed individuals and those actively engaged in treatment.

**Description:** With the introduction of Indonesia's new electronic individual medical records system, SIHA 2.1, the Jakarta PHO and EpiC were able to carry out a retrospective analysis of client attrition.

Of 33,424 PLHIV that were not on ART, 9,996 PLHIV were untraceable, 6,397 persons had transferred out, 8,092 individuals had died, 484 PLHIV were confirmed on treatment, five persons had stopped treatment, 2,937 persons had interruption in treatment (IIT) for more than five years and were presumed untraceable, and 5,423 PLHIV had IIT for less than five years and were in the process of being traced.

This updated data revealed a more accurate picture of Jakarta's HIV cascade: Just 49.6% of PLHIV knew their HIV status, with 72.3% of these persons on ART and 69.1% achieving viral suppression, as of December 2022.

**Lessons learned:** Data system enhancements afford opportunities to audit historical progress and cast a new light on HIV cascade achievements, highlighting the critical nature of data accuracy for strategic planning and intervention prioritization.

**Conclusions/Next steps:** A retrospective analysis of first and second 95 performance goals has revealed substantial gaps in the number of current estimated PLHIV who know their status and have demonstrated improvements in second 95 performance.

Gaps in the third 95 have been closed following an intensive viral load acceleration strategy that helped 84.6% of PLHIV on ART achieve viral suppression by September 2023.

This strategic recalibration across Jakarta's HIV cascade underscores the importance of data integrity in optimizing HIV program outcomes and guiding future resource allocation, intervention prioritization, and policy enhancements.

## TUPEE631

### Innovative supply chain data analytics models driving HIV service delivery in Uganda

S. Nakade<sup>1</sup>, H. Oundo<sup>1</sup>, D. Okidi<sup>1</sup>, D. Mawerere<sup>1</sup>,

L. Nampa<sup>1</sup>, J. Emiku<sup>1</sup>, P. Elungat<sup>1</sup>, M. Oteba<sup>1</sup>, M. Ajulong<sup>2</sup>, M. Seru<sup>2</sup>, E. Lugada<sup>1</sup>

<sup>1</sup>Management Sciences for Health, USAID/Strengthening Supply Chain Systems Activity, Kampala, Uganda, <sup>2</sup>Ministry of Health, Department of Pharmaceuticals and Natural Medicines, Kampala, Uganda

**Background:** In Uganda, the availability of HIV commodities is essential to achieving UNAIDS targets. Despite the significant funding for health supply chain and program interventions, a comprehensive and reliable system is lacking to track commodity availability, utilization, and oversight of HIV services. Only 0.07% (70/1005) of health facilities (HFs) utilized an electronic logistics information management system to consistently synchronize stock and consumption data into the national health data warehouse. Alternative methodologies to effectively monitor the performance of the health supply chain and the implementation of HIV programs are needed.

**Methods:** With technical assistance from the USAID/Strengthening Supply Chain (SSCS) Activity, the Ministry of Health (MoH) developed a supply chain data analytics model that triangulates HIV program targets with consumption of HIV tests and medications.

For this analysis, SSCS reviewed routinely reported data to evaluate adoption of multi-month dispensing (utilization of TLD 90-day pack) and utilization of HIV/Syphilis Duo test kits for the triple elimination initiative.

From October 2022 to September 2023, we measured performance against set percentage target ratios of 80:20 for clients on TLD MMD 90-day pack compared to 30-day pack and 40:60 for utilization of HIV/Syphilis Duo test kits compared to Determine™ HIV-1/2 test kits for HIV screening.

Using the model, we triangulated target attainment and commodity consumption reported by 2379 HFs across all 136 districts and provided technical support to health facilities to achieve targets.

**Results:** The model provided data on target attainment vs health facility consumption, warehouse distribution, commodity availability, adherence to treatment guidelines, quantification assumptions, and commodity utilization by purpose. By September 2023, adoption of MMD TLD-90 to TLD-30 was sub-optimal (67:33) for 1883 ART accredited public HFs and 494 private sector HFs (70:30).

Utilization of HIV Syphilis Duo in comparison to Determine was also sub-optimal (13:87) in 488 testing private sector HFs and for 1067 public HFs (28:72) in September 2023.

**Conclusions:** Routine and traditional data sources can be triangulated and optimized to track commodity availability, utilization, and oversight of HIV intervention implementation as the country adopts more advanced electronic logistics information management systems to drive health service delivery.

## TUPEE632

### Community led monitoring; improving community role in data management of HIV programming in Nigeria

C.C. Ifekandu<sup>1</sup>, O.T. Ojo<sup>1</sup>, T.U. Suleiman<sup>1</sup>, B.M. Alfa<sup>2</sup>

<sup>1</sup>Lamecon Empowerment Foundation, Programs, Lafia, Nigeria, <sup>2</sup>Diadem Consults, Monitoring and Evaluation, Lafia, Nigeria

**Background:** Two key enablers in PEPFAR 5\*3 strategies are anchored on community leadership and leading with data, thus; the need to strengthen the program integration capacity of community-led organizations (CSOs). Civil Society Organizations are paramount for maintaining the gains of the past four (4) decades of HIV intervention if we are to attain the UNAIDS objective by 2030. It is important to ensure CSOs understand the importance of quality data, and have expertise on it, to ensure quality deliverables, accurate data, and effective HIV programming. This study seeks to understand knowledge of data management by CSOs which is obtainable in HIV programming.

**Methods:** A random sampling of 40 CSOs across 10 states in the six (6) geo-political zones of Nigeria was used, drawn from AYPs, Key populations, faith-based organizations, Health Financing, etc. Questionnaires were administered to the team lead or a member of the senior management team. A simple measure of tendency was used for analysis.

**Results:** 17.5% of the organizations are female-led, 34% are KP, and 15% are into AYP programming. Only 37% have a structured M&E plan, 18% use the Electronic Medical Record System, and only 25% have an S.O.P. for data management. 15% have heard of the Patient Biometric System (PBS). About 3/5 of the CSOs do know the updated MER 2.6.1 at the time of this study, and only about 15% of organizations that use MER 2.6.1 understand at least 6 main indicators. 27% of total respondents do not have a routine DQA plan in their organizations. 37% of the organizations have an M&E officer with over 2 years' experience, with just over ¼ of these who are trained in monitoring and evaluation for HIV programming. Of the M&E officers, only 15% have expertise in at least two (2) statistical tools. Just 5% of the M&E officers have been involved in a research process, and just 3% of these have analyzed a database of more than 1000 respondents.

**Conclusions:** To achieve PEPFAR 5\*3 strategy, CSOs in Nigeria must be fully invested in data systems building, understand data collection methods, and have improved capacity for data management for HIV programming.

## TUPEE633

### Data quality assurance (DQA) to increase program fidelity in Namibia for GrassRoot Soccer programming

L. Mwala<sup>1</sup>, B. Kawana<sup>1</sup>, E. Kalenga<sup>1</sup>, J. Shilongo<sup>1</sup>, P. Ngunaihe<sup>1</sup>

<sup>1</sup>Peace Corps/Namibia, Windhoek, Namibia

**Background:** Partners and Peace Corps Volunteers are rolling out GrassRoot Soccer (GRS) – an evidence-based curriculum rolled out over 12 sessions to shape lifelong health-seeking behaviors and mitigate factors that put adolescents at risk of HIV, violence, and other negative health outcomes. This is funded by the President's Emergency Plan for AIDS Relief (PEPFAR) targeting youth 9- 25 years old. The Peace Corps/Namibia staff developed tools, assessed partners, and developed an action plan to increase program implementation fidelity and quality. The aim is to use data to continuously improve quality of services rendered in communities.

**Description:** Peace Corps developed, tested and adapted a data quality assurance tool comprising 27 questions based on direct observation and review of data. Questions relate to whether there is a safe space for youth, whether facilitators are providing accurate information and collecting data accurately, whether there are necessary resources available, and whether facilitators are asking questions to spark discussion among the group.

The Peace Corps health and monitoring and evaluations teams visited six organizations from six regions in August to September 2023, spending five to seven hours with each to assess quality and develop the action plan.

**Lessons learned:** The tool effectively and efficiently captured strengths and weaknesses of program implementation. The findings can be used to strengthen programming and increase program fidelity.

**Conclusions/Next steps:** This Data Quality Assurance instrument is a powerful tool in rapidly identifying gaps and developing areas for improvement both for current partners as well as future training and partners. Peace Corps staff will strengthen its future training component on some of the weaker parts of the program, particularly when partners implement without a Volunteer. Staff will emphasize the importance of discussion and interaction to ensure behavior change among the beneficiaries.

## TUPEE634

### Using digital DQA approach to improve on quality of data in HIV reporting systems in USAID Fahari ya Jamii supported facilities in Nairobi and Kajiado counties, Kenya

G. Ruttoh<sup>1</sup>, P. Maina<sup>1</sup>, L. Kimathi<sup>2</sup>, A. Munene<sup>1</sup>, C. Kihoro<sup>1</sup>, E. Kubo<sup>1</sup>, S. Arodī<sup>1</sup>, C. Odhiambo<sup>1</sup>, R. Marima<sup>1</sup>, P. Yegon<sup>3</sup>, T. Simiyu<sup>3</sup>, J. Mecha<sup>1</sup>

<sup>1</sup>University of Nairobi, Nairobi, Kenya, <sup>2</sup>Savannah Informatics Limited, Nairobi, Kenya, <sup>3</sup>USAID Kenya / East Africa, Nairobi, Kenya

**Background:** USAID Fahari ya Jamii (FYJ), 'the pride' is a collaborative project between the University of Nairobi and the county governments of Nairobi and Kajiado in Kenya. Its goal is to provide county support for increased use of quality county-led health and social services. Poor quality HIV/TB data has hindered optimal service delivery and data-driven decision-making in HIV/TB program implementation.

We innovated and implemented an intervention geared at improving data quality through automated verification, integration of data sources, enhanced visualization, and promotion of skills development.

**Description:** From October 2022 to March 2023, we developed a customized open-source data quality assessment (DQA) platform using Python with a Postgres database for automated analysis and interactive visualization following a plan-do-study-act (PDSA) cycle methodology. The initial design workshops allowed users to plan ideal functionality. Prototypes were then piloted for user feedback to study real-world performance. Insights from pilots informed design adjustments and new feature development. This rapid iterative process enabled continuous enhancement and evolution to meet user needs.

**Lessons learned:** DQAs performed months after the introduction of digital DQA showed an improvement in the concordance rate from 91% to 95% (t=2.8389, p-value=0.01944). Data verification time was reduced by 40%. We introduced automated in-platform PDF reporting, streamlining, and expediting documentation.

Our DQA dashboard automatically generates summaries at facility-to-program levels, improving efficiency and accuracy. The Data quality improvement (DQI) plans can be tracked in real-time, and it's able to flag the overdue plans.

By continually incorporating insights from the users, we ensured the platform met on-the-ground needs, enhancing local relevance and impact.

**Conclusions/Next steps:** The platform has strengthened data accuracy from 91% to 95%, optimized the use of data for decision-making, and built local capacity unlocking insights from data. The collaborative, iterative design process matched the platform closely to user needs and workflows. We will enhance platform features based on user feedback, expand implementation, and develop a

transition plan for institutionalization and sustainability while continuing to leverage PDSA cycles for ongoing optimization.

## TUPEE635

### Improving the All Services indicator in the Children and Adolescent living with HIV (CALHIV) Audit Tool through effective regular reviews of the tool

S. Malende<sup>1</sup>

<sup>1</sup>Makerere Joint AIDS Program Local Partner Health Services East Central region (MJAP LPHS EC), Monitoring and Evaluation, Kampala, Uganda

**Background:** By April 2023, MJAP LPHS EC had 89.3% (4488/5023) of the CALHIV in care accounted for in the audit tool with only 37% (1660/4488) CALHIV receiving All the services they were eligible for which is below the ministry of health target of 95%. Specifically, suboptimal performance was noted in the indicators of viral load coverage, appointment keeping and multi month dispensing (MMD). These all affected the performance of All services indicator thus indicating that the tool was used for reporting and not for planning purposes. The project thus developed strategies to improve the All services indicator in the CALHIV audit tool from 37% in April 2023 to 95% by Sept 2023 through weekly review of the CALHIV audit tool.

**Methods:** The capacity of facility teams was built through onsite mentorship on how to update and utilize the audit tool for micro planning. Clear deliverables were shared with the stakeholders involved in the updating and review of the tool. Weekly review of the audit tool was instituted with the site teams who provided accountability on the frequently missed services and continuously reviewed health facility processes to identify any inefficiencies in updating of the tool. The review facilitated the sharing of service gaps with partners such as those targeting orphans and vulnerable children for follow up.

Furthermore, resources required to support the facility teams with the updating and patient tracking were availed.

**Results:** A total of 10 weekly review meetings were held with the All services indicator significantly improving from 37% to 76% (3,589/4,746) in the same period. Comparison between the audit tool for April 2023 and June 2023 showed improvement in viral load coverage from 83% (3,388/4,067) to 89% (4,051/4,560); MMD uptake from 81% to 87% and appointment keeping from 85% to 97%.

**Conclusions:** Regular review of the audit tools facilitates stakeholder involvement, learning, encourages active participation to enhance holistic understanding of tasks and identification of areas of potential improvement. It also improves quality of services provided as evidenced by improvement in particular service indicators.

## TUPEE636

### Advancing data-driven interventions: implementation and impact of the Ghana Key Population Unique Identification System (GKPUIS) in HIV programming

D. Annang<sup>1</sup>, D. Kpogo<sup>2</sup>

<sup>1</sup>Ghana AIDS Commission, Research Monitoring and Evaluation, Accra, Ghana, <sup>2</sup>Ghana AIDS Commission, Finance and Administration, Accra, Ghana

**Background:** To track and monitor Key Populations (KP) and the services provided to them, the Ghana AIDS Commission (GAC) developed the Ghana Key Population Unique Identification System (GKPUIS) to serve as the sole repository for KP data in Ghana. The GKPUIS is being used by KP implementing agencies across the country to collect and report data on KP clients. The GAC in partnership with partners worked to equip KP implementing partners with the requisite skills in using the GKPUIS application.

**Description:** The training involved 155 participants (101 males and 54 females) made up of project coordinators, field officers, peer educators and case managers from 14 KP implementing agencies in 13 out of the 16 regions of Ghana. The training occurred in June 2023 and focused on the 15 modules of the system with a special emphasis on registration, UIC generation, case management, data approvals and report generation.

**Lessons learned:** The GKPUIS provides an overall improvement in data management associated with KP programming providing real-time data on prevention and treatment information for KPs. The system-generated unique identity codes (UIC) helped to minimize double counting of KP clients.

The reports generation module provided summary statistics of KPs registered and service provision through the use of the custom indicators and power BI and aided the participants in making informed decisions about their interventions.

The analysis of the pre and post-test scores showed a significant enhancement in knowledge in using the GKPUIS (p-value <0.05), with pre-test mean at 48.5 (N=147) and post-test mean at 75.2 (N=123).

**Conclusions/Next steps:** The rollout of the GKPUIS represents a crucial step by the GAC towards more data-driven, targeted and responsive public health interventions in the context of HIV.

Ongoing support will be provided to the Project Teams of KP implementing agencies in capturing and reporting data from the system and will focus on ensuring that KPs who tested positive are linked to care and captured in the national DHIS2 eTracker system. GAC will support KP implementing partners to conduct step-down training at the various sites for other officers to use the system effectively.

Transforming the delivering of children and adolescents HIV epidemic control interventions through artificial intelligence: the case of USAID ECAP II Zambia

Y. Mulenga<sup>1</sup>, A. Lesa<sup>2</sup>, T. Makayi<sup>3</sup>, C. Mukelabai<sup>4</sup>,  
M. Chiyengo<sup>4</sup>

<sup>1</sup>Project Concern Zambia, Management, Lusaka, Zambia,

<sup>2</sup>BlueCode Systems Ltd, Programs, Lusaka, Zambia,

<sup>3</sup>BlueCode Systems Ltd, Software Development, Lusaka, Zambia, <sup>4</sup>Project Concern Zambia, Strategic Information, Lusaka, Zambia

**Background:** Zambia is nearing the achievement of UN-AIDS 95-95-95 targets with the second and third 95 targets achieved. However, the first 95 continues to elude the achievement of epidemic control and accelerated efforts are needed to find sub populations that are still being missed such as children and adolescents and link them to preventive and care services.

**Description:** Between March 2021 and September 2023, Project Concern Zambia (PCZ) integrated into the USAID Empowered Children and Adolescents Program II (USAID ECAP II) an electronic Case Management System (eCMS) with robust datasets and actionable dashboards to enable automation of paper-based data collection tools. Flexible and practicum training approaches were used to train literally challenged case workers on point of care data entry using tables, reporting into the central server, and timely usage of case level data from the eCMS to provide and link VCA to tailored HIV, social, child protection, and education service.

**Lessons learned:** A total of 561 case workers successfully transitioned to the usage of the electronic system and they entered case level data of 9334 VCA and caregivers (70.4% VCA, medium age 10) into the android-based electronic solution.

The system enforced data usage at primary health care (PHC) level with over 500 VCA with HIV, co-morbidities and other socioeconomic vulnerabilities timely identified and linked to multisectoral services as part of the PHC-wide VCA workforce.

A total of 5802 of 7073 (82%) VCA Living with HIV were linked to viral load testing and of these, 96.0% (5512/5802) were virally suppressed; 3086 HIV exposed infants were identified and linked to prophylactic services and 4657 Adolescent Girls and Young Women at elevated risk of HIV acquisition were linked to high impact HIV prevention services.

**Conclusions/Next steps:** Integration of AI-led data systems into community HIV epidemic control programs provides timely and person-centered information needed to provide HIV and structural services tailored to the needs of children and adolescents living with HIV or at accelerated risk of HIV acquisition and necessary to end and sustain HIV epidemic control. Implementation Sci-

ence is needed to explore adaptable and user-friendly AI solutions for community programs targeting populations with high incidence of HIV.

## TUPEE638

Epidemiologically informed HIV pre-exposure prophylaxis targets for Uganda using PrEP-it and the UNAIDS Population Size Estimate tool

K. Kripke<sup>1</sup>, L. Tutegyeize<sup>2</sup>, C. Agwau Akello<sup>2</sup>,  
M. Luwunzu<sup>3</sup>, J. Mubangizi<sup>4</sup>, A. Colletar Awor<sup>5</sup>, S. Melillo<sup>6</sup>,  
D. Kasozi<sup>6</sup>, H. Kadama<sup>7</sup>, W. Kirungi<sup>3</sup>

<sup>1</sup>Avenir Health, Takoma Park, United States, <sup>2</sup>FHI 360, Kampala, Uganda, <sup>3</sup>Uganda Ministry of Health, Strategic Information Department, Kampala, Uganda, <sup>4</sup>UNAIDS, Kampala, Uganda, <sup>5</sup>U.S. Centers for Disease Control and Prevention, Kampala, Uganda, <sup>6</sup>U.S. Agency for International Development, Kampala, Uganda, <sup>7</sup>Uganda Ministry of Health, AIDS Control Program, Kampala, Uganda

**Background:** Uganda adopted oral pre-exposure prophylaxis (PrEP) in 2016. Over 550,000 clients had initiated PrEP by the end of December 2023. PrEP-it—the PrEP Implementation planning, monitoring, and evaluation Tool—helps countries set PrEP targets and estimate costs and commodity needs.

In 2023, Uganda used PrEP-it and the UNAIDS Population Size Estimate (PSE) tool to set national targets for oral PrEP, the dapivirine vaginal ring, and injectable long-acting cabotegravir.

**Description:** Since PrEP should be offered to people at substantial risk of acquiring HIV, PrEP-it users must enter the populations indicated for PrEP in their country and customize inputs for each population. The Uganda team had size estimates for the key populations and serodifferent couples but wanted to estimate the size of other populations at substantial risk of HIV within the populations of adolescent girls and young women (AGYW), pregnant and lactating people, and adult men. The PSE tool provides estimates of HIV incidence, prevalence, and subpopulation size by sex, age, behavioral category, and district.

The Uganda team used it to:

1. Identify districts where AGYW and general population adult women and men have elevated HIV incidence, and;
2. Estimate the size and relative risk of the indicated populations in the specified districts.

We also extracted 205,000 de-identified longitudinal records for clients who initiated PrEP from April 2021 through March 2022 from the national PrEP Tracker database and used a random sample of 1,000 of them in the PrEP-it continuation calculator to estimate continuation and reinitiation rates by population. We incorporated all of these parameters into Uganda's national PrEP-it file for target-setting.

**Lessons learned:** Uganda was the first country to leverage the PSE tool to customize their population inputs and impact factors for PrEP-it. The country team produced its first national PrEP targets for three PrEP products in December 2023, making good use of epidemiological and program data.

**Conclusions/Next steps:** Uganda will incorporate finalized PrEP targets into its upcoming Health Sector HIV/AIDS Strategic Plan 2025–2030. The PSE estimates for 30 countries in Sub-Saharan Africa will be incorporated into PrEP-it in 2024 to automate this process for future country exercises.

## TUPEE639

Application of geospatial information system tools for COVID-19 vaccination: what can we learn to strengthen broader immunization efforts?

S. Govender<sup>1</sup>, D. Chimhamhiwa<sup>1</sup>, H. Brahmbhatt<sup>2</sup>, M. Wolmarans<sup>3</sup>, L. Parmley<sup>2</sup>, T. Maotoe<sup>1</sup>, P. Fabe<sup>3</sup>, P. Rosseau<sup>3</sup>, C. Lucas<sup>3</sup>, T. Moraba<sup>1</sup>, P. Pisa<sup>1,3</sup>

<sup>1</sup>Right to Care, Pretoria, South Africa, <sup>2</sup>USAID, Pretoria, South Africa, <sup>3</sup>National Department of Health, Pretoria, South Africa

**Background:** Since January 2022, USAID has supported the South African National Department of Health to increase delivery of COVID-19 vaccinations through the Accelerating Development Against Pandemic Threats (ADAPT) Program.

We describe South Africa's approach, leveraging ADAPT support in 6 provinces, to apply geospatial information system (GIS) tools to drive micro-level planning and implementation of COVID-19 vaccination.

As South Africa re-commits to strengthening primary health care services, lessons learned from the COVID-19 vaccination response, including approaches and digital tools used, can inform broader immunization activities and disease prevention efforts.

**Description:** Dynamic GIS tools which integrated GIS, population, and COVID-19 vaccination data were developed in November 2022 and incorporated into the National Health Information Centre. Dashboards displayed vaccination coverage at micro-levels, informing weekly monitoring of vaccination coverage in settlements and wards. In ADAPT-supported provinces, printed maps, in combination with GIS dashboards, were used to conduct micro-level planning, population-segment targeting, and identification of locations ideal for vaccine outreach. Demand generation activities were prioritized, and vaccination teams were deployed based on gaps identified through geospatial datasets.

Additional GIS and social mobilization data were collected, in combination with COVID-19 vaccination information, which continued to feed back into the dynamic dashboards and drive vaccination programming.

**Lessons learned:** Overall, 937 individuals were trained to use the GIS platforms. Over 8.5 million COVID-19 vaccine doses were administered in ADAPT-supported provinces as of October 2023, with ADAPT directly administering nearly 1 million of those doses; almost 150,000 doses administered by ADAPT were among priority populations aged 50 years+ and more than 300,000 doses were administered in rural areas with low vaccination coverage.

**Conclusions/Next steps:** Micro-level planning, leveraging GIS, allowed South Africa to identify and support targeted demand and vaccination team deployment to areas with low vaccination coverage.

Digital tools, such as the GIS dashboards developed in response to COVID-19 described, can be leveraged to strengthen broader immunization and health service delivery efforts in the country.

Opacity in the name of transparency: lessons learned from the publication of public subsidies in the research and development of new medicines in France

I. Alaoui<sup>1</sup>, B. Spire<sup>1</sup>, F. Pilorgé<sup>1</sup>, J. Veras<sup>2</sup>, T. Brigand<sup>2</sup>, G. Centlivre<sup>3</sup>, X. Masset<sup>4</sup>

<sup>1</sup>AIDES, Pantin, France, <sup>2</sup>Médecins du Monde, Paris, France,

<sup>3</sup>Action Santé Mondiale, Paris, France, <sup>4</sup>UAEM France, Paris, France

**Background:** In 2021, France effectively implemented transparency measures for public subsidies in the research and development of new medicines, setting a precedent in Europe.

This policy fostered hope for fairer negotiations between the State and the pharmaceutical industry and enhanced treatment accessibility.

However, regulatory provisions introduced by the Government compromised the framework of the measure crafted by civil society and parliamentarians.

**Description:** In 2020, our organizations advocated towards the Ministry of Health and parliamentarians to ensure the translation of the 2019 World Health Assembly resolution on improving the transparency of markets for health products in national legislation.

In the fall of the same year, an amendment was adopted in the 2021 Social Security Financing Bill stating that of the amount of public subsidies received for the research and development (R&D) of new medicines is public.

Our organizations urged the Ministry of health to publish an implementing decree that would secure exhaustive, readable and diachronic information on public R&D subsidies. However, our demands remained unanswered.

The published decree states that pharmaceutical companies should only declare direct public investments they have received during the previous year. The text does not provide for penalties, relying on companies' goodwill to disclose this information to price-setting authorities and the public.

**Lessons learned:** In 2021, out of 111 respondents, only 7 companies declared having received public subsidies totaling 3,082 million euros. In 2022, 2 out of 87 companies declared having received public subsidies amounting to 194 202€. In contrast, the Leem (the French Pharmaceutical Companies Association) published an estimate of 47 million euros of public subsidies received for R&D in France in 2017.

These figures are proof of significant under-reporting. They undermine French public R&D efforts, put the French government at a disadvantage in price negotiations for health products, and thus call for a firm political response.

**Conclusions/Next steps:** Efficient transparency measures of R&D funding must cover direct and indirect public subsidies, with explicit penalties in case of failure to meet the obligation to declare. Involving patient and health organizations at every legislative and regulatory stage is crucial for effective design and implementation by governments.

#### TUPEF641

Monitoring and addressing disruption of HIV treatment, prevention, and care services in coastal Kenya after anti-LGBTQI marches in early 2023

A. Larios Fantinatti<sup>1</sup>, I. Mwendwa Wambua<sup>2</sup>

<sup>1</sup>Global Network of People Living with HIV (GNP+),

Amsterdam, Netherlands, the, <sup>2</sup>HIV and AIDS People's Alliance of Kenya (HAPA-Kenya), Mombasa, Kenya

**Background:** In 2023, key stakeholders supported by a global anti-rights movement, convoked protests, and incited violence towards members of the LGBTQI community and organisations.

GNP+ collaborated with HIV and AIDS People's Alliance of Kenya (HAPA-Kenya), a community-led organization from Coastal Kenya, to document the impact of the anti-LGBTQ attacks on treatment disruptions and access to HIV services among Key-Populations and PLHIV.

**Description:** HAPA Kenya runs a community-based health program reaching 4949 members of KPs in Mombasa (3022), Kwale (1212) and Taita Taveta (715) counties.

Anti-LGBTQI spokespeople, backed by a global anti-rights movement, organized massive protests and incited violence against organizations that offer services for the community.

During the 2-months clinics closures, HAPA assessed the impacts on services demand and to implement a business continuity plan to ensure the community could remain adherent to key HIV prevention and treatment services. Many of those measures were first adopted during COVID-19. In parallel, implemented an advocacy strategy to engage key stakeholders to challenge the negative narrative on LGBTQI community promoted by anti-LGBTQI champions.

**Lessons learned:** Critical services such as ARVs and PrEP distribution, remained stable thanks to DSD and care models developed during COVID-19. Nevertheless, there was a reduction in drop in laboratorial testing services at HAPA's facilities. Other significant changes showed by data is the increased demand for mental health and legal support, given increased human rights violations. The support of longtime allies and partners, such as the

National AIDS Control Council, the National AIDS Control Programme, and the Kenyan Red Cross Society, was key in HAPA Kenya's advocacy to change the narrative about their work and, hence, to ensure continuation of services after a 2-months closure.

**Conclusions/Next steps:** The data collected and the measures implemented by HAPA Kenya are a testimony to the role of community leadership in safeguarding the health outcomes achieved through HIV funding, besides highlighting the role of community-led organisations in keeping health systems resilient. Community-led organisations can only continue to engage stakeholders and challenge harmful narratives with access to flexible funding, and with support allyship from other civil society organisations.

## TUPEF642

The threat of Uganda's anti-homosexuality act to the health and life of LGBTIQ+ people living with HIV and the role of MenEngage Uganda in ensuring continued access to services

M.S. Nabaggala<sup>1</sup>, J. Kule<sup>2</sup>

<sup>1</sup>Sonke Gender Justice, Regional Programmes and Networks, Johannesburg, South Africa, <sup>2</sup>Kawempe Health and Education Initiative (KHEI), Kampala, Uganda

**Background:** Uganda's recent enactment of the Anti-Homosexuality Act-AHA (2023) heightened the vulnerability of the LGBTIQ+ community members, particularly those living with HIV, requiring health workers legal service providers and others to report LGBTIQ+ members seeking services to police for appropriate action. This posed a significant threat to the health and well-being of LGBTIQ+ individuals, impeding their access to essential HIV-related services and putting them at increased risk of stigma, discrimination, and violence. MenEngage Uganda (MEU) key population service providers experienced increased office raids by security operatives, recorded 55 cases of physical attacks, eviction clients, and arbitrary arrests since March 2023. Prominent legal aid organizations and other service institutions issued official statements declaring closure of services to members of the LGBTIQ+ community as they awaited a constitutional court interpretation of some provisions in the ACT.

**Description:** MEU collaborated with the MenEngage Alliance to join the rest the world in putting external pressure on Ugandan leaders to ensure the rights and access to services for LGBTIQ+ people living with HIV are maintained. MEU, through a mapping exercise developed a USSD platform to key population clients to ensure discreet access to services like legal AID, drug refills (ART, PrEP, etc) and counseling services. With support from MenEngage Africa, designated international legal support and instituted an emergency fund locally to support LGBTIQ+ persons faced with attacks and or threats.

**Lessons learned:** 800 LGBTIQ+ community members have received HIV treatment and or prevention services through the USSD platform, 150 who reported attacks and threats were linked to legal aid.

Joint international advocacy by MenEngage and other likeminded partners and governments put pressure on the Ugandan president announced that health services should be open and accessible to all including LGBTI persons.

**Conclusions/Next steps:** This abstract highlights the urgent need to address the intersection of HIV and LGBTIQ+ rights in the context of discriminatory legislation. Overall, the intervention by MEU has supported the continuity of HIV/AIDS prevention services for a population criminalized by law leading to drug adherence, reduced new infections in the community and ensured safety of users by linking them to friendly service providers.

## TUPEF643

The who and how of HIV criminalization in the United States

N. Cisneros<sup>1</sup>

<sup>1</sup>University of California Los Angeles School of Law, Williams Institute, Los Angeles, United States

**Background:** HIV criminalization refers to laws that make otherwise legal conduct illegal because of a person's HIV status. Over half the US states have HIV criminal laws. Many of these laws were passed at the height of the AIDS crisis of the 1980s and 1990s, and have not been updated since.

Systematic study of HIV criminal enforcement has to date not been possible in the United States because of the decentralized nature of law enforcement and crime enforcement statistics. In consequence, even after decades of enforcement we still do not have a clear idea of who and how of HIV criminalization: How many people come into contact with the criminal system because of their HIV status? What groups are more likely to be arrested and prosecuted? What are the circumstances of arrest?

**Methods:** I rely on a series of state-level analyses of HIV-related criminal data to identify broad and state-specific patterns in the enforcement of HIV-criminal laws across the United States. The data come from state-level incident-based reporting systems, court records management systems, department of corrections records, and sex offender registries.

**Results:** Several patterns emerge:

1. Thousands of people have come into contact with the criminal legal system because of their HIV status. This is many orders of magnitude greater than most previous estimates of the number of people criminalized.
2. Black people, women, and sex workers are disproportionately affected. People at the intersection of these identities are much more likely to be criminalized.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

3. Enforcement is not correlated with risk; states criminalize people for conduct that cannot transmit HIV.
4. Women and men are criminalized for different behaviors; gender or race alone cannot account for the patterns of enforcement. For example, when states have sex worker-specific HIV criminal laws, women are more likely to be over-represented.

**Conclusions:** General knowledge about HIV criminal laws remains low, even among policy makers, and tends to reflect media bias in reporting. This study shows that enforcement continues today, that certain vulnerable populations are at increased risk of criminalization, and that enforcement might run counter to stated public health goals around HIV and other communicable illnesses.

## TUPEF644

Bringing scientists and decision-makers into dialogue: the example of an association's advocacy to enable HIV-positive people to join the army

C. Bancillon<sup>1</sup>, M. Salcedo<sup>1,2</sup>, A. Maria<sup>1</sup>, I. Alaoui<sup>1</sup>, A. Decouis<sup>1</sup>, F. Pilorgé<sup>1</sup>

<sup>1</sup>AIDES, Pantin, France, <sup>2</sup>Coalition PLUS, Community-Based Research Laboratory, Pantin, France

**Background:** In France, entry to the army and related corps is conditional on the SIGYCOP referential. This establishes a rating system to determine whether a person's state of health is compatible with their duties. People living with HIV (PLHIV) were excluded due to a mismatch between the reference system and the reality of therapeutic developments. AIDES, in partnership with HIV expert scientists and other organizations, demonstrated through a dual strategy of dialogue and litigation the need to adapt the regulatory and legislative framework to therapeutic realities, thus enabling PLHIV to join these corps since May 9, 2023.

**Description:** Three approaches have been deployed: dialogue and litigation with political decision-makers; collaboration between health and community associations and scientists who are experts in HIV; and dialogue between institutions and scientists.

The litigation strategy was initiated by the organizations, after several attempts at dialogue, via an appeal to the Council of State which AIDES joined in 2021. At the oral hearing in February 2022, a renowned HIV expert was invited to intervene.

At the same time, a working session with the Ministry of the Armed Forces was obtained, enabling the presentation of a proposal for a SIGYCOP grid, produced by the associated scientists, taking into account current treatments and the actual state of health of some PLHIV.

**Lessons learned:** On May 9, 2023, the government published the decree modifying the SIGYCOP grid for HIV. This text puts an end to discrimination by making it possible

for asymptomatic PLHIV, on treatment, with an undetectable viral load and a CD4 count > 500/mm<sup>3</sup>, according to treatment tolerance, to join the army.

**Conclusions/Next steps:** One of the roles of HIV associations is to link the needs of PLHIV (eradicating serophobia, equal access to employment), therapeutic realities (undetectable equals untransmittable) and the legal and regulatory framework.

The aim is to sustain this three-dimensional model, based on litigation, constructive dialogue, and the aggregation of know-how between "political outreach" expertise and scientific demonstrations. Adapting the law to people's actual state of health, rather than presumed helps to combat discrimination and contributes to changing representations of HIV and PLHIV.

## TUPEF645

The situation and needs of HIV testing services for patients under 18 years old among outreach workers and healthcare workers of health centers in Bandung City: a rapid assessment report

A. Pirmansyah<sup>1</sup>

<sup>1</sup>Inti Muda Wes Java, Bandung, Indonesia

**Background:** The research address the gap on HIV testing for youth under 18 in Indonesia. The study evaluates the impact of the Ministry of Health's regulation change, replacing parental consent with "parents or someone who accompanied."

The hypothesis is that this adjustment enhances accessibility for at-risk youth while maintaining confidentiality. The Executive Report on HIV AIDS in Q1 2022 highlights disparities in HIV and AIDS percentages among age groups, emphasizing the need for policy adaptation. Inti Muda West Java's rapid assessment focuses on healthcare providers, examining the evolving landscape of HIV testing accessibility post-regulation change.

**Methods:** Conducted in Bandung city, focuses on HIV program managers at puskesmas and outreach workers. It adopts a cross-sectional quantitative approach, utilizing a questionnaire through Google Form.

The study aims for a comprehensive snapshot of the current situation, particularly in response to regulatory changes regarding parental consent for HIV testing under 18. Data collection occurred through Google Form, ensuring flexibility for respondents. Enumerators assisted in questionnaire completion. Descriptive analysis using SPSS identifies mean & median.

**Results:** The assessment reveals limited access to HIV testing for clients under 18 in Bandung. Most health centers had few visits, with 58.33% of clients aged 17-18 accessing testing, identifying as key populations. Self-enrollment was common (78.33%), but consent from the test provider was still required (68.33%), sometimes leading to involuntary disclosure (35%). In outreach, 69.77% imple-

mented initial screening, with 62.79% requiring clients to be accompanied. Although 73.33% of HIV service managers knew the policy for under-18 testing, only 5.77% fully implemented it. Barriers included a lack of clear information, affecting 73.67% of respondents.

**Conclusions:** The rapid assessment highlights the lack of uniformity in implementing HIV testing services for clients under 18 at health centers. Despite healthcare workers' high knowledge levels, the absence of guidelines and unclear information on regulations pose significant barriers. The biased term "delivery person" in regulations requires clarification.

Addressing these issues is crucial for enhancing the quality of HIV services for clients under 18, emphasizing the importance of clear guidelines and improved implementation to strengthen HIV prevention and care strategies.

## TUPEF646

Advocacy effort to decriminalize the drug use in Bangladesh to create a supportive environment for drug users and harm reduction program and reduce the overcrowding in the prison

E.I. Chowdhury<sup>1</sup>, M. Islam<sup>2</sup>, S. Khan<sup>3</sup>, R. Didarul<sup>4</sup>, P. Narayanan<sup>5</sup>, R. Khan<sup>1</sup>

<sup>1</sup>Save the Children, HIV/AIDS Program, Dhaka, Bangladesh,

<sup>2</sup>Ministry of Home Affairs, Department of Narcotics

Control, Dhaka, Bangladesh, <sup>3</sup>UN Agency, UNAIDS, Dhaka,

Bangladesh, <sup>4</sup>Nongor-CBO, Network of People who Use

Drugs- NPUD, Cox's Bazar, Bangladesh, <sup>5</sup>Malaysian AIDS

Foundation, Drug Policy Reform Program, Kuala Lumpur,

Malaysia

**Background:** Bangladesh's prisons, overflowing with 70% drug users, stand as a stark contrast to their two decades of harm reduction efforts. Punitive Narcotics Control Act laws obstruct these programs, prompting sustained advocacy for drug decriminalization and policy reform.

**Description:** In 2020, a UNODC and Global Fund mission urged Bangladesh to embrace this. Save the Children, as the Global Fund HIV grant's Principal Recipient, partnered with government agencies (GOs) and NGOs like AIDS/STD Program, UNAIDS, and UNODC to spearhead this initiative. Breaking the Barrier: Roundtables discussions and seminars, including the first-ever formal discussion on decriminalization in Bangladesh, engaged law enforcement in a previously taboo topic.

Overcoming the 'zero-tolerance' stance and legal obstacles to needle/syringe distribution required meticulous groundwork and collaboration.

**Lessons learned:** Two consultants, one international and one national, drafted a 'National Framework for Decriminalization' (October-December 2023). Extensive consultations with diverse stakeholders, including the Ministry of Home Affairs, Department of Narcotics Control, police, UN agencies, and drug user networks, revealed crucial

insights. Key parties identified were the Department of Narcotics Control under the Ministry of Home Affairs and the Ministry of Law and Parliamentary Affairs.

The proposed framework prioritizes Government ownership of drug policy reform, Local research on related matters, Learning and capacity building on decriminalization, Legal revisions and alternative sentencing mechanisms, Scaling up drug treatment services and Rigorous monitoring and evaluation.

**Conclusions/Next steps:** Declaration of zero tolerance towards drug use came from the top-level of political leaders in Bangladesh. Thus, stakeholders should reach up to that level to get a sustainable development in the effort 'decriminalization of drug use'.

Continuous advocacy with policy makers by using global evidence and highlighting the contextual needs has no alternatives. LEA and policy makers should learn and orient on human rights and should realize how the rights of drug users are violated through the actions of LEA.

## TUPEF647

Monitoring the landscape of newer HIV medicines: multiple patenting and access challenges

M.L. Bacigalupo<sup>1</sup>, G. Costa Chaves<sup>1</sup>, C. Thays Scopel<sup>1</sup>,

M.F. Pignataro<sup>1</sup>, T. Swan<sup>1</sup>, S. Kondratyuk<sup>1</sup>, O. Mellouk<sup>1</sup>

<sup>1</sup>Make Medicines Affordable Campaign, International

Treatment Preparedness Coalition-Global (ITPC-Global),

Bryanston, Johannesburg, South Africa

**Background:** The Make Medicines Affordable (MMA) Campaign, a consortium of community and civil society organizations from low- and middle-income countries (LMIC), uses different approaches to overcome patent barriers, including patent oppositions. Multiple patenting on the same HIV medicine is one of the evergreening strategies adopted by pharmaceutical companies; it allows them to extend monopolies on, and maintain high prices for lifesaving medicines by preventing market entry of more affordable generics. Patent landscape monitoring should include oversight of clinical trials for new HIV treatments, and new formulations of existing HIV medicines, to anticipate patent evergreening and identify approaches to prevent it.

The study aims to develop a patent landscape of selected antiretrovirals (ARV) and provide patenting trends.

**Methods:** Five ARVs compounds were selected (cabotegravir, dolutegravir, islatravir, lenacapavir, and rilpivirine) for building the patent landscape, considering patent applications filed through the Patent Cooperation Treaty (PCT) system. Patent landscapes for these ARVs were built from existing landscapes from publicly available databases, complemented by a search at the commercial CAS Scientific Patent Explorer database of publicly available filings until September 2023.

**Results:** PCT patent applications were identified for each ARV as follows: 14 for cabotegravir, 12 for dolutegravir, 9 for islatravir, 6 for lenacapavir, and 19 for rilpivirine. Preliminary results indicate the following patenting trends: combination with other compounds, salts, polymorphs, prodrugs, process of synthesis, key-intermediates and different dosage forms, which all constitute minor modifications of old molecules that do not deserve patents.

Considering that some of the compounds have been studied and approved as long-acting formulations, several related patent applications have been identified: four for cabotegravir, four for islatravir, one for lenacapavir, and four for rilpivirine.

**Conclusions:** The findings have shown multiple patenting on key ARVs, including newer applications on dosage forms, such as long-acting formulations, which have the potential to either extend or establish a monopoly over the active pharmaceutical ingredients (API) and delay market entry of generics, if filled in the countries.

Approaches to address patent barriers, such as the use of public health-based TRIPS flexibilities, should be pursued, including patent oppositions, compulsory licences and a public health perspective for patent examination.

## TUPEF648

### Legal and policy implications of acculturation on HIV among immigrants

O. Ekerin<sup>1,2</sup>, D.O. Shomuyiwa<sup>3,4</sup>

<sup>1</sup>School of Public Health, University of Port Harcourt, Port Harcourt, Nigeria, <sup>2</sup>State AIDS and STIs Control Program, Department of Public Health, Kaduna State Ministry of Health, Kaduna, Nigeria, <sup>3</sup>Faculty of Pharmacy, University of Lagos, Lagos, Nigeria, <sup>4</sup>Global Health Focus, Lagos, Nigeria

**Background:** Immigrants undergo a dynamic process of acculturation, influenced by legal and policy frameworks that shape their experiences and interactions including their healthcare-seeking behaviors within host countries. Also, some of these host countries have implemented restrictive migration policies aimed at hindering people living with HIV from entering their countries.

This critical analysis delves into the intricate relationship between acculturation and HIV among immigrants, specifically examining how restrictive immigration policies and legal status contribute to disparities in healthcare access among immigrants.

**Methods:** We conducted a review of literature published between 2010 and 2023. We searched major databases such as PubMed, Google Scholar, and relevant grey literature sources using relevant keywords such as "migration policies," "HIV prevention," "care," "treatment," "asylum seekers," "refugees," "acculturation," "cultural adaptation," "perceived HIV risk", and related terms. Inclusion criteria encompassed peer-reviewed articles, cross-sectional or

longitudinal studies, and research that focused on migration policies, acculturation and HIV risk perception and exploring diverse cultural groups and populations.

**Results:** The analysis revealed that the a restrictive legal and policy environment significantly influences the acculturation trajectories of immigrants, impacting their access to healthcare, social services, and HIV-related information.

Findings indicate that immigrants facing precarious legal statuses, such as undocumented individuals, experience heightened vulnerability to HIV due to limited healthcare access, fear of deportation, and restricted engagement with preventive interventions.

Legal status was found to be a critical determinant, with individuals facing immigration-related challenges being more prone to engage in risky behaviors and less likely to undergo HIV testing.

**Conclusions:** The study underscores the critical role of legal and policy frameworks in shaping the acculturation experiences of immigrants and consequently affecting their vulnerability to HIV.

Addressing the legal barriers that hinder immigrants' access to healthcare and social support is paramount for effective HIV prevention and care.

Policies fostering inclusivity and removing punitive measures against immigrants living with HIV are essential to create an environment that promotes early detection, treatment, and prevention of HIV within immigrant communities.

This analysis provides actionable insights for policymakers, healthcare professionals, and advocacy groups to develop targeted interventions addressing the intersectionality of acculturation, legal status, and HIV risk among immigrants.

**TUPEF649**

## Descriptive profiles of knowledge, attitudes, and practices of pre-exposure prophylaxis (KAPREP) among key populations in Honduras

L.I. Zambrano<sup>1</sup>, L.A. Medina<sup>2</sup>, I. Fuentes<sup>3</sup>, F. Muñoz<sup>4</sup>,  
I. Lorenzana<sup>5</sup>, E. Palou<sup>6</sup>, A.L. de Souza<sup>7</sup>, M. Cooper<sup>2</sup>

<sup>1</sup>National University of Honduras (FMC/UNAH), Department of Morphological Sciences, Tegucigalpa, Honduras, <sup>2</sup>Global Communities, Tegucigalpa, Honduras, <sup>3</sup>Department of Obstetrics and Gynecology at Hospital Materno Infantil, Tegucigalpa, Honduras, <sup>4</sup>National University of Honduras (FMC/UNAH), Department of Internal Medicine, Tegucigalpa, Honduras, <sup>5</sup>National University of Honduras (FMC/UNAH), Department of Microbiology, Tegucigalpa, Honduras, <sup>6</sup>National University of Honduras (FMC/UNAH), Department of Internal Medicine and Infectious Diseases, Tegucigalpa, Honduras, <sup>7</sup>Federal University of Sao Paulo, Department of Psychobiology, Sao Paulo, Brazil

**Background:** In Honduras, limited information on knowledge and practices regarding HIV and PrEP exists, especially within key populations (KP). Global Communities, Ministry of Health and National University of Honduras assessed knowledge, attitudes, and practices related to sexual activity, HIV, and PrEP among KP; the results were used for program design.

**Methods:** A descriptive survey was carried out from 2021-2022 in the 5 main cities of Honduras. A total of 557 individuals participated, including Garifuna, Sex Workers, Transgender, Men who have Sex with Men (MSM), Bisexuals, sero-discordant couples, and people in confined settings. Sociodemographic data, STD's and HIV's history and knowledge about PrEP were collected for each KP using questionnaires with different validated scales.[CED1] [LZ2] Descriptive and univariate analysis was used using JAMOV software, and approval was received from the CEIB ethics committee #030-2021.

**Results:** As a result, from the questionnaires, 4.8% of the participants had an STD, with Syphilis being the most prevalent. 79.8% of the participants had an HIV test within the past 5 months. 20.3% of the participants tested positive for HIV.

No participant mentioned being part of a follow-up service or currently using antiretroviral therapy, and none were aware of self-testing for HIV. However, after an explanation about self-testing, 11.3% knew someone who had used this method, with 16.1% of them being Transgender and 14.7% MSM. 24.1% of the participants had knowledge about PrEP, with Transgender individuals (30.4%) and MSM (33%) having higher awareness. 66% of the participants believe that PrEP is an HIV prevention strategy, but only 14.2% know people currently using PrEP or PEP.

**Conclusions:** Groups with the most information about PrEP are MSM and Transgender individuals. However, there is a low level of knowledge in some vulnerable populations, especially among sex workers.

For the sex worker group, a public policy focusing on information, support, and assistance is crucial. Our results show that knowledge about PrEP is considerable, but usage remains low, especially among key groups and sex workers. Therefore, a massive information campaign is imperative.

Additionally, we observed the positive impact of PrEP adoption in Honduras in the public service, particularly among key populations.

**Political drivers and policy contexts of HIV****TUPEF650**

## Analysing United States participation in South Africa's HIV/AIDS response

S. Srinivasan<sup>1</sup>

<sup>1</sup>Rhodes Trust, Trinity College, University of Oxford, Faculty of History, Centre for the History of Science, Medicine and Technology, Oxford, United Kingdom

**Background:** This abstract examines U.S. intervention in South Africa's HIV/AIDS crisis, through the lens of the President's Emergency Plan for AIDS Relief (PEPFAR), the largest bilateral global health program in world history.

The project provides a comprehensive analysis of the social, economic, and political factors that contributed to the HIV/AIDS epidemic in South Africa, the circumstances that prompted U.S. intervention, as well as the impact there of.

**Description:** The project draws on various primary source materials, including digital and physical archives, and interviews with key stakeholders, such as community activists, program architects and staff, South African clinician-activists, and UNAIDS staff.

Beginning with the rise of HIV/AIDS in South Africa in 1983, as well as early U.S. participation during the Clinton administration, the project explores the 2003 inception of PEPFAR by the Bush administration, alongside the impact of apartheid policy, AIDS denialism, and Western resistance on the spread of HIV in South Africa.

From there, the changing practices of the program are examined under the backdrop of changing presidential administrations and, as a result, changing PEPFAR leadership and policies towards MSM and PWUD.

**Lessons learned:** Building upon historical research analysing global health in the context of colonialism, this research finds that global health interventions must be interpreted in their political, social, economic, geographic, and historical contexts.

This project raises attention to the duality of global health programming as practiced by the U.S. via PEPFAR,

Oral

E-posters

Late-breaker abstracts

Author Index

complicated by exceptional programmatic successes amidst occasionally disempowering structural dynamics and wavering domestic agendas.

**Conclusions/Next steps:** Overall, this project contributes to the scholarship around the complex and dynamic practices of global health, particularly U.S. intervention in South Africa. Marked by altruistic intentions and fluctuating domestic policy, changing scientific knowledge and disease dynamics, under the backdrop of apartheid and post-apartheid dynamics, the project finds that U.S. intervention has played a crucial role in the South African HIV/AIDS response, especially considering early government inaction.

However, for maximum impact in the present day, PEP-FAR's continued role must be defined mutually, especially amidst the precarious political climate in the US.

## TUPEF651

Impact of the war in Ukraine on client access to HIV-related healthcare services: a qualitative study

A. Shapoval<sup>1</sup>, A. Barsukova<sup>1</sup>, M. Shvab<sup>1</sup>, N.H. Puttkammer<sup>2</sup>, O. Vitruk<sup>2</sup>, A. Ihnatyuk<sup>1</sup>, M.R. McDowell<sup>2</sup>, P.Y. Collins<sup>2</sup>, L. Hetman<sup>3</sup>

<sup>1</sup>International Training and Education Center for Health (I-TECH)/UW, Global Health, Kyiv, Ukraine, <sup>2</sup>International Training and Education Center for Health (I-TECH)/UW, Global Health, Seattle, United States, <sup>3</sup>Public Health Center (PHC) of the MoH of Ukraine, HIV Care and Treatment, Kyiv, Ukraine

**Background:** The full-scale war launched by Russia against Ukraine in 2022 caused serious challenges for national HIV response. HIV antiretroviral therapy coverage declined from 83% to 77%. Access to HIV care is particularly challenged for people living with HIV (PLHIV) from Eastern and Southern regions at the war frontlines. This study documented wartime experiences of PLHIV in obtaining healthcare, as reported by clinicians from Donetsk region.

**Methods:** This exploratory qualitative case study employed in-depth interviews with healthcare workers (HCWs) from healthcare facilities offering HIV antiretroviral therapy (ART) and pre-exposure prophylaxis (PrEP) in Donetsk region.

A directed content analysis with inductive and deductive approach was conducted. Ten HCWs (6 [60%] doctors, 4 [40%] nurses; 9 [90%] female) were interviewed.

**Results:** HCWs described how the war increased motivation among PLHIV to protect their health. Yet, many clients desperately feared interruptions in healthcare access. Several described using private encrypted messaging to counsel clients who fled their homes, including where to get care and what medication regimen to request. They described hearing from clients who became refugees

outside of Ukraine about their fear of seeking HIV care as it may jeopardize their temporary residency as well as on how language barriers prevented healthcare access:

"We couldn't give out ART for longer time initially. PLHIV were crying and asking to give them medicine for six months, but we could only do two. People who fled abroad also didn't want to disclose their HIV status. They cried: 'What if they find out? They can kick us out, they won't give us a place to stay?'. We tried to send medicine with mail or their relatives picked it."

For clients who stayed in Donetsk, HCWs described acute concerns for clients like lack of public transportation between rural towns and clinics, lack of power, lack of safe water as well as a high burden of trauma, depression, and anxiety.

**Conclusions:** HCWs presented a picture of disruption in healthcare services for many PLHIV from Eastern Ukraine. They described PLHIV fears about losing access to HIV treatment layered onto the psychological trauma of displacement, loss of lives, homes, and livelihoods.

## TUPEF652

Empowering labour leaders to address HIV-related stigma and discriminatory practices in workplace setting in Thailand

P. Duangmala<sup>1</sup>, S. Thunprom<sup>2</sup>, J. Siriphan<sup>3</sup>

<sup>1</sup>Foundation for AIDS Rights, Program, Bangkok, Thailand, <sup>2</sup>Foundation for AIDS Rights, Coordinator, Bangkok, Thailand, <sup>3</sup>Foundation for AIDS Rights, Director, Bangkok, Thailand

**Background:** Mandatory HIV testing, prior to job enrollment or as part of annual health check-up, in workplace setting remained pervasive in Thailand. This seriously limits job opportunities among people living with HIV and affects their overall quality of life. Thailand's policy against this practice has not been widely implemented as workplace was only 'asked for cooperation'. There was no punishment for non-implementers and a lack of systematic monitoring of policy implementation.

The Foundation for AIDS Rights (FAR) worked with labor organizations aiming at empowering labor leaders to address this discriminatory practice in their workplace through evidence-based advocacy.

**Description:** FAR, in partnership with Thai Trade Union Congress, Confederation of Thai Labour, and State Enterprises Workers' Relations Confederation, launched a survey to evaluate stigma and discriminatory practices in workplace setting. Findings were used by the partnership to develop a 'Stigma-free Workplace Curriculum'. Labour leaders were trained and participated in a workshop to develop a Stigma-free Workplace action plan.

**Lessons learned:** A total of 3,514 individuals, from 157 labor unions and 167 workplaces, participated in the survey. Among them, 46.6% agreed that people living with HIV

should not be allowed to work in any job positions which involve a direct contact with others and 45.1% agreed with mandatory HIV testing prior to job enrollment. 'Stigma-free Workplace Curriculum' were developed accordingly to survey findings and used to train 37 labour leaders. Stigma-free Workplace action plan was developed by these labour leaders to establish and expand the number of stigma-free labour union core members within each workplace through training, production of video clips, online magazine, poster, and workplace broadcasting. More than 9,000 employees were reached through these activities.

**Conclusions/Next steps:** Almost half of employees in Thailand agreed with mandatory HIV testing in workplace and that people living with HIV should be given limited opportunity on job hiring. Using workplace-wide strategies led by labour leaders are crucial parts of Stigma-free Workplace action plan.

In addition to improving knowledge and attitude, civil society's movement to propose anti-discrimination laws has been ongoing to establish legal consequences of all-form discriminative practices in workplace and other settings.

## TUPEF653

### Drug policy and HIV epidemic in Bangladesh: the untold repression and deprivation

M.O. Faruque<sup>1</sup>, S.I. Obaed<sup>1</sup>, A. Taher<sup>2</sup>

<sup>1</sup>Network of People who Use Drugs (NPUD), Bangladesh, Dhaka, Bangladesh, <sup>2</sup>United Nations Office on Drugs and Crime, Programme Office in Bangladesh, Dhaka, Bangladesh

**Background:** Bangladesh, with a population of 163 million projected to rise to 230–250 million by 2050, confronts a significant public health crisis due to evolving drug use trends. The shift from traditional drugs like cannabis and opium to heroin and 'yaba' (methamphetamine) profoundly impacts the country's health landscape. Approximately 7 million people are estimated to use drugs, with 5 million among them using 'yaba'.

The strict 2018 Narcotics Control Act, mirroring the Philippines' drug war approach, has raised considerable human rights and public health concerns, especially affecting the estimated 33,067 people who inject drugs (PWUD) and intensifying their HIV risk.

**Description:** This comprehensive study looks into the shift in drug usage patterns and legislative responses in Bangladesh. It critically assesses the Narcotics Control Acts of 1990 and 2018, focusing on their public health implications. Notably, Sections 21, 23, and 26 of the 2018 Act empower law enforcement to search, seize injecting equipment, and arrest PWUD based on mere suspicion of current, past, or future drug use. This legal framework has significantly impacted the HIV prevalence among PWUD, which

stands at an alarming 5.1% in Dhaka and 4.1% nationwide – starkly contrasting the general population's HIV prevalence of less than 0.01%.

The study also examines the ramifications of the Rohingya refugee crisis, particularly the surge in drug trafficking activities following the arrival of over 900,000 refugees in 2017.

**Lessons learned:** Bangladesh's current drug policies inadvertently escalate HIV risks among PWUD. The punitive measures have not only led to heightened human rights abuses but also contributed to the proliferation of over 1,000 unregulated drug treatment centers, notorious for malpractices and exacerbating HIV transmission risks.

**Conclusions/Next steps:** The data advocate for a paradigm shift in Bangladesh's drug policy towards harm reduction and 'de facto' decriminalization.

Essential steps include collaborative efforts for capacity building of law enforcement and health professionals, alongside high-level advocacy with government bodies. Such reforms aim to improve PWUD's wellbeing and effectively manage the HIV epidemic in Bangladesh, ensuring alignment with global health goals.

## TUPEF654

### High prevalence of gender-based violence among female, male and transgender female sex workers in seven provinces in Thailand – a national cross sectional study

C. Phaennongyang<sup>1</sup>, S. Janyam<sup>1</sup>, S. Sumalu<sup>1</sup>,

S. Sukthongsa<sup>1</sup>, A. Somwaeng<sup>1</sup>, C. Manopaiboon<sup>2</sup>,

D. Clarke<sup>2</sup>, P. Girault<sup>2</sup>, R. Vannakit<sup>2</sup>

<sup>1</sup>SWING (Service Workers In Group Foundation), Bangrak, Thailand, <sup>2</sup>BIRD (Bangkok Interdisciplinary Research and Development), Phayathai, Thailand

**Background:** Sex workers (SW) are particularly vulnerable to different forms of gender-based violence (GBV) resulting in significant consequences in physical and mental health and impeding access to health, social and legal services. The issue of GBV is not included in the HIV response in Thailand (National Strategy to End AIDS, 2017–2030). As part of a national PrEP study among SW populations in Thailand, the prevalence and types of GBV reported by SW were studied.

**Methods:** A cross-sectional study, led by SWING Foundation and BIRD (Bangkok Interdisciplinary Research and Development), was implemented between April and December 2023.

This study explored PrEP uptake and associated factors using a quantitative questionnaire, which included GBV-related questions, administered face-to-face to respondents. A total of 1,511 SW was enrolled including Thai male sex workers (MSW), female sex workers (FSW) and transgender female sex workers (TGSW), aged ≥18 years old, HIV-negative, and engaged in sex work in the past

Index

three months. A descriptive analysis was conducted using univariate analysis. Pearson's chi-squared test was used to determine the relationship between two variables examined during this analysis.

**Results:** The total sample included 621 FSW (41%), 452 MSW (30%), and 438 TGSW (29%). The median age of SW was 32 years old. More than a third (35.8%) of SW reported experiencing any form of GBV in the past 12 months. The highest rates were found among TGSW (45.5%) and MSW (36%). Verbal violence was the most common form reported (22.7%) followed by intimidation (17.3%), physical (9.9%) and sexual (7.2%) violence. Clients were the most common perpetrator of GBV mentioned by SW (40%).

In univariate analysis, any reported GBV was significantly associated ( $p$ -value<0,05) with history of incarceration, drug use in the past 12 months, group sex in past 3 months, and HIV high-risk perception.

**Conclusions:** GBV needs to be integrated in the national HIV response, involving a multi-sectoral response ensuring safety in the workplace and the community for SW together with training of establishment staff, community-based outreach workers and law enforcement agencies. Linkages to health, social and legal services should be developed to respond to the needs of GBV survivors.

## TUPEF655

Advocacy with Law enforcement and Judiciary as a socio-legal enabler for MSM, TG/ Hijra community and other at-risk population

V. Patil<sup>1</sup>, S. Latad<sup>1</sup>, M. Sivasubramanian<sup>2</sup>

<sup>1</sup>The Humsafar Trust, Advocacy, Mumbai, India, <sup>2</sup>The Humsafar Trust, Mumbai, India

**Background:** Even with progressive judgements and legislations in 2023, Law-enforcement authorities continue to remain uninformed about challenges such as social discrimination, blackmail, extortion, sexual harassment, rape and life-threatening violence faced by LGBTQ+, leading to an lack of faith in the legal redressal mechanisms. In 2022-2023, MSM and TG/ Hijra communities reported 102 situations requiring legal redressal (Source: The Humsafar Trust). This abstract reports on strategies used to mitigate these cases.

**Description:** The Humsafar Trust (HST), India's oldest LGBTQ+ organisation works on the forefront for community response for crisis management. While community capacity building on enhanced cyber-literacy, civils-rights awareness and safe-sex practices are a precautionary crisis management measure, HST also has a strong crisis management team equipped to handle emergency health and legal situations.

HST consciously invests resources in strategically tackling the gap of information and implementation of progressive laws and judgements by engaging in advocacy with law enforcement bodies, judiciary, and allied institutions.

In 2023, HST engaged 1,081 law enforcement individuals and 130 judiciary and quasi-judiciary personnel in HIV and LGBTQ+ focused dialogue using innovative advocacy tools.

**Lessons learned:** Crisis management measures play an important role in strengthening the outcomes of preventive advocacy measures taken. The Indian Law enforcement and judiciary allied institutions follow a traditionally hierarchical structure that limits the scope of junior level personnel in offering support beyond their capacities during crisis situations.

Thus, it becomes crucial to involve senior level authorities in a support seeking dialogue and strengthen relationship.

**Conclusions/Next steps:** The simultaneous management of crisis on the community as well as law enforcement end acts as a strong advocacy measure in limiting and managing identity-based discrimination and violence.

These advocacy efforts also normalise the socio-legal challenges faced by the at-risk population and positively affects their vulnerability to HIV exposure.

Administration of Post Exposure Prophylaxis (PEP) sexual-violence and HIV exposure has been a key highlight of our implementations.

It also highlights that an advocacy focused financing system plays a significant role in securing access to a stigma-free society and should be a priority for multi-lateral HIV-care financing.

## TUPEF656

Community response to the epidemic in Ukraine - priorities elaboration and ranking within the National Request of Ukraine to the Global Fund

O. Karpenko<sup>1</sup>, L. Kravets<sup>2</sup>, O. Zahrebelnyi<sup>1</sup>

<sup>1</sup>FREE ZONE, Kyiv, Ukraine, <sup>2</sup>National TB and HIV/AIDS Council of Ukraine, Kyiv, Ukraine

**Background:** Previous experience of our organization in the preparation of the Request to the GF showed that prisons are not a priority, especially within limited funding, and the penitentiary interventions are scattered across thematic groups. Being a community-based organization, FREE ZONE faced a situation where interventions proposed by national stakeholders within thematic groups were more aligned with state needs, rather than community ones. It results in interventions not meeting the expectations and vision of the communities.

**Description:** A separate subgroup was launched to prepare, review, and finalize interventions that relate exclusively to the penitentiary sector, becoming a unique professional environment for stakeholders interaction and the development of interventions within the penitentiary sector.

Together with the Secretariat of the National Council, we ensured the coordination of defining, unifying, and har-

monizing priorities for all communities and civil society. These priorities were intended to guide the Thematic Expert Group (TEG) in rating interventions and the National Council in making decisions regarding the GF Request. The collected and unified priorities reflect the vision of all communities and meet their urgent needs.

**Lessons learned:** The separate penitentiary subgroup became the basis for the interdepartmental Working Group on the Sustainability of Services in Penal Institutions of State Criminal-Executive Service of Ukraine under the Program Committee of the National TB and HIV/AIDS Council. The group facilitates the monitoring of compliance with and violations of prisoners' and ex-prisoners' rights regarding HIV prevention services and prisoners living with HIV in correctional facilities. Currently, all issues related to the penitentiary sector are considered within this group.

Active discussion of collected and unified priorities of communities and their dissemination among stakeholders influenced the preparation of the GF Request. Despite war and limited funding, all communities not only received funding but were included in the Request as pre-selected co-implementers.

**Conclusions/Next steps:** It is planned to propose a new format for Request preparation that considers penitentiary interventions within a separate subgroup. It is suggested to use a new evaluation criterion by TEG members, focusing on the alignment of interventions with the communities and civil society priorities. This approach ensures all community suggestions are evaluated and considered within the GF Request.

## TUPEF657

Grassroots mobilisation for policy change: a lifetime evaluation of the support. Don't punish campaign

J. Fernández Ochoa<sup>1</sup>, B. Hickman<sup>2</sup>, T. Brigden<sup>3</sup>, M. Camacho<sup>3</sup>

<sup>1</sup>International Drug Policy Consortium (IDPC), London, United Kingdom, <sup>2</sup>Myriad Research, London, United Kingdom, <sup>3</sup>Elton John AIDS Foundation, London, United Kingdom

### Background:

Despite global progress in reducing HIV transmissions and mortality, people who use and inject drugs continue to face a disproportionate impact, with an HIV prevalence rate seven times higher than in the general population. This disparity results from punitive drug policies, including criminalisation and associated police violence, and limited harm reduction access.

Only 1% of people who inject drugs live in countries meeting UN-recommended harm reduction coverage. Since 2013, the Support. Don't Punish campaign has globally mobilised community-led organisations and their allies

to advocate for approaches that promote community well-being and human rights through harm reduction and drug policy reform.

**Description:** The core interventions of the campaign are the provision of financial, communications, and guidance resources to grassroots organisations for its Global Day of Action and follow-up projects. A lifetime (11 years) evaluation, supported by the Elton John AIDS Foundation, utilised Contribution Analysis to identify key outcomes and impacts. Data were collected via literature review, document review of over 1,800 records, interviews with 16 campaign leaders, survey to 200 local partners, social network analysis, and 4 case studies.

**Lessons learned:** Support. Don't Punish mobilised local organisations from over 300 cities in 110 countries, with a significant representation of community-led networks. Partners reported enhanced capacity and confidence, leveraging campaign resources to develop and strengthen strategic collaborative work plans. This empowerment facilitated their influence on and engagement with public opinion, media, and policymakers. Sustained involvement favoured influence in national policies and practices on harm reduction and alternatives to punitive approaches, as well as civil society participation, destigmatisation and, in some cases, reduced police violence. Decentralisation, collaboration, bottom-up organising, funding facilities, and global branding recognition were key success factors. Challenges include limited financial sustainability, Global North involvement, media access, and international coherence due to policy landscape differences.

**Conclusions/Next steps:** Support. Don't Punish significantly contributes to harm reduction and drug policy reform, mobilising globally with a grassroots-centred approach. Campaign evaluation lessons will inform recalibration and reinforcement strategies, sustaining aims, enhancing global/local network coordination, and supporting other community-driven campaigns for key/marginalised communities.

## TUPEF658

Turning opportunity into action: lessons learnt from the creation of Aotearoa New Zealand's National HIV Action Plan

J. Rich<sup>1</sup>, S. Saini<sup>1</sup>, B. Beebe<sup>1</sup>, C. Leakey<sup>1</sup>, R. Olin<sup>1</sup>, J. Bruning<sup>2</sup>, M. Fisher<sup>3</sup>, M. Stewart<sup>4</sup>

<sup>1</sup>Burnett Foundation Aotearoa, Auckland, New Zealand, <sup>2</sup>Positive Women Inc., Auckland, New Zealand, <sup>3</sup>Body Positive, Auckland, New Zealand, <sup>4</sup>Toitū Te Ao, Rotorua, New Zealand

**Background:** In 2023, Aotearoa New Zealand (NZ) launched an ambitious National HIV Action Plan, committing to eliminating new local HIV transmissions by 2030, ending AIDS as a public health threat, and ensuring people living with HIV have healthy lives free from stigma and

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

discrimination. However, these ambitious goals and the resources attached have come after 14 years of operating in a policy vacuum with no central government strategy or funding increases.

**Description:** In the absence of government leadership, community-based organisations led the NZ HIV response. Ongoing advocacy to government for national guidance resulted in lacklustre attempts at plans, which were rejected by the sector for being outdated, not evidence-informed, and lacking community involvement.

Years of groundwork, advocacy, and persistence eventuated in the creation of the 2023 Plan, however, there are ongoing challenges. Here we address successes and missteps to inform other countries with the opportunity to influence national guidance.

**Lessons learned:** This Action Plan shows how critical community leadership is in securing government support, and how its absence will result in foreseeable implementation gaps.

As the largest NGO, Burnett Foundation Aotearoa had significant involvement in the Plan's development, however decisionmakers were quick to act without meaningfully engaging people living with HIV and peer support organisations.

People living with HIV mobilised to self-fund the Stigma Index, creating evidence to demonstrate significant levels of stigma and discrimination and that support for people living with HIV must be prioritised, which heavily informed the Plan

Luck and timing were key with an infectious disease doctor as the Minister of Health who prioritised this work on the policy agenda.

Although historic in its scope and funding commitment, the Plan lacks a clear path to reach elimination. Timing has been a constraint, alongside central coordination of funding and transparency on implementation, and therefore strong relationships between the HIV community organisations have been pivotal.

**Conclusions/Next steps:** NZ can be world leading in eliminating new transmissions. The Plan's existence is a testament to the success of community in cultivating positive, non-partisan relationships with government and maintaining the HIV epidemic as a public health priority. Continued advocacy and collaboration are necessary for success.

# Human rights and responses to HIV

## TUPEF659

### Unveiling pivotal human rights empowerment for people living with HIV/AIDS in Kibera, Africa's largest slum

V. Ndam<sup>1</sup>

<sup>1</sup>UCESCO-AFRICA, Development Director/Peer Counselor, Nairobi, Kenya

**Background:** Kibera, Africa's largest slum, grapples with extreme poverty and a staggering HIV/AIDS prevalence of 12%, linked primarily to high-risk behaviors like multiple partnerships amid complex socio-economic dynamics. Despite efforts, interventions face hindrances due to insecurity, compounding challenges for individuals with HIV/AIDS. Pervasive stigma, discrimination, and a culture of silence further obstruct access to treatment and support. Targeted interventions emphasizing human rights awareness offer hope in mitigating discrimination.

This research aims to analyze barriers hindering effective HIV/AIDS intervention implementation in Kibera, evaluating socio-economic impacts and societal dynamics. The study hypothesizes that educating individuals about their rights can combat stigma.

By highlighting these issues, this research underscores holistic approaches to address structural barriers, aiming to create a more supportive environment for those living with HIV/AIDS.

#### Methods:

Study Period and target groups	<p>The study was conducted over a period of 12 months in Kibera, Africa's largest slum, known for its extreme poverty and a high prevalence of HIV/AIDS (12%). Surveys, in-depth interviews, and participatory discussions formed the primary modes of data collection, aimed at assessing the awareness and comprehension of human rights among individuals affected by HIV/AIDS.</p> <p>The study population comprised women and men aged 15-35, given the prevalence of HIV/AIDS linked to multiple sexual partnerships within this demographic. Additionally, children aged 0-14 were included as part of the study population due to a significant number being born with HIV/AIDS, often due to the lack of awareness and testing among parents.</p>
Data Analysis	<p>Data analysis was conducted using two distinct methodologies. Quantitative data obtained from surveys underwent rigorous analysis utilizing the Statistical Package for Social Sciences (SPSS). This facilitated the statistical interpretation of quantitative findings. Qualitative data from in-depth interviews and participatory discussions were analyzed using Nudist 4, a software tailored for qualitative analysis. This approach ensured a robust and comprehensive interpretation of both qualitative and quantitative data, allowing for a multifaceted understanding of the awareness and understanding of human rights among the studied population in Kibera.</p>

## Results:

Women and Men Aged 15-24:	Children Aged 0-14:	Overall Summary:
Among the surveyed 5,842 households, 76% of individuals in the age range of 15-24 demonstrated a lack of awareness regarding their human rights. The primary reason cited for this limited understanding was the prevalent fear of discrimination and potential harm within their community, driving the hesitance to seek or comprehend their rights.	From the surveyed households and schools, totaling 7,200, children aged 0-14 were assessed. Specific data on this group's awareness of human rights wasn't directly highlighted in the provided information. However, the study indicated a concerning lack of awareness within this vulnerable age group, likely contributing to their increased vulnerability to acquiring HIV/AIDS, either at birth or during early childhood.	<p>1. The research uncovered a staggering lack of awareness among both adolescents and young adults aged 15-24 regarding their human rights.</p> <p>2. Fear of discrimination and harm significantly deterred these individuals from understanding and asserting their rights within the community.</p> <p>3. Though specific data on children aged 0-14 wasn't disaggregated, the study implied a similar trend of limited awareness among this vulnerable demographic.</p> <p>The findings underscored the critical need for targeted interventions and education initiatives aimed at fostering awareness of human rights, particularly among the younger age groups. Addressing this lack of awareness is essential to mitigate the vulnerability and marginalization experienced by these populations within Kibera, ultimately improving their access to necessary healthcare services and support systems.</p>

**Conclusions:** Empowering vulnerable communities in Kibera demands a multifaceted, rights-based approach that transcends conventional healthcare interventions. The findings from this study shed light on the critical necessity of fostering human rights awareness within populations affected by HIV/AIDS. Addressing this lack of awareness and understanding is foundational to alleviating the entrenched marginalization and vulnerability experienced by individuals within this community. It's imperative to pivot interventions toward rights-based approaches that not only prioritize healthcare but also focus on education, empowerment, and advocacy for justice. Governmental and non-governmental organizations must collaborate synergistically to create a comprehensive framework that supports gender equity and sensitizes individuals on sexual and reproductive health rights.

By equipping individuals with knowledge about their rights, particularly in the realm of healthcare and societal inclusion, interventions can significantly alter the landscape for vulnerable populations. Strengthening awareness programs and community-based initiatives

becomes instrumental in creating an environment where individuals feel empowered to assert their rights and demand equitable access to treatment and support services.

Advocating for justice remains pivotal. This involves not just legislative measures but also community-led initiatives that challenge discriminatory practices and promote inclusivity. Creating avenues for these communities to seek justice and receive fair treatment is essential in dismantling the pervasive stigma and discrimination they face daily.

## TUPEF660

### Transgender people's health realities and access challenges during wartime in Ukraine: results of a qualitative study

O. Kovtun<sup>1</sup>, Y. Yoursky<sup>2</sup>

<sup>1</sup>Alliance for Public Health, Kyiv, Ukraine, <sup>2</sup>ECOM - Eurasian Coalition on Health, Rights, Gender and Sexual Diversity, Tallinn, Estonia

**Background:** In Ukraine, approximately 9,963 [7,352-12,571] transgender people (TP) face heightened health needs due to the ongoing Russian war, despite collaborative efforts by community-based and non-governmental organizations (NGOs) to enhance healthcare access.

We sought the challenges faced by TP in accessing healthcare during the war against Ukraine, including barriers to services and required support, to optimize current and develop new interventions that meet the TP's needs.

**Methods:** In January 2023, we conducted 12 in-depth interviews with TP across seven cities of Ukraine. Sample size ensured diversity in gender identity, sexual orientation, age, gender transition, education, and employment. Thematic content analysis was employed to derive the results.

**Results:** Interviews included 5 transgender women, 4 transgender men, and 3 non-binary people, aged 19 to 52. Challenges identified included:

1. Wartime exacerbated difficulties in accessing gender-affirming hormones, leading to self-administration. Financial constraints hindered health examinations for monitoring hormone therapy.
2. Active war-related migration increased the scarcity of TP-friendly healthcare providers. Financial limitations and a lack of information about qualified practitioners contributed to the unavailability of gender-affirmation surgeries.
3. HIV concerns gave way to humanitarian needs; only a few sought HIV services. Economic constraints led some to sex work, with stable instances of violence. A few engaged in non-injectable drugs and chemsex.
4. Most reported mental health struggles during the war, exacerbated by financial limitations hindering

Author Index

therapy and prescribed medications access. Active involvement in NGOs' activities served as a coping mechanism.

5. While some improved family ties during the war, discontinuing interactions after coming out remained relevant. War-induced stress led participants to refrain from coming out, aiming to minimize health risks for elderly family members.

**Conclusions:** In 2023, Ukraine officially recognized TP as a key population, fostering legislative support. Acknowledging healthcare challenges during wartime is crucial for effective HIV programs.

The study's findings form a basis for focused interventions to enhance TP's well-being, emphasizing the need for:

1. Tailored hormonal therapy and gender-affirming surgeries;
2. Education programs targeting healthcare providers to create TP-friendly environments;
3. Comprehensive HIV programs addressing economic barriers and limited access to gender-affirmation services;
4. Prioritizing mental health support through accessible therapy and prescribed medications.

## TUPEF661

Prepared for action: lessons learned from the first year of the HIV Justice Academy

S. Vázquez Villanueva<sup>1</sup>, A. Lahov<sup>1</sup>, A. Symington<sup>1</sup>, E.J. Bernard<sup>1</sup>

<sup>1</sup>HIV Justice Network, Amsterdam, Netherlands, the

**Background:** As of January 2024, 85 countries have HIV-specific criminal laws, and in the past five years alone, 26 additional countries have prosecuted people for HIV non-disclosure or exposure using other kinds of laws.

While the movement against these unjust and ineffective laws and prosecutions continues to grow, much remains to be done.

To support community advocates to counter these problematic criminal laws and prosecutions, the HIV Justice Academy was launched in October 2022 as a global learning and resource hub. Usage has been tracked through LearnDash and Google Analytics tracking systems.

**Description:** The online platform provides free and easy access to information for beginners through to experts, in three formats:

- Online Learning: a self-paced, six chapter online course on HIV criminalisation;
- Action Toolkits: practical and actionable guidance; and
- Resource Library: a vast archive of reports, research papers and guides.

Originally launched in English, throughout 2023 it was made more widely available with the addition of French, Spanish and Russian versions.

In 2023, the HIV Justice Academy was visited by over 2600 people from 110 countries. More than 500 learners enrolled in the course and the completion rate was 18.8% – above the average for online training.

**Lessons learned:** In their post-course surveys, graduates of the HIV Criminalisation Online Course told us they found it relevant, interesting and engaging. Specifically:

- The first-person testimonials provided nuanced and context-specific understanding of the multiple harmful impacts of HIV criminalisation.
- Scientific and legal aspects of HIV criminalisation were made accessible to all learning levels.
- We were able to reach a wide audience through the multi-language content.
- Social media and thematic listservs have been effective to promote the Academy and allow graduates to share their learnings.

**Conclusions/Next steps:** Ending HIV criminalisation requires strengthening grassroots legal literacy to support advocacy.

Online learning allows for information on the science of HIV and the implications of existing laws to be widely understood. Existing content will continue to be updated, and new materials will be developed to assist community advocates in their efforts to end HIV criminalisation.

## TUPEF662

Assessing discriminatory attitudes towards key populations among police officers: the development of a monitoring tool and new indicators for Global AIDS Monitoring

L. Viljoen<sup>1</sup>, G. Hoddinott<sup>1</sup>, T. Pliakas<sup>2,3</sup>, Z. Kavalieratos<sup>1</sup>, V. Bendaud<sup>4</sup>, A. Stangl<sup>5</sup>  
<sup>1</sup>University of Stellenbosch, Department of Paediatrics and Child Health, Cape Town, South Africa, <sup>2</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>3</sup>Impact Epilysis, Thessaloniki, Greece, <sup>4</sup>Joint United Nations Programme on HIV/AIDS, Data for Impact Practice, Geneva, Switzerland, <sup>5</sup>US Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States

**Background:** Key populations (KPs), including men who have sex with men (MSM), sex workers (SW), people who inject drugs (PWID), and transgender people (TGP) often face stigma and discrimination from the police that heighten their risk of HIV infection and impede access to HIV services. We sought to develop a new monitoring tool for national governments to assess:

1. Discriminatory attitudes and behaviors among police, and
2. Current training and policies that may influence these attitudes. We also validated four indicators that measure discriminatory attitudes towards MSM, SW, PWID, and TGP among police.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Methods:** The 88-item monitoring tool was developed based on literature review and finalized with input from an advisory group composed of community, academia, multi-laterals, and implementers. Cognitive interviews were completed at two urban police stations in the Western Cape Province, South Africa. The tool was refined and piloted at 25 police stations (7 urban, 9 peri-urban, 9 rural) between July-August 2022. Exploratory factor analysis was used to determine items for inclusion in the final tool and the four indicators.

The four indicators were calculated using 28-items from the tool. Reliability was assessed using Cronbach's alpha and construct validity established using logistic regression with Wald test. The post-pilot tool and indicators were finalized in consultation with the advisory group.

**Results:** Respondents who completed the refined tool (n = 171) were mostly male, between the ages of 35-44 years-old, held lower ranks, and had been in service for ≥11 years.

All indicators demonstrated good internal consistency ( $\alpha > 0.70$ ). Among police officers in our pilot, 26.3% reported discriminatory attitudes towards MSM, 40.9% towards SW, 42.1% towards PWID, and 27.5% towards TGP.

Other domains captured in the tool included: training, reporting mistreatment of KPs by co-workers, co-worker attitudes, and policing practices.

**Conclusions:** The new monitoring tool will enable countries to monitor progress towards the 2021 Political Declaration sub-target of "less than 10% of law enforcement officers report negative attitudes towards key populations by 2025".

Data generated based on the tool will support the design of interventions and policies to reduce and mitigate stigma and discrimination experienced by KPs in the justice setting.

## TUPEF663

Strategic cases and the role of non-governmental organisations (NGOs) in supporting migrants living with HIV in the Russian Federation (RF)

E. Romanyak<sup>1</sup>

<sup>1</sup>REG, Moscow, Russian Federation, the

**Background:** In the region of Eastern Europe and Central Asia (EECA), legal context and policy framework related to support to migrants has changed significantly in recent years. Migrants face persistent bureaucratic burden and additional financial costs to ensure their stay is legal and more or less safe from the pressure of the authorities. Negative HIV test is among the preconditions for legal residence for work or study in the country, while those who are tested positive are denied of the residence permission irrespectively of their social status and living circumstances, and have to leave the country voluntarily or under the forced deportation.

**Description:** A 2022 study in Tajikistan conducted by the Regional Expert Group on Migrants' Health (REG) found that every 4th HIV case in 2021 was diagnosed among Tajik citizens who were former labour migrants. With the decision of the national authorities on the restricted residence, migrants often have to stay illegally in Russia, facing further health risks. REG with the support of the Elton John AIDS Foundation is implementing a project "The migrant-sensitive HIV care in the Russian Federation". Under the project, professional lawyers provide legal support to migrants with HIV. In 2023, more than 40 PLWH from EECA had opportunities to appeal earlier residence restrictions by the Russian authorities on the grounds of availability of relatives who are Russian citizens, violations in issuing orders, deadlines and other illegal actions by decision-making and enforcement agencies. The Project lawyers are currently leading 6 strategic cases in courts.

**Lessons learned:** Professional lawyers help beneficiaries a lot in obtaining reliable and sufficient information related to their specific circumstances and in addressing the existing legal and bureaucratic barriers. In new conditions, courts' practices demonstrate the tendency to cancelling earlier malpractice decisions of the relevant authorities, while judges are more persistent in comprehensive consideration of the circumstances of each specific case. Through social networks and the REG Website community and professionals are being regularly informed on legislative changes, as well as personal stories.

**Conclusions/Next steps:** The Project and its outcomes help to consider the real scale of migration processes and levels of HIV among migrants in the EECA region.

## TUPEF664

A pregnant pause: does the global focus on 'eliminating mother-to-child transmission' adhere to WHO Guidelines and rights of women living with HIV?

A. Namiba<sup>1</sup>, J. Alesi<sup>2</sup>, S. Bewley<sup>3</sup>, R. Dhairyawan<sup>4</sup>, L. Kwardem<sup>5</sup>, L.W. Njenga<sup>6</sup>, S. Tariq<sup>7</sup>, M. Tholana<sup>8</sup>, A. Welbourn<sup>9</sup>

<sup>1</sup>4M Network of Mentor Mothers CIC, c/o STOPAIDS, London, United Kingdom, <sup>2</sup>Jacquelyn Ssozi Foundation, Kampala, Uganda, <sup>3</sup>Kings College, London, United Kingdom, <sup>4</sup>Barts NHS Health Trust, London, United Kingdom, <sup>5</sup>4M Network of Mentor Mothers CIC, London, United Kingdom, <sup>6</sup>Positive Young Women Voices, Nairobi, Kenya, <sup>7</sup>University College London, London, United Kingdom, <sup>8</sup>Making Waves and STREAM Network Zimbabwe, Harare, Zimbabwe, <sup>9</sup>Salamander Trust, London, United Kingdom

**Background:** Women living with HIV have long called for sensitive, respectful language to uphold their Sexual and Reproductive Health and Rights (SRHR), in line with the World Health Organization's (WHO) 2017 SHRH Guideline. Language has long been known to shape how we

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

feel, think, act and react. Medical language can affect women's use of maternity services and people's use of harm-reduction services and can even influence adherence to ARVs. Yet much language used in global policies and practice around care, treatment, and support of women living with HIV remains unchanged.

We therefore conducted participatory values and preferences research in relation to policy language in order to assess its impact.

**Methods:** A qualitative participatory review process with thematic analysis comprising:

1. Desk-top review of 40 global policy documents and journal articles;
2. Discussions with 13 women living with HIV from 4MNet's mentor mothers' international group.

The focus was on current language in documents, and respondents' views about how this affects their own, and others' perceptions of, their SRHR.

**Results:** Dehumanizing language and abbreviations are persistently used: for example, "dropouts", "defaulters" and "eMTCT"(elimination of mother-to-child transmission"). Respondents found these and similar terms to be disrespectful, disempowering and triggering.

Terms like 'eMTCT' (versus 'reducing vertical transmission') also undermine WHO's 2017 SRHR Guideline, which recommends language, policies and practices that prioritise women's lifelong SRHR. This language exists alongside continuing SRHR violations like coerced sterilisation, confidentiality breaches and obstetric violence.

Furthermore, global policies focus on 'eMTCT' at the expense of ensuring holistic woman-focused care, respect and support for women's SRHR.

**Conclusions:** There is already widespread evidence of rights violations of women living with HIV and throughout pregnancy and birth. Language reveals and shapes attitudes, policy and practice. Current terminology in global policy disrespects women living with HIV.

Replacing it with language aligned with women's own priorities is essential in delivering respectful maternal care and upholding women's SRHR, thus optimising outcomes for women and their babies. We recommend that 'eMTCT' be replaced with empowering language and policies and practices seeking to 'ensure the SRHR of women living with HIV(eSRHR)'.

## TUPEF665

Perpetrators in focus: how to respond to human rights violations in hard-dealing countries

V. Kalyniuk<sup>1</sup>

<sup>1</sup>Alliance for Public Health, Kyiv, Ukraine

**Background:** In Central Asian countries, laws criminalizing HIV transmission, drug consumption, and sex work are still in effect, and in Uzbekistan, same-sex relationships are criminalized.

The repressive policies of these countries towards vulnerable groups result in numerous human rights violations, cases of discrimination, and violence.

**Description:** To effectively **document such cases and provide quality assistance and support to victims**, CBOs and NGOs use the **online tool REAct**. Despite the challenging political situation and the inability to quickly change it, REActors (peer consultants/paralegals) offer legal, psychological, and social services to community members. They also **work with perpetrators to prevent similar violations in the future**. For instance, in Tajikistan, in 2023, 78% of appeals were related to violence and discriminating attitudes toward people living with HIV in their settings, this testifies enormous level of stigma. However, through direct interventions to enlighten about HIV, 30% of cases are positively resolved and addressed. Important to note, that victims are more likely to disclose their issues to peer consultants, rather than to the police, as the police is the second biggest perpetrator, constantly violating human rights and abusing laws related to HIV and vulnerable groups.

**Lessons learned:** Despite the challenging political situation and the impossibility of active open advocacy, we have found a way to reduce the level of stigma and discrimination. In addition to services and support for victims, we also need to work with those who violate rights and discriminate, explaining to them that their actions are illegal and inhumane. In this way, we increase public awareness.

Such a strategy requires quality training for consultants in conducting awareness-raising discussions and also entails comprehensive measures for personal safety.

**Conclusions/Next steps:** We plan to continue the REAct project and deepen the focus both on supporting victims and on enlightening perpetrators to reduce the number of human rights violations and discrimination cases.

## TUPEF666

### Transgender HIV activism in Eastern Europe and Central Asia

Y. Kirey-Sitnikova<sup>1</sup>

<sup>1</sup>Uppsala University, Uppsala, Sweden

**Background:** Eastern Europe and Central Asia (EECA) is a region with the fastest growing HIV epidemic in the world. Transgender (trans) people are one of the key population groups susceptible to HIV, according to the UNAIDS. However, in 8 out of 12 EECA countries, they are not recognized as a key population group by the state.

**Methods:** Semi-structured interviews with 12 activists working on transgender HIV issues in EECA.

**Results:** The study identified four interconnected spheres of HIV-related trans activism in EECA: provision of services, advocacy, research, and working with doctors. To improve the quality of services, activists sensitized doctors and engaged in advocacy to make the state recognize trans people as a separate key group.

Such recognition would make HIV services more affordable (because of specifically allocated funding) and acceptable (because trans women would be recognized as women, not MSM).

Moreover, recognition as a separate group was used as a vehicle to drawing attention to trans-specific medical services (hormonal replacement therapy, consultations with endocrinologists, psychologists, and psychiatrists) and including them in HIV programs.

To underpin their advocacy, NGOs conducted research (mainly quantitative) that made their claims better founded. Trans population estimates were used to plan programs and write grant applications.

When asked about the reliability of these studies, the respondents listed the following issues that may affect representativeness: the lack of trust on behalf of trans people, lack of motivation to participate, and frequent changes of the place of residence.

Activists faced the following challenges in their work: the lack of interest on HIV issues among trans people, repression by the state and physical attacks, the lack of support by the civil society.

**Conclusions:** The study gave insight into the intersection of HIV and trans issues in the underexplored region of EECA through the eyes of activists. The importance of recognizing trans people as a separate key group by the state was the main finding.

## TUPEF667

### Results from the 2023 assessments of progress in in scaling up human rights interventions for HIV and tuberculosis in 20 'Breaking Down Barriers' countries

J. Amon<sup>1</sup>, S.K.H. Chu<sup>2</sup>, K. Grant<sup>3</sup>, M. Clayton<sup>4</sup>, N. Sun<sup>5</sup>, A. Shaw<sup>6</sup>, A. Iovita<sup>6</sup>

<sup>1</sup>Drexel University, Office of Global Health, Philadelphia, United States, <sup>2</sup>HIV Legal Network, Toronto, Canada,

<sup>3</sup>Consultant, Johannesburg, South Africa, <sup>4</sup>Consultant, Windhoek, Namibia, <sup>5</sup>Consultant, Durham, United States,

<sup>6</sup>Global Fund, Geneva, Switzerland

**Background:** In 2017, the Global Fund launched *Breaking Down Barriers* (BDB), supporting 20 countries in scaling up programs and interventions to remove human rights-related barriers to access to HIV, tuberculosis and malaria services.

**Description:** In 2023, progress assessments were conducted in Benin, Botswana, Cameroon, Côte d'Ivoire, Democratic Republic of the Congo, Ghana, Honduras, Jamaica, Indonesia, Kenya, Kyrgyzstan, Mozambique, Nepal, Philippines, Senegal, Sierra Leone, South Africa, Tunisia, Uganda, and Ukraine.

Assessments involved reviews of country and program documents, key informant interviews with implementers, partners and beneficiaries, and in-country research visits.

Assessments focused on scope, scale, sustainability, integration, and quality of human rights programs within HIV, tuberculosis and malaria responses, and progress since baseline and mid-term assessments.

Emerging themes included strategies for working in challenging national environments, innovative approaches to cross-sector collaborations and recommendations for optimizing human rights interventions to drive impact.

**Lessons learned:** Progress assessments documented substantive progress in scale up of HIV, tuberculosis and human rights-based programs even in countries with challenging rights environments.

Prior to the Russian invasion, Ukraine demonstrated significant scale up of both HIV and TB-related human rights programs, and despite the challenging environment since the invasion, many continued to operate.

Mozambique recorded substantial increases in human rights program coverage in the context of HIV, with Uganda, Indonesia and Ukraine recording the large increases in the context of tuberculosis.

Ukraine, Uganda and Ghana highlighted ways in which implementing partners adapted to address challenges, such as conflict and punitive laws.

Numerous countries, including Senegal, Indonesia, Jamaica and the Democratic Republic of Congo, demonstrated cross-sector approaches that strategically integrated and facilitated progress in multiple program areas.

**Conclusions/Next steps:** Meaningful scale-up of human rights programs and HIV and tuberculosis services and reducing barriers to access was possible across a range of national contexts and environments. Evidence generated by BDB assessments can inform efforts to optimize, integrate and adapt HIV/TB services in challenging settings.

One year into the Anti-Homosexuality Act in Uganda: lessons learned on sustaining HIV services delivery to the marginalized populations

V. Vasireddy<sup>1,2</sup>, W.W. Popp<sup>3</sup>, N. Shah<sup>2</sup>, J.S. Cavanaugh<sup>2</sup>, S.H. Lacy<sup>2</sup>, J.A. Ake<sup>2</sup>

<sup>1</sup>U.S. Department of Defense Walter Reed Army Institute of Research, Kampala, Uganda, <sup>2</sup>U.S. Department of Defense Walter Reed Army Institute of Research, Silver Spring, United States, <sup>3</sup>U.S. Department of State, U.S. Ambassador to Uganda, Kampala, Uganda

**Background:** The Parliament of Uganda passed the Anti-Homosexuality Act (AHA) with overwhelming majority on 21 March 2023, and the President signed it into law on 26 May. The AHA criminalizes consensual same-sex sexual conduct and the ill-defined "promotion of homosexuality" with sentences ranging from 10 years to the death penalty.

The hostile environment created by AHA has led to reduced access to Key Population (KP)--friendly services.

**Description:** The President's Emergency Plan for AIDS Relief (PEPFAR) supports over 1.3 million Ugandans on HIV treatment, and over 80 drop-in-centers (DIC) that provide HIV prevention and treatment services focusing on KP clients. We describe the impact of AHA on utilization of KP-friendly services in Uganda across three DICs throughout the cycle of AHA until now, and PEPFAR's efforts to sustain KP-friendly services.

**Lessons learned:** The AHA discourse increased in the Ugandan media starting January 2023. Weekly data shows a steady decrease in KP client visits to the 3 DICs, with the lowest when the AHA was in the Parliament, and associated increase in human rights abuses during this time. PEPFAR began adapting and scaling-up KP-friendly service delivery models in February 2023, including but not limited to:

- home delivery of anti-retroviral therapy (ART) and prevention products like condoms and Pre-exposure Prophylaxis (PrEP)
- scaling up multi-month dispensing (MMD) for eligible clients
- employing paralegal peers to offer legal support for KP clients.

These mitigation measures led to a resumption of KP clients accessing HIV services by April which continues to this day as shown in Figure 1.

Figure 1. Cumulative service delivery visits at the 3 DICs.

**Conclusions/Next steps:** PEPFAR programs partnered with civil society organizations to quickly adapt and scale-up client-centric programs showing resilience and adaptability throughout the AHA.

While PEPFAR continues to provide life-saving HIV services, punitive laws like the AHA have potential to derail HIV epidemic control due to the criminalization of homosexual identity and behavior.

## TUPEF669

Breaking down human rights barriers: progress made through the Global Fund to Fight AIDS, Tuberculosis and Malaria initiative in West, Central and North Africa

C. Kazatchkine<sup>1</sup>, J. Papy<sup>2</sup>, J. Mabilat<sup>3</sup>, N. Peerun<sup>4</sup>, D. Lohman<sup>5</sup>, C. Tshimbalanga<sup>6</sup>, D. Sow<sup>7</sup>, M.B. Mahjoubi<sup>8</sup>, S. Ka Hon Chu<sup>1</sup>, J. Amon<sup>9</sup>

<sup>1</sup>HIV Legal Network, Toronto, Canada, <sup>2</sup>Consultant, Königswinter, Germany, <sup>3</sup>Consultant, Frankfurt, Germany, <sup>4</sup>Aids Strategy Advocacy and Policy, Moka, Mauritius, <sup>5</sup>Consultant, Maplewood, United States, <sup>6</sup>UNDP, Dakar, Senegal, <sup>7</sup>Consultant, Dakar, Senegal, <sup>8</sup>Consultant, Tunis, Tunisia, <sup>9</sup>Drexel University, Philadelphia, United States

**Background:** Discrimination and stigmatization hamper access to prevention, care, and treatment. Since 2017, the Global Fund to Fight AIDS, Tuberculosis and Malaria (GF) has been supporting the expansion of programs aimed at removing human rights related barriers to the fight against the three diseases. The Breaking Down Barriers (BdB) Initiative has been deployed in 20 countries around the world. After an initial baseline study, a mid-term evaluation was carried out in 2020 and a progress assessment (PA) in 2023.

**Description:** A team of international and local researchers was set up by Drexel University. Each evaluation involved a literature review and interviews with implementing partners, beneficiaries and other technical and financial partners involved. The evaluation looked at the scale up of human rights programs, their quality, integration (within other prevention and care programs) and impact on access to services. Based on findings, recommendations were made for the GF 2024-2026 new funding cycle.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Lessons learned:** We propose to present progress and challenges identified in Benin, Ivory Coast, the Democratic Republic of Congo, Senegal, and Tunisia where progress assessments of the BaB initiative were conducted in French. PA in these countries have confirmed the importance of integrating human rights programs into other HIV related programs. Peer educators involved in HIV prevention, testing and linkage to care are key to stigma reduction and access to justice of key populations, especially in legal environments that are often punitive. Human rights programs are also interdependent and mutually reinforce one and another. In Ivory Coast, parallel programs coupled with interventions with police forces have reduced stigmatization within law enforcement.

Similarly, in Senegal, LILO ("Looking in Looking Out") sessions for healthcare professionals, together with dialogues with religious and community leaders, police, and administrative authorities have helped reduce stigma and protect HIV interventions for key populations.

**Conclusions/Next steps:** Despite complex social, cultural, and political contexts, progress was made in all countries. Good coordination, including with other technical and financial partners, is essential to scale up human rights programs.

Monitoring and evaluation must also be strengthened to improve our understanding of their impact on access to health and adjust programs where necessary.

majority of the districts in the country and all regions. The documentation and reporting are conducted on a quarterly basis, to provide an overview of reported cases of violence committed against sex workers and LGBTQI persons. The documented violation reports are always disseminated in form of hard and soft copies to key HIV and Human rights stakeholders.

**Lessons learned:** There has been a continuous increase in the number of cases reported involving actions that deliberately targeted sex worker and LGBTQI persons for negative treatment on the basis of their real or presumed sexual orientation and gender identity.

In October to December 2023, a total of 69 cases involving LGBTQ persons were reported across our networks while 83 cases involving sex workers also were reported. The highest number of cases registered were house evictions, community mob justice, poor attitudes by health care providers, increased community stigma.

**Conclusions/Next steps:** Criminalization of sex work and passing of Anti Homosexuality Act, 2023 has significantly affected the lives of sex workers and LGBTQI persons especially affecting access to HIV prevention services. UN-ESO shall continue to document and report the human rights cases and violations committed against sex workers and LGBTQI persons for evidenced advocacy.

There is need to establish and strengthen strategic partnerships and collaborations with human rights organizations, actors and advocates to promote human rights for all.

## TUPEF670

Documenting the effects of sex work criminalizing law and anti-homosexuality Act 2023 on access to HIV services and wellbeing of sex workers and LGBTIQ persons in Uganda

M. Naomi<sup>1</sup>

<sup>1</sup>Uganda Network of Sex Worker - Led Organisations (UNESO), Sex Worker Network, Kampala, Uganda

**Background:** Uganda Network of sex worker-led organizations (UNESO) has continued to monitor the human rights situation and lived realities of sex workers and LGBTIQ persons in the wake of sex work being criminalized and penalized and the passing of the Anti-Homosexuality Act (AHA) 2023 in Uganda. UNESO documents and reports on cases and violations committed against sex workers and LGBTQI persons with an aim to inform evidenced advocacy to influence policy and social change, and to promote implementation of sex workers and LGBTQI persons appropriate and targeted HIV prevention interventions.

**Description:** UNESO as a national network that brings together sex worker -led organizations for sex workers collects and documents human rights violations and cases through its country wide network of sex worker -led organizations which are spread out enough to cover the

## TUPEF671

Mitigating healthcare discrimination against key populations in Bayelsa State: strategies for inclusivity and access

M.O. Ati<sup>1,2</sup>

<sup>1</sup>Synergy Care Development Initiative, Yenagoa, Nigeria,

<sup>2</sup>Center for Clinical Care and Clinical Research, Health Service Delivery, Abuja, Nigeria

**Background:** This project aims to combat the pervasive issue of healthcare discrimination against key populations in Bayelsa State by developing and implementing sustainable, inclusive health policies and interventions. The primary objective is to promote equitable access to healthcare, fostering a non-discriminatory environment and ultimately reducing the incidence of HIV/AIDS among vulnerable groups.

**Methods:** The project utilized a systematic approach to site selection, dividing the state into eight local government areas (LGAs) to capture regional differences. Two healthcare facilities (one private and one public) were randomly chosen from each LGA, using lists provided by the Bayelsa State Ministry of Health. A mixed-methods approach was employed, incorporating qualitative and quantitative data collection. Stakeholder interviews, pol-

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

icy analysis, and community engagement were integral components of the methodology. The project implemented an intervention that included sensitivity training for healthcare professionals, community-led advocacy initiatives, and the creation of 'safe spaces' within existing healthcare facilities.

**Results:** The 104-item survey for healthcare professionals covered demographics, practices related to informed consent, testing, disclosure, treatment, and care of Key Population Members living with HIV, as well as attitudes toward these aspects.

Positive shifts in attitudes were observed post-training, and the integration of 'safe spaces' led to a 40% increase in healthcare utilization, enhancing Client-provider interactions. Concerns identified included fear of contamination (81%) and a lack of materials (65%).

Notably, 9% of respondents admitted to refusing care for Persons living with HIV, while 66% observed others doing the same, and 27% witnessed verbal mistreatment. Additionally, 38% disclosed confidential information to clients' families.

**Conclusions:** The success of the intervention underscores the pivotal role of targeted education and policy reform in dismantling healthcare stigma. This evidence-based model addresses the HIV/AIDS response gap in Bayelsa State and offers a replicable template for similar challenges globally.

For the International AIDS Conference, this study provides impactful insights, advocating for the integration of discrimination-mitigation into public health approaches. Emphasizing sustained monitoring, future directions involve refining methodologies, disseminating best practices, and expanding 'safe spaces' to catalyze systemic healthcare changes, potentially influencing global HIV/AIDS strategies.

## TUPEF672

"The benefits do not reach us": analyzing the discrepancies between the policy and reality for transgender women (hijra) in Dhaka, Bangladesh

S.D. Irfan<sup>1</sup>, H.H. Shanto<sup>1</sup>, M. Reza<sup>1</sup>, M.N. Morshed Khan<sup>1</sup>, S. Islam Khan<sup>1</sup>

<sup>1</sup>International Centre for Diarrhoeal Diseases Research, Bangladesh, Program for HIV and AIDS, Health Systems and Population Studies Division, Dhaka, Bangladesh

**Background:** Transgender women (hijra), though acknowledged as a separate gender by the Government of Bangladesh, are unable to exercise their rights due to socio-structural challenges rooted in heteronormativity. This includes freely expressing their gender identity and sexual behavioral preferences. This calls for systematic policy analyses to understand whether their gendered rights are preserved against the backdrop of the gender declaration.

**Methods:** A mixed methods study was conducted, aiming to understand lived experiences, patterns, and determinants of sexual rights of hijra enrolled in HIV interventions in Dhaka, Bangladesh. Quantitative interviews were conducted with 296 hijra whereas qualitative data emerged from 20 in-depth interviews, five focus groups, and three life case histories. Descriptive statistics and thematic analysis were used for quantitative and qualitative data, respectively.

**Results:** Findings revealed they predominantly could not embody their gender identity. Qualitative evidence elucidated themes of exclusion, disguise, and ostracization from mainstream settings due to feminine mannerisms. This was substantiated by quantitative findings which revealed that 79.2%, (95% CI: 68.0-87.2) obfuscated their hijra identity, among whom 89.8% hid their identities even at home.

A high proportion of respondents were found to hide their sexual partner from society out of fear of stigmatization which was reported by 80.9%, (95% CI: 73.5-86.6) of participants.

The reasoning behind hiding their sexual partner can be understood as 82.2%, (95% CI: 74.5-88.0) of the participants reporting societal stigmatization and marginalization attributed to their sexual activity. Themes of duplicity were substantiated in qualitative findings, which revealed that hijra community members were forced to conceal their relationships and marry women to appease their families.

Additionally, 98.7% (95% CI: 96.5-99.5) reported discrimination based on gender identity, predominantly in public transport (91.8%) and malls (76.5%). The qualitative evidence also revealed that they disguised their identities and were refused services in shops and buses.

**Conclusions:** The policy analysis illuminated crucial insights about the discrepancies between the policy and grounded realities of hijra, in terms of freely expressing their gender identities and pursuing their desired sexual relationships.

These findings could ultimately guide stakeholders and hijra community to convene and ensure their gender and sexual rights are realized, practiced and upheld.

## Navigating barriers to harm reduction in Uganda: an inquiry among people who inject drugs, healthcare workers, law enforcement and judiciary

G. Tumusinze<sup>1</sup>, Z. Nampewo<sup>2</sup>, D. Kasozi<sup>1</sup>, G. Musinguzi<sup>1</sup>, S.T. Alamo<sup>3</sup>, C. Ajulong<sup>3</sup>, M. Baluku<sup>3</sup>, A.C. Awor<sup>3</sup>, J. Musinguzi<sup>4</sup>, N. Musoba<sup>5</sup>, P. Kyambadde<sup>4</sup>, G. Pande<sup>4</sup>, D. Byamukama<sup>5</sup>, E. Mwebaza<sup>6</sup>, A. Jjuuko<sup>6</sup>, A.G. Fitzmaurice<sup>3</sup>, R. Wanyenze<sup>1</sup>

<sup>1</sup>Makerere University School of Public Health, Disease

Control and Environmental Health, Kampala, Uganda,

<sup>2</sup>Makerere University School of Law, Human Rights and

Peace Center (HURIPEC), Kampala, Uganda, <sup>3</sup>US Centers

for Disease Control and Prevention, Global Health Center,

Division of Global HIV&TB, Kampala, Uganda, <sup>4</sup>Ministry of

Health, Kampala, Uganda, <sup>5</sup>Uganda AIDS Commission,

Kampala, Uganda, <sup>6</sup>Human Rights Advocacy and

Promotion Forum (HRAPF), Kampala, Uganda

**Background:** Stigma, discrimination, punitive laws, and policies can increase HIV vulnerability and reduce access to services for people who inject drugs (PWIDs). Uganda introduced opioid agonist therapy in 2021 and adopted a harm reduction approach to mitigate adverse health behaviors with strategies like needle exchange programs and supervised injection sites. However, punitive laws could reverse progress.

We explored obstacles to implementing harm reduction strategies in Uganda. Guided by a human-rights-based approach, we focused on identifying ways in which laws, policies, and practices can infringe on human rights.

**Description:** We conducted a cross-sectional study in 15 districts across five regions of Uganda in January and February 2022. We conducted desk reviews of existing laws and policies, 56 key informant interviews, 16 focus group discussions, and two consultative workshops, engaging healthcare workers, PWID community members, legal professionals, and government officials from the police and judiciary.

**Lessons learned:** The general approach to drug control in Uganda is punitive rather than restorative, resulting in fear of PWIDs being arrested. This is codified in laws such as the Narcotic Drugs and Psychotropic Substances Control Act of 2016, which criminalizes drug use. The legal environment is exacerbated by enforcement approaches and other marginalizing treatment.

For example, PWIDs reported torture, physical assault, verbal abuse, denial of privacy, and humiliation by law enforcers. They reported negative attitudes from law enforcers manifesting as hostile attitudes, unjust treatment, and premature criminalization, often based on prejudice rather than legal facts.

Furthermore, PWIDs reported being denied the opportunity to legally register as associations under identities reflecting their unique challenges and needs, forcing them to operate under disguises, which consequently hampers their collective ability to advocate.

**Conclusions/Next steps:** The current punitive drug control approach in Uganda undermines harm reduction efforts for PWIDs. Shifting from punitive towards health-centered approaches (e.g., community-based treatment), amending restrictive laws, improving law enforcement practices, and facilitating legal recognition for PWID associations are some ways Uganda might address these challenges and enhance harm reduction strategies.

## TUPEF674

## Despite WHO's fast track strategy for middle-income nations, barriers to HIV treatment are still part of asylum seeker's claims

K. Li<sup>1</sup>, D. Munro<sup>1</sup>

<sup>1</sup>HIV/AIDS Legal Centre, Surry Hills, Australia

**Background:** Australian Migration Act 1958 (Cth) provides that a "refugee" is any individual, due to a well-founded fear of persecution, is outside their country of nationality and unable or unwilling to return. Persecution must involve systematic and discriminatory conduct, and the requirement of "serious harm". Serious harm includes significant economic hardship that threatens the person's capacity to subsist and denial of access to basic services where the denial threatens the person's capacity to subsist. Denial of access to HIV medication and medical treatment for people living with HIV constitutes "serious harm" under Australian migration law.

**Description:** HIV/AIDS Legal Centre (HALC) over the years has been assisting asylum seekers in their pursuit of protection in Australia, including those from middle-income countries. Despite the World Health Organization's progress on Fast-Track or 90-90-90 targets,<sup>1</sup> asylum seekers from middle-income nations frequently articulate fears of serious harm associated with denial or limited access of medical treatment.

1. <https://iris.who.int/bitstream/handle/10665/351996/9789240041264-eng.pdf?sequence=1>

**Lessons learned:** Our case studies reveal a common pattern in middle-income nations regarding medication accessibility for people living with HIV (PLHIV). While it may initially appear that PLHIV have access to HIV treatments, upon closer examination of the deeply rooted cultural norms in these nations, challenges such as stigma, insufficient sexual education, and a lack of HIV awareness emerge, preventing both receipt of treatment and societal acceptance of PLHIV, impacting their ability to thrive. In many instances, these barriers to treatments contribute to asylum seekers meeting the criteria for refugee assessments.

**Conclusions/Next steps:** HIV-related stigma remains a significant obstacle in middle-income countries and impacts PLHIV from accessing adequate treatments, despite government assurances of freely available services. Until there is improvement in sexual and HIV education, it

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

is anticipated that more PLHIV will seek protection due to the denial of medical treatments in their home countries. HALC continues to offer legal advice and representation, as well as legal education to the community and asylum seekers.

## TUPEF675

### Translating human rights concepts into the monitoring framework to inform HIV-programming and advocacy: a community-based approach from Ukraine

N. Semchuk<sup>1</sup>, O. Pashchuk<sup>1</sup>

<sup>1</sup>ICF "Alliance for Public Health", Monitoring and Evaluation, Kyiv, Ukraine

**Background:** Removing human rights-related barriers is crucial to successful HIV response. HIV-related stigma and discrimination, denial of services prevent people living with HIV and key populations from seeking and uptaking of health services. To achieve a significant impact in the fight against HIV, human rights-related barriers must be identified, analysed and redressed.

With the aim of monitoring and addressing human rights violations of key populations, ICF "Alliance for Public Health" in 2019 launched the REAct (*Rights-Evidence-Action*) system.

**Description:** REAct is an on-line community-based human rights monitoring and response programme. System allows to document cases of human rights-related barriers that key populations experience in accessing HIV and other health-related services, as well as to respond to cases identified.

System has been implemented in Ukraine by 101 community-based organizations in 19 regions out of 24. About 10,000 cases of human rights violations among key vulnerable to HIV and TB populations were registered in total. REAct programme using a person-centred approach allows to describe socio-demographic profiles of human rights violations of key populations, as well as to identify patterns and trends in terms of the types, frequency, and causes of human rights violations.

Figure. REAct cases registered by key populations (Ukraine, since 2019).

**Lessons learned:** Implementation of human rights monitoring ensure gathering adequate, sound and real-time data for further analysis, program and advocacy actions. Data documented shapes accessibility and provision design of health and legal services, inform inclusion of rights-holders from key populations in the human rights perspective, as well as facilitate agenda for decision-makers with the aim to drive an individual and system levels rights-based changes.

**Conclusions/Next steps:** Human rights frameworks are essential in filling human rights-related data gaps and informing policy and HIV-programming related to human rights. In seeking redress for human rights violations, monitoring support measurement of the progress (or its lack) in the protection, promotion and fulfillment of human rights among key populations.

## TUPEF676

### United for change: collaborative efforts for gender equity and human rights in the national HIV response in Nigeria

Y. Falola-Anoemuah<sup>1</sup>, E. Clement<sup>1</sup>, F. Iyamu-Obi<sup>2</sup>, Y. Olaifa<sup>2</sup>

<sup>1</sup>National Agency for the Control of AIDS (NACA), Performance Management and Resource Mobilization, Abuja, Nigeria, <sup>2</sup>National Agency for the Control of AIDS (NACA), Community Prevention and Care Services, Abuja, Nigeria

**Background:** The global emergence of the HIV/AIDS pandemic has led to a widespread violation of human rights and fundamental freedoms (UN, 2001s). About 243 million women/girls aged 15-49years, experienced sexual or physical violence globally (UN Women, 2019). The Gender Assessment of the national HIV response in Nigeria (2013, 2022) indicate intrinsic relationship between gender-based violence and other human rights violations and HIV. Human rights violations contribute to the spread of HIV infection and exacerbates its severity on social and economic well-being of individuals.

Gender equity and human rights remain critical pillars in the battle against HIV and informed the collaborative initiative for interventions to address gender and human rights (GHR) barriers impacting key and vulnerable populations in the national HIV response in Nigeria with the support of Global Funds grant circle 6.

**Description:** The Global Fund seven strategies for addressing human rights was used to develop the GHR interventions in the HIV response under the leadership of the National Agency for the Control of AIDS (NACA).

The multi-sectoral partnership included government Ministries Department and Agency at national and sub-national levels including human rights commission, HIV and TB implementing partners, network of people living with HIV, and TB, key populations in their typology (MSM, SW, PWID and Transgender people), and other civil

society groups. Using Community-Led-Monitoring (CLM) framework for feedback mechanism, quantitative and qualitative data was collected from 52,470 community members in selected States on identified key gender and human rights priorities.

**Lessons learned:** Between July 2022 and September 2023, the HIV Gender and Human Rights State Response mechanism using the community rights advocates successfully resolved 72.5%, 282 of the 389 documented cases of gender and human rights violations by employing Alternative Dispute Resolution (ADR). 74 cases (19%) are pending resolution and in litigation while 38 cases (9%) cases were withdrawn by complainants.

**Conclusions/Next steps:** United for change, collaborative endeavors have proven instrumental in advancing gender equity and human rights in the Nigeria's HIV response. The CLM qualitative strategy also revealed deep and detailed perspectives of the gender equity and human rights of HIV. Comprehensive efforts continued to sustain and scale-up the intervention across the country.

## TUPEF677

Strengthening Mozambique sex workers movement capacity to integrate and sustain centered human rights approach to address GBV

A.J. Zandamela Goncalves<sup>1</sup>, J.S. Rajabo<sup>2</sup>, J. Vilanculos<sup>2</sup>

<sup>1</sup>ISCED, Maputo, Mozambique, <sup>2</sup>N/A, Maputo, Mozambique

**Background:** The HIV prevalence, although data shows a slight decrease (13.5% to 12.4%) in general population, for sex workers are increasing where the contribution to HIV epidemic is 30%. Stigma and discrimination, social violence and physical violence are main forms of VBG perpetrated by clients and law enforcement increasing their vulnerability to HIV. To address GBV, Pathfinder is strengthening the sex workers rights movement.

**Description:** Pathfinder is strengthening the sex workers' movement called the National Platform for Sex Workers' Rights( NSWRP) created in 2017 and bringing together 22 sex workers' organizations, aiming to advocate for their human rights , access to health services free of stigma. Capacity building comprises an integrated approach:

- Mapping the needs of organizations using the OCAT (organizational capacity assessment tool) adjusted for key population organizations;
- Jointly drawing up work plans according to joint weaknesses with the definition of specific benchmarks;
- Quarterly meetings to assess the progress of work plans and monitor targets.

**Lessons learned:** A total of 4,814 cases (19% transgender women, 42% FSW and 10% MSM) of GBV were reported, of which 28% represent young sex workers (<24 years). Of the reported cases of GBV, there were 921 cases of stigma and discrimination, 576 of bullying and intimidation and 749 cases of physical violence.

Strengthen the skills and competencies of SW led to implement violence prevention approaches, increase reporting of GBV cases and strengthen public policy programming for protection and HIV needs. As result of strengthening NSRP, Police is conducting joint planning and supervision activities with Platform both provincial and national level with sex workers to monitor and manage cases of violence perpetrated either by clients or law enforcement.

The data is discussed in a quarterly basis between Police and NSRP representatives, and actions plans are developed and monitored together.

**Conclusions/Next steps:** The data demonstrates the relevance of strengthening sex worker-led organizations so that they can implement an integrated GBV and HIV prevention actions. As a next step, Pathfinder will work collaboratively with the Platform to register as a SW consortium, and link NSWRP board to technical working group for HIV prevention at national and provincial level.

Low engagement of key populations in HIV health services in Tanzania. Analysis of community, legal and policy factors

A. Kigombola<sup>1</sup>, J. Lyimo<sup>2</sup>, M. Mizinduko<sup>3</sup>, D. Mkembela<sup>4</sup>, W. Kafura<sup>5</sup>, A. Maghimbi<sup>1</sup>, C. Musanhu<sup>2</sup>

<sup>1</sup>CIHEB Tanzania, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>WHO Tanzania, Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>Muhimbili University, Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>UNDP, Dar es Salaam, Tanzania, the United Republic of, <sup>5</sup>TACAIDS, Dar es Salaam, Tanzania, the United Republic of

**Background:** Key populations (KP) are defined by the World Health Organization (WHO) as both vulnerable populations and populations at higher risk of acquiring HIV infection. KP often face legal and social challenges that increase their vulnerability to HIV. These experiences include criminalization, higher levels of stigma and discrimination which negatively affect access to HIV services. This study aims to understand legal, community and policy factors affecting engagement of KP in HIV health interventions.

**Methods:** Qualitative research design involving a desk review and stakeholder's engagement. Desk review of national and zonal dialogues minutes, legal literacy meetings reports, national HIV response guidelines and policies was done. We reviewed program data from NACP on how KP access health services and then conducted three stakeholders' engagement meetings with 78 participants from 11 regions. Factors affecting access to health services by KP were documented. Data were organized using socio-ecological model (SEM).

**Results:** Program data showed only 49% of the estimated KP accessed health services. In the stakeholders' meetings, a total of 78 participants were involved. Barriers to

accessing health services at the interpersonal level include lack of social support and association with high-risk networks linked with risk behaviours. At the community, stigma and discrimination in different settings including health facilities, limited engagement of influential leaders in advocacy and addressing discrimination and violence were noted. In health facilities, lack of trained staff to provide KP friendly services coupled with limited HIV services beyond working hours affected utilization of health services.

At structural level, despite improvements in laws and policies, still various laws negated engagement of KP such criminalizing drug use, same sex relationship and sex work. Harassment and unwarranted arrests from law enforcement further marginalize KP and makes access to health intervention harder.

**Conclusions:** Engagement of key population into HIV health interventions was limited at multiple levels. The study recommends building capacity on KP friendly services for communities, law enforcement and health care providers, further engagement of communities including religious leaders on KP issues and implementing differentiated service delivery models for KP.

## TUPEF679

Empowering communities, enhancing care: the role of comprehensive harm reduction in the HIV/HCV response

K. Schiffer<sup>1</sup>, I. Jeziorska<sup>1</sup>

<sup>1</sup>Correlation - European Harm Reduction Network, Amsterdam, Netherlands, the

**Background:** People who use drugs and related populations are disproportionately affected by HIV/HCV, while their right to health and freedom from discrimination are often not guaranteed. Furthermore, their access to integrated HIV/HCV prevention, treatment and care services remains limited. As health risks are frequently associated with high-risk drug use, harm reduction services are an essential element of the policy response.

The BOOST project aims to support and strengthen community-based organisations, enhancing their capacity to deliver communicable disease services as integral components of comprehensive harm reduction strategies.

**Methods:** The BOOST Multi-Modular Survey (MMS) aimed to gather information about infectious disease services within European community-based harm reduction settings. Distributed across major European harm reduction networks, it yielded 65 complete responses. The MMS was complemented by focus group discussions (FGDs) with people with living experience in four European cities.

**Results:** Survey findings show that various health interventions are offered on-site or via referral, with stigma-related reluctance being the primary barrier (62%) to reach out to potential clients, followed by funding constraints,

limited capacity, and accessibility issues. At the level of inter-service collaboration, stigma and limited accessibility of specialist services pose challenges to continuity of care. The results of FDGs highlight the greater involvement of peers, scaling up rapid testing in harm reduction services, increasing availability of testing in non-medical settings and lowering the treatment threshold as essential factors for more accessible care.

**Conclusions:** The data underscores stigma and service accessibility as the principal obstacles hindering access to vital HIV and HCV services for people who use drugs, hindering the continuity of care. The findings emphasise the need for comprehensive policies addressing discrimination, promoting inclusivity, and supporting community-based and community-led services.

The significance of this study and the BOOST project lies in its potential to inform targeted policies and actions aiming to improve the accessibility of care for people who use drugs. Integrated testing, treatment and care as part of a comprehensive harm reduction approach and locating it in community-based settings will enhance service delivery, ensure continuity, and prioritise key populations' human rights and well-being.

## TUPEF680

The power of GIPA/MIPA: the game-changing framework for advocacy in Aotearoa New Zealand

R. Olin German<sup>1</sup>, S. Saini<sup>1</sup>, B.M. Hollingshead<sup>1</sup>, C. Leakey<sup>1</sup>, J. Brunning<sup>2</sup>, M. Fisher<sup>3</sup>, J. Rich<sup>1</sup>, M. Stewart<sup>4</sup>, S. McAllister<sup>5</sup>, C. Greenwood<sup>6</sup>, J. Mukakayange<sup>2</sup>, C. Healy<sup>7</sup>

<sup>1</sup>Burnett Foundation Aotearoa, Auckland, New Zealand,

<sup>2</sup>Positive Women Inc., Auckland, New Zealand, <sup>3</sup>Body

Positive, Auckland, New Zealand, <sup>4</sup>Toitu Te Ao, Rotorua,

New Zealand, <sup>5</sup>University of Otago, Dunedin, New Zealand,

<sup>6</sup>Needle Exchange Programme, Wellington, New Zealand,

<sup>7</sup>NZ Prostitutes Collective, Wellington, New Zealand

**Background:** 2024 marked 30 years of the Paris Declaration on the Meaningful Involvement of People living with HIV (MIPA). In 2019, people living with HIV mobilised to implement the Stigma Index in NZ, which has since been used as an advocacy tool to recentre conversations in the HIV response on the wellbeing of people living with HIV. The legacy of this ground-breaking work in NZ includes the subsequent embedding of the MIPA principles throughout the national HIV response, including in the writing of the first HIV Action Plan published by the government in 20 years.

**Description:** The NZ Stigma Index reports were launched in 2020. It was a collective effort by HIV-sector and community-based organisations of people living with HIV and allies. The reports highlighted stigma and discrimination in relation to healthcare settings, disclosure, internalised stigma, and compounded stigma. Data on quality of life was also collected.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Lessons learned:** Community research conducted by and for people living with HIV is a powerful tool for advocacy. It mobilises people living with HIV, it is empowering and creates evidence to advocate for systemic change. MIPA principles were adopted by the NZ Ministry of Health in its HIV Action Plan along with most of the 39 Stigma Index Report recommendations.

However, the work required to ensure the diversity of people living with HIV is captured through MIPA processes, takes significant time and resources. Continued advocacy was needed to ensure peer support organisations were included in the development of the Action Plan.

This remains a challenge given continuing insufficient funding and time allocated to MIPA processes and projects, specific to the health and wellbeing of people living with HIV.

**Conclusions/Next steps:** NZ is on track to end local transmission of HIV by 2030, but work must continue to advocate for greater and meaningful involvement of people with HIV and AIDS in the response, to ensure people living with HIV can live healthy lives free of stigma and discrimination.

Creative collaboration, unity, and shared resources among community organisations is foundational to the continued progress of MIPA, and securing resources for projects focusing on empowering people living with HIV.

## Ethics and HIV

### TUPEF681

Potential opportunities in data-related workflow processes to minimize bias within Electronic Health Records data: a qualitative study

A. N'Diaye<sup>1</sup>, S. Qiao<sup>1</sup>, C. Garrett<sup>1</sup>, G. Khushf<sup>1</sup>, B. Olatosi<sup>1</sup>, J. Zhang<sup>1</sup>, X. Li<sup>1</sup>

<sup>1</sup>University of South Carolina, Department of Health Promotion, Education and Behavior, Columbia, United States

**Background:** Electronic health records (EHR) data has been widely used in public health research including HIV-related studies.

However, it is also limited by potential bias due to incomplete and inaccurate information, lack of generalizability, and lack of representativeness.

This study explores how improved workflow processes within HIV clinics and data scientists may minimize opportunities for bias within EHR.

**Methods:** Using a constructivist grounded theory approach, we conducted in-depth individual interviews with 15 participants (5 health care practitioners within an HIV clinic, 5 persons with HIV (PWH), and 5 data scientists in

charge of data integration) purposively recruited in South Carolina between August 4th-18th 2023. Interviews took 45 to 60 minutes with a semi-structured interview guide and were transcribed verbatim.

Analysis was conducted as outlined by Charmaz (2006), whereby transcripts were first initially coded. These initial codes were then focus, axial, and theoretically coded. The analytical matrix of study findings was sufficiently discussed to obtain consensus.

**Results:** To reduce bias in the EHR, the data entry forms should capture critical patient self-reported social determinants of health (SDOH) information like gender identity, sexual orientation, preferred language, disability status, and access to transportation, etc.,.

During the data collection, healthcare providers should create a supportive healthcare environment by developing strong patient rapport, proactively asking patients about their SDOH information, and accurately documenting in EHR what patients shared during their appointments.

Patients should access their EHR to check and verify that all identity specific data (i.e., gender, race, sexual orientation) are correctly stated.

During data management and cleaning, data scientists should inspect datasets for completeness and accuracy prior to model development, and educate users about the limitations of the EHR datasets.

**Conclusions:** To our knowledge this is the first study to examine how workflow processes are structured to minimize bias within EHR for PWH.

Future research should examine how healthcare systems can be incentivized to create and implement EHR bias reduction strategies across all workflows.

### TUPEF683

Empowering sex workers: Jasmine online platform for reporting and preventing violence

P.G. Macioti<sup>1</sup>

<sup>1</sup>Médecins du Monde, Paris, France

**Background:** Since the adoption of the law criminalizing clients of sex workers and Covid, Médecins du Monde has noted an increase in the number of sex workers working through the internet.

We estimate that more than a third of sex workers have already been exposed to rape. This rate of exposure to sexual violence by a stranger is 15 times higher than in the general population.

As a result of sexual violence, exposure to HIV is increased by 25%, yet only 1/3 of sex workers seek care following an assault.

Consequently, combating violence against sex workers is clearly part of the response to the epidemic.

**Description:** The first answer in the fight against violence against sex workers is prevention.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

The sex workers most exposed to violence are those new to the business, yet they have no access to informal systems for sharing information on aggressors.

We have developed a website available in 10 languages, providing:

A platform for reporting incidents of violence, enabling sex workers to identify the telephone numbers of potential aggressors.

- Information on global health.
- An interactive, geo-localized map listing structures providing access to care and rights following violence.
- A multilingual interview guide to help identify health needs following a sexual assault.
- The site was developed in close collaboration with the sex workers' community to ensure its acceptability.
- Each report of violence is followed up with a referring to a support organization to ensure better access to health care.

**Lessons learned:** It is essential to work closely with sex workers communities on this type of tool, in particular by integrating sex workers into the project team.

We diversified communication and outreach methods aimed at sex workers. A communication strategy using social networks has been developed.

**Conclusions/Next steps:** Adopted by communities of sex workers, the alert system is seen as an indispensable prevention tool.

In order to guarantee its effectiveness in preventing violence, as well as its anchorage within the sex workers' community, we plan to transfer the program to a new community-led organization created and supported by Médecins du Monde.

## TUPEF684

### Adolescent perspectives on enrolling in two HIV clinical research vignettes during pregnancy

H. Baron<sup>1</sup>, A. Mussa<sup>2,3</sup>, R. Rajeshmohan<sup>2,4</sup>, A. Hagan-Bezgin<sup>2,5</sup>, A. Thom<sup>6</sup>, M. Bapabi<sup>2</sup>, K. Ramontshonyana<sup>2</sup>, P. Mmodzi<sup>6</sup>, P. Winner<sup>6</sup>, M. Kasule<sup>2</sup>, A. Bula<sup>6</sup>, C. Morroni<sup>2,7</sup>, A.D. Lyerly<sup>1</sup>, S. Day<sup>8</sup>

<sup>1</sup>University of North Carolina at Chapel Hill, Center for Bioethics, Social Medicine, Chapel Hill, United States, <sup>2</sup>Botswana Harvard AIDS Institute Partnership, Gaborone, Botswana, <sup>3</sup>Usher Institute, University of Edinburgh, Edinburgh, United Kingdom, <sup>4</sup>University of California, Berkeley, School of Public Health, Berkeley, United States, <sup>5</sup>University of Liverpool, Liverpool, England, School of Medicine, Liverpool, England, United Kingdom, <sup>6</sup>UNC Project Malawi, Lilongwe, Malawi, <sup>7</sup>MRC Centre for Reproductive Health, University of Edinburgh, Edinburgh, United Kingdom, <sup>8</sup>University of North Carolina at Chapel Hill, Division of Infectious Diseases, Department of Medicine, Chapel Hill, United States

**Background:** Pregnant adolescents face greater challenges related to HIV compared to pregnant adults, including higher risk of HIV acquisition and maternal/fetal morbidity and mortality. However, pregnant adolescents are often excluded from clinical HIV research participation, resulting in less evidence to inform safe and effective treatment/prevention strategies.

We sought to understand the views of adolescents on potential enrollment in HIV prevention/treatment research in order to develop ethical guidance that can help expand the responsible inclusion of pregnant adolescents in clinical research.

**Methods:** Eighty in-depth interviews were conducted with ever pregnant adolescents (40 living with HIV, 40 at-risk) recruited from local clinics in Botswana and Malawi.

Questions in the semi-structured interview guide explored decision-making around enrollment during pregnancy using two vignettes depicting hypothetical HIV studies:

1. Testing a new medication to prevent/treat HIV that has not yet been studied in pregnancy, and;
2. A randomized control trial (RCT) comparing a daily pill vs. a new injectable that has not yet been studied in pregnancy.

Interviews were transcribed, translated to English, and coded in NVivo, and emergent themes were identified.

**Results:** Most adolescents reported willingness to join at least one of the two vignette studies. The most common reasons for willingness to join were potential benefit of treating and/or preventing HIV in themselves and the fetus and helping women or people who can become pregnant in the future.

Some participants also noted interest in joining an HIV prevention study to prevent potential HIV acquisition from unfaithful partnerships. However, some participants

were reluctant to join the RCT, citing uncertainty of randomization because of wanting to decide for themselves which medication they will take during pregnancy.

**Conclusions:** While adolescents highlighted concerns of randomization and medication safety during pregnancy, their ability to assess study risks and benefits and their high willingness to join at least one vignette study suggests that current HIV research, which largely excludes pregnant adolescents, may be misaligned with the views, interests, and capacities of potential participants. These findings underscore the need for ethical guidance to support adolescent inclusion in HIV research during pregnancy.

## Policy development, implementation and analysis

### TUPEF685

#### Community-led monitoring in prisons of CEECAC region

A. Koshikova<sup>1</sup>

<sup>1</sup>*Eurasian Movement for the Right to Health in Prisons, Tbilisi, Georgia*

**Background:** The purpose of the study was to assess the existing policies and practices of community-led monitoring (CLM) in prisons of CEECAC region. The results of the study became the basis for the CEECAC Road map on CLM of access to HIV, TB, HCV services without discrimination. The study included desk research and 16 in-depth interviews with community representatives and civil society activists from 8 countries of the region.

**Description:** CLM policies and practices in prisons differ much from country to country based on country context and the level of cooperation with penitentiary authorities and prison administrations.

There are important differences between CLM approaches in the penitentiary and civil sector attributed to limited opportunities for direct engagement with the incarcerated population, restricted access to the Internet and digital communication devices, security threats, confidentiality of data, limited access to prisons, possibilities to use received data for advocacy.

**Lessons learned:** While CLM is supposed to be fully community-driven, in the situation with prison settings it is necessary to use **existing government monitoring mechanisms** with the involvement of community representatives to conduct CLM in prisons. Such mechanisms include public oversight commissions/groups (POC), national preventive mechanisms (NPM), Ombudsperson's office and other independent national mechanisms. CLM may serve as a tool to inform POCs and NPMs about spe-

cific instances of right to health violations and can bolster their ability to identify indicators of inadequate health-care within prisons, particularly for specific vulnerable groups. Best CLM practices include Ukraine with a special digital tool developed by a CBO and accepted for official use by prisoners by the penitentiary authorities, Moldova with regular CLM conducted through service provision projects by NGO and active participation of community representatives in the work of NPM.

**Conclusions/Next steps:** Based on the result of the study we have proposed a **logical matrix for CLM implementation** that can be adapted on the ground based on the CLM objectives, particular country contexts, capacity of organizations, conducting CLM and other relevant factors, as well as suggested **data institutionalization mechanisms** based on specific country examples of CLM practices in the domain of ensuring the right to health in prisons.

### TUPEF686

#### Generating data to enhance ethics deliberations and policies regarding HIV molecular surveillance

J. Bollinger<sup>1</sup>, G. Geller<sup>1</sup>, J. Brewer<sup>2</sup>, A. Schuster<sup>3</sup>, M. Valenzuela Lara<sup>4</sup>, J. Bridges<sup>3</sup>, J. Sugarman<sup>1</sup>

Study of Ethics and Stakeholder Attitudes towards Molecular Epidemiology (SESAME) Study Team

<sup>1</sup>*Johns Hopkins University, Baltimore, United States*, <sup>2</sup>*Johns Hopkins Bloomberg School of Public Health, Baltimore, United States*, <sup>3</sup>*Ohio State University, Columbus, United States*, <sup>4</sup>*Emory University, Atlanta, United States*

**Background:** Molecular HIV surveillance (MHS) uses antiretroviral resistance testing (ARVRT) data to help identify and respond to emerging HIV transmission clusters. However, MHS raises ethical concerns around consent, privacy, stigma and potential HIV criminalization leading to some calls for a moratorium on its use. MHS policy recommendations have recently begun to emerge, including a US Presidential Advisory Council on HIV/AIDS (PACHA) resolution. As such guidance is developed, it is important for it to be informed by empirical data reflecting a broad range of stakeholders.

**Methods:** We conducted a mixed methods study regarding MHS risks and benefits with multiple stakeholders: (1) Developing an educational whiteboard video regarding MHS with town hall input (n=4); (2) In-depth interviews (IDIs) with people living with HIV and those at increased risk (n=24); (3) National surveys and survey experiments with (MSM) men who have sex with men (n=2524, n=3851); and (4) Open-ended survey questions to assess the needs of researchers and public health practitioners (n=57) related to MHS.

**Results:** IDIs identified support for MHS, but perspectives about MHS were conflated with concerns about HIV public health surveillance more generally. A survey with MSM (n=2524) revealed that the level of discomfort with MHS

Oral

decreased as awareness increased. A survey experiment with MSM (n=3851) found that most are willing to undergo ARVTR when MHS uses are disclosed by a clinician, however, discovery of MHS use after testing decreased ARVTR willingness. In the needs assessment with professionals, ethical concerns were identified as a major challenge of using MHS by nearly one in five researchers (19.5%) and public health practitioners (19.8%).

All the suggestions for addressing these ethical concerns focused on eliminating HIV criminalization laws. Moreover, 20% of public health practitioners identified a lack of community support as a major challenge in MHS.

**Conclusions:** Overall, our findings provide evidence supporting many of the actions called for in the 2022 PACHA resolution such as community engagement, collecting evidence concerning MHS use, addressing HIV criminalization laws, and encouraging clinicians to disclose MHS uses of ARVTR results to those tested. Nevertheless, these data must be supplemented by those from other stakeholders.

## TUPEF687

**Empowering youth: a multi-component approach to strengthening SRHR for HIV prevention and resilient health systems in Uganda**

A. Kyagera Nairuba<sup>1</sup>

<sup>1</sup>Center for Human Rights, University of Pretoria, Pretoria, South Africa

**Background:** This abstract highlights the "Get Up Speak Out" (GUSO) initiative, a transformative project addressing the significant challenges faced by Ugandan youth, aged 10-24, in accessing Sexual and Reproductive Health and Rights (SRHR) services. Implemented in Mayuge, Jinja, Iganga, and Bugiri districts, GUSO responded to the limited autonomy of young people in Uganda, where over half the population is below 18 years old.

Through a multi-component approach, the program aimed to empower young people, particularly girls and young women, fostering a positive societal environment for their sexual and reproductive health.

**Description:** The GUSO program, spanning from 2016 to 2020, aimed to enhance SRHR through strengthened alliances, empowered youth, increased SRHR information utilization, and improved the socio-cultural and legal environment.

Implemented in collaboration with the SRHR Alliance in Uganda and GUSO consortium partners, the program engaged in diverse activities, including capacity-building, mentorships, media campaigns, and innovative responses to the challenges posed by the COVID-19 pandemic, such as webinars and online meetings. The project addressed critical issues like child protection and child labor, contributing to a positive impact on youth empowerment and SRHR outcomes.

**Lessons learned:** Through robust monitoring and evaluation, the GUSO program showcased significant accomplishments. Over 269 young individuals received SRHR information, and around 60 duty bearers experienced strengthened capacities. The program effectively collaborated with Members of Parliament, advocating for supportive SRH Youth-Friendly Services environments.

Notably, the partnership with the Mayuge District COVID-19 task force enabled continued SRHR work during the pandemic, highlighting the adaptability of the initiative.

Key lessons learned underscored the potency of peer-to-peer approaches in reaching young people with SRHR information and the pivotal role of youth participation in decision-making bodies, exemplified by Community Health Advocates in the district task force.

**Conclusions/Next steps:** GUSO's findings have vital implications for HIV prevention and care. By addressing SRHR barriers for young individuals, the program strengthens health systems. Successful COVID-19 innovations, like webinars, emphasize the importance of virtual approaches. Looking forward, sustained efforts are needed to integrate SRHR into HIV programs, emphasizing youth empowerment for enduring progress in HIV prevention and public health.

## TUPEF688

**Harmonizing a global vision with local action: safeguarding clients in HIV programming in Vietnam**

A.V.T. Nguyen<sup>1</sup>, H.K.T. Tran<sup>1</sup>, R.S. Coley<sup>1</sup>, D.M. Levitt<sup>1</sup>

<sup>1</sup>FHI 360 Vietnam, Hanoi, Viet Nam

**Background:** Participants of HIV programming may experience increased vulnerability to sexual exploitation and abuse (SEA), and other harms. In July 2022, FHI 360 launched new global safeguarding standards and toolkits. The USAID-funded and FHI 360-implemented EpiC Vietnam project, which supports HIV service provision, sought to align the global guidance with local project needs.

**Description:** In October 2022, EpiC Vietnam assessed the project's vulnerability to SEA, risks that increase the likelihood of SEA/other harm, compliance with safeguarding actions, and implementing partners' adherence to safeguarding standards using four self-assessment checklists. Identified risks included data collection for minors, service provision for key populations, contextual challenges, gender imbalances, and supplier- and media-related risks. By tailoring a headquarters tool, Vietnam then formulated anti-trafficking compliance and action plans to address identified risks and harmonize global policies with local practices. EpiC integrated safeguarding topics into project trainings, adjusted consent forms, reviewed relevant local requirements, improved supplier monitoring,

disseminated accessible reporting channels, and organized awareness-raising activities. A follow-up evaluation in September 2023, using the same four tools, underscored EpiC's commitment to robust safeguarding and accountability measures.

**Lessons learned:** Consistently high SEA vulnerability ratings reflect the project's work with vulnerable populations and highlight the importance of internal measures to mitigate risk.

To communicate the global standards effectively and ensure compliance, alignment with Vietnamese policies and reflection on potential adjustments to global policies were critical. With FHI 360 authorization, EpiC adapted age and consent requirements to align with Vietnamese law and strategy to promote HIV testing among younger populations.

Figure. EpiC Vietnam compliance with safeguarding domain standards (self-assessment).

**Conclusions/Next steps:** Implementation of global safeguarding policies for HIV program participants requires harmonization with local contexts.

Despite these efforts, EpiC Vietnam still recognizes discrepancies between global and local standards, and challenges aligning them.

Continuous efforts are needed to tailor the project's future safeguarding efforts, ensure effective risk mitigation, and measuring the compliance.

## TUPEF689

Breaking coordination-planning-and-programming barriers and silos: the primacy and impact of organizational change in Malawi's HIV development partner group

U. Roxo<sup>1,2</sup>, N. Ceesay<sup>3</sup>, C. Mablekisi<sup>4</sup>, R. Nyirenda<sup>5</sup>

<sup>1</sup>U.S. Department of State, Lilongwe, Malawi,

<sup>2</sup>Radford University Carilion, Radford, United States,

<sup>3</sup>UNAIDS, Lilongwe, Malawi, <sup>4</sup>National AIDS Commission,

Lilongwe, Malawi, <sup>5</sup>Government of Malawi, Lilongwe,

Malawi

**Background:** UNAIDS and U.S. Department of State jointly led Malawi's HIV/AIDS Donor group (HADG) with bilateral and multilateral donors to contribute toward reaching HIV epidemic control. However, an organizational shift was needed. HADG leaders incorporated new organizations and coordination hubs integrating HIV prevention,

diagnosis, treatment, viral load suppression, resource tracking, human rights, climate change and pandemic response mandates.

**Description:** In lieu of the Paris Declaration on Aid Effectiveness (2005) and Lusaka Agenda on the Future of Global Health Initiatives (2023), a broader constituency-based forum for leaders supporting Malawi's national HIV and AIDS strategy was instituted. As a multi-stakeholder working group chaired by rotating agencies in close collaboration with Government of Malawi, members meet monthly. This reconstituted 2022 HIV and Development Partners (HADEP) now benefits from more effective engagement across national ministries, departments, and agencies (MDAs). MDAs co-convene local stakeholders and implementers to limit duplication and better target investments to reach people living with HIV and adolescent subpopulations.

**Lessons learned:** Intensive outreach and a growth of 50% in active HADEP membership, facilitated improved monitoring and decision-making inputs at central and district level. HADEP worked to engage diverse organizations (21) and MDAs (five); achieve consensus on shared priorities (4 per year) through an annual Master Workplan; and drive monthly tracking of progress against missed milestones. This organizational model enhanced the quality of

- Data-informed funding prioritization within the President's Emergency Plan for AIDS Relief, UNAIDS Technical Support Mechanism, and Global Fund Grant Cycle processes;
- HIV service coordination from recent use of stakeholder inventory and activity reporting tools,
- Resource allocation considerations, and
- Harmonization of technical support.

**Conclusions/Next steps:** HADEP presents a practical example of how to unite external funders and local stakeholders, who often have competing interests, under a common framework of cooperation.

This approach involves creating a transparent environment where areas of overlap and duplication in activities, investments, and infrastructures are openly identified and addressed.

This kind of initiative highlights how collaboration among multiple donors and implementing partners is crucial for integrating HIV into mainstream health initiatives and laying the groundwork to advance long-term sustainability of HIV programs.

Navigating pathways towards Thailand's Universal Health Coverage on transgender health: the importance of catalytic funding, concerted community-led efforts, and political advocacy

K. Samitpol<sup>1,2</sup>, R. Janamnuysook<sup>1,2</sup>, P. Getwongsa<sup>1</sup>, T. Amatsombat<sup>1</sup>, A. Chancham<sup>1</sup>, V. Sripoonbun<sup>1</sup>, S. Janyam<sup>3</sup>, R. Taesombat<sup>4</sup>, P. Rattakitvijun Na Nakorn<sup>5</sup>, A. Arunmanakul<sup>6</sup>, S. Mills<sup>6</sup>, N. Phanuphak<sup>1,2</sup>

<sup>1</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>2</sup>Center of Excellence in Transgender Health, Chulalongkorn University, Bangkok, Thailand, <sup>3</sup>Service Workers in Group Foundation (SWING), Bangkok, Thailand, <sup>4</sup>The Foundation of Transgender Alliance for Human Rights, Bangkok, Thailand, <sup>5</sup>USAID Regional Development Mission Asia, Bangkok, Thailand, <sup>6</sup>USAID EpiC Thailand, FHI 360, Asia Pacific Regional Office, Bangkok, Thailand

**Background:** The Tangerine Clinic as the first transgender-led health clinic in Thailand has proven that the integration of gender-affirming care into sexual health services increased access to HIV services among transgender populations. However, despite HIV testing, treatment, and pre-exposure prophylaxis being covered under Thailand's Universal Health Coverage (UHC), gender-affirming care is not included.

We describe community-driven efforts to advocate for the inclusion of gender-affirming care under UHC by using data to inform policy change discussions.

**Description:** Established in 2015, Tangerine Clinic provides gender-affirming care and HIV services to transgender population where data were collected as part of a prospective cohort study, and positive outcomes were published in the Lancet HIV, JIAS, and Transgender Health. The Tangerine Clinic partnered with Chulalongkorn University in establishing the Center of Excellence in Transgender Health and developed the Thai Handbook of Transgender Healthcare Services as a tool to guide the development and expansion of transgender-competent care service models in Thailand and the region.

In 2020, Tangerine Clinic and a sex worker-led SWING Foundation proposed the inclusion of gender-affirming care under Thailand's UHC using these community-collected data. The proposal was selected and proceeded to a two-year effective coverage study being conducted in 2023. Together with persistent advocacy from rights-based civil society organizations and the Foundation of Transgender Alliance for Human Rights to all political parties for transgender-inclusive policies, following the General Election in 2023, the government announced to support gender-affirming care as their priority and anticipated to include it as part of UHC within 2024, in parallel with the effective coverage study.

**Lessons learned:** International funding was vital for the entire policy change process, including the establishment of a transgender-led health service model, data collec-

tion, feasibility demonstration, and evidence-based advocacy for sustained and scalable programs. Concerted stakeholder efforts were crucial for amplifying the needs and requiring changes. Engaging with political bodies was important as they played a decision-making role.

**Conclusions/Next steps:** Community-driven, evidence-informed policy change processes can enhance health equity towards an ending HIV goal. Countries receiving international funding must use them in a catalytic way from demonstrating feasibility of innovative models to advocate for sustainability/domestic financing.

## TUPEF691

Perspectives from Thailand's National Stakeholders on implementation of key population-led hepatitis C virus test and treat: a qualitative pre-implementation study

K. Sinchai<sup>1</sup>, A. Wongsai<sup>1</sup>, R. Janamnuysook<sup>1</sup>, S. Saiwaew<sup>2</sup>, S. Janyam<sup>3</sup>, P. Phanuphak<sup>1</sup>, N. Phanuphak<sup>1</sup>, R.A. Ramautarsing<sup>1</sup>

<sup>1</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>2</sup>Rainbow Sky Association of Thailand, Bangkok, Thailand, <sup>3</sup>Service Worker in Group Foundation, Bangkok, Thailand

**Background:** Due to high Hepatitis C virus (HCV) prevalence and low linkage to treatment with direct acting antivirals (DAAs) among key populations in Thailand, we plan on implementing HCV test and treat services in two community-led clinics in Bangkok. HCV testing and DAA treatment will be conducted and delivered by key population lay providers experienced in providing HIV and related health services. We explored perspectives from national HCV stakeholders to inform implementation strategies.

**Methods:** From September-November 2023, we conducted in-depth interviews with national HCV stakeholders from the Ministry of Public Health's Department of Disease Control (DDC), National Health Security Office (NHSO), Bangkok Metropolitan Administration (BMA), and the Thai Association for the Study of the Liver (THASL). Semi-structured interviews were audio recorded, transcribed and analyzed using selected thematic analysis guided by the Consolidated Framework for Implementation Research. Data were coded in Dedoose program.

**Results:** All (n=10) stakeholders agreed that implementing key population-led HCV test and treat at community-led clinics was feasible. All noted key facilitators within the construct Culture in the domain Inner Setting: the subconstructs human equality-centeredness and recipient-centeredness (proven track records of community-led clinics of providing stigma-free HIV and sexual health services and of identifying and recruiting members of key populations). Identified barriers were: 1. Outer Setting domain, construct Policies and laws (legal challenges

in keeping DAA stocks in community-led clinics), 2. Inner Setting Domain, construct Structural Characteristics, sub-construct Work Infrastructure (lack of standard operating procedures - SOPs), and 3. Individuals domain, Characteristics subdomain (capability of lay providers to conduct physical examinations).

**Conclusions:** Thailand's national HCV stakeholders showed support and confidence in implementing key population-led HCV test and treat at two community-led clinics. Community-led clinics can play instrumental roles in providing stigma-free health services beyond HIV and have the capacity to integrate HCV as part of comprehensive service package. Identified barriers will inform the design of multi-level implementation strategies, including capacity-building interventions and certification for lay providers, SOP-development, arranging teleconsultations with physicians, and advocating for policy changes related to DAA stock, to support successful implementation of the key population-led HCV test and treat service.

## TUPEF692

### Enhancing workplace inclusion to mitigate HIV risks among vulnerable transgender communities in India

A. Siroya<sup>1</sup>, S. Latad<sup>1</sup>, M. Maske<sup>1</sup>, S. Srinivas<sup>1</sup>, D. Goenka<sup>1</sup>, M. Sivasubramaniam<sup>1</sup>, V. Anand<sup>1</sup>

<sup>1</sup>The Humsafar Trust, Advocacy, Mumbai, India

**Background:** The Trans-communities in India faces multifaceted challenges, including societal stigma, educational exclusion, discrimination which exacerbates vulnerability to HIV/AIDS. These challenges add to workplace exclusion and other employment opportunities which further marginalizes the community and vulnerability to HIV. The legal recognition of Transgender identity by the Apex court in 2014 and The Transgender Persons Act 2019 has led to a wave of workplace inclusion by employers. Diversity and Inclusion is still at a very nascent stage in India but is paving an alternative employment opportunity for Trans-communities.

**Description:** The Humsafar Trust, LGBTQ+ community-based organization (CBO) leads an initiative named SAKSHAM (Empowered) - Communities Leading inclusion, with a dual faced approach which engages with employers and marginalized communities for workplace inclusion by bridging the gap between the two. Community engagement involves, Upskilling, resume building, and workplace readiness programs in collaboration with employers. Employers' engagement involves, a multidimensional approach using community lead sensitization Sessions, Policy review and drafting and community mobilization for targeted hiring. Workplace inclusion for transgender person not only provide an equal opportunity but also serves as an alternative from sex work thus reducing the risk of HIV and violence.

The step towards having Inclusive policies at workplace like including Gender neutrality, Transition care in employee Health benefits, leave for transition, Mental care support and other employee benefits provide a comprehensive approach towards minimizing the risk for HIV and strengthening inclusion.

**Lessons learned:** A continued engagement with employers and negotiating for "Skills over Qualification" is the need of the hour. Workplace inclusion happens with a readiness at both the ends of the chain. Employers need to Collaborate with the CBO for effective Trans Hiring. CBOs need to work with the potential recruiter to enhance their understanding of HIV related scientific and sensitive information which will be beneficial for all their employees, transgender persons included.

