AIDS 2024, the 25th International AIDS Conference

[aids2024.org](https://aids2024.org)

# AIDS 2024 Organizing Committee

**IAS President and  
International Co-Chair**  
Sharon Lewin, Australia

**Local Co-Chair**  
Christoph Spinner, Germany

**Regional Co-Chair representing  
eastern Europe**  
Andriy Klepikov, Ukraine

## Members

Beatriz Grinsztejn, Brazil  
Birgit Poniatowski, Switzerland  
Kenneth Ngunjiri, Kenya  
Glory Alexander, India  
Jacquelyne Alesi, Uganda  
Erika Castellanos, the Netherlands  
Asier Sáez-Cirión, France  
Susana Valente, USA  
Thanyawee Puthanakit, Thailand  
Laura Waters, United Kingdom  
Elizabeth Bukusi, Kenya  
Caroline Sabin, United Kingdom  
Ines Dourado, Brazil

Sybil Hosek, USA  
LaRon E Nelson, USA  
Valdiléa Gonçalves Veloso, Brazil  
Felicita Hikuam, Namibia  
Michel Kazatchkine, Switzerland  
Morten Ussing, Switzerland  
Geoff Garnett, USA  
Barbara Günsheimer-Bartmeyer, Germany  
Tobias Oliveira Weismantel, Germany  
Elizabeth Atieno Onyango, Kenya

## Track Committees

### Track A – Basic Science

**Co-lead**  
Asier Sáez-Cirión, France  
Susana Valente, USA

**Members**  
Fernando Valiente-Echeverria, Chile  
Maria Salgado Bernal, Spain  
Priti Kumar, USA  
Ulrike Protzer, Germany  
Zhiwei Chen, Hong Kong

### Track B – Clinical Science

**Co-lead**  
Thanyawee Puthanakit, Thailand  
Laura Waters, United Kingdom

**Members**  
Allison Agwu, USA  
Christoph Boesecke, Germany  
Elena Vovc, Switzerland  
Johannes Bogner, Germany  
N Kumarasamy, India  
Sanjay Bhagani, United Kingdom

### Track C – Epidemiology and prevention science

**Co-lead**  
Elizabeth Bukusi, Kenya  
Caroline Sabin, United Kingdom

**Members**  
Andrey Poshtaruk, Türkiye  
Ishwar Gilada, India  
Kawango Agot, Kenya  
Michael Traeger, Australia  
Viviane Dias Lima, Canada

### Track D – Social and behavioural sciences

**Co-lead**  
Ines Dourado, Brazil  
Sybil Hosek, USA

**Members**  
Heidi van Rooyen, South Africa  
Kane Race, Australia  
Laio Magno, Brazil  
Lisa Hightow-Weidman, USA  
Saiqa Mullick, South Africa

### Track E – Implementation science, economics, systems and synergies

**Co-lead**  
LaRon E Nelson, USA  
Valdiléa Gonçalves Veloso, Brazil

**Members**  
Fabio Mesquita, Brazil  
Kimberly Green, Vietnam  
Maryam Shahmanesh, United Kingdom  
Micheal Ighodaro, USA  
Nathan Ford, Switzerland

### Track F – Political research, law, policy and human rights

**Co-lead**  
Felicita Hikuam, Namibia  
Michel Kazatchkine, Switzerland

**Members**  
Allan Maleche, Kenya  
Carolyn Gomes, Jamaica  
Lillian Mworeko, Uganda  
Mariam Jashi, Georgia  
Daouda Diouf, Senegal

# Abstract submission

Over 7200 abstracts were submitted to the 25th International AIDS Conference.

The Organizing Committee (OC) is very grateful for all the abstract submissions received. While the OC found many very high-quality abstracts among the submissions, due to limitations in the conference programme, more abstracts were rejected than accepted – with an overall acceptance rate of 38% (which includes the late breaker abstracts).

All abstracts went through a blind peer-review process completed by over 830 abstract reviewers. These reviewers are international experts in the field of HIV, including members of the OC and track committees.

Each abstract was reviewed by three to four reviewers. The abstracts were reviewed for the quality and original-

ity of the work. Late-breaking abstract reviews included an additional assessment of the late-breaking nature of the research.

All reviewers were instructed to abstain from scoring any abstract on which they were an author or co-author, had a financial or personal conflict of interest, or did not have the appropriate expertise to evaluate.

Each abstract was scored numerically against five pre-determined criteria, which were equally weighted to get a final score. The final score ranged from one (the lowest) to six (the highest). Any abstracts that received less than two reviews or where there was a scoring discrepancy between reviewers were additionally reviewed by the track committees.

## Statistics for abstracts

6,679	Regular abstracts submitted
2,663	Regular abstracts accepted
160	Oral abstracts
2,237	Poster exhibition abstracts
236	E-poster abstracts
581	Late-breaking abstracts submitted
109	Late-breaking abstracts accepted
37	Late-breaking oral abstracts
72	Late-breaking poster exhibition abstracts
7,260	Total abstracts submitted
2,772	Total abstract accepted

AIDS 2024, the 25th International AIDS Conference received more than 6,670 abstract submissions, which went through a blind, peer-reviewed process carried out by an international panel of reviewers who play a critical role in designing a strong scientific programme.

More than 830 specialists from around the world volunteered their time and expertise to serve as peer reviewers, helping to ensure that the abstracts presented were selected on the basis of rigorous review and were of the highest scientific quality.

We extend our special thanks to the large pool of abstract reviewers for the time they dedicated to the success of the conference.

# TABLE OF CONTENTS

Oral abstract sessions			OAD37	Exploring the kaleidoscope of experiences among people living with HIV	84
OAA02	It's about timing: When to start, when to stop	15	OAE04	Advanced HIV disease: Hiding in plain sight	86
OAA06	HIV in children: What are the challenges?	17	OAE12	Welcome to the prevention choice agenda!	89
OAA13	The quest for HIV vaccines	19	OAE20	A tale of two diseases: Novel strategies towards elimination of tuberculosis and viral hepatitis	91
OAA28	Cracking the code of the tissue reservoir	22	OAE23	Realizing nothing about us without us: Communities in the lead, ensuring accountability and quality	94
OAA35	Immune dysfunction and residual viremia	25	OAE25	Integrating social enterprise for sustainability of key population programmes	96
OAB01	STick-it	27	OAE30	The new vital sign: Evidence for action to improve mental health access for diverse populations	99
OAB17	TB or not TB?	30	OAE39	New strategies for optimizing person-centred care	101
OAB21	Young people age too!	32	OAF03	The law, human rights and access to medicines	103
OAB26	ART nouveau	35	OAF11	The HIV response in the context of political instability and emergencies	106
OAB34	Co-morbidities: The heart of the matter	38	OAF27	Criminalized populations addressing human rights barriers: Pathways to progress	108
OAB36	Co-morbidities: Beyond the heart	41	OAF31	Transformative leadership and approaches for people living with HIV and criminalized populations	110
OAB38	An INSTIgrated tale	43	OAF41	Removing legal, policy and human rights barriers for children and young people	112
OAC08	HIV and STI prevention: Understanding preferences and perceptions	47	Poster exhibition abstracts		
OAC10	Paving the way to safety: Harm reduction successes in challenging settings	49			
OAC15	Meeting people where they are: Interventions to support testing	52			
OAC18	Communities taking charge: Overcoming prevention challenges through peer-led interventions	55			
OAC22	Progress towards safe motherhood: Preventing vertical transmission	57	TUPEA001-004	HIV virology	116
OAC29	Weather, wealth and war: Political, environmental and social determinants of HIV outcomes	60	TUPEA005-006	HIV pathogenesis	118
OAC33	The long and winding road: Trends in HIV diagnosis, treatment and mortality	62	TUPEA007-013	Host immune responses	119
OAC40	Care for the whole person: Co-infections and co-morbidities	65	TUPEA014-020	Understanding and targeting persistent HIV reservoirs	124
OAD05	Mental health matters	68	TUPEA021-031	Novel treatment and prevention strategies, vaccines and immunotherapies	128
OAD07	Emerging patterns: Exploring trends and shifts in drug use	70	TUPEA032-035	HIV-associated viruses, co-infections and co-morbidities	135
OAD14	Opportunities and vulnerabilities in the digital age	72	TUPEA036-039	SARS-CoV-2 virology, pathogenesis, host immune responses, vaccines and immunotherapies	137
OAD16	Catalysts of change: Key population-led innovations	75	TUPEB040-042	Course of HIV disease	140
OAD19	Navigating adversities: HIV response in conflict zones and migration pathways	77	TUPEB043-052	Diagnostic and monitoring tools	142
OAD24	Climates' double burden: Tackling HIV most-affected regions	79	TUPEB053-070	Co-infections (including opportunistic infections)	144
OAD32	Unveiling layers: Exploring intersectionality and addressing HIV stigma and discrimination	81			

TUPEB071-89	Co-morbidities and clinical complications of HIV and antiretroviral therapy	158	TUPEE493-519	Implementation science and scale up of prevention	407
TUPEB090-093	HIV and ageing	171	TUPEE520-558	Implementation science and scale up of treatment	423
TUPEB094-116	Antiretroviral therapies and clinical issues in adults	173	TUPEE559-569	Global and national financing, economic evaluation and sustainability	446
TUPEB117-134	Antiretroviral therapies and clinical issues in adolescents and young adults	188	TUPEE570-574	Costing, cost effectiveness and affordability	452
TUPEB135-141	Clinical issues specific to key populations	199	TUPEE575-593	Health systems, health systems strengthening and partnerships	455
TUPEB142	Other strategies and therapies	203	TUPEE594-596	HIV and development synergies	466
TUPEB144-147	ART resistance	204	TUPEE597-616	Integration of HIV services with other health and support services	468
TUPEB148-152	COVID-19, conflict and climate	206	TUPEE617-639	Innovations in data collection, monitoring and evaluation	480
TUPEC153-163	Epidemiology of HIV	210	TUPEF640-649	Political and legal factors affecting people living with, vulnerable to and affected by HIV	494
TUPEC165-177	Surveillance: Measuring the HIV pandemic	216	TUPEF650-658	Political drivers and policy contexts of HIV	499
TUPEC178-181	Modelling the HIV pandemic	224	TUPEF659-680	Human rights and responses to HIV	504
TUPEC182-217	HIV prevention research	226	TUPEF681-684	Ethics and HIV	517
TUPEC218-231	Integration of HIV services with other services, including sexual and reproductive health	248	TUPEF685-694	Policy development, implementation and analysis	519
TUPEC232-255	Population-specific interventions for HIV prevention	257	TUPEF695-699	The role of politics, human rights and law in pandemic preparedness	524
TUPEC256-275	HIV testing	271	TUPEF700-702	Politics and geopolitics	527
TUPEC276-292	Cascades of HIV care and treatment	281	WEPEA002-004	HIV virology	529
TUPEC293-295	Monitoring the spread, impact and prevention of new or resurgent pathogens	291	WEPEA005-007	HIV pathogenesis	531
TUPEC296-300	Monitoring and population-level interventions for non-HIV outcomes	293	WEPEA008-017	Host immune responses	533
TUPEC301-303	Methodology to support epidemiological studies	296	WEPEA018-024	Understanding and targeting persistent HIV reservoirs	539
TUPEC703	Population-specific interventions for HIV prevention	270	WEPEA025-032	Novel treatment and prevention strategies, vaccines and immunotherapies	543
TUPED304-311	Social science theories, concepts and methods	299	WEPEA033-037	HIV-associated viruses, co-infections and co-morbidities	548
TUPED312-352	Social and behavioural aspects and approaches to HIV and living with HIV	303	WEPEA038-040	SARS-CoV-2 virology, pathogenesis, host immune responses, vaccines and immunotherapies	552
TUPED353-367	Social, political, legal and behavioural determinants of health in different contexts	326	WEPEB041-045	Course of HIV disease	555
TUPED368-399	Social science, community and HIV prevention	334	WEPEB046-052	Diagnostic and monitoring tools	558
TUPED400-462	Key populations and other vulnerable populations: Behavioural, social and cultural issues and contexts	353	WEPEB053-072	Co-infections (including opportunistic infections)	562
TUPED463-473	Sexuality, gender, relationships and sexual cultures	390	WEPEB073-091	Co-morbidities and clinical complications of HIV and antiretroviral therapy	573
TUPED474-477	Sexualities and sexual cultures: Meanings, identities, norms and communities	396	WEPEB092-097	HIV and ageing	585
TUPEE478-492	Implementation science and scale up of HIV testing	399	WEPEB098-119	Antiretroviral therapies and clinical issues in adults	589
			WEPEB120-129	Antiretroviral therapies and clinical issues in adolescents and young adults	603

WEPEB130-137	Antiretroviral therapies and clinical issues in neonates, infants and children	609	WEPEF639-650	Political and legal factors affecting people living with, vulnerable to and affected by HIV	916
WEPEB138-143	Clinical issues specific to key populations	614	WEPEF651-660	Political drivers and policy contexts of HIV	922
WEPEB144-145	Other strategies and therapies	618	WEPEF661-681	Human rights and responses to HIV	928
WEPEB146-149	ART resistance	619	WEPEF682-684	Ethics and HIV	939
WEPEB150-153	COVID-19, conflict and climate	623	WEPEF686-699	Policy development, implementation and analysis	941
WEPEC154-169	Epidemiology of HIV	627	WEPEF700	The role of politics, human rights and law in pandemic preparedness	949
WEPEC170-194	Surveillance: Measuring the HIV pandemic	636	WEPEF701-702	Politics and geopolitics	949
WEPEC195-231	HIV prevention research	652	THPEA001-004	HIV virology	951
WEPEC232-247	Integration of HIV services with other services, including sexual and reproductive health	675	THPEA005-011	HIV pathogenesis	953
WEPEC248-271	Population-specific interventions for HIV prevention	685	THPEA012-017	Host immune responses	957
WEPEC273-295	HIV testing	699	THPEA018-024	Understanding and targeting persistent HIV reservoirs	961
WEPEC296-315	Cascades of HIV care and treatment	712	THPEA025-030	Novel treatment and prevention strategies, vaccines and immunotherapies	965
WEPEC316-318	Monitoring the spread, impact and prevention of new or resurgent pathogens	724	THPEA031-036	HIV-associated viruses, co-infections and co-morbidities	969
WEPEC319-326	Monitoring and population-level interventions for non-HIV outcomes	726	THPEA037-040	SARS-CoV-2 virology, pathogenesis, host immune responses, vaccines and immunotherapies	973
WEPEC327-329	Methodology to support epidemiological studies	731	THPEB041-043	Course of HIV disease	977
WEPED330-334	Social science theories, concepts and methods	734	THPEB044-052	Diagnostic and monitoring tools	979
WEPED335-376	Social and behavioural aspects and approaches to HIV and living with HIV	737	THPEB053-068	Co-infections (including opportunistic infections)	984
WEPED377-385	Social, political, legal and behavioural determinants of health in different contexts	760	THPEB069-079	Co-morbidities and clinical complications of HIV and antiretroviral therapy	993
WEPED386-421	Social science, community and HIV prevention	766	THPEB080-085	HIV and ageing	1000
WEPED422-476	Key populations and other vulnerable populations: Behavioural, social and cultural issues and contexts	786	THPEB086-108	Antiretroviral therapies and clinical issues in adults	1005
WEPED477-496	Sexuality, gender, relationships and sexual cultures	818	THPEB109-123	Antiretroviral therapies and clinical issues in adolescents and young adults	1019
WEPED497-499	Sexualities and sexual cultures: Meanings, identities, norms and communities	829	THPEB124-130	Clinical issues specific to key populations	1028
WEPEE500-512	Implementation science and scale up of HIV testing	832	THPEB131-132	Other strategies and therapies	1032
WEPEE513-540	Implementation science and scale up of prevention	839	THPEB133-136	ART resistance	1033
WEPEE541-569	Implementation science and scale up of treatment	857	THPEB137-142	COVID-19, conflict and climate	1036
WEPEE570-574	Global and national financing, economic evaluation and sustainability	873	THPEC143-152	Epidemiology of HIV	1040
WEPEE575-580	Costing, cost effectiveness and affordability	876	THPEC154-170	Surveillance: Measuring the HIV pandemic	1045
WEPEE581-598	Health systems, health systems strengthening and partnerships	879	THPEC171-174	Modelling the HIV pandemic	1056
WEPEE599-602	HIV and development synergies	890	THPEC175-208	HIV prevention research	1059
WEPEE603-618	Integration of HIV services with other health and support services	892	THPEC209-222	Integration of HIV services with other services, including sexual and reproductive health	1079
WEPEE619-638	Innovations in data collection, monitoring and evaluation	903	THPEC223-246	Population-specific interventions for HIV prevention	1087
			THPEC247-268	HIV testing	1101
			THPEC269-290	Cascades of HIV care and treatment	1114
			THPEC291-293	Monitoring the spread, impact and prevention of new or resurgent pathogens	1127
			THPEC294-299	Monitoring and population-level interventions for non-HIV outcomes	1129

## E-poster abstracts

THPEC301-303	Methodology to support epidemiological studies	1133	EPA001-002	HIV pathogenesis	1363
THPED304-309	Social science theories, concepts and methods	1136	EPA003-007	Host immune responses	1364
THPED310-355	Social and behavioural aspects and approaches to HIV and living with HIV	1139	EPA008-009	Novel treatment and prevention strategies, vaccines and immunotherapies	1366
THPED356-372	Social, political, legal and behavioural determinants of health in different contexts	1165	EPA010	HIV-associated viruses, co-infections and co-morbidities	1368

##### Consecutive analytical treatment interruption enhances CD8 T-cell functionality during virological control

G. Duettes<sup>1,2</sup>, S. Cronin<sup>1,2</sup>, K. Fisher<sup>1</sup>, S.G. Deeks<sup>3</sup>, A.D. Kelleher<sup>4</sup>, S. Palmer<sup>1,2</sup>

<sup>1</sup>The Westmead Institute for Medical Research, Centre for Virus Research, Westmead, Australia, <sup>2</sup>The University of Sydney, Faculty of Medicine and Health, Sydney, Australia, <sup>3</sup>University of California, San Francisco, Department of Medicine, San Francisco, United States, <sup>4</sup>The Kirby Institute, University of New South Wales, Sydney, Australia

**Background:** The PULSE clinical trial is one of the first studies where 68 people living with HIV underwent three consecutive analytical treatment interruptions (ATIs). During this trial we observed that 10% of the participants transiently controlled HIV rebound after the 2<sup>nd</sup> and/or 3<sup>rd</sup> ATI. In this study, we investigated whether consecutive ATIs result in an improved antiviral CD8 T-cell immune response during delayed viral rebound.

**Methods:** We obtained peripheral blood mononuclear cells from four participants enrolled in the PULSE clinical trial: two non-controllers (NCs) who experienced rapid viral rebound during all ATIs and two transient controllers (TCs) who exhibited virological control for up to six months during the 2<sup>nd</sup> and/or 3<sup>rd</sup> ATI. To evaluate CD8 T-cell functionality during the consecutive ATIs, CD8 T-cells were stimulated with Gag/Pol/Nef peptides to assess cytokine production (IFN- $\gamma$  and TNF- $\alpha$ ) and stained with CellTrace Far Red to quantify proliferation by flow cytometry. To compare the CD8 T-cell cytolytic capacity across the ATIs, participant-derived CD4 T-cells were infected with HIV-NL4-3 and cocultured with autologous CD8 T-cells from each ATI timepoint. At day three of coculture, the levels of p24 were measured by ELISA.

**Results:** For TC participants, we observed an increase in both CD8 T-cell proliferation and cytokine production (3-34 fold) during the transient viral control timepoints. In contrast, the capacity for CD8 T-cells to proliferate and produce cytokines did not increase across the ATI timepoints for the NCs. Moreover, TC-derived CD8 T-cells from the 3<sup>rd</sup> ATI, where viral rebound is delayed, eliminated HIV-infected CD4 T-cells more efficiently, as reflected by a 2-5 fold decrease in p24, when compared to CD8 T-cells from earlier ATI timepoints. In contrast, within NCs, we did not observe a consistent enhancement of CD8 T-cell cytolytic response across the ATI timepoints.

**Conclusions:** Our findings indicate that in some participants from the PULSE study, repeated exposure to viral antigens during consecutive ATIs results in a potential

"vaccinal effect" improving CD8 T-cell proliferation, cytokine production and cytotoxicity. Importantly, these results provide insight into the immunological mechanisms contributing to viral control indicating that enhanced host immunity is pivotal for achieving viral remission after an ATI.

#### OAA0203

##### HIV reservoir characteristics in spontaneous viral controllers and individuals treated during both acute and chronic HIV-1 infection in South Africa

T.J.B. Chikwore<sup>1,2</sup>, N. Reddy<sup>1,3</sup>, G.Q. Lee<sup>4</sup>, K. Dong<sup>5,6</sup>, K. Reddy<sup>1</sup>, T. Ndung'u<sup>1,2,3,5,6</sup>

<sup>1</sup>Africa Health Research Institute, Durban, South Africa, <sup>2</sup>University College London, London, United Kingdom, <sup>3</sup>University of KwaZulu Natal, Durban, South Africa, <sup>4</sup>Weill Cornell Medicine, New York, United States, <sup>5</sup>University of KwaZulu Natal, HIV Pathogenesis Programme, Doris Duke Medical Research Institute, Durban, South Africa, <sup>6</sup>MIT and Harvard University, Ragon Institute of MGH, Cambridge, United States

**Background:** The HIV reservoir is the main barrier to cure efforts. Individuals who control the virus without antiretroviral therapy (ART) represent a model of functional cure, but few studies have characterized reservoir dynamics and mechanisms of persistence in these individuals. In this study, we measured and characterized the reservoir size and genetic landscape before and after ART in spontaneous controllers versus viremic individuals who initiated ART in acute or chronic phases of infection.

**Methods:** Participants were from a natural controller and the FRESH acute infection cohorts in Durban, South Africa. At enrolment, all participants were ART-naïve and included 16 elite controllers (EC, viral load [VL] <100 copies/ml); 9 viremic controllers (VC, VL <2000 copies/ml); 12 with viremic chronic HIV infection (CHI, VL >2000 copies/ml) and 35 with acute HIV infection (AHI, median of 1 (1-3) day post detection). A subset from each group initiated ART during follow up and were assessed prior to treatment; one, three- and five-years after treatment. HIV DNA was measured in PBMCs by droplet digital PCR (ddPCR). Pro-viral genome characteristics were analysed by near full-length individual proviral sequencing (FLIP-Seq).

**Results:** In untreated infection, there was no significant difference in total HIV-1 DNA between the study groups. Notably, elite controllers showed a lower proportion (9.68%) of intact genomes in comparison to both individuals with untreated AHI (62.04%) and CHI (31.18%). ECs and individuals treated in AHI showed a significant reduction in proviral load ( $p=0.035$  and  $<0.0001$  respectively) in contrast to VCs and CHI-treated participants who showed no significant change after 5 years of ART. Additionally, after one year of treatment, no intact genomes were

detectable in AHI-treated individuals whereas in ECs and CHI-treated individuals, 14.06 and 3.85% of genomes were intact.

**Conclusions:** In untreated HIV-1 subtype C infection, proviral load is similar between spontaneous controllers and individuals with AHI or CHI. ECs and individuals initiating treatment in AHI showed a significant reduction in reservoir size after treatment.

Our results suggest that reservoir quality and not size may, in part, explain ART-free viral control and that the timing of ART initiation might play a key role in a potential post-treatment functional cure.

## OAA0204

### Characterization of the HIV-1 reservoir in early treated individuals from the Zurich Primary HIV Infection Study with low-level viremia

J. Tschumi<sup>1,2</sup>, L. Jörimann<sup>1,2</sup>, K. Neumann<sup>1,2</sup>, M. Zeeb<sup>1,2</sup>, P. Frischknecht<sup>1</sup>, D. Braun<sup>1,2</sup>, R.D. Kouyos<sup>1,2</sup>, K.J. Metzner<sup>1,2</sup>, H.F. Günthard<sup>1,2</sup>, Swiss HIV Cohort Study

<sup>1</sup>University Hospital Zurich, Department of Infectious Diseases and Hospital Epidemiology, Zurich, Switzerland, <sup>2</sup>University of Zurich, Institute of Medical Virology, Zurich, Switzerland

**Background:** In most people living with HIV (PWH), antiretroviral therapy (ART) reduces viral loads to undetectable levels. However, in some individuals, viremia remains detectable despite very early initiation of ART during primary HIV infection, adherence to drug regimens and absence of drug resistance mutations. The causes of such residual viremia remain unclear. We conducted a longitudinal analysis of the HIV-1 reservoir in early treated individuals with low-level viremia to investigate potential HIV-1 evolution.

**Methods:** Near full-length HIV-1 proviral NGS in bulk was applied to three longitudinal PBMC samples from well characterized participants enrolled in the Zurich Primary HIV Infection study with low-level viremia between 50 – 500 copies/ml plasma (n=7) for at least four years and matched controls with viral loads <50 copies/ml plasma (n=14). All individuals initiated ART during primary HIV-1 infection and reported highest levels of adherence. We included a baseline sample prior to, and a sample two years and four years after ART initiation. After removing hypermutated reads, genetic distances and diversities were calculated and drug resistance mutations were assessed. Total, intact and unintegrated HIV-1 DNA and HIV-1 transcript were quantified using digital PCR.

**Results:** We observed similar frequencies of intact HIV-1 proviruses in individuals with and without low-level viremia. While the numbers of unspliced HIV-1 RNA in PBMCs of individuals with low-level viremia was higher than of those without, numbers of HIV-1 multiply spliced RNA and 2-LTR circles showed no significant differences between individuals with and without low-level viremia.

After removing hypermutated reads, no increase in genetic distance or diversity of proviral sequences over time was detected in individuals with low-level viremia. While minor variants of proviral drug resistance mutations with frequencies <15% appeared and vanished over time, major drug resistance mutations with frequencies >15% were not detected in proviral DNA in any individual with low-level viremia.

**Conclusions:** Our results show no evidence of evolution of the HIV-1 reservoir or drug resistance development, despite years of low-level viremia. Thus, treatment intensification of individuals with low-level viremia may not be needed in PWH who initiated ART with a high resistance barrier during primary HIV-1 infection, given optimal adherence and frequent monitoring.

## OAA0205

### Experimental macaque model of post-treatment SIV control presents distinct features of viral reservoirs in blood and tissues, the pVISCNTI study

C. Charre<sup>1,2</sup>, A. Melard<sup>1</sup>, A. Chaillon<sup>3</sup>, E. Gardienet<sup>1</sup>, D. Desjardins<sup>4</sup>, C. Passaes<sup>5</sup>, V. Monceaux<sup>5</sup>, M. Muller-Trutwin<sup>5</sup>, C. Rouzioux<sup>6</sup>, R. Le Grand<sup>4</sup>, A. Saez-Cirion<sup>5</sup>, V. Avettand-Fenoël<sup>1,2</sup>

<sup>1</sup>Université Paris Cité; INSERM, U1016; CNRS, UMR8104, Paris, France, <sup>2</sup>APHP Hôpital Cochin, Virology Department, Paris, France, <sup>3</sup>University of California, Department of Medicine/Division of Infectious Diseases, San Diego, United States, <sup>4</sup>Université Paris-Saclay, CEA, INSERM, UMR1184, Immunology of Viral, Auto-Immune, Hematological and Bacterial Diseases (IMVA-HB/IDMIT Department), Fontenay-aux-Roses/Le Kremlin-Bicêtre, France, <sup>5</sup>Institut Pasteur, HIV Inflammation et Persistance Unit, Paris, France, <sup>6</sup>Université Paris Cité/APHP Hôpital Necker - Enfants Malades, Paris, France

**Background:** The pVISCNTI study confirmed in a non-human primate model of Simian Immunodeficiency Virus (SIV) infection that post-treatment control is favored by antiretroviral treatment (ART) initiation at day (D)28 (ET) vs 6 months post-infection (LT) (Passaes *et al.* Nat Com 2024).

However, intrinsic viral features of reservoirs in such control remain elusive. We performed a large analysis of tissue and blood reservoirs in the cynomolgus macaques (CyMs) of this study.

**Methods:** SIVmac251-infected CyMs were classified as post-treatment controllers (PTCs, n=11) or non-PTCs (n=11) depending on their capacity to control viremia <400 copies/ml for >6 months after analytical treatment interruption (ATI) after 24 months of ART. Necropsy was performed 6-12 months after ATI. From antemortem serial blood and lymph nodes (LN) specimens and postmortem tissues from 12 anatomical sites, we quantified total SIV-DNA, cell-associated SIV-RNA (caRNA) and evaluated reservoir

Late-breaker  
abstractsAuthor  
Index

integrity by Intact Provirus DNA Assay. Near-full-length SIV genome nanopore sequencing was performed in 5 PTCs (3ET, 2LT) and 5 non-PTCs (2ET, 3LT).

**Results:** SIV-DNA was lower in PTCs vs non-PTCs from D14 post-ATI in circulating CD4+T cells ( $p=0.009$ ). caRNA in PB-MCs was lower in PTCs than non-PTCs from D28 post-ATI ( $p=0.004$ ). No difference was noticed before ATI. At necropsy, SIV-DNA and caRNA were lower in PTCs than non-PTCs in thymus, LN, spleen, ileum, colon, rectum and PB-MCs ( $p<0.05$ ).

Intact proviruses were less abundant in PTCs vs non-PTCs in LN before ATI ( $p<0.001$ ) and in LN, spleen and colon at necropsy ( $p<0.015$ ); investigation in other tissues is ongoing.

Regardless time of treatment initiation, post-mortem tissue proviruses showed:

- Individual-related evolution in non-PTCs in contrast to sequences intermingled between PTCs;
- Lower pairwise genetic distance to the inoculum in PTCs vs non-PTCs ( $p=0.008$ ).

In non-PTCs, but not in PTCs, tissue proviruses at necropsy were genetically closer to circulating viruses at the time of ART initiation than to those at primary infection ( $p=0.014$ ).

**Conclusions:** PTC status was associated with lower levels of intact proviruses in LN before ATI and with limited reservoir size, transcriptional activity and viral evolution. This study might help to better understand which factors in addition to early treatment initiation are important for post-treatment control.

**Methods:** In this study, we comprehensively profiled humoral immune responses in breastmilk of cohorts from the Zambia Exclusive Breastfeeding Study. All 34 mother/child dyads included in our analysis (17 without and 17 with HIV breastfeeding-associated transmission) were ART naïve. We applied our System's Serology platform, an approach that interrogates subclass/isotype/Fc-receptor binding across different antigen-specificities and functional assays to measure antibody effector functions in parallel; all linked to systems biology/machine learning algorithms.

**Results:** We demonstrated that antibody responses in the breastmilk of transmitting mothers are higher after HIV transmission compared to non-transmitting women, despite similar viral loads in plasma and breastmilk as well as CD4 T-cell counts between the two groups. Particularly, higher IgG levels and FcγR2A binding against gp41 and gp140 were detected in the transmitting group ( $p < 0.05$ ), in addition to higher FcγR2B and ADCD against gp41 ( $p < 0.05$ ). We also observed an increase in humoral response over time in transmitting mothers, while antibody response progressively decreased in non-transmitting mothers.

**Conclusions:** This study suggests that a strong immune activation in the milk of HIV-infected mothers is seen with breastfeeding associated HIV transmission and highlights particular antibody Fc-effector profiles that might be involved in this transmission. These data contribute to a more comprehensive understanding of Fc-mediated antibody response in the breastmilk, which is crucial for advancing therapeutic strategies aimed at eliminating this route of mother-to-child transmission.

## OAA06 HIV in children: What are the challenges?

### OAA0602

#### Antibody signatures associated with HIV transmission during breastfeeding

N. Nziza<sup>1</sup>, W. Jung<sup>1</sup>, F. Li<sup>2</sup>, J. Hsiao<sup>1,3</sup>, T. Chen<sup>1</sup>, C. Atyeo<sup>1</sup>, R. McNamara<sup>1</sup>, G. Alter<sup>1</sup>, L. Kuhn<sup>4</sup>, N. Tobin<sup>2</sup>, G. Aldrovandi<sup>2</sup>, B. Juelg<sup>1</sup>

**Background:** In the absence of antiretroviral therapy, up to 15% of mothers living with HIV transmit the virus to their children during pregnancy, delivery and breastfeeding. Antibodies have largely been studied for their impact on HIV transmission to children *in utero*, but their presence in the milk and the mechanisms by which they might affect HIV transmission to the newborn during breastfeeding is less well understood.

### OAA0603

#### Increased cardiovascular risk in perinatally HIV-acquired adolescents (PHIV) may linked to proinflammatory NK cells

N. Liyanage<sup>1</sup>, M.A. Alles<sup>2</sup>, M. Gunasena<sup>2</sup>, V. Musiime<sup>3</sup>, C. Kityo<sup>4</sup>, B. Tamilselvan<sup>4</sup>, B. Richardson<sup>4</sup>, W. Ching-Wen L<sup>4</sup>, S. Sun<sup>5</sup>, C. Cameron<sup>4</sup>, M. Cameron<sup>4</sup>, S. Dirajlal-Fargo<sup>5</sup>, N. Funderburg<sup>1</sup>

<sup>1</sup>The Ohio State University, College of Medicine, Columbus, United States, <sup>2</sup>The Ohio State University, Columbus, United States, <sup>3</sup>Joint Clinical Research Center, Kampala, Uganda, <sup>4</sup>Case Western Reserve University School of Medicine, Cleveland, United States, <sup>5</sup>Northwestern University Feinberg School of Medicine, Chicago, United States

**Background:** Our initial findings and literature suggest a potential reprogramming of innate immune cells in adolescents acquiring HIV perinatally and undergoing antiretroviral therapy. This reprogramming may accelerate aging, increasing the risk of future complications, particularly cardiovascular disease (CVD). Natural killer (NK) cells, with diverse functions, play a crucial role in HIV

Index

pathogenesis and are implicated in comorbidities like CVD through immune crosstalk. Despite this understanding, the specific involvement of NK cells in HIV-related cardiovascular risks remains unclear. Here, we studied NK cell subsets and their potential role in cardiovascular risk in adolescents with and without HIV.

**Methods:** In this cross-sectional study, using high-dimensional flow cytometry, plasma biomarker profiling, and transcriptomics, we compared cardiovascular risk factors and immune signatures in cryopreserved peripheral blood mononuclear cells, as well as cardiovascular biomarkers (carotid intima-media thickness and pulse wave velocity-PWV) in Ugandan adolescents with perinatally acquired HIV on antiretroviral therapy and virally suppressed (n=18) and age/sex-matched HIV-unexposed and uninfected adolescents, (n=20). At baseline, the median age was 14 years, and 50% were females.

**Results:** In the PHIV, we found elevated activation, maturation, memory, and pro-inflammatory/migration markers in most NK subsets compared to HIV- (p<0.05). Oxidized LDL levels were significantly lower in the plasma of PHIVs (p<0.05). Further, negative correlations were found between all activated CCR5+NK subsets and plasma ox-LDL among PHIVs. This was confirmed by in vitro studies which revealed increased uptake of oxLDL by macrophages in the presence of activated NK cells (p<0.05). Bulk-RNA sequencing data revealed differential expression of genes associated with immune cell migration, cholesterol uptake into tissue, and vascular remodeling, and enrichment of pathways associated with NK activation and epigenetic regulation in the PHIV group (p<0.05). Interestingly, the dysregulated NK subsets showed significant correlations with carotid intima-media thickness and pulse wave velocity (PWV).

**Conclusions:** Our data, for the first time, reveal an increase in several activated, mature NK subsets capable of homing to vascular tissue. This correlates with increased plasma oxLDL uptake by macrophages. Dysregulated NK subsets exhibit significant correlations with carotid intima-media thickness and PWV, suggesting a potential link between NK cells and cardiovascular risk in adolescents with PHIV.

## OAA0604

### Comparative analysis of the HIV reservoir localisation and cellular function in paediatric and adult tonsillar tissues

F. Shaik Abdool<sup>1,2</sup>, K. Gopee<sup>1</sup>, S. Mfusi<sup>1</sup>, N. Mthabela<sup>3</sup>, F. Karim<sup>3</sup>, A.L. Sibiyi<sup>4</sup>, W. Kuhn<sup>5</sup>, J.Z. Porterfield<sup>1,6</sup>, A. Leslie<sup>1,7</sup>, H.N. Kløverpris<sup>1,8</sup>

<sup>1</sup>Africa Health Research Institute, Basic and Translation Science (Immunology), Durban, South Africa, <sup>2</sup>University of KwaZulu-Natal, School of Clinical & Laboratory Medicine, Durban, South Africa, <sup>3</sup>Africa Health Research Institute, Clinical Core, Durban, South Africa, <sup>4</sup>King Edward VIII hospital, University of KwaZulu-Natal, Department of Otorhinolaryngology, Durban, South Africa, <sup>5</sup>General Justice Gizenga Mpanza Regional Hospital, University of KwaZulu-Natal, Department of Ear, Nose and Throat, Durban, South Africa, <sup>6</sup>University of South Florida, Division of Infectious Disease and International Medicine, Tampa, United States, <sup>7</sup>University College London, Division of Infection and Immunity, London, United Kingdom, <sup>8</sup>University of Copenhagen, Department of Immunology and Microbiology, Copenhagen, Denmark

**Background:** Anti-retroviral treatment in paediatric HIV infection is challenging with low ART adherence throughout childhood and adolescence, particularly in under resourced populations. Therefore, non-ART strategies are important to achieve HIV remission during paediatric HIV. Viral reservoir seeding occurs rapidly within lymphoid tissues after transmission and remains the major source of viral rebound following ART cessation. However, the size, localisation and mechanisms of viral silencing and reactivation within viral reservoirs in lymphoid tissues from children born with HIV remain unknown.

**Methods:** We hypothesise that differences in CD4+ T-follicular helper cell (TFH) frequencies within germinal centres (GCs) in children and adults contribute to variations in the viral reservoir landscape. To study the paediatric HIV lymphoid tissue reservoir, we used flow cytometry, single-cell RNA sequencing (scRNAseq), and fluorescent microscopy to study the viral reservoirs from resected tonsils from children (<12 years) born with HIV from our larger cohort of adult and paediatric participants within South Africa.

**Results:** We found higher frequencies of TFH (PD-1<sup>++</sup>/CXCR5<sup>+</sup>) in paediatric participants compared to adults (P=0.004) suggesting elevated levels of HIV susceptible cells in paediatric lymphoid tissues. Immunofluorescent microscopy showed that HIV-p24 antigen were localised within both GC and extrafollicular localisation in viremic paediatric samples, whereas plasma viral suppressed individuals overall showed lower frequencies of GC HIV localisation. scRNAseq (10X Genomics) and HIV sequencing from tonsils of people living with HIV is underway to determine the transcriptional profiles, viral diversity and frequency of intact virus between paediatric and adult participants.

**Conclusions:** This study presents a unique opportunity to investigate the viral reservoir location in paediatric lymphoid tissues that is important to tailor HIV cure strategies for children born with HIV.

## OAA0605

### Altered immune response to tetanus pediatric vaccines among HIV exposed uninfected infants

S. Osawe<sup>1</sup>, C. Co Chukwu<sup>2</sup>, J.A. Okopi<sup>3</sup>, A. Abimiku<sup>1</sup>

<sup>1</sup>Institute of Human Virology Nigeria, International Research Center of Excellence, Abuja, Nigeria, <sup>2</sup>National Veterinary Research Institute, Medical Laboratory Science, Vom, Nigeria, <sup>3</sup>Federal University of Health Sciences, Department of Microbiology, Otuipo, Nigeria

**Background:** Evidence suggests that the developing immune system of HIV-exposed but uninfected (HEU) infants early in life, differs from their HIV-unexposed (HU) peers. More so, reports show that HEU infants do not respond optimally to pediatric vaccinations, thereby increasing their vulnerability to infectious diseases and raising the potential for elevated rates of morbidity and mortality. This study documented the impact of HIV exposure on how infants respond to a pediatric vaccination.

**Methods:** We documented the immune responses in HEU and HU infants and their moms by quantifying the total IgG antibodies against Tetanus toxoid (TT), one of the prescribed pediatric vaccines, in a Nigerian birth cohort. Plasma samples collected from each mother-infant pair at Birth (mother and infant) and Week 15 (infants only), were tested to quantify specific anti-TT IgG titers.

**Results:** A total of 200 pregnant women were enrolled with their infants, 140 living with HIV and 60 living without HIV. Mean maternal age was similar for both groups ( $p=0.24$ ) as were the number of pregnancies, number of live births, and mode of delivery ( $p=0.19$ ,  $p=0.38$  and  $p=0.77$ ). A total of 205 infants were enrolled at birth with 144 HEU infants and 61 HU infants with significant differences in weight ( $p=0.00$ ), height( $p=0.03$ ), and head circumference ( $p=0.016$ ). There was also a 12% decrease in the median transfer of anti-TT IgG antibodies in mothers living with HIV ( $p=0.02$ ). HU infants maintained significantly higher anti-TT IgG titers at Week 15 compared to HEU infants at birth ( $p=0.018$ ) and Week 15 ( $p=0.001$ ).