**Conclusions/Next steps:** SAKSHAM will serve as a peer learning model for other Community based organization to facilitate Workplace inclusion in their region. Having more community driven initiatives will lead to inclusion of Transpersons in workplace and mitigate the HIV/AIDS risk for vulnerable Trans-communities.

## TUPEF693

### Challenges in the sustainability of the national HIV/AIDS program in Brazil: a critical analysis of the economic impact of dolutegravir and patent barriers

S. van der Ploeg<sup>1</sup>, C.T. Scopel<sup>1</sup>, V. Terto Jr.<sup>1</sup>

<sup>1</sup>Brazilian Interdisciplinary AIDS Association, Rio de Janeiro, Brazil

**Background:** The challenge of sustainability in the supply of dolutegravir (DTG) in Brazil is aggravated by its high price, significantly compromising the antiretroviral (ARV) public budget in 2023. Being the most used medicine for HIV treatment in Brazil, the patent barrier prevents the acquisition of generics, price reduction through competition and compromises vital health resources.

This study aims to understand the cost structure of DTG production and to indicate the price this ARV could be offered in developing country markets.

**Methods:** National price and their respective suppliers were obtained from a Ministry of Health document in November 2023, utilizing the Access to Information Law (reflecting 2023 prices).

Additionally, the lowest international price was derived from a publication by The Global Fund in April 2023. Direct manufacturing costs and factory prices for DTG 50 mg were calculated based on cost structure data, considering direct costs (equipment, salaries, materials), the IFA price at US\$ 400.00/kg, profits and general expenses at 50%. The production cost was compared with the price charged in Brazil in the acquisition of DTG by the Ministry of Health through the strategic alliance between Fiocruz-ViiV/GSK in 2023.

**Results:** From comparisons with the international price, it was found that the Brazilian government pays an excessive price for dolutegravir, despite having a significant demand.

A DTG tablet unit could be produced for R\$ 0.68, however, the Brazilian Ministry of Health paid R\$ 4.40 per tablet in 2023. Considering the volume of 200 thousand tablets acquired, it compromised 51% of the entire ARV budget of 2023.

**Conclusions:** The commercialization of DTG in Brazil is covered by a granted patent, which constitutes a barrier to the entry of generic competitors. The difference between the production cost and the price charged in Brazil shows that the price is not directly related to the cost of production and it reflects the price-setting power of the pharmaceutical industry in monopoly situations.

The high price paid by the Brazilian government compromises the public budget, threatens the sustainability of the national HIV program and highlights the negative impact of patents on national public policy and access to essential medicines.

## TUPEF694

### Navigating the HIV response along communities of PLHIV and key populations in MENA: the experiences of Love Alliance MENA

A. Fantinatti<sup>1</sup>, M. Hassan<sup>1</sup>, A. ElHamri<sup>1</sup>

<sup>1</sup>Global Network of People Living with HIV (GNP+), Amsterdam, Netherlands, the

**Background:** There have been persistent challenges to prevent and treat HIV in the Middle East and North Africa (MENA) region since the implementation of the first HIV programmes. Major issues include absence of clear strategies to prevent HIV transmission, inadequate resources and staffing in treatment facilities, and, most importantly, the neglect of key populations' needs in HIV policies.

**Description:** GNP+ conducted research among communities of PLHIV and key populations, besides key stakeholders, to acquire deeper insights into HIV policies in MENA, and potential entry points for dialogues with governments for expanding and improving access to HIV prevention, treatment, care in the region.

**Lessons learned:** While expecting current countries and societies in the MENA region to advance human rights for key populations may be unrealistic, there are potential avenues through which PLHIV, including KPs, could have an improved quality of life in these countries.

One crucial step is for MENA governments to invest in researching the realities faced by PLHIV to guide the development and implementation of efficient HIV programmes.

Currently, HIV is considered a non-priority issue, resulting in limited government investigation into the matter and sustaining a growth in new HIV infection rates.

Global health governance organisations also must reconsider the exclusion of MENA as a non-priority region for investments in the HIV response, especially with 30% annual increase in new infections for the past decades. The lack of space at key advocacy platforms is hindering communities' possibilities to voice its needs and establish crucial collaborative advocacy efforts.

**Conclusions/Next steps:** Community and expert recommendations for re-introducing HIV as a priority issue include:

- Strengthening communities capacity to engage in constructive dialogues with key stakeholders, and in the design and implementation of HIV programs supporting their empowerment and advocacy skills.
- Enhance the capacity of CSOs and health facilities to deliver quality and integrated HIV services for sex workers, LGBTQI, and PWUD, using innovative approaches such as online outreach and self-testing.
- Facilitate exchange of knowledge on best practices and lessons learned among KPs from MENA through increasing funds for community-led organisations and encouraging global platforms working on HIV to include MENA advocates in their strategies and working plans.

## The role of politics, human rights and law in pandemic preparedness

### TUPEF695

#### Fading identities in the COVID 19 era; improving access to gender affirming care and HIV services for transgender women and men in Malawi

P. Mikel Juao<sup>1</sup>, Y. Chimwaza Mbilizi<sup>2</sup>

<sup>1</sup>Centre for the Development of People, Advocacy Coordinator, Lilongwe, Malawi, <sup>2</sup>Medical Consultant, Medical Person, Blantyre, Malawi

**Background:** The COVID-19 pandemic exacerbated healthcare challenges for transgender people, especially access to essential services like gender-affirming care and its link to HIV services in Malawi.

Pandemic-related lockdowns, restricted travel, and limited imports of non-essential drugs and medications (including gender-affirming medications) between 2020/21 had a negative impact on transgender people who were dependent on hormonal use.

The cessation of routine doses had serious physical and mental health consequences, discouraging many people from seeking HIV services and care.

**Description:** Recognizing these difficulties, a collaborative effort between two medical practitioners and a local transgender group addressed the crisis by providing hormone access to 25 transgender women and 20 transgender men.

This initiative ensured an uninterrupted supply of routine doses and distributed essential HIV services such as self-test kits, condoms, and lubricants thanks to a global COVID-19 Emergency Response grant from Outright Action International.

This intervention not only restored access to essential healthcare but also highlighted the importance of understanding the interactions between hormone treatments and HIV medications in order to avoid the discontinuation of ART or PrEP.

**Lessons learned:** This trailblazing initiative, led by medical professionals, not only provided critical healthcare but also dispelled myths that prevented transgender people on hormones from accessing HIV services.

The study emphasized the critical role of hormonal treatments in enabling transgender people to access HIV services, as well as the critical need for inclusive healthcare policies that address the marginalized based on gender identity.

**Conclusions/Next steps:** To ensure that this marginalized group is not excluded from care, transgender considerations should be incorporated into future pandemic planning and emergency response frameworks.

To support equity and ensure broadened gender-responsive pandemic plans for the Ministry of Health, urgent advocacy and gender affirmation therapy integration into HIV programming is required.

## TUPEF696

### Navigating COVID-19 vaccination challenges among people living with HIV in Uganda

C. Kanyesigye<sup>1</sup>

<sup>1</sup>Independent Public Health Consultant, Kampala, Uganda

**Background:** In Sub-Saharan Africa, despite people living with HIV (PLWH) being a priority group for COVID-19 vaccination, there is a deficit of data on vaccine acceptability. This study conducted in Uganda addresses this gap, aiming to describe the acceptability of COVID-19 vaccines and identify associated factors among PLWH.

**Methods:** A cross-sectional study was undertaken at six accredited ART clinics in Kampala, involving 767 PLWH aged ≥18. Participants were recruited purposefully, and vaccine acceptability, defined as willingness to accept any available COVID-19 vaccine, was gauged through interviewer-administered questionnaires. The study also assessed vaccination status, complacency towards COVID-19, vaccine confidence, and perceived vaccine convenience. Modified Poisson regression with robust standard errors analyzed factors influencing vaccine acceptability.

**Results:** Of the enrolled participants, 63% were women, and they exhibited a higher vaccination rate (73% vs. 63% in men). Among the unvaccinated, 72.7% expressed willingness to accept vaccination, indicating notable acceptability.

Factors positively associated with vaccine acceptability included increased vaccine confidence (adjusted prevalence ratio [aPR] 1.44; 95% CI: 1.08-1.90) and the perception that obtaining a vaccine would be easy (aPR 1.57; 95% CI: 1.26-1.96).

**Conclusions:** The study reveals high vaccine acceptance among PLWH in Uganda, particularly among women. Ensuring widespread vaccine confidence and easy accessibility should be prioritized in vaccination programs targeting PLWH to effectively address the intersection of COVID-19 and HIV vulnerabilities.

## TUPEF697

### Disease X preparedness and response: the contribution of the HIV response

E. Lamontagne<sup>1,2</sup>, M. Kavanagh<sup>3</sup>

<sup>1</sup>UNAIDS, Equitable Financing, Johannesburg, South Africa,

<sup>2</sup>Aix-Marseille University, CNRS, EHESS, Centrale Marseille, Aix-Marseille School of Economics, Marseille, France,

<sup>3</sup>Georgetown University, Center for Global Health Policy & Politics, Washington, United States

**Background:** HIV and SARS-CoV-2 are novel viruses that caused pandemics, with 36 and 7 million deaths, respectively. Disease X is a hypothetical pathogen that could cause a future pandemic.

This study examined how the lessons learned from the HIV response can inform Disease X preparedness.

**Description:** We conducted a published and grey literature review on the HIV and SARS-CoV-2 response, focused on societal and programmatic enablers and identified key elements mobilised by civil society, governments, and global actors that could be pivotal in Disease X response.

#### Lessons learned:

- Global public financing: HIV funding mechanisms enabled redistribution of resources to LMIC's HIV responses. The lack of ready financing undermined the SARS-CoV-2 response. Disease X needs rapid funding mechanisms for response, not just preparedness.
- Community engagement: In HIV responses, funded community-led/based organisations provide adequate services and accountability and participate in decisions.
- Health technology/production: HIV and SARS-CoV-2 grew due to unequal countermeasure access. HIV technology transfer diversified production, whereas transfer was too limited in SARS-CoV-2. Disease X preparedness should already build on the HIV model.

Oral abstracts

- Leveraging Infrastructure: Laboratory, surveillance, and community systems for HIV have been adaptable for addressing pandemics like SARS-CoV-2, showing the importance of contingency planning and differentiated service delivery.
- Human rights: To build trust and reach the marginalised, a rights-based approach, including reducing stigma, is necessary for pandemic responses.
- Surveillance and data utilisation: Disease monitoring involving communities, identifying hotspots, and understanding the demographics of inequalities distinguished effective response.
- Policy and legislative frameworks: Inclusive policies and interventions were determinants in the HIV response, especially those addressing discrimination and free access to services. Disease X response must ensure that access to prevention and treatment is genuinely inclusive.
- Intersecting inequalities: Vulnerability to HIV and SARS-CoV-2 intersects with inequalities such as race, gender, ethnicity, or socioeconomic status, exacerbating the impact of the pandemic.

**Conclusions/Next steps:** Many lessons from HIV were not taken up in COVID-19 and must be in future pandemics. Addressing inequality, using a global public goods approach, and mobilising communities was decisive. Policies and programmes for Disease X should focus on the disease and improving at-risk people's social and economic conditions.

## TUPEF698

Consequences of large anti-drug drive in Bangladesh, and program and advocacy measures to limit the disaster among the people who inject drugs (PWID) and harm reduction program

E.I. Chowdhury<sup>1</sup>, S. Islam<sup>1</sup>, C.A.A. Asif<sup>1</sup>, S. Islam Pappu<sup>2</sup>, I. Mohammad<sup>3</sup>, R. Khan<sup>1</sup>

<sup>1</sup>Save the Children, HIV/AIDS Program, Dhaka, Bangladesh,

<sup>2</sup>Network of People Who Use Drug (NPUD), Harm Reduction Program, Dhaka, Bangladesh, <sup>3</sup>Save the Children US, Department of Global Health, Washington, United States

**Background:** The harm reduction program for PWID has initiated in Bangladesh in 1998. NSP, which is an integral part of the program has been faced an enormous challenge from 2018 to 2020 due to launching a large anti-drug drive by the Law Enforcement Agencies (LEA). Lack of contact with Peer Outreach Workers (POW) due to evictions led to increase the unsafe injecting and syringe disposal, posing a serious public health threat for both PWID and the broader community. This period highlighted the fragility of harm reduction efforts and the need for adaptable strategies to navigate challenging circumstances.

**Description:** Based on the findings from various research, conducted between 2018-19 a series of interventions were launched in 13 districts with 35 Drop-In Centers (DICs) for PWID. By implementing innovative strategies like SOP/guideline development, training of staff at different levels, organizing community campaigns, installing drop boxes for needle syringe disposal in absence of POW, the program tackled safe disposal issues. In addition, Task Forces has been formed by Network of People Who Use Drugs (NPUD) to conduct advocacy with local units of LEA to reduce the harassment.

**Lessons learned:** Building upon the initial findings, 150 drop boxes were strategically placed in catchment areas surrounding the DICs. To maximize program effectiveness, six rounds of comprehensive orientation sessions were conducted for program staff.

Additionally, two rounds of orientation sessions were organized for LEA to foster collaboration and understanding regarding the importance of harm reduction interventions and 140 community-based safe disposal campaigns were implemented.

As a result, collection of used needle and syringes surpassed 80% at the end of 2020, which was only 40% prior 2020. Knowledge on safe disposal among the staff increased from 40% to 90%. Hepatitis C among the PWID was found 33.2% in the year 2020, which was similar with earlier rounds.

**Conclusions/Next steps:** Advocacy with LEA to remove punitive laws is highly important to avoid sudden drive towards the PWID. Otherwise, increase of the prevalence of HIV and Hepatitis C is inevitable. Advocacy also is required to introduce Safe Injecting Sites (SIS) in Bangladesh taking lessons from best practice models to ensure optimum safe injecting and disposal.

## TUPEF699

Strengthening pandemic preparedness and response through CDC's technical assistance for Global Fund COVID-19 Response Mechanism grants

K.F. Clark<sup>1</sup>, E. Tangel Chehab<sup>1</sup>, O. Khan<sup>1</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention, Atlanta, United States

**Background:** To combat the COVID-19 pandemic, the US Government increased its funding to the Global Fund to Fight AIDS, Tuberculosis, and Malaria (GFATM) to support countries in responding to COVID-19 and mitigating the pandemic's impact on HIV, tuberculosis, and malaria (HTM) programs.

To support GFATM principal recipients (PRs) and host country governments, the US Centers for Disease Control and Prevention (CDC) received \$50 million from the US Department of State to provide technical assistance (TA) in strengthening country responses to COVID-19.

**Description:** CDC's approach to TA focused on two primary objectives: supporting GFATM's COVID-19 response mechanism (C19RM) grants at the country level and seconding staff to the GFATM Secretariat.

On-site technical experts were deployed by ten CDC implementing partners in 34 countries, supporting governments with national COVID-19 responses, pandemic preparedness and response (PPR) capacity, and HTM program continuity. CDC personnel across multiple divisions provided strategic support to improve PPR globally by leveraging the agency's surveillance, laboratory diagnostics, and emergency management expertise.

CDC teams at the global and country levels routinely met with PRs, host country governments, and TA providers to ensure that the CDC-supported TA was adaptive, reflecting the pandemic's evolving priorities.

**Lessons learned:** CDC's role in the C19RM initiative underscores the importance of providing technical expertise to recipients of health emergency funds. Integrating CDC's technical knowledge at the global level (at the GFATM secretariat) and in-country presence enhanced health responses and systems resilience that mitigated the effects of the COVID-19 pandemic. The initiative demonstrated the value of collaborative and expert-led TA to support governments in global health emergencies. Successful outcomes were improved disease surveillance, enhanced public health emergency management, and continuity of critical health services.

**Conclusions/Next steps:** The findings highlight the need for ongoing investment in technical support for PPR and health systems resilience. The CDC's targeted provision of TA met a critical need for GFATM C19RM recipients. This is an important lesson for future activities funded by GFATM and other donors. Providing TA tailored explicitly to each country's needs maximizes the impact of GFATM's investments in improving health outcomes during the pandemic and beyond.

## Politics and geopolitics

### TUPEF700

Providing humanitarian assistance to key populations and PLHIV in Ukraine

R. Yorick<sup>1</sup>, J. Rashbass<sup>1</sup>

<sup>1</sup>Elton John AIDS Foundation, London, United Kingdom

**Background:** After the Russian full-scale invasion of Ukraine, over 6.2 million Ukrainians have become refugees, an additional 5.1 million have been internally displaced, and millions live in areas affected by military operations. These include key populations (KP) and PLHIV with their specific needs that have been exacerbated with the start

of the war. In 2022-2023, the Elton John AIDS Foundation (the Foundation) supported five community-based humanitarian assistance and HIV service projects to meet the needs of KPs and PLHIV in Ukraine.

**Description:** Project activities included:

1. HIV testing, linkage, ART delivery, and transportation of blood samples to repair the disrupted links between remote rural sites and the regional center;
2. Small cash transfers to members of KP communities to cover their transportation, food, accommodation and medicine expenses in transit to safer sites;
3. Direct humanitarian assistance in the form of food, hygiene supplies, warm clothing, blankets, power banks, lanterns and other basic items;
4. Winterization of shelters for KPs; and,
5. Developing the capacity of civil society organizations (CSOs) and initiative groups to enable their access to humanitarian assistance resources.

**Lessons learned:** Over 68,000 people from KPs and PLHIV directly benefitted from humanitarian assistance. Eighty CSOs received technical assistance on applying for, managing and reporting on humanitarian aid for KPs and PLHIV.

Forty-five shelters benefitted from winterization audits and repairs to power generators, batteries, bedding and other equipment and furnishing.

Factors of success included:

1. Community groups on the ground understanding immediate most urgent needs of their members;
2. Trusted CSO networks available to quickly move resources to the people in need;
3. Dedication of CSO staff to their communities and beneficiaries.

In addition to the chaos of the war, the challenges were:

1. Stigma and discrimination towards members of KPs in providing shelter and other humanitarian services;
2. Lack of knowledge and experience in KP and HIV service CSOs accessing humanitarian assistance resources;
3. The balance between due diligence and the urgency of needs.

**Conclusions/Next steps:** Under the ongoing full-scale invasion of Ukraine, humanitarian needs remain high. International humanitarian agencies should recognize and meet the needs of KPs and PLHIV alongside with other vulnerable groups.

## TUPEF702

Evidence-informed advocacy for sustainable change - how communities came together to change global policies

M.A. Torres<sup>1</sup>, A. Nieves<sup>2</sup>

<sup>1</sup>International Council of AIDS Service Organizations (ICASO), Toronto, Canada, <sup>2</sup>Accion Ciudadana Contra el SIDA (ACCSI), Caracas, Venezuela, Bolivarian Republic of

**Background:** The collapse of the Venezuelan economy amid instability and widespread human rights violations resulted in a complex humanitarian crisis that put the health system in ruins, reversing progress against HIV and other diseases. ICASO's efforts to raise awareness about this helped to mobilize international support.

The collaboration included supporting community-led monitoring of AIDS and other related services and evidence-informed advocacy to address the unique challenges faced by PLHIV. Advocates approached the Global Fund in 2016 requesting assistance to Venezuela.

The Global Fund expressed concern about the situation but only provided support in 2018 when the Board adopted a policy of providing exceptional funding to countries in crisis that did not meet the eligibility criteria. For five years, the Global Fund supported Venezuela's TB, HIV, and malaria interventions, including monitoring led by people living with HIV.

**Description:** The multi-prong, multi-level, evidence-based advocacy resulted in, among others, a decision by the Global Fund Board in November 2022 to make Venezuela eligible for the VIH component as Venezuela was temporarily unclassified by the World Bank. The advocacy approach was grounded in robust evidence collected and analyzed by communities, combining epidemiological data, human rights perspectives, and real-life narratives of PLHIV.

The evidence not only shed light on the prevalence of HIV but also highlighted the intersections of health disparities, human rights violations, economic challenges, and political instability that exacerbate HIV.

**Lessons learned:** Helping communities develop their capacities relating to evidence generation and analysis in their local contexts is a valuable strategy for enabling communities to shape health infrastructure, policy decision-making, and partnerships more effectively.

Evidence-informed advocacy effectively drives policy changes, mobilizes resources, and fosters a supportive environment for PLHIV in Venezuela.

**Conclusions/Next steps:** By aligning advocacy efforts with the Global Fund's mission, stakeholders contribute to a comprehensive response that addresses the multi-faceted challenges faced by PLHIV in the context of Venezuela's complex socio-political landscape.

## WEPEA001

High resistance to second generation non-nucleoside reverse transcriptase inhibitors among HIV-1 treatment naïve individuals with multi-class drug resistance in Botswana

N.S. Ndlovu<sup>1,2</sup>, O.T. Bareng<sup>1,3</sup>, W.T. Choga<sup>1</sup>, D. Nkwe<sup>2</sup>, V. Novitsky<sup>1,4</sup>, S. Moyo<sup>1,4</sup>, S. Gaseitsiwe<sup>1,4</sup>

<sup>1</sup>Botswana Harvard Health Partnership, Gaborone, Botswana, <sup>2</sup>Botswana International University of Science and Technology, Department of Biological Sciences and Biotechnology, Palapye, Botswana, <sup>3</sup>University of Botswana, Department of Medical Sciences, School of Allied Health Professions, Gaborone, Botswana, <sup>4</sup>Harvard T. H. Chan School of Public Health, Department of Immunology and Infectious Diseases, Boston, United States

**Background:** Understanding the dynamics of transmitted HIV drug resistance is paramount as pre-existing resistance could impede the efficacy of future antiretroviral therapy (ART). We therefore evaluated if treatment naïve individuals with multi-class drug resistance (MDR) are susceptible to second-generation non-nucleoside reverse transcriptase inhibitors (NNRTIs).

The study aimed to explore the viability of doravirine (DOR), etravirine (ETR) and rilpivirine (RPV) as alternative therapy for treatment naïve individuals with MDR.

**Methods:** This was a retrospective study utilising 1280 HIV-1C proviral *pol* sequences of treatment-naïve individuals who were enrolled on a randomised trial in 30 communities in Botswana. We analysed for major HIV drug resistance mutations (DRMs) according to the Stanford HIV drug-resistance database. Participants harbouring resistance to 2 or more ARV classes (MDR), with at-least NNRTI, were further evaluated for resistance to DOR, ETR, and RPV. The Stanford "DRM penalty scores" were utilised to predict resistance levels.

**Results:** Within the 1280 individuals, 143 (11.2%; 95% CI: 9.5-13) had resistance to at-least one ARV class, with 45/143 (31.5%) resistant to NNRTIs. Among the 45, 27 (60%) had resistant to one drug class and 18 (40%) had multi-class drug resistance. Of the 18, 14 (77.8%; 95% CI: 37.9-68.3) had resistance to all three ARVs, DOR, ETR and RPV. Majority of participants had high level RPV (85.7%) and DOR (45.8%) resistance.

The predominant mutations were G190E (50%), associated with intermediate-ETR-resistance, and high-DOR- and RPV-resistance, and K101E (21.4%) associated with low-level-DOR and ETR-resistance, and intermediate-RPV-resistance (Table 1). Individuals failing second-generation NNRTIs had high prevalence of resistance to nucleoside

reverse transcriptase inhibitors (13/18; 92.9%) and protease inhibitors (7/18; 50%). No integrase strand transfer inhibitor resistance was observed within these individuals.

	DOR (n=14)	ETR (n=14)	RPV (n=14)
<b>Overall (%)</b>	<b>77.8</b>	<b>77.8</b>	<b>77.8</b>
Low Level	29.2	33.3	0
Intermediate	25.0	38.1	14.3
High Level	45.8	28.6	85.7
<b>Specific Mutations</b>			
L100I	8.3 <sup>a</sup>	9.5 <sup>b</sup>	9.5 <sup>c</sup>
K101E	29.2 <sup>a</sup>	33.3 <sup>a</sup>	33.3 <sup>b</sup>
V106M	16.7 <sup>b</sup>	-	-
Y181C	-	14.3 <sup>b</sup>	14.3 <sup>b</sup>
G190E	33.3 <sup>c</sup>	38.1 <sup>b</sup>	38.1 <sup>c</sup>
H221Y	-	-	9.5 <sup>a</sup>
F227L	4.2 <sup>c</sup>	-	-

<sup>a</sup> Mutation associated with low level resistance

<sup>b</sup> Mutation associated with intermediate resistance

<sup>c</sup> Mutation associated with high level resistance

- Mutation associated with susceptibility

Table 1. Prevalence of DOR, ETR and RPV resistance.

**Conclusions:** We report a high proportion of resistance to second generation NNRTIs among treatment-naïve individuals in Botswana. Therefore, we strongly suggest genotypic testing prior to ART use among treatment naïve individuals.

## WEPEA002

HIV-2 drug resistance and viral load in HIV-2-infected adults in Burkina Faso, West Africa

R.S.T. Soubeiga<sup>1</sup>, A.T. Yonli<sup>2</sup>, N.M. Senghor<sup>3</sup>, J. Simporé<sup>3</sup>

<sup>1</sup>Institut de Recherche en Sciences de la Santé (IRSS), Ouagadougou, Burkina Faso, <sup>2</sup>Pietro Annigoni Biomolecular Research Centre (CERBA), Ouagadougou, Burkina Faso, <sup>3</sup>University Joseph Ki-Zerbo, Ouagadougou, Burkina Faso

**Background:** In Burkina Faso, there are few data on HIV-2 viral load and HIV-2 antiretroviral resistance genotyping for better management of HIV-2-infected individuals.

This study aimed to evaluate HIV-2 viral load and HIV-2 antiretroviral resistance in adult patients infected with HIV-2 in Burkina Faso, West Africa.

**Methods:** This cross-sectional study was conducted from February 2017 to March 2019. The study included HIV-infected adult patients receiving antiretroviral treatment and followed up at care centers in Ouagadougou, Burkina Faso. Whole blood samples were collected, and plasma HIV-2 viral loads were determined using in-house assays from plasma on the ABI PRISM 7500 thermal cycler (Applied Biosystems, USA). For HIV-2 antiretroviral resistance testing, nucleic acids were extracted from plasma. HIV-2 reverse transcriptase and protease genes were amplified, sequenced, and analyzed for antiretroviral resistance mutations and HIV-2 group.

Genotypes were assessed for evidence of antiretroviral resistance using the HIV2EU web tool and the Stanford HIVdb program for HIV-2.

**Results:** A total of 126 adult HIV-2-infected patients were included. The mean age was  $58.99 \pm 8.66$  years. Women were the most represented (63.5%). Most patients (55.5%) had an undetectable viral load, and only 15.9% had a high viral load (over 1000 copies/mL). Both groups A and B were detected in this study, the majority being group A (15.1%). HIV-2 subtype CRF01\_AB was detected in 3 patients (3.75%). Only seven patients had antiretroviral resistance mutations. RT mutations were (K65R, Q151M, M184V) and PR mutations were (V47A, I84V, I82F, I50V).

**Conclusions:** This study revealed recent data on the status of HIV-2 viral load and genotypic resistance in Burkina Faso. Although few HIV-2 patients on ARV therapy have developed resistance, it is essential to set up a system for monitoring HIV-2 resistance to antiretrovirals.

## WEPEA003

Tenofovir and doravirine are potential reverse-transcriptase analogs for combination with the new reverse-transcriptase translocation inhibitor (Islatravir) among treatment-experienced patients in Cameroon: designing future treatment strategies for low- and middle-income countries

A.D. Nka<sup>1</sup>, Y. Bouba<sup>1</sup>, D.-H. Gouissi<sup>1</sup>, G. Teto<sup>1</sup>, E. Ngoufack Jagni Semengue<sup>1</sup>, C. Ambe Chenwi<sup>1</sup>, D. Takou<sup>1</sup>, M.C. Tommo Tchouaket<sup>1</sup>, W. Pabo<sup>1</sup>, D. Tambe Ayuck Ngwesse<sup>1</sup>, A.M. Kengni Ngueko<sup>2</sup>, D. Armenia<sup>3</sup>, V. Colizzi<sup>2</sup>, M.-M. Santoro<sup>2</sup>, F. Ceccherini-Silberstein<sup>2</sup>, C.-F. Perno<sup>4</sup>, J. Fokam<sup>1</sup>

<sup>1</sup>Chantal Biya International Reference Centre for Research on HIV/AIDS Prevention and Management (CIRCB), Virology, Yaounde, Cameroon, <sup>2</sup>University of Rome Tor Vergata, Virology, Rome, Italy, <sup>3</sup>Saint Camillus School of Medicine, Rome, Italy, <sup>4</sup>Bambino Gesù Paediatric Hospital, Rome, Italy

**Background:** Islatravir is a new antiretroviral that inhibits HIV-1 reverse transcriptase through multiple mechanisms. M184V mutation have been shown to reduce the in-vitro antiviral activity of islatravir. Thus, long-term exposure to nucleoside(NRTI) and non-nucleoside(NNRTI) reverse transcriptase inhibitors could reduce the susceptibility of islatravir.

Our objective was to evaluate the predictive efficacy of islatravir and potentially active antiretrovirals for combination therapy among patients failing ART in Cameroon.

**Methods:** Using the CIRCB Antiviral Resistance database in Cameroon, 1716 sequences were analysed from patients failing first-line ART(2NNRTI+NRTI, n=1016) and second-line(2NNRTI+PI/r, n=710). HIV-1 sequences were analyzed using Seqscape.v.2.6 and drug-resistance mutations (DRMs) were interpreted using Stanford HIVdb.v9. Patterns

of pairwise interactions were analysed between M184V and other NRTI and NNRTI DRMs. Fisher's exact test was performed to assess difference in the co-occurrence of the mutated residues with variables related to the independent assumption.

**Results:** Median(IQR) age of the study-population was 41 [29-57] years; 61.2% female; with a broad diversity of HIV-1 non-B: CRF02\_AG (53.3%), A1 (18.2%), D (5.7%), 22 other viral clades (22.8%). The overall prevalence of resistance to NRTI and NNRTI was 52.4% and 31.8% respectively. The most frequent NRTI DRMs were M184V (52.4%), M41L (17.3%) and T215F (12%). For NNRTI, the most frequent DRMs were K103N (31.8%), Y181C (16.7%) and G190A (12.3%).

After adjustment, NRTI-DRMs involved in positive correlations with M184V on first-line ART was L210W ( $\phi=0.12$ ,  $p=0.0001$ ); on second-line ART M41L ( $\phi=0.31$ ,  $p<0.0001$ ), D67N ( $\phi=0.29$ ,  $p<0.0001$ ), K70R ( $\phi=0.26$ ,  $p<0.0001$ ) and L210W ( $\phi=0.22$ ,  $p<0.0001$ ). For NNRTI-DRMs, M184V positively correlated with V106A ( $\phi=0.11$ ,  $p=0.029$ ), E138Q ( $\phi=0.27$ ,  $p=0.0008$ ) and G190A ( $\phi=0.13$ ,  $p=0.001$ ) for first-line ART patients; K103N ( $\phi=0.22$ ,  $p<0.0001$ ) and G190A ( $\phi=0.18$ ,  $p<0.0001$ ) for second-line ART patients. Following these covariations, potentially active antiretrovirals to combine with islatravir were TDF (partial efficacy) and Doravirine (fully active).

**Conclusions:** Overall, high rate of resistance to nucleos(t)ide and non-nucleoside reverse-transcriptase inhibitors has been observed in people failing first- and second-line ART in Cameroon.

According to our data, Islatravir can serve as an additional therapeutic weapon, particularly if combined with TDF and/or Doravirine (better if with an integrase inhibitor), in rescuing regimens after first- or second-line ART failure in LMICs sharing similar programmatic challenges like Cameroon

## WEPEA004

LEF-1/RBEIII cluster duplication stabilizes HIV-1 transcriptional silence

S. Mishra<sup>1</sup>, P. Panchal<sup>1</sup>, A. Anil<sup>1</sup>, M. Shanmugam<sup>2</sup>, H. Buch<sup>1</sup>, A. Panchapakesan<sup>2</sup>, U. Ranga<sup>1</sup>

<sup>1</sup>Jawaharlal Nehru Centre For Advance Scientific Research, Molecular Biology And Genetics Unit, Bangalore, India,

<sup>2</sup>Y. R. Gaitonde Centre for AIDS Research and Education, Molecular Biology, Chennai, India

**Background:** We recently reported the emergence of several LTR variant strains of HIV-1 in India, containing a significant impact on viral transcription and latency properties. For example, RBEIII motif duplication requires an activation threshold 4-10 folds higher for efficient latency reversal. While the effect of duplication of the NF- $\kappa$ B (predominantly transcription-enhancing) and RBEIII (R, predominantly transcription-suppressing) motifs has been extensively characterized in our laboratory, the im-

pact of the LEF-1 (L)/RBEIII cluster co-duplication on HIV-1 transcription has not been examined, which is the primary aim of the present work.

**Methods:** We examined the latency profiles of a panel of sub-genomic reporter viruses using Jurkat and primary CD4 T-cells under variable activation conditions by flow cytometry.

Further, latent reservoir stability was evaluated in a cohort of 10 subjects in the early or chronic phase of the infection, using U-TILDA and deep sequencing of proviral DNA and cell-associated RNA. Site-directed inactivation of the LEF-1 motif and pharmacological interventions using LiCl were performed to examine LEF-1-mediated Wnt-signaling. Integration site analysis is performed using Integration Site Loop Amplification (ISLA) assay.

**Results:** Variant viral strains containing the LEF-1/RBEIII motif co-duplication (LRLR-LTR strains) established latency at a rate significantly faster than the canonical virus and showed significant resistance to latency reversal in primary CD4 cells and Jurkat cells.

Furthermore, LEF motif inactivation caused significantly enhanced transcriptional activity. Pharmacological intervention of the LEF-1-mediated signaling annulled activator-induced viral gene expression. Latent reservoir stability is being evaluated in enriched CD4 T-cells using the Integration Site Loop Amplification (ISLA) assay and deep sequencing.

Additionally, EMSA and CUT&RUN are used to assess the transcription factor occupancy at the LEF-1 motif.

**Conclusions:** In summary, LEF-1/RBEIII motif co-duplication substantially impacted the latency of HIV-1C, requiring an approximately 16-fold higher activation threshold level for latency reversal. The unique high-magnitude resistance to latency reversal appears to be HIV-1C-specific, as demonstrated for the first time.

Our data allude to a negative influence of the LEF-1-mediated signaling on HIV-1C transcription, which contributes to establishing stabler latent reservoirs. Our work is relevant to viral evolution, reservoir dynamics, and cure research.

## HIV pathogenesis

### WEPEA005

#### In silico genomic recombination, analysis reveals HIV-1/HIV-2 mosaic genomes in circulation

E. Magomere<sup>1,2</sup>, G. Kyei<sup>3</sup>, P. Quashie<sup>1,2</sup>

<sup>1</sup>West Africa Center for Cell Biology of Infectious Pathogens (WACCBIP), University of Ghana, Biochemistry, Cell and Molecular Biology, Accra, Ghana, <sup>2</sup>University of Ghana, Biochemistry, Cell and Molecular Biology, Accra, Ghana, <sup>3</sup>Noguchi Memorial Institute of Medical Research, Department of Virology, Accra, Ghana

**Background:** Recombination is a shared feature among retroviruses, which occurs when reverse transcriptase enzyme transfers between the two RNA templates in these pseudo-diploid virions. Recombination events result in a progeny of viruses carrying genomic fragments from two genetically distinct parental strains. Currently, more than 118 HIV-1 inter-subtype recombinants have been documented but there is no record of inter-type (HIV-1 and HIV-2) recombinants. We hypothesized that interaction between HIV-1 and HIV-2 in dually infected individuals could result in inter-type recombinants.

**Methods:** To test this hypothesis, we developed a bioinformatic pipeline to analyze HIV near-full length genomes (NFLGs) for evidence of recombination. NFLGs were downloaded from the Los Alamos HIV-DB and visualized in UGENE. We wrote R-scripts for multiple sequence analysis in R. The resultant multiple sequence alignment was used as input file in RDP4 for full exploratory scanning to detect recombinant sequences. Identified recombinant sequences were confirmed by evolutionary analysis.

**Results:** In total, 504 NFLGs from 6 west African countries were included in this study. RDP4 detected 19 potential HIV1/HIV2 recombinants out of which 6 sequences passed all the seven statistical tests built in RDP4. Three of the 6 sequences were further confirmed as recombinants by phylogenetic analysis. Recombination hotspots were found to be located between nucleotide position 4502 and 6754, spanning from integrase to Env genomic regions. The affected genes code for integrase, protease, vif, vpr, tat, Rev, vpx/vpu, and Env. The largest genomic fragment transferred from a minor to a major parent was 1566 nucleotides long. We identified three putative HIV-1/HIV-2 mosaic sequences. Recombination hotspots were dense in the region between 4502 and 6754 nucleotide positions affecting 8 genes.

**Conclusions:** The affected genes including integrase and Env are important drug and/or vaccine targets. Thus, recombination between HIV-1 and HIV-2 might confer drug resistance and/or immunological escape. Moreover, Env is an important player in cell invasion and recombination in this gene would interfere with viral transmission, hence the slow disease progression in coinfections.

### Inflammation and immune activation in lactating women living with HIV and taking antiretroviral therapy in the postpartum period: effects of gut microbiota imbalance and gut dysfunction

P.T. Munjoma<sup>1</sup>, P. Chandiwana<sup>1</sup>, J. Wyss<sup>2</sup>, A.J. Mazhandu<sup>1</sup>, S.B.U. Jordi<sup>2</sup>, R. Gutsire<sup>1</sup>, L. Katsidzira<sup>3</sup>, B. Yilmaz<sup>2</sup>, B. Misselwitz<sup>2</sup>, K. Duri<sup>1</sup>

<sup>1</sup>University of Zimbabwe, Laboratory Diagnostic and Investigative Science, Harare, Zimbabwe, <sup>2</sup>University of Bern, Department of Visceral Surgery and Medicine, Inselspital, Bern, Switzerland, <sup>3</sup>University of Zimbabwe, Department of Internal Medicine, Harare, Zimbabwe

**Background:** Despite success of antiretroviral therapy in controlling HIV viremia, chronic low-level viremia and gut microbiota dysbiosis remain challenges contributing to gut inflammation, immune activation and systemic inflammation. We investigated associations between the gut microbiota, microbial translocation, gut and systemic inflammation in lactating women living with HIV in Harare Zimbabwe.

**Methods:** Women living with and without HIV were enrolled at 6 weeks and followed up at 24 weeks postpartum. We used 16S rRNA sequencing to profile the gut microbiome. MesoScale V-Plex and ELISA assays were used to quantify plasma inflammatory, microbial translocation, monocyte activation and gut inflammation biomarkers. These included lipopolysaccharide-binding protein (LBP), soluble cluster of differentiation 14 (sCD14) and fecal calprotectin. Markers of HIV disease progression were also assessed.

**Results:** 77 lactating women were recruited of whom 35% were living with HIV. Alpha diversity indices did not differ by HIV status at 6 and 24 weeks postpartum. However, beta diversity differed significantly by HIV status ( $p < 0.001$ ). In women living with HIV, abundance of genera *Collinsella* and *Slackia* was higher whereas *Clostridium sensu stricto\_1* was lower.

We observed positive correlations between abundance of Actinobacteriota phylum ( $q = 0.018$ ) and genus *Actinomyces* ( $q = 0.032$ ) with LBP and fecal calprotectin respectively. Fecal calprotectin levels were similar by HIV status. In women living with HIV at 6 weeks postpartum, fecal calprotectin was elevated [158.1  $\mu\text{g/g}$  (75.3–230.2)] in those with CD4+ T-lymphocyte counts  $< 350$  cells/ $\mu\text{L}$  compared to those with  $\geq 350$  cells/ $\mu\text{L}$  [21.1  $\mu\text{g/g}$  (0–58.4)],  $p = 0.032$ . Higher plasma sCD14 levels were observed in women living with HIV at both time points,  $p < 0.001$ . Plasma LBP levels were similar by HIV status, but higher in women living with HIV who had elevated fecal calprotectin. Fecal calprotectin, LBP and sCD14 correlated positively with systemic inflammatory biomarkers.

**Conclusions:** Lactating women living with HIV had increased microbial translocation associated with gut inflammation. ART-mediated viral suppression possibly

preserves immune function with reduction in effects of HIV on the gut microbiota. Correlation of gut inflammation, microbial abundance and translocation with systemic inflammation may suggest a synergistic effect on health. Gut microbiota modification through probiotics could potentially control chronic inflammation in people living with HIV.

## WEPEA007

### Gut microbiome composition changes rapidly during primary HIV infection, but timing-of-ART initiation during this period has minimal long-term impact

D. Pinto-Santini<sup>1</sup>, K. McCauley<sup>2</sup>, S. Minot<sup>1</sup>, D. Li<sup>2</sup>, R. Alfaro<sup>3</sup>, J.R. Lama<sup>3</sup>, S.V. Lynch<sup>2</sup>, A. Duerr<sup>1</sup>  
<sup>1</sup>Fred Hutchinson Cancer Center, Seattle, United States, <sup>2</sup>University of California, San Francisco, United States, <sup>3</sup>Asociacion Civil Impacta Salud y Educacion, Lima, Peru

**Background:** The gastrointestinal (GI) tract is a major site of HIV replication, and gut microbes are intimately linked to immune function. We characterized the dynamic changes in GI microbiota that occur in primary HIV infection and as antiretroviral therapy (ART) is initiated.

**Methods:** The Sabes study (conducted from 2013–2017) followed cisgender MSM and transgender women in Peru for 2 years with monthly HIV testing; participants with acute and early HIV were rapidly enrolled and randomized to begin ART immediately or 6 months later.

We calculated Estimated Date of Detectable Infection (EDDI) using a published algorithm and collected stool samples throughout 4 years. 16S rRNA amplicon sequencing was performed on 841 samples from 164 Sabes participants, plus 17 controls without HIV and 30 with untreated chronic HIV. Analysis used PERMANOVA and linear mixed effect models to determine:

1. Effect of time since HIV acquisition (EDDI to enrollment:  $\leq 30$ , 31–60, or  $> 60$  days) on gut microbial composition ( $N = 49$ ) and
2. Impact of timing of ART initiation on gut microbiota.

**Results:** GI microbial diversity at enrollment was related to time since EDDI. Fecal phylogenetic diversity (Faith) was lower in samples closer to EDDI (Figure 1A).

Community composition (Weighted UniFrac) of samples shortly after acquisition (closer to EDDI) resembled HIV-negative samples, while samples farther from EDDI were closer to untreated chronic HIV (Figure 1B).

Fecal microbiota became less like HIV-negative samples and more like untreated chronic HIV samples within 60 days of HIV acquisition.

Over the course of the 4-year study, trajectories of overall gut microbiota composition did not significantly differ in those who had started ART immediately vs. deferred ART for 6 months.

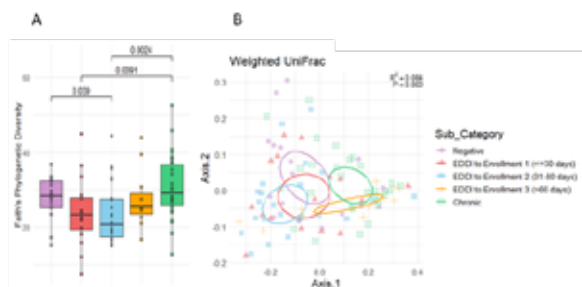

Figure 1. Comparison of microbial diversity metrics across EDDI-to-enrollment groups vs HIV negative and HIV chronic untreated groups.

**Conclusions:** In this Peruvian population, changes in gut microbiota composition were primarily related to the duration of HIV primary infection prior to ART initiation, with little long-term impact of timing of ART initiation.

## Host immune responses

### WEPEA008

#### Metabolic defects of exhausted CD8<sup>+</sup> T cells in people living with HIV

Y.T. Chan<sup>1</sup>, R. Rajasuriar<sup>2,3</sup>, K.-K. Cheng<sup>4</sup>,  
A. Kamarulzaman<sup>2,3</sup>, W.F. Wong<sup>1</sup>

<sup>1</sup>Universiti Malaya, Medical Microbiology, Kuala Lumpur, Malaysia, <sup>2</sup>Universiti Malaya, Medicine, Kuala Lumpur, Malaysia, <sup>3</sup>Universiti Malaya, Centre of Excellence for Research in AIDS (CERiA), Kuala Lumpur, Malaysia, <sup>4</sup>Universiti Teknologi Malaysia, Pagoh, Malaysia

**Background:** CD8<sup>+</sup> T cell exhaustion often occurs due to human immunodeficiency virus (HIV) persistence and is coupled to cellular metabolic alteration. Deciphering the metabolic landscapes at the transcriptomic level can provide insights to uncover potential intervention targets in chronic HIV-mediated cellular exhaustion.

This study aimed to investigate the differential metabolic gene expression and metabolic defects in the exhausted CD8<sup>+</sup> T cells derived from the people living with HIV (PLWH).

**Methods:** A total of 62 PLWH were recruited from the University of Malaya Medical Centre, Malaysia between September and December 2019. The cohort was divided into two groups:

- Aviremic antiretroviral therapy-treated (viral load <20 copies/ml) and;
- Viremic treatment-failure or treatment-naïve (viral load >20 copies/ml) groups.

From the peripheral blood mononuclear cells, naïve (CCR7<sup>+</sup> CD45RA<sup>+</sup>), effector (PD1<sup>+</sup> CD107a<sup>+</sup> and PD1<sup>+</sup>CD107a<sup>+</sup>), and exhausted (PD1<sup>+</sup> CD107a<sup>-</sup>) T cell subsets were isolated. Following RNA extraction from each subset, differen-

tial expressions of metabolic genes were analysed using NanoString Human Metabolic Pathways panel and Gene Ontology (GO) term enrichment analysis.

Key indicators of mitochondrial function including mitochondrial mass (MM), mitochondrial membrane potential (MMP) and reactive oxygen species (ROS) production were further analyzed. Targeted plasma metabolites involved in glucose and ROS scavenging metabolism were also measured in PLWH.

**Results:** Our results demonstrated higher levels of exhausted CD8<sup>+</sup> T cells with metabolic derangement in the viremic PLWH. Effector cells exhibited upregulated gene sets (log<sub>2</sub> fold change > 1) including T cell signalling, nucleotide, amino acid, fatty acid and mitochondrial metabolism relative to quiescent cells; intriguingly, down-regulation of these pathways (log<sub>2</sub> fold change < -1) were detected in the exhausted cells.

Increased *superoxide dismutase 2 (SOD2)* in the exhausted cells indicated high ROS level, correlated with high MM and low MMP. Besides, altered plasma metabolites including cysteine and tryptophan were also observed in viremic PLWH.

**Conclusions:** The transcriptomic and metabolite profiles of exhausted CD8<sup>+</sup> T cell in the viremic PLWH suggest that the alterations of mitochondria, ROS, cysteine and tryptophan level could jointly contribute to CD8<sup>+</sup> T cell exhaustion. Therefore, interventions to reverse these metabolic changes could be considered to restore metabolic fitness and CD8<sup>+</sup> T cell function.

### WEPEA009

#### Plasma proteomics analysis of Chinese HIV-1 infected individuals focusing on the immune and inflammatory factors afford insight into the viral control mechanism

W. Ni<sup>1</sup>, L. Ren<sup>1</sup>, L. Liao<sup>1</sup>, D. Li<sup>1</sup>, Z. Luo<sup>2</sup>, M. Zhu<sup>1</sup>, Y. Liu<sup>1</sup>, H. Xing<sup>1</sup>,  
Z. Wang<sup>1</sup>, Y. Shao<sup>1,3,4</sup>

<sup>1</sup>National Center for AIDS/STD Control and Prevention, Chinese Center for Disease Control and Prevention, Division of Research on Virology and Immunology, Beijing, China, <sup>2</sup>BioRay Pharmaceutical Co., Ltd., San Diego, United States, <sup>3</sup>Changping Laboratory, Beijing, China, <sup>4</sup>Zhejiang University, Zhejiang, China

**Background:** Long-term non-progressors (LTNPs) with HIV infection can naturally control viral replication for up to a decade without antiretroviral therapy (ART), but the underlying mechanisms of this phenomenon remain elusive.

**Methods:** To investigate the relevant immune and inflammatory factors associated with this natural control mechanism, plasma samples were collected from 16 LTNPs, 14 untreated viral progressors (VPs), 17 successfully ART-treated patients (TPs), and 16 healthy controls (HCs). The OLINK immune response panel and inflammation

panel were employed to detect key proteins, and the plasma neutralizing activity against a global panel of pseudoviruses was assessed using TZM-bl cells.

**Results:** Our findings showed that IL10, CXCL1, IL18, CXCL6, and CCL25 are crucial factors in the immune activity balance network of LTNP, with IL10 and CXCL1 identified as key nodes.

Additionally, TNFRSF9 showed positive correlations with neutralization breadth and Geometry Median Titer (GMT). The robust homeostatic regulation of the immune system in LTNP suppresses viral replication and avoids excessive inflammation.

Furthermore, we identified that the combination of IL17C, IL18, DDX58, and NF2 contributes to the discrimination between LTNP and VPs, while CXCL9 and CXCL10 may serve as auxiliary diagnostic indicators for the success of ART treatment.

**Conclusions:** In summary, this study identified a set of biomarkers in HIV-infected individuals at different infection states, each playing a role in immune balance regulation, plasma neutralization capacity, and antiviral treatment outcomes.

These findings provide important clues for further exploration of the mechanisms underlying HIV immune regulation.

## WEPEA010

### Characterization of HIV-specific follicular memory CD8 T cells: insights into transcriptional dynamics and functional attributes during acute and chronic infection

D. Wang<sup>1,2</sup>, L. Rogers<sup>1,2</sup>, O. Baranov<sup>1,2</sup>, T.M. Eser<sup>1,2</sup>, M.I.M. Ahmed<sup>1,2</sup>, I. Andr  <sup>3</sup>, W. Mbuya<sup>4</sup>, S. R  ger<sup>5</sup>, M. **Background:** T helper cells in lymph node follicles are major reservoirs of HIV replication and continue to express viral gene products during treatment with ART. Follicular memory CD8 T cells expressing the homing receptor CXCR5 (mTf) can access these sites and contribute to the clearance of HIV. This study aimed to characterize HIV-specific mTf in people living with HIV (PLWH).

**Methods:** PLWH were recruited from Germany and Tanzania (total  $n = 30$ ). HIV-specific and HIV-nonspecific memory CD8 T cells were identified in peripheral blood samples using peptide-HLA tetramers and sorted via flow cytometry. Low-input RNA sequencing and differential gene expression analyses were performed on sorted cell subsets stratified by the expression of CXCR5.

**Results:** Only a small fraction of circulating memory CD8 T cells expressed CXCR5 (median: 1.67% in the tanzanian cohort, 1.45% in the german cohort). In acute infection, HIV-specific mTf underexpressed genes associated with the TCR complex relative to HIV-specific memory CD8 T cells lacking expression of CXCR5, and in chronic infection, HIV-specific mTf underexpressed genes associated with effector functionality, activation, and exhaustion and overexpressed genes encoding various chemokines and TLRs relative to HIV-specific memory CD8 T cells lacking expression of CXCR5. These transcriptional profiles were observed in both cohorts and were unaffected by ART.

The frequencies of HIV-specific mTfC were significantly higher in aviremic versus viremic PLWH ( $p = 0.04$ ). HIV-specific mTfC also expressed genes encoding innate antiviral factors and exhibited an enriched elite controller gene signature in aviremic PLWH. In addition, HIV-specific mTfC overexpressed genes associated with a type I interferon response relative to HIV-specific memory CD8 T cells lacking expression of CXCR5, even after prolonged treatment with ART.

**Conclusions:** These results provide insights into the transcriptional characteristics of HIV-specific mTfC at different stages of infection, highlighting functional pathways associated with immune control of viral replication in the absence or presence of ART.

## WEPEA011

Differences in immune markers in youth with recent HIV acquisition, youth living with HIV on treatment, at risk youth, and healthy controls

H. Dong<sup>1</sup>, R. Cortado<sup>1</sup>, T. Kerin<sup>1</sup>, M. Shin-Sim<sup>2</sup>, B. Ank<sup>1</sup>, S. Paiola<sup>1</sup>, E. Arnold<sup>3</sup>, D. Swendeman<sup>4</sup>, M.I. Fernandez<sup>5</sup>, M.J. Rotheram<sup>4</sup>, O. Yang<sup>2</sup>, Y. Bryson<sup>1</sup>, K. Nielsen-Saines<sup>1</sup>, ATN CARES

<sup>1</sup>University of California, Los Angeles, Pediatric Infectious Diseases, Los Angeles, United States, <sup>2</sup>University of California, Los Angeles, Department of Medicine, Los Angeles, United States, <sup>3</sup>University of Texas Southwestern, Dallas, United States, <sup>4</sup>University of California, Los Angeles, Department of Psychiatry, Los Angeles, United States, <sup>5</sup>Nova Southeastern University, Fort Lauderdale, United States

**Background:** Studies in adults suggest early initiation of antiretrovirals (ART) mitigate chronic immune dysregulation. Less data is available for youths. We hypothesize that immune marker profiles are distinct between youths with newly diagnosed HIV, virologically suppressed youth living with HIV, at-risk youth, and healthy controls.

**Methods:** We assessed 49 immune markers (41 pro-inflammatory, 8 anti-inflammatory) by Luminex in 231 youths aged 13-24: 103 with newly-diagnosed (NDY) HIV (36 acutely and 67 non-acutely acquired based on Fiebig staging) pre-ART, 8-12 (12M) and 18-24 (24M) months post-ART initiation; 34 youths on longstanding ART > 24 months (CY) with virologic suppression (VS), 59 high-risk uninfected youths (HRY), 35 healthy controls (HC). Immune profiles were compared between patient groups and in NDY pre/post-ART.

**Results:** Participants were mainly young men-who-have-sex-with-men of Black or Hispanic background (median age: 20 years), enrolled in ATN studies between 7/2017 to 12/2020. All groups except HC had high STI prevalence (63%). Among 49 immune markers, 7 were elevated in all groups except HC. No difference was found between groups for 4 markers (IL4, IL1a, MCP3, TNFb).

Compared to HC, 9, 12, 19, 17, and 7 pro-inflammatory markers were elevated in HRY, NDY pre-ART, NDY 12M, NDY 24M, and CY respectively. No significant differences in immune markers were found between NDY at 12M and 24M. Compared to NDY pre-ART, NDY at 12M and 24M showed decreases in 7 pro-inflammatory markers. Compared to NDY at 12M and 24M, CY had decreases in 10 pro-inflammatory markers.

Figure. Comparison of immune markers (pro and anti-inflammatory) across 6 different groups along the spectrum of HIV risk and infection.

**Conclusions:** HRY had significant immune activation resembling and sometimes exceeding that of youths with HIV, potentially from concurrent STIs which may "prime" HIV-acquisition. Despite significant decline in immune activation markers post-ART, NDY with VS had more immune activation at 24 months than CY with VS. Longer term follow-up is needed to evaluate immune activation changes in NDY.

## WEPEA012

Impacts of VMMC adaptations in HIV prevention among 15-29 age group in Kisumu, Kenya

O. Samwel<sup>1</sup>

<sup>1</sup>Maseno University, School of Public Health and Community Development, Kisumu, Kenya

**Background:** Adapting Voluntary Medical Male Circumcision (VMMC) is a timely and most effective intervention in HIV prevention among the 15-29 age group in Kenya due to their vulnerability to HIV transmission. This study seeks to emulsify the impacts of integrating VMMC with peer induced initiatives and time frame of conducting VMMC procedures by assessing the uptake of adapted VMMC strategies and its effectiveness in preventing HIV transmission among individuals aged 15-29.

**Methods:** The study was conducted in Chulaimbo County Hospital and Marera Community Unit between November to December 2023 holidays. By random sampling, 80

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker

VMMC clients aged 15-29years and 10 Service providers were recruited into the study. Consent was obtained both from the participants and parents of the participants less than eighteen years of age and only from participants, for those who were eighteen years and above before capturing data through Focused group discussions, structured questionnaire and in-depth interviews. Excel sheet was used to analyze data.

**Results:** There is a direct proportionality pointing to a positive correlation between VMMC uptake and a reduction in HIV incidence rates within the target population. Deduced from the study, is increase in VMMC uptake among the 15-29 age group. Qualitative insights pointed out positive peer influence and long holidays/recess sessions to have catapulted and spurred the uptake of VMMC services. Socio-cultural factors presented itself as major barrier in accessing VMMC services thus downscaling VMMC as HIV prevention strategy among the 15-29 age group.

Variable Age	15-20 years	21-29 years
VMMC Uptake rates	74%	36%
HIV Incidence rates	42%	12%

**Conclusions:** Substantially as predicted by the results, adapted VMMC interventions have positively impacted HIV prevention among the 15-29 age group in Kenya. Projecting into future programs and policies, emphasizing the need for context-specific approaches will enhance efficacy through fostering partnerships between health-care providers and community leaders.

## WEPEA013

Role of extracellular HIV-1 Tat protein and anti-Tat antibodies in HIV pathogenesis and disease progression

A. Cafaro<sup>1</sup>, A. Tripiciano<sup>1</sup>, S. Moretti<sup>1</sup>, V. Francavilla<sup>1</sup>, I. Schietroma<sup>1</sup>, F. Mancini<sup>1</sup>, M.R. Pavone Cossut<sup>1</sup>, M. Campagna<sup>1</sup>, L. Sernicola<sup>1</sup>, M.T. Maggiorella<sup>1</sup>, R. Belli<sup>1</sup>, S. Farcomeni<sup>1</sup>, O. Picconi<sup>1</sup>, M. Falchi<sup>1</sup>, A. Borsetti<sup>1</sup>, C. Sgadari<sup>1</sup>, P. Monini<sup>1</sup>, B. Ensoli<sup>1</sup>

<sup>1</sup>Istituto Superiore di Sanità (ISS), National Center for HIV/AIDS Research (CNAIDS), Rome, Italy

**Background:** The transactivator of viral transcription Tat is one of the first HIV-1 proteins to be produced upon infection, as it is strictly required for HIV gene expression, replication and spreading. Tat is also incorporated in viral particles. Most of Tat produced during acute infection exits infected cells and binds the extracellular matrix (ECM) via heparan sulfate proteoglycans (HSPG) (Ensoli, Nature 1990 and 1994; Chang, AIDS 1997), thus accumulating in tissues, where it enhances target cells recruitment, activation, and infection (Ensoli, 2021). Indeed, when Tat is immobilized, mimicking ECM-bound Tat,

it enhances virus infectivity by capturing viral particles (Tat-assisted infection) (Nappi, Gene Med 2009). Further, by binding Env spikes, Tat forms a virus entry complex promoting integrin-mediated infection of dendritic cells (DCs), and efficient virus transmission to T cells (Monini, PLoS ONE 2012).

Of note, the minority of people living with HIV-1 (PLWH) who develop anti-Tat antibodies (20-30%) experiences containment of viral load, maintenance of CD4 T-cell counts, and low progression to disease as compared to anti-Tat seronegative PLWH (Rezza, J Infect Dis 2005; Bellino, Retrovirology 2014; Tripiciano, EBioMedicine 2021).

**Funding:** Project INV-037179 Vaxxit-BMGF : Evaluations of Tat and Tat-Env as targets for HIV interventions.

**Methods:** To address the role of extracellular Tat and anti-Tat immunity in HIV-1 infection, novel *in vitro* HIV neutralization assays were set up.

**Results:** Our data indicate that anti-Tat antibodies block HIV infection by neutralizing native extracellular Tat released by infected cells or present on viral particles ("Conventional" model of infection). Further, anti-Tat antibodies neutralize HIV infection in the Tat-assisted infection model. Finally, we show that recombinant soluble Tat added to the virus inoculum shields HIV from Env-neutralizing antibodies enhancing HIV infectivity, while anti-Tat antibodies restore HIV neutralization (Cafaro et al, and Francavilla et al, in preparation).

**Conclusions:** These results indicate that Tat plays a pivotal role in virus acquisition, spreading, and persistence. The induction of anti-Tat immune responses represents a pathogenetic intervention to intensify antiretroviral therapy (ART) and to attack the ART-resistant virus reservoir as well as an excellent candidate for novel preventative vaccines, alone or in conjunction with Env.

## WEPEA014

Platelet origin TGFβ and PGE2 are associated with functional deficits of monocyte derived dendritic cells in people living with HIV

K. Sutton<sup>1</sup>, Z. Boodoo<sup>1</sup>, S. Peres<sup>2</sup>, M. Covacevich Vidalle<sup>2</sup>, L. Thomson<sup>3</sup>, C. Butze<sup>2</sup>, E. Waterman<sup>2</sup>, A. Brinkman<sup>4</sup>, V.B. Singh<sup>3</sup>, P. Kalinski<sup>4</sup>, G. Schifitto<sup>2</sup>, M.V. Singh<sup>2</sup>

<sup>1</sup>University of Rochester School of Medicine and Dentistry, Microbiology and Immunology, Rochester, United States,

<sup>2</sup>University of Rochester School of Medicine and Dentistry, Neurology, Rochester, United States, <sup>3</sup>Albany College of Pharmacy and Health Sciences, Life Sciences, Albany, United States, <sup>4</sup>Roswell Park Comprehensive Cancer Center, Immunology, Buffalo, United States

**Background:** Upon activation, platelets secrete immunomodulatory molecules including CD40L, TGFβ, β2-microglobulin (β2M), and PGE2. People living with HIV (PLWH), exhibit increased platelet activation and platelet-monocyte complexes (PMCs). Differentiation of PMCs to dendrit-

ic cells (MoDCs) *in vitro* resulted in deficiencies in antigen uptake, expression of immunostimulatory molecules and proliferation of CD4<sup>+</sup> and CD8<sup>+</sup> T cells.

This study aims to quantify the levels of immunomodulatory molecules secreted by activated platelets from PLWH as compared to people living without HIV (PLWOH) and to investigate if clinically approved anti-platelet drugs (APD) can be employed to improve the immunogenicity of MoDCs.

**Methods:** Platelets isolated from PLWH (n=10) and age, sex matched PLWOH (n=6) were treated with APD (clopidogrel or aspirin) followed by activation using collagen. Cell supernatants were used to measure CD40L, TGFβ, β2M, and PGE2 by ELISAs.

Alternatively, platelets were mixed with autologous monocytes and differentiated into type 1 mature DCs and pulsed with VSV-g-pseudo-typed, replication deficient HIV isolate. DCs were used for RT-PCR assays or to stimulate CFSE labelled autologous CD4<sup>+</sup> or CD8<sup>+</sup> T cells. Results were analyzed using one-way ANOVAs, and Tukey's post-test or Welch t tests.

**Results:** Activated platelets secreted significantly higher levels of CD40L (p=0.0035) and TGFβ (p=0.0086). APD treatment resulted in levels similar to not-activated platelets. Clopidogrel but not aspirin treatment resulted in increased PGE2 secretion (p=0.003).

Further, platelets from PLWH secreted higher levels of immune-suppressor molecules such as TGFβ (p=0.0273) and PGE2 (p=0.0403) but not β2M or CD40L. DCs treated with activated platelets and clopidogrel treated platelets showed increased RNA expression of IL-10 (p=0.0401) and S100A9 genes (p=0.0353). Lastly, APDs rescued the quantitative deficit in CD4<sup>+</sup> (p=0.005) and CD8<sup>+</sup> (p=0.0257) T cell proliferation induced by activated platelets irrespective of the HIV status.

**Conclusions:** TGFβ and PGE2 secreted by platelets might be responsible for inducing functional defects in MoDC derived from PMCs especially in PLWH by inducing expression of genes related to myeloid derived suppressor cells. Since monocytes serve as the predominant source of MoDCs for immunotherapies and *in vivo* MoDCs during infections/inflammation, an in depth understanding of immune modulation by platelets can be used to improve such therapies and endogenous anti-viral immunity.

## WEPEA015

### New molecular mechanisms associated with profound alteration in Th17 cell functions and biology in people with HIV under ART and in elite controllers

A. Yero<sup>1</sup>, J.-P. Goulet<sup>2</sup>, T. Shi<sup>1</sup>, C.T. Costiniuk<sup>3</sup>, J.-P. Routy<sup>3</sup>, C. Tremblay<sup>4</sup>, R.-S. Mboumba Bouassa<sup>1</sup>, Y. Alexandrova<sup>1</sup>, A. Pagliuzza<sup>4</sup>, N. Chomont<sup>4</sup>, P. Ancuta<sup>4</sup>, M.-A. Jenabian<sup>1</sup>

<sup>1</sup>Université du Québec à Montréal (UQAM), Department of Biological Sciences, Montreal, Canada, <sup>2</sup>Cell Carta, Bioinformatics, Montreal, Canada, <sup>3</sup>Research Institute of the McGill University Health Centre, Medicine, Montreal, Canada, <sup>4</sup>Centre de Recherche du CHUM, Faculté de Médecine, Université de Montréal, Montreal, Canada

**Background:** Despite successful antiretroviral therapy (ART), frequencies and immune function of memory CCR6<sup>+</sup> Th17-polarized T-cell are not fully restored.

Furthermore, these cells contribute to HIV persistence under ART. However, the molecular mechanisms underlying these alterations remain elusive.

**Methods:** A total of 65 participants enrolled in the study, including successfully ART-treated (ST, n=23), HIV elite controllers (EC, n=18) and HIV- controls (n=24). Illumina mRNA sequencing was performed in FACS-sorted memory CCR6<sup>+</sup> CD4<sup>+</sup> T-cells from leukapheresis.

Differential gene expression (DEG) validation was done by RT-PCR, flow cytometry analysis, and/or *in vitro* functional assays. Total and integrated HIV-DNA were quantified using ultra-sensitive RT-PCR.

**Results:** Frequencies of T-cells with a Th17 phenotype (based on CCR6/CCR4/CXCR3, CD26/CD161) reduced in ST and EC compared to HIV-, along with their impaired Th17 *in vitro* cytokine secretion (IL-17A/F, IL-22, IFN-γ).

Memory CCR6<sup>+</sup> T-cells from ST and EC *versus* HIV- expressed higher levels of activation (CD38/HLA-DR) and senescence/exhaustion (PD-1/CD57) markers but lower levels of proliferation marker Ki-67.

These alterations coincided with an increased transcriptional expression of NR1D1/REV-ERBa (repressor of Th17 functions), and a decreased expression of Semaphorin 4D (inducer of Th17 differentiation), in Memory CCR6<sup>+</sup> T-cells from STs and ECs *versus* HIV-, confirming impairment in their differentiation, stability, proliferation, and functions.

Downregulation of HIV restriction factors (SERINC3, KLF3, and RNF125) and HIV inhibitors (tetraspanins: CD37, CD81, and CD82), along with increased expression of MRE11 (positive regulator of HIV acquisition) in Memory CCR6<sup>+</sup> T-cells from STs and ECs suggest higher susceptibility/permissiveness to HIV acquisition.

Memory CCR6<sup>+</sup> T-cells from STs and ECs had lower TFAP4 expression and increased expression of EED *vs.* HIV-, which is associated with HIV persistence, as confirmed by total and integrated HIV-DNA in these cells.

Markers of DNA damage/modification were elevated in STs and ECs vs. HIV-, including H2AX, PARP, and DNA methylases DNMT1/DNMT3A.

**Conclusions:** This study reveals novel molecular mechanisms associated with profound Th17 functional and biological alterations regardless of viral suppression, including deficient Th17 polarization, increased HIV permissiveness and persistence, and impaired Th17 survival.

New therapeutic strategies specifically targeting these mechanisms may restore Th17 functions in view of promoting immunological remission at mucosal level in people with HIV.

## WEPEA016

Characterization of natural killer cells in early-life HIV and antiretroviral therapy exposed children at 5 years of age

H. Mataramvura<sup>1</sup>, J. Jäger<sup>2</sup>, A. Jordan-Paiz<sup>2</sup>, L.R. Mazengera<sup>1</sup>, F.Z. Gumbo<sup>3</sup>, M.J. Bunders<sup>2</sup>, K. Duri<sup>1</sup>

<sup>1</sup>University of Zimbabwe Faculty of Medicine and Health Sciences, Laboratory Diagnostic and Investigative Sciences, Harare, Zimbabwe, <sup>2</sup>Leibniz Institute of Virology, Virus Immunology, Hamburg, Germany, <sup>3</sup>University of Zimbabwe Faculty of Medicine and Health Sciences, Pediatrics and Child Health, Harare, Zimbabwe

**Background:** Children of women living with HIV, regardless of HIV status, present with higher morbidity compared to HIV-unexposed (HUU) peers. Early-life HIV or/and antiretroviral therapy (ART) exposure has been associated with natural killer (NK) cell dysfunction within the first year of life. However, there is paucity of data on immunological consequences of early-life HIV/ART exposure on NK cells in children post weaning with minimal maternal contribution.

We investigated the association of early-life exposure to maternal HIV and ART with NK cell subsets in children aged ~five years of age.

**Methods:** Multi-parametric flow cytometry was used to assess the phenotype of peripheral blood-derived NK cells in age matched breastfed children exposed to but not living with (HEU) children compared to HUU controls. The HEU children were classified as long (HEULT) and mid-term (HEUMT) according to duration of *in utero* ART exposure. An exploratory group of children living with HIV (HEI) was also included. CD56<sup>bright</sup> and CD56<sup>dim</sup> NK cell subsets were assessed and correlated to documented sick clinic visits/hospitalisations from birth to 5 years.

In addition, expression of inhibitory markers, cell differentiation markers and intracellular perforin/granzyme B was also assessed.

**Results:** 139 children (43-HEULT, 38-HEUMT, 52-HUU and 6-HEI) with median age of 5 years were enrolled and 48.2% were female. Proportions of total NK cells, CD56<sup>bright</sup> and CD56<sup>dim</sup> subsets and expression of NKG2A, KIR3DL1/

KIR2DL2/L3 and CD57 surface markers were similar between HEU, HUU and HEI groups. In the HEU group, HEULT had higher CD56<sup>bright</sup> ( $p < 0.001$ ) and lower CD56<sup>dim</sup> NK cell proportions ( $p < 0.0001$ ) than HEUMT children. Markers of cytolytic potential (intracellular granzyme B and perforin) and proportions of perforin+ granzyme B+ NK cells were significantly lower in HEI compared to HUU children ( $p < 0.01$ ) whereas no differences were noted between HUU and HEU children. CD56<sup>dim</sup> NK cell counts negatively correlated with recurrent respiratory conditions and total sick clinic visits in HUU and HEUMT groups ( $\rho = -0.38$ ;  $p = 0.005$  and  $-0.4$ ;  $p = 0.011$  respectively).

**Conclusions:** Despite exposure to HIV/ART, HEU children presented with an NK phenotype and cytolytic potential similar to HUU children at 5 years of age. Further, NK cell cytolytic potential is altered in children living with HIV despite taking ART.

## WEPEA017

Plasticity of longitudinal antibody immune responses during antiretroviral treatment-naïve periods in HIV-1 CRF02\_AG infection

A. Nanfack<sup>1</sup>, G. Ambada<sup>1</sup>, C. Courtney<sup>2</sup>, M. Tuen<sup>2</sup>, R. Duerr<sup>2</sup>

<sup>1</sup>International Reference Centre Chantal Biya, Immunology, Yaounde, Cameroon, <sup>2</sup>New York University School of Medicine, Pathology, New York, United States

**Background:** Understanding subtype diversity is crucial for vaccine development, which need to elicit immune responses capable of targeting various subtypes. An effective vaccine against HIV will likely require the elicitation of a combination of functional antibody immune responses of which neutralizing antibodies (nAbs) are a critical component. So far, nAb studies have focused on individuals infected with subtypes A, B and C.

Here we evaluated longitudinal antibody immune responses and envelope binding patterns during antiretroviral treatment (ART)-naïve period in individuals infected with HIV-1 CRF02\_AG, the most prevalent subtype in West-Central Africa (>50%).

**Methods:** Archived samples longitudinally collected over 2 to 8 years' period from ART-naïve HIV-1 CRF02\_AG infected individuals were used for antibody neutralization assays (TZM-bl assay). The specificity of the plasma neutralization was determined following mapping of antibody responses (ELISA and neutralization fingerprinting).

**Results:** Antibody immune responses were very diverse in breadth (0 to 7) as well as in potency (0 to 620). All study participants showed a relatively constant neutralizing patterns which remained durable for the entire study period. One participant (NYU128) stood out with broad and potent nAb responses against pseudovirus tested ( $300.3 \leq \text{BP score} \leq 620.9$ ) with no significant increase over time. But significant longitudinal changes in antibody binding responses and affinity were observed with gradual increase

in binding to V1V2sc. throughout the study period. Phylogenetic analyses of *Env* and *Pol* sequences of NYU128 suggested the presence of dual infection with HIV-1 CRF02\_AG (genetic distance up to 7.5%). *Env* sequence analyses revealed no evident selection pressure at major broadly nAbs epitopes, but substantial variation in the immunodominant V1V2 epitope region and presence of VRC01 and PGT151-like antibodies.

**Conclusions:** Our findings reveal the plasticity of antibody immune response in ART-naïve individuals and provided additional insight into *Env* binding patterns in HIV-1 CRF02\_AG infected individuals in the context of the underlying *Env* epitope landscape of the infecting viruses. These findings may prove valuable for the development of regional vaccines, especially in West-central Africa where CRF02\_AG prevails.

## Understanding and targeting persistent HIV reservoirs

### WEPEA018

Host metabolites modulate romidepsin's efficacy in reactivating latent HIV

L. Giron<sup>1</sup>, J. D. Gunst<sup>2</sup>, M. Tolstrup<sup>2</sup>, O. Schmeltz Søgaard<sup>2</sup>, M. Abdel-Mohsen<sup>1</sup>

<sup>1</sup>The Wistar Institute, Philadelphia, United States, <sup>2</sup>Aarhus University, Aarhus, Denmark

**Background:** Dysregulated host metabolic processes influence several cellular functions central to HIV persistence. However, the impact of these processes on the effectiveness of HIV cure strategies remains unknown. Our recent studies have shown that byproducts of glutaminolysis, including  $\alpha$ -ketoglutarate ( $\alpha$ -KG), can inhibit HIV transcription.

This suggests that glutaminolysis may impact the success of curative strategies aimed at modulating HIV transcription, such as the shock-and-kill.

**Methods:** We examined the impact of  $\alpha$ -KG on the ability of romidepsin to reactivate HIV using: 1) J-Lat (flow cytometry) and ACH-2 (p24 ELISA) HIV latency models; and 2) PBMCs isolated from six people living with HIV (PLWH) on antiretroviral therapy (ART), assessed for cell-associated HIV RNA and DNA using qPCR.

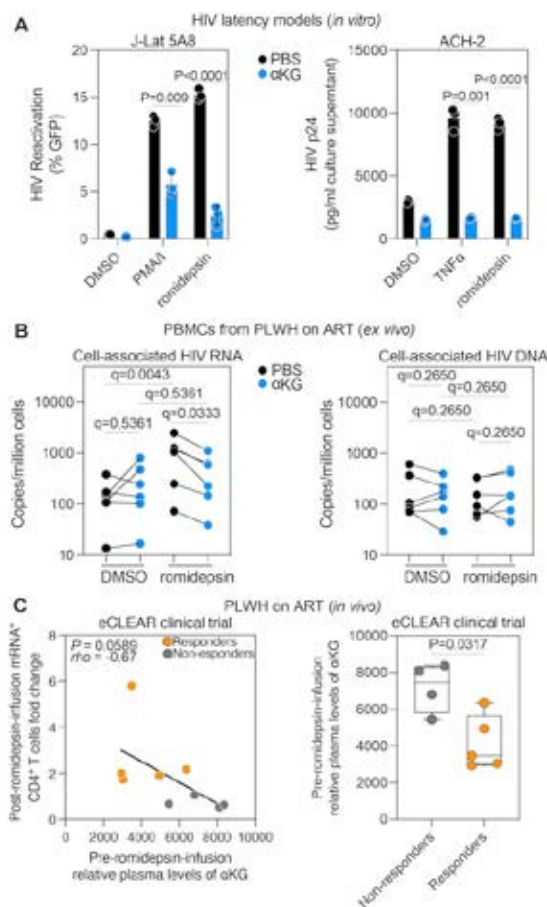

Additionally, we analyzed the pre-infusion plasma levels of  $\alpha$ -KG by LC/MS in nine PLWH who underwent romidepsin infusion as part of the eCLEAR study, correlating them with 2 hours post-infusion induction of CD4<sup>+</sup> T cells expressing HIV mRNA (RNAflow).

Finally, the effects of  $\alpha$ -KG on histone post-translational modifications were examined in JLat cells using an epiproteomic panel.

**Results:**  $\alpha$ -KG significantly inhibited the ability of romidepsin to reactivate HIV in the J-Lat and ACH-2 models ( $P \leq 0.0009$ ; Fig.1A).

Using primary PBMC from PLWH on ART,  $\alpha$ -KG also inhibited romidepsin-mediated induction of cell-associated HIV RNA ( $q=0.033$ ) without impacting HIV DNA levels (Fig.1B).

The pre-infusion levels of  $\alpha$ -KG negatively correlated with romidepsin's efficacy in inducing CD4<sup>+</sup> T cells expressing HIV mRNA *in vivo* ( $P=0.0589$ ; Fig.1C-left), with PLWH who responded to romidepsin exhibiting lower pre-infusion levels of  $\alpha$ -KG than non-responders ( $P=0.032$ ; Fig.1C-right). Lastly,  $\alpha$ -KG induced several histone modifications known to inhibit HIV transcription, such as H3K27me3 ( $P=0.019$ ).

**Conclusions:** Host metabolites, particularly  $\alpha$ -KG, might impose unrecognized epigenetic forces affecting the efficacy of HIV curative strategies aimed at modulating HIV transcription. Investigating approaches to manipulate these metabolic pathways could enhance the efficiency of these strategies.

### GS-8588, a novel envelope-targeting bispecific T-cell engager for HIV cure

C.-Y. Lam<sup>1</sup>, J. Goldsmith<sup>1</sup>, R. Dave<sup>1</sup>, E. McGlinchey<sup>1</sup>, M. Hung<sup>1</sup>, M. Nagel<sup>1</sup>, S. Ding<sup>1</sup>, K. Orsted<sup>1</sup>, M. Baca<sup>1</sup>, B. Carr<sup>1</sup>, C. Pace<sup>1</sup>, W. Blair<sup>1</sup>, N. Thomsen<sup>1</sup>

<sup>1</sup>Gilead Sciences, Foster City, United States

**Background:** Persistence of latent viral reservoirs remains a major barrier to an HIV cure. A therapeutic agent that can recognize the HIV envelope protein (Env) expressed on latently infected cells after provirus activation, and effectively engage the immune system to eliminate these cells, can potentially play a role in achieving a functional cure.

Here, we describe the preclinical characterization of GS-8588, a bispecific T-cell engager that employs an engineered CD4 domain 1 variant for broad Env targeting and a humanized anti-CD3 arm for T-cell recruitment.

**Methods:** GS-8588 was evaluated in vitro for its potency in mediating killing of primary CD4+ T cells infected with a panel of 32 HIV-1 clinical isolates. Off-target killing of major histocompatibility complex class II-expressing B cells was assessed in the same assay. T-cell activation and cytokine secretion were monitored ex vivo in GS-8588-treated peripheral blood mononuclear cell (PBMC) samples derived from people living with HIV.

Pharmacokinetics of GS-8588 were measured in nonhuman primates (NHPs) at a single 1 mg/kg intravenous dose. Safety and tolerability of GS-8588 were evaluated in an NHP study at 5 weekly doses up to 100 mg/kg/week.

**Results:** GS-8588 mediated potent killing of primary CD4+ T cells infected with 29 of the 32 clinical isolates tested (median EC50, 0.12 µg/mL). For the 3 remaining isolates, GS-8588-mediated killing was observed in alternative killing assays using activated PBMCs.

Off-target killing of B cells was not detected. GS-8588 mediated low-level T-cell activation (geometric mean EC10 for CD69+ T cells, ≥ 10.3 µg/mL) and cytokine secretion (mean maximum signals, ≤ 52 pg/mL for IFN-γ, TNF-α, IL-6, IL-2, IL-4, and IL-10) ex vivo. GS-8588 exhibits IgG-like pharmacokinetics in NHPs with a predicted half-life of 12 days in humans. No adverse events were observed in the NHP toxicology study.

**Conclusions:** The preclinical activity, pharmacokinetics, and safety profile support clinical investigation of GS-8588 as a therapeutic candidate for the elimination of latent HIV-infected cells, and potentially as part of an HIV cure regimen.

## WEPEA020

### The impact of amino acid & micronutrient supplementation on gut HIV reservoir in the AMAZE trial

M. Khan<sup>1</sup>, D. Freitas<sup>1</sup>, P. Kelly<sup>1,2</sup>, J. Thornhill<sup>1</sup>

<sup>1</sup>Queen Mary, University of London, Immunobiology, The Blizard Institute, London, United Kingdom, <sup>2</sup>University of Zambia, School of Medicine, Department of Medicine, Lusaka, Zambia

**Background:** Gut-associated-lymphoid-tissue (GALT) is a key site of HIV persistence, while HIV-associated gut dysbiosis and epithelial barrier damage are drivers of chronic immune activation. Nutritional supplements which enhance gut flora & integrity have been investigated to reduce T-cell activation in people with HIV(PHW).

We examine the impact of amino acids (AA) or micronutrients (MM) on gut HIV DNA & immune markers in PWH from the AMAZE trial, a factorial RCT designed to investigate if AA and/or MM impacts gut barrier dysfunction in Zambian adults with environmental enteropathy.

**Methods:** AMAZE participants were randomised to placebo, AA only, MM only or AA plus MM. Duodenum biopsies were taken at baseline & five months post-intervention. The Mechanistic Target of Rapamycin Complex 1 (mTORC1) activity on T cells was assessed using flow cytometry by phosphor-4E-binding protein 1 (p4E-BP1) expression. Plasma soluble CD14, C-reactive protein (CRP) & serum endotoxin levels were measured using ELISA. Gut barrier leak was measured using confocal laser endomicroscopy. Total HIV DNA in GALT was quantified using a single-copy-assay targeting integrase.

**Results:** Twenty-six PWH were included, median age was 41(IQR 35-47), 22/26 were female. In those (n=16) who received 'any intervention' (AA, MM, or both), we observed a significant reduction in gut HIV DNA (p=0.03) between pre-intervention (median=14.1, 95%CI 7.1,18.9 copies/106 cells) & post-intervention (median=6, 95%CI 3.7,14.7 copies/106 cells). No difference in HIV DNA was observed (p=0.9) in PHW who received placebo (n=4). Median (95%CI) CD4 mTORC1 activity was lower pre 'any intervention' [MFI 529 (394,624)] compared to post 'any intervention' [MFI 218 (153,383)], p=0.003. Median (95%CI) CD8 mTORC1 activity was also lower [MFI 490 (374,571)] compared to post 'any intervention' [MFI 280 (158,478)], (p=0.02). Baseline HIV DNA correlated with CD4+ mTORC1 activity (R<sup>2</sup>=0.9, p=0.003). No difference in markers, gut barrier leak (p=0.52), endotoxin levels (p=0.3) or CRP (0.4) was observed.

**Conclusions:** This exploratory analysis suggests an impact of AA & MM supplementation on GALT in PWH with an observed reduction in mTORC activation on T-cells in HIV reservoir in PWH treated with AA, MM or both. These findings support further investigation of mTORC modulators in PWH to alter immune dysfunction & HIV DNA in GALT.

## WEPEA021

### Exploring the Hypoxia-CD73-Adenosine (HCA) axis in HIV persistence: a novel route for cure strategies

H.S. Schwarzer-Sperber<sup>1</sup>, Z. Karaköse<sup>1</sup>, Y. Henning<sup>2</sup>, J. Sbeiti<sup>1,2</sup>, B. Budeus<sup>3</sup>, C. Elsner<sup>4</sup>, S. Esser<sup>1,5</sup>, J. Fandrey<sup>2</sup>, S. Winning<sup>2</sup>, R. Schwarzer<sup>1</sup>

<sup>1</sup>University Hospital Essen, Institute for the Research on HIV and AIDS-associated Diseases, Essen, Germany, <sup>2</sup>University of Duisburg-Essen, Institute for Physiology, Essen, Germany, <sup>3</sup>University Hospital Essen, Center for Medical Biotechnology, Essen, Germany, <sup>4</sup>University Hospital Essen, Institute for Virology, Essen, Germany, <sup>5</sup>University Hospital Essen, Dept. of Dermatology and Venerology, Essen, Germany

**Background:** The progress towards finding a cure for HIV has been impeded by the persistence of long-lived, latently-infected cells, which are hidden from the immune system and prevail despite effective antiretroviral therapy (ART). We have previously unveiled an increased surface expression on latent cells of CD73 – a hypoxia-regulated, adenosine-producing ectoenzyme.

We thus introduced the Hypoxia-CD73-Adenosine (HCA) model of HIV persistence, proposing that HIV perseveres in oxygen-deprived regions, such as lymphoid tissues, by exploiting CD73-dependent adenosine signaling. We now explore this novel latency concept to harness it for the development of better cure strategies.

**Methods:** We characterized the transcriptome of human CD73-expressing CD4 T cells, which represent a relatively small subset of circulating CD4+ T cells. The BD Rhapsody system was then deployed for single-cell transcriptomic profiling of lymphocytes under hypoxic (HOX) and normoxic (NOX) conditions. HIV latency reversal under HOX and the influence of HCA factors on HIV transcription were examined in a cell line model of latency using pharmacological inhibition and CRISPR interference.

Finally, we measured HIV reservoir size and HCA factors in blood from people living with HIV (PLWH) to assess their predictive and diagnostic potential *in vivo*.

**Results:** CD73+ CD4 T cells exhibit distinct gene expression profiles compared to CD73- cells, including key immunoregulatory pathways and genes involved in cell activity and homeostasis. Knockdown of CD73 or inhibition of adenosine signaling facilitated latency reversal, while hypoxic conditions repressed HIV transcription.

Phenotyping of immune cells from PLWH revealed altered surface expression of HCA factors compared to HIV negative participants. Correlation analyses uncovered an association between HIV reservoir size and expression of HCA factors.

**Conclusions:** We report transcriptional features of CD73+ CD4 T cells that favor viral quiescence, immune evasion, and cell survival. The effect on HIV transcription and latency reversal upon manipulation of the HCA cascade and the altered expression of HCA factors in blood of

PLWH despite ART suggests an involvement of the HCA axis in long-term HIV persistence. Thus, similar to solid tumor cells, latent HIV reservoirs may hijack the HCA axis as a persistence mechanism. These findings advocate for further exploration of HCA-focused anticancer therapeutics as host-directed HIV-cure approaches.

## WEPEA022

### GITR expression on CD4+ T-cells from people living with HIV (PLWH) and its role on viral reactivation: a possible target for new latency reversal agents

A. Czernikier<sup>1,2</sup>, L. Baquero<sup>1,2</sup>, L. Cruces<sup>1,2</sup>, A. Osegueda<sup>1,2</sup>, P. Benencio<sup>1,2</sup>, J. Savarese Schilling<sup>1,2</sup>, L. Osorio Ocampo<sup>1,2</sup>, Y. Ghiglione<sup>1,2</sup>, N. Laufer<sup>1,2,3,4</sup>, M.F. Pascutti<sup>5</sup>, G. Turk<sup>1,2,4</sup>

<sup>1</sup>CONICET-Universidad de Buenos Aires. Instituto de Investigaciones Biomédicas en Retrovirus y Sida (INBIRS), Buenos Aires, Argentina, <sup>2</sup>Universidad de Buenos Aires, Facultad de Medicina, Buenos Aires, Argentina, <sup>3</sup>Hospital Juan A. Fernandez, Unidad de Enfermedades Infecciosas, Buenos Aires, Argentina, <sup>4</sup>Universidad de Buenos Aires, Facultad de Medicina, Departamento de Microbiología, Parasitología e Inmunología, Buenos Aires, Argentina, <sup>5</sup>Leiden University Medical Center, LUMC., Department of Immunology, Leiden, Netherlands, the

**Background:** Latently infected CD4+ T cells (CD4TCs) represent the main barrier to achieving an HIV cure. Thus, the development of more effective latency reversal agents is crucial. Glucocorticoid-Induced TNF Receptor (GITR), a costimulatory molecule, plays a role in cellular proliferation and effector function. However, little is known about GITR in the context of HIV infection and there are no reports on its impact on viral reactivation.

This study aimed to assess GITR expression on peripheral CD4TCs and investigate the effects of a novel GITR agonist on HIV transcription from latently infected CD4TCs.

**Methods:** To characterize the immune-phenotype of GITR-expressing CD4TCs, peripheral blood mononuclear cells from 11 PLWH off-ART were stimulated with HIV-peptide pools. Then, surface expression of GITR and memory markers (CD45RO/CCR7) were measured by flow cytometry. Regulatory CD4TCs (Tregs) were defined by the expression of CD25/FOXP3.

Additionally, correlation with viral load (VL) and CD4TC count was evaluated by non-parametric statistics. To assess the GITR-mediated effect on latency reversion, purified CD4TCs from 3 on-ART PLWH were treated for 16h with a novel Fc-Flag-TNC-GITRL agonist and unspliced HIV transcripts were quantified by qRT-PCR.

**Results:** In both conventional-CD4TCs (Tconv) and Tregs, GITR-expression was significantly enriched within central memory (CM) and effector memory (EM) phenotypes, compared to naïve and terminal effector subpopulations ( $p < 0.0001$ ).

Moreover, the majority of GTR-expressing Tconv and Tregs displayed an EM phenotype (median=92.32% and 80.55%, respectively). Interestingly, a positive correlation between GTR+ Tconv<sub>CM</sub> and CD4 count was found ( $r=0.448$ ,  $p=0.048$ ).

Within Tregs (bulk, CM and EM), GTR expression negatively correlated with VL ( $r=-0.683$ ,  $p=0.002$ ;  $r=-0.604$ ,  $p=0.008$  and  $r=-0.647$ ,  $p=0.004$ , respectively). Notably, costimulation with GTR agonist led to a mean fold increase of 3.02 of HIV unspliced RNA/10<sup>6</sup> cellular equivalents.

**Conclusions:** Our results showed that GTR expression in both Tconv and Tregs correlated with CD4 count and VL, suggesting a role of this molecule in the control of infection. Interestingly, we observed a significant enrichment of GTR expression in the CM phenotype, a major subset contributing to the HIV reservoir.

Our findings suggest that costimulation through GTR pathway enhances viral transcription, positioning GTR as an interesting target for the development of novel latency reversal agents.

## WEPEA023

Investigation of the sociodemographic, clinical, and immunogenetic factors influencing HIV reservoir size and total proviral load during ART

M. Duncan<sup>1,2</sup>, F.H. Omondi<sup>1,2</sup>, E. Barad<sup>1,2</sup>, N. Kinloch<sup>1,2</sup>, H. Lapointe<sup>2</sup>, S. Speckmaier<sup>2</sup>, N. Moran Garcia<sup>2</sup>, A. <sup>1</sup>Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada, <sup>2</sup>British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada, <sup>3</sup>University of British Columbia, Department of Medicine, Vancouver, Canada, <sup>4</sup>University of British Columbia, School of Population and Public Health, Vancouver, Canada, <sup>5</sup>University of British Columbia, Department of Family Practice, Faculty of Medicine, Vancouver, Canada, <sup>6</sup>Simon Fraser University, Department of Molecular Biology and Biochemistry, Faculty of Science, Burnaby, Canada

**Background:** Understanding the factors that influence HIV persistence is critical to the development of curative strategies. We investigated sociodemographic, clinical, and immunogenetic correlates of HIV reservoir size and total proviral load during antiretroviral therapy (ART).

**Methods:** In this cross-sectional analysis, we studied 105 adults with HIV receiving ART in British Columbia, Canada. HIV reservoir size (defined as genomically intact proviruses/million CD4<sup>+</sup> T-cells) and total proviral load (total HIV DNA/million CD4<sup>+</sup> T-cells, including intact and defective genomes) were measured using the Intact Proviral DNA Assay, where primers/probes were adapted to within-host HIV polymorphism where required. HLA class I types were characterized by sequence-based typing.

**Results:** Most (90%) participants were male and the median age was 51 (interquartile range [IQR] 38-59) years. Participants had a median recent CD4<sup>+</sup> T-cell count of 740 (IQR 508-953) cells/mm<sup>3</sup>, and a median nadir CD4<sup>+</sup> T-cell count of 260 (IQR 110-480) cells/mm<sup>3</sup>. They had been receiving ART for a median 8.7 (IQR 4.4-13.2) years, and 65% were receiving an integrase inhibitor (INSTI)-based regimen at time of sampling. The predominant HIV subtype was B (92%).

The median reservoir size was 79 (IQR 31-194) genome-intact HIV copies/million CD4<sup>+</sup> T-cells. The median total proviral load was 984 (IQR 509-2143) total HIV copies/million CD4<sup>+</sup> T-cells.

These measures correlated strongly (Spearman  $\rho=0.72$ ,  $p<0.0001$ ). HLA-B\*07:02 carriage was associated with both larger reservoirs and larger total proviral load, while HLA-A\*02:01 was associated with larger total proviral load (all  $p<0.02$ ,  $q<0.18$ ).

In univariable analyses, lower nadir and recent CD4<sup>+</sup> T-cell counts, and receiving a non-INSTI-based regimen were associated with larger reservoirs ( $p<0.03$ ), but no variables were significant after multivariable correction.

Older age, lower nadir CD4<sup>+</sup> T-cell count, longer time on ART, and receiving a non-INSTI-based regimen were associated with higher total proviral load (all  $p<0.002$ ), but only older age and lower nadir CD4<sup>+</sup> T-cell count remained significant in multivariable analysis (both  $p<0.05$ ).

**Conclusions:** Older age and lower nadir CD4<sup>+</sup> T-cell count were key correlates of higher total proviral loads during ART, confirming the importance of early ART initiation in limiting total proviral DNA load. The mechanisms underlying HLA associations with reservoir size require further investigation.

## WEPEA024

CD30+/CD4+ T cells from blood and lymph nodes have unique phenotypes that may facilitate HIV-1 persistence

J. Okoro<sup>1</sup>, C. Prator<sup>1</sup>, D. Maison<sup>1</sup>, T. Ma<sup>2</sup>, C. Thanh<sup>1</sup>, T. Pan<sup>1</sup>, S. Kumar<sup>1</sup>, S. Cobarrubias<sup>1</sup>, M. Traglia<sup>2</sup>, R. Thomas<sup>2</sup>, R. Hoh<sup>3</sup>, S. Deeks<sup>3</sup>, N. Roan<sup>2</sup>, T. Henrich<sup>1</sup>

<sup>1</sup>University of California, San Francisco, Department of Experimental Medicine, San Francisco, United States, <sup>2</sup>Gladstone Institutes, San Francisco, United States, <sup>3</sup>University of California, San Francisco, Division of HIV, Infectious Diseases & Global Medicine, San Francisco, United States

**Background:** We previously demonstrated that HIV-1 transcripts are preferentially expressed in CD4<sup>+</sup> T cells expressing CD30, a TNF receptor superfamily tumor marker associated with cell survival and proliferation. We hypothesize that HIV upregulates CD30 to facilitate infected cell survival and evade immune-mediated clearance.

We performed high-dimensional CD4<sup>+</sup> T cell immunophenotyping and gene expression analyses in people with HIV (PWH) on suppressive ART.

**Methods:** We performed CyTOF immunophenotyping to characterize blood CD4<sup>+</sup> T cells (n=6), and RNAseq analysis on highly purified CD4<sup>+</sup> T cells from blood (n=9) and lymph nodes (n=5) from people with HIV (PWH) and uninfected controls (n=2) sorted by surface CD30 expression. Differential gene expression and ontologic analyses were performed.

**Results:** CytOF analysis revealed that compared to CD30<sup>-</sup>/CD4<sup>+</sup> T cells, CD30<sup>+</sup>/CD4<sup>+</sup> T cells had significantly higher expression of central memory, follicular helper, and regulatory markers and lower expression of markers of effector and transitional memory. CD30<sup>+</sup>/CD4<sup>+</sup> T cells also expressed higher markers of T cell activation and exhaustion/immune checkpoint and tissue homing (OX40, CD38, CD25, ICOS, HLA-DR, TIGIT, CTLA4, PD-1, CD62L, CCR7, CXCR5, CXCR4, CCR5; all P<0.05).

Gene expression in CD30<sup>+</sup>/CD4<sup>+</sup> T cells was dramatically different compared to CD30<sup>-</sup>/CD4<sup>+</sup> T cells from the same participants and compared to CD4<sup>+</sup> T cells from people without HIV.

Genes related to immune responses, cell cycling and survival ontologies were significantly upregulated in the CD30<sup>+</sup> subset. A similar transcriptional pattern was observed between CD30<sup>+</sup> and CD30<sup>-</sup> lymph node-derived T cells.

Genes related to innate and adaptive immune responses were upregulated in CD30<sup>+</sup> cells from lymph nodes compared to CD30<sup>+</sup> cells from peripheral blood. HIV-1 transcripts were identified by RNAseq in CD4<sup>+</sup> cells from one participant but only in CD30<sup>+</sup> cells.

**Conclusions:** CD30<sup>+</sup>/CD4<sup>+</sup> T cells have a central memory, regulatory, and follicular phenotype that have gene expression ontologies consistent with cell survival. These data suggest that either HIV infection leads to an upregulation of pathways consistent with infected host-cell survival, or that cells which express these proliferation and survival pathways are more likely to harbor transcriptionally active HIV after years of ART. Efforts to directly target CD30 in the clinic are in development.

## Novel treatment and prevention strategies, vaccines and immunotherapies

#### HIV therapeutic vaccination based on archived HIV-1 proviral epitopes and HLA class I allele matching in two Brazilian cities

O. Botelho<sup>1</sup>, P. A. Botelho<sup>1</sup>, M. V. M. Souza<sup>1</sup>, M. M. Garrido<sup>2</sup>, V. P. da Hora<sup>3</sup>, B. L. M. Alves<sup>1</sup>, M. A. Soares<sup>1</sup>

<sup>1</sup>Brazilian National Cancer Institute, Programa de Genética e Virologia Tumoral, Rio de Janeiro, Brazil, <sup>2</sup>Hospital Federal de Ipanema, Serviço de Doenças Infecciosas, Rio de Janeiro, Brazil, <sup>3</sup>Universidade Federal do Rio Grande, Escola de Medicina, Rio Grande, Brazil

**Background:** Despite the success of antiretroviral therapy, the life-long use of antiretroviral treatment requires a high financial investment, results in an increase of antiretroviral resistance and may have side effects. Thus, novel treatment strategies are emerging based on therapeutic vaccination of people living with HIV (PLHIV), where viral replication will be controlled at undetectable levels by the host's immune system after antiretroviral treatment discontinuation. This ability to control HIV infection has been correlated with certain human leukocyte antigen (HLA) alleles.

In this context, the present study longitudinally evaluated the HIV-1 proviral epitopes inferred from near full-length genome (NFLG) sequences with high affinity to the most frequent HLA-A, -B and -C alleles of PLHIV from two Brazilian cities, Rio de Janeiro (RJ) and Rio Grande (RS).

**Methods:** Overall, 86 PLHIV (RJ = 46; RS = 40) were recruited and had their peripheral whole blood collected. HIV-1 proviral NFLG were amplified by nested PCR and ultradeep-sequenced in an Illumina MiSeq platform. Results were analyzed in Geneious package and T-cell epitopes were predicted using the MHC-I Binding Prediction Tool.

**Results:** All samples included in the first timepoint have been sequenced and 96.5% (83/86) had the NFLG determined. Six epitopes with high affinity to the most frequent HLA alleles and to the specific alleles from each individual were selected among viral sequences from RJ (RTLNAWVKV-Gag, HQKEPPFLW-Pol, KHQKEPPFL-Pol, TQDFWEVQL-Pol, VLDVGDAYF-Pol and VNTPLVLK-Pol) and three from RS (KHQKEPPFL-Pol, TQDFWEVQL-Pol and VLDVGDAYF-Pol). Twenty RJ individuals had a second timepoint collected after two years of follow-up and the six selected HIV proviral epitopes remained in the peripheral blood compartment of 19 (95%) samples.

**Conclusions:** Altogether, a set of HIV epitopes were selected in two conserved regions of HIV proteins. Three Pol epitopes were present in both cities, despite the differences in HLA frequencies and viral sequences between cities.

These epitopes showed high affinity to the most frequent HLA class I alleles, were highly conserved among circulating viruses and highly stable across time in the samples analyzed. Therefore, these are promising immunogen candidates for the development of therapeutic vaccines to counteract HIV-1 infection and disease progression in those regions of Brazil.

## WEPEA026

Eliciting bnAbs against the global panel HIV-1 pseudoviruses by mimicking an elite natural neutralizer

M. Zhao<sup>1</sup>, Q. Zhang<sup>2</sup>, T. Zhou<sup>3</sup>, L. Zhang<sup>2</sup>, Z. Chen<sup>1</sup>

<sup>1</sup>AIDS Institute and Department of Microbiology, School of Clinical Medicine, Li Ka Shing Faculty of Medicine, The University of Hong Kong, Pokfulam, Hong Kong, Hong Kong, SAR of China, <sup>2</sup>Center for Global Health and Infectious Diseases, Comprehensive AIDS Research Center, Department of Basic Medical Sciences, School of Medicine, Tsinghua University, Beijing, China, <sup>3</sup>Vaccine Research Center, National Institute of Allergy and Infectious Diseases, National Institutes of Health, Bethesda, United States

**Background:** Human immunodeficiency virus type-1 (HIV-1) causes over one million new infections annually, yet HIV-1 vaccine inducing a protective level of broadly neutralizing antibody (bnAb) remains elusive. Due to challenging bnAbs-secreting B cell maturation, vaccinations mimicking the natural bnAb development is a promising approach. However, strategies to optimize the vaccination procedure remain to be investigated.

Here, we test the hypothesis that sequential vaccinations using stable envelopes (Envs) optimized from an HIV-1 elite neutralizer may model the natural infection for inducing bnAbs against the global panel HIV-1 pseudoviruses.

**Methods:** An elite neutralizer was identified from a Chinese cohort exhibiting increasingly potent polyclonal HIV-1 bnAb response during the natural course of infection. Four phylogenetically and chronologically related Env genes from the neutralizer were optimized and constructed as both DNA and live replication-competent recombinant modified vaccinia strain Tian Tan (rMVT) vaccines. The rMVT vaccines were generated by homologous recombination to replace Envs into vaccinia HA extracellular domain, validated by genome PCR. rMVT antigenicity was tested by immunofluorescence assay on infected Vero cells. Vaccine immunogenicity was then evaluated in BALB/C mice and NZW rabbits based on serum endpoint titers against Envs and ID<sub>50</sub> titers against HIV-1 pseudoviruses by ELISA and ghost cell neutralization assay, respectively.

**Results:** Stable Env expressed by rMVT was confirmed after six rounds of clonal purifications. Env expression of MVT was detected by a panel of bnAbs targeting

CD4bs, V3, quaternary V2, and MPER epitopes. Sequential immunizations using vaccines delivering the four Envs resulted in modestly broad neutralization in mice and rabbits against heterologous pseudoviruses. The most potent rabbit serum displayed an ID<sub>50</sub> titer greater than 80 against 45% global panel HIV-1 pseudoviruses as of 2-week post the third immunization. Increased endpoint titers against the third Env and heterologous neutralization breadth from 2- to 9-week post second immunization were observed, indicating plausible evolution of bnAbs-secreting B cell maturation.

**Conclusions:** Our results demonstrated the construction of vaccine candidates expressing stable Envs derived from an elite neutralizer. The preliminary results of these vaccines showed their potential of mimicking the natural course of bnAb induction, contributing to the strategies of preventive HIV-1 vaccine design.

## WEPEA027

Pre-clinical profiles of HIV-1 capsid inhibitors VH4004280 (VH-280) and VH4011499 (VH-499)

C. Wang<sup>1</sup>, H. Huang<sup>1</sup>, L. Valera<sup>1</sup>, K. Parcella<sup>2</sup>, C. Iwuagwu<sup>2</sup>, J. Simmermacher<sup>3</sup>, K. Kieltyka<sup>3</sup>, S. Jenkins<sup>3</sup>, L. Wang<sup>4</sup>, R.T. Nolte<sup>4</sup>, D. Meinhold<sup>4</sup>, L. Sardo<sup>1</sup>, E.P. Gillis<sup>2</sup>, M. Krystal<sup>1</sup>, R.A. Fridell<sup>1</sup>

<sup>1</sup>ViiV Healthcare, Discovery Biology, Branford, United States,

<sup>2</sup>ViiV Healthcare, Chemistry, Branford, United States, <sup>3</sup>ViiV Healthcare, DMPK, Branford, United States, <sup>4</sup>GSK, Structural & Biophysical Sciences, Collegeville, United States

**Background:** The HIV-1 capsid protein (CA) fulfills multiple roles in the replication cycle and represents a high-quality target for HIV-1 inhibition. Here, we report on the pre-clinical profile of two capsid inhibitors (CAIs) currently in clinical development (VH-280 and VH-499).

**Methods:** Antiviral activity was evaluated in MT-2 cells infected with replication-competent reporter viruses. CAI/CA binding affinity was determined by surface plasmon resonance. Late-stage antiviral activity was measured using VSV-G pseudotyped virus. 2-LTR circles and proviral DNA were measured by quantitative PCR analyses. Resistance selection was carried out in MT-2 cells infected with NL<sub>4-3</sub> and treated with escalating doses of the CAI.

**Results:** VH-280 and VH-499 bind to the mature capsid hexamer and exhibit a mean dissociation constant of 60 and 190 pM, respectively. VH-280 and VH-499 demonstrated EC<sub>50</sub>s of 93 and 23 pM, respectively, against NL<sub>4-3</sub> virus. Both CAIs inhibited replication of chimeric viruses engineered with CA sequences from at least 47 clinical isolates with mean EC<sub>50</sub>s of 320 and 57 pM, respectively. The CC<sub>50</sub>s of the CAIs are >20 μM, yielding high therapeutic indices.

Mode of action studies demonstrated that VH-280 and VH-499 inhibited both early and late stages of the HIV-1 life cycle, with inhibition of the early stages ~9- to 14-fold

greater than that observed for the late stage of inhibition. Time of addition studies exemplified that VH-280 and VH-499 inhibition occurs between reverse transcription and integration.

Further, quantification of 2-LTR circles and proviral DNA in HIV-1-infected cells showed that VH-280 and VH-499 can inhibit both nuclear import and integration. CA resistance-associated mutations selected by other CAs (L56I, M66I, Q67H, N74D, A105E, T107N, and Q67H/N74D) also reduce susceptibility to VH-280 and VH-499.

Additionally, VH-280 and VH-499 selected resistant viruses at similar positions, including Q67H, A105E, T107A/D/N, and double or triple substitutions containing those residues. VH-280 and VH-499 were co-crystallized with CA hexamer and displayed binding contacts similar to PF74 and lenacapavir.

Finally, both CAs exhibited DMPK profiles suitable for clinical development.

**Conclusions:** The pre-clinical virology profiles and other favorable drug-like properties of VH-280 and VH-499 support progression of these two CAs into clinical development.

## WEPEA028

### Preclinical assessments of a cabotegravir prodrug predicting human dosing durations of >6 months

M. Baker<sup>1</sup>, W. Proctor<sup>2</sup>, N. Falco<sup>3</sup>, L. Chen<sup>3</sup>, V. Ironmonger<sup>4</sup>, S. Pearce<sup>4</sup>, A. Weber<sup>5</sup>, M. Lataillade<sup>6</sup>

<sup>1</sup>ViiV Healthcare, Munchenbuchsee, Switzerland, <sup>2</sup>GSK, Waltham, United States, <sup>3</sup>GSK, Upper Providence, United States, <sup>4</sup>GSK, Stevenage, United Kingdom, <sup>5</sup>ViiV Healthcare, Durham, United States, <sup>6</sup>ViiV Healthcare, Branford, United States

**Background:** Long-acting ARVs for treatment and prophylaxis are now commercially available providing up to Q2M dose intervals. ViiV is developing prodrug formulations of CAB to provide a significant extension to the CAB dose interval ( $\geq$  every six months) – a parenterally administered ultra-long acting (ULA) 2DR combination treatment with other ViiV LAI candidates, and an ultra-long duration PrEP regimen.

An INSTI-based LAI treatment administered at least every six months brings a significant upgrade to the dosing frequency combined with the potential to improve treatment adherence and satisfaction by reducing the need for frequent clinic visits, with fewer injections per year, decreasing the psychological impact in PLHIV while offering even greater discretion.

**Methods:** ViiV has two novel drug formulations of the CAB prodrug (CP) and are developing them with an intent to optimize drug loading, simplify drug product manufacturing, and ensure physical stability of drug product. Both drug products were administered in preclinical studies in

male rats (n=3 SC, at 75 mg/kg) and monkeys (cynomolgus macaques) (n=3 at each dose level SC, at 40 and 75 mg/kg). The pharmacokinetics of CP and CAB as well as general tolerability in both species was monitored for  $\geq 1$  year.

**Results:** Both formulations delivered similar, long duration CAB PK in the rat and monkey. Their apparent half-lives were estimated as being >200 days compared to up to 23 and 32 days observed after CAB SC administration to rat and monkey, respectively. Prodrug levels were generally >100x lower than CAB levels in both species.

ViiV's data characterizing CAB, combined with these pre-clinical data, suggested a predicted terminal half-life of >200 days in humans with the potential for >6-month dose administrations. Only minor ISR-related observations were noted.

**Conclusions:** The preclinical PK assessments of the CAB prodrugs support their ongoing development and transition into the clinic. A FTiH study would determine the human PK, safety and dose predictions.

These emerging CAB prodrug data, combined with existing CAB safety and efficacy data, can facilitate efficient development of a long-acting regimen with a >6-month dosing interval for HIV treatment and PrEP.

First-in-human evaluation of the safety, pharmacokinetics, and neutralization activity of PGDM1400-LS, a V2 glycan-specific HIV-1 broadly neutralizing antibody, infused intravenously or subcutaneously in people without HIV-1 (HVTN140/HPTN101 Part A)

Corey<sup>2</sup>, M. Cohen<sup>5</sup>, S. Mahomed<sup>11</sup>, M. Siegel<sup>12</sup>, C.F. Kelley<sup>13</sup>, HVTN 140/HPTN 101 (Part A) Study Teams

<sup>1</sup>Duke University, Durham, United States, <sup>2</sup>Fred Hutchinson Cancer Center, Vaccine and Infectious Diseases Division, Seattle, United States, <sup>3</sup>FHI 360, Durham, United States, <sup>4</sup>National Institute of Allergy and Infectious Diseases, Rockville, United States, <sup>5</sup>University of North Carolina, Chapel Hill, United States, <sup>6</sup>Johns Hopkins University, Baltimore, United States, <sup>7</sup>Vanderbilt University, Nashville, United States, <sup>8</sup>San Francisco Department of Health, San Francisco, United States, <sup>9</sup>National Institute for Communicable Diseases, Johannesburg, South Africa, <sup>10</sup>Harvard Medical School, Center for Virology and Vaccine Research, Beth Israel Deaconess Medical Center, Boston, United States, <sup>11</sup>CAPRISA, Durham, South Africa, <sup>12</sup>George Washington University School of Medicine and Health Sciences, Washington, United States, <sup>13</sup>Emory University School of Medicine, Division of Infectious Diseases, Department of Medicine, Atlanta, United States

**Background:** HIV-1 Envelope (Env) specific broadly neutralizing antibodies (bnAbs) administered intravenously (IV) or subcutaneously (SC) are a promising prevention modality. The Antibody Mediated Prevention (AMP) trials demonstrated that bnAbs can prevent acquisition of neutralization sensitive HIV-1 viruses. Development of combination bnAb cocktails targeting multiple Env sites and engineered to increase half-life in vivo are key targets for product development.

PGDM1400-LS is a bnAb targeting the Env V2 glycan centered on N160, with lysine and serine substitutions (LS) to improve serum and tissue half-life and is under consideration for use in future efficacy trials.

**Methods:** HVTN 140/HPTN 101 Part A (open-label, dose escalation, first-in-human) enrolled 15 people without HIV-1 in the USA across 5 groups (November 2021-March 2022), receiving a single dose of PGDM1400-LS IV (5, 20, or 40 mg/kg) or SC (20 or 40 mg/kg). Serum PGDM1400-LS concentrations at 7 timepoints (Day 0-Day 168 post-administration) were assessed via a validated anti-idiotypic binding assay and analyzed via non-compartmental pharmacokinetic analysis. Serum neutralization activity (ID80) was assessed by a validated TZM-bl assay with sensitive

Env-pseudotyped viruses and a tier 2 neutralization magnitude-breadth panel isolated from AMP participants with incident HIV-1.

**Results:** Overall, 10/15 (67%) of participants identified as female sex-at-birth, 14/15 (93%) non-Hispanic and 11/15 (73%) White, median age of 27 years (range: 24-47). PGDM1400-LS was safe and well-tolerated, with mild-moderate solicited local and systemic symptoms.

Pharmacokinetic analyses indicated dose proportionality by route, with peak concentrations observed immediately post-infusion (IV, range: 95.7-727.4 micrograms/mL) or on study Day 6 (SC, range: 205.6-547.1 micrograms/mL). Median elimination half-life was 55 days (range: 48-59 days), representing a 2-3 fold increase vs. wild-type PGDM1400. Estimated SC bioavailability was 50-60%. ID80 neutralization titers exhibited agreement with predicted ID80, indicating maintenance of neutralization activity in vivo.

Serum PGDM1400LS concentrations by treatment group and target day. Colors represent treatment groups as indicated, with dots representing individual participant mAb concentrations. Vertical lines indicate standard error of the mean. SPA = study product administration

**Conclusions:** Intravenously-administered PGDM1400-LS exhibits favorable pharmacokinetics in vivo and is a promising candidate for future efficacy trials.

## WEPEA030

Intracellular uptake of antiretrovirals in human peripheral blood mononuclear cells (PBMCs): quantitation and application in HIV and COVID-19-related clinical studies

D. Xiao<sup>1</sup>, P. Arora<sup>1</sup>, K.H.J. Ling<sup>1</sup>, T. Tarnowski<sup>1</sup>

<sup>1</sup>Gilead Sciences, Inc., Clinical Pharmacology Sciences, Foster City, United States

**Background:** PBMCs may serve as reservoirs for HIV-1 or COVID-19 infection. These viruses can establish latent infections within these cells, which makes it challenging to eradicate them completely. Nucleoside/nucleotide analogs for the treatment of HIV-1 or COVID-19 are often prodrugs that require intracellular activation through sequential metabolism to pharmacologically active intracellular metabolites for antiviral activities.

Understanding triphosphates levels in PBMCs is essential for steering the development of new antiretrovirals (ARVs) that can effectively reach and inhibit viral replication within these reservoirs and thereby improve the overall effectiveness of the treatment.

**Methods:** Using TFV-DP, FTC-TP and GS-443902 as representative examples, this presentation addresses 5 aspects of validated procedures for well-developed and reliable bioanalytical methods for determination of their intracellular concentrations:

1. A well-developed and carefully observed cell sample collection and processing procedure.
2. Well established procedures for PBMC lysis, analyte extraction, and sample cleaning.
3. Use of a surrogate (cell lysate) matrix for standards and QCs, followed by an ion exchange LC-MS/MS method.
4. Establishment of a validated cell counting method that counts all the collected cells that contain DNA, but not cells without DNA.
5. Establishment of an incurred sample stability window.

**Results:** For the validated triphosphate quantitation methods, the calibration ranges (fmol/10<sup>6</sup> cells) for TFV-DP, FTC-TP and GS-443902 are 4.47 - 2236, 41.1 - 20566, and 94 - 34529. Incurred sample stabilities established were 742, 742, and 182 days at -70°C. The methods were successfully applied both for the determination of TFV-DP and FTC-TP from people who could benefit from HIV-1 PrEP following oral administration of TRUVADA, DESCovy and BIKTARVY, as well as for the determination of GS-443902 from patients receiving RDV or ODV treatment after COVID-19 infection.

Although the efficacious PBMC threshold TFV-DP levels has been seen previously at ~16 fmol/million cells, the accurate assessment of TFV-DP levels in clinical study participants enabled determination of improved correlations between efficacy and corresponding active intracellular drug levels.

**Conclusions:** Accurate, precise, and reproducible quantitation of ARVs in PBMCs and its correlation with plasma pharmacokinetics, drug effect, dose determination and adherence monitoring can help optimize HIV/COVID-19 treatment, thus preventing drug resistance and improving patient outcomes.

## WEPEA031

### Nonclinical profile of GS-4182, a once-weekly oral prodrug of the HIV-1 capsid inhibitor lenacapavir in clinical development

R. Subramanian<sup>1</sup>, J. Farand<sup>2</sup>, B. Lu<sup>1</sup>, J. Wang<sup>1</sup>, J. Mack<sup>2</sup>, T. Gurney<sup>2</sup>, S. Rahmani<sup>3</sup>, J. Leung<sup>1</sup>, N. Kato<sup>2</sup>

<sup>1</sup>Gilead Sciences, Drug Metabolism and Pharmacokinetics, Foster City, United States, <sup>2</sup>Gilead Sciences, Medicinal Chemistry, Foster City, United States, <sup>3</sup>Gilead Sciences, Formulation and Process Development, Foster City, United States, <sup>4</sup>Gilead Sciences, Nonclinical Safety and Pathobiology, Foster City, United States, <sup>5</sup>Gilead Sciences, Research Discovery Sciences & Tech, Foster City, United States, <sup>6</sup>Gilead Sciences, Research Discovery Virology, Foster City, United States

**Background:** Lenacapavir (LEN) is a first-in-class capsid inhibitor approved as a twice-yearly injectable therapy for adults with multidrug-resistant HIV-1 infection. While LEN tablets support oral lead-in and bridging therapy in the clinic, LEN's solubility profile indicates some limitations in its oral absorption and tablet drug load that may present challenges for long-acting oral administration. Here we describe the nonclinical profile of GS-4182, a novel solubilizing oral prodrug of LEN designed to reduce tablet size and pill burden when combined with a partner agent in a once-weekly oral treatment regimen.

**Methods:** Standard in vitro methods were used to characterize GS-4182 solubility, cell permeability and metabolic stability. Anti-HIV-1 activity was evaluated in MT-4 cells. Cytotoxicity was assessed in human cell lines and primary cells. Plasma pharmacokinetic parameters for GS-4182, LEN and Met-A (a metabolite formed from the prodrug moiety of GS-4182) were assessed in rat, dog and monkey following oral administration. GS-4182 and Met-A were evaluated in safety pharmacology and toxicology studies.

**Results:** GS-4182 readily converted to LEN in nonclinical and human gastrointestinal S9 fractions and showed low permeability across Caco2 cell monolayers and ≥100-fold improved solubility relative to LEN in simulated intestinal fluids. Upon oral administration in nonclinical species, GS-4182 underwent extensive pre-systemic conversion to LEN, resulting in substantially improved bioavailability relative to oral administration of LEN only.

These pharmacokinetic data were supportive of an efficacious once-weekly human oral dose. GS-4182 showed little-to-no systemic exposure following its oral administration in nonclinical species, but the Met-A that was formed in the gastrointestinal tract was readily absorbed and was observed in plasma. While unlikely to accumulate in humans due to its short terminal half-life, Met-A

showed no antiviral activity and low cytotoxicity in vitro. When evaluated in safety pharmacology and toxicology studies, GS-4182 and Met-A were nongenotoxic, showed low potential for off-target effects, and the in vivo no-observed-adverse-effect-levels were established at the highest doses tested in rat and dog.

**Conclusions:** LEN prodrug GS-4182 exhibits a favorable nonclinical profile that supports its continued clinical development as a component of an optimized once-weekly oral regimen for the treatment of HIV-1 infection.

**Background:** Vector-mediated antigen delivery and/or the modality of protein delivery is believed to impact follicular helper T cell (Tfh) recruitment to draining lymph nodes, germinal center formation and eventually the quality and sustainability of binding and neutralizing antibody responses.

**Methods:** Four groups of 10 cynomolgus monkeys were primed (W0, W4) with a VSV-GP vector (i.m.) expressing a first generation membrane-tethered clade C 96ZM651 gp140 (VSV-gp140) and boosted at W12 and W24 with a state-of-the-art prefusion stabilized ConC Env trimer (ConCv5KIKO) either via the i.m. route (group 1, G1) or via an osmotic pump (OP) that was transplanted into the deltoid to release the ConCv5KIKO trimer protein subcutaneously over a period of 2 weeks (G2). For comparison, animals receiving a booster immunization with ConCv5KIKO trimer via the i.m. route and the OP were co-ad-

mistered with VSV-gp140 at the same time points (G3, and G4, respectively). VSV- and HIV-Env-specific T cell and antibody responses were monitored at regular intervals up to 34 weeks.

**Results:** Whereas VSV-vector-specific T cell responses were overall low (G1, G2) to moderate (G3, G4), animals vaccinated four times with VSV-gp140 started to produce substantial levels of VSV-GP-specific neutralizing antibodies after the third VSV immunization. HIV-specific T cell responses were detectable only after the second booster immunization in G1 and G3 (i.m. ConCv5-KIKO), whereas an accelerated development of T cell responses already after the first boost was observed in G2 and G4 (OP). ConCv5KIKO booster immunization via the OP yielded significantly higher titers of ConCv5-KIKO-specific binding and neutralizing (primarily tier 1) antibody responses in G2 and G4 as compared to G1 and G3 (i.m.) ( $p < 0.0001$ ).

This was most pronounced after the second boost and came along with a higher percentage of CXCR5<sup>+</sup>/PD1<sup>+</sup> Tfh cells among CD4<sup>+</sup> T cells in the draining lymph node ( $p = 0.0075$ ).

**Conclusions:** Co-administration of VSV-gp140 as part of the booster immunizations had no impact on the immunological outcome. ConCv5-KIKO Env trimer booster immunizations via the osmotic pump were clearly superior to i.m. protein delivery with regard to binding and neutralizing Abs, correlating with improved Tfh-recruitment to draining lymph nodes and probably more efficient germinal center formation.

explore the correlation between intestinal *Akkermansia muciniphila* (AKK) abundance and metabolic diseases specifically overweight, non-alcoholic fatty liver disease (NAFLD), and hyperlipidemia in PLWHIV.

**Methods:** Participants (n=103) were enrolled in a 1:1 ratio for the NAFLD and non-NAFLD groups based on baseline controlled attenuation parameters (CAP) for liver steatosis. Baseline data were meticulously collected, and stool samples were obtained for AKK quantification using the RT-qPCR method. Subsequent analyses included Pearson correlation and logistic regression methods.

**Results:** Metagenomic sequencing identified AKK as a significantly reduced intestinal species in PLWHIV with NAFLD. Kegg analysis revealed genes mainly annotated in metabolism-related pathways. Of the enrolled PLWHIV, 52 were in the NAFLD group and 51 in the non-NAFLD group. AKK abundance in PLWHIV with NAFLD and overweight was notably lower than in the non-NAFLD group ( $P=0.049$ ) and the non-overweight group ( $P=0.033$ ), respectively. Negative correlations were identified between AKK abundance and CAP value ( $r=-0.241$ ,  $P=0.014$ ) and body mass index (BMI) ( $r=-0.263$ ,  $P=0.001$ ). AKK emerged as an independent factor for baseline NAFLD (OR=0.684,  $P=0.039$ ) and overweight (OR=0.722,  $P=0.034$ ). Subgroup analysis within the NAFLD group revealed lower AKK abundance in the obese-NAFLD group compared to the non-NAFLD group ( $P=0.0233$ ). Importantly, AKK abundance independently predicted obese-NAFLD (OR=0.582,  $P=0.015$ ). Additionally, AKK demonstrated predictive capabilities for NAFLD after 48 weeks of antiretroviral therapy (ART) (AUROC=0.687,  $P=0.033$ ) and remained an independent factor for NAFLD at week 48 (OR=0.635,  $P=0.041$ ).

**Conclusions:** Abundance of AKK was characteristically declined in PLWHIV with NAFLD and it was associated with overweight and NAFLD specifically obese-NAFLD among PLWHIV and further it can predict NAFLD after 48 week's HAART.

CAB (5.0 mg/kg; 93 litters). Doses were optimized to yield clinically relevant plasma levels. INSTIs were given with emtricitabine/tenofovir (E/T; 33.3/50 mg/kg) daily by oral gavage from plug detection to E15.5. Maternal outcomes and fetal anomalies were assessed. Differences between treatment groups were assessed using Kruskal-Wallis with Dunn's test.

**Results:** The DTG+E/T group had the highest resorption rate (9.7%), followed by RAL+E/T (8.4%), BIC+E/T (6.9%), control (6.3%), and CAB+E/T (5.3%). Viability was lowest in DTG+E/T and highest in CAB+E/T. Litter average fetal weight was significantly lower in DTG+E/T (0.34g), BIC+E/T (0.34g), and CAB+E/T (0.33g), but not RAL+E/T (0.37g), compared to control (0.38g). DTG+E/T and CAB+E/T had lower litter average placenta weights, and BIC+E/T and CAB+E/T had lower fetal-to-placenta weight ratios versus control. Compared to control, lower percent increase in maternal weight (normalized to litter size) was observed in RAL+E/T, BIC+E/T, and CAB+E/T groups.

Rates of brain and spinal cord defects were similar between INSTI groups and significantly higher versus control (DTG+E/T 0.42%, RAL+E/T 0.69%, BIC+E/T 0.88%, CAB+E/T 0.45%, control 0%). Compared to controls, open NTDs were significantly higher in DTG+E/T and RAL+E/T groups, not in BIC+E/T and CAB+E/T. CAB+E/T had higher rates of growth-restricted fetuses (5.29%) and craniofacial anomalies (1.51%) versus control (1.6%, 0%). Vascular/bleeding defects were higher in all INSTI groups (DTG+E/T 19.1%, RAL+E/T 22.4%, BIC+E/T 39.2%, CAB+E/T 27.3%, control 14.7%), especially in BIC group.

**Conclusions:** Fetal outcomes for BIC and CAB are similar to DTG and RAL. Rates of open NTDs for BIC and CAB were similar to control. BIC was associated with higher rates of vascular/bleeding defects and CAB with greater growth restriction compared to DTG and RAL. Further human studies are needed to comprehend the clinical relevance of these findings.

**Background:** Women living with HIV (WLWH) have increased risk of high-risk (HR) human papillomavirus (HPV) infection and developing cervical cancer (CC) as compared to women without HIV. Many African countries aim to start HPV molecular screening as recommended by the World Health Organization.

However, the optimal interval to re-screen HR-HPV negative and positive WLWH is unclear and could be influenced by the HPV type. We evaluated HR-HPV persistence and incidence in previously HR-HPV positive and negative WLWH in four African countries.

**Methods:** Participants were enrolled into the African Cohort Study (AFRICOS) from 12 clinics in Tanzania, Kenya, Uganda, and Nigeria. From 2015 onwards, adult WLWH

within AFRICOS were offered HR-HPV testing annually, where cervical cytobrush specimens from women were genotyped for 14 HR-HPV types using the multiplex See-gene Anyplex real-time PCR.

**Results:** From 2015 to 2022, 383 WLWH underwent serial screening for HR-HPV. Their median age was 43.2 years (interquartile range 36.3-49.1 years) and 370 (96.6%) of them were on ART. A positive first HPV test was observed in 247 participants (64.5%), of whom 167 (67.6%) had persistent HPV one year later.

We also observed a 29%-61% type-specific HPV persistence with HPV45 being the most persistent (61.5% (8 of 13) persistent infections), followed by HPV52, HPV33, HPV16 and HPV35 (55.8% (24/43), 54.5% (18/33), 51.4% (37/72) and 51.1% (23/45) respectively). HPV18 infections were persistent in 33.3% (10/30) of cases. The frequency of persistent HR-HPV in WLWH with CD4 T-cells of <200, 200-500 or >500 cell/mm<sup>3</sup> at their first HPV test was 80.9%, 72.2% and 61.5% respectively (p=0.095). Among 136 participants with a negative first HPV test, 37 (27.2%) had incident HR-HPV infections one year later, of whom 12 (32.4%) had HPV16/18/45 and 8 (21.6%) had HPV35.

**Conclusions:** HR-HPV type-specific short-term persistence and incidence is high even in ART-treated WLWH with high CD4 T-cell counts from four African countries. These preliminary data support yearly HPV re-screening of WLWH.

## WEPEA036

### Targeted metabolomics reveals energy metabolism alterations across various mitochondrial haplogroups in people with HIV

M. Wang<sup>1</sup>, X. Chen<sup>1,2</sup>, L. Haijiang<sup>1,2</sup>, W. Shen<sup>2</sup>, S. Wang<sup>2</sup>, J. Xia<sup>1</sup>, N. He<sup>1,3,4</sup>

<sup>1</sup>Fudan University, Department of Epidemiology, School of Public Health, Shanghai, China, <sup>2</sup>Taizhou City Center for Disease Control and Prevention, Department of AIDS/STD, Taizhou, China, <sup>3</sup>Fudan University, Shanghai Institute of Infectious Diseases and Biosecurity, Shanghai, China, <sup>4</sup>Fudan University, Yi-Wu Research Institute, Shanghai, China

**Background:** Mitochondria generate energy for cells in most eukaryotes, contain their own genome, known as mitochondrial DNA (mtDNA). The combinations of mtDNA polymorphisms define mitochondrial haplogroups. People with HIV (PWH) are susceptible to premature aging and aging-related noncommunicable chronic diseases (NCDs). Despite altered mitochondrial energy metabolism is a significant characteristic of the aging process, whether and how the mitochondrial haplogroups impact on the energy metabolism among PWH remain to be addressed.

**Methods:** A total of 666 PWH were recruited from the Comparative HIV and Aging Research in Taizhou (CHART) cohort, Eastern China. MtDNA was extracted from whole

peripheral blood, sequenced for the entire mtDNA genome (16,569 bp) in comparison with the Revised Cambridge Reference Sequence (rCRS), and classified as mitochondrial haplogroups by HaploGrep (2.4.0) based on the mtDNA tree Build 17. Plasma were subject to targeted energy metabolomics analysis, with differential metabolites screened using linner model, fold change, and Orthogonal Partial Least Squares Discriminant Analysis. Pathway analysis was conducted using MetaboAnalyst 6.0.

**Results:** Among the participants, 73.2% were male, the median age was 44 years (IQR: 35-53), and the average time on ART was 5.9 ( $\pm 2.3$ ) years. The relatively common mitochondrial haplogroups were D4 (15%), M7 (10.5%), B4 (11.3%), F1 (9.6%), A (7.8%) and N9 (5.6%) (Figure 1a). Haplogroup A was significantly associated with down-regulation of DL-Glyceric-Acid and D(+)-Glucose but up-regulation of Pyruvic acid in the glycolysis metabolic pathway. Haplogroup F1 was manifested with upregulation of D-Glucose-6-phosphate, D-Fructose-6-phosphate, Phosphoenolpyruvic acid, Lactate, as well as L-Alanine and Alpha-Ketoglutaric Acid, suggesting active glycometabolism including glycolysis and tricarboxylic acid (TCA) cycle. Haplogroup N9 was associated with purine metabolism as signified by upregulation of glycerol-3-phosphate and downregulation of AMP, IMP and guanosine-diphosphate.

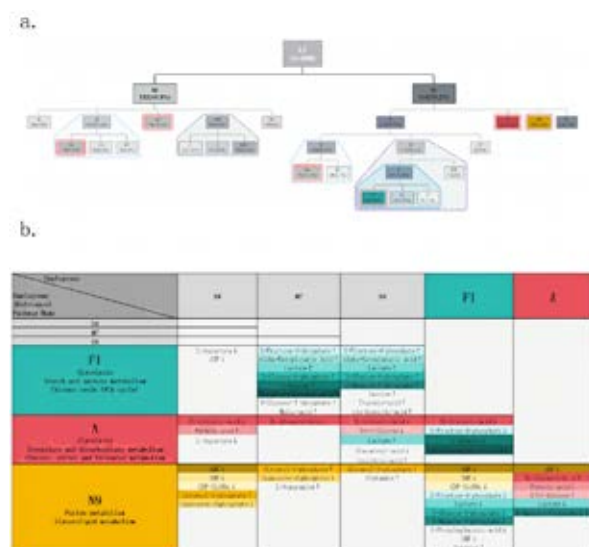

Figure 1. Mitochondrial haplogroups and associated energy metabolism alterations among people with HIV. (a) Distribution of mitochondrial haplogroups. (b) Selected mitochondrial haplogroups with significant alterations of energy metabolism and metabolic pathways.

**Conclusions:** PWH with certain mitochondrial haplogroups are more predisposed to energy metabolism alterations, and are potentially key targets of precision prevention for aging-related NCDs.

## WEPEA037

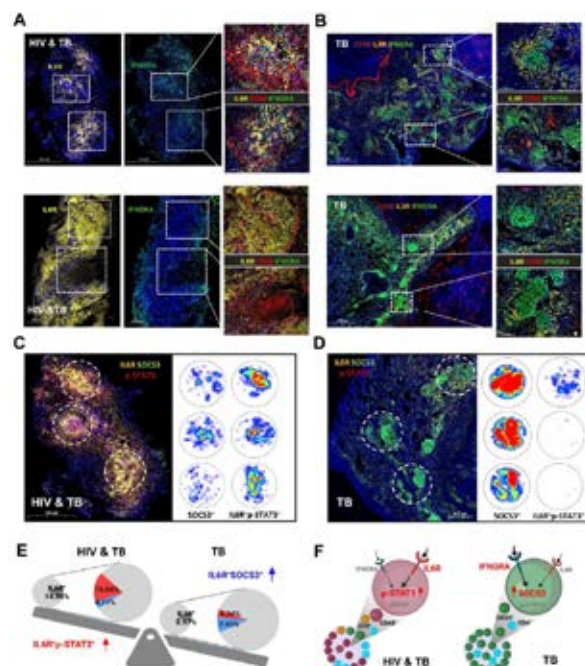

### Deciphering lung granulomas in HIV & TB: unveiling macrophages aggregation with IL6R/STAT3 activation

Q. Li<sup>1</sup>, J. Wang<sup>1</sup>, H. Lu<sup>1</sup>, F. Zhao<sup>1</sup>, Q. Zhang<sup>1</sup>, Q. Peng<sup>1</sup>, Y. He<sup>1</sup>

<sup>1</sup>The Third People's Hospital of Shenzhen (National Clinical Research Center for Infectious Diseases), Department of Infectious Diseases and Immunology, Shenzhen, China

**Background:** Tuberculosis (TB) remains a leading cause of mortality among people living with human immunodeficiency virus (PLWH). Although lung granulomas are a distinctive feature of TB, the intricate pathological dynamics and precise mechanisms of HIV & TB lung inflammation during HIV & TB remain not fully understood.

**Methods:** Spatial immune staining and Visium sequencing were performed on TB and HIV & TB lung specimens, revealing the intricacies of inflammatory aggregates. This involved analyzing immune cellular composition, architecture, and alterations in inflammatory and pathogenic regulation mechanisms. Subsequently, RNA-seq was utilized to validate the selection of HIV & TB inflammation-associated immune cells and cell-specific genes in peripheral blood. FACS analyses were further employed to confirm the identity of these cell subsets and their functions.

**Results:** Through comprehensive multiplex immunostaining on TB and HIV & TB lung specimens, distinct histopathological markers were identified. A notable observation was the pronounced expression of IL-6R and p-STAT3 in CD68+ macrophages within HIV & TB lung granulomas, highlighting their pivotal role in disease progression. Conversely, the diminished SOCS3 expression in these macrophages accentuated the intensified inflammatory milieu. TB granulomas, on the other hand, exhibited

a contrasting pattern: reduced transcription factor expression in CD68+IL6R+ cells, juxtaposed with heightened SOCS3 levels, delineating a unique regulatory landscape distinct from people living with HIV & TB. Spatial transcriptome profiling further revealed the pathogenic roles of CD68+ macrophages and the activation of the IL6-STAT3 pathway within HIV & TB granulomas, accompanied by diminished SOCS3 expression in lung inflammation.

Additionally, meticulous analysis of peripheral blood samples, utilizing RNA-seq on FACS-sorted monocyte subsets, unveiled specific IL6/STAT3 activation trajectories paired with attenuated SOCS3 expression, prominently observable in the CD16+CD14+ cells of HIV & TB.

**Conclusions:** These insights hold promise for refining diagnostic approaches and designing targeted therapeutic strategies for individuals facing the dual challenges of HIV & TB.

Dynamic SARS-CoV-2-specific B and T-cell responses following immunization with an inactivated COVID-19 vaccine booster in people living with HIV

X. Wang<sup>1</sup>, X. Yang<sup>1</sup>, X. Zhang<sup>1</sup>, H.x. Yan<sup>1</sup>, J. Jin<sup>1</sup>, J. Duan<sup>2</sup>, G. Zhang<sup>2</sup>, T. Huang<sup>2</sup>, R. Xin<sup>3</sup>, C. Jin<sup>4</sup>, H. Wu<sup>1</sup>, T. Zhang<sup>1</sup>, B. Su<sup>1</sup>

<sup>1</sup>Beijing Key Laboratory for HIV/AIDS Research, Sino-French Joint Laboratory for HIV/AIDS Research, Clinical and Research Center for Infectious Diseases, Beijing Youan Hospital, Capital Medical University, Beijing, China, <sup>2</sup>Tian Yuan Studio, Beijing Youan Hospital, Capital Medical University, Beijing, China, <sup>3</sup>Institute for STD/AIDS Prevention and Treatment, Beijing Center for Disease Prevention and Control, Beijing, China, <sup>4</sup>National Center for AIDS/STD Control and Prevention, Chinese Center for Disease Control and Prevention, Beijing, China

**Background:** Little is known about the dynamic SARS-CoV-2-specific B-cell and T-cell responses after the booster vaccination of inactivated COVID-19 vaccines in people living with HIV (PLWH).

**Methods:** Fifty PLWH and thirty healthy controls (HCs) were enrolled to assess B-cell and T-cell responses at the day before the booster dose (T<sub>1</sub>), one month (T<sub>2</sub>), three months (T<sub>3</sub>), and 12 months (T<sub>4</sub>) after the booster dose. Immunophenotyping, enzyme-linked immunospot (ELISPOT), and cytokines were used to assess vaccine responses at four timepoints in this study.

**Results:** The results have showed that SARS-CoV-2-specific B-cell and T-cell responses in both PLWH and HCs after receiving a third booster dose of inactivated SARS-CoV-2 vaccine were effectively induced and reached a peak at T<sub>3</sub>, declined at T<sub>4</sub> but still stronger than T<sub>1</sub>. However, the peaked frequencies of Spike-specific circulating B cells, memory B cells and SARS-CoV-2-specific CD4 and CD8 T cells in PLWH were lower than that of HCs.

In PLWH and HCs, the extent of CD4 and CD8 T cell activation and exhaustion was significantly increased after T<sub>0</sub>, and the magnitude of SARS-CoV-2-specific CD8 T-cell responses in PLWH was negatively associated with the extent of CD8 T-cell activation and exhaustion.

In addition, PLWH exhibited higher levels of IL-4 and IL-5 on T<sub>2</sub> and T<sub>3</sub>, which were found to have positive relationships with the strengthen of T cells response shown by ELISpot on T<sub>2</sub>.

**Conclusions:** These data define the nature of the SARS-CoV-2 vaccine-induced immune landscape in PLWH and provide insights into B and T-cell immunogenicity of a booster vaccination.

Our findings that the poor SARS-CoV-2 specific B and T-cell responses induced in PLWH have implications for clinical decision-making and public health policy for PLWH.

### WEPEA039

RSV fitness is increased by concomitant SARS-CoV-2 infection following a multi-level remodeling of cellular homeostasis

C. Vanetti<sup>1</sup>, I. Saulle<sup>2</sup>, G. Cappelletti<sup>1</sup>, S. Zecchini<sup>1</sup>, S. Strizzi<sup>1</sup>, M. Garziano<sup>1,2</sup>, C. Fenizia<sup>2</sup>, C. Moscheni<sup>1</sup>, V. Artusa<sup>1</sup>, L.A. Citterio<sup>1</sup>, A. Tosoni<sup>1</sup>, P. Ogno<sup>1</sup>, M. Nebuloni<sup>1</sup>, M.S. Clerici<sup>2,3</sup>, D. Trabattini<sup>1</sup>, F. Limanaqi<sup>1</sup>, M. Biasini<sup>1</sup>

<sup>1</sup>University of Milan, Department of Biomedical and Clinical Sciences, Milan, Italy, <sup>2</sup>University of Milan, Department of Pathophysiology and Transplantation, Milan, Italy, <sup>3</sup>IRCCS Fondazione Don Carlo Gnocchi, Milan, Italy

**Background:** Concurrent infections with two or more pathogens with an analogous tropism, such as Respiratory Syncytial Virus (RSV) and SARS-CoV-2, may antagonize or facilitate each other, modulating disease outcomes. Clinically, a severe phenotype has been reported in children with RSV/SARS-CoV-2 co-infections. However, experimental models to study the cellular, molecular, and immunological dynamics of co-infections are extremely limited. Herein, we propose an in vitro co-infection model to assess how RSV/SARS-CoV-2 alters cellular homeostasis.

**Methods:** A549-hACE2-expressing cells were either infected with RSV and SARS-CoV-2 alone or co-infected with both viruses (Figure 1).

Viral replication was assessed at 72 hours post-infection (hpi) using RT-qPCR, Droplet Digital PCR (ddPCR), immune-fluorescence (IF), and transmission electron microscopy (TEM) analyses. Anti-viral, receptor, and autophagy

gene expression (RT-qPCR) was evaluated and confirmed by secretome analyses (Multiplex Cytokine ELISA) and intracellular protein production (Western Blot).

Figure 1. Synoptic representation of the study design.

**Results:** RSV/SARS-CoV-2 co-infection was characterized by a significant increase in the replication rate of RSV compared to single infection ( $p<0.01$ ). Co-infection significantly increased ICAM1 expression, one of the RSV host receptors, compared to uninfected control ( $p<0.0001$ ) and to RSV single-infection ( $p<0.01$ ), and induced a significant upregulation in pro-inflammatory genes expression, which was confirmed by secretome analysis.

Substantial morphological changes were observed in co-infected A549-hACE2 cells, as an increase in the number and length of cellular conduits was detected.

Finally, following co-infection, cells displayed a significant increase in LC3B gene expression ( $p<0.05$ ), and LC3BII/LC3BI ratio, further confirmed by IF and TEM analysis, suggestive of an alteration of the autophagy pathway.

**Conclusions:** The RSV/SARS-CoV-2 co-infection model displays a unique and specific viral and molecular fingerprint. These findings shed light on the molecular reasons justifying the augmented clinical severity of RSV/SARS-CoV-2 co-infection.

This in vitro co-infection model may represent an attractive cost-effective approach to mimic both viral dynamics and host cellular responses, providing readily measurable targets predictive of co-infection progression.

## WEPEA040

### Medical mistrust and vaccine hesitancy mediate the relationship between poverty and SARS-CoV-2 non-vaccination: findings from the MACS/WIHS Combined Cohort Study

M. Friedman<sup>1</sup>, G. Wingood<sup>2</sup>, S. Krier<sup>3</sup>, A. D'Souza<sup>4</sup>, E. Marques<sup>3</sup>, M.-C. Kempf<sup>5</sup>, M. Mimiaga<sup>6</sup>, J. Kwait<sup>7</sup>, D. Jones Weiss<sup>8</sup>, J. Martinson<sup>3</sup>, P. Tien<sup>9</sup>, K. Anastos<sup>10</sup>, C. Ramirez<sup>11</sup>, M. Cohen<sup>12</sup>, C. Rinaldo<sup>3</sup>

<sup>1</sup>Rutgers University, Newark, United States, <sup>2</sup>Columbia University, New York City, United States, <sup>3</sup>University of Pittsburgh, Pittsburgh, United States, <sup>4</sup>Johns Hopkins University, Baltimore, United States, <sup>5</sup>University of Alabama-Birmingham, Birmingham, United States, <sup>6</sup>UCLA, Los Angeles, United States, <sup>7</sup>Whitman-Walker Institute, Washington, D.C., United States, <sup>8</sup>University of Miami, Miami, United States, <sup>9</sup>University of California-San Francisco, San Francisco, United States, <sup>10</sup>Albert Einstein College of Medicine, New York City, United States, <sup>11</sup>University of North Carolina, Chapel Hill, United States, <sup>12</sup>Cook County Hospital, Chicago, United States

**Background:** SARS-CoV-2 vaccines are effective against severe COVID-19 disease; however, SARS-CoV-2 vaccine uptake has lagged in the U.S. Non-receipt of SARS-CoV-2 vaccination has been associated with socioeconomic position and attitudes including medical mistrust and generalized vaccine hesitancy.

To understand relationships between these factors among people living with HIV (PWH) or vulnerable to HIV, we assessed associations between poverty, medical mistrust, vaccine-hesitant attitudes, and SARS-CoV-2 vaccination among participants in a longstanding, mixed-serostatus cohort study (MWCCS) in 13 U.S. sites.

**Methods:** Interviewer-assisted questionnaires assessed SARS-CoV-2 vaccination, medical mistrust, and generalized vaccine-hesitant attitudes from March 2021–September 2022 ( $n=3948$ ). Poverty was denoted by annual income below the 2021 U.S. Federal Poverty Level. Covariates included age, race/ethnicity, gender, HIV status, site, and co-morbidity burden.

We conducted multivariable logistic regressions to assess effects of these co-factors on SARS-CoV-2 vaccination and constructed a structural equation model to determine whether medical mistrust and vaccine-hesitant attitudes serially mediated the relationship between poverty and SARS-CoV-2 non-vaccination.

**Results:** The mean age was 56.7 (range: 28–97); 55.3% were Black, 52.6% cisgender female, 62.6% PWH, and 26.1% in poverty. 10.1% ( $n=400$ ) of participants reported never receiving SARS-CoV-2 vaccinations.

Participants in poverty ( $aOR=1.94$ ; 95% CI: 1.28, 2.95), aged  $<50$  ( $aOR=2.82$ ; 95% CI: 1.81, 4.41), living without HIV ( $aOR=1.56$ ; 95% CI: 1.03, 2.38), and conveying highly vaccine-hesitant attitudes ( $aOR=7.40$ ; 95% CI: 4.91, 11.17) had higher odds of non-vaccination than their counterparts.

Medical mistrust and vaccine-hesitant attitudes mediated the relationship between poverty and SARS-CoV-2 non-vaccination (indirect effect:  $\beta=0.02\pm0.005$ ;  $p<0.001$ ), accounting for 36.4% of that effect. No significant differences in these relationships by gender or race/ethnicity were detected.

*Figure 1. Relationship between poverty status and SARS-CoV-2 vaccination non-uptake, mediated by medical mistrust and vaccine-hesitant attitudes, MWCCS (N=3948), 2021 - 2022.*

**Conclusions:** Poverty was a key predictor of SARS-CoV-2 non-vaccination in this cohort. Findings indicate a profound need for renewed vaccine promotion efforts tailored to combat medical mistrust and vaccine-hesitant attitudes in impoverished communities in the U.S., particularly those affected by HIV.

High burden and mortality of advanced HIV disease (AHD) among PLHIV- urgent need to prioritize care

A. Subramanian<sup>1</sup>, S. Kataria<sup>2</sup>, K. Rajeshwari<sup>3</sup>

<sup>1</sup>Maulana Azad Medical College, Medicine, New Delhi, India, <sup>2</sup>Lok Nayak Hospital, ART Center, New Delhi, India,

<sup>3</sup>Maulana Azad Medical College, Pediatrics, New Delhi, India

**Background:** Despite the universal access to Antiretroviral treatment (ART) and implementation of the "test and treat" policy, PLHIV still present with advanced HIV disease (AHD). AHD remains a leading cause of mortality in PLHIV in low-middle income countries. Identifying PLHIV with AHD with highest risk of mortality will help prioritizing care for this vulnerable group.

**Methods:** The burden of AHD and 6-month death/loss to follow-up (LFU) were analysed among ART-naïve PLHIV aged ≥15 years newly enrolled in an ART center (ARTC) at a tertiary-care institution in New Delhi, India, between April 2020-March 2023.

Additional 12, 36 and 24 month follow up analysis of eligible PLHIV was also done. Baseline socio-demographic and clinical characteristics of AHD was evaluated and predictors of death among those with AHD were analyzed using multivariate logistic regression.

**Results:** During this period, 917 PLHIV were newly registered in care at the ARTC. Of these, 29.6% (272/917), had AHD. The mean age of PLHIV with AHD was 35.9 ± 10.1 years, 81.6% were men, 46% were married and 21% were injecting drug users. The mean CD4 count was 128.1 ± 92.2 cells/mm<sup>3</sup> and 43.3% had CD4 < 100 cells/mm<sup>3</sup>. More than a third (37.5%) of PLHIV with AHD had active TB disease, 58.8% had an opportunistic infection and 9.5% were hospitalised with serious illness. 72% PLHIV with AHD had same day ART initiation and 90% had ART initiation by 18 days. At 6 months, 36 /250 had died- a mortality of 14.4%, 22/272 (8%) were lost to follow up. There were 3 additional deaths by 12 months and 1 more each at 24 and 36 months. Lower baseline CD4 counts (89.19 vs 136.34 cells/mm<sup>3</sup>, p=0.001) and lower body weight (43.85 vs 51.15 kg, p=0.002) were significantly predictive of mortality.

**Conclusions:** Nearly a third of PLHIV still present with AHD. AHD is associated with high mortality especially within the first 6 months despite initiating ART. PLHIV with lower CD4 counts (especially CD4 <100 cells/mm<sup>3</sup>), those requiring hospitalization and with undernutrition are at highest risk for mortality. These PLHIV must be prioritized to receive urgent, early interventions to save lives.

## WEPEB042

Standardizing routine mortality review among children living with HIV on antiretroviral therapy in Tanzania

A. Temu<sup>1</sup>, R. Van de Ven<sup>1</sup>, M. Peter<sup>1</sup>, F. Bigirwamungu<sup>1</sup>,

L.A. Faux During<sup>1</sup>, K. Malembela<sup>1</sup>, J. Mkumbo<sup>1</sup>,

L. Mutasingwa<sup>1</sup>, S. Kimambo<sup>1</sup>, F. Haraka<sup>1</sup>, M. Maro<sup>1</sup>

<sup>1</sup>Elizabeth Glaser Pediatric AIDS Foundation, Technical, Dar es Salaam, Tanzania, the United Republic of

**Background:** In Eastern and Southern Africa, children comprised about 5% of people living with HIV, but almost 14% of all deaths due to AIDS in 2022. The Elizabeth Glaser Pediatric AIDS Foundation through the USAID Afya Yangu Northern project established routine pediatric mortality reviews to determine the underlying causes of deaths among children receiving antiretroviral therapy (ART) in Tanzania.

**Methods:** Pediatric death audit forms were introduced in the project-supported health facilities to learn lessons from each child death to guide quality improvement.

A retrospective chart review of the care and treatment cards and pediatric death audit forms was conducted on all deaths that occurred among children aged 0-14 years at 472 care and treatment clinics in the five supported regions between October 2022 - September 2023.

Descriptive analysis was done on client demographics and included age at death, place of death, duration on ART, and underlying causes of death recorded.

**Results:** A total of 5,999 children were receiving ART services by September 2023. Between October 2022 and September 2023, 76 (1.2%) pediatric deaths were recorded with 40 (53%) of the deaths in children under five years of age.

Eight (11%) children died within the first two weeks after ART initiation, whereas 41 (54%) of children died after being on ART for more than six months.

The majority of deaths (71%) occurred within the health facility. The main underlying causes of death recorded were malnutrition in 38 children (50%) and tuberculosis in 20 children (26%). See figure for other diagnoses.

Figure: Number and proportion of underlying causes of death recorded among 76 children on ART who died between October 2022 - September 2023.

**Conclusions:** Routine mortality reviews create better understanding of the major treatment challenges. Pediatric HIV programs should consider integrating nutritional intervention packages and strengthening tuberculosis monitoring to improve outcomes in children on ART.

## WEPEB043

Differences in mortality in hospitalized advanced HIV disease between treatment-naïve and treatment-discontinuing individuals: a comparative retrospective study from Mexico City

H. Rivera<sup>1</sup>, Y. Caro-Vega<sup>1</sup>, A. Trujillo-Gamboa<sup>1</sup>, R. Ville-Benavides<sup>1</sup>, A. Lopez-Iñiguez<sup>1</sup>, J. Sierra-Madero<sup>1</sup>, B.E. Crabtree-Ramirez<sup>1</sup>

<sup>1</sup>Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubiran, Infectious Diseases, Mexico City, Mexico

**Background:** Advanced HIV disease remains a public health problem in the Latin American region and represents a major cause of morbidity and mortality in people living with HIV (PWH). It has been reported that COVID-19 pandemic and fragmented health systems, like ours, have jeopardized the HIV continuum of care, leading to a major frequency of hospitalization.

It is unknown whether mortality and unfavorable outcomes differ between those with AIDS-defining events who are treatment-naïve versus those with advanced disease due to abandonment of antiretroviral treatment.

We aim to compare differences in mortality in PWH between treatment-naïve (TN) and treatment-abandoned (TA) hospitalized individuals.

**Methods:** All adults hospitalized for complications related to advanced HIV disease (<200 CD4 cell/mm<sup>3</sup> and/or with an AIDS-defining event) were included and divided into TN and TA between January 2015 and December 2022 in a tertiary center in Mexico City. Demographic, clinical, and laboratory data were collected. The outcomes were days of hospitalization, 30-day and one year mortality after admission.

**Results:** A total of 1,371 hospitalizations occurred in 755 PWH during the study period, of which 470 events were related to advanced HIV disease in 310 individuals. Of these, 213 (69%) were TN at the time of admission, while 97 (31%) were TA. No differences were found in male sex (88 % vs 84%,  $p=0.46$ ), median age (36y vs 37y,  $p=0.63$ ), mean days of hospitalization (15 vs 14,  $p=0.81$ ), median CD4 (39cells/mL vs 48cells/mL,  $p=0.35$ ), years of education (14y vs 12y,  $p=0.072$ ), and individuals with comorbidities (28% vs 36%,  $p=0.17$ ). TN were significantly more likely to have acquired HIV by sexual transmission ( $p=0.006$ ). Mortality at one year was significantly higher in those with TA (24% vs 8%) ( $p=0.011$ ). A tendency towards more mortality at 30 days was found in TA (12% vs 5.5%,  $p=0.062$ ).

**Conclusions:** Frequency of TA HIV clients is inadmissibly high and is associated with worse clinical outcomes when compared to TN HIV clients. Biological, social, and/or unknown factors may contribute to the difference in mortality observed.

Future research should focus on understanding the reasons for these findings and designing public health strategies to avoid disruption of the continuum of care.

## WEPEB044

Treatment interruption and mortality among persons living with HIV (PLHIV) initiating antiretroviral treatment in Jamaica

S. Beckford Jarrett<sup>1</sup>, S. Stephens<sup>1</sup>, T. Butterfield<sup>2</sup>, A. Robb-Allen<sup>2</sup>, J. Williams<sup>3</sup>, K.-A. Gordon-Johnson<sup>4</sup>, R. Kaur<sup>1</sup>, W. McFarland<sup>1</sup>, N. Skyers<sup>2</sup>

<sup>1</sup>University of California, San Francisco, Institute of Global Health Science, San Francisco, United States, <sup>2</sup>Ministry of Health, HIV/STI/TB Unit, Kingston, Jamaica, <sup>3</sup>Caribbean Vulnerable Communities, UCSF Jamaica Country Programs, Kingston, Jamaica, <sup>4</sup>Centers for Disease Control and Prevention, Global Health Center, Division of Global HIV & TB Caribbean Office, Kingston, Jamaica

**Background:** Of an estimated 32,000 PLHIV in Jamaica, 21,342 initiated antiretroviral therapy (ART) by 2020; however, only 12,032 were retained on ART.

**Methods:** We examined treatment interruption and mortality through June 2022 among PLHIV initiating ART from 2018-2020 using national clinic data in Jamaica. Kaplan-Meier, Cox proportional hazards, and logistic regression analyses identified factors associated with treatment interruption (defined as no clinic contact for  $\geq 90$  days after last scheduled appointment) and mortality.

**Results:** Among 4,784 PLHIV initiating ART during 2018-2020, 54% were female, median age was 37 years and 27% had CD4 count <350. By June 2022, 73% were retained on ART. Attrition was due to treatment interruption (11%), death (10%), and migration/transfer (5%). Retention was higher among women compared to men (76.2% vs. 71.4%,  $p<0.001$ ). In multivariable analysis, treatment interruptions were less likely for clients aged 50 years and older ( $aOR:0.52$  [0.35-0.77] vs. 16-24), rural residents ( $aOR:0.75$  [0.59-0.95] vs. urban), and first CD4 count <200 cells/mm<sup>3</sup> ( $aOR:0.44$  [0.32-0.62]) or 201-349 ( $aOR:0.70$  [0.50-0.96]) vs. those with first CD4 count  $\geq 350$ . Mortality rates were higher for males vs. females ( $p<0.001$ ), persons aged 50 years and above ( $p<0.001$ ) vs. younger, and clients with CD4 count  $\leq 200$  at ART initiation ( $p<0.001$ ) (Figure 1). In Cox proportional hazards analysis, CD4 count of <200 at ART initiation ( $aHR:1.67$  [1.27, 2.20]) was the only significant predictor for higher mortality, while ART regimen change from NNRTI-based regimens to PIs was associated with lower mortality ( $aHR:0.29$  [0.29, 0.71]).

Figure 1. Kaplan-Meier survival curves for mortality, Jamaica.

**Conclusions:** Our analysis of national data in Jamaica found one-fourth of PLHIV initiating ART were not retained after 18 months.

Close monitoring of males, older clients, and persons initiating ART with low CD4 counts may avert mortality, as well as timely review and switch for persons failing NNRTIs or other ineffective regimens.

## WEPEB045

Sequencing of provirus integration sites reveals a reduced reservoir size and heterogeneous clonal types in individuals initiating ART during acute HIV infection

J. Wang<sup>1,2</sup>, Q. Li<sup>1</sup>, Q. Peng<sup>1,3</sup>, F. Zhao<sup>1</sup>, Q. Zhang<sup>1</sup>, L. Zhang<sup>1</sup>, Y. Jia<sup>1</sup>, M. Rao<sup>1</sup>, Y. Song<sup>1</sup>, S. Wang<sup>1</sup>, H. Zhang<sup>1</sup>, H. Wang<sup>1</sup>, Y. He<sup>1</sup>, H. Lu<sup>1</sup>

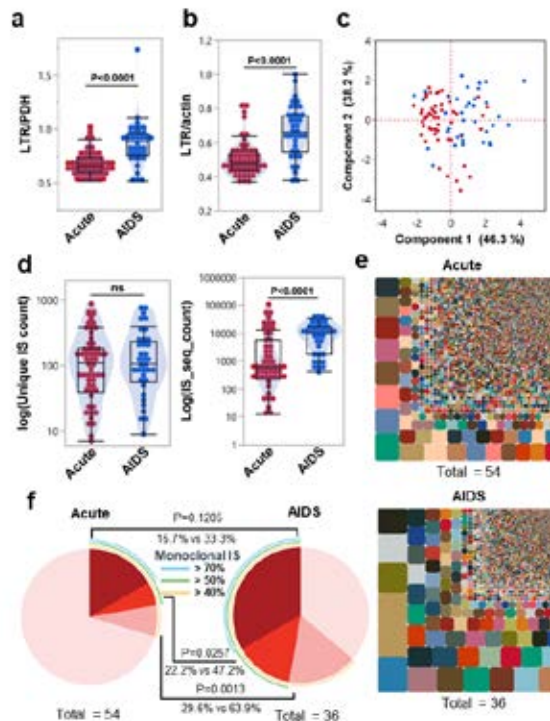

<sup>1</sup>National Clinical Research Center for Infectious Diseases (Shenzhen), The Third People's Hospital of Shenzhen and The Second Affiliated Hospital of Southern University of Science and Technology, Shenzhen, China, <sup>2</sup>The Fifth People's Hospital of Wuxi, Jiangnan University, Clinical Medical Research Center, Wuxi, China, <sup>3</sup>AIDS Institute, Department of Microbiology, Li Ka Shing Faculty of Medicine, the University of Hong Kong, Shenzhen, China

**Background:** Despite evidence favoring early ART initiation during acute HIV infection, the optimal treatment timing remains uncertain. Studies suggest benefits like reduced infected cells and limited latent pool size. However, a lack of clinical evidence hinders direct comparison of provirus integration site (IS) counts between those initiating ART in acute HIV and AIDS stages.

**Methods:** In this study, we use LAM-PCR and Next Generation Sequencing to longitudinally examine proviral integration sites, comparing clonal counts between those starting ART during acute HIV infection and AIDS stages. This allows for a detailed analysis of integrated HIV provirus over time.

**Results:** In individuals living with HIV, the initiation of ART treatment during the acute phase results in lower reservoir levels compared to those starting treatment during the AIDS phase (Fig1a-c). Upon calculating unique IS counts, our findings indicate that although the total IS counts are higher in individuals starting ART during AIDS stages compared to those initiating ART during the acute phase, the counts of unique IS remain similar between the two groups (Fig1d).

Notably, individuals initiating treatment at different stages of ART display distinct clonal distribution patterns of unique IS. Those in the acute phase exhibit greater heterogeneity, while individuals in the AIDS stage tend to demonstrate more homogeneity. Additionally, patients initiating treatment during the AIDS stage show a higher prevalence of single-clonal distribution (Fig1e-f)

**Conclusions:** Overall, we introduce a clinical method to assess provirus size in human peripheral blood. Our findings offer evidence that individuals living with HIV who initiate ART treatment during the acute phase have lower reservoir levels compared to those starting treatment during the AIDS phase.

Furthermore, we identify a widespread existence of monoclonal distribution of IS in AIDS patients after ART treatment, which could pose barriers to effective treatment for AIDS.

Need for increased HIV testing prior to and during pre-exposure prophylaxis with cabotegravir long-acting injections in routine clinical care in the United States

R. Hsu<sup>1,2</sup>, L. Brunet<sup>3</sup>, A. Mills<sup>4</sup>, K. Mounzer<sup>5</sup>, M. Wohlfeiler<sup>6</sup>, K. Frost<sup>7</sup>, G. Pierone<sup>8</sup>, M. Sension<sup>9</sup>, P. Lackey<sup>10</sup>, J. Fusco<sup>3</sup>, C. Brown<sup>11</sup>, V. Vannappagari<sup>11</sup>, M. Aboud<sup>11</sup>, P. Budnik<sup>12</sup>, G. Fusco<sup>3</sup>

<sup>1</sup>AIDS Healthcare Foundation, New York, United States, <sup>2</sup>NYU Langone Medical Center, New York, United States, <sup>3</sup>Epidian, Raleigh, United States, <sup>4</sup>Men's Health Foundation, West Hollywood, United States, <sup>5</sup>Philadelphia FIGHT, Philadelphia, United States, <sup>6</sup>AIDS Healthcare Foundation, Miami, United States, <sup>7</sup>Foundation for AIDS Research (amfAR), New York, United States, <sup>8</sup>Whole Family Health Center, Vero Beach, United States, <sup>9</sup>CAN Community Health, Fort Lauderdale, United States, <sup>10</sup>Wake Forest University School of Medicine, Winston-Salem, United States, <sup>11</sup>ViiV Healthcare, Durham, United States, <sup>12</sup>ViiV Healthcare, London, United Kingdom

**Background:** Cabotegravir long-acting (CAB LA) is approved as pre-exposure prophylaxis (PrEP) for prevention of HIV. As per the label and CDC guidelines, HIV-1 testing should be performed prior to starting CAB LA PrEP and every two months (prior to each injection). We describe the frequency of HIV testing prior to CAB LA PrEP injections in routine clinical practice in the US.

**Methods:** Individuals without HIV, ≥12 years old who received ≥1 CAB LA injection between 21DEC2021 and 31MAR2023 in the OPERA cohort were followed through 30JUN2023. Administration of HIV testing (antigen/antibody [Ag/Ab] and/or RNA test) ≤1 week before/at each injection was assessed. A sensitivity analysis using a 4-week window before/at injection was conducted.

**Results:** Of 560 CAB LA PrEP users, median age was 31 years (IQR: 25, 38); 13% were women, 32% were Black, and 29% were Hispanic. Within ≤1 week before/at the first injection, 352 (63%) had any HIV test done (268 Ab/Ag test only, 14 RNA test only, 70 both tests). The 498 individuals with ≥2 CAB LA injections received a median of 3 follow-up injections (IQR: 2, 4; max: 8).

The median proportion of injections with any HIV test within ≤1 week before/at injection was 80% (IQR: 40%, 100%), with 50% having a test before each injection; 44% had an Ag/Ab test and 9% had an RNA test before each injection (Figure). Using a 4-week window, a median of 100% of injections had a test (IQR: 50%, 100%).

**Conclusions:** During routine clinical care in the US, HIV testing among CAB LA PrEP users does not conform to the label or CDC guidelines. Providers and users of CAB LA PrEP should be educated on the need for HIV testing prior to

all injections, as timely HIV diagnosis and switch to a full antiretroviral therapy regimen reduces the potential for development of resistance.

Figure. Presence of HIV testing within 1 week before/at follow-up CAB LA PrEP injections, among individuals with ≥2 injections (N = 498).

Ab, antibody; Ag, antigen; CAB, cabotegravir; IQR, interquartile range; LA, long acting; N, number; PrEP, pre-exposure prophylaxis; RNA, ribonucleic acid.

### WEPEB047

A novel qPCR method to count CD4+ T helper cells using dried blood

J.J. Schulze<sup>1</sup>, J. Werner<sup>1</sup>, S. Seiffert<sup>2</sup>, S. Walter<sup>1</sup>, U. Salzer<sup>3</sup>, B. Grimbacher<sup>3</sup>, U. Staub<sup>1</sup>, U. Sack<sup>2</sup>  
<sup>1</sup>Epimune GmbH, Berlin, Germany, <sup>2</sup>Universitätsklinikum Leipzig, Institut für Klinische Immunologie, Leipzig, Germany, <sup>3</sup>Universität Freiburg, Zentrum für chronische Immundefizienz, Freiburg, Germany

**Background:** The CD4+ T cell quantification in people living with HIV (PLWH) is important to identify those suffering from advanced disease (<200 CD4 cells/μl) at antiretroviral therapy initiation and during monitoring. Flow cytometric quantification requires fresh blood which is challenging especially in resource-limited settings. Here, epigenetic quantification of CD4+ T cells from dried blood spots is demonstrated to overcome this obstacle.

**Methods:** An epigenetic qPCR assay was established co-amplifying a CD4+ T cells specific demethylated region, the GAPDH locus for the quantification of leukocytes as well as an internal control for the absolute quantification. Genomic DNA from blood is bisulfite converted and subsequently purified before analysis.

CD4 counts were determined in liquid blood samples as well as matched DBS samples of 41 PLWH and compared to flow cytometry data. Furthermore, liquid blood and DBS samples of 159 people with diverse immunological conditions were analysed in parallel. For each analysis, 40 μl whole blood or one 6mm punch was used. The real-time PCR was performed using different qPCR platforms.

**Results:** For both substrates, a significant Spearman's correlation factor of  $>0.9$  was determined when comparing flow cytometric and epigenetic CD4+ T cell data. A substrate-specific correction equation was defined to compensate the bias between both technologies. Applying the correction, a bias  $<6\%$  to flow cytometry (Bland-Altman analysis) was achieved using liquid or DBS samples.

Figure 1. Exemplary presentation of the Spearman's correlation and Bland-Altman analysis comparing epigenetic results of DBS cards with flow cytometric data. Data points in red representing the HIV patients.

The established correction was independently tested on an immunodeficiency cohort. All samples with  $<200$  CD4 cells/ $\mu$ l as determined by flow cytometry were correctly identified using the LightCycler480II.

**Conclusions:** Accurate quantification of CD4+ T helper cells out of a dried blood spot was shown using the epigenetic qPCR assay. Thus, the determination and monitoring of the CD4+ T cell count in PLWH could be significantly simplified by using DBS cards especially when combined with viral load testing on DBS.

## WEPEB048

Prevalence of gonococcal and chlamydial infections among clients receiving sexually transmitted infection testing at the Thai Red Cross AIDS Research Centre Anonymous Clinic, Bangkok

S. Pattanachaiwit<sup>1</sup>, N. Chumpa<sup>2,3</sup>, T. Pipattaweepon<sup>1</sup>, T. Pankam<sup>1</sup>, N. Chanasriphum<sup>1</sup>, S. Barisri<sup>1</sup>, Y. Pichitchok<sup>1</sup>, O. Putcharoen<sup>1,2,3</sup>, S. J Kerr<sup>4</sup>

<sup>1</sup>The Thai Red Cross AIDS Research Centre (TRCARC), Bangkok, Thailand, <sup>2</sup>King Chulalongkorn Memorial Hospital, Thai Red Cross Emerging Infectious Diseases Clinical Center, Bangkok, Thailand, <sup>3</sup>Faculty of Medicine, Chulalongkorn University, Division of Infectious Diseases, Department of Medicine, Bangkoktha, Thailand, <sup>4</sup>HIV-NAT, The Thai Red Cross AIDS Research Centre (TRCARC), Bangkok, Thailand

**Background:** Sexually transmitted infections (STIs) such as gonorrhea, chlamydia, and syphilis, pose a significant public health concern. Nucleic acid amplification tests (NAATs) can simultaneously detect  $>1$  STI at the same time, and new multiplex platforms help to meet increased demands for rapid, accurate, and cost-effective testing.

This study aimed to determine the prevalence of STIs by site with the Alinity m STI assay, and assess agreement of results between 2-testing platforms.

**Methods:** Clients attending the Thai Red Cross AIDS Research Centre for STIs screening during May to December 2020 and April 2021 were included. Cervical, rectal, oropharyngeal, urine, and pooled samples, were tested for *Chlamydia trachomatis* (CT) and *Neisseria gonorrhoeae* (NG) using NAATs; NG, CT and *Mycoplasma genitalium* (MG) were tested using the Alinity m STI assay.

**Results:** 300 samples were tested from 41 females, 206 males, and 53 transgender women (median age 31 years); 109 (36%) were people living with HIV (PLH). The overall prevalence of both CT and NG was 21%.

Discordant results from the Abbott RealTime CT/NG and the Alinity m STI assay occurred in 12/300 (4%) samples: 3 were positive for CT by Abbott RealTime CT/NG and negative by Alinity m ( $p=0.08$ ); 6 NG samples were positive by Abbott RealTime CT/NG and negative by Alinity m, and 3 were positive by Alinity m and negative by Abbott RealTime CT/NG ( $p=0.32$ ).

In 15 cervical, 40 anal, 45 oropharyngeal, 100 urine and 100 pooled samples, the Alinity m detection rates for CT were 13.3%, 32.5%, 8.9%, 7% and 31%, and for NG were 13.3%, 55%, 17.8%, 5%, and 19% respectively. Eight percent of samples tested positive for MG. PLH were more likely to test positive for GN (risk difference = 19.7 (95%CI 9.9 to 29.5%);  $P<0.001$ ) but not CT (risk difference = 1.9 (95%CI -7.4 to 11.2%);  $P=0.7$ ).

**Conclusions:** The Alinity multiplex and NAAT tests for CT and NG showed high rates of agreement. CT and NG prevalence ranged from 5 to 55% in different anatomical sites, and PLH were more likely to have positive NG but not CT results. Comprehensive screening for STIs remains crucial for effective prevention and control.

### Impact of quality improvement approach to improve uptake of early infant diagnosis services by young mothers living with HIV

P. Kuchochi<sup>1</sup>, A. Sellberg<sup>1</sup>, V. Chitiyo<sup>1</sup>, N. Willis<sup>1</sup>, M. Kapurura<sup>1</sup>, N. Nduku<sup>1</sup>, T. Maphosa<sup>2</sup>, R. Malaba<sup>3</sup>, Z. Bangani<sup>3</sup>, K. Thomson<sup>4</sup>, S. Wiktor<sup>5</sup>, A. Mushavi<sup>6</sup>, P. Andifasi<sup>6</sup>, B. Chikwinya<sup>7</sup>, G. Gonesse<sup>7</sup>

<sup>1</sup>Zvandir, Programs, Harare, Zimbabwe, <sup>2</sup>Centre for Disease control, Public Health, Harare, Zimbabwe,

<sup>3</sup>Centers for Disease Control and Prevention, Public Health, Harare, Zimbabwe, <sup>4</sup>Global Health, Epidemiology, Harare, Zimbabwe, <sup>5</sup>Global Health, Clinical, Harare, Zimbabwe, <sup>6</sup>Ministry of Health and Child Care, EMTCT Program, Harare, Zimbabwe,

<sup>7</sup>Zimbabwe Technical Assistance, Training and Education Centre for Health (Zim-TTECH), Public Health, Harare, Zimbabwe

**Background:** Early infant diagnosis (EID) of HIV is a strategy which identifies HIV Exposed Infants (HEI) and assists them to access timely testing and referral to treatment services using DNA/PCR testing. According to Spectrum 2021 HIV estimates for Zimbabwe, only 74.8% of children living with HIV know their HIV status and programmatic data for October 2021 reported an EID coverage of 76% among children less than 2 months old.

However, HIV positive pediatric case investigations show elevated vertical transmission among young mothers (YMs) living with HIV (YMLHIV). Zvandiri established the Young Mentor Mother (YMM) programme, a peer-led innovation being implemented in 17 districts and supporting 2,003 young mothers across Zimbabwe through the ZimPAAC consortium.

Under this programme, Zvandiri was tracking EID coverage for HEI in Lupane and Sanyati. At the beginning of October 2021, the EID sample collection rate among enrolled infants was 39% (52/132), 33% (17/52) received results, 1% (3/52) seroconversions rate.

**Methods:** EID is done at birth, 6 weeks, 9 months and at 18 months or 3 months post cessation of breastfeeding, whichever comes last. A quality improvement (QI) project was implemented in Lupane and Sanyati districts from March-September 2022 after the districts had reported low performance on the indicator. Based on a fishbone analysis performed by Lupane and Sanyati districts, peer counselling, information sharing, including lived experiences for eMTCT, importance of adherence to EID testing services, close collaboration of HCWs and YMMs for follow up and community testing were implemented to address EID coverage.

**Results:** 174 YMLHIV (7% aged 15-19; 93% aged 20-24) and 126 HEI with ages ranging from birth to 21 months, with a median age of 10 months, were enrolled and received support from 11 YMMs. At the end of September 2022, Sanyati and Lupane district had improved EID coverage

from 14% to 51% and 41% to 90% respectively. By 2023, EID coverage was 76% (52/64), 100% (52/52) received results, 0% seroconversions rate.

**Conclusions:** Peer counselling can enhance EID coverage. Multi-component interventions should be done to improve EID services quality management and bridge service gaps, aimed on promoting an HIV-free generation.

## WEPEB050

### Real-time adherence patterns in persons starting oral antiretrovirals support baseline management of depression, methamphetamine use, homelessness and real-time adherence interventions

S. Browne<sup>1</sup>, A. Umlauf<sup>2</sup>, T. Katsivas<sup>1</sup>, T. Blaschke<sup>3</sup>, F. Vaida<sup>4</sup>, C. Benson<sup>1</sup>, J. Caperna<sup>1</sup>

<sup>1</sup>University of California, San Diego, Medicine, La Jolla, United States, <sup>2</sup>University of California, San Diego, Psychiatry, La Jolla, United States, <sup>3</sup>Stanford, Medicine, Palo Alto, United States, <sup>4</sup>University of California, San Diego, Biostatistics, La Jolla, United States

**Background:** Early identification of persons starting oral antiretroviral (ARV) treatment who need personalized support is limited.

We captured real-time daily adherence in persons starting ARVs, analyzing dosing patterns and their associations with detailed baseline characteristics.

**Methods:** The real-time adherence behavior pattern was captured using FDA-approved digital-health-feedback system (DHFS) with ingestible-sensor-enabled ARVs in persons starting oral ARVs for 16 weeks.

Baseline demographics, urine toxicology and self-report questionnaires were obtained. Kaplan-Meier Estimate evaluated persistence on study. Dot-plot captured individual patterns of daily medication taking; Spearman's rho and permutation tests analyzed dose taking patterns. Mixed-effects logistic regression, with multiple imputation, modeled characteristics associated with treatment adherence.

**Results:** Sixty-eight participants, 83.8% male, average age 38.8 years, 64.7% White, 23.5% Black race, 36.8% Hispanic ethnicity, were followed for 112 days median (14 -270) generating 6634 observation days. Persistence on study (surrogate for retention in care) for 16 weeks was 48.5%, with methamphetamine use (HR=2.48; CI<sub>95</sub> 1.21, 5.07; p=0.015), depression PHQ-8 (HR=1.08; CI<sub>95</sub> 1.01, 1.15; p=0.020) and greater life chaos (HR=1.12; CI<sub>95</sub> 1.05, 1.21; p=0.002) predictors of early dropout. Figure 1 shows dot-plot of individual participant daily medication taking patterns (legend insert provides color code).

Missed doses occurred on consecutive days, mean 1.36 days, p<0.001. The likelihood of daily confirmed doses was higher in the absence of baseline depression, methamphetamine use and homelessness (see Table 1).

	Single-predictor model		Multi-predictor model with backward model selection, $p < 0.15$	
	Odds ratio ( $CI_{95\%}$ )	P-value	Odds ratio ( $CI_{95\%}$ )	P-value

Life chaos, per 1 score	0.846 (0.791, 0.906)	< 0.001	---	---

**Table 1: Factors associated with daily confirmed doses, longitudinal mixed-effects logistic regression. Subject-specific odds ratios (ORs) and 95% confidence intervals ( $CI_{95\%}$ ) reported. Results with  $p < 0.04$  are in bold. PHQ-8=Patient Health Questionnaire (8-items).**

**Conclusions:** Real-time adherence patterns in persons starting oral ARV treatment verified missed doses occurred on consecutive days supporting real-time adherence interventions, and confirmed baseline methamphetamine use, depression and homelessness impact adherence early in treatment.

## WEPEB051

Six months outcomes for people living with HIV on Dolutegravir-based regimens with high viral loads: lessons from AIDS healthcare foundation Eswatini

S. Khumalo<sup>1</sup>, Y. Mafulu<sup>1</sup>, V. Williams<sup>2</sup>, N. Dube<sup>1</sup>, B. Simelane<sup>2</sup>, S. Haumba<sup>2</sup>

<sup>1</sup>AIDS Healthcare Foundation, Medical, Manzini, Eswatini,

<sup>2</sup>Georgetown University, Mbabane, Eswatini, Center for Global Health Practice and Impact, Mbabane, Eswatini

**Background:** Dolutegravir-containing regimens are the most widely used antiretroviral therapy (ART) in Eswatini and are effective at achieving viral load (VL) suppression.

The World Health Organisation (WHO) advises that all clients with a high VL (HVL) should receive stepped-up adherence counselling (SUAC) for three months and a repeat VL test to minimise selection resistance and viral transmission. AIDS Healthcare Foundation (AHF) provides HIV services to 32,000 clients at six health facilities in Eswatini. We describe the outcomes of clients on a DTG-containing regimen six months after the initial high VL and three months of SUAC.

**Methods:** A retrospective cohort analysis was done for records of clients with HVL ( $\geq 1000$  c/ml) reported between July 2022 and July 2023 from six health facilities. Individual client records and six-month cohort reports were used. The sociodemographic and clinical data of clients were extracted from the client management information system (CMIS), and descriptive analysis was used.

**Results:** Of 581 clients, 406 (68.9%) were females; the median age was 34 years (interquartile range 28-41), and 352 (60.5%) were 20 – 39 years. Ninety-one percent ( $n=531$ ) had at least one SUAC session. The median time between the VL result and the first SUAC was 33 days, and 75% ( $n=434$ ) had a repeat VL at six months.

For those with repeat VL results, 321 (74%) were virologically undetectable, 66 (15.2%) had low-level viraemia ( $VL \geq 50, < 1000$ ), and 45 (10.4%) had persistent HVL. The median time to the first adherence session was 54 days for clients who received  $> 3$  months of ART prescriptions.

Only one pregnant client was switched to a second-line regimen after a second HVL. Loss to follow-up within the cohort was 10.2% ( $n=59$ ).

**Conclusions:** Most clients achieved virologic suppression within six months following SUAC. However, a notable proportion showed low-level viremia or persistent HVL, signifying a need for continued adherence counselling.

The loss to follow-up of 10.2% underscores the importance of improved retention strategies to address other barriers to ART, particularly in clients with evidence of adherence challenges.

Remote counselling should be considered for clients with  $\geq 3$  months of prescriptions who are usually reluctant to return for SUAC.

## WEPEB052

Alinity m MPXV - a new qualitative realtime PCR for MPOX virus

M. Obermeier<sup>1</sup>, M. Prentice<sup>1</sup>, J. Dhein<sup>2</sup>, K. Pfeifer<sup>2</sup>, R. Ehret<sup>1</sup>

<sup>1</sup>Medizinisches Infektiologiezentrum Berlin, Laboratory Medicine, Berlin, Germany, <sup>2</sup>Abbott GmbH, Scientific Affairs, Wiesbaden, Germany

**Background:** Timely testing of monkeypox (MPOX) virus is important for client care, contact tracing, and decreasing transmission. The new Alinity m MPXV Research Use Only (RUO) assay developed for direct qualitative detection of MPXV DNA in clinical specimens was evaluated by

comparison with a MPOX/Ortho-pox Virus in-house assay (LDT) established with start of the global outbreak in summer 2022.

**Methods:** Residual archived swab samples tested with the LDT in 2022 were selected (100 negatives, 300 positives) and were diluted 1:10 to obtain sufficient material for parallel testing of specimens with the Alinity m MPXV RUO test (Abbott Molecular) and the LDT (extraction: Nimbus, See-gene, primers/probes: TibMolbiol; PCR: Cfx96, Bio-Rad) to estimate the correlation between both tests.

Assay linearity was assessed with a dilutional series of cell-culture supernatant (INSTAND e.V., Germany) quantified by digital PCR, with concentrations ranging from 500,000 to 160copies/mL and tested at 10 replicates each. Detection limits of both tests (95% hit-rates) were determined by Probit analysis.

**Results:** All samples initially negative for MPOX were confirmed as negative with both tests. 95.3% (286/300) of the diluted positive samples were reported positive with both tests. Samples that were not positively confirmed had Ct values of >37 cycles upon initial testing of undiluted material. The correlation between results was very high ( $R^2$  0.96). The mean difference in Ct-values determined by Bland-Altman analysis was 0.54 cycles, with the lower Ct-values for the Alinity m MPXV RUO assay. The dilution series demonstrated linearity for both assays. Probit analyses showed 95% hit-rates of 293 and 446 copies/mL for the Alinity and LDT, respectively.

**Conclusions:** In our comparative analysis, the Alinity m MPXV RUO assay showed very high specificity and sensitivity with a lower detection limit of 293copies/mL at a 95% hit rate.

Continuous random access and stat capabilities of the Alinity m system allowed for improving turn-around-time in comparison to the batch-based in-house assay.

### WEPEB053

#### High burden of human papilloma virus infection and persistence in people living with HIV

E. Grüner<sup>1</sup>, G. Reiling<sup>1</sup>, R. Stirner<sup>1</sup>, G. Ibarra<sup>1</sup>, R. Conca<sup>2</sup>, N. Postel<sup>3</sup>, C. Dächert<sup>4</sup>, J. Bogner<sup>1</sup>, C. Geldmacher<sup>5</sup>, U. Seybold<sup>1</sup>, J. Roider<sup>1</sup>

<sup>1</sup>LMU University Hospital, LMU Munich, Department of Infectious Diseases, Department of Medicine IV, Munich, Germany, <sup>2</sup>LMU University Hospital, LMU Munich, Department of Pediatrics, Dr. von Hauner Children's Hospital, Munich, Germany, <sup>3</sup>Prinzmed, Munich, Germany, <sup>4</sup>Faculty of Medicine, LMU Munich, Max von Pettenkofer Institute, Virology, Munich, Germany, <sup>5</sup>University Hospital, LMU Munich, Division of Infectious Diseases and Tropical Medicine, Munich, Germany

**Background:** In people living with HIV (PLH), coinfection with human papilloma virus (HPV) is a major source for comorbidity and mortality due to HPV-associated tumors. Despite highly efficient antiretroviral therapy (ART), HIV infection still increases the risk for HPV persistence, the cumulative lifetime risk of HPV disease progression and thus incidence of HPV-associated cervical, anal and oropharyngeal cancer (Perez-Gonzalez et al., 2022).

**Methods:** This study analyses the association of HIV-induced dysfunctional immune response and HPV persistence in an observational, prospective, longitudinal study (follow-up visits after 3, 6 and 12 months) conducted at the LMU university hospital and Prinzmed practice in Munich. Anal and oral HPV status regarding 28 high- (HR) and low-risk (LR) subtypes were evaluated. Concomitantly, HPV-specific T cell responses targeting five HR-HPV types were monitored by ELISpot assays using freshly isolated peripheral blood mononuclear cells.

**Results:** 75 male and 3 female individuals (63 people living with and 15 without HIV) with a median age of 54 (IQR 43-61) have been recruited. All PLH were on ART (viral load < 50cp/ml) with stable CD4 counts (median 603 (IQR 504-773)). At baseline, HPV was anally and/or orally detectable in 90% and 35% of participants, respectively. While single infections dominated in the oral cavity (90%), most anal infections consisted of multiple HPV subtypes (73%). 42% of anal and 5% of oral infections persisted at least up to one year. Only 31 out of 105 (30%; all timepoints merged) individuals with acute HPV16, 18, 35, 45 or 58 infection showed a corresponding interferon-gamma T cell response against the infecting subtype. Overall, HPV-specific T cell responses were detectable in 70% by interferon-gamma ELISpot.

**Conclusions:** HPV infections are highly prevalent within the study population at baseline and anal infections frequently persist up to the one year. Only a small propor-

tion of infected individuals showed an interferon-gamma response against the infecting subtype. Additional analysis of immune cell effector populations in peripheral blood and anal tissue by FACS and RNA-seq experiments will further characterize (dys)functionality of the immune system and provide insight how immune impairment associates with HPV persistence in PLH.

## WEPEB054

People living with HIV (PLWH): who is hospitalized in modern antiretroviral therapy (ART) era?

V. Joly<sup>1</sup>, M. Cortier<sup>1</sup>, Q. Le Hingrat<sup>1</sup>, N. Peiffer-Smadja<sup>1</sup>, C. Rioux<sup>1</sup>, M. Digumber<sup>1</sup>, A. Strukov<sup>1</sup>, G. Peytavin<sup>1</sup>, L. Maisonneuve<sup>1</sup>, Z. Julia<sup>1</sup>, C. Charpentier<sup>1</sup>, S. Le Gac<sup>1</sup>, D. Descamps<sup>1</sup>, J. Ghosn<sup>1</sup>, Y. Yazdanpanah<sup>1</sup>

<sup>1</sup>Hopital Bichat Claude Bernard, Infectious Diseases, Paris, France

**Background:** Modern ART has extended survival and reduced hospitalization of PLWH. A better knowledge of the profile of hospitalized PLWH in the context of aging with increasing comorbidities would be helpful to improve management of this population.

**Methods:** We assessed the profile of all PLWH hospitalized over one year in our Infectious Diseases Unit (IDU) clinic. Data were extracted from the hospital computerized database after written informed consent.

**Results:** Among 5,242 followed up in our clinic, 151 PLWH were hospitalized between 1st July 2022 and 30st June 2023, with a total of 203 hospitalizations, representing 15.6% of all hospitalizations in our IDU clinic. 89 were male, 47 female and 15 transgender females. Median age was 51 yrs [40, 60] and median CD4 cell count 320/mm<sup>3</sup> [110, 620] at time of hospitalization.

Plasma HIV RNA was < 50 cps/mL in 93 PLWH. Median duration of HIV infection was 15.4 yrs [4.6, 23.2] and median delay since first ART initiation 13.3 yrs [6.2, 21.3] in treated PLWH.

30 PLWH were hospitalized for HIV stage B or C event (39 hospitalizations), 45 PLWH for non tuberculous bacterial infections, including low respiratory tract infection in 18 and urinary tract infection in 8 (total = 47 hospitalizations), 27 PLWH for viral infections, including 7 mpox and 6 COVID19 and 10 PLWH for neoplastic disease not related to HIV status (11 hospitalizations). 10 PLWH were hospitalized for immuno-virological failure (2 PLWHIV-2 with multi-resistant virus and 8 PLWH with poor adherence to ART) and 9 PLWH to explore weight loss.

Hospitalizations for non-communicable diseases were rare: vascular event in 2, chronic liver disease in 3, cognitive impairment in 3 and neurologic or psychiatric disorders in 8 PLWH.

Ten PLWH died during the study period, including 4 with cancer and 2 with an AIDS defining event. In 11 PLWH, HIV infection was diagnosed at time of hospitalization.

**Conclusions:** In modern ART era, hospitalizations of PLWH remain driven by infectious diseases: 47% due to community infections, and 20% due to opportunistic infections in late presenters or lost to follow-up PLWH. High frequency of community infections underline the value of vaccine coverage in PLWH.

## WEPEB055

Length of hospital stay, in-hospital mortality, and factors associated with mortality among people living with HIV and cryptococcal meningitis receiving liposomal amphotericin B in real world setting

O.C. Namuju<sup>1</sup>, R. Kwizera<sup>1</sup>, L. Tugume<sup>2</sup>, D.R. Boulware<sup>3</sup>, D.B. Meya<sup>2</sup>

<sup>1</sup>Infectious Diseases Institute, Makerere University, College of Health Sciences, Kampala, Uganda, <sup>2</sup>Infectious Diseases Institute, Makerere University, Kampala, College of Health Sciences, Kampala, Uganda, <sup>3</sup>Division of Infectious Diseases and International Medicine, University of Minnesota, Department of Medicine, Minnesota, United States

**Background:** Cryptococcal meningitis (CM) remains the second most common and lethal opportunistic infection among People Living with HIV (PLWHIV) in sub-Saharan Africa. Currently, PLWHIV are managed on single high-dose liposomal amphotericin B and flucytosine. However, there is no sufficient data on whether the new treatment regimen has an effect on reducing in-hospital mortality and length of hospital stay in the real-world setting.

We aimed to investigate the proportion of in-hospital mortality, length of hospital stay (LOS), and factors associated with mortality among PLWHIV with associated CM receiving liposomal amphotericin B-flucytosine regimen.

**Methods:** This was a cross-sectional study that reviewed medical records of PLWHIV admitted between December 2022 and May 2023 at 11 tertiary hospitals in Uganda. Medical records of 173 PLWHIV and CM were captured using the Kobo Collect app.

Univariate descriptive statistics were used to summarize the background characteristics. Modified Poisson regression was used to ascertain factors associated with mortality at bivariable and multivariable levels.

Associations were presented through adjusted prevalence ratios with their 95% confidence intervals. Data were analyzed using STATA v15.

**Results:** Of the 173 medical records reviewed, majority (58.4%) were males with a median age of 38 years (IQR= 30, 48) and over half (55.5%) were married. Forty percent of PLWHIV and CM had altered mental status (GCS<15) on admission. Overall, in-hospital mortality for liposomal amphotericin B was 35.8% (compared to 42% of amphotericin B deoxycholate) and this significantly varied by health facility (range 7.1-100%). The median LOS was 7 days (IQR = 3, 12).

Factors associated with mortality were male sex [adjusted prevalence ratio (APR); 1.87, 95%CI (1.21-2.87)], p-value=0.005, admission with a convulsion [APR, 1.86, 95%CI (1.21-2.86), p-value=0.005], altered mental status [APR; 1.66, 95%CI (1.07-2.57), p-value=0.023], and presence of a comorbid condition [APR, 2.26 95%CI (1.44-3.53), p-value=0.006]. Therapeutic lumbar punctures were significantly associated with reduced mortality [APR; 0.47, 95%CI (0.29-0.73), p-value=0.001].

**Conclusions:** Liposomal amphotericin B regimen has lower mortality than deoxycholate in the real-world setting. PLWHIV on average spend more than a week in hospital. Male sex, admission with a convulsion, altered mental status, and comorbid conditions were independently associated with mortality. Therapeutic LPs significantly reduced in-hospital mortality.

**Background:** The West African Clade II mpox virus outbreak in 2022 led to a global public health emergency and expanded the mpox virus geographical footprint. A robust immunological test for use in both endemic and non-endemic mpox regions is needed. Understanding geographical orthopoxvirus cross-reactivity is essential for differentiating background in African, Asian and North

American samples to determine cutoff values for a multiplex electrochemiluminescence-based ELISA targeting 5 mpox and 5 analogous vaccinia antigens (Meso ScaleDiscovery [MSD] orthopoxvirus assay).

**Methods:** IRB approved samples from participants in Nigeria, Uganda, Kenya, Tanzania, Thailand, and the US, who were at very low risk of acquiring mpox, as well as, commercially available mpox PCR positive samples, were analyzed using the pre-commercially released V-PLEX Orthopoxvirus Panel 1 (IgG) kits obtained from MSD. Sample type, specificity, cutoff thresholds and background were characterized. Kruskal-Wallis test was applied using GraphPad8.

**Results:** Mpox-specific antibodies (Ab) were induced against 3/5 mpox antigens. No significant IgG Ab binding differences were observed between serum and plasma (EDTA and ACD). No significant differences between background binding Abs from negative African samples (Nigeria, Kenya, Tanzania, and Uganda) were observed; thus, a single negative threshold cutoff for African studies was established (1770 AU/mL). In contrast, negative samples from Thailand, showed lower range of Ab cross reactivity and a lower cutoff was identified of 386 AU/mL (p<0.001). Positive samples from the US and South America collected 1-2 months post-symptoms yielded high mpox E8L Ab levels, while samples collected 5-10 days post symptoms showed lower levels but maintained high Ab detection sensitivity (>95%).

**Conclusions:** These data informed threshold cutoffs for implementing the multiplex quantitative MSD mpox serological platform and are critical for ensuring accurate assessment of humoral responses across geographically diverse populations, allowing for the generation of robust prevalence data.

## WEPEB057

### Untreated HIV remains a key driver of the HIV-associated TB epidemic in high burden settings

A. Naidoo<sup>1</sup>, A. Moodley-Reddy<sup>1</sup>, E. Chinonso Osuala<sup>1</sup>, F. Made<sup>1</sup>, M.P. Letsoalo<sup>1</sup>, R. Perumal<sup>1,2</sup>, K. Naidoo<sup>1</sup>, INSIGHT Study Team

<sup>1</sup>Center for the AIDS Program of Research in South Africa (CAPRISA), Nelson R Mandela School of Medicine, University of KwaZulu-Natal, Durban, South Africa, <sup>2</sup>Division of Pulmonology and Critical Care, Department of Internal Medicine, Nelson R Mandela School of Medicine, Inkosi Albert Luthuli Central Hospital, University of KwaZulu-Natal, Durban, South Africa

**Background:** TB remains a leading cause of morbidity and mortality in people with HIV (PWH). ART is the single most important intervention to avert mortality in these individuals. Late presentation with HIV and disengagement from HIV care are potential contributors to the on-

going HIV-associated TB epidemic in hyper endemic settings. This study aimed to evaluate engagement in health care services among PWH presenting with tuberculosis.

**Methods:** We included individuals (>15 years), newly diagnosed with TB, accessing care in approximately 25 public health care facilities in Durban, KwaZulu-Natal between December 2021 and March 2023, as part of pre-screening for a clinical study (NCT04734652).

We collected de-identified information, including demographics, HIV status, ART status, TB diagnosis and laboratory results from hospital/clinic records, electronic and paper-based HIV and TB registers.

Data was captured into Redcap (Version 13.3.1) and analysed using R (Version 4.3.1). Ethical approval was obtained from the University of KwaZulu Biomedical Research Ethics Committee (BREC/00001300/2020) and the National Health Research Ethics Council (NHREC) [DOH-27-012021-6789]. Statistical significance was assessed at the alpha level of 0.05.

**Results:** We identified 272 PWH presenting with TB to these healthcare facilities; 59.0% (160/272) were male and 39.7% (108/272) were ART naïve. Of the ART experienced patients, 30.5% (83/272) reported current ART use and 29.7% (81/272) reported previous ART use and were currently disengaged from HIV care, with 41.8% (28/67) and 32.3% (20/62) presenting with CD4 counts  $\leq 100$  cells/ $\mu$ l respectively.

A total of 69.5% (189/272) of PWH who presented at clinics with TB were not currently on ART. The median viral load of people currently on ART was 595230 copies/ml and median CD4 was 134 cell/ $\mu$ l. A higher proportion of males presented as ART naïve although individuals who previously disengaged from care were predominantly female.

**Conclusions:** Among newly diagnosed TB individuals with HIV, approximately two-thirds had advanced immunosuppression and were not on suppressive ART. Symptomatic TB resulted in engagement or re-engagement into care for 69.4% of PWH. Achieving and sustaining the UNAIDS 95-95-95 targets are essential for TB control in hyperendemic settings.

## WEPEB058

### Prescription practices and willingness to prescribe among medical practitioners caring for people living with HIV: a nationwide survey in Madagascar

M. Raberahona<sup>1,2</sup>, C.E. Andry<sup>1</sup>, E. Lamaly<sup>1</sup>, O. Arovanjanahary<sup>1</sup>, E. Botofotsy<sup>3</sup>, V. Andriananjana<sup>1</sup>, R.A. Rakotoarivelo<sup>3,4</sup>, M.J.d.D. Randria<sup>1,2</sup>

<sup>1</sup>University Hospital Joseph Raseta Befelatanana, Infectious Diseases, Antananarivo, Madagascar; <sup>2</sup>University of Antananarivo, Faculty of Medicine, Antananarivo, Madagascar; <sup>3</sup>University Hospital Tambohobe, Infectious Diseases, Fianarantsoa, Madagascar; <sup>4</sup>University of Fianarantsoa, Faculty of Medicine, Fianarantsoa, Madagascar

**Background:** The objective of this study was to assess the prescription practices and the willingness to prescribe isoniazid prophylaxis therapy (IPT) among physicians caring people living with HIV (PLHIV).

**Methods:** We conducted a cross-sectional survey among all physicians listed as caring for PLHIV. Physicians from centers where IPT is already implemented (pilot sites) were surveyed regarding their prescription practices, while those working in centers where IPT is not implemented were surveyed regarding their willingness to prescribe.

**Results:** Of the 162 physicians listed as caring for PLHIV in Madagascar, 97 (60%) responded to the survey. They were working all over Madagascar. There were 19 (19.6%) specialists and 78 (80.4%) general practitioners. They practiced in university hospital (34%), regional hospitals (16.5%), district hospitals (27.8%) and primary health care centers (21.7%).

Among surveyed physicians, 58.8% were working in pilot sites. Among them, 31.6% stated that IPT is available in their ward, 35.1% reported its availability in another ward, and 33.3% stated that IPT is available in a different hospital.

Among those working in pilot site, only 38.6% have already prescribed IPT. Main reasons for non-prescription were fear of inducing antituberculosis drug resistance (34.3%), omission (28.6%), lack of knowledge about TPI (20%), and fear of adverse reactions (5.7%).

Among physicians working in center where IPT is not already implemented, 57.5% knew IPT, 42.5% knew IPT indications and only 37.5% were ready to prescribe IPT.

Among the latter, main reasons for unwillingness to prescribe IPT were the lack of knowledge (88%) and the fears of inducing antituberculosis drug resistance (12%). In pilot sites, specialists were prescribing more IPT compared to general practitioners (70.6% vs 25%,  $p=0.002$ ).

The same was observed for physicians practicing in university hospitals compared to other centers (65.5% vs 10.7%,  $p<0.001$ ). There were more prescriptions of when it was available on site than when it was available elsewhere (94.4% vs 12.8%,  $p<0.001$ ).

**Conclusions:** The proportion of physicians prescribing IPT and willing to prescribe IPT remains low. Updating physicians' knowledge, providing them with appropriate tuberculosis diagnostic tools, and ensuring that IPT is directly available on site would strongly contribute to increasing prescription of IPT.

**Efficacy of integrase inhibitors or efavirenz-based regimens for antiretroviral treatment of people with HIV and tuberculosis in Brazil: insight from programmatic data**

R. Coelho<sup>1</sup>, L. Esteves Coelho<sup>2</sup>, C. Pimenta<sup>1</sup>, C. Landmann Szwarcwald<sup>3</sup>, S. Wagner Cardoso<sup>2</sup>, V. Gonçalves Veloso<sup>2</sup>, B. Grinsztejn<sup>2</sup>, D. Barreira<sup>1</sup>, N. De Castro<sup>4,5</sup>

<sup>1</sup>Brazilian Ministry of Health, DATHI, Brasília, Brazil,

<sup>2</sup>Oswaldo Cruz Foundation, National Institute of Infectious Diseases Evandro Chagas, Rio de Janeiro, Brazil, <sup>3</sup>Oswaldo Cruz Foundation, ICICT, Rio de Janeiro, Brazil, <sup>4</sup>Bordeaux University, Global Health in the Global South (GHiGS)-Bordeaux Population Center, Bordeaux, France, <sup>5</sup>AP-HP Hôpital Saint-Louis, Infectious Diseases, Paris, France

**Background:** The efficacy of integrase strand transfer inhibitors (INSTIs)- based regimens to treat people living with HIV (PLWH) and tuberculosis (TB) have been evaluated in few clinical trials. Data from national programs are key to provide data from larger cohorts in real life settings. The objective of the present study was to evaluate virologic efficacy of dolutegravir, raltegravir and efavirenz-based regimens within the Brazilian national HIV/TB program.

**Methods:** Retrospective cohort study including all adult Brazilian PLWH who started ART between 01/01/2016 and 30/06/2022, while also receiving TB treatment. We excluded participants without HIV viral load (HIV-VL) available. Probabilistic record linkage methodology was applied to national databases of the Brazilian Ministry of Health: Information System of Notification Diseases (HIV/AIDS and tuberculosis), Control of Laboratory Tests (CD4+ T cell counts and HIV-VL), Logistic Control System of Medicines (ART dispensations) and Mortality Information System. We defined 4 categories of ART-regimens: 2NRTI+dolutegravir, 2NRTI+raltegravir, 2NRTI+efavirenz, and other ART combinations. Virologic success was defined as HIV-VL < 50 copies/mL 1 year after ART initiation (window 9-18 months).

**Results:** Over the 7 year period of the study, 19,663 PLWH treated for tuberculosis started concomitant ART ; 5,666/19,663 (28.8%) had no VL measures available and 13,997/19,663 (61.2%) participants were included in the present analysis. Median age was 36 (IQR: 29-45) years and 21.7% were females. At ART initiation, median CD4+ T-cell count and HIV-VL were 125 (IQR: 48-278) cells/mm<sup>3</sup> and

5.1 (IQR 4.2-5.7) log<sub>10</sub> copies/mL, respectively. 6,531/13,997 (46.7%) participants started dolutegravir, 2,439/13,997 (17.4%) raltegravir, 4,694/13,997 (33.5%) efavirenz and 333/13,997 (2.4%) other ART regimens. One year after ART initiation, 8,206/13,997 (58.6%) participants achieved virologic suppression overall: 3,923/6,531 (60.1%) on dolutegravir, 1,417/2,439 (58.1%) on raltegravir, 2,697/4,694 (57.5%) on efavirenz-based regimens. One-year post-ART introduction, 1116/13,997 (8%) persons had died, with similar proportions in the 3 ART groups.

**Conclusions:** In this analysis from the Brazilian national HIV/TB program, virologic suppression in PLWH concomitantly treated for tuberculosis were lower than expected, similar between INSTI-based or efavirenz-based regimens. For a significant proportion of PWH, virologic monitoring was not available which emphasizes the need to improve HIV-VL monitoring and retention in care for persons with advanced disease.

## WEPEB060

**Management of syphilis in people living with HIV: the importance of time to serological response and immunological status**

J.L. Casado<sup>1</sup>, I. Izuzquiza<sup>1</sup>, P. Vizcarra<sup>1</sup>, I. Gonzalez Cuello<sup>1</sup>, M.J. Rodriguez<sup>2</sup>, B. Romero<sup>2</sup>, S. Martin Colmenarejo<sup>1</sup>, C. Fernandez Chica<sup>1</sup>, M. Ameiz<sup>1</sup>, A. Abad<sup>1</sup>, A. Moreno<sup>1</sup>, A. Vallejo<sup>3</sup>

<sup>1</sup>Hospital Ramón y Cajal, Infectious Diseases, Madrid, Spain, <sup>2</sup>Hospital Ramón y Cajal, Microbiology, Madrid, Spain, <sup>3</sup>Hospital Ramón y Cajal, Laboratory of Immunovirology, Madrid, Spain

**Background:** There are controversial data about syphilis in people living with HIV (PLWH), in special about time to serological response, serofast status, and the factors associated.

**Methods:** Cohort of PLWH in follow up in a tertiary hospital. Univariate analysis was done to determine factors associated with syphilis presentation and serological outcomes. Survival curve analysis and multivariate Cox regression analysis were used.

**Results:** A total of 334 episodes of syphilis (1-8) were diagnosed in 176 PLWH between 2016-2022. In the first episode, mean age was 47 yrs (19-80), 95% were MSM, and nadir CD4+ count was 303 cells/mc (nadir CD4/CD8 ratio 0.42). At the time of syphilis diagnosis (47% had latent early stage -13% primary, 17% secondary), median RPR was 1/32 (IQR, 4-64). Fever (2%), systemic symptoms (2%) or headache (2%) were rare, and only 4 (2%) had ocular/ otosyphilis or CNS focal symptoms. Of note, a non-significant fall in CD4+ count and CD4/CD8 ratio during syphilis episode was observed.

Moreover, RPR level at diagnosis was inversely correlated with CD4+count (r=-0.162; p=0.03). The rate of response at 12 months was 82% (144), associated with higher RPR at di-

agnosis ( $p<0.001$ ) and nadir CD4/CD8 ratio ( $p=0.06$ ). During the 1<sup>st</sup> year, the rate of initial response was 67% (118) in a median time of 5.6 months (IQR, 3.8-7 months), associated with higher RPR ( $p<0.001$ ), and higher nadir CD4+ count ( $p=0.03$ ). Of those without initial response, an additional 44% (26) responded in a median of 10.7 months (8.8-12 months) since diagnosis, again associated with higher RPR at diagnosis ( $p<0.01$ ), higher nadir CD8+, and nadir CD4/CD8 ratio ( $p=0.02$ ).

The persistence of serofast status was observed in 39% of cases with lower RPR titers ( $p=0.02$ ) and higher nadir CD4/CD8 ratio ( $p=0.02$ ). In the 2<sup>nd</sup> episode (86 cases), there were no differences in RPR, rate of initial response (64%), response at 12 months (81%), time to initial response (5.4 months), and persistence of serofast (43%).

**Conclusions:** Our data demonstrate the importance of considering initial RPR level and immune status after a syphilis diagnosis, a fact that could modify the evolution and management of syphilis in PLWH.

Serologic evidence of cytomegalovirus reinfection during pregnancy and congenital transmission among women living with HIV in Quebec

C. Tidafi<sup>1,2,3</sup>, F. Kakkar<sup>1,2,4</sup>, S. Valois<sup>1,2</sup>, M. Giroux<sup>1,2</sup>, N. Abdollahi<sup>1,2</sup>, A. Larouche<sup>1,2</sup>, M.-S. Kang Dufour<sup>1,2</sup>, S. Gant<sup>1,2,5</sup>, S. Taillefer<sup>1,2</sup>, H. Soudeyns<sup>1,2,5</sup>, I. Boucoiran<sup>1,2,3,6</sup>

<sup>1</sup>Centre de Recherche du CHU Sainte-Justine, Montreal, Canada, <sup>2</sup>Centre d'Infectiologie Mère-Enfant (CIME), Montreal, Canada, <sup>3</sup>École de Santé Publique de l'Université de Montréal (ESPUM), Montreal, Canada, <sup>4</sup>Université de Montréal, Department of Pediatrics, Faculty of Medicine, Montreal, Canada, <sup>5</sup>Université de Montréal, Department of Microbiology, Infectiology & Immunology, Faculty of Medicine, Montreal, Canada, <sup>6</sup>Université de Montréal, Department of Obstetrics and Gynecology, Faculty of Medicine, Montreal, Canada

**Background:** Maternal HIV infection increases the risk of congenital CMV infection (cCMV) >4-fold compared to the general population, even with effective ART during pregnancy. The proportion of these cCMV cases that are due to reactivation of chronic CMV infection versus maternal reinfection with a new CMV strain during pregnancy is unknown.

**Methods:** Samples were drawn from a prospective cohort (1999-2020) of pregnant women living with HIV (WLWH) who were CMV seropositive (IgG>6.0 AU/mL), and their newborns exposed to but not living with HIV. Serologic testing of maternal plasma from the first (T1) and third (T3) trimesters for CMV was performed using the Architect chemiluminescent microparticle immunoassay and a strain-specific ELISA that distinguishes between antibody responses directed against 4 different CMV epitopes (located in glycoproteins B and H of two laboratory strains

(AD169 and Towne)). Reinfection was defined as acquisition of an antibody response to a new epitope between T1 and T3. cCMV was confirmed via qPCR on infant serum, plasma, or urine within 21 days of life.

**Results:** Among 411 pregnancies with available samples at T1 (mean gestational age GA=11.5 weeks) and T3 (mean GA=35 weeks), six (1.63%) of 369 newborns were positive for cCMV. A greater IgG titer increase from T1 to T3 was observed in cCMV cases (mean difference=607 AU/mL) compared to those without cCMV (mean difference=121 AU/mL;  $p<0.01$ ). Of 299 pregnancies with strain-specific ELISA results, 14 reinfections (4.7%) were detected, two of which were associated with cCMV. Compared to cases without reinfection, those with reinfection had lower T3 IgG titers (mean difference=130 AU/mL;  $p=0.896$ ).

**Conclusions:** Our results suggest that a majority of cCMV cases among children born to WLWH occurred due to reactivation of latent maternal CMV infection. However, because strain-specific ELISA does not capture responses to all circulating CMV variants, the rate of reinfection was possibly underestimated. More sensitive methods for detecting CMV reinfection are needed to inform strategies to prevent cCMV among children of WLWH.

## WEPEB062

Food insecurity at tuberculosis treatment initiation is associated with clinical outcomes in rural Haiti: a prospective cohort study

A. Richterman<sup>1,2</sup>, E. Saintilien<sup>3</sup>, M. St-Cyr<sup>3</sup>, L. Claudia Gracia<sup>3</sup>, S. Sauer<sup>4,5</sup>, I. Pierre<sup>3</sup>, M. Compere<sup>3</sup>, A. Elnaïem<sup>6,5</sup>, D. Dumerjuste<sup>3</sup>, L. Ivers<sup>4,5</sup>

<sup>1</sup>University of Pennsylvania, Department of Medicine (Infectious Diseases), Philadelphia, United States, <sup>2</sup>University of Pennsylvania, Leonard Davis Institute of Health Economics, Philadelphia, United States, <sup>3</sup>Health Equity International / St. Boniface Hospital, Fond-des-Blancs, Haiti, <sup>4</sup>Massachusetts General Hospital, Boston, United States, <sup>5</sup>Harvard Medical School, Boston, United States, <sup>6</sup>Brigham and Women's Hospital, Boston, United States

**Background:** Tuberculosis is a leading cause of death worldwide, and food insecurity is known to negatively influence health outcomes through nutritional, behavioral, mental health, and inflammatory pathways. Few studies interrogate the relationship between food insecurity and tuberculosis outcomes, particularly independent of nutrition.

**Methods:** We conducted a prospective cohort study of adults initiating first-line treatment for clinically suspected or microbiologically confirmed drug-sensitive tuberculosis at St. Boniface Hospital, a rural referral center in Southern Haiti. We administered a baseline questionnaire, collected baseline and outcome clinical data, and analyzed laboratory samples. We used logistic regression

models to estimate the relationship between household food insecurity (measured using the Household Hunger Scale) and treatment failure or death. We controlled for loss to follow-up using inverse probability of censoring weighting and confounding using inverse probability of treatment weighting.

**Results:** We enrolled 257 participants between May 2020 and March 2023. Participants had a median age of 35 (IQR 25-45), 94 (37%) were female, and 40 (16%) were living with HIV. There were 105 (41%) participants with no hunger in the household, 104 (40%) with moderate hunger in the household, and 48 (19%) with severe hunger in the household at baseline.

Over 80% of participants had a favorable treatment outcome – either cure (56%) or treatment success (25%). 33 participants (13%) were lost to follow-up. Eleven participants (4%) died and 6 (3%) had treatment failure.

After adjusting for loss to follow-up and confounding (including baseline body mass index), food insecurity was significantly associated with treatment failure or death (odds ratio 5.78, 95% CI 1.20 to 27.8,  $p=0.03$ ).

**Conclusions:** Household food insecurity at tuberculosis treatment initiation was significantly associated with death or treatment failure after adjusting for loss to follow-up and measured confounding including nutritional status. In addition to the known importance of under-nutrition, our findings indicate that food insecurity is independently important for tuberculosis treatment outcomes in Haiti. Interventions to address food insecurity may be important for all people with food insecurity and tuberculosis regardless of body mass index.

administered subcutaneously (at 0, 1, and 6 months). Among primary responders ( $n=164$ , 59%), we analyzed the durability of anti-HBV seroprotection by assessing antibody titers at least twice after the vaccination. Participants with decreasing anti-HBs titers  $<10$  mIU/mL were defined as earlier loss of anti-HBV seroprotection. Cox proportional hazards analysis was performed to identify predictors of earlier loss of HBV seroprotection.

**Results:** 152 participants were included in the analysis. The median age was 39 (IQR: 35-46) years and 144 (95%) were men. The median body mass index (BMI) was 22.9 (20.7-26.1) and 55 (36%) were overweight (BMI $>25$ ). The median CD4 cell count was 479 (352-651) / $\mu$ L, and 98 (64%) were receiving antiretroviral therapy at the entry of this program. During 616.3 participant-years of follow-up, 113 (74%) showed a loss of anti-HBV seroprotection. The median time to loss of anti-HBV seroprotection was 3.5 and 10.2 years for participants with an anti-HBs titer of 10-100, and  $>100$  mIU/mL at first vaccination, respectively. Cox-proportional hazards analysis showed overweight (BMI $>25$ ) and low anti-HBs antibody titer (anti-HBs titer  $<100$  mIU/mL) after vaccination were independently associated with early loss of anti-HBs seroprotection, adjusting for age, CD4 and HIV viral suppression [adjusted hazard ratio (aHR) 1.882, 95% confidence interval (CI) 1.261-2.810;  $p=0.002$ , aHR 3.979, 95%CI 2.517-6.290;  $p<0.001$ , respectively].

**Conclusions:** The response to HBV vaccination in Japanese PLWH was weak, both in terms of initial response and long-term durability of seroprotection. Further research is warranted to implement better HBV vaccination strategies for PLWH.

## WEPEB063

Overweight and low anti-HBs antibody titers are associated with earlier loss of anti-HBV seroprotection after HBV vaccination in Japanese people living with HIV

T. Muramatsu<sup>1</sup>, R. Miyashita<sup>1</sup>, Y. Kamikubo<sup>1</sup>, T. Yamaguchi<sup>1</sup>, A. Ichiki<sup>1</sup>, Y. Chikasawa<sup>1</sup>, M. Bingo<sup>1</sup>, R. Sekiya<sup>1</sup>, M. Yotsumoto<sup>1</sup>, T. Hagiwara<sup>1</sup>, K. Amano<sup>1</sup>, E. Kinai<sup>1</sup>

<sup>1</sup>Tokyo Medical University Hospital, Laboratory Medicine, Shinjuku, Japan

**Background:** Hepatitis B virus (HBV) co-infection is one of the most common co-infections among people living with HIV (PLWH). Although vaccination against HBV is recommended for all PLWH without immunity to HBV infection, HBV vaccination response and duration of seroprotection are suboptimal in PLWH. The earlier loss of anti-HBs antibody has been reported but the associated factors are unknown.

**Methods:** We performed a retrospective analysis of the hepatitis B virus vaccination program among PLWH in our hospital ( $n=277$ ). Three doses of hepatitis B vaccine (Biimugen<sup>®</sup>, containing 10 $\mu$ g of hepatitis B surface antigen) were

Hepatitis B viral rebound in people living with HIV under antiretroviral therapy active on HIV/HBV and associated factors

G. Morsica<sup>1</sup>, S. Bagaglio<sup>1</sup>, S. Diotallevi<sup>1</sup>, R. Lolatto<sup>1</sup>, H. Hasson<sup>1</sup>, A. Siribelli<sup>1,2</sup>, E. Messina<sup>1</sup>, D. Canetti<sup>1</sup>, A. Castagna<sup>1,2</sup>, C. Uberti Foppa<sup>1,2</sup>, C. Bertoni<sup>1,2</sup>

<sup>1</sup>IRCCS, San Raffaele, Infectious Diseases, Milan, Italy, <sup>2</sup>Vita Salute University, Milan, Italy

**Background:** The reasons for HBVDNA rebound during HBV active ART are unclear. Our study aims to investigate factors associated with HBV-rebound in people living with HIV (PLWH) with chronic HBV (CHB) under at least 6 months of stable ART active on both viruses.

**Methods:** PLWH with CHB in years 2007-2023 under emtricitabine (FTC)+ tenofovir alafenamide TAF, 3TC/FTC+ tenofovir disoproxil fumarate (TDF) or 3TC alone were included. Characteristics at the first HBV-rebound, after reaching HBVDNA negative test, or at the last HBVDNA, in persistently HBVDNA negative, reported as median (inter-quartile range, IQR) or frequency (%), were compared by

Mann-Whitney and Chi-Square/Fisher's tests. HBV resistance pattern was assessed by direct sequencing. Odds ratio of HBV-rebound, adjusted for nadir CD4, ALT levels and ART active on both viruses, was estimated by multi-variable logistic regression.

**Results:** Older age, higher values for liver enzymes, total bilirubin, HCV-RNA ( $\geq 15$  IU/mL vs.  $<15$  IU/mL) and use of ART active on both viruses were related to HBV-rebound,  $P$  invariably  $<0.05$ . [SD1] Adequate adherence was reported by physicians; however, forgiveness was not excluded. By multivariate analysis, PLWH on 3TC/FTC had a higher probability of HBV-rebound [aOR=4.88 (95%CI=1.28, 20.10),  $P=0.02$ ] while, PLWH on FTC+TAF had lower probability of HBV-rebound [aOR=0.05 (95%CI=0.002, 0.27),  $P=0.005$ ], compared to those on 3TC/FTC+TDF. 3TC resistance was observed in 6/8 available sequences (5 PLWH were on 3TC, 1 on TDF).

Characteristics of PLWH with Chronic HBV on ART active on both viruses according to HBV rebound or not

	Overall (n=137)	PLWH no HBV rebound (n=58)	PLWH HBV rebound (n=79)	P value
Age (years)	45.2 (8.0, 65.5)	46.2 (8.0, 65.5)	44.9 (8.0, 65.5)	0.981

FTC+TAF (%)	82 (84.2)	82 (84.1)	1 (6.0)	
3TC/FTC+TDF (%)	54 (35.3)	37 (28.0)	17 (20.0)	
Years of follow-up	6.58 (2.57, 10.2)	7.61 (3.03, 10.9)	2.48 (1.06, 4.04)	$<0.001$

Abbreviations: ART=antiretroviral therapy; MSM=men who have sex with men; ISU=injecting drug users; HCV RNA=antibody against hepatitis C; HIV RNA=antibody against hepatitis C; ALT=alanine aminotransferase; AST=aspartate aminotransferase; 3TC=zidovudine; FTC=tenofovir; TAF=tenofovir alafenamide; TDF=tenofovir disoproxil fumarate.

**Conclusions:** The finding of less frequent occurrence of HBV-rebound in PLWH on TAF based ART vs. 3TC alone is related to genetic barrier, while respect to TDF based ART, may reflect a higher level and persistence of TAF within hepatocyte, suggesting a better performance respect to TDF in cases with no full adherence to double acting ART.

## WEPEB065

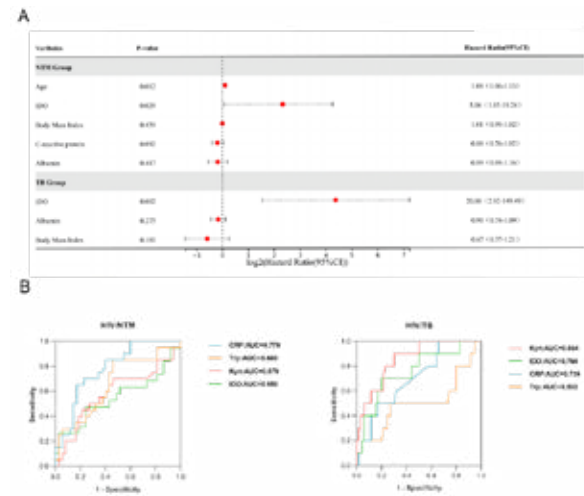

### Indoleamine 2,3-dioxygenase activity predicts prognosis of non-tuberculous mycobacteria diseases in people living with HIV

R. Jiang<sup>1</sup>, J. Chen<sup>1</sup>, J. Sun<sup>1</sup>, J. Xun<sup>1,2</sup>, Y. Shen<sup>1</sup>

<sup>1</sup>Shanghai Public Health Clinical Center, Fudan University, Department of Infection and Immunology, Shanghai, China, <sup>2</sup>Shanghai Public Health Clinical Center, Fudan University, Scientific Research Center, Shanghai, China

**Background:** Elevated indoleamine 2,3-dioxygenase (IDO) activity is a recognized prognostic marker for tuberculosis (TB) among people living with HIV (PLWH). However, its role in non-tuberculous mycobacterial (NTM) diseases remains unknown. This study aimed to evaluate IDO activity in PLWH with active TB and NTM diseases, and its association with mortality.

**Methods:** Clinical data of PLWH with active TB and NTM diseases between March 2018 and December 2020 in Shanghai, China, were collected. These participants were followed-up to 180 days from admission. IDO activity was estimated using the serum kynurenine-to-tryptophan (Kyn/Trp) ratio in plasma samples obtained upon admission. Kaplan-Meier curve and Cox regression were used to analyze the survival and its predictors.

**Figure 1 (A)** Multivariate Cox regression for HIV/NTM and HIV/TB group on 60-day mortality. **(B)** Receiver operator curve analysis of serum concentrations of Kyn, Trp, CRP and IDO activity for predicting mortality in PLWH with NTM and TB.

**Results:** A total of 137 participants were included. In 57 participants with NTM diseases, 94.7% were male with mean age  $42.2 \pm 13.9$  years. The mean CD4+T cell count was  $71.4 \pm 157.6$  cells/ $\mu$ L. Of the 80 TB participants, 93.8% were male with mean age  $43.7 \pm 13.9$  years. The mean CD4+T cell count was  $54.8 \pm 60.2$  cells/ $\mu$ L. Within 180 days from admission, 35.1% NTM participants deceased whereas 12.5% TB participants deceased.

Comparing the two groups, the NTM group had significantly lower levels of IDO activity ( $p=0.041$ ) together with higher Trp ( $P<0.001$ ) levels of than TB group. IDO activity can predict 60-day survival in participants with NTM diseases (Figure 1A). Among TB patients, IDO activity was also

Author Index

a significant predictor of 60-day mortality (Figure 1A). The receiver operator curve analysis was shown in Figure 1B. High-IDO-activity group ( $>2.21\text{ nM}/\mu\text{M}$ ;  $>2.25\text{ nM}/\mu\text{M}$ ) showed significantly worse survival than the low-IDO-activity groups in both NTM diseases and TB patients.

**Conclusions:** IDO activity demonstrated better predictive value in TB than NTM participants, it still serves a viable prognostic marker in PLWH with NTM diseases. These findings provide evidence for the correlation between tryptophan catabolism and the prognosis of NTM disease, which warrants further investigation.

Siqueira do Valle<sup>3</sup>, S. W Cardoso<sup>1</sup>, B. Grinsztejn<sup>1</sup>, V. G Veloso<sup>1</sup>

<sup>1</sup>Oswaldo Cruz Foundation (FIOCRUZ), Evandro Chagas National Institute of Infectious Diseases, Rio de Janeiro, Brazil, <sup>2</sup>Federal University of Rio de Janeiro (UFRJ), Rio de Janeiro, Brazil, <sup>3</sup>Oswaldo Cruz Foundation (FIOCRUZ), Vice-Presidência de Pesquisa e Coleções Biológicas (VPPCB), Rio de Janeiro, Brazil

**Background:** People with an HCV antibody rapid test (HCV-RT) encounter multiple obstacles in accessing HCV care. We aimed to examine the HCV cascade-of-care within a pilot demonstration study implemented in Rio de Janeiro, Brazil.

**Methods:** Implemented at the Basic Health Unit (CF-Felipe Cardoso) in Rio de Janeiro, Brazil (<https://ensaio-sclinicos.gov.br/rg/RBR-4qmypqq>), the project aimed to improve the HCV care continuum. Health-facility users aged 18-79 years were invited to undergo HCV-RT after providing informed consent between 04-Jul-2022 to 16-Jan-2024. Those declining testing were excluded. Participants completed questionnaires and HCV-RT (SD Bioline®). Individuals with positive HCV-RT were scheduled for point-of-care (POC) HCV-RNA (GeneXpert®) at a referral center (INI/FIOCRUZ). Individuals with positive HCV-RT and undetectable HCV-RNA were classified as spontaneous clearance/false-positive or achieving sustained virological response (SVR) if previously treated. Those with active HCV infection (positive HCV-RT with detectable HCV-RNA) were proposed a pan-genotypic regimen (SOF/VEL 400/100 mg qd for 12 weeks). Prevalence and risk factors for HCV infection was assessed. The HCV cascade-of-care and the turnaround times from HCV-RT at the Primary Care System to initiation of HCV treatment at the referral center were evaluated.

**Results:** A total of 5,348 individuals [76% female sex-at-birth, median age=50 (IQR,35-61)] were included. The prevalence of positive HCV-RT was 0.95% (95%CI,0.73-1.25) [n=51/5,348]. Factors associated [OR (95%CI)] with positive HCV-RT included: male sex, [2.45 (1.40-4.28)], age (years) [1.06 (1.04-1.08)]; HIV infection [9.93 (3.43-28.73)] and history of blood-transfusion [2.26 (1.28-4.00)]. Among those with positive HCV-RT, 88% (n=45/51) underwent HCV-RNA testing, with a median (IQR) delay of 6 (3-9) days between HCV-RT and HCV-RNA. Of these, 60% (n=27/45) had detectable HCV-RNA. Of those with undetectable HCV-RNA, 39% (n=7/18) were SVR. The prevalence of active HCV infection was 0.50% (95%CI 0.35-0.74) (n=27/5,348). Among those with detectable HCV-RNA (n=27), 93% (n=25) initiated HCV treatment within a median time of 11 (IQR, 7-16) days after the HCV-RNA result. SVR was 100% in who have finished the study follow-up to the date of this analysis (n=10).

**Conclusions:** A majority of individuals with HCV infection were rapidly linked to care through the utilization of POC tests and collaborative efforts between the Primary Care System and a referral center.

## WEPEB067

**CMV IgG titer as a marker of CMV reactivation and immune dysregulation among children living with HIV**

Y. Fougère<sup>1</sup>, J. Brophy<sup>2</sup>, M.T. Hawkes<sup>3</sup>, T. Lee<sup>4</sup>, L. Samson<sup>2</sup>, S. Gantt<sup>1,5,6</sup>, M.-S. Kang Dufour<sup>1,7</sup>, A. Bitnun<sup>8</sup>, S. Read<sup>8</sup>, H. Soudeyns<sup>1,4</sup>, F. Kakkar<sup>1,5</sup>, EPIC4 Study Group  
<sup>1</sup>Sainte-Justine University Hospital Research Centre, Montréal, Canada, <sup>2</sup>Children's Hospital of Eastern Ontario, University of Ottawa, Ottawa, Canada, <sup>3</sup>University of British Columbia, Department of Pediatrics, Vancouver, Canada, <sup>4</sup>Canadian HIV Trials Network, Vancouver, Canada, <sup>5</sup>University of Montreal, Department of Pediatrics, Montréal, Canada, <sup>6</sup>University of Montreal, Department of Microbiology, Infectious Diseases and Immunology, Montréal, Canada, <sup>7</sup>University of California, Berkeley, United States, <sup>8</sup>The Hospital for Sick Children, University of Toronto, Toronto, Canada

**Background:** While higher CMV IgG titers have been associated with immune activation, HIV viremia and worse clinical outcomes among adults living with HIV, pediatric data are more limited. The objective of this study was to determine the association between CMV IgG titer and HIV viral load (VL), CMV VL, and lymphocyte subsets in children living with HIV (CLWH).

**Methods:** Sub-study of the Early Pediatric Initiation Canada Child Cure Cohort Study (EPIC4) using both prospectively and retrospectively collected data from children with perinatal HIV-1 infection. CLWH were followed every 3-6 months from 2014 to 2018, with HIV-1 and CMV VL assessed at each visit. CMV IgG titers were determined at baseline using the Architect chemiluminescent micropar-

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

ticle immunoassay, and the associations between CMV IgG titer and immunological outcomes or CMV viremia were assessed through multivariable linear regression.

**Results:** Median age of CLWH enrolled in EPIC4 ( $n = 225$ ) was 13.9 years (IQR = 9.3-17.0). The majority of participants (98.9%) were treated with combination antiretroviral therapy (cART); 81% of participants had suppressed HIV VL, 85.3% ( $n = 192$ ) were CMV seropositive at baseline and among them 17.7% were viremic for CMV at least once during follow-up. Among CMV seropositive CLWH, median anti-CMV IgG titer at baseline was 164.5 AU/ml (IQR = 101.8-232.8; range = 7.8-1727.5). Higher CMV IgG titers were significantly associated with higher baseline CD8% ( $p < 0.001$ ), lower CD4% ( $p < 0.001$ ), lower absolute CD4 count ( $p = 0.009$ ), lower CD4/CD8 ratio ( $p < 0.001$ ), and occurrence of detectable CMV viremia ( $p < 0.001$ ), but not with detectable HIV-1 viremia during follow-up ( $p = 0.12$ ). With the exception of baseline CD4 count, all associations remained statistically significant after adjustment for age, age at cART initiation, instances of cART interruption, and instances of detectable HIV VL during follow-up.

**Conclusions:** In this cohort of CMV seropositive CLWH, the magnitude of the anti-CMV humoral response was associated with CMV reactivation and immunological parameters, suggesting that quantitative CMV antibody assessment may be used as a surrogate marker of CMV activity and CMV-induced immune dysregulation among CLWH. Additional studies are needed about the potential clinical implications of these findings and associations between higher anti-CMV titers CLWH.

## WEPEB068

Utility of CRP for TB risk stratification in people with new diagnosis of HIV and symptoms concerning for pulmonary TB

K. Dupnik<sup>1</sup>, V. Rivera<sup>1</sup>, N. Dorvil<sup>2</sup>, A. Apollon<sup>2</sup>, E. Dumont<sup>2</sup>, V. Rouzier<sup>2</sup>, S. Pierre<sup>2</sup>, P. Severe<sup>2</sup>, Y. Duffus<sup>1</sup>, H. Akbarnejad<sup>3</sup>, Y. Gao<sup>3</sup>, J. Liu<sup>3</sup>, J. Pape<sup>2</sup>, S. Koenig<sup>4</sup>

<sup>1</sup>Weill Cornell Medicine, New York, United States, <sup>2</sup>GHEKIO, Port au Prince, Haiti, <sup>3</sup>Analysis Group, Inc., Boston, United States, <sup>4</sup>Harvard Medical School, Boston, United States

**Background:** The WHO recommends same-day ART for people with non-meningitic TB symptoms at HIV diagnosis concurrent with evaluation for TB. For pre-ART TB screening, the WHO conditionally recommends C-reactive protein (CRP) with cutoff 5 mg/L. We assessed CRP for risk-stratification of people with new diagnosis of HIV and positive TB symptom screen.

**Methods:** 500 people with new diagnosis of HIV and positive symptom screen for TB (cough, fever, night sweats, or weight loss) participated in a randomized trial at GHEKIO (PLoS Med 2023;20:e1004246). Sera were processed within 4 hours and biobanked at -80°C. CRP was measured retrospectively in 498 baseline sera using a CRP

Quantikine ELISA (R&D Systems). We calculated sensitivity, specificity, positive and negative predictive values, and positive and negative likelihood ratios of different CRP thresholds ( $\geq 1.0$ ,  $\geq 2.0$ ,  $\geq 5.0$ ,  $\geq 10.0$  mg/L) in bacteriologically confirmed and empirically treated TB groups, and stratified by symptoms.

**Results:** At enrollment, 67 participants were diagnosed with bacteriologically-confirmed and 20 with empirically treated TB. Median CRP was 33.0 mg/L (IQR: 5.1, 85.5) in those diagnosed with TB, and 2.6 mg/L (IQR: 0.8, 11.7) in those without TB. More than half (53%) of participants had baseline CRP  $\geq 3.0$  mg/L. As the CRP threshold increased from  $\geq 1$  mg/L, to  $\geq 3$ ,  $\geq 5$ , and  $\geq 10$  mg/L, the PPV for TB in the total cohort increased from 22.4% to 28.1%, 29.2%, and 35.4%, respectively, and the NPV decreased from 96.9% to 94.8%, 92.3%, and 92.3%. If CRP concentrations had been included in the ART eligibility algorithm, then with CRP thresholds of  $< 1$ ,  $< 2$ ,  $< 3$ ,  $< 5$ , and  $< 10$  mg/L, a total of 25.5%, 38.2%, 46.4%, 54.6%, and 64.9% of participants would have been eligible for same-day ART. A total of 0.8%, 2.2%, 2.4%, 4.2%, and 5.0% participants, respectively, would have had untreated active TB at ART initiation despite a CRP below the cut-off.

**Conclusions:** This study highlights the potential utility of CRP for decision making about same-day ART when there are symptoms of TB, but optimal thresholds are needed and may vary by symptom type. CRP may be helpful in high-burden settings without access to mycobacterial culture and chest radiographs.

## WEPEB069

Evaluation of the efficacy of DTG-based regimens at 12 and 24 months of treatment in DTG-initiated patients in Senegal: a WANETAM study

M. Fall<sup>1</sup>, A.A. Ba<sup>1</sup>, N.M.P. Manga<sup>1</sup>, N. Leye<sup>2</sup>, P.Y. Sene<sup>1</sup>, O. Diop-Diongue<sup>1</sup>, D. Samate<sup>1</sup>, S. Mboup<sup>2</sup>, S. Ndiaye<sup>1</sup>, S. Diallo<sup>1</sup>, C. Toure-Kane<sup>2</sup>, H. Diop-Ndiaye<sup>1</sup>

<sup>1</sup>HIV National Reference Laboratory, Dakar, Senegal,

<sup>2</sup>Institut de Recherche en Santé, de Surveillance Epidémiologique et de Formation, Dakar, Senegal

**Background:** In Senegal, the transition to use DTG-based regimens began in 2020. The aim of our study was to evaluate the efficacy of DTG after 12 and 24 months of antiretroviral treatment in naïve HIV-1 patients adults and children.

**Methods:** A descriptive study was performed on adults and children on DTG after 12 months (M12) and 24 months (M24) of ART. Viral load (VL) measurement was done on m2000rt/sp (Abbott) and CobasTaqman (Roche) platforms. Virological success rate (VSR) defined by VL $<1000$  copies/ml were assessed at M12 and M24 and genotyping was carried out for VL $>1000$  copies/ml in protease (PR), reverse transcriptase (RT) and integrase (IN) using the HIV-1 Genotyping kit (Thermo Fisher, USA). Sequence ed-

Oral abstracts

Poster exhibition

Author Index

iting and drug resistance mutation (DRM) analysis were performed using Recall (V2.32.1) and phylogenetic analysis using Seaview.

**Results:** From January 2022 to December 2023, 426 patients (36 children and 390 adults) at M12 and 498 patients (30 children and 468 adults) at M24 were included. Mean ages were 12 years [1-17] and 36 years [18-81] for children and adults, respectively. The sex ratio (M/F) was 1.3 in children and 1.1 in adults.

At M12, the VSR was 80.5% (29/36) in children and 90.5% (353/390) in adults. At M24, the VSR was 66.7% (20/30) in children and 94.4% (442/468) in adults.

In children, genotyping performed on PR-RT (2/7) showed no mutation at M12, while at M24 M184V (2/5) and K103N (1/5) were found out of 5 sequenced.

In adults, 18/37 were genotyped at M12 and 3 showed DRM (M184V, K70E, V106VI and E138A).

At M24, 11/26 were genotyped and 1 sample showed multiple DRM (M41L, T215Y M184V, K103N and E138A).

No major mutations were found in IN for both children and adults and only accessory mutations were present, namely H51Y, L74M, and E157Q.

Phylogenetic analysis showed a large genetic diversity with the predominance of CRF02 in both PR-RT and IN.

**Conclusions:** Our results show a good VSR to DTG regimen in adults, whereas in children the failure rate was high at M24. Preliminary genotyping data show a low circulation of resistant strains and a large genetic diversity.

### Anogenital warts co-infection with HIV among men who have sex with men in Lagos, Nigeria

E. Shoyemi<sup>1</sup>, T. Oluwadamilola<sup>2</sup>, O. Azeez<sup>1</sup>, K. Okeke<sup>1</sup>, D. Ugandan<sup>3</sup>

<sup>1</sup>Centre for Population Health Initiatives, Lagos, Nigeria, <sup>2</sup>Centre for Population Health Initiatives, Lagos, Nigeria, <sup>3</sup>Henry Jackson Foundation Medical Research International, Abuja, Nigeria

**Background:** Anogenital warts, caused by Human Papillomavirus (HPV), are the most common sexually transmitted infection among men who have sex with men (MSM); it is potentially serious because it serves as potential indicators of increased vulnerability to HIV and associated risk with anal cancer. The study aimed to determine the prevalence of anogenital warts and its associated risk with HIV.

**Methods:** A prospective cross-sectional study was conducted over 12 months between January and December 2023 involving MSM aged 18 to 45 presenting at the Centre for Population Health Initiatives' one-stop-shop center in Lagos, Nigeria. Anogenital warts symptoms were clinically assessed, and blood samples were collected for HIV testing using the national algorithm. Descriptive statistics and logistic regression analyses were employed to deter-

mine co-positivity rates and associated factors.

**Results:** A total of 1,252 MSM accessed HIV testing services. Anogenital warts symptoms were identified in 66.5%. HIV positivity was observed in 10.1% of the cohort. Notably, 52.2% of those presenting with anogenital warts symptoms were living with HIV. Co-infection was statistically associated with MSM's age ( $p<0.001$ ) and was detected in 55.3% of the MSM living with HIV. The number of sexual partners was statistically associated with the symptoms identified ( $p<0.001$ ; OR=2; 95% CL:0.55-7.11).

**Conclusions:** The findings underscore a substantial co-infection rate of anogenital warts with HIV among MSM in Nigeria. The co-occurrence of these infections emphasizes the need for integrated healthcare strategies targeting MSM to address both anogenital warts and HIV. The study reveals a critical intersection between sexually transmitted infections, highlighting the importance of holistic approaches to MSM health.

## WEPEB071

### Mortality by HIV status among children diagnosed with TB in Accra-Ghana. A single Centre Retrospective study

Y. Alhassan<sup>1,2</sup>, A.K.A. Afrane<sup>3,4</sup>, V. Ganu<sup>5,6</sup>

<sup>1</sup>University of Ghana, Biostatistics, Legon-Accra, Ghana, <sup>2</sup>Total Family Health Organisation (TFHO), Research Department, Accra, Ghana, <sup>3</sup>Korle-Bu Teaching Hospital, Department of Child Health, Accra, Ghana, <sup>4</sup>University of Ghana Medical School, Department of child Health, Accra, Ghana, <sup>5</sup>Korle-Bu Teaching Hospital, Department of Medicine, Accra, Ghana, <sup>6</sup>University of Ghana, Department of Epidemiology and Disease Control, Legon-Accra, Ghana

**Background:** TB is the leading cause of death in among people living with HIV (PLHIV). Data on HIV-TB treatment outcomes is however limited. The study sought to investigate the factors associated with TB mortality among children living with HIV (CLHIV).

**Methods:** A retrospective cohort study that extracted treatment records of children below 15 years of aged diagnosed with TB between 2015 and 2019 at the child health department of Korle-Bu teaching Hospital (KBTH) in Ghana. Binary logistic regression model was used to assess the factors associated with TB mortality among the children. Sub-group analysis was further performed separately for two CLHIV and non-CLHIV groups. Stata MP version 18 was used for analysis.

**Results:** A total of 407 children diagnosed with TB were involved in the study with a median age of 6 years (IQR=2-10years), approximately half being males (51.1%) and 42.8% were CLHIV. Extra pulmonary TB clinically diagnosed TB, sputum positive TB were 33.9%, 61.7% and 4.4% respectively. Treatment completion, default and mortality were 68.3%, 14.3% and 17.4% respectively. Mortality was higher among CLHIV (23.0%) compared to non-CL-

Late-breaker  
abstractsAuthor  
Index

HIV (13.3%) whilst default was higher among non-CLHIV (18.0%) compared to CLHIV (9.2%). The adjusted odds of deaths were 4 times high among the CLHIV ( $\alpha\text{OR}=4.00$ ,  $\text{CI}=1.11\text{--}14.45$ ,  $p=0.034$ ) compared to non-CLHIV.

Among the CLHIV, relative to children aged below 1 years, the odds of death were less among children aged 1–4 years ( $\alpha\text{OR}=0.33$ ,  $\text{CI}=0.11\text{--}0.99$ ,  $p=0.049$ ), 5–9 years ( $\alpha\text{OR}=0.18$ ,  $\text{CI}=0.06\text{--}0.53$ ,  $p=0.002$ ) and 10–14 years ( $\alpha\text{OR}=0.26$ ,  $\text{CI}=0.08\text{--}0.83$ ,  $p=0.024$ ). None of the variables were associated with mortality among the non-CLHIV.

**Conclusions:** Mortality among children diagnosed with TB was higher in CLHIV compared to those who were not CLHIV and specifically CLHIV who were infant had higher risk of death compared to older CLHIV. Strengthening TB/HIV collaborative efforts is essential to improve TB treatment success among TB/HIV coinfecting children.

## WEPEB072

### Utility of sputum culture (MGIT) to diagnose pulmonary TB in hospitalized people living with HIV in South Africa

E. van der Westhuizen<sup>1</sup>, R. Berhanu<sup>2</sup>, F. Nabeemeeah<sup>3</sup>, N. Sabet<sup>3</sup>, T. Moloantoo<sup>1</sup>, K. Otjombe<sup>1</sup>, M. Wong<sup>4</sup>, P. Mangena<sup>5</sup>, P. Abraham<sup>3</sup>, K. Hlongwane<sup>3</sup>, E. Variava<sup>6</sup>, N. Martinson<sup>3,7</sup>

<sup>1</sup>Perinatal HIV Research Unit, TB Unit, Johannesburg, South Africa, <sup>2</sup>Vanderbilt University Medical Center, Division of Infectious Diseases, Nashville, United States, <sup>3</sup>Perinatal HIV Research Unit, Johannesburg, South Africa, <sup>4</sup>University of the Witwatersrand, Internal Medicine Pulmonology, Johannesburg, South Africa, <sup>5</sup>Mankweng Hospital, Department of Internal Medicine, Polokwane, South Africa, <sup>6</sup>University of the Witwatersrand, Internal Medicine Klerksdorp/Tshepong Hospital, Klerksdorp, South Africa, <sup>7</sup>Johns Hopkins University, Baltimore, United States

**Background:** TB is a leading cause of morbidity and mortality amongst people living with HIV (PWH) in high HIV prevalence settings, but often is paucibacillary. In the face of a negative Xpert MTB/RIF Ultra (Ultra) and persistent symptoms of TB, current guidelines require sputum be subjected to automated liquid culture using mycobacterial growth indicator tube (MGIT). We assessed the incremental yield of MGIT in hospitalized PWH, tested with XpertUltra and point-of-care urine lipoarabinomannan (u-LAM)

**Methods:** We recruited hospitalized adults with presumptive pneumonia between May 2019 and October 2021 in a three tertiary hospitals in South Africa. All participants had a sputum sample tested Ultra and MGIT; PWH had u-LAM testing, irrespective of CD4 count. Other data was abstracted from clinical records.

**Results:** 2000 study participants were recruited of whom 1079 (54%) were PWH. A high proportion (383/1079, 36%) reported prior TB. 650/1079 (60%) of PWH were receiving an-

tiretroviral therapy (ART) their median CD4 was 204 cells/ml (80 – 333) and 249/650 (38%) were virally suppressed (<50 copies/ml). Most PWH provided an analyzable sputum specimen (822/1079, 76%).

Among 349 TB diagnoses in PWH, 219/349 (63%) had both Ultra and MGIT results – 144/219 (66%) diagnosed by XpertUltra, 99/219 (45%) by MGIT, and 107/219 (49%) by u-LAM – the remaining TB diagnoses were based on clinical findings. MGIT detected 8 (3%) more people with TB than Ultra (95% CI 2% – 7%), whereas u-LAM detected 67 (31%) additional participants (67/219, 95% CI 25% – 37%).

**Conclusions:** In hospitalized PWH sputum MGIT identified few additional participants with TB when compared to Ultra, whereas u-LAM which detected an additional 31% (67/219) of TB relative to Xpert Ultra.

Our findings challenge the utility of sputum culture in this group, considering the high cost, complexity, and limited availability of MGIT testing in resource-constrained environments.

### Prevalence and associated factors of chronic kidney disease in young people living with HIV in Uganda

E. Nasuuna<sup>1,2</sup>, L.A. Tomlinson<sup>3</sup>, R. Kalyesubula<sup>4</sup>, B. Castelnuovo<sup>1</sup>, C. Dziva Chikwari<sup>5,6</sup>, H.A. Weiss<sup>5</sup>

<sup>1</sup>Infectious Diseases Institute, Makerere University College of Health Sciences, Kampala, Uganda, <sup>2</sup>Medical Research Council/Uganda Virus Research Institute and London School of Hygiene and Tropical Medicine Uganda Research Unit, Non Communicable disease Program, Entebbe, Uganda, <sup>3</sup>London School of Hygiene and Tropical Medicine, Department of non-Communicable Disease Epidemiology, London, United Kingdom, <sup>4</sup>Makerere University College of Health Sciences, Departments of Physiology and Medicine, Kampala, Uganda, <sup>5</sup>MRC International Statistics and Epidemiology Group, London School of Hygiene & Tropical Medicine, London, United Kingdom, <sup>6</sup>Biomedical Research and Training Institute, Harare, Zimbabwe

**Background:** Young people living with HIV (YPLHIV) are at increased risk of developing chronic kidney disease (CKD). CKD is usually diagnosed late and associated with high mortality and morbidity.

We set out to determine the prevalence, associated factors and to compare serum creatinine and cystatin C for diagnosis of CKD among YPLHIV in Kampala, Uganda.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Methods:** A cross sectional study with YPLHIV aged 10 to 24 years was conducted in seven HIV clinics. Participants provided a urine and blood sample to measure urinary albumin, proteinuria, serum creatinine and cystatin C levels at baseline and at three months. The estimated glomerular filtration rate (eGFR) and albumin creatinine ratio (ACR) were calculated. Prevalence of CKD was estimated using CKDEPI 2021 equation in those aged >18 years and bedside Schwartz in those aged <18 years.

Logistic regression was used to determine the associated factors and chi square tests used to compare proportions of people with urinary abnormalities correctly diagnosed by creatinine or cystatin C.

**Results:** A total of 500 participants were enrolled. Females were 56% (280) and aged 10 to 17 years 66.9% (335). The prevalence of CKD ranged from 0 to 1.2% depending on age and the biomarker. Among those aged >18 years, prevalence was 0.2% using serum creatinine and 0% using cystatin C. Among those aged 10 to 17 years, prevalence was 0% using creatinine and 1.2% using cystatin C. ACR above 30mg/g was 10.1% and 24% of YPLHIV had proteinuria.

The associated factors were being aged 10 to 17 years with adjusted odds ratio (aOR) 7.3 (95% CI 2.4-22.2,  $p < 0.001$ ), being male aOR 2.2 (95% CI 1.3-3.9,  $p = 0.006$ ) and having proteinuria aOR 4.3 (95% CI 2.4-7.4,  $p < 0.001$ ). Cystatin C emerged as the better biomarker as eGFR from cystatin C identified more YPLHIV with increased ACR, proteinuria and hypertension  $p$  value 0.03.

**Conclusions:** The prevalence of CKD among YPLHIV was low. However, the prevalence of kidney damage was high. The definition of CKD and best biomarker for YPLHIV should be revised to correctly identify all that have CKD. Estimating equations should be validated in YPLHIV to improve their accuracy in estimating GFR.

## WEPEB074

Low achievement rate of metabolic and cardiovascular targets in a cohort of women with HIV: an urgent call for action for cardiometabolic health

M. Mazzitelli<sup>1</sup>, C. Cozzolino<sup>2</sup>, L. Sasset<sup>1</sup>, D. Leoni<sup>1</sup>, C. Putaggio<sup>1</sup>, V. Scaglione<sup>2</sup>, V. Baldo<sup>2</sup>, A. Cattelan<sup>2</sup>

<sup>1</sup>Padua University Hospital, Padova, Italy, <sup>2</sup>Padua University, Padova, Italy

**Background:** Cardiometabolic health became crucial in people with HIV, especially in women (WWH). Therefore, we assessed achievement of targets for hypertension, dyslipidaemia, and diabetes (H/Dy/DT) in primary prevention in our cohort of WWH.

**Methods:** Cross-sectional analysis including all WWH in our clinic, excluding those who had a myocardial infarction. We evaluated rate of achievement of the different H/Dy/DT according to EACS guidelines and individual car-

diovascular risk, CVR (measured by ESC calculator), by using logistic regression to evaluate differences in H/Dy/DT achievement between migrant and Italian women.

**Results:** We included 292 WWH, 55.5% Italian and 44.5% migrant, median age and CD4+count were 50 (IQR:42-58) years and 617.5 (448-825) cell/mm<sup>3</sup>, respectively, 94.5% had HIV RNA< 50 copies/ml. Median time living with HIV was 16 (9-25.8), 55.1% women had a high level of education, 27.1% were smokers, 19.2% did regularly physical exercise, 64.4% presented multimorbidity. Overall, 76%, 19% and 5% women presented a low, a high, and a very high CVR, respectively. Among Italians, 28.4% and 6.2% women presented a high and a very high CVR, respectively. Considering migrants, 7.7% and 3.8% women presented a high and a very high CVR, respectively.

Figure 1 summarizes the rate of H/Dy/DT achievement in Italian vs. migrant women and by the presence of prescribed treatments (statins, anti-hypertensives, hypoglycaemic drugs). Overall, the subset of women with high CVR and migrant were more likely to be not at target than those with low risk (especially for LDL-c and blood pressure in people on treatment), despite no detected statistically significant differences. By contrast migrants were more likely to achieve glycaemic targets than Italians ( $p=0.032$ ).

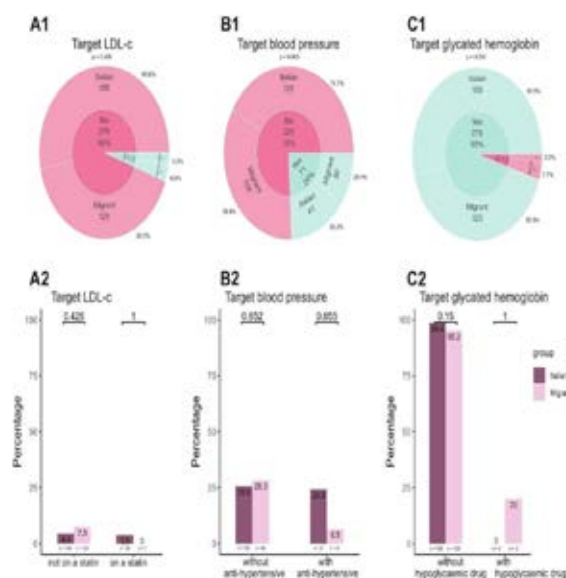

Figure 1.

**Conclusions:** Even if CV screening was performed, H/Dy/DT achievement is suboptimal, especially in migrants. A more aggressive pharmacological control, also assessing adherence to medical prescriptions, and promotion of healthy lifestyle should be urgently implemented, possibly redrawing current model of care.

## WEPEB075

### Effects of long-acting therapy on renal and metabolic profiles in people living with HIV: results from the SCohoLART study

C. Muccini<sup>1</sup>, N. Gianotti<sup>1</sup>, S. Diotallevi<sup>1</sup>, R. Lolatto<sup>1</sup>, V. Spagnuolo<sup>1</sup>, D. Canetti<sup>1</sup>, S. Bagaglio<sup>1</sup>, V. Gordo Perez<sup>1</sup>, T. Clemente<sup>2</sup>, M. Bottanelli<sup>2</sup>, C. Candela<sup>2</sup>, S. Nozza<sup>1,2</sup>, A. Castagna<sup>1,2</sup>

<sup>1</sup>IRCCS San Raffaele Scientific Institute, Department of Infectious Diseases, Milan, Italy; <sup>2</sup>Vita-Salute San Raffaele University, Milan, Italy

**Background:** Aim of this study was to evaluate changes in kidney and metabolic parameters in people living with HIV (PLWH) switching to long-acting (LA) cabotegravir (CAB) and rilpivirine (RPV).

**Methods:** SCohoLART (NCT05663580) is a single-center, prospective, cohort study of PLWH on virological suppression enrolled when switched to two-monthly LA CAB/RPV. Participants' characteristics were reported as median (interquartile range, IQR) or frequency (%).

Crude annual mean changes (slopes) with corresponding 95% confidence interval (95%CI) in renal and metabolic parameters were estimated using linear mixed models. Participants starting/stopping statin during follow-up were excluded.

**Results:** We included 504 participants: 453 (89.9%) were male, median age was 49.0 (40.0-56.4), median years from HIV diagnosis 14.4 (9.0-21.2), and median months of study follow-up in LA therapy 9.4 (6.4-11.4); other characteristics are reported in Table 1.

Parameters	N=504
<b>Creatinine (mg/dL)</b>	1.1 (1.0-1.2)
<b>Estimated glomerular filtrate rate (mL/min/1.73 m<sup>2</sup>)</b>	80 (70-90)
<b>Body mass index</b>	25.0 (23.0-27.4)
<b>Glucose (mg/dL)</b>	89 (82-97)
<b>Triglycerides (mg/dL)</b>	99.0 (76.0-136)
<b>Cholesterol (mg/dL)</b>	181 (159-203)
<b>Cholesterol HDL (mg/dL)</b>	49 (41-58)
<b>Cholesterol LDL (mg/dL)</b>	114 (96-137)
<b>Cholesterol TOT/HDL</b>	3.7 (3.1-4.4)

Table 1.

Overall, mean decrease in creatinine was -0.12 mg/dL/year (95%CI:-0.15,-0.1, p<0.0001) and mean increase in estimated glomerular filtrate rate +7.36 mL/min/1.73m<sup>2</sup> (95%CI:5.78,8.94, p<0.0001).

In participants switching to LA, mean changes in high-density lipoprotein (HDL) and low-density lipoprotein (LDL)-cholesterol were +2.14 mg/dL/year (95%CI:0.48-3.81, p=0.012) and +4.59 mg/dL/year (95%CI:0.55-8.63, p=0.026), respectively. People treated without tenofovir alafenamide before starting LA had a higher increase of LDL-choles-

terol [+6.81 mg/dL/year (95%CI:1.56-12.07, p=0.011)]. Mean change in weight was +0.97 Kg/year (95%CI:0.02-1.92, p=0.045) and in BMI +0.34/year (95%CI:0.03-0.66, p=0.034). Other changes are described in Figure 1.

Variable	Overall crude mean change per year (95% CI)	Crude mean change per year among people treated without tenofovir alafenamide long-acting start (95% CI)	Crude mean change per year among people treated with tenofovir alafenamide post start (95% CI)	p-value (vs. LA)
Weight (kg)	0.97 (0.02,1.92), p=0.045	0.8 (-0.40,2.04), p=0.208	1.24 (-0.25,2.73), p=0.102	p=0.112
Body Mass Index (kg/m <sup>2</sup> )	0.34 (0.03,0.66), p=0.034	0.31 (-0.10,0.72), p=0.139	0.39 (-0.10,0.88), p=0.115	p=0.094
Glucose (mg/dL)	-3.34 (-7.33,6.95), p=0.512	-3.48 (-8.84,1.87), p=0.177	-2.18 (-6.73,3.96), p=0.483	p=0.305
Triglycerides (mg/dL)	-3.88 (-11.86,3.46), p=0.303	-5.1 (-12.48,6.34), p=0.334	-4.93 (-15.35,5.48), p=0.434	p=0.569
Cholesterol (mg/dL)	2.69 (-2.43,6.46), p=0.349	2.27 (-3.38,7.92), p=0.430	1.82 (-5.18,7.95), p=0.602	p=0.640
Cholesterol HDL (mg/dL)	2.14 (-0.40,3.81), p=0.012	1.64 (-0.56,3.85), p=0.146	2.79 (-0.23,3.31), p=0.033	p=0.034
Cholesterol LDL (mg/dL)	4.59 (0.55,8.63), p=0.026	6.81 (1.56,12.07), p=0.011	5.37 (-4.92,7.86), p=0.468	p=0.035
Cholesterol TOT/HDL	-0.28 (-0.58,0.02), p=0.083	-0.29 (-0.88,0.38), p=0.42	-0.11 (-0.78,-0.64), p=0.18	p=0.189

Figure 1. Crude mean changes in renal and metabolic parameters.

**Conclusions:** In people switching to CAB/RPV, kidney function significantly improved. HDL and LDL-cholesterol and weight slightly increased; however, longer follow-up is needed to confirm these changes over time and assess potential cardiovascular risk modification.

## WEPEB076

### Weight gain and health-related quality of life in people with HIV on antiretroviral therapy

B.K. Tadese<sup>1</sup>, K. Li<sup>2</sup>, O.-T. Carter<sup>2</sup>, F. Hennessy<sup>2</sup>, T. Holbrook<sup>2</sup>, G. Pranjapati<sup>1</sup>

<sup>1</sup>Merck & Co., Inc., Rahway, United States; <sup>2</sup>Adelphi Real World, Bollington, United Kingdom

**Background:** Studies have reported an increase in adverse weight gain associated with certain classes of antiretroviral drugs. This study evaluated the impact of weight gain on health-related quality of life (HRQoL) among people with HIV (PWH) using real-world data.

**Methods:** Data from the Adelphi HIV Disease Specific Programme (DSP)<sup>TM</sup>, a real-world, cross-sectional survey of physicians and virologically suppressed PWH under their treatment in the US between June 2021 and July 2022 was used. PWH weight at date of data collection and at 12 months prior were abstracted from medical chart. HRQoL was assessed using the Impact of Weight on Quality of Life - Clinical Trials (IWQoL-Lite-CT) questionnaire with a score ranging from 0-100, with higher values indicating a better functioning. Propensity score matching (PSM) was used to balance the pre-specified covariates between PWH groups with 12-month weight gain of ≥5% and those with weight <5% (includes PWH with weight loss). The IWQoL-Lite-CT composite scores were compared between the groups using the Average Treatment Effect (ATE) obtained from the weighted regression.

**Results:** A total of 225 PWH (≥5%: 54 and <5%: 171) consulting at 60 participating physicians were analyzed. The overall mean age was 46.3 (SD: 12.5) years; 222 (80.1%) males; 152 (54.9%) White and 86 (31.0%) Black; mean Charl-

son Comorbidity Index 4.2 (SD: 0.67). After PSM and regression adjustment, the  $\geq 5\%$  weight gain group vs  $< 5\%$  had a lower average IWQoL-Lite-CT total composite score (65.8 vs 74.4; ATE=8.6,  $p<0.001$ ) and sub-domain scores, indicating poorer HRQoL (Figure 1).

Figure 1.

**Conclusions:** PWH with  $\geq 5\%$  increase in weight in the past 12 months were found to have poorer HRQoL. These findings show the humanistic impact of weight gain in PWH highlighting the need to monitor and consider weight gain when selecting antiretroviral therapy in the management of HIV to improve the patient quality of life.

## WEPEB077

Bone health in Malaysian women living with HIV: uncovering the pores in osteoporosis screening and management in a high-risk population

A. Kukreja<sup>1</sup>, M.A.H. Zakria<sup>2</sup>, A. Salleh<sup>3</sup>, A.S. Anak Abeng<sup>2</sup>, Q.H. Lim<sup>1</sup>, R. Rajasuriar<sup>1</sup>

<sup>1</sup>Universiti Malaya, Medicine, Kuala Lumpur, Malaysia,

<sup>2</sup>Universiti Malaya, Faculty of Medicine, Kuala Lumpur, Malaysia,

<sup>3</sup>Universiti Malaya, Centre of Excellence for Research in AIDS (CERIA), Kuala Lumpur, Malaysia

**Background:** Post-menopausal women face heightened osteoporosis risks. For women living with HIV (WLWH), these risks are compounded by accelerated aging and chronic inflammation. In Malaysia, tenofovir-based therapies, linked to increased bone turnover, are first-line treatment. Yet, data on bone health among WLWH in our region is scarce.

Our study aims to identify gaps in screening and management of osteoporosis and osteopenia among Malaysian WLWH in a tertiary teaching center.

**Methods:** We reviewed the records of adult Malaysian WLWH who attend the Infectious Diseases Clinic, University Malaya Medical Centre. We collected demographics, HIV metrics, body mass index, menopausal status, and serum vitamin D levels. We noted bone mineral density (BMD) examination results. Diagnoses of osteoporosis and osteopenia followed definitions from the Malaysian Clinical Practice Guidelines. For osteoporotic women, we checked treatment initiation. For osteopenic women, the fracture risk assessment tool (FRAX®) score was computed to determine treatment need. We provide descriptive statistics.

**Results:** We collected data from 168 WLWH. The median age was 50 years (Interquartile Range IQR: 43,58), with 82(48.8%) aged  $< 50$  years and 86(51.2%)  $\geq 50$  years. The median duration of living with HIV was 12 years (IQR 7,17). All participants received antiretroviral therapy, and 160(95.2%) had an undetectable viral load. Menopause status was recorded in 67.9%(n=114), of which 47.3%(n=54) were menopausal. Only 10(6%) were active smokers. Of those aged  $< 50$  years (n=82), 26.8%(n=22) had a BMD examination, all of whom had normal z-scores. Among women aged  $\geq 50$  years (n=86), only 40(46.5%) had a BMD examination, with 8(20%) and 24(60%) having osteoporotic and osteopenic t-scores respectively. Amongst the 8 osteoporotic women, half had low BMI, three (37.5%) received treatment and two (25%) were on a tenofovir-based regimen. Only 2(25%) had Vitamin D levels, with both readings  $< 35$  nmol/L. The osteopenic women (n=24) had median FRAX® 10-year risks of 3%(IQR 2,6) for major fractures and 0.8%(IQR 0.2,1.5) for hip fractures. However, most women (n=21,87.5%) had their last BMD examination  $> 2$  years ago, and half (n=12, 50%) continue on tenofovir-based regimens.

**Conclusions:** Older Malaysian WLWH face under-screening and inadequate management of bone health. HIV physicians should extend care beyond viral suppression, emphasizing comprehensive bone health.

## WEPEB078

Prevalence of mental health conditions among people living with HIV in Odessa, Ukraine: results of the implementation of a screening model

Y. Basarab<sup>1,2</sup>, Y. Lopatina<sup>1</sup>, K. Voronova<sup>1</sup>, Y. Kvasnevskaya<sup>1</sup>, O. Tereshchenko<sup>3</sup>

<sup>1</sup>AIDS Healthcare Foundation, Kyiv, Ukraine, <sup>2</sup>Kyiv City AIDS Center, Inpatient Department of HIV/AIDS and Opportunistic Infections, Kyiv, Ukraine, <sup>3</sup>AIDS Healthcare Foundation, Test & Treat Clinic, Odessa, Ukraine

**Background:** Highly prevalent mental health disorders, including depression, are associated with poor outcomes among people living with HIV. Integrating the screening and treatment mental health conditions into routine HIV care can improve treatment outcomes.

Here, we aimed to describe the prevalence of mental health disorders in people living with HIV identified following the implementation of a model for depression screening and management of mental health conditions at the Test & Treat Clinic in Odessa, Ukraine.

**Methods:** In this cross-sectional study, 776 people living with HIV were enrolled between 2018-2023. Depression screening was done using the Patient Health Questionnaire PHQ-2 and PHQ-9.

**Results:** Among 776 people living with HIV screened with PHQ-2/PHQ-9, 315 (40.5%) had a syndromic diagnosis of depression; the prevalence among women was signifi-

Index

cantly higher (44.5%) than in men (35.4%;  $p=0.010$ ). Of the 315 clients identified with depression, 297 (94.2%) started treatment with antidepressants or neuroleptics.

A previously established diagnosis of depression was more frequently reported in the 35-50 years old group (51.1%) than among participants over 50 years of age (34%) or among those in the 25-35 years old group (8.0%;  $p = 0.005$ ). A third of the clients (268, 34.3%), were diagnosed with other psychiatric and/or behavioural disorders on consultation of those, only 25 (9.3%) did not seek specific pharmacological treatment or psychotherapy. Differences in the prevalence of mental and behavioural disorders by gender were noteworthy: alcohol and substance use disorders predominated in women (4.2% vs. 0.9% among men;  $p = 0.005$ ); stress related neurotic disorders and somatoform disorders were also significantly more common in women (7.2% vs. 3.6% in men;  $p = 0.050$ ). Schizophrenia and schizotypal disorders occurred only in males (2.4%;  $p = 0.001$ ). Contrastingly, mood disorders were rare, and no significant differences were observed by gender (0.9% and 2% among men and women, respectively).

**Conclusions:** The model for depression screening revealed that depression is common but commonly missed among people living with HIV. Routine screening of depression is a low-cost strategy to promote diagnosis and care and improve overall client outcomes.

## WEPEB079

A comparative study evaluating renal outcomes after switching from TDF+FTC+EFV To TDF/3TC/DTG (TLD) versus DTG+3TC in virologically suppressed Thai PWH

S. Patamatamkul<sup>1,2</sup>, S. Kanogtorn<sup>1</sup>, O. Putcharoen<sup>2,3</sup>

<sup>1</sup>Faculty of Medicine, Mahasarakham University, Suddhavej Hospital, Maha Sarakham, Thailand, <sup>2</sup>Division of Infectious Diseases, Department of Medicine, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand, <sup>3</sup>Emerging Infectious Diseases Clinical Center Thai Red Cross, Bangkok, Thailand

**Background:** PWH in Thailand on TDF+FTC+EFV are switched to TDF/3TC/DTG (TLD) according to the WHO 2022 and Thai HIV guidelines. Switching to tenofovir-sparing dual therapy with 3TC+DTG is safe and effective compared with tenofovir-based combined ART (cART). However, there is yet a direct comparison of estimated glomerular filtration rates (eGFR) among PWH currently treated with TDF-based regimens who are switched to TLD versus 3TC+DTG.

**Methods:** We prospectively enrolled virologically suppressed PWH age  $\geq 18$  years currently on TDF+FTC+EFV to either switch to TLD or 3TC+DTG at 2 tertiary care hospitals. At 24 weeks, we evaluated changes of eGFR calculated by creatinine, LDL, body weight, and BMI.

**Results:** Among 50 recruited participants, there were 19 and 15 participants completed the 2<sup>nd</sup> follow-up in the TLD and 3TC+DTG group, respectively. The mean age was lower in the TLD than in the 3TC+DTG group (Table 1). The eGFR was significantly reduced in the TLD than in the 3TC+DTG:  $-18.23 \pm 7.77$  vs.  $-8.4 \pm 9.03$  ml/min/1.73 m<sup>2</sup> ( $p=0.002$ ) (Figure 1). Switching to 3TC+DTG is a strong predictor for lesser odds for the reduction in the eGFR after switching with an odds ratio  $<0.001$  (95% CI  $<0.0001 - 0.057$ ) even after adjusting for age and BMI from the general linear regression model ( $p=0.005$ ).

Baseline characteristics	TLD (n = 19)	3TC+DTG (n = 15)	p-value
Age, years ( $\pm$ SD)	39.53 $\pm$ 15.65	50.47 $\pm$ 12.26	0.04*
Sex, male, n (%)	17 (89.5)	9 (60)	0.10
Body mass index, kg/m <sup>2</sup> (IQR)	21.98 (19.53, 23.66)	24.9 (23.82, 25.73)	$<0.01^*$
Duration from HIV diagnosis to switching, years ( $\pm$ SD)	7.22 $\pm$ 3.73	10.37 $\pm$ 6.87	0.12
Nadir CD4, cells/mm <sup>3</sup> ( $\pm$ SD)	297.28 $\pm$ 270.24	226.93 $\pm$ 196.55	0.43
Pre-switch CD4, cells/mm <sup>3</sup> ( $\pm$ SD)	455.32 $\pm$ 200.44	639.93 $\pm$ 303.94	0.06
Pre-switch creatinine, mg/dL ( $\pm$ SD)	0.95 $\pm$ 0.14	0.91 $\pm$ 0.22	0.55
Pre-switch eGFR by CKD-EPI (ml/min/1.73 m <sup>2</sup> )	98.61 $\pm$ 17.43	88.2 $\pm$ 21.26	0.13
Comorbidities, n (%)			
- Diabetes mellitus	0 (0%)	5 (20%)	0.08
- Chronic kidney disease	1 (5.3%)	1 (6.7%)	1.00
LDL, mg/dL ( $\pm$ SD)	128.7 $\pm$ 34.68	130 $\pm$ 43.28	0.65

Table 1.

Figure 1.

**Conclusions:** There was a significant reduction of eGFR among PWH who were switched to TLD than to the 3TC+DTG. Changes in the LDL and BMI were comparable. Dual therapy with 3TC+DTG may be a preferred option as a switching therapy over TLD in selected cases with renal safety concerns.

### HIV and inflammation predict initiation of methamphetamine use in sexual and gender minorities

A. Carrico<sup>1</sup>, D. Ryan<sup>2</sup>, J. Berona<sup>2</sup>, B. Dominguez<sup>2</sup>,  
J. Schrock<sup>2</sup>, T. McDade<sup>3</sup>, M. Newcomb<sup>2</sup>, R. D'Aquila<sup>3</sup>,  
B. Mustanski<sup>2</sup>

<sup>1</sup>Florida International University, Robert Stempel College  
of Public Health and Social Work, Miami, United States;

<sup>2</sup>Northwestern University, Institute for Sexual and Gender  
Minority Health and Wellbeing, Chicago, United States;

<sup>3</sup>Northwestern University, Chicago, United States

**Background:** Methamphetamine use is an established risk factor for HIV and inflammation. We sought to determine if the converse is also true. Do HIV seroconversion and greater inflammation increase risk for initiation of methamphetamine use in sexual and gender minority (SGM) people?

**Methods:** This prospective cohort study enrolled 1,302 SGM people ages 16–29 who were assigned male at birth to identify multi-level determinants of substance use and HIV. Youth with HIV were enrolled at baseline ( $n = 195$ ) or seroconverted during follow-up ( $n = 89$ ). Plasma samples were collected to measure systemic inflammation (C-reactive protein (CRP), interleukin-6, tumor necrosis factor - alpha) among 834 participants.

Only participants where HIV diagnosis and inflammatory markers preceded incident, first-time methamphetamine use were included. From 2015–2023, prevalence of any self-reported methamphetamine use was estimated.

Among youth reporting no history of methamphetamine use at baseline, the rate of incident, first-time methamphetamine use (i.e., self-report or reactive urine toxicology results) was examined.

**Results:** Most participants were Black (32%) or Latinx (30%), identified as cisgender men (90%), and were HIV-negative (85%) with mean age of 21.5 (SD = 3.2) years. Participants were followed for a median of 5.0 (IQR = 2.0–7.1) years.

There were significant increases in the prevalence of methamphetamine use from 2015–2023 (IRR = 1.17; 95% CI = 1.04–1.33;  $p = 0.01$ ) that were most pronounced among participants ages 25 or older at baseline (IRR = 2.20; 95% CI = 1.33–3.63;  $p = 0.002$ ). The median age of incident, first-time methamphetamine use was 23.9 (IQR = 22.1–26.9).

Adjusting for other substance use, there was a two-fold greater rate of incident, first-time methamphetamine use after HIV diagnosis (aHR = 2.02; 95% CI = 1.27–3.23;  $p = 0.003$ ). Higher CRP independently predicted greater rates of incident, first-time methamphetamine use (aHR = 1.18; 95% CI, 1.05–1.34;  $p = 0.008$ ).

**Conclusions:** Biobehavioral interventions to prevent methamphetamine use should focus on emerging adulthood, people with HIV, and those with greater systemic inflammation. Identifying the mechanisms whereby HIV

and inflammation alter key neurobehavioral processes favoring use (e.g., anhedonia) would inform interventions to prevent initiation of methamphetamine use.

## WEPEB081

### Epigenome-wide and methylation risk score analysis of body mass index among people with HIV

University, Medicine and Global Health, Atlanta, United

States; <sup>7</sup>Atlanta Veterans Affairs Health Care System,

Decatur, United States

**Background:** People with HIV (PWH) on antiretroviral therapy (ART) may experience weight gain, elevating the risk of type 2 diabetes and cardiovascular disease. While DNA methylation (DNAm) markers have been associated with obesity in the general population, its role in PWH remains unknown.

This study investigated epigenetic associations with body mass index (BMI) in PWH, aiming to enhance the understanding and management of obesity-related risks in this population.

**Methods:** An epigenome-wide association study (EWAS) of BMI was conducted on 992 male PWH of African ancestry from the Veterans Aging Cohort Study (VACS). Associations between DNAm and BMI were examined using linear mixed models with adjustment for potential confounders. Soluble CD14 (sCD14) was additionally adjusted for given its moderate association with BMI and role as an epigenetic modifier.

Results were compared with previously reported BMI-associated cytosine-guanine nucleotide (CpG) sites among people without HIV (PWoH).

To examine the joint impact of CpG sites on BMI in PWH, previously reported CpG sites and machine learning methods were utilized to calculate and evaluate methylation risk scores (MRS) of BMI.

**Results:** EWAS meta-analysis identified thirty CpG sites significantly associated with BMI after correction for multiple testing (Bonferroni-corrected  $p$ -value  $< 0.05$ ). After adjusting for sCD14, only four sites (cg17061862, cg10601624, cg04907505, and cg06178669) remained genome-wide significant.

When compared to 1,063 previously reported BMI-associated CpG sites in PWoH, 70.3% of those were directionally consistent (binomial test  $p$ -value  $< 2.2 \times 10^{-16}$ ) in PWH. A

BMI MRS constructed from 349 CpG sites explained 17.6% of BMI variance in PWH. The performance of internally trained BMI MRS using Elastic-Net models, as assessed by the median R-squared value ranged from 22.0% to 24.8% in 5-fold cross-validation.

**Conclusions:** Identified DNAm markers and MRS were strongly associated with BMI among PWH, with a significant overlap in epigenetic profiles between PWH and PWH.

This indicates shared and independent molecular pathways underlying BMI. Integrating a large epigenetic study of BMI among PWH and PWH could provide insights into obesity-related risk in the context of HIV infection and ART, potentially guiding targeted strategies to mitigate the elevated chronic disease risk among PWH.

## WEPEB082

Relationship between TM6SF2 rs58542926 genotype, liver fibrosis and diabetes mellitus among people with HIV who have steatotic liver disease

W.M. Han<sup>1,2</sup>, T. Apornpong<sup>2</sup>, N. Chuaypen<sup>3</sup>, H.M. Su Lwin<sup>2</sup>, A. Hiransuthikul<sup>2</sup>, S. Gatechompol<sup>2,4</sup>, S. Ubolyam<sup>2,4</sup>, S. Kerr<sup>5,2</sup>, P. Tangkijvanich<sup>3</sup>, A. Avihingsanon<sup>2,4</sup>, HIV-NAT 006 Study Team

Centre, Faculty of Medicine, Chulalongkorn University,

Bangkok, Thailand

**Background:** Steatotic liver disease (SLD) is increasingly prevalent in people with HIV (PWH) in the contemporary antiretroviral therapy (ART) era. Little is known regarding the role of genetic polymorphisms in the development of advanced liver fibrosis, or pathogenesis of diabetes mellitus (DM) in PWH and SLD.

**Methods:** PWH aged ≥18 years in a HIV cohort in Bangkok, Thailand, were routinely evaluated with FibroScan for liver stiffness measurements (LSM) and controlled attenuation parameter (CAP). SLD and advanced liver fibrosis were defined as CAP ≥248 dB/m and LSM ≥7.5 kPa, respectively. Participants who tested for single nucleotide polymorphisms (SNPs) including patatin-like phospholipase-domain-containing 3 (PNPLA3) rs738409 and transmembrane 6 superfamily member 2 (TM6SF2) rs58542926 were included.

In this cross-sectional analysis, multivariable logistic regression was used to investigate associations of these SNPs with advanced liver fibrosis and DM. Analyses were stratified by the presence of SLD.

**Results:** A total of 756 participants (35% female, median age 45 [interquartile range, 36–52] years) were analysed. TM6SF2 rs58542926 CC, CT and TT genotypes were present in 77%, 21% and 2%, respectively. Median CD4 count was 581 (422–753) cells/mm<sup>3</sup>; 36% had SLD (22% with advanced liver fibrosis) and 19% were diabetic. TM6SF2 rs58542926 CT/TT (vs. CC) was associated with an increased risk of advanced liver fibrosis (adjusted odds ratio [aOR]=1.91, 95%CI 1.17–3.14, p=0.009) after adjusting for age, sex, BMI, waist circumference, hypertension, dyslipidemia, AST, SLD, PNPLA3rs738409 genotype and ART duration. However, the association was only significant among individuals with SLD (3.33, 95%CI 1.56–7.13, p=0.002), not among those without SLD (p=0.36).

In contrast, TM6SF2 rs58542926 CT/TT (vs. CC genotype) was associated with a decreased risk of DM among individuals with SLD (0.36, 95%CI 0.13–0.95, p=0.039). We found no association with the PNPLA3rs738409 genotype and advanced liver fibrosis or DM.

**Conclusions:** The TM6SF2 rs58542926 T allele was associated with an increased risk of liver fibrosis but provided modest protection from DM among individuals with HIV and SLD. This suggests a complex interplay of genetic factors influencing both hepatic and metabolic outcomes in this population, emphasizing the need for tailored therapeutic approaches and further exploration of the underlying mechanisms.

## WEPEB083

Characteristics of PLHIV who acquire TB disease after completing TB Preventive Therapy at a large facility in Kampala, Uganda

L. Bitira<sup>1</sup>, G. Namale<sup>2</sup>, E. Sendaula<sup>2</sup>, J. Kaleebi<sup>2</sup>

<sup>1</sup>Reach Out Mbuya Community Initiative, Paediatrics

and Adolescents, Kampala, Uganda, <sup>2</sup>Reach Out Mbuya

Community Initiative, Kampala HIV Project, Kampala,

Uganda

**Background:** Even though, Tuberculosis preventive therapy (TPT) has proven to be an effective measure in reducing the incidence of active tuberculosis (TB) disease among people living with HIV (PLHIV) who are at an elevated risk, the prevalence of TB in this specific population remains at 5.8% post-completion of a TPT course.

This study therefore set out to investigate the characteristics of PLHIV who acquire TB disease after successful completion of TPT.

**Methods:** We performed a retrospective cohort analysis of PLHIV records in TB and ART registers between 1<sup>st</sup> January 2022 and 31<sup>st</sup> December 2023 at Kawaala Health Centre IV, a large ART facility in Kampala. Data on socio-demographic and clinical characteristics were collected using a data transcription form. Data were entered in Excel and later exported to SPSS for further management and analysis.

In Excel, we traced back TPT completion using ART numbers from EMR and client files. The participant characteristics were summarised in descriptive terms such as mean, median, standard deviation (SD) or percentage, as appropriate.

**Results:** A total of 9,417 PLHIV who had completed TPT were included in the analysis; the mean age was 36.6 (SD  $\pm$  13.6) years old and most were female 6,912 (73.4%). Eighty-seven (0.9%) PLHIV acquired TB disease after completion of TPT and of these 68 (78%) had a documented TPT completion date with the average duration between TPT completion and TB diagnosis 2.5 (SD  $\pm$  13.1) years, 55 (63%) were bacteriologically diagnosed, more than half were female 46 (53%), majority 80 (92%) were on DTG based regimens, most 66 (76%) had a documented viral load within 1 year of being diagnosed with TB and of these 52 (79%) were virologically suppressed (viral load <200 copies/ml). Of the 87, 2 died before completion of treatment.

**Conclusions:** In this cohort, it is the stable PLHIV who acquire TB disease after completion of TPT. This shows that the current measures are not enough. There is need to strengthen intentional routine screening of TB even among stable PLHIV who may be enrolled in various Differentiated Service Delivery community and facility models.

## WEPEB084

### Putting people first: holistic HIV care with integrated mental health services

K.P. Viswanath<sup>1</sup>, S. Prasad<sup>1</sup>, E. Michael<sup>1</sup>, M. Kumar<sup>1</sup>, S. Dwivedi<sup>1</sup>, L.H. Mojica<sup>1</sup>  
<sup>1</sup>AHF India Cares, New Delhi, India

**Background:** AIDS Healthcare Foundation - India implements the Centre of Excellence ART Clinics - The People's Clinic in Delhi and Mumbai. This study emphasizes prioritizing individuals' well-being by integrating mental health services into HIV care. Focusing on the relationship between mental well-being and HIV treatment outcomes, it integrates mental health services for 2200 individuals in antiretroviral therapy (ART).

The approach puts people at the center, addressing both physical and mental health in HIV care.

**Description:** The study seamlessly integrated mental health screenings into routine HIV treatment evaluations. A specialized interview captured mental health indicators alongside standard physical assessments.

The aim was to establish correlations between mental health status, ART adherence, and treatment outcomes, prioritizing people behind the data.

**Lessons learned:** Findings reveal a significant link between mental health and HIV treatment success. Integrated mental health support led to higher ART adherence, improving viral suppression and overall well-being. Untreated mental health challenges were associated

with lower adherence, compromising efficacy and quality of life. Among 2200 clients, 46% required mental health interventions, with anxiety predominant at 71%, followed by depression (26%) and psychosis (3%). Notably, 24% needed referrals to mental health specialists. 27% underwent pharmacological interventions, while 73% had non-pharmacological interventions.

Addressing mental health issues improved client retention, emphasizing the positive impact of a people-centric approach.

Mental Health Challenges	Percentage
Anxiety	71%
Depression	26%
Psychosis	3%

Management Type	Percentage
Referrals	24%
Interventions in clinic	76%

**Conclusions/Next steps:** This research advocates for a paradigm shift in HIV care, emphasizing the critical integration of mental health services as a fundamental component. Recognizing and proactively addressing the mental health needs of individuals living with HIV optimizes treatment adherence, improves outcomes, and fosters a holistic approach.

The study urges policymakers, clinicians, and healthcare systems to seamlessly integrate mental health services with HIV treatment protocols, prioritizing people and paving the way for a more effective model of care. This approach addresses the multifaceted needs of individuals living with HIV, enhancing overall care quality.

### Impact of depression on virological outcomes and quality of life among people living with HIV in Thailand

T. Nochaiwong<sup>1</sup>, W.M. Han<sup>1,2</sup>, J. Sophonphan<sup>1</sup>, T. Apornpong<sup>1</sup>, H.M.S. Lwin<sup>1</sup>, S. Thammapiwan<sup>1</sup>, C. Tongyong<sup>3</sup>, S. Gatechompol<sup>1</sup>, S.J. Kerr<sup>1,4,2</sup>, A. Avihingsanon<sup>1,5</sup>

<sup>1</sup>HIV-NAT, Thai Red Cross AIDS Research Centre, Bangkok, Thailand, <sup>2</sup>Kirby Institute, UNSW Sydney, Sydney, Australia,

<sup>3</sup>Chulalongkorn University, Department of Psychiatry, Faculty of Medicine, Bangkok, Thailand, <sup>4</sup>Biostatistics Excellence Centre, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand, <sup>5</sup>Center of Excellence in Tuberculosis, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand

**Background:** Depressive symptoms impact the well-being and quality of life (QoL) in people living with HIV (PLWH), and is often associated with poorer virological control.

This study investigated the relationship between depression, virological outcomes, and QoL among PLWH.

**Methods:** A cross-sectional study was conducted among PLWH at HIV-NAT, Thai Red Cross AIDS Research Centre, Thailand, from December 2020 to June 2023. A Patient Health Questionnaire (PHQ)-9 score  $\geq 10$  was considered to represent moderate-to-severe depression. QoL was measured using the World Health Organization's Quality of Life-HIV (WHOQOL-HIV BREF) which is a validated 31-item in six domains, each rated on a 5-point scale. Mean scores for each domain were computed. The scores ranged between 4 and 20. Higher scores indicated better QoL.

**Results:** Among 508 participants, 17.5% were female, and the median age was 33.3 years, with 90.4% had viral loads  $< 50$  copies/mL. Fifty individuals (9.8%) experienced moderate-to-severe depressive symptoms.

Of all participants, 72.1% reported good or very good overall QoL and 71.1% expressed satisfaction and very good satisfaction with their general health perception. PLWH with minimal or mild depression had higher mean overall QoL ( $4.0 \pm 0.7$  vs.  $3.2 \pm 0.7$ ,  $P < 0.001$ ), general health perception ( $3.9 \pm 0.8$  vs.  $3.2 \pm 0.9$ ,  $P < 0.001$ ), and higher proportion with HIV RNA  $< 50$  copies/mL (91.7% vs 78%,  $p = 0.002$ ) compared to those with moderate-to-severe depression. In a multivariable model, females (aOR: 4.18, 95%CI: 1.04-16.72) and HIV RNA  $\geq 50$  copies/mL (aOR: 3.07, 95%CI: 1.28-7.35) had higher risk to develop moderate-to-severe depression. PLWH with moderate-to-severe depression and virological non-suppression had the lowest QoL overall and in each QoL domain.

	Overall (mean $\pm$ SD)		Domain (mean $\pm$ SD)					
	Overall QoL	General health percep- tion	I. Physical	II. Psycholo- gical	III. Level of independ- ence	IV. Social relation- ships	V. Environ- mental	VI. Spirituality/ Self-beliefs
Total (N=508)	3.9 $\pm$ 0.7	3.8 $\pm$ 0.9	16.4 $\pm$ 2.6	15.7 $\pm$ 2.6	16.4 $\pm$ 2.5	15.1 $\pm$ 2.5	15.4 $\pm$ 2.4	15.4 $\pm$ 3.2
Minimal and mild depression (N=458)	4.0 $\pm$ 0.7	3.9 $\pm$ 0.8	16.7 $\pm$ 2.3	16.0 $\pm$ 2.3	16.6 $\pm$ 2.4	15.4 $\pm$ 2.4	15.6 $\pm$ 2.3	15.7 $\pm$ 3.1
Virological suppression (n=420)	4.0 $\pm$ 0.7	3.9 $\pm$ 0.8	16.7 $\pm$ 2.3	16.0 $\pm$ 2.4	16.7 $\pm$ 2.4	15.4 $\pm$ 2.5	15.6 $\pm$ 2.4	15.7 $\pm$ 3.1
Virological non- suppression (n=38)	3.9 $\pm$ 0.7	3.7 $\pm$ 1.0	17.2 $\pm$ 1.9	16.2 $\pm$ 2.1	16.2 $\pm$ 2.1	15.6 $\pm$ 2.1	15.7 $\pm$ 2.0	15.7 $\pm$ 3.2
Moderate to severe depression (N=50)	3.2 $\pm$ 0.7	3.2 $\pm$ 0.9	13.0 $\pm$ 3.1	12.6 $\pm$ 2.5	14.3 $\pm$ 2.4	12.6 $\pm$ 2.2	13.3 $\pm$ 2.4	12.7 $\pm$ 3.0
Virological suppression (n=39)	3.2 $\pm$ 0.7	3.3 $\pm$ 0.9	13.8 $\pm$ 2.8	12.8 $\pm$ 2.3	14.9 $\pm$ 2.2	12.9 $\pm$ 2.2	13.4 $\pm$ 2.4	13.1 $\pm$ 2.9
Virological non- suppression (n=11)	2.9 $\pm$ 0.9	2.8 $\pm$ 0.9	10.3 $\pm$ 2.6	11.9 $\pm$ 2.9	12.3 $\pm$ 2.0	11.6 $\pm$ 2.0	13.0 $\pm$ 2.5	11.5 $\pm$ 3.4

Table 1. Comparing the quality of life among (QoL) PLWH based on depression status and virological outcomes.

**Conclusions:** PLWH with elevated rates of depression had lower QoL scores and were higher rates of virological non-suppression. Prioritizing mental health care is essential to improve health outcomes and quality of life in PLWH.

### The risk profile of people living with HIV switched to Dolutegravir who gain clinically significant weight at a large program HIV clinic in Uganda

E.A. Laker Odongpiny<sup>1,2</sup>, B. Otaalo<sup>1</sup>, J. Musaaizi<sup>3</sup>, E.A. Nalugga<sup>3</sup>, M. Kesby<sup>2</sup>, A. Ddungu<sup>1</sup>, N. Owarwo<sup>1</sup>, B. Castelnuovo<sup>3</sup>, A. Semeere<sup>1</sup>, M. Holden<sup>2</sup>, D. Sloan<sup>2</sup>, C. Sekaggya<sup>3</sup>

<sup>1</sup>Infectious Diseases Institute, Prevention, Care and Treatment Department, Kampala, Uganda, <sup>2</sup>University of St. Andrews, School of Medicine, Fife, United Kingdom, <sup>3</sup>Infectious Diseases Institute, Research Department, Kampala, Uganda

**Background:** Weight gain has been described for people living with HIV (PLWH) switched to integrase strand transfer inhibitors. It is important to understand which PLWH are at risk of significant weight gain ( $\geq 10\%$  of their baseline) and prioritize them for weight reduction initiatives. We conducted a retrospective analysis in the programmatic setting among PLWH who were switched to Dolutegravir (DTG) at the Infectious Diseases in Uganda to determine those at risk.

**Methods:** Socio-demographic and clinical data was extracted from the electronic database for the period February 2017-December 2022. We included all PLWH who had been on Efavirenz (EFV), Nevirapine (NVP), and Protease Inhibitors (PIs) (Atazanavir ATV/r and Lopinavir LPV/r) for at least 24 months, with a viral load  $< 1000$  copies/ml, and were on DTG for at least 12 months. We carried out a cox-proportional regression analysis at 95% level of significance.

**Results:** Of the 5,323 PLWH included in the analysis, at the time of switch 3,138 (58.9%) were female, the median age was 45 years (IQR; 40-52), 3130 (58.8%) were previously on EFV, 1558 (29.3%) on NVP, and 635 (11.9%) on PI. Median duration on previous ART was 8.9 years (IQR; 6.0 - 12.8), 2,570 (48.7%) had a BMI between 18.5-24.9 kg/m<sup>2</sup> with a median of 24.3 kg/m<sup>2</sup> (IQR; 21.3 - 28.1).

The cumulative risk of  $\geq 10\%$  weight gain at 24 months was 32.3% (IQR; 30.4% - 34.3%). The median weight change in the general cohort at 24 months was 1.9 kg (IQR; -1.2 - 5.1) and in those who had  $\geq 10\%$  weight gain, it was 5.3 kg (IQR; 1.2 - 9.4).

PLWH were more likely to gain weight if they were previously on EFV or PI (adjusted Hazard Ratio (aHR) 1.52; 95% Confidence Interval (CI) 1.30-1.78 and aHR 1.79; 95% CI 1.41 - 2.29 respectively), were female (aHR 1.68; 95% CI 1.48 - 1.90) or had BMI  $< 18.5$  kg/m<sup>2</sup> (aHR 1.64; 95% CI 1.35 - 2.00). Those who had a BMI  $\geq 25.0$  kg/m<sup>2</sup> were less likely to put on weight (aHR 0.70; 95% CI 0.61-0.81).

**Conclusions:** Females, those previously on PIs and EFV are more likely to put on significant weight and could be prioritized for weight reduction initiatives.

**Background:** Increased prevalence of obesity is observed globally. Weight gain is a multifactorial process associated with demographics, diet, exercise, psychological and clinical comorbidities, and co-medications. Increased prevalence of obesity has also been observed among PWH, but the role of HIV treatment on weight gain is unclear.

This study evaluates weight change over 5 years in PWH compared to the general population, utilizing robust propensity score methodologies.

**Methods:** The HIV-HEART (HIVH; PWH cohort) and Heinz Nixdorf Recall Study (HNR: general population cohort) are prospective studies assessing cardiovascular risk using similar methodologies in the Ruhr area of Germany. HIVH and HNR cohorts were matched 1:1 using propensity score (PS) methods. The covariates in the PS matched model included: age, sex, diabetes mellitus, blood pressure, lipids, smoking, and physical activity. Linear regression models were used to estimate differences in 5-year weight change parameters between HIVH and HNR cohorts.

**Results:** After matching the cohorts, there were 624 participants in HIVH- and HNR each (17.6% female participants). Covariates used in the PS matching were well balanced [Figure].

Linear regression analysis showed lower baseline weight (-6.6kg [95%CI -8.12;-4.65]), and BMI (-2.8kg/m<sup>2</sup> [95%CI -3.3;-2.3]) in the HIVH cohort. Five-year changes in weight and body-mass-index (BMI) were modestly higher in HIVH compared to HNR (Figure): +0.8kg (95%CI 0.15;1.44); +1.15% (95%CI 0.36;1.94).

On average, the HIVH cohort had lower 5-year weight (HIVH: 80.5kg vs. HNR: 85.4kg) and BMI (HIVH: 26.2±5.1kg/m<sup>2</sup> vs. HNR: 28.4±4.7kg/m<sup>2</sup>).

		HIVH (prevalence ~ age at B1, sex at B1, smoking at B1, DM at B1, LDL/HDL/Chol at B1, syst/dia. BP at B1, phys. activity at B1, PS matched, PS matching (greedy alg. exact: 100))							
		Baseline				5-Year Follow-Up

weight-to-hip ratio		624	0.91 ± 0.07	624	0.93 ± 0.03	415	0.93 ± 0.14	624	0.97 ± 0.08
smoking	yes	624	262 (42.0%)	624	240 (38.5%)	616	279 (45.3%)	622	196 (31.5%)
physical exercise	yes	624	148 (23.7%)	624	141 (22.6%)	425	68 (16.2%)	622	243 (39.2%)
mean changes within 5 years									
standardized abs. weight	(kg)					624	2.05 ± 5.66	624	1.20 ± 5.89
standardized rel. weight	(%)					624	2.77 ± 7.50	624	1.62 ± 6.06
standardized abs. BMI	(kg/m <sup>2</sup> )					624	0.34 ± 7.21	624	0.51 ± 5.88
standardized rel. BMI	(%)					624	3.08 ± 8.75	624	2.40 ± 6.09
Linear Reg. relation						R [95%CI]			
weight at baseline (kg)						-6.6 [-8.3 to -4.9]			
BMI at baseline (kg/m <sup>2</sup> )						-2.8 [-3.3 to -2.3]			
abs. weight diff. after 5 years (kg)						1.8 [0.2 to 3.5]			
rel. weight diff. after 5 years (%)						1.2 [0.3 to 2.1]			

**Conclusions:** PWH had lower weight and BMI compared to the general population at baseline. Propensity score matched participants in both cohorts gained weight over 5 years.

Despite the significantly greater weight gain by 1% in PWH compared to the general population, the 5-year gains were modest (+160 grams/year) and likely not clinically meaningful. After 5 years, weight in PWH still remains less than in the general population.

### Hypertension management and risk of dementia in people with and without HIV infection

J. Lam<sup>1</sup>, C. Hou<sup>2</sup>, C. Lee<sup>1</sup>, Z. Samiezade-Yazd<sup>1</sup>, T. Levine<sup>1</sup>, M. Horberg<sup>3,4</sup>, D. Satre<sup>1,5</sup>, M. Silverberg<sup>1,4,6</sup>

<sup>1</sup>Kaiser Permanente Northern California, Division of Research, Oakland, United States, <sup>2</sup>Kaiser Permanente Northern California, South San Francisco Medical Center, South San Francisco, United States, <sup>3</sup>Kaiser Permanente Mid-Atlantic States, Mid-Atlantic Permanente Research Institute, Rockville, United States, <sup>4</sup>Kaiser Permanente Bernard J. Tyson School of Medicine, Department of Health Systems Science, Pasadena, United States, <sup>5</sup>University of California San Francisco, Weill Institute for Neurosciences, Department of Psychiatry and Behavioral Sciences, San Francisco, United States, <sup>6</sup>University of California San Francisco, Department of Epidemiology and Biostatistics, San Francisco, United States

**Background:** Hypertension is a well-established risk factor for dementia. Few studies have examined how the degree and duration of hypertension control may affect dementia risk among people living with HIV.

**Methods:** We conducted a retrospective cohort study of demographically matched people with and without HIV who were members of a large US healthcare system be-

Oral

Index

tween 7/1/2013 and 12/31/2021. Included individuals were  $\geq 50$  years old and had a hypertension diagnosis but no dementia diagnosis in the electronic health record. People with HIV were additionally required to have  $\geq 1$  antiretroviral therapy prescription fill.

Hypertension control was calculated using a novel disease management index (DMI) which captured the degree and duration above the hypertension treatment goals of systolic blood pressure (SBP)  $< 140$  mmHg and diastolic blood pressure (DBP)  $< 90$  mmHg (based on clinical guidelines during the study period). DMI values ranged from 0% to 100% (perfect control); hypertension was considered "inadequately controlled" if DMI  $< 80\%$  (i.e., not in control for at least 80% of the time).

Annual, time-updated DMI was calculated separately for SBP and DBP. The outcome of interest was incident dementia, identified using ICD codes. The associations of annual SBP and DPB control with incident dementia were evaluated using extended Cox regression models, accounting for sociodemographics, substance use, body mass index, depression, anxiety, cardiovascular disease, diabetes, and outpatient visit frequency.

**Results:** The study included 3,026 people with HIV (mean age: 58.3 years, 90.0% men) and 66,016 people without HIV. During follow-up, 83 people with HIV and 2,480 people without HIV were diagnosed with dementia. Each year of inadequate SBP control was associated with greater dementia risk in both people with HIV (adjusted hazard ratio [aHR]=1.27, 0.93-1.65) and people without HIV (aHR=1.28, 1.22-1.35; p-interaction=0.75).

Similarly, inadequate DBP control was also associated with greater dementia risk in both people with HIV (aHR=1.42, 0.87-1.97) and people without HIV (aHR=1.75, 1.53-1.98; p-interaction=0.35).

	People with HIV N=3,026 aHR (95% CI)	People without HIV N=66,016 aHR (95% CI)	p for interaction
Each year of inadequate SBP control	1.27 (0.93-1.65)	1.28 (1.22-1.35)	0.75
Each year of inadequate DBP control	1.42 (0.87-1.97)	1.75 (1.53-1.98)	0.35

**Conclusions:** Findings suggest the association of inadequate hypertension control with greater dementia risk is similar by HIV status. Stronger associations of DBP control with dementia will be important to investigate further.

## WEPEB089

### Prevalence and risk factors of chronic kidney disease among people living with HIV older than 50 years at Newlands Clinic, Zimbabwe

C. Chimbetete<sup>1</sup>, C. Taderera<sup>1</sup>, T. Shamu<sup>1,2</sup>

<sup>1</sup>Newlands Clinic, Harare, Zimbabwe, <sup>2</sup>University of Bern, Institute of Social and Preventive Medicine, Bern, Switzerland

**Background:** Renal dysfunction is independently associated with morbidity and mortality among people living with HIV (PLHIV). Elderly PLHIV face numerous health challenges including deterioration of kidney function due to multiple risk factors. We assessed the burden of chronic kidney disease (CKD) and its associated risk factors among PLHIV older than 50 years enrolled in an HIV treatment program in Zimbabwe in 2024.

**Methods:** Routinely collected patient data were exported from the clinic's electronic records to excel and analyzed using Stata version 16.1. Kidney function was assessed by estimated glomerular filtration rate (eGFR) calculated using the chronic kidney disease epidemiology collaboration (CKD-EPI) equation.

We defined CKD as  $\geq 2$  eGFR measurements  $< 60$  mL/min/1.73m<sup>2</sup> for  $\geq 3$  months and determined the prevalence of moderate, and severe kidney dysfunction among participants with CKD defined as eGFR  $< 60$ , and  $< 30$  mL/min/1.73m<sup>2</sup>, respectively. We used multivariable logistic regression to determine factors associated with CKD.

**Results:** Among 2 472 adults aged  $> 50$  years, 1 517 (61%) were female and 955 (39%) were male. The median age was 57 years (Interquartile range (IQR): 53-62) and the median BMI was 26 (IQR: 23-31). The median nadir CD4 cell count was 180 cells/mm<sup>3</sup> (IQR: 93-330) and median duration of antiretroviral therapy (ART) was 14 years (IQR: 9.8-17.4), 99% had a viral load of  $< 1000$  copies/mL. Hypertension was common (n=1389, 56%).

A total of 502 (20.3%) had CKD. Among participants with CKD, 465 (92.6%) and 37 (7.4%) had moderate and severe CKD, respectively. Hypertension (aOR 1.6, 95%CI 1.3-2, p $< 0.001$ ), was the most significant risk factor associated with CKD (Figure 1).

Figure. Forest plot showing adjusted odds ratios of having chronic kidney disease (eGFR  $< 60$  mL/min/1.73m<sup>2</sup>).

**Conclusions:** Our data show a high burden of CKD among elderly PLHIV highlighting the need for routine renal function monitoring. Early ART initiation and adequate control of hypertension and HIV may play a role in improving renal function in elderly PLHIV.

Improving cervical cancer screening and treatment outcomes for women living with HIV utilizing virtual and social media platforms in Zambézia Province, Mozambique

J. Tique<sup>1</sup>, M. Bravo<sup>1</sup>, E. Graves<sup>2</sup>, C. De Schacht<sup>3</sup>, T. Ntasis<sup>4</sup>, D. Correia<sup>5</sup>, J. Matsimbe<sup>6</sup>, B. Castolino<sup>6</sup>, C. Verissimo<sup>7</sup>, C.W. Wester<sup>2,8</sup>

<sup>1</sup>Friends in Global Health (FGH), Clinical Department, Maputo, Mozambique, <sup>2</sup>Vanderbilt University Medical Center, Institute for Global Health (VIGH), Nashville, United States, <sup>3</sup>Friends in Global Health (FGH), Evaluations Department, Maputo, Mozambique, <sup>4</sup>Friends in Global Health (FGH), Maputo, Mozambique, <sup>5</sup>Centers for Disease Control and Prevention, Maternal and Child Health (MCH), Maputo, Mozambique, <sup>6</sup>Friends in Global Health (FGH), Clinical Department, Quelimane, Mozambique, <sup>7</sup>Ministry of Health, Provincial Health Directorate of Zambézia, Quelimane, Mozambique, <sup>8</sup>Vanderbilt University Medical Center, Department of Medicine, Division of Infectious Diseases, Nashville, United States

**Background:** Cervical cancer (CC) is a leading cause of cancer-related deaths among women in sub-Saharan Africa, including Mozambique, particularly those living with HIV. In Mozambique, CC is the most frequent cancer among women over 25 years of age.

We report the impact of a capacity-building intervention utilizing virtual and social media platforms as training tools to enhance early identification of pre-cancerous/cancerous lesions among women living with HIV (WHIV) in Zambézia Province, Mozambique.

**Description:** We used a conceptual framework for quality improvement to understand barriers to CC screening, design and implement interventions. Lack of continuous training for nurses was the main barrier identified. Interventions commenced in October 2022, including virtual training sessions using Zoom-application and weekly training via WhatsApp groups, during which teaching images were shared and discussed on how to identify squamous columnar junction, transformation zone, low- and high-grade lesions, and characteristics of cervixes with malignant transformation(s).

Concomitantly, access to thermocoagulation treatment was expanded. We analyzed aggregated data from 140 health facilities describing trends in WHIV undergoing screening via visual inspection with acetic acid, and in WHIV diagnosed with abnormal lesions and receiving treatment, comparing the periods October 2021-September

2022 (12 months pre-implementation) and October 2022-September 2023 (12 months during-implementation).

**Lessons learned:** During the implementation period, 38 virtual (Zoom) trainings and 38 weekly WhatsApp sessions were done involving 144 Maternal and Child Health nurses, with average participation rates of 30% (mainly due to challenges related to inconsistent internet access at peripheral sites) and 72%, respectively. Pre-implementation, 3,754 (3.5%) of 106,301 screened WHIV were identified with pre-cancerous lesions, with 3,082 (82%) receiving treatment: predominantly cryotherapy (73%), also via thermocoagulation (20%) and/or loop electrosurgical excision procedure (LEEP) (7%).

During intervention, there was a 3.5-fold increase in yield, with 12,267 (13%) of 94,405 screened WHIV identified with pre-cancerous lesions, and a 13% increase in proportion receiving treatment (93%), 18% via cryotherapy, 79% via thermocoagulation and 3% via LEEP.