**Conclusions:** Our data shows that HEU infants present with altered immune responses compared to HU infants. Exposure to HIV in these infants may alter the responses to infectious diseases and how well they respond to childhood immunization highlighting the need for focused strategies to improve responses to vaccine-preventable diseases and the possibility of including additional booster shots.

## OAA13 The quest for HIV vaccines

### OAA1303

#### The HIV-1 Tat-based therapeutic vaccine to intensify or replace antiretroviral therapy: results of extended (8-years) follow-up of Phase-II clinical trials in Italy and South Africa

C. Sgadari<sup>1</sup>, A. Tripiciano<sup>1</sup>, O. Picconi<sup>1</sup>, A. Cafaro<sup>1</sup>, S. Moretti<sup>1</sup>, V. Francavilla<sup>1</sup>, M.R. Pavone Cossut<sup>1</sup>, M. Campagna<sup>1</sup>, I. Schietroma<sup>1</sup>, F. Mancini<sup>1</sup>, R. Belli<sup>1</sup>, M.T. Maggiorella<sup>1</sup>, P. Monini<sup>1</sup>, B. Ensoli<sup>1</sup>

<sup>1</sup>Istituto Superiore di Sanità (ISS), National HIV/AIDS Research Center (CNAIDS), RM, Italy

**Background:** Although antiretroviral therapy (cART) effectively suppresses HIV replication, it is unable to eradicate the virus, which persists in cART-resistant reservoirs. New therapeutic interventions are, therefore, needed to improve cART effectiveness, and, possibly, to eradicate HIV. Preclinical and observational studies indicated that naturally-occurring anti-Tat antibodies block HIV replication, and are associated with slower progression to AIDS and better response to therapy (Bellino, Retrovirology 2014; Tripiciano, Ebiomed 2021; Ensoli, Expert Rev Vaccines 2022).

**Methods:** One phase-I (ISS T-001) and 2 phase-II (ISS T-002 and ISS T-003) Tat-based therapeutic vaccine trials, were conducted in naïve and cART-treated persons living with HIV (PLWH) in Italy and South Africa (SA) (395 volunteers). Each trial was followed by an extended observational study (up to 8 years) to evaluate persistence of anti-Tat immune responses and to monitor immunological and virological parameters.

**Results:** The Tat vaccine is safe in PLWH and promotes a long-lasting anti-Tat immunity, associated with significant improvements of immune system functions, even after long-term cART (median of 6 years). These include increases of CD4<sup>+</sup> T cells and CD4<sup>+</sup>/CD8<sup>+</sup> T cell ratios, re-equilibration of CD4<sup>+</sup> and CD8<sup>+</sup> T cell memory subsets with reduction of effector cells, improvement of T cell responses, and B cell and NK cell gains (Longo, Vaccine 2009; Ensoli B, PLoS ONE 2010; Ensoli F, Retrovirology 2015; Ensoli B, Retrovirology 2016).

This suggests a return to immune homeostasis that cART alone fails to restore. Strikingly, this was accompanied by a sustained proviral DNA decay, with a drastic reduction of the virus reservoirs (up to 90%) in blood after 8 years from vaccination with an average speed 4-7 times greater than observed in PLWH treated with cART alone (Sgadari, Front Immunol 2019; Ensoli et al, in preparation). We are now investigating correlates of protection (functional anti-Tat antibodies) and the long-term effects of vaccination.

**Conclusions:** Results indicate that Tat is a key virulence factor, which plays a pivotal role in virus spreading and persistence, and that the induction of anti-Tat immune responses represents a pathogenetic intervention to in-

**Background:** Deletion of Env-V1 region of the DNA/ALVAC/gp120/alum vaccine regimen improves efficacy compared to envelope-replete immunogens and efficacy is linked to antibody responses to the envelope V2 region.

We hypothesized that mucosal vaccination with V2-peptide CKFNMTGLKRDKTKEYNETWYSTDLVCEQGNSTDNESR-CYMNHC scaffolded as pentamers with Typhoid Toxin B subunit(V2-TTB) might further improve efficacy, and used poly(DL-lactic-co-glycolic-acid) (PLGA) nanoparticles (NPs) (<100nm) was administered orally to deliver V2-TTB-NPs to the colon.

**Methods:** Rhesus macaques(n=44) were immunized intramuscularly with the systemic ΔV1/DNA/ALVAC/gp120/alum vaccine regimen at weeks 0, 4, 8 and 12. At weeks 0, 4, and 16, one group (n=12), also received oral immunizations with V2-TTB-NPs, while other groups(n=9) received TTB-NPs or empty-NPs(n=9). All animals were given 11 weekly intrarectal challenges with SIV<sub>mac251</sub>. Virological and immunological responses were analyzed to understand their role in vaccine efficacy.

**Results:** Addition of V2-TTB-NP to the vaccine did not significantly reduce acquisition risk compared to the systemic vaccine, although the peak viral load (VL) and area-under-curve VL(AUC) were both significantly reduced in animals that acquire SIV.

Surprisingly, no vaccine efficacy was observed in animals vaccinated with the systemic vaccine plus either TTB-NPs or empty NPs. V2-TTB-NP group exhibited higher

ADCC titers, deltaV1-specific IgA rectal plasmablasts and plasmacytes, and IgG in rectal secretions after the last boost.

Conversely, TTB-NP or empty-NP-treated animals showed increased plasmacytoid dendritic cells (pDC) ( $p=0.056$  and  $p<0.0001$ , respectively) and IFN- $\gamma$ <sup>+</sup>NKp44<sup>+</sup>NKG2A<sup>+</sup> cells ( $p<0.0001$  and  $p<0.0001$ , respectively) compared to that of V2-TTB-NP group. These cells were associated with increased acquisition in TTB NP group.

On the other hand, V2-specific ADCC ( $p=0.01$  and  $p=0.01$ , respectively), mucosal CD14<sup>+</sup> cells ( $p=0.02$  and  $p<0.0001$ , respectively) and NKp44<sup>+</sup> cells ( $p=0.004$  and  $p<0.0001$ , respectively) were decreased in the TTB-NP or empty-NP groups versus V2-TTB-NP group and correlating with protection from acquisition in V2-TTB-NP group.

**Conclusions:** Collectively the data indicate that despite some stronger mucosal V2- or deltaV1-specific immune responses in V2-TTB-NP group, empty-NPs and TTB-NPs shifted innate mucosal immunity toward a 'non-protective' immune environment for ALVAC-based HIV vaccine. Furthermore, presence of V2 increases the "protective" responses compared to Nanoparticle alone groups.

These data underscore the importance of both quality of innate responses and antibodies to V2 in protection against SIV/HIV acquisition.

**Background:** An effective HIV vaccine will need to exhibit potent immunogenicity and broad cross-subtype coverage. HVTN 124 evaluated the safety and immunogenicity of a unique polyvalent DNA-protein HIV vaccine regimen with matching envelope (Env) immunogens.

**Methods:** HVTN 124 (NCT03409276) was a randomized, phase 1, placebo-controlled, double-blind study, including participants without HIV aged 18-50 years with low likelihood for HIV acquisition. The DNA vaccine comprised five plasmids: four copies expressing Env gp120 (clades A/B/C/AE) and one *gag* p55 (clade C). The protein vaccine included four DNA vaccine-matched gp120 proteins adjuvanted with GLA-SE. Participants were randomized to placebo or

one of two vaccine groups (prime-boost or co-administration). Vaccines were delivered via intramuscular injection. Part A (N=12) evaluated the safety of the protein/adjuvant vaccine. Part B (N=48) evaluated the safety and immunogenicity of two regimens: DNA prime (Months 0/1/3) with protein boost (Months 6/8), and DNA/protein co-administration (Months 0/1/3/6/8). Part B per-protocol participants were included in the immunogenicity analysis using samples collected two weeks after the last injection. All participants (intent-to-treat) were included in the safety analysis.

**Results:** Sixty participants (26 male, 34 female) were enrolled. Both vaccines were safe. Both regimens in Part B elicited IgG response rates >90% of high titer against a panel of heterologous gp120/gp140 antigens from diverse viral subtypes (Figure 1). High-titer IgG responses were observed in 67-100% of participants against gp70-V1V2 antigens from subtypes A, B, C, and AE. Neutralizing antibody activity was detected against Tier 1A and Tier 1B viruses (clades B, C, AE and AG). Antibody-dependent cellular cytotoxicity was detected in all of participants against AE CM235 and in ≥80% of prime-boost recipients against other subtypes. Response rates and magnitudes for antibody-mediated responses in the prime-boost arm were similar to or exceeded those in the co-administration arm. The prime-boost regimen elicited Env-specific CD4+ T-cell responses in 15/15 participants vs 5/13 for co-administration ( $p=0.0002$ ). IgG/IgG3 responses against gp70 V1V2, an established correlate of protection, were higher in the HVTN124 prime-boost regimen than comparable regimens in the RV144, HVTN702, and HVTN705 trials.

**Conclusions:** This vaccine regimen was safe and highly immunogenic against multiple HIV clades, warranting evaluation in larger trials.

<sup>1</sup>Peter Doherty Institute, University of Melbourne, Infectious Diseases, Melbourne, Australia, <sup>2</sup>Mount Sinai Hospital, New York, United States, <sup>3</sup>St. Vincent's Institute, Melbourne, Australia, <sup>4</sup>Peter Doherty Institute, University of Melbourne, Computational Science Initiative, Melbourne, Australia, <sup>5</sup>Peter Doherty Institute, University of Melbourne, Infectious Diseases, Melbourne, Australia, <sup>6</sup>John Hopkins University, Baltimore, United States, <sup>7</sup>University of Adelaide, South Australia, Australia, <sup>8</sup>AMC, George Washington University, Washington, United States, <sup>9</sup>Kirby Institute, Sydney, Australia, <sup>10</sup>Aarhus University Hospital, Aarhus, Denmark

**Background:** In people living with HIV (PWH), immune dysfunction persists with elevated expression of the exhaustion marker programmed death (PD1) despite suppressive antiretroviral therapy (ART). Anti-PD1 therapy in people with cancer can enhance tumor-specific T-cell responses through the proliferative burst of exhausted effector T-cells ( $T_{EX}$ ). We aimed to determine the effects of anti-PD1 in vivo on the T-cell receptor (TCR) repertoire of HIV-specific CD8 T-cells.

**Methods:** As part of a prospective longitudinal clinical trial of PWH on ART with cancer (AIDS Malignancy Consortium-095 Study), participants received anti-PD1 (nivolumab) every 3 weeks. Blood was collected prior to and following the first, fourth and subsequent infusions. We sorted HIV-tetramer+ CD8 T-cells from six participants and performed single cell RNA sequencing and TCR repertoire computational analysis. We used a data-based frequency cut-off and considered a clonotype as expanded when a particular TCR sequence constituted > 2% of the overall TCR sequences.

**Results:** Out of 1828 TCR clonotypes, 55 expanded, totalling 913 cells, with 78.2% identified as  $T_{EM}$  or  $T_{EX}$  cells. All cells with expanded clonotypes showed differentially expressed genes upregulated for effector functions and

antigen recognition. Baseline TCR diversity positively correlated with expanded clonotypes after a single anti-PD1 dose ( $r=0.57$ ). In 3 participants, high diversity in HIV tetramer+ CD8 T-cells led to rapid expansion and subsequent contraction with additional doses. In the other 3 participants, lower diversity also resulted in clonotype expansion, but only after multiple anti-PD1 doses. Pair-wise TCR distance analysis demonstrated that expanded clones were biochemically diverse and therefore likely recognise a diverse range of HIV epitopes.

**Conclusions:** PWH on ART and cancer with a diverse HIV-specific TCR repertoire at baseline exhibit rapid clonotype expansion after a single anti-PD1 dose, while a less diverse TCR repertoire requires multiple doses of anti-PD1 for expansion. Whether these expanded clonotypes can control HIV replication once ART is stopped remains to be determined in future clinical trials of anti-PD1 in PWH on ART.

Smith<sup>3</sup>, S. Gianella<sup>3</sup>, N.R. Roan<sup>1,2</sup>

<sup>1</sup>J. David Gladstone Institutes, Gladstone Institute of Virology, San Francisco, United States, <sup>2</sup>UCSF, Urology, San Francisco, United States, <sup>3</sup>University of California, San Diego, Division of Infectious Diseases and Global Public Health, La Jolla, United States

**Background:** Memory CD4+ T cells are important long-lived reservoirs for HIV. Yet, the phenotypic and functional features of these cells within tissue compartments of people with HIV (PWH) remain poorly characterized. Furthermore, the association of these features with HIV persistence remains unexplored.

**Methods:** We developed and applied a 40-parameter CyTOF panel to deeply phenotype and quantitate subsets of memory CD4+ T cells from 26 different tissue specimens (including ileum, colon, rectum, para-tracheal and aortic lymph nodes, spleen, liver, kidney, prostate, testes, and bone marrow) from 6 ART-suppressed PWH. Specimens were also analyzed by digital droplet PCR for levels of cell-associated total HIV DNA and unspliced RNA, which were associated with subset distribution using linear re-

gression models. All participants were enrolled in the Last Gift Study, comprised of altruistic PWH who donate their bodies post-mortem for research.

**Results:** Across tissue compartments, HIV DNA levels significantly associated with the frequencies of T resident memory (Trm, CD45RA-CD45RO+CD69+) CD4+ T cells ( $P=0.022$ ), while a positive trend ( $P=0.069$ ) was observed for T follicular helper (Tfh) (CD45RA-CD45RO+PD1+CXCR5+) CD4+ T cells. By contrast, HIV DNA levels trended negatively with the frequencies of T central memory (Tcm, CD45RA-CD45RO+CCR7+CD27+) CD4+ T cells ( $P=0.160$ ). HIV RNA was more frequently detectable (Wilcoxon t-test,  $P=0.07$ ) in tissue specimens with lower frequencies of Trm cells. Memory CD4+ T cells from distinct tissue compartments varied in expression of activation (HLADR, CD38), differentiation (CD127, CD57), and homing (CCR5, CCR6) markers.

**Conclusions:** Although Tcm from blood have previously been reported as a preferential reservoir for HIV, our data suggest that this may not be the case in tissues where Tcm frequencies negatively associated with HIV DNA levels. Instead, our data suggest that Tfh and especially Trm may be preferential tissue-based reservoir cells among CD4+ T cells given their positive association with HIV DNA levels.

Our observation that Trm frequencies associate positively with overall HIV DNA but negatively with detectable HIV gene expression (RNA) suggests that these cells may be a preferential latent tissue reservoir of HIV. Our data also revealed phenotypic features of memory CD4+ T cells specific to various tissue compartments.

## OAA2803

Concurrent depletion and dysfunction of tissue-resident memory-like CD4+ T cells in the small intestine coinciding with intestinal epithelial cell hyperproliferation in people living with HIV (PLWH)

Madela<sup>5</sup>, S. Khader<sup>5</sup>, A. Leslie<sup>4</sup>, A. Shalek<sup>2</sup>, H. Kløverpris<sup>4</sup>

<sup>1</sup>AHRI, Durban, South Africa, <sup>2</sup>Institute for Medical Engineering and Science, Department of Chemistry, Boston, United States, <sup>3</sup>University of Copenhagen, Copenhagen, Denmark, <sup>4</sup>Africa Health Research Institute, Basic and translational science, Durban, South Africa, <sup>5</sup>Inkosi Albert Luthuli Central Hospital, Division Upper Gastrointestinal Tract and Colorectal Surgery, Durban, South Africa

**Background:** HIV infection impacts gut-resident CD4+ T-cells and gut homeostasis, both of which are central to the overall HIV-associated pathology. Gut resident CD4+ T-cells support epithelial cell renewal and differentiation in the intestinal crypt base. However, the differential im-

pacts of HIV infection on CD4+ T-cell levels and function in the small intestine versus the large intestine, as well as their effects on epithelial hyperproliferation, remain unknown.

**Methods:** Here, we studied the frequency and function of remaining tissue-resident CD4+ T-cells in the small and large intestine of people living with HIV (PLWH) in South Africa. Biopsies from >250 clinically indicated individuals from HIV endemic regions in South Africa were analyzed for CD4+ T-cell levels, and phenotyped by flow and mass cytometry and transcriptionally profiled after *ex vivo* live sorting. We used spatial profiling to identify HIV infection levels, CD4 T-cell location and epithelial hyperproliferation by fluorescent microscopy.

**Results:** Tissue resident memory-like (TRM-like) CD69<sup>+</sup>CD103<sup>+</sup>CD4<sup>+</sup>T-cells expressed the HIV co-receptor CCR5 and were enriched in the duodenum compared to the colon. In PLWH, these cells were preferentially depleted in the duodenum, but not in the colon. RNA sequencing of remaining duodenal CD4<sup>+</sup> TRM-like cells showed transcriptional downregulation of genes involved in proinflammatory cytokine signaling (IL-8, IL-6, IL-2, GM-CSF) and upregulation of genes involved in the IL-17 and Th2 pathway in PLWH. In addition, integrin signaling was downregulated in the duodenum and consistent with loss of duodenal integrin CD103<sup>+</sup> CD4<sup>+</sup> T-cells. In contrast, limited gene regulation was observed in the colon with limited CD4<sup>+</sup> T-cell depletion. In the non-hemopoietic epithelial compartment within the same cohort, we found increased proliferation (Ki-67) of duodenal crypt-based cells colocalizing with OLFM4 expressing Intestinal stem cells (ISCs) suggesting a direct link between CD4 TRM loss in the upper small intestine and ISC hyperproliferation.

**Conclusions:** HIV infection preferentially depletes TRM-like CD4<sup>+</sup> T-cells in the small intestine, while the remaining cells show dysfunctional profiles. This may have implications for cytokine signaling to intestinal stem cells, a critical process for epithelial cell differentiation and gut barrier integrity in PLWH.

### Study of the transcriptional microenvironment and associated viral dynamics of the SIV tissue reservoirs during ART and post-ATI

R. Lorenzo-Redondo<sup>1,2</sup>, M.S. Arif<sup>3</sup>, C.T. Thuruthiyil<sup>3</sup>, S.S. Pascoe<sup>3</sup>, M.A. Shaaban<sup>1,2</sup>, Y. Thomas<sup>3</sup>, J.M. Hasson<sup>1,2</sup>, S. Samer<sup>3</sup>, M.R. Haque<sup>3</sup>, F.A. Engelmann<sup>3</sup>, M.D. McRaven<sup>3</sup>, M. Araínga<sup>4</sup>, L. Simons<sup>1,2</sup>, J. Hultquist<sup>1,2</sup>, E. Martinelli<sup>1</sup>, F. Villinger<sup>4</sup>, T.J. Hope<sup>3</sup>

<sup>1</sup>Northwestern University Feinberg School of Medicine, Department of Medicine (Infectious Diseases), Chicago, United States, <sup>2</sup>Northwestern University Robert J. Havey, MD Institute for Global Health, Center for Pathogen Genomics and Microbial Evolution, Chicago, United States, <sup>3</sup>Northwestern University Feinberg School of Medicine, Cell and Developmental Biology, Chicago, United States, <sup>4</sup>University of Louisiana at Lafayette, New Iberia Research Center, New Iberia, United States

**Background:** Despite effective antiretroviral therapy (ART), HIV-1 persistence is the major obstacle to a functional cure. To eliminate this viral reservoir, it is key to characterize reservoirs tissue microenvironment and associated viral population dynamics during ART, and after analytical treatment interruption (ATI).

**Methods:** We have developed immunoPET/CT-guided bulk and spatial transcriptomics pipelines, combined with immunofluorescence detection of viral proteins and whole genome long-read deep viral sequencing using the SIV/rhesus macaque model.

For this study, rhesus macaques were intra-venously challenged with SIVmac239, ART initiated at week 10 after infection, and maintained for 54 weeks, followed by PET/CT-guided necropsy after early ATI (4-7 days post-ATI). <sup>64</sup>Copper-labelled probe against viral envelope efficiently detected infection sites as early as 4-days post-ATI and immunoPET/CT-guided transcriptomics allowed the characterization of these PET/CT+ "hot" areas. Additionally, we performed viral long-read deep sequencing and population dynamics analysis in the same tissue sections.

**Results:** SIV presence in early post-ATI tissue reservoirs is associated with higher overall transcriptional levels and specific activation of genes associated to metabolic processes, cell localization, and cytokine immune signaling. Moreover, we detect specific transcriptional clusters that are highly associated with active SIV rebounding foci. These foci are characterized by higher estimated presence of immune cells and upregulation of immune cell migration and immune activation.

Analysis of intra-host viral population dynamics from the same "hot" areas of the tissues indicates highly complex dynamics during ART and after ATI. Early after ATI, we observe similar viral quasispecies structure between different anatomical compartments indicating possible viral recirculation during ART or immediately after ATI.

However, we observe significantly dissimilar patterns of

viral diversification in different tissue reservoirs. Interestingly, the highest viral diversity levels are consistently detected in GALT reservoirs where our spatial transcriptomics show activation of genes associated with viral production and immune activation pathways.

**Conclusions:** Overall, we have demonstrated the extreme sensitivity of our newly developed methods to study the SIV reservoirs. We have identified various possible biomarkers of such reservoirs. The combination of these methods is providing a unique view of the virus-host system that leads to viral persistence during ART and fast recovery of the viral populations immediately after ATI.

## OAA2805

### Development of a novel approach to treat HIV reservoirs in gut associated lymphoid tissues using nanoformulation of cART drugs

D. Roy<sup>1</sup>, A. Paul<sup>1</sup>, M.J. Haney<sup>2</sup>, M.M. Zarei<sup>1</sup>, H. Rodrigo<sup>3</sup>, E.V. Batrakova<sup>2</sup>, U. Roy<sup>1</sup>

<sup>1</sup>The University of Texas Rio Grande Valley, Health and Biomedical Science, Brownsville, United States, <sup>2</sup>University of North Carolina, Chapel Hill, Department of Molecular Pharmaceutics, Chapel Hill, United States, <sup>3</sup>The University of Texas Rio Grande Valley, Department of Mathematical & Statistical Sciences, Edinburg, United States

**Background:** Combination antiretroviral therapy (cART) has effectively controlled the viral load below the detection level and significantly extended the life of people with HIV (PWH). However, cART does not eliminate the virus from the host and certain cART drugs do not efficiently reach the HIV reservoirs of organs such as gut-associated lymphoid tissue (GALT). Considering GALT is one of the major reservoirs of HIV, reducing the viral load within the tissue is important for a better outcome of the treatment. We propose that a formulation of three clinically available cART drugs, Emtricitabine (FTC), Tenofovir (TFV), and Dolutegravir (DTG) into polymer-based nanoparticles would significantly improve their accumulation in the GALT and increase drug therapeutic efficacy. Self-assembling polymer micelles consisting of two block copolymers, Pluronic F127 and Pluronic L61 were used as nanocontainers for cART drugs. Specifically, we hypothesized that cART nanoformulation targeted to Microfold cells (M-Cells) of the intestine would efficiently penetrate towards HIV reservoirs in GALT.

**Methods:** Various cART nanoformulations were manufactured and their accumulation in M-cells was examined in *in vitro* and *in vivo* mouse models. The pharmacokinetics and therapeutic efficacy study in BALB/c mice and humanized mice have determined the targeted drug delivery and anti-HIV activity of current formulations.

**Results:** The selected nanoformulations showed sustained drug release with no significant toxicity in different immune cells and *in vitro* M-cell models. A single dose of

cART nanoformulation had significantly higher retention in plasma compared to free drugs, showing a sustained release for 14 days.

Finally, the selected nanoformulation of the cART combination was highly effective against HIV in GALT tissue.

**Conclusions:** Loading cART drugs into polymer-based micelles provided significantly higher therapeutic efficacy against HIV in *in vitro* and *in vivo* models compared to free drugs. Thus, this approach may provide the next-generation anti-HIV medicine with targeted delivery to the GALT and better therapeutic efficacy with much fewer side effects with a once-a-week dosing schedule.

## OAA35 Immune dysfunction and residual viremia

### OAA3502

Daily variations of CD4<sup>+</sup> T cell counts and phenotype in relationship with residual viral transcription in the blood of people with HIV-1 receiving antiretroviral therapy

A. Fert<sup>1</sup>, D. Chatterjee<sup>1</sup>, T.R. Wiche Salinas<sup>1</sup>, Y. Zhang<sup>1</sup>, D. Planas<sup>1</sup>, A. Cattin<sup>1</sup>, L. Raymond Marchand<sup>2</sup>, E. Moreira Gabriel<sup>1</sup>, C.-D. Ngassaki-Yoka<sup>1</sup>, J. Girouard<sup>3</sup>, A. Filali-Mouhim<sup>2</sup>, N. Cermakian<sup>4</sup>, D.E. Kaufmann<sup>1</sup>, J.-P. Routy<sup>3</sup>, P. Ancuta<sup>5</sup>

<sup>1</sup>Université de Montréal and CHUM Research Centre, Montréal, Canada, <sup>2</sup>CHUM Research Centre, Montréal, Canada, <sup>3</sup>Chronic Viral Illness Service and Division of Hematology, Research Institute of the McGill University Health Centre, Montreal, QC, Canada, Montréal, Canada, <sup>4</sup>Douglas Research Centre, McGill University, Montreal, QC, Canada, McGill University, Montréal, Canada, <sup>5</sup>Université de Montréal and CHUM Research Centre, Microbiologie, infectiologie et immunologie, Montréal, Canada

**Background:** Biological functions exhibit circadian rhythms to align with day/night environmental changes. The circadian clock master regulators CLOCK/BMAL1 bind on E-boxes in the promoters of clock-regulated genes, including HIV-1. Circadian variations in residual viral transcription were reported in people with HIV-1 (PWH) receiving antiretroviral therapy (ART).

Here, we investigated quantitative, phenotypic and transcriptional features of CD4<sup>+</sup> T-cells in relationship with daily variations in residual HIV-1 transcription during ART.

**Methods:** Eleven male ART-treated PWH were admitted at the CHUM Unit for Innovative Therapies for 36 hours. Blood was collected every 4 hours, before food intake, for 24 hours. Plasma levels of cortisol/melatonin and markers of intestinal permeability (FABP2, LBP) were measured by ELISA. Flow cytometry allowed the quantification/char-

acterization of leukocytes. Sorted CD4<sup>+</sup> T-cells were used for cell-associated integrated HIV-DNA and Gag HIV-RNA quantification by nested PCR/RT-PCR and RNA-Sequencing by Illumina technology. The impact of time on immunological/virological parameters was investigated using Cosinor and linear mixed models.

**Results:** Typical peaks in melatonin and cortisol levels were observed at 4:00 and 8:00, respectively. The highest FABP2 and lowest LBP levels were observed at 4:00. CD4<sup>+</sup> T-cell counts were at nadir levels in the morning, but significantly increased at 20:00.

This increase coincided with a superior expression of HIV-1 co-receptors CCR5/CXCR4, Th17 marker CCR6, gut-homing ITGB7; follicular helper (CXCR5<sup>+</sup>PD-1<sup>+</sup>) and effector memory (CD45RA<sup>+</sup>CCR7<sup>+</sup>) phenotype on memory CD4<sup>+</sup> T-cells; and robust changes in differential gene expression at 20:00 and 4:00 *versus* other time points.

While integrated HIV-DNA levels *per* million CD4<sup>+</sup> T-cells were stable, the proviral load normalized *per* ml of blood varied in a time-dependent manner with the highest abundance at 20:00.

The HIV-RNA/DNA ratio (surrogate marker of HIV transcription) peaked at 4:00 and negatively correlated with levels of cortisol and LBP. Peak HIV-RNA/DNA ratios coincided with unique transcriptional profiles encoding for regulators of T-cell functions and viral transcription (SP6, Jun, BCL6, BCL3, SOCS3).

**Conclusions:** Our results reveal a massive influx of CD4<sup>+</sup> T-cells carrying proviral HIV-DNA in the blood at 20:00, a peak in residual HIV-1 transcription at 4:00, and a transcriptional signature associated with these daily immune/viral variations in ART-treated PWH.

### OAA3503

Failure to achieve undetectable viral load caused by HIV expression from defective proviruses and large reservoir size

V. Hariharan<sup>1</sup>, J. Siliciano<sup>1</sup>, R. Siliciano<sup>1</sup>, F. Simonetti<sup>1</sup>

<sup>1</sup>Johns Hopkins University, School of Medicine, Baltimore, United States

**Background:** Antiretroviral therapy (ART) halts viral replication and reduces plasma HIV RNA to undetectable levels in weeks to months in most people living with HIV (PLWH). However, ART is not curative due to HIV persistence in memory CD4<sup>+</sup> T cells. Some individuals experience nonsuppressible viremia (NSV) despite adherence to ART, usually after years of undetectable viral load.

Here, we characterized the source of NSV and reservoir composition in two PLWH who never reached undetectable viral load despite adherence and CD4 recovery.

**Methods:** We longitudinally sequenced plasma HIV RNA and proviral DNA in CD4<sup>+</sup> T cells. We measured infected cell frequency using the IPDA and viral outgrowth assay. Additionally, we developed custom digital PCR assays to

quantify lineage-specific deletions, which we introduced into NL4-3 to assess their impact on virion production and infectivity.

**Results:** Viral sequences contributing to NSV exhibited no known drug resistance mutations and showed no evolution. They were remarkably polyclonal, in contrast to previous reports of NSV.

Furthermore, after two years on ART, total HIV DNA (29,000 and 11,000 proviruses/ $10^6$  CD4<sup>+</sup> T cells; for P1 and P2, respectively) was >100-fold greater than the median value from 400 ART-suppressed PLWH (755 proviruses/ $10^6$  CD4<sup>+</sup> T cells). For each participant, >90% of proviruses shared an identical deletion despite being diverse elsewhere in the genome, an unexpected finding given the lethal nature of the deletions.

In Participant 1, we found two deletions affecting the open reading frames of *vif*, *vpr*, *tat*, *rev*, *vpu*, and *env*; in participant 2, we found a 270-nucleotide deletion in the first exon of *tat*. Proviruses with these deletions contributed between 40-70% to the NSV. These proviruses could be induced to make virions *ex vivo* but did not give rise to exponential outgrowth by qVOA.

Finally, introducing these deletions into NL4-3 resulted in >5-log reduction in viral titer relative to the wild-type.

**Conclusions:** Failure to achieve undetectable HIV RNA on ART can be caused by a large population of infected cells, including those carrying defective proviruses with deletions. We hypothesize that the expression, dissemination, and diversification of these defective genomes is due to pre-ART superinfection with intact proviruses.

## OAA3504

### Modeling of ALT flares and liver inflammation in chronically SHIV/HBV co-infected rhesus macaques

S. Biswas<sup>1</sup>, S. Lutz<sup>1</sup>, S. Yusova<sup>1</sup>, J. Tran<sup>1</sup>, L. Rust<sup>1</sup>, S. Naldiga<sup>1</sup>, M. Fisher<sup>1</sup>, H. Crank<sup>1</sup>, J. Smedley<sup>1</sup>, J. Sacha<sup>1</sup>, B. Burwitz<sup>1</sup>

<sup>1</sup>Oregon Health & Science University, Pathobiology and Immunology, Beaverton, United States

**Background:** 20% of individuals living with HIV also acquire HBV in their lifetime primarily due to common transmission routes. Rhesus macaques (RMs) have served as a model for HIV research for decades, but they have never been used to study HIV/HBV co-infection. Our group has shown that RMs infected with SHIV<sub>DH12 Clone 7</sub> and HBV<sub>genotype D</sub> support chronic HIV/HBV co-infection.

A major advantage of the RM model is that we can obtain longitudinal biopsies and constantly monitor immune cell phenotyping and ALT changes during the various stages of co-infection; something that is impossible to obtain in clinical patients to understand co-infection-associated pathogenesis.

**Methods:** We infected RM intravenously with SHIV<sub>DH12 Clone 7</sub> ( $5 \times 10^3$  TCID<sub>50</sub>) followed by HBV (genotype D,  $1 \times 10^9$  virions, i.v) three weeks later. We next subcutaneously administered

co-infected RM with combination ART (cART) approximately eleven weeks post-infection; consisting of Tenofovir (5.1 mg/kg), Emtricitabine (40 mg/kg) and Dolutegravir (2.5 mg/kg).

Once the HBV viral loads went down to  $10^2$  copies/ml, we replaced cART with Dolutegravir monotherapy (10 mg/kg). We collected weekly blood draws to monitor HBV/SHIV infection, and track CD4<sup>+</sup> and CD8<sup>+</sup> T cells, HBV surface antigens (HBsAg) and monitor ALT levels.

We obtained longitudinal liver biopsies to monitor changes in liver immune cell population and investigate signs of fibrosis by immunohistochemistry.

**Results:** One RM from our pilot study exhibited co-infection for >76 weeks making it the first ever animal to exhibit chronic HIV/HBV co-infection. cART-treated SHIV/HBV co-infected RM suppressed HBV and SHIV viremia with no effect on HBsAg levels. However, Dolutegravir monotherapy led to the rebound of HBV viremia only.

A major finding was the spike in ALT level during ART that was associated temporally with an increase in CD4<sup>+</sup> T cells. Immunohistochemistry analysis is ongoing to detect signs of fibrosis in the chronically infected RM.

**Conclusions:** Thus, we present here the first ever RM model to exhibit long-term SHIV/HBV co-infection that exhibited similar outcomes of ART as observed in clinically co-infected patients undergoing ART. Our data also shows that we can model ALT flares during ART which would be crucial in understanding immune cell dynamics across the stages of co-infection.

### Characterization of adipose tissue B cell antibodies in persons with diabetes and HIV

L.M. Obare<sup>1</sup>, C. Wanjalla<sup>1</sup>, R. Gangula<sup>1</sup>, X. Zhang<sup>1</sup>, K. Nthenge<sup>1</sup>, W.J. McDonnell<sup>2</sup>, S.A. Smith<sup>1</sup>, S. Mallal<sup>1</sup>, J.R. Koethe<sup>1</sup>, S. Bailin<sup>1</sup>

<sup>1</sup>Vanderbilt University Medical Center, Infectious Diseases, Nashville, United States, <sup>2</sup>Infinimmune, San Ramon, United States

**Background:** Persons living with HIV (PLWH) experience a 1.5–2-fold higher incidence of cardiovascular disease (CVD) not solely attributable to traditional risk factors. Changes in subcutaneous adipose tissue (SAT) immune cells contribute to inflammation and proatherogenic dyslipidemia. B cells have been associated with cardiometabolic disease in the general population and are present in SAT. However, the role of B cells in cardiometabolic disease has not been studied in PLWH. We leveraged an existing cohort to investigate the changes in SAT B cells with cardiometabolic disease among PLWH.

**Methods:** SAT from PLWH with varying metabolic states and HIV-negative participants with diabetes were obtained via liposuction. Single-cell sequencing using cellular indexing of transcriptomes and epitopes (CITE-seq)

was employed to analyze immune and non-immune cells in SAT. B cell receptor (BCR) sequences were analyzed using the 10X/enclon genomics analysis. The top 20 clonal BCRs were synthesized as IgG isotypes, and enzyme-linked immunosorbent assay (ELISA) against CMV antigens determined CMV specificity. Statistical analyses utilized Graph-Pad Prism software.

**Results:** We identified distinct B cell subsets, plasmablasts, naïve and memory B cells in SAT through CITE-seq using well-defined markers CD19, CD20, CD38, and CD27. Plasmablasts were significantly higher in prediabetic/diabetic PWH (Median 60 [IQR 20.3-88.9],  $P=0.01$ ), and diabetic HIV-negative persons (50 [20.6-77.1],  $P=0.003$ ) compared to non-diabetic PLWH (11.9 [5.3-33.3]).

There was no difference in the proportion of memory B cells based on HIV or diabetes, while naïve cells were higher in non-diabetic PWH (42.9 [21.9-63.4]) compared to diabetic PLWH (50 [0-28.6],  $P=0.008$ ) and trending towards significant in HIV-negative with diabetes (15.48 [0-44.5],  $P=0.06$ ).

BCR sequencing revealed that B cells expressing all four immunoglobulin isotypes (IgD, IgM, IgA, and IgG) were present in SAT. Clonal B cells were more prevalent in the SAT of diabetic PWH compared with non-diabetic PWH and diabetic HIV-negative, suggesting differences in antigen-driven responses within the SAT. Of the 20 clonal BCRs, only one clone among HIV-positive individuals bound weakly to CMV.

**Conclusions:** Clonal B cells that accumulate in the SAT with diabetes, irrespective of HIV status, may be important in the pathogenesis of cardiometabolic disease.

The effectiveness of different anal cancer screening strategies for people living with HIV/AIDS

Y. Liu<sup>1</sup>, A. Deshmukh<sup>2</sup>, K. Sigel<sup>3</sup>, M. Gaisa<sup>3</sup>

<sup>1</sup>Icahn School of Medicine at Mount Sinai, New York, United States, <sup>2</sup>College of Medicine, Medical University of South Carolina, Charleston, United States, <sup>3</sup>Icahn School of Medicine at Mount Sinai, Department of Medicine, New York, United States

**Background:** People living with HIV/AIDS (PLWHA) have the highest incidence of HPV-associated anal cancer. The new anal cancer screening guidelines, published in 2024 by the International Anal Neoplasia Society, outline five screening strategies in high-resource settings: anal cytology alone, high-risk HPV (hrHPV) testing alone, cytology with hrHPV triage, hrHPV testing with cytology triage, or cotesting.

We aim to compare the effectiveness of these strategies in detecting anal cancer/precancer within a large cohort of PLWHA undergoing primary screening.

**Methods:** The study included 1,620 PLWHA who underwent anal cytology, hrHPV testing, and high-resolution anoscopy (HRA)-guided biopsy at our institution between 2012 - 2019. Using biopsy-proven anal HSIL as an endpoint, we calculated sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), and the number of HRA referrals triggered by each screening strategy.

**Results:** The median age was 45 years (range: 34-54), with 90% of the participants being men who have sex with men living with HIV/AIDS. Anal HSIL rate was 42%. The performance of each screening strategy is summarized in **Table 1**. All strategies showed comparable performance metrics. HrHPV testing alone demonstrated the highest sensitivity (96%), while hrHPV with cytology triage showed the highest specificity (48%). The approach of hrHPV with cytology triage, or vice versa, yielded the highest PPV (54%) and while hrHPV alone had the highest NPV (92%). The number of HRA referrals triggered by screening was highest for hrHPV alone (83%) followed by cytology alone (77%) and lowest for hrHPV with cytology triage (66%).

Screening Strategy	Results triggering HRA referral	Sensitivity (95% CI)	Specificity (95% CI)	PPV (95% CI)	NPV (95% CI)	# HRAs
Cytology alone	ASCUS or worse	88 (85-90)	30 (27-33)	48 (45-51)	77 (72-81)	1,252 (77%)
hrHPV alone	hrHPV+	96 (95-97)	27 (25-30)	49 (47-52)	92 (88-95)	1,341 (83%)
Cytology with hrHPV triage	ASCUS/hrHPV+ LSIL/hrHPV+ ASC-H/HSIL All HPV16+	85 (82-88)	47 (44-50)	54 (51-57)	81 (78-84)	1,080 (67%)
hrHPV with cytology triage	hrHPV+/ASCUS or worse All HPV16+	85 (82-88)	48 (44-51)	54 (51-57)	81 (78-84)	1,073 (66%)
Cotesting	NILM/hrHPV+ ASCUS/hrHPV+ LSIL/hrHPV+ ASC-H/HSIL All HPV16+	89 (86-91)	40 (37-44)	52 (49-55)	83 (80-87)	1,167 (72%)

**Conclusions:** All screening strategies outlined in the new guidelines demonstrate comparable effectiveness in detecting anal cancer and precancer among PLWHA. Nevertheless, the combined approach of cytology and hrHPV testing, whether utilized as cotesting or triage, proves more effective than cytology or hrHPV testing alone. Significantly, the incorporation of hrHPV testing increases specificity and results in a reduced number of HRA referrals, a critical consideration given the limited HRA capacity, even in high-resource settings.