**Conclusions/Next steps:** Using continuous virtual training, we saw an improved CC pre-cancerous lesions identification. The success of this approach underscores the potential of leveraging clinical quality improvement methods and m-health technology in resource-constrained settings.

## WEPEB091

Inside out: inflammation in acute HIV predicts persistent depressive symptoms despite antiretroviral therapy

J.V. Chavez<sup>1</sup>, K. Cho<sup>2</sup>, J. Bolzenius<sup>2</sup>, J. Mannarino<sup>2</sup>, C. Saccalan<sup>3,4</sup>, P. Chan<sup>5</sup>, S. Farhadian<sup>5</sup>, L. <sup>1</sup>Florida International University, Environmental Health Sciences, Miami, United States, <sup>2</sup>University of Missouri - St. Louis, Missouri Institute of Mental Health, St. Louis, United States, <sup>3</sup>SEARCH Research Foundation, Bangkok, Thailand, <sup>4</sup>Chulalongkorn University, Faculty of Medicine, Bangkok, Thailand, <sup>5</sup>Yale University School of Medicine, Yale Center for Brain and Mind Health, New Haven, United States, <sup>6</sup>Walter Reed Army Institute of Research, U.S. Military HIV Research Program, Silver Spring, United States, <sup>7</sup>Henry M. Jackson Foundation for the Advancement of Military Medicine, Inc., Bethesda, United States, <sup>8</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>9</sup>Florida International University, Health Promotion and Disease Prevention, Miami, United States

**Background:** Depression is two- to three-times more prevalent among people with HIV (PWH) and is associated with increased mortality risk despite suppressive antiretroviral therapy (ART). Although pathophysiological alterations during acute HIV acquisition (AHA) could

have long-term neuropsychiatric consequences, scant research has examined depressive symptom trajectories post ART initiation.

**Methods:** RV254/SEARCH010 is an AHA cohort in Bangkok, Thailand. Participants undergo extensive clinical phenotyping, including self-reported depressive symptom severity, during AHA and following ART initiation.

Hierarchical density-based spatial clustering with uniform manifold approximation and projection was used to examine depressive symptom trajectories over 96 weeks. ANOVA and chi-square tests examined the associations of demographic, clinical, behavioral, and inflammatory correlates of persistent depressive symptom trajectories. Logistic regressions were conducted to estimate odds ratios.

**Results:** A total of 443 participants were included in the analysis. The median age of participants was 27, and more than half reported having a bachelor's degree or higher. Ninety-eight percent of the sample identified as sexual minority men.

Nearly one-in-five participants (19%) reported methamphetamine use, 15% reported amyl nitrite (e.g., popper) use, and 8% reported using erectile dysfunction (ED) medications during the AHA visit. Two clusters emerged through machine learning analyses.

Cluster 1 (n=258, 58%) included participants who started with depressive symptoms that exceeded the screening threshold for a depressive disorder over 96 weeks.

Cluster 2 (n=185, 42%) included participants who started with low levels of depressive symptoms that continued to decline post-ART initiation. The odds of persistent depressive symptoms were higher among participants who reported ED med use (OR = 2.855, 95% CI=1.048, 7.778) and popper use (OR = 2.388; 95% CI=1.169, 4.877).

Additionally, the odds of persistent depressive symptoms increased for every 1 unit increase in log plasma viral load (OR = 1.272; 95% CI= 0.988, 3.353) and sTNFaR2 (OR=1.229, 95% CI=1.039, 1.453).

**Conclusions:** Half of participants reported persistent depressive symptoms over 96 weeks, despite early ART intervention. Greater systemic inflammation, higher plasma viral load, and chemsex drug use at the AHA visit were associated with persistent depressive symptom trajectories over 96 weeks of suppressive ART. AHA may represent a critical setpoint where biobehavioral factors have long-term mental health consequences.

Research and Evaluation (CORE), Montreal, Canada,

<sup>3</sup>McGill University, Department of Psychiatry, Montreal,

Canada, <sup>4</sup>McGill University, Department of Epidemiology, Biostatistics & Occupational Health, Montreal,

Canada, <sup>5</sup>McGill University, Department of Neurology & Neurosurgery, Montreal Neurological Institute, Montreal,

Canada, <sup>6</sup>McGill University, School of Physical and Occupational Therapy, Montreal, Canada

**Background:** Frailty occurs earlier in those living with HIV compared to the general population, and its diagnosis often necessitates specialized training and functional tests.

This study aimed to estimate how well a selected range of sociodemographic, clinical, and medication-related factors can predict the risk of physical frailty in a population of people aging with HIV, potentially aiding in clinical decisions and early interventions.

**Methods:** Utilizing baseline data from the Positive Brain Health Now study, our analysis involved 824 adults, predominantly male (85%) with a mean age of 53. Physical frailty was evaluated using a modified Fried's Frailty Phenotype, with scores  $\geq 3$  indicating frailty. We considered a broad spectrum of sociodemographic, lifestyle, physiological, and clinical predictors.

The cohort was divided into 80% training and 20% testing groups. Feature selection was performed using machine learning and statistical methods, leading to model development via logistic regression, random forest, extreme gradient boosting, and neural networks.

Model performance was gauged using metrics like F-beta and AUC-ROC, with calibration checked by Brier scores and calibration plots. Decision Curve Analysis was applied to determine the models' clinical benefit.

**Results:** In our cohort, frailty prevalence was 16%. The most effective predictive model was a logistic regression derived through Learning Vector Quantization feature selection.

Key predictors, ranked by importance, included weakness, anticholinergic burden, numbness, alcohol use, education, slim limbs, antidepressant use, anxiety/depression, comorbidity count, non-antiretroviral medication count, HIV duration, and albumin levels. The model demonstrated acceptable discrimination in the test set (F-beta = 0.65,

AUC = 0.84, Sensitivity = 0.84, Specificity = 0.71). A Brier score of 0.11 and a calibration plot confirm the model's reasonable accuracy, with a mean absolute error of 0.074. Decision Curve Analysis revealed the model's clinical utility, offering benefits over non-intervention, although it did surpass the "treat-all" strategy at any point.

**Conclusions:** The model demonstrated robust discriminative ability in predicting concurrent physical frailty using readily available variables. Given the calibration and decision curve outcomes, its clinical utility is optimally positioned as a decision support tool for low-cost and low-harm interventions. Further research should focus on external validation and refining the model's calibration.

## WEPEB093

### Association of depression with non-adherence to antiretrovirals and to co-medications in older adults living with HIV in Brazil

T.S. Torres<sup>1</sup>, P.M. Luz<sup>1</sup>, V.I. Avelino-Silva<sup>2</sup>, M.J.R. Aliberti<sup>2</sup>, R.S. Nogueira<sup>3</sup>, G. Haimowski<sup>3</sup>, C. Brites<sup>4</sup>, T. Cordeiro<sup>4</sup>, S.W. Cardoso<sup>1</sup>, B. Grinsztejn<sup>1</sup>, J.L. Castilho<sup>5</sup>, ELEA-Brasil  
<sup>1</sup>Instituto Nacional de Infectologia Evandro Chagas, Fiocruz, Rio de Janeiro, Brazil, <sup>2</sup>Universidade de São Paulo, Faculdade de Medicina, São Paulo, Brazil, <sup>3</sup>Centro de Referência e Treinamento DST/AIDS-SP, São Paulo, Brazil, <sup>4</sup>Universidade Federal da Bahia, Hospital Universitário Professor Edgard Santos - HUPES, Salvador, Brazil, <sup>5</sup>Vanderbilt University Medical Center, Division of Infectious Diseases, Nashville, United States

**Background:** Older people living with HIV (OPWH) often experience multimorbidity, including non-communicable diseases and mental health disorders, leading to a high prevalence of polypharmacy. Depression is a highly prevalent condition in this population, with potential impact in adherence to antiretroviral therapy (ART) and to co-medications. We explored the associations of depression with non-adherence to ART and to co-medications among OPWH in Brazil.

**Methods:** We enrolled OPWH aged ≥50 years on antiretroviral therapy in four outpatient clinics located in three Brazilian cities. Our main outcomes were non-adherence to ART and to co-medications based on self-report of a missing ≥1 dose in the past four days. Our main exposure was depressive symptoms, measured by the Patient Health Questionnaire (PHQ-9; scores range 0-27; higher scores correspond to higher depression symptoms). Logistic regression models were used to estimate the associations between PHQ-9 scores and study outcomes adjusted for site, gender, race, income, substance use (any use in past 3 months), alcohol consumption (>weekly use in past 3 months) and polypharmacy (≥5 medications). We also quantified the association between non-adherence to ART and non-adherence to co-medications using logistic regression model.

**Results:** Of 703 OPLWH included, mean age was 62 years; 63% were cisgender men, 35% cisgender woman, and 2% transgender women. Most were non-white (55%), <12 years of education (60%), low income (42%, <USD480/month), polypharmacy (72%); 9% and 29% reported substance use and alcohol consumption, respectively. Median PHQ-9 score was 3(IQR:1-7); 16% score ≥10 (≥moderate depression symptoms). Prevalence of non-adherence to ART and to co-medications were 9% and 21%, respectively. Non-adherence to co-medications was strongly associated with non-adherence to ART (OR12.65, 95%CI:7.13-23.31). In multivariable models, non-adherence to ART was associated with PHQ-9 scores depression (aOR1.07, 95%CI:1.02-1.12; per 1-point increase) and substance use (aOR2.42, 95%CI:1.07-5.13). Non-adherence to co-medications was also significantly associated with depression (aOR1.08, 95%CI:1.04-1.12) and polypharmacy (aOR2.58, 95%CI:1.47-4.75).

**Conclusions:** We observed low rates of non-adherence to ART but higher rates of non-adherence to co-medications among OPWH in Brazil. Providers should deliver comprehensive adherence counseling to OPWH on polypharmacy. HIV care services should include screening for depression among OPWH to provide mental health treatment and adherence support.

**Background:** Life expectancy improvement for people living with HIV is coming up against the problems associated with aging and chronic diseases. Frailty is a concern affecting a growing number of patients, particularly the elderly in this population.

Our study aimed to determine the prevalence of frailty and its predictors on people living with HIV aged 50 years and older followed at the Outpatient Treatment Clinic (CTA) in Dakar.

**Methods:** We conducted a cross-sectional study of descriptive and analytic purposes ranging from November 2022 to August 2023, in CTA, Dakar (Senegal). We included people living with HIV aged 50 years and older under antiretroviral therapy for at least 6 months (≥ 6 months).

Frailty was considered according to Fried criteria with a score  $\geq 3$ . To identify the predictors of frailty, we performed a multivariate logistic regression analysis using STATA software version 18.

**Results:** We included 199 patients. The median age at the moment of the study was 58 years old [50-91] with a sex ratio (M/F) of 0.58. The most representative age group was that of [50-59] years (59.3%). HIV-1 profile was most common in 89.45%. The median duration under antiretroviral therapy was 180 months [6-284] and 94% of patients received a Tenofovir Diproxyl Fumarate (TDF)-containing regimen with 43% of them for at least 10 years.

Viral load was undetectable ( $\leq 40$  copies/ml) in 98% of cases. WHO Stage III was more common at inclusion and 55.78% had nadir TCD4+ Lymphocyte counts  $< 200$  elements/mm<sup>3</sup>. In our study, 80% of patients underwent at least one comorbidity ( $\geq 1$ ) and 31% of patients had poly-medication ( $\geq 5$ ). Nutritional disorder was found in 65 patients.

Frailty and prefrailty appeared in 28% and 36% of cases respectively. In multivariate analysis, nutritional disorder [aOR=3.8 (2.3-6.4)], length of TDF-containing regimen exposure  $\geq 10$  years [aOR=29.03 (9.5-89.7)], and polypharmacy [aOR=1.53 (1.1-2.12)] were associated with frailty.

**Conclusions:** Our study confirms the high prevalence of frailty among older people living with HIV. Its prevention should consider the management of comorbidities and the implementation of non-pharmacological interventions such as nutrition.

Incidence, predictors and health outcomes associated with cognitive frailty in people ageing with HIV

S.F. Hisham<sup>1</sup>, K. Hasmukharay<sup>2</sup>, M. Neelamegam<sup>3</sup>, X.W. Tan<sup>1</sup>, S.F. Syed Omar<sup>1</sup>, A. Kukreja<sup>1</sup>, H.C. Ong<sup>1</sup>, S.A. Abdul Aziz<sup>4</sup>, S.B. Kamaruzzaman<sup>2</sup>, M.L. Chong<sup>1</sup>, P.L. Wong<sup>1</sup>, R. Rajasuriar<sup>1</sup>

<sup>1</sup>University Malaya, Department of Medicine and Centre of Excellence for Research in AIDS, Kuala Lumpur, Malaysia, <sup>2</sup>University Malaya, Department of Medicine, Kuala Lumpur, Malaysia, <sup>3</sup>The University of North Texas, School of Public Health, Fort Worth, United States, <sup>4</sup>National University of Malaysia, Department of Clinical Pharmacy, Kuala Lumpur, Malaysia

**Background:** Cognitive frailty (CF) is associated with an increased risk of dementia, disability and mortality but little is known about this construct among people with HIV (PWH). We explored the incidence, predictors and health outcomes associated with CF in ageing PWH.

**Methods:** 180 PWH on antiretroviral therapy (ART) and under routine HIV care in University Malaya Medical Centre, Malaysia and 81 controls (all  $\geq 25$  years) were prospectively assessed for frailty, cognitive function and health out-

comes at two time-points; 2014-2016 (baseline) and 2020-2023 (follow-up). Incident CF was defined as the new onset of frailty ( $\geq 2$  Fried's criteria) and impaired Montreal cognitive assessment (MoCA) scores (global deficit score  $\geq 0.5$ ) at follow-up in participants without clinical dementia.

Multivariate logistic regression was performed to assess baseline factors predicting the simultaneous worsening of MoCA and frailty scores during follow-up and to assess the association of CF with outcomes of quality of life (CASP-19), mortality risk scores (VACS 1.0) and disability (WHODAS 2.0).

**Results:** All 261 participants were followed-up and the median (interquartile range, IQR) duration between visits was 7 (6-7) years. Median (IQR) age at baseline among PWH and controls were 43 (36-50) and 45 (31-53) years, respectively. 83% of PWH and 56% of controls were males. CF incidence was higher in PWH vs controls (4.53 vs 2.22 per 100 person-years). Male sex, lower stress scores, lower HDL, lower grip strength and lower haemoglobin levels independently predicted declines in both physical and cognitive health in PWH (Figure 1). CF in PWH was associated with greater disability but not poorer QoL and increased mortality risks.

\* Stepwise logistic regression: Other factors included in the model but not significant were age, ethnicity, social isolation score, depression score, anxiety score, nutrition score, BMI, blood pressure, appendicular skeletal muscle mass, baseline and current CD4, AIDS-defining illness, CD4 CD8 ratio, hepatitis C and B status, total number of comorbidities, total number of medications, eGFR, fasting glucose, HbA1c, LDL, total cholesterol, triglycerides, total protein, hsCRP, CVD risk.  
\* Multivariate logistic regression: Adjusted for age, sex and ethnicity

Figure 1.

**Conclusions:** Ageing PWH on stable ART experience an increased risk of CF which negatively impacts their functional ability. Modifiable factors, potentially amenable to lifestyle interventions, predicted declines in physical and cognitive health among PWH. The unexpected protective role of stress against CF needs further investigation.

An assessment of clinical frailty and early aging among a cohort of people living with HIV in Ontario, Canada

N. Bauer<sup>1,2</sup>, S. Hillier<sup>3</sup>, K. O'Brien<sup>2</sup>, L. Light<sup>2</sup>, L. Sirisegaram<sup>4</sup>, A. Kroch<sup>2</sup>

<sup>1</sup>University of Toronto, Temerty Faculty of Medicine, Toronto, Canada, <sup>2</sup>Ontario HIV Treatment Network (OHTN), Toronto, Canada, <sup>3</sup>York University, School of Health Policy & Management, Toronto, Canada, <sup>4</sup>University Health Network and Sinai Health Systems, Division of General Internal Medicine and Geriatric Medicine, Department of Medicine, Toronto, Canada

**Background:** In order to meet the UNAIDS targets, focus must be placed on quality of life for older adults living with HIV (OALWH). OALWH experience earlier biologic aging and have an increased risk of aging-associated cognitive and physical comorbidities. Aging involves complex biopsychosocial factors which interact to yield a clinical phenotype of frailty.

In this analysis, we used a cumulative deficit model to examine frailty in a cohort of OALWH.

**Methods:** The OHTN Cohort Study (OCS) is an open longitudinal cohort of people living with HIV at 15 clinical sites in Ontario, Canada, with currently over 5000 people under active follow-up.

The study includes data abstraction from clinical records, laboratory reports, and an annually administered questionnaire. We identified clinical frailty using the modified frailty index (mFI), approximated with aggregations of ICD-10 codes from diagnostic records. Presentation of a frailty related condition contributes to a frailty score. A score of 0 represents no clinical frailty, 1-2 is pre-frailty, and  $\geq 3$  is clinical frailty.

**Results:** Data from 6582 participants and diagnostic reports from 1940-2018 were included. Overall, the median age was 51. 52.4% had no indicators of frailty, 41.6% had pre-frailty (median age 44), and 6.0% had clinical frailty (median age 55). The frailty indicators with the highest prevalence were COPD/pneumonia (17.0%), impaired sensorium (15.4%), non-independent functional status (13.9%), and hypertension (13.6%).

Females were found to have greater pre-frailty (41.4% vs. 42.7%) whereas males had greater clinical frailty (6.3% vs. 4.3%). Among those who acquired HIV from intravenous drug use (IVDU), there were higher rates of pre-frailty (52.2% vs. 39.5%) and clinical frailty (7.6% vs. 5.7%).

In a multivariate logistic model, IVDU (OR 2.03,  $p < .0001$ ), AIDS (OR 1.58,  $p < .0001$ ), and age (OR 1.04 pre-frailty,  $p < .0001$ ; OR 1.08 clinical frailty,  $p < .0001$ ) were found to be associated with frailty. Adjusted sex and non-white race were not independently associated with frailty.

**Conclusions:** OALWH in Ontario exhibit greater rates of clinical frailty at earlier ages than people living without HIV, predisposing this population to an increased risk of

poor health outcomes. Policy and service providers must aim at better integrating HIV and geriatric care models to effectively support OALWH.

## WEPEB097

Associations between HIV diagnosis and frailty, cognitive impairment, and sarcopenia in Brazilian older adults

M.B. Antonio<sup>1</sup>, M.J.R. Aliberti<sup>2</sup>, L. Hypolito<sup>3</sup>, L. Quintanilha<sup>3</sup>, E. Bau<sup>3</sup>, E.G. Kallás<sup>1</sup>, J.L. Castilho<sup>4</sup>, V. Avelino-Silva<sup>1,5,6</sup>

<sup>1</sup>University of Sao Paulo, Department of Infectious and Parasitic Diseases, Faculdade de Medicina, Sao Paulo, Brazil, <sup>2</sup>University of Sao Paulo, Laboratorio de Investigacao Medica em Envelhecimento (LIM-66), Servico de Geriatria, Hospital das Clinicas HCFMUSP, Faculdade de Medicina, Sao Paulo, Brazil, <sup>3</sup>University of Sao Paulo, Centro de Pesquisas Clinicas 2, Hospital das Clinicas HCFMUSP, Faculdade de Medicina, Sao Paulo, Brazil, <sup>4</sup>Vanderbilt University Medical Center, Nashville, United States, <sup>5</sup>Vitalant Research Institute, San Francisco, United States, <sup>6</sup>University of California San Francisco, Department of Epidemiology and Biostatistics, San Francisco, United States

**Background:** Despite improvements in lifespan, studies suggest that older adults living with HIV (OALH) are at a higher risk of chronic noncommunicable diseases and geriatric syndromes compared to age-matched counterparts.

**Methods:** We enrolled OALH and older adults without diagnosed HIV (OANH) in neighboring outpatient units in Sao Paulo, Brazil, to investigate associations between HIV diagnosis and frailty, cognitive impairment, and sarcopenia. Frailty was assessed using the Fried Phenotype scale (0, not frail; 1-2, pre-frail;  $\geq 3$ , frail). Cognitive impairment was assessed using the Montreal Cognitive Assessment ( $< 10$ , severe impairment; 10-17, moderate; 18-25, mild;  $\geq 26$  normal cognition). Sarcopenia was evaluated using the Short Physical Performed Battery ( $\leq 2$ , sarcopenia; 3-9, possible sarcopenia;  $\geq 10$ , no sarcopenia).

We fit multivariable modified Poisson models for binary outcomes (moderate/severe cognitive impairment; pre-frail/frail condition; possible sarcopenia/sarcopenia) adjusted for age ( $\leq 65$ ; 66-70; 71-75; 76-80;  $> 80$  years old), sex (male/female), race (White/non-white), monthly income ( $\leq 2$ ; 3-6; and  $> 6$  minimum wages), and number of comorbidities.

**Results:** We included 110 OALH and 84 OANH  $\geq 60$  years old between September/2022-October/2023. Compared to OANH, the group of OALH was younger (median age 68 vs. 74;  $p < .001$ ), had a higher percentage of males (62 vs. 29%;  $p < .001$ ), and higher number of comorbidities (median 3 vs. 2;  $p < .001$ ; Table). In multivariable models, HIV status was not significantly associated with cognitive impairment ( $p = 0.104$ ), frailty ( $p = 0.192$ ), or sarcopenia ( $p = 0.340$ ).

Madrid, Spain, <sup>4</sup>Centro Sandoval, Madrid, Spain, <sup>5</sup>Hospital

Universitario German Trias i Pujol, Badalona, Spain, <sup>6</sup>BCN

Checkpoint, Barcelona, Spain

**Background:** Primary HIV infection (PHI) is a period with a high risk of transmission. Thus, rapid antiretroviral therapy (ART) initiation and rapid viral load suppression are essential in this period.

Our aim was to evaluate the efficacy and safety of rapid initiation of bictegravir/emtricitabine/tenofovir alafenamide (BIC/FTC/TAF) treatment during PHI.

**Methods:** Multicenter, single-arm clinical trial in persons with confirmed PHI (<3 months post-infection, documented by seroconversion or incomplete confirmatory serologic tests) starting BIC/FTC/TAF. Primary endpoint was proportion of participants with VL<50 copies/mL at 48-weeks by ITT, according to FDA Snapshot analysis.

**Results:** We included 64 participants, 94% male, median (IQR) age 32 (26;41) y.o.; 78% were MSM and 58% from Europe. At ART initiation, Fiebig stages were II (14%), III (11%); IV (5%), V (54%) and VI (16%); median (IQR) VL was 496,520 (110,000;1,285,000) copies/mL (highest VL was 113,000,000 copies/mL); median (IQR) CD4 T cell count was 406 (322;535) cells/ul; 6% had active HBV co-infection. Median (IQR) time between HIV diagnosis and ART initiation was 0 (0;3) days. VL decline was rapid (Figure 1);

Figure 1.

\*Among the following list of comorbidities: hypertension; coronary artery disease; cerebrovascular disease; cardiovascular disease; hyperlipidemia; diabetes; osteoporosis; chronic lung disease; depression; cancer

\*\*Missing five participants without diagnosed HIV

Table: Demographic characteristics, comorbidities, and geriatric syndromes among study participants, by HIV status

**Conclusions:** In this study, we found no significant associations between HIV diagnosis and prevalent frailty, cognitive impairment, or sarcopenia.

Potential limitations include residual confounding; single-site enrollment; small sample size; and limitations of screening instruments. Neighborhood matching may have balanced important social determinants of health that need additional investigation.

Despite these limitations, this is one of the few studies reporting geriatric syndromes in populations living with and without HIV, providing relevant insights to an increasing population of older adults globally.

Figure 2. Efficacy w48 (Snapshot FDA).

81% had undetectable VL at 48-weeks by ITT (figure 2); 52/56 (93%, 95CI:83%;98%) participants who were on-treatment at 48-weeks had VL <50 copies/mL. Adverse events (AE) were common (72% of participants had at least one), but only 3% were grade 3/4; 91% were not-related to BIC/FTC/TAF and none led to discontinuation. Four serious AE were reported, none related to BIC/FTC/TAF.

**Conclusions:** BIC/FTC/TAF was associated with rapid virological decline, good safety and tolerability and high virological suppression rates in participants with PHI.

## WEPEB099

Switching to doravirine in the absence of genotypic resistance tests in people living with HIV virally suppressed on antiretroviral treatment at a London HIV clinic

J. Mason<sup>1,2</sup>, M. Kohli<sup>1,2</sup>, I. Maan<sup>1</sup>, Y. Gharib<sup>1,2</sup>, E. Suonpera<sup>1,2</sup>, E. Pool<sup>1,2</sup>, V. Naidu<sup>1,2</sup>, I. Williams<sup>1,2</sup>, L. Waters<sup>1,2</sup>, A. Arenas-Pinto<sup>1</sup>, R. Gilson<sup>1</sup>, S. Pett<sup>1</sup>

<sup>1</sup>University College London, Institute for Global Health, Centre for Clinical Research in Infection and Sexual Health, London, United Kingdom, <sup>2</sup>Central and North West London NHS Foundation Trust, Department of Sexual Health and HIV, London, United Kingdom

**Background:** Doravirine is a non-nucleoside reverse transcriptase inhibitor (NNRTI) recommended for switch and first-line antiretroviral therapy (ART) in major guidelines. Doravirine does not have a high genetic barrier to resistance, and genotypic resistance testing (GRT) pre-switch is recommended. Data on its use without pre-switch GRT is limited.

We describe the outcomes of doravirine use in virologically suppressed patients in routine practice.

**Methods:** Data were extracted from electronic health records of people with HIV prescribed doravirine 12/2019-11/2023 at a London service. Demographics, ART history, GRT, and virological and clinical outcomes were analysed. Virological failure (VF) was defined as  $\geq 2$  detectable HIV viral loads (VL) >200copies/mL or one VL >200copies/mL considered VF clinically.

**Results:** 603 patients were prescribed doravirine: 76% male, 56% White, and median age 50 years (IQR:43-57). Median time on doravirine was 93 weeks (IQR:59-138). 97% (n=586/603) were ART-experienced with a median number of previous regimen changes of 3 (IQR:2-5). Of these, 86% were prescribed as doravirine/emtricitabine/tenofovir-disoproxil fixed-dose combination (FDC).

Emtricitabine/tenofovir-alafenamide FDC plus doravirine was the next most common regimen (6%). For ART-experienced patients, GRT confirming no doravirine resistance was available for 83% (n=488/586) pre-switch. Of these, 95% (n=462/488) maintained continuous virological suppression (VL<50copies/mL), 3% (n=15/488) had viral blips/rebounds and re-suppressed without regimen change, <1% (n=2/488) had low-level viraemia, and 2% (n=8/488) experienced VF; 2 with NNRTI and NRTI resistance. For ART-experienced patients with pre-switch GRT, 23% (n=114/488) switched away from doravirine.

Among those switched to doravirine without baseline GRT (n=98), all were virally suppressed at switch and 62% were already on an NNRTI. 95% (n=93/98) maintained continuous virological suppression; 4% (n=4/98) had viral blips/rebounds and re-suppressed without regimen change. 1 patient with documented poor adherence experienced VF after 93 weeks; subsequent GRT demonstrated NNRTI and NRTI resistance.

23% of ART-experienced without GRT (n=23/98) switched away from doravirine; common reasons included transaminitis (20%), sleep disturbance (16%), and gastrointestinal symptoms (16%).

**Conclusions:** In our clinical practice, doravirine demonstrated safety and efficacy, including in the absence of GRT. Only 1% of virally suppressed patients switching to doravirine without baseline GRT experienced VF, compared to 2% with GRT. However, consequent extensive NNRTI resistance limits future ART options.

## WEPEB100

## Characteristics and outcomes of PLHIV on antiretroviral therapy with viral non-suppression in Vietnam (2018-2023)

H. Phan<sup>1</sup>, N. Do<sup>1</sup>, K. Sulzman<sup>2</sup>, H. Duong<sup>3</sup>, M. Tejan<sup>2</sup>, K.B. Nguyen<sup>4</sup>, C. Nguyen<sup>5</sup>, H. Luong<sup>5</sup>, L.A. Nguyen<sup>1</sup>, T. Nguyen<sup>6</sup>, M.H. Bui<sup>5</sup>, H. Nguyen<sup>4</sup>, T.H. Bui<sup>4</sup>, Q. Nguyen<sup>4</sup>, M. Shah<sup>4</sup>, E. Dziuban<sup>4</sup>, C. Tran<sup>2</sup>

<sup>1</sup>Vietnam Authority of HIV/AIDS Control (VAAC), Ha Noi, Viet Nam, <sup>2</sup>Division of Global HIV & Tuberculosis, US Centers for Disease Control and Prevention, Atlanta, United States, <sup>3</sup>Ho Chi Minh City Center for Disease Control, Ho Chi Minh, Viet Nam, <sup>4</sup>Division of Global HIV & Tuberculosis, US Centers for Disease Control and Prevention, Ha Noi, Viet Nam, <sup>5</sup>Division of Global HIV & Tuberculosis, US Centers for Disease Control and Prevention, Ho Chi Minh, Viet Nam, <sup>6</sup>Ho Chi Minh City Department of Health, Ho Chi Minh, Viet Nam

**Background:** While Vietnam has one of the highest HIV viral load (VL) suppression rates globally, the management of people living with HIV (PLHIV) on antiretroviral therapy (ART) with viral non-suppression remains a challenge. Vietnam HIV treatment guidelines recommend repeat VL testing within three months and enhanced adherence counseling (EAC) with non-suppression. We aim to investigate the characteristics, management, and outcomes of PLHIV on ART with viral non-suppression in Vietnam.

**Methods:** Electronic medical records data from HIV treatment sites in five provinces and two cities in Vietnam between January 1, 2018 – July 31, 2023, were analyzed. Participants with unique identifiers and  $\geq 2$  VL results during ART were included in the analysis. VL results were categorized as non-suppressed (VL  $\geq 1,000$  copies/mL) and suppressed (VL  $< 1,000$  copies/mL).

The characteristics of participants with viral non-suppression and their subsequent virologic outcomes were examined. Data for enhanced EAC, available for clients treated in Ho Chi Minh City, was analyzed.

**Results:** Of 46,465 participants included in the analysis, 2,444 (5%) had  $\geq 1$  non-suppressed VL. Of 2,444 participants with  $\geq 1$  non-suppressed VL, 50% were aged 40-59 years and 75% were male.

The median time for those with a first non-suppressed viral load (N= 1,414) to their second viral load measurement was five months (IQR: 4-8 months); 24% of participants received a second VL within the recommended three months.

Of the 2,444 participants with  $\geq 1$  non-suppressed VL, 1,700 (70%) achieved viral suppression at their last VL; 744 (30%) remained non-suppressed.

Among 3,230 participants in Ho Chi Minh City with  $\geq 1$  non-suppressed VL, 2,597 (80%) had no documented EAC sessions, 631 (20%) had  $\geq 1$  EAC session documented and 385 (12%) had  $\geq 2$  EAC sessions documented.

**Conclusions:** In a five-year analysis, only 5% of PLHIV on ART in this study had  $\geq 1$  non-suppressed VL, the majority of whom subsequently achieved viral suppression. The timing of repeat VL testing and the documentation of EAC for participants with non-suppressed VL did not align with national guidelines. Further analyses to understand the impact of interventions for viral non-suppression, including EAC and ART regimen changes, are planned to inform program priorities.

## Prediction of intracellular tenofovir-diphosphate concentrations during pregnancy using a semi-mechanism-based population pharmacokinetic model

Y. Yu<sup>1</sup>, R. Bies<sup>1</sup>, J. Momper<sup>2</sup>, B. Best<sup>2</sup>, M. Mirochnick<sup>3</sup>, R. Heffron<sup>4</sup>, C. Celum<sup>4</sup>, K. Brooks<sup>5</sup>, P. Anderson<sup>5</sup>, M. Marzinke<sup>6</sup>, D. Joseph Davey<sup>7,8</sup>, L. Myer<sup>7</sup>, G. Doncel<sup>9</sup>, C. Hendrix<sup>6</sup>, R. Scott<sup>10,11</sup>

<sup>1</sup>University of Buffalo, Buffalo, United States, <sup>2</sup>University of San Diego, San Diego, United States, <sup>3</sup>Boston Medical Center, Boston, United States, <sup>4</sup>University of Washington, Seattle, United States, <sup>5</sup>University of Colorado Anschutz, Aurora, United States, <sup>6</sup>Johns Hopkins University, Baltimore, United States, <sup>7</sup>University of Cape Town, Cape Town, South Africa, <sup>8</sup>University of California Los Angeles, Los Angeles, United States, <sup>9</sup>Eastern Virginia Medical School, CONRAD, Norfolk, United States, <sup>10</sup>MedStar Health Research Institute, Washington D.C., United States, <sup>11</sup>Georgetown University School of Medicine, Washington D.C., United States

**Background:** Tenofovir(TFV)-based regimens are backbones of HIV treatment and pre-exposure prophylaxis(PrEP) during pregnancy. Multiple cohorts demonstrated decreased dried blood spot (DBS) tenofovir-diphosphate (TFV-dp) concentrations by up to one-third during pregnancy among participants on TFV-disoproxil-fumarate (TDF).

However, there are no published data or mechanism-based models describing concentrations of TFV-dp, the active moiety, inside peripheral blood mononuclear cells (PBMCs) of pregnant individuals receiving TDF or tenofovir-alafenamide (TAF).

**Methods:** Using data from the CONRAD-137 trial, we developed a semi-mechanism-based population pharmacokinetic(PK) model that simultaneously describes plasma TAF, plasma TFV, and PBMC TFV-dp concentrations among non-pregnant, cisgender-women on TAF and TDF. We separately developed population PK models using data from Partners Demonstration Project and International Maternal Pediatric Adolescent AIDS Clinical Trials(IMPACT) network-P1026s to identify the impact of pregnancy (specifically second and third trimesters) on PK parameters.

Using the developed models, we simulated 14 days of daily oral 300mg TDF or 25mg TAF dosing in 1000 virtual individuals, integrating the pregnancy effects. The simulated PBMC TFV-dp concentration reductions were compared to the reduction observed in IMPAACT-2009 DBS TFV-dp concentrations during pregnancy.

**Results:** The simulation of PK in pregnant individuals on TDF showed a 30% reduction of steady-state trough TFV-dp concentrations in PBMC relative to non-pregnant individuals (Figure 1.A). The simulated steady-state trough PBMC TFV-dp concentrations among pregnant individuals on TAF were not distinguishable from those of non-pregnant individuals ( $p=0.92$ ) (Figure 1.B).

Solid lines represent the predicted median pharmacokinetics profile for non-pregnant (black) and pregnant (red) populations. The regions encompass the 5% and 95% percentiles of prediction for non-pregnant (grey) and pregnant (pink) populations. Black dots represent non-pregnant data from CONRAD 137. In Panel B, only pregnant simulation point-estimate (red line) and overlapping 95% confidence band (grayish-pink) are apparent due to complete overlap of pregnant and non-pregnant simulations.

Figure 1. Concentration-time profiles for TFV-dp in non-pregnant and pregnant individuals (A) PBMCs TFV-dp concentration after TDF dosing, (B) PBMCs TFV-dp concentration after TAF dosing.

**Conclusions:** Among pregnant individuals on TDF, our simulation showed a 30% reduction in PBMC TFV-dp concentrations. Increased PrEP failure with TDF-based PrEP in pregnancy has not been reported, but is challenging to evaluate. Among individuals on TDF-based treatment in pregnancy, decreased TFV-dp exposure has not been associated with virologic failure; dose adjustment is not recommended given the presence of a third antiretroviral. Among individuals on TAF during pregnancy, negligible reduction in PBMC TFV-dp concentrations was predicted; evaluation of TAF-based PrEP efficacy in cisgender-women is ongoing.

## WEPEB102

### How OECD HIV clinical guidelines address adherence to antiretroviral therapy: a scoping review

D. Chu<sup>1,2</sup>, K. Engler<sup>1</sup>, T. Schuster<sup>2</sup>, R. Palich<sup>3</sup>, J. Ishak<sup>1</sup>, B. Lebouché<sup>1,2,4</sup>

<sup>1</sup>McGill University Health Centre, Center for Outcomes Research and Evaluation, Research Institute, Montreal, Canada, <sup>2</sup>McGill University, Department of Family Medicine, Faculty of Medicine and Health Sciences, Montreal, Canada, <sup>3</sup>Sorbonne Université, Assistance Publique Hôpitaux de Paris, Pitié-Salpêtrière Hospital, Paris, France, <sup>4</sup>McGill University Health Centre, Chronic Viral Illness Service, Royal Victoria Hospital, Division of Infectious Disease, Department of Medicine, Montreal, Canada

**Background:** Approaches to antiretroviral therapy (ART) adherence abound as to its definition, thresholds, assessment, addressed barriers, and proposed interventions. To gain clarity, this review synthesized these features across HIV clinical guidelines.

**Methods:** A scoping review was conducted. Eligible HIV guidelines and their updates concerned adults with HIV and ART from Organization for Economic Co-operation and Development (OECD) countries and international health organizations. English or French publications since 2017 were included. Three databases were searched in March 2023, along with grey literature in five guideline-specific databases.

A targeted Google search for omitted OECD countries was conducted. Two reviewers participated in document selection and data charting. Content analysis was performed with NVivo software.

**Results:** There were 24 guidelines identified from 7 countries and 2 international health organizations. Only one (8%) provided a definition of ART adherence and none offered a threshold for adequate adherence (one (4%) addressed this topic, noting the lack of a minimum threshold).

However, most guidelines (20;83%) reported interventions for adherence, including reducing pill burden (15;63%), education (13;54%), and peer or social support (13;54%). Nineteen guidelines (79%) highlighted methods to assess adherence, such as clinical assessment with patients (8;33%), viral load monitoring (6;25%), and examining pharmacy records or pill count (5;21%).

Eighteen guidelines (75%) proposed a frequency for assessing adherence, including at each visit (11;46%) and suspected or observed drug resistance or virologic failure (8;33%). Fourteen (58%) guidelines identified adherence barriers, including lifestyle or activities (11;46%), social challenges (10;42%), and health system barriers (9;38%).

**Conclusions:** Despite its centrality to ART's success, this review underscores a conspicuous lack of definition and consensus around adherence and its management. Very few guidelines define adherence, none offer an optimal

threshold, and there is no agreement on how to gauge it. More systematic and preventative approaches to monitoring adherence may be needed.

## WEPEB103

### Early learnings from Zambia's introduction of darunavir/ritonavir (DRV/r) for second-line HIV treatment

M. Mulenga<sup>1</sup>, C. Chimhundu<sup>2</sup>, S. Sivile<sup>3</sup>, D. Kampamba<sup>3</sup>, K. Zyambo<sup>3</sup>, P. Haimbe<sup>1</sup>, Z. Panos<sup>4</sup>, H. Shakwelele<sup>1</sup>, C. Amole<sup>5</sup>, L.B. Mulenga<sup>3</sup>

<sup>1</sup>Clinton Health Access Initiative, Lusaka, Zambia, <sup>2</sup>Clinton Health Access Initiative, Harare, Zimbabwe, <sup>3</sup>Ministry of Health, Lusaka, Zambia, <sup>4</sup>Clinton Health Access Initiative, Nairobi, Kenya, <sup>5</sup>Clinton Health Access Initiative, New York City, United States

**Background:** Zambia was the first country in sub-Saharan Africa to introduce best-in-class Darunavir/ritonavir 400/50mg (DRV/r) for use in second-line (2L) HIV treatment, starting a phased introduction in 2022.

With national scale-up underway, the programme reflects on early learnings to inform further scale-up within Zambia and the broader region.

**Description:** The first phase of Zambia's 2L DRV/r introduction began in 2022 in 15 sites across 3 provinces, prioritizing recipients of care (ROC) failing dolutegravir-based first-line (1L) regimens.

Phase II, starting in early 2023, expanded eligibility to ROC on atazanavir/ritonavir and increased the geographic footprint to 35 sites. National scale-up commenced in late 2023, with approximately 700 ROC on DRV/r by the end of 2023.

Critical components of the successful introduction process included partnerships with communities, through engagement meetings and joint supportive supervision visits and monthly virtual mentoring sessions.

**Lessons learned:** Data collected during supervision visits and interviews with healthcare workers (HCW) and ROC yielded the following lessons:

1. Quality and ongoing training and mentorship is critical to empower HCW to feel confident making switching decisions for 2L ROC, especially amidst HCW attrition;
2. Strengthening enhanced adherence counseling practices can prevent adherence-related treatment failure and shorten time to regimen switch when clinically indicated;
3. Expanding access to point-of-care VL can mitigate delays in laboratory result delivery that slow switching decisions;
4. High prevalence of tuberculosis in ROC failing treatment complicates protease inhibitor (PI) sequencing in absence of access to generic rifabutin;
5. Clients appreciated a reduction in side effects compared to legacy PIs;

6. Early involvement of community groups increased momentum for transition at national and site levels.

**Conclusions/Next steps:** Zambia's introduction of DRV/r in 2L has highlighted the complexities around treatment optimization in treatment-experienced ROC, lessons learned for further scale-up, as well as the client benefits of using optimal medicines. The programme is collecting data on viral suppression to better understand the clinical impact of 2L DRV/r in resource-limited settings.

As momentum for broader 2L DRV/r adoption grows, with the WHO evaluating its guidelines for PIs and PEPFAR initiating procurement, disseminating lessons from early adopter countries will be critical to support broader access and uptake.

## WEPEB104

### Perceptions, barriers, and facilitators for injectable lenacapavir in the management of HIV

K. Alford<sup>1</sup>, S. Sidat<sup>2</sup>, K. Bristowe<sup>3</sup>, F. Cresswell<sup>1</sup>, P. Cicconi<sup>4</sup>, J. Vera<sup>1,5</sup>

<sup>1</sup>Brighton and Sussex Medical School, Brighton, United Kingdom, <sup>2</sup>Barts Health NHS Trust, London, United Kingdom, <sup>3</sup>King's College London, London, United Kingdom, <sup>4</sup>University Hospitals Oxford NHS Foundation Trust, Oxford, United Kingdom, <sup>5</sup>University Hospitals Sussex NHS Foundation Trust, Brighton, United Kingdom

**Background:** The six-monthly injectable lenacapavir antiretroviral therapy (ART) provides a treatment option for people living with HIV (PLWH) particularly those who are heavily treatment experienced with drug resistance or experiencing pill fatigue.

This study aimed to understand the preferences, barriers and facilitators for uptake and implementation of lenacapavir to inform clinical practice.

**Methods:** In-depth, semi-structured qualitative interviews and focus groups with purposively sampled PLWH and healthcare professionals (HCP) from UK HIV services were conducted. Verbatim pseudonymised transcripts were analysed using summative and conventional content analysis based on Hsieh et (2005) framework.

**Results:** Thirty-four PLWH with varied ART experience were recruited from 2 UK HIV services. 22 were male (64.7%) 6 (35.3%) female; median age was 55 years (range 26-76); 14 (41.2%) were White British, 9 (26.5%) were Black African; 17 (50%) were men who have sex with men. 14 HIV HCP (7 (50%) HIV physicians, 6 (42.9%) staff nurses, 1 (7.1%) HIV nurse specialist) took part in 3 focus groups.

Four key themes were identified: lenacapavir as a treatment option; lenacapavir versus oral ART; switching considerations and; administering lenacapavir.

The majority (30, 88%) of PLWH were interested in switching to lenacapavir if offered. However, PLWH preferred an all-injectable regimen: preference was reduced to 26.5% if an oral ART pairing was required. PLWH cited the con-

venience of a six-monthly dose schedule, freedom from pill burden and reduced stigma as reasons for interest in lenacapavir, but had concerns regarding efficacy, dosing intervals windows, monitoring and side effects. HCP felt the benefit of lenacapavir was as a treatment option for those with adherence issues, resistance to other ART, and a high pill burden. Broader use of lenacapavir raised concerns over drug resistance, delivery capacity and storage.

Theme	Quote
Lenacapavir as a treatment option	<p>"It would stop me worrying for six months, I'd know I've got the injection, I've had it, so I just don't need to worry anymore...I can get on with everything and just forget" (PLWH participant, PT27)</p> <p>"At the moment I'd be quite hesitant...I've only just got myself comfortable with like the undetectable untransmissible and it's taken a lot of research to get my mind feeling better about it...[so] I wouldn't say I'd be 100% keen" (PLWH participant, AC24)</p> <p>"For those with that struggle to take the oral, or when they have limited options...yeah I think for that" (HCP participant, FG2)</p>
Lenacapavir versus oral ART	<p>"When I started the antiretrovirals [it was] because I was dying...so you know it is a constant reminder that somethings wrong, really wrong...everyday" (PLWH participant, MSG13)</p> <p>"You'd just have to sort of balance it up, in what is the least hassle...if you are having some sort of injectable and you are taking fewer pill, or pills not so often, then it would still be of interest to me" (PLWH participant, SL32)</p>
Switching considerations	<p>"Not having to take three pills everyday would be nice, but it's not the major factor. The major factor is effectiveness, number 1, sustainability and security [of supply], number 2" (PLWH participant, AB01)</p> <p>"[What] I am worried about is the long-term effects...with an injection I don't know, I might get some serious ones or are they going to be long-term?...If it's one big dose, is that really strong? how will that make me react?" (PLWH participant, JM19)</p>
Administering lenacapavir	<p>"I don't think I would feel confident enough...if I don't take my pill properly I know...but I'd be worried that if I didn't administer it [the injection] right, and you wouldn't know if you had or not" (PLWH participant, AC24)</p> <p>"I quite like the staff at the HIV clinic...I'd rather visit them than anyone else, I don't mind going...it keeps everything nice and neat. So bloods then injection" (PLWH participant, KW28)</p> <p>"It's capacity for us at the moment...for the other one too [cabotegravir + rilpivirine]...amazing potential but we have to make sure we have the systems to deliver it in place" (HCP participant FG1)</p>

**Conclusions:** Lenacapavir would be a suitable treatment choice for many PLWH, provided an all-injectable regimen was available. HCP raised concerns over capacity and viral resistance if large numbers of PLWH were on lenacapavir. Feasibility assessments for provision of injectable ART and research on self-administration are needed.

## WEPEB105

### Clinical pharmacokinetics and safety of orally administered VH4011499 (VH-499), a novel HIV-1 capsid inhibitor, in Adults Without HIV

N. Thakkar<sup>1</sup>, A. Pierce<sup>2</sup>, R. Griesel<sup>3</sup>, B. Shepherd<sup>4</sup>, V. Bainbridge<sup>4</sup>, K. Angelis<sup>4</sup>, A. Tomlinson<sup>4</sup>, Y. Gandhi<sup>1</sup>, D. Brimhall<sup>5</sup>, B. Spears<sup>6</sup>, D. Anderson<sup>2</sup>, E. Pinnick<sup>4</sup>, C. Acupil<sup>2</sup>, C. McCoig<sup>7</sup>, M. Baker<sup>8</sup>, M. Lataillade<sup>9</sup>, P. Benn<sup>3</sup>  
<sup>1</sup>GSK, Collegeville, United States, <sup>2</sup>ViiV Healthcare, Durham, United States, <sup>3</sup>ViiV Healthcare, Brentford, United Kingdom, <sup>4</sup>GSK, Brentford, United Kingdom, <sup>5</sup>PPD-Thermo Fisher Scientific, Las Vegas, United States, <sup>6</sup>PPD-Thermo Fisher Scientific, Austin, United States, <sup>7</sup>ViiV Healthcare, Madrid, Spain, <sup>8</sup>ViiV Healthcare, Nyon, Switzerland, <sup>9</sup>ViiV Healthcare, Branford, United States

**Background:** VH4011499 (VH-499) is a novel HIV-1 capsid inhibitor that demonstrated potent in vitro antiviral activity against a wide spectrum of HIV-1 strains and clinical isolates. We present the pharmacokinetics, drug interaction potential, and safety of VH-499 in a first-time-in-human study.

**Methods:** This double-blind, randomized, placebo-controlled, phase 1 study evaluated oral VH-499 in healthy adults administered as single ascending doses as powder-in-bottle (PiB) and tablet (parts 1 and 3, respectively) and as multiple ascending doses as PiB for 14 days with or without midazolam (part 2), evaluating VH-499 inhibition/induction of CYP3A4.

**Results:** 73 participants were included (placebo, n=17; VH-499, n=56); 93% and 93% were male, 30% and 56% identified as Black or African American, and median age was 37 and 34 years in parts 1 and 3 and part 2, respectively. VH-499 plasma exposures (C<sub>max</sub> and AUC) displayed less-than-dose-proportional increases, with median t<sub>max</sub> of 8 to 12 hours (PiB) and 24 hours (tablet). Geometric mean of the terminal half-life was >2 days, ranging from 51 to 66 hours, leading to maintenance of VH-499 above the therapeutic target (3.3 ng/mL; Figure).

Figure. Mean plasma VH-499 concentration-time plots in (A) parts 1 and 3 and (B) part 2 (semi-logarithmic scale).

Tablet administration led to 45% to 63% less exposure compared with PiB. Midazolam exposures were unchanged.

Frequency of adverse events (AEs) was comparable between placebo and VH-499 groups. VH-499-related AEs were predominantly grade 1 (none serious). No AEs leading to withdrawal or deaths were observed.

There were no trends in vital signs, electrocardiograms, or laboratory hematology or chemistry parameters, except for a possible trend of increased total and low-density-lipoprotein cholesterol at exposures anticipated to exceed therapeutic exposures.

**Conclusions:** VH-499 was well tolerated, does not inhibit/induce CYP3A4, and exposures exceeded the anticipated therapeutic target across a range of single and multiple oral doses.

These early data support further development of VH-499 as a long-acting antiretroviral for the treatment of HIV-1.

## WEPEB106

Phase 1, open-label study to evaluate the drug interaction between MK-8527, an HIV-1 nucleoside reverse transcriptase translocation inhibitor, and the oral contraceptive levonorgestrel/ethinyl estradiol in healthy adult females

R.P. Carstens<sup>1</sup>, Y. Kapoor<sup>1</sup>, G.C. Garrett<sup>1</sup>, A. Bhattacharyya<sup>1</sup>, S. Pagnussat<sup>2</sup>, R. Vargo<sup>1</sup>, S.A. Stoch<sup>1</sup>, G. Gillespie<sup>1</sup>

<sup>1</sup>Merck & Co., Inc., Rahway, United States, <sup>2</sup>QPS 2 Miami Research, South Miami, United States

**Background:** Hormonal contraceptives are among the most commonly used contraceptive options; however, clinically significant drug-drug interactions (DDIs) can occur when used concurrently with some medications, including certain HIV antiretroviral agents. MK-8527 is a novel deoxyadenosine analog under clinical development as an antiretroviral for treatment of HIV-1.

A phase 1 clinical trial was conducted in healthy participants to evaluate potential effects of MK-8527 when given concurrently with the oral hormonal contraceptive levonorgestrel (LNG)/ethinyl estradiol (EE).

**Methods:** This was an open-label, 2-period, fixed-sequence trial of healthy females aged 18 to 70 years who were postmenopausal or had undergone bilateral oophorectomy. In Period 1, participants received a single oral dose of LNG 0.10 mg/EE 0.02 mg followed by a 7-day washout (Figure).

In Period 2, a single dose of LNG 0.10 mg/EE 0.02 mg was coadministered with a single 12-mg oral dose of MK-8527. Pharmacokinetic samples for evaluation of plasma LNG and EE (Periods 1 and 2) and MK-8527 (Period 2) concentrations were collected predose and up to 168 hours post-dose in each period.

Safety and tolerability were assessed by standard clinical evaluations, including adverse event (AE) reporting, vital sign monitoring, laboratory values (including hematological parameters), and electrocardiograms.

Figure. Study design.

**Results:** Fourteen postmenopausal females were enrolled. The pharmacokinetics of LNG and EE were determined with and without MK-8527 to assess any interaction (study complete; finalized data pending).

Five participants (36%) reported AEs that were mild in severity; 4 were deemed treatment-related by the investigator. No participants reported serious AEs or discontinued study treatment due to an AE.

**Conclusions:** The study evaluated the potential for any DDI of LNG/EE with MK-8527 to allow the use of hormonal contraceptives without dose adjustment in individuals receiving MK-8527. Coadministration of a single dose of MK-8527 with LNG/EE was generally well tolerated; further pharmacokinetics results to be presented at the conference.

## WEPEB107

Five-day-on-two-day-off (FOTO) vs daily BIC/FTC/TAF: a proof-of-concept randomized clinical trial

H.-Y. Sun<sup>1</sup>, Y.-T. Lin<sup>2</sup>, W.-C. Liu<sup>1</sup>, C.-W. Huang<sup>1</sup>, C.-H. Kuo<sup>2</sup>, C.-C. Hung<sup>1,3</sup>

<sup>1</sup>National Taiwan University Hospital, Internal Medicine, Taipei, Taiwan, Province of China, <sup>2</sup>National Taiwan University, Pharmacy, Taipei, Taiwan, Province of China,

<sup>3</sup>National Taiwan University Hospital Yunlin Branch, Internal Medicine, Yunlin, Taiwan, Province of China

**Background:** *In vitro* studies suggest that bicitegravir (BIC)/emtricitabine (FTC)/tenofovir alafenamide (TAF) could be taken less frequently to maintain viral suppression. This open-label, randomized clinical trial determined the trough plasma concentration ( $C_{trough}$ ) of BIC and compared the virologic efficacy with daily BIC/FTC/TAF versus with BIC/FTC/TAF taken five-day-on-two-day-off (FOTO) in people with HIV (PWH).

**Methods:** 60 PWH aged  $\geq 20$  years who had achieved plasma HIV RNA load (PVL)  $< 50$  copies/ml with BIC/FTC/TAF for  $\geq 6$  months were randomized in a 1:1 ratio to daily vs FOTO group.

The primary end-point was the proportion of participants maintaining BIC  $C_{trough}$  above the in-vitro protein-adjusted 95% effective concentration of 162 ng/ml at Week 4, 28, and 52. The secondary end-point was the proportion of participants with PVL  $< 50$  copies/ml at the same time points. After Week 52, all participants entered the extension phase to receive FOTO BIC/FTC/TAF.

**Results:** There were no significant differences in the baseline clinical characteristics between the two groups. In FOTO group, the percentages of trough BIC concentrations  $>162$  ng/ml at Week 4, 28, and 52 were 90%, 93.3%, and 100%, respectively, and their respective median BIC trough concentrations were 649.9, 835.8, and 637.8 ng/ml. In intention-to-treat analysis, the rate of maintaining PVL  $<50$  copies/mL at Week 4, 28, and 52 was 100%, 93.3%, 100%, respectively, in the FOTO group, compared with 96.7%, 93.3%, and 96.7%, in the daily group. The median concentrations of intracellular tenofovir-diphosphate also showed significantly lower in FOTO than daily group at Week 4 (103.2 vs. 224.3 fmol/ $10^6$  cells) and 28 (23.1 vs. 70.7), but not at Week 52 (79.9 vs. 101.6).

Of the 5 participants in the FOTO group who had trough BIC concentrations  $<162$  ng/ml at Week 4 ( $n=3$ , 85.5, 116.6, and 108.8, respectively) and 28 ( $n=2$ , 46.0 and 110.5), all maintained PVL  $<50$  copies/ml. 57 participants entered the extension phase and, at week 84, all continued to maintain PVL  $<50$  copies/ml.

**Conclusions:** Our finding of successfully maintaining viral suppression with FOTO BIC/FTC/TAF provides support to undertake a randomized clinical trial of a large sample size to confirm the efficacy of FOTO BIC/FTC/TAF.

## WEPEB108

Factors associated with poor adherence to antiretroviral therapy in people with HIV in Taiwan

H. Lai<sup>1</sup>, Y. Yen<sup>1</sup>, C. Wang<sup>2</sup>, P. Yeh<sup>2</sup>, T. Yen<sup>3</sup>

<sup>1</sup>School of Medicine, College of Medicine, National Yang Ming Chiao Tung University/Section of Infectious Diseases, Taipei City Hospital, YangMing Branch, Taipei City, Taiwan, Province of China, <sup>2</sup>Section of Infectious Diseases, Taipei City Hospital, Linsen, Chinese Medicine, and Kunming Branch, Taipei City, Taiwan, Province of China, <sup>3</sup>Taipei City, Hospital, Linsen, Chinese Medicine and Kunming Branch, Nursing, Taipei City, Taiwan, Province of China

**Background:** According to UNAIDS statistics, there are 39 million people with HIV (PWH) globally in 2022. Antiretroviral therapy (ART) has been used for decades and dramatically improved life quality and life expectancy of PWH. However, factors affecting ART adherence are major concerns by caregivers because poor adherence could cause poor viral suppression that contributes to treatment failure. Therefore, we conducted this study to find out factors causing poor adherence to ART.

**Methods:** This study recruited PWH from one single HIV clinic in northern Taiwan between December 2018 and December 2020. All participants who agreed to join this study would be interviewed face to face by recording charts and Medication Adherence Report Scale (MARS-5). MARS-5 was used to evaluate treatment adherence and score  $<23$  defined as poor adherence. This study was approved by the IRB of TCH (no. TCHIRB-10612120).

**Results:** 831 participants were enrolled, and 93 participants were considered poor adherence to ART. The different characteristics between two groups were that people with low medication adherence were younger, lower body mass index, shorter ART treatment duration, lower education level, lower income level, more history of gonorrhea acquired, more illicit drugs use within 3 months especially methamphetamine and sildenafil, living with friends, more with chronic disease, lower CD4 counts and detectable viral load.

Univariate analysis showed that PWH with poor adherence were associated with having chronic disease (OR=1.991,  $p=0.002$ ), history of gonorrhea acquired (OR=2.101,  $p=0.012$ ), taking illicit drugs within 3 months (OR=2.976,  $p=0.002$ ) which methamphetamine (OR=2.78,  $p<0.001$ ) and sildenafil (OR=2.976,  $p=0.002$ ) were significant, living with friends (OR=3.39,  $p=0.004$ ) and detectable viral load (OR=5.927,  $p<0.001$ ).

Older age (OR=0.944,  $P<0.001$ ), longer ART treatment duration (OR=0.951,  $P=0.02$ ), higher CD4 count (200-499 OR=0.299,  $p=0.034$ ;  $\geq 500$  OR=0.174,  $p=0.003$ ), higher income level (OR=0.466,  $p=0.027$ ) and education level above university (OR=0.589,  $p=0.026$ ) were prone to good adherence.

**Conclusions:** Factors of PWH with poor adherence in this study were younger age, shorter ART treatment duration, with chronic disease, history of gonorrhea acquired, living with friends, illicit drugs use within 3 months especially methamphetamine or sildenafil using, lower CD4 count and detectable viral loads. Therefore, for PWH with these characteristics, we need to pay more attention to whether they have poor adherence.

## WEPEB109

Real world experience on the use of two-drug antiretroviral therapy in older people with HIV

T.S. Kwong<sup>1</sup>, H.C.T. Tang<sup>1</sup>, Y.C.P. Chan<sup>2</sup>, T.C. Wu<sup>1</sup>, M.Y. Chu<sup>1</sup>, K.W. Lam<sup>1</sup>, S.Y.H. Chan<sup>1</sup>, S.K. Yung<sup>1</sup>, W.M. Ting<sup>1</sup>, W. Lam<sup>1</sup>, W.S. Leung<sup>3</sup>, S. Lamb<sup>1</sup>, K.Y.D. Yeung<sup>1</sup>, M.P. Lee<sup>1</sup>

<sup>1</sup>Queen Elizabeth Hospital, Department of Medicine, Hong Kong, Hong Kong, SAR of China, <sup>2</sup>Yale University School of Medicine, Department of Neurology, New Haven, CT, United States, <sup>3</sup>Kwong Wah Hospital, Department of Medicine and Geriatrics, Hong Kong, Hong Kong, SAR of China

**Background:** Two-drug regimens (2DRs) may reduce long-term drug toxicities and drug-drug interactions for people with HIV (PWH) on antiretroviral treatment (ART). However, older PWH were under-represented in major 2DRs studies. This retrospective study explored real-world outcomes of PWH 50 years or older (PWH $\geq 50$ ) who switched from standard ART to oral 2DRs.

**Methods:** PWH $\geq 50$  virally suppressed on standard ART who switched to oral 2DRs at the HIV clinic of Queen Elizabeth Hospital, Hong Kong were identified through elec-

tronic records. 2DR formulations and clinical outcomes at 48 and 96 weeks after switch were retrieved. Viral suppression (VS) was defined as sustained plasma HIV RNA (VL) <50 copies/mL; virologic failure (VF) was VL >200 copies/mL.

**Results:** Between January 2014 and December 2023, 113 PWH ≥50 (86% male, median age 59 years, median pre-switch ART duration 14 years) switched to oral 2DRs. All but one received INSTI-based 2DRs: 97 (86%) combined with NRTI, 10 (9%) with PI, and 5 (4%) with NNRTI. 24% had pre-ART genotypic resistance tests and 16% had histories of VF pre-switch.

By 48 weeks, two discontinued due to adverse effects (AEs), three succumbed, and 105/108 (97.2%) of the remaining PWH maintained VS (VF=1; blip=2). Among 89 who continued 2DRs beyond week 48, three discontinued due to AEs, five succumbed (including one with VF), and 77/81 (95.1%) of the remaining PWH maintained VS (VF=0; blip=3; loss to follow-up=1).

The first VF was related to unplanned treatment interruption; VS was achieved after original 2DR resumption.

The second VF was taking DTG+3TC, without past history of VF, had M184I mutation without INSTI-associated resistance at the time of VF, achieved VS after changing to standard ART but succumbed to malignancy.

Parameters, median (IQR)	All PWH who switched to 2DRs (N=113)
Age at 2DR switch, year	(all ≥ 50 at switch) 59 (55-66)
Duration on ART pre-switch, year	14 (7-19)
CD4+ T-cells (x 10 <sup>9</sup> cells/L), pre-switch	523 (380-662)
DTG+3TC regimen, n (%)	97 (85.8%)
Virologic failure (VL>200 copies/ml), n	Week 0-48 = 1; Week 49-96 = 1
2DRs discontinuation due to adverse effects, n	Week 0-48 = 2 (rash, sleep disturbance) Week 49-96 = 3 (diarrhea, involuntary movement, hyperlipidemia) All grade 1-2 reactions
All-cause mortality, n	8 (malignancy (2), non-HIV related infection (4), untraceable (2))

**Conclusions:** In this group of older PWH who had stable switch to oral 2DRs, virological control was achieved in most while VF was uncommon at week 96 post-switch.

## WEPEB110

### The pharmacokinetics, pharmacogenetics, and toxicity of the interaction between efavirenz and isoniazid

J. Taylor<sup>1</sup>, G. Maartens<sup>1</sup>, S. Sokhela<sup>2</sup>, N. Chandiwana<sup>2</sup>, G. Akpommiemie<sup>2</sup>, F. Venter<sup>2</sup>, P. Sinxadi<sup>1,3</sup>

<sup>1</sup>University of Cape Town, Department of Medicine, Division of Clinical Pharmacology, Cape Town, South Africa, <sup>2</sup>University of Witwatersrand, Wits Health Consortium, Ezintsha, Johannesburg, South Africa, <sup>3</sup>South African Medical Research Council, SAMRC/UCT Platform for Pharmacogenomics Research and Translation, Cape Town, South Africa

**Background:** People with *CYP2B6* poor metaboliser genotypes have higher efavirenz concentrations, which are further increased by isoniazid, which inhibits the accessory metabolising enzyme of efavirenz, CYP2A6.

We hypothesized that higher efavirenz concentrations would be associated with more toxicity in *CYP2B6* poor metabolisers on isoniazid preventive therapy (IPT) and efavirenz-based antiretroviral therapy (ART).

**Methods:** We conducted a post-hoc substudy of participants randomized to the efavirenz arm of the ADVANCE trial (NCT03122262), who received IPT and consented to genotyping. We compared efavirenz concentrations on and off IPT and stratified by *CYP2B6* genotype.

We used linear regression to detect associations between *CYP2B6* genotype and the following outcomes: efavirenz concentrations on IPT; changes from baseline to week 24 in lipids, alanine aminotransferase (ALT), fasting plasma glucose, sleep quality, and Modified Mini Screen (MMS) scores.

Multivariable models adjusted for age, sex, weight, viral load, CD4 count, baseline value of outcome variable, *NAT2* acetylator and *CYP2A6* genotypes.

**Results:** We enrolled 176 participants, median age 32 years, 58% female. Baseline, median HIV-1 RNA 4.38 log<sub>10</sub> copies/mL and CD4 count 297 cells/μL.

Efavirenz concentrations on IPT were greater than off IPT (pseudo-median difference 0.48 μg/mL [95% CI 0.19 to 0.91] p-value=0.001). In multivariable analysis *CYP2B6* poor metabolisers had higher log-transformed efavirenz concentrations on IPT than extensive metabolisers (β=1.66 [95% CI 0.98 to 2.34] p<0.001).

Total cholesterol and high-density lipoprotein (HDL) increased over 24 weeks. In multivariable analyses *CYP2B6* slow metabolisers had greater increases in total cholesterol (β=0.44 [95% CI 0.01 to 0.86] p=0.04) and HDL-cholesterol (β=0.39 [95% CI 0.21 to 0.57] p<0.001) than extensive metabolisers.

There was no association between *CYP2B6* genotype and change in ALT, fasting plasma glucose, triglycerides, low-density lipoprotein (LDL), sleep scores or MMS scores over 24 weeks.

**Conclusions:** *CYP2B6* slow metabolisers on IPT had greater increases in total cholesterol and HDL-cholesterol. We found no association between *CYP2B6* genotype and worsening sleep quality or psychiatric symptoms.

## WEPEB111

Effectiveness and durability of dolutegravir/lamivudine in older people with HIV from the Veterans Aging Cohort Study (VACS)

L. Yan<sup>1,2</sup>, C. Henegar<sup>3</sup>, V. Marconi<sup>4,5</sup>, C. Hicks<sup>3</sup>, V. Vannappagari<sup>3</sup>, A. Justice<sup>1,2</sup>, M. Aslan<sup>1,2</sup>

<sup>1</sup>Veterans Affairs (VA) Cooperative Studies Program Clinical Epidemiology Research Center (CSP-CERC), VA Connecticut Healthcare System, West Haven, CT, United States, <sup>2</sup>Yale University, New Haven, CT, United States, <sup>3</sup>ViV Healthcare, Research Triangle Park, NC, United States, <sup>4</sup>Atlanta VA Medical Center, Atlanta, GA, United States, <sup>5</sup>Emory University, Atlanta, GA, United States

**Background:** Dolutegravir/lamivudine (DTG/3TC) is a 2-drug antiretroviral regimen (2DR) demonstrating non-inferior efficacy and safety compared to 3-drug regimens (3DRs) in clinical trials. Real-world data on DTG/3TC use among older people with HIV (PWH) remains limited.

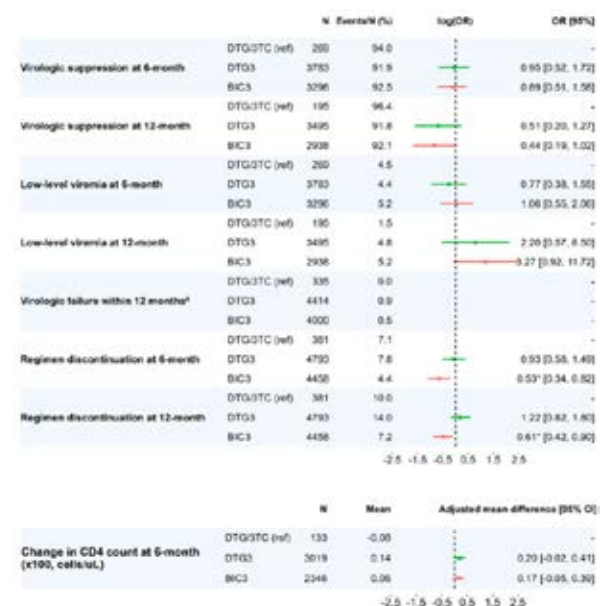

**Methods:** Treatment-experienced, virologically suppressed [viral load (VL) <50 copies/mL] PWH enrolled in the VACS ≥50 years old and switching to DTG/3TC, DTG- or bictegravir (BIC)-based 3DRs 01JAN2014 – 30SEP2022 were included. Virologic suppression (VS; VL <50 copies/mL), low-level viremia (VL ≥50 and <200 copies/mL), and regimen discontinuation were compared 6- and 12-month post-regimen switch (baseline). Virologic failure (VF; 2 consecutive VLs ≥200 copies/mL, or 1 VL ≥200 copies/mL followed by regimen discontinuation) was evaluated over 12 months. Change in CD4 cell count from baseline was assessed at 6 months. Outcomes were compared using inverse probability of treatment weighted logistic or linear regression.

**Results:** Among 9,632 treatment-experienced, suppressed older PWH (37% ≥65 years old, 96.8% male, 7.5% Hispanic, 46.9% Black), 381 received DTG/3TC, 4,793 DTG-3DR, and 4,458 BIC-3DR. Polypharmacy was common (median of 9 classes of non-ARVs taken at baseline). Six-month VS (DTG/3TC: 94.0%; DTG-3DR: 91.9%; BIC-3DR: 92.5%) and low-level viremia (DTG/3TC: 4.5%; DTG-3DR: 4.4%; BIC-3DR: 5.2%) were statistically comparable across regimens.

Twelve-month VS (DTG/3TC: 96.4%; DTG-3DR: 91.8%; BIC-3DR: 92.1%) and low-level viremia (DTG/3TC: 1.5%, DTG-3DR: 4.8%, BIC-3DR: 5.2%) were statistically comparable across regimens (Figure 1). VF was rare across regimens (DTG/3TC: 0%; DTG-3DR: 0.9%; BIC-3DR: 0.5%).

Discontinuations by 6 and 12 months were similar between DTG/3TC and DTG-3DR. BIC-3DR showed reduced likelihood of discontinuation at both 6 (BIC-3DR: 4.4% vs.

DTG/3TC: 7.1%) and 12 months (BIC-3DR 7.2% vs DTG/3TC 10.0%). Change in CD4 at 6 months showed no statistical differences between regimen groups.

<sup>1</sup> Odds ratios and confidence intervals were calculated from inverse-probability weighted models, which adjusted for age, sex, race and/or ethnicity, region, smoking, alcohol use disorder, drug use and dependence, homelessness, baseline low-density lipoprotein, baseline CD4 count, baseline viral load, baseline VACS 2.0 index, and years on ART regimen. \*, \*\*, and \*\*\* indicate significance at the 10%, 5%, and 1% levels.

<sup>2</sup> Virologic failure could not be modeled due to zero events in the DTG/3TC group. Abbreviations: DTG3: dolutegravir-based 3-drug regimen; BIC3: bictegravir-based 3-drug regimen; DTG/3TC: dolutegravir/lamivudine (DOVATO); ART: antiretroviral therapy; PWH: people with HIV; OR: adjusted odds ratio; CI: confidence interval; VACS: the Veterans Aging Cohort Study; CD4: clusters of differentiation 4.

Figure 1. Treatment outcomes for those receiving DTG- and BIC-based 3-drug regimens compared to those receiving DTG/3TC among ART-experienced PWH<sup>1</sup>.

**Conclusions:** Among treatment-experienced PWH ≥50 years old, DTG/3TC demonstrated high levels of effectiveness comparable to DTG- or BIC-based 3-drug regimens.

## WEPEB112

Multiple ATIs and protection of HIV Gag-specific CD4 T cells enables durable CD8 T cells immunity and viral control

M. Conant<sup>1</sup>, J. Galvin<sup>1</sup>, A. Jain<sup>1</sup>, J. Boyle<sup>1</sup>

<sup>1</sup>Addimmune, Rockville, United States

**Background:** Auto-vaccination blunts HIV viral rebound and allows an analytical treatment interruption (ATI) to demonstrate the efficacy of gene and cell therapy (CGT) of genetically modified T cells protected from HIV with micro RNAs that block CCR5, Tat, and Vif.

**Methods:** Four volunteers, previously infused with CGT product underwent autovaccination (NCT05540964) by allowing their HIV viral load to rise above 100,000 cps/mL. They resumed treatment, and when HIV was no longer detectable, they underwent a second ATI. They were followed for up to three months and then placed back on their original HIV treatment program.

**Results:** All four volunteers demonstrated partial immunological control of their disease and allowed a second ATI to demonstrate a clinical setpoint that was lower

than the anticipated historical setpoint. After antiviral treatment was resumed all volunteers achieved an undetectable viral load and the resumption of a normal CD4 count.

There were no serious adverse events, there was no resistance to their original HIV medication, and there was no report of HIV transmission. Participants will be continuously monitored for 15 years as part of the Long Term Follow Up protocol (NCT05529342).

All our participants already had their first-year follow-up visit and more than half had their second-year visit.

**Conclusions:** Autovaccination can play an important role in HIV gene therapy trials by establishing partial immunological control and preventing robust viral rebound. In this study, the technique was safe and effective.

## WEPEB113

Population pharmacokinetics (POPPK) for thigh as alternative Rilpivirine Long-Acting (RPV LA) injection site

A. Dari<sup>1</sup>, A. Russu<sup>2</sup>, R. Van Solingen-Ristea<sup>3</sup>, B. Baugh<sup>4</sup>, K. Vandermeulen<sup>5</sup>, H. Crauwels<sup>1</sup>

<sup>1</sup>Janssen Pharmaceutica NV, Clinical Pharmacology and Pharmacometrics, Beerse, Belgium, <sup>2</sup>Janssen Pharmaceutica NV, Clinical Pharmacology and Pharmacometrics, Milan, Italy, <sup>3</sup>Janssen Pharmaceutica NV, Medical Department, Beerse, Belgium, <sup>4</sup>Johnson and Johnson Innovative Medicine, Medical Affairs, Titusville, United States, <sup>5</sup>Janssen Pharmaceutica NV, Global Clinical Development, Beerse, Belgium

**Background:** RPV LA, with cabotegravir (CAB) LA, is the first all-injectable regimen for HIV-1 treatment. A healthy volunteer Phase 1 study and a Phase 3 substudy in ATLAS-2M in participants with HIV-1 evaluated pharmacokinetics (PK) and safety of single dose or short-term (4 monthly, 2 every 2 months injections), respectively, intramuscular (IM) administration of CAB+RPV LA in the vastus lateralis (thigh) muscle, as potential alternative injection site. The RPV LA POPPK model was updated to evaluate potential continuous thigh administration of RPV LA.

**Methods:** The existing RPV LA POPPK model, including 2 separate PK depots describing gluteal absorption, was updated by evaluating RPV plasma concentrations after thigh injection from above mentioned (sub)studies. To adequately describe RPV thigh absorption, two separate PK absorption depots, different from gluteal PK absorption depots, were included. The updated POPPK model was used for modeling and simulation of continuous monthly and every 2 months RPV LA dosing in thigh as compared to gluteal muscles.

**Results:** RPV plasma concentrations after thigh IM injection in healthy volunteers and participants with HIV-1 were similar to those observed for gluteal IM injection. RPV absorption from thigh was best described by 2 parallel

absorption pathways: a fast absorption route describing the initial RPV peak and a second slow absorption route determining the terminal part of the RPV concentration-time curve, reflecting flip-flop kinetics after IM injection.

After absorption from the IM injection site, RPV disposition was described by an open, 1-compartment model with linear elimination, similar for gluteal and thigh administration.

There were no significant covariates explaining variability in RPV exposure after IM administration of RPV LA in the thigh. RPV PK after chronic IM thigh dosing was simulated with this updated model. Median RPV C<sub>trough</sub> and C<sub>max</sub> after thigh administration was similar to or higher than that after gluteal administration, with a large overlap of ranges. These differences are not considered clinically relevant. RPV LA thigh administration was overall well tolerated.

**Conclusions:** Modeling and simulation informed by clinical data showed that chronic IM administration of RPV LA in the thigh muscle resulted in similar RPV plasma exposure compared to IM administration in the gluteal muscle.

## WEPEB114

In vitro characterization of VH4524184 (VH-184, S-365598), a new third-generation integrase strand transfer inhibitor (INSTI) with a unique resistance profile

T. Seki<sup>1</sup>, S. Arita<sup>1</sup>, K. Ishida<sup>1</sup>, S. Miki<sup>1</sup>, A. Kagitani-Suyama<sup>1</sup>, S. Miki-Kawauchi<sup>1</sup>, S. Kitamura<sup>1</sup>, T. Miyamoto<sup>1</sup>, Y. Taoda<sup>1</sup>, Y. Tomida<sup>1</sup>, T. Shishido<sup>1</sup>, M. Koyama<sup>1</sup>, T. Yoshinaga<sup>1</sup>  
<sup>1</sup>Shionogi & Co., Ltd., Osaka, Japan

**Background:** VH4524184 (VH-184) was discovered by Shionogi & Co., Ltd. (S-365598) and currently under development by ViiV Healthcare as a third-generation HIV-1 integrase strand transfer inhibitor (INSTI) with potential for use in ultra-long-acting HIV regimens. We present the in vitro antiviral potency, mechanism of action, and resistance profile of VH-184.

**Methods:** Antiviral activity of VH184 was measured against HIV laboratory strains and clinical isolates using cell lines and/or PBMCs. Mechanism of action was determined using in vitro integrase strand transfer assays. Fold change in susceptibility against INSTI-resistant site-directed mutants was determined with a HeLa-CD4 cell assay.

**Results:** VH-184 inhibited HIV integrase in an in vitro strand transfer assay with an IC<sub>50</sub> of 5.8 nM. VH-184 inhibited integration of HIV proviral DNA in an MT-4 cell based assay system with an IC<sub>50</sub> of 0.46 nM and resulted in the accumulation of 2-LTR circles. VH-184 exhibited an IC<sub>50</sub> of 0.95 nM in an MT-4 cell based HIV-1 IIIB assay. To evaluate for barrier to resistance of VH-184, a passage study was conducted but no amino acid substitution was identified

for 112 days in the presence of VH-184. The broad-spectrum antiviral activity was confirmed by testing VH-184 against HIV-1 primary isolates from subtypes A, B, C, D, E, G, O, CRF01\_AE and HIV-2 isolates ( $IC_{50}$  range in this assay was 0.0337 to 0.911 nM). VH-184 has demonstrated in vitro anti-HIV activity against wild type virus as well as lab strain NL432 harboring first- and second-generation INSTI-resistance associated site-directed mutations (see Figure).

*Figure. Antiviral activity of VH-184 against a panel of HIV-1 molecular clones harboring INSTI-resistant associated mutations. Blank bars represent the variants which were not tested.*

**Conclusions:** The in vitro antiviral potency of VH-184 is comparable to DTG and CAB and its resistance profile is distinct from prior INSTIs. VH-184 is a third generation INSTI candidate with a superior resistance profile compared to DTG and CAB. These data support its further development for HIV-1 treatment.

Cabotegravir/rilpivirine long-acting therapy real world experience in a large clinical cohort of HIV patients

A. Moreno<sup>1</sup>, S. del Campo<sup>1</sup>, M.J. Vivancos<sup>1</sup>, M. Vélez<sup>2</sup>, J.L. Casado<sup>1</sup>, F. Dronda<sup>1</sup>, J. Martinez<sup>1</sup>, A. Garcia<sup>1</sup>, S. Martín-Colmenarejo<sup>1</sup>, C. Fernandez-Chica<sup>1</sup>, M.A. Amezcua-Segovia<sup>1</sup>, P. López-Guzmán<sup>1</sup>, E.B. Ruiz-Romero<sup>1</sup>, S. Moreno<sup>1</sup>, M.J. Pérez-Eliás<sup>1</sup>

<sup>1</sup>Hospital Ramón y Cajal, Infectious Diseases, Madrid, Spain, <sup>2</sup>Hospital Ramón y Cajal, Pharmacy, Madrid, Spain

**Background:** Long acting (LA) Cabotegravir/Rilpivirine (C/R) is a new paradigm in antiretroviral therapy (ART), showing a high rate of efficacy and patients acceptance, both in clinical trials and real world cohorts.

**Methods:** Prospective, ongoing, single center cohort to assess safety and efficacy of C/R outside clinical trials in the first year of implementation in a monographic HIV outpatient clinic at a tertiary center in Madrid, Spain.

**Results:** Between Jan-2023/Jan 2024 270 patients started C/R (8% of patients on ART at our center), after patient's request in 129 (48%). Mean time on ART was 112 months (1-385), and median prior ART lines 4.4±3.7. Prior ART was BIC/TAF/FCT in 139 (51.5%); 98(36%) were NNRTI-experienced, with failure and resistance mutations in 4: Y181C (N=2),

K103N (N=1), N348I plus V108I (N=1). Prior AIDS in 140 (51.8%). Mean age 43.8 years (range 23-70), 35(13%) were women. Women were older (51.7±11 vs 44.6±12, p=0.001), and with a longer time on ART (190±112 vs 132±96 months; p=0.001). Comorbidities were present in 136 (50%), mostly dyslipidemia (22%) and hypertension (20%), and 12% had prior psychiatric disorders.

Overall, 110 (40.7%) had concomitant medications. HIV-subtype was available in 44% (N=119, 71% B-subtype). Baseline BMI was 25.3 (16-43), with 29 (10.7%) with BMI>30. Baseline CD4 was 734 cells/mL (31-1958). Three subjects started C/R with detectable HIV-RNA. 59 patients (22%) lacked HBsAb antibodies (17 isolated HBcAb, 42 not fully vaccinated and/or vaccination failure). The rate of discontinuation was low (2.5%, N=7), 5 due to AES (1.8%). Of note, none of the patients with prior INSTI-related CNS toxicity (N=27) discontinued for CNS-related AES. 2 transient blips were observed, and only one confirmed virological failure. No subjects with NNRTI-mutations had viral rebound.

**Conclusions:** Cabotegravir/Rilpivirine was used in 8% of our patients, in an aged HIV population with a significant rate of comorbidities, long time on ART, and concomitant medications. In this real world cohort, Cabotegravir/Rilpivirine was safe, showing a low rate of discontinuations similar to that reported in clinical trials (2.5%).

We observed only one confirmed viral failure and two transient HIV RNA blips, and patients with prior NNRT-mutations maintained undetectable HIV load

## WEPEB116

Phase 1a safety and pharmacokinetics of single ascending doses of oral GS-1720 in people without HIV-1

H. Zhang<sup>1</sup>, M. Jaber<sup>1</sup>, E. Mortensen<sup>1</sup>, H. Wang<sup>1</sup>, I. Mendes<sup>1</sup>, M. Sobczyk<sup>1</sup>, A. Share<sup>1</sup>, R. Palaparthi<sup>1</sup>, D. Marathe<sup>1</sup>

<sup>1</sup>Gilead Sciences, Inc., Foster City, United States

**Background:** Long-acting oral antiretroviral agents for HIV-1 infection may help address suboptimal adherence, stigma, and treatment fatigue. GS-1720, an oral integrase strand transfer inhibitor (INSTI), has potent anti-HIV-1 activity with physicochemical properties suitable as a long-acting agent. Safety and pharmacokinetics (PK) of single-ascending doses (SAD) of GS-1720 were evaluated in participants without HIV-1.

**Methods:** This Phase 1a randomized, blinded, placebo-controlled study enrolled adults without HIV-1 into multiple cohorts, with data from four SAD cohorts reported here. Participants received a single oral GS-1720 dose of 50, 150, 450, and 1350 mg (n=8/cohort), or matched placebo (n=2/cohort), under fasting conditions on Day (D) 1. Primary endpoints included the incidence of adverse events (AEs) and laboratory abnormalities, and plasma PK parameters (including terminal half-life [ $t_{1/2}$ ], maximum concentration [ $C_{max}$ ], and area under the concentra-

abstractsAuthor  
Index

tion-versus-time curve extrapolated-to-infinity [ $AUC_{inf}$ ]). All participants were followed-up until D70. PK data were used in population PK modeling to inform dose selection for a Phase 1b proof-of-concept monotherapy study in participants with HIV-1.

**Results:** Of the 40 participants enrolled, median age was 34 years and 50% of participants were male. GS-1720 appeared to be generally well tolerated with a favorable safety profile; there were no serious AEs, Grade 3/4 AEs, or clinically significant laboratory abnormalities at any dose level.

Based on preliminary data to date (cut off: November 15, 2023), GS-1720 median  $t_{1/2}$  was 9.3 days and time to reach  $C_{max}$  was 4 hours. GS-1720 demonstrated nonlinear PK, with 3-fold dose increases in each SAD escalation resulting in  $C_{max}$  increases of 1.6–2.2 fold and  $AUC_{inf}$  increases of 1.7–2.5 fold.

Based on population PK modeling leveraging these data, the initial cohort dose for the Phase 1b study was GS-1720 450 mg on D1 and D2, 3 which would achieve plasma concentrations of approximately five-fold the 95% effective concentration on Day 11.

**Conclusions:** GS-1720 was well tolerated across the doses tested and exhibited a nonlinear PK with a half-life supportive of once-weekly oral dosing. The emerging safety and PK data from this study were used to inform dose selection for Phase 1b and Phase 2 studies.

## WEPEB117

Safety and pharmacokinetic profile of single and multiple ascending doses of GS-4182, an oral prodrug of lenacapavir, in participants without HIV-1

N.A. Shaik<sup>1</sup>, R. Singh<sup>1</sup>, R. Rao<sup>1</sup>, S. Regan<sup>1</sup>, D. Xiao<sup>1</sup>, F. Wang<sup>1</sup>, S. Lau<sup>1</sup>, J. Hindman<sup>1</sup>

<sup>1</sup>Gilead Sciences, Inc., Foster City, United States

**Background:** Lenacapavir (LEN) is a first-in-class capsid inhibitor with a long half-life and can be dosed orally or by subcutaneous injection. LEN undergoes rapid absorption following oral administration, but its absolute bioavailability is low. GS-4182 is a novel, solubilizing oral prodrug of LEN that undergoes conversion to LEN in the gut, and is under development as a once-weekly (QW) HIV-1 therapeutic.

The present, first-in-human study assessed the safety and pharmacokinetics (PK) data from a Phase 1a study of GS-4182 in participants without HIV-1.

**Methods:** This randomized, blinded, placebo-controlled study included single ascending doses (SAD; per cohort: active n=6, placebo n=2) and multiple ascending doses (MAD; per cohort: active n=9, placebo n=3) of oral GS-4182 in participants without HIV-1 aged 18–45 years. Plasma PK parameters for GS-4182-derived analytes, and safety (treatment-emergent adverse events [TEAEs] and labora-

tory abnormalities), were assessed through study Day 77 (SAD) and 113 (MAD). Here, we report data from two SAD cohorts (GS-4182 200 mg or 600 mg) and one MAD cohort (GS-4182 200 mg QW for 6 weeks).

**Results:** GS-4182 was undetected in most participants after administration, with mean LEN concentrations rapidly achieving target efficacy levels (inhibitory quotient-4). LEN exposure following single-dose GS-4182 200 mg was similar to previously published exposure from LEN 300 mg tablet administration (CROI 2020, Abstract 470).

Following single-dose GS-4182 600 mg, LEN exposure was double that of previously published LEN 600mg tablet administration (CROI 2022, Abstract 433). Mean LEN concentrations on Day 7 following single doses of GS-4182 200 mg and 600 mg achieved an inhibitory quotient of 4.2 and 9.3, respectively.

Following GS-4182 MAD 200 mg QW, 3.7-fold accumulation was observed for LEN  $C_{trough}$ . No Grade  $\geq 2$  TEAEs, serious TEAEs or discontinuations due to TEAEs occurred. Eight Grade  $\geq 3$  treatment-emergent laboratory abnormalities were reported.

**Conclusions:** GS-4182 demonstrated favorable LEN PK, with LEN exposure following oral GS-4182 600 mg administration approximately double compared with the equivalent dose of oral LEN. GS-4182 was well tolerated with a favorable safety profile, supporting its further development as a QW oral agent for HIV-1 treatment.

## WEPEB118

Reasons for discontinuation of dolutegravir-based two- and three-drug regimens

H. Höller<sup>1</sup>, A. Ivanova<sup>2</sup>, K. Rücker<sup>3</sup>, F. Schabaz<sup>3</sup>, C. Wiese<sup>3</sup>, A. von Krosigk<sup>3</sup>, E. Wolf<sup>3</sup>, C. Jonsson-Oldenbüttel<sup>3</sup>, S. Noe<sup>3</sup>

<sup>1</sup>Technical University of Munich, Munich, Germany,

<sup>2</sup>Hasselt University, Hasselt, Belgium, <sup>3</sup>MVZ München am Goetheplatz, Munich, Germany

**Background:** Drug-sparing antiretroviral therapies (ART) have become popular under the promise of favorable (long-term) tolerability and toxicity profiles.

This study aimed to explore differences in reasons for discontinuation from dolutegravir (DTG) containing two- (2DR) and three-drug-regimens (3DR) in people with HIV (PWH).

**Methods:** Retrospective analysis of clinical routine data from a single, large HIV center in Munich, Germany. People with HIV (PWH) on a DTG-based 2DR (either in combination with lamivudine (3TC) or rilpivirine (RPV)) were identified for analysis in the 2DR stratum of the study, while those on a DTG-based 3DR (DTG with a combination of 2 NRTIs) without a history of a DTG-based 2DR served as the comparison group.

Proportions of PWH discontinuing in the 2DR and 3DR arms were compared by reasons for discontinuation, using Bonferroni-adjustment for multiple testing.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Results:** 854 PWH were included, of which 462 (54.1%) were on a 2DR. 135 discontinuations were observed, of which 102 (75.6%) occurred in the 3DR group. The figure illustrates the proportion of PWH discontinuing for distinct reasons in the 2DR and 3DR arms.

Figure.

**Conclusions:** Discontinuation in general, but in particular for reasons including weight gain, gastrointestinal problems, general side effects, and in order to reduce cardiovascular risk, were significantly more frequent in the 3DR arm.

While some of these individual reasons might be less relevant today with the availability of abacavir- and tenofovir disoproxil-free 3DRs, our data are some of the first real-world evidence to support the notion of better tolerability, probably because of less toxicity, with DTG-based 2DRs compared to 3DRs.

## WEPEB119

### Outcomes in people with HIV (PWH) who resume or switch to B/F/TAF following an antiretroviral treatment interruption (TI)

R. Elion<sup>1</sup>, M. Dunbar<sup>2</sup>, J. Gruber<sup>3</sup>, A. Frick<sup>1</sup>, J. Radtchenko<sup>1</sup>, P.E. Sax<sup>3</sup>, J.J. Eron<sup>4</sup>, G. Huhn<sup>5</sup>, A. Mills<sup>6</sup>

<sup>1</sup>Trio Health, Louisville, United States, <sup>2</sup>Gilead Sciences, Foster City, United States, <sup>3</sup>Brigham and Women's Hospital, Boston, United States, <sup>4</sup>University of North Carolina at Chapel Hill, Chapel Hill, United States, <sup>5</sup>The Ruth M. Rothstein Core Center, Rush University Medical Center, Chicago, United States, <sup>6</sup>Men's Health, Los Angeles, United States

**Background:** B/F/TAF is a guideline-recommended antiretroviral treatment (ART) regimen for treatment-naïve and experienced PWH. This observational study evaluated clinical outcomes among PWH who resumed treatment on B/F/TAF following first TI.

**Methods:** Retrospective study using EMR and dispensing data from Trio Health HIV Network in the US Population: PWH age ≥18, initiated a new ART after 01/01/2021 with ≥6 months follow-up. Virologic failure (VF): viral load (VL) ≥500

copies/mL or 2 consecutive VLs ≥200 copies/mL; TI: ≥90 day gap in dispenses. Virologic outcomes were analyzed after TI, stratified by viral load detectability.

**Results:** 2,710 PWH with ART dispenses were analyzed; 90% were on single-tablet regimens, 93% treatment-experienced; 765 (28%) had a TI. PWH with TIs were more likely to be female (24% vs 19%), Black (50% vs 35%), with substance use (14% vs 9%), CD4 <200 cells/mm<sup>3</sup> (15% vs 8%), and less likely to be commercially insured (48% vs 62%) or virologically suppressed prior to TI (76% vs 85%).

Of 765 PWH with TI, 370 restarted previously discontinued B/F/TAF and 9 switched to B/F/TAF. Mean observation period after resumption was 7.5 months. Of PWH with TI, 9% had a subsequent gap ≥90 days after restart.

Among 47 with confirmed viremia at restart, 27 (57%) had ≥1 VL during follow-up, 17 (63%) were suppressed (77% within 3 months, 94% within 6 months), Table.

Of 87 with unknown viral status at restart, 46 (53%) had ≥1 VL during follow-up, and 44 (96%) achieved VS (61% within 3 months, 86% within 6 months).

Of 245 suppressed at restart, 137 (56%) had ≥1 VL during follow-up, 129 (94%) maintained viral suppression (VS).

VL at Restart of B/F/TAF *Numerator/denominator represent those with available viral load during follow-up.	N	Suppressed During Follow-up (F/U)*	With ≥3 Months F/U Post Restart	Suppressed During ≥3 Months F/U*	With ≥6 Months F/U Post Restart	Suppressed During ≥6 Months F/U*
Suppressed	245	129/137 (94%)	141 (58%)	113/117 (97%)	111 (45%)	95/97 (98%)
Unknown	87	44/46 (96%)	59 (68%)	39/41 (95%)	43 (49%)	31/33 (94%)
Viremic	47	17/27 (63%)	21 (45%)	15/19 (79%)	12 (26%)	9/11 (82%)

**Conclusions:** In a US cohort between 2021-2023, over 25% PWH had a TI ≥90 days. Unexpectedly, 65% were suppressed at restart; 94% of those suppressed at restart maintained VS during follow-up. The majority of those viremic or of unknown virologic status restarting B/F/TAF maintained or achieved VS during follow-up. Future prospective studies evaluating the effectiveness of B/F/TAF in rapid restart may be warranted.

## WEPEB120

Inflammatory biomarkers as potential mediators of the association between HIV status and depressive symptoms in young people

A. Mudra Rakshasa-Loots<sup>1,2,3</sup>, S. Naidoo<sup>1</sup>, T. Hamana<sup>1,4</sup>, B. Fanqa<sup>1</sup>, K.S. van Wyhe<sup>1,5</sup>, F. <sup>1</sup>Stellenbosch University, Family Centre for Research with Ubuntu (FAMCRU), Tygerberg Hospital, Department of Paediatrics and Child Health, Cape Town, South Africa, <sup>2</sup>University of Edinburgh, Edinburgh Neuroscience, School of Biomedical Sciences, Edinburgh, United Kingdom, <sup>3</sup>University of Edinburgh, Lothian Birth Cohorts Group, Department of Psychology, Edinburgh, United Kingdom, <sup>4</sup>University of Cape Town, Division of Biomedical Engineering, Faculty of Health Sciences, Cape Town, South Africa, <sup>5</sup>University of Cape Town, ACSENT Lab, Department of Psychology, Cape Town, South Africa, <sup>6</sup>Massachusetts General Hospital, A.A. Martinos Center for Biomedical Imaging, Boston, United States, <sup>7</sup>Harvard Medical School, Department of Radiology, Boston, United States, <sup>8</sup>Stellenbosch University, Division of Medical Microbiology, Cape Town, South Africa, <sup>9</sup>National Health Laboratory Service (NHLS), Tygerberg Business Unit, Cape Town, South Africa, <sup>10</sup>University of Cape Town, Neuroscience Institute, Cape Town, South Africa, <sup>11</sup>Cape Universities Body Imaging Centre, Cape Town, South Africa

**Background:** People living with HIV are at three times greater risk for depressive symptoms. Inflammation is a notable predictor of depression, and people with HIV exhibit chronic inflammation despite antiretroviral therapy. We hypothesised that inflammatory biomarkers may mediate the association between HIV status and depressive symptoms.

**Methods:** We recruited  $N = 60$  young people (53% girls, median age 15.5 years, 70% living with HIV) in Cape Town, South Africa. Participants completed the nine-item Patient Health Questionnaire (PHQ-9). We measured inflammatory biomarkers in the brain (choline and myo-inositol) using magnetic resonance spectroscopy and in blood serum (16 proteins) using immunoassays.

We then calculated the standardised indirect effect estimate with 95% confidence intervals for each biomarker as a potential mediator of the association between HIV status and PHQ-9 score using structural equation modelling.

**Results:** Median [interquartile range] total PHQ-9 score was 3 [0, 7]. HIV status was significantly associated with total PHQ-9 score ( $B = 3.32$ ,  $p = 0.022$ ). Participants with

HIV showed a higher choline-to-creatine ratio in the basal ganglia than those without HIV ( $\beta = 0.86$ ,  $p_{FDR} = 0.035$ ). In blood serum, participants with HIV showed higher monocyte chemoattractant protein-1 (MCP-1,  $\beta = 0.59$ ,  $p_{FDR} = 0.040$ ), higher chitinase-3 like-1 (YKL-40,  $\beta = 0.73$ ,  $p_{FDR} = 0.032$ ), and lower interleukin-1beta (IL-1 $\beta$ ,  $\beta = -0.67$ ,  $p_{FDR} = 0.047$ ) than those without HIV.

None of the biomarkers were significantly associated with total PHQ-9 score. Consequently, none of the indirect effects were significant, mediating <13.1% of the association. Findings remained consistent when accounting for age, gender, and time between neuroimaging and PHQ-9 administration.

**Conclusions:** We have shown that participants living with HIV in a community-based sample reported greater depressive symptoms than those without HIV, but we did not find that neuroimaging and blood biomarkers of inflammation significantly mediated this association. Further research with participants experiencing severe depression may help to clarify the links between HIV, inflammation, and depression.

## WEPEB121

Results of the CombinADO Implementation Science Study, a multicomponent, youth-focused, youth-informed intervention to improve viral suppression among adolescents and young adults living with HIV in Mozambique

E.J. Abrams<sup>1,2</sup>, P. Mogoba<sup>3</sup>, A. Zerbe<sup>1</sup>, J. Falcao<sup>1</sup>, A. Couto<sup>4</sup>, C. Desmond<sup>5</sup>, E. Pimental de Gusmao<sup>1</sup>, C.A. Mellins<sup>6</sup>, T.B. Simone<sup>4</sup>, F. Yates<sup>7</sup>, L. Myer<sup>3</sup>  
<sup>1</sup>ICAP at Columbia University, Mailman School of Public Health, New York, United States, <sup>2</sup>Department of Pediatrics, Vagelos College of Physicians and Surgeons, Columbia University, New York, United States, <sup>3</sup>Division of Epidemiology & Biostatistics, School of Public Health & Family Medicine, University of Cape Town, Cape Town, South Africa, <sup>4</sup>National STI, HIV/AIDS Control Program, Maputo, Mozambique, <sup>5</sup>Centre for Rural Health, University of KwaZulu Natal, Durban, South Africa, <sup>6</sup>HIV Center for Clinical and Behavioral Studies, Department of Psychiatry, New York State Psychiatric Institute and Columbia University Irving Medical Center, New York, United States, <sup>7</sup>Maternal and Pediatric Infectious Diseases Branch, Eunice Kennedy Shriver National Institute of Child Health and Human Development, Bethesda, United States

**Background:** Adolescents and young adults living with HIV (AYAHIV) lag behind adults in achievement of 95-95-95 targets. The 2021 Mozambique Population HIV Impact Assessment estimated that for young people aged 15-24 years, the 95-95-95 target achievements were 54-53-42 underscoring the urgent need for interventions to improve AYAHIV outcomes.

**Methods:** From 2021 - 2023, the CombinADO study was implemented in adolescent-friendly services at 12 health facilities (HF) in Nampula, Mozambique. Using a cluster randomized trial design, we compared the effectiveness of the CombinADO strategy, a human-center designed multilevel intervention to improve HIV outcomes among AYA HIV, to an enhanced standard of care (eSOC) on the primary outcome of VS (viral load <50 copies/mL).

The CombinADO strategy consisted of an empathy-building community campaign (billboards, radio ads), youth-friendly clinic experience (treatment and self-reflection toolkits, motivational video/wall, mental health screening, peer support) and AYA HIV/caregiver support groups.

Generalized estimating equations were utilized to evaluate the impact of the intervention and covariates on VS, reporting adjusted odds ratios (aOR) with 95% confidence intervals (CI).

**Results:** Outcomes were assessed among 1380 AYA HIV at 12 HF: 67% female; 25% 10-14y, 36% 15-19y, 39% 20-24y. There were no differences in participant characteristics between CombinADO vs eSOC sites. VS <50 copies/mL was 54%, with no differences by intervention condition (eSOC 55% vs CombinADO 54%). VS at different thresholds did not vary by intervention condition (<200 copies/mL: 71%, <1000 copies/mL: 81%). Females were more likely to achieve VS (56%) than males (50%), and VS rates increased with age (43% 10-14y, 53% 15-19y, 63%, 20-24y).

Age and sex-aORs showed that individuals in the highest socioeconomic category were twice as likely to achieve VS (aOR: 2.04, 95% CI: 1.38-2.04,  $p < 0.001$ ) versus the lowest category. Increased self-reported adherence, HIV knowledge and adherence self-efficacy measures were significantly associated with VS, though these were not different by intervention condition.

**Conclusions:** Overall rates of VS in this population of young people on dolutegravir-based ART were low but implementation of the CombinADO strategy did not result in higher rates of VS among AYA HIV attending adolescent-friendly services compared with an eSOC. Ongoing analyses are exploring other critical AYA HIV outcomes including retention, adherence and mental health.

### Results of a stepped-wedge, cluster-randomized, multisite trial of a combination intervention to improve viral suppression among youth on antiretroviral therapy in Nigeria

B. Taiwo<sup>1,1</sup>, O. Agbaji<sup>2</sup>, L. Kuhns<sup>3</sup>, E. Yiltok<sup>2</sup>, A. David<sup>4</sup>, P. Ezemelue<sup>4</sup>, S. Akanmu<sup>5</sup>, P. Akintan<sup>5</sup>, A. Akinbami<sup>6</sup>, O. Sodipo<sup>6</sup>, O. Omigbodun<sup>7</sup>, O. Awolude<sup>7</sup>, K. Kuti<sup>7</sup>, F. Adekanmbi<sup>8</sup>, J. Mautin<sup>8</sup>, T. Badru<sup>9</sup>, M. Cervantes<sup>3</sup>, P. Janulis<sup>1</sup>, O. Okonkwo<sup>1</sup>, B. Berzins<sup>1</sup>, R. Garofalo<sup>3</sup>, iCARE Nigeria Study Team

<sup>1</sup>Northwestern University, Chicago, United States, <sup>2</sup>Jos University Teaching Hospital, Jos, Nigeria, <sup>3</sup>Lurie Children's Hospital and Northwestern University, Chicago, United States, <sup>4</sup>Nigerian Institute of Medical Research, Lagos, Nigeria, <sup>5</sup>Lagos University Teaching Hospital, Lagos, Nigeria, <sup>6</sup>Lagos State University Teaching Hospital, Lagos, Nigeria, <sup>7</sup>College of Medicine, University of Ibadan, Ibadan, Nigeria, <sup>8</sup>Olabisi Onabanjo University Teaching Hospital, Sagamu, Nigeria, <sup>9</sup>iCARE Nigeria, Lagos, Nigeria

**Background:** Interventions are needed to improve antiretroviral treatment (ART) adherence and viral suppression (VS) among youth living with HIV (YLH). We combined two youth-specific, evidence-based interventions (peer navigation and TTX daily text message ART reminders) in our study, iCARE Nigeria, and demonstrated efficacy in a pilot of 40 YLH on ART in Ibadan.

To further evaluate the combination intervention, we conducted a trial in diverse ART clinics across four Nigerian cities.

**Methods:** We recruited from six sites with active ART-adherence programs. Eligibility required age 15-24 and ART for at least 3 months. Using a stepped-wedge design, Cluster 1 (Ibadan, pilot site) was non-randomized, and Cluster 2 (three sites in Lagos) and Cluster 3 (Sagamu and Jos) were randomized to sequences of routine care (control period) and 48 weeks of the combination intervention (intervention period).

The primary endpoint was VS (viral load <200 copies/mL). Secondary endpoints included adherence measured by self-report using a 30-day recall via the visual analogue scale, with at least 90% considered adherent. Post-hoc analysis assessed virologic control below 50 copies/mL and 1000 copies/mL, the WHO benchmark.

Generalized estimating equations determined the difference between intervention and control periods in the intention-to-treat population while controlling for secular trends and cluster membership.

**Results:** We enrolled 558 YLH (17 were withdrawn) and followed 541 over time (mean age 18 years, 53.8% female, 71.7% perinatally infected, and 38.6% virologically non-suppressed (>200 copies/mL) at enrollment). Most (71%) were on a dolutegravir-based, first-line regimen. For the primary endpoint, the intervention periods displayed a small but non-significant increase in VS (OR = 1.16 [0.88,

1.54],  $p = 0.297$ ). Post-hoc analysis showed a significant effect of the combination intervention only when virologic control was assessed using the WHO  $<1000$  copies/mL threshold (OR = 1.42 [1.03, 1.94],  $p = 0.030$ ). Self-reported adherence increased significantly during the intervention (OR = 2.07 [1.46, 2.95],  $p < 0.001$ ).

**Conclusions:** The combination of peer navigation and daily text message ART reminders significantly improved virologic control among ART-experienced YLH only when using the WHO threshold, despite significant improvement in adherence. This highlights the complexities of improving viral suppression among YLH in care, particularly those perinatally infected.

## WEPEB123

### "Make it convenient for us": design and delivery preferences for a targeted long-acting drug-combination injectable treatment for children and youth with HIV in Kenya

K. Beima-sofie<sup>1</sup>, F. Beers<sup>1</sup>, H. Moraa<sup>2</sup>, I. Njuguna<sup>1,2</sup>,

A.J. Melvin<sup>3</sup>, R.J. Ho<sup>4</sup>

<sup>1</sup>University of Washington, Department of Global Health, Seattle, United States, <sup>2</sup>Kenyatta National Hospital,

Department of Research and Programs, Nairobi, Kenya,

<sup>3</sup>Seattle Children's Hospital, Seattle, United States,

<sup>4</sup>University of Washington, Department of Pharmacy, Seattle, United States

**Background:** Long-acting all-in-one injectable combination-ART (LAI-cART) has potential to improve adherence and treatment outcomes for people with HIV. User acceptability and implementation feasibility are important to reap the full benefit. Given high rates of HIV among youth and challenges to oral-ART in children, LAI-cART products could provide significant benefit for these populations.

Understanding client and provider preferences early in LAI development can guide design and delivery strategies, thus accelerating pediatric access to LAI-cART.

**Methods:** The Targeted Long-acting Combination ART (TLC-ART) program has validated a combination triple drug LAI-cART. Grounded in the TLC-ART-101 and -301 products, we conducted semi-structured focus group discussions (FGDs) with adolescents with HIV (ages 14-19), parents of children (ages 0-10) with HIV, and healthcare workers (HCWs) from two clinics in Kenya. FGDs were audio recorded, translated and transcribed. Thematic analysis was used to identify key factors influencing LAI-cART preferences.

**Results:** Fifty-four individuals participated in 6 FGDs. All participants believed LAI-cART could improve adherence by reducing pill fatigue, lowering stigma, and addressing challenges with syrup formulations (Table). Most participants preferred less frequent dosing, small volumes and a single injection, with the key feature being ease of ac-

cess and convenience. Adolescents were particularly concerned about visible injection site reactions, while all participants expressed concerns about having to return to oral regimens during stockouts, having to switch to a new regimen to receive LAI-cART, and lack of proper storage leading to reduced medication effectiveness.

While the TLC-ART product is developed to be a subcutaneous injection, most participants preferred clinic-based delivery by HCWs given concerns about self-injection pain, storage at home, and missing out on HCW support. For rollout, HCWs emphasized the importance of determining eligibility requirements, while all participants felt community education, universal access and free cost would be essential.

Theme	Example Quotation
Side effects	"For me, what will make this drug undesirable is if after having it, it results in body weakness. Then I will rather have the pills."
Design	Delivery Location "So coming over here [to clinic] is better because you will find a person who will motivate you and cheer you up, then you will be at ease to take the injection. But back at home there would be no one to talk to or cheer you up, so I prefer coming to the clinic."
Dosing Frequency	"The one-month duration is challenging for those in boarding school....in that one month you find you have an exam going on at school. You are not going to ask for permission to come get the injection. They will have to increase the duration."
Product supply and stockouts	"Sometimes we have drug shortages. Will there be a shortage of those injectable drugs.....because you can't say you want to bring us a new drug, yet after using it for the first 5 or 6 years there will be a shortage that will make us go back to the old form of drugs."
Delivery	Community Education and Sensitization "We have elderly who will question each and every bit. You will hear some say it's a way for the whites to kill us so that they can take over Africa. That's how they began when the COVID vaccine was introduced. So, we should create awareness."
Equitable Access	"In Kenya the rich overcome the poor. They are not supposed to undermine some people, or they inject the injectables only for the rich and look down on the poor. If it's here to help everyone, it should help everyone."

Table: Design and delivery considerations

**Conclusions:** LAI-cART products for children and adolescents should address self-injection fears and accessibility barriers, and include consideration of health system processes and constraints.

**Background:** TAF is approved for first- and second-line treatment in CYP, and has been shown to be safe and effective in paediatric trials, but data are limited from routine care settings.

**Methods:** Data on CYP aged <18 years at ART initiation, <25 years at TAF start, and ever followed in paediatric clinics in 12 European cohorts were included. Characteristics at TAF start, proportion with viral load (VL)<50c/ml at 48 and 96 weeks on TAF, cumulative incidence of VL<50c/ml among those unsuppressed (VL≥50c/ml) at TAF start, cumulative incidence of virologic failure (VF, defined as failure to suppress within 48 weeks, or, ≥2 consecutive VL≥50c/ml, or 1 VL≥50c/ml followed by change in anchor drug), and the rate of treatment-emergent laboratory events (DAIDS criteria) were analysed. Follow-up time was censored at earliest of TAF discontinuation (+30 days for laboratory analysis), death, 25<sup>th</sup> birthday or last visit.

**Results:** Among 580 CYP on TAF-based regimens, 57% were female, 98% had perinatally-acquired HIV or were aged <10 years at HIV diagnosis; 41% from UK/Ireland, 33%

Spain, and 26% rest of Europe. Median age at ART initiation and TAF start were 3.1[IQR 0.6,8.8] and 15.7[12.6,18.5] years, respectively.

At TAF start: 58% were on INSTI-based regimens, 27% PI, 8% NNRTI; 53% previously used TDF; 4% were treatment-naïve, 53% treatment-experienced with VL<50c/ml, 25% treatment-experienced with VL≥50c/ml and 18% treatment-experienced with unknown VL.

Median duration on TAF was 1.7[0.7,2.9] years. At 48 and 96 weeks on TAF, 84% (262/312) and 86% (168/196) had VL<50c/ml. By 48 weeks, cumulative incidence of VL<50c/ml among those viremic at TAF start was 79% (95% CI 71%, 86%).

By 96 weeks the cumulative incidence of VF was 3% (1%, 6%) among those treatment-experienced with VL<50c/ml and 30% (20%, 43%) among those treatment-experienced with VL≥50c/ml (insufficient numbers for treatment-naïve).

Among 371 (64%) with laboratory data, 20 (5%) had 23 grade ≥3 events, giving an event rate of 2.3(1.5, 3.6) per 100 person-years. There were no deaths.

**Conclusions:** CYP starting TAF-based regimens had high levels of viral suppression and the incidence of virologic failure was low among those suppressed at start. Few had severe or life-threatening laboratory events.

## WEPEB125

### Association between worsening social determinants of health and depressive symptoms among young adults affected by HIV in New York City during the COVID-19 pandemic

P. Kreniske<sup>1</sup>, N. Nguyen<sup>2</sup>, C. Snyder<sup>3</sup>, O. Poku<sup>4</sup>, L. Kluisza<sup>5</sup>, A. Ahmed<sup>5</sup>, L. Liotta<sup>6</sup>, O. Mgbako<sup>7</sup>, C. Dolezal<sup>5</sup>, R.N. Robbins<sup>5</sup>, E. Abrams<sup>8</sup>, C.A. Mellins<sup>5</sup>

<sup>1</sup>City University of New York (CUNY), Community Health and Social Sciences Department and Institute for Implementation Science in Population Health (ISPH), New York, United States, <sup>2</sup>The Aaron Diamond AIDS Research Center, New York City, United States, <sup>3</sup>Cardiovascular Research Foundation (CRF), New York, United States, <sup>4</sup>Columbia University and New York State Psychiatric Institute, Department of Psychiatry, Division of Gender, Sexuality, and Health, New York, United States, <sup>5</sup>New York State Psychiatric Institute and Columbia University, HIV Center for Clinical and Behavioral Studies, New York, United States, <sup>6</sup>City University of New York (CUNY), Hunter College, New York, United States, <sup>7</sup>New York University, Department of Medicine, Department of Population Health, New York, United States, <sup>8</sup>Columbia University, ICAP at Mailman School of Public Health and Vagelos College of Physicians & Surgeons, New York, United States

**Background:** CASA is a longitudinal study following New York City-based youth with perinatally-acquired HIV or perinatal HIV-exposure from adolescence (N=340). We ex-

amined how the COVID-19 pandemic impacted social determinants of health (SDoH) for this population in young adulthood (mean age 28.5 years).

**Methods:** Survey data collected from 60 CASAH participants interviewed immediately before (3/2018-3/2020) and during the pandemic (3/2020-3/2021) were examined. We used Latent Class Analyses to identify "pandemic SDoH profiles" based on whether participants "worsened", "stayed-the-same", or "improved" across 10 SDoH variables (Figure 1).

We compared participant demographics by pandemic profiles and used logistic regression to estimate the association between pandemic profiles and the presence of depressive symptoms measured during the pandemic. Participants were classified as having depressive symptoms if they self-reported being depressed, scored  $\geq 5$  on the Patient Health Questionnaire-9, or met criteria for depression on the DISC.

**Results:** Three distinct pandemic experience profiles (Fig 1) were identified: 1) "Worsened" (n=9; more food insecurity, neighborhood stress, and violence); 2) "Staying-the-Same" (n=38; few SDoH changes); 3) "Improved" (n=13; less neighborhood stress and food insecurity, more familial support.) There were no demographic or HIV differences between profiles. The prevalence of depressive symptoms during the pandemic was high (44.7%), and significantly higher among participants with "Worsened" (77.7%) versus "Improved" (30.8%) profiles; those with "Worsened" profile had 15 times the odds of pandemic depressive symptoms versus "Improved" profile (p=0.01), adjusting for age, sex, HIV status, and depressive symptoms pre-COVID.

Figure 1. Conditional Probabilities by Pandemic Social Determinants of Health (SDoH) Profiles

\*Conditional Probabilities are the probability of a CASAH participant reporting that a SDoH improved, stayed the same, or worsened during the pandemic, conditional on belonging to one of the three identified Pandemic SDoH Experience Profiles ("Improved", "Stayed-the-Same", "Worsened").

**Conclusions:** We found high rates of depression symptoms among young people affected by perinatal HIV during COVID-19, with a small vulnerable subgroup experiencing worsening SDoH and > 3/4 of that group reporting depressive symptoms.

These findings, underscore the importance of mental health services for this population, and systemic changes to address the persistent SDoH challenges, in the context of a public health emergency like the COVID-19 pandemic.

## WEPEB127

### The prevalence of depression and associated factors among adolescents and young people living with HIV at a first-level hospital in Lusaka, Zambia

Lusaka, Zambia, <sup>10</sup>Seed Global Health, Programs, Lusaka,

Zambia

**Background:** Depression is associated with poor clinical outcomes among people living with HIV. Screening, assessment, early diagnosis, and early intervention has the potential to improve the quality of life. However, few studies in sub-Saharan Africa have examined the prevalence and associated risk factors in routine HIV care.

We aimed to determine the prevalence and associated factors of depression among adolescents and young people living with HIV and receiving antiretroviral therapy (ART) at a primary health care facility in Lusaka, Zambia

**Methods:** We conducted a cross-sectional survey from September to December 2023 at a first-level hospital in Lusaka. A total of 307 young people aged 15 to 24 years living with HIV were enrolled through a complete enumeration of hospital ART registers.

Depression was measured using the Patient Health Questionnaire (PHQ-9) administered by a research assistant, with a positive screen defined by a score  $\geq 5$ .

Frequencies and proportions were used to determine prevalence and a logistic regression model, was employed to identify correlates of depression

**Results:** Out of 307 participants, 94.8% consented, with females comprising 66%, and a median age of 20 years (IQR 18-23).

Overall depressive symptoms were prevalent in 70% (95%CI 64-75), with 55% having mild, 31% moderate, 12% moderately severe, and 2% severe depression. Females showed higher rates of moderate (60%) and moderately severe depression (64%) than males. The highest rate of moderately severe (48% CI 28-69) and severe depression (75% CI 19-99) were among those aged 21-24 years compared to the other age groups.

For all levels of depression, those aged 15-17 years had the lowest proportions compared to those aged 18-20 and 21-24 years.

Individuals who self-reported feeling stigmatized ( $\alpha\text{OR}$  2.13; 95%CI 1.07-4.49,  $p=0.037$ ) and those forced into their last sexual encounters ( $\alpha\text{OR}$  8.64; 95%CI 1.67-159,  $p=0.04$ ) were more likely to have depressive symptoms.

**Conclusions:** There is a high prevalence of depression among young people living with HIV. Routine screening for depression is feasible and can be integrated into routine HIV clinic visits.

Efforts to address HIV-related stigma and sexual abuse must be strengthened to support adolescents and young people who are a vulnerable population.

## WEPEB128

### Uncovering the impact of socio-ecological barriers on longitudinal ART adherence trajectories among adolescents living with HIV in South Africa

S. Zhou<sup>1</sup>, E. Toska<sup>1</sup>, L. Knight<sup>2</sup>, L. Cluver<sup>3</sup>

<sup>1</sup>University of Cape Town, Centre for Social Science Research, Cape Town, South Africa, <sup>2</sup>University of Cape Town, Division of Social and Behavioural Sciences, School of Public Health, Observatory, South Africa, <sup>3</sup>University of Oxford, Department of Social Policy and Intervention, Oxford, United Kingdom

**Background:** Adherence to antiretroviral therapy (ART) among adolescents remains low compared to other age-groups. No studies have explored the integrative pathways linking these barriers to long-term ART adherence trajectories among adolescents living with HIV (ALHIV). Anchored by socio-ecological theory, this study explored the mechanisms linking socio-ecological barriers to longitudinal ART adherence among adolescent.

**Methods:** We used data from a cohort of 1046 adolescents living with HIV (55% female aged on average 13.8 years), conducted in the Eastern Cape Province of South Africa. Adolescents aged 10-19 were recruited at baseline (2014) and followed up twice between 2016 and 2018. ART adherence outcome was categorised as four distinct longitudinal adherence trajectories modelled over three study waves, namely: consistent adherence, low start and increasing adherence, gradually decreasing adherence, and low start and decreasing adherence. Bivariate logistic regression was used to select baseline barriers for inclusion ( $p<0.20$ ) in the subsequent analysis – for each trajectory depicting inconsistent adherence over time— compared with the consistent adherence trajectory group. Path analysis examined the direct and indirect associations of baseline barriers and longitudinal adherence trajectories.

**Results:** Experiencing any mental health symptoms ( $\alpha\text{OR}^{\text{DE}}=1.33$ , 95%CI 1.07-1.67), and medication side-effects ( $\alpha\text{OR}^{\text{DE}}=1.33$ , 95%CI 1.04-1.72) at baseline were directly associated with the low start and increasing adherence trajectory, while experiencing food insecurity ( $\alpha\text{OR}^{\text{DE}}=1.42$ ,

95%CI 1.02-2.0) and clinic travel ( $>1$  hour) ( $\alpha\text{OR}^{\text{DE}}=1.60$ , 95%CI 1.12-2.28) was directly associated with gradually decreasing adherence trajectory. Any mental health symptoms ( $\alpha\text{OR}^{\text{DE}}=1.49$ , 95%CI 1.02-2.21), medication side-effects ( $\alpha\text{OR}^{\text{DE}}=1.86$ , 95%CI 1.25-2.77), internalized HIV stigma ( $\alpha\text{OR}^{\text{DE}}=2.30$ , 95%CI 1.55-3.44), clinic travel ( $>1$  hour) ( $\alpha\text{OR}^{\text{DE}}=2.72$ , 95%CI 1.15-6.43), and witnessing domestic violence ( $\alpha\text{OR}^{\text{DE}}=1.67$ , 95%CI 1.01-2.78) was directly associated with the low start and decreasing adherence trajectory.

The association between medication side-effects and low start and increasing adherence trajectory was partially mediated by experiencing any mental health symptoms ( $\alpha\text{OR}^{\text{E}}=1.14$ , 95%CI 1.02-1.31), while the association between emotional bullying and low start and increasing adherence trajectory was fully mediated by mental health symptoms ( $\alpha\text{OR}^{\text{E}}=1.12$ , 95%CI 1.01-1.25).

**Conclusions:** We identified multiple modifiable socio-ecological barriers and their unique pathways to longitudinal suboptimal adherence. Understanding how adolescents' experiences at the individual, household, community, and healthcare level interact to influence their long-term ART adherence may facilitate the development of multi-level tailored adherence support intervention packages for ALHIV.

## WEPEB129

### HIV diagnostic disclosure and health outcomes among children and adolescents living with HIV aged 8-14 years in four provinces of Mozambique

M. Maringa<sup>1</sup>, J. Moiane<sup>1</sup>, W.M. Olivier<sup>2</sup>, J. Saturnino<sup>1</sup>, J. Alexandre<sup>1</sup>

<sup>1</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique, Maputo, Mozambique, <sup>2</sup>Efficiencies for Clinical HIV Outcomes (ECHO) Project, Mozambique/ Pathfinder International, Maputo, Mozambique

**Background:** The increasing availability and effectiveness of antiretroviral treatment (ART) has enabled HIV-positive children to survive to older age. HIV diagnostic disclosure (HDD) has become crucial for achieving successful treatment outcomes as well as psychological well-being for this population. The estimated prevalence of HDD among children and adolescents living with HIV (CALHIV) in Sub-Saharan African countries is 58%, and in Mozambique, in 2022, was 45%.

We analyzed HDD rate and health outcomes according to disclosure status among CALHIV aged 8-14 in provinces supported by the USAID-funded Efficiencies for Clinical HIV Outcomes (ECHO) project.

**Methods:** This is a quantitative cross-sectional study of CALHIV aged 8-14 who initiated ART from November 2019 to March 2023. Data was extracted from electronic medical records from 148 health facilities in four project-supported provinces. Descriptive statistics were used to characterize study sample and determine HDD rate,

defined as the proportion of CALHIV with partial or total (full information and knowledge about HIV) HDD, and the prevalence of health outcome variables (viral load (VL) suppression, defined as VL test result <1,000 copies/ml, and retention in care until end of March 2023).

**Results:** 3,448 CALHIV aged 8-14 were included in the analysis, of whom 54.7% (1,886/3,448) were female. The median age was 12 years [interquartile range (IQR) 9 – 14 years]. HDD rate was 51.4% (1,772/3,448), of whom 65% (1,150/1,772) had full disclosure and 35% (622/1,772) partial disclosure. Among those with full disclosure, 69.4% (697/1,005) of eligible CALHIV had an updated VL test result, 79.6% (555/697) were virally suppressed, and 100% were retained in care. Among those with partial disclosure, 65.2% (328/503) had an updated VL test result, 83.5% (274/328) were virally suppressed and almost 100% (621/622) retained in care. For the group without HDD, results were 31.9% (494/1,549), 81% (400/494) and 50.2% (841/1,676), respectively.

**Conclusions:** HDD rate was found to be low, although comparable with regional and national prevalence. While VL suppression was found to be equivalent across all groups, VL coverage and retention in care were double among CALHIV with full or partial disclosure. Targeted interventions will be needed to improve HDD rate, prioritizing those who are potentially sexually active.

## Antiretroviral therapies and clinical issues in neonates, infants and children

Missed opportunities for HIV diagnosis and management among children born to HIV positive women: case studies from the child health and mortality prevention surveillance (CHAMPS) network, Kenya

L. Nyabiage<sup>1</sup>, V. Akelo<sup>2</sup>, A. Cleveland<sup>1</sup>, D. Onyango<sup>3</sup>, A. Igunza<sup>4</sup>, J. Kuboka<sup>1</sup>, J. Agaya<sup>4</sup>, J. Were<sup>4</sup>, D. Gethi<sup>4</sup>, J. Verani<sup>5</sup>, D. Blau<sup>5</sup>, B. Barr<sup>1</sup>

<sup>1</sup>US Centers for Disease Control and Prevention, Global Health Center, Division of Global HIV & TB, Kisumu, Kenya,

<sup>2</sup>Liverpool School of Tropical Medicine, Pembroke, United Kingdom, <sup>3</sup>Kisumu County Department of Health Services, Kisumu, Kenya, <sup>4</sup>Kenya Medical Research Institute, Kisumu, Kenya, <sup>5</sup>US Centers for Disease Control and Prevention, Global Health Center, Division of Global HIV & TB, Atlanta, United States

**Background:** Pediatric HIV remains a public health challenge in many African countries including Kenya, with mother-to-child transmission being a major source of HIV acquisition. Missed opportunities for early diagnosis and treatment initiation among exposed infants persist, con-

tributing to preventable child mortality. We used mortality surveillance data to analyze characteristics of deaths among children and infants of HIV-positive mothers.

**Methods:** We analyzed Kenya Child Health and Mortality Prevention Surveillance (CHAMPS) data (May 2017-December 2022) from maternal and child health records in western Kenya. CHAMPS identifies deaths of children aged <60 months and utilizes minimally invasive tissue sampling (MITS), postmortem laboratory and pathology testing, verbal autopsy, and expert adjudication to determine cause of death.

This analysis included decedents aged 1 to 59 months born to HIV positive mothers, who underwent MITS, had documented immediate cause of death and HIV test result. Causes of death among all decedents and characteristics of HIV-positive decedents are described.

**Results:** In total, 81 underwent MITS of whom 92.6% (n=75) had HIV test results and documented cause of death. The leading immediate causes of death were pneumonia (30.7%, n=23/75), sepsis (26.7%, n=20/75) and malaria (22.7%, n=17/75). Malnutrition was the most common underlying cause of death at 37.3% (n=28/75) including 51.4% (n=18/35) among HIV positive decedent of whom 94.4% (n=17/18) had severe wasting compared with 25.0% (n=10/40) among HIV negative decedent (odds ratio 2.83, 95% CI: 1.06 – 7.51).

In total, 46.7% (n=35/75) tested HIV-positive [with higher rates in children aged >12-59 months (56.8%, 21/37) than in infants aged 1-12 months old (36.8%, 14/38)] of whom 26 (74.3%) were not on ART. Of the 26, 17 (65.4%) had up-to-date immunization, 14 (53.8%) died in the community, 13 (50%) had HIV wasting syndrome, 8 (30.8%) had ever been hospitalized and 3/14 (21.4%) had documented maternal HIV negative status from antenatal clinic.

**Conclusions:** Majority of deaths of children born to HIV-positive mothers are preventable. Most HIV-positive children were not on ART half of whom had severe malnutrition. Closing gaps in timely HIV case identification, linkage to treatment and appropriate management of childhood illnesses remains critical.

### Integrase inhibitor (INSTI) use and outcomes among children living with HIV in Latin America & the Caribbean

M.T. Luque<sup>1</sup>, L. Du<sup>2</sup>, V. Rouzier<sup>3</sup>, D.M. Machado<sup>4</sup>, L. Otero<sup>5</sup>, J. Pinto<sup>6</sup>, B.E. Shepherd<sup>2</sup>, J.L. Castilho<sup>7</sup>

<sup>1</sup>Hospital Escuela Universitario, Departamento Pediatría, Tegucigalpa, Honduras, <sup>2</sup>Vanderbilt University Medical Center, Department of Biostatistics, Nashville, United States, <sup>3</sup>Les Centres GHESKIO, Port-au-Prince, Haiti, <sup>4</sup>Federal University of São Paulo, Paulista School of Medicine, São Paulo, Brazil, <sup>5</sup>Universidad Peruana Cayetano Heredia, Instituto de Medicina Tropical Alexander von Humboldt, Lima, Peru, <sup>6</sup>Federal University of Minas Gerais, School of Medicine, Belo Horizonte, Brazil, <sup>7</sup>Vanderbilt University Medical Center, Division of Infectious Diseases, Nashville, United States

**Background:** Though dolutegravir (DTG) is recommended for primary treatment for all people with HIV, limited data exist on integrase strand inhibitor (INSTI) use among children. We assessed DTG and raltegravir (RAL) use and outcomes among Latin American and Caribbean children living with HIV.

**Methods:** Caribbean, Central and South America network for HIV epidemiology cohorts from Brazil, Haiti, Honduras, and Peru contributed data for children (age <18 years) receiving care since widespread availability of DTG/RAL (approximately 2013-2022). Trends and factors associated with INSTI (DTG/RAL) initiation were examined using multivariable logistic and Cox regression models among antiretroviral therapy (ART)-naïve and -experienced children, respectively.

We compared outcomes (viral suppression, ART switch, CD4 recovery, and mortality) among ART-naïve children starting INSTI vs. other ART using generalized linear and Cox regression models.

**Results:** Among 192 ART-naïve children, 77 started DTG, 6 started RAL, and 109 started other ART. The proportion of ART-naïve children initiating INSTI-based ART increased from 0% in 2013 to 93% (13/14) in 2022.

In adjusted analyses, starting INSTI-based ART was more likely in Haiti and Brazil, older children, and more recent calendar years ( $p < 0.001$  for all). Among 560 ART-experienced children, 123 switched to DTG and 30 switched to RAL. More recent calendar year, greater number of prior ART regimens, and living in Haiti or Brazil were associated

with a higher incidence of switching to INSTI in adjusted analyses ( $p < 0.05$  for all). There was no statistical difference in CD4 recovery, virologic suppression (Figure A), nor mortality among ART-naïve children by INSTI use ( $p > 0.05$  for all). Children started on INSTI had longer duration of first regimen than those started on other ART (Figure B).

**Conclusions:** INSTI use among children has increased parts of Latin America and the Caribbean. As more children start INSTI regimens, further research is needed to understand the impact of INSTI on clinical outcomes.

## WEPEB132

### Pediatric Dolutegravir Optimization: 18 month follow up of viral load suppression

M. Abadie<sup>1,2</sup>, S. Dlamini<sup>1,2</sup>, J. Petrus<sup>1,2</sup>, N. Mthethwa<sup>3</sup>, S. Perry<sup>1,2</sup>

<sup>1</sup>Baylor College of Medicine Children's Foundation Eswatini, Mbabane, Eswatini, <sup>2</sup>Baylor College of Medicine, Houston, United States, <sup>3</sup>Eswatini Ministry of Health, Eswatini National AIDS Program, National Pediatric HIV Care and Treatment Coordinator, Mbabane, Eswatini

**Background:** In August 2021, Eswatini began optimizing children on first line Antiretroviral Therapy (ART) and under 20kg to pediatric dolutegravir (pDTG)-based treatment. All children with viral load (VL)  $\leq 400$  copies/mL were optimized to ABC/3TC/DTG. Those with VL 401-999 received adherence counseling then repeated VL. Those with VL  $\geq 1000$  copies/mL accessed genotypes and those results informed an optimized NRTI backbone with pDTG. All new pediatric clients were initiated on ABC/3TC/DTG. Since starting pDTG, some children have now transitioned to 50mg DTG based ART per national weight-based dosing guidelines.

**Methods:** This is a retrospective review of routinely collected data from all children on first line ART optimized to pDTG based ART from August 2021 until January 2023 at Baylor College of Medicine Children's Foundation-Eswatini. Data were extracted from electronic medical records and imported into STATA 17 for analysis. McNemar's Test using 95% confidence intervals ( $p < 0.05$ ) was used to determine significance in viral suppression ( $\leq 400$  copies/mL).

**Results:** Between August 2021 and January 2023, 368 children accessed pDTG, 58 as new initiations and 310 through optimizations.

Of the newly initiated with VL data, 41/58 (71%) remain active in care. They are 51% female with average age at DTG initiation of 19 mos. VL suppression is 87.8% (36/41) at average 16 months post pDTG initiation.

Of the children optimized to pDTG with VL data, 255/310 (82%) remain active in care. They are 54% female with an average age of 56 months at time of DTG initiation. Majority (99%) were transitioned from ABC/3TC/LPV/r to a pDTG based regimen, 251 to ABC/3TC/LPV/r and 4 to AZT/3TC/LPV/r based on genotype results. VL suppression in-

creased from 91.3% pre switch (233/255) to 94.9% (242/255) at average 18.5 months post switch (23-124wks) ( $p=0.06$ ). When both groups were combined and stratified by age, VL suppression was  $>90\%$  for all ages except for the 24mos-36mos group who were at 72%.

**Conclusions:** Many children have benefited from the introduction of pDTG, however improvement in viral suppression observed was not statistically significant. Some of our youngest clients still struggle with adherence despite improved formulations. Focus must still be on improving this group through innovative programming.

## WEPEB133

### Emerging dolutegravir resistance in children and adolescents living with HIV in Malawi

K. Simon<sup>1,2</sup>, C.M. Cox<sup>2,1</sup>, C. Wallrauch<sup>3,4</sup>, P. Bisani<sup>3</sup>, E. Adisoni<sup>3</sup>, J. Kathyoka<sup>3</sup>, B. Wilson Matola<sup>5</sup>, H. Kanise<sup>6</sup>, G. Bello<sup>7</sup>, K. Steegen<sup>8,9</sup>, J. Bitilinyu-Bingoh<sup>10</sup>, B. Bighignoli<sup>11,7</sup>, M. Hosseinipour<sup>12</sup>, R. Nyirenda<sup>5</sup>, A. Jahn<sup>11</sup>, T. Heller<sup>11,3</sup>, J. Van Oosterhout<sup>6,13</sup>

<sup>1</sup>Baylor College of Medicine Children's Foundation Malawi, Lilongwe, Malawi, <sup>2</sup>Baylor College of Medicine, Department of Pediatrics, Houston, Texas, United States, <sup>3</sup>The Lighthouse Trust, Lilongwe, Malawi, <sup>4</sup>Abteilung fuer the Infektions- und Tropenmedizin, LMU Klinikum, Munich, Germany, <sup>5</sup>Directorate of HIV, STI and Viral Hepatitis, Ministry of Health, Lilongwe, Malawi, <sup>6</sup>Partners in Hope, Lilongwe, Malawi, <sup>7</sup>International Training and Education Center for Health (I-TECH), Lilongwe, Malawi, <sup>8</sup>National Priority Programme, National Health Laboratory Service, Johannesburg, South Africa, <sup>9</sup>Department of Molecular Medicine & Haematology, University of the Witwatersrand, Johannesburg, South Africa, <sup>10</sup>National Laboratory Program, Lilongwe, Malawi, <sup>11</sup>International Training and Education Center for Health (I-TECH), University of Washington, Seattle, Washington, United States, <sup>12</sup>University of North Carolina Project, Lilongwe, Malawi, <sup>13</sup>University of California Los Angeles, Department of Medicine, David Geffen School of Medicine, Los Angeles, California, United States

**Background:** In 2021, Malawi transitioned children and adolescents living with HIV (CALHIV) to dolutegravir-based ART. Most had zidovudine exposure and transitioned to abacavir/lamivudine/dolutegravir ( $< 30$ kgs) or tenofovir/lamivudine/dolutegravir ( $\geq 30$ kgs). Transitions often happened without recent viral load (VL) results. CALHIV VL suppression rates improved post DTG transition but remain below 85%, raising concerns about emergence of dolutegravir resistance.

**Methods:** National guidelines recommend HIV drug resistance (HIVDR) testing for individuals with confirmed virological failure (VL  $\geq 1,000$  copies/mL after enhanced adherence counseling) on dolutegravir-based regimens. We reviewed HIVDR testing applications and available

genotype results between December 2019 and November 2023 from CALHIV 0-18 years on dolutegravir-based ART in Malawi's ART program. Genotyping was performed from DBS samples at National Health Reference Laboratory in Lilongwe, Malawi or National Health Laboratory Service, Johannesburg, South Africa. Drug resistance was defined as resistance score  $\geq 15$  (Stanford HIVdb version 9.5.1).

**Results:** Of 310 applications from CALHIV with confirmed virologic failure (all on 2NRTI+dolutegravir), 99 were approved and had genotype results; 31(31%) had dolutegravir resistance (Table).

Categories of genotypic resistance	Genotypes
No resistance detected (wild type)	26
Single-class resistance: NRTI only and NNRTI only	21
Single-class resistance: DTG only	3
Dual-class resistance: NRTI + DTG	5
Dual-class resistance: PI + DTG	1
Dual-class resistance: NNRTI + NRTI / NNRTI + PI / NNRTI + DTG	23
Triple-class resistance: NRTI+NNRTI+PI / NRTI+NNRTI+DTG	18
Quadruple-class resistance: NRTI+NNRTI+PI+DTG	2
Total	99

Table. Genotypic results of 99 Malawian CALHIV with confirmed virological failure.

Among 31 CALHIV with dolutegravir resistance, median age was 10 years (range 2-18). Four (13%) were  $<5$  years and 16(52%) 10-18 years; 19(61%) were male. Median total time on ART was 75 months (range 21-182), median on current regimen 21 months (range 1-39); 25(81%) were on abacavir/lamivudine; 2(6%) on zidovudine/lamivudine and 4(13%) on tenofovir/lamivudine. Dolutegravir resistance mutations caused 12(39%) high, 17(55%) intermediate and 2(6%) low-level resistance. Two children (10%) presented with quadruple class resistance, including one with darunavir resistance.

**Conclusions:** While access to HIVDR testing has remained limited in Malawi, dolutegravir resistance was confirmed among a large proportion of CALHIV with confirmed virologic failure on dolutegravir-based ART. Streamlined protocols are needed to detect dolutegravir resistance early and define practical, appropriate adherence support and switching strategies.

**Background:** Gaps and inequities remain in elimination of vertical transmission (EVT) and HIV diagnosis and treatment for children. Between October 2022 and September 2023, PEPFAR introduced the Accelerating Progress in Pediatrics and PMTCT initiative (AP3) in seven countries with the largest gaps in PMTCT and pediatric HIV outcomes: Democratic Republic of the Congo, Mozambique, Nigeria, South Africa, Tanzania, Uganda, and Zambia.

**Description:** AP3 countries' objectives were to:

1. Reduce HIV acquisition in children,
2. Identify children living with HIV and link them to treatment, and;
3. Increase rates of pediatric viral suppression.

PEPFAR AP3 country teams planned and implemented a six-pronged surge for pediatric and EVT programming that included dedicated human resources; strategic budgeting and expenditure monitoring; strengthened monitoring and evaluation efforts; pediatric community-led monitoring (CLM); socioeconomic support, psychosocial support, and case management; and regular review meetings.

Teams used routine PEPFAR monitoring, evaluation and reporting and custom indicators to monitor their implementation strategy. An AP3 steering committee comprised of pediatric, PMTCT, and orphans and vulnerable children experts facilitated cross-country sharing, ensured quality technical assistance, and monitored quarterly progress.

**Lessons learned:** AP3 demonstrated progress across all objectives. Notably, between July and September 2022 and July and September 2023, maternal HIV retesting increased from 39% to 62%, pediatric viral suppression (<1,000 copies/mL) increased from 85% to 88%, and the volume of pediatric dolutegravir bottles dispensed increased 32%.

AP3 encouraged collaborations and synergies across program areas to achieve key results and strengthened collaborations with ministries of health, social welfare workforce, civil society, and other stakeholders.

Best practices included equitable resourcing, use of granular data and custom indicators and CLM to monitor implementation; regular, timely meetings to review data and adjust strategy; and cross-sectoral and cross-country sharing of implementation successes and challenges.

**Conclusions/Next steps:** Through a concerted effort to close pediatric and EVT gaps, the AP3 initiative made progress toward its objectives, but did not fully reach them.

Continued and dedicated support for EVT and pediatrics is needed in country plans to end HIV and AIDS in children. A population-specific initiative like AP3 may be useful in helping to achieve these goals in other settings.

## WEPEB135

### Inadequate serologic response following vaccination against hepatitis B virus in children who were exposed to HIV

S. Dorval<sup>1</sup>, I. Boucoiran<sup>2</sup>, C. Renaud<sup>3</sup>, V. Lamar<sup>1</sup>, S. Gantt<sup>1</sup>, J. Brophy<sup>4</sup>, M. Hawkes<sup>5</sup>, H. Soudeyns<sup>1,3</sup>, F. Kakkar<sup>1</sup>

<sup>1</sup>University of Montreal, CHU Sainte-Justine, Pediatrics, Montreal, Canada, <sup>2</sup>University of Montreal, Obstetrics and Gynaecology, Montreal, Canada, <sup>3</sup>University of Montreal, Microbiology and Immunology, Montreal, Canada, <sup>4</sup>University of Ottawa/ Children's Hospital of Eastern Ontario, Ottawa, Canada, <sup>5</sup>University of British Columbia/ British Columbia Children's Hospital, Vancouver, Canada

**Background:** Given the global burden of Hepatitis B virus (HBV) and HIV co-infection, ensuring an appropriate response to vaccination among children who were HIV exposed and uninfected (CHEU) is essential to reduce their morbidity and mortality.

The objective of this study was to assess seroprotection following a primary series of vaccination against HBV among CHEU.

**Methods:** Retrospective study of mother-infant pairs enrolled in the CMIS Montreal Cohort (1997-2020). Anti-HBs titers were measured in first trimester of pregnancy, and in CHEU after 3 doses of HBV vaccine given according to guidelines at birth, 1 month and 6 months between 1998-2012 (early schedule) and at 2 months, 4 months and 18 months between 2013-2020 (late schedule).

Infants born to women with evidence of active HBV infection were excluded. A titer of <10 IU/ml following completion of the primary series was considered non-protective (NP) according to provincial guidelines.

**Results:** 161 CHEU were included; 144 were tested <5 years following their primary HBV series (median = 7.3 months, IQR = 6.1-17 months) and 17 at age > 5 years (median = 5.3 years, IQR = 4.8-6.8 years).

Overall, 13.2% of infants were considered NP. Among those with HBV titers first assessed at >5 years, 53% were NP vs. 6.6% of those assessed at <5 years. There was a higher proportion of NP among CHEU vaccinated according to the early vs late schedule (22% vs 8.3%,  $p = 0.015$ ) and those born to women with CD4 counts <200 vs >200 cell/mm<sup>3</sup> at delivery (33% vs 12.2%,  $p = 0.08$ ), but no difference according to maternal viral load at delivery or receipt of maternal HBV vaccination during pregnancy. There was no significant correlation between maternal first trimester anti-HBs and post-vaccination titers in children ( $R^2 = -0.073$ ,  $p = 0.82$ ).

**Conclusions:** While the overall proportion of CHEU considered NP after an HBV primary series (8.3%) was slightly higher than that reported in the general population (5%), the proportion NP when tested >5 years after vaccination was very high (53%). These data suggest that response to HBV vaccination may be inadequate among CHEU and should be further assessed in larger cohorts.

## WEPEB136

### Improved growth during bNAb-only treatment among early-treated suppressed children with HIV

J. Banga<sup>1,2</sup>, B.S. Nelson<sup>3</sup>, G. Ajibola<sup>4</sup>, M. Sakoi-Mosetlhi<sup>4</sup>, O. Batlang<sup>4</sup>, K. Maswabi<sup>4</sup>, O. Dinah Pule<sup>4</sup>, M. Shapiro<sup>1,2,4</sup>, K.M. Powis<sup>2,4,8</sup>

<sup>1</sup>Beth Israel Deaconess Medical Center, Division of Infectious Diseases, Boston, United States, <sup>2</sup>Harvard T.H. Chan School of Public Health, Department of Immunology and Infectious Diseases, Boston, United States, <sup>3</sup>Harvard T.H. Chan School of Public Health, Department of Biostatistics, Boston, United States, <sup>4</sup>Botswana Harvard Health Partnership, Gaborone, Botswana, <sup>5</sup>Brigham and Women's Hospital, Department of Infectious Diseases, Boston, United States, <sup>6</sup>Harvard Medical School, Boston, United States, <sup>7</sup>Ragon Institute of Mass General, MIT, and Harvard, Cambridge, United States, <sup>8</sup>Massachusetts General Hospital, Departments of Medicine and Pediatrics, Boston, United States

**Background:** Broadly neutralizing monoclonal antibodies (bNAbs) are an ART-sparing HIV treatment option with potential to avoid toxicities associated with lifelong ART. We evaluated anthropometrics over time among children in Botswana who underwent up to 6 months of ART interruption while receiving dual-bNAbs (VRC01LS and 10-1074) alone.

**Methods:** The Tatelo Study included 25 early-treated children with HIV who paused lopinavir/ritonavir-based triple ART and received dual bNAbs for up to 24 weeks. Anthropometric data were converted to length/height-for-age (HAZ) and weight-for-age (WAZ) z-scores using World Health Organization Growth Standards adjusted for age and sex. We included up to 38 months of data for each child during different treatment modalities: before dual bNAb initiation (including single-bNAb PK assessment for a subset), ART plus dual bNAb administration, dual bNAbs alone, and ART restart after bNAb discontinuation. Wilcoxon signed rank test was utilized to assess for changes in z-scores before and after dual bNAb-only treatment (ART pause).

**Results:** Eleven (44%) participants maintained viral suppression for 6 months during dual bNAb-only treatment period and 14 experienced virologic rebound (Figure 1). HAZ remained stable over time throughout follow-up for all participants. In participants who maintained viral suppression during bNAb-only treatment, there was a slight improvement in WAZ (median change pre-post ART pause 0.28, IQR 0.14 – 0.49,  $p=0.02$ ), which was not sustained following ART restart (median change from 1 to 6 months following ART restart -0.10, IQR -0.34 – 0.13,  $p=0.15$ ). In participants with viral rebound on bNAb-only treatment (and less time off ART), no significant changes in WAZ were observed.

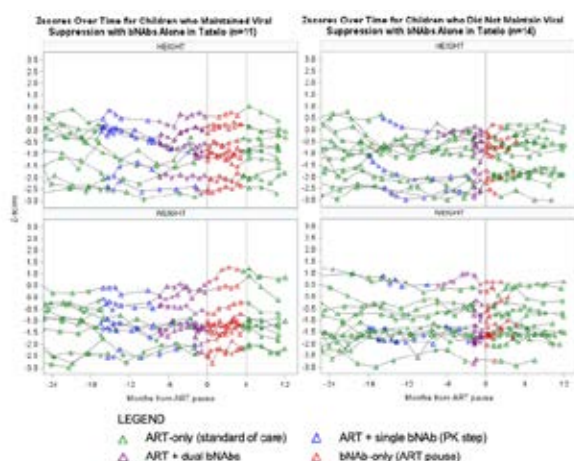

Figure 1. Z-scores over time for early treated children enrolled in Tatelo study (n=25).

**Conclusions:** Children who maintained virologic suppression during dual bNAbs-only treatment had significant improvement in WAZ that was not sustained following ART restart.

These results suggest improved WAZ during bNAbs treatment and ART pause, though further studies are needed to assess the impact on growth with different ART regimens and longer ART pauses.

## WEPEB137

Viral load outcome of CALHIV in disclosure groups in Haiti

S. Charles<sup>1</sup>, T. Lewis<sup>1</sup>, E. Carras-Terzian<sup>1</sup>, D. Adrien<sup>1</sup>

<sup>1</sup>Caris Foundation International, Colleyville, United States

**Background:** Adherence to antiretroviral therapy (ART) remains the burden and the most considerable cause of virologic failure and non-suppression in children and adolescents living with HIV (CALHIV), while being a determinant part of the management of HIV.

When a child is not aware of his/her status, management of disease can be challenging due to stigmatization and lack of psycho-social support for both the CALHIV and caregivers, especially in low-and middle income countries, like Haiti. Since 2021, Caris Foundation International via the USAID funded Impact Youth program, started leading disclosure groups for caregivers and their CALHIV between the ages of 9-17 years old.

Via the disclosure groups, caregivers can choose to disclose their child's status themselves or choose for their social worker and their clinic's psychologist to assist with the process.

**Description:** A pediatric cohort of 293 CALHIV aged from 9-17 years old was taken from The Impact Youth project in Haiti. Through the implementation of disclosure groups for CALHIV over the past 3 years, data showed that 111 CALHIV enrolled in disclosure groups were 2.13 times more likely to attain viral load suppression, versus those who were not.

Association between being in a disclosure group and VL suppression (outcome of interest) were assessed using a multivariate mixed effect logistic regression model.

**Lessons learned:** Children aged 9-17 years old knowing their HIV status were 2.13 were likely to be virally suppressed. Scaling up children disclosure groups has been successful and led to increased viral load suppression in CALHIV. Participation in these support groups increased adherence to ART, viral load coverage, peer-to-peer support, and increased knowledge on disease management and other pertinent health-related topics.

**Conclusions/Next steps:** The Caris OVC program continues to work with caregivers of HIV-positive 9 to 17 years of age who are not aware of their status to participate in disclosure groups. Caris continues to work with caregivers who have refused for their children to attend disclosure groups to overcome these barriers. Caris is also developing other approaches to reach CALHIV who are not enrolled in disclosure groups, and targeting their caregivers, to improve adherence and have better health outcomes.

## Clinical issues specific to key populations

Disclosure decision-making processes and antiretroviral therapy adherence among gay, bisexual, and other men who have sex with men living with HIV in Jamaica

C. Logie<sup>1</sup>, L. Gittings<sup>2</sup>, F. MacKenzie<sup>1</sup>, K. Levermore<sup>3</sup>, P. Shuper<sup>4</sup>, P. Lalor<sup>3</sup>

<sup>1</sup>University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, <sup>2</sup>Western University, London, Canada, <sup>3</sup>Jamaica AIDS Support for Life, Kingston, Jamaica, <sup>4</sup>Centre for Addiction and Mental Health, Toronto, Canada

**Background:** Decision-making processes for HIV disclosure are shaped by antecedent goals to achieve positive outcomes (approach-focused goals) and prevent negative outcomes (avoidance-focused goals). HIV prevalence among men who have sex with men (MSM) in Jamaica is 29%, and only 38% take ART and 31% are virally suppressed. Yet little is known of their experiences navigating HIV care. To address this knowledge gap, we explored disclosure experiences and ART engagement among MSM living with HIV in Jamaica.

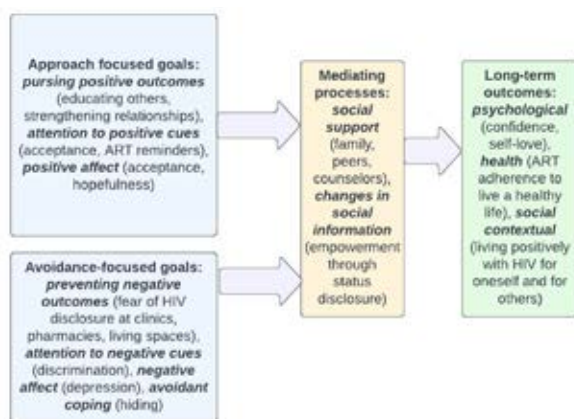

**Methods:** We conducted three focus groups and twenty-one in-depth interviews with MSM living with HIV, and ten key informant interviews with HIV and LGBTQ health/social service providers, in Kingston, St. Ann, and Montego Bay, Jamaica.

We explored disclosure experiences and HIV care engagement. We applied thematic analysis guided by the Disclosure Process Model to understand antecedent goals associated with ART uptake and adherence.

**Results:** Participants included MSM (n=49) in focus groups (n=28, mean age: 28.43, standard deviation [SD]=5.49) and interviews (n=21, mean age: 24.5, SD=3.16) and n=10 key informants (5 cisgender women, 5 cisgender men).

Participants reported avoidance-focused antecedent goals that presented barriers to ART adherence, including: preventing negative outcomes (fear of HIV disclosure at clinics, pharmacies, living spaces), attention to negative cues (discrimination), negative affect (depression), and avoidant coping (hiding).

Approach-focused goals that facilitated ART adherence included: pursuing positive outcomes (educating others about HIV, strengthening relationships), attention to positive cues (acceptance, ART reminders), and positive affect (acceptance, hopefulness). Social support and changes in social information (empowerment through HIV disclosure) facilitated long-term psychological (confidence, self-love), health (ART adherence), and social-contextual (living positively with HIV) outcomes.

**Conclusions:** Decision-making processes regarding ART uptake and adherence among MSM in Jamaica are shaped by complex, multi-level considerations and goals. Findings can inform ART adherence interventions informed by the Disclosure Process Model, supportive programs, and stigma reduction with and for MSM with HIV.