### Prevalence of high risk penile human papillomavirus in men who have sex with men (MSM) and transgender women (TGW)

D. Salusso<sup>1</sup>, A. Gun<sup>1</sup>, A. Nava<sup>1</sup>, J. Garcia<sup>1</sup>, M. Abba<sup>2</sup>, M.E. Salas<sup>2</sup>, P. Delgado<sup>1</sup>, M. Golemba<sup>1</sup>, M. Moragas<sup>1</sup>, J. Naipauer<sup>3</sup>, C.F. Perez<sup>1</sup>, C. Cesar<sup>1</sup>, P. Cahn<sup>1</sup>, M.I. Figueroa<sup>1</sup>, V. Fink<sup>1</sup>

<sup>1</sup>Fundación Huésped, Research Department, Buenos Aires, Argentina, <sup>2</sup>Facultad de Ciencias Médicas, Universidad de La Plata, Centro de Investigaciones Inmunológicas Básicas y Aplicadas, La Plata, Argentina, <sup>3</sup>UBA-CONICET, Instituto de Fisiología, Biología Molecular y Neurociencias, Buenos Aires, Argentina

**Background:** High-risk HPV in anogenital locations, can lead to preneoplastic and neoplastic lesions. HPV transmission occurs through genital-genital or oral-genital contact and penile HPV represents a potential reservoir. This study aims to evaluate the prevalence of penile HPV among MSM and TGW populations.

**Methods:** A study on penile HPV was conducted at a Buenos Aires research center, involving MSM and TGW, some participating in an ongoing anal and oral HPV study. Epidemiological and clinical data were collected and penile samples were obtained using a 600-grit emery paper and a saline water-imbibed Dacron swab. DNA was purified using the Biocomma Universal Genomic DNA Purification kit, and HPV was detected with ATILA (Genotyping High-Risk HPV Real Time Fluorescent Detection).

**Results:** Between June 2022-August 2023, 200 participants were enrolled. Median age: 33(IQR 28-40); 98.5%(197) hispanic-latino ethnicity; 13.5%(27) circumcised; 85%(171) had at least one previous sexually transmitted infection (STI): syphilis (63%), gonorrhea (27.5%), chlamydia (21.5%), 36.5% (73) had HIV, median CD4 count: 417 cel/mL (IQR 315-664); 44% (88) had a history of anal or penile warts and 59% (69/113) anal intraepithelial lesions; 14.5% (29) had complete HPV vaccination. Baseline characteristics by group are shown in the table.

	MSM (n=164)	TGW (n=36)	P value
Tertiary education level	141 (86%)	10 (28%)	<0.001
History of STIs	137 (84%)	34 (94%)	0.092
HIV diagnosis	51 (31%)	22 (61%)	<0.001
Sexual work	31 (19%)	31 (86%)	<0.001
Lifetime insertive vaginal sex	89 (54%)	13 (36%)	0.048
Condom use in anal/vaginal insertive sex (more than 50%)	70 (47%)	21 (68%)	0.035
Condom use in oral insertive sex (less than 50%)	156 (97%)	26 (77%)	<0.001

Penile HPV was detected in 69 participants (34.5%), with no differences between groups (MSM/TGW 33.5/38.9%). HPV genotypes distribution were: HPV-33(26%), HPV-59(17%), HPV-35,HPV-43,HPV-45(16%), HPV-16(15%), HPV-56(14%), HPV-18,HPV-31,HPV-39(10%), HPV-52,HPV-68(9%),

HPV-58(7%), HPV-51(4%), HPV-66(3%). 19 penile samples (10%) showed 3 or more concomitant genotypes. Among those with anal (n=99) and oral (n=103) samples, the HPV prevalence was 79% and 22% respectively. HPV-33 was the most frequent genotype in penile and anal samples. Participants with penile HPV had a higher frequency of anal infection (p=0.02). No other statistically significant association was found.

**Conclusions:** One third of participants presented high-risk HPV penile infection. An association between penile and anal HPV was found. These facts reinforce the potential role of the penis as a reservoir. Prevention strategies such as gender-neutral vaccination and circumcision should be considered.

### Dynamic interplay of high-risk human papillomavirus in women living with HIV: persistence, clearance, incidence and synergies with human T-lymphotropic virus-1 infections in a Kenyan teaching referral hospital

J. Kangethe<sup>1,2,3,4</sup>, S. Gichuhi<sup>5</sup>, E. Odari<sup>6</sup>, J. Pintye<sup>7</sup>, K. Mutai<sup>1</sup>, M. Mureithi<sup>8</sup>

<sup>1</sup>Kenyatta National Hospital, Comprehensive Care Center for HIV, Nairobi, Kenya, <sup>2</sup>Kenyatta National Hospital, Department of Medical Research, Training and Innovation, Nairobi, Kenya, <sup>3</sup>University of Nairobi, Department of Medical Microbiology and Immunology, Nairobi, Kenya, <sup>4</sup>Consortium for Advanced Research Training Research in Africa, Nairobi, Kenya, <sup>5</sup>University of Nairobi, Department of Ophthalmology, Nairobi, Kenya, <sup>6</sup>Jomo Kenyatta University of Agriculture and Technology, Nairobi, Kenya, <sup>7</sup>University of Washington, Department of Biobehavioral Nursing and Health Informatics, Seattle, United States, <sup>8</sup>University of Nairobi, Department Medical Microbiology and Immunology, Nairobi, Kenya

**Background:** Cervical cancer (CC) is a major global health threat, especially in low- and middle-income countries like Kenya. Women living with HIV (WLHIV) are more susceptible to high-risk HPV (HR-HPV) infections, increasing their risk of cervical cancer and co-infections like HTLV-1. Our study at Kenyatta National Hospital (KNH) explored HR-HPV persistence, clearance, and incidence, examining their interaction with HTLV-1 in WLHIV on antiretroviral therapy (ART).

**Methods:** We conducted a prospective cohort study with 152 WLHIV, including 17 with HTLV-1 co-infections at KNH. After 12 months, cervical samples were retested for HR-HPV using Gene Xpert® and HPV Genotypes 14 Real-TM Quant. Data were analyzed using SPSS 23.0, presenting outcomes as proportions, stratified by HR-HPV genotypes and synergy with HTLV-1. Descriptive comparisons and statistical tests assessed associations, with odds ratios reported for risk estimation.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Results:** This prospective cohort study included 152 WLHIV who had initial HR-HPV infections, among whom 17 were co-infected with HTLV-1 and provided consent. Participants had a mean age of 41.3 years (SD 8.7) and 29.6% had predictable virological failure (HIV 1 RNA  $\geq 1000$  copies/mL of plasma).

The study revealed an overall HR-HPV persistence rate of 89.5%, with a clearance rate of 10.5%. Notably, HR-HPV 52 exhibited the highest persistence rate at 29.6%, followed by type 16 (22.4%) and 18 (19.1%) respectively.

Statistical analysis demonstrated a significant association between age and HR-HPV persistence, with rates of 86.8% and 13.2% for older and younger individuals, respectively ( $p < 0.001$ ). HIV diagnosis at an older age ( $\geq 35$  years) and a shorter duration of ART ( $< 5$  years) use were associated with HR-HPV persistence, with rates of 60.3% versus 39.7% ( $p = 0.002$ ) and 64.7% versus 35.3% ( $p = 0.004$ ), respectively. Furthermore, co-infection with HTLV-1 was associated with a 100% HR-HPV persistence rate, compared to an 88.8% rate among participants with HR-HPV infections only.

**Conclusions:** The study revealed a significant 89.5% HR-HPV persistence rate among WLHIV, with HR-HPV 52, 16, and 18 showing elevated persistence.

These findings underscore the importance of implementing the 9-valent HPV vaccine in Kenya, particularly for WLHIV, and highlight a 100% type-specific HR-HPV persistence rate in the presence of HTLV-1 co-infection.

Detection of *Treponema pallidum* DNA for diagnosis, resistance identification, and treatment outcome prediction in early syphilis among men who have sex with men

T.-Y. Wu<sup>1</sup>, L.-H. Su<sup>1</sup>, H.-Y. Sun<sup>1</sup>, W.-D. Liu<sup>1</sup>, Y.-S. Huang<sup>1</sup>,  
W.-C. Liu<sup>1</sup>, K.-Y. Lin<sup>1</sup>, S.-Y. Chang<sup>2</sup>, C.-C. Hung<sup>1,3</sup>

<sup>1</sup>National Taiwan University Hospital and National Taiwan University College of Medicine, Department of Internal Medicine, Taipei, Taiwan, Province of China, <sup>2</sup>National Taiwan University Hospital and National Taiwan University College of Medicine, Department of Laboratory Medicine, Taipei, Taiwan, Province of China, <sup>3</sup>National Taiwan University Hospital Yunlin Branch, Department of Internal Medicine, Yunlin, Taiwan, Province of China

**Background:** The study aimed to investigate the use of *Treponema pallidum* DNA (TP-DNA) for diagnosis, resistance identification, and treatment outcome prediction in early syphilis among men who have sex with men (MSM).

**Methods:** Adult MSM seeking care for sexually transmitted infections were prospectively enrolled from September 2021 to September 2023. The diagnosis of syphilis was made based on serologic testing and clinical presentations. Collected clinical samples, including oral rinse, rec-

tal swab, and urethral swab, were tested for TP-DNA with the use of PCR assay targeting the 47 kDa gene. The cycle threshold (Ct) value of PCR assay was determined and the result was considered positive with a Ct value  $< 38$ .

Resistance-associated mutations (RAMs) to macrolides and tetracyclines were identified. Serologic responses were compared between individuals with detected TP-DNA and those without.

**Results:** During the study period, 570 MSM were enrolled, contributing to 386 tests for early syphilis, 169 treated syphilis, and 87 without syphilis. TP-DNA was detected in at least 1 clinical sample in 48.4% (187/386) of participants with early syphilis and 1.1% (1/87) of those without syphilis, resulting in a specificity of 98.9% and sensitivity 48.4%. TP-DNA was most frequently detected in participants with secondary syphilis (71.8%), followed by those with primary and early latent syphilis (51.6% and 34.4%, respectively). The detection rate of TP-DNA was higher in participants with rapid plasma regain (RPR) titers  $\geq 1:32$  compared with those with lower titers (54.0% vs 19.4%,  $P < 0.001$ ). The rate of *T. pallidum* harboring RAMs to macrolides (A2058G, A2058T, and A2059G) was 55.6% (109/196), while the rate of RAMs to tetracyclines (G966T, C967T and C1192G) was 0.6% (1/156). Regardless of RPR titers and syphilis staging, participants with detected TP-DNA had higher serologic responses compared to those without, with rates of 50.3% vs 35.2% at month 3 and 80.5% vs 66.5% at month 6.

**Conclusions:** Among MSM, the detection of TP-DNA showed high specificity for early syphilis, which correlated with the stage of syphilis, RPR titers and treatment response. The prevalence of *T. pallidum* strains with RAMs to macrolides was  $> 50\%$ , warranting further close monitoring.

## OAB1702

Pharmacokinetics and HIV viral load suppression of one month-daily rifapentine and isoniazid (1HP) for tuberculosis preventive therapy among adults with HIV taking standard dolutegravir based regimens

**Background:** Ultrashort 1-month of daily rifapentine 600/isoniazid 300 mg (1HP) is an effective and attractive Tuberculosis Preventive Therapy (TPT) regimen. However, co-administration of 1 HP and Dolutegravir (DTG) based ART is limited due mainly to potential suboptimal DTG concentrations.

Recent findings from A5372 and Taiwanese HIV cohort suggest the potential concomitant use of 1 HP with standard dose DTG in Asian people with HIV (PWH). We therefore assessed safety, pharmacokinetics and HIV viral load suppression of once daily tenofovir disoproxil fumarate/lamivudine/DTG (TLD) when co-administration with 1HP in ARV naïve and ARV experienced PWH.

**Methods:** We analyzed data from an ongoing Phase 3 multicenter, randomized trial comparing 1HP and 3 HP (weekly isoniazid 900 mg/ rifapentine 900 mg for 12 weeks) among adult PWH (≥18 years) without evidence of active TB from 14 HIV clinics in Thailand. 1HP was initiated 2-4 weeks after starting TLD. Dolutegravir concentrations were collected at Day 0 (before 1HP) and day 28. Dolute-

gravir concentrations were analyzed at Center for Personalized Precision Medicine of Tuberculosis, Inje University College of Medicine, South Korea.

**Results:** 252 PWH (81% male, median age 32 (IQR: 26-41) years, BW 64.9 (IQR: 56.5-73.8) kg) on TLD and 1HP were analyzed. Median CD4 cell count was 451 (IQR: 287-682) cells/mm<sup>3</sup>, 202 (80%) were ARV naïve (no baseline VL) and 20% participants were ARV experienced with pre- 1HP HIV VL < 50 copies/ml. A total of 99.2% participants completed the 1HP; 2 (0.8%) permanently discontinued treatment due to possible 1HP related adverse events.

Hypersensitivity reaction occurred in 0.8%. Grade 3 and 4 asymptomatic hepatitis developed in 0.4%, and 1.2% SAEs were reported. HIV RNA < 50 copies/ml at 24 weeks and 48 weeks were 95.2% and 97.7%, respectively.

The geometric mean (95%CI) dolutegravir trough concentrations were 0.56 mg/dL (0.27-1.16) on day 0 vs 0.15 mg/dL (0.09-0.24) on day 28. Almost 92.6% had DTG Ctrough > 0.064 mg/dL.

**Conclusions:** Although there were substantial reductions in DTG Ctrough, almost 93% of participants had DTG Ctrough concentration above the protein-binding -adjusted IC<sub>90</sub>. Co-administration of 1HP and TLD were well tolerated, with robust high rates of HIV virological suppression. These findings highlight potential co-administration of 1HP with standard dose TLD.

## OAB1703

High incidence of tuberculosis in young children living with HIV in the Western Cape, South Africa

K. Anderson (Melunsky)<sup>1</sup>, H. Rabie<sup>2</sup>, B.S. Eley<sup>3</sup>, L. Frigati<sup>2</sup>, J. Nuttall<sup>3</sup>, E. Kalk<sup>1</sup>, A. Heekes<sup>4</sup>, M. Smith<sup>4</sup>, A. Boule<sup>1,4,5</sup>, V. Mudaly<sup>6</sup>, M.-A. Davies<sup>1,4,5</sup>

<sup>1</sup>University of Cape Town, Centre for Infectious Disease Epidemiology and Research, School of Public Health, Cape Town, South Africa, <sup>2</sup>Tygerberg Hospital, Stellenbosch University, Department of Paediatrics and Child Health, Stellenbosch, South Africa, <sup>3</sup>Red Cross War Memorial Children's Hospital, University of Cape Town, Department of Paediatrics and Child Health, Cape Town, South Africa, <sup>4</sup>Western Cape Department of Health and Wellness, Health Intelligence, Cape Town, South Africa, <sup>5</sup>University of Cape Town, Division of Public Health Medicine, School of Public Health, Cape Town, South Africa, <sup>6</sup>Western Cape Department of Health and Wellness, Service Priorities Coordination, Cape Town, South Africa

**Background:** We examined tuberculosis (TB) trends among children living with HIV (CLHIV), age ≤5 years, in Western Cape, South Africa. Early infant HIV testing and early antiretroviral therapy (ART) initiation is implemented in this high HIV and TB setting.

**Methods:** We analysed routinely-collected healthcare data for CLHIV born May 2018-October 2022 (database closure mid-2023). We examined factors associated with

TB diagnosis using Fine-Gray competing risk models (death and loss to follow-up as competing events), adjusted for sex, birth year and previous TB.

**Results:** We included 2219 CLHIV; 30% diagnosed with HIV at age  $\leq 7$  days, 41% at age 8-365 days and 29% at age  $>1$  year. Median follow-up from birth was 38 months (IQR 24-50); 90% of CLHIV started ART. TB was diagnosed in 28% of CLHIV ( $n=626/2219$ ); 62% first diagnosed before/within 3 months of ART start (TB before ART) and 38%  $>3$  months after ART start (TB after ART).

Of those with 'TB before ART' ( $n=390$ ), median age at HIV diagnosis was 13 months (IQR 6-22) and median time from HIV diagnosis to TB diagnosis was 5 days (IQR 0-31). 'TB before ART' was significantly associated with older age at HIV diagnosis and advanced/severe immunodeficiency.

Of those with 'TB after ART' ( $n=258$ ), median age at HIV diagnosis was 2 months (IQR 0-8) and median time from ART start to TB diagnosis was 12 months (IQR 7-21). 'TB after ART' was associated with increased viral load and advanced/severe immunosuppression (time-updated) but not age at ART start.

Even low-level viraemia (500-999 vs  $<100$  copies/ml) was associated with 'TB after ART' (aSHR 2.75; 95%CI 1.05-7.18). Overall, 5% ( $n=112/2219$ ) of CLHIV died, 36% of whom were diagnosed with TB (median time from TB diagnosis to death: 58 days; IQR 17-191).

**Conclusions:** Young CLHIV in this setting have high TB-associated morbidity and mortality. Susceptible groups include: CLHIV diagnosed with HIV and TB concurrently at an older age, associated with advanced/severe immunodeficiency; and CLHIV who, despite starting ART in early infancy, develop TB later, associated with advanced/severe immunodeficiency and elevated viral load. Efforts to improve early HIV diagnosis, viral suppression and TB preventive therapy are needed.

**Background:** Cryptococcal meningitis is a leading cause of AIDS-related mortality. Cryptococcal antigen (CrAg) predicts development of meningitis. Historically, despite standard-of-care fluconazole, 25-30% of asymptomatic CrAg-positive persons develop breakthrough meningitis or death. Recently single-dose liposomal amphotericin (10mg/kg) was recommended as first-line therapy for the treatment of cryptococcal meningitis by the World Health Organization.

We evaluated whether a single high dose of liposomal amphotericin could prevent cryptococcal meningitis and death in persons with asymptomatic cryptococcal antigenemia.

**Methods:** Participants with HIV and asymptomatic cryptococcal antigenemia in Uganda were randomized to one dose of liposomal amphotericin (10mg/kg) with fluconazole or fluconazole alone through 24 weeks (clinicaltrials.gov NCT03945448).

Participants were enrolled from two sites in Uganda from April 2019 to April 2022. Twenty-four week meningitis-free survival was compared between treatment groups using a log-rank test. Hazard ratio was estimated using a univariate Cox proportional hazard model.

Upon review of the interim data, the data safety and monitoring board (DSMB) recommended no further enrollment of participants with low serum CrAg titers ( $\leq 1:80$ ). Herein, we present results among participants with a low serum CrAg titer.

**Results:** We enrolled 251 of 593 CrAg-positive participants screened, of whom 168 had a low CrAg titer ( $\leq 1:80$ ). Median CrAg titer and baseline characteristics were comparable between the two groups. During 24-weeks of follow up, clinical events occurred in 14.5% (12/83) of participants randomized to liposomal amphotericin with fluconazole versus 10.6% (9/85) assigned to fluconazole alone (ARR = 3.9%; 95% CI, -6.13% to 13.9%;  $p=0.45$ ) with a hazard ratio of 1.42 (95% CI, 0.60 to 3.36;  $p=0.43$ ). Clinical adverse events were more common in the intervention group, however,

no specific adverse event was more notable in one group or the other. There was no difference between the occurrence of grade 3 and 4 laboratory adverse events across the two groups (liposomal amphotericin 24% (20) versus standard-of-care 24% (20);  $p=0.93$ )

**Conclusions:** Among CrAg-positive persons with low titers ( $\leq 1:80$ ), the addition of single-dose liposomal amphotericin to fluconazole as preemptive therapy provided no additional clinical benefit.

## OAB1705

Prevalence of isolated cryptococcal antigenemia and efficacy of preemptive fluconazole treatment in people living with HIV (PLWH) in China

Y. Lu<sup>1</sup>, Y.-k. Chen<sup>1</sup>

<sup>1</sup>Chongqing Public Health Medical Center, Department of Infectious Diseases, Chongqing, China

**Background:** Studies have shown that Isolated cryptococcal antigenemia (ICA) is a risk factor for death or cryptococcal meningitis (CM) in PLWH, and that preemptive antifungal treatment for ICA is vital for prevention of CM or death in this population. However, there is a dearth of published studies concerning the prevalence of ICA and preemptive fluconazole utilization in PLWH in China.

**Methods:** This was a multicenter, retrospective study at eight hospitals in China. Data from Jan 2019 to Dec 2022 were retrospectively analyzed. CrAg positive PLWH received extensive laboratory and radiological examinations to evaluate the presence of underlying cryptococcal disease. Those with CM, pulmonary cryptococcosis (PC), or cryptococcemia, and those having less than one year of follow-up were excluded from the analysis. Only PLWH with ICA were enrolled in our study.

**Results:** A total of 14678 PLWH underwent serum CrAg testing. Of these, 369 with CM, 101 with PC, and 67 with cryptococcemia were excluded, and of the remaining 10649 PLWH, the data of 433 with ICA were pooled and analyzed. In our cohort, the overall prevalence of ICA was observed to be 4.1%, and the prevalence of ICA in patients with CD4+ T-cell counts of  $<200$  cells/ $\mu$ L was 5.2%. Additionally, the prevalence of ICA in patients with CD4+ T-cell counts of  $<100$  cells/ $\mu$ L was 6.6%. Interestingly, we observed five further PLWH with ICA in a subset of 1260 individuals having CD4+ T-cell counts ranging from 200 cells/ $\mu$ L to 500 cells/ $\mu$ L.

When comparing one group without preemptive fluconazole treatment and the other with preemptive fluconazole treatment, we found that the cumulative incidence of CM and/or death in these groups was lower in the preemptive fluconazole treatment group (8.6% vs. 19.0%,  $p=0.144$ ), and patients who did not receive preemptive fluconazole treatment had a significantly higher risk of CM and/or death (aHR: 3.035, 95%CI, 1.067–8.635;  $p=0.037$ ).

**Conclusions:** Our results demonstrate that overall ICA prevalence in our PLWH cohort exceeded the threshold of 3%, indicative of a high endemic rate of cryptococcal infection in PLWH in China. Preemptive fluconazole treatment is an effective strategy for reducing the risk of CM and death in China.

Randomised placebo-controlled trial of high-dose vitamin D and low-dose calcium supplementation to improve bone density in adolescents with perinatally-acquired HIV in Southern Africa

R. Ferrand<sup>1,2</sup>, N. Dzavakwa<sup>1,2</sup>, L. Kasonka<sup>3</sup>, H. Banda-Mabuda<sup>3</sup>, T. Bandason<sup>2</sup>, M. Chisenga<sup>3</sup>, S. Filteau<sup>1</sup>, K. Kranzer<sup>1,2</sup>, H. Mujuru<sup>4</sup>, U. Schaible<sup>5</sup>, S. Rowland-Jones<sup>6</sup>, V. Simms<sup>1,2</sup>, C. Gregson<sup>7,2</sup>, VITALITY Trial Group

<sup>1</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>2</sup>Biomedical Research and Training Institute, Harare, Zimbabwe, <sup>3</sup>University Teaching Hospital, Lusaka, Zambia, <sup>4</sup>University of Zimbabwe, Harare, Zimbabwe, <sup>5</sup>Research Centre Borstel, Leibniz Lung Centre, Borstel, Germany, <sup>6</sup>University of Oxford, Oxford, United Kingdom, <sup>7</sup>University of Bristol, Bristol, United Kingdom

**Background:** HIV adversely affects skeletal development in children despite antiretroviral therapy (ART). Vitamin D deficiency, highly prevalent among children with HIV in Africa, has a further adverse impact on bone health. We investigated whether adjuvant vitamin D<sub>3</sub> and calcium carbonate supplementation improves bone density among adolescents with HIV.

**Methods:** We conducted a multi-country individually randomised, double-blinded placebo-controlled trial of weekly high-dose (20,000IU) vitamin D<sub>3</sub> plus daily calcium carbonate (500mg) supplementation for 48 weeks. Adolescents with HIV aged 11-19 years taking ART for  $\geq 6$  months were recruited from HIV clinics in Zimbabwe and Zambia.

The primary outcome was total body less-head bone mineral density (TBLH-BMD) Z-score using a UK reference population, measured by dual-energy X-ray absorptiometry (DXA). Lumbar spine bone mineral apparent density (LS-BMAD) Z-score was a secondary outcome. Linear regression was used to compare arms adjusting for site and baseline value of the measure. Pre-specified subgroup analyses by age-group, sex, pubertal stage and baseline vitamin D insufficiency (defined as 25(OH)D level  $<75$ nmol/l) were performed.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

**Results:** 842 participants, 448 (53.21%) female, were enrolled. 75.9% were vitamin D insufficient. Baseline characteristics were balanced between arms; at 48 weeks DXA outcomes were available for 751 (89.2%) participants. There was no difference by arm in the primary outcome (mean 48-week TBLH-BMD Z-score -1.56 (SD 1.12) in intervention arm vs -1.53 (1.18) in the control arm, adjusted mean difference [AMD] -0.03 (95% CI -0.08,0.02)). Results were similar for LS-BMAD Z-score (mean -0.71 (1.16) vs -0.64 (1.19; AMD -0.04 (95%CI -0.11,0.02)). However, among participants with vitamin D insufficiency, there was a significant difference by arm in both TBLH-BMD- and LS-BMAD- Z-scores (Table 1). There was no evidence of effect in other subgroups. No drug-related severe adverse events were observed.

TBLH-BMD Z-score					LS-BMAD Z-score				
Baseline 25(OH) D level	N	Control arm mean (SD)	Intervention arm mean (SD)	Adjusted Mean Difference (95% CI)	P-value	Control arm mean (SD)	Intervention arm mean (SD)	Adjusted Mean Difference (95% CI)	P-value
<75 nmol/L	562	-1.53 (1.22)	-1.61 (1.13)	-0.06 (-0.11, -0.01)	0.027	-0.67 (1.19)	-0.72 (1.13)	-0.09 (-0.17, -0.02)	0.016
≥75 nmol/L	189	-1.52 (1.03)	-1.45 (1.12)	0.05 (-0.07, 0.16)	0.44	-0.51 (1.08)	-0.70 (1.24)	0.10 (-0.03, 0.23)	0.13

Table 1: Outcomes by baseline Vitamin D<sub>3</sub> level.

**Conclusions:** High-dose vitamin D<sub>3</sub> and low-dose calcium supplementation, a safe, easily available and cheap intervention, during adolescence (a period of rapid growth) may promote bone accrual and mineralization towards maximizing peak bone mass, which may reduce the risk of fractures among children growing up with HIV.

## OAB2103

### Neurocognitive trajectories among a young adult cohort from four African countries: associations with HIV and food insecurity

S. Frndak<sup>1,2</sup>, E. Tsoy<sup>3</sup>, N. Dear<sup>1,2</sup>, H. Kibuuka<sup>4</sup>, J. Owuoth<sup>5,6</sup>, V. Sing'oei<sup>5,6</sup>, J. Maswai<sup>1,7</sup>, E. Bahemana<sup>1,8</sup>, V. <sup>1</sup>U.S. Military HIV Research Program, Walter Reed Army Institute of Research, Silver Spring, United States, <sup>2</sup>Henry M. Jackson Foundation for the Advancement of Military Medicine, Inc., Bethesda, United States, <sup>3</sup>University of California San Francisco, Department of Neurology: Memory and Aging Center, San Francisco, United States, <sup>4</sup>Makerere University Walter Reed Project, Kampala, Uganda, <sup>5</sup>U.S. Army Medical Research Directorate - Africa, Kisumu, Kenya, <sup>6</sup>HJF Medical Research International, Kisumu, Kenya, <sup>7</sup>U.S. Army Medical Research Directorate - Africa, Kericho, Kenya, <sup>8</sup>HJF Medical Research International, Mbeya, Tanzania, the United Republic of, <sup>9</sup>HJF Medical Research International, Abuja, Nigeria

**Background:** HIV and food insecurity (FI) compound cognitive impairment in adulthood. It is unclear how HIV and FI may impact neurodevelopment in young adults.

**Methods:** The African Cohort Study (AFRICOS) prospectively enrolls people with (LWH) and without (LWoH) HIV, aged ≥15 years, in care at 12 PEPFAR-supported facilities in Kenya, Nigeria, Tanzania, and Uganda. Participants were administered neuropsychological tests annually including the WHO/NIMH Auditory-Verbal Learning (AVLT) total recall (verbal memory), Trail Making (TMT) time (processing speed), and Grooved Pegboard (GP) time (motor speed and dexterity). FI was self-reported as not enough to eat or <3 meals per day.

We restricted the sample to participants <26 years old at first neuropsychological test and on antiretroviral therapy ≥6 months if LWH. Linear mixed models (LMMs) assessed baseline HIV status and time-varying FI on cognition longitudinally across age. Interactions included: FI\*HIV, gender\*FI, gender\*HIV, FI\*age, HIV\*age. Age interactions assessed differences in rate of cognitive score change. All models controlled for gender, household income, education, and prior tuberculosis infection.

**Results:** Young adults (n=902) were primarily female (56%), LWH (74%), and 29% were FI, with 4 visits on average. Overall, increasing age was associated with better scores. Longitudinally, those LWoH scored better than those LWH (total recall  $\beta$ =1.03; TMT time  $\beta$ = -5.55; GP time  $\beta$ = -0.12; all  $p$ ≤0.05). Females scored better than males LWH on total recall longitudinally (interaction  $p$ <0.01), with no gender difference for those LWoH. For FI\*age, FI was associated with a greater positive rate of change in total recall (interaction  $p$ =0.002) (Figure). No FI\*HIV interactions were significant and rates of change for TMT and GP was not different by FI or HIV status.

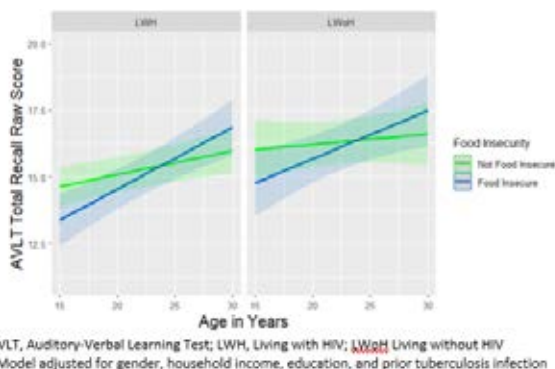

Figure. AVLT total recall score across time (age) stratified by HIV status and food insecurity status.

**Conclusions:** FI was associated with a greater positive rate of change in total recall among both treatment-experienced young adults LWH and LWoH, possibly reflecting developmental catch-up resulting from clinical care.

**Background:** With age and duration of antiretroviral therapy (ART), young adults with perinatally acquired HIV (YA-PHIV) are at risk for cardiovascular disease. Inflammatory biomarkers including high sensitivity C-reactive protein (hs-CRP), interleukin (IL)-18, and soluble CD163 (sCD163) have been associated with increased cardiovascular morbidity and mortality. We assessed biomarker levels and their association with HIV viremia and metabolic syndrome in a long-term cohort of YA-PHIV.

**Methods:** YA-PHIV, who started ART in pediatric clinics at five sites in Thailand aged 18-25 years, were recruited from November 2020 to July 2021. Clinical assessments and blood sampling for hs-CRP, IL-18, and sCD163 levels were performed. Metabolic syndrome was defined using National Cholesterol Education Program-Adult Treatment Panel III criteria. The hs-CRP levels between 1.0 to < 3.0 and  $\geq 3$  mg/L were defined as intermediate and high risk for cardiovascular disease, respectively. Biomarker association with HIV viremia and metabolic syndrome were assessed using Mood's median non-parametric test.

**Results:** Of the total 347 YA-PHIV, 187 (54%) were biological females. At enrolment, median age and duration on ART were 21.8 years (interquartile range, IQR 20.1-23.5) and 16.7 years (IQR 13.4-18.4), respectively. Their median CD4 was 564 cells/mm<sup>3</sup> (IQR 356-753), 14% had CD4 count <200 cells/mm<sup>3</sup>, 19% had HIV-RNA >1,000 copies/mL, and 7.8% had metabolic syndrome.

Overall, 25% had hs-CRP levels associated with intermediate and 26% with high risk for cardiovascular disease; levels were similar (24% and 23%) in those with HIV-RNA <1,000 copies/mL. The median serum IL-18 was 82.4 pg/mL (IQR 33.8-151.9) and sCD163 was 53.6 ng/mL (IQR 31.1-90.1). YA-PHIV with HIV-RNA >1,000 had significantly higher hs-CRP ( $p=0.001$ ), IL-18 ( $p<0.001$ ), and sCD-163 ( $p=0.003$ ) than those with HIV-RNA <1,000 copies/ml. YA-PHIV with metabolic syndrome were more likely to have higher median hs-CRP ( $p=0.008$ ) and a trend toward higher sCD163 ( $p=0.07$ ) than those without, but there was no difference in IL-18 levels. Higher median IL-18 was observed in males than females.

**Conclusions:** YA-PHIV with HIV-RNA >1,000 copies/ml had increased biomarkers of cardiovascular disease, and those with metabolic syndrome had increased hs-CRP and sCD163. Further research on the predictive value of these biomarkers on cardiovascular outcomes in aging YA-PHIV is warranted.

## OAB2105

### Biomarker-confirmed, unhealthy alcohol use among adolescents and young adults with HIV is associated with viral non-suppression in Uganda and Kenya in the SEARCH-Youth study

F. Mwangwa<sup>1</sup>, S. Puryear<sup>2</sup>, M. Nyabuti<sup>3</sup>, D. Black<sup>4</sup>, J. Peng<sup>5</sup>, E. Bukusi<sup>3</sup>, L.B. Balzer<sup>6</sup>, C. Camlin<sup>7</sup>, J. Ayieko<sup>8</sup>, T. Ruel<sup>9</sup>, G. Chamie<sup>9</sup>, M., R. Kamya<sup>10</sup>, D.V. Havlir<sup>9</sup>, J. Hahn<sup>2</sup>

<sup>1</sup>Infectious Diseases Research Collaboration, Research, Kampala, Uganda, <sup>2</sup>University of California San Francisco, Division of HIV, ID and Global Medicine, San Francisco, United States, <sup>3</sup>Kenya Medical Research Institute, Research, Nairobi, Kenya, <sup>4</sup>University of California San Francisco, Division of HIV, San Francisco, United States, <sup>5</sup>University of Washington, school of Public Health, Department of Biostatistics, Seattle, United States, <sup>6</sup>University of Massachusetts, Amherst, School of Public Health and Health Sciences, Amherst, United States, <sup>7</sup>University of California San Francisco, Center for AIDS prevention studies, San Francisco, United States, <sup>8</sup>Kenya Medical Research Institute, Adult and adolescent studies, Nairobi, Kenya, <sup>9</sup>University of California San Francisco, School of Medicine, San Francisco, United States, <sup>10</sup>Makerere University, Department of Medicine, Kampala, Uganda

**Background:** We previously demonstrated in a clinic-cluster randomized trial that the multilevel SEARCH-Youth intervention, which included life-stage assessments, person-centered care, and rapid viral load feedback, improved HIV outcomes among adolescents and young adults with HIV (AYAH) aged 15-24 in Uganda and Kenya. In a cross-sectional study, we evaluated whether alcohol use predicted viral non-suppression.

**Methods:** We conducted a survey on alcohol use and tested for phosphatidylethanol (PEth), a blood-based biomarker of prior month alcohol consumption, among intervention participants. We defined unhealthy alcohol use as Alcohol Use Disorders Identification Test - Consumption (AUDIT-C, prior 3 months) positive ( $\geq 3$  for women,  $\geq 4$  for men) OR PEth  $\geq 50$  ng/mL, and explored the association between unhealthy alcohol use and viral non-suppression ( $\geq 400$  copies/mL) using logistic regression, adjusting for gender, age, and country.

**Results:** Unhealthy alcohol use was assessed in 718 AYAH: 409 (57%) in Uganda and 309 (43%) in Kenya. Eighty percent were female, median age 24 years, and 95% were virally suppressed at the time of the survey and PEth measures, 30-36 months after enrollment.

The prevalence of unhealthy alcohol use was 24.8% and more common among males, older AYAH, and participants in Uganda (Table).

Participants with unhealthy alcohol use had 2.8 times higher odds of viral non-suppression (adjusted odds ratio = 2.80, 95%CI: 1.19-6.58,  $p=0.02$ ).

	No or low-risk alcohol use, n (row %)	Unhealthy alcohol use*, n (row %)
All	538 (75.2)	177 (24.8)
Male	92 (64.3)	51 (35.7)
Female	446 (78.0)	126 (22.0)
Aged 15-19	98 (94.2)	6 (5.8)
Aged 20-24	245 (75.6)	79 (24.4)
Aged 25-29	139 (68.4)	60 (31.6)
Ugandan	251 (62.2)	155 (38.2)
Kenyan	287 (92.9)	22 (7.1)

\*Alcohol Use Disorders Identification Test - Consumption (AUDIT-C, prior 3 months) positive ( $\geq 3$  for women,  $\geq 4$  for men) OR PEth  $\geq 50$  ng/mL

Table.

**Conclusions:** Unhealthy alcohol use, was more common in males and increased with age, suggesting there may be a window for intervention. After adjusting for gender, age, and country, unhealthy alcohol use was highly predictive of non-suppression among AYAH receiving the intensive, multi-level SEARCH Youth intervention, suggesting alcohol use may play a role in ongoing HIV transmission among AYAH.

**Background:** The combination of bictegravir (BIC), an integrase strand transfer inhibitor, and lenacapavir (LEN), a first-in-class capsid inhibitor, could consolidate treatment in virologically suppressed (VS) people with HIV-1 (PWH) who are otherwise unable to take a single-tablet regimen (STR). The 24-week primary efficacy and safety outcomes for BIC + LEN in VS PWH on a complex regimen have been presented; here we report longer-term data through Week 48.

**Methods:** In this Phase 2, randomized, open-label, multicenter study (ARTISTRY-1, NCT05502341), PWH on a stable baseline regimen (SBR) ( $\geq 6$  months prior to screening)

were randomized 2:2:1 to receive once-daily oral BIC 75 mg + LEN 25 mg, oral BIC 75 mg + LEN 50 mg, or to continue SBR. The proportion of participants with HIV-1 RNA <50 copies/mL (missing=excluded), change in CD4 cell count and treatment-emergent adverse events (TEAEs) were assessed.

**Results:** At baseline (N=128), 19% of participants were female, 31% were Black and 16% were Hispanic/Latinx; median (Q1, Q3) age was 60 (56, 65) years and participants were taking a median (range) of 3 (2-9) tablets per day. 121 participants completed the Week 48 visit (BIC 75 mg + LEN 25 mg: N=49; BIC 75 mg + LEN 50 mg: N=47; SBR: N=25). At Week 48, all participants in the BIC 75 mg + LEN 50 mg group had HIV-1 RNA <50 copies/mL; changes in CD4 counts were comparable among groups (*Table*). One participant on BIC 75 mg + LEN 50 mg had HIV-1 RNA ≥50 copies/mL at Week 36 and resuppressed after switching treatment. BIC + LEN was well tolerated, with few TEAEs leading to premature treatment discontinuation (*Table*).

	BIC 75 mg + L5M 25 mg N=49	BIC 75 mg + L5M 50 mg N=48	SBR N=28
Mean ± SD, ±SD (coefficient of variation) in %	47 (95.3)	48 (100.3)	25 (90.3)
Change from baseline in CD4 count, cells/μL, mean (SD)	35 (105.3)	43 (157.2)	43 (200.4)
≥1 TEAE up to Week 48, n (%)	42 (85.7)	40 (83.3)	19 (67.9)
≥1 TEAE of Grade 3 or higher up to Week 48, n (%)	5 (10.2)	4 (8.3)	1 (3.6)
≥1 TEAE leading to premature treatment discontinuation up to Week 48, n (%)	1 (2.0)	1(1.3)	0
≥1 treatment-related TEAE up to Week 48, n (%)	3 (6.1)	3 (6.3)	0
≥1 serious TEAE up to Week 48, n (%)	4 <sup>a</sup> (8.2)	3 <sup>a</sup> (6.3)	2 <sup>a</sup> (7.1)
Deaths up to Week 48, n (%)	0	1 <sup>a</sup> (2.1)	0

\*One participant had a study visit during the Week 48 analysis window, but had not completed the Week 48 visit. †Missing-excluded analysis includes all available HIV-1 RNA data regardless of being on or off study treatment. ‡Percentages were based on: BIC 75 mg + LEN 25 mg, N=51; BIC 75 mg + LEN 50 mg, N=52; Nausea, Vomiting, †Unrelated to study treatment. BIC, bictegravir; LEN, lenvatinib; SD, standard deviation; TTR, treatment-emergent adverse event.

*Table. Summary of efficacy and safety outcomes at week 48 (Phase 2).*

**Conclusions:** These findings support continued evaluation of the combination of BIC and LEN to simplify treatment in VS PWH who are receiving complex regimens. A BIC/LEN STR will be assessed in Phase 3.

## OAB2603

Phase 1 study of VH4524184 (VH-184), a new third-generation integrase strand transfer inhibitor (INSTI) with a unique resistance profile

L. Kahl<sup>3</sup>, F. Halliday<sup>4</sup>, J.L. Jeffrey<sup>1</sup>, S. Byrne<sup>5</sup>, T. Onodera<sup>5</sup>,  
J. Horton<sup>6</sup>, M. Lataillade<sup>7</sup>, M. Gartland<sup>1</sup>

<sup>1</sup>Viiv Healthcare, Durham, United States, <sup>2</sup>GSK, Collegeville, United States, <sup>3</sup>Viiv Healthcare, Brentford, United Kingdom, <sup>4</sup>GSK, Brentford, United Kingdom, <sup>5</sup>Shionogi & Co., LTD., Osaka, Japan, <sup>6</sup>Parexel International, Durham, United States, <sup>7</sup>Viiv Healthcare, Branford, United States

**Background:** Due to widespread use, new INSTIs that can overcome second-generation INSTI-related resistance may be needed. VH4524184 (VH-184) is a third-generation INSTI in development for HIV-1 treatment. We present the pharmacokinetics, safety, and in vitro resistance profile of VH-184.

**Methods:** A double-blind, randomized, placebo-controlled, phase 1, first-time-in-human (FTIH) study evaluated oral VH-184 in healthy adults administered as single ascending doses (10–460 mg; part 1), multiple ascending doses (160–480 mg) for 14 days with concomitant midazolam (part 2), and as a single dose (100 mg) under fasted and fed conditions (part 3).

Additionally, resistance to VH-184 was evaluated in vitro against a panel of HIV-1 clinical isolates from the phase 3 SAILING and DAWNING studies.

**Results:** In the FTIH study, 84 participants were included (placebo, n=21; VH-184, n=63; 5 female, 34 Black, 28 Hispanic). Geometric mean VH-184 plasma concentrations increased in a dose-proportional manner after single doses of 10 to 300 mg, without further increase after 460-mg single or 480-mg multiple doses; geometric mean half-life was ~24 hours. Accumulation in exposures ranging from 1.3- to 1.9-fold was observed after repeat VH-184 dosing of 480 and 160 mg, respectively. Results suggested VH-184 had minimal impact on the pharmacokinetics of CYP3A substrates and a moderate positive food effect. Generally, adverse events (AEs) were mild (n=44 in 29 participants); none were serious. Laboratory AEs were asymptomatic and unrelated to VH-184. VH-184 demonstrated potent in vitro antiviral activity against dolutegravir-selected INSTI-resistant isolates (Figure).

Figure. Antiviral activity of Vb-184 against a panel of HIV-1 clinical isolate populations<sup>††</sup> and clonal variants<sup>††</sup> from the phase 3 studies (A) SAILING and (B) DAWNING.

*Figure.*

**Conclusions:** FTIH study results helped characterize VH-184 pharmacokinetics and indicate that VH-184 does not inhibit or induce CYP3A4 and has a moderate positive food effect. The in vitro resistance profile of VH-184 is distinct from prior INSTIs, retaining antiviral activity against second-generation INSTI-resistant clinical isolates. Early data support the safety and further development of VH-184 as a third-generation INSTI for HIV-1 treatment.

## OAB2604

### Subcutaneous injections of cabotegravir + rilpivirine in virally suppressed adults with HIV-1: a substudy of the Phase 3 FLAIR study

R. D'Amico<sup>1</sup>, K. Han<sup>2</sup>, S. Min<sup>1</sup>, R. DeMoor<sup>2</sup>, M. St Clair<sup>1</sup>, S.L. Ford<sup>3</sup>, C. Harrington<sup>1</sup>, E. Bernal Morell<sup>4</sup>, J. Lombaard<sup>5</sup>, H. Crauwels<sup>6</sup>, I. Kolobova<sup>1</sup>, N. Patel<sup>7</sup>, N. Jamil<sup>7</sup>, R. Van Solingen-Ristea<sup>6</sup>, C. Acuipli<sup>1</sup>, W. Spreen<sup>1</sup>  
<sup>1</sup>ViiV Healthcare, Durham, United States, <sup>2</sup>GSK, Collegeville, United States, <sup>3</sup>GSK, Durham, United States, <sup>4</sup>Sección de Enfermedades Infecciosas, Hospital General Universitario Reina Sofía, Murcia, Spain, <sup>5</sup>Joshua Research, Bloemfontein, South Africa, <sup>6</sup>Janssen Research & development, Beerse, Belgium, <sup>7</sup>GSK, London, United Kingdom

**Background:** Cabotegravir+rilpivirine (CAB+RPV) administered via intramuscular gluteal (IM) injections is approved for maintaining HIV-1 virologic suppression. Subcutaneous (SC) injection may enable self-administration at home.

We present outcomes from the Phase 3 FLAIR (NCT02938520) substudy evaluating SC anterior abdominal injections of CAB+RPV in participants with >3 years' experience with IM injections.

**Methods:** FLAIR participants who consented for the substudy received IM injections during screening, 3 SC injections from Day 1 to Week (W) 8, and IM injections at W12. All injections were administered by study staff using the FLAIR study regimen and schedule (Q4W, CAB+RPV [400 mg/600 mg]). Outcomes assessed included pharmacokinetics, safety, tolerability, efficacy, and PROs.

**Results:** 93 participants enrolled into the substudy and received SC injections; 19% were female sex at birth, 23% were ≥50 years, and 20% were Black. CAB and RPV plasma exposures were generally comparable between SC and IM injections, with 90% CIs of geometric LSM ratios all within 0.80–1.25 bioequivalence limits (Table).

Pain, nodules, and erythema were the most commonly reported SC-related injection site reactions (ISRs), occurring with 48%, 34%, and 26% of injections. Median ISR duration was 10 days; however, median induration and nodule durations were longer with SC vs. IM administration (33 vs. 26 days and 39 vs. 9 days, respectively).

Five (5%) participants withdrew due to an SC-related ISR. At W12, 90% (n=84/93) of participants maintained HIV-1 RNA <50 copies/mL, and 2% (n=2/93) had HIV-1 RNA ≥50 copies/mL; no participants had confirmed virologic failure during the substudy.

At W9, most participants preferred IM injections (59%; n=50/85), most commonly citing less injection site swelling (58%; n=29/50) and fewer nodules (58%); 34% (n=29/85) preferred SC, most commonly citing convenience (86%; n=25/29). 59% (n=51/87) of participants were "extremely" or "very" interested in self-administration.

Analyte	Parameter	SC Injection 1	SC Injection 2	SC Injection 3	Return to Gluteal (assessed post hoc)
CAB	Cmax	0.942 (0.897, 0.990) (n=89)	0.911 (0.860, 0.965) (n=86)	0.910 (0.857, 0.966) (n=83)	1.003 (0.938, 1.074) (n=82)
	Ctau	0.948 (0.901, 0.998) (n=63)	0.935 (0.877, 0.995) (n=74)	0.934 (0.872, 1.000) (n=70)	0.999 (0.943, 1.059) (n=76)
RPV	Cmax	0.938 (0.895, 0.982) (n=88)	0.918 (0.876, 0.963) (n=85)	0.905 (0.861, 0.952) (n=82)	0.937 (0.891, 0.986) (n=80)
	Ctau	1.002 (0.952, 1.056) (n=63)	0.961 (0.921, 1.002) (n=73)	0.928 (0.885, 0.973) (n=68)	1.003 (0.955, 1.053) (n=74)

Values displayed are geometric LSM ratios (90% CI) between each injection vs. the IM gluteal injection immediately prior to the first SC injection. Return to gluteal: the IM gluteal injection immediately following the third (final) SC injection vs. the IM gluteal injection immediately prior to the first SC injection.

CAB, cabotegravir; CI, confidence interval; Cmax, plasma concentration approximately one week post injection; Ctau, plasma concentration at end of dosing interval; IM, intramuscular; LSM, least squares mean;

PK, pharmacokinetics; RPV, rilpivirine; SC, subcutaneous.

**Table. Geometric LSM ratios and 90% CIs for CAB and RPV PK parameters following SC (test) and gluteal (reference) administration by injection interval (paired data).**

**Conclusions:** Equivalent pharmacokinetics and similar efficacy were established for CAB+RPV at the SC administration site. Most participants favored IM, but a majority were still interested in the option of self-administration.

## OAB2605

### PedMAB1 clinical trial: safety assessment of CAP256V2LS and VRC07-523LS to prevent breastmilk HIV transmission in HIV-1 exposed and negative neonates

Goga<sup>7</sup>, on behalf of the PedMAB1 clinical trial team

<sup>1</sup>IRCCS Ospedale San Raffaele srl, Viral Evolution and Transmission, Milan, Italy, <sup>2</sup>SA-MRC, Durban, South Africa, <sup>3</sup>National Institute of Health, Vaccine Research Center, Bethesda, United States, <sup>4</sup>University Montpellier/INSERM, Montpellier, France, <sup>5</sup>University of Bergen, Bergen, Norway, <sup>6</sup>Wits Health Consortium/NICD, Johannesburg, South Africa, <sup>7</sup>SA-MRC, Pretoria, South Africa

**Background:** Breastmilk transmission of HIV-1 contributes to residual vertical HIV transmission. PedMAB1 aims to define the optimal doses, ideal combination and timing of subcutaneous (SC) administration of two broadly neutralizing antibodies, VRC07-523LS and CAP256V2LS, to prevent vertical HIV transmission.

Here we first report on reactogenicity and safety of CAP256V2LS, for the first time in infants, and VRC07-523LS.

**Methods:** Since study start on 1st September 2022 eight eligible HIV-exposed uninfected infants in each study arm received 5, 10 or 20 mg/kg CAP256V2LS (arms 1-3) or 20 or 30 mg/kg VRC07-523LS (arms 4 and 5), SC within 96 hours of birth. All infants were observed for 4 hours post-dose, and followed up face-to-face at days 3, 14 and 28, then monthly until 6 months for safety and pharmacokinetic assessments. In a pictorial study diary mothers documented reactogenicity and early adverse events (AEs). An internal study safety committee reviewed safety data two-weekly. Here we report on reactogenicity and AEs until 19 January 2024. The Division of AIDS Table, version 2.1. July 2017, was used to grade AEs.

**Results:** Reactogenicity grade 1 events observed at 4 hours or over the first 3 days post-dose were recorded in 3/8 and 2/8 infants receiving CAP256V2LS at 10 and 20mg/kg, respectively; and in 4/8 and 3/8 infants receiving VRC07-523LS at 20 and 30 mg/kg, respectively. AEs were mostly common illnesses (except for low absolute neutrophils, a palatal cyst and an uncomplicated umbilical hernia). 99 AEs were reported in 24 infants receiving CAP256V2LS, but only two (grade 1), one infant with raised AST and one with irritability in the 10 and 20 mg/kg arms, respectively, were related to study product. 61 AEs were reported in 16 infants receiving VRC07-523LS, and only two (raised AST and ALT) grade 1 and 2, in one infant were related to the 20mg/kg administration. All related AEs were asymptomatic and resolved within two weeks.

**Conclusions:** CAP256V2LS and VRC07-523LS at the doses here administered SC to infants within max 96 hours of birth are safe and showed overall low reactogenicity. Reported product related AEs were rare and expected. Analysis of the pharmacokinetics of the study products is ongoing.

## OAB34 Co-morbidities: The heart of the matter

### OAB3402

Detailed modelling of viremia exposure does not independently predict cardiovascular disease in people with HIV

O. Elvstam<sup>1</sup>, on behalf of the RESPOND Study Group

<sup>1</sup>Lund University, Department of Translational Medicine, Malmö, Sweden

**Background:** People with HIV have increased risk of cardiovascular disease (CVD), and prolonged viremia has been considered a CVD risk factor. Still, many previous studies have had insufficient data on potential confounders. We explored the association between viremia and CVD after adjusting for established risk factors.

**Methods:** Adults from RESPOND (data from 2012–2021) without prior CVD were followed from the first date with complete data until the first of CVD (myocardial infarction, stroke, or invasive cardiovascular procedures), loss to follow-up, or death. We fitted Cox models including the variables in the D:A:D score (age, gender, smoking, family history, diabetes, current abacavir, CD4 count, blood pressure, cholesterol, high-density lipoprotein, stavudine, didanosine, indinavir, lopinavir, and darunavir; all time-updated).

We analyzed the associations between six measures of viremia (detection limit, 200 copies/mL) and CVD after adjusting for the D:A:D variables. We compared model performance with and without viremia with Harrell's C in 5-fold internal cross-validation.

**Results:** 547 events (39% myocardial infarctions and 31% strokes) were observed in 17,497 persons (median follow-up, 6.8 years). Median age at inclusion was 45 years, 76% were male, and median total viremia-copy-years was 2.7 log<sub>10</sub> copy-years/mL. While several viremia variables were associated with CVD in univariable analyses, there were no statistically significant associations when adjusting for the D:A:D variables, neither for measures of current or pre-ART viral load, highest viremia category during ART, or cumulative viremia. None of the viremia variables improved prediction capacity (weighted mean, 0.70 for D:A:D variables without viremia and 0.70 for all models combining D:A:D and viremia variables).

**Conclusions:** In this large cohort, HIV viremia was not associated with CVD after adjusting for established risk factors. Although we are unable to analyze the impact of viremia before HIV diagnosis, our results provide evidence against a role for viral load in predicting CVD among people with HIV.

## OAB3403

### Risk of major cardiovascular events with dolutegravir versus efavirenz-based antiretroviral therapy: retrospective cohort analyses using routine, de-identified data from South Africa

J. Dorward<sup>1,2</sup>, X. Masombuka<sup>3</sup>, L. Lewis<sup>2</sup>, C. Pastellides<sup>3</sup>, J. van der Molen<sup>2</sup>, K. Asare<sup>2</sup>, C. Bottomley<sup>4</sup>, D. Jacobs<sup>3</sup>, S. Collie<sup>3</sup>, N. Garrett<sup>2,5</sup>

<sup>1</sup>University of Oxford, Nuffield Department of Primary Care Health Sciences, Oxford, United Kingdom, <sup>2</sup>Centre for the AIDS Programme of Research in South Africa (CAPRISA), Durban, South Africa, <sup>3</sup>Discovery Health, Johannesburg, South Africa, <sup>4</sup>London School of Hygiene & Tropical Medicine, London, United Kingdom, <sup>5</sup>University of KwaZulu-Natal, Discipline of Public Health Medicine, School of Nursing and Public Health, Durban, South Africa

**Background:** Integrase inhibitors such as dolutegravir may be associated with increased cardiovascular disease (CVD) but there are few data from low-and middle-income countries (LMICs), where dolutegravir has largely replaced efavirenz.

**Methods:** We used de-identified, routinely collected data from a South African managed healthcare organisation to conduct a retrospective cohort study among people with HIV (PWH) ≥18 years old, without known CVD, and initiating tenofovir disoproxil fumarate, emtricitabine and efavirenz (TEE), or tenofovir disoproxil fumarate, lamivudine and dolutegravir (TLD). We used a multivariable Cox regression to evaluate associations between TLD and the primary outcome of CVD admissions/deaths, adjusted for baseline characteristics. In a sensitivity, 'as-treated' analysis, we censored people if they changed their ART regimen during follow-up.

**Results:** Between April 2020 and December 2022, 5107 PWH initiated TLD (n=2204) and TEE (n=2903). Median (IQR) age was 37 (32-44) years, 56.8% were female, and 9.8% had a risk factor for CVD at baseline (Table).

Variable	Levels	TLD n, %	Total
Age (years)	Median (IQR)	37.0 (32.0 to 44.0)	38.0 (32.0 to 44.0)
Gender	Female	1733 (59.9)	2903 (56.8)
TB at ART initiation	Yes	86 (3.0)	160 (3.1)
Hypercholesterolaemia	Yes	45 (1.6)	85 (1.7)
Hypertension	Yes	231 (8.0)	439 (8.6)
Diabetes mellitus	Yes	80 (2.8)	124 (2.4)
CVD risk factor	Yes	269 (9.3)	503 (9.8)
Statin use	Yes	85 (2.9)	164 (3.2)

Median follow-up was 535 days (IQR 308-582). There were 33 CVD events after a median 487 (IQR 245-844) days. 25 occurred in the TEE group (observed rate 4.91/1000 person-years, 95%CI 3.17-7.24) and 8 in the TLD group (2.49/1000 person-years, 95%CI 1.08-4.91). In the multivariable Cox regression model, there was no evidence of a higher risk of

CVD events with TLD versus TEE (hazard ratio 0.49, 95% CI 0.22-1.09, p = 0.080). In the TLD group, 3.4% PWH changed their ART regimen after a median 268 days, and in the TEE group 13.1% changed ART after median 314 days, and were censored in the 'as-treated' analysis with similar results to the main model.

**Conclusions:** We found no evidence of increased risk of CVD in people who initiated TLD versus TEE in this large South African cohort with medium term follow-up, supporting the decision to replace TEE with TLD at ART initiation in South Africa.

## OAB3404

### Dolutegravir-containing antiretroviral therapy and incident hypertension: findings from a prospective cohort in Kenya, Nigeria, Tanzania, and Uganda

**Background:** Randomized trials in African countries have suggested that people with HIV (PWH) initiating antiretroviral therapy (ART) with dolutegravir may have increased risk of hypertension compared with efavirenz. This risk needs to be assessed in real-world populations.

**Methods:** The ongoing African Cohort Study enrolls PWH and people without HIV (PWoH) aged ≥15 years in care at 12 PEPFAR-supported facilities in Kenya, Nigeria, Tanzania, and Uganda. For these analyses, observation time began at ART initiation or cohort enrollment (whichever later) for PWH and at cohort enrollment for PWoH.

We defined hypertension as blood pressure  $\geq 140/90$  mmHg at  $\geq 2$  consecutive 6-monthly visits or receipt of any anti-hypertensive medication. We excluded participants who met this definition prior to the start of observation time (i.e., prevalent hypertension) and study visits with pregnancy. We used Cox proportional hazards models to examine associations between time-varying ART anchor drug (or PWoH) and incident hypertension, changing reference groups to allow for all comparisons with dolutegravir. We ran an unadjusted model, a model adjusted for sociodemographic characteristics only, and a model additionally adjusted for time-varying body mass index (BMI).

**Results:** Between 01/2013–08/2023, 2935 participants meeting inclusion criteria for these analyses were enrolled and followed for a median of 5.4 years; 2477 (84%) were PWH, 1691 (58%) were female, and mean (SD) age was 36 (12) years. During of follow-up, 423 (14%) participants had incident hypertension. In unadjusted and adjusted models (Figure), dolutegravir was not significantly associated with incident hypertension compared with efavirenz, protease inhibitors, and PWoH. Dolutegravir was associated with significantly reduced hazards of incident hypertension compared with nevirapine (adjusted hazard ratio 0.45, 95% CI: 0.32–0.63). Adjusting for time-varying BMI did not have a major impact on comparisons.

Figure. Adjusted and unadjusted time-varying Cox proportional hazard models examining the associations between time-varying antiretroviral therapy anchor drug and incident hypertension.

**Conclusions:** Dolutegravir was not associated with any significant deleterious impact on incident hypertension compared with other ART anchor drugs.

## OAB3405

### Integrating non-communicable disease screening and treatment in antiretroviral clinics: insights from Malawi

S. Kawonga Dunga<sup>1</sup>, A. Yemane Berhan<sup>2</sup>, L. Kalitera<sup>1</sup>, S. Fatch<sup>1</sup>, A. Maida<sup>3</sup>, T. Maphosa<sup>1</sup>

<sup>1</sup>Elizabeth Glaser Pediatric Aids Foundation, Lilongwe, Malawi, <sup>2</sup>Elizabeth Glaser Pediatric AIDS Foundation, Washington DC, United States, <sup>3</sup>U.S Centers for Disease Control, Division of Global HIV & TB, Lilongwe, Malawi

**Background:** Increased access to antiretroviral therapy (ART) has improved the life expectancy of people living with HIV (PLHIV), resulting in an aging cohort at high risk of developing non-communicable diseases (NCDs). Integrating NCD care within HIV clinics is pivotal for comprehensive health care. We share the outcomes of integrating NCD screening with ART services in Malawi.

**Description:** The initiative by the Elizabeth Glaser Pediatric AIDS Foundation involved using lay health workers (LHW) to implement hypertension (HTN) and diabetes mellitus (DM) screening among PLHIV aged  $> 30$  and  $> 40$  years, respectively, across 46 health facilities.

We analyzed routinely collected data from screening registers for all ART clients screened for HTN or DM between January and September 2023. We used descriptive analysis and logistic regression based on two outcome variables: HTN, defined as at least two blood pressure readings of  $> 140/90$  mmHg, and DM, defined as a random blood sugar level of  $\geq 200$  mg/dl or fasting blood sugar level of  $\geq 163$  mg/dl.

**Lessons learned:** A total of 106,880 PLHIV on ART were eligible for HTN screening, while 60,572 were eligible for DM screening. Of those eligible, 23,841 (22%) underwent HTN screening, and 9,835 (16%) DM screening. The screening cohorts predominantly consisted of women (67% and 63% within the HTN and DM cohorts, respectively). The prevalence of HTN and DM was 3,815 (16%) and 197 (2%), respectively.

The prevalence of HTN was higher in males (16.8%) than females (15.5%) ( $p = 0.013$ ). Individuals aged  $> 60$  years were more likely to have HTN (Adjusted Odds ratio (AOR) = 2.84, 95% CI: 2.50 – 3.21) or DM (AOR = 2.04, 95% CI: 1.43 – 2.9,  $p < 0.001$ ) than those aged 40 – 60 years. A high percentage diagnosed with HTN (91.7%), and DM (89%) were treated within the HIV clinic. Severe HTN requiring hospitalization was noted in 9 PLHIV.

**Conclusions/Next steps:** The findings show the significance of addressing the healthcare needs of patients on ART, particularly in integrating NCD care into HIV services. Enhancing NCD screening rates and optimizing treatment within ART clinics can better manage HIV comorbidities.

### OAB3602

Time is of the essence: clinical frailty among a cohort of Indigenous peoples aging with HIV in Ontario, Canada

N. Bauer<sup>1,2</sup>, K. O'Brien<sup>2</sup>, L. Light<sup>2</sup>, L. Sirisegaram<sup>3</sup>, R. Jackson<sup>4</sup>, M. Young<sup>5</sup>, A. Kroch<sup>2</sup>, S. Hillier<sup>6</sup>

<sup>1</sup>University of Toronto, Temerty Faculty of Medicine, Toronto, Canada, <sup>2</sup>Ontario HIV Treatment Network (OHTN), Toronto, Canada, <sup>3</sup>University Health Network and Sinai Health Systems, Division of General Internal Medicine and Geriatric Medicine, Department of Medicine, Toronto, Canada, <sup>4</sup>McMaster University, Department of Health & Aging and the School of Social Work, Hamilton, Canada, <sup>5</sup>Ontario Aboriginal HIV/AIDS Strategy (OAHAS), Barrie, Canada, <sup>6</sup>York University, School of Health Policy & Management, Toronto, Canada

**Background:** As the cohort of people living with HIV (PLHIV) grows older on average, geriatric and HIV care must co-evolve. Within this cohort, Indigenous Peoples remain overrepresented. The aging experience for Indigenous older adults living with HIV (IOALWH) involves the intersecting effects of systemic colonial oppression, inter-generational trauma, continued racist violence, service inaccessibility, and socioeconomic disadvantage. These factors have contributed to increasing health disparities within Indigenous communities, translating to higher co-morbidity burden and worse health outcomes. Owing to both their HIV status and Indigenous identity, IOALWH may face disproportionate burdens while aging. This study aims to characterize clinical frailty in a cohort of IOALWH.

**Methods:** The OHTN Cohort Study (OCS) is an open longitudinal cohort of PLHIV at 15 clinical sites in Ontario, Canada, with currently over 5000 people under active follow-up. The study includes data abstraction from clinical records, laboratory reports, and an annually administered questionnaire. We assessed clinical frailty using the modified frailty index (mFI), approximated with aggregations of ICD-10 codes from diagnostic records. Presentation of a frailty related condition contributes to a frailty score. A score of 0 represents no clinical frailty, 1-2 is pre-frailty, and  $\geq 3$  is clinical frailty.

**Results:** Data from 6582 participants (n=330 Indigenous) and diagnostic reports from 1940-2018 were included. IOALWH faced greater rates of pre-frailty (49.7% vs. 41.1%) and clinical frailty (8.8% vs. 5.8%). IOALWH acquired all clinical indicators at earlier median ages, including HIV (31 vs. 34), AIDS (36 vs. 40), pre-frailty (40 vs. 44), and clinical frailty (51 vs. 56). Certain frailty indicators were overrepresented among IOALWH compared to non-Indigenous OALWH, including impaired sensorium (+21.1% greater

prevalence), COPD/pneumonia (+7.6%), diabetes (+2.3%), and non-independent functional status (+2.3%). In a multivariate logistic model, intravenous drug use (IVDU; OR 1.97, p<.0001), AIDS (OR 1.57, p<.0001), and Indigenous identity (OR 1.57, p<.0001) were found to be independent predictors of pre-frailty and clinical frailty.

**Conclusions:** IOALWH face disproportionate burdens of aging-related co-morbidities and acquire clinical frailty at earlier ages compared to non-Indigenous OALWH, independent of IVDU and AIDS. Healthcare delivery must address underlying inequities by co-evolving HIV and geriatric care to respond to earlier and more complex care needs.

### OAB3603

Association of PNPLA3 rs738409 genotype with hepatic steatosis among non-obese people living with HIV

T. Apornpong<sup>1</sup>, N. Chuaypen<sup>2</sup>, H.M.S. Lwin<sup>1</sup>, A. Hiransuthikul<sup>1,3</sup>, S. Gatechompol<sup>1</sup>, S. Ubolyam<sup>1</sup>, S. Kerr<sup>1,4,5</sup>, P. Tangkijvanich<sup>2</sup>, A. Avihingsanon<sup>1</sup>, W.M. Han<sup>1,5</sup>, HIVNAT 006 <sup>1</sup>HIV-NAT, Thai Red Cross AIDS Research Centre, Bangkok, Thailand, <sup>2</sup>Center of Excellence in Hepatitis and Liver Cancer, Chulalongkorn University, Department of Biochemistry, Faculty of Medicine, Bangkok, Thailand, <sup>3</sup>Chulalongkorn University, Department of Preventive and Social Medicine, Faculty of Medicine, Bangkok, Thailand, <sup>4</sup>Biostatistics Excellence Centre/Chulalongkorn University, Faculty of Medicine, Bangkok, Thailand, <sup>5</sup>The Kirby Institute, UNSW, Sydney, Australia

**Background:** In addition to the well-established association of obesity, there is a growing recognition of genetic influences on susceptibility to liver diseases. We investigated genetic determinants of steatotic liver disease (SLD) among Thai people with HIV (PWH).

**Methods:** A cross-sectional study was conducted at the HIV Netherlands Australia Thailand (HIV-NAT), Bangkok, Thailand. PWH aged  $\geq 18$  years without excessive alcohol consumption who underwent controlled attenuation parameter (CAP) between July 2013 and June 2023 and had tested with single nucleotide polymorphism (SNPs) including PNPLA3 rs738409 and HSD178B rs6834314 were analysed. SLD was defined as CAP  $\geq 248$  dB/m.

Multivariable logistic regression investigated associations between SNPs and SLD, and interactions between genotypes and obesity (BMI $>25$  kg/mm<sup>2</sup>).

**Results:** Of 764 PWH (35% female, median age 45 (IQR 36-52) years) analysed, SLD was observed in 270 (35.3%) participants and 136 (50%) were not obese. The median duration of ART and median CD4 count was 11 (5-18) years and 581 (422-753) cells/mm<sup>3</sup>, respectively. Seventy-four (35%) were on integrase integrase strand transfer inhibitors. Participants with SLD had higher BMI (24.9 [22.8-28.1] vs 22.1 [IQR 20.3-23.9] kg/m<sup>2</sup>) and a higher

proportion diabetes mellitus (25% vs. 16%), hypertension (83% vs. 60%), dyslipidemia (88% vs. 76%) and liver fibrosis (LSM $\geq$ 7.5 kPa, 22% vs. 12%), compared to those without SLD. Overall, PNPLA3 rs738409 CC, CG and GG genotypes were present in 50%, 39% and 11%, and HSD178B rs6834314 AA, AG and GG genotypes in 36%, 51% and 13%, respectively. In the multivariable model, the male sex ( $\alpha$ OR=1.98, 95% CI 1.23-3.18,  $p=0.005$ ), higher BMI ( $\alpha$ OR=1.32, 95% CI 1.24-1.41,  $p<0.001$ ) and PNPLA3 rs738409 G allele ( $\alpha$ OR=1.49, 95% CI 1.003-2.22,  $p=0.049$ ) were associated with an increased risk of SLD. There was a significant interaction between PNPLA3 rs738409 genotype and BMI ( $p=0.014$ ). After subgroup analysis using BMI, PNPLA3 rs738409 G allele was significantly associated among non-obese individuals ( $\alpha$ OR=1.79, 95% CI 1.18-2.72,  $p=0.006$ ).

**Conclusions:** Nearly half of the participants with SLD in our cohort were not obese. PNPLA3 rs738409 genotype was associated with SLD among non-obese Thai individuals. This underscores that genetic factors can influence liver disease susceptibility in PWH, independent of established risk factors.

## OAB3604

### Additional time post-integrase inhibitor to protease inhibitor switch shows trend to weight loss: DEFINE 48-week results

D. Anderson<sup>1</sup>, M. Ramgopal<sup>2</sup>, D. Hagins<sup>3</sup>, J. Lee<sup>1</sup>, R.B. Simonson<sup>1</sup>, T.-H. Hsu<sup>1</sup>, P. Xu<sup>4</sup>, N. Ahmad<sup>1</sup>, W.R. Short<sup>5</sup>  
<sup>1</sup>Johnson & Johnson, Infectious Diseases & Vaccines, Titusville, United States, <sup>2</sup>Midway Immunology and Research Center, Fort Pierce, United States, <sup>3</sup>Chatham CARE Center, Savannah, United States, <sup>4</sup>Johnson & Johnson, Janssen Research & Development, Titusville, United States, <sup>5</sup>Perelman School of Medicine, University of Pennsylvania, Philadelphia, United States

**Background:** Integrase inhibitor (INI)-based antiretroviral (ARV) therapies are associated with greater weight gain than non-nucleoside reverse transcriptase inhibitor- or boosted protease inhibitor (PI)-based regimens. The primary analysis of DEFINE found no significant difference in percent body weight change from baseline to Week 24 when switching to darunavir/cobicistat/emtricitabine/tenofovir alafenamide (D/C/F/TAF) vs continuing INI+TAF/emtricitabine (FTC). Longer-term weight/metabolic data through Week 48 post-ARV switch are reported here.

**Methods:** DEFINE (ClinicalTrials.gov: NCT04442737) is a randomized (1:1), prospective, 48-week, active-controlled, open-label, multicenter phase 4 study evaluating a switch to D/C/F/TAF (immediate switch [IS]) vs continuance of INI+TAF/FTC (for Weeks 0-24, then delayed switch [DS] to D/C/F/TAF for Weeks 24-48) in virologically-suppressed adults with HIV-1 acquisition and  $\geq 10\%$  weight gain within the preceding 36-month period on the INI-based regi-

men. Percent weight change from baseline was analyzed in the intent-to-treat (ITT) population. Outcomes are reported in the IS arm (with no comparator).

**Results:** 103 adults were randomized (IS arm:  $n=53$ ; DS arm:  $n=50$ ); 61% were Black/African American and 30% were female. Versus 24-weeks, weight loss and DEXA changes were observed at Week 48 (median [IQR] percent change,  $-0.84\%$  [ $-4.10, 1.69$ ]; *Table*). Participants were increasingly likely to experience any weight loss (63.0% vs 44.9%) and achieve  $\geq 3\%$  weight loss (30.4% vs 14.3%) at Week 48 vs 24, respectively. With extended time post-switch, minor improvements in BMI (57.1% with BMI  $\geq 30$  kg/m<sup>2</sup> at Week 24 vs 50.0% at Week 48) and waist circumference were also seen. D/C/F/TAF was safe and well-tolerated, with high levels of virologic suppression.

	Week 24	Week 48
Weight change, %, median (interquartile range; [IQR])	0.52 ( $-1.80, 2.91$ ) [ $n=49$ ]	$-0.84$ ( $-4.10, 1.69$ ) [ $n=46$ ]
Experienced $\geq 3\%$ weight loss, $n$ (%)	7 (14.3) [ $n=49$ ]	14 (30.4) [ $n=46$ ]
Weight change, %, Black/African American subgroup, median (IQR)	$-0.15$ ( $-2.39, 2.91$ ) [ $n=30$ ]	$-1.11$ ( $-5.60, 1.70$ ) [ $n=28$ ]
Weight change, %, female subgroup, median (IQR)	0.73 ( $-2.18, 3.49$ ) [ $n=14$ ]	$-1.75$ ( $-4.05, 1.70$ ) [ $n=12$ ]
Weight change, %, Black/African American female subgroup, median (IQR)	0.03 ( $-2.29, 3.32$ ) [ $n=12$ ]	$-2.81$ ( $-5.19, 2.17$ ) [ $n=11$ ]
Weight change, %, baseline body mass index [BMI] $\geq 30$ kg/m <sup>2</sup> subgroup, median (IQR)	$-0.34$ ( $-1.77, 2.43$ ) [ $n=26$ ]	$-1.07$ ( $-3.55, 1.80$ ) [ $n=24$ ]
Weight change, %, baseline BMI $\geq 40$ kg/m <sup>2</sup> subgroup, median (IQR)	$-0.58$ ( $-2.39, 1.38$ ) [ $n=11$ ]	$-2.81$ ( $-2.91, 0.96$ ) [ $n=9$ ]

*Table.*

**Conclusions:** The trajectory of weight change after INI to PI switch appeared different in the first 24 weeks post-switch (no weight loss observed) vs Weeks 24-48, where a trend to weight loss emerged.

Secondary metabolic endpoints remained stable or paralleled weight loss. Longer time post-ARV switch suggests medication management may be an important component to address this issue.

### A pilot study assessing changes in cerebral function parameters in persons with insomnia switching integrase inhibitors

M. Henderson<sup>1</sup>, K. Alford<sup>2</sup>, N. Doyle<sup>1</sup>, A. Busza<sup>3</sup>, S. Vundavalli<sup>4</sup>, A. Winston<sup>1</sup>, J. Vera<sup>2</sup>

<sup>1</sup>Imperial College London, Department of Infectious Disease, London, United Kingdom, <sup>2</sup>Brighton and Sussex Medical School, Department of Global Health and Infection, Brighton, United Kingdom, <sup>3</sup>Imperial College London, Department of Brain Sciences, London, United Kingdom, <sup>4</sup>Brighton and Sussex University Hospitals NHS Trust, Department of Imaging and Nuclear Medicine, Brighton, United Kingdom

**Background:** Sleep disturbances are frequently reported in persons with HIV and have been associated with the use of integrase strand transfer inhibitors (INSTIs). This exploratory study assessed changes in cerebral function parameters in individuals with insomnia switching INSTIs.

**Methods:** Individuals with an insomnia severity index (ISI) above 8 and virologically suppressed on a dolutegravir-containing ART regimen (DTG-ART) were randomised 1:1 to either continue DTG-ART or switch to tenofovir-alafenamide/emtricitabine/bictegravir (BIC-ART) for 120 days.

Cerebral function parameters were measured at baseline and day 120 and included patient-reported outcomes (PROs) assessing sleep (ISI, Epworth Sleepiness Scale (ESS)) and quality of life (QoL) (Short Form 36-Physical Function (SF36-PF)), resting-state functional cerebral MRI (RS fMRI) examining functional connectivity (FC) networks previously associated with DTG use, and plasma soluble inflammatory biomarkers (sCD14, IL-6 and IP-10).

Between group analyses of PRO change scores and the impact of covariates were analysed using Mann-Whitney U and linear regression modelling. RS fMRI were examined by independent component analysis using Matlab's CONN toolbox.

Figure. Enhanced RS-fMRI functional connectivity in the default mode network (DMN) in those switched to BIC-ART from DTG-ART. Yellow: areas of enhanced DMN connectivity at 120 days compared to baseline.

**Results:** Of 19 individuals (12 DTG-ART, 7 BIC-ART), median age was 55 years (range 28-83), all were male and 17 of white ethnicity. Over 120 days, improvements in sleep and QoL in those randomised to BIC-ART vs DTG-ART were observed. Median change in ISI score -9 (-14 to -2) vs -1 (-10

to -4),  $p=0.0247$ , ESS -3.0 (-6 to -1) vs 2 (-3 to 6),  $p=0.005$  and SF36-PF -5 (-40 to 5) vs 0 (-5 to 15),  $p=0.025$ , respectively. BIC-ART was also associated with increased FC in the Default Mode Network ( $p<0.005$ ), most pronounced in the middle temporal and superior frontal gyri. No significant changes in soluble biomarkers were observed.

**Conclusions:** In this exploratory study individuals with insomnia who switched to BIC-ART had improvements in self-reported sleep, QoL and RS networks associated with sleep, when compared to those continued on DTG-ART.

## OAB38 An INSTIgrated tale

### OAB3802

#### Analysis of dolutegravir scaleup and HIV-1 treatment outcomes in Uganda from 2021-2023

K. Huang<sup>1</sup>, P. Solis Reyes<sup>1</sup>, A. Ayitewala<sup>2</sup>, F. Kyeyune<sup>2</sup>, I. Nankia<sup>2</sup>, E. Arts<sup>1</sup>

<sup>1</sup>University of Western Ontario, Microbiology and Immunology, London, Canada, <sup>2</sup>Joint Clinical Research Centre, Center for AIDS Research Laboratories, Kampala, Uganda

**Background:** As the rapid DTG scale-up in sub-Saharan Africa nears completion, assessment on the impact of this major transition is necessary. Critically, little is known about the suppression rates of DTG-based regimens in sub-Saharan Africa following mass implementation. The Joint Clinical Research Centre (JCRC) is headquartered in Kampala, Uganda, and houses one of the largest HIV clinics and research facilities in Africa. Together with its regional facilities, the JCRC provides care to over one million HIV clients yearly. Here, we report on the clinical outcomes of DTG and NNRTI-based regimens seen in clients receiving care at the JCRC between January 2021 and September 2023.

**Methods:** The treatment regimen and outcome (suppression or failure) was recorded for clients treated at the JCRC in Kampala, Uganda, between 2021-2023. Frequency and suppression/failure rates of each regimen were determined.

**Results:** The clinic provided care for 1,258,368 clients (95.2% viral suppression) in January-September 2023 (2023n), up from 975,622 clients in 2021 (95.9% suppression). Use of DTG-based regimens increased from 876,872 (89.9%) in 2021 to 1,250,188 (99.4%) in 2023n. This corresponded with an increase in DTG failure rate from 3.5% (30,944 clients) in 2021 to 4.8% (59,677 clients) in 2023n. The two most common DTG-based cocktails were TDF/3TC/DTG (TLD) and ABC/3TC/DTG (1,195,722 and 41,761 clients in 2023n, respectively). Strikingly, virologic failure was 3.4-fold higher for ABC/3TC/DTG compared to TLD (0.14% vs 0.04%) in

AIDS 2024

2023n. The most common DTG-based salvage therapy was DRV/RTV/TDF/3TC/DTG (417 clients in 2023n), with a virologic suppression of 78.9% (329/417 clients) in 2023n. The highest rate of suppression among DTG-based salvage therapies (>10 clients) was observed for DRV/RTV/DTG/ETV (28/34 clients, 82.4%) in 2023n. NNRTI-based regimen use decreased from 98,746 clients in 2021 to <10,000 clients in 2023n. Average virologic failure on an NNRTI-based regimen was 8.9% from 2021-2023

**Conclusions:** Thus, in one of the largest reports on the clinical outcomes of the DTG scale-up to date, our findings support the continued widespread use of TLD in sub-Saharan Africa to achieve UNAIDS' 95% suppression target. However, as a consequence of observed rates of virologic failure >5%, we emphasize continued caution in the use of ABC/3TC/DTG and NNRTI-based regimens.

## OAB3803

### Viral suppression, viral failure and safety outcomes in children and adolescents on dolutegravir (DTG) in Europe and Thailand

**Background:** There are limited data on DTG safety and effectiveness in children and adolescents living with HIV(-CALWHIV) in routine-care settings.

**Methods:** Data on CALWHIV aged <18years at DTG start were pooled from 15 cohorts in the European Pregnancy and Paediatric Infections Cohort Collaboration. Effectiveness outcomes were proportion virally suppressed<50copies/mL at 24/48/96/144/192 (±12) weeks after DTG start; and cumulative incidence of viral failure (≥2 viral load(VL) ≥400c/mL or 1 VL≥400c/mL followed by DTG discontinuation), overall and by age, ART/VL status and weight-band at DTG start. Safety outcomes were frequency of clinical adverse events(AEs) and serious AEs(-SAEs) causally associated with DTG, incidence of laboratory abnormalities and DTG discontinuation.