## WEPEB139

### Influence of gender identity stigma and COVID-19 economic stressors on mental health and HIV risk of transgender women in South India: findings from mediation analyses

R. Nelson<sup>1</sup>, A. Sebastian<sup>2</sup>, J. Kaur<sup>3</sup>, M. Shunmugam<sup>1</sup>, T. Mani<sup>4</sup>, K. Kasinathan<sup>4</sup>, V. Chakrapani<sup>1</sup>

<sup>1</sup>Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, <sup>2</sup>National Institute of Advanced Studies (NIAS), Bangalore, India, <sup>3</sup>Postgraduate Institute of Medical Education and Research (PGIMER), Chandigarh, India, <sup>4</sup>Thozhi, Chennai, India

**Background:** Transgender women (TGW) globally bear a disproportionate HIV burden. Harmful social conditions such as gender identity-related stigma faced by them, and COVID-19 economic stressors may contribute to syndemic psychosocial conditions and HIV risk.

We examined whether the effects of transgender identity stigma, sex work stigma and COVID-19 economic stressors on condomless anal sex (CAS) are mediated through mental health and internalized transprejudice among TGW in Chennai, South India.

**Methods:** We conducted path analyses in Mplus8 on cross-sectional data collected between September-December 2022 through online and offline surveys among 250 TGW. Standardized scales were used to measure stigmas, and psychosocial health conditions (past 2-week depression: PHQ-2, past 2-week anxiety: GAD-2, past 3-month problematic alcohol use: AUDIT-C) dichotomized as presence or absence of syndemics (co-occurrence of two or more psychosocial conditions).

The binary outcome measure was past 2-month CAS with male partners ('any type', regular and non-regular). The analyses were adjusted for educational status, social support and gender affirmation. Standardized coefficients ( $\beta$ ) are presented for effect estimates.

**Results:** Participants' mean age was  $29 \pm 5.7$  years; 47% had a college degree. A majority (90%) engaged in sex work and 86% reported CAS. The prevalence of psychosocial syndemics was 70%.

Transgender identity stigma and COVID-19 economic stressors had significant direct effects on syndemics and CAS with non-regular partners (Figure 1).

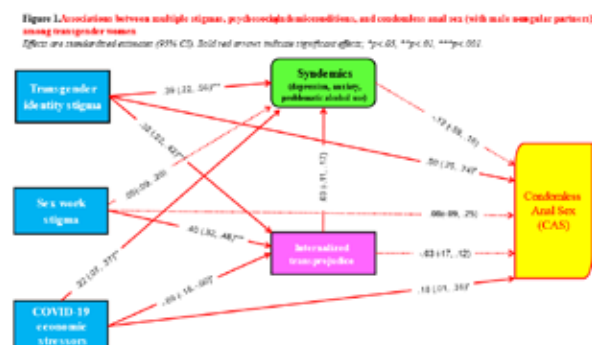

Figure 1. Associations between multiple stigmas, psychosocial conditions, and condomless anal sex (with male non-regular partners) among transgender women. Effects are standardized estimates (beta). Solid red arrows indicate significant effects: \*p<0.05, \*\*p<0.01, \*\*\*p<0.001.

Total effects of identity stigma ( $\beta=.45$ ; 95% CI.26,.64;  $p<.001$ ) and COVID-19 economic stressors ( $\beta=.16$ ; 95% CI .01, .31;  $p=.04$ ) on CAS were significant. Identity stigma had similar effects on CAS with regular and 'any type' of partners. Further, mediation effects were non-significant in all the models.

**Conclusions:** Experiences of stigma and COVID-19 stressors play a pivotal role in increasing HIV risk and psychosocial syndemics among TGW. Trans-specific HIV-prevention interventions, therefore, need to take steps to reduce transgender identity stigma and economic vulnerabilities, and promote mental health.

## WEPEB140

Lymphogranuloma venereum serovars in men who have sex with men (MSM) and transgender women (TGW) in Buenos Aires, Argentina

L. Spadaccini<sup>1</sup>, M. Vacchino<sup>2</sup>, M.I. Figueroa<sup>1</sup>, G. Mernies<sup>1</sup>, A. Nava<sup>1</sup>, C.F. Perez<sup>1</sup>, D. Salusso<sup>1</sup>, M.V. Iannantuono<sup>1</sup>, J. Garcia<sup>1</sup>, C. Cesar<sup>1</sup>, V. Fink<sup>1</sup>, P. Galarza<sup>2</sup>, P. Cahn<sup>1</sup>

<sup>1</sup>Fundacion Huesped, Research, City of Buenos Aires, Argentina, <sup>2</sup>ANLIS Malbran Institute, City of Buenos Aires, Argentina

**Background:** In Argentina, the first reports of lymphogranuloma venereum (LGV) occurred in 2018. Since then, new cases have occurred mainly in MSM living with HIV. This study aims to describe the sociodemographic, clinical characteristics and serovars involved in LGV diagnosis among MSM and TGW in Buenos Aires, Argentina.

**Methods:** We conducted a retrospective review of the LGV cases assisted at one research site in Buenos Aires, Argentina from March 2019 to December 2022. LGV diagnosis was made in first void of urine, rectal and/or ulcer swabs by sequencing a fragment of the ompA gene among those samples with previous positive Chlamydia trachomatis PCR.

Sociodemographic data included age, gender, educational level, substance use, and sex work. We also collected data regarding HIV pre-exposure prophylaxis (PrEP) use and concomitant sexually transmitted infections (STIs) at the time of LGV diagnosis: including HIV, syphilis, gonorrhea and viral hepatitis.

**Results:** We included 19 LGV cases: 16 (84%) among MSM and 3 (16%) in TGW, median age was 29 years (CI 26-41): 47% completed tertiary education, 53% reported substance use (mainly cannabis and cocaine) and 100% of TGW reported sexual work. Regarding concomitant STIs, 7 had HIV diagnosis (3/7 recent diagnosis), 4 syphilis, 2 gonorrhea, 3 hepatitis B resolved infection and one active HCV.

Among those HIV negative (12, 63%), 92% were on PrEP. Anatomic location was rectal (89%) and genital (11%); 89% were symptomatic. We detected 3 serovars: L1 (9, 47%), L2b (5, 26%) and L2 (5, 26%).

We found no association between serovars and sociodemographic variables. However, we observed an association between L1 serovar and being HIV negative ( $p: 0.006$ ), as well as being on PrEP ( $p:0.028$ ) and between L2b serovar and genital localization ( $p:0.044$ ) (Table 1)

Variable/serovar	Overall, n = 19	L2b, n = 5	L2, n = 5	L1, n = 9
HIV				
Negative	12 (63%)	1 (20%)	2 (40%)	9 (100%)
Positive	7 (37%)	4 (80%)	3 (60%)	0 (0%)
PrEP	11 (58%)	1 (20%)	2 (40%)	8 (89%)
Rectal LGV	17 (89%)	3 (60%)	5 (100%)	9 (100%)
Genital LGV	2 (11%)	2 (40%)	0 (0%)	0 (0%)

Table 1.

**Conclusions:** Most LGV were diagnosed in PrEP users, among these L1 was the prevalent serovar. Rectal localization was the most frequent among all serovars. Clinical suspicion is important to avoid delay in diagnosis, prevent complications and stop transmission.

## WEPEB141

Pilot study of a clinical-community Peer Mentor program for postpartum women living with HIV

M. Cameron<sup>1,2,3</sup>, O. Awofeso<sup>4</sup>, W. Koay<sup>5,2</sup>, N. Rakhmanina<sup>5,2</sup>, L. Anderson<sup>5,2</sup>

<sup>1</sup>Georgetown University, Infectious Disease, Washington, United States, <sup>2</sup>DC Center for AIDS Research (CFAR), Washington DC, United States, <sup>3</sup>International Community of Women Living with HIV, Washington DC, United States, <sup>4</sup>Childrens National Hospital, Division of Infectious Diseases, Washington DC, United States, <sup>5</sup>Medical University of South Carolina, Department of Pediatrics, Division of Infectious Diseases, Charleston, United States

**Background:** Studies have generally shown that people living with HIV (PLHIV) are more vulnerable to mental health and a high prevalence of depression reportedly leads to quality of life and poor treatment adherence; For WLHIV postpartum depression (PPD) is the most common co-morbidity; It impacts ART treatment adherence to care resulting in increased viral load with poor health outcomes including opportunistic infections. An accumulative effect of these could lead to transmission of HIV to the infant.

The prevalence of PPD among WLHIV is high. The first 12 months postpartum is the most vulnerable, with minor and major depression occurring frequently post-delivery, particularly in the first three months [2]. Symptoms of PPD feelings of inadequacy, guilt, tearfulness, irritability, fatigue, and a loss of appetite[3].

It is important to catch PPD early, as high prevalence of PPD among HIV-positive pregnant women has been associated with higher rates of poor adherence to ART, adversely affecting the outcome of their HIV care.

**Description:** We proposed a program that would strengthen Adherence counseling and prevent treatment failure. Early identification and management of PPD has to be considered. HIV positive perinatal women need counseling to PPD.

**Lessons learned:** The research is still in progress but important lessons have already been learned including prioritizing the optimization of HIV care and treatment for pre and postpartum women - something that has been neglected in health care and policy and including people with lived experience in a multi-disciplinary team of investigators.

**Conclusions/Next steps:** We have already completed our first Aim, which was to develop a comprehensive wellness package (Training and Peer Support Network) to support postpartum mothers with HIV through clinical-community integration.

This aim sought to connect healthcare providers and community organizations to develop an innovative package for postpartum mothers with HIV that address mental health concerns and increased adherence to HIV care and treatment.

We continue to work on our second Aim which is to determine feasibility and acceptability of delivering the wellness package to postpartum mothers with HIV in other clinical settings, especially those serving women living with HIV.

## WEPEB142

### Impaired adherence and higher prevalence of experienced antiretroviral treatment side-effects among migrants living with HIV in Sweden

M. Mehdiyar<sup>1</sup>, J. Brännström<sup>2,3</sup>, C. Carlander<sup>2</sup>, E. Carlsson Lallo<sup>4</sup>, Å. Mellgren<sup>5,6,7,8</sup>

<sup>1</sup>The National Health Agency of Sweden, Department of Communicable Disease Control and Health Protection, Stockholm, Sweden, <sup>2</sup>Karolinska Institute, Department of Medicine Huddinge, Stockholm, Sweden, <sup>3</sup>Södersjukhuset, Department of Infectious Diseases/Venhälsan, Stockholm, Sweden, <sup>4</sup>University of Borås, Faculty of Caring Science, Work Life and Social Welfare, Borås, Sweden, <sup>5</sup>University of Gothenburg, Sahlgrenska Academy, Institute of Biomedicine, Department of Infectious Diseases, Gothenburg, Sweden, <sup>6</sup>Sahlgrenska University Hospital, Department of Infectious Diseases, Gothenburg, Sweden, <sup>7</sup>Karolinska University Hospital, Department of Infectious Diseases, Stockholm, Sweden, <sup>8</sup>Karolinska Institute, Department of Medical Epidemiology and Biostatistics, Stockholm, Sweden

**Background:** Patient reported outcomes (PROs) applies in HIV-care as part of person-centered care for people living with HIV (PLHIV). In Sweden, PROs assessing physical, psychological and sexual health, experience of side effects, adherence and satisfaction with care were integrated

nationally in HIV-care since 2011. The PROs are available in 10 languages, aimed to be assessed yearly and included in the Swedish National InfCareHIV registry.

The aim of this study was:

- To investigate sociodemographic differences between migrants and Swedish-born living with HIV and;
- To investigate PROs in PLHIV with focus on antiretroviral treatment (ART) adherence and experienced side effects among migrants and Swedish born living with HIV.

**Methods:** Cross-sectional observational study including all adult ( $\geq 18$  years) PLHIV who had performed PROs in the National Quality Registry InfCareHIV for year 2020.

**Results:** The descriptive analysis of the data showed sociodemographic differences between migrants and Swedish-born individuals. Of 7766 adults PLHIV ( $\geq 18$  years) were 64% migrants and 36% were Swedish-born individuals.

Women were overrepresented among migrants while men were overrepresented among Swedish-born individuals. Heterosexual transmission was the most common route among migrants, while homosexual transmission was the most common route among Swedish-born individuals.

The study showed impaired adherence among migrants compared to Swedish born living with HIV, where 14,1% of migrants reported 1-2 missed doses last week, compared to 7% of Swedish born (OR 1.92; 95% CI 1.4-2.62;  $p < 0.001$ ).

Overall, 12,2% reported experienced side effects from ART; 14% of migrants compared to 10.2% of Swedish born individuals ( $p = 0.01$ ).

**Conclusions:** Socio-demographic differences between Swedish-born and migrants living with HIV require need-based support to different groups of PLHIV. Impaired ART adherence and experience of side effects to ART were more common in migrants compared to Swedish-born living individuals.

These differences calls for targeted interventions with participatory approach to improve adherence. Interventions to address experience of ART side-effects may, besides consider ART change, include actions to increase PLHIV participation in care and support physical health.

### Stimulant use and its correlates in MSM and TGW populations: an analysis in a multi-country context - ImPrEP study

C. Coutinho<sup>1</sup>, H. Vega-Ramirez<sup>2</sup>, T. S. Torres<sup>1</sup>, I. Leite<sup>1</sup>, P. Leite<sup>1</sup>, R. Moreira<sup>1</sup>, K. A. Konda<sup>3</sup>, B. Hoagland<sup>1</sup>, R. Robles-Garcia<sup>2</sup>, J. V. Guanira<sup>3</sup>, S. Bautista-Arredondo<sup>4</sup>, H. Vermandere<sup>4</sup>, M. Benedetti<sup>1</sup>, C. Pimenta<sup>1</sup>, B. Grinsztajn<sup>1</sup>, C. F. Caceres<sup>3</sup>, V. G. Veloso<sup>1</sup>, the ImPrEP Study Group

<sup>1</sup>Instituto Nacional de Infectologia Evandro Chagas, Rio de Janeiro, Brazil, <sup>2</sup>Nacional Institute of Psychiatry Ramon de la Fuente Muñiz, Mexico City, Mexico, <sup>3</sup>Center for Interdisciplinary Studies in Sexuality, AIDS and Society, Universidad Peruana Cayetano Heredia, Lima, Peru, <sup>4</sup>National Institute of Public Health, Morelos, Mexico

**Background:** The use of substances is linked to increased vulnerability to HIV/STI among men who have sex with men (MSM) and transgender women (TGW). It is essential to identify the most commonly used substances and their related health issues in order to understand their impact on adherence to prevention measures such as oral PrEP and DoxyPEP.

This study evaluated substance use and factors associated with stimulant use among MSM/TGW attending HIV/STI testing/clinics in Latin America.

**Methods:** ImPrEP, a multi-country implementation study, evaluated the feasibility of providing same-day oral PrEP delivery to MSM/TGW in Brazil (n=3,928), Mexico (n=3,288), and Peru (n=2,293). Utilizing baseline data, we examined the prevalence of substance use in the three months preceding PrEP initiation.

A Poisson model was used to identify factors associated with stimulant use, including substances such as ecstasy, lysergic acid diethylamide, or gamma-hydroxybutyrate, cocaine (powder, crack, or paste).

**Results:** Overall, 94.3% were cis-MSM, 5.7% TGW, 26.1% aged 18-24, 32.2% aged 25-34, and 41.7% aged >34 years old. The majority (73.1%) were Black/Pardo/Mestizo, with more than secondary education (81.3%). The most prevalent substances or consumption pattern across the three countries were: binge drinking (65.3% Brazil, 61.1% Mexico, and 73.2% Peru), marijuana (28.4%, 46.3%, and 16.5%), and stimulants (18.2%, 27.0%, and 6.1%). Stimulant use was higher in Mexico (aPR=1.38, 95%CI:1.22-1.55,  $p<0.0001$ ) compared to Brazil and lower in Peru (aPR=0.32, 95%CI:0.26-0.39,  $p<0.0001$ ).

Associated factors with higher stimulant use included being white (aPR=1.28, 95%CI:1.14-1.44,  $p<0.0001$ ), having primary education (aPR=1.50, 95%CI:1.01-2.22,  $p<0.05$ ), multiple sex partners (2-3 partners: aPR=1.32, 95%CI:1.01-1.71,  $p<0.04$ ;  $\geq 4$  partners: aPR=2.47, 95%CI:1.97-3.09,  $p<0.0001$ ), receptive condomless anal sex (aPR=1.15, 95%CI:1.02-1.29,  $p<0.02$ ), transactional sex (aPR=1.56, 95%CI:1.38-1.77,  $p<0.0001$ ), and binge drinking (aPR=1.82, 95%CI:1.61-2.05,  $p<0.0001$ ). Seek-

ing PrEP when attending the service (aPR=0.82, 95%CI:0.68-0.99,  $p=0.04$ ), and being young (18-24 years, aPR=0.76, 95%CI:0.66-0.88,  $p<0.01$ ) were protective factors.

**Conclusions:** MSM/TGW in Latin America exhibited a high prevalence of substance use, which was linked to increased sexual HIV exposure.

These findings underscore the necessity for tailored and comprehensive interventions, incorporating harm reduction strategies, mental health support and PrEP adherence support to enhance the overall effectiveness of PrEP.

## Other strategies and therapies

## WEPEB144

### CCR5Δ32/Δ32 Allogeneic hematopoietic stem cell graft: time to analytical antiretroviral interruption?

H. Laroche<sup>1</sup>, C. Boschi<sup>1</sup>, S. Benkouiten<sup>1</sup>, O. Zaegel-Faucher<sup>1</sup>, M.C. Dos Santos<sup>1</sup>, A. Motte<sup>1</sup>, F. Legrand<sup>2</sup>, D. Olive<sup>2</sup>, P. Colson<sup>1</sup>, S. Bregigeeon-Ronot<sup>1</sup>

<sup>1</sup>Assistance Publique-Hôpitaux de Marseille (AP-HM), Marseille, France, <sup>2</sup>Institut Paoli-Calmettes, Marseille, France

**Background:** To date, six reported cases of remission/functional cure after Hematopoietic stem cell transplantation (HSCT) challenged the current paradigm that HIV cure cannot be achieved. Five of those cases received an allogeneic HSCT (aHSCT) from HLA-compatible CCR5Δ32 homozygous donors, while the last one received aHSCT from an unrelated HLA-matched wildtype CCR5 donor. We report here a new case in which Analytical antiretroviral Treatment Interruption (ATI) was considered.

**Methods:** HIV RNA/DNA detection was performed using commercial assays, NeuMoDx/Xpert and Generic, respectively, with an ultrasensitive (US) procedure for some samples. HIV-1 Western blot confirmatory assay was performed on sequential samples. HIV RNA/DNA sequencing was performed by Sanger or Next-Generation Sequencing (NGS) (Illumina) technologies with quasispecies analysis. Standard HIV-1 co-culture and cell permissiveness to R5 HIV-1 were attempted using in-house protocols.

**Results:** We report a woman in her 50s diagnosed with HIV in 1999 and with acute myeloid leukemia in February 2020. She received aHSCT from an HLA-mismatched (HLA-A) donor with CCR5Δ32 homozygous genotype in July 2020 after conditioning based on Baltimore (fludarabine 150 mg/m<sup>2</sup>, cyclophosphamide 29 mg/kg and total body irradiation 200 cGy) and GVHD prophylaxis.

Full donor chimerism was obtained after three donor lymphocyte infusions. She was HIV-treated with Tenofovir DF/FTC and Raltegravir pre-graft, then was switched

to Abacavir/3TC and Raltegravir from 14-months post-graft. Pre-graft, HIV DNA was 32 copies/million PBMC, HIV RNA was undetectable (<20 copies/mL) and CD4 cell count was 250 cells/mm<sup>3</sup>. HIV genotypic tropism tests by NGS showed R5 tropism without minority X4 viruses.

Post-graft, HIV-DNA/RNA were undetected on 12 sequential blood samples, even under US conditions, and CD4 cell count increased to 1535 cells/mm<sup>3</sup>.

Sequential Western blot showed progressive disappearance of seven major reactivities with only anti-gp160 reactivity eventually remaining at month 41. HIV-1 co-culture was negative and host cells were non-permissive to R5 HIV-1.

**Conclusions:** This case questions about the most appropriate conditions allowing ATI in people living with HIV-1 post-CCR5D32/D32 HSCT.

Determining the predictive elements of HIV remission appears to be an important task as similar attempts have failed previously due to virological rebound, or to premature death related to the hematological malignancies.

## WEPEB145

### Improved targeting of human CD4+ T cells by nanobody coupled lipid nanoparticles

M. Wittner<sup>1</sup>, N. Beschoner<sup>1</sup>, L. Gkionis<sup>2</sup>, P. Kaiser<sup>3</sup>, P. Hartjen<sup>4</sup>, V. Fehring<sup>2</sup>, J. Schulze zur Wiesch<sup>4</sup>, O. Keil<sup>2</sup>, U. Rothbauer<sup>5</sup>, J. Chemnitz<sup>1</sup>

<sup>1</sup>PROVIREX Genome Editing Therapies GmbH, Hamburg, Germany, <sup>2</sup>Panthera Therapeutics GmbH, Berlin, Germany, <sup>3</sup>Universität Tübingen, NMI Naturwissenschaftliches und Medizinisches Institut, Tübingen, Germany, <sup>4</sup>University Medical Center Hamburg-Eppendorf, I. Department of Medicine, Hamburg, Germany, <sup>5</sup>Universität Tübingen, Pharmaceutical Biotechnology, Tübingen, Germany

**Background:** Antiretroviral drug therapies do not target the integrated proviral DNA (i.e. the provirus). PROVIREX is developing novel cure approaches based on the *in vitro* engineered Brec1 recombinase which excises the provirus of most HIV-1 strains and subtypes with high specificity. The current approach involves lentiviral transduction of hematopoietic stem cells and autologous transplantation of these modified cells, which is very complex and cost-intensive.

Nanobody-coupled lipid nanoparticles (LNP) could simplify the administration of the HIV-specific recombinase and also make this type of personalized medicine available to low-income countries.

**Methods:** LNP coupled with CD4 specific nanobody were tested on a T cell line, CD4+ / CD4- mixed cultures, as well as on primary CD4+ T cells and PBMC with regard to transfection rates, specificity and antiviral activity. Cell lines and primary cells were transfected with LNP and examined using flow cytometry, ddPCR and endpoint PCR.

**Results:** The transfection experiments with LNP coupled with nanobodies showed excellent transfection rates of over 90% on T cell lines and high specificity in CD4+ / CD4- mixed cultures. Very good transfection rates of could also be achieved with low LNP concentrations in CD4+ primary T cells of up to 30%. In PBMC, high CD4-dependent transfection rates of up to 25% could be achieved in CD4+ T cells, with low background in the other cell populations. Antiviral activity was demonstrated in HIV reporter cells and HIV infected cell lines.

**Conclusions:** LNPs with CD4-specific nanobodies coupled to their surface can be used to successfully transfect cell lines and primary CD4+ T cells, as well as CD4+ T cells in a mixture of blood cells (PBMC). Antiviral activity of functional HIV-specific recombinase could be detected after transfection of HIV reporter cells and in infections experiments.

Targeting of infected CD4+ T cells *in vivo* could aid in diminishing the reservoir, thus leading to reconstitution of the immune system, thereby enabling PLWH to maintain stable viral loads without the need of additional medication ("functional cure"). It could also result in prolonged ART-free intervals, lowering the risk of both the development of drug resistance and long-term toxicity.

## ART resistance

## WEPEB146

### Resistance analyses during treatment of lenacapavir with broadly neutralizing antibodies in people with HIV

L. Selzer<sup>1</sup>, S. Demirdjian<sup>1</sup>, R. Martin<sup>1</sup>, B. Falkard<sup>1</sup>, S.E. Collins<sup>1</sup>, J. Eron<sup>2</sup>, L.A. VanderVeen<sup>1</sup>, C. Callebaut<sup>1</sup>

<sup>1</sup>Gilead Sciences, Foster City, United States, <sup>2</sup>University of North Carolina, Chapel Hill, United States

**Background:** Combination of lenacapavir (LEN) with broadly neutralizing antibodies (bNAbs) teropavimab (TAB; 30 mg/kg), and znlirvimab (ZAB; either 10 or 30 mg/kg) was investigated in a phase 1b randomized clinical study in virally suppressed people with HIV. Enrolled participants' virus was susceptible to both bNAbs (Primary Cohort, n=20) or susceptible to either TAB or ZAB (Pilot Cohort, n=10), defined for this protocol as IC90 ≤ 2 µg/mL in the PhenoSense mAb assay (Monogram Biosciences). Virologic suppression (HIV-1 RNA < 50 copies/mL) was maintained in 27/30 participants at 26 weeks. Here, we describe resistance analyses through week 26.

**Methods:** Genotypic and phenotypic analyses of proviral Gag and Env were performed at baseline using deep sequencing (Seq-IT) and the PhenoSense Gag-Pro and mAb assays. For participants with virologic rebound (VR; HIV-

1 RNA  $\geq$  50 copies/mL), commercial genotyping methods were unsuccessful. Therefore, low copy number genotyping methods for capsid and a 1 kb stretch of gp120 (nt# 102-1092) from rebound virus were developed and performed. Amplicons were cloned into vectors to determine phenotypic susceptibility to LEN, TAB, and ZAB.

**Results:** One participant in the Primary Cohort (10 mg/kg ZAB) experienced VR at week 16 (124 copies/mL). At baseline, the participant was susceptible to LEN and both bNAb. The participant developed Q67H in capsid at week 16 (fold-change = 3.65-4.71), but had no resistance to bNAb and resuppressed with resumption of oral ART. Two participants in the Pilot Cohort (10 mg/kg ZAB) experienced unconfirmed VR at week 26 (55 and 87 copies/mL). At baseline, neither of the two participants had mutations to LEN, one was susceptible to TAB, and one was susceptible to ZAB. Neither participant had emergent resistance to LEN or changes in susceptibility to TAB or ZAB compared to baseline.

**Conclusions:** High rates of virologic suppression were maintained during treatment with LEN and bNAb, including among participants susceptible to only one bNAb. Development of low-copy number genotyping allowed geno- and phenotypic resistance analyses in three participants with VR, with emergent LEN resistance only detected for one participant. All three participants with VR received 10 mg/kg of ZAB, suggesting a higher dose of ZAB may decrease risk of VR.

**Background:** The World Health Organisation (WHO) recommends dolutegravir (DTG)-based regimens as the preferred antiretroviral therapy (ART) in low- and middle-income countries (LMICs). However, a client's clinical

status, unsuppressed viremia and treatment history may favour the emergence of HIV drug resistance (HIVDR) to DTG, hence calling for surveillance to optimise ART-strategies. In Cameroon, a country with 69.2% viral load (VL) coverage, we determined the prevalence and patterns of integrase strand-transfer inhibitor (INSTI) resistance-associated mutations among DTG-treated people with unsuppressed-viremia.

**Methods:** Following WHO recommendations, a laboratory-based sentinel-surveillance survey was conducted from January 2022 to August 2023 on 174 plasma-specimens from clients with viremia (>1000 copies/ml) receiving DTG-containing ART at the Chantal BIYA International Reference Centre for research on HIV/AIDS prevention and management in Yaoundé-Cameroun.

Following consecutive-sampling of all eligible specimens, Sanger-sequencing of HIV-1 protease/reverse-transcriptase and integrase was performed and drug resistance mutations (DRMs) interpreted and estimated using the Stanford HIVdb.v.9.5, with susceptible and potential drug resistance classified as susceptible.

**Results:** Overall, the median-age [IQR] was 38 [17-46] years; 57.5% female; median-viremia: 13,364 [1,563-135,271] copies/mL and median-CD4: 186 [70-365] cells/mm<sup>3</sup>. Median-duration on DTG-containing ART 12 [6-24] months, with 42.0% (73) on first-line, 16.0% (28) second-line, and 42.0% (73) third-line ART. The prevalence of DTG acquired-resistance was 2.86% [95%CI: 0.93-6.54].

The following INSTI mutations were detected: R263R/K (n=3), T66I (n=2), L74I/M (n=2), G118R (n=2), E138K (n=2), S153Y (n=1); ranging from 1-5 DRMs per person. DTG-resistance was found in two cases of unsuppressed-viremia when transitioning from first-line TDF-3TC-EFV(TLE) to TDF-3TC-DTG(TLD) with K65R and M184V detected at failure of TLD (i.e. DTG functional-monotherapy); two third-line cases with multi-class HIVDR (of which one case of 4-class resistance); and one third-line case of HIV/tuberculosis coinfection on concomitant anti-tuberculosis treatment (DTG50mgx2/day).

**Conclusions:** Though transition to TLD is generally successful, INSTI-resistance emergence is detected in cases following transition on first-line therapy to TLD with unsuppressed-viremia; switching to third-line regimen without the benefit of genotypic resistance data (functional-monotherapy); or co-administration of DTG and anti-TB drugs.

Considering these case-scenarios for public-health actions in the landscape of treatment strategies, would substantially limit the emergence of resistance to DTG in LMICs.

## WEPEB148

### CAB/RPV-LA in patients with history of failure and/or drug resistance mutations to NNRTIs or INSTIs: the experience of a French university hospital

G. Mchantaf<sup>1,2,3</sup>, A. Chaillon<sup>4</sup>, C. Charre<sup>2,5</sup>, A. Melard<sup>2</sup>, E. Gardienet<sup>2</sup>, J. Guinard<sup>1</sup>, C. Guillaume<sup>1</sup>, A.-A. Mariaggi<sup>2,5</sup>, L. Hocqueloux<sup>1</sup>, V. Avettand-Fenoel<sup>1,2,3</sup>

<sup>1</sup>CHU d'Orléans, Orléans, France, <sup>2</sup>INSERM U1016, CNRS UMR8104, Université Paris Cité, Institut Cochin, Paris, France, <sup>3</sup>Université d'Orléans, Orléans, France, <sup>4</sup>Division of Infectious Diseases and Global Public Health, University of California San Diego, La Jolla, CA, United States, <sup>5</sup>AP-HP, Laboratoire de Virologie, Hôpital Cochin, Paris, France

**Background:** Long-acting cabotegravir and rilpivirine (CAB/RPV-LA) are indicated for people with HIV (PWH) with no previous history of failure and/or drug resistance mutations (DRMs) to non-nucleoside reverse transcriptase inhibitors (NNRTIs) or integrase inhibitors (INSTIs).

To better understand factors associated with virological response, we examined the case of seven PWH who received CAB/RPV-LA with history of DRMs/failure on one or both classes which was unknown to physician at CAB/RPV-LA initiation.

**Methods:** Seven PWH were included: 6 with virological control on CAB/RPV-LA for >18 months and 1 with failure at 3 months after CAB/RPV-LA initiation. Blood samples taken before the initiation of CAB/RPV-LA were analyzed retrospectively. A near full-length single HIV genome nanopore sequencing was performed on HIV-DNA to search for archived DRMs and evaluate the intactness of sequences harboring DRMs. A custom bioinformatic pipeline adapted from iGDA algorithm was developed to recover haplotypes. The DRMs frequency in *RT* and *integrase* genes was evaluated with NGS HIV-DNA sequencing using Sentosa® SQ HIV Genotyping Assay.

**Results:** 251 HIV-DNA sequences were obtained with Nanopore technology (mean: 36 sequences/participant). The percentage of sequences harboring ≥1 major DRMs to NNRTIs and/or INSTIs (n=27) varied from 0% (in 2 subjects with virological control despite previously described DRMs to NNRTIs (5 and 9 years before) to 32% between participants. 25 genomes were defective (11 large deletions, 13 hypermutations, and 1 Ψ/MSD defect).

Notably, all major G-to-A DRMs were found on hypermutated genomes. Two genomes with DRMs were found intact, both harboring the H221Y mutation on *RT*. They belonged to the same subject with viral control and represent 11 copies/10<sup>6</sup> PBMCs. For the subject with virological failure, 13% of sequences harbored DRMs and were all defective. He had a BMI of 30.2 and low antiretroviral concentrations.

**Conclusions:** Our findings suggest that achieving virological response to CAB/RPV-LA is possible in cases with prior history of DRMs and/or failure on one agent within the

antiretroviral classes. This could be related to the prevalence of DRMs present primarily on defective genomes with intact genomes hosting only a limited fraction. Further studies are needed to define a mutational load below which a virological control could be achieved.

**Background:** Following WHO recommendation in 2022, many countries implemented tenofovir-lamivudine-dolutegravir (TLD) as the regimen of choice. This public health approach yields good virological suppression rates in treatment-naïve people living with HIV (PLWH) and people failing NNRTI-regimens. However, data on whether PLWH with unsuppressed viral load on a protease inhibitor (PI) regimen might require HIV drug resistance (HIVDR) testing prior to switching to TLD, is limited. We assessed the prevalence of PI resistance in PLWH failing PI-based regimens in South Africa.

**Methods:** Retrospective analysis was conducted using partial pol sequences collected from the South African public sector between 2015 and 2022. Demographic and clinical data were extracted from the laboratory information system.

Resistance was defined as low-level resistance or higher (score  $\geq 15$ ), using Stanford HIVdb v9.5.0.

**Results:** A total of 18 170 sequences were available from PLWH with recorded PI-exposure at time of HIVDR testing. Sixty percent of clients were female, 72% were older than 19 years and median viral load was 4.7 log<sub>10</sub> copies/mL (IQR: 4.1-5.3). PI resistance was detected in 26.0% of sequences with a significant increase from 20.4% in 2015 to 28.8% in 2022 ( $p < 0.0001$ ). Darunavir resistance in PI-exposed, darunavir-naïve PLWH, increased from 10.3% in 2015 to 14.2% in 2022 ( $p < 0.0001$ ). High-level darunavir resistance increased from 1.4% to 5.0% ( $p = 0.0969$ ).

The overall prevalence of darunavir resistance was higher in ritonavir-boosted lopinavir (LPV/r)-exposed PLWH (13.5%) compared to ritonavir-boosted atazanavir (ATZ/r) exposed PLWH (9.3%,  $p < 0.0001$ ).

Likewise, high-level resistance to darunavir was more commonly observed in LPV/r-exposed PLWH (1.6%) versus 0.7% in those exposed to ATZ/r ( $p < 0.0001$ ).

**Conclusions:** We observed a notable increase in PI resistance, including resistance to darunavir, in South Africa since 2015. Despite the availability of TLD, performing HIVDR testing, in PLWH failing PI-based regimens, prior to switching to TLD, is recommended to assess the value of darunavir in salvage regimens.

## WEPEB150

### Safety and immunogenicity of a single dose of COVID-19 vaccine: Ad26.CoV2.S, BNT162b2 or SARS-CoV-2 rS-protein-nanoparticle in previously vaccinated and unvaccinated adults living with HIV in South Africa

<sup>1</sup>The Aurum Institute NPC, Clinical Research Division, Johannesburg, South Africa, <sup>2</sup>South African Medical Research Council, Biostatistics Unit, Durban, South Africa, <sup>3</sup>Perinatal HIV Prevention Research Unit, Johannesburg, South Africa, <sup>4</sup>Utrecht University, Department of Interdisciplinary Social Science, Public Health, Utrecht, Netherlands, the, <sup>5</sup>South African Medical Research Council, Antibody Immunity Research Unit, School of Pathology, University of Witwatersrand, Johannesburg, South Africa, <sup>6</sup>National Institute for Communicable Disease of the National Health Laboratory Services, Centre for HIV and STIs, Johannesburg, South Africa, <sup>7</sup>Institute of Infectious Disease and Molecular Medicine, Faculty of Health Sciences, University of Cape Town, Division of Virology, Cape Town, South Africa, <sup>8</sup>Translational Health Science and Technology Institute, CEPI Laboratory, Faridabad, India, <sup>9</sup>Yale School of Public Health, Department of Environmental Health Sciences, New Haven, United States

**Background:** For people with immunosuppression, the World Health Organization recommends an additional COVID-19 vaccine dose as part of the primary vaccination series. The safety and immunogenicity of vaccine strategies was evaluated in people living with HIV (PLWH).

**Methods:** A phase 2a randomized, observer-blinded, multicenter study was conducted. PLWH (on antiretroviral therapy) who previously received one-dose of Ad26.CoV2.S, or two-doses of BNT162b2, or were unvaccinated with prior SARS-CoV-2 acquisition (study groups), received a single-dose of Ad26.CoV2.S, BNT162b2 or SARS-CoV-2-rS-Protein-Nanoparticle (study arms) at least 2-months post-vaccination. Immunogenicity was evaluated pre- and two-weeks post-study vaccination.

**Results:** Between July 2022 and February 2023, of 599 PLWH enrolled, 258 and 254 were previously vaccinated with Ad26.CoV2.S and BNT162b2 respectively and 87 were unvaccinated. Mean age was 43 years, 65.8% female, 99.7% Black African, 88.1% virally suppressed, and median CD4 count 764(IQR 545-1008) cells/mm<sup>3</sup>. Local reactions were reported in 19.4%, 34.5% and 12.3% and systemic reac-

tions in 35.4%, 37.4% and 28.7% of participants in the Ad26.CoV2.S, BNT162b2 and SARS-CoV-2-rS-Protein-Nanoparticle arms respectively. Overall 96.7% of local and systemic reactions were mild to moderate.

There were 30 unsolicited adverse events within 28-days of vaccination, 97% mild to moderate. The Geometric Mean Fold Change (GMFC) in ELISA SARS-CoV-2 spike-binding antibody titres between baseline and day 15 in each arm was: Ad26.CoV2.S (2.2 [1.9-2.5]), BNT162b2 (7.3 [6.4-8.2]), and SARS-CoV-2 rS-Protein-Nanoparticle (3.7 [3.3-4.2]); neutralizing antibody titres (VSV assay) was 2.6 (2.2-3.0), 10.2 (8.7-11.8) and 4.5 (3.8-5.3) respectively.

Antibody responses stratified by prior vaccination group are shown in Figure A. The proportion of participants with CD4+ T-cell ICS responses at day 15 was 98.2%, 99.4% and 100% in the three arms respectively, and CD8+ T-cell responses was 64.1%, 66.3% and 46.3%.

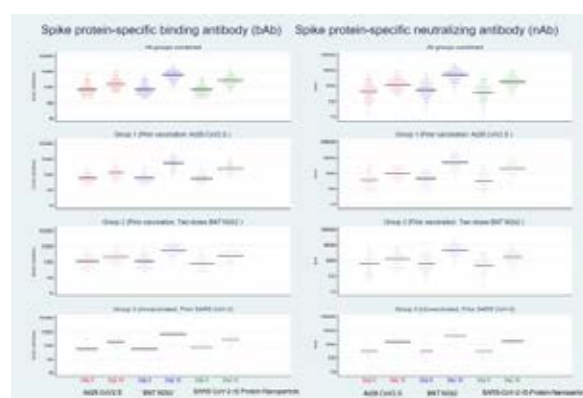

Figure A. Antibody titres.

**Conclusions:** Among PLWH, whether previously vaccinated, or unvaccinated with prior SARS-CoV-2 acquisition, Ad26.CoV2.S, BNT162b2 and SARS-CoV-2-rS-Protein-Nanoparticle were well tolerated and induced significant immune responses. (CEPI-Funded).

### Factors associated with COVID-19 vaccine hesitancy among people vulnerable to HIV in two communities in Western Kenya

J. Tonze<sup>1,2</sup>, B. Gayle<sup>1,2</sup>, T. Hamby<sup>1,2</sup>, M. Romo<sup>1,2</sup>, D. Langat<sup>3,4</sup>, R. Bor<sup>3,4</sup>, G. Schluck<sup>1,2</sup>, C. Akoth<sup>3,4</sup>, F. Sawe<sup>3,4</sup>, J. Ake<sup>1</sup>, M. Yacovone<sup>5</sup>, J. Kosgei<sup>3,4</sup>, T. Crowell<sup>1,2</sup>

<sup>1</sup>U.S. Military HIV Research Program, CIDR, Walter Reed Army Institute of Research, Silver Spring, United States,

<sup>2</sup>Henry M. Jackson Foundation for the Advancement of Military Medicine, Bethesda, United States, <sup>3</sup>HJF Medical Research International, Kericho, Kenya, <sup>4</sup>U.S. Military HIV Research Program, Walter Reed Army Institute of Research - Africa, Kericho, Kenya, <sup>5</sup>National Institute of Health, National Institute of Allergy and Infectious Diseases, Rockville, United States

**Background:** Vaccine perception and uptake are influenced by behavioral and social factors that fluctuate over time and across subgroups. Prior COVID-19 vaccine research in Kenya has identified wide ranges of vaccine acceptance and hesitancy during the COVID-19 pandemic in the general population.

This analysis provides an assessment of COVID-19 vaccination hesitancy among individuals in Western Kenya with behavioral vulnerability to HIV.

**Methods:** From December 2021 to April 2023, participants aged 15-36 years with a high vulnerability to HIV completed questionnaires at enrollment into an HIV incidence cohort at two sites (Kericho and Homa Bay) in Western Kenya. The questionnaire included prompts regarding participant demographics, history of COVID-19 diagnoses, methods of protection against COVID-19, and receipt of a COVID-19 vaccine.

Multivariable robust Poisson regression models were used to estimate prevalence ratios (PRs) and 95% confidence intervals (CIs) for factors potentially associated with COVID-19 vaccine hesitancy.

**Results:** Questionnaires were completed by 394 participants, including 314 (80.0%) aged 15-24 years, 312 (79.2%) assigned female at birth, and 256 (65.0%) employed as sex workers. A total of 226 (57.4%) participants reported never receiving a COVID-19 vaccine, and of those 121 (53.4%) reported that they were unsure or unwilling to receive a COVID-19 vaccine. The factors that were associated with COVID-19 vaccine hesitancy were a preference to build immunity to COVID-19 through natural acquisition, concerns that the COVID-19 vaccine was unsafe, and not avoiding meetings with crowds (Figure).

**Conclusions:** Participants vulnerable to HIV that were unsure or unwilling to take a COVID-19 vaccine represented a majority of those that were not vaccinated against COVID-19.

The identified factors associated with COVID-19 vaccine hesitancy provides opportunities for future vaccination campaigns to target this population to better educate

about COVID-19 transmission, and vaccine safety and effectiveness for COVID-19 and future outbreaks of vaccine preventable diseases.

Figure.

Halperin<sup>6</sup>

<sup>1</sup>Fundacion Huesped, Research Department, Ciudad de Buenos Aires, Argentina, <sup>2</sup>CanSino Biologics Inc, Toronto, Canada, <sup>3</sup>Hospital Juan A. Fernández, Ciudad de Buenos Aires, Argentina, <sup>4</sup>FUNCEI, Ciudad de Buenos Aires, Argentina, <sup>5</sup>Helios Salud, Ciudad de Buenos Aires, Argentina, <sup>6</sup>Dalhousie University, Canadian Center for Vaccinology, Halifax, Canada, <sup>7</sup>CanSino Biologics Inc, Tianjin, China

**Background:** COVID-19 vaccination is recommended for PLWH. We studied a scheme based on the Ad5-nCoV CanSino vaccine. Primary endpoint: to evaluate immunogenicity of two doses of Ad5-nCoV in PLWH. ClinicalTrials.gov:NCT05005156

**Methods:** Phase 2b, open label study. PLWH received two doses of Ad5-nCoV at days 0 and 56, and were assessed for immunogenicity through 52 weeks. Immunological endpoints: proportion of participants with geometric mean increase (GMI)  $\geq 4$  from baseline of receptor-binding domain (RBD) and neutralizing antibodies (nAbs) at days 28, 84, weeks 24 and 52. Overall 52 weeks' humoral responses are presented.

**Results:** Between June 2021-January 2022, 140 PLWH were vaccinated. 93.6% had baseline viral load  $\leq 40$  copies/mL, median CD4 count: 728 cells/ $\mu$ L. 99.3% participants were on HAART. S-RBD seroconversion occurred in 80% at day 28 after the first vaccination. At day 84 seroconver-

Oral  
abstracts

abstracts

Author  
Index

sion was 93%; at week 24, 84% and at week 52, 84%. Five subjects never reached S-RBD seroconversion. Increase in S-RBD antibodies was statistically significant between day 0 and all other visits ( $p < 0.01$ ). Geometric mean concentration (GMC) of S-RBD antibodies: day 0, 7.02 [95% CI 5.79 – 8.51], week 52, 395.29 [95% CI 257.56 – 606.66]. (Figure 1). The nAbs seroconversion occurred in 35% at day 28, 78% at day 84; 57% at week 24 and 78% at week 52. (Figure 2) The mean titres (GMT) of neutralizing antibodies on day 0 was 5.54 [95% CI 4.88 – 6.30] at day 364 73.94 [95% CI 50.16 – 108.99]. The increase in the GMT was statistically significant between day 0 and all other visits ( $p < 0.01$ ).

Figure 1. GMC, percentage of positive subjects at baseline and seroconversion rate for S-RBD antibodies per period after vaccination.

Figure 2. GMTs, percentage of positive subjects at baseline and seroconversion rate for nAbs antibodies per period after first vaccination.

**Conclusions:** Ad5-nCoV vaccine induced an adequate immune response in virologically suppressed PLWH and maintained the titers at least during the first year post-vaccination.

Further vaccine efficacy studies in PLWH should be performed to elucidate the potential impact of various immunization strategies, according to their disease status.

## WEPEB153

### Comparing the coping strategies and resilience adopted by HIV positive and negative LGBT+ individuals during COVID-19 pandemic in India

B. Mohan<sup>1</sup>, S. Rawat<sup>1</sup>, A. Dange<sup>1</sup>, V.R. Anand<sup>1</sup>, R. Chalwadi<sup>1</sup>, M. Shunmugam<sup>2</sup>, S. Tejpan<sup>3</sup>, V. Chakrapani<sup>4</sup>, P.A. Newman<sup>5</sup>

<sup>1</sup>The Humsafar Trust, Mumbai, India, <sup>2</sup>Center for Sexuality and Health Research and Policy (C-SHaRP), Chennai, Chennai, India, <sup>3</sup>VOICES- Thailand Foundation, Chiang Mai, Thailand, <sup>4</sup>Center for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, <sup>5</sup>University of Toronto, Factor-Inwentash, Social Work, Toronto, Canada

**Background:** In India, COVID-19 and lockdowns posed several physical/emotional challenges for the LGBT+ communities. In response a Mumbai based eHealth study was launched in India which aimed at exploring the differentials in coping strategies adopted by both HIV-positive and HIV-negative LGBT+ communities during the pandemic.

**Methods:** In-depth interviews were conducted online with a purposive sample of 43 LGBT+ individuals (Lesbian/Bisexual women having sex with women=10, Transgender Persons=17, Gay/Bisexual MSM=16) aged 18 and above between Oct-Dec 2022 as a part of a larger study. Results were analysed thematically using constant comparison method.

**Results:** Out of the 43 participants, 14% identified as HIV-positive (4 transgender women, 2 gay/bisexual men) while 86% were HIV-negative or unaware of their status. The majority (62.8%) were aged 26-35, 93% had secondary education or higher and 86% were employed.

HIV-positive individuals coped with the physical challenges related to COVID-19 era via activities like home workouts, yoga and meditation, thus fostering positive transformation whereas HIV-negative individuals focused on overall health without any specific emphasis.

*Emotional resilience* was common, with both groups stressing the importance of a positive mindset and seeking support from friends, family, and the community; with HIV-positive relying on meditation, virtual relationships and sharing experiences and HIV-negative individuals focusing on various activities such as cooking, reading, gaming and engaging in educational pursuits. However, both groups demonstrated similar adaptability and resourcefulness during lockdowns, addressing stressful financial situations via pursuing alternate income generation activities.

Both groups expressed fear and concerns about COVID testing. Challenges also existed in accessing healthcare and COVID vaccinations, especially for HIV-positive; all of which were overcome with the support from individuals and community-based organizations.

Support from LGBTQ+ groups and NGOs in the form of financial support, groceries, and information sharing was acknowledged by both groups.

Late-breaker  
abstracts

Author  
Index

**Conclusions:** While there are notable similarities in coping strategies, the differences highlight the unique challenges faced by HIV-positive LGBT+ individuals, including specific concerns related to accessing medication and vaccinations. Both groups, however, underscore the importance of community support, adaptability, and *emotional resilience* in navigating the complexities of the COVID-19 pandemic.

HIV mortality among persons seeking care at CDC-supported antiretroviral therapy treatment sites in Guatemala and Honduras, October 2020–September 2022

R.E. Morales<sup>1</sup>, C. Gutierrez<sup>1</sup>, L. Chang<sup>2</sup>, C. Castaneda<sup>3</sup>, C. Edge<sup>4</sup>, L. Iverson<sup>5</sup>, E. Agyemang<sup>4</sup>, J. Wright<sup>1</sup>

<sup>1</sup>Division of Global HIV & TB, Centers for Disease

Control and Prevention, Guatemala City, Guatemala,

<sup>2</sup>Division of Global HIV & TB, Centers for Disease Control and Prevention, Panama City, Panama, <sup>3</sup>Division of

Global HIV & TB, Centers for Disease Control and

Prevention, San Salvador, El Salvador, <sup>4</sup>Division of Global

HIV & TB, Centers for Disease Control and Prevention,

Atlanta, United States, <sup>5</sup>Division of Global HIV & TB,

Centers for Disease Control and Prevention, and Peraton

Corp, Reston, United States

**Background:** Mortality surveillance is essential for monitoring HIV epidemic trends. A review of causes of mortality among people living with HIV (PLHIV) in Guatemala and Honduras suggested that advanced HIV disease (AHD) was a leading cause of death among PLHIV. In October 2021, Guatemala expanded the recommended World Health Organization (WHO) AHD package of services to include individuals with AHD being reengaged to care and those failing ART. Honduras expanded services in October 2022.

We sought to examine trends in mortality in Guatemala and Honduras, where, due to country-specific resources, interventions began at different times.

**Methods:** Descriptive epidemiological analyses were conducted on data collected at 18 CDC-supported sites in Guatemala and Honduras. AHD was defined as CD4<200 or WHO HIV clinical stage 3–4. Causes of death documented by a national mortality report at these sites were captured in routine data collection systems.

**Results:** In year 1 (October 2020 – September 2021), prior to WHO AHD package implementation, Guatemala and Honduras reported 1.8% and 1.6% all-cause mortality in all PLHIV, respectively. In year 2 (October 2021 – September 2022), in Guatemala, mortality reduced to 0.7% of the total PLHIV cohort, while mortality increased in Honduras to 2.1%.

Across both years, 32.5% of deaths were related to AHD and 11% related to TB, making these the leading causes of death. Deceased clients were 68.5% (343/501) men, 13.3% (67/501) men who have sex with men (MSM), and 0.4% (2/501) were transgender women. MSM were on average

observed to reach mortality 3.6 years after diagnosis, compared to a 6-year average for all other groups. In Guatemala and Honduras, 76% and 86% of deaths were among clients that had previously received ART but had treatment interruptions, respectively.

**Conclusions:** Interventions designed to support AHD clients, such as the WHO AHD package, may have contributed to a reduction in the number of deaths reported in included sites in Guatemala. However, further studies are needed to understand the impact of these interventions as countries adopt recommended strategies. Improvement of mortality surveillance is necessary to refine data quality and obtain accurate causes of death to further tailor interventions.

#### WEPEC155

Associations between sexualized drug use and risky sexual behaviors among men who have sex with men in Southwest China

Y. Zhu<sup>1</sup>, X. Chen<sup>1</sup>, J. Li<sup>1</sup>

<sup>1</sup>Sun Yat-sen University, School of Public Health, Guangzhou, China

**Background:** Sexualized Drug Use (SDU) involves the intentional use of psychoactive substances before or during sexual activity to facilitate, enhance or prolong sexual experiences. This behavior can contribute to the transmission of HIV and STIs by promoting high-risk sexual behavior. Although prevalent among men who have sex with men (MSM), SDU has received limited attention in China. The study aims to examine the prevalence of SDU and risky sexual behaviors among MSM in China and explore the associations between SDU and risky sexual behaviors.

**Methods:** From December 2021 to February 2022, we conducted an anonymous cross-sectional survey was conducted in Chengdu, China. A total of 813 MSM were recruited through two channels: those conducted HIV testing and counselling services at a local gay-friendly organization (Chengdu Tongle Health Counselling Service Centre) and those invited online through the Tongle volunteer peer network.

Among the participants, 727 eligible subjects were included in the analysis. Logistic regression models were employed to analyze the associations between SDU and other risky sexual behaviors.

**Results:** A total of 289 individuals (39.8%) reported SDU in the last 6 months. The prevalences of multiple sexual partners (>1), unprotected sex, group sex, STI and HIV testing positively were 48.6%, 46.3% 15.6%, 3.9% and 5.6%, respectively. Logistic regression models revealed positive associations between SDU and multiple sexual partners ( $aOR = 3.15$ , 95%CI: 2.26–4.39), unprotected sex ( $aOR = 1.74$ , 95%CI: 1.26–2.40), group sex ( $aOR = 2.32$ , 95%CI: 1.48–3.62), STI ( $aOR = 3.67$ , 95%CI: 1.53–8.81).

### Guangzhou could be a transit hub of HIV-1 CRF59\_01B epidemic in China: a molecular network and phylogeography analysis

H. Yan<sup>1</sup>, Z. Han<sup>2</sup>, H. Wu<sup>2</sup>, S. Tang<sup>3</sup>, Y. Hao<sup>4</sup>, Y. Liu<sup>5</sup>, J. Gu<sup>1</sup>

<sup>1</sup>Sun Yat-sen University, Department of Medical Statistics, School of Public Health, Guangzhou, China, <sup>2</sup>Guangzhou Center for Disease Control and Prevention, Guangzhou, China, <sup>3</sup>Southern Medical University, Department of Epidemiology, School of Public Health, Guangzhou, China, <sup>4</sup>Peking University Center for Public Health and Epidemic Preparedness & Response, Beijing, China, <sup>5</sup>Guangzhou University of Chinese Medicine, School of Public Health and Management, Guangzhou, China

**Background:** HIV-1 CRF59\_01B was first identified in 2013 in China, and has been detected nationwide, urging early prevention and control. Guangzhou, the central city in South China, has a substantial CRF59\_01B circulation. This study aimed to investigate the role of Guangzhou in the spread of CRF59\_01B.

**Methods:** We established a HIV-1 *pol* gene sequence dataset by incorporating all available CRF59\_01B sequences and their metadata from Guangzhou CDC or the Los Alamos National Laboratory database. These sequences collected outside of Guangzhou were categorized into six groups according to their sampling regions.

To investigate the spatio-temporal dynamic, a molecular network was constructed to characterize the transmission while Bayesian phylogeography analysis was performed to unveil the migration pattern between these regions.

**Results:** Of the 265 CRF59\_01B sequences sampled between 2007 and 2021, 209 (78.9%) formed 25 molecular clusters, comprising 1,131 links. Around 25% of these connections occurred between Guangzhou and the nearby city Shenzhen while Guangzhou showed wide transmission linkages with four other regions.

Bayesian phylogeography analysis indicated that CRF59\_01B could originate in Shenzhen (posterior probability = 0.722) around 1997.5 (95% highest probability density interval: 1992.9–2001.5). By counting the transitions of location state along the phylogeny, Guangzhou exhibited similar export to Shenzhen, but twice import, being a key recipient and source in CRF59\_01B migration. Seven migration pathways between regions were strongly supported (posterior probability 0.50 and Bayes factor 3).

The migration history of CRF59\_01B revealed its introductions from Shenzhen to Guangzhou (5.08 events/year) and North China, followed by its spread to Central, East,

South, and Southwest China from Guangzhou. Moreover, CRF59\_01B returned to Shenzhen from Guangzhou (1.89 events/year).

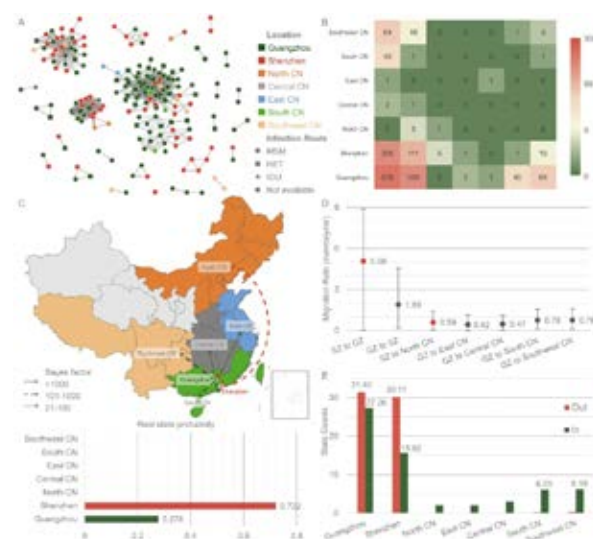

Figure 1. The nationwide transmission pattern of HIV-1 CRF59\_01B in China. (A) The molecular network based on 265 sequences collected from China during 2007 and 2021. (B) The intensity matrix of transmission. The number in the grid cell at the intersection of two regions represents the number of links between the sequences in two regions. (C) The migration map with the root state posterior probability shown at the bottom. (D) The migration rates for significant pathways. (E) The total counts of location state transitions.

**Conclusions:** Shenzhen might be the origin and Guangzhou could serve as the transit hub of CRF59\_01B epidemic in China. These findings underscore the importance of joint precise prevention strategies between regions, focusing the origin and the transit hub.

## WEPEC157

### Identifying sexual risk profiles for clients and non-paying partners of female sex workers to inform HIV prevention in Port Elizabeth, South Africa: a latent class analysis

Y. Mi<sup>1</sup>, J. Rosen<sup>2</sup>, A. Rao<sup>1</sup>, M. Mcingana<sup>3</sup>, K. Atkins<sup>2</sup>, H. Hausler<sup>3</sup>, K. Rucinski<sup>2</sup>, S. Mishra<sup>4</sup>, M.-C. Boily<sup>5</sup>, P. Vickerman<sup>6</sup>, S. Baral<sup>1</sup>, S. Schwartz<sup>1</sup>

<sup>1</sup>Bloomberg School of Public Health, Johns Hopkins University, Department of Epidemiology, Baltimore, United States, <sup>2</sup>Bloomberg School of Public Health, Johns Hopkins University, Department of International Health, Baltimore, United States, <sup>3</sup>University of Pretoria, TB HIV Care and Department of Family Medicine, Cape Town, South Africa, <sup>4</sup>University of Toronto, Department of Medicine, Division of Infectious Diseases, Toronto, Canada, <sup>5</sup>Imperial College London, Faculty of Medicine, School of Public Health, London, United Kingdom, <sup>6</sup>University of Bristol, Bristol Population Health Science Institute, Bristol, United Kingdom

**Background:** Female sex workers (FSW) in South Africa experience disproportionate HIV burden, with approximately 60% living with HIV. Little is known about the sexual behaviors and characteristics of clients of FSW, which could inform HIV prevention efforts. We characterized partnership patterns among male clients and non-paying partners of FSW in Port Elizabeth, South Africa.

**Methods:** Time-location sampling was used to recruit 563 male clients and/or non-paying partners in a cross-sectional bio-behavioral survey in 2017. We used LCA to identify underlying groups of men with similar risk profiles based on:

1. Years buying or exchanging sex;
2. Number of paid/transactional partners;
3. Number of primary non-paying partners;
4. Number of non-paying casual partners; and,
5. Condom use during vaginal and anal sex in the last 3 months.

We fit latent class models with 2-4 classes and inspected fit statistics to identify the best-fitting model. Demographic characteristics, HIV seropositive prevalence, and service use patterns were estimated by class.

**Results:** The median age of participants (N=563) was 32 years [IQR:27-34], and most (n=343, 60.9%) engaged in transactional sex for >10 years. HIV prevalence in the overall sample was 14.2% (80/563). We identified a 3-class solution as the best-fitting latent class model, which consisted of the following behavioral profiles:

Class 1: consistent condom use, multiple partners of all types, shortest duration paying for sex (n=268, 48%);

Class 2: consistent condom use, 1 main partner, no casual unpaid partners, longest duration (n=234, 42%);

Class 3: inconsistent condom use, 1 main partner, no casual unpaid partners, moderate duration (n=61, 11%).

HIV prevalence was 21.7% in class 3, 16.0% in class 2 and 11.3% in class 1.

**Conclusions:** Distinct sexual risk profiles among clients of FSW were identified. Tailored interventions should focus on reaching men at greatest risk for HIV especially those with inconsistent condom use. Data collection is needed to assess trends in behavioral risks and HIV among clients over time.

## WEPEC158

### Prevalence of HIV and viral hepatitis in transgender women in Cali Colombia

J.A. Garcia Luna<sup>1,2,3</sup>, J.D. Ramirez-Ayala<sup>1</sup>, S.A. Silva-Peña<sup>1</sup>, J.S. Hurtado<sup>1,4</sup>, L. Aguirre-Martínez<sup>1</sup>, A.J. Martínez-Valencia<sup>1,5</sup>, A.D. Smith<sup>6</sup>, J.C. Salazar<sup>7,8</sup>, J.D. Radolf<sup>7,8</sup>

<sup>1</sup>Centro Internacional de Entrenamiento e Investigaciones Médicas (CIDEIM), Clinical and Community Research Unit, Cali, Colombia, <sup>2</sup>Universidad Icesi, Cali, Colombia,

<sup>3</sup>Universidad del Valle, Division of Dermatology and Dermatologic surgery, Calico, Colombia, <sup>4</sup>Public Health Department of Valle del Cauca, Cali, Colombia, <sup>5</sup>Fundación Clínica Valle del Lili, Cali, Colombia, <sup>6</sup>University of Oxford, Nuffield Department of Population Health, Oxfordshire, United Kingdom, <sup>7</sup>UConn Health, Farmington, United States, <sup>8</sup>Connecticut Children's, Hartford, United States

**Background:** Transgender women (TGW) have been identified as a key at-risk population for HIV and viral hepatitis. Previous studies in Colombia have shown a prevalence of HIV ranging from 18% to 29% in TGW; however, the prevalence of viral hepatitis is unknown. Due to social exclusion and economic marginalization, TGW are a hard to reach population. We performed a respondent-driven sampling study to assess the prevalence of HIV and viral hepatitis in TGW in Cali, Colombia.

**Methods:** Eight seed TGW were identified from the community to start the referral chain, with a maximum of two referrals allowed per participant. A sociodemographic and behavioral survey was performed followed by a targeted physical examination. Serum was collected and tested for HIV (3<sup>rd</sup> and 4<sup>th</sup> generation Enzyme Linked Immunosorbent Assay [ELISA]), hepatitis B (HBsAg and anti-core ELISAs) and C (ELISA). Point estimates of demographic, behavioral and HIV/hepatitis measures were adjusted for individual network degree using the RDS-II method.

**Results:** Between May and October 2023, 169 TGW were enrolled. The median age was 41, 32% had completed at least high school and only 8.5% were employed full-time. Approximately half of the participants reported onset of sexual activity before age 14, 52% reported a history of sexual abuse and only 14% had never engaged in commercial sex. HIV, hepatitis C, HBsAg, and anti-core ELISAs were positive in 39%, 2.4%, 4.2% and 44% of the participants, respectively. The adjusted prevalences were 37.5% (95%CI 26.2-48.8) for HIV, 1.8% (95%CI 1.1-2.6) for hepatitis C, 3.4% (95%CI 1.9-4.9) for active hepatitis B and 40.4% (95%CI 29.5-51.3) for exposure to hepatitis B. Data achieved convergence on HIV and hepatitis measures, and there was no evidence of homophily.

**Conclusions:** In Colombia the prevalence of HIV has been estimated at 0.25 per 100 inhabitants, while the prevalence of viral hepatitis is unknown. Therefore, our results reveal the extreme burdens of HIV and viral hepatitis in

TGW in Cali, Colombia despite universal healthcare coverage. There is a failure of the health care system to provide optimal care to diverse populations and an urgent need for tailored strategies to provide adequate health care in these populations.

## WEPEC159

Factors associated with HIV-infection in people who use new psychoactive substances in Kazakhstan: a multicentre hospital-based study

M. Prilutskaya<sup>1</sup>, A. Shukimbayeva<sup>1</sup>, G. Altybayeva<sup>2</sup>, G. Zakhidova<sup>3</sup>, A. Zhumasheva<sup>4</sup>

<sup>1</sup>Semey Medical University, Personalized Medicine, Pavlodar, Kazakhstan, <sup>2</sup>Semey Medical University, Psychiatry, Semey, Kazakhstan, <sup>3</sup>Bukhara State Medical Institute, Psychiatry, Bukhara, Uzbekistan, <sup>4</sup>Semey Medical University, Pediatrics, Pavlodar, Kazakhstan

**Background:** The prevalence of HIV infection in Kazakhstan is 0.3%. Over the past decade, parenteral transmission of HIV infection has decreased significantly. National experts attribute this trend not only to the effectiveness of harm reduction measures, but also to the rapid spread of new psychoactive substances (NPS). Hospitalizations for people with NPS use disorders have increased from 6% in 2017 to 25% in 2021.

While HIV prevalence among people who inject drugs (PWID) has decreased over the last decade (7.6% in 2022), there are no national data on HIV prevalence specifically among people who use NPS. The aim was to investigate factors associated with HIV infection among people with NPS use disorders.

**Methods:** We retrospectively reviewed 1633 medical records of people hospitalised for NPS use disorders in 20 drug addiction treatment centres across Kazakhstan from 1 January 2018 to 31 December 2021. We examined the association of positive HIV status with key demographic characteristics and NPS use patterns using binary logistic regression.

**Results:** Of the total sample, 198 individuals had positive HIV status (12.1%), with significantly higher HIV prevalence among women: 18.7% and 11.0% respectively ( $\chi^2=11.33$ ,  $p=0.001$ ). The mean age of the sample was 32.39 years ( $SD=7.82$ ), with older age among those with positive HIV status (difference=4.87,  $p<0.001$ ). Regarding the NPS groups used, 304 people (18.6%) had problems with synthetic cannabinoids, while 1462 (89.5%) used synthetic stimulants. In the regression model, HIV infections were associated with the female sex ( $OR=1.78$ ; 95%CI: 1.17, 2.69), synthetic stimulant use ( $OR=2.70$ ; 95%CI: 1.04, 7.00), and NPS combination with heroin injections ( $OR=10.06$ ; 95%CI: 6.65, 15.23).

Among people with synthetic stimulant use, HIV infection was additionally associated with parenteral routes of stimulant administration ( $OR=3.47$ ; 95%CI: 2.21, 5.44).

**Conclusions:** Our results indicate a higher prevalence of HIV infection among treatment-seeking populations with NPS use disorders compared with PWID.

Well-organised and tailored harm reduction interventions are needed in Kazakhstan, especially for women with NPS experience and for people using synthetic stimulants.

## WEPEC160

Trends in the prevalence of HIV and other self-reported Sexually Transmitted Infections in Malawi: DHS 2004, 2010 and 2015-2016

E.N. Kudowa<sup>1</sup>, M.B. Chagomerana<sup>2,3</sup>, J. Chirombo<sup>1</sup>, V. Mwapasa<sup>4</sup>, M.C. Hosseinpour<sup>2,5</sup>, E. Singogo<sup>2</sup>

<sup>1</sup>Malawi Liverpool Wellcome Programme, Blantyre, Malawi, <sup>2</sup>University of North Carolina Project-Malawi, Lilongwe, Malawi, <sup>3</sup>University of North Carolina at Chapel Hill, Department of Medicine, Chapel Hill, United States, <sup>4</sup>Kamuzu University of Health Sciences, Blantyre, Malawi, <sup>5</sup>University of North Carolina at Chapel Hill, Department of Medicine, Chapel Hill, United States

**Background:** HIV and sexually transmitted infections (STIs) pose significant health challenges globally, particularly in sub-Saharan Africa. Malawi, like many other countries in the region, faces a substantial burden of these infections, impacting public health and socioeconomic stability. We explored trends in the prevalence and spatial distributions of self-reported STIs and HIV in Malawi in the last two decades.

**Methods:** We analyzed data from the 2004, 2010, and 2015-2016 Malawi Demographic Health Surveys for individuals aged between 15 and 49. We profiled the STI and HIV cases and estimated prevalence and co-infections at district level and utilized geospatial methods to visualize spatial patterns. Sample weights were applied to calculate weighted proportions and their corresponding confidence intervals.

**Results:** A total of 33,195 individuals (5,150 in 2004; 13,588 in 2010; 14,457 in 2015-2016) were included in HIV analysis, and 66,622 individuals in STI analysis (13,113 in 2004; 25,716 in 2010; 27,793 in 2015-2016). We observed a decrease in HIV prevalence and HIV/STI co-infections over time, and an increase in STI prevalence.

HIV prevalence was 11.8% (95%CI: 11.0%-12.7%) in 2004, 10.6% (95%CI: 10.1%-11.1%) in 2010 and 8.8% (95%CI: 8.3%-9.2%) in 2015-2016. STI prevalence was 7.8% (95%CI: 7.3%-8.3%) in 2004, 10.5% (95%CI: 10.2%-10.9%) in 2010 and 13.6% (95%CI: 13.2%-14.0%) in 2015.

Prevalence of HIV/STI co-infections was 9.6% (95%CI: 7.7%-11.6%) in 2004, 11.8% (95%CI: 10.5%-13.2%) in 2010 and 9.1% (95%CI: 8.0%-10.2%) in 2015. HIV, STI and HIV/STI prevalence varied across the districts with higher prevalence in southern region districts than other regions (Figure 1).

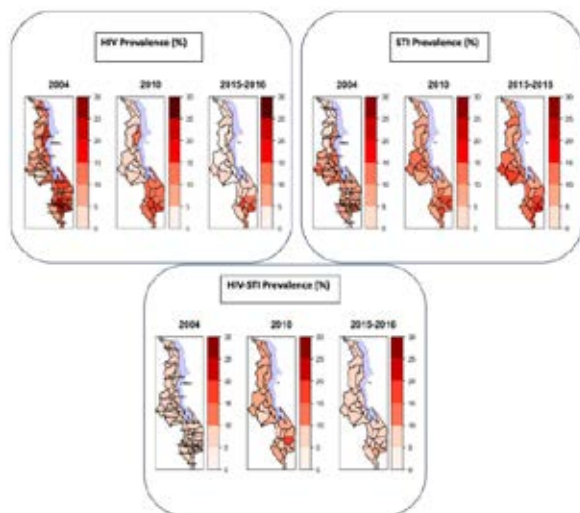

Figure 1. Prevalence of HIV, STI and HIV-STI co-infections.

**Conclusions:** The decline in HIV prevalence and co-infections can be linked to the effectiveness of several HIV prevention and treatment strategies that have been implemented over the years.

The rise in STI infections emphasizes the importance of enhancing screening and treatment of STIs and HIV and promote safer sexual practices among the sexually active population.

## WEPEC161

### Prospective monitoring of HIV transmission cluster dynamics in North Carolina, 2020-2023

A. Dennis<sup>1</sup>, C. Broshkevitch<sup>1</sup>, S. Frost<sup>2</sup>, S. Zhou<sup>1</sup>, S. Sherrard<sup>3</sup>, A. Williams<sup>3</sup>, A. Greifinger<sup>4</sup>, E. Volz<sup>5</sup>, R. Swanstrom<sup>1</sup>, M. Cohen<sup>1</sup>, J. Eron<sup>1</sup>, V. Mobley<sup>4</sup>, E. Samoff<sup>4</sup>

<sup>1</sup>University of North Carolina at Chapel Hill, Chapel Hill, United States, <sup>2</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>3</sup>Mecklenburg County Health Department, Charlotte, United States, <sup>4</sup>North Carolina Department of Health and Human Services, Raleigh, United States, <sup>5</sup>Imperial College, London, United Kingdom

**Background:** Responding to clusters is a pillar of the US Ending the HIV Epidemic (EHE). However, uncertainty remains in optimal cluster prioritization both within and between EHE and non-EHE regions.

We examined growth dynamics and geographical distribution of clusters in North Carolina (NC) including the Charlotte EHE region.

**Methods:** In 2018, we launched an automated platform integrating HIV sequences, surveillance data, and cluster metrics for monthly cluster monitoring in NC. Sequences are reported from reference laboratories (2010-2023) or de novo sequencing from remnant diagnostic specimens (2018-2022). Clusters were identified using pairwise genetic distance <1.5%. Priority clusters (PCs) were defined as ≥5 members with diagnoses in the prior 3 years and ≥1 mem-

ber without viral suppression (VS) in the prior year. Cluster composition and factors associated with PCs among persons with new diagnoses were evaluated.

**Results:** 22,416 persons had ≥1 sequence and 3,300 were newly diagnosed (2020-2023); most were Black (58%), MSM (60%) and resided in Charlotte (22%) or Raleigh (22%). Most new diagnoses were in a cluster (64%), distributed in 676 clusters; 146 clusters were identified at least once as a PC. By 2024, median PC size was 13 (range 5-129 members) and only 18 (12%) PCs comprised a majority of Charlotte EHE residents.

Across all PCs, there were 1,086 new diagnoses and 1,482 without VS evaluated for bridge counseling. Eleven PCs had ≥20 new diagnoses and involved several regions (Figure). New diagnoses in PCs were more likely to be MSM (73% vs. 54%), <30 years (58% vs. 39%), and less likely to reside in Charlotte (19% vs. 25%) [ $p < 0.01$ ].

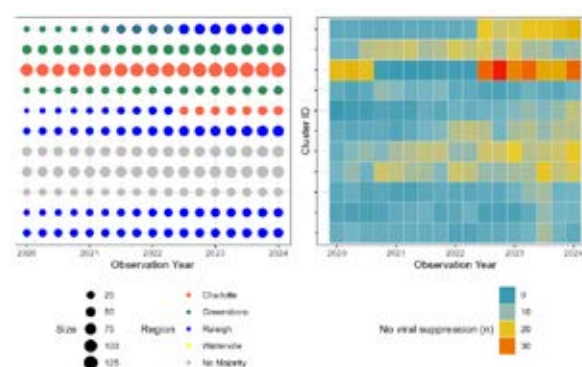

Figure. Clusters with high growth of members with new HIV diagnoses.

**Conclusions:** We identified a high proportion of clustering among persons with new diagnoses which indicates localized recent transmission, crossing multiple regions. Large clusters with incident diagnoses had high numbers of members without VS which underscores the need for innovative strategies to improve care retention.

### Predictive factors of progression to AIDS after diagnosis of HIV acquisition in the vertical transmission cohort - Youth in the state of Sao Paulo

M.V. Tancredi<sup>1</sup>, A. Tayra<sup>1</sup>, A. Sanudo<sup>2</sup>, M.C. Polon<sup>1</sup>, A.C. Freitas<sup>3</sup>, D.M. Machado<sup>2</sup>, D.V. Bertolini<sup>1</sup>, A.D. Oliveira<sup>1</sup>, M.A.D. Silva<sup>1</sup>, A.P. Ferrara<sup>4</sup>, C.G. Luppi<sup>2</sup>

<sup>1</sup>Sao Paulo AIDS STI Reference Center, Epidemiological Surveillance, Sao Paulo, Brazil, <sup>2</sup>Escola Paulista de Medicina, Universidade Federal de São Paulo, Sao Paulo, Brazil, <sup>3</sup>Hospital das Clínicas HCFMUSP, Faculdade de Medicina, Universidade de Sao Paulo, Divisão de Clínica de Molestias Infecciosas e Parasitárias, Sao Paulo, Brazil, <sup>4</sup>Grupo de Incentivo à Vida, Sao Paulo, Brazil

**Background:** The evolution of people living with HIV depends on the appropriate HIV cascade care. We evaluated the time elapsed between HIV diagnosis and AIDS (TBHA) in adolescents and young adults who acquired HIV perinatally (YHP) and investigated the predictors associated with the AIDS free-time in different diagnosis periods in the State of Sao Paulo.

**Methods:** We have developed a retrospective cohort study, including 6,149 YHP, diagnosed between 1988 and 2003 and followed until 2021. The Kaplan-Meier method was applied to estimate TBHA and the Cox proportional hazards model was used to evaluate the predictors of TBHA, calculating the Hazard Ratio (HR).

The variable period of diagnosis was used as a proxy for the treatments used. Sources of information Data were: the Sao Paulo AIDS Program and Notifiable Diseases Database (SINAN-AIDS)

Figure 1. Kaplan-Meier estimates of cumulative probability of AIDS-free time by diagnosis period from 1987 to 2021.

**Results:** The cumulative probability of AIDS-free time for the follow-up of 12 years was 25.5%. The median TPHA was 10.2 months, 18.0 months, 34.0 months, and 44.0 months for the diagnostic periods 1987-1994, 1995-1998, 1999-2002, and after 2003, respectively. It was associated with progression to AIDS regardless of other exposures: period of diagnosis from 1987 to 1994 (HR=3.38;95%CI 3.10- 3.67), from 1999 to 2002 (HR=0.29; 95%CI 0.27-0.32), after 2002

(HR=0.06;95%CI 0.05-0.07), belonging to the age group under 13 years old (HR=1.67;95%CI 1.46-1.90), for 20 to 24 years old (HR=0.36;95%CI 0.32-0.40), between 25 and 29 years old (HR=0.09;95%CI 0.08-0.11), for 30 years old and over (HR=0.02;95%CI 0.01-0.03), and living in the Municipality of Sao Paulo (HR=1.26;95%CI 1.10-1.44) and being male (HR=1.07;95%CI 1.01-1.13).

**Conclusions:** The HIV cascade care for young people has improved over time as it has increased the AIDS-free time, highlighting the importance of public health policies, identifying how many young people are living with HIV/AIDS and how they live.

## WEPEC163

### The reduced impact of HIV in the pediatric inpatient sector: operational results from a breastfeeding infant ward in Mozambique

N. Schniering<sup>1</sup>, M. Manhacaze<sup>1</sup>, P. Mosquera<sup>2</sup>, C.D. Herrera Molina<sup>2</sup>, Á. Ballesteros<sup>2</sup>, E. Diaz Perez<sup>1</sup>, B. Alface<sup>1</sup>, J. Salência<sup>1</sup>, A. Maieca<sup>3</sup>, W. Joaquim<sup>3</sup>, U. Cassia<sup>3</sup>, M. Sidat<sup>3</sup>, C. Massitela<sup>3</sup>, Q. Adriano<sup>3</sup>, S. Martins<sup>3</sup>, B. Elias<sup>1</sup>, W.C. Buck<sup>4</sup>

<sup>1</sup>Hospital Central de Maputo, Pediatrics, Maputo, Mozambique, <sup>2</sup>Hospital 12 de Octubre, Pediatrics, Madrid, Spain, <sup>3</sup>Universidade Eduardo Mondlane, Faculdade de Medicina, Maputo, Mozambique, <sup>4</sup>University of California David Geffen School of Medicine, Pediatrics, Maputo, Mozambique

**Background:** Mozambique has made impressive strides in its pediatric HIV and PMTCT programs through decentralization, optimization of pediatric antiretroviral treatment (ART), and implementation of Option B+, with improved ART coverage and outcomes, and decreased maternal-child transmission. However, limited data is available to understand the impact of these advancements in the inpatient sector.

**Methods:** Infants hospitalized from January 2020 to December 2023 on the Breastfeeding Ward at Hospital Central de Maputo, the largest academic and referral hospital in Mozambique, were included. Routine data on provider-initiated testing and counseling for HIV (PITC) and point-of-care nucleic acid testing (PoC-NAT) were collected retrospectively from the ward discharge register. Pearson's Chi-squared tests were used to evaluate temporal trends.

**Results:** There were 845, 812, 1231, and 1416 admissions in 2020, 2021, 2022, and 2023, respectively. HIV serostatus was confirmed for 98.5% of patients. The proportion of infants with HIV declined significantly from 5.7% to 1.6% (p<0.001), Figure 1. The proportion of mothers newly diagnosed with HIV declined significantly from 2.5% to 0.4% (p<0.001), as did the positivity of PoC-NAT for exposed infants from 22.2% to 7.5% (p<0.001), Figure 2. HIV-associated mortality was 15.2%, 10.6%, 17.9%, and 16.7% in 2020, 2021, 2022, and 2023, respectively (p=0.704).

Figure 1. HIV serostatus of infants hospitalized on the breastfeeding ward at Hospital Central de Maputo, 2020-2023.

Figure 2. PITC positivity for breastfeeding mothers and PoC-NAT positivity for exposed infants on the breastfeeding ward at Hospital Central de Maputo, 2020-2023.

**Conclusions:** The burden of HIV on inpatient infant care has decreased dramatically, but routine PITC of breastfeeding mothers and PoC-NAT for inpatient early infant diagnosis are still critical for case-finding. Inpatient mortality remains stubbornly high in infants living with HIV, highlighting the importance of the recently-launched national advanced HIV disease program.

## WEPEC164

Using a rule-based algorithm to automatic classify cause of mortality from free-text on death certificates: AIDS-related mortality results among PLHIV registered in the National AIDS Program, Thailand, 2008-2022

C. Lertpiriyasuwat<sup>1</sup>, W. Kiatchanon<sup>2</sup>, N. Punsuwan<sup>1</sup>, P. Namahoot<sup>3</sup>, S. Aungkulanon<sup>2</sup>, S. Noknoy<sup>1</sup>, P. Wareechai<sup>3</sup>, T. Naiwatanakul<sup>2</sup>, A. Kanphukiew<sup>2</sup>, S.C. Northbrook<sup>2</sup>

<sup>1</sup>Division of AIDS and STI, Department of Disease Control, Nonthaburi, Thailand, <sup>2</sup>Division of Global HIV/TB, U.S. Centers for Disease Control and Prevention, Nonthaburi, Thailand, <sup>3</sup>National Health Security Office, Bangkok, Thailand

**Background:** The Thai National AIDS Program (NAP) has collected demographic, behavioral, and HIV-related data for all people living with HIV (PLHIV) under Universal Health Coverage since 2008. NAP links individual data with the National Death Registration with non-coded,

free-text data documenting causes of death. We developed a rule-based methods to automatic classify cause of death and analyzed major causes of death to determine geographic disparities from 2008 to 2022.

**Methods:** A rule-based algorithm was developed to classify cause of death (COD) from free-text on death certificates and patient characteristics (age and clinical information prior to death).

We applied text mining technique to categorize free text into 3 major groups: AIDS-related causes, non-AIDS related causes including non-communicable diseases, and ill-defined COD following Thai HIV case surveillance definitions and WHO HIV clinical staging guidelines. Accuracy evaluation involved expert reviews of both free-text and algorithm-derived causes.

We calculated the ratio of AIDS to non-AIDS-related deaths to measure geographical disparity and assessed potential determinants of AIDS-related mortality using multiple regression (SAS v 9.4).

**Results:** The cause of death algorithm achieved 92% accuracy. Of 120,793 deaths, 58.1% were AIDS-related, 37.8% non-AIDS-related, and 4.1% ill-defined causes. Tuberculosis, pneumocystis pneumonia, and other pneumonia were most common among AIDS-related causes. Trend of AIDS-related deaths declined from 60.6% in 2008 to 48.7% in 2022, with a significant decrease in the number of provinces with high AIDS-related deaths and proportion of AIDS-related deaths in the lower northern, northeastern, and central provinces.

Factors associated with AIDS-related mortality included baseline CD4 <200, age <24 years, female gender, key populations (men who have sex with men, sex workers), and no ART history.

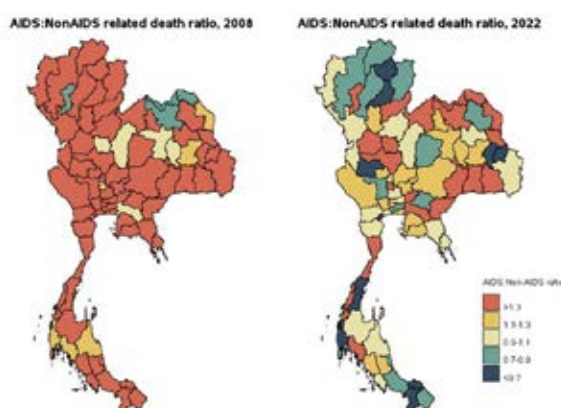

Figure. Geographical distribution of AIDS to non-AIDS-related deaths ratio, Thailand, 2008 and 2022.

**Conclusions:** AIDS-related causes accounted for the majority of deaths using a rule-based algorithm. Targeted interventions to increase ART coverage and TB prevention, diagnosis, and treatment are critical to reduce AIDS-related deaths.

### Retention in care among clients with advanced HIV disease: results from the phased implementation of the Advanced HIV Disease package of care in Nigeria

O. Abudior<sup>1</sup>, W. Eigege<sup>1</sup>, N. Otubu<sup>1</sup>, O. Sowale<sup>1</sup>, I. Amamilo<sup>2</sup>, J. Conroy<sup>2</sup>, F. Lufadeju<sup>1</sup>, C. Amole<sup>2</sup>, O. Wiwa<sup>3</sup>, D. Onotu<sup>4</sup>, K. Sanni<sup>5</sup>, P. Nwaakennaya<sup>5</sup>, P. Mohammed-Ibrahim<sup>5</sup>, A. Ikpeazu<sup>5</sup>, A. Bashorun<sup>5</sup>, O. Agbaji<sup>6</sup>, S. Oguiche<sup>7</sup>, R. Oladele<sup>8</sup>, S. Akanmu<sup>9</sup>

<sup>1</sup>Clinton Health Access Initiative, Infectious Diseases, Abuja, Nigeria, <sup>2</sup>Clinton Health Access Initiative, Infectious Diseases, Boston, United States, <sup>3</sup>Clinton Health Access Initiative, Abuja, Nigeria, <sup>4</sup>US Centers for Disease Control and Prevention, Abuja, Nigeria, <sup>5</sup>Federal Ministry of Health, Nigeria, National AIDS and STI Control Programme, Abuja, Nigeria, <sup>6</sup>Jos University Teaching Hospital, Department of Internal Medicine, Jos, Nigeria, <sup>7</sup>Jos University Teaching Hospital, Department of Paediatrics, Jos, Nigeria, <sup>8</sup>Lagos University Teaching Hospital, Department of Microbiology, Lagos, Nigeria, <sup>9</sup>Lagos University Teaching Hospital, Department of Haematology, Lagos, Nigeria

**Background:** Nigeria introduced the Advanced HIV Disease (AHD) package of care in 2020 and commenced a phased roll-out in 2021. Phase one of the roll-out was implemented in 28 facilities, and lessons from this phase influenced the ongoing national scale up.

As part of the implementation, the country assessed the retention in care and mortality among clients with AHD at these facilities.

**Methods:** In February 2021, an AHD package of care was piloted at 28 high-volume facilities in 4 states in Nigeria. Clients were enrolled into care from February to September 2021 at the 28 facilities and each client was followed up for 12 months. We assessed the retention in care and mortality among PLHIV with AHD at months 3, 6, and 12 after enrolment.

We also analyzed the Kaplan-Meier estimated survival probabilities at 12 months for this population disaggregated by the presence of opportunistic infections.

**Results:** A total of 1,850 clients with AHD were enrolled in care within the reporting period. Of these, 1,599 clients were retained in care at three months, 1,421 at six months, and 1,204 at 12 months post-enrolment into care. This translates to 86.4%, 76.8%, and 65.1% retention rates in months 3, 6 and 12, respectively. Of the 1,850 AHD clients, mortality data for 174 were unavailable. The mortality rates at months 3, 6, and 12 were 4%, 6%, and 7%, respectively. The Kaplan-Meier estimated survival probability for all clients diagnosed with AHD, regardless of opportunistic infections, at 12-month post-enrolment in care, was 0.93 (95% CI). 0.94 (95% CI) was the survival rate for AHD clients with negative results for TB LF-LAM and CrAg, while that for those who were TB LF-LAM-positive was 0.88 (95% CI) and CrAg positive was 0.82 (95% CI).

**Conclusions:** The 12-month retention rate for AHD clients was lower than the average national retention rate in the general ART population, and the reported mortality was highest in the first three months. This underscores the critical role of active follow-up for AHD clients, as recommended in the AHD package of care, which has been re-intensified for the national scale-up.

## WEPEC166

### HIV infection among key populations in Uzbekistan: epidemiological characteristics in the project cohort (2021-2023)

I. Zarubina<sup>1</sup>, P. Kuipers<sup>1</sup>, O. Burtseva<sup>2</sup>

<sup>1</sup>AFEW International, Amsterdam, Netherlands, the, <sup>2</sup>RNGO "ISHONCH VA HAYOT", Tashkent, Uzbekistan

**Background:** Despite the growth of the HIV epidemic in Uzbekistan, people belonging to the most vulnerable groups for HIV infection remain underexamined.

The study aimed to determine the epidemiological characteristics of a cohort of people from key populations (KPs).

**Methods:** The study sample is a project-based cohort of people at higher risk of acquiring HIV (people who inject drugs (PWIDs), women who exchange sex for money (female sex workers) (FSWs), men who have sex with men (MSM)) were tested for HIV in Tashkent and the Tashkent region from October 2021 to April 2023. Characteristics of cohort members and risk of HIV-positive diagnosis by sex, age group, and transmission category were described. Odds ratios (ORs), 95% confidence intervals (CIs), and p-values were calculated with the level of statistical significance set at p-value<0.05.

**Results:** Of 8376 persons, 63.1% were men, median age was 33 years. 62.0% were PWID, 25.7% FSWs, and 12.3% MSM. 817 individuals tested positive for HIV. Men and people aged 18 to 39 years are disproportionately affected by HIV, accounting for 67.7% and 59.6% of HIV diagnoses, respectively.

HIV prevalence was 10.4% (95% CI 9.65-11.3) among males, 8.6% (95% CI 7.6-9.6) among females, 12.4% (95% CI 11.5-13.3) among PWID, 4.5% (95% CI 3.7-5.5) among FSWs, and 7.7% (95% CI 6.2-9.5) among MSM (P<0.05). PWIDs were almost three times more likely to test positive for HIV than FSWs (OR=2.9, 95% CI 2.4-3.7) and had a 70% increase in the odds than MSM (OR=1.7, 95% CI 1.3-2.2) (P<0.05).

Women of 18 to 24 years (OR=1.7, 95% CI 1.1-2.6), 35 to 44 years (OR=2.6, 95% CI 1.9-3.6), 45 to 54 years (OR=4.1, 95% CI 2.7-6.2) and aged 55 years and older (OR=11.5, 95% CI 6.4-20.7) had more odds of testing positive for HIV than women aged 25-34 years (P<0.05). However, no such statistically significant differences by age were found among men.

**Conclusions:** Our findings indicated a high HIV prevalence among KPs in Uzbekistan, especially among PWIDs. Women under 24 years and over 34 years were identified

as the particular risk category. Comprehensive prevention efforts among KPs should be implemented to control the HIV epidemic.

## WEPEC167

Factors associated with chemsex and sexually transmitted infection positivity in individuals attending self-screening clinics: a cross-sectional study in Québec, Canada

J.Y. Lee<sup>1</sup>, K. Benomar<sup>1</sup>, M. Régimbal-Éthier<sup>1</sup>

<sup>1</sup>Prelib, Montreal, Canada

**Background:** Chemsex, sexual engagement under drug influence, is associated with increased risks of sexually transmitted infections (STI). While chemsex has been primarily studied in at-risk populations, limited data exist in unselected populations. We assessed prevalence and factors associated with chemsex, and compared STI positivity between chemsex users and non-users attending Prelib STBI self-screening clinics.

**Methods:** We performed cross-sectional analysis on unselected population attending Prelib (12/2018 - 06/2023). We evaluated factors associated with chemsex with multivariable logistic regression with predictor variables: age range, self-identified gender, new sex partner, last unprotected sex (< 2 months), sex worker, men who have sex with men (MSM), drug use (past year), past STI diagnosis, and pre-exposure prophylaxis (PrEP).

We assessed difference in STI positivity proportions (including first valid tests) between chemsex and no-chemsex groups with Fisher's exact test.

**Results:** There were 57765 complete unique client risk assessment questionnaires. 1310 (2.3%) reported chemsex in the past 6 months; the rest (n=56455, 97.7%) reported no chemsex. Factors associated with chemsex included age  $\geq 50$  [aOR 1.6 (95% CI 1.2, 2.2)], self-identified non-binary gender [1.8 (1.3, 2.4)], trans-female [3.8 (2.0, 6.9)], and other [3.3 (1.3, 7.2)], last unprotected sex (< 2 months) [1.5 (1.3, 1.7)], sex worker [3.4 (2.7, 4.4)], MSM [3.3 (2.8, 3.9)], drug use (past year) [8.1 (7.1, 9.2)], past STI diagnosis [1.3 (1.1, 1.4)], taking PrEP everyday [2.5 (1.6, 4.0)], and no disclosure [6.0 (1.8, 17.6)]. Higher proportion of chemsex users tested positive for any STI (13% v. 7%,  $p < 0.0001$ ), NG urinary (1% v. 0.5%,  $p = 0.03$ ), anal (8% v. 2%,  $p < 0.0001$ ) and oral (7% v. 1%,  $p < 0.0001$ ), syphilis (1% v. 0.3%,  $p = 0.007$ ), and HIV (0.3% v. 0.02%,  $p = 0.01$ ).

**Conclusions:** In a large sample of unselected clients attending Prelib, chemsex was associated with older age, self-identified gender, unprotected sex, sex worker, MSM, drug use, past STI diagnosis, and PrEP. Significantly higher proportions of chemsex users tested positive for any STI, NG urinary, anal and oral, syphilis, and HIV.

Future studies are needed to assess the role of chemsex in STI transmission and potential adverse interactions/effects in therapy.

## WEPEC168

The greying pandemic: understanding the comorbidity profile and outcomes of antiretroviral treatment among older population of people living with HIV in western Kenya

C. Ngeno<sup>1</sup>, E. Amadi<sup>1</sup>, J. Ombagi<sup>1</sup>, S. Okumu<sup>1</sup>, V. Makokha<sup>1</sup>, E. Kinyua<sup>2</sup>, E. Owino<sup>3</sup>, T. Lascko<sup>4</sup>, E. Katiku<sup>5</sup>, A. Biser<sup>1</sup>, S. Wafula<sup>1</sup>, E. Koeh<sup>1</sup>, K. Stafford<sup>6,7,8</sup>

<sup>1</sup>Center for International Health Education and Biosecurity (CIHEB), Kenya, Programs, Nairobi, Kenya, <sup>2</sup>Ministry of Health, County Department of Health, Kisumu, Kenya, <sup>3</sup>Ministry of Health, County Department of Health, Migori, Kenya, <sup>4</sup>University of Maryland, School of Medicine, Baltimore, Center for International Health Education and Biosecurity, Maryland, United States, <sup>5</sup>Center for Disease Control, Division of Global HIV and TB, Nairobi, Kenya, <sup>6</sup>University of Maryland, School of Medicine, Institute of Human Virology, Baltimore, United States, <sup>7</sup>University of Maryland, School of Medicine, Center for International Health Education and Biosecurity, Baltimore, United States, <sup>8</sup>University of Maryland, School of Medicine, Division of Global Health Sciences, Department of Epidemiology and Public Health, Baltimore, United States

**Background:** Scale-up of efficacious antiretroviral treatment (ART) has improved life expectancy among people living with HIV (PLHIV), with 27% projected to be over the age of 50 by 2040. Aging-related conditions pose challenges to HIV care, in settings such as sub-Saharan Africa where expertise on management of co-morbidities, poly-pharmacy and social issues is inadequate. There is little data on ART outcomes and comorbidities in older ( $\geq 50$  years) people in Kenya.

This study compares the comorbidity profile and ART outcomes among PLHIV  $\geq 50$  years with those  $< 50$  years in two counties in Kenya.

**Methods:** We conducted a retrospective cohort analysis of routinely collected data from 105 facilities, for PLHIV on ART who made  $\geq 1$  clinic visit between October 2021-September 2023. Comorbidities of interest included hypertension, diabetes, chronic kidney disease, cancer, and asthma while the outcomes included most recent viral suppression (VS;  $< 200$  copies/ml) status and continuity of treatment (COT; no interruption for  $> 30$  days). Generalized linear models were used to assess treatment outcomes by age.

**Results:** Of the 96,589 PLHIV on ART, the median age was 39 [Interquartile range (IQR) 31 - 48] years; with a median duration on ART of 7.74 [IQR 4.61 - 10.56] years. 20,706 (21%) were aged  $> 50$  years, with 51% (10,495) in the older group having been on ART  $> 10$  years. The median age in the older and younger group was 57 [(IQR) 53-63] years and 36 years (IQR 38-42) respectively.

Overall, 92% and 87% of older and younger clients had COT, with VS at 95% and 92% respectively. Comorbidity prevalence was 8% and 1% among older and younger

clients respectively. After adjusting for sex, regimen and time on ART, older clients were more likely to have a chronic illness (adjusted risk ratio (aRR):4.62, 95%CI:4.24-5.03) compared to younger clients. There was no significant difference in VS, [aRR:1.02, 95%CI:1.00-1.04], COT (aRR:1.01, 95%CI:0.99-1.03) by age.

**Conclusions:** The older population was four times more likely to have comorbidities but were not significantly different from the rest in VS and COT. Therefore, there is need to define geriatric services in Kenya. A minimum package of care for older clients and integration of services to manage non-HIV clinical outcomes is critical.

## WEPEC169

Factors associated with mortality of people living with HIV in Senegal

C.B.D. Gueye<sup>1</sup>, A. Sagna<sup>1</sup>, C.T. Koulibaly<sup>1</sup>, D. Niang<sup>1</sup>, S. Thiam<sup>1</sup>  
*<sup>1</sup>Executive Secretariat of the National Council for the Fight against AIDS, Monitoring, Evaluation and Research Unit, Dakar, Senegal*

**Background:** In Senegal the epidemic is concentrated, with low prevalence in the general population and high prevalence in certain particular groups and regions. The national strategic plan to combat AIDS 2018-2022 had the objective of reducing AIDS deaths by 80% in 2022. UNAIDS Spectrum estimates show a steady decline in deaths during this period. However, the analysis of factors associated with mortality is necessary to avoid their early occurrence and thus improve the quality of life of HIV-infected patients.

The objective of this study is to identify factors associated with mortality in HIV-infected patients.

**Methods:** This is a retrospective and analytical study carried out from January 2018 to December 2022 and covering 26,272 patients living with HIV under ARV treatment across treatment sites in the country. Data was collected in EXCEL. Statistical analysis was carried out with SPSS 20.0 software.

**Results:** 2307 cases of AIDS-related deaths were recorded. The female sex represented 53.3% of deaths, 92.3% were aged 15 and over. The average age was 45 years old. Depending on the level of study, 62.5% of patients have no education, 23.8% primary level, 10.5% secondary level and 3.1% higher level. Among the deaths recorded, 57.1% of patients had clinical stage 3 or 4, 10.5% were diagnosed positive for tuberculosis and 10.5% were positive for HBSAg. Multivariate analysis shows that, WHO stage 3 and 4 (OR = 4.2 [1.53-9.50]; p = 0.009), the occurrence of tuberculosis in patients on antiretrovirals (OR = 4.3 [1.2-10.2]; p=0.003), positive diagnosis of hepatitis B was independently associated with HIV/AIDS-related death.

**Conclusions:** Opportunistic infections such as tuberculosis, positive diagnosis for hepatitis B and late clinical stage constitute factors associated with AIDS-related mortality

in Senegal. Efforts are needed to take into account cases of HIV at advanced stages. Active search for signs of TB as well as treatment of tuberculosis before starting ART in HIV+ patients will help reduce this mortality.

The new strategy for providing differentiated services, GenXpert, constitutes an asset for the early diagnosis, care and monitoring of PLHIV who contribute to the reduction of AIDS-related mortality among PLHIV in Senegal.

## Surveillance: Measuring the HIV pandemic

### WEPEC170

A decade of progress against HIV in Kenya: approaching epidemic control targets, declines observed in HIV incidence in Siaya County, Western Kenya, 2010-2022

D. Kwaro<sup>1</sup>, A. Cleveland<sup>2</sup>, M. Otieno<sup>1,1</sup>, S. Khagayi<sup>1</sup>, S. Gachau<sup>2</sup>, V. Kamire<sup>1</sup>, S. Munga<sup>1</sup>, A. Appolonia<sup>2</sup>, R. Joseph<sup>3</sup>  
*<sup>1</sup>Kenya Medical Research Institute, Center for Global Health Research, Kisumu, Kenya, <sup>2</sup>Centers for Disease Control and Prevention, Division of HIV/TB, Kisumu, Kenya, <sup>3</sup>Centers for Disease Control and Prevention, Division of HIV/TB, Pretoria, South Africa*

**Background:** Assessing HIV incidence trends is vital for understanding the epidemic and evaluating interventions, yet quality incidence data during a period of treatment scale-up are lacking, especially in Eastern Africa. We leveraged over a decade of longitudinal serological/behavioral data from serial surveys in a high-prevalence region of Kenya to help address this evidence gap.

**Methods:** We conducted retrospective analysis of data collected through HIV behavioral and serological surveys, conducted roughly every two years from 2010-2022, in a health and demographic surveillance system (HDSS) among ~220,000 individuals in Siaya county, Western Kenya. Surveys measured HIV status, and treatment coverage. We estimated age-adjusted HIV prevalence and incidence per 1,000 person-years (PY), and used Poisson regression to calculate HIV incidence rate ratios (IRRs) by age/gender for persons aged ≥15 years.

**Results:** HIV prevalence rose from 11.2% (95%CI: 11.0-11.4) in 2010 to 12.6 (95%CI: 12.4-12.9) in 2022; current ART use increased from 81.4% (95% CI: 80.6 - 82.3) to 97.1% (95% CI: 96.8 - 97.5) over this same period.

During this period, we observed 680 new HIV infections across 155,839 years of follow-up (cumulative incidence: 4.36/1,000 PY). Overall HIV incidence declined 60.0% from 6.5/1,000 PY (95% CI: 5.7-7.4) in 2010-2012 to 2.6/1,000 PY (95% CI: 1.9-3.6) in 2020-2022.

Incidence significantly declined among those aged 15-24 and women aged 25+, with less change observed among males aged 25+ (Figure). There were no incident HIV cases detected among males in 2022.

**Conclusions:** Over a decade, HIV prevalence rose moderately as near-universal treatment coverage was attained in this high-burden region. The 60% decline in HIV incidence signifies progress towards HIV epidemic control. However, the incidence rate of 2.6/1,000 PY in 2020-2022 indicate gaps persist, especially among key groups like adults aged 25+.

Still, substantial declines among persons 15-24 years provide encouraging evidence that investments in HIV programming are translating into tangible impact in Siaya County, Western Kenya.

## WEPEC171

### Establishing laboratory-based cyclical acquired HIV drug resistance surveillance in Tanzania

C. Festo<sup>1</sup>, C. Mahende<sup>2</sup>, W. Maokola<sup>3</sup>, D. Temba<sup>1</sup>, A. Wang<sup>2</sup>, A. Mganga<sup>1</sup>, H. Msuya<sup>2</sup>, A. Ismail<sup>2</sup>, D. Damian<sup>2</sup>, F. Msafiri<sup>1</sup>, V. Mushi<sup>1</sup>, P. Njau<sup>3</sup>, M. Dahoma<sup>4</sup>, J. Kengia<sup>5</sup>, R. Pati<sup>6</sup>, S. Pals<sup>6</sup>, D.-P. Zheng<sup>6</sup>, N. Springstubb<sup>6</sup>, N. Aitchison<sup>6</sup>, M. Swaminathan<sup>2</sup>, S. Porter<sup>2</sup>, D. Sando<sup>1</sup>

<sup>1</sup>Management Development for Health (MDH), Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>U.S. Centers for Disease Prevention and Control (CDC), Division of Global HIV and TB, Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>Ministry of Health, Community Development, Gender, Elderly and Children, National AIDS, STI and Hepatitis Control Program (NASHCoP), Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>Ministry of Health Zanzibar, Zanzibar Integrated HIV, Hepatitis, TB and Leprosy Program (ZIHHTLP), Zanzibar, Tanzania, the United Republic of, <sup>5</sup>President's Office Regional Administration and Local Government (PORALG), Dar es Salaam, Tanzania, the United Republic of, <sup>6</sup>U.S. Centers for Disease Control and Prevention (CDC), Division of Global HIV and TB, Atlanta, United States

**Background:** Tanzania implemented the first round of laboratory-based acquired HIV drug resistance (HIVDR) surveillance using remnant HIV viral load (HVL) specimens in 2023.

The objective of the surveillance activity is to measure the prevalence of HIVDR mutations affecting efficacy of dolutegravir (DTG)-containing regimens and other antiretroviral therapy (ART) regimens over time.

**Description:** Seven of 19 HVL reference laboratories in mainland Tanzania and two point-of-care HVL testing sites in Zanzibar were purposively selected to participate. Prior to implementation, government and technical stakeholders developed the surveillance protocol, assessed the capacity of laboratories to identify samples, and trained laboratory staff.

During implementation, eligible plasma samples from clients with HVL  $\geq 1,000$  copies/mL and on DTG-containing regimens for  $\geq 9$  months were identified at the HVL reference laboratory. Eligible samples were shipped to a central laboratory for extraction and genotypic analysis. The extracted RNA was amplified using ThermoFisher HIV-1 genotyping kit with protease, reverse-transcriptase (PRRT) and integrase genes and sequenced on Sanger sequencing platform.

The Stanford database for HIVDR mutations was used to interpret results. Clients' clinical and demographic information were abstracted from the electronic national HIV/AIDS database and linked with HIVDR data for analysis.

**Lessons learned:** Sample identification began in April 2023 for a period of 6 months but the time each laboratory actively identified samples varied due to stock-out, equipment breakdown, and staff turnover. In total, 1,381 plasma samples were identified and shipped to the central laboratory. PRRT amplification failures were common (62%); remediation included repeating samples and using a version of the genotyping kit without integrase. Poor sample quality, cold chain interruptions, and sensitivity of genotypic primers might have contributed to amplification failure. Sequence failures were uncommon overall (12%); failure rate was improved using a software to recall failed sequences.

On-site supportive supervision at laboratories and weekly check-in meetings with the surveillance staff improved overall protocol compliance.

**Conclusions/Next steps:** Establishing HIVDR surveillance required an interdisciplinary team to design the protocol and oversee implementation. Functioning HIV/AIDS information systems, selection of HVL laboratories, capacity of laboratories and staff to conduct testing, and analyze data were paramount. Lessons learned during initial implementation will be incorporated into future HIVDR surveillance in Tanzania.

## WEPEC172

### Forecasting recent HIV and HIV-related mortality to determine progress towards HIV epidemic control by mid-2025 using October 2020 to October 2023 surveillance data in Zambia

C. Haabeenzu<sup>1</sup>, S. Fwoloshi<sup>2,3</sup>, N. Sinyange<sup>4</sup>, D. Banda<sup>4</sup>, L. Mulenga<sup>2,3</sup>

<sup>1</sup>Ministry of Health, HIV Surveillance, Lusaka, Zambia,

<sup>2</sup>University Teaching Hospital School of Medicine, Lusaka, Zambia, <sup>3</sup>Ministry of Health, Lusaka, Zambia, <sup>4</sup>Zambia National Public Health Institute, Lusaka, Zambia

**Background:** Despite HIV being a major public health problem, Zambia has achieved good progress towards the 95-95-95 epidemic elimination targets with 89% persons living with HIV aware of their status, 97% on antiretroviral therapy and 96% have viral suppression. This

progress can be attributed to comprehensive intervention addressing both treatment and prevention of HIV acquisition. UNAIDS proposed four potential criteria of determining epidemic control including percentage reduction in incidence, incidence-to-mortality ratio, incidence-to-prevalence ratio, and annual incidence.

To compliment the 95-95-95 achievements, the incidence-to-mortality ratio as an alternative indicator for HIV epidemic control was explored. The recent HIV and HIV related mortality were forecasted to mid-2025 to access readiness in view of mid-term epidemic control review.

**Methods:** A time series analysis was performed with data from October 2020 to October 2023. A recent HIV was defined as having tested positive for HIV-1, a positive test for recent infection (TRI) and an initial viral >1000, while an HIV-related mortality was a mortality whose cause of death was HIV-related as captured in. Data were synched by facility and time from October 2020 to October 2023. An autoregressive integrated moving average (ARIMA) model was fitted in R, decomposed the data for trends, seasonality, and autocorrelation before making a 24-month's forecast.

**Results:** Mortality counts initially surpassed recent HIV until August 2021, after which they consistently remained lower. Recent HIV peaked around November 2022 before gradually declining, but still consistently exceeding mortality counts. Females and individuals aged >30 years had sustained higher recent HIV, with mortality trendlines by gender crisscrossing at various points.

The forecasted recent HIV remained sustainedly higher than HIV-related mortality by mid-2025, projected at 267 (95% CI: 21-513) recent HIV and 96 (95% CI: -106-298) HIV-related mortality.

**Conclusions:** The observed higher trend of recent HIV among females, despite a comparable mortality trend, suggests improved health-seeking behavior among females. However, the forecasted persistence of higher recent HIV emphasizes the imperative to intensify HIV preventive measures.

Despite progress towards epidemic elimination, the sustained higher trend of new HIV acquisition suggests that HIV may not be controlled by mid-term review, therefore a refocus on intervention may be necessary

## WEPEC173

### Progress towards 95-95-95 and challenges with viral suppression among people who inject drugs in Unguja, Zanzibar, 2023

M. Mtoro<sup>1</sup>, I. Mohamed<sup>2</sup>, J. Ndayongeje<sup>1</sup>, C. Said<sup>3</sup>, W. McFarland<sup>4</sup>, F. Khalid<sup>5</sup>, A. Khatib<sup>2</sup>, P. Khamisi<sup>2</sup>, S. Porter<sup>6</sup>, A. Kailembo<sup>6</sup>, H. Solomon<sup>7</sup>, S. Welty<sup>3</sup>, M. Dahoma<sup>2</sup>

<sup>1</sup>Global Programs, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Zanzibar Integrated HIV, Hepatitis, TB, and Leprosy Programme, Unguja, Tanzania, the United Republic of, <sup>3</sup>University of California, San Francisco, United States, <sup>4</sup>San Francisco Department of Public Health, San Francisco, United States, <sup>5</sup>Ministry Health, Unguja, Tanzania, the United Republic of, <sup>6</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Dar es Salaam, Tanzania, the United Republic of, <sup>7</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States

**Background:** Zanzibar has a concentrated HIV epidemic among key populations, including people who inject drugs (PWID). Several biobehavioral surveys (BBS) have been implemented to monitor the epidemic and progress towards realizing the UNAIDS 95-95-95 targets. We present findings among PWID from the latest BBS conducted in Unguja Island, Zanzibar, in 2023.

**Methods:** We used respondent-driven sampling to recruit individuals aged ≥15 years who had lived in Unguja for ≥3 months and injected drugs in the past 3 months. We assessed HIV testing and treatment history through an interviewer-administered questionnaire and offered point-of-care HIV testing per national guidelines. For those testing HIV-positive, we quantified HIV viral load (VL). We defined viral suppression as <1,000 HIV RNA copies/mL, low level viremia (LLV) as 50-999 copies/mL, and an undetectable VL as <50 copies/mL.

We classified those who disclosed a positive HIV status or were virally suppressed as knowing their status, and those who self-reported ART use or were virally suppressed as on ART. We produced weighted point estimates, reported as percentages with 95% confidence intervals (CI).

**Results:** We recruited 455 PWID with a median age of 38 years (interquartile range: 32-45 years). HIV prevalence was 9.3% (n=41; 95%CI: 6.0-12.4). Of PWID who tested HIV positive, 89.3% (95%CI: 74.1-100.0) knew their HIV status. Of those, 98.3% (95%CI: 82.0-100.0) were on ART, of whom 80.2% (95%CI: 64.2-95.5) were virally suppressed. Among PWID who were virally suppressed, 93.7% (95%CI: 84.5-100.0) had an undetectable VL, and 6.3% (95%CI: 0-15.5) had LLV.

**Conclusions:** The findings highlight gaps in the first and third 95 targets. To enhance diagnosis and viral suppression, interventions including expanded HIV testing, such as self-testing, removing barriers to ART retention, and harm reduction services are essential.

**WEPEC174****Generalizability of the sample of people living with HIV in the all of us database**

N. Plummer<sup>1</sup>, A. Ratnayake<sup>2</sup>, R. Cavanaugh<sup>2</sup>, C. Wong<sup>3</sup>, B. Olivieri-Mui<sup>1,2,3</sup>

<sup>1</sup>Northeastern University, Bouve College of Health Sciences, Boston, United States, <sup>2</sup>Roux Institute Northeastern, Portland, United States, <sup>3</sup>The Marcus Institute for Aging Research, Hebrew SeniorLife - Harvard Medical School, Boston, United States

**Background:** There are an estimated 1.2 million people living with HIV (PLWH) in the United States. HIV diagnoses disproportionately occur among non-Hispanic Black, Latine, gay, bisexual, and other men who have sex with men (GBMSM). Databases with large sample sizes for studying HIV are few and rarely representative of the U.S. HIV population. In 2018, the All of Us (AoU) Research Program was launched, with the goal of enrolling 1 million Americans under-represented in biomedical research such as people with HIV. This study examined the diversity and generalizability of data contributed by PLWH in AoU. Specifically, we sought to characterize the AoU HIV cohort and compare this cohort to U.S. HIV surveillance statistics.

**Methods:** We used the 'allos' R package to extract survey responses to the HIV-related questions with the relevant concept IDs (1384391, 43530505, 43528832, 43530347). We compared demographic statistics to Centers for Disease Control and Prevention HIV surveillance statistics using Pearson's chi-squared tests.

**Results:** 1,714 people self-reported having HIV. Most were male (n=1282, 76.4%) and reported a non-heterosexual sexual orientation (n=1239, 71.2%). A plurality were 55 and older (n=821, 47.9%), and a quarter were aged 45-55 (n=459, 26.8%). Nearly half were non-Hispanic White (n=783, 45.7%), 30.6% (n= 525) were non-Hispanic Black, 16.4% (n=281) were Hispanic. Compared to the national data, the AoU self-reported HIV population was similar to the national HIV population in gender/sex and age but not in race/ethnicity (Table 1).

	All of Us Cohort (n=1714) n (%)	US population living with HIV (n~1,200,000) n (%)
Age category		
13-24	<20 (1.1)	45,900 (3.8)
25-34	173 (10.1)	218,700 (18.2)
35-44	243 (14.2)	228,000 (19.0)
45-54	459 (26.8)	290,000 (24.2)
55+	821 (47.9)	407,100 (33.9)
Gender		
Female	348 (20.8)	263,900 (22.0)
Male	1282 (76.4)	925,800 (77.2)
Gender diverse	47 (2.8)	10,300 (0.8)
Race/ Ethnicity *		
Non-Hispanic White	783 (45.7)	338,600 (28.2)
Non-Hispanic Black	525 (30.6)	479,300 (39.9)
Hispanic	281 (16.4)	294,200 (24.5)
Mixed race	34 (2.0)	54,100 (4.5)
Other	36 (2.1)	22,800 (1.9)

\* = Chi-square p-value <0.05

Table 1: Demographic proportions in All of Us compared to U.S. population by chi-square.

**Conclusions:** Despite being similar in age and gender/sex, individuals from non-Hispanic Black and Hispanic backgrounds remain underrepresented in AoU. This may be due to the lack of a sampling frame in AoU. Future research will reevaluate generalizability after expanding the AoU HIV cohort definition to use health records and medications. However, interpretations of AoU compared to the U.S. HIV population should consider limitations in generalizability.

**WEPEC175****Facility- and client-level predictors of AIDS-related cause of death among people living with HIV on antiretroviral drug treatment in Nigeria, 2021-2023: a multilevel model analysis**

A. Phillips<sup>1</sup>, A. Adekogbe<sup>1</sup>, E. Urueye<sup>1</sup>, O. Idowu<sup>1</sup>, O. Azurunwa<sup>1</sup>, C. Imarhiagbe<sup>1</sup>, F. Ogirima<sup>1</sup>, P. <sup>1</sup>Centre for Integrated Health Programs, Abuja, Nigeria,

<sup>2</sup>Big Data Health Science Center, University of South Carolina, Columbia, United States, <sup>3</sup>University of Iowa, College of Public Health, Iowa, United States, <sup>4</sup>U.S. Centers for Disease Control and Prevention, Abuja, Nigeria

**Background:** Nigeria recently introduced verbal autopsy (VA)-based mortality surveillance (MS) to determine the cause of death (COD) among people living with HIV (PLWH). However, little is known about the simultaneous effect of health facility- and client-level factors on AIDS-related deaths (ARD).

This study aimed to identify facility- and client-level predictors of ARD among dead clients on ART.

**Methods:** A retrospective cross-sectional data analysis of 812 clients across 39 facilities in Gombe, Kaduna, Kogi, and Lagos States dying between 9<sup>th</sup>, April 2021 and 8<sup>th</sup>, June 2023, with COD from computer-certified VA. Facility-level variables included derived variables measuring facility-level performance averaged across 2020-2023 (e.g. HIV viral load (VL) coverage, VL suppression rate ( $\geq 95\%$ ), and rate of client's interruption in treatment (IIT) – missing clinical appointment for  $\geq 28$  days). Client-level variables included client's clinical and demographic profiles.

The study outcome was the proportion of ARD among all COD. We used multilevel Generalized Estimating Equations to estimate adjusted odd ratios (AOR), specifying exchangeable working correlation matrix and robust standard errors for clustering effect of clients nested within facilities.

**Results:** The median age was 43 years (IQR=34-53), with 430 (53%) female and 382 (47%) male. The median ART duration from initiation to death was 2.80 years (IQR=0.25-

9.32), while 26% of clients had at least one episode of IIT. Fifty-two percent (422) of clients died of ARD. Of 578 PLWH having VL results, 76% were virally suppressed (last VL). Twenty-eight (71%) of the facilities were secondary level-of-care while 25 (64%) had high VL coverage (> median of 88%).

Client-level predictors of ARD were age-group (AOR=0.49 [p=0.020] for 0-14 years, and AOR 1.51 [p=0.001] for 25-49 years compared to 50+) and ART duration (AOR=1.46 [p=0.048] for <3years compared to ≥8 years). Facility-level predictors were state of location (AOR=1.98, p=0.038 for Kaduna compared to Gombe), low facility VL coverage compared to high (AOR=1.67, p=0.003); and higher facility IIT level (third quintile) compared to lowest quintile (AOR=2.67, p<0.001).

**Conclusions:** Both facility- and client-level factors may be critical for ARD. Improving facility-level performance, especially IIT rates and VL coverage, and strengthening HIV care and treatment interventions may reduce HIV-preventable deaths among PLWH.

## WEPEC176

Seroprevalence of HIV, Hepatitis B, HIV/Hepatitis B co-infection and associated risk factors among the population aged 15-64 years: evidence from the 2018 Cameroon Population-based HIV Impact Assessment (CAMPHIA)

C. Kengne-Ndé<sup>1</sup>, J.d.D. Anoubissi<sup>1</sup>, G. Nguemkam<sup>2</sup>, R. Wounang<sup>3</sup>, S.-C. Billong<sup>1,4,5</sup>, M.-C. Okomo<sup>6</sup>, A.C. Zoung-Kanyi Bissek<sup>2</sup>, J.-B. Elat Nfetam<sup>1,5</sup>

<sup>1</sup>National Aids Control Committee, Research Planning Monitoring and Evaluation, Epidemiologic Surveillance, Yaoundé, Cameroon, <sup>2</sup>Ministry of Public Health, Direction of Operational Research, Yaounde, Cameroon, <sup>3</sup>National Institute of Statistics, Yaoundé, Cameroon, <sup>4</sup>University of Yaounde 1, Faculty of Medicine and Biomedical Sciences (FMBS), Yaounde, Cameroon, <sup>5</sup>National AIDS Control Committee, National HIV Drug Resistance Surveillance and Prevention Working Group, Yaounde, Cameroon, <sup>6</sup>National Laboratory of Public Health, Yaoundé, Cameroon

**Background:** The Hepatitis B virus (HBV) can cause acute and chronic liver infections, especially among people living with HIV. While a vaccine for HBV exists, there is no cure for those living with HIV. Our objective was to estimate the national HIV, HBV, and HIV/HBV co-infection prevalence among adults aged 15-64 years and explore associated risk factors.

**Methods:** We used data from CAMPHIA, a two-stage cluster sampling and cross-sectional household-based national survey, that was conducted between July 2017 and February 2018 to estimate national HIV and HBV prevalence and measure the uptake of HIV care and treatment services. Eligible participants were interviewed and tested for HIV using the national serial algorithm with refer-

ence laboratory confirmation of seropositive samples. A representative subsample was tested for chronic active HBV. We estimated HIV, HBV, and HIV/HBV co-infection prevalence, and associated factors were explored using a multinomial logistic regression.

**Results:** Of the 27,264 adults aged 15-64 years enrolled, the median age was 29 years [IQR: 21-40] and 50.9% were women. The estimation of HIV prevalence was 3.7% (95% CI: 3.3 – 4.0), HBV prevalence was 8.3% (95% CI: 6.5 – 10.2) and HIV/HBV co-infection prevalence was 0.3% (95% CI: 0.2-0.4).

Compared to no infection, Males were more likely to have Hepatitis B (aOR: 2.2 ; 95% CI : 1.3-3.7) and were less likely to have HIV Infection (aOR: 0.5 ; 95% CI : 0.4-0.6) and HIV/HBV co-infection (aOR: 0.6 ; 95% CI : 0.3-1.0).

Moreover, uncircumcised males were less likely to have HIV Infection (aOR: 0.4 ; 95% CI : 0.1-0.9). People who did not use condom at last sexual intercourse with their last non-marital, non-cohabitating partner in the past 12 months were 4 times more likely to be HIV/HBV Co-infected (aOR: 4.5; 95% CI : 1.1-19.1).

Compared to no infection, adults beyond 45 years were less likely to be HBV infected (aOR: 0.3 ; 95% CI : 0.1-0.8) than adolescents aged 15-24 years.

**Conclusions:** HIV/HBV co-infection prevalence is low while HBV prevalence is high. This result confirms the burden of HBV in Cameroon, and the need to reinforce prevention strategies including vaccine to fight HBV, specifically among adolescent.

## WEPEC177

Determinants of persistent low-level viremia among HIV recipients of care in three Nigerian States: a retrospective cohort study

T.N. Yakubu<sup>1</sup>, R. Oladigbolu<sup>1</sup>, G.B. Obasa<sup>1</sup>, F. Emerenini<sup>1</sup>, E.E. Okwor<sup>2</sup>, C. Immanuel<sup>1</sup>, B. Dare<sup>2</sup>, P. Anyanwu<sup>1</sup>, U. Omo-Emmanuel<sup>3</sup>, K. Olatunbosun<sup>3</sup>, A. Akinjeji<sup>1</sup>, E. Atuma<sup>2</sup>, R.N. Fayorsey<sup>4</sup>

<sup>1</sup>ICAP at Columbia University, Abuja, Nigeria, <sup>2</sup>JHPIEGO, Abuja, Nigeria, <sup>3</sup>United States Agency for International Development, Abuja, Nigeria, <sup>4</sup>ICAP at Columbia University, New York, United States

**Background:** HIV programming in Nigeria has made progress towards attaining the UNAIDS 95:95:95 goals with 91% viral load (VL) coverage and 96% viral suppression in 2023. However, the incidence of Persistent Low-Level Viremia (pLLV) defined as two or more consecutive VL measurements between 50 and 999 copies/mL, an early pointer to Virologic Failure (VF), may deter the progress towards epidemic control. Monitoring pLLV among HIV recipients of care (RoCs) has the potential of predicting adherence challenges, VF, and AIDS defining events.

This study aimed at deciphering the prevalence and predictors of pLLV among RoCs.

**Description:** We conducted a retrospective cohort study of RoCs who have been on antiretroviral therapy (ART) for at least 6 months, from October 2019 to March 2023 with at least 2 documented VL tests done across 101 health facilities in Akwa Ibom, Cross River, and Taraba States, in Nigeria. Kaplan-Meier plot was used to assess the probability of occurrence of pLLV by sex, age, WHO Clinical staging, CD4 count, ART status, functional status, ART regimen, weight, and marital status. Cox Proportional Hazard regression was used to ascertain the determinants of pLLV at an alpha level of <0.05 at a 95% confidence interval.

**Lessons learned:** There were 43,750 RoCs (male 34.3%, female 65.7%) with at least two consecutive documented VL with a mean age  $38 \pm 12$  years, CD4 Count  $429 \pm 296$  cells/mm<sup>3</sup>, and  $5.1 \pm 4$  years of pLLV. Prevalence of pLLV was 20.2%. The Kaplan-Meier plots for time-to-pLLV showed that RoCs aged 35-49 years, being on TDF-3TC-DTG, active on ART, CD4 $\geq$ 200 cells/mm<sup>2</sup>, single, married, female sex, and WHO Stage I were less likely to have pLLV ( $p < 0.001$ ). Long rank test revealed significant association of pLLV with marital status ( $p = 0.014$ ), ART regimen ( $p < 0.001$ ), CD4 count ( $p = 0.015$ ), and current ART status ( $p < 0.001$ ). CD4 count  $< 200$  cells/mm<sup>3</sup> (HR=1.3,  $p < 0.001$ ) and reduced body weight (HR=1.1,  $p = 0.029$ ) were predictors of pLLV.

**Conclusions/Next steps:** Our data showed that CD4 count  $< 200$  cells/mm<sup>3</sup> and reduced body weight were predictors of pLLV. Program implementations need to focus on active surveillance for pLLV to optimize quality of care for RoCs to ensure they achieve undetectable VL.

## WEPEC178

HIV risk behaviors and HIV prevalence among people who inject drugs in Georgia – results from simplified bio-behavioral survey methodology, the BBS-Lite

M. Gogia<sup>1</sup>, K. Stvilia<sup>2</sup>, E. Ruadze<sup>3</sup>, I. Khonelidze<sup>4</sup>, B. Methers<sup>5</sup>, A. Verster<sup>6</sup>, K. Sabin<sup>7</sup>

<sup>1</sup>Georgian Harm Reduction Network, HIV Prevention, Tbilisi, Georgia, <sup>2</sup>National Center for Disease Control and Prevention of Georgia, HIV, Tbilisi, Georgia, <sup>3</sup>National Center for Disease Control and Prevention of Georgia, HIV Program Monitoring, Tbilisi, Georgia, <sup>4</sup>National Center for Disease Control and Prevention of Georgia, Tbilisi, Georgia, <sup>5</sup>World Health Organization Department of Global HIV, Hepatitis and STI Programmes and Kirby Institute, University of New South Wales Sydney, Geneva, Switzerland, <sup>6</sup>World Health Organization, Department of Global HIV, Hepatitis and STI Programmes, Geneva, Switzerland, <sup>7</sup>Joint United Nations Programme on HIV/AIDS, Geneva, Switzerland

**Background:** Injecting drug use was considered to be a leading route of HIV transmission in the early stages of the HIV epidemic in Georgia. Simplified BBS-Lite methodology with different approaches to surveillance was developed

in 2021 to assess risky behaviors and HIV/HCV testing uptake among PWIDs and Generate evidence for advocacy, policy-making, and programming. Later in 2023 another round of BBS-Lite was conducted.

**Methods:** 2000 PWIDs were recruited through combined methodology of on-site consecutive recruitment at Needle and Syringes Program (NSP) sites and mobile outreach, and snowball sampling. The study was conducted in seven major cities. A brief online questionnaire was administered through face-to-face interviews with participants. Blood samples were taken to measure HIV/HCV prevalence.

**Results:** 51.3% of study participants never used the NSP services. Among new clients, 19% were recruited through outreach, 60% through the "snowball" method, and 21% through HR service sites. The most common drugs injected the last time was heroin (56%). During the last injection, sharing drug preparation other equipment was mentioned by 34% of respondents, but 96% percent reported using sterile needles. 19% reported injecting practice while abroad in the last 12 months, including countries with no harm reduction programs Turkey (29%), Russia (6%). Usage of condoms during the last sexual intercourse was reported by 33% of respondents. 81% had HIV testing experience. Drug injection and sex behavior among PWID were nearly similar in 2021 and 2023 BBS-Lite surveys.

	2021 BBS-Lite			2023 BBS-Lite		
	Total	Client	Non-client	Total	Client	Non-client
Total sample	2000	1342 (67.1%)	658 (32.9%)	2000	975 (48.8%)	1025 (51.3%)
Median age	43 [35 – 50]	44 [36 – 51]	39 [32 – 48]	42 [34 – 49]	44 [38 – 51]	38 [32 – 46]
Aged $\leq 24$	59 (3.0%)	19 (1.4%)	40 (6.1%)	80 (4.0%)	20 (2.1%)	60 (5.9%)
Female	52 (2.6%)	35 (2.6%)	17 (2.6%)	53 (2.6%)	45 (4.6%)	8 (0.7%)
Inject daily	820 (41.0%)	589 (43.9%)	231 (35.1%)	633 (31.7%)	344 (35.2%)	289 (28.2%)
Overdose in last 12 months	136 (6.8%)	103 (7.7%)	33 (5.0%)	168 (8.4%)	90 (9.2%)	78 (7.6%)
Shared equipment last injection	60 (3.0%)	27 (2.0%)	33 (5.0%)	52 (2.6%)	15 (1.5%)	37 (3.6%)
Received treatment for drug dependence in last 12 months	773 (38.7%)	559 (41.7%)	214 (32.5%)	644 (32.2%)	412 (42.3%)	232 (22.6%)
Received OAMT in last 12 months	501 (16.9%)	379 (28.2%)	122 (18.5%)	395 (19.7%)	263 (26.9%)	132 (12.9%)

Table 1. Selected characteristics of samples recruited

**Conclusions:** BBS-Lite study provided a good alternative for reaching out new clients and assess the drug injecting practices in PWIDs not currently utilizing harm reduction services. Risky sex behavior among PWID remains challenging and requires attention of harm reduction program to develop targeted peer driven interventions to address it.

Ten-year trends in risk behaviors, preventive practices, and services uptake among men who have sex with men, Vietnam, 2012-2022

P.D. Manh<sup>1</sup>, D.C. Thanh<sup>2</sup>, B.H. Duc<sup>1</sup>, D.T. Lo<sup>1</sup>, H.T.T. Ha<sup>3</sup>, N.T.T. Ha<sup>3</sup>, K.V. Nghia<sup>4</sup>, N.D. Phuc<sup>4</sup>, N.C. Quoc<sup>2</sup>, N.H. Minh<sup>2</sup>, A. Mirzazadeh<sup>5</sup>, W. McFarland<sup>5</sup>, P.T.T. Huong<sup>1</sup>

<sup>1</sup>Vietnam Administration of HIV/AIDS Control, Ministry of Health, Ha Noi, Viet Nam, <sup>2</sup>US. CDC Vietnam, Division of HIV and TB, Ha Noi, Viet Nam, <sup>3</sup>National Institute of Hygiene and Epidemiology, Ha Noi, Viet Nam, <sup>4</sup>Pasteur Institute of Ho Chi Minh City, Ho Chi Minh City, Viet Nam, <sup>5</sup>Institute for Global Health Sciences, University of California San Francisco, Epidemiology and Biostatistics, San Francisco, United States

**Background:** Rising HIV incidence and prevalence among men who have sex with men (MSM) in Vietnam in recent years is concerning

This study describes the magnitude and trends in HIV-related risk behaviors, preventive practices, and services uptake among MSM in the last decade to identify strategies for prevention interventions.

**Methods:** Using venue-based sampling, repeated cross-sectional surveys were conducted in 11 provinces between 2012-2022 among MSM age  $\geq 16$  years who had anal sex with other men in the previous 12 months. Participants completed a questionnaire to obtain data on sexual and drug use risk behaviors, preventive practices, and services uptake. P-values were calculated for analysis of trends between 2012-2022. National level analysis was adjusted for the clustering effect.

**Results:** Cumulatively, 13,518 MSM participated in the surveys between 2012-2022. For risk behaviors, the percentage of MSM who ever had sex involving more than two people at a time varied from 9.9% in 2014 to 8.3% in 2022. Ever using illicit drugs increased from 15.3% in 2012 to 47.7% in 2022 ( $p < 0.05$ ).

For preventive practices, using condoms at last anal sex increased from 52.7% to 62.4% ( $p < 0.05$ ) and receiving free condoms decreased from 71.0% to 64.3% ( $p < 0.001$ ).

For services uptake, testing for sexually-transmitted infections in the previous 3 months increased from 25.5% in 2012 to 32.0% in 2022 ( $p < 0.001$ ); HIV testing in the previous 6 months increased from 27.9% in 2012 to 45.0% in 2022 ( $p < 0.001$ ).

Among MSM living with HIV, status awareness increased from 5.0% in 2013 to 45.1% in 2020 ( $p < 0.001$ ) and those on anti-retroviral therapy increased from 0% to 96.9% ( $p < 0.001$ ). Measured only in 2022, the percentage of MSM who have ever taken daily pre-exposure prophylaxis (PrEP) was 23.3%.

**Conclusions:** Low HIV status awareness and PrEP uptake, coupled with continuing risk behaviors, may be driving the rising HIV epidemic among MSM in Vietnam. High and increasing prevalence of drug use is of particular concern.

Rapid benefits towards slowing the spread of HIV among MSM in Vietnam may be achieved by diversifying HIV testing modalities and implementing low-barrier PrEP programs.

## WEPEC180

Estimations of antiretroviral therapy coverage and mortality rates among people living with HIV using electronic medical record data from 2007-2023 in Tanzania

R. Ghosh<sup>1</sup>, J.L. Kadota<sup>1</sup>, L.J. Packel<sup>1</sup>, S. Kwilasa<sup>2</sup>, W. Maokola<sup>2</sup>, P.F. Njau<sup>2</sup>, S. Shabani<sup>2</sup>, A. Sabasaba<sup>3</sup>, S.I. McCoy<sup>1</sup>

<sup>1</sup>University of California Berkeley, School of Public Health, Berkeley, United States, <sup>2</sup>Ministry of Health, Dodoma, Tanzania, the United Republic of, <sup>3</sup>Institute of Public Health, Kilimanjaro Christian Medical University College, Moshi, Tanzania, the United Republic of

**Background:** Antiretroviral therapy (ART) coverage in Tanzania increased from under 20% in 2007 to over 80% in 2022-2023. Analysis of routine electronic medical record (EMR) data provided the opportunity to examine the long-term relationship between adherence to ART and mortality among people living with HIV (PLHIV) in two regions (Geita and Kagera) of Tanzania, between 2007 and 2023.

**Methods:** The study used Ministry of Health HIV care and treatment data. Datasets documented each facility visit and recorded patient demographics, disease stage, vital status, ART regimen, dispensing dates, visit dates, and facility type. Follow-up started with an individual's first visit and ended either at the last visit, death, or February 28, 2023, whichever was latest.

Adherence was defined as uninterrupted dispensing of ART; an ART interruption event was a period of over 4-weeks without medications. We used a retrospective longitudinal design and an adjusted discrete time survival model.

Figure 1. Mortality rates per 10,000 person-months among people living with HIV (PLHIV) between 2007 and 2023 in Geita and Kagera regions of Tanzania.

**Results:** There were 10.2 million person-facility visits from 334,151 individuals and 27,950 deaths. Mortality rates per 10,000 person-months declined sharply from 44 in 2007

to 8 in 2009 ( $P_{\text{trend}} < 0.001$ ), followed by a gradual decrease thereafter (Figure 1). The median durations of follow-up and adherence to ART were 45 months [Interquartile range (IQR): 20-77] and 18 months (IQR: 5-44), respectively. The adjusted hazard ratio for mortality was 0.971 (95% CI: 0.966-0.975) for each month retained on ART, and 1.065 (95% CI: 1.044-1.086) for each ART interruption event, with no difference by sex.

**Conclusions:** Findings from one of the largest studies of EMR data from Tanzania reveal a dramatic decline in mortality among PLHIV who accessed care over the last 16 years. Despite limitations inherent in routine EMR data and in our definition of adherence, the increased risk of mortality associated with treatment interruptions reinforces the need for continuous, lifelong retention on ART to increase survival.

## WEPEC181

### Mapping HIV clustering among pregnant women in Senegal

C.T. Koulibaly<sup>1</sup>, S. Thiam<sup>2</sup>, C.B. Dieye<sup>1</sup>, A. Sagna<sup>1</sup>, D. Niang<sup>1</sup>, C.T. Ndour<sup>3</sup>

<sup>1</sup>National AIDS Fighting Council of Senegal, Monitoring and Evaluation, Dakar, Senegal, <sup>2</sup>National AIDS Fighting Council of Senegal, Dakar, Senegal, <sup>3</sup>Ministry of Health, AIDS Fighting Division of Senegal, Dakar, Senegal

**Background:** New HIV infections during pre-conception and pregnancy are significant contributors of mother-to-child transmission in Sub-Saharan Africa. In Senegal, the number of pregnant women newly diagnosed HIV positive was estimated at 762/year from 2019-2022 with strong spatial and temporal variation across the country. Looking at the spatiotemporal perspectives can provide valuable information with the outstanding visualization benefits that maps provide.

This study examines the spatiotemporal trends of newly diagnosed HIV positive among pregnant women from 2019-2022.

**Methods:** The research is based on the PMTCT routine data collected from antenatal clinics from 2019 to 2022 at districts level. ArcGIS 10.1 version was used to explore the spatial distribution of newly pregnant women diagnosed HIV positive and identifying significant hotspot areas through the Index distance weighting and trend tools. The cluster and outlier analysis was performed using the Anselin Local I index to evaluate global and local spatial.

**Results:** Analysis revealed wide spatial and temporal variation in the concentration of pregnant women newly diagnosed HIV positives at regional and district level. From 2019-2020, 10 clusters of high concentration have been identified from Dakar (Z score =2.3,  $P < 0.01$ ) to the localities of Kaolack (Z score =3,  $P < 0.02$ ), Mbour (Z score =1.96,  $P < 0.04$ ) and southern regions as Kolda (Z score =6,  $P < 0.001$ ),

Ziguinchor (Z score =3,  $P < 0.02$ ). From 2021-2022, high clusters were located in Kolda (Z score =7.18,  $P = 0$ ), Sedhiou (Z score =2.13,  $P < 0.03$ ), Dakar (Z score =2.8,  $P < 0.003$ ), Tambacounda (Z score =1.9,  $P < 0.04$ ), Diourbel (Z score =3,  $P < 0.002$ ). The trend analysis confirmed very high concentrations in the southern regions, moderate concentrations from Dakar to the central regions and low concentrations in the Northern regions of Senegal.

**Conclusions:** The study proved strong geographic clustering of newly infected pregnant women in such regions as Kolda and Ziguinchor and moderately Dakar, Kaolack and Sedhiou. However, new hotspots have been recently identified in such areas as Tambacounda, Thies and Diourbel.

Therefore, public health interventions specially targeting these new hotspots are needed to improve awareness and reduce the incidence of HIV/AIDS among pregnant women.

## WEPEC182

### Assessing behavioural HIV risk among men who have sex with men (MSM) across 15 countries in Asia: results from the PrEP APPEAL Study

B. Bavinton<sup>1</sup>, J. Ong<sup>2,3,4</sup>, N. Phanuphak<sup>5</sup>, D. Fraser<sup>1</sup>, W. Tieosapjaroen<sup>2,3</sup>, H.-M. Schmidt<sup>6,7</sup>, C. Chan<sup>1</sup>, PrEP APPEAL Study Group

<sup>1</sup>University of New South Wales, Kirby Institute, Sydney, Australia, <sup>2</sup>Alfred Health, Melbourne Sexual Health Centre, Melbourne, Australia, <sup>3</sup>Monash University, Central Clinical School, Melbourne, Australia, <sup>4</sup>London School of Hygiene and Tropical Medicine, Faculty of Infectious and Tropical Diseases, London, United Kingdom, <sup>5</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>6</sup>UNAIDS, Geneva, Switzerland, <sup>7</sup>World Health Organization, Global HIV, Hepatitis and STIs Programme, Geneva, Switzerland

**Background:** Asia has some of the fastest growing epidemics among men who have sex with men (MSM) globally. Measuring behaviours associated with HIV risk is critical to determine areas for improvement and monitoring.

**Methods:** We used data from an online cross-sectional survey conducted in 15 Asian countries among MSM from May-November 2022. Among those who were sexually active, we assessed behavioural HIV risk from questions on sexual behaviour, condom use, and PrEP use in the last 6 months. Risk categories were:

1. No anal/vaginal intercourse,
  2. Consistent condom use,
  3. Condomless intercourse with casual partners (CLIC) with PrEP, and
  4. CLIC without PrEP (considered at highest-risk for HIV).
- Factors associated with CLIC without PrEP were identified with multivariable logistic regression.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

**Results:** Among 13,437 MSM, within the last 6 months, 1,520 (11.3%) had no anal/vaginal sex, 4,016 (29.9%) consistently used condoms, 1,984 (14.8%) had CLIC with PrEP, and 5,917 (44.0%) had CLIC without PrEP. This varied significantly by country (Figure).

Compared to those not at highest-risk, participants reporting CLIC without PrEP were more likely to: live in a high-income country (28.4% vs 33.9%, aOR=1.40, 95%CI=1.29-1.51), have been paid for sex (10.3% vs 12.8%, aOR=1.37, 95%CI=1.21-1.54), or have engaged in chemsex (18.3% vs 21.2%, aOR=1.23, 95%CI=1.12-1.35). They were less likely to: be older (31.4 vs 30.9, aOR=0.99, 95%CI=0.99-0.99), be in a relationship (44.5% vs 41.9%, aOR=0.93, 95%CI=0.86-1.00), or have engaged in injecting drug use (7.4% vs 6.1%, aOR=0.71, 95%CI=0.61-0.83). They were more likely to prefer event-driven PrEP (23.9% vs 26.0%, aOR=1.29, 95%CI=1.15-1.44) or a monthly oral pill (23.9% vs 26.1%, aOR=1.32, 95%CI=1.18-1.48) compared to daily PrEP.

**Conclusions:** Significant proportions of MSM throughout Asia reported sexual behaviour with a risk of HIV transmission. Greater PrEP access, including to new PrEP modalities, and supporting condom use, should remain priorities in this region.

## WEPEC183

### Non-injection drug use among the incarcerated people in Iran: findings from three consecutive national bio-behavioral surveys

H. Sharifi<sup>1,2</sup>, M. Rafiee<sup>1</sup>, M. Karamouzian<sup>1,3,4</sup>, M. Sharifi<sup>1</sup>, A. Mirzazadeh<sup>5,1</sup>, M. Khezri<sup>1,6</sup>, A.A. Haghdoust<sup>1</sup>, S. Mehmandoust<sup>1</sup>

<sup>1</sup>HIV/STI Surveillance Research Center, and WHO Collaborating Center for HIV Surveillance, Institute for Futures Studies in Health, Kerman University of Medical Sciences, Kerman, Iran, Islamic Republic of, <sup>2</sup>Institute for Global Health Sciences, University of California, San Francisco, San Francisco, United States, <sup>3</sup>Centre on Drug Policy Evaluation, MAP Centre for Urban Health Solutions, St. Michael's Hospital, Toronto, Canada, <sup>4</sup>Dalla Lana School of Public Health, University of Toronto, Toronto, Canada, <sup>5</sup>Department of Epidemiology and Biostatistics, University of California, San Francisco, United States, <sup>6</sup>Department of Epidemiology, New York University School of Global Public Health, New York, United States

**Background:** Non-injection drug use inside prison is a significant concern due to its potential progression to injection drug use and other high-risk behaviors inside and outside prison.

This study seeks to address this gap by investigating the prevalence, trends, and associated factors of non-injection drug use among incarcerated people in Iran.

**Methods:** We utilized data from three national bio-behavioral surveillance surveys conducted among incarcerated people in Iran in 2009, 2013, and 2017. Overall, 17,228 participants across all surveys were recruited by multi-stage random sampling.

Each participant underwent a face-to-face interview and HIV test. The primary objective of the study was to assess self-reported non-injection drug use within the prison environment within the last month.

A multivariable logistic regression model was used to determine associated covariates with drug use inside prison and an adjusted odds ratio (aOR) with a 95% confidence interval (CI) was reported.

**Results:** The prevalence of non-injection drug use inside the prison was 24.1% (95% CI: 23.5, 24.7) with a significant decreasing trend (39.7% in 2009, 17.8% in 2013, 14.0% in 2017; P-value<0.001).

Overall, 44.0% of those who used drugs were also receiving opioid agonist therapy (OAT) and we noted that in 2017, 75.4% of them used stimulants. The results of the multivariable logistic regression model indicated that the year of interview [2013: aOR=1.63; 95% CI:1.41, 1.87 and 2009: aOR=7.24; 95% CI:6.26, 8.39], younger age [19-29: aOR=1.33; 95% CI:1.17, 1.50 and 30-40: aOR=1.37; 95% CI:1.22, 1.55], male sex [aOR=2.82; 95% CI:2.08, 3.83], less than high school education [aOR=1.23; 95% CI:1.11, 1.36], having a history of previous incarceration [aOR=1.18; 95% CI:1.08, 1.29], having a history of lifetime HIV testing [aOR=1.43; 95% CI

1.30, 1.59], and insufficient HIV knowledge [ $aOR=1.21$ ; 95% CI: 1.03, 1.42] were associated with recent non-injection drug use inside the prison.

**Conclusions:** Approximately one in four incarcerated people have reported drug use within the last month inside the prison in Iran. Although a decreasing trend was observed, significant gaps in harm reduction programs within prisons in Iran persist.

There is a need for improvement in drug use treatment programs, with a particular emphasis on incorporating initiatives tailored for stimulant users.

## WEPEC184

### High HIV incidence in an urban Ugandan population based cohort for persons aged 13 and above years

United States, <sup>6</sup>Africa Medical & Behavioral Sciences Organization, Kampala, Uganda, <sup>7</sup>Africa Medical & Behavioral Sciences Organization, Programs, Kampala,

Uganda, <sup>8</sup>Makerere University, School of Public Health, Kampala, Uganda, <sup>9</sup>Africa Medical & Behavioral Sciences Organization, Statistics, Kampala, Uganda, <sup>10</sup>Makerere University, School of Public Health, Epidemiology & Biostatistics, Kampala, Uganda, <sup>11</sup>Uro Care Hospital,

Kampala, Uganda, <sup>12</sup>Karolinska Institutet, Stockholm, Sweden

**Background:** Uganda like many other countries with high incidence rates for HIV, has implemented several prevention interventions to achieve the UNAIDS 95-95-95 targets with the goal of ending the epidemic by 2030. However, today limited data are available on HIV incidence in urban settings at population level.

We sought to determine the effect of HIV prevention efforts on incidence using data from Uganda's first predominantly urban population-based cohort in Mid-Western & Central Uganda.

**Methods:** Data were collected from six urban communities in four complete surveys (2018-2023) by the Africa Medical & Behavioral Sciences Organization (AMBSO) population health surveillance (APHS) cohort. APHS is an open, population-based cohort of persons 13+ years.

We assessed trends in the incidence of HIV on the basis of observed sero-conversion data using Poisson regression.

**Results:** A total of 4,192 persons who were initially HIV-negative contributed 7,267 person years (PY) of follow up. The mean age (SD) was 31.4 (14) years and majority were females (56.8 %). By 2023, ART increased from 65.0% (219/337) in 2018/2019 to 73.4 % (174/ 237) in 2022/2023 ( $P<0.001$ ). HIV testing service coverage among negative persons decreased from 81.1% (3,397/ 4,191) in 2018/2019 to 75.1% (930/1,238) in 2022/2023 ( $P<0.001$ ). Male circumcision coverage increased from 54.3% to 60.6% by 2023 ( $P<0.001$ ).

A total of 95 sero-conversions were observed. HIV incidence increased from 1.03 cases per 100 PY (CI: 0.73-1.47) in 2018-2019 to 1.57 per 100 PY (95%CI: 1.11-2.22) in 2019-2020, and later to 1.44 per 100 PY (95%CI: 1.01-2.04) in 2022/2023; greater case declines were between 2021/2022 to 2022/23 among women (2.45 cases per 100 PY; 95%CI: 1.68-3.57 to 1.69 cases per 100 PY; 95%CI: 1.08-2.65) than among men (0.54 cases per 100 PY; 95%CI: 0.22-1.30 to 1.17 cases per 100 PY, 95%CI: 0.66-2.06).

**Conclusions:** The findings suggest a concerning rise in HIV incidence compared to what was seen in rural Rakai, Uganda (2019-2020) before combination HIV prevention. The observed gender differences highlight the importance of targeted interventions.

Therefore, an urgent need to continue monitoring and adapting public health measures to curb the spread of HIV in urban Uganda settings.

### Temporal trends in rapid initiation of antiretroviral therapy and associated factors among people with newly-acquired HIV: 2015-2023

B. Alejos<sup>1</sup>, K. Porter<sup>2</sup>, I. Suarez Garcia<sup>3,4,5</sup>, N. Pantazis<sup>6</sup>, S. Grabar<sup>7</sup>, M. van der Valk<sup>8</sup>, L. Meyer<sup>9</sup>, C. Carlander<sup>10</sup>, G. Touloumi<sup>6</sup>, J. Gill<sup>11</sup>, B. Spire<sup>12</sup>, A. Volnyanne<sup>13</sup>, I. Jarrin<sup>14,4</sup>, CASCADE Collaboration

<sup>1</sup>Independent Researcher, Madrid, Spain, <sup>2</sup>Institute for Global Health, University College London, London, United Kingdom, <sup>3</sup>Hospital Universitario Infanta Sofia, FIIB HUIS HHEN, Infectious Diseases Group, Department of Internal Medicine, Madrid, Spain, <sup>4</sup>CIBER de Enfermedades Infecciosas (CIBERINFEC), Madrid, Spain, <sup>5</sup>Universidad Europea, Department of Medicine, Madrid, Spain, <sup>6</sup>National and Kapodistrian University of Athens, Department of Hygiene, Epidemiology and Medical Statistics, Medical School, Athens, Greece, <sup>7</sup>Institut Pierre Louis d'Epidémiologie et de Santé Publique, Sorbonne Université, AP-HP, Hôpital St Antoine, Paris, France, <sup>8</sup>HIV Monitoring Foundation, Amsterdam, Netherlands, the, <sup>9</sup>INSERM CESP U 1018, APHP Hôpital de Bicêtre, Le Kremlin-Bicêtre, Paris-Saclay University, Gif-sur-Yvette, France, <sup>10</sup>Karolinska University Hospital, Department of Infectious Diseases, Stockholm, Sweden, <sup>11</sup>Southern Alberta HIV Clinic, Calgary, Canada, <sup>12</sup>Aix Marseille Univ., Inserm, IRD, SESSTIM, ISSPAM, Marseille, France, <sup>13</sup>Paris, Île-de-France, France, <sup>14</sup>Instituto de Salud Carlos III, Madrid, Spain

**Background:** Early ART initiation is crucial for reducing risk of clinical events, increasing life expectancy and quality of life, and reducing risk of onward HIV transmission.

**Methods:** We used data from the CASCADE Collaboration of individuals with well-estimated dates of HIV seroconversion diagnosed September-2015 (START trial publication) to May-2023. We examined temporal trends in the proportion rapidly initiating ART (defined as within 14 days of HIV diagnosis). We used multivariable logistic regression to identify associated factors.

**Results:** Of 5,058 individuals, 5,058 started ART, 88.7% were male and median age at HIV diagnosis was 33.1 years (IQR: 26.7; 42.8). Median CD4 and HIV RNA at HIV diagnosis were 480 cells/ $\mu$ L (IQR: 346;644) and 90,780 copies/mL (18,219;509,249), respectively.

Overall, the median time from HIV diagnosis to ART initiation was 19 days (8; 39) and the proportion of rapid initiators was 40.8% (n=2063), increasing from 34.8% (95% CI:27.7%-42.9%) in 2015 to 55.4% in 2022 (47.9%-62.8%) (P-trend<0.001) (Figure A). Median CD4 count at ART initiation was >400 cells/ $\mu$ L throughout. Among rapid initiators, the median time to initiation was 7 (3; 10) days and remained unchanged over time.

Rapid ART initiation was less likely for those with CD4  $\geq$ 500 cells/ $\mu$ L at HIV diagnosis (aOR, 95% CI: 0.64, 0.43-0.93), for those aged >50 years (0.89, 0.81-0.98), for those originating from Sub-Saharan African countries (0.84, 0.75-0.93) and

Latin-America/Caribbean countries (0.67, 0.59-0.76) and for people who inject drugs (0.52, 0.32-0.84). Rapid initiation was more likely for HIV-RNA >100,000 copies/mL (1.67, 1.37-2.04) (Figure B). Results for rapid initiation defined as within 7 days were qualitatively unchanged.

**Conclusions:** A significant increase in rapid ART initiation was observed from 2015 to 2023. Addressing barriers to rapid initiation remains crucial, however, for optimizing HIV care and reducing transmission risk.