Figure: Time to viral failure on DTG stratified by (a) age-group, (b) ART and viral status and (c) weight-band at DTG start.

**Results:** Of 1231 CALWHIV ever on DTG, characteristics at DTG start were: median[IQR] age 14[11,16] years, 50% male, 95% perinatal HIV, 42% black ethnicity; 10% ART-naïve, 49% ART-experienced/suppressed (VL<200c/mL), 13% ART-experienced/viraemic (VL≥200c/mL), and 28% ART-experienced/unknown VL. Median duration on DTG was 93[49,163] weeks. Viral suppression was 88-91% throughout time on DTG; highest among those ART-experienced/suppressed at DTG start(92-94%), lowest among ART-experienced/viraemic at DTG start(72-83%). Overall cumulative incidence (95% CI) of viral failure by 96 and 144-weeks was 4%(3-6) and 8%(6-11), respectively. Incidence varied by ART/VL status at DTG start: lowest in ART-experienced/suppressed and highest among ART-experienced/viraemic ( $p<0.001$ , Figure). Of 1146/1231(93%) with clinical data, 26(2%) experienced 52 AEs causally related to DTG, including 5 SAEs (no deaths). Among 936/1231(76%) with laboratory data, 49(5%) experienced 57 DAIDS grade ≥3 events; a rate of <1 per 100

person-years. Overall, 95(8%) discontinued DTG at median 90[36,138] weeks: 5(5%) due to viral failure, 17(18%) toxicity, and 73(77%) treatment simplification/other reasons. Cumulative incidence of discontinuation was 5%(4-7) and 10%(8-12) by 96 and 144-weeks, respectively. Follow up was censored at earliest of last viral load or discontinuation of DTG in patients who did not fail. Analysis was restricted to patients with at least 24 weeks follow up after DTG start.

**Conclusions:** DTG was generally well tolerated with high viral suppression; overall incidence of viral failure was low but significantly higher among those ART-experienced/viraemic at DTG start.

## OAB3804

Extended efficacy and safety of dolutegravir and darunavir containing regimens at week 96 in the international randomised clinical trial: D<sup>2</sup>EFT

N. Kumarasamy<sup>1</sup>, on behalf of D<sup>2</sup>EFT study group

<sup>1</sup>Voluntary Health Services, Chennai Antiviral Research and Treatment (CART), Chennai, India

**Background:** D<sup>2</sup>EFT is an international randomised trial comparing dolutegravir (DTG) with ritonavir boosted darunavir (DRV/r) versus DTG with fixed tenofovir and lamivudine or emtricitabine (TDF/XTC) versus standard of care (SOC:DRV/r+2NRTIs with a rotation of nucleosides or adaptation to HIV genotype) in adult people living with HIV-1 whose first-line NNRTI-based therapy has failed. At the 48-week primary endpoint both intervention arms demonstrated non-inferiority to SOC in terms of HIV-RNA<50 copies/mL with the DRV/r+DTG arm also showing superiority.

**Methods:** Week 96 data are here presented as modified intent to treat analysis including all available data.

**Results:** 826 participants from 14 resource-constrained countries were randomised: DTG+DRV/r (n=271), DTG+TDF/XTC (n=294), SOC:DRV/r+2NRTIs (n=261). Median age 39 years, 55% female and 69%, 25% and 2% of Black, Asian and White ethnicity respectively. Median CD4 was 206 cells/mm<sup>3</sup> and median HIV-RNA was 15,400 copies/mL. Median BMI was 23 kg/m<sup>2</sup>.

By week 96 proportions remaining on original randomised regimen were 98%, 97% and 91% for DTG+DRV/r, DTG+TDF/XTC and DRV/r+2NRTIs respectively. At 96 weeks when compared to the SOC, the percentage with HIV-RNA<50 copies/mL was significantly higher for both DTG+DRV/r (85.6% vs 76.0%, [difference 9.6% (95% CI:2.7-16.4),  $p=0.01$ ] and DTG+TDF/XTC (81.6 vs 72.6% [difference 9.0% (95%CI 1.4, 16.6),  $p=0.02$ ).

In a snapshot analysis in which response at week 96 was defined as remaining on randomised regimen and HIV-RNA <50 copies/mL, the proportions were 68.6% SOC, 77.9% DTG+DRV/r and 76.5% DTG+TDF/XTC ( $p<0.05$  for both intervention arms against SOC).

abstracts

Author  
Index

Overall mean CD4 gain to week 48 was 156 cells/mm<sup>3</sup> and by week 96 was 204 cells/mm<sup>3</sup>. At week 96 CD4 count gain was on average 53 cells greater in the DTG+DRV/r arm and 35 cells greater in the DTG+TDF/XTC arm compared to SOC ( $p<0.003$  and  $0.06$  respectively).

Mean weight gain over 96 weeks was 4.1kg (SD7.2), 7.4kg (SD7.9) and 5.8kg (SD8.1) in SOC, DTG+DRV/r and DTG+TDF/XTC arms respectively. Trajectory of weight gain in DTG+TDF/XTC versus SOC plateaued after week 48 but continued in DTG+DRV/r.

**Conclusions:** Extended week 96 analysis in the D<sup>2</sup>EFT study confirms the efficacy and tolerability of DTG-containing regimens with both arms reaching superiority against DRV/r+2NRTI for virologic suppression to <50 copies/mL.

## OAB3805

Switching from a second-line ritonavir-boosted protease inhibitor (PI/r)-based regimen to bictegravir/emtricitabine/tenofovir alafenamide (B/F/TAF): results of a randomized clinical trial

S. Pierre<sup>1</sup>, J.B. Marc<sup>1</sup>, F. Homeus<sup>1</sup>, G.R. Bernadin<sup>1</sup>, L. Trevisi<sup>2</sup>, E. Jean<sup>1</sup>, E. Dumont<sup>1</sup>, S. Sundaresan<sup>3</sup>, V. Rivera<sup>1</sup>, D. Israelski<sup>4</sup>, S.E. Collins<sup>4</sup>, J.W. Pape<sup>5</sup>, B. Liautaud<sup>1</sup>, P. Severe<sup>1</sup>, P.E. Sax<sup>6</sup>, S. Koenig<sup>6</sup>

<sup>1</sup>GHEKIO, Medicine, Port-au-Prince, Haiti, <sup>2</sup>Harvard Medicine School, Global Health and Social Medicine, Boston, United States, <sup>3</sup>Analysis Group, Inc, Boston, United States, <sup>4</sup>Gilead Sciences, Inc, Foster City, United States, <sup>5</sup>GHEKIO, Medicine, Port-au-Prince, Haiti, <sup>6</sup>Brigham and Women's Hospital, Medicine, Boston, United States

**Background:** Patients on PI/r-based regimens in resource-limited settings have high rates of NRTI resistance, but testing is rarely available. This study compared continuing PI/r + NRTIs vs. B/F/TAF in PWH on second-line ART with no prior drug resistance testing.

**Methods:** This prospective, open-label trial conducted at GHEKIO in Haiti, randomized adults ( $\geq 18$  years) with viral suppression on second-line PI/r-based ART to continue current regimen vs. switch to B/F/TAF.

The primary endpoint was the proportion of participants with HIV-1 RNA  $\geq 200$  copies/mL at week 48 using the FDA snapshot algorithm; difference between groups was assessed with non-inferiority margin of 4%.

**Results:** Between October 2020 and March 2023, 310 participants were randomized and treated (B/F/TAF: 153; PI/r: 148). Median age was 50 years (IQR 42, 58) and 173 (57%) were women. At enrollment, 180 (59.8%) were taking lopinavir/r and 121 (40.2%) atazanavir/r; 234 (77.7%) were taking TDF, 54 (17.9%) zidovudine, and 13 (4.34%) abacavir; all were taking lamivudine or emtricitabine. Median time on PI/r was 3.7 years (IQR 2.2, 5.7). At week 48, the proportion with HIV-1 RNA  $\geq 200$  copies/mL was 0.7% (1/153) and 3.4% (5/148) in the B/F/TAF and PI/r groups, respectively; difference -2.7 (95% CI: -6.7 to 1.2), meeting non-inferiority

for B/F/TAF compared to PI/r (Table 1). 144 (94.1%) and 135 (91.2%), respectively had 48-week HIV-1 RNA <200 copies/mL. There were no drug discontinuations due to adverse events in either group. Baseline archived proviral DNA (B/F/TAF group) and genotypic resistance testing for virologic failures (both groups) are pending. This study was conducted during both COVID-19 and severe civil unrest and gang-related violence in Haiti. Follow-up was enabled by community health workers and neighborhood drug distribution.

Week 48 Outcome	B/F/TAF (n=153)	Boosted PI (n=148)
Primary end point: HIV-1 RNA $\geq 200$ copies/mL	1 (0.7%)	5 (3.4%)
HIV-1 RNA $\geq 200$ copies/mL in 48-week window	0	3
Treatment discontinued before week 48 owing to lack of efficacy	0	0
Died or LTFU with last available HIV-1 RNA value of $\geq 200$ copies/mL	1	2
HIV-1 RNA <200 copies/mL in 48-week window	144 (94.1%)	135 (91.2%)
No data for final outcome (censored)	8 (5.2%)	8 (5.2%)

Table 1. Primary End Point – Virologic Outcomes at Week 48.

**Conclusions:** Switching virally suppressed adults on a second-line PI/r regimen to B/F/TAF is non-inferior to continuing PI/r-based ART. Rates of viral suppression were high in both groups.

# OAC08 HIV and STI prevention: Understanding preferences and perceptions

## OAC0802

### Understanding barriers and facilitators to doxycycline post-exposure prophylaxis adherence among young women in Western Kenya: a qualitative study

B. Kwach<sup>1</sup>, Z. Kwen<sup>1</sup>, L. Violette<sup>2</sup>, J. B. Oduyo<sup>1</sup>, K. Oware<sup>1</sup>, J. Simoni<sup>3</sup>, E. A. Bukusi<sup>1,2,4</sup>, J. M. Baeten<sup>2</sup>, J. Stewart<sup>5,6</sup>

<sup>1</sup>Kenya Medical Research Institute (KEMRI), Centre for Microbiology Research, Kisumu, Kenya, <sup>2</sup>University of Washington, Departments of Global Health, Seattle, United States, <sup>3</sup>University of Washington, Departments of Psychology, Seattle, United States, <sup>4</sup>University of Washington, Departments of Ob/Gyn, Seattle, United States, <sup>5</sup>Hennepin Healthcare, Division of Infectious Diseases, Minneapolis, United States, <sup>6</sup>University of Minnesota, Department of Medicine, Minneapolis, United States

**Background:** Sexually transmitted disease rates are high among women using PrEP in sub-Saharan Africa. Doxycycline post-exposure prophylaxis (dPEP) effectively prevented STIs in trials among cisgender men and transgender women but not among cisgender women because use of dPEP was low.

Understanding the barriers to dPEP adherence in women is essential to interpreting trial results and to inform implementation.

**Methods:** We conducted a qualitative analysis nested in the dPEP Kenya Study, an open-label randomized controlled trial of dPEP (200mg of doxycycline taken within 72 hours of exposure) among 449 cisgender women, aged 18-30 and taking HIV PrEP in Kisumu, Kenya.

We completed serial, in-depth interviews (n=40) and four FGDs (n=29) among women purposively sampled from 224 participants assigned to dPEP group between June 2021 and August 2023. IDs and FGDs were audio-recorded, transcribed, and translated from preferred language to English for coding and analysis. An inductive content analysis approach was used to identify themes (De-doose).

**Results:** Five main themes on barriers to dPEP adherence emerged (**Table 1**). We found that side effects, such as nausea from medication on an empty stomach, challenges in interpreting dosage instructions, and pill burden were major barriers to dPEP adherence. Stigma associated with taking dPEP and fear of partner reaction also discouraged use of dPEP. Three key themes emerged as facilitators to use of dPEP in women, the perceived value of dPEP in preventing STI, familiarity with doxycycline, and use of a discrete pill case motivated some women to take dPEP.

Factors	Themes	Category	Exemplary Quotes
Barriers to dPEP use	Side effects (e.g., nausea/vomiting, fatigue, headache, photosensitivity, increased libido, smell of urine, taste in mouth, weight loss, and interaction with menstrual cycle)	Challenges of taking dPEP on empty stomach.	"I am not used to doxy, so if I take it, I don't feel well. The first week I was given, I took them 6 times. Since it was giving me side effects like nausea, the following week I took it 4 times, so the following week I didn't use because of the side effects. I don't know how you will help me for the side effects"
	Challenges in interpreting post-exposure dosage instructions	Knowledge gap, trusting main partner	"What I didn't know is to use doxy when I have sex with my boyfriend because he is someone I trust, and I can also say that he trusts me(laughter) its only that he doesn't know that I have other sex partners"
	Pill burden	Challenges of taking dPEP with PrEP or other medication	"This might discourage me if the number of pills that I am taking are many, if you think of adding dPEP on top of those you will feel discouraged. Let's say I am on anti-malarial medication; I will have to finish this dose first in order for me to continue with the dPEP. If I am sick and I have been issued with medication from the hospital, this might make me discontinue the use of dPEP for a while."
	Fear of partner's reaction	Partner influence on decision to take dPEP and dosing time	"There is main partner, and when he is around it is hard to take dPEP because I don't know what he will think of me."
	Stigma	Stigma associated with dPEP medication	"The people I used to live with had no issues with me taking PrEP since they were also using it. But when it came to dPEP, I was the only one using it in that living space. So, they asked me if I intended to become more of a prostitute than them. They asked why I was using dPEP and said that it would make me increase sexual partners, which was somehow true. They felt that using dPEP made me a prostitute; a prostitute more than them. That was the challenge I had. Their words made me sit down at times and wonder whether I should keep taking the drug if my friends could tell me such things"
	Discrete pill case	AGYW desire private and concealed environment to take medication – at home and while traveling	"What I do when traveling, there is a container that looks like that one for nail polish that I was given with dPEP. Whenever I remove it, nobody realizes that it is medicine because it may lead someone into thinking that I want to apply it, so that gives me an easy time"
Facilitators to dPEP use	STI risk awareness	Role of dPEP in STI prevention to continue with routine activities is valued	"It's not hard for me to take it, for me to protect my life I must use it. With the way the situation is as at now, if you were to get an STI you will have to stay at home and your children will end up struggling. You have to leave your house and hustle"
	Doxycycline familiarity	Perception of diverse uses of doxycycline as a motivation to take dPEP	"I like doxycycline because it is not like PrEP. Some people will assume that you are using ARVs when they see PrEP. But with doxycycline, they may think that you are experiencing some stomach upset. They will not be able to understand why you are using it. That is why"

Table 1: facilitators and barriers to dPEP adherence.

**Conclusions:** Adherence to doxycycline prophylaxis could be better supported in this population by decreasing frequency of dosing and urgency of dosing to allow for optimal location and timing of dosing. These findings are critical in contextualizing the null results of the dPEP Kenya Study and informing future biomedical prevention interventions.

### Doxycycline PrEP prevents STIs without affecting vaginal bacterial flora in female sex workers

S. Abe<sup>1</sup>, D. Shiojiri<sup>2</sup>, A. Kawashima<sup>1</sup>, H. Uemura<sup>1</sup>, N. Ando<sup>1</sup>, D. Mizushima<sup>1</sup>, H. Gatanaga<sup>1</sup>, S. Oka<sup>1</sup>

<sup>1</sup>National Center for Global Health and Medicine, Tokyo, Japan, <sup>2</sup>Personal Health Clinic, Tokyo, Japan

**Background:** The efficacy and potential harm of Doxycycline prophylaxis in women remain controversial. We investigated the impact of Doxycycline Pre-exposure Prophylaxis (DoxyPrEP) on reducing sexually transmitted infections (STIs) and its effect on the vaginal microbiome in female sex workers (FSWs).

**Methods:** Daily doxycycline (100mg) was initiated in October 2022 at a private STI clinic in Tokyo, based on shared decision-making. This analysis comprised a retrospective cohort study and a survey. Targeted STIs included Chlamydia trachomatis, Neisseria gonorrhoeae, and Syphilis. Routine clinical practice involved microscopic examination of vaginal smears every 1-3 months to monitor the vaginal microbiome.

We compared incidence rates (per 100 person-years) before and during DoxyPrEP, using Incidence Rate Ratios (IRRs) with conditional fixed-effects Poisson regression. Perturbations of the vaginal microbiome, defined by microscopic abnormalities and antimicrobial treatment, were also examined. Adherence to the regimen, adverse events, and user satisfaction were monitored through surveys.

**Results:** Forty FSWs with a median age of 29 years (interquartile range 26-33.5) were analyzed. Before DoxyPrEP, the overall STI incidence rate was 232.3 per 100 person-years. After initiating DoxyPrEP, the overall STI incidence rate declined to 79.2 per 100 person-years. There was a significant reduction in overall STIs (IRR=0.33, P=0.020) and a marginally significant reduction in Chlamydia trachomatis (IRR=0.35, P=0.056). The incidence of syphilis was reduced to zero.

	Before DoxyPrEP			After starting DoxyPrEP			IRR*** (95%CI) p-value
	Number of Diagnosis	PYs*	IR** (/100 PYs)	Number of Diagnosis	PYs*	IR** (/100 PYs)	
C. Trachomatis (N=40)	74	46.5	159.2	13	22.7	57.2	0.35(0.12-1.03) p-value=0.056
N. Gonorrhoeae (N=40)	26	46.5	55.9	5	22.7	22.0	0.45(0.15-1.29) p-value=0.136
Syphilis (N=40)	8	46.5	17.2	0	22.7	0	—
Overall STIs (N=40)	108	46.5	232.3	18	22.7	79.2	0.33(0.13-0.84) p-value=0.020
Bacteria Vaginosis (N=27)	36	34.2	105.2	23	16.7	137.4	1.19(0.72-1.94) p-value=0.499
Candida Vaginitis (N=27)	18	34.2	52.6	12	16.7	71.7	1.52(0.62-3.70) p-value=0.358

\*PYs: Person-Years \*\*IR: Incidence Rates \*\*\*IRR: Incidence Rate Ratio

Table. Incidence for each infection before and after starting DoxyPrEP.

However, there was no significant change in Neisseria gonorrhoeae (IRR=0.45, p=0.136). Incidences of bacterial vaginosis and Candida vaginitis did not significantly increase (IRR=1.19, P=0.499 and IRR=1.52, P=0.358, respective-

ly). Of the 40 participants, 22 completed surveys, almost all participants adhered strictly to DoxyPrEP. No severe doxycycline-related adverse events were reported. Condom use remained constant in 95.4% of participants. Regarding satisfaction, 72.7% of participants reported reduced anxiety about acquiring STIs.

**Conclusions:** DoxyPrEP significantly reduced STI rates in FSWs without significantly increasing other vaginal infections. This supports the introduction of DoxyPrEP in high-risk populations.

## OAC0804

### Sex workers' challenges with condom use and their perspectives on HIV PrEP - lessons from a participatory qualitative study of sex workers' health needs in Germany

E. Willems<sup>1</sup>, M. Ceres<sup>2</sup>, U. Probst<sup>3</sup>, N. Sarma<sup>4</sup>, J. Claass<sup>5</sup>

<sup>1</sup>Deutsche Aidshilfe, Berlin, Germany, <sup>2</sup>Berufsverband erotische und sexuelle Dienstleistungen, Berlin, Germany, <sup>3</sup>Freie Universität, Institut für Sozial- und Kulturanthropologie, Berlin, Germany, <sup>4</sup>Robert Koch Institut, Berlin, Germany, <sup>5</sup>Centrum für HIV und sexuell übertragbare Infektionen in Altona (CASAblanca), Hamburg, Germany

**Background:** Sex workers (SW) are at increased risk of acquiring HIV globally. However, there is little data on the situation in Germany. In order to improve the understanding of the health needs of SW in Germany, we conducted a participatory qualitative study. One aim was to assess the potential of HIV pre-exposure prophylaxis (PrEP) for SW. This topic highlighted an important interaction with condom use.

**Methods:** Between 10/2022 and 04/2023, 10 peer researchers conducted 11 focus group interviews across Germany in 5 languages. The 80 participants were female, trans and male sex workers in various fields of sex work (street, escort, brothels) from 23 countries. The sample was characterized by high diversity through the large proportion of SW with vulnerabilities such as illegal residence status or drug addiction. The data was analyzed using Qualitative Content Analysis.

**Results:** More than half of the participants had never heard of PrEP. Identified barriers to PrEP knowledge include the belief that PrEP is only suitable for people who practice condomless sex. Female SW who were interested in PrEP described fear of stigmatization due to the association of PrEP with condomless sex.

Many participants reported frequent clients' demands for condomless sex and perceived this as a growing trend. Some described how this trend, combined with exacerbated financial precariousness, pressure them to offer condomless sex. Some female and trans SW mentioned the fear that widespread PrEP use intensifies this pressure.

For most participants, PrEP seems an attractive HIV prevention method, whether because they practice condomless sex or as an additional strategy in case of condom breakage or stealthing.

**Conclusions:** PrEP education for SW needs to be expanded in Germany, especially for non-MSM. To prevent stigmatization and pressure on SW to offer condomless sex, the association "PrEP = condomless sex" must be countered. Study participants suggested that PrEP should not be presented as an alternative to condoms, but as a combined protection method. SW need support in negotiating condom use and prices of sexual services. Support could be peer-to-peer empowerment, professionalization measures and information for clients.

## OAC0805

### PrEP perception and PrEP initiation among adolescent men who have sex with men and transgender women in Brazil

S. Seixas<sup>1</sup>, N. Galvão<sup>1</sup>, B. Oliveira Leite<sup>2</sup>, F. Soares<sup>2</sup>, L. Amorim<sup>2</sup>, J.A. Pinto Junior<sup>3</sup>, D.B. Greco<sup>4</sup>, A. Grangeiro<sup>5</sup>, I. Dourado<sup>2</sup>, L. Magno<sup>1,2</sup>

<sup>1</sup>Universidade do Estado da Bahia, Departamento de Ciências da Vida - Campus I, Salvador, Brazil, <sup>2</sup>Universidade Federal da Bahia, Instituto de Saúde Coletiva (ISC), Salvador, Brazil, <sup>3</sup>Universidade Federal Fluminense, Departamento de Estatística Instituto de Matemática e Estatística, Rio De Janeiro, Brazil, <sup>4</sup>Universidade Federal de Minas Gerais, Departamento de Clínica Médica, Belo Horizonte, Brazil, <sup>5</sup>Universidade de São Paulo, Departamento de Medicina Preventiva, São Paulo, Brazil

**Background:** Perceptions about PrEP are multifaceted, shaped by influences from friends, family, and social networks. These perceptions can impact the decision to start PrEP. We aimed to describe patterns of PrEP perceptions and their association with PrEP initiation among adolescent men who have sex with men (AMSM) and transgender women (ATGW).

**Methods:** PrEP1519 constituted a single arm, multicentric demonstration cohort study focusing on daily oral PrEP among AMSM and ATGW aged 15-19 years, in three Brazilian cities. Our analysis encompassed baseline data collected from February/2019-February/2023. Latent class analysis (LCA) was used to identify patterns of PrEP perception based on eight observable binary indicators (agree or disagree). Logistic regression was conducted to estimate adjusted odds ratios (aOR) of the association between PrEP perception and the outcome PrEP initiation (PrEP dispensing within 30 days of starting in the cohort vs not initiation PrEP).

**Results:** 1,477 adolescents enrolled in the study, with 91.0% identified as MSM, 74.5% falling within the 18-19 age group, 72.0% self-reported Black/Brown skin color and the majority, 81.4% initiated PrEP. The prevalence of PrEP perception

indicators were: 33.2% considered PrEP to be the same medication for treating HIV, 26.0% believed it had many side effects, 14.0% thought it was exclusively for MSM or TGW, 11.0% believed it was only for those with numerous partners, 9.0% were concerned about interactions with other medications like hormones, 24.6% thought it could negatively impact one's image, 8.0% found it inconvenient that PrEP was the same as HIV treatment, and 10.0% perceived it as a hassle to take preventive medication. Classes were distinguished by "positive PrEP perception" (N =1,350; 93.2%), described by very low probabilities of agreement with specific indicators, and "negative PrEP perception" (N=98; 6.8%), represented by higher prevalences for the indicators. Adolescents with a positive PrEP perception were more likely to initiate PrEP (aOR: 2.46: 1.37-4.41) adjusted by potential confounders

**Conclusions:** Our findings underscore the significance of the initiation decision for PrEP and highlight the influential role of perception in this process among adolescents. Moreover, it is crucial to foster a positive perception of this preventive strategy to enhance its adoption among adolescents.

### Multi-level community-based HIV prevention intervention for people who inject drugs (PWID) on the US-Mexico border: an effectiveness evaluation

G. Perez<sup>1</sup>, N. Ludwig-Barron<sup>2</sup>, V. Alan<sup>3</sup>, J. Puentes<sup>4</sup>, J. Salazar<sup>5</sup>, R. Maria Elena<sup>6</sup>, S. John<sup>7</sup>, J. Lechuga<sup>1</sup>  
<sup>1</sup>Hunter College, Psychology, New York, United States, <sup>2</sup>University of California San Francisco, Prevention Medicine, San Francisco, United States, <sup>3</sup>The University of Texas at El Paso, Psychology, El Paso, United States, <sup>4</sup>The University of Texas at El Paso, Public Health, El Paso, United States, <sup>5</sup>University of California San Francisco, Medicine, San Francisco, United States, <sup>6</sup>Maria Elena Ramos, Ciudad Juarez, Mexico, <sup>7</sup>University of California San Francisco, Prevention medicine, San Francisco, United States

**Background:** Prevalence of injection drug use on the US-Mexico border is three times the national average. Border communities are places where the risk of drug use harms and HIV acquisition is augmented due to the confluence of factors operating across the physical, social, economic and policy environment. A theory informed multilevel, community based, behavioral intervention was implemented to promote engagement in harm reduction behaviors among PWID.

**Methods:** The behavioral intervention consisted of 3 components aimed at ameliorating the negative influence of factors operating at the structural, interpersonal, and individual levels:

1. Rapid HIV testing at community sites;
2. Peer led multi-session psychoeducational harm reduction sessions to promote self-efficacy among small networks of PWID; and,
3. Community wide events to reduce HIV stigma.

A quasi-experimental design was employed consisting of time repeated survey assessments administered at 6 and 12 months after the roll out of intervention components. Participants were recruited through respondent driven-sampling.

**Results:** Three hundred and fifty five PWID (70% male) with a mean age of 39.53 years (SD = 10.93) were recruited to participate in the cross-sectional assessment surveys. Participants reported a mean of initiating injection drug use of 21 years and injecting a mean of 5.6 times daily. Three generalized estimating equations testing the influence of exposure to intervention components controlling for assessment time indicated that exposure to the three intervention components compared to exposure to no intervention components increased safe-injection ( $M = 3.6$  vs  $M = 2.5$ ),  $\beta = .65$ ,  $p < .01$ ), engagement in a greater number of preventative behaviors ( $M = 4.06$  vs  $M = 2.4$ ,  $\beta = 1.65$ ,  $p < .01$ ), reduction in the number of condomless sex ( $M = 29.04$  vs  $M = 65.04$ ,  $\beta = -.76$ ,  $p < .05$ ), and reduction in HIV stigma ( $M = 2.29$  vs  $M = 2.68$ ,  $\beta = -.30$ ,  $p < .05$ ).

**Conclusions:** Findings suggest that the intervention was effective in reducing drug use harms and risk of HIV acquisition by promoting engagement in preventative behaviors and reducing stigma. Future directions include testing which combination of components is most effective under resource constraints to promote scalability.

## OAC1003

### Leading the way: indigenous communities successfully advancing HIV care outcomes post-pandemic

I. Khan<sup>1</sup>, M. Andkhoie<sup>1</sup>, D. Bryant<sup>2</sup>, G. Cote<sup>3</sup>, C. Shingoose<sup>4</sup>, S. Key<sup>5</sup>, C. Roache<sup>1</sup>, L. Matz<sup>1</sup>, R. Ramsingh<sup>1</sup>, S. Skinner<sup>6</sup>, S. Konrad<sup>1</sup>, C. McArthur<sup>5</sup>, C. Wishnevetski<sup>1</sup>, L. Jagoe<sup>1</sup>, A. Wiebe<sup>1</sup>, T. Wong<sup>7</sup>

<sup>1</sup>Government of Canada, Indigenous Services Canada, Regina, Canada, <sup>2</sup>Cote First Nation, Health, Cote First Nation, Canada, <sup>3</sup>Cote First Nation, Chief, Cote First Nation, Canada, <sup>4</sup>Keeseekoose First Nation, Health, Keeseekoose First Nation, Canada, <sup>5</sup>The Key First Nation, Health, The Key First Nation, Canada, <sup>6</sup>Wellness Wheel, Regina, Canada, <sup>7</sup>Government of Canada, Indigenous Services Canada, Ottawa, Canada

**Background:** The COVID-19 pandemic significantly affected timely access to healthcare, including access to HIV care in rural parts of Saskatchewan, Canada. In the southeast region, Indigenous people living with HIV (PLWH) have shared personal stories about encountering stigma and discrimination within the healthcare system. In response to these challenges, Indigenous leadership took a proactive role, focusing on improving testing and diagnosis for sexually transmitted and blood-borne infections (STBBIs) and achieving notable milestones in HIV care since the region declared an HIV outbreak in 2016.

**Description:** Local Indigenous leaders made pivotal commitments to cultural approaches that emphasize trust-building and normalized access to HIV prevention and care among equity-denied populations. These strategies encompassed establishing convenient testing locations with culturally grounded, respectful, trauma-informed and compassionate prevention and care services that provide comprehensive support, including transportation, family support, food incentives, and land-based therapies.

**Lessons learned:** Between 2018 and 2022, the area achieved a 100% timely linkage to care for new HIV cases and ensured treatment for all diagnosed individuals within 12 months. In 2022, 81% of the PLWH in the area achieved viral suppression. From 2018 to 2022, HIV and HCV screenings increased by 403% and 448%, respectively. During the same period, over 532,000 new syringes and 2,700 safer inhalation kits were distributed. New HCV diagnosis decreased by 57% during this period, and new HIV diagnosis decreased from the rates of 45 cases per 100,000 population to zero cases. Timely care prevented mother-to-child transmission, resulting in seven HIV-negative births among pregnant PLWH since 2020.

**Conclusions/Next steps:** These initiatives resulted in a significant rise in testing uptake, the establishment of on-site infectious disease care clinics, prompt prescription linkages and pharmacy support. Active harm reduction and wellness outreach, along with rural-to urban pre-

natal referrals, contributed to a decline in HCV and HIV cases. In addition, the measures resulted in achieving viral suppression for the majority of PWLH, and the adoption of "U=U" (Undetectable equals Untransmittable) by health professionals impacted and improved the STBBI outcomes in the area. The consistent and frequent support from local leadership, coupled with cultural approaches, played a crucial role in rebuilding trust and optimizing health outcomes among PLWH.

## OAC1004

### Addressing substance use: decreased problematic substance use among young transgender women in Brazil - findings from a peer-led intervention study

C. Coutinho<sup>1</sup>, E. Jalil<sup>1</sup>, T. Vargas<sup>1</sup>, N. Bertoni<sup>2</sup>, C. Arsolino<sup>1</sup>, E. Peixoto<sup>1</sup>, C. Jalil<sup>1</sup>, M. St Silva<sup>1</sup>, R. Moreira<sup>1</sup>, M. Ramos<sup>1</sup>, S. W Cardoso<sup>1</sup>, V. Veloso<sup>1</sup>, L. Monteiro<sup>1</sup>, B. Grinsztejn<sup>1</sup>, E. Wilson<sup>3</sup>, BeT Study Group

<sup>1</sup>Instituto Nacional de Infectologia Evandro Chagas, Rio de Janeiro, Brazil, <sup>2</sup>INCA, Rio de Janeiro, Brazil, <sup>3</sup>Center for Public Health Research, San Francisco Department of Public Health, San Francisco, United States

**Background:** Substance use linked to challenging social conditions may increase HIV risk among young trans women (YTGW) in Brazil. This study aimed to evaluate substance use among Brazilian YTGW and identify factors associated with a high risk of problematic substance use (PSU).

**Methods:** Data from BeT, a 48-week status-neutral peer-led HIV systems navigation intervention study in Rio de Janeiro, Brazil (February 2022-August 2023), targeting YTGW (18-24 years old). to improve HIV prevention/care outcomes were analyzed. Baseline to follow-up visits data (48-week) were compared to assess changes in lower (0-10 for alcohol, 0-3 for others), moderate (11-26 for alcohol and 4-26 for others) and high risk PSU (27+) using ASSIST. Anxiety/depression screenings used PHQ4 (moderate/severe >5). Factors associated with moderate/high risk of any PSU (except tobacco/alcohol/marijuana) were identified using adjusted logistic regression models.

**Results:** Among 164 participants (most were aged 20-24 years (74%), identified as Black/Pardo (66%), higher than secondary education (66%), and 49% reported transactional sex. Substance use prevalence at baseline included alcohol (82%), binge drinking (74%), marijuana (66%), tobacco (65%), cocaine/crack (12%), inhalants (9%), and amphetamines (8%). Moderate/high-risk of PSU decreased significantly from baseline to follow-up for all substances, especially tobacco (57.7%-39.7%), alcohol (22.5%-0.9%), marijuana (62.9%-50.9%), crack/cocaine (8.6%-4.3%), amphetamines (3.4%-0.9%), inhalants (8.6%-0.9%) (see Figure). No participant had high risk of PSU at follow-up. High risk of any PSU (except tobacco/

alcohol/marijuana) at baseline was associated with lower education ( $\alpha$ OR:4.12[95%CI:1.02-17.02]; p-value=0,046), binge drinking ( $\alpha$ OR:5.92[95%CI:1.55-39.36];p-value=0.024), and moderate/severe anxiety/depression score ( $\alpha$ OR:4.13[95%CI:1.22-17.23];p-value=0.032).

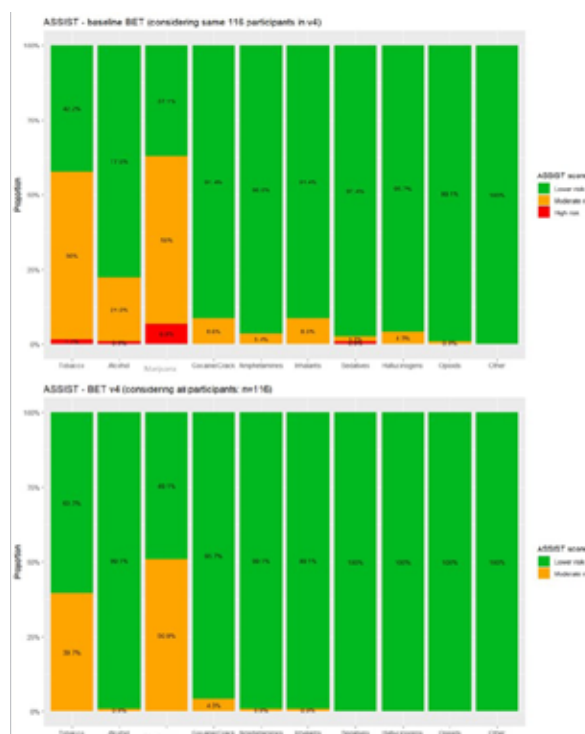

Figure. Risk of problematic substance use according to ASSIST among young transgender women in BeT, Rio de Janeiro, Brazil, 2022-2023.

**Conclusions:** An unanticipated outcome of the intervention was a significant decrease in problematic substance use among YTGW in Brazil, indicating the relevance of intervention components beyond HIV. PSU was highly correlated with lower education, binge drinking, and mental distress among YTGW in our intervention. Intensive peer-led systems navigation interventions may serve as models for substance use reduction with YTGW.

Effect of training and clinical mentoring on prevention, linkage and retention to HIV care among key populations in Zambézia Province, Mozambique

C. Orlando de Castro Rafael<sup>1</sup>, C. Belo<sup>1</sup>, J. Seleme<sup>2</sup>, G. Maibaze<sup>3</sup>, C. De Schacht<sup>1</sup>, C.W. Wester<sup>4,5</sup>, J. Tique<sup>1</sup>

<sup>1</sup>Friends in Global Health (FGH), Maputo, Mozambique, <sup>2</sup>Ministry of Health, National Directorate of Public Health, HIV program, Maputo, Mozambique, <sup>3</sup>US Centers for Disease Control and Prevention (CDC), Division of Global HIV & TB, Maputo, Mozambique, <sup>4</sup>Vanderbilt University Medical Center (VUMC), Department of Medicine, Division of Infectious Diseases, Nashville, United States, <sup>5</sup>Vanderbilt Institute for Global Health (VIGH), Nashville, United States

**Background:** Key populations (KP), i.e., sex workers, men who have sex with men, transgender people, people who inject drugs, and people in prisons and other closed settings, experience stigma, discrimination, and structural barriers when accessing services for HIV prevention and care.

We describe the effect of interventions implemented to strengthen provision of KP-friendly services at 128 health facilities (HF) in Zambézia Province, Mozambique.

**Description:** We used a quality improvement conceptual framework to understand barriers to provision of KP-friendly services, design and implement interventions. Lack of appropriate provider training was the main barrier identified. Evaluation occurred over two years, including pre-intervention (October 2021-September 2022) and during-intervention (October 2022-September 2023) periods. Interventions included:

1. Training 85 clinicians and 103 lay staff, some of whom self-identify as KP, on providing KP-friendly services;
2. Performing 2,245 one-on-one mentoring sessions to clinicians and lay staff from 128 HF (average six sessions per HF) on KP-related skills using standardized tools; and
3. A monitoring strategy including data triangulation. Aggregated clinical data on pre-exposure prophylaxis (PrEP), antiretroviral therapy (ART) linkage and uptake, viral load (VL) coverage, and suppression were used to assess trends.

**Lessons learned:** Results show an increase in PrEP initiation among KP by 171%, with 5,772 individuals initiating PrEP during-implementation compared to 2,130 pre-implementation. Linkage to ART services increased 22.6% from 62% pre- to 76% during-implementation.

The number of individuals currently receiving ART increased by 39% from 5,191 pre-implementation to 7,189 during-implementation.

Testing for VL coverage (77%) during-implementation remained the same as in the pre-implementation period (Table), while VL suppression (91%) increased compared to pre-implementation (87%).

	Pre-implementation	During-implementation	Percentage Change
Tested for HIV <sup>a</sup> (n)	10417	10999	5.6%
Negative test result (n)	8331	8994	8.0%
Initiated PrEP (n)	2130	5772	170.9%
Positive test result (n, %)	2086 (20%)	2005 (18%)	-3.9%
Linkage to ART <sup>b</sup> (%)	62%	76%	22.6%
Initiated ART (n)	1975	2091	5.9%
Currently receiving ART (n)	5191	7189	38.5%
Tested for VL in last 12 months (n)	3177	4720	48.6%
VL coverage <sup>c</sup> (%)	77%	77%	0%
VL suppression <sup>d</sup> (n, %)	2777 (87%)	4282 (91%)	54.2%

<sup>a</sup>Some persons could have been tested several times, as guidelines recommend HIV testing for KP 4x/year (in 2021/2022) or 2x/year (as of 2023); <sup>b</sup>Linkage to care is calculated by dividing the total number of persons initiating ART with the total number of persons living with HIV identified during the specific period (may include individuals tested by other institutions/partners); <sup>c</sup>VL coverage is a proxy indicator calculated by dividing the number individuals with one VL result registered within the last 12 months and the number of individuals on ART 6 months prior; <sup>d</sup>Viral suppression is calculated by dividing the number of individuals with a VL result less than 1000 copies/ml and the total number of individuals with a VL result registered.

Table. HIV services for key populations, pre- and during-implementation in Zambézia Province.

**Conclusions/Next steps:** These findings highlight the favorable effect of training and clinical mentoring on key HIV prevention and care outcomes in the HF context in resource-constrained settings. Use of clinical quality improvement methods can be a meaningful tool to identify barriers and develop solutions to improve provision of KP-friendly services.

## OAC15 Meeting people where they are: Interventions to support testing

### OAC1502

Unveiling a new path of HIV services in prison setting in Bangladesh

M. Akhtaruzzaman<sup>1</sup>, F. Khatun<sup>1</sup>

<sup>1</sup>AIDS/ STD Programme, Directorate General of Health Services (DGHS), Ministry of Health & Family Welfare, Dhaka, Bangladesh

**Background:** Bangladesh faced challenges in achieving the first 95 target for HIV, with a current standing at 73%. The AIDS/STD Programme (ASP) took a proactive role in enhancing HIV testing services, focusing on overlooked areas like prisons. Unfortunately, progress was hindered by the absence of established testing and prevention facilities, influenced by restrictive policies. Across the nation's 68 prisons living 90,000 inmates. Program data revealed 1,110 People Who Inject Drugs (PWID) in jail between 2018 and 2020, with 169 on Opioid Substitution Therapy (OST) and 114 HIV positive. The lack of HIV services in prisons resulted in the discontinuation of OST and Antiretroviral Therapy (ART). In response, ASP launched a project in 2021 aiming to integrate HIV services within prison hospital settings.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Description:** In June 2021, ASP engaged in advocacy with the prison directorate, conducting workshops to present data and evidence for approval from the Ministry of Home Affairs. On September 21, 2022, an MoU was signed, enabling ASP to intervene in nine selected prisons prioritized based on HIV prevalence districts. Human resources were deployed, prison staff were trained to identify and test inmates, especially Key Populations (KPs). Testing began in October 2022, with 7,976 HIV and 5,596 Syphilis tests conducted by December 2023, identifying 5 new HIV and 140 Syphilis cases, all enrolled in HIV and STI treatment. In three prisons, 144 PWID were identified, including 12 persons who were HIV positive, having entered jail for a short time. The project ensured Antiretroviral Drugs (ARVs) for short-term cases, although 39 persons were OST recipients, but OST remained unavailable.

**Lessons learned:** Successful lessons included the establishment of testing facilities in high-prevalence districts, with inmates showing willingness to undergo testing. Three ARV dispensing centers within prison hospitals improved access for HIV-positive inmates.

**Conclusions/Next steps:** The imperative next step is to expand HIV services to all 68 prisons, as motivated by the Directorate of Prisons. While the pilot phase from 2021-2023 didn't initiate OST in selected prisons, efforts are underway to introduce this service in districts where NGO facilities offer it. Valuable insights from the end-of-grant cycle survey results in February 2024 will guide future planning and improvements.

## OAC1503

Breaking the barriers: opportunities for integrating HIV testing with other services for incarcerated population. Results from Plan India's Prison and OCS intervention funded by GFATM in 13 Indian states

K. Biswas<sup>1</sup>, R. Rana<sup>1</sup>, A. Rawat<sup>1</sup>, B. Borah<sup>1</sup>, M. Asif<sup>1</sup>  
<sup>1</sup>Plan International (India Chapter), New Delhi, India

**Background:** Though estimated national adult prevalence remained low in India 0.20% (0.17-0.25%) in 2022, the observed HIV prevalence among inmates in jails remained very high. 1.93% (95% CI: 1.75-2.12). Complementing Govt. of India's effort to end AIDS by 2030, Plan India is implementing Prison and Other Close Settings (OCS) intervention in 13 priority Indian states through an integrated HIV prevention project funded by The Global Fund.

**Description:** Plan India in collaboration with state and central Govt., has introduced an Integrated HIV prevention service along with STI, Hep-B, Hep-C and TB for the incarcerated population in 357 prisons and 218 Other Closed Settings since September, 22 with a focus to undertriads.

The project targeted to:

A. Mapping all the prison and OCS in project states,

B. Expand and strengthen HIV and priority disease screening facility in the prison set up, and

C. Capacitate Prison Peer Volunteers (PPVs) among prison inmates towards sustainability.

**Lessons learned:** Eighty seven percent (n= 320,825) of the incarcerated population those received HIV testing during the period of September, 22 to September, 23 were undertrial inmates. 1,479 inmates identified as HIV positive while positivity varied widely within the project states 0.44% (0.1-4.97). 77% have been linked with ART treatment within 30 days. 80% of newly identified HIV positive inmates (n=1479) are from injecting drug use background. Out of the inmates tested for TB 1.93% (n=240,780) were identified as Symptomatic and 0.91% (n=4,487) were diagnosed with TB.

STI screening resulted 0.57% (n=38642) cases diagnosed, and 1.19% (n=78,642) inmates were identified as Hep-C positive. Around 6,000 Prison Peer Volunteers has been identified and trained to carry out community-based HIV screening and providing ART adherence support to HIV positive inmates.

**Conclusions/Next steps:** The result suggests a significant impact created within the prison setting with the integrated HIV and other priority disease screening among incarcerated population.

Advocacy with Govt. departments and collaboration with prison officials has resulted in ensuring increase identification and early linkage of HIV positive inmates.

Plan India's Prison intervention shows the pathways to expand and saturate the incarcerated population with integrated package of screening services and beyond.

## OAC1504

AEGLIDA: an intervention to support uptake of HIV self-testing and PrEP among women who exchange sex and/or use substances in Kazakhstan

V. Frye<sup>1</sup>, B. West<sup>1</sup>, M. Darisheva<sup>2</sup>, N. Zholnerova<sup>3</sup>, E. Grigochuk<sup>4</sup>, A. Terlikbayeva<sup>2</sup>, S. Primbetova<sup>2</sup>, T. McCrimmon<sup>5</sup>, L. Gilbert<sup>1</sup>, M. Chang<sup>6</sup>, N. El-Bassel<sup>1</sup>

<sup>1</sup>Columbia University School of Social Work, Social Intervention Group, New York, United States, <sup>2</sup>Global Health Research Center of Central Asia, Almaty, Kazakhstan, <sup>3</sup>Amelia, Almaty, Kazakhstan, <sup>4</sup>Independent Consultant, Almaty, Kazakhstan, <sup>5</sup>Columbia University Mailman School of Public Health, New York, United States, <sup>6</sup>Columbia University School of Social Works, New York, Virgin Islands, United States

**Background:** Women who exchange sex and/or use substances (WESUS) face stigma-related barriers to HIV testing, the gateway to PrEP/PEP and ART. In Kazakhstan, HIV self-testing (HST), a user-controlled method, may increase consistent HIV testing, but it is a new option for WESUS and interventions are needed to promote and increase uptake.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

**Methods:** AEGIDA is a 4-session intervention designed for WESUS to support consistent HIV testing via HST training and PrEP awareness. To create AEGIDA, we conducted formative research (30 interviews/4 focus groups) identifying preferences/barriers/facilitators of HST and applied modified intervention mapping to adapt an evidence-based intervention (TRUST).

To evaluate AEGIDA, we screened 305 women (47% eligible) and enrolled 90 women (6 transgender women), who completed baseline self-interviews and were randomized in a 2:1 assignment to active (AEGIDA) vs. a time-attention control (didactic self-screening) conditions with 6-month follow-ups.

AEGIDA's theoretically-based intervention sessions include evidence-based techniques (motivational interviewing, peer education, harm reduction, cognitive reframing, and self-compassion) to reduce internalized stigma and build HST skills (via videos created by sex worker advocates and hands-on practice with facilitator) to increase consistent HIV testing. Sessions were delivered face-to-face and via videoconference, with a closed Instagram page for active condition participants.

**Results:** At baseline, average participant age was 39 (SD=8.8); 37% completed 9<sup>th</sup> grade or less. Nearly half were homeless and two-thirds were food insecure in the 3 months before enrollment. STIs were common (13 syphilis; 4 gonorrhea; 17 trichomonas; 5 chlamydia).

About half reported not using condoms with paying partners and getting extra money for it in the past 3 months. Just half had HIV tested in 6 months before enrollment. Preliminary analyses find that AEGIDA is acceptable and feasible to deliver.

Session attendance was 100%, 92%, 87% and 80%; median number of days to complete all 4 sessions was 18.3 (4-63 days).

**Conclusions:** AEGIDA has the potential to promote HST and PrEP uptake by addressing key stigma-related barriers to testing and prevention access among WESUS in Kazakhstan. When 6-month follow-up is complete in March 2024, we will calculate preliminary efficacy and analyze exit interview data, and disseminate our findings in collaboration with our community and governmental partners.

## OAC1505

**Innovations in HIV testing. A story of how we utilized a failed grasshopper harvesting season to conduct moonlight HIV testing and counselling among young men in Uganda**

A. Nanyonjo<sup>1,2</sup>, F. Nabaweesi<sup>1</sup>, B. Kemigisa<sup>2</sup>, R.N. Kikonyogo<sup>3,4</sup>, L.S. Namara<sup>3</sup>, A. Bagarukayo<sup>5,4</sup>

<sup>1</sup>PillPower Uganda, Hoima, Uganda, <sup>2</sup>DFCU Bank, Kampala, Uganda, <sup>3</sup>Infectious Diseases Institute, Kampala, Uganda, <sup>4</sup>Youth Space Uganda, Kyegegwa, Uganda, <sup>5</sup>Center for Domestic Violence Prevention, Kampala, Uganda

**Background:** Today, young people (15-24) account for 40% of all new adult HIV infections. We utilized a failed business venture to mobilize youth to know their status. Grasshoppers are a delicacy and a very lucrative source of income in Uganda. The seasonal swarms are trapped only in the night using very bright lights and water drums. During the season, most young people employed in the informal sector usually co-opt this business as an extra income. This business is accompanied with reckless lifestyle of drinking, partying and buying sex workers especially after receiving huge sums of money. This year, the anticipated grasshoppers did not come in time due to changes in weather. This rendered the business men idle and open to listening.

**Description:** Pill Power Uganda (PPU) utilized this opportunity to conduct HIV campaigns in the town centers where the business men had set up. YSU utilized projectors and screens to showcase testimonies from those living with HIV. The counsellors also discussed condom use, PrEP and PEP and routine testing and counseling. The team then welcomed a Q&A session, followed by a free testing and counselling session.

**Lessons learned:** A total of 2809 young people (2630 Males, 179 Females) were reached in the with HIV counseling and testing services with 32 (21 Males, 11 Females) testing HIV positive giving a positive rate of 1%. More men (94%) were reached with HIV testing services compared to females at 6%. The moonlight campaigns contributed 35% of the total number of individuals who received HIV testing services in Kyegegwa district. The business men after knowing their status made resolutions to change their behavior. The unexpected good outcome is that 411 of the MARPs e.g commercial sex workers, long distance truck drivers and bar workers were also attracted by the testimonies.

**Conclusions/Next steps:** Innovation of cost-efficient approaches with massive reach are essential for continuity of HIV knowledge dissemination programs. utilization of 'cover of darkness' events to offer HIV services reaches many young men particularly in the urban settings. YSU intends to research and utilize more of the moonlight business opportunities to conduct HIV awareness campaigns and testing.

# OAC18 Communities taking charge: Overcoming prevention challenges through peer-led interventions

## OAC1802

Let communities lead the HIV response: sharing experiences from key population civil society organisations in Uganda, 2022-2023

K. Kulu<sup>1</sup>, L. Babirye<sup>1</sup>, R. Bbosa<sup>1</sup>, D. Wabomba<sup>1</sup>, J. Kigozi<sup>1</sup>, R. Lusimbo<sup>2</sup>, A.G. Fitzmaurice<sup>3</sup>, C. Ajulong<sup>3</sup>, S. Alamo<sup>3</sup>, N. Kalema<sup>1</sup>, F. Namimb<sup>1</sup>

<sup>1</sup>Infectious Diseases Institute, Makerere University, Health Systems Strengthening, Kampala, Uganda, <sup>2</sup>Uganda Key Population Consortium, Kampala, Uganda, <sup>3</sup>US. Centres for Disease Control and Prevention, Entebbe, Uganda

**Background:** Community-led solutions are necessary to mitigate public health threats, including HIV. PEPFAR funded the Infectious Diseases Institute (IDI) to support civil society organisations (CSOs) to create safe spaces in the community for delivery of person-centered differentiated services to key populations (KPs).

We assessed the contribution of seventeen CSO safe spaces to HIV service delivery in Kampala and Wakiso districts of Uganda.

**Description:** We identified indigenous KP-led CSOs and capacitated them into safe spaces, known as drop-in centres (DICs). DICs were empowered to provide a package of comprehensive stigma-free health HIV services to KPs using the PEPFAR KP service layering table.

We trained, mentored, and linked frontline DIC leaders and facility staff to deliver targeted HIV prevention strategies including HIV self-testing in KP hotspots, linking HIV-negative KPs to pre-exposure prophylaxis (PrEP) or KPs with HIV to counselling for initiation or re-engagement into antiretroviral therapy (ART) and care. All service data are routinely entered in a centralised data system known as the KP Tracker.

We analysed data in the KP Tracker to compute the contribution of DICs as proportions to overall KP service provision performance for the period October 2022-September 2023.

Figure. Civil society organisation drop-in center contributions to key population service delivery in Kampala and Wakiso districts, Uganda, October 2022 - September 2023.

**Lessons learned:** A total of 99,014 KPs received a package of at least three HIV services, including (95,229, 96%) who received an HIV test. Of these, only 14% (13,206) tested at CSO DICs. Among KPs identified as living with HIV, nearly half (603/1,271, 47%) were tested at CSO DICs, of whom 599/603 (99%) initiated ART. DICs also contributed nearly half (7,470/15,526, 48%) of KPs initiating PrEP.

**Conclusions/Next steps:** CSO DICs performed HIV case-finding and initiated KPs on PrEP more efficiently compared to facility-based KP programs in Kampala and Wakiso districts. Well-supported CSOs can successfully implement peer-led solutions at community DICs to improve delivery of HIV prevention and treatment services to KPs.

## OAC1803

HIV testing – community-based peer-led strategies; HIV testing to support case-finding

K. Chiyenu<sup>1</sup>, M. Musheke<sup>2</sup>, C. Siame<sup>2</sup>, A. Samona<sup>2</sup>, B. Ngosa<sup>2</sup>, F. Mwape<sup>2</sup>, S. Shebo<sup>1</sup>, M. Zimba<sup>3</sup>, M. Kabwe<sup>4</sup>, M. Mulenga<sup>5</sup>, C. Kanene<sup>6</sup>, A. Phiri<sup>6</sup>

<sup>1</sup>Centre for Infectious Disease Research in Zambia, Strategic Information, Lusaka, Zambia, <sup>2</sup>Centre for Infectious Disease Research in Zambia, Implementation Science, Lusaka, Zambia, <sup>3</sup>Key Population Alliance Zambia, Lusaka, Zambia, <sup>4</sup>The Lotus Identity, Lusaka, Zambia, <sup>5</sup>Sustainable Health Advocacy and Dynamic Empowerment Zambia, Lusaka, Zambia, <sup>6</sup>United States Agency for International Development, Lusaka, Zambia

**Background:** Zambia has made significant progress (89:96:97) towards reaching the 95-95-95 targets. However, with 28,000 new HIV acquisition being reported annually, identifying and implementing effective HIV case-finding strategies has become more imperative. We compare the effectiveness of three different strategies - social network strategy (SNS), mass mobilisation, and index testing - for case-finding among key populations in seven (7) districts of Zambia.

**Description:** The USAID-funded Controlling HIV Epidemic for Key and Underserved Populations (CHEKUP) I is implementing a key populations (KP) program in seven (7) districts of two (2) provinces of Zambia, targeting female sex workers (FSW), men who have sex with men (MSM), transgender persons (TGs), and people who inject drugs (PWID). Community-based KP Wellness Centers linked to government health facilities have been established, run by key populations civil society organizations (KP CSOs), who conduct community outreach, social network testing, and index testing through their peer promoters and HIV counsellors.

**Lessons learned:** Utilisation of a combination of HIV testing modalities is crucial to mobilising KP for HIV services. Between December 2021 and September 2023, 25,709 KP were reached: 22,805 through community outreach, 1,590 through SNS, and 1,314 through index testing.

Overall, 23% tested HIV-positive. Comparing the HIV testing modalities, index testing generated the highest positivity, at 41%, followed by SNS at 31%, with mass mobilisation generating a comparatively low HIV positivity, at 20%.

Further analysis of KP tested through the three different testing modalities indicated that treatment continuity was highest among those reached through SNS and index testing, at 77% and 70%, respectively, compared to those reached through mass mobilisation, at 62%. Treatment continuity among KP reached through SNS and index testing was comparatively higher due to the utility of social networks for tracking and reaching KP.

**Conclusions/Next steps:** While HIV positivity was highest using SNS and index testing, mass mobilisation was, by comparison, very effective in reaching a high number of KP, which is also crucial for combination HIV prevention. Therefore, as countries strive to achieve epidemic control, utilisation of a combination of HIV testing modalities is crucial to reaching hard-to-reach population groups, such as KP, for HIV services.

## OAC1804

Exploring pre-exposure prophylaxis (PrEP) uptake and continuation among gender and sexually diverse populations in Bangladesh: a pilot program analysis

G. Sarwar<sup>1</sup>, A. Rahaman<sup>1</sup>, M. Haque<sup>1</sup>, S. Islam Khan<sup>1</sup>  
<sup>1</sup>International Centre for Diarrheal Disease Research, Bangladesh (icddr,b), Program for HIV and AIDS, Health Systems and Population Studies Division, Dhaka, Bangladesh

**Background:** Pre-exposure Prophylaxis (PrEP) has emerged as a ground-breaking biomedical intervention in the fight against HIV. The efficacy of PrEP relies on strict adherence to the prescribed medication regimen, as consistent and correct use is crucial for optimal protection, and suboptimal adherence can diminish its effectiveness. In Bangladesh, there is a growing HIV epidemic, disproportionately affecting men who have sex with men (MSM), male sex workers (MSW), and transgender women (locally known as hijra).

This pilot program analysis aims to investigate the patterns of PrEP uptake and continuation within these populations (KPs) in Bangladesh.

**Description:** The pilot intervention took place at two drop-in centers (DICs) located in Dhaka city. From February 2022 to December 2022, a total of 208 participants (70 MSM, 100 MSW, and 38 hijra) were enrolled in the PrEP intervention program.

Adhering to the World Health Organization's six-step cascade, PrEP services were provided. PrEP continuation was prioritized through peer-led navigation and digital platforms, including text messaging, social media (WhatsApp,

Messenger), and audio-visual counselling. Baseline data on HIV and STIs were collected, with follow-up assessments at the third and sixth-month intervals.

**Lessons learned:** At the 3rd-month follow-up, 96.2% of participants continued with PrEP, while 3.8% discontinued. By the 6th month, 87.5% of participants completed PrEP follow-up services, with 12.5% unable to sustain PrEP usage. Prominent reasons for discontinuation included going abroad for job or study purposes (53.84%), relocation from intervention sites (15.38%), and being in a monogamous relationship (11.54%). Regarding STIs, the overall incidence among participants at baseline was 22.6%. From the 3rd to the 6th-month follow-up, the incidence of STIs decreased to 16.0% and 5.49%, respectively. No HIV-positive cases were detected at the 3rd and 6th-month follow-up visits.

**Conclusions/Next steps:** The high retention rate at PrEP at the 3rd-month follow-up suggests initial success in PrEP uptake, highlighting its potential to curb HIV transmission. However, discontinuation was observed between 3rd to 6th months, emphasizing the need for targeted support and intense PrEP adherence counselling to maintain a good retention rate.

## OAC1805

"I am Manu, your virtual sexual health advisor": using chatbot technology for innovative approaches and managing demand for HIV prevention among key populations in Central America

C.A. Palma Solórzano<sup>1</sup>, A. Cabrera<sup>1</sup>, S. Lungo<sup>1</sup>  
<sup>1</sup>Pan American Social Marketing Organization (PASMO), Guatemala, Guatemala, Guatemala

**Background:** In 2023 and under the Prevention Services against HIV project implemented by the Pan American Social Marketing Organization (PASMO) with funds from the United States Agency for International Development (USAID), PASMO developed and launched "Manu", the first HIV/STI-related chatbot in Central America. Leveraging chatbot technology, "Manu" was designed to help manage the high online demand for HIV/STI prevention services and information generated under PASMO's cyber-education and social media outreach strategies targeted to key populations (KP), especially men who have sex with men (MSM), given that, from October 2022 to September 2023 alone, these strategies helped PASMO reach more than 18,000 at-risk KPs through online channels and new technologies were needed to help respond to user needs for information and referrals to the project's prevention services.

**Description:** PASMO worked with an external development team to design a comprehensive chatbot decision tree that would allow "Manu" to address information about HIV and STI risks and automatically generate re-

ferral coupons to PASMO's free prevention services such as HIV testing, HIV self-tests, and PrEP. The chatbot was designed to operate within one of PASMO's Facebook Fan Page's Messenger apps 24 hours a day, 7 days a week, yet users can also request "human" to interact with a PASMO online outreach worker / "cyber-educator". Since its April 2023 launch, Manu reports more than 5,000 entries from KPs seeking HIV/STI prevention information and services and more than 700 clients have been referred to project services.

**Lessons learned:** PASMO used audience insight collection tools and innovative eye-tracking and heat map research to give a name and face to the chatbot which was illustrated in 3D to better interact with users. Chatbot tracking data shows that more than 50% of KPs who access "Manu" do so outside of working hours (6pm to 6am), evidencing the importance of 24/7 technology to manage demand and maintain user access to information and referrals.

**Conclusions/Next steps:** The "Manu" chatbot is proving to be an important tool to maintain the access of young and at-risk KPs to HIV/STI information and services referrals at all times of the day and on weekends.

Mozambique, <sup>7</sup>University of California Los Angeles, David Geffen School of Medicine, Los Angeles, United States, <sup>8</sup>Instituto Universitário Egas Moniz, Almada, Portugal, <sup>9</sup>German Center for Infection Research (DZIF), Partner site Munich, Munich, Germany, <sup>10</sup>Helmholtz Center Munich,

German Research Center for Environmental Health (HMGU), Unit Global Health, Munich, Germany

**Background:** Roughly 1.3 million infants are exposed and 150,000 newly diagnosed with HIV annually. Estimates of Vertical HIV transmission (VHT) vary by setting. We assessed risk factors for VHT among infants born to women living with HIV (WLWH) in Tanzania and Mozambique.

**Methods:** Between October 2019 and August 2021, we collected data from pregnant WLWH who participated in the EDCTP-funded LIFE study at 28 primary health facilities in Tanzania and Mozambique. VHT was assessed up to month 3 for all infants and up to month 18 for a subset of infants. Demographics and clinical characteristics were collected to assess risk factors for VHT, including maternal HIV viral load measurements at baseline and month 3. Additionally, facility-level programmatic factors including number of staff and annual HIV-positive deliveries were collected. We used mixed effects models adjusted for health facility clustering to calculate odds ratios (OR) for VHT.

**Results:** In total, 6505 WLWH and their 6602 infants were included in the study with 1296 infants participating in the month 18 subset. VHT up to month 18 was 2.92% (95% CI: 2.42-3.49) in Mozambique, significantly higher than the 0.82% (95% CI: 0.51-1.24) observed in Tanzania (OR: 3.66, 95% CI: 2.31-6.12). On average, Mozambican mothers were

significantly younger, attended antenatal care less frequently, and had been on antiretroviral treatment for a shorter period. Maternity staff per 100 HIV-positive deliveries was 9.9 (SD 5.0) in Tanzania and 2.3 (SD 1.0) in Mozambique ( $p < 0.0001$ ).

After adjusting for these factors, virologic non-suppression ( $>1000$  copies/ml) at delivery was the principal risk factor for transmission (adjusted OR: 28.3, 95% CI: 15.7-50.9). In Mozambique, 31.0% of mothers were not suppressed at delivery compared to 8.1% in Tanzania; only 10.4% infants who acquired HIV had mothers who were virally suppressed at delivery.

**Conclusions:** We observed a striking difference in VHT between countries. Lack of viral suppression in the early postpartum period was the main risk factor for VHT, and we observed differences in programmatic factors between countries.

These results highlight the need for a better understanding of the individual, community, and health system factors associated with lack of viral suppression in pregnant and lactating WLWH.

## OAC2203

[Eliminating mother-to-child-transmission of syphilis through the introduction of HIV/ syphilis dual tests amongst pregnant women in Liberia, a national roll-out success story](#)

E. Efronson<sup>1</sup>, D.J. Flomo<sup>2</sup>, M. Silikpoh<sup>1</sup>, M.K. Tobii<sup>2</sup>, A. Konstantanova<sup>3</sup>, K. Gray<sup>2</sup>, E.P. Jimmy<sup>2</sup>, A. Alvarez<sup>3</sup>, A. Forleh<sup>2</sup>, A. Kitchel<sup>3</sup>, C. Faire<sup>1</sup>, D.S. Dunbar<sup>4</sup>, W.K. Zaza<sup>2</sup>, G.M. Jackson<sup>2</sup>

<sup>1</sup>Evidence Action, Monrovia, Liberia, <sup>2</sup>National AIDS and STI Control Program, Ministry of Health, Monrovia, Liberia, <sup>3</sup>Evidence Action, Washington D.C., United States, <sup>4</sup>Redemption Hospital, ART, Monrovia, Liberia

**Background:** The WHO recommends the use of Dual HIV/ Syphilis rapid diagnostic tests for screening pregnant women during antenatal care (ANC). Furthermore, women with HIV-and-syphilis-co-infection are 2.5-times more likely to transmit HIV to their children. Despite over 95% of pregnant women attending at least one ANC visit - of which 80% are screened for HIV, less than 8% of all pregnant women have been tested for syphilis.

In September 2021, the National AIDS and STI Control Program (NACP) began to scale dual-tests across Liberia to address this gap.

**Description:** Syphilis screening and treatment outcomes were estimated utilizing results from a survey administered across 67 facilities randomly sampled from 567 trained sites in 15 counties.

We utilized a triangulation-approach to estimate screening coverage combining the rates of commodity availability, provider knowledge and adherence to clinical guidelines, and patient consent. Using data from Jan-

uary-August 2023 we estimate 77% (92,298/ 120,559) of pregnant women attending first ANC were screened for syphilis and that 2.7% (2,529/ 92,298) were positive of whom 88% (2,232/2,529) received treatment.

**Lessons learned:** Introduction of dual-testing increased syphilis screening by nearly ten times (77%) almost mirroring that of HIV screening (80%), demonstrating that dual-testing can be easily integrated in national HIV programs. Empowering local county and district health teams with effective tools and training to lead on-site training and supervision allows providers to offer quality services that put clients first.

Furthermore, high screening paired with high treatment rates improves overall point of care services and health outcomes for pregnant women and their unborn children in a cost effective and sustainable manner.

**Conclusions/Next steps:** Other low-and-middle-income-countries (LMIC), looking to roll-out dual-tests or new HIV-testing guidelines should borrow successes from Liberia's national roll-out. Investment in county and district health teams reduce the need for repetitive capacity building at facilities and build upon existing structures to support future HIV-programs, ensuring that clients receive high quality, comprehensive services. Liberia's ability to achieve significant improvements in syphilis screening and treatment rates demonstrates dual-testing in ANC settings is feasible and readily adopted by healthcare providers and clients.

## OAC2204

[Monitoring Malawi's national integrated testing rates for HIV, syphilis, and hepatitis B and the co-infection prevalence for pregnant women using routine individual data captured through artificial intelligence technology](#)

T.C. Chirwa<sup>1,2</sup>, J. Nkhonjera<sup>3</sup>, K. Namachapa<sup>3</sup>

<sup>1</sup>Ministry of Health Malawi, Directorate of HIV, Syphilis and Viral hepatitis, Lilongwe, Guatemala, <sup>2</sup>International Training and Education Center for Health, Lilongwe, Malawi, <sup>3</sup>Directorate of HIV, STI and Viral Hepatitis, Lilongwe, Malawi

**Background:** Malawi's 2023 HIV testing program guidelines has integrated testing for three diseases of HIV, syphilis, and Hepatitis B Virus (HBV) to align with the WHO's triple elimination goal by 2030 among pregnant women. The program used ScanForm, an innovative tool that captures data from paper registers using Optical Character Recognition (OCR) via a simple smartphone, and further digitizes this information using Artificial Intelligence (AI). This enhances the granular monitoring of testing rates and co-infection prevalence for high-risk groups such as pregnant women. This study aimed to estimate both the testing rates of the three diseases and the co-infection prevalence rates among pregnant women.

**Methods:** This study analyzed testing rates for HIV, syphilis, and HBV among pregnant women attending Antenatal Care (ANC) at 456 out of 657 ANC sites across Malawi, from December 2022 to December 2023. Data was collected via ScanForm, and analysis included computing testing and co-infection rates, using descriptive statistics and chi-square tests for age group associations

**Results:** Among 425,496 women, testing rates were 96.56% for HIV, 81.24% for syphilis, and 57.93% for HBV. The highest co-infection rate (0.2%) was for HIV-syphilis among 331,683 tested women, particularly in the 25-39 age group. Syphilis-Hepatitis B coinfection was found in 0.1% (298) of 215,897 tested women, mostly in the 30-39 age group. The HIV-Hepatitis B combination had a <1% prevalence, with a higher rate in the 25-39 age group. Triple infections were rare, with only 12 cases found.

Age group	HIV-Syphilis n = 331,683	HIV-HepB N = 236,092	Syphilis-HepB N = 215,897	HIV-Syphilis-HepB N = 207,302
	No (%) Yes (%)	No (%) Yes (%)	No (%) Yes (%)	No (%) Yes (%)
15-19	90,006 (99.9) 50 (0.1)	65,617 (>99) 5 (<1)	58,341 (>99) 18 (<1)	57,660 (>99) 1 (<1)
20-24	110,707 (99.8) 260 (0.2)	78,522 (>99) 21 (<1)	70,630 (99.9) 85 (0.1)	68,959 (>99) 5 (<1)
25-29	65,758 (99.6) 235 (0.4)	46,292 (99.9) 29 (<1)	42,595 (99.8) 71 (0.2)	40,578 (>99) 2 (<1)
30-34	38,924 (99.6) 138 (0.4)	27,741 (99.9) 16 (<1)	26,260 (99.7) 68 (0.3)	24,325 (>99) 3 (<1)
35-39	20,563 (99.6) 73 (0.4)	14,412 (99.9) 17 (<1)	14,262 (99.7) 37 (0.3)	12,727 (>99) 1 (<1)
40+	4,892 (99.7) 17 (0.3)	3,419 (>99) 1 (<1)	3,511 (99.5) 19 (0.5)	3,041 (100) 0 (0)
Total	330,910 (99.8) 773 (0.2)	236,003 (>99) 89 (<1)	215,599 (99.9) 298 (0.1)	207,290 (>99) 12 (<1)
$\chi^2$ P-value	0.000*	0.000*	0.000*	0.548

\*Significant at the 95% significance level

Table. Co-infection rates among ANC women.

**Conclusions:** Malawi's integrated testing program effectively tracks and monitors STI testing and co-infection rates, crucial for evaluating program impact and enhancing maternal and child health outcomes. Further analysis on the scanform data will focus on multivariate analysis of factors affecting the prevalence of the co-infections rates.

### The impact of intimate partner violence on mother-to-child HIV transmission in 2022: a modelling analysis of 42 countries in sub-Saharan Africa

S. Kuchukhidze<sup>1</sup>, M. Walters<sup>2</sup>, D. Panagiotoglou<sup>1</sup>, M.-C. Boily<sup>2</sup>, S. Diabaté<sup>3,4</sup>, W.A. Russell<sup>1</sup>, H. Stöckl<sup>5</sup>, L. Sardinha<sup>6</sup>, F. Mbofana<sup>7</sup>, R.K. Wanyenze<sup>8</sup>, J.W. Imai-Eaton<sup>9</sup>, M. Maheu-Giroux<sup>1</sup>

<sup>1</sup>McGill University, Department of Epidemiology and Biostatistics, Montreal, Canada, <sup>2</sup>Imperial College London, MRC Centre for Global Infectious Disease Analysis, School of Public Health, London, United Kingdom, <sup>3</sup>Université Laval, Département de Médecine Sociale et Préventive, Quebec, Canada, <sup>4</sup>Université Laval, Centre de Recherche du CHU de Québec, Quebec, Canada, <sup>5</sup>Ludwig Maximilian University of Munich, Institute for Medical Information Processing, Biometry, and Epidemiology, Medical Faculty, Munich, Germany, <sup>6</sup>World Health Organization, The UNDP-UNFPA-UNICEF-WHO-World Bank Special Programme of Research, Development and Research Training in Human Reproduction (HRP), Development and Research Training in Human Reproduction (HRP), Department of Sexual and Reproductive Health and Research, Geneva, Switzerland, <sup>7</sup>Conselho Nacional de Combate ao HIV/Sida, Maputo, Mozambique, <sup>8</sup>Makerere University, Department of Disease Control and Environmental Health, School of Public Health, College of Health Sciences, Kampala, Uganda, <sup>9</sup>Harvard T.H. Chan School of Public Health, Center for Infectious Disease Dynamics, Department of Epidemiology, Boston, United States

**Background:** The 2022 *Global Alliance to End AIDS in Children* highlights addressing gender inequities as key to eliminating mother-to-child HIV transmission (MTCT). Women experiencing intimate partner violence (IPV) may be at an increased risk of MTCT due to vulnerability to HIV acquisition and barriers to accessing care. Burden of IPV and new paediatric HIV acquisitions are among the highest in sub-Saharan Africa. However, the proportion of MTCT attributable to IPV is unknown.

**Methods:** We created a probability tree model for MTCT among women (15-49 years) in 42 sub-Saharan African countries in 2022. We estimated the proportion of MTCT attributable to past-year physical and/or sexual IPV, as an age-standardized population attributable fraction (PAF). We accounted for perinatal and postnatal MTCT among women who acquired HIV before pregnancy, during pregnancy, and during breastfeeding. Model parameters included: fertility, HIV prevalence/incidence, ART uptake/retention and breastfeeding duration from UNAIDS' 2023 Spectrum model; IPV prevalence from the WHO Global Database on Violence Against Women; and effect measures for IPV's impact on model parameters from literature reviews. We derived uncertainty intervals (95%UI) through 1,000 Monte Carlo simulations.

**Results:** Across 42 countries, 15% (95%UI:7-23%) of paediatric HIV acquisitions were attributed to IPV in 2022. PAF ranged from 4% (95%UI:2-7%) in Niger to 28% (95%UI:13-42%) in Uganda. PAF was highest among 15-19-year-olds (23%;95%UI:9-36%) and lowest among 40-45-year-olds (7%;95%UI:4-11%). ART uptake was most correlated with PAF ( $R^2=0.6$ ; Figure 1). In high ART uptake settings, IPV could lead to a large drop in ART use and subsequent rise in MTCT. Where ART uptake is low, reducing IPV has a smaller impact on preventing MTCT.

**Figure 1.** A) Age-standardized population attributable fraction of post-year physical and/or sexual intimate partner violence in sub-Saharan Africa in 2022 in each country. B) Overall (non-IPV stratified) antiretroviral treatment uptake prior to pregnancy among women in sub-Saharan Africa in 2022 in each country. South Africa does not use Spectrum to make HIV incidence and prevalence projections. Djibouti, Mauritius, Nigeria, and Somalia had no publicly available Spectrum files in 2022. PAF=population attributable fraction; ART=antiretroviral treatment

**Conclusions:** 1 in 7 new paediatric HIV acquisitions in sub-Saharan Africa may be due to IPV, rising to 1 in 5 among adolescent girls. Ending IPV could accelerate MTCT elimination, especially among young women with highest IPV prevalence and HIV incidence.

### OAC2902

Food insecurity directly impacts adherence to antiretroviral therapy and to pre-exposure prophylaxis among sexual and gender minorities in Brazil

P. Luz<sup>1</sup>, T. Torres<sup>1</sup>, V. Matos<sup>1</sup>, B. Hoagland<sup>1</sup>, M.C. Pimenta<sup>1</sup>, M. Benedetti<sup>1</sup>, B. Grinsztejn<sup>1</sup>, V. Veloso<sup>1</sup>

<sup>1</sup>Fundacao Oswaldo Cruz, Rio de Janeiro, Brazil

**Background:** Brazil offers free-of-charge antiretroviral therapy (ART) for people living with HIV (PLHIV) as well as pre-exposure prophylaxis (PrEP) to eligible individuals through its national health system. Adherence to ART and to PrEP is essential to achieving the expected benefits of virologic suppression and prevention of HIV acquisition. We explored whether food insecurity had direct effects on nonadherence to ART/PrEP.

**Methods:** Cross-sectional web-based survey targeting adult sexual and gender minorities living in Brazil (May-September/2021) recruited through dating apps

and social media. PLHIV reporting ART use and HIV-negative individuals reporting daily oral PrEP use were eligible for this analysis. Self-report of ART adherence was measured by the WebAd-Q instrument (3-items/past 7 days) plus a slider question regarding missed doses in the past month (latent outcome).

Self-report of PrEP adherence was measured by the number of days the person took PrEP in the past week (binary outcome: <daily vs. daily). The 7-item Brazilian Scale of Food Insecurity (EBIA) was used to measure food insecurity (higher scores=more severe food insecurity).

We used structural equation modeling (SEM) to assess the direct and indirect effects of variables on ART/PrEP non-adherence.

**Results:** In total, 1,230 PLHIV were using ART, and 991 HIV-negative individuals were using daily oral PrEP. Median age of PLHIV was 37 years (HIV-negative: 34 years), most were cisgender (97%). More PLHIV reported moderate/severe food insecurity 21% (HIV-negative: 12%). Self-report of ART nonadherence (WebAd-Q) was 45% (PrEP nonadherence: 7%).

Higher socioeconomic status (latent variable measured by income, education, and sex work) had a strong negative effect on food insecurity. Among PLHIV, food insecurity (standardized coefficient [SC]:0.30, standard error [SE]:0.07,  $p<0.01$ ), in addition to substance use and binge drinking in the past 6 months had direct effects on ART nonadherence. Among HIV-negative individuals, only food insecurity (SC:0.31, SE:0.13,  $p=0.02$ ) had direct effect on PrEP nonadherence.

**Conclusions:** Brazil has experienced worsening social inequalities, exacerbated by the COVID-19 pandemic, leading to increases in food insecurity especially among vulnerable populations.

Our findings suggest that providing socio-economic support could directly help PLHIV by improving their quality of life, vulnerable HIV-negative individuals by preventing HIV acquisition, and ultimately populations through decreased HIV transmissions.

### OAC2903

The nexus between climate change and HIV/AIDS: a Kenyan perspective

D. Opondo<sup>1,2</sup>, G. Rutto<sup>1</sup>, S. Arodi<sup>1</sup>, R. Marima<sup>1</sup>

<sup>1</sup>University of Nairobi/USAID Fahari Ya Jamii Project, Infectious Diseases, Nairobi, Kenya, <sup>2</sup>St. Mary's Mission Hospital, Comprehensive Care Clinic, Nairobi, Kenya

**Background:** Climate change and HIV/AIDS are among the most significant public health challenges in Sub-Saharan Africa in the 21st century. However, there is a limited understanding of the complex relationship between these two challenges, which hinders progress in HIV/AIDS prevention and management within the context of the climate crisis.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Description:** The framework employed in this systemic review identified five pivotal pathways interlinking climate change and HIV/AIDS, drawing insights from an analysis of 50 studies comprising varied designs, geographical locations, and focus areas. The identified pathways included extreme weather events, food insecurity, the spread of infectious diseases, increased migration, and pressure on health services, forming the investigation's foundation.

**Lessons learned:** The review's findings provided insights into the dynamics between climate change and HIV/AIDS, with specific regional nuances. Notably, food insecurity emerged as a catalytic factor, intensifying the prevalence of transactional sex with about 60% involving women.. Lessons gleaned from regions around Lake Victoria, Mankindu, Taita Taveta and Turkana County underscored the vulnerability of established practices among young girls and women who were previously cabbage farmers but are now reliant on handouts to meet their basic needs in the face of climate-induced disruptions, especially drought.

Moreover, the review highlighted the amplifying effect of extreme weather events on the spread of vector-borne infectious diseases among individuals living with HIV (PLHIV). Climate-induced migration in northern Kenya, for example, Turkana, emerged as a destabilizing force, exacerbating economic instability and rendering communities susceptible to transactional sex, sexual violence, and exploitation.

Furthermore, the review shed light on the adverse consequences of migration on the accessibility of HIV and sexual health services, as demonstrated by Turkana County with its significant HIV burden. The strain exerted by extreme weather conditions on healthcare systems, including HIV services, acted as a hindrance to the advancement of Universal Health Coverage.

**Conclusions/Next steps:** Collaboration between stakeholders in the fight against HIV/AIDS and the climate emergency is crucial. By deepening our understanding of the complex relationship between climate change and HIV/AIDS, we can develop sustainable strategies and interventions to address these challenges. This knowledge will inform the development of programs and policies to control the spread of HIV in Kenya.

## OAC2904

### HIV risks among Ukrainian women during the war: national survey results

O. Kovtun<sup>1</sup>, S. Shevchenko<sup>2</sup>, O. Haryhina<sup>2</sup>, Y. Fedotova<sup>1</sup>, I. Boyko<sup>2</sup>, I. Balieva<sup>2</sup>

<sup>1</sup>Alliance for Public Health, Kyiv, Ukraine, <sup>2</sup>TOV 'IPSOS', Kyiv, Ukraine

**Background:** Before the full-scale Russian invasion, non-key population women represented 22.2% of new HIV acquisitions and 35.8% of those living with HIV in Ukraine.