## WEPEC186

### Leveraging HIV case surveillance data to create an epidemiologic profile of people living with HIV in Botswana, 2022

C.A. Buyu<sup>1,2</sup>, J. Nawa<sup>3</sup>, L.A. Okui<sup>4</sup>, P. Mubiri<sup>4</sup>, O. Ntwayagae<sup>5</sup>, O. Phuthego<sup>5</sup>, T. Lasko<sup>1,2</sup>, K. Sebina<sup>5</sup>, T. Chebani<sup>3</sup>, P. Tema<sup>3</sup>, B. Kaisara<sup>3</sup>, P. Mogomotsi<sup>3</sup>, B. Nkomo<sup>3</sup>, K. Bagapi<sup>6</sup>, P. Lekone<sup>6</sup>, T.H. Dinh<sup>7</sup>, N. Ndwapi<sup>5</sup>, K.A. Stafford<sup>1,2,8</sup>

<sup>1</sup>Institute of Human Virology, University of Maryland School of Medicine, Baltimore, United States, <sup>2</sup>Center for International Health, Education and Biosecurity, University of Maryland School of Medicine, Baltimore, United States, <sup>3</sup>Ministry of Health, Gaborone, Botswana, <sup>4</sup>Center for International Health, Education and Biosecurity, MGIC - an affiliate of the University of Maryland, Gaborone, Botswana, <sup>5</sup>Botswana University of Maryland School of Medicine Health Initiative (Bumhhi), Gaborone, Botswana, <sup>6</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Gaborone, Botswana, <sup>7</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States, <sup>8</sup>Division of Global Health Sciences, Department of Epidemiology and Public Health, University of Maryland School of Medicine, Baltimore, United States

**Background:** HIV case surveillance (CS) is recommended for monitoring the epidemic, providing information on individuals from diagnosis to death. In 2021, the CS system in Botswana was established using the National Data Warehouse (NDW), which receives patient level data from 85% of government facilities, including laboratory data, and the national births and death registry system. We describe the HIV epidemiological profile of individuals reported in the CS system.

Late-breaker  
abstracts

Author  
Index

**Methods:** We created a CS analytical data set by extracting records with an HIV-positive diagnosis in the NDW from the year 2000 to 2022. Demographic, treatment, and mortality data were included. Records were deduplicated and linked longitudinally using demographic information and a national unique identifier. Data were analyzed using STATA software.

**Results:** A total of 343,827 HIV-positive individuals were identified: including 34,723 deceased and 309,104 living. Among individuals on treatment eligible for a viral load (VL) test ( $n=255,572$ ), 95% ( $n=241,723$ ) had a documented VL; 98% ( $n=235,745$ ) were virally suppressed (VLS) at  $< 400$  copies/mL.

Those living included 5,882 newly diagnosed in 2022; of whom 57% were women. Adults aged 35-39 years represented the highest proportion of new diagnoses by age group (17%) and 5-14 years the lowest ( $<1\%$ ).

The highest proportion of new diagnoses by sex and age were 22.4% ( $n=566$ ) among men 35-39 years, and 19.4% ( $n=650$ ) among women 25 - 29 years. Among individuals newly diagnosed, 26% ( $n=1,537$ ) had a documented baseline CD4 count. Of these, 27% ( $n=415$ ) presented with a CD4 count of  $\leq 200$  cells/ $\mu$ L.

Of new diagnoses, 83% ( $n=4,875$ ) had documented treatment initiation; 56% ( $n=2,723$ ) had same day treatment initiation. A tuberculosis diagnosis was made for 3% ( $n=167$ ) of new diagnoses; of whom 66% ( $n=110$ ) were men.

**Conclusions:** More than half of individuals with a new diagnosis were women, majority 20 -34 years, and one-in-four had a baseline CD4 count. Provision of VL test and VLS suppression was high among all individuals, but same day treatment initiation could be improved among those newly diagnosed.

Using unique identifiers, CS data can be used to develop epidemiologic profiles and provide timely information to improve treatment and prevention programs.

Persistent high estimates of recent HIV acquisition and incidence among men who have sex with men and transgender women: a trend analysis in a major Brazilian HIV service

S.L.M. Teixeira<sup>1</sup>, C.M. Jalil<sup>2</sup>, C. Coutinho<sup>2</sup>, E. Jalil<sup>2</sup>, L. Monteiro<sup>2</sup>, E. Carnevali<sup>2</sup>, D. Bezerra<sup>2</sup>, M.S. Silva<sup>2</sup>, B. Hoagland<sup>2</sup>, J. Freitas<sup>2</sup>, S.W. Cardoso<sup>2</sup>, T. Santos<sup>2</sup>, P.M. Luz<sup>2</sup>, T.S. Torres<sup>2</sup>, B. Grinsztejn<sup>2</sup>, V. Veloso<sup>2</sup>

<sup>1</sup>Instituto Oswaldo Cruz, Laboratorio de AIDS & Imunologia Molecular, Rio de Janeiro, Brazil, <sup>2</sup>Instituto Nacional de Infectologia Evandro Chagas, Rio de Janeiro, Brazil

**Background:** In Brazil, men who have sex with men (MSM) and transgender women (TGW) constitute the groups most disproportionately affected by HIV. Accurate HIV incidence estimation is crucial for monitoring the HIV epidemic dynamics.

This study aims to evaluate the temporal trends of HIV estimated incidences using recency testing among MSM/ TGW in Rio de Janeiro, Brazil.

**Methods:** We included MSM/TGW aged 18+ who sought HIV testing at a prominent HIV referral service in Rio de Janeiro, Brazil between March 2018 and December 2022. The Maxim HIV-1 Limiting Antigen Avidity EIA (LAG) was utilized to identify recent HIV acquisition in plasma samples as part of the recency algorithm.

Annualized HIV incidences per year were compared using the UNAIDS/WHO incidence estimator tool and the incidence difference calculator, excluding individuals with a prior HIV diagnosis or prior/current antiretroviral use.

**Results:** Out of 6284 individuals, 5029 (80.0%) identified as MSM and 1255 (20.0%) as TGW. The median age was 27 years (IQR:11). Among 752 individuals living with HIV (prevalence: 12%), 657 (87.4%) had available plasma samples for LAG testing, of which 158 (24%) had recently acquired HIV. The overall estimated HIV incidence was 5.76%/year (95%CI:4.32-7.20).

Estimates ranged from 4.52%/year (95%CI:2.86-6.19) in 2022 to 8.67%/year (95%CI:4.68-12.66) in 2020, representing the year with the highest HIV incidence. Incidence comparisons significantly differed by year when compared to 2018 (2019, 2020, 2021, p-value:0.01) and to 2020 (2022, p-value:0.03).

HIV estimated incidences among MSM and TGW  
Rio de Janeiro, Brazil, 2018-2022

MSM: men who have sex with men; TGW: transgender women. Bars represent lower and upper limits of 95% confidence intervals.

**Conclusions:** Despite the presence of public health prevention strategies in Brazil, HIV incidences among MSM/ TGW remain at unacceptably high levels. Although the 2020 HIV incidence might be overestimated due to Covid-19 restrictions impacting sample availability, the HIV incidence remained elevated post-pandemic. A successful agenda for the HIV response should focus on MSM/ TGW in the most vulnerable settings.

## WEPEC188

The recent plateauing HIV diagnoses in gay and bisexual men in England masks variation by ethnic group

A. Brown<sup>1</sup>, K. Okumu-Camerra<sup>1</sup>, N. Mackay<sup>1</sup>, A. Shah<sup>1</sup>,  
C. Chau<sup>1</sup>, S. Mandal<sup>1</sup>

<sup>1</sup>Uk Health Security Agency, London, United Kingdom

**Background:** New HIV diagnoses first made in England in gay, bisexual and other men who have sex with men (GBMSM) halved from 1403 in 2015 to 738 in 2020. This was attributed to high levels of HIV testing in sexual health services (SHS), PrEP availability and ART coverage. Since 2020, HIV diagnoses plateaued despite the sustained numbers of tests during the COVID-19 pandemic. We describe differences in new HIV diagnosis trends, testing and late diagnoses between white and ethnic minority GBMSM between 2020-2022.

**Methods:** New HIV diagnoses (excluding men diagnosed abroad) were taken from the nationally comprehensive HIV and AIDS reporting system (HARS). HIV testing data were taken from GUMCAD, also nationally comprehensive. Late HIV diagnoses were defined as a CD4 count <350 within 91 days of diagnosis, excluding men with recent infection.

**Results:** There were 738 HIV diagnoses in GBMSM in 2020, 784 in 2021 and 724 in 2022. In white men, diagnoses fell from 497 in 2020 to 420 in 2022 but rose in ethnic minority men from 178 to 227 respectively. By 2022, 35% of HIV diagnoses in GBMSM were among ethnic minority men (24% in 2018).

The number of white GBMSM testing at SHS rose by 37% (55,583 to 72,889) between 2020 and 2022 compared to a 61% rise 13,597 to 21,015 among ethnic minority GBMSM. In 2022, 6% of ethnic minority men declined a test when offered compared to 3% of white men. The positivity rate in sexual health clinics fell from 0.5% to 0.3% between 2020-2022 compared to 0.9% and 0.7% in ethnic minority men. Between 2020-2020, the number of white men diagnosed fell slightly from 138 (33%) to 129 (35%) but and rose from 30 (22%) to 77 (37%) in ethnic minority men.

**Conclusions:** The recent plateauing of HIV diagnoses in GBMSM masks a rise in diagnoses in ethnic minority men. While partially accounted for by increased testing in this group, the elevated positivity and late diagnosis rate suggests higher rates of undiagnosed HIV in this population. The profile of newly diagnosed GBMSM is diversifying. Services must keep pace to ensure they remain accessible and culturally competent.

## WEPEC189

Increasing HIV case identification from safe index testing of recent HIV acquisition. Experiences from Laikipia County, Kenya

G. Mochama<sup>1</sup>, Z. Alfajiri<sup>2</sup>

<sup>1</sup>Government, Health, Nanyuki, Kenya, <sup>2</sup>UTJ, Health, Nanyuki, Kenya

**Background:** Increasing case identification from safe index testing of recent HIV acquisition. a case of Laikipia county, Kenya.

To achieve the global goal of linking to care and retaining at least 95% of newly identified HIV acquisition, person newly identified with HIV should be reached and initiated on treatment. Laikipia County has an estimated 11352 persons living with HIV of whom 9786 (86%) have been identified and linked to HIV treatment. In regions where HIV treatment coverage is high, identifying the remaining <14% remains a challenge. Longitudinal Follow up of the Diagnosed Positive is critical to help in the Tracking of the infection Chain.

**Description:** The USAID Tujenge Jamii (UTJ) project working with the County Department of Health in Laikipia County implemented HIV recency surveillance in four high volume health facilities in the year 2022 May to 2023 September. This was aimed at identifying recent infections among the newly identified HIV positive persons. This was done using Asante assay.

**Lessons learned:** Among the 351 (244 female and 107 Male) persons newly diagnosed with HIV in the four facilities, 16(11female and 5 male) were found to have a recent HIV infection. The persons with recent HIV acquisition were counseled on safe ethical index testing and 15 of them gave consent. Those who consented were taken through contact elicitation and 30 contacts were elicited for testing.

Of the 30 contacts elicited, 5 were known positives, 25 were established to be eligible for HIV testing. Those who were successfully reached and tested were 25 with 6 of them being diagnosed as HIV positive and linked. This gave a case identification rate of 24%. This was over 3 times higher than the routine non-targeted case identification rate of about 7%.

**Conclusions/Next steps:** Safe index testing for recent HIV acquisition is an efficient strategy for HIV case identification. It provides a higher case identification rate for fewer HIV tests done compared to the routine HIV testing. Increasing coverage of recency surveillance to more sites and also improving testing of those elicited and eligible for testing is a promising strategy to improve case identification.

# WEPEC190

## Evaluation of the continuity of HIV care in 2023 among the Ukrainian refugees in Poland in comparison to the local population

M. Rosińska<sup>1</sup>, A. Smaga<sup>2</sup>, A. Tymicka<sup>3</sup>,  
M. Niedźwiedzka-Stadnik<sup>1</sup>

<sup>1</sup>National Institute of Public Health NIH - National Research Institute, Department of Epidemiology, Warsaw, Poland, <sup>2</sup>National Institute of Public Health NIH - National Research Institute, Department of Monitoring and Public Health Analysis, Warsaw, Poland, <sup>3</sup>Ennoia, Warsaw, Poland

**Background:** Displaced people living with HIV (PLH) experience difficulties to remain in care. Poland received a significant number of refugees from Ukraine in 2022 including PLH, mostly previously in care, who were granted access to public healthcare in Poland.

We aimed to evaluate retention in HIV care in I – VI.2023 of refugees versus local population.

**Methods:** Algorithms using National Health Fund 2015–2022 claims data were developed to identify:

1. Adult PLH registered by 2022, and;
2. Ukraine refugee status. Data on I–VI.2023 claims in this group were categorised by service type (primary care, specialised ambulatory care, hospitalizations).

Due to different age-sex distribution of refugees vs local population (Figure) we report indicators among local population standardized to refugees age-sex distribution. As most of refugees were transferred to care, not newly diagnosed, we take local population diagnosed before 2022 for comparison.

	Refugees with first visit with a HIV-related ICD-10 code in 2022	PLH in Poland diagnosed before 2022	PLH in Poland diagnosed in 2022
Number of PLH	2297	15799	1318
% of PLH with at least one medical service in I–VI.2023	68%	85%	85%
% of PLH with at least one HIV-related service in I–VI.2023	59%	72%	75%
Average number of services per person among those with at least one service in I–VI.2023	2,25	2,78	2,86
% with 4+ services among those with at least one service in I–VI.2023	11%	25%	26%
% with at least 1 service in primary care among those with at least one service in I–VI.2023	2%	2%	3%
% with at least 1 service in outpatient specialist care among those with at least one service in I–VI.2023	95%	84%	87%
% with at least 1 service in telehealth specialist care among those with at least one service in I–VI.2023	5%	16%	13%
% with at least 1 hospitalization among those with at least one service in I–VI.2023	4%	3%	7%

**Results:** There were 2297 refugees and 17117 local PLH with services in 2022, including 1318 diagnosed in 2022 (Table). Of them significantly less refugees (68%) than local PLH (85%) received HIV care in I–VI.2023. In addition, among those who received HIV care, refugees less often received more than 4 services (11% vs 25%) and telehealth services (5% vs 16%).

**Conclusions:** Lower retention rates of refugees could be due to further mobility or barriers in accessing care, both of which can compromise continuity of treatment. Moreover, worse access could be supported by lesser average number of visits. Solutions to improve healthcare access and facilitate possible transfers to care elsewhere should be considered.

## Modelling the HIV pandemic

### WEPEC191

#### Clusters contribute disproportionately to future HIV transmission in the United States

N. Panneer<sup>1</sup>, A.M. France<sup>1</sup>, K. Schlanger<sup>1</sup>, R. Billock<sup>1</sup>,  
P. Farnham<sup>1</sup>, A. Oster<sup>1</sup>, H. Islam<sup>1</sup>, A. Baxter<sup>1</sup>, R. Bonacci<sup>1</sup>,  
C. Gopalappa<sup>2,1</sup>

<sup>1</sup>Centers for Disease Control and Prevention, Atlanta, United States, <sup>2</sup>University of Massachusetts Amherst, Amherst, United States

**Background:** Cluster detection and response is a foundational pillar of the *Ending the HIV Epidemic in the U.S.* initiative. HIV molecular clusters have elevated transmission rates and high proportion of undiagnosed infections at the time of cluster detection. However, the extent of transmission after detection remains unclear. Understanding how clusters contribute to future HIV transmission can elucidate the added value of cluster-based interventions in averting new infections.

**Methods:** Using a stochastic dynamic network simulation model of HIV disease progression and sexual transmission, we applied a cluster generation algorithm to simulate priority molecular clusters representing rapid transmission. These were defined as  $\geq 3$  people with HIV (PWH) diagnosed in 2017 and with sequences, connected using a 0.5% genetic distance threshold. We then applied the algorithm to all PWH to identify the full extent of priority clusters, including people with undiagnosed infection and those with diagnosed infection who are out of care. We calculated a cumulative transmission rate, defined as the number of new infections during 2018–2022 per 100 PWH in 2017, overall and stratified by cluster membership, diagnosis, and viral suppression status. The model was calibrated to 2017 care continuum and molecular cluster distributions from the U.S. National HIV Surveillance System. We simulated 1300 trials (130 runs; 10 replicates/run); medians and ranges are presented.

AIDS 2024

Oral abstracts

Poster exhibition

Late-breaker abstracts

Author Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Results:** Cumulative transmission rates during 2018-2022 were 21 [18-23] infections per 100 PWH in 2017 for all PWH and 48 [0-300] for clusters. In clusters, cumulative transmission rates for people with undiagnosed infection and diagnosed but unsuppressed infection were 88 [0-500] and 57 [0-1300], respectively.

Among all PWH, cumulative transmission rates for people with undiagnosed infection and diagnosed but unsuppressed infection were 65 [54-78] and 25 [19-34], respectively.

**Conclusions:** Future transmissions are more than twice as high in HIV clusters as among all PWH, indicating sustained, high transmission five years after cluster detection.

Transmission for people with undiagnosed infection or diagnosed but unsuppressed infection was also higher in clusters, suggesting additional network associated factors contributing to heightened, ongoing transmission.

These findings underscore the importance of focusing testing, prevention, and care activities to reach people in clusters and their networks.

## WEPEC192

Predicating client re-engagement in HIV treatment services amongst clients experiencing interruptions in treatment in Ethiopia using Machine Learning Models

M. Dessie<sup>1</sup>, J. Stephens<sup>1</sup>, K. Srikanth<sup>1</sup>, L. Baraki<sup>1</sup>, C. Nichols<sup>1</sup>, A. Negash<sup>2</sup>, S. Mehrete<sup>2</sup>, E. Seid<sup>3</sup>

<sup>1</sup>United States Agency for International Development, OHA, Washington, United States, <sup>2</sup>United States Agency for International Development, Health Team, Addis Ababa, Ethiopia, <sup>3</sup>Project Hope, Addis Ababa, Ethiopia

**Background:** The long-term continuity of people living with HIV (PLHIV) on antiretroviral therapy (ART) is key for improving clinical health outcomes and reducing HIV transmission, yet interruption in treatment (IIT) persists. Machine Learning (ML) models have been used to predict negative health events for PLHIV and when integrated into health information systems (HIS), can inform interventions, creating opportunities for targeted service delivery (SD).

This study developed a classification model to predict re-engagement of PLHIV who experienced ART IIT in community-based service delivery care models in Ethiopia.

**Methods:** Routine program data from the community-based health system, consisting of 1,535 individual clients who experienced IIT and had one or more tracing attempts from October 2022 through May 2023 at facilities in Addis Ababa, Ethiopia, was used to train machine learning classification algorithms.

A logistics regression was selected as the best performing model among seven classification models trained and evaluated, using a cross-validation strategy with

K-folds=5 and a 70/30 train-test split. We evaluated accuracy, specificity, sensitivity, recall, precision, the F1-score, and area under the receiver operating characteristic curve (AUC).

**Results:** The final model predicted clients' re-engagement with 78.74% accuracy, 80.27% specificity and 0.72 AUC. PLHIV who were on ART for longer (3+ years) before interruption (OR=1.83, p=0.005) and those traced through home visits (OR=7.24, p=0.003) were significantly more likely to re-engage. Re-engagement was significantly less likely among clients with 60 to 90 days between tracing date and treatment interruption date (OR=0.46, p=0.027) and >90 days (OR=0.28, p<0.001), compared to clients with less than 30 days between tracing and treatment interruption.

**Conclusions:** Early tracing through home visits was associated with re-engagement in care, underscoring the importance of this intervention. Contacting clients within 30-60 days improves retention and reduces IIT. Predicting IIT creates efficiencies in human resources for health and resource allocation.

Future studies on uses and integration of ML should be tested to improve outcomes for PLHIV, especially considering multi-month dispensing models.

## WEPEC193

The impact of COVID-19 on the HIV epidemic among men who have sex with men in Australia

R. Weng<sup>1</sup>, J.A. Kwon<sup>1</sup>, M. Hammoud<sup>1</sup>, N. Scott<sup>2</sup>, S. McGregor<sup>1</sup>, R.T. Gray<sup>1</sup>

<sup>1</sup>Kirby Institute, UNSW Sydney, Sydney, Australia, <sup>2</sup>Burnet Institute, Melbourne, Australia

**Background:** During the first two years of the COVID-19 pandemic, there was a large reduction in HIV notifications in Australia.

This study aimed to understand this decrease among men who have sex with men in Australia and whether it was due to reduced HIV transmission, a decline in HIV testing, and/or the closure of international borders.

**Methods:** Aggregated monthly data between January 2020 and August 2022 including sexual partnerships, condom use, HIV testing, and pre-exposure prophylaxis use were obtained from the Flux study and routine national HIV surveillance.

A model was developed to estimate monthly HIV incidence given changes in these variables. Two scenarios were simulated: a COVID scenario with all changes in place and a no COVID scenario where input parameters remained at pre COVID-19 values.

**Results:** In the absence of the COVID-19 pandemic, the estimated number of cumulative infections from 2020 to 2022 would have been 1,164 [95% Percentile Interval (PI): 896-1600] compared to 905 (95% PI: 697-1,228) for the COVID-19 scenario (a 22% reduction).

The largest reduction in infections (43%) occurred in 2020 with 259 (95% PI: 204–338) infections versus 457 (95% PI: 361–603) in the no COVID scenario. There was a rebound with 357 infections (95% PI: 269–497) in 2021, followed by a reduction to a level by August of 2022 slightly lower than in the no COVID scenario.

**Figure 1.** Monthly new HIV infections among men who have sex with men in Australia: comparison of two scenarios.

**Conclusions:** COVID-19 resulted in a substantial reduction in new HIV infections in Australia, despite reductions in access to HIV testing and prevention services. Given the rebound in infections seen in 2021–2022, it is imperative to maintain vigorous response efforts and take advantage of the gains made to end HIV as a public health threat in Australia.

## WEPEC194

### Dynamic shifts in the HIV epidemic: analyzing the evolution of risk groups in Sub-Saharan Africa

S. Awad<sup>1</sup>, P. Mee<sup>2</sup>, K. Tram<sup>3</sup>, M. Inghels<sup>2</sup>, A. Tomita<sup>4</sup>, H.-Y. Kim<sup>5</sup>, F. Tanser<sup>6</sup>, D. Cuadros<sup>1</sup>

<sup>1</sup>University of Cincinnati, Digital Epidemiology Laboratory, Cincinnati, United States, <sup>2</sup>University of Lincoln, Lincoln, United Kingdom, <sup>3</sup>University of Washington, Seattle, United States, <sup>4</sup>University of KwaZulu-Natal, Durban, South Africa, <sup>5</sup>New York University, New York, United States, <sup>6</sup>Stellenbosch University, Stellenbosch, South Africa

**Background:** The HIV epidemic in sub-Saharan Africa, characterized by its dynamic nature, has been profoundly influenced by a myriad of external forces including natural disease progression, societal changes, and targeted interventions. Notably, in regions like the uMkhanyakude district in KwaZulu-Natal, South Africa, these forces have precipitated significant shifts in demographics and risk group compositions, urging a reevaluation of current intervention strategies to address the evolving landscape of HIV transmission.

**Methods:** A compartmental mathematical model was developed, stratifying the population into ten risk groups based on age, socio-economic status, behavior, and healthcare access. The model, parameterized with regional data from the rural uMkhanyakude district in KwaZulu-Natal, comprehensively incorporated compart-

ments for susceptible, acquires HIV (not on ART), and acquires HIV (on ART) within each risk group. A sexual-mixing matrix simulated interactions among these groups.

Ten scenarios, including the introduction of super-spreaders, targeted interventions, behavioral changes, and healthcare infrastructure changes, were evaluated to understand their impact on the force of infection.

Data visualization techniques including heatmaps and Sankey diagrams were employed to demonstrate the infection dynamics and force of infection shifts across risk groups over time.

**Results:** The model unveiled the impact of external interventions and societal dynamics on the HIV infection landscape. Noteworthy shifts in the force of infection were observed, migrating from established high-risk groups to newly emergent ones, underscoring the fluid nature of risk within the population. The scenarios demonstrated that targeted interventions, while beneficial, can inadvertently redirect the epidemic's focus, necessitating the continuous adaptation of strategies.

The emergence of drug-resistant strains and variations in healthcare access further complicated the transmission dynamics, illustrating the intricate interplay of factors influencing HIV risk.

**Conclusions:** This study accentuates the need for adaptable and dynamic intervention strategies in the face of an ever-evolving HIV epidemic in sub-Saharan Africa. Emergence of new high-risk groups, propelled by a confluence of external forces, supports a paradigm shift from static to dynamic approaches in public health responses. By embracing the fluid nature of risk dynamics, we can design more effective public health measures, ensuring that our efforts to combat the HIV epidemic remain robust and responsive to an evolving epidemic.

From awareness to use: PrEP cascade among at-risk individuals presenting for HIV screening in northern Thailand

N. Salvadori<sup>1</sup>, T. Akarasereenont<sup>2</sup>, P. Promnites<sup>2</sup>, J. Achalapong<sup>3</sup>, S. Nangola<sup>4</sup>, C. Kloypan<sup>5</sup>, E. Prompant<sup>4</sup>, N. Wongplucksin<sup>6</sup>, S. Arunothong<sup>7</sup>, P.-o. Sukrakanchana<sup>1</sup>, S. Chalermpanmetagul<sup>1</sup>, W. Khamduang<sup>1</sup>, N. Ngo-Giang-Huong<sup>8</sup>, S. Pornprasert<sup>1</sup>, S. Ongwandee<sup>9</sup>, G. Jourdain<sup>1</sup>

<sup>1</sup>Chiang Mai University, Chiang Mai, Thailand, <sup>2</sup>STI Clinic of the Office of Disease Prevention and Control Region 1, Chiang Mai, Thailand, <sup>3</sup>Chiangrai Prachanukroh Hospital, Chiang Rai, Thailand, <sup>4</sup>University of Phayao, School of Allied Health Sciences, Phayao, Thailand, <sup>5</sup>University of Phayao, School of Medicine, Phayao, Thailand, <sup>6</sup>Mae Lao Hospital, Mae Lao, Thailand, <sup>7</sup>Ministry of Public Health, Office of Disease Prevention and Control Region 1, Department of Disease Control, Chiang Mai, Thailand, <sup>8</sup>French National Research Institute for Sustainable Development (IRD), Chiang Mai, Thailand, <sup>9</sup>Ministry of Public Health, Nonthaburi, Thailand

**Background:** Despite the introduction of pre-exposure prophylaxis (PrEP) in Thailand in 2016, the HIV incidence has not declined.

This study aims to assess the PrEP continuum among individuals at risk of HIV acquisition in northern Thailand.

**Methods:** Any individual aged ≥15 years could self-screen for HIV, syphilis, hepatitis B and hepatitis C free of charge and anonymously at six participating facilities in northern Thailand as part of the Napneung project. Participants completed a tablet-based questionnaire to collect data on demographics, recent risks of HIV acquisition and PrEP awareness, knowledge, use and retention.

This analysis includes participants at recent risk of HIV acquisition – defined as reporting multiple sex partners and non-systematic condom use in last 6 months –, not previously diagnosed with HIV, and born in Thailand or a neighboring country (Myanmar, Laos or Cambodia). Risk factors at each step of the PrEP cascade were assessed using multivariable binary logistic regression models.

**Results:** 1,826 at-risk participants were screened between 19 October 2020 and 31 December 2023. 1,012 (55%) were born male, 937 (51%) were aged 15–24 years, and 1,143 (63%) had never tested for HIV. 850 (47%) had already heard of PrEP, 543 (30%) knew what PrEP is used for, 100 (5%) ever used PrEP and 45 (2%) were currently using PrEP.

No significant change in the PrEP cascade was observed during the study period. Women, men who have never had sex with men and participants never tested for HIV were less likely to have heard of PrEP, to know what PrEP is used for and to have used PrEP. Of 40/1,826 participants

newly diagnosed with HIV, 24 (60%) had heard of PrEP, 15 (38%) knew what PrEP is used for, and none ever used PrEP. Of the 40 participants, 31 were MSM, 4 other men and 5 women; 26 (65%) had never tested for HIV before.

**Conclusions:** PrEP awareness, knowledge and use remain low among people at risk of HIV in northern Thailand, particularly among women and among men who have never had sex with men. Increasing awareness and creating demand may be as much needed as facilitating access to and availability of PrEP.

## WEPEC196

Interest in seeking post-trial PrEP services by postpartum women in Uganda: a case for MTN-042/DELIVER study

P.K. Ssemambo<sup>1</sup>, J. Nansimbe<sup>1</sup>, M. Lubega<sup>1</sup>, R. Byogero<sup>1</sup>, E. Kyomukama<sup>1</sup>, S. Nakabuye<sup>1</sup>, J. Nalwoga<sup>1</sup>, B.G. Mirembe<sup>1</sup>, C. Nakabiito<sup>1</sup>

<sup>1</sup>Makerere University Johns Hopkins University (MU-JHU) Research Collaboration, Women's Health, Kampala, Uganda

**Background:** Pregnant and breastfeeding women in sub-Saharan Africa have high HIV incidence rates, with 3-fold and 4-fold increase in HIV-1 acquisition risk per condomless sex act respectively. In 2015, WHO recommended once-daily oral pre-exposure prophylaxis (PrEP) for HIV prevention in people at substantial risk of HIV acquisition, including pregnant and postpartum women. There is limited data on post-trial PrEP access following participation in PrEP trials.

**Methods:** MTN-042 is a multi-site, two-arm, randomized, open label Phase 3b study evaluating the safety, adherence, and acceptability profiles of the monthly Dapivirine Vaginal Ring and daily oral Truvada when used by HIV-uninfected pregnant women in Africa. The study took a step-wise approach to dosing as follows; Cohort 1: 36 0/7–37 6/7 weeks, Cohort 2: 30 0/7–35 6/7 weeks and Cohort 3: 12 0/7–29 6/7 weeks. Follow-up started at enrollment through 6 weeks postpartum. Referral for further PrEP services was offered at study exit.

We seek to describe; uptake of referrals for PrEP and reasons for non or delayed uptake as documented in chart notes, number of women who took PrEP at the infant 6-month visit as documented on the infant feeding assessment case report forms.

**Results:** In Uganda, 154 participants were enrolled. 22/44 (50%), 10/42 (23.8%) and 14/68 (21%) in Cohorts 1, 2 and 3, respectively were interested in post-trial PrEP. Women of advanced pregnancy were more interested than their counterparts who used study product longer.

Reasons for low interest in post-trial PrEP included sexual inactivity, absence from and need to consult partners, preference for condoms, frequent HIV testing, faithfulness, drug use and hospital visits fatigue, non-readiness/

unexplained lack of interest, anticipated transport constraints. At the infant's 6 months visit, none of the participants reported being on PrEP despite referral.

**Conclusions:** Results showed low interest (30%) in PrEP post-trial. More data is needed to assess HIV risk perception post-delivery, and if improved community sensitization techniques would increase interest and uptake of PrEP post-trial. There is an ongoing need for PrEP modality choices for HIV prevention, plus other support services and education to promote PrEP re-uptake in this group of sub-Saharan African women.

## WEPEC197

### Increasing uptake to Oral Pre-exposure Prophylaxis (PrEP) for Men who have Sex with Men (MSM) in Taraba state, Nigeria

C. Nwagbo<sup>1</sup>, E. Anene<sup>1</sup>

<sup>1</sup>International Centre for Total Health and Rights Advocacy Empowerment (ICTHARAE), Programmes, Abuja, Nigeria

**Background:** Men who Sex with Men (MSM) in Taraba state are disproportionately affected by HIV with a prevalence rate of 24% . Pre-exposure Prophylaxis (PrEP) is known to decrease the incidence of HIV and its recommended for all individuals with substantial risk of acquiring HIV.

This study explored the increase uptake of PrEP at the community level between 2019 to 2023 in Taraba state.

**Description:** International Centre for Total Health and Rights Advocacy Empowerment (ICTHARAE) established partnerships in the optimizing HIV investment of impact and National Aligned HIV/AIDS Initiative projects. We identified and validated hotspots through engagements with community stakeholders and by community inclusive planning, tailored oral PrEP services. Our oral PrEP prevention intervention where provided in hotspots, home delivery and community center, PrEP services was followed by risk reduction counseling, and referrals to other support programs. At the community center, psycho-social support were also provided. Men who Sex with Men community members in Taraba led PrEP service provision efforts. Eligibility for oral PrEP screening were Men who Sex with Men who tested HIV negative. Descriptive analysis of routine programmatic data was applied to illustrate program outcomes.

**Lessons learned:** During the four (4) years period, 8515 MSM tested for HIV and 7362 were HIV negative. All the Men who Sex with Men who tested negative were screened for oral PrEP eligibility, and 6995 (95.0%) were eligible. A total of 6855 MSM (98% [6856/6995]) initiated oral PrEP. From October 2019 to September 2023, we recorded a progressive increase in the uptake of oral PrEP by Men who Sex with Men in Taraba state from 37 in 2019 to 205 by December 2020 and 6855 by September 2023. This shows uptake increase from 3% as of December 2020 to 95% as at September 2023.

**Conclusions/Next steps:** Community taking the lead in providing prevention services such as PrEP will give room for context specific approach that addresses structural barriers among the MSM community to enable uptake of services. More efforts will be useful to understand the barriers to increase uptake of PrEP among Men who Sex with Men to 100%.

## WEPEC198

### Factors associated with the use of patient portals to disclose STI test results among U.S. men who have sex with men: a call for patient-facing guidance and interventions

K.-M. Jackman<sup>1</sup>, K. Atkins<sup>2</sup>, S. Murray<sup>3</sup>, T. Carpino<sup>4</sup>, I. Lucas<sup>5</sup>, T. Sanchez<sup>5</sup>, S. Baral<sup>4</sup>

<sup>1</sup>Johns Hopkins University School of Medicine, Pediatrics, Baltimore, United States, <sup>2</sup>Johns Hopkins University School of Public Health, International Health, Baltimore, United States, <sup>3</sup>Johns Hopkins University School of Public Health, Mental Health, Baltimore, United States, <sup>4</sup>Johns Hopkins University School of Public Health, Epidemiology, Baltimore, United States, <sup>5</sup>Emory University, Atlanta, United States

**Background:** The heightened burden of sexually transmitted infections (STIs), including HIV, among gay men and other men who have sex with men (MSM) persists as a major public health problem in the United States (U.S.). Prior studies demonstrate willingness among MSM to use patient portals as a tool for disclosing STI test results with sex partners.

However, little is known about its reach for accessing test results and use for disclosures among MSM.

To address this gap, the current study estimates the proportion of portal use for disclosures and its association with STI risk factors among U.S. MSM.

**Methods:** Data come from adult participants of the 2022 American Men's Internet Survey. Participants were asked to report their use of patient portals for viewing test results and sharing STI results with partners.

Poisson regression models with robust error variance measured associations of STI risk factors (sexual behavior stigma, PrEP use, number of condomless male sex partners, number of STI tests, and STI diagnosis) with the likelihood to report STI test result disclosure to a partner using the portal. Models controlled for age, race, sex work, and HIV status.

**Results:** 88% (2,700/3,079) reported using a patient portal to view test results and 16% (486/3,079) to share STI results with a partner. In adjusted models (Table), using a portal to share STI test results with a partner was significantly more prevalent among those who reported HIV PrEP use, stigma from family/friends, and '1 to 3' or '4 or more' STI tests versus 'no STI test'.

Variable	Total	Showed partner STI results using portal		Adjusted Prevalence Ratio (95%CI) <sup>a,b,c</sup>
		Yes (n=486)	No (n=2,593)	
Age (median, interquartile range)	44 (33, 75)	40 (33, 52)	46 (34, 58)	0.99 (0.98, 0.99) <sup>e</sup>
Condomless sex in prior 12 months				
No condomless sex partners	367 (31.4)	39 (20.4)	368 (33.5)	Reference
1 to 2 partners	591 (19.2)	74 (15.2)	517 (19.9)	0.96 (0.72, 1.26)
3 to 4 partners	470 (15.3)	69 (14.2)	401 (15.5)	1.05 (0.79, 1.40)
5 to 10 partners	548 (17.8)	118 (24.3)	430 (16.6)	1.29 (0.99, 1.67)
10+ partners	503 (16.3)	126 (25.9)	377 (14.5)	1.28 (0.97, 1.68)
Sex work in prior 12 months (Yes)	101 (3.3)	28 (5.8)	73 (2.8)	1.38 (1.00, 1.91) <sup>e,f</sup>
Number of STI tests in prior 12 months				
None	1,150 (37.4)	70 (14.4)	1,080 (41.8)	Reference
1 to 3	1,187 (38.5)	180 (36.9)	998 (38.5)	2.30 (1.73, 3.06) <sup>e</sup>
4+	742 (24.1)	227 (46.7)	515 (19.9)	3.33 (2.41, 4.60) <sup>e</sup>
Living with HIV (Yes)	419 (13.6)	53 (10.9)	366 (14.1)	0.76 (0.57, 1.06) <sup>e</sup>
STI diagnosis in prior 12 months (Yes)	575 (18.7)	157 (32.3)	418 (16.1)	1.16 (0.96, 1.40) <sup>e</sup>
Currently on PrEP (Yes)	1,169 (38.0)	279 (57.4)	890 (43.3)	1.26 (1.01, 1.58) <sup>e</sup>
Family or friends stigma (mean, SD)	0.56 (0.98)	0.71 (1.06)	0.53 (0.96)	1.12 (1.01, 1.24) <sup>e</sup>
Healthcare provider stigma (mean, SD)	1.06 (1.76)	1.26 (1.93)	1.02 (1.73)	0.98 (0.93, 1.04)
Social stigma (mean, SD)	0.76 (1.23)	0.97 (1.43)	0.72 (1.19)	1.02 (0.94, 1.11)

Table. Characteristics of United States 3,079 gay, bisexual and other men who have sex with men associated with use of a patient portal to disclose STI test results to a sex partner, 2022-2023.

**Conclusions:** Patient portals have the reach and potential among U.S. MSM to be leveraged as STI prevention tools. Designing interventions that use patient portals to help patients make healthy decisions are a burgeoning field of research. Studies are needed to guide the implementation of patient-facing strategies to optimize sexual health decision-making.

## WEPEC199

Interest in long-acting PrEP modalities among a diverse multisite cohort of women in the United States: findings from the MACS/WIHS Combined Cohort Study (MWCCS)

Goparaju<sup>13</sup>, M.L. Alcaide<sup>14</sup>, M. Philbin<sup>15</sup>

<sup>1</sup>Dalla School of Public Health, University of Toronto, Toronto, Canada, <sup>2</sup>Columbia University Mailman School of Public Health, New York, United States, <sup>3</sup>Emory University School of Medicine, Division of Infectious Diseases, Department of Medicine, Atlanta, United States, <sup>4</sup>University of California San Francisco, Benioff Homelessness and Housing Initiative, Department of Medicine, San Francisco, United States, <sup>5</sup>Milken Institute School of Public Health, George Washington University, Department of Prevention and Community Health, Washington D.C., United States, <sup>6</sup>John H. Stroger Jr Hospital of Cook County, Department of Medicine, Chicago, United States, <sup>7</sup>School of Public Health, State University of New York, Downstate Health Sciences University, Department of Community Health Sciences, Brooklyn, United States, <sup>8</sup>University of North Carolina School of Medicine, Division of Infectious Diseases, Chapel Hill, United States, <sup>9</sup>Albert Einstein College of Medicine, Department of Epidemiology and Population Health, Bronx, United States, <sup>10</sup>Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology, Baltimore, United States, <sup>11</sup>University of Alabama at Birmingham Heersink School of Medicine, Department of Medicine, Birmingham, United States, <sup>12</sup>University of California San Francisco, School of Pharmacy, San Francisco, United States, <sup>13</sup>Georgetown University Medical Center, Department of Medicine, Washington D.C., United States, <sup>14</sup>University of Miami Miller School of Medicine, Department of Medicine, Miami, United States, <sup>15</sup>University of California San Francisco, Division of Vulnerable Populations, Department of Medicine, San Francisco, United States

**Background:** Despite US women constituting 19% of incident HIV cases, they are vastly underrepresented among pre-exposure prophylaxis (PrEP) users (5%). To improve HIV prevention uptake via a novel delivery formulation, we examined associations with willingness to use long-acting injectable (LAI) PrEP and preferences for LAI versus oral PrEP among a sociodemographically-diverse population of women.

**Methods:** From October 2020-November 2021, we conducted a cross-sectional study of 481 women without HIV across nine U.S. centers of the MACS/WIHS Combined Cohort Study: Atlanta, GA; Birmingham, AL/Jackson, MS; Bronx, NY; Brooklyn, NY; Chapel Hill, NC; Chicago, IL; Miami, FL; San Francisco, CA; and Washington, DC. Multivari-

able logistic regression assessed factors associated with willingness to try LAI PrEP (definitely/probably would vs not sure/definitely/probably would not try), and preference for LAI versus oral PrEP, adjusting for sociodemographic, psychosocial, and behavioral characteristics.

**Results:** Among 481 participants, median age was 52 years, 73% self-identified as Black, 83% as heterosexual, and 51% met the modified CDC criteria for PrEP indication (e.g. endorsing any recent: injection drug use; unprotected sex; 1+ sexual partners; STI).

Overall, 21% were definitely/probably willing to try LAI PrEP. When asked to choose one modality, 30% preferred LAI-PrEP, 10% oral PrEP, 21% were undecided, and 37% were unwilling to use any PrEP. Non-Hispanic Black vs White participants were less willing to try LAI PrEP (OR=0.31; 95% CI 0.15–0.65) whereas LGBTQIA vs heterosexual individuals were more willing (OR=1.91; 95% CI 1.11–3.23).

Depressive symptoms (OR=1.34; 95% CI 1.08–2.79) and perception of HIV risk (OR=5.42; 95% CI 2.79–10.70) were associated with willingness to try LAI PrEP.

Participants who endorsed a preference for LAI vs oral PrEP were more likely to be insured ( $\alpha$ OR: 3.68; 95% CI 1.10–1.36) and have a perception of HIV risk ( $\alpha$ OR 11.30; 95% CI: 1.41–90.41).

**Conclusions:** Participants reported low interest in LAI PrEP but important sub-group differences, particularly by race, LGBTQIA orientation, mental health, and perceived HIV risk, underscore the complexity of PrEP modality preferences.

These multilevel factors must be considered in designing innovative PrEP implementation strategies so that access and uptake are optimized, equitable, and tailored to women's choice.

## WEPEC200

### Stopping and restarting HIV pre-exposure prophylaxis (PrEP): a systematic review and meta-analysis

R. Kiggundu<sup>1,2</sup>, Q.R. Soh<sup>2</sup>, W. Tiesapjaroen<sup>1,2</sup>, C. K. Fairley<sup>1,2</sup>, L. Zhang<sup>1,2</sup>, J. D. Tucker<sup>3,4</sup>, W. Tang<sup>4</sup>, J. J. Ong<sup>1,2,3</sup>

<sup>1</sup>Monash University, Central Clinical School, Melbourne, Australia, <sup>2</sup>Alfred Health, Melbourne, Australia, Melbourne Sexual Health Centre, Melbourne, Australia, <sup>3</sup>London School of Hygiene and Tropical Medicine, Faculty of Infectious and Tropical Diseases, London, United Kingdom, <sup>4</sup>University of North Carolina at Chapel Hill, Institute for Global Health and Infectious Diseases, Chapel Hill, United States

**Background:** High coverage of pre-exposure prophylaxis (PrEP) will reduce HIV transmission and help end the HIV pandemic. However, PrEP users face challenges, including long-term adherence. The review aimed to provide a pooled proportion of users who restarted PrEP and document reasons for restarting PrEP.

**Methods:** We systematically searched seven databases for original research studies. We extracted data on the proportion of people who stopped and then restarted PrEP, reasons for restarting and strategies to support people restarting PrEP. We used a random-effects meta-analysis to pool estimates of restarting.

**Results:** Of 988 publications, 34 were included: 27 reported the proportion restarting PrEP, 10 reported reasons for restarting PrEP, and no study evaluated interventions for restarting PrEP. Most studies were from high-income countries (17/27, 63%) and the Americas region (15/27, 56%). Overall, 23.8% (95% CI: 15.9–32.7, I<sup>2</sup>=99.8%, N=85,683) of people who stopped PrEP restarted PrEP during the study period (Figure 1).

There was a lower proportion of restarting in studies from middle-income countries compared to high-income countries (adjusted odds ratio (AOR) 0.6, 95% CI: 0.50 – 0.73, P-value <0.001). There was a higher proportion restarting in studies from Africa compared to the Americas (AOR 1.55, 95% CI: 1.30 – 1.86), and heterosexuals compared to men who have sex with men or transgender women (AOR 1.50, 95% CI: 1.25 – 1.81, P-value <0.001). Reasons for restarting PrEP included perceived higher risk for HIV acquisition and removal of barriers to access PrEP.

Figure 1.

AGYW = adolescent girls and young women;

MSM = men who have sex with men; TGW = transgender women;

USA = United States of America

**Conclusions:** The proportion of people restarting PrEP is low. There is need for more research and support for individuals to restart PrEP.

## WEPEC201

### HIV pre-exposure prophylaxis as a statutory health insurance service in Germany - a descriptive, longitudinal claims data analysis

S. Schmischke<sup>1</sup>, C. Kollan<sup>1</sup>, D. Schmidt<sup>1</sup>

<sup>1</sup>Robert Koch Institute, Department of Infectious Disease Epidemiology, Berlin, Germany

**Background:** Human immunodeficiency virus (HIV) remains a global public health challenge. The introduction of HIV pre-exposure prophylaxis (PrEP) into the coverage of the German statutory health insurance in September 2019 reduced financial barriers to access to an effective tool for the prevention of HIV infection.

This study aims to provide a descriptive, longitudinal analysis of HIV PrEP care in a real-world setting in Germany between September 1, 2019 and December 31, 2022 using claims data from the statutory health insurance provider BARMER.

**Methods:** We assessed anonymized claims data to gain insight into PrEP care and user characteristics. PrEP initiations, discontinuations and reinitiations were analysed, as well as the proportion of days covered (PDC) as a metric of adherence, post-exposure prophylaxis courses (PEP) and incident HIV infections.

**Results:** 4,299 individuals who initiated PrEP within the study were identified totaling to an observation time of 7,998 person years. The median age of PrEP users at the time of first initiation was 34 years (IQR 28-43). 98.8% of them were male. The median PDC was 92.0% (IQR 80.0%-98.9%) for all observed courses. Of 202 PEP courses detected, 86.1% took place before PrEP initiation (Table 1). The HIV incidence rate was 0.04/100 person years. All detected infections occurred after PrEP discontinuation.

Characteristics	N (%)
<b>Total study population</b>	<b>4,299</b>
Age (years)*	
16-19	77 (1.8%)
20-29	1,267 (29.5%)
30-39	1,522 (35.4%)
40-49	831 (19.3%)
50-59	487 (11.3%)
≥ 60	115 (2.7%)
Sex	
Male	4,247 (98.8%)
Female	52 (1.2%)
No. of PrEP courses initiated	5,643
1	4,299 (100%)
2	1,041 (24.2%)
3	265 (6.2%)
4	36 (0.8%)
5	2 (0.05%)
PEP courses	202 (100%)
Before PrEP	174 (86.1%)
During PrEP	16 (7.9%)
After PrEP	12 (5.9%)
HIV infections	3 (<0.1%)
Deaths	12 (0.3%)

\* age at time of first PrEP initiation

Table 1. Characteristics of BARMER insured PrEP users between September 2019 and December 2022.

**Conclusions:** Overall PrEP coverage was high and PrEP proved to be highly effective with regards to the HIV incidence in a real-world setting.

This study supports previous findings of high PrEP demand within the community of men who have sex with men (MSM) and suggests that barriers to accessing PrEP and gaps in provision still exist outside of MSM communities, at least among women who would benefit from PrEP.

## WEPEC202

### Changes in sexual behavior among adolescent girls receiving long-acting injectable cabotegravir for HIV prevention: the HPTN 084-01 study

<sup>1</sup>MU-JHU Care LTD, CLlinic, Kampala, Uganda, <sup>2</sup>Fred Hutchinson, Seattle, United States, <sup>3</sup>Fred Hutchinson Statistical Center, Seattle, United States, <sup>4</sup>University of Witwatersrand, Johannesburg, South Africa, <sup>5</sup>University of Zimbabwe-CRTC, Harare, Zimbabwe, <sup>6</sup>MU-JHU Care LTD, Kampala, Uganda, <sup>7</sup>FHI 360, North Carolina, United States, <sup>8</sup>University of Illinois, Chicago, United States

**Background:** The HPTN 084-01 trial evaluated the safety, tolerability, and acceptability of long-acting injectable cabotegravir (CAB LA) for HIV prevention among adolescent girls in Africa. Adopting effective pre-exposure prophylaxis (PrEP) may reduce the concern for HIV acquisition but may lead to other riskier sexual behaviors. We sought to identify evidence of changes in sexual behavior following PrEP initiation within this cohort.

**Methods:** HPTN 084-01 enrolled HIV negative adolescent girls aged 12-17 years from 3 sites in South Africa, Uganda, and Zimbabwe who reported sexual activity with a male in the last 12 months and were willing to provide assent with parent/guardian consent. Data on self-reported sexual behavior, namely

1. Use of a condom at last vaginal sex and
2. Number of sexual partners in past month was assessed at study weeks 0, 4, 5, 9, 17, 25 and 33 by Computer Assisted Self-administered Interview.

Change in frequency of condomless vaginal sex (CVS) and number of sexual partners over time was assessed through generalized estimating equations.

**Results:** In total, 55 adolescents were enrolled with a median age 16 years, a median of 2 (IQR 1-4) episodes of vaginal sex in the past month, and 22% reporting transactional sex. At week 0, median number of male partners in the past month was 1 (range 1-30), and 29% had more than one male partner while mean episodes of CVS in the past month was 1 (sd 2.1), and 47% reported CVS. Between weeks 0 and 33, a modest decline in number of sexual partners was observed though not statistically signifi-

cant; average change -0.3 partners (95% CI -0.61, 0.06,  $p=0.11$ ). We observed a decrease in the number of episodes of CVS between weeks 0 and 33; average change -0.6 episodes (95% CI -1.03, -0.14,  $p=0.0093$ ).

**Conclusions:** In this cohort of African adolescent girls initiating CAB LA for PrEP, we also observed declines in other risk behaviors. This is consistent with other PrEP studies and confirms that HIV prevention trial participation provides benefits beyond access to medical interventions like PrEP.

## WEPEC203

**Fine-grained trends in combination HIV prevention among gay, bisexual and other men who have sex with men in Aotearoa New Zealand 2002-2022 using national surveillance**

P. Saxton<sup>1,2</sup>, S. McAllister<sup>2</sup>, J. Rich<sup>3</sup>, K. Haunui<sup>4</sup>, K.T. Sriamporn<sup>1</sup>, C. Leakey<sup>1</sup>, S. Ritchie<sup>5</sup>, J. Paynter<sup>1</sup>, P. Priest<sup>2</sup>

<sup>1</sup>University of Auckland, School of Population Health, Auckland, New Zealand, <sup>2</sup>University of Otago, AIDS Epidemiology Group, Dunedin, New Zealand, <sup>3</sup>Burnett Foundation Aotearoa, Auckland, New Zealand, <sup>4</sup>Burnett Foundation Aotearoa, Wellington, New Zealand, <sup>5</sup>University of Auckland, Faculty of Medicine, Auckland, New Zealand

**Background:** New Zealand (NZ) has a well-controlled HIV epidemic concentrated among gay, bisexual and other men who have sex with men (GBM). Eliminating HIV transmission by 2030 requires high uptake of combination HIV prevention at the population level. High-quality behavioural surveillance, capturing these behaviours, can be used to fine-tune HIV prevention delivery and interpret epidemiological trends. We report 20 years of behavioural surveillance data.

**Methods:** Data from repeat cross-sectional HIV behavioural surveillance in NZ 2002-2022 were examined ( $n=18,679$  GBM). Surveys were voluntary, anonymous and self-completed online or in-person at gay community settings. Participants reporting casual sex within six months were grouped into nine discrete combination prevention categories, defined by anal intercourse positioning, HIV status, condom use, pre-exposure prophylaxis (PrEP) or HIV treatment, and HIV testing history. Combination HIV prevention coverage was defined as either no anal intercourse; or consistent condom use; or condomless sex with PrEP or HIV treatments.

We examined trends using nonparametric tests. Routine national epidemiological surveillance data was used to record locally-acquired HIV diagnoses among GBM.

**Results:** Of 12,253 participants reporting casual sex within six months, combination HIV prevention coverage declined from 2002 (77.3%) to 2014 (60.9%), then increased in 2022 (71.4%;  $p<0.001$ ). Consistent condom use declined (45.6% in 2002 to 16.8% in 2022) as did the proportion avoiding anal intercourse (31.8% to 16.5%).

Conversely, condomless sex with either PrEP (0% to 33.7%) or HIV treatment increased (1.6% in 2011 to 4.4% in 2022). The proportion of participants engaging in receptive condomless anal intercourse who had never tested for HIV was highest in 2006 (9.5%) before declining to 2.5% in 2022 ( $p$  for trend all  $<0.001$ ).

Epidemiological surveillance data showed the number of GBM with locally-acquired HIV increased from 33 in 2002 to 97 in 2016, then declined to 34 in 2022.

**Conclusions:** After a gradual decline, combination HIV prevention coverage is now high among NZ GBM and is consistent with trends in HIV diagnoses.

Importantly, many GBM engaging in condomless sex are now likely protected by sexual mixing with partners on PrEP or HIV treatment. GBM should be supported to adopt their choice of combination prevention options.

## WEPEC204

**Systematic use of HIV PrEP medication refill notifications in a population-based PrEP program in British Columbia, Canada**

J. Toy<sup>1,2</sup>, R. Espinoza<sup>1</sup>, J. Antic<sup>1</sup>, E. Ready<sup>2</sup>, S. Thio<sup>1</sup>, R. Barrios<sup>1</sup>, J. Montaner<sup>1</sup>

<sup>1</sup>British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada, <sup>2</sup>St. Paul's Hospital, Ambulatory Pharmacy, Vancouver, Canada

**Background:** Publicly-funded HIV PrEP has been available in British Columbia (BC), Canada since 1-Jan-2018, involving over 2000 prescribers and approximately 12,000 cumulative clients. As engagement tools, the centralized program issues client-specific, pre-printed PrEP refill forms prior to anticipated refill dates, and a 'late refill notification' (LRN) if there is an extended lapse without medication dispensing. We describe the utilization of the LRN tool in our population-based PrEP program.

**Methods:** Data from BC's PrEP Program database between 1-Jan-2019 through 31-Dec-2023 were used to determine quarterly counts for:

- Active program clients (i.e., clients with PrEP medication within the last 6 months);
- LRNs sent (after 3-month lapse post-expected refill date for daily prescribed use, or after a 5-month lapse for prescribed on-demand use);
- LRN responses received (i.e., continues PrEP, discontinued PrEP, no longer under the prescriber's care or lost to follow-up, other).

Results were summarized with descriptive statistics.

**Results:** PrEP program participation and LRNs increased over the 5-year period (See Figure). Median (Q1-Q3) quarterly LRNs sent was 572 (481-716). A plateau in program participation was observed during the COVID-19 pandemic, and a high number of LRNs were issued in 3rd quarter of 2020. The quarterly response rate to LRNs sent was median 60% (55-65).

Responses included: continuing PrEP in median 48% (41-51) of respondents, no longer under the prescriber's care in median 26% (24-28), and PrEP discontinued in median 22% (18-26). Over 75% of 'PrEP discontinued' respondents were reportedly no longer at risk.

**Conclusions:** A centralized PrEP program allows systematic application of an engagement tool, based on possible lapse of PrEP medication. Confirmed PrEP continuation despite an apparent lapse in prescription suggests greater intermittent or on-demand PrEP use than formally captured. PrEP may also be discontinued when no longer indicated. Systematic notifications can remind providers to follow-up with clients who have disengaged from care.

## WEPEC205

### Pre-exposure prophylaxis discontinuation among HIV-negative persons in Nigeria: a three-year retrospective cohort study

O. Airaoje<sup>1</sup>, M. Li<sup>2</sup>, E. Ondura<sup>1</sup>, O. Ogorry<sup>1</sup>, D. Suliaman Dauda<sup>2</sup>, C. Obiora-Okafo<sup>3</sup>, A. Idemudia<sup>3</sup>, C. Nwadike<sup>3</sup>, K. Kakanfo<sup>3</sup>, B. Pius<sup>3</sup>, B. Oyawola<sup>3</sup>, B. Onimode<sup>3</sup>, O. Asaolu<sup>3</sup>, A. Bashorun<sup>4</sup>, A. Gambo<sup>5</sup>, J. Pius<sup>3</sup>, O. Oyelaran<sup>3</sup>, R. Goldstein<sup>3</sup>

<sup>1</sup>Data.FI/Palladium International, Abuja, Nigeria,

<sup>2</sup>Data.FI/Palladium International, Washington DC, United States, <sup>3</sup>Office of HIV/AIDS and TB, United States Agency for International Development, Abuja, Nigeria, <sup>4</sup>National AIDS, Sexually Transmitted Infections Control and Hepatitis Programme (NASCP), Federal Ministry of Health, Nigeria, Abuja, Nigeria, <sup>5</sup>National Agency for the Control of AIDS (NACA), Abuja, Nigeria

**Background:** This study estimates time and predictors of oral pre-exposure prophylaxis (PrEP) discontinuation among clients at higher risk of contracting HIV. Date of discontinuation was defined as one's last missed clinical appointment when client tracking outcomes confirmed the client as discontinued.

**Methods:** A retrospective cohort study on Nigerian clients who started PrEP between 2020 and 2023 used data from 617 health facilities across 17 states. The cohort included at least 15-year-olds, general or key population (GP or KP) members. The study analyzed demographic factors, and blood pressure (BP) outcomes using multivariate Cox

proportional hazards models and Kaplan-Meier survival model. The "Conditional\_surv\_est" function in R was used to estimate the time to discontinue PrEP.

**Results:** Of 53,936 participants, 22,653 (42%) were male and 31,283 (58%) were female. The median age was 29 years (interquartile range [IQR]:24-34).

Of those clients ever enrolled on PrEP, 13,579 (25.2%) were currently active, and 40,357 (74.8%), had discontinued, the median time to PrEP discontinuation was 279 days (95% CI: 277-285) as of Sept. 30, 2023.

Clients aged less than 20 years exhibited a significantly higher hazard (aHR:1.58, 95% CI: 1.46-1.72, p<0.001) compared to those of higher age group.

Male clients had a significantly higher risk (aHR:1.09, 95% CI:1.04-1.15, p=0.001) compared to female clients; KPs, including female sex workers (FSW), men who have sex with men (MSM), and people who inject drugs (PWID)—FSW; aHR : 0.68, 95% CI: 0.64 – 0.72, p<0.001, MSM; aHR: 0.58, 95% CI: 0.51 – 0.58, p<0.001 and PWID; aHR: 0.84, 95% CI: 0.79 – 0.89, p<0.001—exhibited significantly lesser hazard compared to the GP group.

Clients with an unemployed status (aHR:1.08, 95% CI:1.04-1.12, p<0.001) exhibited a significantly higher hazard compared to those employed.

Conversely, clients with elevated BP had a significantly lower risk (aHR:0.93, 95% CI:0.89-0.98, p=0.003) compared to those with normal BP.

**Conclusions:** The study reveals a higher risk of PrEP discontinuation among clients younger than 20 years, with a decrease in risk as age increases. Unemployed, and male client have a higher risk, while KPs, and clients with elevated blood pressure have low risk. Clients behavioural factors and socio-economic factors are recommended for future studies.

"Everyone should have access to it":  
perspectives on PrEP product choice and  
implementation from MSM and TGW in an

**Background:** HPTN083 demonstrated preventive superiority of CAB-LA. Participants' experiences once they learned their randomization (post-unblinding) can provide insight into implementation, including product choice.

**Methods:** Post-unblinding, participants were offered product choice. Participants (n=150) from five sites (two U.S., three international) completed qualitative interviews and were grouped according to their choices: switching from oral to injectable (n=50), switching from injectable to oral (n=11), staying on oral (n=29), staying on injectable (n=56), other (e.g., switching more than once, change in serostatus, n=4). Data were analyzed using content analysis.

**Results:** To address key factors associated with implementation of injectable PrEP, data were organized according to the Practical Robust Implementation and Sustainability Model (PRISM).

**Implementation and sustainability infrastructure.** Some preferred governments or large NGOs for PrEP oversight and delivery for their existing infrastructure, while others favored clinic-level management.

**Recipients- organizational characteristics.** Participants wanted dissemination to span the medical and lay/community arenas. Specifically, participants noted PrEP needs to be available both in community (e.g., health fairs) and medical settings. Participants wanted PrEP knowledge from healthcare professionals (valued for medical expertise) and PrEP users (to add legitimacy and to support normalization of PrEP use).

**Recipients-patient characteristics.** Participants felt many could benefit from PrEP, particularly younger people. When reporting **preferences for PrEP modality**, participants who chose injectable PrEP favored convenience, perceived effectiveness, and ability to minimize stigma due to discreet delivery.

Participants who chose oral PrEP cited its familiarity (e.g., product has been available for use longer), ability to start and stop at any time, and general mistrust of injections. Underlying many perceptions of PrEP implementation were **external environment** factors of stigma and misinformation; this was particularly salient for injectable PrEP because of its novelty.

Clear messaging on side effects, effectiveness, and the preventive nature of all PrEP formulations, rather than treatment, was emphasized.

**Conclusions:** MSM/TGW described factors that influence product choice; knowledge of these factors may support effective prescriber conversations around PrEP, and aid persons in selecting the most effective product for individual circumstances. Data suggest that successful implementation hinges on correcting negative community beliefs about PrEP and ensuring access in both community and medical settings.

### Acceptability of the monthly vaginal ring and daily oral PrEP during pregnancy in four Sub-Saharan African countries

L. Fairlie<sup>1</sup>, M. Stoner<sup>2</sup>, A. Mayo<sup>3</sup>, K. Bunge<sup>4</sup>, F. Mhlango<sup>5</sup>, A. Van der Straten<sup>6</sup>, J. Piper<sup>7</sup>, T. McClure<sup>3</sup>, L. Gadama<sup>8</sup>, E. Horne<sup>1</sup>, D. Kemigisha<sup>9</sup>, P. Mutero<sup>10</sup>, P. Musara<sup>10</sup>, J. Nansimbe<sup>9</sup>, L. Seyama<sup>8</sup>, S. Hillier<sup>4,11</sup>, E. Montgomery<sup>2</sup>  
<sup>1</sup>Wits RHI, Maternal and Child, Johannesburg, South Africa, <sup>2</sup>RTI International, Women's Global Health Imperative, Berkeley, United States, <sup>3</sup>FHI 360, Durham, United States, <sup>4</sup>Magee-Womens Hospital of UPMC, Pittsburgh, United States, <sup>5</sup>University of Zimbabwe Clinical Trials Research Centre, Harare, Zimbabwe, <sup>6</sup>ASTRA Consulting, Kensington,, United States, <sup>7</sup>DAIDS/NIAD/NIH/HHS, Rockville, United States, <sup>8</sup>Johns Hopkins Research Project-Kamuzu University of Health Sciences, Blantyre, Malawi, <sup>9</sup>Makerere University - Johns Hopkins University (MU-JHU) Research Collaboration CRS, Kampala, Uganda, <sup>10</sup>The University of Zimbabwe Clinical Trials Research Centre (UZ-CTRC) Clinical Trials Unit (CTU) - Zengeza CRS, Harare, Zimbabwe, <sup>11</sup>Microbicide Trials Network, Pittsburgh, United States

**Background:** Pre-exposure prophylaxis (PrEP) including the dapivirine vaginal ring (ring) and oral PrEP as tenofovir/emtricitabine (oral PrEP) are proven effective and acceptable in non-pregnant people.

We evaluated acceptability of both products in pregnant individuals in the MTN-042/DELIVER study conducted in South Africa, Zimbabwe, Malawi and Uganda.

**Methods:** MTN-042 enrolled pregnant individuals in three stepwise gestational age cohorts: cohort 1 (36-37 weeks), cohort 2 (30-35 weeks) and cohort 3 (12-29 weeks). Randomization was 2:1 (cohorts 1 & 2), and 4:1 (cohort 3) to receive ring or oral PrEP respectively and participants were followed until 6-weeks postpartum.

Acceptability of study products was a trial secondary objective. Trained staff assessed perceived attitudes, willingness, product acceptability, sexual behaviors and relationships at the 4-week visit through questionnaires in cohorts 2 & 3 (cohort 1 data not included).

We used descriptive statistics to summarize these endpoints, stratified by study cohort and assigned product. All cohorts additionally had qualitative acceptability assessments (data not shown).

**Results:** Participants' median age was 24 years (IQR 22, 29) across all cohorts (N=408), with 308 (75%) randomized to receive the ring. In cohorts 2 and 3 most participants (97%) reported having a primary partner, however, only 25% reported definitively knowing that their partner was monogamous. At Week 4, satisfaction with their assigned PrEP product and future willingness to use it when pregnant or non-pregnant was high overall and across study arms (Table 1). Participants preferred their assigned products to the alternative. Furthermore, 57% of participants disliked male condom use.

	Cohort 2			Cohort 3		
	Overall (N=143)	Assigned to Ring (n=101)	Assigned to Oral PrEP (n=45)	Overall N=242	Assigned to Ring (n=196)	Assigned to Oral PrEP (n=46)
	% (95% CI)	% (95% CI)	% (95% CI)	% (95% CI)	% (95% CI)	% (95% CI)
Very satisfied or satisfied with assigned study product	98.7 (95.2, 99.8)	99.0 (94.7, 1.00)	97.8 (88.7, 99.9)	99.6 (97.7, 100)	100 (98.1, 100)	97.8 (88.4, 99.9)
Willing to use the assigned study product in future pregnancy	94.6 (89.6, 97.6)	95.2 (89.0, 98.4)	93.3 (81.7, 98.6)	97.9 (95.3, 99.3)	97.5 (94.1, 99.2)	100 (92.3, 100)
Willing to use the assigned study product in the future when not pregnant	94.6 (89.6, 97.6)	97.1 (91.7, 99.4)	88.9 (76.0, 96.3)	96.3 (93.1, 98.3)	95.9 (92.1, 98.2)	97.8 (95.5, 99.9)
<b>Product Preferences</b>						
Vaginal Ring	61.5 (53.7, 68.3)	84.5 (77.5, 91.5)	8.9 (3.5, 17.2)	70.7 (64.5, 76.3)	85.7 (80.0, 90.3)	6.5 (1.4, 17.9)
Oral PrEP	23.6 (16.8, 30.5)	1.9 (0.0, 4.6)	73.3 (60.4, 86.3)	13.2 (9.2, 18.2)	1.5 (0.3, 4.4)	63.0 (47.6, 76.8)
Both	14.9 (9.1, 20.6)	13.6 (6.9, 20.2)	17.8 (6.6, 28.9)	15.7 (11.4, 20.9)	12.2 (8.0, 17.7)	30.4 (17.8, 45.8)

Table 1. Acceptability towards the ring and oral PrEP use at week 4 in the MTN-042 study cohort 2 and 3.

**Conclusions:** High acceptability of the ring and oral PrEP was reported after 4 weeks of use during pregnancy in the MTN-042 study, consistent with qualitative analyses across cohorts\*.

Pregnant people are at high risk of HIV infection and a majority dislike condoms, highlighting the need for optimized HIV-prevention choice during pregnancy.

## WEPEC208

### Are university students PrEP savvy? A cross sectional study on knowledge, attitudes, and behaviour towards HIV pre-exposure prophylaxis (PrEP) from University of Saskatchewan, Canada

A. Mueen<sup>1</sup>, T. Carr<sup>2</sup>

<sup>1</sup>University of Saskatchewan, Family Medicine, Saskatoon, Canada, <sup>2</sup>University of Saskatchewan, Community Health and Epidemiology, Saskatoon, Canada

**Background:** The number of new HIV diagnoses in young adults is increasing globally making this an important group to consider in efforts to end the HIV epidemic. Little is known about the awareness and acceptability of PrEP amongst university students in Canada. We conducted this survey to gain insight into their attitudes as an initial step in scaling up PrEP on campus.

**Methods:** A web-based survey was distributed to all 22,004 actively enrolled students at the University of Saskatchewan between March 11-31, 2022. The 28-item questionnaire investigated students' perception of HIV risk, HIV testing, sexual behaviour, and knowledge and attitude towards PrEP. Descriptive and inferential statistical analyses was performed on all completed responses and for Men who have Sex with Men (MSM). Statistical analyses were conducted using SPSS 26.

**Results:** 3,005 students completed the questionnaire; respondents were predominantly undergraduate students (79%), 28 years or younger (75%). Survey cohort was 66%

female, 30% male, 77% heterosexual, 11% bisexual and 2% gay. Prior to the survey, only 30% of all respondents were aware of PrEP, having heard about it from social media and at university; and only 3% had taken it. These numbers were much higher for Gay MSM (GMSM), being 94% and 35% respectively. Only 34% of respondents were likely to talk to their health care provider about PrEP. 52% were not likely to take PrEP themselves, while 68% would recommend it to others. 94% were willing to take it if recommended by a health care provider. 94% would take it as a daily pill and 92% were willing to get regular STI testing done while on it. 84% of respondents were comfortable seeking PrEP on campus, the main reasons being easy access and feeling safe.

**Conclusions:** PrEP awareness is low amongst students at University of Saskatchewan except for GMSM. Acceptability is high. Scaling up PrEP on campus would require raising awareness among all students not just key populations, a proactive approach by health care providers in discussing PrEP with those vulnerable to HIV, engaging students in raising peer awareness and ensuring that care provided at campus wellness centers is safe, nonjudgmental, and easily accessible.

HIV PrEP initiation leads to reduced HIV and PrEP stigma and depression severity among GBMSM in Singapore: a prospective cohort study and mixed-methods analysis

K.N.C. Naidu<sup>1</sup>, C. Ong<sup>2</sup>, R.K.J. Tan<sup>2</sup>, T. Le<sup>3</sup>, S.C. Chia<sup>3</sup>, T.P.C. Chia<sup>3</sup>, S. Archuleta<sup>3</sup>, D. Olszyna<sup>4</sup>

<sup>1</sup>National University Health System and National University of Singapore, Department of Psychological Medicine and Saw Swee Hock School of Public Health, Singapore, Singapore, <sup>2</sup>National University of Singapore, Saw Swee Hock School of Public Health, Singapore, Singapore, <sup>3</sup>National University Hospital, Department of Infectious Diseases, Singapore, Singapore, <sup>4</sup>National University Hospital, Department of Advance Internal Medicine, Singapore, Singapore

**Background:** PrEP initiation may be beneficial for emotional well-being among gay, bisexual and other men who have sex with men (GBMSM) through empowerment as well as reduced fears of acquiring HIV. However, no prior study has explored the impact of PrEP initiation on the mental wellbeing of GBMSM in Singapore.

**Methods:** A concurrent mixed-methods study design was employed. Quantitative data were collected at baseline, 6 and 12 months following PrEP initiation at a clinical setting. Outcomes of interest including HIV risk perception, internalised homophobia, depression, HIV stigma and PrEP stigma were measured as the composite score of several Likert scale questions. A longitudinal mixed effect linear model incorporating indicator variables for each

time point and controlling for key sociodemographic variables. Participants were purposively sampled to participate in in-depth interviews about their PrEP experience at the end of the study, which were analyzed through inductive thematic analysis.

**Results:** The baseline cohort consisted of 53 participants, with 40 individuals remaining in the study at the 6-month follow-up and 36 participants at the 12-month follow-up. A total of 13 participants participated in in-depth interviews. At the 6-month mark, HIV stigma ( $C=-2.13$ ,  $CI=[-4.00, -0.26]$ ) and PrEP stigma ( $C=-1.36$ ,  $CI=[-2.59, -0.14]$ ) decreased compared to baseline.

At the 12-month mark, HIV risk perception ( $C=-1.07$ ,  $CI=[-1.87, -0.32]$ ), depression ( $C=-1.55$ ,  $CI=[-2.81, -0.29]$ ), HIV stigma ( $C=-2.26$ ,  $CI=[-4.20, -0.32]$ ) and PrEP stigma ( $C=-2.08$ ,  $CI=[-3.35, -0.81]$ ) decreased compared to baseline.

Participants highlighted in interviews that being on PrEP helped them feel less worried and fearful of acquiring HIV and significantly improved their mental health. They also articulated how initiating PrEP gave them more confidence and opportunities to have sex with people living with HIV, and positively shaped their views towards both HIV and PrEP use in the community.

**Conclusions:** PrEP initiation has a significant positive impact on the mental wellbeing of GBMSM and has the potential to help in destigmatizing both PrEP use and having HIV in the community.

Further research is needed to explore the use of PrEP as a platform for addressing HIV-related stigma.

<sup>1</sup>Jhpiego Mozambique, Maputo, Mozambique, <sup>2</sup>ELOS Association, Maputo, Mozambique, <sup>3</sup>Jhpiego Kenya, Nairobi, Kenya

**Background:** Voluntary Medical Male Circumcision (VMMC) is a critical intervention in reducing heterosexual transmission of HIV in sub-Saharan Africa. Effective demand creation strategies are essential for the success of VMMC programs, thus it is critical to know where to find most clients. To find out from which places clients are being mobilized for VMMC, we present an analysis of VMMC client mobilization efforts in the Gaza and Sofala Provinces of Mozambique, focusing on the period from October 2022 to September 2023 (FY23).

**Methods:** Data were sourced from the National VMMC database and included details of the locations where clients were mobilized for VMMC services in Gaza and Sofala Provinces. Mobilization places for VMMC included health

facilities, homes (door-to-door mobilization), markets, prisons, community locations, roads, sports pitches, promotional campaigns, religious institutions, schools, and workplaces.

**Results:** In FY23, 26,332 clients were circumcised in both provinces, corresponding to 81% of the target of 32,400 clients. From the total circumcised, 21,245 clients (80.7%) were mobilized from their homes (90% in Gaza and 74.5% in Sofala). Home mobilization decreased as age increased (86% for 15 to 29; 66% for 30 to 49; 16% for 50+ years), was similar between rural and urban areas (91% versus 90%) in Gaza, and different in Sofala (72% urban vs 77% rural). Market mobilization accounted for 1,206 clients (4.6%; 1.1% in Gaza and 6.9% in Sofala), with 3%, 8% and 21% for the three age bands.

Other places combined (prisons, community settings, road works, soccer/sports pitch) accounted for 2,042 clients (8%), with 5%, 17% and 28% for the age bands; 787 clients (3.0%) were mobilized at school and workplaces; 956 (3.6%) clients were mobilized at health facilities; 96 (0.4%) were mobilized at promotional campaigns and religious functions.

**Conclusions:** Home-based mobilization was the most successful strategy for VMMC client recruitment in both Gaza and Sofala Provinces, especially in Gaza, and for younger clients.

Market-based strategies also contribute significantly but could benefit from further enhancement. Strategies involving promotional campaigns, religious institutions, schools and workplaces need reconsideration. The variety of sources highlights the importance of a multi-pronged approach to VMMC demand creation.

## WEPEC211

The relationship between recent condomless anal sex and willingness to use injectable PrEP among transgender women and MSM in India: testing the mediating role of risk perception

V. Chakrapani<sup>1</sup>, A. Sebastian<sup>2</sup>, R. Nelson<sup>1</sup>, M. Shanmugam<sup>1</sup>, J. Kaur<sup>3</sup>, P.A. Newman<sup>4</sup>

<sup>1</sup>Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, <sup>2</sup>National Institute of Advanced Studies (NIAS), Bengaluru, India, <sup>3</sup>Postgraduate Institute of Medical Education and Research (PGIMER), Chandigarh, India, <sup>4</sup>University of Toronto, Toronto, Canada

**Background:** Several theories (e.g., Risk Perception Attitude framework) and empirical findings indicate that risk perception may predict future behaviors or intentions to adopt healthy behaviors, and that past behaviors can influence risk perception.

We tested the hypothesis that recent condomless anal sex (CAS) will predict willingness to use injectable PrEP through increased risk perception among TGW and MSM.

**Methods:** In 2022, we conducted online/self-administered and offline/interviewer-administered surveys among 250 TGW and 251 MSM in Chennai. We collected data on CAS with last male non-regular partner (yes/no), risk perception score ("To what extent are you afraid you might contract HIV?: 'not at all afraid'=0, 'to very afraid'=3"), oral PrEP awareness/use, and willingness to use injectable PrEP (yes/no). Causal mediation analysis was used in Stata-18 to estimate the natural direct (NDE), indirect (NIE), and total (TE) effects on willingness to use injectable PrEP.

**Results:** Participants' mean age was 29 years (SD=5.7) for TGW and 30 years (SD=6.9) for MSM. Engagement in sex work: TGW=93.9%; MSM=39.2%. CAS was higher among MSM (41.5%) compared to TGW (21.7%;  $p<.001$ ). Among TGW, CAS had significant direct (NDE=0.35, 95% CI 0.25 to 0.46,  $p<.001$ ) and total (TE=0.41, 95% CI 0.28 to 0.54,  $p<.001$ ) effects on willingness to use injectable PrEP, and a significant indirect effect through risk perception (NIE=0.06, 95% CI 0.01 to 0.10,  $p<.01$ ; proportion mediated=15%).

Among MSM, there were no significant TE, NDE or NIE; however, among MSM who engage in sex work, CAS had a significant direct and total effects on willingness to use injectable PrEP (NDE=0.19, 95% CI 0.04 to 0.35,  $p=.02$ ; TE=0.19, 95% CI 0.04 to 0.34,  $p=.02$ ), but risk perception was not a significant mediator.

Among MSM, CAS was not a significant predictor of risk perception and higher income predicted willingness to use injectable PrEP.

**Conclusions:** Our findings support the mediating role of risk perception in the association between CAS and willingness to use injectable PrEP among TGW. Among MSM, as CAS was not associated with risk perception, strategies to increase accurate HIV risk perception, along with PrEP education campaigns and affordable/subsidized pricing may increase willingness to use injectable PrEP.

## WEPEC212

Highly effective PrEP implementation program under Thailand's Universal Health Coverage (UHC) scheme provided by key population-Led and hospital-based services to reduce newly acquire HIV to end AIDS by 2030

K. Intawong<sup>1</sup>, S. Chariyalertsak<sup>1</sup>, P. Namahoot<sup>2</sup>, P. Wareechai<sup>2</sup>, S. Chautrakarn<sup>1</sup>, A. Thongprachum<sup>1</sup>

<sup>1</sup>Chiang Mai University, Faculty of Public Health, Muang Chiang Mai, Thailand, <sup>2</sup>National Health Security Office, Bangkok, Thailand

**Background:** UHC scheme had initiated to pilot free of charge for HIV pre-exposure prophylaxis (PrEP) services for high-risk population in Thailand since 2020. In 2022, there were several Key Population-Led Health Services (KPLHS) run by Community Based Organizations (CBOs) and hospital-based facilities distributed throughout the country to provide PrEP services for KPs.

Oral

**Methods:** PrEP services under UHC were recorded under National AIDS Program (NAP) through online system. We used the data from NAP for newly registered PrEP users in 2022 then followed up to December 2023 to explore PrEP persistence and newly HIV seroconvert among PrEP users who either still used PrEP or discontinued and restarted PrEP later.

We used linked de-identified PrEP users and HIV testing results who newly registered under NAP and initiated PrEP in 2022 and follow up them till December 2023. PrEP retention (continuously on PrEP) and PrEP persistence for 12 months (continuously PrEP users and person who initiated PrEP and stopped > one month, then restarted PrEP again) were analysed. HIV testing results were used to estimate HIV incidence among PrEP users during study period.

**Results:** There were 10,938 people who initiated PrEP under UHC which 9,237 (84.45%) were newly PrEP users and 1,701 (15.55%) who ever used PrEP and restarted to use PrEP again. From 10,938 users, 8,295 (75.84%) received PrEP services by KPLHS and 2,643 (24.16%) by hospitals. Most common key-population were MSM (78.13%) and TGW (9.54%) by KPLHS and MSM (72.34%) and partner of PLHIV (14.30%) by hospital-based services. PrEP retention at 12 months was 14.33% by KPLHS and 15.02% by hospital. PrEP persistence at 12 months was 26.85% by KPLHS and 25.77% by hospital.

There was no single HIV seroconvert among people who were still on PrEP or restarted PrEP during the study period except 3 cases who were found to have HIV positive at one month visited after PrEP initiation.

**Conclusions:** PrEP implementation under UHC by KPLHS and hospital-based facilities had demonstrated the highly effective results to reduce HIV acquisition among high risk population who engaged in PrEP services.

Scaling up PrEP services among KPs and early recruit newly HIV infection on ART will be crucial strategies to end AIDS by 2030.

## WEPEC213

### Acceptability of pharmacy-based Pre-Exposure Prophylaxis (PrEP) refills for people who sell sex in Zimbabwe

S. Munhenzva<sup>1</sup>, F. Masiyambiri<sup>1</sup>, H. Archer<sup>2</sup>, C. Watadzaushe<sup>1</sup>, K. Chidhanguro<sup>1</sup>, N. Ruhode<sup>1</sup>, C. Madanhire<sup>1</sup>, L. Packel<sup>2</sup>, F.M. Cowan<sup>1,3</sup>, S.I. McCoy<sup>2</sup>, E. Sibanda<sup>1,3</sup>

<sup>1</sup>Centre for Sexual Health and HIV AIDS Research (CeSHHAR), Zimbabwe, Sexual Reproductive Health, Harare, Zimbabwe,

<sup>2</sup>University of California, Berkeley School of Public Health, Sexual Reproductive Health, California, United States,

<sup>3</sup>Liverpool School of Tropical Medicine, Sexual Reproductive Health, Liverpool, United Kingdom

**Background:** Pre-exposure prophylaxis (PrEP) has potential to decrease the HIV burden among sex-workers (SW). However, PrEP continuation among SW initiated on PrEP is low, an issue that could be partially mitigated with community-based PrEP refills from pharmacies.

We report on the acceptability of a pharmacy-based PrEP refill program nested within Zimbabwe's existing Key Populations (KP) program (formerly Sisters) for PrEP initiation in Harare, Zimbabwe.

**Methods:** Participants were purposively selected between June-July 2023. In-depth interviews were conducted with SW, pharmacists, and key informants from various health departments, namely, Harare City Health, Ministry of Health, National AIDS Council and CeSHHAR to determine their perspectives on pharmacy-based PrEP refills. SW were selected to ensure diversity in gender, age, and participation levels in the KP program. Thematic analyses were conducted.

**Results:** Overall, 20 SW, aged 16-23 years were interviewed (16 female, 3 transgender females and 1 male). Six pharmacists and 4 key informants were also interviewed. All SW viewed the use of pharmacies for PrEP refills positively, with most SW expressing willingness to collect PrEP from this venue which was viewed as convenient and time saving. Most (n=18, 90%) SW perceived pharmacy staff as friendly. Pharmacies were also viewed as acceptable places for accessing new PrEP technologies such as injectables; and conducting HIV self-tests for PrEP refills. Potential barriers raised by SW included possible lack of confidentiality of pharmacy staff and fear of being judged by pharmacists compared to the KP program staff, who were viewed as creating a safe and comfortable environment. Two (10%) SW perceived pharmacists would provide inadequate health information, and 'felt inferior to pharmacy staff' making it difficult to seek clarification. Pharmacists were highly supportive of the intervention: they acknowledged that SW are part of their clientele and said they would uphold confidentiality as part of their professional responsibility. Key informants viewed pharmacy-based PrEP refills as practical and achievable with potential to increase access options for SW.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Conclusions:** SWs, pharmacists, and key informants found pharmacy-based PrEP refills acceptable and potentially feasible if confidentiality is prioritised. A multi-disciplinary team is co-developing a tailored, safe, and acceptable pharmacy-based PrEP intervention for Zimbabwean sex work populations.

## WEPEC214

Elevating PrEP access: a game-changing ePharmacy model for key populations in South Africa

J. Pienaar<sup>1</sup>, R. Rawlinson<sup>2</sup>, V. Ncube<sup>1</sup>, M. Chabane<sup>1</sup>  
<sup>1</sup>Aurum Institute, Johannesburg, South Africa, <sup>2</sup>Careworks, Cape Town, South Africa

**Background:** Ensuring access to Pre-Exposure Prophylaxis (PrEP) for key populations, specifically men who have sex with men (MSM) and transgender women (TGW), is crucial in achieving the 95-95-95 goals for HIV prevention. Challenges such as poor patient monitoring, clinic visit costs, and lengthy wait times have been associated with PrEP adherence issues. Recognizing the need for more client-friendly and convenient services, the Aurum Institute's POP INN clinics serving men who have sex with men (MSM) and transgender women (TGW) have successfully implemented an innovative approach - ePharmacy.

**Description:** This online, courier-based medication delivery system, facilitated by CareWorks, a digital and health-care innovation organization in South Africa, has proven effective in reaching these subgroups of KPs across SA. The ePharmacy model is a program that enrolls eligible MSM, connecting them with the Careworks digital and call centre. This innovative system enables clients to engage with telehealth services from any location in South Africa. Careworks proactively contacts clients two weeks before their PrEP supply runs out, allowing clients to specify their preferred delivery location for the next supply.

This flexible approach means clients are not confined to the district where they initiated PrEP, eliminating the need for clinic visits and enabling access to PrEP from any part of South Africa. From April 2022 to December 2023, a total of 813 clients were enrolled in the ePharmacy program. Within this period, 606 clients were actively using daily PrEP, while 56 opted for Event-Driven PrEP.

**Lessons learned:** ePharmacy, when integrated with outreach and facility-based strategies, effectively overcomes barriers such as HIV stigma, lengthy waiting times, staffing costs, and travel expenses. Its cost-effectiveness facilitates consistent provision of pharmaceutical services to remote or non-facility-based community members.

**Conclusions/Next steps:** This model highlights the potential of public-private partnerships in decentralizing access to PrEP. By leveraging digital platforms and courier-based solutions, such partnerships can overcome traditional barriers, ensuring that PrEP is delivered con-

veniently and confidentially to individuals irrespective of their geographic location. This not only improves adherence but also addresses issues such as stigma, long waiting times, and travel costs, making PrEP more accessible and attractive to those who need it the most.

## WEPEC215

Developing a novel mobile app to support adherence to Event-Driven PrEP (ED-PrEP) among MSM: the PrEPsmart Study

A. Liu<sup>1,2</sup>, C.-D. Alleyne<sup>1</sup>, S. Sicro<sup>1</sup>, G. Muñoz Acosta<sup>1</sup>, J. Moss<sup>1</sup>, J. Vinson<sup>1</sup>, P. von Felten<sup>1</sup>, M. Spinelli<sup>2</sup>, M. Gandhi<sup>2</sup>, S. Buchbinder<sup>1,2</sup>, R. Amico<sup>3</sup>, H. Scott<sup>1,2</sup>, T. Torres<sup>4</sup>  
<sup>1</sup>San Francisco Department of Public Health, Bridge HIV, San Francisco, United States, <sup>2</sup>University of California, San Francisco, San Francisco, United States, <sup>3</sup>University of Michigan, Ann Arbor, United States, <sup>4</sup>Instituto Nacional de Infectologia Evandro Chagas, Fundação Oswaldo Cruz, Rio de Janeiro, Brazil

**Background:** Several studies have demonstrated the effectiveness of event-driven (ED)-PrEP as an alternative to daily PrEP. While ED-PrEP has promising potential to increase PrEP uptake/persistence, adherence to this complex regimen is challenging.

**Methods:** Using the Information-Motivation-Behavioral Skills Model, a multi-disciplinary team developed the PrEPsmart app which features pill-taking/sex diary, SMS-reminders for ED-PrEP dosing, and feedback on PrEP protection levels and dosing summaries. We conducted focus groups (FG) among MSM in San Francisco, CA to develop the app, followed by a two-month pilot to assess acceptability using System Usability Scale (SUS).

**Results:** 15 MSM participated in four FGs (mean age 29, 60% minority race/ethnicity). When shown wireframes, participants appreciated how PrEPsmart simplified the process of taking ED-PrEP and liked that the app assisted with planning for sex and notifying them when they would be protected after dosing. Several felt trends and insights are useful in helping MSM understand their sexual patterns and would help them decide whether to switch to daily PrEP. They recommended in-app notifications followed by text messages for dosing reminders, as well as a chat feature to answer questions and stay in touch with their provider. Based on FG feedback, we developed key features of PrEPsmart (figure), removed disliked components (e.g. partner-rating feature in sex diary), and tailored language to be sex-positive.

Among 12 MSM (mean age 41, 42% minority race/ethnicity) in the pilot, baseline median sex partners in last 3 months was 4 (IQR:3-7), and 8 were already using ED-PrEP. Mean SUS score was 64/100 ("good" range). Overall, 83% reported the app met their needs for PrEP support, 83% reported it helped them take ED-PrEP, and 92% would use PrEPsmart in future studies.

AIDS 2024

Oral  
abstracts

Poster  
exhibition

<sup>2</sup>ViiV Healthcare Ltd, Brentford, United Kingdom, <sup>3</sup>ViiV

Healthcare Ltd, Durham, United States, <sup>4</sup>ViiV Healthcare

Ltd & Chelsea and Westminster Hospital, Brentford/

London, United Kingdom, <sup>5</sup>ViiV Healthcare Ltd, München,

Germany

**Background:** Long-acting injectable pre-exposure prophylaxis for HIV (LA-PrEP) is approved for use in Europe and can substantially contribute to HIV prevention by fulfilling unmet needs. To date no large-scale comprehensive data is available that investigates interest and intention to use this new modality among men-who-have-sex-with-men (MSM) in Europe.

**Methods:** Data was collected via a cross-sectional survey from October to December 2023 among 8,642 HIV negative MSM participants from Spain (n=1,982), Germany (n=2,069), France (n=1,921), UK (n=1,137) and Italy (n=1,587). We investigated interest and intention to use LA-PrEP and its determinants, including sociodemographic information, sexual behavior, PrEP use (naïve, current, past; type of regimen), substance use, and psychosocial indicators using multivariable logistic regression.

**Results:** Overall, interest and intention to use LA PrEP were high (74%; 67%), particularly among current oral PrEP users (80%; 79%). Higher likelihood of the intention to use was associated with: dating (aOR=1.19; 1.04-1.379), open relationship (aOR=1.24; 1.06-1.45), past condomless anal intercourse (aOR=1.57; 1.38-1.79), chemsex (aOR=1.42; 1.14-1.76), PEP use (aOR=1.41; 1.18-1.69), more sexual partners (aOR=1.61; 1.22-2.15), sexual positioning (versatile aOR=1.22; 1.07-1.39; bottom 1.27; 1.07-1.51), perceived HIV risk (aOR=1.34; 1.26-1.41), perceived HIV concern (aOR=1.29; 1.23-1.35). It was

lower among MSM reporting: higher education (aOR=0.85; 0.74-0.97), higher income (aOR=0.78; 0.7-0.88), no or second generation migration background (aOR=0.71; 0.53-0.95), HIV testing less than once annually (aOR=0.7; 0.51-0.94), never testing for STI (aOR=0.62; 0.45-0.86), PrEP naïve (aOR=0.72; 0.61-0.85), fear of needles (aOR=0.93; 0.88-0.98), worries about side-effects (aOR=0.84; 0.8-0.88), injection pain (aOR=0.87; 0.82-0.91).

For current oral PrEP users, neither type of regimen (daily or on-demand), nor self-reported adherence predicted LA-PrEP intention to use. For model comparison, see figure.

**Conclusions:** MSM in Europe are interested and intend to use LA PrEP if made available. This innovation has the potential to help fulfilling unmet HIV prevention needs. The results can inform tailoring of access, public health policies, and messaging.

### Demand creation strategies to improve voluntary medical male circumcision uptake in a traditionally non-circumcising community in Eastern Uganda

D.J. Olweny<sup>1</sup>, P. Sekiranda<sup>1</sup>, R. Opito<sup>1</sup>, G. Muzaaya<sup>1</sup>,

B. Oryokot<sup>1</sup>, B. Bakashaba<sup>1</sup>, S. Alwedo<sup>2</sup>, Y. Miya<sup>1</sup>,

E. Benard Micheal<sup>3</sup>, K. Mugisha<sup>1</sup>, G. Kabuye<sup>4</sup>

<sup>1</sup>The AIDS Support Organization, Programs and Capacity

Development, Kampala, Uganda, <sup>2</sup>The AIDS Support

Organization, Care and Treatment, Kampala, Uganda,

<sup>3</sup>The AIDS Support Organization, Kampala, Uganda, <sup>4</sup>US Centers for Disease Control and Prevention, Global Health Center, Division of Global HIV & TB, Kampala, Uganda

**Background:** Voluntary medical male circumcision (VMMC) is a one-time preventive measure that reduces by 60% the risk of transmission of HIV to men in settings of high HIV prevalence. In some areas of Uganda such as Bugisu, most men are traditionally circumcised. However, in Teso sub-region where The AIDS Support Organization (TASO) implemented a U.S. President's Emergency Plan for AIDS Relief (PEPFAR)-funded health system strengthening project from 2017-2023, men do not routinely circumcise and VMMC is associated with myths such as impotence and Islamization. Stigma, fear of pain and prolonged abstinence period are also key barriers.

To increase the uptake of circumcision in this community, we designed a comprehensive community and health systems strengthening strategy.

**Description:** We designed and implemented a comprehensive community and health systems strengthening approach to strengthen VMMC uptake in 10 districts and 1 city in Teso-subregion, that is, Soroti, Kalaki, Kaberamaido, Amuria, Kapelebyong, Katakwi, Kumi, Bukedea, Ngora, Serere districts and Soroti City. The community systems approach involved dialogue meetings and trainings of opinion leaders such as religious, political, and cultural leaders who acted as gate keepers of VMMC mobilization activities. We also trained and engaged community-based peer mobilizers who conducted door-to-door mobilization for VMMC services. The health systems strengthening involved training of 121 health workers, enabling VMMC service expansion from 4 sites in 2017 to 13 in 2023. District health teams conducted regular site support supervision to mobilize men for high-quality, low-risk VMMC. Circumcision uptake increased from 7,515 (63% of target) at the start of the project (April-September 2017) to 24,751 (94% of the October 2017-September 2018 target) and subsequently maintained between 100%-120% (30,000-39,000 per year) until end of project in Sept 2023.

**Lessons learned:** The community is willing to take up VMMC services. Health and community systems strengthening is key to dispel myths and increase access, acceptability, and uptake of VMMC services in a traditionally non-circumcising community.

**Conclusions/Next steps:** Using a comprehensive and health systems strengthening strategy for demand creation increased uptake of VMMC in a traditionally non-circumcising community of eastern Uganda. Adoption and scaling up of these strategies might lead to reaching and sustaining HIV epidemic control.

## WEPEC218

### Falling through the cracks: optimization of post exposure prophylaxis for sexual violence HIV exposure outcomes using a target program cascade approach in Uganda, 2023

R. Apondi<sup>1</sup>, R. Baryamutuma<sup>2</sup>, H. Kiyingi<sup>1</sup>, U. Kanagasabai<sup>3</sup>, J. Cheptoris<sup>4</sup>, G. Namazzi<sup>1</sup>, A. Awor<sup>1</sup>

<sup>1</sup>Division of Global Health HIV & TB, Center for Global Health, Division of Global Health HIV and TB, US Centers for Disease Control and Prevention (CDC), Kampala, Uganda, <sup>2</sup>Makerere School of Public Health, Kampala, Uganda, <sup>3</sup>Division of Global Health HIV & TB, Center for Global Health, Division of Global Health HIV and TB, US Centers for Disease Control and Prevention (CDC), Atlanta, United States, <sup>4</sup>Ministry of Health, Kampala, Uganda

**Background:** Sexual violence significantly impacts many women every year, amplifying the risk of HIV acquisition. Post-exposure prophylaxis (PEP) reduces HIV acquisition risk when taken within 72 hours of exposure and completed as a regimen. A cascade is a model for evaluating client retention across sequential stages of care required to achieve a successful desired outcome. Cascades with targets to standardize and optimize service delivery could improve PEP outcomes.

However, there is no defined cascade for PEP provision. We sought to define a PEP cascade and determine utility in identifying PEP service provision gaps among sexual violence survivors.

**Description:** Using World Health Organization guidelines, we assessed key indicators for PEP eligibility after possible HIV exposure, self-reported PEP initiation, and regimen completion, and HIV test confirmed sero-conversion monitoring among those who completed the regimen. We developed a monthly PEP-cascade data collection tool reporting into the US President's Emergency Plan for AIDS Relief (PEPFAR) Reporting System in Uganda from April to September 2023.

Figure. Post exposure prophylaxis cascade for 35,701 sexual violence survivors from 1806 health facilities in Uganda (April to September 2023).

**Lessons learned:** From 35,701 cases identified, majority were female (98%), and between aged 10-24 years (70%). Overall, 6,100 (17%) were eligible for PEP, 4,942 (81%) initiated PEP, 728 (15%) completed PEP and 101 (14%) of those who completed PEP sero-converted. These findings highlight missed opportunities for client follow-up for PEP regimen completion and sero-conversion monitoring. The PEP cascade presents an opportunity to profile cases, identify repeat PEP users eligible for pre-exposure prophylaxis and improve linkage to care for sero-converted individuals.

**Conclusions/Next steps:** To maximize PEP benefits for sexual violence survivors, it would be best to optimize the proportion of eligible clients initiated and ensure that most of those initiated complete PEP. Like the UNAIDS 95-95-95 treatment targets, a target program PEP-cascade may improve outcomes by identifying gaps to address and avert HIV seroconversions among sexual violence survivors.

## WEPEC219

### High adherence to oral PrEP in a large PrEP implementation project in Kenya

L. Wu<sup>1,2</sup>, E. Irungu<sup>3</sup>, N. Mugo<sup>3,1</sup>, E. Bukusi<sup>4,5</sup>, J. Odoyo<sup>5</sup>, S. Peacock<sup>1</sup>, J. Morton<sup>1</sup>, K. Ngure<sup>1,6</sup>, I. Mukui<sup>7</sup>, P. Anderson<sup>8</sup>, J. Baeten<sup>9,1</sup>, K. Mugwany<sup>2,1</sup>,

Partners Scale-Up Project Team

<sup>1</sup>University of Washington, Department of Global Health, Seattle, United States, <sup>2</sup>University of Washington, Department of Epidemiology, Seattle, United States, <sup>3</sup>Kenya Medical Research Institute, Centre for Clinical Research, Nairobi, Kenya, <sup>4</sup>University of Washington, Department of Obstetrics and Gynecology, Seattle, United States, <sup>5</sup>Kenya Medical Research Institute, Centre for Microbiology Research, Nairobi, Kenya, <sup>6</sup>Jomo Kenyatta University of Agriculture and Technology, Department of Community Health, Juja, Kenya, <sup>7</sup>Ministry of Health, National AIDS & STI Control Program, Nairobi, Kenya, <sup>8</sup>University of Colorado-AMC, Skaggs School of Pharmacy and Pharmaceutical Sciences, Aurora, United States, <sup>9</sup>University of Washington, Department of Medicine, Seattle, United States

**Background:** Oral pre-exposure prophylaxis (PrEP) effectiveness is linked to adherence, and accurate adherence measurement is crucial for appropriately interpreting the success of PrEP programs.

We assessed oral daily PrEP adherence via tenofovir diphosphate (TFV-DP) levels in dried blood spots (DBS) from a large PrEP implementation project.

**Methods:** Data are from the Partners Scale-Up Project, a stepped-wedge cluster-randomized pragmatic trial to integrate PrEP delivery in 25 public HIV care clinics in Kenya from 2017-2019. DBS samples were obtained from individuals returning for PrEP refill visits at all clinics on a random subset of days in a month. TFV-DP levels were measured

in DBS using liquid chromatography/tandem mass spectrometry at University of Colorado. We used DBS adherence benchmarks established in men to define the proportion of participants who took 7, 4-6, 2-3, and <2 doses per week. GEE regression was used to evaluate the association between TFV-DP levels  $\geq 700$  fmol/punch (optimal adherence) and demographic factors, including age at enrollment, gender, and serodifferent partnership.

**Results:** Overall, 4898 individuals initiated PrEP. A total of 195 DBS samples were randomly collected from 168 individuals. Median age at enrollment was 33 years (IQR 27-44), 66% were female, 79% were in monogamous marriages, and 90% were in serodifferent partnerships. Median duration between PrEP initiation and sample collection was 6 months (IQR 3-13), with 4%, 16%, and 80% of samples collected at month 1, 2-3, and >3 post-initiation, respectively. Overall, TFV-DP was detectable in 188 (96%) of 195 DBS samples. Median TFV-DP concentration was 1247 fmol/punch (IQR 830-1681) and 82% had TFV-DP levels associated with  $\geq 700$  fmol/punch. Notably, 50% (97), 32% (62), 11% (21), and 7% (15) had DBS TFV-DP levels corresponding to 7, 4-6, 2-3, and <2 doses/week, respectively. TFV-DP levels  $\geq 700$  fmol/punch were more common in older individuals, males, and those in serodifferent partnerships, although none of these differences were statistically significant ( $P < 0.05$ ).

**Conclusions:** We observed high detection of TFV-DP levels suggestive of consistent use among individuals returning for PrEP refills in a large Kenyan PrEP implementation program. These data indicate adherence can be adequately high among clients at risk for HIV and motivated to use oral PrEP.

biomedical HIV prevention options. The ongoing SEARCH study in rural East African communities evaluated the uptake of a structured patient-centered HIV prevention package with choices of product, testing mode, and location of care delivery. In this qualitative study, we sought to understand clients' experiences of this 'dynamic choice prevention' (DCP) model and highlight pathways of action to inform HIV prevention delivery models.

**Methods:** In-depth semi-structured interviews were conducted from November 2021 through March 2022 with a purposively-selected sample of n=56 participants in the SEARCH study DCP trials (across outpatient departments, antenatal clinics, and community settings), and n=21 healthcare providers (total n=77). A seven-person multi-regional team translated and inductively-coded transcript data. We used a framework analysis approach to identify emergent themes.

**Results:** Individuals taking up PrEP reported feelings of relief, a sense of liberation from fears of acquiring HIV, and satisfaction with being able to take action despite their partner's behaviors. Couples used a range of approaches afforded by the study to persuade partners to get tested and opt for PrEP. PEP use was less common, although women welcomed it in the event of sexual coercion or assault. Participants discussed switching from PEP to PrEP after familiarizing themselves with usage and ascertaining ongoing risk. Participants reported feeling respected by providers and able to contact them directly for telephone support. Prevention uptake was hindered by stigma, limited experience with and knowledge of prevention methods, gendered and generational power dynamics within intimate partnerships and families, and negative perceptions of methods due to properties of the products themselves. Participants anticipated long-acting injectable PrEP could solve their challenges regarding pill size, daily pill burden, and likelihood of unwanted disclosure.

**Conclusions:** Diverse preferences and barriers to uptake of prevention require a choice of HIV prevention options, locations and delivery modalities- but in addition, flexible, competent and friendly care provision is crucial to promote uptake. Helping clients feel valued, and addressing their unique needs and challenges, enables their agency to prioritize their health.

### Pre-Exposure Prophylaxis (PrEP) option preferences among sex workers (SW) in seven provinces in Thailand: a national cross-sectional study

S. Sukthongsa<sup>1</sup>, S. Sumalu<sup>1</sup>, A. Somwaeng<sup>1</sup>, C. Phaennongyang<sup>1</sup>, S. Janyam<sup>1</sup>, C. Manopaiboon<sup>2</sup>, D. Clarke<sup>2</sup>, P. Girault<sup>2</sup>, R. Vannakit<sup>2</sup>

<sup>1</sup>SWING (Service Workers In Group Foundation), Bangrak, Thailand, <sup>2</sup>BIRD (Bangkok Interdisciplinary Research and Development), Phayathai, Thailand

**Background:** Despite Thailand offering free PrEP under Universal Health Coverage since 2019, only 8% of users are sex workers (SW) – males (MSW), females (FSW), and transgender females (TGSW) – Thailand Ministry of Public Health, 2023. As part of a PrEP study among SW in Thailand, current PrEP uptake status and preferred PrEP options reported by SW were investigated.

**Methods:** A national cross-sectional study was conducted from April–December 2023 by SWING Foundation and BIRD (Bangkok Interdisciplinary Research and Development) in seven provinces in Thailand. This study investigated PrEP uptake and associated factors among SW using a questionnaire that included questions on current PrEP status and preferred PrEP options: i) PrEP oral dose; ii) long-acting injectable cabotegravir (CAB-LA); and iii) PrEP vaginal ring. Regarding PrEP options, interviewers provided information on these, mentioning that some options have not yet been registered in Thailand. The study enrolled a total of 1,511 Thai SW (FSW: 621 – MSW: 452 – TGSW: 438), aged ≥18 years old, HIV-negative, and engaged in sex work in the past three months. Data collection was conducted face-to-face by trained outreach workers.

**Results:** The median age of SW was 32 years. Out of the total, 35.9% had started sex work in the past 12 months, 136 (9.0%) reported currently using PrEP, 370 (24.5%) reported not being interested in PrEP, and 898 (59.4%) were willing to initiate PrEP. After explanation of the different options, injectable CAB-LA was the most preferred option (FSW: 43.6%; MSW: 40.0%; and TGSW: 43.6%) followed by daily oral dose (FSW: 30.6%; MSW: 28.8%; and TGSW: 38.1%). Among SW who reported not being interested in PrEP (n=370), after receiving further information, 71.8% selected a PrEP option, with 40% stating a preference for CAB-LA and 17.3% for daily oral dose.

**Conclusions:** Information provided to SW about different PrEP options can increase demand among those previously reporting no interest. Such information enabled interested SW to select the PrEP option best suited to their needs. Enhanced information provision for SW will be needed for PrEP scale up. Different PrEP options need to be made available and accessible for SW, including affordable injectable CAB-LA, in the public health system.

## WEPEC222

### Accelerating HIV prevention in Cameroon: factors associated with early sexual risk among 15-19 adolescent girls and young women, including adolescent mothers

O.J. Baruwā<sup>1</sup>, B.H. Banougnin<sup>2</sup>, R. Tamarabang<sup>2</sup>,  
P. Nyamukondiwa<sup>1</sup>, R. Yates<sup>2</sup>, B. Maughan-Brown<sup>2</sup>,  
J. Ferguson<sup>1</sup>, E. Toska<sup>1</sup>

<sup>1</sup>University of Cape Town, Centre for Social Science Research (CSSR), Rondebosch, South Africa, <sup>2</sup>University of Cape Town, Cape Town, South Africa

**Background:** Reaching global HIV targets requires supporting epidemiological transitions in different epidemics, including concentrated epidemics, such as the case of Cameroon, the most HIV-affected country in West Africa. Understanding which adolescent girls and young women should be prioritized for HIV prevention services is central to targeting HIV prevention investments.

This study focuses on examining factors associated with HIV and sexual risk behaviors among adolescent girls (15-19 years) in Cameroon.

**Methods:** The study's specific objectives are to examine differences in sexual risk behaviors among very young adolescent girls and young women in Cameroon by motherhood status, followed by investigating factors associated with outcomes. This study utilized the cross-sectional data from the 2018 Cameroon Population-based HIV Impact Assessment (CamPHIA) survey, with a special focus on adolescents who are mothers.

We assessed eight individual measures of HIV and sexual risk behaviors: inconsistent condom use, transactional sex, age-disparate sex, multiple sexual partners, inequitable sex (transactional sex and age-disparate sex), tested and received HIV results, contraceptive use, and high-risk sex behaviors (inconsistent condom use and any or all the other listed sexual risks).

We calculated, weighted frequencies, odds ratios (ORs), and average marginal effects (AMEs) for individual HIV and sexual risk behaviors associated with vulnerability factors, adjusting for covariates using STATA 16.

**Results:** Bivariate results show that adolescent mothers report higher rates of HIV-related risks in all outcomes. AGYW who were mothers were more likely to report inconsistent condom use ( $\alpha\text{OR}=2.13$ ,  $95\%\text{CI}=1.74-2.59$ ), age-disparate sex ( $\alpha\text{OR}=1.69$ ,  $95\%\text{CI}=1.36-2.10$ ), inequitable sex partner ( $\alpha\text{OR}=1.63$ ,  $95\%\text{CI}=1.33-2.00$ ), high-risk sex ( $\alpha\text{OR}=1.73$ ,  $95\%\text{CI}=1.38-2.18$ ), and knowing their HIV status ( $\alpha\text{OR}=1.43$ ,  $95\%\text{CI}=1.14-1.80$ ) in multivariable analyses. Adolescent girls who were married, mothers, experienced early sexual debut (sex by 16 years), and were not in school had a 71.9% predicted probability of HIV risk behaviors, compared to 12.9% among AGYW who experienced neither of these factors.

**Conclusions:** In times of limited HIV prevention resources, targeting HIV prevention in concentrated epidemics such

as Cameroon may require more intensive efforts to reach very young adolescent mothers, especially those who are out of school and married early.

## WEPEC223

### Roles of key population-led health services (KPLHS) in identifying new cases of HIV acquisition in Chiang Mai, Thailand

S. Chautrakarn<sup>1</sup>, K. Intawong<sup>1</sup>, A. Thongprachum<sup>1</sup>,  
S. Chariyalertsak<sup>1</sup>

<sup>1</sup>Faculty of Public Health, Chiang Mai University, Chiang Mai, Thailand

**Background:** The Key Population-Led Health Services (KPLHS) model is critical to Thailand's HIV epidemic and has demonstrated feasibility and accessibility to key population. Chiang Mai, Thailand's second largest city, has two KPLHSs (Caremat Foundation and MPlus) that have been in operation for more than a decade. Their work includes HIV prevention in communities, outreach to key populations, HIV testing services, and referring those who test positive for treatment. The purpose of this study was to describe the HIV prevalence among clients receiving services from KPLHSs in Chiang Mai, as well as the CD4 level at the first HIV diagnosis.

**Methods:** A cross-sectional using secondary data from the KPLHS client databases (eCascade) from 2021 to 2023 was conducted to describe the HIV prevalence and CD4 levels. All clients receiving services from KPLHSs in Chiang Mai were included in the analysis.

**Results:** Out of 24,770 client records reviewed, 24,768 (99.9%) had complete data for analysis. The majority of clients were MSM (89.2%), followed by TGW (4.6%). The mean age was 26.67 years (SD9.22). The HIV prevalence based on the first HIV testing provided by KPLHS appears to be declining between 2021 and 2023 (2.6%,1.6%,1.4%, respectively). Of those who tested positive for HIV, 82.3% were MSM and 11.8% were TGW. The average CD4 level at the first test was 449.22 cells/uL (SD253.87). Data separated by year is shown in Table 1.

Year	2021	2022	2023
All clients (n, %)	6,457 (26.1%)	10,401 (42.0%)	7,910 (31.9%)
Age in years			
Mean (SD)	28.86 (9.20)	26.97 (9.59)	24.05 (8.87)
Key populations (n, %)			
- MSM	5,447 (84.4%)	9,532 (91.7%)	7,104 (89.6%)
- TGW	535 (8.3%)	383 (3.7%)	228 (2.9%)
- Others	475 (7.3%)	486 (4.6%)	578 (7.3%)
HIV positive cases (n, %)			
- MSM	166 (2.6%)	172 (1.6%)	113 (1.4%)
- TGW	136 (81.9%)	146 (84.9%)	89 (78.8%)
- Others	19 (11.4%)	17 (9.9%)	17 (15.0%)
- Others	11 (6.7%)	9 (5.2%)	7 (6.2)
CD4 (cells/uL)			
- Mean (SD)	441.67 (228.57)	446.78 (289.37)	459.22 (243.75)
- Median	456.5	397	393.5

Table 1. KPLHS clients and HIV prevalence (n = 24,768).

**Conclusions:** The majority of KPLHS clients were key populations. The overall average CD4 count of new HIV cases was relatively high.

This information may confirm that KPLHSs in Chiang Mai played an important role in rapidly reaching out to key

populations who may be at risk of HIV to get tested, know their HIV status, and then receive treatment in order to reduce transmission, in line with the global ultimate goal of ending AIDS by 2030.

## WEPEC224

Epidemiological impact of pre-exposure prophylaxis in HIV prevention: a single center observational experience in pre- and post-PrEP availability era

L.F. Rezzonico<sup>1,2</sup>, C. Baiguera<sup>3</sup>, A. Raimondi<sup>3</sup>, C. Rogati<sup>3</sup>, N.B. Bana<sup>3,4</sup>, F. Peracchi<sup>3,4</sup>, F. D'Amico<sup>3</sup>, D. Calzavara<sup>5</sup>, M.C. Moio<sup>3</sup>, L.G. Chianura<sup>3</sup>, M. Puoti<sup>3,4</sup>, R. Rossotti<sup>3</sup>  
<sup>1</sup>ASST Santi Paolo e Carlo, Milan, Italy, <sup>2</sup>University of Milan, Milan, Italy, <sup>3</sup>ASST Grande Ospedale Metropolitano Niguarda, Infectious Diseases, Milan, Italy, <sup>4</sup>University of Milan-Bicocca, Milan, Italy, <sup>5</sup>Milano Checkpoint, Milan, Italy

**Background:** HIV transmission is decreasing because of effective preventive tools such as treatment as prevention (TasP) and PrEP. In Italy, PrEP was introduced only in 2018: almost half of Italian PrEP users lives in Milan where HIV decrease appears more pronounced compared to the other Italian cities. PrEP net effect on epidemiology has not been clearly proven yet.

The aim of this analysis is to address potential PrEP role on new HIV cases trajectory.

**Methods:** This monocentric retrospective study included all new HIV cases from 2012 to 2023 stratified into 3 periods: pre-TasP (2012-2015), TasP (2016-2018) and PrEP (2019-2023). Descriptive statistics and non-parametric tests were used to depict study population. Linear regression analysis was applied to predict the trajectories of diagnoses in different subgroups including individuals eligible to PrEP, defined as MSM with CD4+ >500 cell/mm<sup>3</sup>.

**Results:** We included 656 persons (343 pre-TasP, 152 TasP and 161 PrEP): demographic and clinical features are summarized in Table 1.

		Overall (n=656)	Pre-TasP (n=343)	TasP (n=152)	PrEP (n=161)	p
Gender, n (%)	Males	507 (77.3)	263 (76.7)	115 (75.7)	129 (80.1)	0.001
	Females	119 (18.1)	73 (21.3)	29 (18.4)	18 (11.2)	
	TGW	30 (4.6)	7 (2.0)	9 (5.9)	14 (8.7)	
Age, years, median (IQR)		37 (30-47)	36 (30-48)	37 (30-50)	40 (31-48)	<0.001
Race/ethnicity, n (%)		371 (56.6)	203 (59.2)	80 (52.6)	88 (54.7)	0.341
Risk Factor, n (%)	MSM	368 (56.1)	173 (50.9)	88 (57.9)	105 (65.2)	0.013
	Heterosexual contact	249 (38.1)	139 (40.8)	60 (39.5)	50 (31.1)	
	IVDU	36 (5.5)	27 (7.9)	3 (2.0)	6 (3.7)	
Reason for testing, n (%)	Parenteral	2 (0.3)	1 (0.3)	1 (0.6)	—	<0.001
	Other disease	361 (55.0)	192 (56.0)	60 (39.5)	89 (55.3)	
	Risky behavior	166 (25.3)	88 (25.7)	47 (30.9)	31 (19.3)	
	Routine screening	44 (6.7)	18 (5.2)	3 (2.0)	23 (14.3)	
	Partner's infection	32 (4.9)	12 (3.5)	5 (3.3)	15 (9.3)	
	Pregnancy	10 (1.5)	8 (2.3)	1 (0.7)	1 (0.6)	
CDC Stage C, n (%)	Other	43 (6.6)	25 (7.3)	16 (10.5)	2 (1.2)	0.033
		164 (25.0)	97 (28.3)	30 (19.7)	37 (23.0)	
T Lymphocyte CD4 count, cells/mm <sup>3</sup> , median (IQR)		538 (119-525)	538 (115-516)	333 (112-517)	350 (129-542)	0.885
HIV RNA, log <sub>10</sub> , median (IQR)		4.92 (4.23-5.54)	4.91 (4.17-5.54)	4.90 (4.14-5.50)	4.99 (4.35-5.54)	0.373

TGW: transgender women; MSM: men who have sex with men; IVDU: intravenous drug users

Table 1. Demographic and clinical features of study population.

MSM were the largest group (56.1%) while PrEP candidates represented only a small portion (17.1%). Features of new cases were significantly different in the three study periods. New HIV diagnoses decreased significantly over time (b-coefficient: -0.167, p=0.018). The linear regression applied to risk factors showed a significant reduction in heterosexuals (b-coefficient: -0.263, p=0.027) and in intravenous drug users (b-coefficient: -1.740, p<0.001) but not in MSM (b-coefficient: -0.219, p=0.226). Subjects eligible to PrEP did not show a decreasing trajectory (b-coefficient: -0.366, p=0.375), but, after period stratification, the model predicted a significant decrease after 2018 when PrEP was available (b-coefficient: -0.727, p=0.015, Figure 1).

Figure 1. Linear regression analysis to predict trajectory of new HIV infections in MSM eligible to PrEP stratified according to study period (PrEP versus pre-TasP/TasP).

**Conclusions:** The overall number of new HIV diagnoses showed a progressive reduction during the last decade. The trajectory for MSM eligible to PrEP showed a significant downward trend in recent years suggesting that this tool may be effective for HIV transmission even at population level.

## WEPEC225

### "Is CAB-LA the answer to oral PrEP user challenges?" Clients' perceptions towards injectable PrEP scale-up in Malawi: a qualitative study

A. Bula<sup>1</sup>, L. Msumba<sup>2</sup>, R. Chilongosi<sup>3</sup>, F. Saidi<sup>4</sup>, K. Murombedzi<sup>3</sup>, D. Hoege<sup>5</sup>, L. Hills<sup>6</sup>, M. Hosseinipour<sup>4,6</sup>, S. Schwartz<sup>7</sup>, B. Afirima<sup>8</sup>, R. West<sup>9</sup>, R. Nyirenda<sup>10</sup>, Y. Magwira<sup>8</sup>, J. Nkhonjera<sup>10</sup>, W. Ozituosauka<sup>10</sup>, G. Kaur<sup>9</sup>, C. Holmes<sup>5</sup>

<sup>1</sup>University of North Carolina at Chapel Hill, School of Nursing, North Carolina, United States, <sup>2</sup>UNC Project, Nursing, Lilongwe, Malawi, <sup>3</sup>Population Services International, Blantyre, Malawi, <sup>4</sup>UNC Project, Lilongwe, Malawi, <sup>5</sup>Georgetown University, Washington, D.C, United States, <sup>6</sup>University of North Carolina, North Carolina, United States, <sup>7</sup>Johns Hopkins University, Baltimore, United States, <sup>8</sup>National AIDS Commission, Lilongwe, Malawi, <sup>9</sup>Ipsos, London, United Kingdom, <sup>10</sup>Department of HIV & AIDS, Ministry of Health, Lilongwe, Malawi

**Background:** Despite the introduction of oral PrEP in 2021, new HIV infections remain high especially among key and priority populations due to challenges with oral PrEP, including pill burden, side effects, and stigma. The introduction of injectable PrEP may reduce challenges and improve uptake and persistence.

This study assessed the feasibility, acceptability, and sustainability of introducing injectable PrEP.

**Methods:** 69 in-depth interviews (IDIs) were conducted between May-Dec 2023 with HIV- negative key and priority populations in Malawi as part of a pre-implementation study to assess preferences for injectable PrEP. IDIs explored clients' knowledge and experiences with oral PrEP, and delivery point and service integration, as well as anticipated barriers and facilitators to use. Interviews were translated and transcribed into English, followed by a rapid analysis of interview summaries; data was coded and analyzed using NVivo 1.7.

**Results:** Participants expressed motivation to initiate and continue injectable PrEP, citing its ease, lack of pill burden, long lasting effect, and discreteness as benefits. Many participants had previously taken but discontinued oral PrEP. Preferred injectable PrEP delivery models varied by population type; key populations noted a preference for delivery at drop-in centres, while priority populations indicated a preference for delivery at public health facilities. Respondents expressed that side effects might be a barrier, particularly given that they are irreversible once the injection has been received.

Co-administering and integration with other services was broadly accepted, though combining ART and PrEP delivery points was not accepted by many. Due to privacy concerns, participants preferred to be followed up by phone call or peer educators rather than SMS or home visits. Despite demonstrating motivation to use injectable PrEP, participants expressed some fears including the concern

that ART may be less effective in the event of seroconversion. Common misconceptions about injectable PrEP were that it may lead to sexual dysfunction in men, cause infertility in women, or that it could serve as a contraceptive or HIV vaccine.

**Conclusions:** Injectable PrEP was accepted by most key and priority groups and those using oral PrEP indicated readiness to switch methods. Injectable and oral PrEP communication, delivery, and follow-up should be tailored to population type.

## WEPEC226

### Size matters: a randomized controlled trial to assess the impact of external diameter on preference, adherence and acceptability of three intravaginal rings (IVRs) in 24 US couples

B.A. Friedland<sup>1</sup>, M. Plagianos<sup>1</sup>, I. Bruce<sup>1</sup>, J. Sales<sup>2</sup>, J. Atrio<sup>3</sup>, A. Gottert<sup>4</sup>, S. Shetty<sup>2</sup>, C. Sant'Anna Marinho<sup>3</sup>, J.B. Burnett-Zieman<sup>1</sup>, R. Merkatz<sup>1</sup>, L.B. Haddad<sup>1</sup>

<sup>1</sup>Population Council, Center for Biomedical Research, New York, United States, <sup>2</sup>Emory University, Atlanta, United States, <sup>3</sup>Albert Einstein College of Medicine, Bronx, United States, <sup>4</sup>Population Council, SBSR, Washington DC, United States

**Background:** Women need multipurpose prevention technologies (MPTs) for simultaneous prevention of HIV, other sexually transmitted infections, and unintended pregnancy. More than half of the MPTs in development are intravaginal rings (IVRs), however, no empirical data supports the current 54-58mm external diameter as ideal. Understanding the impact of size on preference, adherence, and acceptability is critical for designing products that users will be satisfied with, leading to effective use.

**Methods:** We conducted a 3-month randomized cross-over trial among 24 mutually monogamous couples in Atlanta and the Bronx to compare 3 non-medicated silicone IVRs (46mm, 56mm, 66mm external diameters) each used continuously for ~30 days. Women reported on preference and acceptability (19-item scale) via self-administered questionnaires, and adherence via daily texts.

We used random effects regression models to compare mean acceptability scores (scale of 1-5); adherence (IVR never out >30 minutes in 24h); and odds of removals, expulsions, and the IVR being out of the vagina all day, per day of use.

**Results:** 23/24 couples completed the study (mean age 27). More women preferred the 46mm IVR (59% vs 18% for the 56mm and 66mm IVRs;  $p=0.0045$ ), although, mean acceptability scores were identical for the 46mm and 56mm IVRs (4.54), and significantly higher than for the 66mm IVR (3.94;  $p<0.001$ ). There was no difference in overall adherence by IVR (46mm, 78%; 56mm, 75%; 66mm, 59%;  $p=0.30$ ), however, expulsions were more likely with the 46mm and

66mm IVRs than the 56mm IVR (OR 5.72, 95% CI: 1.25-26.1 and OR 25.9, 95% CI: 6.11-109, respectively); and the 66mm IVR was more likely to have been out all day than the 56mm IVR (OR 6.50, 95% CI 3.46-12.2).

**Conclusions:** Our findings demonstrate the impact of external diameter on preference, adherence, and acceptability of non-medicated IVRs. Although most women preferred the smaller 46mm IVR, the 56mm IVR was equally acceptable and yielded the fewest expulsions or removals, indicating that diameters ranging from 46mm-56mm are likely to be acceptable to most women. Additional research is needed to explore how compressibility affects acceptability and adherence.

## WEPEC227

**Uptake and continuation of daily oral pre-exposure prophylaxis among population representative adolescents and young adults enrolled in a factorial randomised controlled trial: findings from rural KwaZulu-Natal, South Africa**

I. Beesham<sup>1,2</sup>, J. Busang<sup>1</sup>, N. Chimbindi<sup>1,3,4</sup>, N. Okesola<sup>1</sup>, C. Herbst<sup>1</sup>, J. Dreyer<sup>1</sup>, J. Seeley<sup>1,3,5</sup>, N.O. Behuhuma<sup>1</sup>, T. Zuma<sup>1,3,4</sup>, K. Baisley<sup>1,3,5</sup>, M. Shahmanesh<sup>1,3,4</sup>

<sup>1</sup>Africa Health Research Institute, Mtubatuba, South Africa, <sup>2</sup>University of Alabama at Birmingham, Division of Infectious Diseases, Birmingham, United States, <sup>3</sup>University of KwaZulu-Natal, Durban, South Africa, <sup>4</sup>UCL Institute for Global Health, London, United Kingdom, <sup>5</sup>London School of Hygiene & Tropical Medicine, London, United Kingdom

**Background:** Adolescents and young people in South Africa are at substantial risk of acquiring HIV with approximately 56,000 new HIV acquisitions occurring among those aged 15-24 years in 2022. Daily oral pre-exposure prophylaxis (PrEP) is highly effective in preventing HIV acquisition, if taken as prescribed.

We describe PrEP uptake and early continuation in a 2x2 factorial randomised controlled trial (Isisekelo Sempilo) that aimed to assess the effectiveness of HIV prevention embedded in sexual health with or without peer navigator support to reduce prevalence of transmissible HIV.

**Methods:** The Isisekelo Sempilo trial, conducted from 2020-2022, enrolled 1743 adolescents and young adults aged 16-29 years randomly selected from a demographic health surveillance site in rural KwaZulu-Natal, South Africa. Follow-up was 12 months. Those living without HIV and eligible for PrEP according to country guidelines were offered PrEP and followed at month 1, 2, 6, 9 and 12. Participants had to link to a clinic following enrolment to initiate PrEP. Data were analysed descriptively and disaggregated by sex.

**Results:** Of the 1743 enrolled, 16% (n=161) were eligible for PrEP and 151 (94%) initiated PrEP. The most frequent reason for not being eligible for PrEP was not wanting to take

a daily pill, 45% of males and 33% of females respectively. PrEP continuation overall was 48% at month-1 and 28% at month-2.

Figure 1. PrEP cascade in the Isisekelo Sempilo study.

Reason for not being eligible for PrEP	Males n (%)	Females n (%)
Not wanting to take a pill everyday	167 (45)	167 (33)
On ART	20 (5)	123 (25)
Not sexually active	76 (21)	76 (15)
Not willing to test for HIV	29 (8)	48 (10)
Not ready/wants to think about it	36 (10)	29 (6)
Not interested in PrEP	27 (7)	40 (8)
Prefer condom use	9 (2)	2 (<1)
Other	6 (2)	14 (3)
Total	370 (100)	499 (100)

**Conclusions:** While PrEP uptake was high among males and females, half discontinued PrEP early. Daily pill taking is a barrier, and choice of PrEP including long-acting drugs and event driven PrEP are needed.

## WEPEC228

**Access, adherence, and acute HIV infections: a characterization of seroconversion with PrEP in Eswatini**

A. Hetteima<sup>1</sup>, S. Matse<sup>2</sup>, C. Nyapokoto<sup>2</sup>, N. Khanyile<sup>3</sup>, B. Mahlalela<sup>3</sup>, L. Kudrick<sup>4</sup>, L. Levy<sup>5</sup>, U. Parikh<sup>4</sup>, J. Peterson<sup>5</sup>  
<sup>1</sup>FHI 360- Eswatini, Mbabane, Eswatini, <sup>2</sup>Ministry of Health, National AIDS Program, Mbabane, Eswatini, <sup>3</sup>FHI 360, Mbabane, Eswatini, <sup>4</sup>University of Pittsburgh, Pittsburgh, United States, <sup>5</sup>FHI 360, Durham, United States

**Background:** Eswatini is one of the first countries in Africa to introduce the dapivirine vaginal ring alongside oral Tenofovir disoproxil fumarate/Lamivudine to provide Pre-exposure prophylaxis (PrEP) choice and expand HIV

prevention options. Monitoring for seroconversion and understanding adherence in PrEP programs is crucial to inform ongoing scale-up and guide interventions to increase effective PrEP use. We evaluated product interruption and self-reported adherence in individuals who acquired HIV in the Eswatini PEPFAR/USAID-supported Maximizing Options to Advance Informed Choice for HIV Prevention (MOSAIC) project.

**Methods:** The Eswatini PrEP HIV drug-resistance study is an ongoing national assessment in current or recent PrEP users (collected PrEP and/or self-reported PrEP use in the last three months) who acquire HIV as diagnosed per national algorithm using sequential third-generation rapid tests.

We analyzed the demographic data as well as self-reported PrEP use to characterize individuals who seroconverted from study start in May 2023 through January 2024.

**Results:** Of approximately 15,000 PrEP initiations, 10 clients tested HIV positive during a PrEP follow-up visit. All were female, with a median age of 28.1 years (IQR 22.7–31.9); 5 were pregnant or breastfeeding. At the time seroconversion was identified, 7 were using oral PrEP and 3 were using the PrEP ring. Seroconversion was identified within 45 days of oral PrEP (re-)initiation in 1/7 oral PrEP users and all ring users. One ring user reported a product interruption of 13 days before returning to the facility to get more product; 6 of 7 oral PrEP clients reported product interruption, including 2 reporting an interruption of 3–7 days and 4 reporting an interruption of 20–84 days. Reported reasons for ineffective PrEP use included missing doses, delays in obtaining services, or unavailability of their PrEP product.

**Conclusions:** Seroconversions remain rare in the Eswatini PrEP program. Causes of seroconversion in individuals using PrEP monitored in this study may be initiating PrEP during acute HIV infection and interruption of PrEP availability and/or product use.

This study highlights the importance of monitoring seroconversions and product effective use to inform and best support PrEP programs for long-term success in reducing HIV incidence.

## WEPEC229

Factors condemning condom uptake among adolescent girls and young women (AGYW) in strongly cultural communities: insights from the girls act program in Uganda

T. Emojei<sup>1</sup>

<sup>1</sup>AIDS Healthcare Foundation Uganda Cares, HIV prevention, Kampala, Uganda

**Background:** AGYW in Uganda continue to face barriers that hinder optimal condom usage, exposing them to risks of unintended pregnancies and sexually transmitted infections (STIs), including HIV/AIDS. This abstract reveals

challenges hampering condom use among Adolescent Girls and Young Women (AGYW) in strongly cultural communities in Uganda, drawing lessons from the innovative Girls Act program.

**Description:** The Girls Act program, is a global girl-led HIV primary prevention program designed by AIDS Health-Care Foundation, a global HIVAIDS organization providing HIV care and treatment in 45 countries including Uganda. The intervention was designed to reduce vulnerabilities of adolescent girls and young women by adopting a comprehensive approach, integrating education, empowerment, and effective community engagement, increasing access of AGYW to HIVAIDS services and empowerment goals. 75% of the beneficiaries are AGYW living with HIV due to higher vulnerability.

Qualitative studies conducted in deeply cultural communities using community focus group discussions in three regions where Girls Act in Uganda exists led to discovery of the following factors influencing poor condom uptake.

**Lessons learned: Sociocultural norms and conservative religious beliefs** deeply rooted in the Ugandan context have associated condoms with immorality, fornication, stigmatizing discussions around condom use and pressured AGYW to deprioritize their own sexual health due to sociocultural demands.

**Fear of relationship consequences.** Females in relationships carrying condoms in the Ugandan context reported being associated with promiscuity and often led to conflict or even rejection. Unequal power dynamics and fear of losing partner led to poor negotiation of AGYW for safer sex practices and therefore poor condom use.

**Limited Comprehensive Sexuality Education** in schools and communities and from parents who reportedly resisted conversations on sexual health has left AGYW uninformed about the importance of condom use, proper usage, and the associated risk of unprotected sex.

**Conclusions/Next steps:** Girls Act program in Uganda has revealed the need for a holistic approach to engage community and religious leaders, parents, families in breaking down societal barriers stigmatizing condom use.

The need for comprehensive, age appropriate CSE dispelling myths around condoms should be prioritized as well as further empowerment of the girl-child to strengthen her negotiation for safer sex practices.

Baseline preferences and acceptability ratings for long-acting pre-exposure prophylaxis (LA-PrEP) implants and injections: evidence for choice in HIV prevention among South African men

A.M. Minnis<sup>1</sup>, T. Palanee-Phillips<sup>2,3</sup>, M. Atujuna<sup>4</sup>, C. Hart<sup>5</sup>, K. Reddy<sup>2</sup>, S. Zulu<sup>2</sup>, E. Browne<sup>1</sup>, N. Mangxilana<sup>4</sup>, E. Luecke<sup>5</sup>, P. Macdonald<sup>4</sup>, N. Ndlovu<sup>2</sup>, S. Tenza<sup>2</sup>, K. Gill<sup>4</sup>, E.T. Montgomery<sup>1</sup>, T. Samurai Study Team<sup>4,1,2</sup>

<sup>1</sup>RTI International, Women's Global Health Imperative, Berkeley, United States, <sup>2</sup>Wits RHI, University of the Witwatersrand, Johannesburg, South Africa, <sup>3</sup>University of Washington, Epidemiology Department, School of Public Health, Seattle, United States, <sup>4</sup>Desmond Tutu HIV Centre, University of Cape Town, Cape Town, South Africa, <sup>5</sup>RTI International, Women's Global Health Imperative, Research Triangle Park, United States

**Background:** Gender-specific end-user input on the design of new biomedical HIV prevention is critical to yielding products that overcome adherence challenges. Assessing acceptability of and preferences for LA-PrEP delivery modalities among men is an important step in broadening uptake of HIV prevention.

We examined baseline preferences and acceptability of two placebo LA-PrEP delivery formulations - injections and implants - among South African cis-gender heterosexual and men who have sex with men (MSM).

**Methods:** SAMURAI is an ongoing (July 2022-June 2024) randomized clinical cross-over study of placebo implant and intramuscular injection use among 184 men aged 18-35 residing in Johannesburg or Cape Town.

This baseline analysis examines men's stated preferences between the two formulations after viewing an educational video, including preferences relative to condoms and oral PrEP; and anticipated acceptability (10-point satisfaction rating, 10=high).

We examined differences in acceptability and preference between MSM (N=84) and MSW (N=100) and by age using paired t-tests and contingency table analysis.

**Results:** Median age was 22 (IQR: 21-27), median number of recent sexual partners was 3 (IQR: 2-5), 73% reported a primary partner, and 12% were diagnosed with an STI and treated prior to enrollment. More MSM than MSW reported ever use of oral PrEP (39% vs 9%,  $p<0.0005$ ), with 9%, overall, using currently.

At enrollment, most men preferred the option of an injection (67%) over the implant (25%); 8% reported no preference, predominantly MSM. Younger men (ages 18-21) reported a higher preference for injections (80% vs 60%,  $p=0.015$ ).

Anticipated satisfaction for study use of both placebo formulations was high, though higher for injections than implants (injections: 7.7; implants: 6.8,  $p<0.001$ ), with no differences between MSM and MSW. LA-PrEP formulations

were more often selected as the most preferred option for future use relative to condoms or oral PrEP (injection: 35.9%, implant: 27.7%, condom: 18.5%, oral PrEP: 17.9%).

**Conclusions:** Men indicated interest in both LA-PrEP formulations, with high anticipated satisfaction ratings. Future work will examine preferences and satisfaction after use, comparing results with baseline acceptability. Product rankings of the LA-PrEP formulations alongside condoms and oral PrEP indicated that offering men choices will be important to achieving HIV prevention goals.

## WEPEC231

The intravaginal ring acceptability scale (IVR-AS): a new tool to improve and standardize vaginal ring acceptability measurement among end-users

A. Gottert<sup>1</sup>, B.A. Friedland<sup>2</sup>, M. Plagianos<sup>2</sup>, B. Zieman<sup>2</sup>, J.M. Sales<sup>3</sup>, J. Atrio<sup>4</sup>, S. Shetty<sup>3</sup>, C. Sant'Anna Marinho<sup>4</sup>, R. Merkatz<sup>2</sup>, L.B. Haddad<sup>2</sup>

<sup>1</sup>Population Council, Social and Behavioral Science Research, Washington, United States, <sup>2</sup>Population Council, Center for Biomedical Research, New York, United States, <sup>3</sup>Emory University, Atlanta, United States, <sup>4</sup>Albert Einstein College of Medicine, Bronx, United States

**Background:** Several intravaginal rings (IVRs) are marketed for HIV prevention, contraception, and other indications. More are in development, with IVRs the most common delivery type for multipurpose prevention technologies.

We sought to develop and validate a multi-dimensional scale - the IVR Acceptability Scale (IVR-AS) - in response to calls for a comprehensive, standardized tool for assessing IVR acceptability among end-users.

**Methods:** Scale items reflect specific aspects of IVR acceptability for women and men. Response options range from 1 (not at all acceptable) to 5 (highly acceptable). We evaluated the IVR-AS within a randomized, crossover clinical trial of 3 non-medicated silicone IVRs of differing external diameters (46mm, 56mm, 66mm) in 24 heterosexual couples in Atlanta, GA and Bronx, NY who used each of the 3 IVRs for ~30 days. After each IVR use period, women and men responded to a self-administered survey with the IVR-AS.

We conducted exploratory factor analysis and multivariable regression to assess convergent validity. Qualitative follow-up in-depth interviews with all participants helped gauge relevance of IVR-AS sub-dimensions.

**Results:** 24 couples participated in the study (mean age 27, both sexes); 23 completed surveys after all three IVRs. The final 19-item women's scale ( $\alpha=0.93$ ) included 4 sub-dimensions: ease of use (5 items); experience and sensation (7 items); effect on sexual desire/engagement (3 items), and effect on vaginal sex (4 items) (all  $\alpha>0.78$ ). The final 8-item men's scale comprised 2 sub-dimensions: effect on sexual desire/engagement and effect on vagi-

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

nal sex (3 and 5 items, respectively) (all alphas>0.89). IVR-AS scores demonstrated good variability (e.g., women's overall mean=4.3, std=0.64, range=1.4-5.0). For both sexes, higher overall/subdimension scores were consistently associated (most  $p<0.001$ ) with other study assessments, e.g., reported difficulty inserting or removing the IVR, feeling it during sex, and adherence.

The 46/56mm IVRs had higher overall ( $p<0.001$ ) and sub-dimension ( $p<0.001$ - $p<0.05$ ) scores than the 66mm IVR. Qualitative data further reinforced the salience of the IVR-AS overall and its sub-dimensions.

**Conclusions:** The IVR-AS captures multiple dimensions of IVR acceptability among women and their partners. The scale demonstrated excellent reliability and convergent validity. Further validation is warranted in future studies. 46mm and 56mm IVR diameters were more acceptable than 66mm.

## Integration of HIV services with other services, including sexual and reproductive health

### WEPEC232

Progress toward triple elimination of mother-to-child-transmission of HIV, HBV, and syphilis: a 12-months retrospective analysis of testing coverage in antenatal care clinics in Cameroon

B.K. Tchounga<sup>1</sup>, E. Shu<sup>1</sup>, T. Longla<sup>1</sup>, R. Kana<sup>1</sup>, J. Simen<sup>1</sup>, M. Mayer<sup>2</sup>, R. Ajeh<sup>3</sup>, T. Djikeussi<sup>1</sup>, Y. Moussa Fadil<sup>2</sup>, S. Talla<sup>1</sup>, A.N. Njoya<sup>1</sup>, E. Takem<sup>2</sup>, E. Akwo<sup>1</sup>, P. Tchendjou<sup>1</sup>, C. Ndongmo<sup>2</sup>, J. Ditekemena<sup>4</sup>, L. Guay<sup>5,6</sup>, R. Machekano<sup>5</sup>, M. Jalloh<sup>2</sup>, A. Tiam<sup>5</sup>

<sup>1</sup>Elizabeth Glaser Pediatric AIDS Foundation, Public Health Evaluation and research, Yaoundé, Cameroon, <sup>2</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Yaoundé, Cameroon, <sup>3</sup>Ministry of Public Health, National AIDS Control Council, Yaoundé, Cameroon, <sup>4</sup>Elizabeth Glaser Pediatric AIDS Foundation, Public Health Evaluation and Research, Kinshasa, Congo, the Democratic Republic of the, <sup>5</sup>Elizabeth Glaser Pediatric AIDS Foundation, Public Health Evaluation and Research, Washington DC, United States, <sup>6</sup>George Washington University, Milken Institute School of Public Health, Washington DC, United States

**Background:** As Cameroon engages in the triple elimination initiative, there is scarcity of data on prevention of mother-to-child transmission (PMTCT) of HIV, HBV, and syphilis. We assessed testing coverage and the PMTCT cascade for HIV, HBV, and syphilis and associated factors among pregnant women.

**Description:** We conducted a retrospective cohort analysis of pregnant women attending their first antenatal care visit in 15 PEPFAR-supported health facilities between October 2020 and September 2021. We abstracted mothers' demographic and clinical characteristics, HIV, HBsAg, syphilis testing results and child diagnosis status.

A multivariable logistic regression was used to determine factors associated with testing and with positivity to HBV and syphilis.

**Lessons learned:** Overall, 21,419 pregnant women were enrolled, with a median age of 27 (IQR: 23-31). Among these women, 807 (3.9%) were HIV positive (592 known HIV positive, 215 newly diagnosed). Of the 11,086 (51.8%) women tested for HBV, 406 (3.7%) were HBsAg positive, including 18 receiving tenofovir as part of their HIV treatment. Of 12,534 (58.5%) women tested for syphilis, 126 (1.0%) tested positive and were prescribed treatment.

In total, 21 women were HIV/HBV co-infected, 6 were HIV/syphilis co-infected, and 8 were HBV/syphilis co-infected. Of the 21,419 women, 8,799 (41.1%) completed their pregnancy follow-up in the same facility and gave birth to 8,903 children. Among them, 446 infants were HIV exposed, of whom 12/264 (4.5%) tested positive after 24 months; 197 infants were HBV-exposed including 4 (2.0%) who received HBV-immunoglobulin and 15 (7.6%) who received vaccine at birth; 61 infants were syphilis-exposed with no documentation of maternal treatment uptake or child diagnosis. In multivariable analysis, being a woman living with HIV (WLHIV) was significantly associated with lower odds of being tested for HBV (aOR:0.78, 95%CI:0.67-0.92) and syphilis (aOR:0.74, 95%CI:0.64-0.87). Adjusting for age, marital status, and presence of a pregnancy complication, being a WLHIV (aOR:1.68, 95%CI:1.02-2.61) was significantly associated with a higher risk of HBV.

**Conclusions/Next steps:** Despite considerable progress made with PMTCT of HIV, gaps remain for PMTCT of HBV and syphilis, particularly for infants. Integration and documentation of HBV and syphilis testing and treatment for mother-baby pairs is critical for child survival.

## WEPEC233

Prevalence of HCV and HIV/HCV Co-infection among people who inject drugs in six sites in Kyrgyz Republic in 2021 – findings from respondent-driven sampling surveys

N. Usmanova<sup>1</sup>, B. Kalmyrzaev<sup>1</sup>, D. Bilibosunova<sup>1</sup>, P. Nadol<sup>1</sup>, S. Shadaker<sup>2</sup>, D. Kanny<sup>2</sup>, B. Sheralieva<sup>3</sup>, U. Sarymsakov<sup>3</sup>, C. Zhumalieva<sup>3</sup>, A. Solpueva<sup>3</sup>, A. Bekbolotov<sup>3</sup>, M. Tursunbekov<sup>4</sup>, G. Esenkeldieva<sup>4</sup>, V. Ivakin<sup>5</sup>, A. Deryabina<sup>5</sup>, S. Handanagic<sup>2</sup>

<sup>1</sup>CDC, DGHT, Bishkek, Kyrgyzstan, <sup>2</sup>CDC, DVH, Atlanta, United States, <sup>3</sup>RCBVHHC, Bishkek, Kyrgyzstan, <sup>4</sup>ICAP, KG Office, Bishkek, Kyrgyzstan, <sup>5</sup>ICAP, CAR Regional Office, Almaty, Kazakhstan

**Background:** Kyrgyz Republic (KR) has high prevalence of hepatitis C virus (HCV) in the general population with increased risk among persons who inject drugs (PWID). The 2022-2026 National Blood-borne Viral Hepatitis and HIV Strategy includes scaling-up direct acting antivirals treatment for HCV. In 2021, we conducted a survey to assess HIV and HCV acquisition among PWID in the KR.

**Methods:** We recruited PWID from six sites in KR: Bishkek, Tokmok, Sokuluk, Kara-Balta, Osh, and Karasu using respondent-driven sampling (RDS). Inclusion criteria included ≥18 years old, self-reported injecting drugs in past 60 days, and residing in survey area. Participants self-reported demographics and risk behaviors and were offered HIV and HCV rapid testing (RT).

Those with reactive HCV RT were tested for HCV RNA. In an aggregated model containing all sites, we calculated adjusted prevalence ratios (aPR) using Poisson regression to identify factors associated with HCV while adjusting for location, age, and sex and accounting for RDS design.

**Results:** A total of 985 PWID were recruited from August-December 2021. The prevalence of HIV and HCV RNA combination ranged from 5.3% in Bishkek to 10.1% in Tokmok.

The anti-HCV prevalence ranged from 49.4% in Tokmok to 71.3% in Bishkek, while HCV RNA prevalence ranged from 32.1% in Osh to 41.9% in Tokmok. HCV RNA positive PWID were more likely to be older (≥30 vs. 18-29 aPR 1.3, 95% CI: 1.2-1.4), male (aPR 1.2, 95% CI: 1.1-1.3), with history of incarceration (aPR 1.2, 95% CI: 1.1-1.2), injected drugs >5 years (aPR 1.2, 95% CI: 1.1-1.3), and tried unsuccessfully to access opioid substitution treatment (OST) (aPR 1.1, 95% CI: 1.0-1.1).

**Conclusions:** A substantial proportion of PWID had exposure to HCV and had viremic HCV; burden was significant among older males experiencing incarceration, long-term injection drug use (IDU), and challenges accessing OST.

Implementing client-centric approaches focusing on older PWID with long-term IDU experience and prisoners can improve access to prevention services. To reduce the high burden of HCV among PWID, screening, testing,

and access to medication should be expanded. Harm-reduction efforts, including needle-syringe exchange and low-threshold OST, with HIV and HCV services, are needed.

## WEPEC234

Pay-it-forward gonorrhea and chlamydia testing among men who have sex with men and male STD patients in China: interim findings from the PIONEER pragmatic, cluster randomized controlled trial

G. Marley<sup>1</sup>, L. Ye<sup>1</sup>, K. Li<sup>2</sup>, R. Tan<sup>3</sup>, Z. Zhu<sup>1</sup>, L. Zhang<sup>1</sup>, T. Wang<sup>1</sup>, M. Sun<sup>1</sup>, Q. Tang<sup>1</sup>, Q. Sheng<sup>1</sup>, R. Ramaswamy<sup>4</sup>, D. Wu<sup>5</sup>, S. Sylvia<sup>6</sup>, C. Wang<sup>7</sup>, P. Zhao<sup>7</sup>, L. Yang<sup>7</sup>, D. Luo<sup>1</sup>, K. Gray<sup>6</sup>, D. Van-Duin<sup>6</sup>, W. Tang<sup>6</sup>, J. Tucker<sup>8</sup>

<sup>1</sup>UNC-Project China, Guangzhou, China, <sup>2</sup>UCLA, Los Angeles, United States, <sup>3</sup>National University of Singapore, Singapore, Singapore, <sup>4</sup>Cincinnati Children's Hospital Medical Center, Cincinnati, United States, <sup>5</sup>Nanjing Medical University, Nanjing, China, <sup>6</sup>University of North Carolina at Chapel Hill, North Carolina, United States, <sup>7</sup>Dermatology Hospital of Southern Medical University, Guangzhou, China, <sup>8</sup>LSHTM, London, United Kingdom

**Background:** Sexual health services are closing or being restricted in many jurisdictions because of limited funds. Pay-it-forward (PIF) interventions, where individuals receive a free healthcare service (test) accompanied by personalized messages and an opportunity to support others through donations, may increase STD test uptake and generate funds.

We report interim results from a PIONEER trial in China, which evaluates PIF strategies that encourage gonorrhea/chlamydia testing among men compared to the standard-of-care.

**Methods:** The PIONEER study (NCT05723263) is a cluster RCT comparing PIF implementation strategies for promoting dual gonorrhea/chlamydia testing in 12 clusters (six MSM-led and six public STD clinics) in six cities in Guangdong Province, China. Men were recruited 2:1 into pay-it-forward compared to standard-of-care (self-pay). Men over 17 years old and not tested for CT/NG in the last six months who were seeking STD care services at an MSM-led or public STD clinic were recruited.

The primary outcome was gonorrhea/chlamydia testing. Pre-specified subanalyses focused on MSM compared to non-MSM participants, clinic type (MSM-led or not), and PrEP eligibility (based on number of sexual partners, engagement in unprotected sex, and HIV testing). The uptake between PIF and standard-of-care was compared using Chi-square and GEE analyses.

**Results:** By December 18, 2023, 617 men, with an average age of 34 years (SD=11.2), were recruited into the standard-of-care (n=177) and PIF arms (n=440). Overall, 63.9% (n=395) reported sex with other men, 72.6% (n=442) had ever tested for HIV, and 34.4% (n=212) were PrEP-eligible. Gonor-

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

rhea/chlamydia testing uptake was 71.3% (n=440) in the PIF arm and 3.4% (6/177) in the standard-of-care arm. 25.2% (n=111) of PIF participants donated 267 USD. Testing uptake was significantly higher in the PIF than in the control arm (proportional difference: 70.0%; 95%CI=63.60%–76.90%). In subgroup analysis, more MSM than non-MSM participants (proportional difference: 24.3%; 95%CI=0.21–0.29) tested for gonorrhea and chlamydia.

Testing was also higher among MSM-led clinic participants than public STD clinic participants (proportional difference: 22.4%; 95%CI=0.19–0.26) and PrEP-eligible participants than non-eligible participants (proportional difference: 8.9%; 95%CI=6.70–11.60).

**Conclusions:** The PIF intervention increased gonorrhea/chlamydia testing among men in diverse settings. Hence, scaling up PIF could potentially promote other STD services uptake and improve financial support for differentiated HIV prevention services.

## WEPEC235

High prevalence of curable sexually transmitted infections among young adults in rural South Africa: baseline data from Thetha Nami Ngithethe Nawe cluster randomised trial of HIV prevention

J. Busang<sup>1</sup>, J. Jarolimova<sup>2</sup>, N. Chimbini<sup>1,3,4</sup>, N. Okesola<sup>1</sup>, C. Herbst<sup>1</sup>, J. Dreyer<sup>1</sup>, T. Zuma<sup>1,3,4</sup>, M. Luthuli<sup>1</sup>, D. Gumede<sup>1</sup>, S. Hlongwane<sup>1</sup>, S. Mdluli<sup>1</sup>, S. Msane<sup>1</sup>, T. Smit<sup>1</sup>, N.O. Behuhuma<sup>1</sup>, J. Seeley<sup>1,5</sup>, A. Copas<sup>4</sup>, K. Baisley<sup>1,5</sup>, L. Lebina<sup>1,4,6</sup>, M. Shahmanesh<sup>1,4,3</sup>

<sup>1</sup>Africa Health Research Institute, Mtubatuba, South Africa,

<sup>2</sup>Massachusetts General Hospital, Division of Infectious

Diseases, Boston, United States, <sup>3</sup>University of KwaZulu-

Natal, Durban, South Africa, <sup>4</sup>UCL Institute for Global

Health, London, United Kingdom, <sup>5</sup>London School of

Hygiene & Tropical Medicine, London, United Kingdom,

<sup>6</sup>University of the Witwatersrand, Johannesburg, South Africa

**Background:** Sexually Transmitted Infections (STIs) are a major public health concern and increase HIV acquisition among adolescents and young adults (AYA). STI services provide a gateway into HIV prevention for AYA at greatest risk of HIV in rural South Africa (SA).

We estimate the STI prevalence among AYA from an ongoing stepped-wedge cluster randomised trial, *Thetha nami ngithethe nawe*, investigating the effectiveness, implementation, and cost-effectiveness of peer-led social mobilisation into decentralised, integrated HIV and sexual and reproductive health (SRH) services amongst AYA in rural KwaZulu-Natal, SA.

**Methods:** Between May–December 2022, we conducted a baseline survey among a random sample of 15–30-years-olds, assessed the prevalence of curable STIs (Chlamydia, Gonorrhoea, Trichomoniasis) using GeneXpert on home-based, self-sampled urine and vaginal swab specimens,

and collected dried blood spots for HIV and viral load (VL) testing. We fitted logistic regression models using generalised estimating equations to assess sociodemographic, behavioural, and clinical factors associated with STI diagnosis. All analyses were disaggregated by sex.