The war may worsen HIV transmission, affecting women and young girls. We sought to understand HIV risks among Ukrainian women during the war to improve current interventions and develop new ones that meet the women's needs.

**Methods:** In August 2023, we surveyed 1,000 women aged 15-49 in Kyiv City and 24 regions of Ukraine (government-controlled territories) using Computer-Assisted Telephone Interviews (CATI). The survey covered war-related experiences, healthcare and HIV-service experiences, behaviors, self-perceived HIV risk, and needs. Data were weighted by age, settlements, and region, and correlation analysis was conducted.

**Results:** Among 1,000 women, 53.1% reported 'war-related experiences', and 19.1% stayed in active fighting areas. Due to the war unprotected contact with blood had 3.0%; 1.0% faced medical procedures without sterile instruments; and 5.0% of post-war pregnancies skipped national protocol tests. About 0.2% engaged in drug use, sex work, or faced sexual violence, and 45.3% never used condoms during the war. Self-declared HIV prevalence was 0.2%; 7.0% and 1.4% perceived medium or high HIV risk, and it was higher among those with war-related blood contacts – 25.8% ( $p \leq 0.001$ ). HIV testing experience before the war was reported by 60.9%, dropping to 19.1% during the war.

Compared to the adults, girls aged 15-17 were less aware of HIV testing locations (55.6% vs 69.7%,  $p \leq 0.001$ ), free testing (64.2% vs 70.0%,  $p < 0.05$ ), and free treatment (31.3% vs 48.4%,  $p \leq 0.001$ ). Among internally displaced persons (IDPs), 25.9% lacked medical care due to war-related reasons compared to 2.2% of those without displacement ( $p \leq 0.001$ ).

**Conclusions:** The results emphasize the need to enhance HIV programs for women with personal war-related experiences, focusing on prevention and testing. Additional efforts are required to educate girls (15-17) about HIV and available services and to expand healthcare access for IDPs.

Future research should concentrate on targeted HIV risk assessment among women, considering potential sensitivity issues with CATI. Given the assumption of high sexual exploitation in temporarily occupied territories, further investigation is crucial for understanding HIV risks in those regions.

Examining community factors associated with interruption in treatment (IIT) among key population accessing HIV care in Southern Nigeria

B. Edet<sup>1</sup>, G. Emmanuel<sup>2</sup>, P. Umoh<sup>2</sup>, R. Abang<sup>2</sup>, P. Ameachi<sup>3</sup>, K. Abiye<sup>4</sup>, M. Katbi<sup>4</sup>, O. Bartholomew Boniface<sup>5</sup>

<sup>1</sup>Heartland Alliance Nigeria, Strategic Information Unit, Calabar, Nigeria, <sup>2</sup>Heartland Alliance Nigeria, Program, Abuja, Nigeria, <sup>3</sup>Heartland Alliance Nigeria, Strategic Information Unit, Abuja, Nigeria, <sup>4</sup>United States Agency for International Development, Programs, Abuja, Nigeria, <sup>5</sup>Heartland Alliance Nigeria, Chief Executive Director HALG, Abuja, Nigeria

**Background:** Interruption in Treatment (IIT) has been associated with an increase in new infection and high viral load among Key population living with HIV. Interruptions in treatment (IIT) for these populations can lead to poor health outcomes and increased transmission risk. This study aims to identify community factors that contribute to IIT among KPs in this region.

**Methods:** A mixed-methods approach was employed, combining quantitative data from KP-CARE 1 data from medical records to identify rates and patterns of IIT, with qualitative client exit and satisfaction form to explore the experiences and challenges faced by KPs in accessing and adhering to HIV treatment. Data were collected from 14 Heartland Alliance HIV treatment One-Stop-Shop across Southern Nigeria.

**Results:** Among the 74,733 clients extracted for this study, 9% of clients were recorded as been interrupted in treatment. Among the clients investigated, 38% were Female Sex Workers, 33% Men who have sex with Men, 28% People who inject drugs and 1% transgender. The FSW clients had the highest IIT of 51% followed by MSM with 25%, PWID with 23% and transgender with 1% respectively. 64% of the clients on IIT were aged 25-39 as at the last ART pickup date with MMD of 6months. Analysis indicates that factors such as transportation barriers ( $\alpha\text{OR} = 0.01$ ), economic hardship ( $\alpha\text{OR} = 0.06$ ), Pill burden ( $\alpha\text{OR} = 0.03$ ), self stigma ( $\alpha\text{OR} = 0.09$ ) and harassment by enforcement ( $\alpha\text{OR} = 0.09$ ) significantly correlate with higher rates of IIT. Notably, high mobility of KPs from one location to another specifically for FSW community emerged as a critical barrier to consistent treatment.

**Conclusions:** The study highlights the complex interplay of community factors leading to IIT among KPs in Southern Nigeria. Addressing these factors requires multifaceted interventions, including stakeholders engagement, Income generating program, stigma reduction programs, reduction on MMD, and continuous providing behaviour change intervention. The findings underscore the need for targeted strategies to support the continuity of HIV care for KPs in the region.

## OAC33 The long and winding road: Trends in HIV diagnosis, treatment and mortality

### OAC3302

30 years of advancement and challenges in early HIV diagnosis in Jamaica

D. Perry<sup>1</sup>, R. Khan-Francis<sup>2</sup>, S. Beckford Jarrett<sup>3</sup>, J. Lawrence<sup>2</sup>, A. Robb-Allen<sup>2</sup>, W. McFarland<sup>3</sup>, N. Skyers<sup>2</sup>

<sup>1</sup>South East Regional Health Authority, Kingston, Jamaica, <sup>2</sup>Ministry of Health and Wellness, Jamaica, Kingston, Jamaica, <sup>3</sup>University of California San Francisco, San Francisco, United States

**Background:** The first case of HIV in Jamaica was reported in 1982 and antiretrovirals (ARV) became available at public treatment sites in 2004. This study examines the epidemiology of HIV among persons living with HIV (PLHIV) from 1990 to 2020.

**Methods:** We analysed data from PLHIV first enrolled at HIV treatment sites in Jamaica between January 1990 to December 2020 to identify changes in client demographics, clinical stage, and location. The data span three periods: 1990-2003 (P1) pre-ARV access; 2004-2017 (P2) - Public ARV for PLHIV with CD4 <350; and 2018-2020 (P3) - Universal Test and Treat in Jamaica. We used chi-square and Kruskal-Wallis H tests to analyze changes across the periods.

**Results:** 25,953 PLHIV registered at treatment sites: 731 were in P1, 21,024 in P2, and 4,201 in P3, Significant differences emerged in sex distribution ( $\chi^2(4)=34.18$ ,  $p < 0.001$ ), age ( $\chi^2(6)=1091.95$ ,  $p < 0.001$ ), area of residence ( $\chi^2(4)=144.054$ ,  $p < 0.001$ ), and WHO HIV stage at registration ( $\chi^2(6)=302.28$ ,  $p < 0.001$ ).

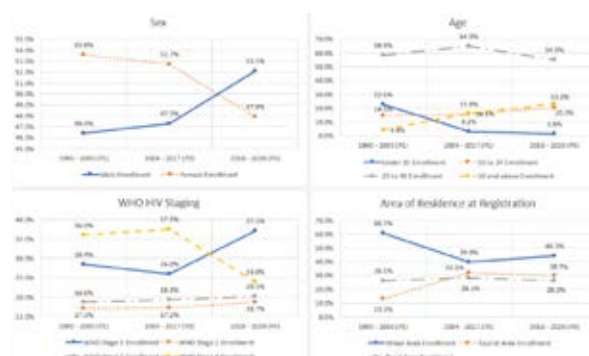

Figure 1. Changes in i) age, ii) sex, iii) HIV stage at diagnosis, and iv) area of residence among PLHIV enrolling in care in Jamaica, 1990-2020, N=25,953.

Median age at registration increased from 29 in P1 to 36 in P3; ( $H(2)=263.68$ ,  $p\text{-value} < 0.001$ ). Baseline CD4 counts increased from P1 to P3 ( $H(2)=343.024$ ;  $p < 0.001$ ). Stage 4 diagnoses decreased in PLHIV ages under 15, 15-24, and 25-49, but not among PLHIV 50 years and older. Similarly, Stage 1 diagnosis increased across all age groups, except those in the 50 and over cohort.

**Conclusions:** The decline in pediatric HIV cases and overall increase in early-stage diagnoses are notable public health achievements. However, Jamaica has an aging cohort of PLHIV entering treatment and targeted testing strategies and behavioural research are needed to reduce HIV transmission and late-stage diagnoses in older adults.

## OAC3303

The trend for HIV test and treatment and retention on antiretroviral therapy among people living with HIV in Sudan from 2012 to 2020

A. Adam<sup>1</sup>, A. Mirzazadeh<sup>1,2</sup>, E. Ali<sup>3</sup>, K. Awad<sup>4</sup>, H. Mohamed<sup>4</sup>, M. Elhassan<sup>4</sup>, B. Mugisa<sup>5</sup>, J. Hermez<sup>6</sup>

<sup>1</sup>University of California San Francisco, Institute for Global Health Sciences, San Francisco, United States, <sup>2</sup>University of California San Francisco, Department of Epidemiology and Biostatistics, San Francisco, United States, <sup>3</sup>The Joint United Nations Program on HIV/AIDS (UNAIDS), Khartoum, Sudan, the, <sup>4</sup>Federal Ministry of Health, Sudan National HIV Control Program, Khartoum, Sudan, the, <sup>5</sup>United States Agency for International Development, Gauteng, South Africa, <sup>6</sup>World Health Organization Regional Office for the Eastern Mediterranean, HIV, Hepatitis and STIs, Cairo, Egypt

**Background:** With timely diagnosis of HIV infection, rapid antiretroviral therapy (ART) initiation, and good retention on treatment, many countries made significant progress in preventing deaths and further transmission of HIV. We analyzed multi-year data from identified persons living with HIV to assess the timing of diagnosis, ART initiation, and retention of treatment in Sudan.

**Methods:** We conducted a retrospective analysis data of 3,974 people diagnosed with HIV between 2012 and 2020 in Omdurman ART center. We reported the distribution of age, sex, stage of disease at diagnosis, and geographical locations of residence. We assessed the lag times between HIV diagnosis, ART initiation, and last clinical visit, and tested for trends over time.

**Results:** Most people were 30 to 49 years old (54.9%), male (56.5%), lived in Omdurman (53.8%), and had clinical stage 3 at diagnosis (51.6%) (Table 1). The proportion of people in clinical stage 1 increased from 7.9% in 2012-14 to 17.4% in 2018-2020 (p-value <0.001). The proportion of people who started ART within 3 months from diagnosis increased from 25.4% in 2012-14 to 92.3% in 2018-2020 (p-value <0.001).

However, among those who started treatment, the proportion who lost to follow-up after starting ART increased from 55.4% in 2012-14 to 96.0% in 2018-2020 (p-value <0.001).

**Conclusions:** Our data showed some improvement in early diagnosis of people living with HIV and a significant improvement in timely and rapid ART initiation in Sudan,

however late diagnosis remains predominant. Furthermore, almost all people who started ART had been lost to follow-up.

The late diagnosis and poor retention in treatment threaten losing all the gains made in improving the HIV response in Sudan. Urgent action is needed to remedy those weaknesses.

Characteristics	Overall (N=3974)	Year of HIV diagnosis			p value

## OAC3304

Changes in early HIV/AIDS mortality rate in people starting antiretroviral treatment between 2013 and 2023: a multicenter survival study in Senegal

B.S. Wembulua<sup>1</sup>, V.M.P. Cisse<sup>1</sup>, D. Ka<sup>1</sup>, N.F. Ngom<sup>2</sup>, A. Mboup<sup>2</sup>, I. Diao<sup>2</sup>, A. Massaly<sup>3</sup>, C. Sarr<sup>1</sup>, C.S. Ohandza<sup>1</sup>, K. Diallo<sup>4</sup>, M.B. Diallo<sup>1</sup>, M. Diop<sup>5</sup>, N.M. Manga<sup>4</sup>, S.O. Wembonyama<sup>6</sup>, Z.K. Tsongo<sup>6</sup>, M. Seydi<sup>1</sup>

<sup>1</sup>Service des Maladies Infectieuses et Tropicales (SMIT), Fann University Hospital, Dakar, Senegal, <sup>2</sup>Centre de Traitement Ambulatoire (CTA), Fann University Hospital, Dakar, Senegal, <sup>3</sup>Pavillon de Traitement Ambulatoire (PTA), Regional Hospital of Kaolack, Kaolack, Senegal, <sup>4</sup>Department of Infectious Diseases, Hôpital de la Paix, Ziguinchor, Senegal, <sup>5</sup>Hôpital Principal de Dakar (HPD), Dakar, Senegal, <sup>6</sup>School of Public Health, University of Goma, Goma, Congo, the Democratic Republic of the

**Background:** Studies conducted after the 1996 antiretroviral treatment (ART) access program in Senegal showed mortality peaks shortly after ART initiation. Considering the national adoption of TATARSEN strategy (Test All, Treat All, and Retain) in 2016 and the scale up of dolutegravir-based regimens in 2020, we aimed to assess changes in early (6-month and 1-year) mortality hazard in Senegalese people starting ART in 2020-23 and 2017-19 compared to 2013-16.

**Methods:** This 10-year multicenter survival study in Senegal analyzed five HIV-cohorts from three regions (Dakar, Kaolack, Ziguinchor). Adults ( $\geq 18$  years) having initiated ART between 2013 and 2023 were considered. Cumulative incidences of death were estimated using the Kalbfleisch-Prentice method. Loss to follow up was accounted as a competing risk.

Shared frailty-based models for competing risk were used to estimate adjusted (for age, sex, WHO stages and CD4 cell count) early mortality hazard ratios (HRs) in participants who started ART in 2013–16 (comparator), 2017–19, and 2020–23.

**Results:** We enrolled 4,006 persons, of whom 2,281 (56.9%) were female, and 635 (15.9%) were at WHO-stage IV. Median age and CD4 cell count at ART initiation were 40 years (IQR: 31–50) and 188 cells/mm<sup>3</sup> (IQR: 57–410) respectively. Median follow-up was 80.4 months (IQR: 48.6–106.7). A total of 463 participants died (4.37 deaths per 100 person-years), 227 at 6 months and 296 at one year, yielding cumulative incidences of 5.7% (95% CI: 5.0–6.4) and 7.4% (95% CI: 6.6–8.2), respectively.

Initiation of ART in 2020–23 was associated with a 38% (adjusted HR [aHR]:0.62, 95% CI:0.40–0.96) and 40% (aHR:0.60, 95% CI:0.41–0.48) reduction in 6-month and 1-year mortality hazards, respectively, compared to the 2013–16 period.

Predictors of 1-year mortality were: Male sex (aHR: 1.54, 95% CI: 1.20–1.97), Age  $\geq 55$  years (aHR: 1.98, 95% CI: 1.50–2.60), first CD4 cell count  $< 200$  cell/mm<sup>3</sup> (aHR:1.45, 95% CI:1.09–1.93), WHO stage IV (aHR:2.34, 95% CI:1.77–3.09).

**Conclusions:** Early mortality risk has significantly decreased over time in Senegal. However, AIDS conditions remain significant predictors of mortality. Continued efforts to ensure early diagnosis and prompt linkage to care are needed to further reduce preventable deaths.

## OAC3305

### HIV mortality trends and spatial distribution among persons living with HIV, Thailand, 2008–2022

N. Punsuwan<sup>1</sup>, T. Naiwatanakul<sup>2</sup>, W. Kiatchanon<sup>2</sup>, P. Namahoot<sup>3</sup>, C. Lertpiriyasuwat<sup>1</sup>, S. Aungkulanon<sup>2</sup>, S. Noknoy<sup>1</sup>, P. Wareechai<sup>3</sup>, A. Kanphukiew<sup>2</sup>, S. Northbrook<sup>2</sup>  
<sup>1</sup>Division of AIDS and STI, Department of Disease Control, Nonthaburi, Thailand, <sup>2</sup>Division of Global HIV/TB, U.S. Centers for Disease Control and Prevention, Nonthaburi, Thailand, <sup>3</sup>National Health Security Office, -, Bangkok, Thailand

**Background:** Despite notable advancements in health-care, challenges in health equity remain, specifically in HIV-related mortality. We compared age-sex adjusted all-cause mortality trends among persons living with HIV (PLHIV) registered in the National AIDS Program from 2008 to 2022 in Thailand.

**Methods:** We conducted a retrospective analysis of all reported PLHIV from over 1,000 facilities registered in the National AIDS Program (NAP) as of 31 January 2023. Demographics and all cause death data were classified according to Thai HIV case surveillance definitions and WHO HIV clinical staging guidelines to calculate age-sex adjusted mortality rate and standardized mortality ratio (SMR). The average Thai population age and sex structure during 2008–2022 was used as the standard population. Age-sex adjusted rates were calculated by dividing the number of observed deaths by the population standard and multiplying by 100,000. Standardized mortality ratio was calculated by dividing the number of observed deaths by the number of expected deaths and multiplying by 100. Spatial autocorrelation of SMR was measured by the Moran's  $I$  coefficient using SAS v 9.4.

**Results:** Of 666,157 diagnosed PLHIV registered in NAP, 157,319 (23.6%) died from all causes. The age-sex adjusted mortality rate increased from 14.9 per 100,000 in 2008 to 16.8 per 100,000 in 2015 to 18.9 per 100,000 in 2022. Moran's  $I$  revealed positive values, indicating spatial clustering of high SMR. In 2022, SMR remained high in Bangkok and central provinces near Bangkok, northern Myanmar and Laos border, and eastern seaboard industrial provinces.

Figure. Geographical distribution of all cause HIV mortality among PLHIV registered in the National AIDS Program, Thailand, 2008–2022.

**Conclusions:** Increase in age-sex adjusted mortality rates and geographic disparities in SMR emphasize the need to identify risk factors for death among PLHIV to address gaps. Our findings underscore the importance of ongoing monitoring and a comprehensive approach to address both individual risk factors and regional disparities to reduce mortality among PLHIV in Thailand.

## OAC4002

Transforming cervical cancer screening for women living with HIV using a digital health application: experiences from Tanzania

A. Kibonga<sup>1</sup>, P. Ngalla<sup>2</sup>, J. Mkumbo<sup>1</sup>, F. Haraka<sup>1</sup>, R. Van de Ven<sup>1</sup>, S. Kimambo<sup>1</sup>, S. Yuma<sup>3</sup>, M. Kombe<sup>4</sup>  
<sup>1</sup>Elizabeth Glaser Pediatric AIDS Foundation, Technical, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>SkyConnect Ink, Program, Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>Ministry Of Health, Technical, Dodoma, Tanzania, the United Republic of, <sup>4</sup>USAID, RMNCH, Dar, Tanzania, the United Republic of

**Background:** Cervical cancer is a leading cause of cancer morbidity and mortality among women in Tanzania. The World Health Organization recommends visual inspection with acetic acid (VIA) for cervical cancer screening in lower-resource settings. However, it is a user-dependent technique vary widely in ascertaining cervical lesions. The Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) rolled out a digital health platform, the smartphone-enhanced VIA (SEVIA) application, for secured sharing of cervical images, enabling remote supportive supervision of providers and expert verification of diagnosis.

**Methods:** Cross-sectional analysis of routine program data from 45 facilities providing cervical cancer screening with SEVIA application services across five supported regions was conducted. Aggregate-level data were extracted from DHIS2 and the SkyConnect server from April 2022 - October 2023. were summarized as proportions using Excel software

**Results:** A total of 33,058 women living with HIV (WLHIV) were screened for cervical cancer; 1,057 (3.2%) were found VIA positive. Out of those, 6,766 WLHIV (20%) were screened using the SEVIA application and verified by expert. The mismatch of VIA results between the provider and expert decreased from 21% in April-June 2022 to 4% in July-September 2023 (see figure).

Figure: Quarterly Trend of Cervical Cancer Screening and Outcome using the SEVIA App.

Among the 546 mismatch images, 245 images (45%) were reported VIA negative by providers, but as per experts, 176 (72%) were found VIA positive, 24 (10%) were suspected cancer, and 45 (18%) had other conditions like polyps and cervicitis.

Also 191 images (35%) were reported VIA positive by providers, but reviewers assessed 185 (97%) of them were VIA negative, four had precancerous lesions, and two cervicitis

**Conclusions:** The use of digital health platform enabled virtual support to providers, enhancing the quality of cervical cancer screening provided to WLHIV and reducing misdiagnoses. Digital platform will likely improve screening and care of cervical cancer among WLHIV.

## OAC4003

Pilot evaluation of a package of evidence-based interventions and implementation strategies based on WHO PEN for a cohort of people living with HIV and cardio-metabolic non-communicable diseases in Lusaka, Zambia

Nachalwe<sup>1</sup>, M. Vinikoor<sup>8</sup>, J.K. Edwards<sup>9</sup>, W. Mutale<sup>7</sup>

<sup>1</sup>Center for Infectious Disease Research in Zambia (CIDRZ), Implementation Science Unit, Lusaka, Zambia, <sup>2</sup>University of North Carolina, School of Medicine, Chapel Hill, United States, <sup>3</sup>University of California Davis, School of Medicine, Sacramento, United States, <sup>4</sup>University of Ghana, Department of Biostatistics, School of Public Health, Accra, Ghana, <sup>5</sup>University of Zambia, Ridgeway, Department of Medicine, Division of Infectious Diseases, Lusaka, Zambia, <sup>6</sup>University of Zambia, Ridgeway, Department of Health Promotion and Education, School of Public Health, Lusaka, Zambia, <sup>7</sup>University of Zambia, Lusaka, Department of Health Policy and Management, School of Public Health, Lusaka, Zambia, <sup>8</sup>University of Alabama, School of Medicine, Birmingham, United States, <sup>9</sup>University of North Carolina, Department of Epidemiology, Chapel Hill, United States

**Background:** With increasing life expectancy for people living with HIV (PLHIV), HIV treatment programs globally must evolve to address non-communicable diseases (NCDs). We developed a package of evidence-based interventions following the WHO package of essential non-communicable disease (PEN) interventions called "TASKPEN".

TASKPEN includes a one-stop shop for managing HIV and cardiometabolic NCDs, delivered by a multi-faceted implementation strategy involving HIV-NCD service integration, practice facilitation, and task-sharing. We report here the preliminary effects of the 'TASKPEN' package

on 'dual control' of HIV and hypertension for a cohort of PLHIV with co-morbid cardio-metabolic NCDs followed prospectively within a pilot stepped-wedge trial.

**Methods:** PLHIV  $\geq 18$  years with a cardiometabolic NCD/risk factor—including hypertension, dyslipidemia, diabetes mellitus, and/or tobacco smoking—identified through a participant screening survey administered at the study clinics from 1 March 2022 to 21 April 2022. For this analysis, we estimated the proportion of participants with suppressed viral load (i.e.,  $<1,000$  copies/ml) and controlled systolic ( $<140$ mmHg) and diastolic ( $<90$ mmHg) blood pressure before (baseline) and after (follow-up) TASKPEN introduction using mixed effects regression. Additionally, we described participants' blood pressure change during the pilot.

**Results:** We enrolled 191 participants, of whom 133 (69.6%) were female, with a median age of 49 years (interquartile range[IQR]: 41-54 years). After a median follow-up of 231 days (IQR:221-238 days), the proportion of participants with dual HIV and blood pressure control was statistically significant, increasing from 30.9% (95% CI: 24.4%, 38.0%) at baseline to 53.6% (95% confidence interval[CI]: 46.0, 53.6%) at follow-up (Table). Average systolic and diastolic blood pressure reduced for participants at follow-up (Figure).

Variable	Baseline Proportion (95% CI)	Follow-up Proportion (95% CI)
Blood pressure[BP] control (i.e., systolic BP $<140$ mmHg and diastolic BP $<90$ mmHg)	36.1% (29.3, 43.4%)	57.3% (49.7, 64.7%)
Suppressed HIV-1 viral load ( $<1000$ copies/mL)	84.8% (78.9, 89.6%)	95.3% (91.2, 97.8%)
Dual Control (i.e., proportion with both viral suppression and BP control)	30.9% (24.4, 38.0%)	53.6% (46.0, 61.6%)

Table.

Figure. (A) Box plot for systolic and diastolic blood pressure among all participants by intervention status, (B) box plot of systolic and diastolic blood pressure among those with an elevated blood pressure at baseline by intervention status.

**Conclusions:** An integrated, WHO-aligned package of NCDs services can achieve blood pressure control while sustaining, and perhaps improving, viral suppression for PLHIV with co-morbid cardiometabolic NCDs.

## OAC4004

### Persistence of symptoms of depression, anxiety, and PTSD among people with HIV aged $\geq 40$ years in low- and middle-income countries in the Sentinel Research Network of IeDEA

**Background:** Persistence of symptoms of depression, anxiety, and PTSD among people with HIV aged  $>40$  years in low- and middle-income countries in the Sentinel Research Network of IeDEA.

**Methods:** We analyzed longitudinal data collected between 2020-2023 from the International epidemiology Databases to Evaluate AIDS (IeDEA) Sentinel Research Network (SRN) cohort of PWH aged  $\geq 40$  on ART at 11 sentinel sites in the Asia-Pacific, Caribbean, Central and South America, and Central, East, Southern, and West Africa IeDEA regions. We documented the prevalence of symptoms of depression (PHQ-9  $\geq 10$ ), anxiety (GAD-7  $\geq 10$ ), and post-traumatic stress disorder (PTSD) (PCL-5  $\geq 33$ ) at enrollment, and 6 and 12 months. Mutually exclusive symptom patterns included:

1. No or mild at all time points,
2. Persistent or worsening,
3. Improved, or;
4. Both worsening and improved.

**Results:** Among 2,521 participants, the median age was 51 and 57% were female. The prevalence of depression was 15%, 9%, and 9% at enrollment, 6- and 12-months, respectively. For depression, 77% reported no or mild symptoms, 7% reported persistent or worsening symptoms, 11% reported improved symptoms, and 5% reported worsening and improved symptoms. The prevalence of anxiety was 10%, 6%, and 7% at enrollment, 6-, and 12-months, respectively. For anxiety, 83% of participants reported no or mild symptoms, 6% reported persistent or worsening symptoms, 7% reported improved symptoms and 4% reported worsening and improved symptoms. The prevalence of PTSD was 6%, 4%, and 4% at enrollment, 6-, and 12-months, respectively. For PTSD, 90% reported no or mild symptoms, 3% reported persistent or worsening symptoms, 5% reported improved symptoms, and 2% reported worsening and improved symptoms. The persistence of symptoms of depression, anxiety, and PTSD varied by sex (Table). Females were more likely to report improved symptoms of depression and anxiety.

Symptom Pattern N (%)	Depression			Anxiety			PTSD		
	Total (n=2330)	Male (n=997)	Female (n=1333)	Total (n=2334)	Male (n=1002)	Female (n=1332)	Total (n=2336)	Male (n=1,002)	Female (N=1334)
None or mild	1786 (77)	794 (80)	992 (74)	1937 (83)	838 (84)	1099 (82)	2095 (90)	897 (89)	1198 (90)
Persistent or worsening	172 (7)	83 (8)	89 (7)	140 (6)	62 (6)	78 (6)	69 (3)	35 (4)	34 (2)
Improved	252 (11)	71 (7)	181 (14)	160 (7)	57 (6)	103 (8)	118 (5)	46 (5)	72 (5)
Worsening & improved	120 (5)	49 (5)	71 (5)	97 (4)	45 (4)	52 (4)	54 (2)	24 (2)	30 (2)

Table: Persistence of symptoms of depression, anxiety, and PTSD among PWH in the leDEA SRN.

**Conclusions:** Symptoms of depression, anxiety, and PTSD were common among this cohort of PWH aged >40. Future research should examine pathways to improve mental health symptoms and differences by sex.

## OAC4005

Unmet need for HPV vaccination among men who have sex with men living with and without HIV in San Francisco, 2023

P.L. Ramirez<sup>1</sup>, A.A. Moscatelli<sup>1</sup>, B. Suprasert<sup>2</sup>, M. Tate<sup>2</sup>, M.A.d.S.M. Veras<sup>3</sup>, E.C. Wilson<sup>2,4</sup>, W. McFarland<sup>2,4</sup>

<sup>1</sup>Faculdade de Ciências Médicas da Santa Casa de São Paulo, São Paulo, Brazil, <sup>2</sup>Center for Public Health Research, San Francisco, Department of Public Health, San Francisco, United States, <sup>3</sup>Faculdade de Ciências Médicas da Santa Casa de São Paulo, Departamento de Saúde Coletiva, São Paulo, Brazil, <sup>4</sup>University of California San Francisco, Department of Epidemiology and Biostatistics, San Francisco, United States

**Background:** Men who have sex with men (MSM) are at higher risk for HPV and resulting anal cancer than non-MSM, with rates highest among older MSM and those living with HIV. Unfortunately, guidelines for adult HPV

vaccination are unclear. The objective of our study was to measure the history of HPV vaccination in a community sample of MSM in 2023 in San Francisco, USA.

**Methods:** Data originate from the CDC-led National HIV Behavioral Surveillance study. Participants are recruited by time-location sampling wherein participants are intercepted at venues where MSM congregate during randomly selected dates and times. Face-to-face interviews collect demographic characteristics, sexual behaviors, sexual health history, access to healthcare, and HIV status.

**Results:** Of 497 MSM respondents, 44.9% reported a history of HPV vaccination. The average age of the first HPV vaccine was 29 years (Median=26, SD=13). Disparities of HPV vaccination were found by age group (74.2% for 18-29 year-olds vs. 22.6% for 50+ year-olds,  $p<0.001$ ), educational level (51.0% for postgraduate level vs. 34.3% for some college,  $p=0.012$ ), seeing a healthcare provider in the past 12 months (47.4% vs. 20.0% among those not seeing a provider,  $p<0.001$ ), having disclosed they have sex with men to their provider (46.2% vs. 23.8%,  $p=0.047$ ), gender identity (68.8% non-binary vs. 42.9% for cis-male vs. 62.5% for or transmasculine,  $p=0.009$ ), and consistent condom use with anal intercourse in the past 12 months (34.6% consistent vs. 48.8% inconsistent,  $p=0.005$ ). MSM who used PrEP were more likely to be vaccinated (63% vs 21.5% not using  $p<0.005$ ). Among MSM living with HIV, the majority (56.3%) were unvaccinated.

**Conclusions:** Despite high risk for HPV and resulting anal cancer, fewer than half of MSM in San Francisco were vaccinated, even among MSM living with HIV. To close the gap, we recommend healthcare providers verify past vaccination history and offer HPV vaccination to unvaccinated men, particularly those who disclose being MSM, who are older and not vaccinated as children, and those who are living with HIV. US and worldwide HPV vaccination policies that specifically address MSM are needed, such as recommending vaccination for MSM at any age.

### AIDS-orphaned or COVID-orphaned? Mental health and suicidality across two pandemics\*

L. Sherr<sup>1</sup>, T. Mawoyo<sup>2</sup>, R. Hisham<sup>3</sup>, C. Laurenzi<sup>2</sup>, K. Steventon Roberts<sup>4</sup>, M. Tomlinson<sup>2</sup>, L. Cluver<sup>3</sup>

<sup>1</sup>University College London, Global Health, London, United Kingdom, <sup>2</sup>Stellenbosch University, Institute for Life Course Health Research, Stellenbosch, South Africa, <sup>3</sup>Oxford University and University of Cape Town, Dept of Social Policy and Intervention, Oxford, United Kingdom, <sup>4</sup>Oxford University, Dept of Social Policy and Intervention, Oxford, United Kingdom

**Background:** Parental/caregiver death dramatically affects children directly and indirectly. These are lifelong, and care provided can impact on the future mental health, achievements and behaviour. This study examines the differences and similarities between AIDS orphanhood and COVID orphanhood on children in South Africa with a focus on mental health, suicidal behaviours and psychosocial and environmental risks.

**Methods:** A total of 611 South African children were assessed by trained researchers with ethical approval. Three groups were studied - 190 had experience parental/caregiver loss through AIDS, 211 through COVID, and a comparison group (n=210) with no loss. Data gathered included demographic variables, mental health, suicidality (mini mental health examination), behaviour, risk behaviours in relation to HIV acquisition, alcohol use, violence, parenting and stigma. Validated scales and established cut off points were used for the analysis including analysis of variance and multivariate regression modelling as appropriate.

**Results:** Comparisons between groups showed similar levels of exposure to poverty and turbulent home environments. Orphanhood from HIV/AIDS was most likely to be stigmatized and had the highest levels of suicidality. One in ten children wished they were dead, with AIDS orphanhood five times and COVID orphanhood 3 times the control group (16.8%;9%;3.8% p<.001). This pattern held true for self-harm (12.6%,9.5%,3.6% p=.006), contemplation of suicide (10.5%,9%,4.3% p=.05) and suicide attempts (9%,2.4%;1.4% p=.001).

The AIDS affected children were most vulnerable to negative developmental outcomes, but were followed closely by COVID orphanhood children. Sexual risks, however, were more pronounced among the COVID orphanhood group.

Multivariate regression results support the existence of a link between poverty, parenting quality, mental health, and social risk behaviours as a pathway to cumulative disadvantage. Increasing age of the child was positively associated with every mental health measure.

**Conclusions:** The mental health burden of orphanhood is high and persists as children age. Little appears to have been learned from the AIDS-pandemic to inform the COVID-pandemic which is following closely in terms of mental health burden, stigma, poverty, violence and social risk. The COVID pandemic may have overshadowed the AIDS pandemic with attention and funding diversions, despite a high level of ongoing support needed and little integrated vision.

## OAD0503

### Adapting and evaluating a mindfulness and acceptance-based mental health support program for adolescents with HIV in a resource-constrained setting. Evidence from Uganda

K. Musanje<sup>1,2</sup>, C. Camlin<sup>3</sup>, R. Kasujja<sup>4</sup>, M. Kamya<sup>2</sup>

<sup>1</sup>Makerere University, Psychology, Kampala, Uganda, <sup>2</sup>Makerere University, Medicine, Kampala, Uganda, <sup>3</sup>University of California San Francisco, Obstetrics, Gynecology and Reproductive Science, San Francisco, United States, <sup>4</sup>Makerere, Psychology, Kampala, Uganda

**Background:** Adolescents with HIV (AWH) report the highest mental health burden in Uganda. The dual challenge of living with HIV and negotiating life stage changes compromises AWH's mental health and related clinical outcomes. While several psychosocial strategies are used with AWH, the persistent mental health gap warrants alternative and innovative approaches to complement existing care services. Mindfulness and Acceptance-based Interventions (MABI), show promise when used to support the mental health of young people.

However, their effectiveness has only been tested in high-income contexts and not with adolescents living with a stigmatized condition such as HIV. We aimed to adapt and test effectiveness of a MABI as an alternative mental health support strategy for AWH in Uganda.

**Methods:** Following two adaptation frameworks (the ecological validity model and the formative method for adapting psychotherapy), we engaged n=30 stakeholders involved in the HIV care cascade to culturally translate a MABI for use in Uganda. Through an open-label randomized trial (NCT05010317), we further tested the effectiveness of the adapted MABI in reducing depression symptoms, internalized AIDS stigma and anxiety among a sample of 122 older AWH (15-19 years) recruited from an urban clinic in Kampala and used paired sample t-tests and multiple linear regression to compare groups pre-post.

**Results:** Key adaptations to MABI included: simplifying the language of the manual, adding local practices and slang into therapy, introducing racially congruent visuals and cards representing emotions and reducing therapy sessions from six to four. Furthermore, preliminary results showed that the intervention was associated with a re-

duction in symptoms of depression (pre-test= 21.64; post-test= 12.07,  $p = <0.001$ ), anxiety (pre-test= 35.47; post-test= 27.41,  $p = <0.001$ ), and stigma (pre-test= 3.09; post-test= 2.07,  $p = 0.002$ ).

**Conclusions:** Results suggest that MABIs have the potential to improve the mental health of AWH in low-resource settings. Large-scale trials building on these preliminary results are needed to generate additional evidence to support advocacy inclusion of MABIs into care for adolescents with HIV.

## OAD0504

Nishikilie (Hold on me): providing responsive community centred mental health interventions for LGBTIQ communities in anti-LGBTIQ polarized contexts

S. Mumba<sup>1</sup>, R.N. Josphine<sup>2,3</sup>, J. Kyana<sup>1</sup>, K.M. Wambua<sup>1</sup>

<sup>1</sup>HAPA Kenya, Programmes, Mombasa, Kenya, <sup>2</sup>HAPA Kenya, Technical Consultant - Programmes, Mombasa, Kenya,

<sup>3</sup>Community Health Advocacy and Learning Initiative, Public Health Consultant, Kilifi, Kenya

**Background:** HAPA-Kenya, a key population-led organization in Mombasa, offers comprehensive health services to 3,022 participants, including 140 PLHIV, through community outreach, support groups, drop-in centers, and advocacy. Evidence shows that pervasive violence, stigma, and discrimination impact key populations' mental health, hindering healthcare access. In 2023, the LGBTIQ community faced cycles of anti-LGBTIQ campaigns, violence, and security polarization, exacerbating these challenges.

**Description:** In 2023, a surge in anti-LGBTIQ campaigns and violence prompted an increased demand for mental health care. To address this, a program was implemented, focusing on mental health screening, psychoeducation, lifeskills building, and group therapy referral. Capacity building included training peer educators and healthcare providers in basic counseling skills and integrated mental health screening. Weekly online check-ins, a monthly alcohol and substance recovery support group, and KPLHIV support groups were introduced to meet the high demand. The program emphasized referrals and linkage to psychiatric and social services, with monthly peer educator supervision, microplanning, and data review.

**Lessons learned:** In 2023, amid heightened mental health care demand due to community-wide traumatic events, 2,010 LGBTIQ individuals engaged in therapist-guided online check-ins. Mental health screening of 3,094 MSM and transgender persons identified 491 with needs, including 140 PLHIV. Notably, 28% received psychological first aid, 43% underwent individual therapy, and 68% participated in group therapy. Ten individuals were referred to Port Riez Hospital in Mombasa for psychiatric treatment, addressing issues like depression (6 cases) and

psychosis (4 cases). This proactive approach, responding to a myriad of challenges, showcases the program's dedication to supporting diverse mental health needs within the community.

Figure 1. The graph shows the number of program participants screened for mental health (purple bars) and those with indication for psychological interventions (blue bars) in the year 2023. The orange bars show the number of participants checking-in for the weekly debrief sessions.

**Conclusions/Next steps:** Anti-LGBTIQ campaigns and violence contribute to a high prevalence of mental health issues in key populations. This emphasizes the urgency to integrate mental health services into key population programs, with a focus on community-level screening, healthcare worker training in CETA, and the expansion of online support services.

## OAD0505

Peer-led interventions: exploring the peer group leader experience of delivering a group-based mental health intervention for adolescents living with HIV in Tanzania

C. Agina<sup>1</sup>, D. Dow<sup>1,2</sup>, F. Nasuwa<sup>2</sup>, J. Mosha<sup>3</sup>, N. Abdul<sup>3</sup>, E. Sanga<sup>3</sup>, L. Samson<sup>4</sup>, L. Amos Ndelwa<sup>5</sup>, J. Noel Baumgartner<sup>6</sup>

<sup>1</sup>Duke University, Global Health Institute, Durham, United States, <sup>2</sup>Kilimanjaro Christian Medical Centre, Moshi, Tanzania, the United Republic of, <sup>3</sup>National Institute of Medical Research, Mwanza Research Centre, Mwanza, Tanzania, the United Republic of, <sup>4</sup>Ifakara Health Institute, Ifakara, Tanzania, the United Republic of, <sup>5</sup>Mbeya Zonal Referral Hospital, Mbeya, Tanzania, the United Republic of, <sup>6</sup>University of North Carolina at Chapel Hill, School of Social Work, Chapel Hill, United States

**Background:** Adolescents living with HIV (ALWH) face mental health challenges which negatively influence their adherence to antiretroviral medication and HIV outcomes. In Africa, where the majority of ALWH reside, there are few mental health professionals. Task-sharing to lay peer leaders may be an effective strategy for delivering mental health care. A peer-led, group-based mental health intervention called *Sauti ya Vijana* (SYV) was found to be a feasible and acceptable to ALWH in Tanzania. This study aims to understand and evaluate peer group leaders' experiences with SYV.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

**Methods:** Twenty-five peer group leaders (PGLs) aged 23 to 29 years and living with HIV were trained to deliver SYV which includes 10 group-based sessions (2 with caregivers), and 2 individual sessions. SYV incorporates three evidence-based components: cognitive-behavioral therapy, interpersonal therapy, and motivational interviewing, to discuss coping, relationships, stigma, disclosure, and value-guided goal pursuit. In-depth interviews (IDIs) were conducted with PGLs after training and their experience delivering SYV in the pilot study leading into a larger, ongoing clinical trial. IDIs were audio-recorded, translated from Swahili to English, and analyzed using NVivo and 28 deductive codes. Excel was used to summarize and display data for the US-Tanzania team-based qualitative data interpretation and identification of themes. Results were presented back to participants for input.