**Results:** A total of 2090 AYA participated in the baseline survey, with 1452 (69.5%) consenting to STI testing and 1345/1452 (92.6%) providing specimens. Median age was 22 years; 55.4% female. HIV prevalence was 15.2%, higher in women (22.2%) than men (6.4%). Sexually transmissible HIV (VL≥400 copies/ml) was 6.5%, higher in women (9.1% vs. 3.1%). HIV pre-exposure prophylaxis (PrEP) use was low (0.9%) despite 40.9% PrEP knowledge.

The overall STI prevalence was 22.7% (95%CI: 20.1%–25.0%), significantly higher among women (28.9%, 95%CI: 25.6%–32.3%) than men (15.0%, 95%CI: 12.2%–18.1%). Factors associated with higher odds of having any STI included age 20–24 years compared to 15–19 years in men (aOR=2.59, 95%CI: 1.09–6.19) and women (aOR=2.00, 95%CI: 1.15–3.48), living with HIV in women (aOR=1.67, 95%CI: 1.17–2.40), and contraception use in women (aOR=1.47, 95%CI: 1.06–2.03). There was some evidence of an association for transmissible HIV in women (aOR=1.69, 95%CI: 0.97–2.94, p=0.062).

**Conclusions:** Prevalence of curable STIs and sexually transmissible HIV remains high among AYA in rural SA. SRH services including STI self-sampling provide an opportunity to deliver effective HIV prevention and may reduce the morbidity associated with curable STIs.

## WEPEC236

Integrated HIV prevention and sexual and reproductive health services among adolescents and young people in sub-Saharan Africa: a systematic review of current approaches

E. Ott<sup>1</sup>, S. Mulwa<sup>1</sup>, S. Floyd<sup>1</sup>, I. Birdthistle<sup>1</sup>

<sup>1</sup>London School of Hygiene & Tropical Medicine, London, United Kingdom

**Background:** Integrating HIV and sexual and reproductive health (SRH) services is a recognised strategy for reaching adolescents and young people (AYP) at highest HIV risk. However, much remains unknown about which integrated service delivery models have the greatest impact on HIV and SRH outcomes among AYP, particularly those that include delivery beyond health facilities.

A systematic review was conducted to identify the range of integration models being implemented and their effectiveness in meeting the HIV prevention and SRH needs of AYP in sub-Saharan Africa (SSA).

**Methods:** Seven databases were searched for peer-reviewed articles reporting on the integration of HIV prevention and SRH services in SSA. Articles published in English between 2010 and 2022 were included. We reviewed the strategies used for HIV prevention and SRH service integration for AYP to identify delivery models, and sum-

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

marised evidence of effectiveness for non-facility-based models (those including community, home, mobile, on-line, or self-care services).

**Results:** Of 1931 records screened, 72 met the inclusion criteria. Of those, 31 records (17 different models) reported on strategies that integrated HIV prevention and SRH services within health facilities, and 41 records (24 different models) reported on service delivery strategies beyond health facilities. Non-facility-based implementation models (n=24) varied considerably, however, four prominent strategies for integrating HIV prevention and SRH services for AYP were identified:

- Services delivered by peers in non-facility-based venues (1);
- Services delivered by community health workers in non-facility-based venues (5);
- Services delivered by providers in non-facility-based venues (8); and,
- Education/curriculum-based programmes delivered in schools and services provided on-site and through referrals to facilities (10).

Data analysis aims to summarise effects of each integration model on HIV-related outcomes (e.g., HIV status knowledge) and SRH-related outcomes (e.g., pregnancy testing uptake).

**Conclusions:** This review identifies new strategies being employed to integrate HIV prevention and SRH services outside of health facilities. They reflect active and diverse efforts to reach AYP with integrated services through peers, schools, and community spaces.

Findings can optimise future design of integrated service delivery models for AYP – a group with unique HIV and SRH needs which, for many, can be met through non-clinical settings.

## WEPEC237

[Integrating STI and cervical cancer screening into mobile HIV testing and counseling services: a holistic, client-centered model of care](#)

A.C. Saint<sup>1</sup>, Y.H. Kyaw<sup>1</sup>, A.Y. Naing<sup>1</sup>, N. Shwe Yee<sup>1</sup>

<sup>1</sup>Asian Harm Reduction Network- Myanmar, Program and Health, Yangon, Myanmar

**Background:** In conflict-affected border regions between Myanmar and China in Northern Shan State, specifically in Laukkaing township, migrant young female sex workers encounter multiple barriers in accessing basic health-care due to the absence of legal protection, making them highly vulnerable to HIV and STIs transmission, and gender-based violence.

For 6 years, Asian Harm Reduction Network (AHRN)-Myanmar has been providing outreach testing services in brothel houses and KTVs in Laukkaing, including serology testing for HIV, Hepatitis B and C, condom distribution, counselling services and linkage to care.

**Description:** Since 2022, AHRN Myanmar has strategically expanded to provide services in a holistic fashion, with an initially focusing on integration of SRHR services into HIV testing and counselling (HTC) program. This initiative introduced a cost-efficient outreach model featuring on-site cervical cancer screening using the VIA (Visual Inspection with Acetic Acid) method.

Procedure is performed by nurse counsellors after obtaining informed consent with rights-based approach. Eligible individuals undergo abdominal, bimanual, and vaginal speculum examination before VIA screening.

Results are disclosed within minutes, and a referral support system is established for the treatment of precancerous lesions identified in positive cases.

**Lessons learned:** This strategy minimizes the necessity for clients, particularly sex workers, to visit the healthcare facility, thereby preventing unfair pay deductions by brothel owners.

Moreover, performing vaginal speculum examination before the VIA procedure not only effectively screens for STIs but also enables ad hoc syndromic management. Statistically, from Jan-Nov 2023, 86% (344 out of 398) of female sex workers who received mobile HTC service were also screened for STIs. Among them, 68 received ad hoc syndromic treatment.

Additionally, 26 sex workers received on-site VIA screening and none tested positive, indicating successful early prevention of cervical cancer without incurring costs or delays in obtaining results.

**Conclusions/Next steps:** This innovative, client-centered intervention not only addresses immediate health needs of the community but also contributes to the project's cost efficiency by integrating SRHR services into existing harm reduction activities.

Despite the unanticipated political unrest in the project area, the comprehensive one-stop approach has demonstrated promising outcomes, potentially serving as a model for other projects in similar contexts.

## WEPEC238

### Leveraging well-child visits to deliver HIV services to children and adolescent mothers: a community-based mixed-methods study in South Africa

C. Wittesaele<sup>1,2,3</sup>, H. Mangqalaza<sup>2</sup>, E. Toska<sup>2,3</sup>, L. Cluver<sup>3,4</sup>, H. Weiss<sup>1</sup>, A. Doyle<sup>1,5</sup>

<sup>1</sup>London School of Hygiene & Tropical Medicine, Department of Infectious Disease Epidemiology, London, United Kingdom, <sup>2</sup>University of Cape Town, Department of Sociology, Cape Town, South Africa, <sup>3</sup>University of Oxford, Department of Social Policy & Intervention, Oxford, United Kingdom, <sup>4</sup>University of Cape Town, Department of Psychiatry, Cape Town, South Africa, <sup>5</sup>Biomedical Research and Training Institute, Harare, Zimbabwe

**Background:** Young maternal age is a predictor for disengagement in prevention of mother-to-child transmission services. All children should regularly attend scheduled well-child visits for prevention and health promotion services. Well-child services could be integral to delivering HIV services for mothers living with HIV and their children. This study examined well-child visit attendance up to 18 months among HIV-exposed and unexposed children of adolescent mothers in South Africa.

**Methods:** Data were obtained from a cohort of adolescent mothers (n=1144) and their children (n=1045) in South Africa (2017-2019). Well-child visit records were available for 453 children aged ≥18 months, including 170 children of adolescent mothers living with HIV (37.5%). Records were analysed using descriptive statistics and disaggregated by maternal HIV-status.

Semi-structured interviews (n=16) with adolescent mothers in 2022 explored factors influencing well-child visit attendance, aligning with the capability, opportunity, and motivation model of behaviour change (COM-B).

**Results:** Attendance declined from 85.9% (95%CI: 82.3-88.9) at 6 weeks old to 49.7% (95%CI: 45.0-54.4%) at 18 months old. Attendance was higher during visits that coincided with the childhood vaccination schedule. There was no evidence of a difference in attendance by maternal HIV-status. Themes influencing attendance were mapped to the COM-B model. Capability: Adolescent mothers were indifferent to harsh attitudes from nurses; mothers' organisational and financial acumen enabled their child's attendance. Opportunity: Lack of childcare support, poor weather, and barriers to access (cost and distance) interfered with attendance; financial and in-kind support from other caregivers and information in the child health booklet facilitated attendance. Motivation: few mothers felt that their own health benefited from well-child visits but were motivated to attend visits to gain knowledge and fulfil their parental role.

**Conclusions:** Suboptimal well-child visit attendance represents a missed opportunity to provide HIV prevention and treatment services to adolescent girls and their chil-

dren. Nurses should maximise contact with both children and their adolescent mothers so that mothers see a benefit for their own health in attending well-child visits. Identifying opportunities to integrate HIV services with well-child and childhood vaccination services may support mothers to stay engaged in care.

## WEPEC239

### Addressing the growing burden of non-communicable diseases in the context of a mature HIV epidemic in Kenya: a modeling study

M. Schnure<sup>1</sup>, A. Fojo<sup>1</sup>, D. Dowdy<sup>2</sup>, B. Genberg<sup>2</sup>, E. Kendall<sup>1</sup>, P. Kasaie<sup>2</sup>

<sup>1</sup>Johns Hopkins University School of Medicine, Baltimore, United States, <sup>2</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, United States

**Background:** As the burden of non-communicable diseases (NCDs) continues to grow among the general population in Kenya, questions remain about the optimal models for integrating NCD and HIV services.

**Methods:** Using national estimates of HIV and NCD epidemiology in Kenya (from UNAIDS and the STEPwise Survey for NCD Risk Factors, respectively), we developed a hybrid simulation approach to forecast the population-level burden of HIV and NCDs through 2040. We considered six scenarios consisting of three levels of NCD/HIV services and two implementation approaches (HIV clinics and community-wide; see Table).

Scenario	Setting	NCD services	HIV services	Rationale
1 No intervention	None	None	No change from current baseline	Status quo for comparison
2 Basic NCD screening/treatment	HIV clinic	10% of HIV engaged persons screened annually 60% successful treatment initiation	No change from current baseline	Representing a basic NCD screening/treatment program offered at the HIV clinics with minimum resource requirements
3 Basic NCD screening/treatment + HIV retention/suppression		10% treatment discontinuation annually	90% of engaged population retained 90% of unsuppressed population gain suppression annually 90% of suppressed population maintain suppression annually	Integrating basic NCD screening/treatment with additional HIV services to improve retention and suppression
4 Intensive NCD screening/treatment + HIV retention/suppression		10% of HIV engaged persons screened annually 80% successful treatment initiation 5% treatment discontinuation annually		Assuming that collocating HIV/NCD services improves NCD treatment uptake and retention
5 Basic NCD screening/treatment	Community	10% of general population screened annually 60% successful treatment initiation 10% treatment discontinuation annually	No change from current baseline	Representing a basic NCD screening/treatment program offered at the community level to the general population
6 Basic NCD screening/treatment + HIV testing/engagement			75% of all population tested annually for HIV 90% of unengaged population engage annually	Integrating basic NCD screening/treatment with an HIV testing/engagement program at the community level
7 Intensive NCD screening/treatment + comprehensive HIV care		10% of general population screened annually 80% successful treatment initiation 5% treatment discontinuation annually	75% of all population tested annually for HIV 90% of unengaged population engage annually 90% of engaged population retained 90% of unsuppressed population gain suppression annually 90% of suppressed population maintain suppression annually	Offering a comprehensive HIV program accompanied by intensive NCD services

**Results:** Basic NCD screening and treatment (10% screened annually, 60% treatment initiation, 10% annual discontinuation) resulted in 23% of the target population on NCD treatment in year 2030. When offered to people living with HIV at HIV clinics, this led to a 0.5% reduction in CVD deaths, while the same scenario offered to the general community resulted in a 4.3% reduction in CVD deaths (Figure, panel A). Including HIV testing and engagement services at a community-level resulted in a 48.5% reduction in HIV deaths; comprehensive HIV care (testing, engagement retention, and suppression) resulted in a 53.2% reduction in HIV deaths (Figure, panel B). Per 1,000 persons treated, the impact of NCD services offered at HIV clinics was greater (20-22 deaths averted) than the impact of community-based programs (13 deaths averted; Figure, panel C).

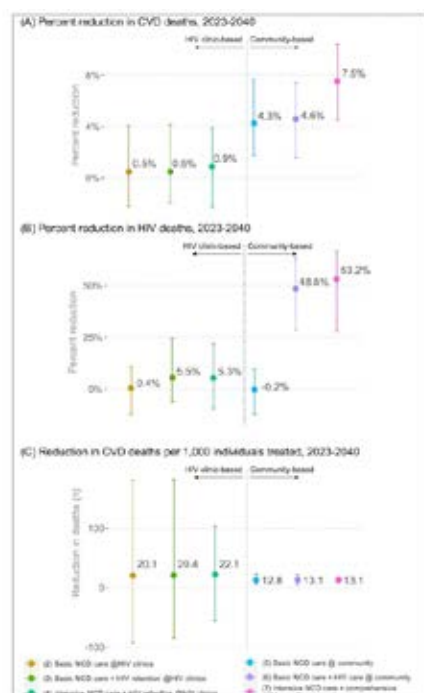

Figure: Forecasted population-level impact of intervention scenarios. Panel A represents the percent reduction in total CVD deaths by scenario relative to no intervention over the study period. Panel B represents the percent reduction in total HIV deaths by scenario relative to no intervention over the study period. Panel C represents the reduction in total CVD deaths per 1,000 individuals treated for one or more NCDs. Abbreviations: non-communicable disease (NCD), cardiovascular disease (CVD).

**Conclusions:** Implementation of NCD services in HIV clinics is effective in reducing future CVD events and deaths, but its impact is constrained to the population living with HIV. Achieving consistent improvements in CVD outcomes at a country level requires comprehensive, community-wide interventions.

## WEPEC240

### Doxy-PEP proliferates among PrEP users in San Francisco, but inequities in awareness are present

A.A. Moreira Moscatelli<sup>1</sup>, P.L. Ramirez<sup>1</sup>, B. Suprasert<sup>2</sup>, M. Tate<sup>2</sup>, S.E. Cohen<sup>2</sup>, M.A.S.M. Veras<sup>3</sup>, E.C. Wilson<sup>2,4</sup>, W. McFarland<sup>2,4</sup>

<sup>1</sup>Faculdade de Ciências Médicas da Santa Casa de São Paulo, São Paulo, Brazil, <sup>2</sup>San Francisco Department of Public Health, Center for Public Health Research, San Francisco, United States, <sup>3</sup>Faculdade de Ciências Médicas da Santa Casa de São Paulo, Departamento de Saúde Coletiva, São Paulo, Brazil, <sup>4</sup>University of California San Francisco, Department of Epidemiology and Biostatistics, San Francisco, United States

**Background:** Doxycycline post-exposure prophylaxis (doxy-PEP) is effective at preventing bacterial sexually transmitted infections (STIs) and is well-tolerated. In 2022, the San Francisco Department of Public Health implemented doxy-PEP prescription guidelines. We measured community levels of doxy-PEP awareness, use, and associated factors among men who have sex with men (MSM) in San Francisco in 2023.

**Methods:** Data were from the San Francisco MSM cycle of the CDC-led National HIV Behavioral Surveillance (NHBS). MSM were recruited using time-location sampling (TLS) through outreach intercepts at randomly chosen venues, dates, and times. Interviewer-administered questionnaires collected demographics, sexual risk and preventive behaviors, sexual health history, healthcare access, and doxy-PEP awareness and use.

**Results:** Of 533 MSM respondents, 66.6% were aware of doxy-PEP, 29.0% discussed it with a healthcare provider (HCP), and 19.3% used doxy-PEP in the last year. Low doxy-PEP awareness was associated with age 50 years old and older (54.7%,  $p<0.001$ ), Black/African American race (54.3%,  $p=0.007$ ), and less than high school education (51.0%,  $p=0.012$ ). Latino/e participants had the highest awareness of doxy-PEP (77.0%). The odds of doxy-PEP awareness increased 5.78-fold among MSM who self-reported having any STI ( $p<0.001$ , 95%CI 3.31-10.09) and 6.66-fold among MSM who had tested for an STI ( $p<0.001$ , 95%CI 4.38-10.12) in the past year. Respondents who took PrEP were more likely to use doxy-PEP (33.9% vs 1.2%,  $p<0.001$ ), more likely to not use condoms (89.8% vs 51.2%,  $p<0.001$ ), and also have had a bacterial STI in the past year (40.4% vs 10.6%,  $p<0.001$ ).

**Conclusions:** Doxy-PEP appears to be reaching PrEP users who do not use condoms, which is a group of MSM for whom this intervention is well suited and already engaged in HIV prevention. While awareness was high among MSM overall, efforts are needed to increase doxy-PEP awareness for older MSM, Black/African-American MSM, and those with lower education in order to achieve equitable reach and benefits of this new prevention strategy.

## WEPEC241

### Prevalence, Risk factors and care of hypertension among people living with HIV in Zambia: results from a national survey

S. Sivile<sup>1,2,3</sup>, H. Phiri<sup>4</sup>, P. Somwe<sup>5</sup>, M. Siwingwa<sup>6</sup>, M. Musukuma<sup>7</sup>, J. Mutukwa<sup>8</sup>, R. Chibale<sup>6</sup>, C. Mandyate<sup>5</sup>, S. Bosomprah<sup>5</sup>, C. Zyambo<sup>4</sup>, M. Sampa<sup>7</sup>, M.P. Chavula<sup>7</sup>, P. Bwembya<sup>7</sup>, N.S. Munyinda<sup>7</sup>, J. Zulu<sup>7</sup>, H. Halwindi<sup>7</sup>, K. Lishimpi<sup>8</sup>, L. Mulenga<sup>2,3,9,10</sup>, W. Mutale<sup>7,9</sup>

<sup>1</sup>University Teaching Hospital, Internal Medicine, Lusaka, Zambia, <sup>2</sup>Ministry of Health, Infectious Diseases, Lusaka, Zambia, <sup>3</sup>University of Zambia, Internal Medicine, Lusaka, Zambia, <sup>4</sup>Ministry of Health, Public Health, Lusaka, Zambia, <sup>5</sup>Center for Infectious Disease Research in Zambia (CIDRZ), Lusaka, Zambia, <sup>6</sup>University Teaching Hospital, Lusaka, Zambia, <sup>7</sup>University of Zambia, Public Health Department, Lusaka, Zambia, <sup>8</sup>Ministry of Health, Lusaka, Zambia, <sup>9</sup>Vanderbilt Institute for Global Health, Nashville, United States, <sup>10</sup>Vanderbilt University Medical Center, Medicine, Nashville, United States

**Background:** The control of non-communicable disease (NCDs) among people living with HIV (PLHIV) is integral for HIV epidemic control. Understanding the NCDs burden, risk factors and care among PLHIV improves outcomes. We report the prevalence, risk factors and care of Hypertension among PLHIV from a Zambian nationwide survey conducted in 2023.

**Methods:** This was a two-stage stratified cross-sectional survey of 5,775 PLHIV adults sampled from 165 health facilities selected using proportional to size approach.

An adapted WHO STEPS survey questionnaire was used, and Anthropometric measurements and biological samples testing were performed.

Hypertension was defined as a systolic blood pressure (SBP)  $\geq 140$ mmHg and/or diastolic blood pressure (DBP)  $\geq 90$ mmHg the average of the last two of three measurements measured with a two-minute interval rest.

Analyses were adjusted for survey clustering, sampling weight and stratification. Multivariate logistic regression was used for predictors.

**Results:** We enrolled 5,204 participants. Women were 67.2%. The median ages were 41 years and 45 years for females and males respectively.

The mean SBP was 122.2mmHg and mean DBP was 78 mmHg. The prevalence of hypertension was 23.9% (25.1% males and females 23.3%).

Among those with hypertension, 44.8% were unaware. The prevalence of hypertension was 10.1%, 18.7%, 31.2%, and 45%, for the age bands 18-29, 30-44, 45-59, and 60+ years respectively. Only 31.6% of those with known hypertension were on antihypertensives and only 43.6% of these had a normal blood pressure.

About 22.7% were overweight (BMI $>25$ -29.9kg/m<sup>2</sup>) with 26.4% among women and 15.2% among men. Prevalence of Obese (BMI $>30$ kg/m<sup>2</sup>) was 10.8% (females 13.9% and men 4.5%).

High sodium intake was 36% and 74.8% consumed less than the recommended 5 servings of fruit and/or vegetable per day.

In the multivariate analysis, age greater than 60yrs (aPR,2.33;95%CI=2.03-2.69; p<0.001), College/University education (aPR,1.24;95%CI=1.07-1.44;p<0.001), Rural dwelling (aPR,0.88;95%CI=0.79-0.99;p<0.031), alcohol consumption (aPR,1.18;95%CI=1.07-1.31;p<0.001) and BMI of  $>30$ kg/m<sup>2</sup> (aPR,1.73;95%CI=1.52-1.96;p=0.001) were predictors of hypertension. Dolutegravir use was not a predictor of hypertension (cPR,0.68;95%CI=0.42-1.13;p=0.135).

**Conclusions:** This large nation-wide survey showed a high prevalence of hypertension in PLHIV (24%) with high rate of un-diagnosis, poor treatment linkages and poor control. Traditional risk factors for hypertension were predictors. We recommend integration of NCD care in HIV services.

## WEPEC242

### Same-day treatment of sexually transmitted infections among people living with HIV: an opportunity to apply lessons learned from community-led clinics in Bangkok, Thailand

A. Wongsai<sup>1</sup>, R. Janamnuyasook<sup>1</sup>, K. Sinchai<sup>1</sup>, J. Boonruang<sup>1</sup>, S. Thitipatarakorn<sup>1</sup>, N. Teeratakulpisarn<sup>1</sup>, S. Saiwaew<sup>2</sup>, S. Janyam<sup>3</sup>, S. Mills<sup>4</sup>, N. Phanuphak<sup>1</sup>, R.A. Ramautarsing<sup>1</sup>  
<sup>1</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>2</sup>Rainbow Sky Association of Thailand, Bangkok, Thailand, <sup>3</sup>Service Workers in Group Foundation, Bangkok, Thailand, <sup>4</sup>USAID EpiC Thailand, FHI 360, Asia Pacific Regional Office, Bangkok, Thailand

**Background:** Community-led clinics are successful in providing same-day antiretroviral treatment (SDART). However, a gap in management of other sexually transmitted infections (STIs) among key populations with HIV remains unaddressed, including treatment of chlamydia trachomatis (CT), Neisseria gonorrhoeae (NG), syphilis, hepatitis B virus (HBV), and confirmatory testing and treatment for hepatitis C virus (HCV).

**Methods:** We implemented SDART at two community-led clinics in Bangkok, Thailand. Thai nationals who tested HIV positive, were at least 13 years old, and had never received ART were eligible for SDART. During the baseline visit, STI, HBV, and HCV testing were conducted. Descriptive analyses were performed.

**Results:** From October 2021-September 2023, 609 people tested HIV-positive, and 595 (97.7%) initiated SDART. Of those, 542/595 (91.1%), 44/595 (7.4%), and 9/595 (1.5%) were men who have sex with men, transgender women, and cisgender women, respectively.

Among people initiating SDART, 120/595 (20.2%), 60/595 (10.1%), and 182/595 (30.5%) tested positive for CT, NG, and syphilis, respectively, 51/595 (8.6%) had CT-NG co-infection. HBV and anti-HCV positivity were 31/595 (5.2%) and 38/595

E-posters

Late-breaker abstracts

Author Index

(6.4%), respectively. HCV-RNA confirmatory testing rate was 22/38 (57.9%), with 15/595 (2.5%) testing positive. All clients with positive STI or HCV were referred for treatment, of those 114/171 (66.7%) initiated treatment for CT, 85/111 (76.6%) for NG, 154/182 (84.6%) for syphilis, and 8/15 (53.3%) for HCV. All clients initiated a tenofovir-based SDART regimen, including those with HBV.

The median (min-max) times to treatment after diagnosis were 1 day (0-90) for CT, 3 days (0-118) for NG, 3 days (0-124) for syphilis, and 0 days (0-286) for HCV. The median (min-max) time to confirmation after screening for HCV was 5 days (0-112). Overall, for 33.15% of clients with STI or HCV, treatment was initiated after more than 5 days.

**Conclusions:** Key populations with HIV initiating SDART at community-led clinics have high STI prevalence. While community-led clinics are successful in providing HIV treatment services, linkage to timely STI management remains a challenge. Using lessons from SDART implementation, same-day STI test and treat should be integrated at community-led clinics, as another promising strategy in order to eliminate HIV and STI co-infections.

## WEPEC243

Knowledge of sexual and reproductive health and rights (SRHR) and its determinants among female sex workers (FSW) in Jashore, Bangladesh

M. Reza<sup>1</sup>, K. Hassan<sup>1</sup>, S.D. Irfan<sup>1</sup>, M.N. Morshed Khan<sup>1</sup>, G. Sarwar<sup>1</sup>, M. Rahman<sup>1</sup>, M.S.A. Imran<sup>1</sup>, S.J. Hossain<sup>1</sup>, S. Sarker<sup>2</sup>, M. Alam<sup>2</sup>, M. Rahman<sup>2</sup>, AKMM. Rana<sup>1</sup>, S. Islam Khan<sup>1</sup>

<sup>1</sup>International Centre for Diarrhoeal Diseases Research, Bangladesh, Program for HIV and AIDS, Health Systems and Population Studies Division, Dhaka, Bangladesh,

<sup>2</sup>International Centre for Diarrhoeal Diseases Research, Bangladesh, Virology Laboratory, Infectious Diseases Division, Dhaka, Bangladesh

**Background:** Sexual and reproductive health and rights (SRHR), despite its importance for promoting overall well-being, is challenging to achieve for FSW due to difficulties in reaching them. Global evidence indicates that FSW lack accurate information about STI prevention and are frequently excluded from reproductive health services despite their unique SRHR needs. Educating FSW about their SRH-related rights can positively influence their behavior and general health.

This analysis aims to describe the knowledge of SRHR and its determinants among FSW in Jashore, Bangladesh.

**Methods:** A cross-sectional survey was conducted utilizing a two-stage probability sampling design in Jashore city in 2023 among 327 FSW. Face-to-face interviews were used to collect data on socio-demographics, sexual risk behaviors and information related to SRHR. A composite score of SRHR knowledge was calculated using 30 questions containing "Yes=1" and "No=0" on STI/HIV/SRHR/

condoms/family planning. Participants having less than the median value of the composite score was classified as inadequate knowledge of SRHR. Descriptive statistics were used to describe the population. Multiple logistic regression was used to measure the net association of inadequate knowledge and different factors.

**Results:** Among 327 FSW, 48.9% (95%CI: 41.5-56.4) had inadequate knowledge of SRHR. FSW those who had inadequate knowledge of SRHR were selling sex since <1 year (14.4%, 95%CI: 8.4-23.5) and had lower income <91USD per month (75.6%, 95%CI: 62.1-85.5). The odds of inadequate knowledge of SRHR were significantly higher among those who had been selling sex for <1-year (AOR: 4.9, 95%CI: 2.4-10.1, p<0.001), living alone (AOR: 5.4, 95% CI: 2.0-14.6, p=0.001) or with husband (AOR: 3.4, 95%CI: 1.5-8.0, p=0.006) or with family/relatives (AOR: 4.3, 95%CI: 2.1-9.0, p<0.001), and had an income of <91 USD (AOR: 3.5, 95% CI: 1.9-6.4, p<0.001), respectively.

**Conclusions:** Half of the FSW possessed inadequate knowledge of SRHR. They were newcomers in sex trade and had lower income. Inadequate knowledge of SRHR was significantly associated with duration of selling sex, living arrangement and monthly income. Targeted intervention, under the implementation science framework, is need to enhance the knowledge of SRHR among FSW to improve situation of SRHR and social well-being.

## WEPEC244

Silent struggles unveiled: high prevalence of depression, suicidal behavior, and substance abuse among adolescents and young adults living with HIV in select facilities in Malawi

L.U. Kalitera<sup>1</sup>, L. Makonokaya<sup>1</sup>, S. Dunga<sup>1</sup>, G. Singini<sup>1</sup>, M. Phoso<sup>1</sup>, L. Msuku<sup>1</sup>, R. Chamanga<sup>1</sup>, A. Maida<sup>1</sup>, T. Maphosa<sup>1</sup>  
<sup>1</sup>Elizabeth Glaser Pediatric AIDS Foundation, Research, Lilongwe, Malawi

**Background:** The impact of mental health disorders on adolescents and young people living with HIV (AYLHIV) is a critical concern, significantly affecting their well-being and health outcomes. Despite the underdiagnosis and lack of treatment, particularly in low-income settings, the Elizabeth Glaser Pediatric AIDS Foundation took a pioneering step in 2023: they integrated mental health screening into HIV care for high-risk groups, such as adolescents, utilizing the Patient Health Questionnaire-9 (PHQ-9) and alcohol/substance use questionnaires. This study examines the prevalence and factors associated with depression among AYLHIV receiving antiretroviral therapy (ART) within this program setting.

**Methods:** This cross-sectional analysis utilized routinely collected data from mental health screening registers across 11 EGPAF-supported healthcare facilities in Malawi. We included all ART clients aged 10-24 years who underwent mental health screening during ARV-refill clinic visits

between March and June 2023. Demographic and clinical characteristics were summarized, and depression prevalence (PHQ-9 score  $\geq 5$ ), suicidal thoughts, and substance abuse estimated via descriptive statistics. Logistic regression, adjusting for sex, age, and reason for screening, was employed to assess factors linked to depression among AYLHIV.

**Results:** Among 561 participants, 61.3% (n=344) were female, with a median age of 17 years. Approximately 24.5% (n=137) screened positive for depression, while 5.2% (n=29) reported suicidal thoughts and 4.9% (n=27) were at risk of alcohol/substance abuse. Severe depression was more prevalent in females (15.4% vs. 3.4%,  $p=0.04$ ), while suicidal thoughts were higher in males (7.8% vs. 3.5%,  $p=0.02$ ). Moreover, older clients showed a significantly higher likelihood of depression than their younger counterparts (10-14 years): Adjusted ORs for 15-19 and 20-24 years 1.86 (95% CI 1.12-3.09) and 2.33 (95% CI 1.36-3.98), respectively.

**Conclusions:** Nearly a quarter of the participants experienced depression, particularly older adolescents. Integrating mental health screening into HIV services is a pivotal strategy for timely identification and treatment of depression among AYLHIV, which ultimately should enhance their quality of life.

## WEPEC245

Using community-based gender-based violence first-line responders to provide ongoing psychosocial support to GBV survivors among AGYW aged 10 to 24 years enrolled in the DREAMS program in Zambia

J. Chipukuma<sup>1</sup>, L.K. Mwango<sup>1</sup>, C. Baumhart<sup>2,3</sup>, P. Olowski<sup>4</sup>, K. Tembo<sup>1</sup>, C. Muleya<sup>5</sup>, C.W. Claassen<sup>2,3,4</sup>

<sup>1</sup>Ciheb Zambia, Lusaka, Zambia, <sup>2</sup>University of Maryland Baltimore (UMB), Center for International Health Education and Biosecurity (Ciheb), Baltimore, United States, <sup>3</sup>University of Maryland Baltimore (UMB), Institute of Human Virology (IHV), Baltimore, United States, <sup>4</sup>Maryland Global Initiatives Corporation Zambia, Lusaka, Zambia, <sup>5</sup>Centers for Disease Control and Prevention (CDC), Division of Global HIV and TB, Lusaka, Zambia

**Background:** In Zambia, adolescents continue to face gender-based violence (GBV), with adolescent girls and young women (AGYW) disproportionately affected compared to boys. However, GBV cases among AGYW continue to be underreported, contributing to gaps or delays in care. The Listen, Inquire, Validate, Enhance safety, and Support (LIVES) package is a WHO-supported curriculum that uses a person-centered approach for open communication, enhanced support, and validation of AGYW. We integrated LIVES into the DREAMS program in three Zambian provinces, and used community-based first-line responders trained in LIVES to provide psychosocial support for survivors of GBV.

**Description:** AGYW aged 10-24 years who enrolled in DREAMS were screened for GBV using the national standardized Risk Assessment Form, which gathered baseline information on experiencing any form of GBV, including physical, sexual, or emotional GBV. AGYW reporting any GBV were provided post-GBV care and ongoing psychosocial support by first-line responders using LIVES, including healthcare workers, DREAMS site coordinators, mentors, and connectors. All first-line responders were trained on LIVES via a training-of-trainers (TOT) model. We examined routinely collected and aggregated client-level data on GBV among AGYW enrolled in DREAMS from October 2021 to June 2022. Data were analyzed using R Studio and STATA.

**Lessons learned:** CIRKUIITS trained six DREAMS Coordinators as TOT trainers, who then cascaded the LIVES training to 98 mentors and 19 connectors. A total of 31,486 AGYW were enrolled in DREAMS; 28,618 were screened for GBV at enrollment, with 12,299 (45%) reporting experiencing GBV (9,491 physical and emotional GBV and 2,808 sexual GBV). All AGYW presenting for GBV services received counselling and referrals from staff trained in LIVES. Of the 2,808 experiencing sexual GBV, 154 (5.5%) presented to GBV care within 72 hours; 117 (76%) accepted post-GBV care and received additional clinical prevention services including HIV testing, emergency contraception, and post-exposure prophylaxis.

**Conclusions/Next steps:** Upon enrollment in DREAMS, almost half of all AGYW reported experiencing GBV throughout their lives, indicating a dire need for support. The LIVES package was effective in scaling-up GBV services for DREAMS AGYW in Zambia. Further equipping front-line responders with necessary skills and resources, such as LIVES, will help AGYW cope with the GBV they experience.

## WEPEC246

Evaluating progress towards triple elimination of HIV, Syphilis and Hepatitis B in Uganda, Tanzania, Eswatini, Kenya and Cameroon

F.A. Tsiouris<sup>1</sup>, R. Khamasi<sup>2</sup>, H. Betty<sup>2</sup>, A. Isavwa<sup>3</sup>, C. Chouraya<sup>3</sup>, P. Tchendjou<sup>4</sup>, B. Tchounga<sup>4</sup>, C. Lwaka<sup>5</sup>, R. Van de Ven<sup>6</sup>

<sup>1</sup>Elizabeth Glaser Pediatric AIDS Foundation (EGPAF), Technical Strategies and Innovation, Washington, United States, <sup>2</sup>EGPAF, Kampala, Uganda, <sup>3</sup>EGPAF, Mbabane, Eswatini, <sup>4</sup>EGPAF, Yaounde, Cameroon, <sup>5</sup>EGPAF, Nairobi, Kenya, <sup>6</sup>EGPAF, Dar es Salaam, Tanzania, the United Republic of

**Background:** In 2022 WHO launched the Triple Elimination Initiative that focuses on prevention of vertical transmission of HIV, syphilis and hepatitis B virus (HBV). While much progress has been made to support routine screening and treatment of HIV in antenatal care (ANC), testing and treatment for syphilis and HBV has lagged behind. We de-

scribe progress made towards triple elimination at sites supported by the Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) in Uganda, Eswatini, Cameroon, Kenya and Tanzania.

**Methods:** Retrospective routinely collected ANC program data for 12 consecutive months between October 2021 – September 2023 were reviewed for EGPAF supported sites in each of the five countries. Aggregate cross-sectional data on testing and treatment of HIV, syphilis and HBV was abstracted from the national health management information systems.

**Results:** A total of 1.2 million ANC Clients enrolled in ANC over a 12-month period at 3,049 health facilities across the five countries. HIV testing coverage was quite high (96-99%) with variability in HIV prevalence in pregnant women ranging from 2.3% in Tanzania to 28% in Eswatini. Treatment coverage for HIV positive women (newly identified and known HIV positive) ranged from 89.6% in Cameroon to 99.3% in Kenya. Suboptimal testing for syphilis was reported in Cameroon and Eswatini (52% and 30% respectively).

However, treatment coverage for women testing positive for syphilis was notably high in Tanzania and Kenya (>100%). HBV testing was not routinely done in Tanzania or Kenya; however testing coverage in Cameroon, Eswatini and Uganda ranged from 14% - 59%.

**Conclusions:** To achieve the ambitious triple elimination initiative efforts by 2030, countries need to leverage the HIV platform to support further integration of routine testing and treatment of syphilis and HBV. Efforts focused on integrated models of care to expand access and overcome existing public health barriers need to be prioritized.

## WEPEC247

### DREAMS community quality improvement intervention improves the uptake of PrEP among adolescent girls and young women in the Acholi Sub-region

B. Bongonyinge<sup>1</sup>, A. Lawino<sup>1</sup>, H. Nandudu<sup>1</sup>

<sup>1</sup>The AIDS Support Organisation (TASO), Gulu, Uganda

**Background:** Adolescent Girls and Young Women (AGYW) 10-24 years are disproportionately affected by the HIV burden in Uganda and globally. Every week, more than 570 AGYW 15-24 years are infected with HIV (UNAIDS 2020). HIV prevalence are three times higher in AGYW compared to boys of the same age. Pre-Exposure Prophylaxis (PrEP) is a safe and effective HIV prevention option. Expanding PrEP and its uptake for AGYW at substantial risk of HIV acquisition is a key COP priority.

However, in the Acholi sub-region, PrEP uptake among AGYW enrolled in the DREAMS program was only 8% among those eligible (Uganda DREAMS Tracking system, October 2022), a missed opportunity for HIV Prevention among this at-risk population.

We, therefore, implemented a community quality improvement intervention with specific focus on improving uptake of PrEP among AGYW in the region.

**Methods:** The USAID LPHS Ankole and Acholi Activity used DREAMS and OVC Tracking system (UDOTS) data to select ten parishes with low PrEP uptake, establishing a community CQI team in each. A QI coach aided the committee in identifying root causes for low AGYW PrEP uptake. These included need for more information on PrEP, reliance on health workers for at-risk AGYW identification, no PrEP integration at safe places, and poor tracking of clients not ready for PrEP initiation.

A PrEP Ambassador was identified in each parish and trained on the adapted Ambassadors toolkit to boost demand, screen for risk, and track eligible clients yet to initiate using a developed PrEP Parish Log. During integrated outreaches, the Activity ensured the availability of a PrEP provider to reduce missed opportunities while AGYW were paired to improve safe-space attendance. Offered monthly coaching visits and updated data in the CQI dashboard.

**Results:** Improved initiation of eligible AGYWs on the DREAMS program on PrEP from 9% in October 2022 to 88% in July 2023. Currently 1,327 AGYW have accessed PrEP.

**Conclusions:** PrEP Ambassadors played a pivotal role in generating demand and demystifying PrEP, leading to readiness among eligible AGYW to initiate PrEP. Decentralizing QI committees substantially improved PrEP uptake and creation of PrEP clubs for AGYWs at safe spaces enhances demand creation and adherence.

## WEPEC248

### Development of a first interim guideline to support breastfeeding in women living with HIV in Argentina

D.M. Cecchini<sup>1,2,3</sup>, M.J. Rolón<sup>1,4</sup>, M. Moyano<sup>1,5</sup>, M. Bruno<sup>1,6</sup>, M. Maydana<sup>1,7</sup>, M. Ortiz de Zárate<sup>1,8</sup>, M. Taicz<sup>1,9</sup>, P. Trinidad<sup>1,3</sup>, A. Durán<sup>1,10</sup>, M. Ceriotto<sup>1,11</sup>

<sup>1</sup>Sociedad Argentina de Infectología, Buenos Aires, Argentina, <sup>2</sup>Hospital Cosme Argerich, Buenos Aires, Argentina, <sup>3</sup>Helios Salud, Buenos Aires, Argentina, <sup>4</sup>Hospital Juan A. Fernández, Buenos Aires, Argentina, <sup>5</sup>Clínica del Niño, La Plata, Argentina, <sup>6</sup>Hospital Carlos Durand, Buenos Aires, Argentina, <sup>7</sup>Hospital Sor María Ludovica, Buenos Aires, Argentina, <sup>8</sup>Hospital Materno Infantil Ramón Sardá, Buenos Aires, Argentina, <sup>9</sup>Hospital Juan P. Garrahan, Buenos Aires, Argentina, <sup>10</sup>Ministerio de Salud de la Ciudad Autónoma de Buenos Aires, Buenos Aires, Argentina, <sup>11</sup>Dirección de Respuesta al VIH e ITS, Ministerio de Salud de la Nación, Buenos Aires, Argentina

**Background:** In Argentina and Latin American countries, breastfeeding is contraindicated for women and transgender men living with HIV. Furthermore, there is unclear evidence to guide on issues like virologic criteria to allow breastfeeding, neonatal prophylaxis, and the timing of mother-child pair control. We describe the process undertaken in Argentina for the development of the first breastfeeding recommendations to optimize vertical transmission prevention programmes within an HIV national policy framework.

**Description:** Considering the impact of the AIDS 2022 "Breast is Best" session and to provide a response to community requests and guidance to healthcare providers (HCP), the HIV Vertical Transmission Group Prevention of the Argentinian Infectious Diseases Society (SADI) drafted during November 2022–May 2023 the first recommendations based on current literature and international guidelines. The Ministry of Health HIV Program (MHHP) organized an "Interdisciplinary Meeting on Breastfeeding and HIV" in May 2023 to review such recommendations with UNAIDS, ethic committees, other scientific societies, and stakeholders from civil society and representatives of HIV programs all over the country.

#### Lessons learned:

Consensus was obtained to promote informed decisions on infant feeding for parents living with HIV and to change the "contraindication" label to "not recommendation" for mothers with undetectable viral load throughout pregnancy. Recommendations were made to provide breastfeeding support and follow-up by HCP for mothers who choose to breastfeed. A summary of key points of the guideline is shown in Table 1.

Key points of a national HIV breastfeeding guideline endorsed by the Argentinian Infectious Diseases Society (SADI) and the Ministry of Health HIV Program, Argentina.

- Infant feeding options should be addressed prior to conception or as soon as possible during pregnancy.
- Family centered approach must be provided.
- There is no evidence that "U" = "U" is applicable to breastfeeding
- Breastfeeding labels change from "contraindicated" to "not recommended" for low risk mothers (those with undetectable viral loads throughout pregnancy).
- For women/transgender men with detectable viremia during pregnancy or antiretroviral therapy (ART) adherence gaps, breastfeeding remains contraindicated.
- A multidisciplinary team should take care of the mother-child pair follow-up. The follow-up plan should be agreed upon with the family before delivery.
- Unless extremely necessary, no changes in maternal effective ART should be made during the breastfeeding period.
- Maternal viral load should be monitored monthly during breastfeeding
- The newborn/child virologic control should be as follows: within the first 3 days of life, 14–21 days, between 6–8 weeks, between 12–16 weeks, and 5–6 months. Finally, at 4–6 weeks, 3 months, and 6 months after weaning.
- It is not recommended to extend breastfeeding beyond 6 months. Mixed feeding should be avoided.
- Neonatal prophylaxis: zidovudine for no more than 6 weeks. The use of additional drugs or prophylaxis extensions is not recommended unless in the context of a clinical trial.
- Breastfeeding should be stopped in cases of maternal detectable viral load, ART adherence issues, nipple lesions, or mastitis. In the presence of diarrhea or systemic diseases in the mother, or newborn/child, case by case decisions should be considered.

**Conclusions/Next steps:** Argentina addressed breastfeeding in women living with HIV in a programmatic framework established by MHHP and including scientific societies, policymakers, and community representatives, promoting informed decisions for parents and standards for HCP. Implementation, follow-up, and registry of cases are the next steps to be evaluated.

## WEPEC249

### PrEP-eligible behaviors and condom use among sexually active older adults in China: findings from the sexual well-being (SWELL) Study

X. Peng<sup>1</sup>, B. Wang<sup>1</sup>, Y. Lu<sup>2</sup>, X. Li<sup>3</sup>, Y. Li<sup>4</sup>, L. Ouyang<sup>3</sup>, G. Wu<sup>3</sup>, Y. Cai<sup>4</sup>, M. Yu<sup>5</sup>, Y. Sakuma<sup>6</sup>, H. Conyers<sup>6</sup>, X. Meng<sup>7</sup>, W. Tang<sup>8</sup>, J.D. Tucker<sup>6</sup>, D. Wu<sup>9</sup>, H. Zou<sup>10</sup>

<sup>1</sup>Sun Yat-sen University, School of Public Health, Shenzhen, China, <sup>2</sup>Guizhou Medical University, Guizhou, China, <sup>3</sup>Chongqing Center for Disease Control and Prevention, Chongqing, China, <sup>4</sup>Shanghai Jiao Tong University, Shanghai, China, <sup>5</sup>Tianjin Center for Disease Control and Prevention, Tianjin, China, <sup>6</sup>London School of Hygiene & Tropical Medicine, London, United Kingdom, <sup>7</sup>Wuxi Municipal Center for Disease Control and Prevention, Wuxi, China, <sup>8</sup>University of North Carolina Project-China, Guangzhou, China, <sup>9</sup>Nanjing Medical University, Nanjing, China, <sup>10</sup>Fudan University, Shanghai, China

**Background:** Older adults remain sexually active and at risk of sexually transmitted infections (STIs). However, data on Pre-exposure prophylaxis (PrEP) eligible behaviors and consistent condom use among sexually active older adults in China are scarce.

**Methods:** Data were collected from a multi-center cross-sectional survey in China between June 2020 and December 2022. Eligibility criteria were community-dwelling older adults aged 50 years and above who have had oral, vaginal, or anal sex in the past year (sexually active). In-person questionnaire interviews included demographic characteristics, general health, and sexual health information.

**Results:** 1332 sexually active older adults were recruited in our study. 33.7% (449/1332) of older adults consistently used a condom in the past year. 7.9% (105/1332) of participants reported PrEP-eligible behaviors. Age (only for women 50–59 years: aOR=0.60, 95%CI: 0.36–0.98; 60–69 years: 0.27, 0.10–0.71), living alone (men: 0.40, 0.20–0.79; women: 0.27, 0.10–0.72), body-mass index (men: 1.59, 1.18–2.14; women: 1.76, 1.13–2.73), general health status (men: 0.62, 0.39–0.97; women: 0.39, 0.16–0.96), talking about sex (men: 1.67, 1.23–2.26), knowledge of condom use to prevent STIs (men: 1.52, 1.06–2.18) were significantly associated with consistent condom use. Individuals who were male (1.76, 1.08–2.90), not in a stable relationship (4.80, 2.41–9.54), and lived alone (2.02, 1.07–3.82) were more likely to have PrEP-eligible behaviors.

**Conclusions:** Consistent condom use was relatively low among sexually active older adults in China. More than one in five older adults who were living alone reported PrEP-eligible behaviors. Comprehensive intervention measures should be combined with the characteristics and health needs of community-dwelling older adults.

## WEPEC250

### Myanmar's experience on PWID centric PrEP access in harm reduction initiatives

A. Yu Naing<sup>1</sup>, Y.H. Kyaw<sup>1</sup>, N. Shwe Yee<sup>2</sup>, M.K. Khine<sup>3</sup>, T. Aung<sup>4</sup>, T.Z. Win<sup>5</sup>, L.A. Thu<sup>6</sup>

<sup>1</sup>Asian Harm Reduction Network, Health, Yangon, Myanmar, <sup>2</sup>Asian Harm Reduction Network, M&E, Yangon, Myanmar, <sup>3</sup>Asian Harm Reduction Network, Program, Yangon, Myanmar, <sup>4</sup>Asian Harm Reduction Network, Health, Waingmaw, Myanmar, <sup>5</sup>Asian Harm Reduction Network, Health, Lashio, Myanmar, <sup>6</sup>Community Partners International, Program & Innovations, Yangon, Myanmar

**Background:** In 2023, the Asian Harm Reduction Network (AHRN) launched a PrEP demonstration project among people who inject drugs (PWID) with a differentiated service delivery (DSD) approach in Waingmaw and Lashio, Myanmar. These areas face high HIV prevalence among PWID, with 35% in Lashio and 56% in Waingmaw. Responding to this urgent need, the project focuses on enhancing PrEP accessibility and acceptability among PWID by tailoring service delivery to their unique needs.

**Description:** AHRN integrated PrEP services into the Lashio and Waingmaw Key Population Service Centers (KPSC)- part of comprehensive harm reduction interventions. Acknowledging heterogeneity among PWID, AHRN employed a DSD model. An innovative interpersonal approach for PrEP demand generation was implemented, recognizing the digital divide among PWID.

Community-based outreach, peer educators, and face-to-face interactions were prioritized over online platforms for information dissemination and PrEP awareness. Group therapeutic education sessions, preferred by PWID,

reduced time spent on healthcare services ensuring flexibility and convenience. Mobile HIV testing and decentralized PrEP service at KPSC further facilitated easy access to PrEP services. AHRN's multi-month PrEP dispensing minimizes unnecessary follow-ups, enhancing convenience for PWID.

**Lessons learned:** AHRN initiated PrEP screening and initiation in August 2023, addressing social determinants and enhancing uptake within harm reduction settings. Out of 235 screened, 222 were deemed eligible, and 195 accepted PrEP offers, with 160 successfully initiating PrEP. Noteworthy referral patterns included 90 from the community and 70 from the KPSC.

Among the 27 who declined, reasons varied: 30% did not perceive PrEP as necessary, 19% expressed reluctance toward daily medication, 15% deferred decision-making, 11% expressed concerns about the time required for clinic follow-up, and 26% cited diverse reasons (e.g., future planning, work-related issues). These outcomes underscore the importance of tailored community engagement, addressing misconceptions, and adapting service delivery models to enhance PrEP acceptance among PWID.

**Conclusions/Next steps:** AHRN's innovative PrEP approach in Waingmaw and Lashio demonstrated promising outcomes with a 72% initiation rate. While success is evident, diverse reasons for non-acceptance underscore the need for ongoing community engagement and tailored education.

These findings emphasize the importance of flexible service delivery models, adapted to the unique needs of PWID, in optimizing PrEP accessibility and acceptance.

## WEPEC251

### HIV service delivery improvements as a result of public health cluster response in Can Tho City, Vietnam, 2022–2023

K.B. Nguyen<sup>1</sup>, T. Hoang<sup>1</sup>, D.M. Pham<sup>2</sup>, V.N. Nguyen<sup>2</sup>, M.T. Huynh<sup>3</sup>, T.G. Giap<sup>3</sup>, A.H. Ly<sup>3</sup>, T.T. Duong<sup>2</sup>, A. Nguyen<sup>1</sup>, H.A. Doan<sup>4</sup>, Q. Nguyen<sup>1</sup>, T.H. Bui<sup>1</sup>, C. Nguyen<sup>5</sup>, E. Dziuban<sup>1</sup>, M. Shah<sup>1</sup>

<sup>1</sup>Division of Global HIV & Tuberculosis, US Centers for Disease Control and Prevention, Ha Noi, Viet Nam,

<sup>2</sup>Vietnam Authority of HIV/AIDS Control (VAAC), Ha Noi, Viet Nam, <sup>3</sup>Can Tho City Center for Disease Control/ Department of Health, Can Tho, Viet Nam, <sup>4</sup>USAID, Ha Noi, Viet Nam, <sup>5</sup>Division of Global HIV & Tuberculosis, US Centers for Disease Control and Prevention, Ho Chi Minh, Viet Nam

**Background:** Despite progress towards HIV epidemic control in Vietnam, HIV transmission persists, especially among key and mobile populations. In November 2022, Vietnam introduced interim guidelines that established district-level thresholds of HIV recency (zone recent (Recency Infection Testing Algorithm, RITA) case/month) and case surveillance (new cases/month >2SD above 36-month

mean) to initiate a public health cluster response (PHCR). Can Tho City, in the Mekong Delta region of Vietnam, had three districts that met PHCR criteria, and activated a response in January 2023.

**Description:** Investigations from Can Tho Department of Health identified the population of concern was men who have sex with men (MSM), especially <25y, students, and migrant workers, prompting engagement with these communities. Intensified review of health facility services and data identified gaps in standards of care for case finding, partner notification services, linkage to treatment, PrEP enrollment and retention, and MSM-appropriate services. Health authorities leveraged national HIV program and PEPFAR technical assistance to respond to these gaps. Key program indicators were monitored on a quarterly basis.

**Lessons learned:** Compared with 9 months prior to PHCR activation, in the subsequent 9 months:

1. HIV cases identified among index partners increased from 6 to 33;
2. linkage to treatment increased from 77% to 89%;
3. same-day antiretroviral treatment initiation increased from 49% to 54%;
4. PrEP enrollment increased from 945 to 1,258; and,
5. PrEP 3-month retention increased from 65% to 76%.

Community engagement was enhanced through coordinated community-facility service provision, HIV self-test distribution, community testing, demand generation, and health promotion.

**Conclusions/Next steps:** Using recency testing and case surveillance as alerts of an increase in recent HIV acquisition to identify and respond to gaps in standards of care for HIV prevention including PrEP and antiretroviral treatment led to rapidly improved service quality and uptake. Lessons from Can Tho demonstrate a promising strategy to control HIV transmission and have informed Vietnam's 5-year national HIV PHCR implementation plan to help achieve its National Strategic Plan by 2030.

## WEPEC252

Attaining elimination of Mother-to-Child transmission of HIV towards reaching global coalition strategies-HIV retesting for pregnant and breast-feeding women from 8 regions in Tanzania

N. Makyao<sup>1</sup>, A. Maro<sup>1</sup>, T. Mashina<sup>1</sup>, A. Kosia<sup>2</sup>, M. Msangi<sup>3</sup>, R. Kisendi<sup>3</sup>, A. Muya<sup>1</sup>, A. Nyirenda<sup>1</sup>, F. Temu<sup>1</sup>

<sup>1</sup>Amref Health Africa, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Christian Social Services Council, Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>Ministry of Health, PMTCT unit, Dodoma, Tanzania, the United Republic of

**Background:** Tanzania aimed for 90% re-testing for pregnant mothers who initially tested negative during the first test. However, re-testing among expectant women

remains low due to health care workers' limited knowledge. At their first antenatal care visit, all pregnant women are offered HIV testing on an "opt out" basis. Amref implemented a strategy of providing mentorship to health care workers with objectives of enhancing their capabilities to offer re-testing during maternal care.

We aimed to build capacity of health care workers on HIV retesting among pregnant and breastfeeding women.

**Description:** We identified two members of regional and council health management teams, paired with health care providers and mentor mothers from identified 170 health facilities. They reviewed antenatal register and mother-child cohort registers and monthly summary forms to identify data on HIV retesting. They found that, health care workers were not doing maternal retesting for pregnant women during 32- 36 weeks, Labour and delivery. A one-week mentorship was provided at the to all providers at the antenatal care. All the data collected were filled in the checklist and descriptive analysis conducted.

**Lessons learned:** From January and December 2023, total of 12,679 pregnant women attended first Antenatal Care (ANC) visit. Among them, 132 (1%) were already known HIV. Out of 11,649 pregnant women tested for HIV during initial ANC visit, 121 (1%) were identified as new positives.

Among them 5,544 women attending ANC between the 32-36 week of pregnancy, 77 (1.3%) were known persons living with HIV, and only 2,291 (41.3%) underwent maternal retesting, diagnosed 14 (0.61%).

During labor and delivery, 5,544 pregnant women were in attendance, and 84 were known women living with HIV. However, only 1,225 (22%) underwent maternal retesting, leading to 17 (1.3%) positive diagnosis.

During postnatal (1-40 days after delivery), 5,040 women attended clinics, and 43 were known positive. Among them, 2,179 (43.2%) underwent maternal retesting, and 8 (0.36%) women diagnosed.

**Conclusions/Next steps:** Maternal retesting during ANC, labour and delivery and postnatal is highly recommended toward elimination of mother to child transmission.

Frequent coaching and mentorship of health care workers is high very important to attain elimination of mother to child HIV transmission.

## WEPEC253

The children of female sex workers (CFSWs):  
a "new" key, vulnerable and underserved  
population

L. Chingumbe<sup>1</sup>, H. Mushisha<sup>1</sup>, K. Mwanda<sup>1</sup>, M. Chisashi<sup>2</sup>

<sup>1</sup>USAID Controlling HIV Epidemic for Key and Underserved Populations (CHEKUP II) primed by John Snow Health Zambia, Technical, Lusaka, Zambia, <sup>2</sup>USAID Controlling HIV Epidemic for Key and Underserved Populations (CHEKUP II) primed by John Snow Health Zambia, Strategic Information, Lusaka, Zambia

**Background:** In the past decades, interventions to end HIV/AIDS have been concentrated on FSWs, with minimal attention paid to the risks faced by their children. Due to their exposure to a wide range of social and economic vulnerabilities, these children are a vulnerable group. They live in extreme poverty, experience food insecurity, poor access to paediatric health, and are at increased risk of HIV exposure, as well as physical, emotional, and sexual violence, lack of family support and school dropout. Many of these risks are the result of stigma, discrimination, and social exclusion due to their mothers' sex work. For female children, to FSWs, they are likely to become FSWs when they come of age and further worsening their vulnerabilities.

**Methods:** The USAID CHEKUP II Activity, implemented by John Snow Health Zambia employed a bi-directional linkage model to strengthen referral pathways for FSWs and their children. We utilized KP community structures to reach FSWs by surging index case testing, screened and elicited for CFSWs. To optimize 'know your child health status' (KYCS+), we introduced bidirectional linkage for the CFSWs. The elicited CFSWs received free health and high impact HIV testing services with additional OVC, economic strengthening and mental health services. The model involved strengthening referral pathways between community cadres, OVC implementing partners, 11 Wellness Centres and health facilities to create a platform for CFSWs to access a comprehensive paediatric health services package.

**Results:** In fiscal year 2023, we reached out to 13,149 FSWs. 564 biological and non-biological hard-to-reach CFSWs were elicited and tested for HIV testing services, 3% (16/564) were identified HIV positive. We managed to link 100% (16/16) to optimal ART treatment and provided them with interventions tailored to their needs such nutritional support and OVC services without social exclusion.

**Conclusions:** Forecasting innovative ideas and strategies of reaching out to this "New" key population in HIV prevention using bi-directional linkage models is critical to ending HIV by 2030. Strengthening bi-directional linkage pathways to reach CFSW is an opportunity for the USAID CHEKUP II Activity to add value to community structures within the marginalized KPs in Zambia.

## WEPEC254

High STI incidence among women who initiated  
PrEP during pregnancy in Kenya

J.N. Mogaka<sup>1</sup>, F. Abuna<sup>2</sup>, E. Akim<sup>2</sup>, J. Dettinger<sup>1</sup>, G. John-Stewart<sup>1</sup>, J. Kinuthia<sup>1,2</sup>, L. Gómez<sup>1</sup>, M. Marwa<sup>2</sup>, C. Morroni<sup>3</sup>, A. Mussa<sup>3</sup>, N. Ngumbau<sup>2</sup>, B. Ochieng<sup>2</sup>, C. Adogo<sup>2</sup>, P. Owiti<sup>2</sup>, S. Watoyi<sup>2</sup>, J. Pintye<sup>1</sup>

<sup>1</sup>University of Washington, Seattle, United States, <sup>2</sup>Kenyatta National Hospital, Nairobi, Kenya, <sup>3</sup>Botswana Harvard AIDS Institute Partnership, Gaborone, Botswana

**Background:** Incidence of sexually transmitted infections (STIs) is high among women on PrEP. Yet, limited data exist on STIs among women who initiate PrEP during pregnancy, a period when STIs pose risks to both women and infants.

**Methods:** We analyzed data from an ongoing RCT that enrolled pregnant women initiating PrEP at 5 clinics in Western Kenya (NCT04472884). All women were HIV-negative, ≥18 years, between 24-32 weeks gestation, initiating PrEP that day within routine antenatal care, and had high empiric HIV risk scores. A subset of women were offered *Chlamydia Trachomatis* (CT) and *Neisseria gonorrhoeae* (NG) testing using Xpert CT/NG® assays with same-day results in pregnancy, at 6- and 9-months post-delivery. Women with CT or NG were offered immediate directly observed treatment (DOT) and expedited partner therapy (EPT) per national guidelines. Incident cases were defined as CT/NG detected following a prior negative test.

**Results:** As of January 2024, 223 pregnant women initiating PrEP were offered CT/NG testing—all accepted. The median age of women was 26 years (IQR: 22-30) and median gestational age was 27 weeks (IQR: 25-29). Most women were married (77%), 36% were primigravida, 2% had syphilis, and 95% had partners of unknown HIV status. Prevalence of CT and/or NG during pregnancy was 19/223 (9%): 4% CT, 4% NG, and 1% CT/NG co-infection. Women <24 years were twice as likely to have prevalent CT and/or NG as older women (13% versus 5%, prevalence ratio=2.5, 95% CI: 1.04-6.19, p=0.042). Overall, 18 incident cases of CT and/or NG infections occurred in 144.6 total person-years of follow-up (median follow-up 0.8 years, IQR: 0.7-1.0), yielding an incidence of 12.4 per 100 person-years (95% CI: 7.8-19.8). Incidence of CT and/or NG was 5-fold higher among women <24 years (hazards ratio=5.0, 95% CI: 1.8-14.1, p=0.002). Same-day DOT and EPT acceptance was high (94%); at subsequent visits, 62% reported offering EPT to partners, of whom 94% said partners completed EPT.

**Conclusions:** We found high CT/NG incidence among women initiating PrEP during pregnancy, especially younger women. Our results indicate that primary STI prevention would be a high-yield strategy in this population, in addition to expanding STI testing and EPT programs.

## WEPEC255

### Gains in PrEP uptake among at-risk adolescents and youth across six African countries, but is it equitable?

C. Lenz<sup>1</sup>, C. Pribyl<sup>1</sup>, F. Gent<sup>2</sup>, P. Fassinou<sup>3</sup>, T. Rabaholo<sup>4</sup>, F. Bigirwamungu<sup>5</sup>, G. H. Mamba<sup>6</sup>, M. Spencer<sup>1</sup>

<sup>1</sup>Elizabeth Glaser Pediatric AIDS Foundation, Washington DC, United States, <sup>2</sup>Elizabeth Glaser Pediatric AIDS Foundation, Lilongwe, Malawi, <sup>3</sup>Elizabeth Glaser Pediatric HIV Foundation, Abijan, Côte d'Ivoire, <sup>4</sup>Elizabeth Glaser Pediatric AIDS Foundation, Maseru, Lesotho, <sup>5</sup>Elizabeth Glaser Pediatric AIDS Foundation, Dar es Salaam, Tanzania, the United Republic of, <sup>6</sup>Elizabeth Glaser Pediatric AIDS Foundation, Mbabane, Eswatini

**Background:** Adolescents and youth (AY) are at increased risk of HIV acquisition. Global efforts focus on increasing awareness and uptake of pre-exposure prophylaxis (PrEP) among this population, alongside other biomedical HIV prevention interventions. The Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) implements comprehensive prevention programming, including initiatives focused on AY and PrEP.

**Methods:** Routinely-reported aggregated PEPFAR-program data from October 2021–September 2023 from EGPAF-supported facilities in six countries (Cote d'Ivoire, Democratic Republic of Congo, Eswatini, Lesotho, Malawi, Tanzania) were analyzed. We collected and analyzed data on eligible individuals newly enrolled on PrEP. Data was disaggregated by age, sex, and country.

**Results:** Across the six countries, 18,150 adolescents (15-19 years) and 29,835 young adults (20-24 years) were newly enrolled on PrEP between October 2021–September 2023. AY (10-24) constitute 47% (47,985/103,127) of all individuals newly enrolled over this period. Females accounted for 85% (n= 15,391) of all adolescents, 76% (n=22,818) of all young adults, and 60% (n=32,973) of total adults enrolling on PrEP. Young females consistently represented the majority of individuals initiating PrEP across countries with the exception of DRC and Tanzania, where the proportion of young men was either equal to or greater than females at 51% (n=1,379) and 62% (n=1,289), respectively. Malawi and Lesotho experienced sharper inclines compared to other countries concerning PrEP uptake among 15-24-year-olds. In Malawi, new enrollments increased from 29 AY between January–March 2021 to 3,097 AY between July–September 2023. In Lesotho, new enrollments increased from 332 to 1,819 AY over the same period. AY constituted an increasing proportion of all newly-initiated individuals on PrEP, increasing from 33% (803/2,450) between October–December 2021 to 53% (7,667/14,568) in July–September 2023 across countries.

**Conclusions:** The proportion of newly enrolled AY generally increased over the time period of interest. Females constitute a larger proportion of PrEP enrollees across age groups and most countries. Young women (20-24) repre-

sented the largest cohort of new PrEP enrollees among adolescents and youth, with boys and young men generally less represented among those initiating PrEP. Deliberate efforts to understand how to adequately engage adolescent boys and young men to improve their uptake of PrEP are needed.

## WEPEC256

### HIV transmission risks among men who experience violence and poverty – an often neglected group

L. Sherr<sup>1</sup>, A. Gibbs<sup>2</sup>, E. Chirwa<sup>3</sup>, G. Harling<sup>1</sup>, N. Chimbindi<sup>4</sup>, J. Dreyer<sup>4</sup>, C. Herbst<sup>4</sup>, N. Okesola<sup>4</sup>, O. Behuhuma<sup>4</sup>, N. Mthiyane<sup>4</sup>, K. Baisley<sup>5</sup>, T. Zuma<sup>4</sup>, T. Smit<sup>4</sup>, N. McGrath<sup>6</sup>, J. Seeley<sup>5</sup>, M. Sahmanesh<sup>1</sup>

<sup>1</sup>UCL, Global Health, London, United Kingdom, <sup>2</sup>University of Exeter, Exeter, United Kingdom, <sup>3</sup>SA MRC, Medical Research Council, Johannesburg, South Africa, <sup>4</sup>AHRI, AHRI, Somkhele, South Africa, <sup>5</sup>LSHTM, LSHTM, London, United Kingdom, <sup>6</sup>University of Southampton, Southampton, Southampton, United Kingdom

**Background:** Men are inadequately engaged in HIV-prevention and-treatment interventions in generalised HIV-epidemics, negatively impacting their health and the health of their sexual partners (female and male). This may be because of unresponsive health systems, poverty, poor mental health, or gender inequitable masculinities shaping men's unwillingness to engage in care. We explore factors which shape transmissible HIV among men in rural South Africa.

**Methods:** Between 2018-2019, a representative cohort N=3580 males 13-35 years were randomly selected from a rural South African surveillance site.

The primary outcome of sexually transmissible HIV was estimated through Dried Blood Spot and viral load (VL) at baseline (defined as living with HIV, and a detectable VL > 400 copies/ml). Detailed demographics (age, education, employment) and measures of poverty, violence, mental health, alcohol use, life chances and gender attitudes were assessed using validated scales.

Descriptive statistics and SEM (lavaan, in R) explored pathways through which food insecurity and violence affect transmissible-HIV.

**Results:** Of the N=2082 participants (mean age 21.2 years) 69% had secondary education, 23.5% unemployed, 12.1% poor mental health, 23.6% binge drinking, 27% reported violence experience. 8.1% had transmissible HIV (11% living with HIV, of which 77.7% detectable viral loads).

Descriptively, sexually transmissible HIV was associated with greater age, out of school, poorer mental health, past month binge drinking and fewer life chances. The relationships between food insecurity and violence experience and transmissible-HIV (Fig. 1), were mediated by poor mental health, limited life chances, alcohol use,

Late-breaker abstracts

Author Index

where greater hunger and violence experience was associated with increases in these, and they in turn were associated with transmissible-HIV.

**Conclusions:** We show that to effectively reduce sexually transmissible-HIV among young men in a rural context, we need to address not only the proximate 'drivers', poor mental health and substance misuse, and the structural drivers of these, namely food insecurity and experiences of violence, additionally how these manifest in perceptions of limited life chances.

## WEPEC257

Reducing new HIV acquisition among men who have sex with men (MSM) and transgender people (TG) living in rural areas of Benin

R.M. Sessou<sup>1</sup>, E. Ganmou<sup>1</sup>, M. Doukpo<sup>1</sup>

<sup>1</sup>Reseau Sida-Benin, Atlantique, Abomey-Calavi, Benin

**Background:** The aim was to:

- raise awareness among men who have sex with men (MSM) and transgender people (TG) living in rural areas of Benin through group educational sessions on HIV/AIDS and STIs,
- promote condom use
- provide community-based HIV screening
- refer reactive cases to appropriate health centers for confirmation and treatment

**Description:** To this end, for a 3-year period from January 2021 to December 2023, 30 MSM Peer Educators (PEs), 08 TG PEs, 15 MSM Community HIV Testing Agents (ACDs), 04 TG ACDs and 04 Animators were recruited and worked in 11 rural areas nationwide.

Each MSM PE had 7 new people to reach during the month, and 5 for the TG PEs. The role of the ACDs was to provide community HIV testing to peers during awareness-raising sessions.

Participants were aged 15 to 25 and over. Each participant was entitled to 16 Male Condoms (MC) and 32 Gel Lubricants (GL) plus 02 Female Condoms (FP) (for TG).

**Lessons learned:** 9,000 people attended the HIV/AIDS and STI awareness sessions, including 7,560 (84%) MSM and 1,440 (16%) TG. Data were collected by age group: 160 (2.11%) MSM aged 15-17, 4,540 (60%) MSM aged 18-24, 2,860 (37.89%) MSM aged 25 and over, 40 (2.77%) TG aged 15-17,

860 (59.72%) TG aged 18-24, 540 (37.5%) TG aged 25 and over. All also benefited from pre-test counseling, screening and post-test counseling.

63 Détermine HIV-reactive cases, 23 (36.5%) of MSM and 40 (63.5%) of TG detected by ACD and not previously on treatment were referred to partner health centers for confirmation and management.

Data were collected by age group: 3 (13.04%) MSM aged 15-17, 13 (56.52%) MSM aged 18-24, 7 (30.43%) MSM aged 25 and over, 5 (12.5%) TG aged 15-17, 20 (50%) TG aged 18-24, 15 (37.5%) TG aged 25 and over.

144,000 PM, 288,000 GL, 18,000 PF were distributed during the period.

**Conclusions/Next steps:** The next steps are to intensify HIV prevention in Benin's LGBTQI community in order to achieve the UNAIDS 95-95-95 targets.

## WEPEC258

Innovative approaches to implementing HIV programs in war conditions: experience of NGO Convictus Ukraine in the regions of Kyiv city, Kyiv and Chernihiv region

Y. Kuvshynova<sup>1</sup>

<sup>1</sup>Convictus Ukraine, All-Ukrainian Charitable Organization, Kyiv, Ukraine

**Background:** Russia's full-scale invasion of Ukraine has had a devastating impact on all systems of our country. Two years of war, the destruction of infrastructure, and the displacement of people have put a critical strain on the national healthcare system. Vulnerable, underprivileged categories of the population found themselves struggling to survive. Ensuring that Ukraine's results in engaging key populations in HIV prevention, testing, and treatment programs were sustained required new approaches.

**Description:** In wartime, Convictus Ukraine introduced new approaches to engaging and retaining key populations - PWID, SW, and TG - in HIV prevention, testing, and treatment programs. In particular, an integrated care center was created on the basis of Convictus, where a multidisciplinary team works and key populations can receive prevention, testing, ART services, as well as testing for Hepatitis C, TB, restoration of lost documents, psychological support, humanitarian assistance, SMT referrals and support. We have also introduced community-based ART delivery and transportation of seriously ill patients to diagnostic services. With the support of international donors, we introduced payment for expensive treatment and strengthened communication with state health facilities.

**Lessons learned:** These integrated services and flexible approaches helped us retain key populations in our programs and attract new clients in 2023, during wartime. Compared to 2022, the number of new clients in the or-

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

ganization's programs increased by 32 %. In particular, in 2023, 45 558 people used prevention, support, assistance, and diagnostics services, 897 new HIV cases were detected, and 657 received ART and support services. In the integrated care center, 126 people (PWID) receive continued support. Support services in the SMT program were provided to 420 people

**Conclusions/Next steps:** The outcomes demonstrate the importance of further implementation of broad services for key populations, including HIV, humanitarian, medical, and psychological assistance; scaling up of integrated care centers and introduction of innovations that are responsive to the challenges of war.

This helps to attract and retain clients in HIV programs. We have also identified the need to develop gender-sensitive services and introduce support services for survivors of violence.

## WEPEC259

### Antiretroviral therapy and male circumcision uptake among family heads and household members in Uganda

H. Nakawooya<sup>1</sup>, R. Ssekubugu<sup>2</sup>, V. Ssempijja<sup>2,3</sup>, G. Nakigozi<sup>2</sup>, D. Serwadda<sup>2,4</sup>, R. H Gray<sup>2,5</sup>, F. Makumbi<sup>6,4</sup>, T. Lutalo<sup>1,7</sup>, L. W. Chang<sup>2,8,9</sup>, M.K. Grabowski<sup>2,10</sup>, F. Nalugoda<sup>2</sup>, S. J Reynolds<sup>2,11</sup>, G. Kigozi<sup>2</sup>

<sup>1</sup>Rakai Health Sciences Program, Data Management and Biostatistics, Kalisizo, Uganda, <sup>2</sup>Rakai Health Sciences Program, Kalisizo, Uganda, <sup>3</sup>Clinical Monitoring Research Program Directorate, Frederick National Laboratory for Cancer Research, Frederick, Maryland, United States, <sup>4</sup>Makerere University School of Public Health, Kampala, Uganda, <sup>5</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, <sup>6</sup>Rakai Health Sciences Program, Data management and Biostatistics, Kalisizo, Uganda, <sup>7</sup>Uganda Virus Research Institute, Kampala, Uganda, <sup>8</sup>Johns Hopkins University School of Medicine, Baltimore, United States, <sup>9</sup>Division of Infectious Disease, Department of Medicine, Johns Hopkins School of Medicine, Baltimore, Uganda, <sup>10</sup>Department of Pathology, Johns Hopkins School of Medicine, Baltimore, United States, <sup>11</sup>Division of Intramural Research, National Institute of Allergy and Infectious Diseases, National Institutes of Health, Bethesda, United States

**Background:** Antiretroviral therapy (ART) and male circumcision (MC) are critical for HIV epidemic control in high HIV prevalence regions. The family head's role may be pivotal in shaping household health decisions, influencing co-resident family members' engagement in services like ART or MC.

Understanding the association between family head's engagement in HIV services and co-resident household members engagement could inform family-centered strategies for HIV care and prevention.

**Methods:** We utilized data from the Rakai Community Cohort Study, a population-based HIV surveillance cohort in Uganda, collected between December 2020 and March 2023 across 39 rural agrarian, semi-urban trading, and Lake Victoria fishing communities.

The objective was to assess the relationship between family head engagement in uptake of HIV services and the uptake of these services by other co-resident family members.

The outcomes examined included MC among non-Muslim men in male-headed households, ART utilization, and HIV viral suppression in households where the family head (FH) was living with HIV.

Potential confounding factors included sex, age, marital status, family head's service utilization, and family head's sex. Modified Poisson regression was used to estimate associations and potential correlation within families was accounted.

**Results:** Out of 13,824 individuals, 60.6% (8,372) assumed the role of FH while 39.4% (5,451) were co-resident household members. Among co-resident household members, 14.2% were reported to be living with HIV and 22.2% among FHs. ART use among individuals living with HIV was significantly higher when FH were on ART compared to when FH were not on ART (Adjusted PR=1.50, 95% CI: 1.16-1.95).

Viral suppression was significantly more prevalent among members with FH who achieved suppression compared to those without suppression (Adjusted PR=1.52, 95% CI: 1.21-1.90). Circumcision prevalence was also significantly higher among non-Muslim male members with circumcised FH compared to those with FHs not circumcised (Adjusted PR=1.14, 95% CI: 1.05-1.25).

**Conclusions:** Higher ART and MC uptake was observed in HH members with FH who also utilized these services. These findings highlight the potential impact of FH's on household health outcomes.

Incorporating family-centered strategies in public health programs, recognizing FHs' influential role, may be one approach to enhancing HIV care and prevention services.

Advancing HIV response among pediatrics and adolescents through AP3 approach and consolidated data-driven interventions for improved service delivery in Ondo State, Nigeria

A. Suraju<sup>1</sup>, S. Lijam<sup>1</sup>, B. Oyelayo<sup>2</sup>, J. Ogunkoya<sup>3</sup>, F. Adurogbola<sup>2</sup>, K. Wudiri<sup>4</sup>, O. Onyegwe<sup>4</sup>, O. Ibiloye<sup>5</sup>, O. Ajayi<sup>6</sup>, O. Amoo<sup>4</sup>, O. Ogunsola<sup>4</sup>, I. Onwuatuolu<sup>5</sup>, J. Osi Samuels<sup>7</sup>, P. Okonkwo<sup>5</sup>

<sup>1</sup>APIN Public Health Initiative, Prevention and Community Services, Alagbaka, Ondo State, Nigeria, <sup>2</sup>APIN Public Health Initiative, Clinical Services, Alagbaka, Ondo State, Nigeria, <sup>3</sup>APIN Public Health Initiative, Strategic Information, Alagbaka, Ondo State, Nigeria, <sup>4</sup>APIN Public Health Initiative, Prevention and Community Services, Apo, Abuja, Nigeria, <sup>5</sup>APIN Public Health Initiative, Clinical Services, Apo, Abuja, Nigeria, <sup>6</sup>APIN Public Health Initiative, Science, Apo, Abuja, Nigeria, <sup>7</sup>APIN Public Health Initiative, Laboratory Services, Apo, Abuja, Nigeria

**Background:** Globally, Human Immuno-Deficiency Virus (HIV) has remained an imperative public health threat in the last three decades, in achieving epidemic control. Although there is significant progress made with unprecedented efforts on HIV, persistent gaps still exist among pediatrics, adolescents, and pregnant and breastfeeding women. According to the United Nations Programme on HIV/AIDS (2021), there are 2.8 million children (0-19 years) living with HIV (CLHIV) worldwide.

Accelerating Progress in Pediatrics and Prevention of Mothers to Child Transmission (PMTCT) (AP3) is an integrative model of care approach implementing a high degree of collaboration and communication among PMTCT/Pediatrics/Orphans and Vulnerable Children service points and providers to close the pediatric treatment gaps.

This study assessed the program performance improvements made in HIV response for P&A through AP3 and consolidated data-driven interventions in Ondo State.

**Description:** AP3 was implemented across 30 supported facilities and 18 Local Government Areas (LGAs) in Ondo State, with dedicated P&A testers. Recency surveillance, ART Treatment, and State population data were used to identify and prioritize LGAs for a focused pediatrics testing and linkage to ART. Consolidated data-driven interventions including Family Index Testing (FIT), Peer to peer testing and support, Operation Triple Zero (OTZ) activities, and comprehensive OVC program support, among others were integrated for improved retention and viral suppression among P&A. Program data trends for Fiscal year (FY22) (October 2021 to September 2022) and FY 23 (October 2022 – February 2023) were analyzed using Microsoft excel and presented in charts and tables.

**Lessons learned:** By the end of FY 22 and FY 23 Quarter two (Q2), 434 and 245 P&A were successfully linked to ART, compared with 98 P&A linked to ART in FY 21 (October 2020 – September 2021). This led to an increase in treatment

growth for P&A across age bands (0-19 years). Pediatrics and Adolescents' Interruption in Treatment (IIT) reduced from 5.0% in FY 21 to 1.1% and 0.8% in FY 22 and FY23 Q2 respectively.

**Conclusions/Next steps:** Overall, AP3 and other consolidated data-driven interventions have been shown to enhance HIV case finding for P&A as well as improve retention and viral suppression among the sub-populations for advancing HIV response in Ondo State.

## WEPEC261

Informing differentiated prevention services using HIV vulnerability profiles among adolescent girls and young women in Lesotho: a population based cross-sectional latent class analysis

A. Greenleaf<sup>1,2</sup>, C.-H. Shrader<sup>3</sup>, D. Reed<sup>4</sup>, S. Jovanovski<sup>2</sup>, M. Cleary<sup>2</sup>, F. Ndagije<sup>5</sup>, S. Saito<sup>4,2</sup>

<sup>1</sup>Columbia University Mailman School of Public Health, Department of Population and Family Health, New York, United States, <sup>2</sup>ICAP at Columbia University, New York, United States, <sup>3</sup>Arizona State University, Tempe, United States, <sup>4</sup>Columbia University Mailman School of Public Health, Department of Epidemiology, New York, United States, <sup>5</sup>ICAP at Columbia - Lesotho, Maseru, Lesotho

**Background:** In Lesotho, adolescent girls and young women (AGYW ages 15-29 years) experience high HIV incidence; yet person-specific HIV vulnerability profiles, which can inform differentiated HIV programming, are less known. We describe age-specific HIV vulnerability groups for AGYW.

**Methods:** We used Lesotho Population-based HIV Impact Assessment survey data, a cross-sectional nationally representative dataset (collected from 2019-2020). We conducted a weighted three-step latent class analysis for three age groups (15-19 years, 20-24 years, 25-29 years) to identify groups of AGYW most vulnerable to HIV acquisition based on self-reported sexual behaviors. We then identified associations between HIV vulnerability group and HIV diagnosis.

**Results:** We included 3,464 AGYW in the analysis of whom 14% were living with HIV (15-19 years=3.7%; 20-24 years=13.2%; 25-29 years=28.0%). The three-class LCA fit each age group best.

Across age groups, those in the low vulnerability group were enrolled in school or had completed secondary education and had lower conditional probabilities of engaging in multiple partnership, condomless sex, having an early sexual debut or age-disparate sex.

Those in the medium vulnerability group were defined by having children, using contraception, and not having multiple partnerships.

Those in the high vulnerability group engaged in sex with partners they do not know the status of or who are living with HIV in addition to risk behaviors that those in the

low vulnerability group did not. The magnitude of AGYW engaging in risk behaviors increased by age and HIV prevalence was highest among women ages 25-29 in the high-vulnerability group: 53% were living with HIV. AGYW in the high-vulnerability groups had increased odds ratio of positive HIV serostatus relative to the low-vulnerability groups.

**Conclusions:** Programming to curb AGYW HIV acquisition in Lesotho should address high risk sexual behaviors. Given the steep increase in HIV prevalence as AGYW age, programming will be most effective for AGYW ages 15-19.

## WEPEC262

Bridging gaps in PrEP awareness regarding SUD treatment and incarceration

R. Schnese<sup>1</sup>, A. Lopez<sup>1</sup>

<sup>1</sup>The LGBTQIA Center of Southern Nevada, Linkage to Care, Las Vegas, United States

**Background:** Recent data emphasizes the heightened vulnerability of individuals with Substance Use Disorder (SUD) and those transitioning from incarceration to HIV contraction. Our extensive outreach, particularly with individuals recently released from detox, treatment, and incarceration, underscores the urgent need for harm reduction tools like Narcan. These interactions reveal a lack of proactive information sharing about Pre-Exposure Prophylaxis (PrEP) even when in contact with medical professionals, highlighting a broader issue of insufficient emphasis on HIV prevention and a critical gap in preventive care.

**Description:** This proposal advocates for integrating Pre-Exposure Prophylaxis (PrEP) into post-Substance Use Disorder (SUD) treatment and incarceration healthcare, emphasizing comprehensive education for providers. It addresses the heightened HIV risk among the SUD population, especially men who have sex with men (MSM) in chemsex or survival sex.

Despite national harm reduction efforts, achieving PrEP goals remains challenging. The proposal aims to bridge gaps for vulnerable populations post-SUD treatment or incarceration through a local survey, informed by Las Vegas tunnel outreach experiences, aiming to engage the

community, enhance healthcare provider education, and establish a network dedicated to reducing HIV transmission in this population.

### Lessons learned:

1. Recognize the community need for more PrEP awareness and education in incarceration and SUD healthcare, where individuals are most vulnerable.
2. Highlight the effectiveness of PrEP integration in the healthcare continuum of SUD treatment and incarceration for clients who have highest potential exposure to HIV.
3. Become familiar with how exactly PrEP can be promoted more heavily in these areas, and what methods can be utilized to heighten the awareness of pre-exposure medication for those vulnerable.

**Conclusions/Next steps:** This session emphasizes the crucial need for accessible Pre-Exposure Prophylaxis (PrEP) in vulnerable populations, particularly incarcerated individuals and people who use drugs (PWUD).

Drawing from extensive frontline experience and outreach efforts in the Las Vegas tunnels, where individuals transitioning from treatment and penal systems lack access to PrEP, the facilitators will present a case for community mobilization.

The session aims to motivate HIV advocates and healthcare providers to address gaps in residential treatment and lock-up facilities, offering actionable responses and practical insights based on a first-hand case study from Las Vegas.

## WEPEC263

HIV risk profiling among adolescent girls and young women aged 15- 24: a resource efficiency innovation for tracking HIV vulnerability in DREAMS Centers in Zambia

C. Kaonga<sup>1</sup>, K. Mwanda<sup>2</sup>, L. Chingumbe<sup>3</sup>, M. Chisashi<sup>4</sup>

<sup>1</sup>USAID CHEKUP II, Priority Population, Lusaka, Zambia,

<sup>2</sup>USAID CHEKUP II, Management, Lusaka, Zambia, <sup>3</sup>USAID CHEKUP II, Key Population, Lusaka, Zambia, <sup>4</sup>USAID CHEKUP II, Strategic Information, Lusaka, Zambia

**Background:** Adolescent girls and young women (AGYW) continue to play a critical role in reaching HIV epidemic control in Zambia. To identify and track unreached AGYW with new HIV prevention approaches, innovative techniques that make efficient use of limited time, staffing, supplies, and other resources are required. The USAID CHEKUP II Activity, implemented by JSH, developed a model of HIV risk profiling to identify and track the risks of all AGYW screened and enrolled in the DREAMS program, and, based on the overall HIV vulnerability of the individual AGYW, immediately introduced HIV prevention services within 48 hours of risk identification.

**Methods:** From October 2022 to September 2023, the HIV risk profiling model was rolled out to 16 DREAMS centers supported by USAID CHEKUP II. A line list of 30,188 DREAMS

AIDS 2024

Late-breaker  
abstracts

Author  
Index

center AGYW was created and a risk profile for each AGYW was created. 84 DREAMS staff were trained and equipped with data management tools for risk profile analysis, along with HIV test kits, condoms, and PrEP commodities for service provision.

**Results:** A total of 30,188 AGYW aged 15-24 years were enrolled based on the standard DREAMS risk profile. Of those enrolled, 10,119 AGYW were at substantial risk of HIV and received HIV counseling and testing.

Of this number 115 (1.1%) tested positive for HIV and were linked for ART. Of the AGYW who tested negative, 10,004, were offered PrEP within the DREAMS centers, and 6,920 (69%) were eligible and accepted to be initiated on oral PrEP.

The remaining 3,084 (31%) were not eligible for PrEP, however, were offered other HIV prevention measures such as condoms.

**Conclusions:** HIV risk profiling is critical in identifying and tracking unreached AGYW at substantial risk of HIV acquisition. This innovative technique has the potential to support Zambia's goal of reaching HIV epidemic control and through better serving AGYW. By making more efficient use of time, staffing, supplies, and other resources required to identify and link enrollees with HIV prevention methods and prevent new HIV under the DREAMS program in Zambia. The Activity recommends the use of this HIV risk profiling model for HIV prevention among AGYW.

## WEPEC264

Improving HIV pre-exposure prophylaxis uptake within status-neutral testing: the United States Agency for International Development (USAID) Zambia Integrated Health project experience

E. Siame<sup>1</sup>, C. Todd<sup>2</sup>, M. Zulu<sup>3</sup>, A. Mutambo<sup>1</sup>, B. Kafulubiti<sup>1</sup>, T. Ventimiglia<sup>2</sup>, E. Sinyinza<sup>4</sup>, P. Kasese-Chanda<sup>5</sup>, I. Banda<sup>6</sup>

<sup>1</sup>Pact Zambia, Kabwe, Zambia, <sup>2</sup>Pact, Washington, United States, <sup>3</sup>Pact Zambia, Ndola, Zambia, <sup>4</sup>Pact Zambia, Lusaka, Zambia, <sup>5</sup>United States Agency for International Development, Lusaka, Zambia, <sup>6</sup>Provincial Health Office - Central Province, Ministry of Health, Government of the Republic of Zambia, Kabwe, Zambia

**Background:** Oral pre-exposure prophylaxis had high initial uptake with select populations in Zambia following introduction in 2018. However, achieving PrEP uptake at progressively greater scale remains challenging. The USAID Zambia Integrated Health project aims to improve PrEP use through status-neutral testing approaches across priority populations.

**Description:** We assessed factors contributing to low PrEP uptake and current use, which were limited provider knowledge leading to hesitancy to provide services and limited PrEP integration with activities that include HIV testing services (HTS), and collaboratively developed microplans with Ministry of Health (MOH) district health

officers and facility managers in Central and North-Western provinces. Microplans included technical mentorship of facility and community providers, promotion targeting facilities and communities, and strengthened linkages for rapid PrEP start.

We compared program data between July to November for 2022 and for 2023 to assess change while considering potential PrEP seasonality.

**Lessons learned:** PrEP uptake markedly increased, largely attributed to increased promotion among pregnant and breastfeeding women and, for men, via voluntary medical male circumcision (VMMC) between years. We attribute these increases to three factors.

First, mentorship improved provider confidence for PrEP counseling, prescribing, and management, particularly within antenatal and postnatal care and for generating HTS and PrEP demand within communities.

Next, PrEP services were newly integrated with other prevention activities, particularly VMMC, with direct or facilitated referral for rapid PrEP start. MOH guidance to integrate PrEP with other services acted synergistically with mentorship to motivate providers.

Last, the project supported strengthened PrEP documentation for relevant facility staff. During implementation, the PrEP and HTS commodity supply chain was stable with no stock-outs.

**Conclusions/Next steps:** Expanded provider and community-based volunteer mentorship and HIV prevention service integration have successfully increased PrEP uptake in two predominantly rural Zambian provinces across five months. The project will explore further adaptations and improve documentation to expand uptake and prevention-effective use.

## WEPEC265

Reducing the incidence of HIV by scaling up interventions for women who use drugs and partners of people who use drugs

S.T. Aung<sup>1</sup>, S.Y. Ko<sup>2</sup>, S.A. Aung<sup>3</sup>

<sup>1</sup>Mandaly University of Distance Education, English, Myitkyina, Myanmar, <sup>2</sup>Medecins Du Monde, Programme, Myitkyina, Myanmar, <sup>3</sup>Myitkyina University, Math, Mohnyin, Myanmar

**Background:** Since 2000, Médecins du Monde (MdM) has been implementing harm reduction activities related to drug use through three services centre) in Kachin State, where HIV prevalence is around 47%. MdM provides prevention services, testing and treatment of HIV, hepatitis and STIs, needles and syringes, primary health care, psychosocial support and operates drop-in centres. The political and social situation has been tensed after the military coup that occurred in February 2021, and amid the conflicts between armed groups and police crackdowns, female drug users and partners of people who inject drugs (PWID) are the most vulnerable, discriminated and commonly marginalized.

**Description:** Although male PWIDs are a high-risk group of HIV transmission, their partners and female users have an inequal access to prevention and care services. Hence, since 2021 MdM adopted a gender sensitive model: recruiting female staff from the community, organizing women mobile clinics and women awareness day, which focus on offering specific health information to women especially in remote villages.

**Lessons learned:** After 2 years, MdM reached out around one-third of female users and partners from the coverage area and the HIV positivity rate among female clients has dramatically decreased as the outreach strategy with tailored activities scaled up.

**Conclusions/Next steps:** To increase accessibility of health services to women, MdM has been including in a meaningful way women in the planning, delivery, and evaluation of the services, to adapt the activities to their real needs amidst the tense political context and cultural disturbances.

## WEPEC266

For key populations by key populations: empowering key population civil society organizations to lead delivery of HIV services to key populations: lessons from the USAID CHEKUP I Project

A. Samona<sup>1</sup>, M. Musheke<sup>1</sup>, C. Siame<sup>1</sup>, F. Mwape<sup>1</sup>, B. Ngosa<sup>1</sup>, M. Zimba<sup>2</sup>, M. Sakala<sup>3</sup>, M. Kabwe<sup>4</sup>, M. Mulenga<sup>5</sup>, C. Kanene<sup>6</sup>, A. Phiri<sup>6</sup>, K. Chiyenu<sup>1</sup>

<sup>1</sup>Centre for Infectious Disease Research in Zambia, Implementation Science, Lusaka, Zambia, <sup>2</sup>Key Populations Alliance of Zambia, CSO, Lusaka, Zambia, <sup>3</sup>Titandizeni Umooyo Network Limited, CSO, Lusaka, Zambia, <sup>4</sup>The Lotus Identity, CSO, Lusaka, Zambia, <sup>5</sup>Sustainable Health Advocacy and Dynamic Empowerment, CSO, Solwezi, Zambia, <sup>6</sup>United States Agency for International Development, HIV prevention, Lusaka, Zambia

**Background:** Due to a restrictive legal and socially conservative environment that prohibits same-sex relations and stigmatizes sex work, identifying and mobilizing key populations (KP) – men who have sex with men (MSM), female sex workers (FSW), transgender persons (TG) and people who inject drugs (PWID) – to access HIV services is always a challenge.

**Description:** The USAID-funded Controlling HIV Epidemic for Key and Underserved Populations (CHEKUP) I is implementing a key populations (KP) program in seven (7) districts of two (2) provinces of Zambia, targeting FSW, MSM, TG and PWID. In May 2023, the project partnered with 4 KP CSOs to lead the implementation of KP activities.

The KP CSOs recruited all the field and district staff, including health care providers and peer promoters, and took responsibility for day-to-day management of the KP wellness centers and planning and implementation of HIV services.

To further strengthen the operational capacity of the KP CSOs, appropriate skills training in relevant domains including organizational and financial management, biomedical service provision, and data management and reporting were provided to all the KP CSOs.

**Lessons learned:** Due to legal and social constraints, KP CSOs play a vital role in mobilizing and reaching KP for HIV services. Between May and September 2023 when USAID CHEKUP partnered with KP CSOs, 8,774 KPs were reached: 5,293 FSW, 2,524 MSM, 957 TG, out of whom 1,211 (32%) tested HIV-positive. Out of 2,532 (68%) who tested HIV-negative, 1,380 (55%) were initiated on pre-exposure prophylaxis. 81,244 condoms and 56,391 lubricants were distributed both at the KP Wellness Center and during community outreach activities. By September 2023, viral load coverage and viral suppression stood at 73% and 93%, respectively.

**Conclusions/Next steps:** A restrictive legal and socially conservative environment makes it hard for KP to easily be reached with HIV services, due to social stigma and

concerns about safety and security. However, these barriers are mitigated by the engagement and involvement of KP CSOs, who use their social networks to build trust, and mobilize KP to receive HIV services. However, to effectively lead implementation, KP CSOs need organizational capacity building and on-site technical mentorship.

## WEPEC267

Pre-exposure prophylaxis uptake and progress towards 95-95-95 goals among serodifferent couples in Zambia: findings from the 2016 and 2021 Zambia Population-based HIV Impact Assessment Surveys

A. Mwila<sup>1</sup>, E. Kim<sup>2</sup>, M. Bronson<sup>2</sup>, A. Auld<sup>3</sup>, L. Sundano<sup>4</sup>, T. Chisenga<sup>4</sup>, K. Nkwemu<sup>5</sup>, C. Claassen<sup>6</sup>, M.-C. Lavoie<sup>6</sup>  
<sup>1</sup>CDC Zambia, Programs Directorate, Lusaka, Zambia, <sup>2</sup>US CDC Atlanta, Atlanta, United States, <sup>3</sup>CDC Zambia, Office of the Director, Lusaka, Zambia, <sup>4</sup>Ministry of Health, Lusaka, Zambia, <sup>5</sup>CDC Zambia, Prevention Care and Treatment Branch, Lusaka, Zambia, <sup>6</sup>University of Maryland Baltimore, Maryland, United States

**Background:** Serodifferent partnerships require both prevention and treatment strategies to prevent HIV transmission to the HIV-negative partner and ensure the HIV-positive partner adheres to treatment and is virally suppressed. We assessed serodifferent couples in Zambia for Pre-exposure prophylaxis (PrEP) knowledge and uptake among HIV-negative partners, and progress towards UNAIDS 95-95-95 targets among HIV-positive partners.

**Methods:** Nationally representative household-based Zambia Population-based HIV Impact Assessment (ZAMPHIA) surveys were conducted in 2016 and 2021. Analysis included couples residing in the same household who identified as married or living together as married and had a valid blood draw.

Questions related to PrEP knowledge and uptake were only included in the 2021 survey. Self-reported awareness of HIV and treatment status were adjusted for detection of antiretrovirals.

Viral load suppression was defined as viral load <1000 copies/ml. To account for complex survey design, analyses were weighted, and confidence intervals were computed using Jackknife estimation.

**Results:** In ZAMPHIA 2016, 3,315 couples were identified, of which 7.6% were serodifferent; in 2021, 3,519 couples were identified, and 6.9% were serodifferent. The female was the HIV-positive partner in 45.5% and 53.7% of serodifferent couples in 2016 and 2021, respectively.

Among serodifferent couples in 2016, 66.3% of HIV-positive partners were aware of their status, 91.1% of those aware of their status were on ART; and 90.5% of those on ART were virally suppressed. Among serodifferent couples in 2021, 83.5% of HIV-positive partners were aware of

their status; 99.2% of those aware of their status were on ART, and 98.2% of those on ART were virally suppressed. In 2021, at least one partner had ever heard of PrEP in 55.8% of serodifferent couples, and in 5.6% of serodifferent the HIV-negative partner was currently on PrEP.

**Conclusions:** Progress towards 95-95-95 targets among HIV-positive partners improved between 2016 and 2021, with HIV-positive partners reaching the overall viral suppression target in 2021. However, knowledge of PrEP was limited, and uptake among HIV-negative partners was low in 2021.

Further research is needed to understand interest and need for PrEP among serodifferent couples. Serodifferent couples may also benefit from targeted PrEP education and service delivery.

## WEPEC268

24-hour PrEP in the city of São Paulo, from in-person to online service

A.Q. Silva<sup>1</sup>, M.C. Abbate<sup>1</sup>, C.M. Matos<sup>1</sup>, R.F. Camargo<sup>1</sup>, S.F.M. Rodrigues<sup>1</sup>, L. Pinheiro<sup>1</sup>, M.A. Barbosa<sup>1</sup>, C.A. Paula<sup>1</sup>, E.A. Sala<sup>1</sup>, F.M.B. Bueno<sup>1</sup>, M.A.F. Souza<sup>1</sup>

<sup>1</sup>Municipal Health Secretariat of São Paulo, STI/Aids Coordination, São Paulo, Brazil

**Background:** The provision of HIV pre-exposure prophylaxis (PrEP) in the city of São Paulo began in 2018, through 5 services of the Municipal Network Specialized in STI/Aids (RME). In 2021, the 27 RME services and another 28 units of the Sampa Trans Network were already offering PrEP and, in the following year, the STI/Aids Coordination implemented the PrEP on the Street (PrEP na Rua) project to provide this technology to a community environment.

**Description:** In 2023, the São Paulo STI/Aids Coordination opened two services to expand access to PrEP, as well as HIV post-exposure prophylaxis (PEP), at alternative hours in comparison to traditional units and intensified the *PrEP na Rua* project. On June 7th, 2023, the Prevention Station – Jorge Beloqui was opened, operating from Tuesday to Saturday, from 5pm to 11pm. That same day, the online service SPREP – Online PrEP and PEP began its activities, offering assistance every day, including on holidays and weekends, from 6pm to 10pm, via online appointments and allowing people to collect PrEP and PEP at 24-hour units. This increased the number of extramural activities by 451%.

**Lessons learned:** From January 2018 to December 2023, municipal health services registered 36,455 people on PrEP, with 12,838 new registrations last year. The new services created, Prevention Station and SPREP, included 12.3% of total new registrations, even though they only operated for 7 months of the year. Extramural activities with the PrEP na Rua project were equivalent to 11.9% in the same period. Therefore, the new units created and the increase of PrEP supply in a community environment, together, ex-

panded the number of new people using PrEP by almost 25%. Regarding post-exposure prophylaxis, these initiatives together corresponded to 4% (1,072) of PEP distributed in 2023 (26,029).

**Conclusions/Next steps:** The diversification of PrEP access points has proven to be an assertive guideline for public prevention policy in the city of São Paulo, which indicates an inclination to open new services that work on week-ends and holidays and/or evening hours.

## WEPEC269

Location preferences for accessing long-acting injectable pre-exposure prophylaxis (LA-PrEP) among men who have sex with men (MSM) in the U.S currently using daily-oral PrEP

J.L. Glick<sup>1</sup>, D.F. Nestadt<sup>2</sup>, T. Sanchez<sup>3</sup>, K. Li<sup>2</sup>, M. Hannah<sup>3</sup>, MK. Rawlings<sup>4</sup>, S. Sarkar<sup>4</sup>, V. Vannappagari<sup>4</sup>

<sup>1</sup>LSUHC- SPH, Community Health Sciences and Policy, New Orleans, United States, <sup>2</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, <sup>3</sup>Emory Rollins School of Public Health, Atlanta, United States, <sup>4</sup>Viiv Healthcare, Durham, United States

**Background:** Men who have sex with men (MSM) are disproportionately impacted by HIV. Long-acting injectable pre-exposure prophylaxis (LA-PrEP), FDA approved in December 2021, could expand PrEP coverage. Providing PrEP services at pharmacies or at-home, in addition to healthcare provider (HCP) settings, may improve PrEP utilization. We sought to investigate MSM location preferences for accessing LA-PrEP.

**Methods:** MSM participating in the 2021 online American Men's Internet Survey (AMIS) currently prescribed daily-oral PrEP who expressed interest in switching to LA-PrEP were asked where they would prefer to receive LA-PrEP injections. Response options were categorized as HCP settings, pharmacy, or at-home.

We used bivariate and multivariable multinomial regression models to estimate adjusted prevalence ratios (aPR) between various socio-demographic, mental health/substance use, sexual behavior, stigma, and HCP-communication variables and location preference.

**Results:** Among 1,076 participants, 60% preferred HCP settings for LA-PrEP services; 26% preferred home; 14% preferred a pharmacy. High-level healthcare stigma (experienced by 52%) was associated with less preference for HCP settings vs. pharmacy (aPR=0.50; 95%CI=0.33-0.78) and vs. at-home (aPR=0.68; 95%CI=0.48-0.94). High-level friends/family stigma (experienced by 45%) was associated with preferring HCP settings vs. pharmacy (aPR=1.90; 95%CI=1.22-2.95).

Prior at-home HIV testing (experienced by 29%) was associated with less preference for HCP settings vs. home (aPR=0.59; 95%CI=0.42-0.84). Being 25-29 (9%; aPR=1.89; 95%CI=1.05-3.42) or 30-39 (31%; aPR=1.51; 95%CI=1.03-2.19) vs.

40+ (56%) was associated with preferring HCP vs. home. Having private health insurance (82%) was associated with preferring HCP settings vs. home (aPR=1.49; 95%CI=0.99-2.24) and less preference for HCP settings vs. pharmacy (aPR=0.40; 95%CI=0.20-0.79).

	HCP vs. pharmacy		HCP vs. Home		Home vs. pharmacy

Table. Crude and adjusted prevalence ratios for LA-PrEP location preference based on multinomial logistic regression (N=1076).

**Conclusions:** LA-PrEP location preferences among PrEP-experienced MSM are influenced by complex factors including stigma, past healthcare experiences, resources, and age. LA-PrEP service provision at multiple locations may most effectively reach diverse MSM wanting to transition from oral to LA-PrEP. HCP settings should address access issues for MSM without private insurance and healthcare stigma exposure.

## WEPEC270

Gaps in access to PrEP in Mexico: a counterfactual analysis to evaluate access bias

F. Macías-González<sup>1</sup>, H. Vermandere<sup>1</sup>, A. Piñeirúa-Menendez<sup>2</sup>, S. Bautista-Arredondo<sup>1</sup>

<sup>1</sup>The National Institute of Public Health of Mexico, Center for Evaluation Research and Surveys, Cuernavaca, Mexico, <sup>2</sup>CISIDAT, Health Research Consortium, Cuernavaca, Mexico

**Background:** In theory, Mexico extends PrEP access to key populations, including MSM, through public health institutions. However, treatment access bias, influenced by individual, social, and structural barriers, may hinder equitable coverage. Employing the counterfactual prediction approach, this study aims to assess such bias.

**Methods:** Utilizing a hypothetical quasi-experimental design, the treatment group comprises MSM initiating PrEP in the MiPrEP, while the counterfactual group is drawn from a national sample of MSM identified in The National Survey on Sexual and Gender Diversity (ENDISEG) 2021. Employing age, education, employment, gender, and number of recent sexual partners, we compared groups using statistical methods to test for treatment access bias. A propensity score matching approach identified those less likely to access PrEP, assessed by unmatched individuals in

the control group. Further demographic characteristics of matched and unmatched individuals in the control group were evaluated. Logistic models gauged the hypothetical population probability of accessing PrEP.

**Results:** The treatment group (n=685) and control group (n=479) exhibited significant differences ( $P<0.05$ ) in age, education, employment, and sexual partner composition. Chi-squared balancing test revealed disproportions, with the intervention group skewed towards 25 to 34-year-olds (54% vs. 27%), higher education (78% vs. 25%), multiple sexual partners (90% vs. 42%), and fewer employed individuals (75% vs. 87%) with a Rubin's B of 199.6 and Rubin's R of 0.23.

The matching algorithm optimized the quality of the matches with NN-matching of 2 neighbors, resulting in 80 matched individuals, with a Rubin's B of 7.7 and Rubin's R of 1.34. Logistic models indicated a higher likelihood of PrEP access for those with advanced education (OR=8.31) and reporting partners of both sexes (OR=9.28).

**Conclusions:** Our findings unveil potential barriers influencing PrEP access, particularly among individuals with basic or lower education levels who might be overlooked by the current PrEP program. Addressing these disparities is critical for optimizing the impact and reach of HIV prevention efforts in Mexico.

## WEPEC271

PrEP uptake and retention amongst sex workers in 13 South African districts

Y. Andrews<sup>1</sup>, S. Hobbs<sup>1</sup>, J. Rangasami,<sup>2</sup>

<sup>1</sup>NACOSA, Key Populations, Cape Town, South Africa,

<sup>2</sup>Impact Consulting, Cape Town, South Africa

**Background:** Estimated 150 029 sex workers (SW) in South Africa; 91% are female with a 59,6% HIV prevalence rate and 5.5% HIV incidence. Sex between SW and clients contributes to 6.9% of new HIV acquisitions. With sex work criminalized, SWs hesitant to approach public health facilities for PrEP.

**Description:** NACOSA managed Sex Work programme funded by Global Fund in thirteen districts: Amathole, Buffalo City, Bojanala, Capricorn, King Cetshwayo, Mopani, Nelson Mandela Bay, Sedibeng, Sekhukhune, Thabo Mofutsanyana, Ugu, West Rand and Zululand.

In 2022, an external evaluation assessed the implementing Sub-recipients' (SRs) PrEP initiation and adherence innovations by referring to its three modalities: Modality 1- Provision from the SR staff only, through both mobile and fixed clinics; Modality 2- Provision from the SR staff in partnership with the Department of Health (DoH) staff, from both mobile and fixed clinics and Modality 3- Provision from the SR staff in partnership with DoH staff, from fixed clinics but NO mobile clinic.

A mixed-methods evaluation design assessed the successes and challenges of PrEP provision; using April

2019-March 2022 programmatic data analysis with 400 interview participants, and 546 mobile surveys with PrEP and non-PrEP users.

**Lessons learned:** High PrEP availability and accessibility in all districts. 3% struggled with access. 96% preferred services from SR mobile clinics to public health facilities. Only 7% of sex workers cycled on and off PrEP, with most PrEP refusals cited as SW 'feeling well' and refusing daily medication. Whilst PrEP accessibility and availability were unaffected by modality, uptake and retention was affected. Highest uptake rates in Modality 1 sites with mobile clinics while SR fixed clinics seldom used.

In Modality 2 sites, fair usage of both fixed sites (42%) and the mobile (36%), however DoH clinics without SR staff seldom used. PrEP uptake and knowledge lowest in Modality 3, reflecting the importance of mobile outreach.

**Conclusions/Next steps:** SR support enabled PrEP uptake and adherence, but these resource-intensive programs by civil society are not sustainable. Key population sensitization at public health facilities is critical to increasing SW's access, uptake, and adherence to PrEP; and in supporting key population programme transitioning from civil society to public health.

## WEPEC272

ART in the Shadows: understanding its use among HIV/TB co-infected persons deprived of liberty in Rio de Janeiro, Brazil

F.L. Dos Santos Ferreira<sup>1</sup>, C. Fausto de Souza Coutinho<sup>2</sup>, A.C. De Oliveira Silva<sup>1</sup>, P. Nascimento<sup>1</sup>

<sup>1</sup>State Health Department, Tuberculosis Management of Rio de Janeiro, Rio de Janeiro, Brazil, <sup>2</sup>Instituto Nacional de Infectologia Evandro Chagas, Rio de Janeiro, Brazil

**Background:** The intersection of tuberculosis (TB) and HIV presents a significant public health challenge, particularly among populations deprived of liberty. In this study, conducted in Rio de Janeiro, Brazil, from 2019 to 2023, we analyzed the incidence of TB and evaluated the proportion of TB/HIV co-infection and antiretroviral therapy (ART) utilization in this vulnerable group.

**Methods:** A retrospective analysis was performed on TB cases reported to the National Disease Notification System in Rio de Janeiro, involving data from 9 municipalities and 51 prison units. The study focused on calculating TB incidence per 1,000 people rate. We also calculated the proportion of TB/HIV co-infections and access to antiretroviral therapy (ART). R software was used for descriptive statistical analysis.

**Results:** Among the 10,263 cases of TB identified within the population deprived of liberty from 2019 to 2023, a total of 393 cases (3.82%) were confirmed as HIV/TB co-infections. The incidence rate of TB declined from 42.73 per 1,000 individuals in 2019 to 32.53 per 1,000 individuals by 2023. The proportion of TB/HIV co-infection exhibited variability

ity, reaching its peak at 4.25% of all confirmed TB cases in 2021. Notably, adherence to antiretroviral therapy (ART) among those with co-infections demonstrated significant oscillation, falling to its lowest point in 2021 at 37.07%, and rising to its highest in 2023 at 71.71% (Figure).

Figure. Incidence rate of tuberculosis (TB) per 1,000 individuals, by year of notification, along with the number of TB/HIV co-infections and the utilization of antiretroviral therapy (ART), among the population deprived of liberty in Rio de Janeiro, Brazil, from 2019 to 2023.

**Conclusions:** This study underscores a critical health issue: the high incidence of TB/HIV co-infection and inconsistent ART adherence among people deprived of liberty. It highlights the urgent need for targeted interventions to improve access to and adherence to ART, as well as the integration of TB and HIV services in correctional facilities to reduce mortality associated with TB/HIV co-infection in this at-risk population.

## HIV testing

### WEPEC273

Reducing the risk of HIV exposure vulnerability through peer- to -peer sessions among adolescent girls and young women: a case study from 5 regions of Tanzania Mainland

M. Ngowa<sup>1</sup>, A. Maro<sup>1</sup>, A. Nyirenda<sup>2</sup>, M. Kawogo<sup>2</sup>, F. Ngalesoni<sup>1</sup>, S. Kasone<sup>1</sup>

<sup>1</sup>Amref Health Africa Tanzania, Monitoring and Evaluation, Dar es Salaam, Tanzania, the United Republic of; <sup>2</sup>Amref Health Africa Tanzania, Disease Control and Prevention, Dar es Salaam, Tanzania, the United Republic of

**Background:** Adolescent girls and young women (AGYW) face disproportionately high risk of contracting HIV acquisition. In Tanzania, 28,000 new HIV acquisition among youth aged 15-24 are recorded annually, AGYW accounting for 80% of all new acquisition. Beyond the biological factors, the burden of HIV among AGYW are driven by behavioral, social and structural factors that operate together to shape individual vulnerability.

Records shows AGYW are more reluctant to the traditional method of health seeking behavior and direct opening up to health care providers on sensitive matters hence increases in HIV risk vulnerability.

**Description:** Amref Health Africa in Collaboration with Tanzania Youth Alliance under Global Fund implement Timiza Malengo program in Singida, Dodoma, Tanga, Geita and Morogoro regions of Tanzania targeting In and out of school AGYW aged 10-24. The program trained 1,377 out of school peer educators whom their main role was to identify AGYW from door -to-door, assess for vulnerability and enroll them into a program.

The program designed safe spaces (village office, church or schools premises) for a peer educator to deliver the comprehensive HIV prevention education to program beneficiaries on monthly basis.

AGYW identified to be HIV vulnerable were referred to HTS counselor for HIV testing services at the nearby facility, AGYW tested HIV positive were enrolled to care, initiated on ART and linked back to peer educators for monitoring and continuity of health education services.

**Lessons learned:** In a period of January,2021 to September,2023, the program reached 350,458 AGYW with comprehensive HIV prevention education, among identified HIV vulnerable 84% were tested for HIV and 2,860 (0.98%) were tested HIV positive and 99% enrolled to care and treatment and initiated on ART. We observed the reduction in positivity rate among newly HIV tested AGYW from 1.80% in 2021 to 0.98% in 2023.

**Conclusions/Next steps:** Programs should make peer-led programs sustainable to ensure continuity of HIV prevention services delivery at community level. Therefore, it is important to fund, scale up and strengthen peer led

programs as an integral part of primary health care that meet comprehensive HIV prevention needs of AGYW beyond health sector and address structural challenges to reduce new HIV acquisition.

## WEPEC274

### Calling for reflection: a ten-year analysis of CD4 count trends at HIV diagnosis in Guatemala (2013–2023)

O. Bonilla<sup>1</sup>, D. Mercado<sup>1</sup>, J.C. Pérez<sup>1</sup>, E. Arathoon<sup>1,2</sup>

<sup>1</sup>Hospital General San Juan de Dios de Guatemala, Clínica Familiar "Luis Ángel García", Guatemala, Guatemala, <sup>2</sup>Asociación de Salud Integral - ASI, Guatemala, Guatemala

**Background:** Delayed HIV diagnoses pose multiple threats, compromising the potential benefits of early ART initiation, escalating morbidity rates, and increasing economic implications, among other challenges. This study explores the landscape of HIV diagnosis over the past decade, analyzing trends in the median CD4 count.

**Methods:** We analyzed data from people living with HIV (PLWH) who received care at "Clínica Familiar Luis Angel Garcia" (CFLAG), a major HIV center in Guatemala City. The study focused on individuals who were HIV diagnosed between 2013 and 2023 with a documented baseline CD4 count. Our primary target was to examine trends in CD4 counts and assess six-month mortality.

**Results:** Between January 2013 to October 2023, CFLAG diagnosed a total of 4,486 HIV-positive individuals, averaging 408 diagnoses annually. The highest number of diagnoses occurred in 2021, totaling 524 cases. Out of these cases, 4,377 (97.5%) had a documented baseline CD4 cell count. The median CD4 cell count showed an increasing trend from 165 in 2013 to 278 in 2023. Although the median CD4 count demonstrated a relative increase over time, the proportion of individuals with Advanced HIV Disease (AHD) (<200 cells/mm<sup>3</sup>) remained high at 37% in 2023. Additionally, when classifying PLWH based on their risk category, we observed a notable improvement among men who have sex with men (MSM), the median CD4 cell count within this group rose from 258 in 2013 to 340 in 2023. ( $p < 0.0001$ ), whereas median CD4 cell count in heterosexual individuals remained almost stable, from 139 in 2013 to 101 in 2023 ( $P = 0.814$ ). In this group, the proportion of ADH has stayed consistently high and it does not change over time from 63% in 2013 to 65% in 2023. Additionally, at 6 months, mortality was significantly higher among individuals with AHD (17.1% vs 1.1%,  $p < 0.0001$ ).

**Conclusions:** While commendable efforts are evident in the early identification of HIV in at-risk populations, it is imperative to implement strategies for the early identification of HIV cases among the heterosexual population in Guatemala, this approach is essential in ensuring that no one is left behind.

## WEPEC275

### Social network strategy for HIV testing and linkage to PrEP/ART services among key populations in Hai Phong City, Vietnam, 2021–2023

H. Nguyen<sup>1</sup>, H. Nguyen<sup>1</sup>, P. Nguyen<sup>1</sup>, T. Hoang<sup>1,1</sup>, B. Nguyen<sup>1</sup>, T. Nguyen<sup>2</sup>, D. Luc<sup>2</sup>, L. Nguyen<sup>3</sup>, N. Nguyen<sup>3</sup>, H. Le<sup>3</sup>, H. Nguyen<sup>3</sup>, M. Shah<sup>1</sup>

<sup>1</sup>US.CDC in Vietnam, Hanoi, Viet Nam, <sup>2</sup>Vietnam Ministry of Health, Hanoi, Viet Nam, <sup>3</sup>Hai Phong CDC, Hai Phong, Viet Nam

**Background:** The HIV epidemic in Vietnam is concentrated among key populations (KP), with HIV prevalence estimated at 12.5%, 12%, and 3.1% among men who have sex with men (MSM), people who inject drugs (PWID), and female sex workers (FSW), respectively (HSS+, 2012–2022). In response, a social network-based strategy (SNS) was introduced in Hai Phong City, an urban center with high HIV burden, in 2021. People living with HIV (PLHIV) or HIV-negative individuals at risk of HIV, were enrolled as SNS recruiters and trained to refer network associates to HIV testing using referral coupons, and subsequently to HIV pre-exposure prophylaxis (PrEP) or anti-retroviral treatment (ART) based on HIV status.

We aimed to assess the feasibility and outcomes of SNS implementation to inform program scale-up and improvement.

**Methods:** SNS client registers between June 2021 – November 2023 from 12 sites in Hai Phong were analyzed. We described the feasibility and effects of SNS through assessing coupon distribution, characteristics of SNS recruiters and network associates, uptake of HIV testing, HIV positivity, use of ART and PrEP among SNS-recruited network associates.

**Results:** Of 988 participants who agreed to be SNS recruiters [median age: 32 (IQR: 25–42), 851 (86%) were male, 509 (52.5%) MSM, 191 (19.3%) PWID, 160 (16.2%) sex partners of PLHIV, 85 (8.6%) other groups, and 33 (3.3%) FSW. 988 recruiters received 2,643 referral coupons; 751 (76%) received two or three coupons. Of 1,624 network associates (62% of distributed coupons) tested for HIV, 109 (6.8%) tested positive. HIV positivity was 4.9% (25/509), 14.4% (50/347), 2.9% (13/442), 3.3% (5/150) and 9.0% (16/178) among MSM, sex partners of KP, and other groups, respectively. Of those who tested positive, 93.5% (102/109) received ART, and 29.3% (444/1,515) of those who tested negative received PrEP. 176 network associates (10.8%) agreed to be new SNS recruiters.

**Conclusions:** SNS is feasible and effective in engaging a variety of KP groups, improving HIV case finding and linkage to ART service, with high HIV test positivity. The SNS strategy can be further strengthened by improving efforts to encourage network associates to participate as SNS recruiters and by improving linkage to PrEP among clients testing negative for HIV.

## WEPEC276

Data for impact: optimizing recency testing data to improve HIV case identification in Eastern Uganda

N. Okiror<sup>1</sup>, W. Akoby<sup>1</sup>, R. Ssebunya<sup>2</sup>, D. Esogu<sup>1</sup>, R. Barusya<sup>1</sup>, P. Ntege<sup>2</sup>, R. Juuko<sup>2</sup>, A. Mugume<sup>1</sup>, D. Birungi<sup>2</sup>, D. Kiragga<sup>2</sup>  
<sup>1</sup>USAID Local Partner Health Services (Baylor-Uganda), Mbale, Uganda, <sup>2</sup>Baylor-Uganda, Kampala, Uganda

**Background:** In 2021, Uganda's ministry of Health (MoH) rolled out recency testing for all newly identified HIV positive clients. In Sept 2022, HIV case identification in Mbale and Tororo districts were suboptimal for example 4.7% and 5.2% for Mukuju and Namatala Health Centres (HCs) respectively.

We describe how we utilized HIV Recency data to improve HIV case identification among individuals 15years and above in seven HCs in mid-eastern Uganda.

**Description:** With support from USAID, the Local Partner Health Services Eastern project (implemented by Baylor-Uganda) in collaboration with MoH, implemented a multi-site quality improvement collaborative project in May 2023 in seven purposively selected high volume HCs within Mbale and Tororo districts. These sites were among the first to be activated for recency testing in the region. The collaborative involved mentoring of healthcare providers (Clinicians, Laboratory teams and Counsellors), bi-weekly review of HIV testing services (HTS) data, collaborative learning across HCs and targeted community-based HTS activities including targeted risk-based mobilization and assisted partner notification. We present descriptive statistics to show HIV case finding performance in the seven HCs.

**Lessons learned:** Of the 45 recent infections identified in May 2023, 94 sexual partners were notified and tested for HIV, 27 (27.6%) were HIV positive, 18 being females. Of the 27 new positive clients identified, the majority (96%) were between 20 and 49 years, 8 (29.6%) were recent infections and 23 (85.1%) were identified from the community. HTS yield improved from 4.7% to 41.6% (Mukuju HCIV) and 5.2% to 25% (Namatala HCIII) and illustrated in figure1 below.

**Conclusions/Next steps:** Use of HIV Recency data to focus HTS interventions is effective and scale-up to other facilities is recommended to sustain HIV epidemic control.

## WEPEC277

Comparing facility-based and outreach testing strategies for migrant communities: insights from the Crossing Countries, Crossing Communities (4C) Project in Greece and the Netherlands

T. Mouhebat<sup>1</sup>, S. Matis<sup>2</sup>, L. Vliegthart- Berman<sup>3</sup>, A. Klimis<sup>4</sup>  
<sup>1</sup>Soa Aids Netherlands, Amsterdam, Netherlands, the, <sup>2</sup>Positive Voice - The Greek Association of People Living With HIV, Athens, Greece, <sup>3</sup>Doctors of the World Netherlands, Amsterdam, Netherlands, the, <sup>4</sup>Dokters of the World Greece, Athenes, Greece

**Background:** STIs including HIV and viral hepatitis, disproportionately affect migrant communities in Europe. Despite comprising only 12% of the European Union's population, migrants represent a substantial 44% of documented HIV cases. To address this health disparity, our project, funded by the European Commission, was launched in 2023. The initiative focuses on implementing facility-based and outreach testing services in Greece and the Netherlands.

**Description:** The project "Crossing Countries, Crossing Communities" (4C) initiated testing interventions in Greece and the Netherlands, specifically targeting MSM, transgender people, and migrants. Interventions were tailored to the unique context and demographics of the migrant population in each region, considering resource availability. This included low-threshold clinical testing and mobile services strategically deployed at refugee camps and other locations frequented by the target groups. Project data, including the number of STI and HIV tests, demographic information, testing history, and test results, was collected. We conducted a comparison between the data of individuals tested at clinics and those reached through outreach efforts.

**Lessons learned:** Through December 2023, facility-based services conducted 15,294 tests for STIs and HIV, while outreach events contributed 8,314 tests. The outreach group exhibited a higher proportion of individuals in the 50+ age category (11.4%) compared to those tested at clinics (7%). Additionally, outreach efforts resulted in reaching a greater percentage of individuals identifying as female and are non-MSM. The STI positive rate was notably higher among the population reached through outreach services (6.6% compared to 2.7%). (Table 1)

	Facility based testing	Outreach
Total number of HIV & STI tests	15,294	8,314
Male	68.7%	56.6%
Female	29.7%	41.2%
Non-binary	0.97%	0.74%
MSM	40.3%	17.4%
STI rate	2.7%	6.6%
Confirmed HIV rate	0.86%	1%

Table 1.

**Conclusions/Next steps:** Outreach testing at migrant-populated sites has demonstrated promising outcomes, reaching a diverse demographic, including non-MSM individuals, females, and those aged 50 and above. Preliminary findings from the first year indicate the potential effectiveness of outreach in detecting previously undiagnosed STIs compared to clinic testing. In the forthcoming phase, we aim to connect this group with tailored prevention strategies and document best practices and lessons learned.

## WEPEC278

Do people prefer digitally facilitated HIV self-sampling or self-testing? An analysis of national HIV testing week data from an online SRH service in the UK

R. Mills<sup>1</sup>, E. Ardines<sup>1</sup>, W. Howells<sup>1</sup>, N. Mohammadian<sup>1</sup>, P. Baraitser<sup>1</sup>

<sup>1</sup>SH24, London, United Kingdom

### Background:

National HIV Testing Week in England aims to encourage HIV testing, SH24 offers HIV tests ordered online and posted to a user's home. In 2023, users were given a choice between a self-sampling or self-testing HIV test (see Figure 1).

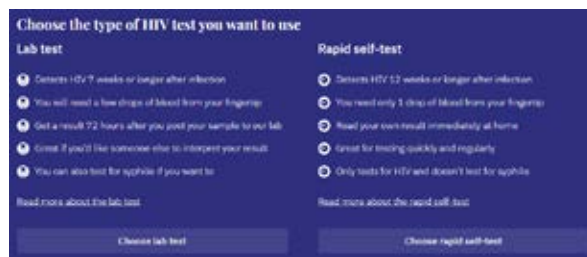

Figure 1 - HIV Test Decision Screen

**Methods:** Routinely collected data from users who ordered a test over National HIV Testing Week 2023, including user feedback, was anonymised and exported from a secure data warehouse for analysis in Excel.

### Results:

Most users chose a self-test kit (n=10305, 68.55%) over a self-sample kit (n=4727, 31.45%). Trends in age were similar across groups. Both self-samplers and self-testers were mostly men, with 67.76% (n=3203) and 68.08% (n=7016) men in each group respectively. A large proportion of users were heterosexual for both self-samplers (n=2022, 42.78%) and self-testers (n=4743, 46.03%), and a significant proportion were gay men, for self-samplers (n=1751, 37.04%) and self-testers (n=3618, 35.11%). Most users were White British, for self-samples (n=2909, 61.54%) and self-tests (n=6510, 63.17%). A higher proportion of those of African ethnicities were self-testers (n=984, 9.55%) compared to self-samplers (n=330, 6.98%). Thirty-one-percent of self-testers (n=3182) had never tested for HIV, compared

to 25.07% (n=1185) of self-samplers (see Table 1). Two HIV positive results were identified through self-sample testing and 1 through self-testing. Ninety-seven-percent (n=524) of self-testers who completed a user feedback survey (n=539) rated the service over 4 stars out of 5.

Last HIV Test	Self-Sample Users	Self-Test Users
Never	1185 (25.07%)	3182 (30.88%)
Over 1 Year Ago	1872 (39.60%)	4129 (40.07%)
Within the Last Year	1337 (28.28%)	2194 (21.29%)
Unknown	333 (7.04%)	800 (7.76%)
Total	4727 (100.00%)	10305 (100.00%)

Table 1: HIV Testing Behaviour

**Conclusions:** HIV self-testing appears more acceptable than self-sampling in this population. Demographic trends were similar in both groups with some important differences, with more self-testers who had never tested for HIV before and of African ethnicities.

## WEPEC279

Sex differences in reported HIV positive tests and changes between 2019-2022: analyses of Global AIDS Monitoring data from 16 countries in sub-Saharan Africa

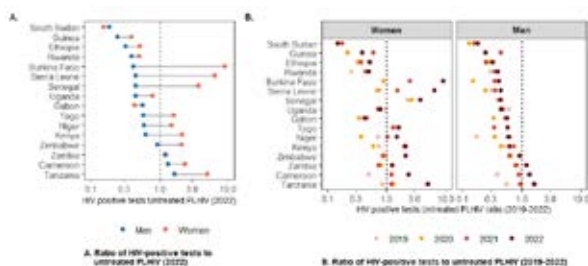

O. Edun<sup>1</sup>, M. Barr-DiChiara<sup>2</sup>, C. Lastrucci<sup>2</sup>, B. Msimanga<sup>2</sup>, C. Johnson<sup>2</sup>, L. Chitembo<sup>3</sup>, M. Beusenbergh<sup>2</sup>, S. Dalal<sup>2</sup>, E.L. Korenromp<sup>4</sup>, M. Mahy<sup>4</sup>, J.W. Imai-Eaton<sup>1,5</sup>, R. Baggaley<sup>2</sup>  
<sup>1</sup>Imperial College London, MRC Centre for Global Infectious Disease Analysis, London, United Kingdom, <sup>2</sup>World Health Organization, HIV, Hepatitis and STI Department, Geneva, Switzerland, <sup>3</sup>World Health Organization, HIV, Hepatitis and STI Department, Lusaka, Zambia, <sup>4</sup>Joint United Nations Programme on HIV/AIDS, Data for Impact Department, Geneva, Switzerland, <sup>5</sup>Harvard University, T.H. Chan School of Public Health, Boston, United States

**Background:** Fewer men than women are tested for HIV in sub-Saharan Africa. Men also have lower HIV prevalence but make-up a higher proportion of people living with HIV not on antiretroviral therapy (untreated PLHIV). Efforts to increase HIV testing and treatment have reduced the prevalence of undiagnosed and untreated PLHIV. We compared national data on HIV-positive tests and estimates of untreated PLHIV by sex to assess differences in the HIV-positive 'diagnoses gaps' and how these have changed over time.

**Methods:** We analysed sex-stratified estimates of numbers of untreated PLHIV from 2023 UNAIDS-published country estimates and numbers of HIV-positive tests (including retests) reported through Global AIDS Monitoring for adults (aged 15+) from 16 countries in sub-Saharan Africa between 2019-2022. We calculated sex-specific ratios of reported HIV-positive tests to estimated untreated PLHIV and compared across countries and between 2019-2022.

**Results:** From 2019–2022, across the 16 countries, the estimated percent of PLHIV untreated decreased from 28% to 15% in men, and from 20% to 8% in women. In 2022, the median ratio of positive tests to untreated PLHIV was 0.51 (interquartile range: 0.41–0.70) in men and 1.56 (0.51–2.70) among women. Across 13 countries reporting positive tests between 2019–2022, the median ratio of positive tests to untreated PLHIV increased from 0.39 (0.31–0.58) to 0.57 (0.44–0.93) in men and from 0.74 (0.45–0.85) to 1.50 (0.52–2.36) in women. In both men and women, this ratio fell temporarily in 2020 compared to 2019, to 0.34 (0.21–0.49) in men, and 0.66 (0.34–0.90) in women.

**Conclusions:** Diagnosis gaps among men and women have reduced between 2019–2022 in sub-Saharan Africa. HIV-positive men remain less likely to know their HIV status and be treated than women annually. Innovative HIV testing strategies and focused efforts are needed to engage men with testing services.

## WEPEC280

HIV testing among female partners following a peer-education HIV prevention intervention for Tajik male migrant workers

M.E. Mackesy-Amiti<sup>1</sup>, M. Bahromov<sup>2</sup>, J.A. Levy<sup>1</sup>, C.M. Luc<sup>1</sup>, J. Jonbekov<sup>2</sup>

<sup>1</sup>University of Illinois Chicago, School of Public Health, Chicago, United States, <sup>2</sup>PRISMA Research Center, Dushanbe, Tajikistan

**Background:** The "Migrants' Approached Self-Learning Intervention in HIV/AIDS for Tajiks (MASLIHAT)" recruits and trains male Tajik migrants who inject drugs as peer educators (PEs) in delivering HIV prevention information and encouragement to adopt risk-reduction norms within their diaspora social networks while reducing their own HIV risk. Reduced rates of syringe sharing and condomless sex among MASLIHAT participants were reported previously. This analysis examines the effect of the intervention on HIV testing among the participants' female sex partners.

**Methods:** The MASLIHAT intervention was tested in Moscow in a cluster-randomized controlled trial with 12 recruitment sites assigned to either the MASLIHAT intervention or comparison health education training (TANSIHAT). Tajik male migrants who inject drugs (N=140) were recruited to attend the 5-session MASLIHAT or TANSIHAT train-

ing and to recruit two network members (NMs) who inject drugs with the intent of sharing the information and positive strategies for change they learned (n=280). All 420 participants were interviewed at baseline and referred to HIV counseling and testing.

Follow-up interviews were conducted at 3-month intervals for 1 year. Modified mixed effects Poisson regression analyses adjusted for participant type and network clustering compared the proportions of participants with a regular female sex partner in each condition who reported that their partner had been tested for HIV.

**Results:** Of the 420 participants, 108 (26%) reported sex with a primary female partner during the study. Prior to the intervention, 4 (4%) indicated that their partner had been tested for HIV. At 3-month follow-up, 70% of MASLIHAT and 28% of TANSIHAT participants with a regular female partner reported their partner had been tested for HIV. At 12-month follow-up, testing increased to 94% for MASLIHAT and 59% for TANSIHAT.

Regression analyses indicated that MASLIHAT participants were significantly more likely to report partner HIV testing at the 3-month follow-up (IRR=2.60, 95% CI 1.41–4.78) and testing increased significantly over the follow-up period in both conditions (Chi2(3)=26.69, p<0.0001).

**Conclusions:** The MASLIHAT intervention for male Tajik migrants who inject drugs doubled the rate of female partner HIV testing compared to participation in HIV counseling and testing paired with a non-HIV focused health education intervention.

## WEPEC281

HIV, hepatitis, and syphilis self-testing among adolescents and young people: a systematic review and meta-analysis

Y. Zhang<sup>1,2</sup>, J. Tapa<sup>1,2</sup>, C.C. Johnson<sup>3</sup>, R.C. Baggaley<sup>3</sup>, C.K. Fairley<sup>1,2,4</sup>, J.J. Ong<sup>1,2,5</sup>

<sup>1</sup>Central Clinical School, Faculty of Medicine, Nursing and Health Sciences, Monash University, Melbourne, Australia, <sup>2</sup>Melbourne Sexual Health Centre, Alfred Health, Melbourne, Australia, <sup>3</sup>Global HIV, Hepatitis and STI Programmes, World Health Organization, Geneva, Switzerland, <sup>4</sup>University of Melbourne, Melbourne, Australia, <sup>5</sup>Faculty of Infectious and Tropical Diseases, London School of Hygiene and Tropical Medicine, London, United Kingdom

**Background:** Adolescents and young people make up a disproportionate share of the world's HIV and sexually transmitted infection (STI). Self-testing can increase testing coverage and strengthen the uptake of HIV/STI prevention and treatment services. We aimed to critically appraise the literature regarding HIV, hepatitis, and syphilis self-testing among adolescents and young people (age 10–24 years, based on WHO definition), and assess its acceptability, feasibility, usability, and cost-effectiveness.

**Methods:** We conducted a systematic review and meta-analysis, searching six databases between January 2010 and October 2023. We included all studies with primary data on HIV, hepatitis and syphilis self-testing in adolescents and young people. A random-effects meta-analysis was used to summarise the uptake, proportion of first-time testers and linkage to care. Qualitative data were narratively synthesised.

**Results:** We identified 104 relevant studies, of which 98 were on HIV, four on hepatitis, and two on syphilis self-testing. Among these, six studies focused on adolescents aged 10-14, 96 studies included adolescents aged 15-19, and 96 studies involved young people aged 20-24.\* A total of 46 studies were included in the meta-analysis. Most studies were conducted in the African region (n=33/46, 72%) and lower-middle-income countries (n=17/46, 37%).

Approximately 90% (95%CI: 82-96%,  $I^2=99\%$ ) of adolescents who were offered any of the three types of self-test completed the test. Around 78% (95%CI: 26-100%,  $I^2=98\%$ ) of adolescent self-testers reporting reactive results subsequently linked to further testing and onward care as needed. In general, adolescents and young people had high acceptability and usability towards self-testing. Adolescents aged 10-14 preferred receiving a self-test kit with pre-test counselling or assisted video/audio instructions from a healthcare worker to guide them on self-testing. Most individuals aged 15-24 liked the confidentiality, convenience and non-invasiveness of self-testing compared to conventional facility-based testing. They found self-testing easy to perform without assistance and were confident in interpreting the results themselves.

**Conclusions:** Self-testing is a safe, effective and accessible way to increase HIV, hepatitis and syphilis testing and treatment in adolescents and young people. Efforts to ensure access to self-testing for this population should be prioritized across disease areas to maximise public health impact.

\*Some studies were from >1 age group.

## WEPEC282

### Effectiveness of web-based HIV self-test distribution and linkage to HIV treatment and PrEP among key populations in Viet Nam: a mixed methods analysis of implementation from pilot to scale-up

V.T.T. Nguyen<sup>1</sup>, Y. Dunkley<sup>2</sup>, H.S. Vo<sup>3</sup>, A.T. Choko<sup>4</sup>, T.T.H. Phan<sup>3</sup>, D.M. Pham<sup>3</sup>, M.T. Dinh<sup>5</sup>, M.T. Huynh<sup>6</sup>, T.G. Dap<sup>6</sup>, T.T. Le<sup>7</sup>, R. Baggeley<sup>8</sup>, C. Johnson<sup>8</sup>

<sup>1</sup>World Health Organization, Country Office in Viet Nam, Hanoi, Viet Nam, <sup>2</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>3</sup>Viet Nam Administration for HIV/AIDS Prevention and Control, Ministry of Health, Hanoi, Viet Nam, <sup>4</sup>Liverpool School of Tropical Medicine, Liverpool, UK, Department of International Health, Liverpool, United Kingdom, <sup>5</sup>The Global Fund Supported Project on HIV/AIDS in Viet Nam, Ha Noi, Viet Nam, <sup>6</sup>Can Tho Centre for Diseases Control, Can Tho, Viet Nam, <sup>7</sup>Minh Phat Social Enterprise and Community development, Vinh, Viet Nam, <sup>8</sup>World Health Organization, Global HIV, Viral Hepatitis and STIs Programmes, Geneva, Switzerland

**Background:** In Vietnam, key populations (KPs) continue to face barriers accessing HIV services. Virtual HIV self-testing platforms are recommended and can increase KP testing access. We investigated the effectiveness of a web-based HIVST program in facilitating linkage to ART and PrEP initiation or continuation.

**Methods:** A mixed-methods study used cross-sectional and qualitative programme data from a web-based HIVST program. Initial piloting started in November 2020 and completed in April-2022. Scale-up delivery and evaluation was completed in 23 provinces from April to December 2022.

After risk assessment, participants registered on the web-site, receiving HIV oral fluid self-test (OraQuick®) by courier, peer educator, or self-collection.

Primary outcomes were proportion differences between pilot and scale-up on HIVST uptake, result reporting, and demographics. Positivity, case finding, incidence risk, and PrEP-use were compared. Thematic content analysis was conducted on responses from client satisfaction survey.

**Results:** 17,589 participants registered for HIVST; 11,332 individuals ordered 13,334 tests. Participants were generally young, a third <25 years old (4,309/11,332, 38.0%), male (9,418/11,332, 83.1%), and MSM (6,437/ 11,332, 56.8%). Nearly half were first-time testers (5,069/11,332, 44.9%).

Two-thirds of test-results were reported, with fewer results reported in scale-up (pilot: 3129/4140, 75.6%, scale-up: 5811/9194, 63.2%,  $p<0.001$ ). 6.3% of tests were reactive (561/8,940). Most initiated ART (509/522, 97.5%).

Case finding was 7.6% (95% CI: 7.0% to 8.3%, 494/6,492); incidence risk of those known negative at their second test was 3.8% (95% CI: 2.9% to 4.9%, 58/1535). One fifth with a negative test, initiated or continued PrEP (pilot: 19.8%,

scale-up; 18.5%,  $p=0.124$ ), with greater absolute positive tests, and PrEP-use in scale-up. Qualitative results demonstrated high- acceptability and minimal challenges.

**Conclusions:** Web-based HIV self-testing in Viet Nam reached people at elevated risk of HIV, facilitating uptake of ART and PrEP initiation and continuation. Web-based programs can expand testing access, supporting global HIV prevention and treatment targets.

## WEPEC283

### HIV testing frequency and predictors for testing among trans and/or non-binary people in Germany

U. Koppe<sup>1</sup>, J. Hamm<sup>2</sup>, C. Spurgat<sup>2</sup>, T. Schlögl<sup>3</sup>, A. Hahne<sup>4</sup>, V. Bremer<sup>1</sup>, K. Pöge<sup>5</sup>, TASG Study Group

<sup>1</sup>Robert Koch Institute, Infectious Disease Epidemiology, Berlin, Germany, <sup>2</sup>Deutsche Aidshilfe (DAH), Berlin, Germany, <sup>3</sup>TransInterQueer e.V. & Sigmund Freud PrivatUniversität Berlin, Berlin, Germany, <sup>4</sup>Freelance Sexual Health Counsellor and Bodyworker, Hamburg, Germany, <sup>5</sup>Robert Koch Institute, Epidemiology and Health Monitoring, Berlin, Germany

**Background:** Trans and non-binary people face barriers to HIV testing and quantitative studies are scarce. We investigated self-reported HIV testing and predictors for testing among trans and/or non-binary people in Germany.

**Methods:** We analysed data from the TASG-study, a participatory cross-sectional study for trans and/or non-binary people in Germany between 01 March and 01 July 2022. The investigated outcome in this analysis was self-reported HIV testing.

Predictors were identified using a bootstrap stepwise selection procedure and determining inclusion frequencies into logistic regression models after 500 bootstrap replications with a cut-off p-value of 0.1.

**Results:** We included 2,328/3,077 trans and/or non-binary participants reporting information on HIV testing and 22.9% reported obtaining HIV testing within the last 5 years. HIV testing sites last used were the doctor's office (43.1%), community-based testing (24.3%), public health office (18.5%), self-collection testing (6.4%), or self-testing (2.2%) (other: 6.4%, missing: 0.7%).

479/2,328 (20.6%) participants had a potential need for HIV testing, e.g. due to indicating multiple sexual partners with penetrative sex, sexualized drug use, or paying or being paid for sex.

Among those, 44.5% obtained HIV testing within the last 5 years. Testing differed by gender identity (female spectrum: 35.0%, male spectrum: 47.2%, non-binary spectrum: 49.0%, non-binary/female spectrum: 48.5%, non-binary/male spectrum: 45.7%) and was higher among participants being older (30+ years: 60.4%, 18-29: 33.8%), living in large cities (1+million: 61.9%, <1 million: 41.1%, <100.000:

31.6%), having higher education (high: 59.8%, middle: 41.0%, low: 25.9%), and being content with own body (yes: 54.1%, partly: 49.0%, no: 31.3%). Obtaining HIV testing varied by experiencing discrimination in daily life (never: 34.0%, sometimes: 50.6%, often: 44.8%, always: 26.3%).

Two predictors for HIV testing were included in >80% of bootstrapped multivariable models: city size (included in 500/500 multivariable models) and age (498/500). Being content with own body (187/500), experiencing discrimination (183/500), education status (142/500), and gender identity (137/500) were less often included.

**Conclusions:** Even among trans and/or non-binary people in Germany with a potential need for HIV testing, less than half were tested within the last 5 years. Testing opportunities outside larger cities and community-tailored information campaigns might help overcome some barriers to testing.

## WEPEC284

### Universal HIV detection strategies in emergency services in Venezuela

M. Comegna<sup>1,2</sup>, E. El Hage<sup>1</sup>, A. Comegna<sup>1</sup>, C. Perez<sup>2</sup>

<sup>1</sup>Once Trece Foundation, Caracas, Venezuela, Bolivarian Republic of, <sup>2</sup>Hospital Vargas de Caracas, Caracas, Venezuela, Bolivarian Republic of

**Background:** In Venezuela, where public HIV testing is virtually non-existent and a private HIV test costs around \$40 in a country with a minimum wage of less than \$5, the reported HIV prevalence was 0.4% to 0.6% in the adult population for 2021 and 2023.

Addressing this gap, a prospective, cross-sectional, descriptive, multicenter, non-experimental study offered free, voluntary, and confidential rapid HIV tests in emergency services of 13 health centers to establish non-directed or 'universal' HIV detection.

**Methods:** Universal screening was conducted for all individuals aged 15 to 70 attending emergency services, without discrimination. Tests were administered free of charge, confidentially, and voluntarily, maintaining confidentiality of results. All positive cases were immediately linked to local health services for antiretroviral treatment initiation. The screening was performed by resident doctors with expertise in administering and analyzing tests, and a second confirmatory test of a different brand was conducted following protocol.

**Results:** A total of 24,098 diagnostic tests were conducted between January 2021 and December 2023, with 469 tests returning positive (1.95%). The majority of these cases were men (72%), totaling 338 male cases, while women accounted for 28%, totaling 131 cases. The average age of positive cases was 36.7 years.

Key populations included MSM (11.6%), FSWs (0.53%), PWID (1.6%), those in poverty (27.2%), and a significant 46.4% were not associated with any high-risk activities.

**Conclusions:** The implementation of universal HIV testing in emergency rooms revealed crucial findings: 46.4% of positive cases did not belong to any high-risk groups, and the prevalence rate found in this study (1.95%) was significantly higher than the official reported rates (0.4% to 0.6%). This suggests that the actual prevalence of HIV in Venezuela could be considerably higher than previously thought, emphasizing the importance of universal testing strategies in HIV detection and public health policy.

## WEPEC285

Improving access to HIV-testing services (HTS) for at risk hard-to-reach male through regional male-friendly clinics' outreach: lessons learned and Implications for Haitian National AIDS Control Program

M.L. Excellent<sup>1,2</sup>, E. Emmanuel<sup>1</sup>, D. Lauture<sup>1</sup>, J.W. Domercant<sup>1</sup>  
<sup>1</sup>Institut pour la Santé, la Population et le Développement (ISPD), Pétion-Ville, Haiti, <sup>2</sup>University of North Carolina at Chapel Hill, Public Health Leadership and Practice (PHLP), Chapel Hill, United States

**Background:** In Haiti, over half of individuals identified as male have never been tested for HIV. The Institute for Health, Population and Development (ISPD) has implemented male-friendly clinics in an effort to address disparities in accessing HIV testing services (HTS) and contribute to reaching 95% of people living with HIV. We present here the results of an outreach intervention led by regional male-friendly clinics in Haiti that aimed to increase the proportion of at risk hard-to-reach male accessing HTS in a stigma-free environment.

**Description:** We implemented a customized outreach intervention where trained providers and community health workers conduct sensitization sessions targeting male public-transportation drivers, homeless, mobile individuals. We also identified hot spots and hard-to-reach males at high risk of exposure to HIV. Through these sessions, males are sensitized on health prevention measures and benefits of timely access to health services. Males are accompanied to clinics where a comprehensive package of services is available with strong emphasis on confidentiality including general outpatient care, urologic care, STI screening, HTS, PrEP, HIV care and treatment, etc. We reviewed HTS data weekly to monitor progress and address challenges timely.

**Lessons learned:** Initially, during FY\_20 Q2&Q3, of the 2373 people tested for HIV 376 (16%) were male of which 15 (4%) were diagnosed HIV positive. Following our intervention, in FY20\_Q4&FY21Q1, 3781 people received an HIV test, 1207 (32%) were male and 83 (7%; n=83/1207) of them were tested HIV positive. During FY21\_Q2&Q3, data reported a significant increase in access to HTS, a total of 5878 people were tested for HIV, 1786 (30%) were male and 166 (9%) of them were found to be living with HIV. The data showed

that targeted outreach linked to male-friendly clinics led to an increased proportion of male accessing HTS and a significant increase in the seropositivity rate for HIV.

**Conclusions/Next steps:** Male-driven outreach interventions have increased access to health services notably HTS for male, expanding such strategy may help achieve the 95-95-95. We believe that implementing culturally-sensitive interventions represents one of the best practices to reach people left out by the system for a better control of the pandemic globally.

## WEPEC286

Enhancing HIV and hepatitis C screening in a vulnerable population through emergency department interventions

C. Buresh<sup>1</sup>, O. Hood<sup>1</sup>, R. Doerning<sup>1</sup>, S. Magnusson<sup>2</sup>  
<sup>1</sup>University of Washington, Emergency Medicine, Seattle, United States, <sup>2</sup>Public Health- Seattle & King County, Ending the HIV Epidemic Coordinator, Seattle, United States

**Background:** The University of Washington is an academic health system with 3 emergency departments (EDs) in Seattle, Washington (King County), averaging 127,000 annual visits. Many patients have complex social needs including housing instability, substance use, and poverty. King County was the first major metropolitan area in the United States to achieve the UNAIDS 90/90/90 goals. This descriptive analysis explores a screening program aiming to identify undiagnosed or disengaged people with HIV (PWH) individuals. Through a public-private partnership, the program bundles HIV and Hepatitis C (HCV) testing and treatment, and treatment for opioid use disorder.

**Methods:** A screening and opt-in testing process for patients over age 18 not tested for HIV and HCV in the past year was implemented. Provider education and electronic medical alerts facilitated screening. Positive cases were contacted by linkage to care coordinators for treatment and addressing barriers to care. Unreachable PWH were located by county staff. Social workers provided assistance with housing and transportation, and drug treatment on-demand was offered through a 24/7 hotline.

**Results:** Pre-program, HIV screening was done in 1.3% and HCV screening was performed in 0.8% of eligible patients. Education and passive electronic alerts raised the rates to 5.5% for HIV and 5.0% for HCV. Ongoing process improvement measures increased rates to 6.8% for HIV and 11.6% for HCV. Since October 2021, 10,279 patients were screened for HIV and 8,663 for HCV, identifying 129 HIV+ cases (1.4%) and 492 HCV cases (5.7%). 66% of PWH were previously diagnosed but out of care, 97% were linked to care within 6 months. UW ED patients accounted for 12% of the HIV diagnoses in the county.

**Conclusions:** The ED serves as a crucial point for screening a vulnerable and hard-to-reach population, employing a syndemic approach to address multiple issues concurrently.

Public-private partnerships are vital for follow-up and linkage to care. Consideration of opt-out universal screening in the ED could enhance identification and service delivery for this population.

## WEPEC287

Complementing community interventions with technology to maximize tracking of HIV-exposed infants (HEI) final outcome: lessons from a community HIV program in Zimbabwe

V. Mubaiwa<sup>1</sup>, M. Wright<sup>2</sup>, D. Kasiyombe<sup>3</sup>, A. Koler<sup>4</sup>, T. Takaidza<sup>1</sup>, T. Sanyatwe<sup>1</sup>, C. Mukwekweze<sup>1</sup>, C. Swikepi<sup>1</sup>, S. Nhongo<sup>1</sup>, F. Mwatenga<sup>1</sup>, B. Magwaza<sup>1</sup>, T. Chidenge<sup>1</sup>, B. Kashiri<sup>1</sup>, T. Takaidza<sup>1</sup>, G. Shumba<sup>5</sup>, B. Mukome<sup>5</sup>, T. Chimbidzika<sup>5</sup>, S. Munhonho<sup>5</sup>, D. Chimedza<sup>5</sup>, G. Nyahuma<sup>6</sup>, T. Kabai<sup>7</sup>

<sup>1</sup>FACT Zimbabwe, Strategic Information and Research, Mutare, Zimbabwe, <sup>2</sup>Pact, Strategic Information, Washington, United States, <sup>3</sup>Pact, Strategic Information, Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>Pact, Programs, Washington, United States, <sup>5</sup>FACT Zimbabwe, Safeguarding and Sustainable Livelihoods, Mutare, Zimbabwe, <sup>6</sup>USAID Zimbabwe, USAID, Harare, Zimbabwe, <sup>7</sup>Fact Zimbabwe, Strategic Information and Research, Mutare, Zimbabwe

**Background:** In 2020, Zimbabwe Mother to Child Transmission (MTCT) rate stood at 8.7% which is above the WHO target of 5% (Zimbabwe HIV Estimates Report, 2021). This is attributable to numerous factors that include manual tracking of HEI resulting in missed clinical appointment dates, poor follow-up of PMTCT mothers with high viral load, delayed final PMTCT outcome testing, and high Nucleic Acid Test (NAT) result turnaround time of more than 6 to 8 weeks.

In helping bridge the gap, FACT Zimbabwe through US-AID/PEPFAR funding is implementing an Orphans and Vulnerable Children (OVC) project in 9 districts in Manicaland and Masvingo.

**Description:** The project utilizes trained mentor mothers through a community case management approach to prevent HEI from seroconversion. The mentors are responsible for bi-weekly home visits to support PMTCT adherence, facilitate for EID testing, regularly check developmental milestones, and provide PMTCT sessions.

In April 2023, the project adopted the DHIS2 tracker capture application with an embedded Early Infant Diagnosis (EID) module to identify HEIs due for EID testing, and record dates and results for completed tests throughout the PMTCT algorithm up to outcome. The application flags pending results while signaling to project staff and

mentors the priority needs for HEIs being case managed, allowing timely follow-up on pending results with the laboratories.

**Lessons learned:** In 2023, 289 HEI enrolled in the project due for the final test were identified through the DHIS2 tracker capture app. 100% (289) were tested for their final PMTCT outcome by September 2023 and 281(97%) received results within two weeks reducing the turnaround time by 50%. Of those tested, 98.6% (277) were negative and 1.4% (4) were positive, achieving an MTCT rate within the national target of <5%.

**Conclusions/Next steps:** Digital longitudinal tracking of HEI is comprehensive, timely, and reliable. Coupled with individual-level case management, these approaches have contributed to high outcome testing among HEI and a low MTC rate. The next phase of the project is scaling the strategy to future cohorts due for their PMTCT outcome test.

## WEPEC288

HIV Self-Testing uptake and its contribution in a Female Sex Work (FSW) program in Ethiopia

S. Jemal<sup>1</sup>, E. Bahru<sup>2</sup>, K. Belete<sup>3</sup>, F. Keder<sup>1</sup>, A. Shewarega<sup>4</sup>, P. Ndase<sup>1</sup>, G. Yadete<sup>1</sup>

<sup>1</sup>Population Services International, HIV/TB and NCD, Addis Ababa, Ethiopia, <sup>2</sup>Population Services International, Monitoring and Evaluation, Addis Ababa, Ethiopia, <sup>3</sup>USAID Ethiopia, HIV/TB, Addis Ababa, Ethiopia, <sup>4</sup>USAID, HIV/TB, Addis Ababa, Ethiopia

**Background:** Innovations in last mile HIV case finding become even more critical as unmet need for HIV testing declines. This is particularly so for Key and Priority populations (KP/PP) who inherently face stigma in most countries. HIV self-test (HIVST) bridges this gap by removing barriers to conventional testing. In 2017, PSI pioneered a pilot initiative for HIVST among FSWs in Ethiopia, resulting in adoption of HIVST by Federal Ministry of Health in 2018.

**Methods:** To determine HIVST contribution and trends in uptake, we extracted HIVST data for the period, October 2022 to June 2023. For confirmatory testing following a reactive HIVST, clients in unassisted HIVST distribution arm were offered alternative options to report back reactive tests, while in assisted distribution, provider was on-hand for confirmatory testing.

We compared overall HIV positivity rate at FSW Drop-in-centers (DICs) during the HIVST kit distribution periods, with periods of no distribution (stock-out phase) in Quarter-4 of FY 2023. Yield from proactive testing modalities such as Index testing and Social Network testing which are only indirectly impacted by HIVST distribution were excluded in analysis.

**Results:** A total of 36,946 HIV self-test kits were distributed, of which 19,906 kits (54%) were through "assisted", and 17,028 (46%) "unassisted" HIV self-test approach.

Oral abstracts

Late-breaker abstracts

Author Index

The assisted arm yielded 459 (2.3%) new positives 368 KPs and 91 PPs, with 100% concordance on confirmatory testing. From 10% (1,734/17,028) kit returns, the unassisted approach yielded 0.7% (12/1,734 of whom 11 were FSWs, and 1 PP). HIVST contributed 33% (471/1,422) of all newly identified positives over the review period, whose overall program case yield was 2.6% (1,422/54,048) excluding excluding Index and Social Network testing.

When compared to Q4 of FY 2023 when no HIVST kits were available, HIV case yield for modalities declined to 1.8% (172/9,691 tested) representing 31% decrease in case identification. Indirect impact of HIVST on yield not quantified.

**Conclusions:** HIVST kit distribution plays a significant role in last mile HIV case finding. Countries need to prioritize and scale HIVST integration in HIV programming.

## WEPEC289

### Confirmation of HIV self testing positive results, Mozambique, 2023

G. Amame<sup>1</sup>, I. Sathane<sup>1</sup>, A. Couto<sup>1</sup>, J. Seleme<sup>1</sup>

<sup>1</sup>MOH, National Program to Control STIs HIV/AIDS, Maputo, Mozambique

**Background:** The World Health Organization recommends HIV self-testing (HIVST) as an additional approach for testing. Actually, in Mozambique HIV testing is offered in health facilities and communities. To reach high risk population who are often not offered testing, and to fill the gaps and challenges in HIV testing services (HTS), HIV Self Testing approach began to be implemented as a community distribution to increase testing coverage and strengthen uptake of HIV prevention and treatment services.

**Description:** In 2022, the Mozambique MOH began to implement nationally the distribution of HIVST in the community areas to ensure HIV diagnosis for all key and vulnerable population. The HIVST is considered an approach to screen the probability of person being leaving with HIV, and create demand for HTS. The HTS providers, lay counselors and other communities' actors were trained for HIVST community distribution, including counseling all clients with HIVST positive results, to confirm their results in HTS sites, using conventional tests.

We analyzed aggregated HIVST program data from January to December 2023 to better understand about confirmation of positive HIVST results.

**Lessons learned:** Nationally, 683.112 HIVST kits was distributed during the evaluation period, 51% was to men, 20% to adolescent 15-19 yo, 28% to young people 20-24 yo and 52% to 25+ yo.

Additionally, 30% who received the kits reported having tested for HIV more than 12 months ago and 14% never been tested for HIV. Data shows that 3,772 clients with positive diagnosis using HIVST and presented themselves at the HTS services to confirm their result, using conventional tests (61% was done at the community).

**Conclusions/Next steps:** Mozambique is one of the high HIV prevalence countries which implements HIVST to ensure the eligibility for HTS of people at risk of being with HIV. HIVST contributed greatly to increasing population testing coverage across the country. Data confirms that the implementation of HIVST create demand for HTS services and allows the rapid access for HIV diagnosis, and identification of PLHIV. Further research is needed to improve the linkage strategies between HIVST and HTS services, and to understand to measure the impact of this HIVST positive confirmation in ART new initiation.

## WEPEC290

### Women comes first: need of the hour – Its unequivocal

E. Michael<sup>1</sup>, V.S. Prasad<sup>2</sup>, M. Kumar<sup>3</sup>, S. Dwivedi<sup>4</sup>, L.H. Mojica<sup>5</sup>

<sup>1</sup>AIDS Healthcare Foundation (AHF) - India Cares, Operations & Partnerships, New Delhi, India, <sup>2</sup>AIDS Healthcare Foundation (AHF) - India Cares, Country Program Director, New Delhi, India, <sup>3</sup>AIDS Healthcare Foundation (AHF) - India Cares, MONITORING & EVALUATION, New Delhi, India, <sup>4</sup>AIDS Healthcare Foundation (AHF) - India Cares, Prevention Program Coordinator, New Delhi, India, <sup>5</sup>AIDS Healthcare Foundation (AHF), Chief Financial Officer, New Delhi, India

**Background:** AIDS Healthcare Foundation (AHF) - India implements HIV community based rapid HIV testing across nine states. The objective of the program is early detection and treatment across all ages among the community. The adult HIV prevalence of India among the population of 15-49 years is estimated at 0.20% (0.17-0.25%) and among women 0.19% in 2023.

**Description:** The operational study was intended to track the HIV positivity among Women of all ages in the sub urban and rural communities in 9 states of India from 2018 to 2023. The testing team would travel to these locations and conduct community-based HIV screening in rural locations.

A total of 703,207 tests were conducted in semi urban and rural areas of which 675,813 women were tested for the first time and 27,394 women were tested for the second time based on their risk profile.

**Lessons learned:** The study clearly indicates a steady rise in the HIV positivity rate among rural women from 2018 to 2023 from 0.8% to 1.3% among the first-time testers which many times than the National Prevalence among women (0.19%).

The women who are followed up from first time testers who are at high risk and were negative during the first-time test were tested the second time after 3 months have the positivity range from 0.75% to 1.74% from 2018 through 2023 respectively.

**Conclusions/Next steps:** It may be observed that the HIV prevalence among women in semi urban and rural areas is showing an increasing trend. These women are married at a young age to a migrant worker /truck driver. Mostly these women are uneducated/ dropouts and are financially dependent. After Child birth these women never return to a health care facility and so these women are detected late. It is crucial to strategize and implement HIV program keeping in mind Women First.

## WEPEC291

### Leveraging existing data systems to identify repeat HIV testers in South Africa

N. Khanyile<sup>1</sup>, L. Parmley<sup>1</sup>, A. Manyuchi<sup>2</sup>, L. Phiri<sup>2</sup>, N. Thibell<sup>2</sup>, S. Malevu<sup>2</sup>, A. Marsh<sup>3</sup>

<sup>1</sup>USAID, Pretoria, South Africa, <sup>2</sup>ANOVA, Johannesburg, South Africa, <sup>3</sup>National Department of Health, Pretoria, South Africa

**Background:** HIV Testing Services (HTS) remains a crucial element for accessing HIV prevention and treatment services. In South Africa, a subset of people living with HIV (PLHIV) continue to seek HTS for re-engagement to care without disclosing their known status to healthcare providers. As South Africa progresses toward achieving the global UNAIDS 95-95-95 targets, tailored case management approaches to align with clients needs, including approaches designed to support clients who received a new diagnosis compared to those with a known HIV-positive status, will be important.

**Description:** To identify previously diagnosed individuals presenting for HTS in primary healthcare facilities in 5 of 7 sub-districts in Johannesburg and all sub-districts in Sedibeng district, we reviewed records from existing data systems-Tier.net and LabTrack-for all clients who received an HIV-positive diagnosis from July to September 2023. History of HIV baseline blood assessments were verified on both systems and all individuals with a prior HIV-positive test were considered known positives.

In Johannesburg, there was heterogeneity in proportions with a known HIV-positive status; 8% (113/1376) of clients who received an HIV-positive result were known positive in sub-district A; 3% (15/486) in sub-district B; 12% (111/917) in sub-district C, 10% (55/524) in sub-district F; and 6%

(89/1445) in sub-district G. In Sedibeng district, 1624 clients tested HIV-positive, of which 5% (82/1624) were identified as known positives.

**Lessons learned:** Verification of HTS client records on Tier .NET or Lab Track is important to identify clients who repeat HIV testing without disclosing their known status to healthcare providers and can facilitate tailored counseling to support (re) engagement in treatment and care. This is especially critical in contexts without a unique patient identifier like South Africa.

**Conclusions/Next steps:** Findings from both districts demonstrate that some clients repeat testing without disclosing their status though magnitude and scope of this phenomenon varies by geography and may be difficult to quantify in the absence of a unique identifier.

Future considerations to leverage existing data systems as part of a standardized approach to identify repeat testers, including development of standard operating procedures, implementation scale-up, and further exploration of repeat testers by disaggregates are warranted.

## WEPEC292

### Enhancing the provision of index testing using near-peer mentors or young people living with HIV in rural Zambia: northern province

L. Chanda<sup>1</sup>, C. Chungu<sup>2</sup>, E. Mwanza<sup>3</sup>, D.T. Kennedy-Tembo<sup>4</sup>, C. Manyele<sup>3</sup>, D. Lee<sup>5</sup>, B. Mkandawire<sup>3</sup>

<sup>1</sup>Grassroot Soccer Zambia, Kasama, Zambia, <sup>2</sup>Grassroot Soccer Zambia, Mbala, Zambia, <sup>3</sup>Grassroot Soccer Zambia, Lusaka, Zambia, <sup>4</sup>Grassroot Soccer, Inc., Lusaka, Zambia, <sup>5</sup>Grassroot Soccer, Inc., Cape Town, South Africa

**Background:** Grassroot Soccer Zambia (GRS) is a sub-implementing partner to Right to Care Zambia (RTCZ) on the USAID Action HIV project with a goal to reduce HIV mortality, morbidity, and transmission by achieving the 95/95/95 goals, improving HIV treatment coverage, and providing comprehensive HIV prevention, care and treatment maintenance services in Northern province. GRS's role is to create demand and linkages to health services.

**Description:** GRS places trained near-peer mentor 'Coaches' in 11 health facilities in Kasama and Mbala Districts, Northern Province, to provide strategic link between young people and critical health services, as well as deliver SKILLZ Plus, a curriculum-based program for adolescents and youth living with HIV (AYLHIV).

Coaches, who are living with HIV themselves, work closely with health facility HTS department which provides index client lists, contacts, and locators to facilitate home visits and community tracking. Coaches first locate clients in the community, and if the client accepts testing, the Coach will either conduct an escorted referral to health facility or arrange for the client to be tested within the community.

## Lessons learned:

- GRS noted increased positivity yield among adolescents and young people (AYP) from 5% (42/911) in FY22 reported in four districts to 7% (32/464) from two districts in FY23 through uptake of index testing. Among different testing modalities, index testing has the highest positivity yield which could be prioritised for HIV case finding among AYP.
- Utilizing near-peer mentor Coaches who are living with HIV in case finding has been effective due to experience in dealing with stigma and discrimination, adherence, and disclosure. Communities report that the mentors have shown great empathy and compassion working with peers, especially clients who test HIV positive.
- The implementation of SKILLZ Plus Interventions has provided a safe space for AYP, also allowing Coaches to further probe for index elicitation and conduct partner notification services.

**Conclusions/Next steps:** Utilizing near-peer mentor Coaches in case finding for index testing has been effective as AYP feel safe to interact with young adults like themselves. This is evidenced by the number of successful referrals in Mbala and Kasama.

## WEPEC293

Individual- and community-level factors contributing towards not knowing one's HIV status: findings following a youth-friendly, integrated HIV and SRH testing service in Zimbabwe

L. Larsson<sup>1,2</sup>, C. Dziva Chikwaro<sup>2,3</sup>, V. Simms<sup>2,3</sup>, C. Bottomley<sup>3</sup>, T. Bandason<sup>2</sup>, O. Mugurungi<sup>4</sup>, T. Apollo<sup>4</sup>, E. Dauya<sup>2</sup>, M. Tembo<sup>2,3</sup>, C. Mavodza<sup>2,5</sup>, R. Abbas Ferrand<sup>2,6</sup>, K. Kranzer<sup>2,6,1</sup>

<sup>1</sup>Ludwig Maximilian University Hospital, Division of Infectious Diseases and Tropical Medicine, Munich, Germany; <sup>2</sup>Biomedical Research and Training Institute, The Health Research Unit Zimbabwe (THRUZim), Harare, Zimbabwe; <sup>3</sup>London School of Hygiene and Tropical Medicine, Department of Infectious Disease Epidemiology, London, United Kingdom; <sup>4</sup>Ministry of Health and Child Care, AIDS and TB Unit, Harare, Zimbabwe; <sup>5</sup>London School of Hygiene and Tropical Medicine, Faculty of Public Health and Policy, London, United Kingdom; <sup>6</sup>London School of Hygiene and Tropical Medicine, Department of Clinical Research, London, United Kingdom

**Background:** Young people remain the group with the highest proportion of undiagnosed HIV despite contributing only 10% of new infections. This study evaluated the population-level prevalence of and factors associated with undiagnosed HIV among young people in communities in Zimbabwe.

**Methods:** A prevalence survey among youth aged 18-24 years was conducted to determine population-level HIV prevalence and HIV viral load (VL) in 24 communities in

three provinces (Harare, Bulawayo, and Mashonaland East) in Zimbabwe. A person who was living with HIV was considered diagnosed if they reported knowing their status or if their VL was < 1,000 copies/mL. Factors associated with undiagnosed HIV were assessed, including the relative contribution of individual- and community-based factors using variance partition coefficients (VPC), derived from a random effects logistic regression model.

**Results:** Overall, 17,550/17,682 (99%) of people recruited had HIV antibody and VL results. Overall HIV prevalence was 7% (n=1,224), of which 529 (43%) were undiagnosed. Individual-level factors associated with being undiagnosed were sex (38% male among undiagnosed vs. 24% among diagnosed) and lack of previous testing (36% never tested among undiagnosed vs. 13% among diagnosed). The VPC among clusters was 25%, indicating that a considerable amount of variability is due to community-level factors. Community-level factors showing a relationship with undiagnosed HIV were contraception use (proxy for service availability), proportion ever tested for HIV, attitudes towards violence against women and socio-economic status (Figure 1).

Figure 1: Linear relationship between various community-level characteristics and proportion undiagnosed among those who were HIV positive.

**Conclusions:** Decreasing the proportion of undiagnosed HIV (the first UNAIDS 95-95-95 target) does not solely rely on addressing individual level barriers. Programmes must address structural factors such as community-level attitudes and availability of services. As exemplified by this study, socio-economic inequity drives inequity in health.

## WEPEC294

### Leveraging social networks to increase HIV testing in Tanzania: qualitative findings from the Confidential Social Network Referrals for HIV Testing (CONSORT) study from Moshi, Tanzania

V. Yelverton<sup>1</sup>, S.-J. Gass<sup>2</sup>, B. Njau<sup>3</sup>, M. Masaki<sup>4</sup>, T. Yamanis<sup>5</sup>, L. McClimans<sup>2,6</sup>, R. Mwangi<sup>3</sup>, A. Hobbie<sup>7,8</sup>, J. Ostermann<sup>2,9,10</sup>, N.M. Thielman<sup>1,7,8</sup>

<sup>1</sup>Duke University, Division of Infectious Diseases, Durham, United States, <sup>2</sup>University of South Carolina, Health Services Policy and Management, Columbia, United States, <sup>3</sup>Kilimanjaro Christian Medical Centre, Moshi, Tanzania, the United Republic of, <sup>4</sup>Kilimanjaro Clinical Research Institute, Moshi, Tanzania, the United Republic of, <sup>5</sup>American University, School of International Service, Washington DC, United States, <sup>6</sup>University of South Carolina, Department of Philosophy, Columbia, United States, <sup>7</sup>Duke University, Duke Global Health Institute, Durham, United States, <sup>8</sup>Duke University, Center for Health Policy and Inequalities Research, Durham, United States, <sup>9</sup>University of South Carolina, South Carolina SmartState Center for Healthcare Quality (CHQ), Columbia, United States

**Background:** The Confidential Social Network Referrals for HIV Testing (CONSORT) intervention proposes to use confidential SMS messaging to promote HIV testing among social network contacts of people living with or at risk of acquiring HIV (Figure 1).

To ensure the acceptability and feasibility of CONSORT, we aimed to identify desirable provider- and client-side characteristics.

Nomenclature: **inviter (A)**: a consented inviter selects message content to be sent to network contacts (B); **invitee (C)**: a network contact identified by the inviter to extend an invitation to test for HIV; **invitee tester (D)**: an invitee presenting for HIV testing; **Consenting invitee**: an invitee tester consenting to become an inviter (A)

Note: Figure was reprinted from Ostermann et al. Manuscript submitted for publication. Abbreviations: CONSORT: Confidential social network referrals for HIV testing; mParis: mobile phone assisted appointment reminder and incentive system

Figure 1. The confidential social network referrals for HIV testing (CONSORT) process.

**Methods:** We conducted seven in-depth interviews (IDIs) and eight focus group discussions (FGDs) in Moshi, Tanzania, between September and October 2023. Participants included clients presenting for HIV testing or HIV care, their social network contacts, and HIV care and testing providers. Participants were asked questions related to CONSORT message content and processes. IDIs and FGDs were conducted in Kiswahili. IDI recordings were tran-

scribed and translated to English. FGD notes and IDI transcripts were analyzed using a rapid analysis approach by two independent coders.

**Results:** Out of 78 participants, 28 were male and 50 were female. Qualitative data indicated that CONSORT is perceived as acceptable and familiar owing to other SMS-based health promotion programs. IDIs and FGDs revealed important design considerations to support the confidentiality of inviters and invitees (e.g., sending messages from a short code, not indicating that the message was initiated by an individual).

Participants recommended selecting messages from a menu of concise, but differently themed messages that convey the importance of HIV testing for the invitee's health and the greater good, while avoiding phrases such as "someone you know" to mitigate confidentiality concerns. Recommendations regarding the process of sending messages included sending reminder SMS, offering incentives for testing, and having inclusive phone requirements.

**Conclusions:** Qualitative research identified important information to support the feasibility, acceptability, and inclusiveness of diverse populations in CONSORT. Findings will guide ethical considerations and inform protocol adaptations to increase implementation and effectiveness outcomes of CONSORT and its goal to increase HIV testing and diagnosis.

self-testing (HST) uptake, behavioral risk reduction, stigma coping strategies, and self-efficacy to link to HIV care. Eligible participants were assigned male sex at birth, were  $\geq 18$  years of age, had a confirmed HIV negative status, reported condomless anal sex with another man in the past 6 months, and reported having a smartphone. At enrollment, participants were randomized 1:1 to receive the WeTest intervention or passive education about HST and linkage to care. We estimated the proportion of participants who uploaded HST results in both arms after six months of follow-up. We also describe engagement in the WeTest intervention.

**Results:** A total of 1800 MSM were enrolled into the WeTest study equally across Suzhou, Wuhan, and Chengdu cities. Participants were a median of 29 years of age, almost half (48%) completed a bachelor's degree or higher, and most (76%) were unmarried without a girlfriend. At six months, 98% (878/900) of participants in the intervention arm and 99% (889/900) of participants in the control arm were retained in the study.

Among these participants, 92% (805/878) in the intervention and 16% (144/889) in the control uploaded HST results, of whom 3 participants in the intervention and 6 in the control had positive results. Among participants in the intervention, almost all (99.5%; 874/878) were WeTest followers.

Further, there were 50 WeChat posts, with each post viewed an average of 151 times, and 71% (625/878) of participants consulted WeTest services, with services being consulted a total of 3,638 times.

**Conclusions:** Findings from this 6-month follow-up assessment show strong overall retention, and substantially higher rates of HIV self-testing results in the WeTest intervention group compared with control. Findings also showed promising levels of engagement with this digital platform.

## Cascades of HIV care and treatment

#### Viral rebound among HIV positive children and adolescents on antiretroviral therapy: a longitudinal study in Tanzania

A. Exavery<sup>1</sup>, J. Charles<sup>1</sup>, A. Koler<sup>2</sup>, D. Kisyonbe<sup>2</sup>, E. Kuhlik<sup>2</sup>, A. Barankena<sup>1</sup>, T. Ventimiglia<sup>2</sup>, J. Mulik<sup>2</sup>, G. Sangiwa<sup>2</sup>, L. Kikoyo<sup>1</sup>

<sup>1</sup>Pact Tanzania, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Pact Inc., Washington DC, United States

**Background:** Although achieving viral load suppression (VLS) remains the primary objective of HIV treatment, a challenge persists in sustaining it over the course of patients' lives for their well-being. This study evaluated the extent of viral rebound and their associated factors among orphaned and vulnerable children (OVC) aged 0-17 years receiving antiretroviral therapy (ART) in Tanzania.

**Methods:** The study is based on data from a community-based USAID-funded Adolescents and Children HIV Incidence Reduction, Empowerment, and Virus Elimination (ACHIEVE) project in Tanzania. Focusing on HIV positive OVC, on ART, and receiving community-based complementary support from the ACHIEVE project, OVC with at least two clinically confirmed viral load tests spaced at least 6 months apart between 2021 and 2023 with the first test indicating that they were virally undetectable (viral load  $< 50$  copies/mL) were included in the analysis. Viral rebound was defined as viral load  $\geq 50$  copies/mL at the second test. Data analysis involved multivariable mixed-effects logistic regression.

**Results:** Out of 21,448 CLHIV (52.4% female) aged 10.8 years on average and virally undetectable at baseline, 86.9% ( $n = 18,643$ ) maintained their undetectable status at the follow-up (second test), and 13.1% ( $n = 2,805$ ) experienced viral rebound. In the regression analysis, various project interventions were associated with lower risk of viral rebound among the OVC, and the significant ones were teen club attendance ( $aOR = 0.60$ , 95% CI 0.51-0.70), and health insurance ( $aOR = 0.76$ , 95% CI 0.69-0.84). On the other hand, viral rebound was higher among OVC on regimens other than DTG ( $aOR = 1.37$ , 95% CI 1.10-1.70), attending school ( $aOR = 1.14$ , 95% CI 1.03-1.27), residing in urban areas ( $aOR = 1.20$ , 95% CI 1.10-1.31), and had caregivers with primary education ( $aOR = 1.19$ , 95% CI 1.06-1.34) and secondary education ( $aOR = 1.33$ , 95% CI 1.06-1.65).

**Conclusions:** Although 13.1% of the OVC experienced viral rebound at the follow-up, the ACHIEVE project interventions showed promise to reduce the problem. Additional support is needed especially by those at an elevated risk of rebound, including those on regimens different from DTG, attending school, residing in urban areas, and having caregivers with primary, secondary, or higher education levels.

## WEPEC297

### HIV prevalence and engagement in HIV care and treatment among female sex workers living with HIV in Rwanda "Progress towards reaching the second 95 of UNAIDs 95-95-95 targets by 2030"

G. Gatete<sup>1</sup>, G. N.Rwibasira<sup>1</sup>, V. Mupenzi<sup>1</sup>, C. Kayitesi<sup>1</sup>, C. Ndinda<sup>1</sup>, J.C. Kwizera<sup>1</sup>, E. Remera<sup>2</sup>

<sup>1</sup>Rwanda Biomedical Centre, Department of HIV Diseases Prevention and Control, Kigali City, Rwanda, <sup>2</sup>Rwanda Biomedical Centre, Research Innovation and Data Science, Kigali City, Rwanda

**Background:** In sub-Saharan Africa, the engagement of female sex workers (FSWs) in HIV care and treatment is relatively low. Understanding the HIV care and treatment engagement experiences among FSWs has important implications for interventions to enhance treatment outcomes.

We conducted an integrated biological and behavior survey to determine HIV prevalence and engagement in HIV care and treatment among FSWs and sexually exploited minors aged 15+ in Rwanda.

**Methods:** A cross-sectional biological and behavior survey was conducted among FSWs and sexually exploited minors aged 15+ in Rwanda. Respondent-driven sampling was used to recruit participants aged 15 years and who resided in the country for at least 3 months before the survey, 2489 was the expected sample size. The study was conducted from 9th May to 25th June 2023, consented participants were interviewed and tested for HIV per Rwandan national HIV testing guidelines. Tablets were used to collect data and transfer daily to the central server for storage.

Descriptive analysis was done, and a multivariable logistic regression model was performed using STATA 17 to analyze factors associated with not taking anti-retroviral treatment (ART).

**Results:** A total of 2,541 FSWs participated in the survey, their mean was 31.8 years (SD:8.1) and the oldest FSW was aged 67 years. Overall, 854 were infected with HIV, yielding a prevalence of 35.2% [31.8,38.7]. Of 698 aware of their HIV-positive status, only 580 (89.8%) [85.7 - 92.9] were taking ART. In the multivariable logistic regression model, not taking ART was significantly associated with FSW's age and residence. Those aged 35 years and above (aOR: 5, C.I: 1.4-17.0), and FSWs living in Eastern Province (aOR: 13.9, C.I: 4.0-47.8), Western Province (aOR:8.6, C.I: 2.6-28.5) and Kigali city (aOR: 3.9, C.I: 1.1-13.3).

**Conclusions:** According to the findings of this survey, HIV prevalence among FSWs in Rwanda is high, and their engagement in treatment and care is inadequate. Intensifying HIV-friendly services for FSWs has the potential to significantly lower the treatment gap and achieve the UNAIDs 95-95-95 targets by 2030.

## WEPEC298

### Retention in care and viral suppression in pregnancy and postpartum among women with HIV in Denmark: a nationwide cohort study

E. Moseholm<sup>1,2</sup>, L.H. Omland<sup>3</sup>, M. Storgaard<sup>4</sup>, G. Pedersen<sup>5</sup>, I.S. Johansen<sup>6</sup>, T.L. Katzenstein<sup>3</sup>, N. Weis<sup>7,8</sup>

<sup>1</sup>Copenhagen University Hospital, Department of Infectious Diseases, Hvidovre, Denmark, <sup>2</sup>University of Copenhagen, Department of Public Health, Faculty of Health and Medical Sciences, University of Copenhagen, Copenhagen, Denmark, <sup>3</sup>Copenhagen University Hospital, Rigshospitalet, Department of Infectious Diseases, Copenhagen, Denmark, <sup>4</sup>Aarhus University Hospital, Skejby, Department of Infectious Diseases, Aarhus, Denmark, <sup>5</sup>Aalborg University Hospital, Department of Infectious Diseases, Aalborg, Denmark, <sup>6</sup>Odense University Hospital, Department of Infectious Diseases, Odense, Denmark, <sup>7</sup>Copenhagen University Hospital, Hvidovre, Department of Infectious Diseases, Hvidovre, Denmark, <sup>8</sup>University of Copenhagen, Department of Clinical Medicine, Faculty of Health and Medical Sciences, Copenhagen, Denmark

**Background:** Adherence to antiretroviral therapy (ART) in pregnancy and postpartum is essential for prevention of perinatal HIV transmission and optimal maternal and child health.

This nationwide study aimed to investigate retention in HIV care and viral suppression in pregnancy and postpartum in women with HIV in Denmark. Factors associated with these outcomes were also evaluated.

**Methods:** In a nationwide register-based study, all women with HIV who had delivered one or more children in Denmark in year 2000 - 2019 were included. Retention in care (two HIV RNA viral load or CD4 measurements,  $\geq 90$  days apart), virological suppression (HIV RNA  $< 200$  copies/mL), and virological failure (two consecutive HIV RNA measurements  $> 50$  copies/mL or one HIV RNA measurement  $> 1000$  copies/mL) was assessed in pregnancy, one and two years postpartum, respectively. Factors associated with outcomes were assessed using logistic regression models.

**Results:** In total, 564 pregnancies were included. Overall, 65% (366/564) were in retention in care in pregnancy, 83% (450/542) in the first postpartum year, and 71% (366/517) in the second postpartum year. The proportion of women with virological suppression decreased from 85% (478/564) in pregnancy to 80% (431/541) in the first postpartum year and 75% (387/514) in the second postpartum year.

The proportion of women with virological failure decreased from 32% (181/564) in pregnancy to 18% (96/541) in the first postpartum year and 15% (76/514) in the second postpartum year. All HIV care outcomes varied over time per changing ART guidelines. Women who initiated ART late in pregnancy were less likely to be retained in care (aOR 0.02 (95% CI: 0.01 - 0.14)) and virologically suppressed (0.15 (95% CI: 0.06 - 0.40)) in pregnancy, and more likely to

experience virological failure in both pregnancy and postpartum (aOR 3.07 (95% CI 1.07 -8.80) and 3.65 (1.27 - 10.45), respectively). Year of delivery  $\geq 2014$  was associated with decreased odds of virological failure in pregnancy (aOR 0.40 (95% CI: 0.23 - 0.71)) and postpartum (aOR 0.18 (95% CI: 0.07-0.44)).

**Conclusions:** Retention in HIV care and viral suppression in pregnant and postpartum women with HIV may still be challenging, despite improvements over time, especially among women initiating ART in pregnancy.

## WEPEC299

### A randomized trial of messages to encourage post-HIV self-test linkage to HIV services among men who purchase sex: a behavioral economics approach

S. Napierala<sup>1</sup>, E. Browne<sup>1</sup>, J.M. Arasa<sup>2</sup>, M.K. Shapley-Quinn<sup>3</sup>, J. Onyango<sup>2</sup>, H. Thirumurthy<sup>4</sup>, K. Agot<sup>2</sup>

<sup>1</sup>RTI International, Women's Global Health Imperative, Berkeley, United States, <sup>2</sup>Impact Research and

Development Organization (IRDO), Kisumu, Kenya, <sup>3</sup>RTI International, Research Triangle Park, United States,

<sup>4</sup>University of Pennsylvania, Philadelphia, United States

**Background:** Men who pay for sex (MPS) have low engagement in HIV services and are twice as likely to be HIV-infected as other men. HIV self-testing (HIVST) can increase testing coverage among MPS, but promoting post-test linkage to services remains a challenge. Since behavioral economics (BE) research suggests framing health messages can influence decision-making, we conducted a randomized trial to determine the optimal messages to include with HIVST kits to promote linkage to services.

**Methods:** Two themes were identified from prior research as most likely to encourage confirmatory testing:

(1) benefits/availability of PrEP;

(2) the concept of Undetectable=Untransmissible.

Utilizing the EAST framework, we developed three messages per theme. We recruited 800 MPS from June-October 2023 in Siaya and Kisumu counties, Kenya. Participants were randomized to view one message per theme or a control message. The primary outcomes proxied for message effectiveness, representing financial and opportunity costs: willingness to

1. contribute money towards a campaign promoting the message;

2. give 20 minutes to learn more about HIV services. Mixed-effect logistic regression was used to compare responses by message.

**Results:** Mean age was 31 years (range 19-68) and 57% were married. Participants had mean 4.7 sexual and 3.3 transactional partners in the past month, and 64% reported hazardous drinking. Contributions of money and time were high across all messages; 64% agreed to both. Messages with highest effect on contributions of mon-

ey and time were PrEP message-1 and ART message-1 (both 83%; Table). Willingness to contribute was statistically greater with the PrEP-message-1 ( $p=0.001$ ) but not ART-message-1 ( $p=0.89$ ) compared to control.

Message	Would you like to donate money (N=800)		Would you like to spend time (N=800)	
	Yes N(%)	No N(%)	Yes N(%)	No N(%)
PrEP messages	1. PrEP is a pill that protects you from getting HIV [Image of man saying:] I don't always use condoms, so I use PrEP to protect myself instead Information on local health centers where you can START PrEP as soon as possible is on the back of this page			
	162 (81)	39 (19)	172 (86)	29 (14)
	2. PrEP is a pill that protects you from getting HIV Some people think PrEP is only for female sex workers, but that is not true. Over 18,000 men in Kenya are already using it. Information on local health centers where you can START PrEP as soon as possible is on the back of this page			
	162 (79)	42 (21)	177 (87)	27 (13)
ART Messages	3. PrEP is a pill that protects you from getting HIV Stay HIV-negative -- Protect yourself and your partner by using PrEP. Information on local health centers where you can START PrEP as soon as possible is on the back of this page			
	142 (76)	46 (25)	153 (81)	35 (19)
	[CONTROL] Information on local health centers where you can START PrEP as soon as possible is on the back of this page			
	139 (67)	68 (33)	159 (77)	48 (23)
ART Messages	1. U=U Undetectable = Untransmissible U=U means if you take ARVs as directed, you will not transmit HIV to your sexual partner. Care for yourself, protect your sexual partner! If you test HIV-positive, start ARVs as soon as possible. If you take as directed, you will maintain your good health, and you will NOT pass HIV to your sexual partner. Information on local health centers where you can START ARVs as soon as possible is on the back of this page.			
	166 (83)	33 (17)	165 (83)	34 (17)
	2. U=U Undetectable = Untransmissible U=U means if you take ARVs as directed, you will not transmit HIV to your sexual partner. 95% of Kenyan men who know they are HIV-positive are currently taking ARVs. If you test HIV-positive, start ARVs as soon as possible. Information on local health centers where you can START ARVs as soon as possible is on the back of this page.			
	161 (81)	37 (19)	161 (81)	37 (19)
ART Messages	3. U=U Undetectable = Untransmissible U=U means if you take ARVs as directed, you will not transmit HIV to your sexual partner. ARVs can help you live a long life and be there for your family. If you test HIV-positive, start ARVs as soon as possible. Information on local health centers where you can START ARVs as soon as possible is on the back of this page.			
	168 (81)	39 (19)	175 (85)	32 (16)
	[CONTROL] Information on local health centers where you can START ARVs as soon as possible is on the back of this page.			
	145 (74)	51 (26)	152 (78)	44 (22)

**Conclusions:** Framing PrEP as a safeguard when condoms are not used and emphasizing treatment as prevention are messages that should be included with HIVST. Findings from this trial will inform the messages included with HIVST kits distributed to MPS in the Pamoja trial evaluating the impact on post-test linkage to HIV services.

## WEPEC300

### The effectiveness of the state programs of the care and support of people living with HIV in Ukraine during wartime in 2022-2023

L. Legkostup<sup>1</sup>, I. Kucheriavyi<sup>1</sup>, I. Kritsina<sup>1</sup>, M. Vyshnevskaya<sup>1</sup>

<sup>1</sup>State Institution, Public Health Center of the Ministry of Health of Ukraine, Kyiv, Ukraine

**Background:** Ukraine remains a region with a high level of HIV prevalence. Russia's full-scale invasion of Ukraine, which began on 24 February 2022, led to significant adjustments in HIV prevention and treatment services. The number of injured among the civilian population is increasing, almost 200 healthcare facilities have been destroyed, and more than 1,600 have been damaged. As of October 2023, the number of internally displaced persons reached 5.09 million, and the number of refugees in other countries reached 5.8 million.

The number of people in government-controlled areas receiving ART fell by 7% from 130,000 in 2021 to 121,000 in 2023. The proportion of people living with HIV receiving ART decreased from 83% in 2022 to 77% in 2023.

**Description:** Since 2019, Ukraine has been the only country in the EECA region where the government has financed a basic package of HIV care and treatment services for people living with HIV from the state budget. Nearly 30,000 people benefit each year from services, provided by community-based organizations contracted by the government.

The services are provided to build adherence to ART and receive HIV-related medical services. HIV-positive persons who are preparing to start ART (newly diagnosed or clients who were under medical supervision) are involved in the service for building adherence to HIV treatment and staying under medical supervision; interrupted ART and/or were lost from medical supervision; are on ART, but have risks of interruption of ART.

#### Lessons learned:

	2021	2022
People received care and support services	33 633	34 255
Newly clients received care and support services in the selected year	19 050	12 121
of them receiving ART as of December 2023	11 603	7 703
%	61%	64%
Newly clients who were engaged under medical supervision in the selected year and received care and support services	5 105	4 315
of them receiving ART as of December 2023	3 372	3 187
%	66%	74%

**Conclusions/Next steps:** State coordination of care and support services ensured the stability of the HIV response system even in conditions of armed conflict. Changes in approaches to the provision of care and support services for people living with HIV, with the involvement of non-governmental organizations, become more relevant in crisis conditions or conditions of uncertainty.

This approach will ensure the sustainability of services in the cascade of HIV-related services and the achievement of the UNAIDS goals of 95%-95%-95%.

## WEPEC301

### Poverty, social and socio-economic vulnerability among people living with HIV in Rwanda

G. Giordana<sup>1</sup>, I. Omondi<sup>1</sup>

<sup>1</sup>World Food Programme, Nairobi, Kenya

**Background:** In 2022, Rwanda Biomedical Center (RBC), with support from the World Food Programme (WFP) and the Rwanda Network of People Living with HIV (RRP+) conducted a comprehensive study (2021) to determine the nutrition, food security, and vulnerability status of people living with HIV (PLHIV).

**Methods:** A cross-sectional study employing a face-to-face survey was conducted, utilizing a cluster sampling technique. The targeted population was stratified into 30 subgroups corresponding to the country's 30 districts. Health centres, served as the primary sampling units, were chosen randomly, with two selected per district. A total of 2,488 adult respondents, representing an equal number of households, were sampled and 1,079 children aged 2-19 years were included, with the objective of obtaining anthropometric measurements and assessing their nutritional status. Data analysis was conducted using SPSS v.24.

**Results:** In 55.2% of households, adults had only one meal the day before the survey. Half of children under 15 had two meals, but in 27.8% of households, children had just one meal.

While the overall food consumption score is generally acceptable, 30.83% and 15.6% of households have borderline and poor caloric availability, respectively.

Participants in the lowest wealth quantile (Ubudehe 1) had the highest reduced coping strategy index (rCSI) at 20.7, indicating more extensive use of negative coping strategies and heightened food insecurity compared to Ubudehe 2 and 3 (rCSI 18.2 and 15.9, respectively). High malnutrition rates are observed in all participant groups, excluding pregnant and breastfeeding women.

Approximately 10.93% of patients missed antiretroviral therapy (ART) doses in the 30 days preceding the survey, and 21.1% cited financial constraints and lack of food as the main reasons for non-adherence.

**Conclusions:** The study reveals prevalent nutritional and food security challenges among the PLHIV, with sub-optimal meal frequency and poor or borderline access to a caloric-sufficient diet. High rates of malnutrition persist across diverse participant groups, necessitating targeted interventions.

The higher rCSI in the Ubudehe category 1 underscores the vulnerability of economically disadvantaged groups to food insecurity and sustained ART adherence. These

### Acceptability of long-acting injectable antiretroviral treatment (LAI-ART) among young Black sexual minority men (SMM) living with HIV in the Southern United States

A. Ogunbajo<sup>1</sup>, W. Vincent<sup>2</sup>, D. Siconolfi<sup>3</sup>, C. Campbell<sup>4</sup>, L. Pollack<sup>5</sup>, S. Kegeles<sup>5</sup>, G. Rebchook<sup>5</sup>, S. Tebbetts<sup>5</sup>, E. Storholm<sup>6</sup>

<sup>1</sup>RAND Corporation, Los Angeles, United States, <sup>2</sup>Temple University, Department of Psychology, Philadelphia, United States, <sup>3</sup>RAND Corporation, Pittsburgh, United States, <sup>4</sup>University of California San Diego, Herbert Wertheim School of Public Health & Human Longevity Science, San Diego, United States, <sup>5</sup>University of California San Francisco, San Francisco, United States, <sup>6</sup>San Diego State University, San Diego, United States

**Background:** Young Black sexual minority men (YBSMM) are more affected by HIV than any other group in the United States. Additionally, YBSMM have poor outcomes across the HIV care continuum (diagnosis, linkage to care, retention in care, and HIV viral load suppression). In 2021, the U.S. Food and Drug Administration approved the first long-acting antiretroviral (LAI-ART) medication. The current study investigated the predictors of LAI-ART acceptability among a sample of YBSMM living with HIV in the Southern U.S.

**Methods:** In 2022, YBSMM (N=138) in Dallas and Houston Texas participated in the 4th wave of a community-based longitudinal survey of men living with HIV. We investigated the relationship between sociodemographic characteristics, experiences of stigma and discrimination, healthcare experiences, mental health and substance use, HIV care continuum outcomes, and LAI-ART acceptability. Bivariate and multivariable logistic regression were used to examine factors associated with willingness to use LAI-ART.

**Results:** Two-thirds of the sample reported being very willing to utilize LAI-ART monthly. In the bivariate model, factors associated with increased odds of being willing to utilize LAI-ART included: higher healthcare empowerment ( $r=0.21$ ,  $p=0.01$ ), higher perceived provider competency ( $r=0.19$ ,  $p=0.05$ ), and higher social support ( $r=0.18$ ,  $p=0.04$ ). Recent cocaine use was associated with decreased odds of LAI-ART willingness ( $r=0.18$ ,  $p=0.04$ ). In the multivariable model, higher trust in the healthcare system was significantly associated with slightly decreased odds of reported willingness to utilize LAI-ART.

**Conclusions:** We found high acceptability of LAI-ART among a sample of YBSMM. YBSMM living with HIV, especially those who have suboptimal adherence to daily

pill regimens, should be a priority population for LAI-ART uptake. Our findings highlight the critical role healthcare systems and providers play in the effective rollout of LAI-ART.

Consequently, it is important that healthcare systems:

- 1, Develop and implement promotional materials for LAI-ART that are both culturally relevant and evidence-based, and
- 2, Train HIV care providers on the clinical indications for LAI-ART and potential barriers to client adoption and adherence.

Lastly, it is important that interventions aimed at increasing LAI-ART uptake consider potential barriers specific to individuals who engage in stimulant use and implement strategies to address these barriers.

## WEPEC303

### Trends in infant HIV positivity and linkage to ART among HIV-exposed infants aged <12 months in CDC-PEPFAR programs, FY2018-FY2023

**Background:** With funding from the U.S. President's Emergency Plan for AIDS Relief (PEPFAR), the U.S. Centers for Disease Control and Prevention (CDC) and Ministries of Health implement comprehensive prevention of mother-to-child (PMTCT) services to reduce vertical transmission and provide timely linkage to antiretroviral treatment (ART) for infants living with HIV. This analysis describes recent trends in infant HIV diagnoses and linkage to ART in PEPFAR-supported countries.

**Methods:** We analyzed aggregate data from Monitoring, Evaluation, and Reporting (MER) indicators across CDC-supported sites in 17 African countries with complete reporting on new HIV diagnoses among HIV-exposed infants (HEI) aged <12 months from U.S. Government Fiscal Years (FY) 2018 to 2023 (October 2017 to September 2023). We reviewed annual trends in the number of HEI with at least one early infant diagnosis (EID) sample collected, the number of HEI diagnosed with HIV, percent of HEI diagnosed with HIV among those with EID samples collected (infant HIV positivity), and percent of infants diagnosed with HIV linked to ART (ART linkage) within the same quarter as diagnosis. We calculated percent and absolute percent change.

**Results:** HEI with EID sample collection increased from 370,478 in FY2018 to 418,927 in FY2023 (percent change: +13%) (Table). HEI diagnosed with HIV steadily decreased from 9,053 to 5,492 (percent change: -39%); eight (47%) countries decreased by ≥50%. Infant HIV positivity by 12 months steadily decreased from 2.4% to 1.3% (absolute percent change: -1.1%). ART linkage increased from 81% to 87% (absolute percent change: +6%). Four (24%) countries achieved ≥95% ART linkage in FY23.

	FY2018	FY2019	FY2020	FY2021	FY2022	FY2023	% Change	Absolute % Change
First EID sample collected	370,478	405,062	406,823	450,220	441,700	418,927	13%	
HEI diagnosed with HIV	9,053	8,554	7,339	6,606	5,928	5,492	-39%	
HEI diagnosed with HIV linked to ART	7,325	7,506	6,125	5,668	5,112	4,794	-53%	
Infant HIV positivity	2.4%	2.1%	1.8%	1.5%	1.3%	1.3%		-1.1%
ART linkage	81%	88%	83%	86%	86%	87%		6%

**Conclusions:** Between FY2018 and FY2023, infant HIV positivity declined in CDC-PEPFAR-supported sites, likely due to efforts to strengthen PMTCT services. Overall, ART linkage remains below the target of 95% in many countries. As countries approach elimination of mother-to-child transmission, they may need to adapt programs to support provision of high-quality prevention, diagnostic, treatment, and retention services to ensure that all HEI living with HIV are identified and linked to services.

## WEPEC304

### Racial, economic, and mental health disparities persist in viral suppression among people with HIV in high resourced settings

A. Batchelder<sup>1,2,3</sup>, J. Foley<sup>2,3</sup>, S. Iyer<sup>1</sup>, D. King<sup>1</sup>, K.H. Mayer<sup>1,4</sup>

<sup>1</sup>The Fenway Institute, Boston, United States,

<sup>2</sup>Massachusetts General Hospital, Department of Psychiatry, Boston, United States, <sup>3</sup>Harvard Medical School, Department of Psychiatry, Boston, United States, <sup>4</sup>Harvard Medical School, Department of Medicine, Boston, United States

**Background:** Despite significant resources having been invested in efforts to control and ultimately eradicate HIV (e.g., the 90-90-90 goals and the Ending the HIV Epidemic initiative), a subset of people with HIV (PWH) have not fully benefitted from treatment and care advances, even in resource-rich settings.

To better understand the factors impeding optimal engagement in care in Massachusetts (where almost all clients have health insurance), we conducted an analysis of the demographic, diagnostic, and mental health screening characteristics associated with being virologically unsuppressed among PWH in high resource settings.

**Methods:** We conducted bivariate comparisons and multivariable regression models using electronic medical record (EMR) data from 2,843 PWH at Fenway Health, a federally qualified community health center in Boston, Massachusetts providing affirmative and culturally tailored care for SGM and PWH from 2012-2022 to assess factors associated with virological suppression.

**Results:** The majority (96.2%) were virally suppressed at their last HIV RNA assessment. Those who were unsuppressed were significantly younger (median age 37 [IQR=29-46] vs. 45 [33-52];  $p<.001$ ), had been in medical care less time (36 months [12-75] vs. 81 [34-114];  $p<.001$ ), and had fewer appointments (12 [4-23] vs. 26 [13-44];  $p<.001$ ). Additionally, those who were unsuppressed were more likely to live under the federal poverty level (59.6% vs. 48.2%;  $p=.03$ ), be Black (22.1% vs. 14.6%) or multi-racial (15.8% vs. 7.6%) compared to White or another race ( $p=.002$ ), and have a psychotic disorder (8.4% vs. 3.5%;  $p=.008$ ), but were less likely to have an alcohol use disorder (5.6% vs. 13.6%;  $p=.02$ ). In a multivariable model, multi-racial PWH had 3.6 greater odds than White PWH of being unsuppressed and those with a psychotic disorder had 5.8 greater odds of being unsuppressed.

**Conclusions:** Over 40 years into the HIV epidemic, in high resource settings with SGM expertise, PWH in poverty, who are Black or multi-racial, and those with serious mental illness (e.g., psychosis) still need additional intervention to achieve viral suppression, including economic interventions, systemic interventions to reduce racial inequities (e.g., efforts to reduce medical mistrust and increase the number of providers of color), and increased access to mental healthcare.

## WEPEC305

HIV continuum among key populations through the Universal Health Coverage program in Thailand in the era of treat all

S. Teeraananchai<sup>1,2</sup>, S. Phuthomdee<sup>1,3</sup>, N. Phanuphak<sup>4</sup>, D.C. Boettiger<sup>5</sup>

<sup>1</sup>Department of Statistics, Faculty of Science, Kasetsart University, Bangkok, Thailand, <sup>2</sup>Biomedical Data Science program, Faculty of Science, Kasetsart University, Bangkok, Thailand, <sup>3</sup>Panyanantaphikkhu Chonprathan Medical Center, Srinakharinwirot University, Nonthaburi, Thailand, <sup>4</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>5</sup>Kirby Institute, University of New South Wales, Sydney, Australia

**Background:** HIV testing among key populations in Thailand has increased since 2015 corresponding to the establishment of the "key population-led health services" (KPLHS). We assessed the cascade of HIV care among key populations and identified predictors of accessing ART and viral suppression (VS) using national database which records HIV test results, antiretroviral therapy (ART) status, and viral load (VL) under Thailand Universal Health Coverage (UHC) system.

**Methods:** We included individuals diagnosed with HIV at age  $\geq 15$  years who were enrolled to start ART between 2015-2022. Individuals were recorded HIV risk group as men who have sex with men (MSM), people who inject drugs (PWID), female sex workers or transgender women. ART initiation at any CD4 count and VL testing were offered to all per national guidelines.

Estimates were calculated as proportion of participants:

- Linked to care/starting ART,
- with VL testing within 6 to 12 months of ART initiation, and;
- with VS (VL  $< 200$  copies/mL). We used logistic regression to investigate characteristics associated with accessing ART and VS.

**Results:** A total of 6,110 individuals were diagnosed with HIV and enrolled in care, comprising 5,587 (91%) MSM, 203 (3%) PWID, 193 (3%) female sex workers and 127 (2%) transgender women. Of those, 5,601 (92%) started ART. Among participants who started treatment, 4,420 (79%) had a VL test within 6 to 12 months of starting ART, with 3,985 (90%) of those tested (71% of the original cohort after starting ART) achieving VS.

MSM (adjusted odds ratio (aOR) 1.88 (95% confidence interval (CI) 1.18-3.01; versus PWID), age 15-24 years (aOR 1.71, 95%CI 1.27-2.33; versus age 34-49 years) and CD4  $\geq 500$  cells/mm<sup>3</sup> (OR=5.34, 95%CI 3.77-7.57; versus CD4  $< 200$  cells/mm<sup>3</sup>) were associated with higher odds of starting ART after HIV diagnosis.

MSM with high pre-ART CD4 and no HIV symptoms at diagnosis were more likely to achieve VS within one year of ART initiation.

**Conclusions:** HIV care cascades varied by key populations in Thailand. Interventions need to be tailored by population and sub-population contexts. Earlier diagnosis at higher CD4 count could benefit both ART initiation and VS among key populations.

## WEPEC306

Effective strategies for operating support groups of adolescents living with HIV: case of Mangochi and Chikwawa districts of Malawi

H. Madukani<sup>1</sup>, E. Mwasinga<sup>2</sup>

<sup>1</sup>COWLHA, Programs, Lilongwe, Malawi, <sup>2</sup>National Association for Young People Living with HIV, Programs, Lilongwe, Malawi

**Background:** Young people face challenges to adhere to treatment and that support groups are known as effective measure to support young people's treatment adherence. However, it is challenging to implement support groups of young people especially to retain young people in support groups.

As such, COWLHA established youth support groups in 2019 to create safe space for offering psychosocial support to young people for better treatment outcomes.

**Description:** COWLHA devised these strategies:

- COWLHA mobilized such young people to form their own youth support groups as it was easier for their parents/guardians to give them permission to become members of youth support groups. Generally, parents/guardians who are not members of support groups do not allow their children to patronize support groups for fear of stigma;
- COWLHA let the youth support groups select their leaders and later trained them to facilitate treatment literacy in the support groups.
- COWLHA made the support groups attractive by incorporating sport activities and procuring equipment such as footballs, netballs, chess, snakes and ladders with diversified support groups activities ranging from treatment literacy lessons, sports and income generating activities;
- COWLHA linked the support groups with institutions of professional support such as health facilities and teen clubs.

**Lessons learned:**

- Increased number of young people in the support groups. In 2019, COWLHA started with 218 young people and this number rose to 2871 in 2022;
- Reduced number of ART defaulters among young people as shown during external evaluation of 2023 (default rate reduced with an average of 40%);
- Increased enrolment of young people in the ART program by 30% for 10 health facilities in Chikwawa and Mangochi districts;

- Sustainability and ownership of the support groups as evidenced by their continued existence even after the project phased out in 2022.
- The support groups are active and innovative as they got engaged in Income Generating Activities (IGAs) like gardening and small scale businesses.

**Conclusions/Next steps:** Setting up youth support groups has proved to be successful with increased membership over the years and better treatment outcomes. If this approach is scaled up to other districts, it will likely improve ART retention among youth living with HIV.

## WEPEC307

### Effect of high-risk mobility on treatment interruption among men in Malawi: secondary analysis of two randomized controlled trials

M. Thorp<sup>1</sup>, K. Balakasi<sup>2</sup>, M. Ramesh<sup>3</sup>, I. Robson<sup>1,2</sup>, A. Choko<sup>4</sup>, R. Hoffman<sup>1</sup>, S. Shoptaw<sup>5</sup>, K. Dovel<sup>1,2</sup>

<sup>1</sup>UCLA David Geffen School of Medicine, Division of Infectious Diseases, Los Angeles, United States, <sup>2</sup>Partners in Hope, Science Department, Lilongwe, Malawi, <sup>3</sup>UCLA David Geffen School of Medicine, Los Angeles, United States, <sup>4</sup>Malawi Liverpool Wellcome Trust, Blantyre, Malawi, <sup>5</sup>UCLA David Geffen School of Medicine, Center for Behavioral and Addiction Medicine, Los Angeles, United States

**Background:** Temporary mobility is associated with treatment interruption (TI) and viremia in men living with HIV (MLHIV), but it is unclear what characteristics of mobility confer greatest risk.

We conducted a secondary analysis to define and predict characteristics of mobility most strongly associated with repeat TI among MLHIV in Malawi.

**Methods:** The IDEaL and ENGAGE trials (ClinicalTrials.gov-#NCT04858243; #NCT05137210) tested interventions designed to improve 6-month ART engagement among MLHIV  $\geq 15$  years old not in care (never initiated ART or missed refill by  $\geq 28$  days). Baseline and endline (4-7 months after enrollment) surveys and medical chart reviews were conducted. For this secondary analysis, we excluded men who did not engage in care during the trial. Our primary outcome was repeat TI ( $\geq 28$  days late for any ART appointment during 6-month trial period) using confirmed medical records.

We used logistic regressions with mixed effects and receiver operator characteristic (ROC) curves to identify aspects of mobility most strongly associated with repeat TI (high-risk mobility) and identify baseline characteristics associated with high-risk mobility.

**Results:** 1,309 men were enrolled in the trial at 28 facilities in Malawi. Of 1,190 who initiated ART and were included in this analysis, 498 (41.9%) experienced repeat TI; 679 (57.0%) spent  $\geq 3$  total nights away from home during the 6-month trial period. Trip length, purpose, destination, and ability to plan were associated with repeat TI (Table).

By ROC analysis, trips  $\geq 30$  nights (aOR 2.26, 95%CI 1.41-3.62, AUC 0.6703) or unplanned trips ( $< 2$  days to plan; aOR 1.83, 95%CI 1.23-2.73, AUC 0.6622) best defined high-risk mobility. Among baseline characteristics, prior mobility (OR 2.02, 95%CI 1.46-2.80), but no sociodemographic variables, was associated with high-risk mobility during the trial period.

	n (%)	Odds ratio	Area under the curve	Adjusted odds ratio†
Experienced repeat TI	498 (41.9%)			
<b>Mobility - quantitative</b>				
Trip $\geq 3$ nights	335 (39.3%)	1.77 (1.32-2.39) ***	0.6595	
Trip $\geq 7$ nights	248 (20.8%)	1.79 (1.33-2.40) ***	0.6562	
Trip $\geq 14$ nights	189 (15.9%)	1.71 (1.24-2.36) ***	0.6577	
Trip $\geq 30$ nights	99 (8.3%)	2.26 (1.77-4.50) ***	<b>0.6703</b>	2.26 (1.41-3.62) ***
Trip $\geq 90$ nights	37 (3.1%)	3.31 (1.59-6.87) ***	0.6570	
<b>Mobility - qualitative</b>				
Traveled for work	199 (16.7%)	1.51 (1.11-2.07) **	0.6527	
Traveled across borders	72 (6.1%)	2.02 (1.22-3.33) ***	0.6566	
Any unplanned travel ( $\leq 2$ days notice)	133 (11.2%)	2.11 (1.45-3.07) ***	<b>0.6622</b>	1.83 (1.23-2.73) **

\* p<0.10; \*\* p<0.05; \*\*\* p<0.01

† Controlled for sociodemographic characteristics (age, marital status, wealth/asset ownership, alcohol consumption) and trial arm.

Table 1. Defining high-risk mobility by association with repeat TI among men in Malawi (n=1190).

**Conclusions:** Trips  $\geq 30$  days or unplanned trips were high-risk for repeat TI among MLHIV in Malawi. Previous mobility was the best predictor of high-risk mobility. Further research is needed to reduce mobility-associated TI.

## WEPEC308

### Clinical outcomes in the era of test and treat among children living with HIV: a cohort study in Zambia

B.M. Hamooya<sup>1</sup>, S.K. Masenga<sup>1</sup>, L. Siame<sup>1</sup>, M. Mutalange<sup>1</sup>, C. Cheelo<sup>1</sup>, M. Sakala<sup>2</sup>, J. Mvula<sup>2</sup>, S. Kunda<sup>2</sup>, S. Kabesha<sup>2</sup>, C. Banda<sup>2</sup>, D. Sikaulu<sup>2</sup>, I. Fwemba<sup>3</sup>, S. Mutembo<sup>4</sup>

<sup>1</sup>Mulungushi University School of Medicine and Health Sciences, Livingstone, Zambia, <sup>2</sup>Provincial Health Office, Ministry of Health, Choma, Zambia, <sup>3</sup>University of Zambia School of Medicine, Lusaka, Zambia, <sup>4</sup>International Vaccine Access Center, Department of International Health, Bloomberg School of Public Health, Johns Hopkins University, Baltimore, United States

**Background:** Initiating antiretroviral therapy (ART) immediately after diagnosis of HIV infection may reduce morbidity and mortality in children living with HIV (CLWH) especially when they are retained in HIV care. However, there is limited data on retention and other clinical outcomes among CLWH in sub-Saharan Africa. We aimed to determine the retention rate before and after implementing a test and treat program among children with HIV.

**Methods:** We conducted a retrospective cohort study in 42 health facilities in 12 districts of the southern region of Zambia. We reviewed 984 files. The cohorts were divided into two groups, 405 (41.2%) before-test and treat (BTT) and 579 (58.8%) after-test and treat (ATT) policy. We collected demographic, laboratory and clinical data using a structured data collection form in REDCap. Descriptive statistics and logistic regression (xtlogit) were the statistical methods employed.

**Results:** The median age (interquartile range (IQR)) of children abstracted was 60 months (22, 100) and 52.3% (n=515) were females. Overall retention rate (24 months) and viral suppression (at 12 months) were 82.0% (n= 807; 95% confidence interval (CI) 79.5, 84.4) and 81.5% (538/660; 95%CI 78.3-84.4), respectively. A higher proportion of children ATT were retained in care (91.0% vs. 69.1%) and virally suppressed (83.7% vs. 78.7%) compared to BTT. Most of the children BTT were transferred out (19.0% vs. 4.8%), lost to follow (11.1% vs. 3.8%) and died (0.7% vs. 0.2%) as compared to ATT cohort.

In multivariable analysis, the factors positively associated with retention were ATT cohort (odds ratio (OR) 4.98; 95%CI 4.06, 6.11) and use of DTG-based regimen (OR 2.66; 95%CI 1.05, 6.72); while female sex (OR 0.80; 95%CI 0.67, 0.95), increasing number of days from the time of HIV diagnosis to ART initiation (OR 0.99; 95%CI 0.99, 0.99), and being in world health organization (WHO) stages 3 (OR 0.68; 95%CI 0.52, 0.90) and 4 (OR 0.30; 95%CI 0.19, 0.48) were inversely associated.

**Conclusions:** The retention and viral suppression among children were suboptimal. Notably, clinical outcomes improved ATT compared to BTT. There is a need to enhance interventions aimed at improving ART retention and viral suppression among children living with HIV in resource-limited settings.

## WEPEC309

### Time to DAA initiation among persons with HIV-HCV co-infection after HIV virological suppression

M. Chalouni<sup>1</sup>, HepCAUSAL Collaboration

<sup>1</sup>Harvard University, CAUSALab and Department of Epidemiology, Boston, United States

**Background:** International guidelines recommend initiating first antiretroviral therapy (ART), then direct-acting antivirals (DAA) in persons with HIV/HCV co-infection. Delayed DAA initiation can increase the risk of HCV-related complications due to liver disease progression, but also have public health consequences, with HCV transmission to others. We estimated the time to DAA initiation after HIV virological suppression in persons with HIV/HCV coinfection in HepCAUSAL, a collaboration of cohorts in Europe and North America.

**Methods:** We included ART-naïve and DAA-naïve persons with HIV/HCV co-infection, who initiated ART and achieved HIV virological suppression between 2014 and 2020 while meeting the criteria for DAA initiation in their country. For each individual, follow-up started at HIV virological suppression and ended at the earliest date of DAA initiation, loss to follow-up, spontaneous HCV clearance, or 3 years. We estimated the cumulative incidence of DAA initiation after achieving HIV virological suppression overall and by sex, CD4 count, and history of injection drug use (IDU).

**Results:** We included 805 individuals. The median time (interquartile range [IQR]) from ART initiation to HIV-virologic suppression was 2.8 months (1.0-6.8). The median age was 46 years (36-56), median CD4 count was 462 cells/mm<sup>3</sup> (252-668), and 354 individuals (44%) had a history of IDU. Forty-two (5%) individuals died, and 100 (12%) had spontaneous HCV clearance.

The median time to DAA initiation was 9 months (95% CI 8-11). Three years after HIV virological suppression, 75.7% (71.9-79.4) of individuals had initiated DAA.

The 3-year proportion of DAA initiators was 76.6% (72.6-80.5) in males and 69.3% (58.2-79.8) in females, 71.9% (65.7-77.7) in persons with IDU history, and 78.9% (74.0-83.3) in persons without.

The proportions were 67.3% (58.0-76.3), 81.5% (75.6-86.7), and 74.2% (68.2-79.8) in individuals with CD4 count <200, 200-500, and ≥500 cells/mm<sup>3</sup>, respectively.

**Conclusions:** While over half of persons with HIV/HCV co-infection initiated DAA treatment within one year after HIV-virologic suppression, a quarter did not receive DAAs by the third year.

This suboptimal DAA uptake highlights the need for better access to HCV treatment for persons with HIV/HCV coinfection to reach WHO HCV elimination targets and reduce liver disease progression and the risk of HCV transmission.

## WEPEC310

### Monitoring HIV drug resistance early warning indicators among children living with HIV attending care and treatment centres in Tanzania

G.P. Judicate<sup>1,2</sup>, F. Assenga<sup>2</sup>, E. Mlaki<sup>2</sup>, E. Daud<sup>3</sup>, V. Sambu<sup>3</sup>, J. Mushi<sup>3</sup>, E. Akyoo<sup>4</sup>, C.C. Musanhu<sup>4</sup>, G.S. Sunguya<sup>1</sup>

<sup>1</sup>Muhimbili University of Health and Allied Sciences, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>National Institute for Medical Research, Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>Ministry of Health. National AIDS, STIs and Hepatitis Control Program, Dodoma, Tanzania, the United Republic of, <sup>4</sup>World Health Organization, Dar es Salaam, Tanzania, the United Republic of, <sup>5</sup>Management and Development for Health, Dar es Salaam, Tanzania, the United Republic of

**Background:** In response to the rising challenges posed by the growing number of People Living with HIV/AIDS (PLWHA) and the escalating HIV Drug Resistance (HIVDR), Tanzania has embraced the World Health Organization (WHO) strategy to enhance the quality of the Antiretroviral Therapy (ART) program. This involves the systematic measurement of Early Warning Indicators (EWI) for HIV Drug Resistance. This study is designed to evaluate the monitoring of children early warning indicators for HIV drug resistance in Tanzania.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

**Methods:** A retrospective study was conducted among children aged below 15 years between January 2020 and December 2022 in 3,784 clinics across Tanzania to evaluate WHO recommended EWI (EWI1-ART prescribing practices, EWI2-lost to follow-up during the first 12 month of ART, EWI3 retention on first-line ART at 12 month, EWI4-On-time ARV drug pick-up) and optional EWI8-Viral load suppression following 12 months of first-line ART).

We abstracted data from the CTC3 database of routinely collected anonymized data on children who are taking ART. All analyses were conducted using STATA version 15 software.

**Results:** A total of 15496 children were initiated on ART, with majority (52.5%) being females. The majority 97.6% children were appropriately prescribed first-line ART, of these (98.6%) continue taking first-line ART regime 12 month after ART initiation. About 37.1% of children ART regime was stopped or modified, with 43.1% changed to different drug classes. Over 32% children living with HIV delayed in picking up their ARV on time, and approximately, 5.8% of children were lost to follow up 12 months after ART initiation. Viral suppression (HVL<1000 copies) was 64.3% at 12 months after ART initiation.

Overall, results revealed unmet targets of 3/5 of assessed EWI including EWI2: -lost to follow up (33% versus <15%), EWI4: on-time pill pickup (68% versus >90%) and viral suppression (84.4% versus >90%).

**Conclusions:** Taken together, our results revealed the poor performance of HIV drug resistance early warning indicators among children living with HIV attending care and treatment centres in Tanzania.

A call for tailored children based care and treatment plans to improve the quality of ART program and aid in reducing the possibility of occurrence of drug resistance among children.

## WEPEC311

Enhancing HIV outcomes among Brazilian young men and non-binary persons who have sex with men: results from a technology-based intervention study

C. M. Jalil<sup>1</sup>, E. M. Jalil<sup>1</sup>, C. Coutinho<sup>1</sup>, B. Hoagland<sup>1</sup>, S. W. Cardoso<sup>1</sup>, E. Peixoto<sup>1</sup>, R. Scarparo<sup>1</sup>, V. G. Veloso<sup>1</sup>, E. C. Wilson<sup>2</sup>, W. McFarland<sup>2</sup>, T. S. Torres<sup>1</sup>, B. Grinsztejn<sup>1</sup>, the Conectad@s Study Team

<sup>1</sup>Oswaldo Cruz Foundation (Fiocruz), Evandro Chagas National Institute of Infectious Diseases (INI), Rio de Janeiro, Brazil, <sup>2</sup>San Francisco Department of Public Health, Center for Public Health Research, San Francisco, United States

**Background:** Tailored interventions for young (18-24 years) men and non-binary individuals who have sex with men (YMSM/NB) are scarce, despite a disproportionately high HIV burden. Limited data exist on HIV prevention

and care continuum among these populations. This study evaluated HIV care/prevention outcomes before and after a technology-based intervention among Brazilian YMSM/NB.

**Methods:** Conectad@s, an intervention study conducted in Rio de Janeiro, Brazil (November/2021-September/2023), assessed HIV prevention and care outcomes among YMSM/NB over 48 weeks, recruited by respondent-driven sampling.

Participants received quarterly visits and were offered weekly technology-based messages from Week 0. Same-day oral pre-/post-exposure prophylaxis (PrEP/PEP) and antiretroviral therapy (ART) were provided as applicable.

**Results:** Among 409 participants (90.5% cis-MSM, 7.3% NB, 2.2% trans-MSM), 70.6% were Black/*Pardo*, median age 21 years (IQR:20-23), with 369 HIV-negative and 40 living with HIV (LWH), and 50.0% unaware of their HIV status; all accepted the intervention. Six (1.6%) seroconverted during the study.

Study retention at W48 was 83.4% (303 HIV-negative, 38 LWH), with 16.6% (68) lost to follow-up. Comparing W0-W48, there was an increase in linkage to HIV care (50.0% - 97.4%), ART use (50.0% - 97.4%), and viral suppression (40.0% - 81.6%).

Among HIV-negative participants, 0.9% were on PrEP at W0, increasing to 68.7% at W48 (88.0% daily, 12.0% on-demand). Reasons for not using PrEP included difficulties in taking a daily pill (34.1%), not perceiving themselves at HIV risk (28.9%), and not willing to take a daily pill (27.0%). If available, injectable PrEP was the preferred option (35.5% at W0 and 66.1% at W48).

Figure 1. HIV prevention and care continuum among YMSM/NB enrolled in the Conectad@s Project, Brazil, 2021-2023.

**Conclusions:** The Conectad@s study successfully engaged and retained YMSM/NB over 48 weeks, showing substantial improvement in HIV outcomes, particularly in viral suppression and PrEP use. Simple interventions, adapted to the youth's reality, combined with expanding PrEP options, may significantly contribute to enhancing HIV outcomes among YMSM/NB.

## WEPEC312

### Trajectories of HIV care engagement in the perinatal period among women in Lilongwe, Malawi

D. Giovenco<sup>1</sup>, Y. Li<sup>2</sup>, W. Kumwenda<sup>3</sup>, S. Waillie<sup>2</sup>, M. Hosseinipour<sup>4,3</sup>, A.M. Bengtson<sup>1,2</sup>

<sup>1</sup>Emory University, Epidemiology, Atlanta, United States,

<sup>2</sup>Brown University, Providence, United States, <sup>3</sup>UNC Project-Malawi, Lilongwe, Malawi, <sup>4</sup>University of North Carolina at Chapel Hill, Chapel Hill, United States

**Background:** Engagement in HIV care is critical for perinatal women with HIV (WHIV). We employed group-based trajectory modeling to:

1. Describe trajectories of HIV care engagement among WHIV during the perinatal period; and,
2. Identify predictors of membership in suboptimal care trajectories.

**Methods:** Data came from a prospective cohort study across five urban clinics in Lilongwe, Malawi from February 2020- August 2022. Eligible participants were living with HIV, ≥18 years, and planning to remain in Lilongwe. Participants were followed from entry into antenatal care (ANC) through 9 months postpartum.

Trajectories were defined based on whether

1. ≥1 HIV care visit was attended; or,
2. ≥1 HIV care visit was missed for a given participant during a given three-month interval during follow-up. Potential predictors were included in a multivariable group-based trajectory model.

**Results:** Among 375 participants, 22% were aged <25 years, the median gestational age at first ANC visit was 20 weeks, and the majority (77%) were enrolled after the start of the COVID-19 pandemic. We identified two optimal trajectory groups for each care engagement outcome (Figure 1).

Women who were <25 years and had >1 hour of travel time to the clinic were more likely to be in the "lower" probability of attending a visit trajectory group (OR=3.82, 1.25-11.73 & OR=3.54, 1.44-8.69). Enrollment after the start of the COVID-19 pandemic and older gestational age, however, were protective against suboptimal membership in the "lower" probability of attending a visit (OR=0.23, 0.07-0.74) and the "higher" probability of missing a visit (OR=0.28, 0.09-0.86) trajectory groups.

**Figure 1.** Plot of unadjusted trajectory groups and confidence intervals for (1) attending an HIV care visit and (2) missing an HIV care visit for 375 pregnant and postpartum women living with HIV in Malawi in 2020-2022. For the "attending an HIV care visit" trajectories, the "consistently high" probability of attending an HIV care visit group (group 1) was modeled using a cubic term, and the "lower" probability of attending a visit group (group 2) was modeled using a linear term. For the "missing an HIV care visit" trajectories, the "consistently low" probability of missing a visit group (group 1) was modeled using the intercept term, and the "higher" probability of missing a visit group (group 2) was modeled using a quadratic term.

**Conclusions:** Younger women and those who had longer travel to the clinic were at greater risk for suboptimal care engagement, and risk differed for trajectories defined by attending vs. missing a visit. Future research should leverage richer covariate information and consider time-varying factors for a more complete and nuanced assessment of predictors.

## WEPEC313

### Closing the gap of access to HIV services for Venezuelan migrants in public health system in Peru

B. Huaman<sup>1</sup>, C. Benites<sup>2</sup>, J. Valencia<sup>3</sup>, R. Mendizabal<sup>4</sup>, N. Farach<sup>5</sup>, J. Franks<sup>6</sup>, A. Azmitia<sup>7</sup>, J. Wright<sup>7</sup>

<sup>1</sup>ICAP at Columbia University, Lima, Peru, <sup>2</sup>Ministerio de Salud, Lima, Peru, <sup>3</sup>AID for AIDS, Bogotá, Colombia, <sup>4</sup>ICAP at Columbia University, Guatemala, Guatemala, <sup>5</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Tegucigalpa, Honduras, <sup>6</sup>ICAP at Columbia University, New York, United States, <sup>7</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Guatemala, Guatemala

**Background:** More than one and a half million Venezuelan migrants (VM) currently reside in Peru. Public health services for the prevention and comprehensive care of HIV in migrants, especially those that are undocumented, present gaps in access, even though the delivery of prevention and treatment programs are free in Ministry of Health (MoH) facilities.

Since 2021, the following PEPFAR funded project aimed to support access of Venezuelan migrants to HIV prevention, diagnosis and comprehensive care services.

**Methods:** The President's Emergency Plan for AIDS Relief (PEPFAR) supports HIV programming for VM in the two cities with the largest VM populations: Lima and Trujillo (support began 2021 and 2023 respectively). Community outreach services include the delivery of an HIV prevention package: condoms, lubricants, HIV and syphilis testing, and linkage to MoH facilities for treatment, where antiretrovirals are provided free of cost. The project supports initial costs for additional laboratory and X-ray test requested prior to starting treatment.

Peer navigators support linkage and early retention to care, ensuring enrolment in the public health system and providing emotional and nutritional support. Services were captured using routine program monitoring systems for Venezuelan migrants in Peru and aggregated for PEPFAR reporting.

**Results:** A total of 14,013 VM received an HIV prevention package between January 2021 and September 2023, 97% were tested for HIV with 623 new diagnoses (4.5% yield), all of whom were linked to antiretroviral therapy (ART). The project supported 1,752 VM living with HIV (VMLHIV) on ART (89% are male and 90% are between 20 and 44

years of age), maintaining a high level of viral suppression (97%), with 82% of viral load coverage annual. Of those on ART, 68% receive multi-month dispensing beyond three months.

**Conclusions:** Community outreach and support, combined with quality services at MoH, has been pivotal to success in HIV programs reaching VM in Peru. Support and monitoring for ART adherence achieved sustained suppression among VMLHIV. Sustaining ongoing collaboration with the national and subnational levels of the Ministry of Health remains essential for early access to comprehensive HIV care services for Venezuelan migrants.

## WEPEC314

### Decentralization and demedicalization of antiretroviral services to improve client experience in care: lessons from Southern Nigeria

O. Toyo<sup>1</sup>, O. Onwah<sup>1</sup>, E. Nwanja<sup>1</sup>, U. Akpan<sup>1</sup>, C. Nwangeneh<sup>2</sup>, K. Olatunbosun<sup>3</sup>, D. Ogundehin<sup>3</sup>, E. James<sup>3</sup>, C. Obiora-Okafo<sup>3</sup>, A. Idemudia<sup>3</sup>, C. Nwadike<sup>3</sup>, K. Kakanfo<sup>3</sup>, B. Pius<sup>3</sup>, B. Onimode<sup>3</sup>, O. Asaolu<sup>3</sup>, A. Bashorun<sup>4</sup>, A. Gambo<sup>5</sup>, J. Pius<sup>3</sup>, O. Oyelaran<sup>3</sup>, R. Goldstein<sup>3</sup>, O. Onyedini<sup>1</sup>, A. Adegboye<sup>1</sup>, A. Eyo<sup>1</sup>

<sup>1</sup>Excellence Community Education Welfare Scheme, Uyo, Nigeria, <sup>2</sup>FHI360, Uyo, Nigeria, <sup>3</sup>USAID, Office of HIV/AIDS and TB, Abuja, Nigeria, <sup>4</sup>Federal Ministry of Health, National AIDS, Sexually Transmitted Infections Control and Hepatitis Programme (NASCP), Abuja, Nigeria, <sup>5</sup>National Agency for the Control of AIDS (NACA), Abuja, Nigeria

**Background:** Socioeconomic challenges including stigma, discrimination, and long distances to health facilities are prominent barriers limiting access to antiretroviral therapy (ART) in Sub-Saharan Africa.

This paper describes the approach to decentralized and de-medicalized ART services implemented with support from PEPFAR/USAID in Akwa Ibom and Cross River States, Southern Nigeria.

**Description:** Decentralized ART services were provided to PLHIV receiving ART in Akwa Ibom and Cross River States in line with national policies from October 2015 to December 2023. The who, what, where and when framework was used to guide the development of models that best fit client needs. Between 2015 and 2017 ART decentralization was provided only through community pharmacies due to a need to keep clients within the health system. By 2017, healthcare worker-led Community ART refill Group model was created in a further shift to community-based decentralized care. By 2020, evolving client needs and the rapid increase in the treatment cohort necessitated a shift to demedicalised community-based refill models that were client-led and provided ART pickup services at routine community structures, such as schools, council halls, churches, patent medicine vendors, etc, where psychosocial support was provided by peers. The scale-up

of home refills due to the COVID-19 pandemic further decentralized services to the community. In 2021, decentralization spoke facilities were introduced as an option for clients who were able to achieve self-care.

**Lessons learned:** Over the eight-year period, ART services were decentralized to a total of 3, 230 community structures (122 pharmacies, 280 Decentralization Spokes, 663 Client-led Community ART refill Groups, and 2,165 Healthcare worker-led Community ART refill Groups).

However, structures were inactivated based on evolving needs. At present, 1,489 community structures are serving 49,336 clients. Engagement with healthcare workers, community stakeholders and the PLHIV community was crucial for ensuring the acceptability of the approaches. Client retention was 99% across the different models. Data use from implementation was essential to the continuous improvement of the interventions.

**Conclusions/Next steps:** The implementation of decentralized, demedicalised ART services enhances accessibility, acceptability, affordability, and quality of HIV care, and empowers clients to take an active role in their health management.

## WEPEC315

### Evaluation of upskilling of healthcare workers on digital tools for improved data management reducing interruptions in treatment and increasing VL coverage in rural health facilities in Zambia

C. Kaayunga<sup>1</sup>, S. Kabesha<sup>1</sup>, M. Sakala<sup>1</sup>, C. Hamabuyu<sup>2</sup>, C. Mukuwa<sup>2</sup>, Y. Nzabika<sup>2</sup>, G. Marchand<sup>2</sup>, S. Fikoloma<sup>2</sup>, G. Phiri<sup>2</sup>, P. Banda<sup>2</sup>, C. Moyo<sup>2</sup>, A. Kalama<sup>3</sup>

<sup>1</sup>Southern Provincial Health Office, Director, Choma, Zambia, <sup>2</sup>Avencion, Client Services, Lusaka, Zambia, <sup>3</sup>Itezhi-Tezhi District Health Office, DHO, Itezhi-Tezhi, Zambia

**Background:** In 2022, the Government of Zambia through the Southern Provincial Health Office, and CDC partnered with a local NGO, Avencion to implement an intervention to strengthen capacity for data utilization to reduce interruption in treatment (IIT) and improve viral load (VL) monitoring in Itezhi-tezhi (ITT) district of Southern Province.

**Objective:** To improve VL coverage and reduce IIT in 14 facilities receiving the intervention.

**Description:** Methodology

The intervention supported the district with:

- Harmonization of appointment systems by day and time (for viral load, Pharmacy Pickup and Clinical appointment)
- Routine mentorship to facility staff in M&E indicators/targets
- ART outreach activities.
- Transitioned facilities from paper-based to an electronic medical records system.

f. Capacity building activities ranging from classrooms training, data quality audits, technical supportive supervision (TSS), granular site monitoring (GSM)

g. Training on utilization of electronic medical records, advance HIV disease and continuous quality improvement (CQI)

The intervention was designed, managed, led and implemented 100% by Zambian youth.

**Lessons learned:** The district improved from 56% VL coverage in October 2022 to 97% by the end of September 2023 (source DHIS2) and most of the key indicators were above 100%. IIT also reduced from 396 in December 2022 to 189 in December 2023 giving us 53% reduction.

Figure. ITT district % VL coverage.

Figure. Reduction of interruption in treatment (IIT) for ART clients receiving intervention (2022-2023).

**Conclusions/Next steps:** Evidence supports that utilization of data to identify and provide longitudinal monitoring of recipients of care is a cost effective and sustainable approach to improving quality of care, reducing interruptions in treatment, and improving viral load coverage.

Assessing validity and reliability of three brief mental health screening instruments among adolescents and young adults living in areas of high HIV prevalence

A. Poudyal<sup>1</sup>, K.L. Lovero<sup>1</sup>, H. Thompson<sup>1</sup>, G.R. Donenberg<sup>2</sup>, PATC<sup>3</sup>H Network

<sup>1</sup>Columbia Mailman School of Public Health, Sociomedical Sciences, New York, United States, <sup>2</sup>University of Illinois Chicago, Department of Medicine, Chicago, United States

**Background:** Adolescents and young adults are at high risk of acquiring HIV and face an increased burden of mental health problems. The shortage of mental health specialists further aggravates the mental health burden in the most affected countries to diagnose mental health disorders. Brief and reliable mental health screening instruments administered by non-specialists are crucial to detecting and monitoring mental health distress.

However, limited evidence on the reliability and validity of such instruments has impeded the effective detection of distress, prevented conclusions about prevalence across populations, and impacted effective monitoring of mental health disorders, particularly in resource-constrained settings highly impacted by HIV.

**Methods:** Leveraging the NIH-funded PATC<sup>3</sup>H network, a consortium of collaborating research projects designed to improve health outcomes among adolescents and young adults affected by HIV across resource-constrained settings, we assessed the internal consistency (Cronbach's  $\alpha$ ) and construct validity of three commonly used mental health measures: the Patient Health Questionnaire (PHQ-9), Generalized Anxiety Disorder (GAD-7), and Primary Care Post Traumatic Stress Disorder (PC-PTSD-5) among adolescents and young adults living in Nigeria, Mozambique, Brazil, and South Africa.

**Results:** A total of 978 participants completed the PHQ-9 (n=812), GAD-7 (n=271), and PC-PTSD (n=225). All instruments showed adequate internal consistency (Cronbach's  $\alpha > 0.7$ ). In Confirmatory Factor Analysis, the model fit indices revealed acceptable to good fit, with high factor loadings across items (loadings  $> 0.4$ ) strongly supporting a one-factor model for the PHQ-9, GAD-9, and PC-PTSD-5. A country-wide analysis showed inadequate fit for PC-PTSD-5 among South African youth and young adults, although sample size (n=59) may have impacted the analyses.

**Conclusions:** Our data indicate that three commonly administered mental health screening tools reliably identified depression, anxiety, and trauma in youth from resource-constrained settings and affected by HIV.

This study is critical in supporting our understanding of the broad-scale monitoring of mental health disorders among AYLHIV in resource-constrained environments.

## WEPEC317

### Postacute sequelae of SARS-CoV-2 among people with HIV: a systematic review and meta-analysis

F. Shi<sup>1</sup>, H. Zhang<sup>2</sup>, W. Giang<sup>1</sup>, A. Kaur<sup>3</sup>, X. Li<sup>1</sup>, X. Yang<sup>1</sup>

<sup>1</sup>University of South Carolina, Health Promotion, Education, and Behavior, Columbia, United States, <sup>2</sup>Peking University, Beijing, China, <sup>3</sup>University of South Carolina, Columbia, United States

**Background:** Postacute sequelae of SARS-CoV-2 (PASC) is the persistence of related symptoms or the development of sequelae after four weeks of SARS-CoV-2 infection. People with HIV (PWH) might be at increased risk of PASC due to their immune dysfunction, chronic inflammation, and alteration in the immunological response against COVID-19.

This systematic review and meta-analysis aim to synthesize the findings in global literature regarding the prevalence, characteristics, and risk factors associated with PACS among PWH.

**Methods:** Multiple databases, including Embase, PubMed, PsycINFO, Web of Science, and Sociological Abstracts, were searched to identify articles published through June 2023. Search terms relevant to HIV (e.g., "HIV infection" and "AIDS"), COVID-19 (e.g., "COVID-19" and "SARS-CoV-2"), and post-acute sequelae (e.g., "enduring" and "haul") were used. Published articles were included if they presented at least one PASC outcome measure among PWH and used quantitative or mixed methods study designs. For effects reported in three or more studies, meta-analyses using random-effects model were performed using R software. This study was pre-registered (PROSPERO-ID: CRD42023445493).

**Results:** We were able to pool 34,976 COVID-19 patients in 16 eligible studies out of 6,158 publications in all the databases. Most of the studies were conducted in the United States (7), China (3), and South Africa (3). It was estimated that 47% of PWH with SARS-CoV-2 infection developed at least one PASC symptoms. Results from random-effects model showed that HIV infection was associated with an increased risk of PASC (OR = 2.98, 95%CI: 1.64-5.42). The most common PASC symptoms among PWH were fatigue, vision problem, Asthenia and sleep disturbance. Risk factors associated with PACS among PWH included history of moderate-severe COVID-19 illness, a CD4 cell count < 200 cells/ $\mu$ L, and increased IP-10 or TNFa level.

**Conclusions:** COVID-19 pandemic continues exacerbating health inequities among PWH due to their higher risk of developing PASC. Our review is informative for public health and clinical communities to develop tailored strategies to prevent aggravated PASC among PWH. Future

research is needed to validate the findings in the current study which is limited by the small number of eligible studies, heterogeneous study design, and varied measurement methods.

## WEPEC318

### The role of multi-site testing for mpox diagnosis: findings from a prospective cohort in Brazil

M. Oliveira Bastos<sup>1</sup>, M. Secco Torres Da Silva<sup>1</sup>, A.D. Echeverría Guevara<sup>1</sup>, C. Coutinho<sup>1</sup>, T. Silva Torres<sup>1</sup>, E. Portela<sup>1</sup>, S. Wagner Cardoso<sup>1</sup>, E. Elias Da Silva<sup>2</sup>, V. Gonçalves Veloso<sup>1</sup>, B. Grinsztejn<sup>1</sup>, INI-Fiocruz Mpox Study Group

<sup>1</sup>Fundação Oswaldo Cruz, Instituto Nacional de

Infecçologia Evandro Chagas, Rio de Janeiro, Brazil,

<sup>2</sup>Fundação Oswaldo Cruz, Instituto Oswaldo Cruz, Rio de Janeiro, Brazil

**Background:** By October-2023, 91,788 mpox cases have been reported worldwide. It is still controversial whether detection of monkeypoxvirus (MPXV) in routine mucosal swabs (anal and oropharyngeal) yields higher diagnostic accuracy. We aimed to explore the role of multi-site testing in a cohort of individuals with mpox in Brazil.

**Methods:** Prospective cohort of individuals with confirmed mpox (detectable MPXV PCR at any site), followed at a major referral center in Rio de Janeiro, Brazil. Baseline lesion and mucosal (anal/oropharyngeal) swabs for MPXV PCR were collected. Baseline characteristics, behavioral and clinical aspects of participants, according to MPXV detection in mucosal swabs are described using Chi-squared/Fisher's or Moods tests.

**Results:** Between June-2022 and October-2023, 478 participants with confirmed mpox were enrolled. Median age was 33 years (IQR 28,40); most were cisgender men (90%,n=429/478) who have sex with men (MSM) (90%,n=371/408), self-declared as Black/Pardo (60%,n=139/397), and with lower than secondary education (58%,n=237/408). Overall, MPXV PCR yielded positive in 96% of lesion swabs (n=453/464), 59% of oropharyngeal swabs (n=251/422), and 70% of anal swabs (n=260/369). MPXV detection in anal swabs was more frequent among MSM, PLWHA or with active syphilis and those reporting fever or with proctitis (Table).

Table. Behavioral and clinical characteristics of enrolled participants according to MPXV detection in mucosal sites

	PCR MPXV in Anal Swab (N=369)			PCR MPXV in Oropharyngeal Swab (N=422)		
	Detectable n = 260	Not Detectable n = 109	p-value	Detectable n = 251	Not Detectable n = 171	p-value
MSM	216/226 (94.7%)	78/83 (93.9%)	0.803	201/221 (90.9%)	132/146 (90.4%)	0.46
Reported sex in the last 30 days	221/247 (89%)	95/106 (89%)	0.97	212/237 (89%)	149/167 (89%)	0.94
Reported Anal Sex in the last 30 days	112/158 (72%)	45/71 (63%)	0.20	102/151 (68%)	79/116 (68%)	0.92
HIV infection	155/258 (60%)	41/108 (38%)	<0.001	131/246 (53%)	81/170 (48%)	0.26
Active syphilis (VDRL>1:8)	64/249 (26%)	17/105 (16%)	0.05	54/235 (23%)	32/181 (18%)	0.46

### Human papillomavirus in women living with and without HIV from Southern Province, Zambia

L. Muchaili<sup>1</sup>, B.C. Mweene<sup>1</sup>, P. Simushi<sup>2</sup>, T. Mwakyoma<sup>1</sup>, S.K. Masenga<sup>1,3</sup>

<sup>1</sup>Mulungushi University, HAND Research Group, School of Medicine and Health Sciences, Livingstone, Zambia, <sup>2</sup>Mulungushi University, Livingstone University Teaching Hospital Laboratory, Livingstone, Zambia, <sup>3</sup>Vanderbilt Institute for Global Health, Vanderbilt University Medical Center, Nashville, United States

**Background:** Cervical cancer is the leading cause of cancer death in women in Zambia and the fourth leading cause of cancer death in women worldwide. Human papillomavirus (HPV) is strongly associated with cervical cancer in women. However, there is a dearth of knowledge on the prevalence and factors associated with HPV testing outcomes in Zambia.

Therefore, this study aimed to determine the prevalence and factors associated with cervicovaginal HPV in women living with and without HIV in the Southern province of Zambia.

**Methods:** Cross-sectional study conducted at Livingstone University Teaching Hospital using programmatic data. 3,013 women were screened for cervicovaginal HPV using the APTIMA HPV kit for the qualitative detection of E6/E7 mRNA transcripts for 14 high-risk HPV types (14, 18, 31, 33, 35, 39, 45, 51, 52, 56, 58, 59, 66, and 68) on Hologic Panther platform from September 2021 to August 2022. Factors associated with HPV were determined using a logistic regression in STATA version 15.

**Results:** Participants had a median age of 38 [interquartile range (IQR) 30, 46]. The majority, 90.8% (2737/3013) were women living with HIV (WLWHIV). Overall HPV prevalence among participants was 35% (1,057/3013). HPV prevalence among the WLWHIV was 36% (986/2734) and 25% (71/279) among women without HIV. Living with HIV, sample collection method, and age were associated with HPV. WLWHIV had increased odds of having a positive HPV result (OR 1.82; 95% CI 1.36-2.45; p. value<0.001) compared to women without HIV. Samples collected by providers were more likely to have a positive result (OR 2.12; 95% 1.65 - 2.73; p. value <0.001) when compared to self-collected samples. Older women had reduced odds of having a positive result compared to younger women (OR .98; 95% CI 0.98 -.99, p. value 0.001).

**Conclusions:** WLWHIV had nearly a twofold increased risk of having cervicovaginal HPV. Regular cervical cancer screening is recommended to reduce the risk in this population. The higher positivity rate in women with provider-collected samples may suggest a need for proper education of women on self-sample collection, with client education, self-collected samples can increase access for WLWHIV to HPV and cervical cancer screening.

Kandel<sup>1</sup>, A.P. Goura<sup>1</sup>, M. Nkwetta<sup>1</sup>, M.A. Mbunka<sup>1</sup>, J. Simen<sup>1</sup>, F. Acho Abongwa<sup>1</sup>, D. Nitchou Tchouakam<sup>1</sup>, E. Takem<sup>2</sup>, Z. Bissemou<sup>1</sup>, C.B. Ndongmo<sup>2</sup>, G. Ndayisaba<sup>1</sup>, M.F. Jalloh<sup>2</sup>, J. Ditekemena<sup>4</sup>, A. Yemane Berhan<sup>5</sup>, A. Tiam<sup>5</sup>, P. Tchendjou<sup>1</sup>

<sup>1</sup>Elizabeth Glaser Pediatric AIDS Foundation, Yaounde, Cameroon, <sup>2</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Yaounde, Cameroon, <sup>3</sup>Ministry of Public Health Health, National AIDS Control Committee, Yaounde, Cameroon, <sup>4</sup>Elizabeth Glaser Pediatric AIDS Foundation, Kinshasa, Congo, the Democratic Republic of the, <sup>5</sup>Elizabeth Glaser Pediatric AIDS Foundation, Washington DC, United States

**Background:** The life expectancy of people living with HIV (PLHIV) has been increasing with the wide use of antiretroviral therapy (ART). The aging cohort of PLHIV are exposed to other health threats such as non-communicable diseases. Exploring risk factors of hypertension and diabetes mellitus (DM) in HIV clinics is important for improving holistic care for PLHIV.

**Methods:** We conducted a cross-sectional analysis of routine program data collected from April to September 2023 following screening of hypertension and DM among adult PLHIV receiving care in seven high-volume hospitals in Littoral and South Cameroon. Hypertension was defined as having two consecutive abnormal measures of blood pressure ( $\geq 140/90$ mmHg) and DM reflected glycaemia ( $\geq 1.26$ g/dl fasting or  $\geq 200$ mg/dl otherwise).

We used binomial logistic regression to assess the associations of hypertension and DM with age, sex, smoking status, alcohol consumption, physical activity, and type and duration on ART.

**Results:** Among 18,220 PLHIV, 8,990 were screened for hypertension and DM, with median age 45 years (IQR 37-53); 3,273 (36.4%) were aged  $>50$  years, 6,581 (73.2%) were female, and 5,625 (62.6%) were receiving ARV for  $>5$  years. Among the PLHIV screened, 6,047 (67.3%) reported alcohol consumption, 7,956 (88.5%) reported never smoking, 633 (7.0%) had hypertension only, 98 (1.1%) had diabetes only, and 63 (0.7%) had both. In multivariable analysis, males had lower odds of hypertension compared to females (aOR:0.77; 95%CI [0.6-0.9]).

The odds of hypertension were greater among those aged 31-49 years (aOR: 5.1; 95%CI [2.6-10.8]) and  $>50$  years (aOR: 13.4; 95%CI [7.3-28.4]) compared to those 15-30 years. PLHIV who reported past or current alcohol consumption had 27% greater odds of hypertension (aOR: 1.27; 95%CI [1.1-1.5]). PLHIV aged  $>50$  years had five-fold increase in

their odds of having diabetes compared to those aged 15-30 years (aOR: 5.3; 95%CI[2.5-13.7]). No association was found between hypertension or DM and duration and type of ART regimen.

**Conclusions:** The odds of hypertension and diabetes increased with age among PLHIV, and past or current alcohol consumption was most strongly associated with hypertension. Our study emphasizes the need for hypertension and DM screening among PLHIV, to inform context-specific improvements in prevention, detection, and treatment strategies.

## WEPEC322

### Perceptions on frailty and frailty screening of people living with HIV and their healthcare professionals in Ethiopia: a qualitative study

E.M. Woldeesemayat<sup>1</sup>, C. Tanner<sup>2</sup>, N. Abera<sup>1</sup>, E. Lijore<sup>1</sup>, S. Marquart<sup>2</sup>, K. Alford<sup>2</sup>, N. t. Clair-Sullivan<sup>2</sup>, A. Kasa<sup>3</sup>, T. Gari<sup>1</sup>, K. Gutema<sup>1</sup>, N. Chea<sup>1</sup>, J. H. Vera<sup>2,2</sup>

<sup>1</sup>Hawassa University, School of Public Health, Hawassa, Ethiopia, <sup>2</sup>University of Sussex, BSMS, Brighton, United Kingdom, <sup>3</sup>Hawassa University, School of Midwifery Nursing, Hawassa, Ethiopia

**Background:** People living with HIV (PLWH) are an ageing population with an increased risk of comorbidities and accelerated onset of geriatric syndromes, including frailty. Nearly two thirds of PLWH globally reside in sub-Saharan Africa (SSA) and it is predicted that, by 2040, 25% of PLWH in SSA will be over 50 years old. New challenges are emerging for healthcare systems in this region with a growing role supporting ageing PLWH affected by difficulties, such as frailty.

The aim of this study was to identify perceptions of frailty and explore frailty-related priorities for PLWH and their healthcare professionals (HCPs) in Ethiopia.

**Methods:** In-depth interviews (IDIs) and focus groups (FGs) were conducted with PLWH and HCPs, recruited from three hospitals in Ethiopia. IDIs took place in person in November 2022; they were originally conducted in Amharic and then translated into English. Pseudonymised transcripts were analysed with thematic analysis using NVivo.

**Results:** 38 participants were recruited for this study across the IDIs and FGs: 26 PLWH (14 male, 11 female, 1 no data) and 12 HCPs (3 male, 9 female). Two main themes were identified: (i) understanding frailty; (ii) talking about frailty: expectations and considerations each containing a number of sub themes (Table 1).

PLWH viewed frailty as an unavoidable consequence of ageing and both PLWH and HCPs considered its causes to be multi-factorial, including socioeconomic challenges. HCPs were concerned that discussing frailty may offend clients. Both felt increased awareness of and practical solutions for frailty were needed.

Themes	Quotes from IDIs and FGs
1. Understanding frailty	
1.1 An unavoidable consequence of ageing and a blessing.	"Frailty is a normal condition that can happen on anyone. It is not like leprosy.... I think living until I become old is a blessing." (PLWH)
1.2 A state of physical and mental deterioration and hopelessness	"Frailty is one indicator of weakness of one's body, brain and movements or activities of the body" (PLWH) "When I think about frailty... he will develop a feeling of hopelessness" (PLWH)
1.3 Product of socioeconomic challenges, malnutrition, and substance use.	"So if one is addicted and uses harmful things, it can faster the rate of frailty." (PLWH) "Basically, mostly frailty caused by is somebody has poor economic status..." (PLWH)
2. Talking about frailty	
2.1. Important to share experience and raise awareness	"We can share the experience of others... It will really will help us." (PLWH) "It's very good to have discussion... and improve their awareness. There are many people who don't know about frailty." (PLWH)
2.2. Provide coping skills and mitigate further deterioration	"If I know more about the causes and means of prevention, I can take care of myself." (PLWH) "They can show significant improvements if we discuss [frailty] during the first contacts." (HCP)
2.3. It may offend clients, so practical solutions are needed in discussion.	"Whatever comes out of my mouth then it is reality to them. Hence, I should take care not to offend my client." (HCP) "If there is no solution, then they will be discouraged" (HCP)

Table 1.

**Conclusions:** This study highlights the importance of both increasing frailty awareness and using a holistic approach to frailty screenings and discussions for PLWH in Ethiopia. Future service development work, focussed on healthy ageing for PLWH in Ethiopia, should incorporate cultural and social factors, as well as the physical and psychological.

## WEPEC323

### Time-varying concordance of self-reported and point-of-care biomarkers of alcohol and substance use measures among older adults with HIV from low- and middle-income countries, the Sentinel Research Network of leDEA

M. Stockton<sup>1</sup>, A. Parcesepe<sup>2</sup>, J. Hahn<sup>3</sup>, T. Chanyachukul<sup>4</sup>, E. Kwobah<sup>5</sup>, H. Byakwaga<sup>6</sup>, P. Carrier<sup>7</sup>, G. Murenzi<sup>8,9</sup>, H. Perazzo<sup>10</sup>, B. Crabtree Ramirez<sup>11</sup>, A. Haas<sup>12</sup>, A. Mandiriri<sup>13</sup>, I. Marbaniang<sup>14</sup>, A. Jaquet<sup>15</sup>, K. Lancaster<sup>16</sup>

<sup>1</sup>University of North Carolina at Chapel Hill, Chapel Hill, United States, <sup>2</sup>University of North Carolina at Chapel Hill, Department of Maternal and Child Health, Gillings School of Global Public Health, Chapel Hill, United States, <sup>3</sup>University of California San Francisco, San Francisco, United States, <sup>4</sup>The Foundation for AIDS Research, TREAT Asia/amfAR, Bangkok, Thailand, <sup>5</sup>Moi Teaching and Referral Hospital, Eldoret, Kenya, <sup>6</sup>Mbarara University, ISS Clinic, Mbarara, Uganda, <sup>7</sup>Aix Marseille University, Marseille, France, <sup>8</sup>Research for Development, Kigali, Rwanda, <sup>9</sup>Rwanda Military Hospital, Kigali, Rwanda, <sup>10</sup>National Institute of Infectious Diseases Evandro Chagas-Oswaldo Cruz Foundation, Rio de Janeiro, Brazil, <sup>11</sup>Instituto Nacional de Ciencias Médicas y Nutrición, Mexico City, Mexico, <sup>12</sup>University of Bern, Institute of Social and Preventive Medicine, Bern, Switzerland, <sup>13</sup>Newlands Clinic, Harare, Zimbabwe, <sup>14</sup>BJ Government Medical College, JHU Clinical Research Site, Maharashtra, India, <sup>15</sup>University of Bordeaux, French National Research Institute for Sustainable Development, Bordeaux, France, <sup>16</sup>Wake Forest University, Department of Implementation Science, Winston-Salem, United States

**Background:** Despite the adverse effects of substance use on HIV virological suppression, objective substance use measures and screening remain rare in clinical settings.

**Methods:** We assessed time-varying concordance (percent agreement) between self-reported unhealthy use and urine biomarkers for alcohol and other drugs among the International epidemiology Databases to Evaluate AIDS (leDEA) Sentinel Research Network (SRN) cohort of people with HIV aged ≥40 at enrollment, 6-, and 12-months. Urine tests included urine ethyl glucuronide (uETG) for alcohol [detectable < prior 5 days] and a 5-panel urine test for opioids, cocaine, cannabis, amphetamines, and benzodiazepines.

Unhealthy use was defined as Alcohol Use Disorder Identification Test (AUDIT)-C score ≥3 (women) or ≥4 (men) and as Alcohol, Smoking and Substance Involvement Screening Test (ASSIST) score ≥4. Concordance was estimated overall and by sex.

**Results:** Of the 2,132 participants, 57% were female, 56% reported drinking alcohol, and 20% reported any drug use at enrollment; cannabis use (12%), cocaine (5%), sedatives or sleeping pills (5%), amphetamines (2%), hallucinogens (1.5%), and opioids (0.1%). Prevalence of unhealthy

alcohol use was 20%, 17% and 17% at enrollment, 6-, and 12-months, respectively, while positive uETG was 12%, 14% and 14% at enrollment, 6-, and 12-months, respectively. The prevalence of unhealthy cannabis use was 2%, 1% and 2% at enrollment, 6-, and 12-months, respectively, while positive urine test was 2%, 3%, and 4% at enrollment, 6-, and 12-months, respectively.

Concordance between self-reported unhealthy alcohol use and uETG and unhealthy cannabis use and urine test was high, varied overtime, and differed by sex, with lower concordance among males than females.

Figure. Percentage agreement with urine screen.

**Conclusions:** Over time concordance was moderate to high between self-reported substance use and urine tests and lower among males than females. Approaches for integrating biomarkers with longer detection periods and quantifiable levels of consumption should be explored for monitoring in real-world clinical settings.

## WEPEC324

### Interaction between SARS-CoV-2 and maternal HIV infection in pregnancy and risk of adverse birth outcomes in the era of antiretroviral therapy in Malawi

A.R. Koudjra<sup>1</sup>, N. Nampota<sup>1,2</sup>, F. Mkandawire<sup>2</sup>, O. Nyirenda<sup>2</sup>, R. Masonga<sup>2</sup>, M. Laufer<sup>1</sup>, A.G. Buchwald<sup>1</sup>

<sup>1</sup>University of Maryland School of Medicine, Center for Vaccine Development and Global Health, Baltimore, United States, <sup>2</sup>Kamuzu University of Health Sciences, Blantyre Malaria Project, Blantyre, Malawi

**Background:** SARS-CoV-2 infection in pregnancy is associated with adverse birth outcomes including hospitalization preterm birth, and low birth weight. The effect of SARS-CoV-2 on birth outcomes in pregnant women living with HIV (PWLWH) is not well established.

**Methods:** We enrolled pregnant women attending their first ANC visit at gestational age of 20-36 weeks in rural and urban sites in Malawi. Participants were recruited in three cohorts: 1) HIV unacquired (HU), 2) PWLWH who initiated ART ≥ 6 months before conception with non-detectable (<400 copies/ml) VL (HIV-lo), 3) PWLWH who initiated ART ≥20 weeks gestation with high (>10,000 copies/ml) VL (HIV-hi). Serum was collected at enrollment and delivery. Exposure to SARS-CoV-2 was assessed using S1 RBD protein

Human IgG ELISA (quantitative) and IgM ELISA (qualitative) and women were considered ever positive for SARS-CoV-2 if they were either IgM positive or seroconverted by IgG between enrollment and delivery.

We assessed the interaction between SARS-CoV-2 and cohort on adverse birth outcomes using log-binomial regression models.

**Results:** We enrolled 1207 pregnant women from March 2018 to 30 June 2022. This analysis includes 422 women screened after December 2019 with 36 HIV-hi, 177 HIV-lo, and 209 HU. Among completed samples, 113/422 (26.8%) were ever positive for SARS-CoV-2 (IgM+ (n=49), IgG seroconversion (n=64)) and 72/113 (63.7%) positives were among HU.

HU women were more likely to be positive for SARS-CoV-2 than PWLWH ( $p<0.001$ ). Among included pregnancies, 98/422 (23%) pregnancies had adverse outcomes, including low birth weight (n=41), death (n=6), hospitalization due to pregnancy complications (n=31), or preterm birth (n=44).

After adjusting for site and maternal education as a surrogate for socio-economic status, there was no association between SARS-CoV-2 and adverse outcomes, however, there was significant interaction between SARS-CoV-2 and HIV positivity ( $p<0.05$ ). PWLWH with SARS-CoV-2 coinfections had increased risk of adverse pregnancy outcomes compared to those with SARS-CoV-2 only (Rate Ratio (RtR) =2.49(95%CI: 1.03, 4.63)) and compared to those with HIV only (RtR=1.74(95%CI: 1.07, 2.68)).

**Conclusions:** In Malawi, PWLWH had lower rates of SARS-CoV-2 during pregnancy than HU women, likely due to decreased seroconversion. Despite this, PWLWH with detected SARS-CoV-2 coinfections were at increased risk for adverse birth outcomes.

## WEPEC325

The prevalence of hepatitis B virus infection among five military populations in sub-Saharan Africa

B. Tran<sup>1</sup>, B. Fidèle<sup>2</sup>, Y.N. Athanase<sup>3</sup>, J. Kowo<sup>4</sup>, Z.J. Chatsika<sup>5</sup>, L. Joaquim<sup>6</sup>, S. Balachandra<sup>1</sup>

<sup>1</sup>Department of Defense HIV/AIDS Prevention Program, San Diego, United States, <sup>2</sup>National Armed Forces of Burkina Faso, Ouagadougou, Burkina Faso, <sup>3</sup>Côte d'Ivoire Armed Forces, Yamoussouko, Côte d'Ivoire, <sup>4</sup>Armed Forces of Liberia, Monrovia, Liberia, <sup>5</sup>Malawi Defence Force, Lilongwe, Malawi, <sup>6</sup>Mozambique Armed Defence Forces, Maputo, Mozambique

**Background:** Hepatitis B virus (HBV) infection remains an important public health priority. In 2019, an estimated 820,000 deaths were attributed to HBV infection. While infection is vaccine-preventable, HBV disproportionately impacts specific populations and countries in sub-Saharan Africa (SSA). HBV and HIV share similar transmis-

sion patterns; military personnel can be at higher risk to both due to the unique culture and exposures of service. HBV prevalence estimates among service members are scarce. This study describes the burden of HBV in five military populations in SSA.

**Methods:** Data from seroprevalence and behavioral epidemiology risk surveys (SABERS) conducted in Burkina Faso (2018; n=1511), Cote D'Ivoire (2021; n=1271), Liberia (2018; n=1583), Malawi (2018; n=1251), and Mozambique (2022; n=1836) were analyzed. SABERS were cross sectional studies that included active-duty military members 18 years or older.

The presence of Hepatitis B surface antigen was determined with Advanced Quality One Step (InTec Products), Alere Determine (Abbott), AllTest (Hangzhou Alltest Biotech Co.), or SD Bioline (Abbott). HBV prevalence estimates and 95% confidence intervals (CIs) were calculated. Statistical differences in HBV prevalence by sex and age group were examined with Pearson's Chi-Square tests.

**Results:** The prevalence of HBV was 5.6% (95% CI: 4.3-6.9) in Malawi, 6.0% (95% CI: 4.9-7.1) in Mozambique, 9.2% (95% CI: 7.6-10.8) in Cote D'Ivoire, 10.1% (95% CI: 8.6-11.6) in Liberia, and 12.2% (95% CI: 10.5-13.8) in Burkina Faso. HBV prevalence was found to be significantly higher in men compared to women in Burkina Faso (12.9% vs. 7.2%;  $p=0.02$ ), Cote D'Ivoire (9.6% vs. 0.0%;  $p=0.01$ ), and Liberia (10.6% vs. 2.8%;  $p=0.01$ ). In Malawi and Mozambique, HBV prevalence was significantly higher in the 25-49 year age group compared to those 18-24 or 50+ ( $p=0.03$  and  $p=0.02$ , respectively).

**Conclusions:** Our findings add to limited data on HBV prevalence among a unique population, military personnel, and can be used to inform mitigation strategies. HIV-negative service members with chronic HBV infection may derive dual benefit from pre-exposure prophylaxis (PrEP) to prevent HIV acquisition and HBV disease progression. Furthermore, HIV-positive individuals should be tested for HBV, and appropriate services provided based on status to prevent adverse health outcomes.

## WEPEC326

Stigma in healthcare and sexual violence as root causes of HIV risk for young trans women in Brazil

E. Wilson<sup>1</sup>, E. Jalli<sup>2</sup>, C. Coutinho<sup>2</sup>, E. Peixoto<sup>2</sup>, N. Bertoni<sup>2</sup>, T. Wargas<sup>2</sup>, C. Castro<sup>2</sup>, C. Arsolino<sup>2</sup>, L. Monteiro<sup>2</sup>, R.I. Moreira<sup>2</sup>, S. Cardoso<sup>2</sup>, V.G. Veloso<sup>2</sup>, B. Grinsztajn<sup>2</sup>

<sup>1</sup>San Francisco Department of Public Health, San Francisco, United States, <sup>2</sup>The Oswaldo Cruz Foundation (FIOCRUZ), Evandro Chagas National Institute of Infectious Diseases, Rio de Janeiro, Brazil

**Background:** The violence epidemic towards adult trans women in Brazil is well documented and known to severely impact, their mental health, engagement in HIV prevention and care and their risk of HIV infection. Less is known

about the experiences of youth. We assessed experience of violence and discrimination for young trans women in Brazil and co-morbidities related to mental health.

**Methods:** Data are from the baseline assessment for an HIV status-neutral intervention that enrolled YTW (18-24 years of age) between February to July of 2022 in Rio de Janeiro, Brazil. Participants answered structured surveys that assessed experiences of violence and discrimination related to gender identity in general, in healthcare, and from sexual partners, and healthcare avoidance due to fear of discrimination.

**Results:** Almost all young trans women in our study (N=164) experienced discrimination due to their gender identity (99%). More than one third (37%) experienced physical violence related to their gender identity and 83% experienced verbal violence. About one fifth experienced sexual violence from a partner (21%), and 43% were worried about violence from a sexual partner.

Many (18%) were treated poorly by healthcare professionals due to their gender identity and 44% avoided healthcare for fear of experiencing discrimination.

**Conclusions:** Young trans women in Brazil face extraordinary societal, systems and interpersonal violence and discrimination. Discrimination from healthcare providers resulted in healthcare avoidance, which is a major barrier to HIV prevention and care engagement in Brazil where universal healthcare is available.

Healthcare avoidance paired with high rates of sexual violence from partners presents extreme HIV risk for young trans women in Brazil who likely lack access to HIV prevention along with bodily autonomy to protect themselves from HIV. Interventions with YTW must address their risk for physical and sexual violence along with stigma in healthcare settings to effectively address HIV risk.

## Methodology to support epidemiological studies

### WEPEC327

A phylogenetic investigation of the determinants of HIV transmission among adolescent girls and young women enrolled in the DREAMS HIV prevention program in KwaZulu-Natal, South Africa

A.H. Jung<sup>1</sup>, N. Chimbindi<sup>2</sup>, T. Ndung'u<sup>2</sup>, F. Magut<sup>3</sup>, J. Dreyer<sup>2</sup>, T. Zuma<sup>2</sup>, J. Seeley<sup>1</sup>, T. Smit<sup>2</sup>, I. Birdthistle<sup>1</sup>, S. Floyd<sup>1</sup>, C.E.M. Coltart<sup>4</sup>, M. Shahmanesh<sup>2</sup>, S. Hué<sup>1</sup>

<sup>1</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>2</sup>Africa Health Research Institute, Durban, South Africa, <sup>3</sup>African Health Research Institute, Somkhele, South Africa, <sup>4</sup>University College London, London, United Kingdom

**Background:** The phylogenetic analysis of viral genomes can support real-time monitoring, understanding and control of HIV epidemics. We explored the use of phylogenetics in understanding the outcomes of the DREAMS (Determined, Resilient, Empowered, AIDS-free, Mentored, and Safe) HIV prevention program.

**Methods:** Randomly selected population-based cohorts of 13-35-year-old men and women from rural KwaZulu-Natal, where DREAMS was delivered, were followed up annually between 2017-2019. DREAMS exposure was determined by self-reported receipt of an invitation to or participation in DREAMS HIV prevention activities. HIV status was ascertained through Dried Blood Spot collection at each time point.

The subtype C *pol* sequence of viruses infecting 45 participants living with HIV was compared to 3,602 HIV-1 subtype C *pol* sequences from diverse studies conducted in KwaZulu-Natal region between 2000-2020 and 72 closely related, publicly available sequences by maximum likelihood phylogenetic inference.

Putative transmission clusters were identified and chi-square tests compared characteristics of individuals within and outside clusters to identify risk factors driving local transmission.

Multivariable logistic regression assessed a potential association between DREAMS program exposure and the odds of belonging to a recent transmission cluster accounting for sex and age group.

**Results:** A total of 691 transmission clusters comprising 1,554 individuals were identified. Twelve clusters (1.74%) included at least one DREAMS participant, totaling 15 participants. A large local cluster, spanning the three-year implementation period 2016-2018, involving 31 adolescents and young adults (AYAs) was identified.

No significant differences in demographic, clinical, and behavioral characteristics were observed between DREAMS participants within and outside transmission

clusters, though study power was low for these comparisons. Evidence was weak for an association between DREAMS exposure and the odds of being in a transmission cluster (adjusted OR=0.53, 95%CI 0.24–1.16, P=0.112).

**Conclusions:** Phylogenetic inference confirmed that most HIV infections were local, and that DREAMS exposure did not have a measurable impact on HIV transmission in the study setting. The ongoing transmission amongst AYAs in this rural community underscores the imperative need for interventions targeting AYAs, including antiretroviral-based prevention.

## WEPEC328

### Development of first-ever subnational HIV-related 95-95-95 targets, gaps, and action plans in Honduras, 2022

N. Farach<sup>1</sup>, S. Nuñez<sup>2</sup>, A. Bueso<sup>2</sup>, T. Rivera<sup>3</sup>, M. Paredes<sup>3</sup>, R. Mendizabal-Burastero<sup>4</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention, Central America office, Division of Global HIV and TB, Tegucigalpa, Honduras, <sup>2</sup>Ministry of Health of Honduras, Tegucigalpa, Honduras, <sup>3</sup>ICAP Central America, Tegucigalpa, Honduras, <sup>4</sup>ICAP Central America, Guatemala City, Guatemala

**Background:** The Ministry of Health (MoH) of Honduras annually calculates estimates of people living with HIV (PLHIV) using UNAIDS' Spectrum software. Previously, these were conducted at the national level, hindering their use to guide measurable HIV case-finding efforts at the subnational level.

With PEPFAR support, the MoH developed a methodology to distribute the estimation of PLHIV among the country's 20 health regions to develop subnational targets, gaps, and action plans to reach the 95-95-95 targets.

**Description:** PLHIV estimations for each of Honduras' 20 health regions were calculated by proportionally distributing the 2022 national PLHIV estimate (22,000) based on the percentage contribution to overall case notification by health region from 2012-2021.

This was multiplied by 95% to obtain the subnational target for the first 95%, i.e., an estimate of the number of PLHIV aware of their status. Subnational targets for the conditional second and third 95%, estimated PLHIV on treatment and virally suppressed respectively, were subsequently obtained.

Gaps to reach the 95-95-95 targets in each health region were calculated using programmatic data from MoH information systems including case notification, PLHIV on antiretroviral treatment (ART) and virally suppressed.

The gap to reach the first 95% was distributed among populations based on the estimated contribution of each group to new HIV infections in the latest Spectrum estimations, as follows: men who have sex with men (44%), clients of male and female sex workers (22%),

transgender women (6%), female sex workers (3%), people who inject drugs (1%). The remaining gap was assigned to general population males and females. Estimates were used to develop plans to reach 95-95-95 targets by health region.

**Lessons learned:** This exercise provided the MoH with an estimate of total PLHIV by health region and, by extension, of the gaps to reach each 95-95-95 target by 2030. The integration of local programmatic data into the calculation increased the acceptability of both the PLHIV estimates and the 95-95-95 targets by local health authorities.

**Conclusions/Next steps:** Subnational PLHIV estimates provide a framework for local health authorities to determine the scope of their HIV epidemic and to develop tailored plans to reach the 95-95-95% targets by 2030.

## WEPEC329

### My Personal Health Guide: an innovative digital health approach to supplementing clinical care HIV education using a relational agent in the stigma-free private space of one's mobile phone

M. Dworkin<sup>1</sup>, A. Huske<sup>1</sup>, S. Upton<sup>1</sup>, S. Lee<sup>2</sup>, K. Niti<sup>1</sup>, C. Luc<sup>1</sup>, J. Jones<sup>3</sup>

<sup>1</sup>University of Illinois at Chicago, School of Public Health, Chicago, United States, <sup>2</sup>Connecticut College, New London, United States, <sup>3</sup>Emory University, Atlanta, United States

**Background:** As part of the effort of ending the HIV epidemic, we iteratively developed My Personal Health Guide, an innovative theory-informed app featuring a slow talking plain speaking realistic relational agent. Among its features are content about HIV that could supplement clinical care education by providing a stigma-free private learning and motivational space in one's own mobile phone.

We report preliminary findings from a randomized multi-state clinical trial in the US and hypothesized that the app would increase HIV knowledge.

**Methods:** YBMSM (18-34 years) living with HIV were recruited throughout the United States and randomized 1:1 to either My Personal Health Guide or a food safety attention control app. Participants had either nonoptimal adherence or retention in care problems (self-reported or provider referred) or recent viral nonsuppression.

We assessed health literacy with a modified REALM-SF. Nine HIV knowledge questions that corresponded to education offered by the avatar were asked at baseline and 6 months. App usage was voluntary.

**Results:** Among the 254 YBMSM from 23 states (57% Southern) who downloaded the app (n=125 intervention vs. n=129 control), 149 were retained and followed for 6 months at the time of analysis. Fifty-six participants (37.6%) had nonoptimal literacy and 23 (15.4%) reported

being homeless during the RCT. Median years since HIV diagnosis = 6. The average knowledge score changed from 64.7% to 71.0% in the intervention group and 64.1% to 64.2% in controls. Average change in knowledge was 6.2 points higher in the intervention group compared to the control group (95% CI: 0.67, 11.69).

Among knowledge questions, the most improvement was observed for defining HIV resistance (39.2% of intervention group participants improved their answer versus 12.9% of controls).

**Conclusions:** We developed an intervention that may enhance care for a population underrepresented in clinical trials who experience many barriers to antiretroviral adherence and retention.

Despite high loss to follow-up, long duration interval between baseline and follow-up, nonoptimal literacy, homelessness, and passive delivery, the direction of change in knowledge was favorable suggesting that this relational agent digital health approach may be promising.

Future study should include other populations and require active engagement to better assess potential impact.

Mapping PrEP use cascades in the Netherlands under the internalised homonegativity "storm" and sexual self-efficacy "sunshine": where do MSM need an umbrella and where do they need sunglasses?

H. Wang<sup>1</sup>, J. Kolstee<sup>1</sup>, H.M. Zimmermann<sup>1</sup>, K.J. Jonas<sup>1</sup>

<sup>1</sup>Maastricht University, Department of Work and Social Psychology, Maastricht, Netherlands, the

**Background:** Oral PrEP is pivotal in curbing new HIV infections and linking individuals to PrEP-related care/services. However, PrEP use can be influenced by psycho-social factors like internalised homonegativity (IH) and sexual self-efficacy (SSE, e.g. confidence to say no to sex). This study mapped the nationwide PrEP use cascade (uptake, suboptimal adherence, discontinuation) among MSM and explored their ecological associations with IH and SSE in the Netherlands.

**Methods:** Data from a Dutch subsample (n=1,102) of PROTECT, an online cross-sectional survey among MSM obtained from October-December 2023 were included. PrEP use cascades, IH, and SSE (measured on a 1-5 Likert scale) were aggregated at the regional level using postcode data I.

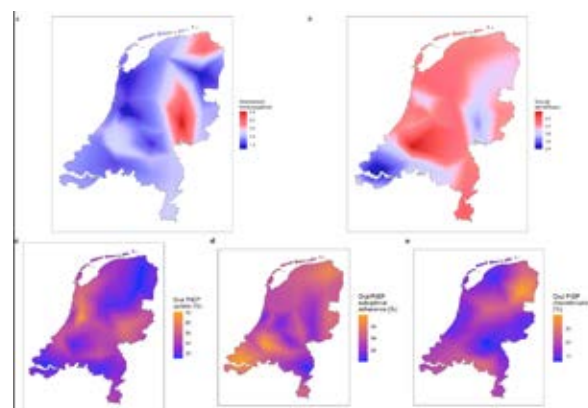

Using a stochastic partial differential equation approach based on Gaussian random field, we mapped the prevalence of each PrEP use cascade, IH "storm" and SSE "sunshine". Ecological regression was then employed to explore the potential spatial associations of IH/SSE on each PrEP use cascade.

**Results:** Figure below illustrates the estimated geostatistical PrEP use cascades, IH (range 1.7-2.6), and SSE (3.4-4.4) in the Netherlands. Nationally, PrEP use cascades vary consistently and heterogeneously: uptake (25.0%-70.9%), suboptimal adherence (10.4%-49.7%), and discontinuation (5.7%-39.8%).

Higher PrEP uptake, lower PrEP suboptimal adherence and lower PrEP discontinuation concentrate around more urban areas, while the opposite cascades concentrate around more rural areas.

Ecologically, higher geostatistical IH was found to be associated with lower uptake ( $B=-1.21$ ), higher suboptimal adherence ( $B=0.54$ ), and higher discontinuation ( $B=1.17$ ) of PrEP.

Conversely, higher geostatistical SSE was found to be associated with higher uptake ( $B=0.36$ ), lower suboptimal adherence ( $B=-0.10$ ), and lower discontinuation ( $B=-0.427$ ) of PrEP.

**Conclusions:** Optimal PrEP use cascades are identified in urban areas of the Netherlands, characterized by lower local IH and higher local SSE.

To promote PrEP use and maximise its public health benefits, interventions/actions should also consider the psycho-social "climate" of MSM, umbrellaing the IH "storm".

### WEPED331

Tuning into transgender realities: analyzing minority stress through the *Purple Royale* podcast in Zimbabwe

K.F. Clark<sup>1</sup>, D.C. Matongo<sup>2</sup>, A. Chacha<sup>3</sup>, T. Musekiwa<sup>3</sup>

<sup>1</sup>The University of Texas Health Science Center at Houston, School of Public Health, Houston, United States, <sup>2</sup>Africa University, College of Health, Agriculture and Natural Sciences, Mutare, Zimbabwe, <sup>3</sup>Purple Royale Podcast, Harare, Zimbabwe

**Background:** This research explores the lived experiences of the transgender community in Zimbabwe. Applying Meyer's minority stress theory (MST), the study aims to understand the proximal and distal minority stress processes, coping and social support mechanisms, and mental and physical health outcomes affecting this community.

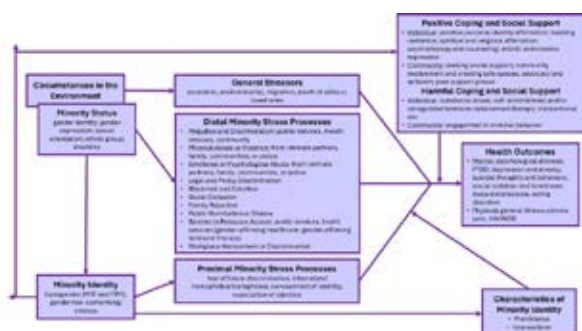

**Methods:** We conducted a qualitative, directed content analysis of 19 episodes of the *Purple Royale* podcast produced in 2022 and 2023. Each episode describes the first-hand lived realities of sexual and gender minority (SGM) populations, totaling 28 unique narratives. Using Dovetail software, we transcribed the podcast recordings.

Focusing on the personal narratives in each episode, two trained coders analyzed the transcriptions alongside the audio recordings, developing a comprehensive codebook grounded in MST.

Within each episode, we coded every distinct mention of minority stress processes, coping mechanisms, and health outcomes, in addition to the demographic details provided by each narrator.

This approach, emphasizing the individuality of experiences, ensured a rigorous analysis with an intercoder reliability of 93%.

**Results:** The analysis highlighted prominent distal minority stress factors, including community prejudice and discrimination (n=34), family rejection (n=31), community-instigated psychological abuse (n=17), and public humiliation (n=16). Proximal stressors included fear of future discrimination (n=15), internalized homophobia/transphobia (n=14), and identity concealment (n=13). Mental health outcomes were alarmingly prevalent, with psychological distress (n=34), PTSD (n=32), depression and anxiety (n=23), and suicidal thoughts (n=9) being most common. However, we documented more positive than harmful coping mechanisms, such as positive identity affirmation (n=21), resilience building (n=13), and community involvement (n=12).

**Conclusions:** The findings underscore the profound impact of minority stress and the harsh realities faced by transgender Zimbabweans. These insights highlight urgent needs for mental health support, gender-affirming healthcare, and accessible HIV services. Understanding and addressing minority stress processes, particularly in the context of HIV, is critical to improving the health of SGM communities in Zimbabwe.

## WEPED332

Examining the relationship between psychological wellbeing, self-efficacy, resilience, and depression among people with HIV

M. Schulte<sup>1</sup>, B. Tang<sup>2</sup>, R. Heaton<sup>2</sup>, D. Moore<sup>2</sup>, D.J. Grelotti<sup>2</sup>

<sup>1</sup>University of California San Diego School of Medicine, San Diego, United States, <sup>2</sup>University of California San Diego School of Medicine, HIV Neurobehavioral Research Program, San Diego, United States

**Background:** Depression is more prevalent in people with HIV (PWH) compared to people without HIV (PWoH). While prior research has identified HIV-related biomarkers of depression among PWH, this study examines the relationship between depression and intervenable psychological factors such as Psychological Wellbeing, Self-Efficacy, and Resilience in PWH.

**Methods:** Data were derived from participants at the HIV Neurobehavioral Research Program between 2015-2022. PWH and PWoH were included if they completed both the

Beck Depression Inventory-II (BDI-II) and the NIH Toolbox Emotion Battery Psychological Wellbeing and Self-Efficacy scales at two separate visits and the Connor-Davidson Resilience Scale and demographic, medical, psychiatric, and substance use measures on at least one visit. We used mixed-effects models with subject-specific random intercepts or linear regression to examine bivariate relationships between variables of interest.

All variables having a bivariate association with BDI-II at  $p \leq 0.15$  were then included in a multivariable analysis and retained in the mixed-effects model if the association with BDI-II remained at  $p < 0.15$ .

**Results:** 235 participants (n=172 PWH; n=63 PWoH) met inclusion criteria. PWH had higher (worse) BDI-II scores (coefficient: 0.209; 95% CI: [0.088, 0.331]) and lower Psychological Wellbeing (coefficient: -3.103; 95% CI: [-5.704, -0.503]) as compared to PWoH, but were comparable on Self-Efficacy and Resilience. Multivariable analysis demonstrated that lower Psychological Wellbeing, lower Self-Efficacy, antidepressant prescription, and lifetime unipolar mood disorder were associated with higher BDI-II scores (Figure).

Figure. Results of multivariable model examining relationship between BDI-II and predictors with  $p < 0.15$ .

**Conclusions:** PWH, compared to PWoH, had greater depressive symptom severity and lower Psychological Wellbeing. However, lower Psychological Wellbeing, but not HIV, was associated with greater depressive symptom severity in the multivariable model.

This suggests that psychosocial conditions differentially affecting PWH might help to explain the higher burden of depression among PWH. Future studies of depression among PWH should measure Psychological Wellbeing and examine if and how targeting Psychological Wellbeing reduces depressive symptom severity among PWH.

Methodological innovations to understand, say-do' gaps in acceptability studies: generating end-user insights on HIV broadly neutralizing antibodies in India through gamified behavioral experiments

S. ul Hadi<sup>1</sup>, J. Mukherjee<sup>1</sup>, P. Aggarwal<sup>1</sup>, P. Rath<sup>2</sup>, P. Manchi<sup>2</sup>, S. Rawat<sup>3</sup>, A.K. SriKrishnan<sup>4</sup>, V. Chakrapani<sup>5</sup>

<sup>1</sup>IAVI, Gurugram, India, <sup>2</sup>Final Mile, Mumbai, India,

<sup>3</sup>Humsafar Trust, Mumbai, India, <sup>4</sup>YRGCARE, Chennai, India,

<sup>5</sup>C-SHaRP, Chennai, India

**Background:** Broadly neutralizing antibodies (bNAbs) represent a new class of HIV prevention products that have shown promise in early-phase clinical trials. To understand drivers of acceptance and uptake of bNAb-based HIV prevention products, especially in comparison to other HIV biomedical prevention options on the horizon, IAVI conducted a study with Humsafar Trust, C-SHaRP, YRGCARE and FinalMile among HIV key populations across three cities in India. However, an important challenge was to preemptively identify decision pathways where stated preferences could potentially diverge from observed behavior, leading to the dreaded "say-do" gap (Strauss et al., 2018).

**Methods:** To address this challenge, we conducted simulated behavioral experiments (n=94) leveraging a conundrum game (Sgaier et al., 2017) across Chennai, Delhi and Mumbai with men who have sex with men, trans-gender women, female sex workers, people who use injectable drugs, and youth.

The experiments engaged participants in a sequence of immersive scenarios mimicking real-life scenarios and asked them to make rapid choices on product use decisions. The emotional appraisal framework (Scherer, 2018) was employed to guide analysis on identifying decision levers, critical inflection points and preference reversal pathways.

**Results:** The conundrum games identified four stable drivers of product choice:

1. Intrinsic product pleasantness and appeal;
  2. Safety and minimal side-effects;
  3. Privacy and opportunity for discreet use; and,
  4. Avoiding stigma resulting from association with HIV.
- They also noted compromises and reversals in stated preferences around pain tolerance and dosing, especially when confronted with trade-offs in more stable preferences.

**Conclusions:** Gamified experiments offer significant advantages in behavioral evidence-generation around product acceptability by:

- a. Making questions around hypothetical product choices more tangible and relatable through simulation and immersion;
- b. Facilitating depersonalization by taking the spotlight away from the participant and minimizing social bias through role-play; and,

c. Identifying non-conscious drivers of choice associated with preference reversal through in-game incentives and rapid response times that limit opportunity for conscious consideration.

Product developers can benefit greatly by studying end-user preferences through such gamified and simulated experiments to develop a better understanding of factors that can potentially enhance or impede the uptake of vaccines and biomedical products in real-world settings.

## WEPEP334

Novel patient reported experience measure shows organizational trauma resilience mediates effect of complex post-traumatic stress disorder on antiretroviral therapy adherence

L.L. Brown<sup>1</sup>, A. Osman<sup>2</sup>, E.S. Kay<sup>3</sup>, P. Rebeiro<sup>4</sup>, T. Smith<sup>1</sup>, D. Wilus<sup>1</sup>, M. Tabatabai<sup>1</sup>, A. Pettit<sup>5,5</sup>

<sup>1</sup>Meharry Medical College, School of Medicine, Nashville, United States, <sup>2</sup>Nashville CARES, Nashville, United States, <sup>3</sup>University of Alabama, Birmingham, Nursing, Birmingham, United States, <sup>4</sup>Vanderbilt University Medical Center, Biostatistics, Nashville, United States, <sup>5</sup>Vanderbilt University Medical Center, School of Medicine, Nashville, United States

<sup>1</sup>Meharry Medical College, School of Medicine, Nashville, United States, <sup>2</sup>Nashville CARES, Nashville, United States, <sup>3</sup>University of Alabama, Birmingham, Nursing, Birmingham, United States, <sup>4</sup>Vanderbilt University Medical Center, Biostatistics, Nashville, United States, <sup>5</sup>Vanderbilt University Medical Center, School of Medicine, Nashville, United States

**Background:** Post-Traumatic Stress Disorder is highly prevalent among people with HIV (PWH) in the United States (~50%) and associated with reduced Antiretroviral Therapy (ART) adherence. Unknowns are effects of the more chronic Complex PTSD (C-PTSD) and the potentially mediating role of Organizational Trauma Resilience (OTR)—extent care is perceived as safe, stable, and nurturing. Exploration of these novel measures could uncover modifiable factors for HIV care organizations (HCOs).

**Methods:** During summer 2023, PWH receiving services from a community-based HCO in urban Tennessee completed a REDCap survey assessing C-PTSD from the International Trauma Questionnaire, five items from the AIDS Clinical Trials Group Adherence Questionnaire on reasons for missed doses, responses from a novel instrument, and the Organizational Trauma Resilience-Patient Reported Experience Measure (OTR-PREM). The Baron & Kenny approach was used to determine if OTR mediated the relationship of C-PTSD with ART adherence (ordinal outcome), when adjusting for demographic factors (race, sexual orientation, education, age, and receipt of mental health care in previous two years), using ordinal logistic regression. R/RStudio version 3.6.0 was used for all analyses and graphical representations of data in conjunction with the R packages haven, lavaan, openxlsx, and tidyverse.

**Results:** Among 114 participants, 75 (66%) were cisgender male, 73 (64%) same gender-loving, 56 (49%) White, and 49 (43%) Black, with a mean age of ~50 (SD=11.38); 27 (24%) met C-PTSD criteria. The OTR-PREM had excellent reliability.

ity and validity (Cronbach's alpha coefficient=.960; mean of the total item correlation=.920), and adjusted models showed three sub-dimensions—Collaboration and Empowerment (CE), Trauma Responsive Services (TRS), and Impact of Provider Training (IPT)—were found to mediate the effects between C-PTSD and reduced ART adherence. See Table 1.

Item	Predictor	Mediator	Direct	95% CI	Indirect	95% CI	Total	95% CI
Missed because fell asleep	C-PTSD	CE	0.148	(-0.56, 0.86)	0.556	(0.13, 0.98)	0.705	(0.09, 1.32)
	C-PTSD	TRS	0.175	(-0.56, 0.91)	0.529	(0.11, 0.95)	0.705	(0.09, 1.32)
	C-PTSD	IPT	0.496	(0.15, 1.15)	0.209	(0.02, 0.40)	0.705	(0.09, 1.32)

Note: Results are from adjusted models, with direct effect indicating effect of exposure on the outcome absent the mediator; the indirect effect as the effect of the exposure on the outcome explained by the mediator; and the total effect as the combination of the direct and indirect effects, indicating the mean difference between exposed/unexposed groups for outcome measure, without regard to mediation. Mediator dimensions are from the Organizational Trauma Resilience—Patient Reported Experience Measure: IPT= Impact of provider training; TRS= Trauma responsive services; and CE= Collaboration and empowerment.

Table 1. Effects between ART adherence, OTR dimensions, and C-PTSD.

**Conclusions:** OTR mediated the effects of C-PTSD on ART adherence, underscoring the urgency of fostering OTR culture in HCO's to improve HIV outcomes.

## Social and behavioural aspects and approaches to HIV and living with HIV

### WEPED335

The interaction between HIV-related stigma and social support on antiretroviral therapy (ART) adherence self-efficacy among adult PLHIV in South Africa

M.Q. Luthuli<sup>1</sup>, J. John-Langba<sup>2</sup>

<sup>1</sup>University of Witwatersrand, Social Work, Johannesburg, South Africa, <sup>2</sup>University of KwaZulu-Natal, Social Work, Durban, South Africa

**Background:** People living with HIV (PLHIV) grapple with distinct challenges, including HIV stigma which affect their antiretroviral therapy (ART) adherence self-efficacy. This study investigated the interaction of HIV stigma and perceived social support on ART adherence self - efficacy among adult PLHIV in South Africa.

**Methods:** Utilizing quantitative cross-sectional survey design 201 male and female participants were recruited using time location sampling (TLS) at a tertiary healthcare facility in Durban, South Africa.

**Results:** HIV stigma was significantly associated with self-efficacy ( $\beta = -7.860$ ,  $t = -4.654$ ,  $p = 0.001$ ), with variations across different stigma levels ( $\beta = -5.844$ ,  $t = -4.003$ ,  $p = 0.001$ ). Social support was significantly associated with

self-efficacy at lower HIV stigma levels ( $\beta = 7.440$ ,  $t = 3.887$ ,  $p = 0.001$ ), in contrast to higher levels ( $\beta = -2.825$ ,  $t = 1.400$ ,  $p = 0.163$ ).

**Conclusions:** Social support significantly influenced self-efficacy, particularly at lower levels of HIV stigma, but the effect of support weakens as stigma intensifies.

Experiences of stigma and discrimination encountered by men who have sex with men on HIV service uptake in Nasarawa state, North Central, Nigeria

I. Enang<sup>1</sup>, A.E. Idepefo<sup>2</sup>, C. Aneke<sup>3</sup>, P. Odangla<sup>2</sup>, R.A. Magaji<sup>2,2</sup>, M.A. Olodu<sup>2</sup>, S. Oshagbami<sup>2</sup>, U. Daniel<sup>4</sup>, D. Adeyemi<sup>5</sup>

<sup>1</sup>Human Support Services, Uyo, Nigeria, <sup>2</sup>National Agency for the Control of Aids, Lagos, Nigeria, <sup>3</sup>National Agency for the control of Aids, Lagos, Nigeria, <sup>4</sup>United Nations Office on Drugs and Crime, Abuja, Nigeria, <sup>5</sup>Doctor, Lagos, Nigeria

**Background:** Stigma and discrimination pose significant barriers to healthcare access for PLHIV. In Nigeria, MSM faces substantial obstacles to utilizing HIV services, with 43% opting not to seek care due to pervasive stigma. Alarming trends indicate that HIV prevalence among MSM in Nasarawa state, Nigeria has not decreased, setting the stage for this study.

Therefore, this study looks at the experiences of stigma and discrimination encountered by MSM regarding service uptake.

**Methods:** This research conducted secondary data analysis of the 2020 Integrated Biological and Behavioral Surveillance Surveys (IBBSS). The study focused on MSM, FSW, PWID typology, selecting states based on specific criteria.

Oral abstracts

For the MSM category, males aged 15+ who engaged in anal sex with another male in the past 12 months were included, utilizing a multistage probability sampling approach. In Nasarawa State, 372 MSM participants were targeted.

**Results:** The study's results unveiled various forms of stigma and discrimination experienced by MSM. A significant percentage reported negative comments from health workers (30.9%), unauthorized disclosure of their HIV status by health workers (24.2%), and being subjected to disparaging comments (70.2%), 70.8% expressed loss of respect, 43.8% endured verbal insults, harassment, and threats, and 76.1% disclosed that their HIV status was sometimes revealed without their permission by people. Consequently, 16.4% refrained from seeking HIV-related services due to the fear of stigma and discrimination.

**Conclusions:** This study reveals stigma and discrimination experienced by MSM, including negative comments from health workers, unauthorized disclosure of their HIV status, verbal abuse, and the reluctance to access services due to stigma.

These findings underscore the need to address this menace, ensuring that individuals, regardless of their sexual orientation, can access HIV services without the burden of prejudice. Combating stigma is essential for equitable healthcare access; immediate interventions are vital for addressing these problems in Nasarawa, Nigeria.

## WEPED337

Stigma and discrimination among elderly women living with HIV: a qualitative study in a peri-urban setting in Uganda

B. Kabakidi<sup>1</sup>, B. Kwagala<sup>1</sup>, F. Nakyeyune<sup>1</sup>

<sup>1</sup>Wakiso District Network of People Living with HIV (WADNET), Uganda, Uganda

**Background:** Although Uganda has achieved notable progress in HIV/AIDS prevention and treatment, the specific challenges faced by elderly women living with HIV remain poorly understood. This study explored the experiences of stigma and discrimination among elderly women living with HIV, including former sex workers. The study also explored strategies they employ to navigate the complex landscape of stigma and discrimination and foster resilience.

**Methods:** Employing semi-structured interviews in a peri-urban area near Kampala in Uganda, we interviewed 40 elderly women living with HIV. In-depth interviews were held with ten elderly women who were formerly sex workers while focus group discussions were held with other elderly women with HIV. Thematic analysis was used to analyze the data.

**Results:** Our findings revealed a landscape saturated with stigma. Elderly women living with HIV encounter societal ostracization within the communities. They report-

ed experiencing neglect and abuse at health facilities. For former sex workers, the burden of past social marginalization compounds their present struggles, hindering access to services and support in the community.

Despite these hardships, the women displayed remarkable resilience. They forge informal support groups and find solace in faith and religious practices.

**Conclusions:** This research highlights the multifaceted experiences of elderly women living with HIV including those who were formerly sex workers in a Ugandan peri-urban setting. It urges healthcare providers, policymakers, and community leaders to develop age-inclusive and inter-sectional interventions that address the unique needs of this often-overlooked population.

## WEPED338

If you make it simpler, they will use it! Applying behavioural principles to improve adoption of data management guidelines: insights from South Africa's MMC Programme

M. Fineberg<sup>1</sup>, A. Kwarteng<sup>1</sup>, J. Swart-Van Biljorn<sup>1</sup>, L. Mulenga<sup>1</sup>, D. Loykisoonlal<sup>2</sup>

<sup>1</sup>Genesis Analytics, Johannesburg, South Africa, <sup>2</sup>South Africa National Department of Health, Pretoria, South Africa

**Background:** South Africa's medical male circumcision (MMC) programme has achieved great scale, with over five million men circumcised since 2010. However, the availability of accurate, complete data for decision-making is compromised by low compliance with the country's data management standards, especially among Department of Health officials. MMC SUSTAIN is a technical assistance programme that empowers government officials to lead a locally coordinated and implemented MMC programme in eight high HIV-burden South African districts.

**Description:** We conducted key informant interviews with officials at the National Department and target districts to understand their behavioural barriers to MMC data management. A major obstacle uncovered was the sheer volume and scope of related policies, guidelines, and tasks.

This resulted in cognitive overload, forcing officials to rely on present bias and focus on familiar and simple tasks, such as data reporting, instead of those they deemed difficult or tedious, such as data analysis and verification. Next, we extracted and validated the most relevant information from diverse sources and packaged them into user-friendly materials, including infographics, automated tools, and checklists.

We socialised users on the materials using a peer-led approach to boost social desirability and through targeted communications, such as newsletters and orientations. To institutionalise their use, we incorporated the mate-

rials into the programme induction pack for new staff and made materials available through the national MMC Knowledge Hub.

**Lessons learned:** An independent programme review conducted in 2021 demonstrated that our interventions effectively improved government officials' compliance with MMC data management standards. Respondents reported that our interventions "made life easier" and "strengthened oversight". More encouragingly, there has been an observed improvement in programme management and governance, as evidenced by the institutionalisation of routine data verification exercises in all eight districts.

**Conclusions/Next steps:** Our experience demonstrates the potential for using simple behavioural interventions in institutionalising desired tasks in low-resource settings. As global efforts towards sustainability and local capacity building gain momentum, our experience can serve as an example for implementing partners seeking evidence-based methods to inform their transition planning.

## WEPED339

"I don't know how to handle my relationship with getting this treatment"- life on antiretroviral therapy. A mix methods study on people's journeys to obtain ART in South Africa

N. Sithole<sup>1</sup>, B. Nkosi<sup>2,3</sup>, J. Seeley<sup>1,3,4</sup>, R.V. Barnabas<sup>5,6</sup>, M.J. Siedner<sup>1,3,5,6</sup>, M. Moshabela<sup>3</sup>

<sup>1</sup>Africa Health Research Institute, Mtubatuba, South Africa,

<sup>2</sup>University of Toledo, Toledo, United States, <sup>3</sup>University of KwaZulu-Natal, Durban, South Africa, <sup>4</sup>London School of Hygiene & Tropical Medicine, London, United Kingdom,

<sup>5</sup>Mass General Hospital, Division of Infectious Diseases, Boston, United States, <sup>6</sup>Harvard Medical School, Boston, United States

**Background:** In the post apartheid era, South Africa remains a highly mobile society with people constantly moving for work and family obligations. While this requires that people with HIV can transfer from one clinic to another, the system remains complex.

We investigated people's journeys navigating the challenges of transferring between HIV clinics in the public sector.

**Methods:** Data were collected from March to October 2023. We used an HIV electronic register in KwaZulu-Natal to compile information on people's journeys between public sector clinics for antiretroviral therapy (ART). Quantitative data were collected from 62 people found to be virally suppressed at treatment initiation at 2 clinics.

We then conducted in depth qualitative interviews with 18/62 people collecting ART from clinics. Interviews were conducted in isiZulu, transcribed and translated into English. Thematic and deductive analysis were conducted.

**Results:** From the HIV electronic register, 17/62 (27%) had previous ART records from other clinics and 14/62 (23%) had previous records from the same clinics, suggesting re-entry into care. We illustrate this finding with two case studies: a 37 year old female farm worker who moved around for work and a 47 year old male construction worker who moved between work sites.

The individuals used multiple strategies to obtain ART after moving to new areas. In both cases, when they presented to their new clinic, they were told they could not access care until they obtained transfer letters from prior clinics. Unable to return to prior centres, they presented to a third clinic stating they were ART naïve, retested and opened new files.

To avoid detection about their status, they changed their names when registering. They also engaged social supporters by asking them for ART. They paid between US \$5-8 for a 28 pill packet to these supporters. Finally, they asked for pills from partners, relatives and community members.

**Conclusions:** People living with HIV who move for work have developed strategies to address the barriers they encounter to obtain ART. Desensitization of clinic staff about challenges faced by migrants could help facilitate transfers between clinics. A linked electronic system could also allow transfers without physical letters.

## WEPED340

Socio-economic vulnerability, isolation, violence, and discrimination: depression severity and associated factors among transgender women living with HIV (ANRS-Trans&VIH, France)

R. Van Huizen<sup>1</sup>, M. Annequin<sup>1,2</sup>, S. Jutant<sup>3</sup>, M. Mora<sup>1</sup>, M. Bourrelly<sup>1,4</sup>, G. Maradan<sup>1,2</sup>, C. Berenger<sup>1,2</sup>, A. Faye<sup>1,4</sup>, F. Michard<sup>5</sup>, Y. Yazdanpanah<sup>5</sup>, A. Freire Maresca<sup>6</sup>, E. Rouveix<sup>7</sup>, M. Salcedo<sup>4,8</sup>, D. Michels<sup>8,4</sup>, L. Blanquart<sup>3</sup>, G. Rincon<sup>3</sup>, C. Protiere<sup>1</sup>, B. Spire<sup>1</sup>

<sup>1</sup>Aix Marseille Univ, Inserm, IRD, SESSTIM, Sciences Economiques & Sociales de la Santé & Traitement de l'Information Médicale, ISSPAM, Marseille, France, <sup>2</sup>ORS PACA, Observatoire Régional de la Santé Provence-Alpes-Côte d'Azur, Marseille, France, <sup>3</sup>ACCEPTESS-T, Paris, France, <sup>4</sup>Community-Based Research Laboratory, Coalition PLUS, Pantin, France, <sup>5</sup>Service de Maladies Infectieuses, Hôpital Bichat - Claude-Bernard, APHP, Paris, France, <sup>6</sup>Service de Maladies Infectieuses et Tropicales, Hôpital Avicenne, APHP, Bobigny, France, <sup>7</sup>Service de Médecine Interne, Hôpital Ambroise-Pare, APHP, Boulogne-Billancourt, France, <sup>8</sup>AIDES, Pantin, France

**Background:** Women, transgender individuals, and people living with HIV are at higher risk of depression—a factor associated with HIV-treatment adherence. Transgender women living with HIV (TGWLWH) face intersecting social positions, putting them at risk for higher rates of

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

depression; data is scarce regarding their mental health. This analysis aims to describe depression severity among TGWLWH and identify associated factors.

**Methods:** ANRS-Trans&VIH (2020-2022) is the first comprehensive, French, cross-sectional study of TGWLWH accessing HIV treatment, with longitudinal, retrospective data. Community-based interviewers administered a face-to-face standardized life-event history, sociodemographic and medical questionnaire to 536 participants in 36 HIV-care units. Depression was measured using the PHQ-9 instrument. Bivariate analyses were conducted and multivariate associations were estimated using multinomial logistic regression.

**Results:** 489 participants completed the PHQ-9, and were included. Median age was 43 (IQR:36-50), 14% had French nationality, 84% were born in Latin America, and median years since HIV diagnosis was 13 (IQR:7-20). Prevalence of mild (MD) and moderate-to-severe depression (MSD) was 32% and 25%, respectively. Lifetime physical violence was 65%, lifetime sexual abuse was 45%, and recent mistreatment on the street was 42%.

In multivariate analyses, precarious health insurance, recent medical discrimination, lifetime sexual abuse, and social isolation were associated with MD and MSD. Lifetime physical violence and at-risk alcohol consumption were associated with MD. Recent mistreatment on the street, and having had a psychiatrist consultation in the context of gender-affirmative-care under French protocol were associated with MSD.

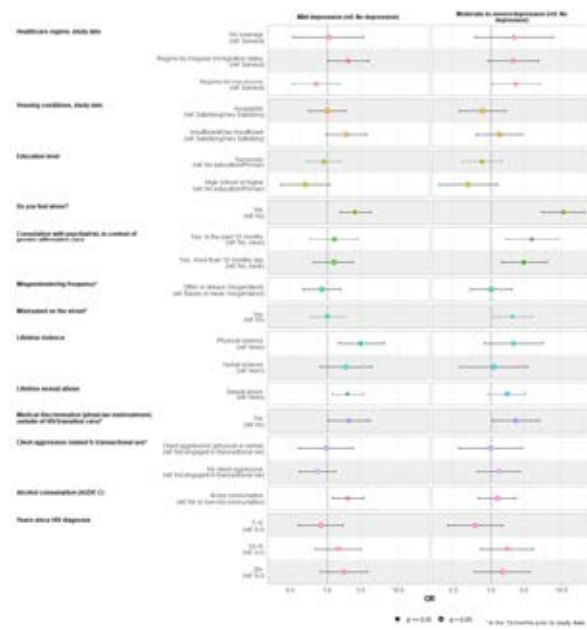

Table 1. Multivariate associations with depression severity, ANRS-Trans & VIH (2020-2022).

**Conclusions:** Results indicate a higher prevalence of depression compared to the general population. As expected, depression among TGWLWH seems to be driven by discrimination. However, socio-economic vulnerability, structural violence, and isolation seem to weigh as heavily on their mental health. Further research is needed regarding access to gender-affirmative-care services, and

the identification of appropriate interventions at the clinical level. Interventions addressing structural vulnerability and systemic transphobia should be prioritized.