**Results:** PGLs reported a range of motivators and perceived benefits, including a desire to help youth, increased confidence, a sense of shared benefit with the youth, and newfound hope for the future. Challenges included concerns about compensation, navigating exposure to difficult life events from the youth that trigger past trauma experience by PGL, maintaining boundaries with the youth, and a need for more in-person supervision. PGLs expressed concerns about job security, particularly around aging out of the peer role. Recommendations for intervention expansion and sustainability included defining key qualities of future PGLs, continuous training, opportunities for career growth, and integrating male and female youth during sessions.

**Conclusions:** Taking the factors mentioned by PGL into consideration can help enhance the SYV PGL experience and position SYV for sustainability as Tanzania navigates scaling mental health care for ALWH.

pilot project using the Web-outreach model has provided services to NPS users, encouraging self-testing for HIV and serving as a bridge to the HIV center upon positive results.

**Description:** Operating in high-drug-use regions (Bishkek, Osh, Chui), the project studied existing online engagement approaches, trained web-outreach workers, and developed a web-outreach guide. We reached 1,754 NPS users (PWUD 78%, PWID 6%, MSM 11%, TG 2%, SW 3%). Among 6% PWID 46% used also heroin (72% using sterile equipment). 100% were tested for HIV (27% self-testing, 73% assisted testing) and received harm reduction kit. Five HIV cases were identified, three confirmed and started ARV treatment. 68% of NPS users stated that their sexual activity increased after use of NPS, 50.5% of beneficiaries had three or more sexual partners in the past month. 25% used condom during the last sexual encounter.

**Lessons learned:** Of all beneficiaries, 37% were reached online because of their fear and distrust. Therefore, it is important to combine online and offline outreach. NPS users as web-outreachers are vital for building trust. Continuous training is essential, given different dynamics in offline and online service provision, requiring skills in communication technologies. Consistent input is essential due to the high rotation/attrition rate among peer web-outreachers. The low detection rate (0.02%) may be an indicator that HIV is just beginning to spread in this group.

**Conclusions/Next steps:** Interim results demonstrate sexual and injection drug use. Without sustained interventions for NPS users, there may be an increase in HIV. The growing interest in NPS among key populations; as well as the shift to injection use of NPS, underscores the urgency of continued interventions to mitigate the potential public health impact.

## OAD07 Emerging patterns: Exploring trends and shifts in drug use

### OAD0702

Piloting online services for people using new psychoactive substances to assess the prevalence of HIV

C. Imankulova<sup>1</sup>, N. Shumskaya<sup>2</sup>, N. Kemelbek kyzy<sup>2</sup>  
<sup>1</sup>Public Foundation "AFEW", Program Management, Bishkek, Kyrgyzstan, <sup>2</sup>Public Foundation "AFEW", Bishkek, Kyrgyzstan

**Background:** People who use new psychoactive substances (NPS users) are at a significant risk of HIV transmission due to injection and unsafe sex practices. Despite this, harm reduction in Kyrgyzstan primarily target opioid users, neglecting the diverse groups using NPS. In 2023, a

### OAD0703

"Bluetoothing": knowledge, attitudes and behaviour on unsafe drug injection behaviour and its risks to HIV transmission among adolescents and young people in Zimbabwe

H. Choi<sup>1</sup>, M. Munjoma<sup>1</sup>, N. Kunaka<sup>1</sup>, N. Nhando<sup>1</sup>, K. Chatora<sup>1</sup>, J. Mavudze<sup>1</sup>, T. Moga<sup>1</sup>, B. Mutede<sup>1</sup>, N. Tarubekera<sup>1</sup>  
<sup>1</sup>Population Solutions for Health, Harare, Zimbabwe

**Background:** Drug and substance abuse (DSA) is one of the most pressing public health issues in young Zimbabwe populations, and 57% of youths were reported to engage in substance use in 2019. Within various DSA patterns, injection accounts for the second riskiest behaviour for HIV acquisition globally.

As DSA becomes more prevalent in high HIV-burden communities like Zimbabwe, it is important to understand contexts around injection drug use and HIV transmission among adolescents and young people (AYP).

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Methods:** We employed a mixed-method study in two metropolitan provinces in Zimbabwe from February to March 2023. We administered a questionnaire to randomly selected AYP and 24 in-depth interviews with purposively selected community- and national-level key stakeholders to assess their knowledge, attitude, and behaviours on adolescent DSA and subsequent HIV risks.

We collected quantitative data with KoBo Toolbox and analysed using SPSS Statistics, and we utilised an inductive approach and thematic coding for qualitative analysis.

**Results:** We recruited 770 AYP (410 male, 358 female, and two transgender) for the survey. 50.5% of males and 36.6% of females responded that they had engaged in DSA within the past three months. 3.8% of them had previously used injection as method, and all of them indicated the experience of sharing unsterilised injection equipment with others. Only 26.2% and 10.1% of AYP who use drugs had knowledge of HIV transmission risk through sharing and using non-sterilised injection equipment, respectively, whereas 97.6% were aware of the risk of unprotected sex. From IDIs, we identified a rise of a new drug injection behaviour called 'bluetoothing' among AYP, a direct person-to-person injection of blood drawn from an individual who is already intoxicated, mainly due to a lack of financial resources to purchase safe injection supplies and substances.

**Conclusions:** Findings show an intricate dynamic between DSA and potential HIV transmission through a new unsafe drug injection behaviour in Zimbabwe. Lack of resources and attention towards 'bluetoothing' facilitates AYP's easier access to substance use and increases their chances of HIV acquisition. As we move to the status neutral approach, it is necessary to develop targeted solutions for unsafe injection behaviours to prevent transmission among AYP.

## OAD0704

Synergistic effects of exposure to multiple types of violence on non-fatal drug overdose among women who inject drugs in Indonesia: Implications for broadening the scope of harm reduction services

C. Stoicescu<sup>1</sup>, B. Medley<sup>2</sup>, E. Wu<sup>2</sup>, N. El-Bassel<sup>2</sup>, P. Tanjung<sup>3</sup>, L. Gilbert<sup>2</sup>

<sup>1</sup>Monash University, Indonesia, Public Health and Preventive Medicine, Jakarta, Indonesia, <sup>2</sup>Columbia University, School of Social Work, New York, United States, <sup>3</sup>Women and Harm Reduction International Network, Jakarta, Indonesia

**Background:** While research has demonstrated associations between violence from intimate and non-intimate partners and drug overdose among women who inject drugs, existing research focuses predominantly on the

Global North and is methodologically limited. Guided by syndemics theory and the risk environment framework, this study examined whether different experiences of gender-based violence exert independent and interactive effects on non-fatal drug overdose among women who inject drugs in Indonesia. Findings have implications for broadening the scope and gender-responsiveness of harm reduction services in Indonesia, which are presently HIV-focused, to address violence- and overdose-related harms.

**Methods:** We recruited 731 cisgender adult women who injected drugs in the preceding year via respondent-driven sampling. Multivariate logistic regressions examined associations between intimate partner violence (IPV), police sexual violence, and police bribery, and non-fatal drug overdose, with covariance adjustment for theory-informed demographic and social factors. To assess whether victimization with multiple types of violence exerts a synergistic effect on overdose, we tested for interaction effects among violence measures by calculating metrics for attributable proportion, relative excess risk due to interaction, and synergy index.

**Results:** Lifetime prevalence of non-fatal overdose was 31.4% (95% CI 27.6, 35.5). Experiencing IPV (AOR 2.38; 95% CI 1.17, 4.83;  $p=0.016$ ), police bribery (AOR 2.12; 95% CI 1.45, 3.10;  $p<0.001$ ), and police sexual violence (AOR 3.70; 95% CI 1.47, 9.28;  $p=0.005$ ) each independently predicted overdose. A significant positive interaction on the additive scale was detected between IPV and police sexual violence on overdose (AP=0.64,  $p=0.001$ ; S=3.76,  $p=0.015$ ), such that these factors' joint effect was associated with a fourfold increase in overdose risk.

**Conclusions:** This is the first study to show that women who inject drugs exposed to IPV, police sexual violence, and police bribery are significantly more likely to experience overdose, with concurrent experiences of IPV and police sexual violence exerting an amplifying effect on overdose beyond the additive effects of each exposure. Results suggest that eliminating one form of violence when multiple forms of violence are present could magnify the expected reduction in overdose. Expanding HIV-focused harm reduction services in Indonesia to address concurrent violence and overdose would support more comprehensive and gender-responsive harm reduction provision.

Transforming risky behaviors among people who use drugs: a blend of community sexual and reproductive health and harm reduction interventions in Dominican Republic

A. Martin<sup>1</sup>, A. Arciniegas<sup>2</sup>, M.E. Carbuca<sup>1</sup>, L. Balham<sup>2,3</sup>, J.C. Jones<sup>2,3</sup>, R. Zeriuoh<sup>2</sup>

<sup>1</sup>Centro de Orientación e Investigación Integral (COIN), Santo Domingo, Dominican Republic, the, <sup>2</sup>AIDES, Paris, France, <sup>3</sup>Coalition Plus, Community-based Research Laboratory, Pantin, France

**Background:** The PRINCIPE project was implemented from 2020 to 2023 in Haiti and Dominican Republic with the aim of strengthening innovative, community-based HIV services tailored to the needs of Key Populations. In the Dominican Republic, the focus was on combined prevention and harm reduction interventions integrated into a sexual health offering for people who use drugs (PWUD). PWUD in the Dominican Republic have a higher HIV prevalence than the general population (3.2% Vs 0.9 %). The lack of harm reduction interventions, discrimination, violence, and criminalization put PWUD at higher risk of contracting HIV.

**Description:** The project featured two main strategies. A comprehensive community approach and the empowerment of PWUD through the strengthening of their activism via a PWUD-led group called Resiliencia Comunitaria (RC). Outreach was conducted by peer educators (PE). Each PE was assigned an intervention area to find PWUD, established a mutual trust relationship, and accompanied them in risk reduction by providing education, harm reduction (HR) kits, and inviting them to RC. Health services, including medical, nursing, psychological services, HIV and hepatitis C testing, were provided through a mobile unit positioned near sales or consumption areas. People who tested positive or required additional services were referred to the organization's clinic, on-site and offered accompaniment by a PE.

**Lessons learned:** Over 600 PWUDs were reached. Using PE for delivering HR and sexual, and reproductive health services to the communities proved effective in promoting behavior change. 62% of PWUD reported that they had changed their behavior to reduce the risk of acquiring HIV. 42% reduced the frequency of sharing consumption equipment. Additionally, 57% increased the frequency of condom use, and 71% improved their access to health services. Moreover, the empowerment and advocacy process led by RC enhanced PE's effectiveness in outreach, and authorities increased receptiveness to harm reduction interventions.

**Conclusions/Next steps:** Harm reduction services are more effective when paired with empowerment initiatives, further support to RC and the scale-up of harm reduction are needed. Also, significant gaps were identified in access to tuberculosis services for crack users.

Tailored community strategies implemented through a Civil Society Organization-Government alliance are required to address and tackle this problem.

## OAD14 Opportunities and vulnerabilities in the digital age

Using smartphones and GPS technology in public health and HIV/AIDS research for young men who have sex with men (YMSM) residing in small cities and towns in the United States

B.P. Takenaka<sup>1,2</sup>, F.J. Griffith<sup>1,2</sup>, R. Barbour<sup>2</sup>, S. Kirklews<sup>1,2</sup>, C. Tengtenga<sup>3</sup>, E. Nicholson<sup>1,2</sup>, C.K. Lauckner<sup>4</sup>, J. Gibbs<sup>5</sup>, N.B. Hansen<sup>6</sup>, T. Kershaw<sup>1,2</sup>

<sup>1</sup>Yale School of Public Health, Social and Behavioral Sciences, New Haven, United States, <sup>2</sup>Center for Interdisciplinary Research on AIDS (CIRA), New Haven, United States, <sup>3</sup>University of Connecticut, School of Medicine, Farmington, United States, <sup>4</sup>University of Kentucky, College of Medicine, Lexington, United States, <sup>5</sup>University of Georgia, School of Social Work, Athens, United States, <sup>6</sup>University of Georgia, College of Public Health, Health Promotion & Behavior, Athens, United States

**Background:** In 2021, 67% (24,107) of HIV incidence in the US were attributable to male-to-male sexual contact, and 39% were among young men. The social-spatial environments of YMSM shape their HIV risk. Yet, studies primarily use static residential locations on HIV acquisition risk; missing data capturing YMSM's co-opted social spaces (e.g., bars, parties, clubs).

We highlight the innovative opportunities GPS methods and data provide to understanding the social-spatial influences on YMSM's sexual health.

**Description:** Through the Men's Voices on Mapping, Neighborhoods, and Technology (#MVMNT) study, our app collects individual GPS data continuously, creates heat maps of usage (daily, weekly, monthly levels), movement patterns, and facilitates experience sampling (surveys external triggers). To demonstrate the research possibilities, we will show examples of this methodology using our sample of YMSM (18-34) located in non-metropolitan areas. We used GPS activity space assessments, qualitative interviews, and experience sampling to examine influences of social-spatial environments on HIV-related behaviors, and to assess areas in need of structural interventions.

**Lessons learned:** From June 2019 to March 2023, 396 YMSM have completed the #MVMNT study. Use of time and place-based experience sampling provided novel or nu-

anced insight on MSM's sociocultural and environmental interactions. High acceptability, usability, feasibility, and overall positive user experiences were shared by YMSM who completed the study. Smartphone usage and participatory mapping of MSM's locations helped examine real-time objective and subjective neighborhood experiences, and physical and virtual contexts of YMSM's substance use and sexual behaviors.

Our study found high geospatial data validity in trends in YMSM's social and geographic experiences, and these trends shaped HIV risk behaviors. Place-based sampling ensured real-time sampling of multiple contextual factors related to substance use and sexual behaviors among YMSM, and risk for HIV acquisition.

**Conclusions/Next steps:** These findings reveal significant gaps in YMSM's interactions within their social-spatial environments and patterns in sexual behaviors and substance use. Utilizing real-time data and storytelling provides groundbreaking advantages over previous studies on HIV risk among YMSM. Successful user-experience supplies critical data for ecological momentary methods utility in future research. Geospatial data can inform needed structural interventions to reduce HIV acquisition risk among YMSM.

## OAD1403

### Digitally viral sex-positive content that targets HIV stigma among MSM in Aotearoa New Zealand (NZ)

B. Clotworthy<sup>1</sup>, R. Olin<sup>2</sup>, C. Butler-Smith<sup>1</sup>, M. Power<sup>3</sup>, S. Saini<sup>4</sup>, B. Hollingshead<sup>4</sup>, S. Dareth<sup>1</sup>, J. Rich<sup>5</sup>, C. Chalmers<sup>6</sup>, S. Maddox<sup>6</sup>, H. Habgood<sup>6</sup>, J. Spedding<sup>6</sup>, A. Smith<sup>6</sup>, A. Wattie<sup>6</sup>, E. Watkins<sup>6</sup>, K. Bray<sup>6</sup>, M. Bosma<sup>6</sup>, B. Hopkinson<sup>6</sup>, E. Soule<sup>6</sup>, M. Flynn<sup>6</sup>, A. Long<sup>6</sup>, L. Barke<sup>6</sup>, T. Cottle<sup>6</sup>, Burnett Foundation Aotearoa and YoungShand  
<sup>1</sup>Burnett Foundation Aotearoa, Social Marketing, Auckland, New Zealand, <sup>2</sup>Burnett Foundation Aotearoa, Services and Outreach, Auckland, New Zealand, <sup>3</sup>Burnett Foundation Aotearoa, Marketing, Communications and Fundraising, Auckland, New Zealand, <sup>4</sup>Burnett Foundation Aotearoa, Policy, Advocacy, and Science, Auckland, New Zealand, <sup>5</sup>Burnett Foundation Aotearoa, Senior Leadership, Auckland, New Zealand, <sup>6</sup>YoungShand, Auckland, New Zealand

**Background:** It is common on sexual networking apps (e.g. Grindr) for men who have sex with men (MSM) to use the word "clean" to describe someone's HIV status. However, this perpetuates the stigmatising idea that people living with HIV are 'dirty', leading to social exclusion and isolation. HIV stigma also creates barriers to accessing testing and treatment, which can lead to late diagnoses and AIDS.

**Description:** Burnett Foundation Aotearoa created a sex-positive, fun animation and song that allows MSM to recognise that they may be using "clean" to refer to

HIV status, perpetuating stigma on HIV. Titled "Don't be a Dick Getting Dick", the song features colloquialisms and tongue-in-check references, with lyrics explaining why "clean" should not be used. Designed for TikTok, the bright and bold animation is a musical style that features in TikTok trends. The content appeared on other digital platforms including YouTube, Instagram, Radio, and Podcast platforms, and we used targeted digital advertising placements on Grindr and PornHub.

The audience were also directed to our website with resources to change their behaviours. Posters and condom wallets enhanced the content message in physical spaces relevant to MSM.

**Lessons learned:** The campaign was a success with significant reach. Instagram outperformed TikTok with 51602 plays and a total reach of 39514. Our targeted digital advertisement on Grindr had 131227 views, performing well above average industry benchmarks. The virality of the digital performance, delivered the content to MSM and wider support networks, ensuring greater reach of anti-stigma messaging. Community also fed back that they would be reinforcing this messaging with their wider networks. TikTok's strict community guidelines created significant barriers to uploading content, indicating censorship of sexual health promotion is a challenge to dismantling HIV stigma. Verification on TikTok supported and legitimised our ongoing work on the platform. Instagram earned over 240% engagement compared to our recent content.

**Conclusions/Next steps:** We will continue to create content underpinned by sound public health theory, whilst being responsive to community need and seeking further opportunities to deliver content through meaningfully involving people living with HIV to ensure that we dismantle HIV stigma in NZ

## OAD1404

### New forms of sex work and prostitution in Senegal: emerging vulnerabilities in the digital age

T.M. Diallo<sup>1</sup>, N.k. Sow<sup>1</sup>, K. Diop<sup>1</sup>, B. Thiam<sup>2</sup>, S. Thiam<sup>3</sup>  
<sup>1</sup>Centre Régional de Recherche et de Formation (CRCF) du CHNU de Fann, Sciences Sociales, Point E, Senegal, <sup>2</sup>Comité de Veille et d'Alerte, Dakar, Senegal, <sup>3</sup>Conseil National de Lutte Contre le VIH Sida du Sénégal (CNLS), Dakar, Senegal

**Background:** In Senegal, HIV prevalence among femal sex workers (FSWs) remains high (18.5% in 2010 to 5.8% in 2022). This study focuses on the vulnerabilities generated by the emergence of new forms of sex work, strongly influenced by digital technologies.

**Methods:** The study, supervised by the Conseil National de Lutte contre le Sida and financed by the Global Fund, adopted a qualitative approach with 32 individual interviews and 17 focus groups conducted between February and June 2022 in eight Senegalese regions. A total of 156

FSWs and 25 health agents were interviewed, and the data were analyzed using an inductive approach and the Dedoose application. The study was approved by the Senegalese Health Research Ethics Committee.

**Results:** The FSWs surveyed, mostly divorced or widowed women aged between 20 and 50, have abandoned traditional solicitation in favor of new methods of contacting customers, mainly via social networks. The emergence of these new practices has led to peer groupings to rent dedicated spaces, often assisted by brokers facilitating interactions with customers online. The adaptation of FSWs to strategies of concealment, normalization and even professionalization is reflected in their reduced visibility in traditional spaces, commonplace dress, and reduced consumption of drugs and alcohol. However, these changes have also created new vulnerabilities. FSWs are now exposed to online risks, such as blackmail from website managers, non-consensual video capture, and the threat of public disclosure. These new forms of prostitution, facilitated by digital technologies, increase the clandestinity of practices, making access to HIV prevention interventions and regular medical care difficult.

**Conclusions:** This study makes a valuable contribution to the HIV program by highlighting the need to adapt HIV prevention interventions to take account of new forms of prostitution and the vulnerabilities they entail. It is imperative to rethink prevention approaches, increase access to medical care and raise awareness among SWs of the increased risks associated with these developments.

## OAD1405

**Tough Talks virtual simulation HIV disclosure intervention for young men who have sex with men living with HIV: results from a randomized controlled trial**

B. Stamp<sup>1</sup>, K. Muessig<sup>2</sup>, K. Powers<sup>1</sup>, Z. Soberano<sup>2</sup>, S. Levintow<sup>1</sup>, M. Rosso<sup>2</sup>, M. Adams Larsen<sup>3</sup>, L. Hightow-Weidman<sup>2</sup>

<sup>1</sup>University of North Carolina at Chapel Hill, Gillings School of Global Public Health, Department of Epidemiology, Chapel Hill, United States, <sup>2</sup>Florida State University, Institute on Digital Health and Innovation, College of Nursing, Tallahassee, United States, <sup>3</sup>Virtually Better Inc., Decatur, United States

**Background:** Disclosing one's HIV serostatus can improve adherence to care or medications and reduce transmission risk behaviors among young men who have sex with men (YMSM) with HIV. *Tough Talks*, a digital health intervention, was designed to build decision-making skills for HIV status disclosure using artificial intelligence (AI)-facilitated role-playing scenarios with digital avatars.

**Methods:** We enrolled 156 YMSM (ages 16-29) into a three-arm, parallel-group randomized controlled trial (NCT03414372) from May 2019 to April 2022 and followed

each participant for six months. Participants were randomized 1:1:1 to either the:

1. *Tough Talks* Participant-Driven intervention, in which each participant had unlimited digital access to intervention features;
2. *Tough Talks* Staff-Driven intervention, in which study staff scheduled two in-person or online meetings for participant intervention use within a 30-day window, and unlimited self-directed digital access thereafter; or
3. Standard of care (SOC).

We conducted binomial regression analyses with inverse probability of treatment weighting (IPTW) to estimate weighted probability differences (PDs) in six-month viral suppression (HIV RNA <20 copies/ml), and weighted risk differences (RD) in six-month condomless anal intercourse (CAI) with a potentially susceptible partner, defined as ≥1 act of CAI with a partner who was not known to have HIV, comparing each of the intervention arms with the SOC arm.

**Results:** Of the 156 participants, 129 (83%) completed their six-month survey, and 119 (76%) had a viral load measured at six months. The probability of viral suppression at six months was higher among those randomized to the staff-driven arm vs. SOC (PD=0.072; 95% CI=0.022, 0.122) and lower in the participant-driven arm vs. SOC (PD=-0.044; 95% CI=-0.094, 0.005). Similarly, six-month risk of CAI with a susceptible partner was lower in the staff-driven arm vs. SOC (RD=-0.277; 95% CI=-0.334, -0.220) and higher in the participant-driven arm vs. SOC (RD=0.077; 95% CI=0.022, 0.131).

**Conclusions:** *Tough Talks* may work most effectively as a hybrid intervention that allows for human interaction to help improve decision-making capacity for HIV status disclosure. Recent advances in AI chatbots may also enhance similar interventions by increasing conversational complexity, facilitating greater rapport, and increasing intervention efficacy.

## OAD1602

Red Umbrella Academy: empowering sex workers in HIV prevention in Europe - lessons, challenges, and advocacy for PrEP access through community-based participatory research (CBPR)

L. Stevenson<sup>1</sup>, F. Belizario<sup>2</sup>

<sup>1</sup>European Sex Workers Rights Alliance, Amsterdam, Netherlands, the, <sup>2</sup>University of Coimbra, Coimbra, Portugal

**Background:** Numerous reports highlight the scarcity of consistent data on health services' access for sex workers (ESWA, 2021; ECDC, 2015). In alignment with the Sex Workers Implementation Tool (SWIT), developed by WHO, UNAIDS, and other stakeholders, the European Sex Workers' Alliance (ESWA) implemented the second edition of the Red Umbrella Academy (RUA) from May 2023 to January 2024. This initiative aimed to enhance sex workers' knowledge of HIV and combination prevention, document Pre-Exposure Prophylaxis (PrEP) access, identify challenges in access to combination prevention, and emphasize the role of peer-workers and community leadership in HIV prevention.

**Description:** RUA engaged 24 sex workers' rights activists (SWRA) from Armenia, Austria, France, Germany, Netherlands, Poland, Sweden, and Turkey, and employed Community-Based Participatory Research (CBPR) to comprehensively analyze the situation of HIV prevention access by sex workers (SW), particularly to PrEP. Facilitated by SW, the academy activities focused on advocacy, quality of life, community leadership, and discrimination. SWRA also facilitated a exploratory research on sex workers' PrEP access, consisted of in-depth interviews with 44 respondents. Findings will be disseminated by RUA trainees utilizing methodologies acquired during the program.

**Lessons learned:** The training and the research not only augmented comprehension regarding PrEP but also elucidated the distinct challenges encountered by disparate countries in the implementation of effective HIV prevention services for sex workers. Disparities in PrEP availability, affordability, and acceptability underscored the necessity for integrated services, data collection on adherence, SW empowerment, and acknowledgment of their specific needs and constraints. Overall, PrEP is not only a source of prevention but is seen as a source of confidence, an opportunity to ensure adherence to health services, educate the community about HIV prevention and treatment and the opportunity to empower the community to educate their surroundings.

**Conclusions/Next steps:** The Red Umbrella Academy serves as a model for CBPR efficacy, addressing data gaps, and empowering sex workers as key advocates. The

findings stress the importance of sex workers as advocates, establishing a foundation for impactful community outreach and research programs.

## OAD1603

Co-design of national information campaign: unveiling Australia's community-led HIV Treatment for All campaign

L.R. Melanie<sup>1</sup>, L. Stackpool-Moore<sup>2</sup>, S. Finnegan<sup>2</sup>,

A. Cogle<sup>3</sup>, B. Clifton<sup>3</sup>, A. Ogier<sup>3</sup>, E. Oxenburgh<sup>3</sup>, D. Reeders<sup>3</sup>, M. Valencia Moreno<sup>4</sup>, C. Afele<sup>5</sup>, J.Y.-H. Chen<sup>6</sup>, L. Durow<sup>7</sup>, D. Cordner<sup>8</sup>, K. Sinclair<sup>9</sup>, B. Newham<sup>3</sup>

Australia, <sup>8</sup>Graphic Design Consultant, Melbourne,

Australia, <sup>9</sup>Web Consultant, Sydney, Australia

**Background:** This abstract provides a dual perspective on Australia's ground-breaking "HIV Treatment for All" awareness campaign, shedding light on both the campaign's transformative policy shift and the collaborative efforts of key stakeholders propelling it forward.

The campaign informs about Australia's pivotal transition from an industry-sponsored antiretroviral treatment (ART) compassionate access scheme to the Federation Funding Agreement (FFA) model. This shift ensures free HIV testing and treatment for all residents, regardless of eligibility for Medicare, which is Australia's subsidized public health care. The policy change was initially announced on World AIDS Day 2021 and came into effect in mid-2023.

**Description:** The campaign emphasizes timely testing and treatment, particularly for people in Australia without Medicare, who are often people on student, travel, and temporary work visas. The campaign explains implementation details across states and territories, such as where the scheme covers medication costs, and in jurisdictions where additional expenses related to care or treatment side effects are not included. A peer-led community advisory group guided the process throughout and people living with HIV were also involved within the campaign's collaborative project team.

**Lessons learned:** Spearheaded by the National Association of People with HIV Australia (NAPWHA), the campaign models an example of community leadership in co-designing a national public health promotion campaign. NAPWHA's national influence and expertise in championing the rights of people living with HIV serve as the campaign's driving force. Diverse and inclusive community leadership at every stage ensured authenticity and relevance, supported by expertise in health, community

engagement, and advocacy. The collaborative effort incorporated insights from community advisory group members in Australia and New Zealand.

**Conclusions/Next steps:** The success of the "HIV Treatment for All" campaign lies in the seamless integration of diverse roles, emphasizing the importance of inclusive, community-driven initiatives. This multidisciplinary approach paves the way for equitable access to HIV testing and treatment for all in Australia. Interested parties are invited to explore the campaign's implementation details on the website:

promoting transparency, awareness, and community engagement.

## OAD1604

More attention is needed by young girl who sells sex in eastern Indonesia: analysis of regular HIV program monitoring data

R.G.P. Pandiangan<sup>1</sup>, N.L.P. Ariastuti<sup>1</sup>, N.L.B. Febriani<sup>1</sup>

<sup>1</sup>Kerti Praja Foundation, Denpasar, Indonesia

**Background:** Young people who sell sex are one of the most vulnerable groups in HIV settings due to the lack of programs that address their specific needs, legal and economic barriers. However, currently, there is no sufficient data related to this group in Indonesia. The programs available related to sex work only reach female sex workers (FSW) with limitations. This study aims to analyse data of young girl who sell sex in Eastern Indonesia in 2023.

**Methods:** The study analysed regular 2023 programmatic data from HIV prevention program for FSW in Eastern Indonesia. Monthly data were collected and reported by outreach workers from 55 districts spread in Kalimantan, East Java, Sulawesi, Bali, West Nusa Tenggara, East Nusa Tenggara, Maluku, Papua and West Papua. Data collected consist of date of birth, HIV tests, HIV tests result, Initiation of ARV and 3 months retention of ARV. Data then segregated by age categorization 15-19, 20-24 and ≥25 years old.

**Results:** Through 2023, the program reached 51,539 FSW and 27% (13,670) of all FSW reached were young girl aged 15-24 years old and among them, 15% were aged < 19 years old. 28% tested in health services, 29% through mobile HIV testing and 26% referred to do confirmatory test after reactive in HIV screening using oral fluid test. Young girl who sells sex accounted for 22% of all new HIV cases finding which among them, 15% were age <19 years old. Only 54% of HIV-positive young girl who sell sex continue to Antiretroviral treatment and only 34% fulfil 3 months of ARV retention.

**Conclusions:** Almost a quarter of new HIV case findings among the female sex workers population is contributed by young girls aged 15-24 years old and among them 15%

considered children (age<19 years old), additionally only half of them receive ARV treatment with poor adherence. Indonesian government needs to pay more attention to these vulnerable young groups, ensuring they can receive proper support and access to sexual and reproductive health information and services tailored based on their specific needs.

## OAD1605

Community HIV index testing: a case for revitalizing primary health care in improving uptake of same day/fast-track ART initiation of newly diagnosed PLHIV in Botswana

P.P. Chibatamoto<sup>1</sup>, W. Gaogane<sup>2</sup>, A. Sejamitlwa<sup>2</sup>, E. Kanyane<sup>2</sup>, C. Nyambe<sup>2</sup>, L. Difongo<sup>2</sup>, K. Sibiya<sup>2</sup>, M. Zulu<sup>2</sup>  
<sup>1</sup>Humana People to People, Project Management Unit, Gaborone, Botswana, <sup>2</sup>Humana People to People, Gaborone, Botswana

**Background:** Botswana is implementing layered HIV prevention programs targeting those most-at-risk of acquiring HIV. Approaches include community index testing, same-day initiation of ART (SDART) for all persons diagnosed with HIV and ready to start treatment, and fast-track initiation within two weeks of HIV diagnosis. The purpose of this study was to assess the extent to which community-based HIV index testing contributes to same-day and fast-track initiation.

**Description:** HPP Botswana (HPPB), a local NGO, provides community-based HIV index testing and linkage services in eight health districts in Botswana. This study describes routine HIV testing services (HTS) data (March 2021-September 2023) collected by trained HPP community health workers (CHWs). Using a health facility HIV client list, HPPB CHWs engaged PLHIV as index clients and elicited their sexual contacts for HIV testing, following Botswana's National HTS guidelines. At community-level, CHWs screened contacts for HIV using HIV self-testing kits and confirmed HIV status through diagnostic HIV rapid test kits. Positive clients were offered same-day initiation (SDART) or fast-track options.

Figure. HPP Community index partner testing results and ART initiation by sex, March 2021 - Sept 2023

**Lessons learned:** HPPB tested 9,702 sexual contacts of index clients for HIV, yielding a 17% positivity rate, 67% SDART rate, 84% fast-track initiation rate, and a 96% over-

all initiation rate. Men comprised 57% of the index clients tested. Although there were no noticeable differences in positivity rates and same-day initiation (SDART) between the sexes, women had slightly higher fast-track (86%) and overall initiation (98%) rate as compared to their male counterparts (81% and 94% respectively).

**Conclusions/Next steps:** Community-based HIV index partner testing is effective in HIV case-finding and timely ART initiation amongst both men and women. Synchronisation of community index partner testing with same day and fast track ART initiation is an important treatment as prevention (TasP) intervention in supporting Botswana's goal of ending AIDS by 2030 and may be effective in reaching hidden pockets of unknown HIV cases.

## OAD19 Navigating adversities: HIV response in conflict zones and migration pathways

### OAD1902

Comprehensive support and rehabilitation for women and children affected by conflict: a holistic approach to HIV in Ukraine

H. Skipalska<sup>1</sup>, T. Castillo<sup>2</sup>, A. Saienko<sup>1</sup>, T. Khytryk<sup>1</sup>

<sup>1</sup>Ukrainian Foundation for Public Health, Kyiv, Ukraine,

<sup>2</sup>HealthRight International, New York, United States

**Background:** The prolonged conflict in Ukraine has led to significant challenges for women and children, including displacement, violence, and social disintegration, as well as over 12,200 HIV cases in 2022. In response, a holistic program has been implemented to provide comprehensive support to women and children affected by or at high risk for HIV. This initiative includes the establishment of three Day Centers and three Halfway Houses. The program utilizes various support strategies and the innovative @TakeCareUA\_bot for health education.

**Description:** Our project aimed to address the multifaceted challenges faced by clients affected by conflict, particularly those with HIV. Our comprehensive approach included psychological counseling vocational training for practical skills, and legal support to protect beneficiaries' rights. The holistic services aimed to foster resilience and empower individuals towards recovery and self-sufficiency. A robust referral process ensured seamless access to medical care, with 33 clients referred to healthcare facilities, including 17 initiating antiretroviral therapy. In total, 2,425 clients received comprehensive care, with a focus on HIV services. Testing services identified 5 syphilis cases, 10 hepatitis C cases, and 36 HIV cases. The project's commitment to a seamless referral system reinforced its client-centered and comprehensive approach.

**Lessons learned:** Our project's success is evident not just in numbers but in the integrated approach and collaboration between Day Centers and Halfway Houses aligned with UN standards for Women and Girls Safe Spaces. This approach ensures comprehensive services, such as group and individual counseling, medical service coordination, document restoration assistance, and facilitating children's enrollment in kindergartens. Technology, specifically the @TakeCareUA\_bot chatbot, has significantly improved service accessibility and efficiency by providing information, emotional support, and directing clients to appropriate services.

**Conclusions/Next steps:** A holistic approach, integrating physical shelter, psychological support, medical care, legal assistance, and technological innovation, proves impactful. This not only addresses immediate needs but also fosters long-term resilience and empowerment for women and children affected by HIV in conflict regions. The success of this model emphasizes the significance of a comprehensive service continuum in tackling multifaceted challenges in such contexts.

### OAD1903

Exploring the impact of digital platforms in increasing access to PREP and mental health support

S. Atuhura<sup>1</sup>, M. Kimbugwe<sup>1</sup>

<sup>1</sup>Spectrum Uganda Initiatives, Human rights, Kampala, Uganda

**Background:** The enactment of the anti-homosexuality act, 2023 in Uganda created significant obstacles for the provision of essential health services to the LGBTIQ community. Access to crucial services like PREP and mental health support has become increasingly challenging. The law imposed heightened scrutiny and constraints on LGBTIQ drop-in centers, which previously served as safe spaces for healthcare provision. The immediate impact of the law, registered the number of young MSM on PREP dropping from 106 to 12 within a month. Access to mental health services for young MSM plummeted from 95 to zero.

**Description:** Spectrum Uganda Initiatives developed an online application that facilitates virtual meetings between young MSM aged 15 to 24 years and healthcare workers. The application has a directory of anonymous friendly health workers operating across the country. The main objective was for the digital platform to allow clinicians to enroll individuals in virtual adherence clubs, where they can freely access comprehensive information on PREP adherence and mental health support.

**Lessons learned:** 26 virtual adherence clubs comprising of 10 to 12 members were formed. Each member was given a unique referral code which was used for linkage to a key populations' clinic. The numbers adhering to PREP

skyrocketed to 268 young MSM within 6 months. 150 young MSM embraced the opportunity to access mental health support through the digital platform.

**Conclusions/Next steps:** This innovative digital solution has proved instrumental in overcoming the challenges imposed by the hostile legal environment in Uganda. By providing a virtual space for healthcare services, the application has effectively bridged the gap in access to essential HIV information, PREP adherence, and mental health support for young MSM.

## OAD1904

HIV pre-exposure prophylaxis (PrEP) awareness, and willingness to use among migrants in transit through Central American countries

D. Cerecero-García<sup>1,2</sup>, F. Macías González<sup>1</sup>, H. Vermandere<sup>1</sup>, C. Palma<sup>3</sup>, S. Soberanis<sup>3</sup>, S. Lungo<sup>3</sup>, S. Bautista-Arredondo<sup>1</sup>

<sup>1</sup>National Institute of Public Health, Cuernavaca, Mexico,

<sup>2</sup>Imperial College, Department of Primary Care and Public Health, London, United Kingdom, <sup>3</sup>Pan American Social Marketing Organization, Guatemala, Guatemala

**Background:** The global movement of people has reached unprecedented levels in recent years, presenting challenges and uncertainties for migrants. One particular risk that migrants in transit often encounter is an increased vulnerability of HIV transmission, emphasizing the necessity for targeted prevention strategies. This study focuses on PrEP awareness and willingness to use it among migrants across five Central American countries.

**Methods:** As part of USAID's Prevention Services against HIV project in Central America, we conducted a study between September 2022 and September 2023, involving 2,513 international migrants in transit through Mexico, Guatemala, El Salvador, Honduras, and Panama.

The study assessed PrEP awareness and willingness to use among the general sample and key populations (i.e., LGBTQ+ migrants, MSM, transgender individuals, and sex workers). PrEP eligibility was defined as either having engaged in condomless sex with more than one sexual partner, having had a previous STI diagnosis, or having engaged in sex under the influence of drugs during transit. Multivariate logistic regression models were utilized to explore predictors of PrEP awareness and willingness to use.

**Results:** Among key populations, 38.7% of migrants met the eligibility criteria for PrEP, compared to only 6.8% among the general population. PrEP awareness was 29% among key populations versus 8% among the general population. Willingness to use daily (70% vs. 56%), injectable (50% vs. 41%), and implant (48% vs. 36%) PrEP was significantly higher among key populations. Engaging in sex during transit was positively and significantly associated with willingness to use all PrEP schemes. Compared with women, men were less likely to be willing to use injectable

(OR=0.72; 95% CI 0.61-0.96) and implant (0.57; 95% CI 0.48-0.68) PrEP. Having an HIV test in the past 12 months was significantly associated with higher odds of PrEP awareness (OR=1.64; 95% CI 1.29-2.23).

**Conclusions:** The heightened HIV risk faced by migrants in transit underscores the urgent need for targeted prevention strategies. The high willingness to use in our sample suggests that preventive PrEP should be considered as part of preventive measures offered to migrants, especially among key populations, given their high eligibility rate.

## OAD1905

Exploring uncharted territories: understanding adolescent sexuality, gender, and HIV risk among refugee girls in Southwestern Uganda

Z. Nahumuza<sup>1</sup>, U. Muhumuza<sup>2</sup>, E.S. Abay<sup>3</sup>

<sup>1</sup>International University of Africa, Khartoum, Sudan, the,

<sup>2</sup>Africa CDC, Kampala, Uganda, <sup>3</sup>Africa CDC, Addis Ababa, Ethiopia

**Background:** This groundbreaking research delves into unexplored terrain, seeking to unravel the intricate dynamics of adolescent sexuality, gender, and HIV risk among refugee girls in Southwestern Uganda. Distinct from previous studies, this research pioneers an in-depth examination of this vulnerable demographic that is faced with unique challenges, such as displacement, cultural adaptation, and limited access to resources shedding light on nuanced factors that remain understudied.

By addressing gaps in existing literature, this study contributes significantly to the high-level scientific discourse on HIV prevention in marginalized populations.

**Methods:** Conducted over 18 months, this study included a meticulously selected sample of 500 adolescent refugee girls, aged 13 to 18, from diverse camps in Southwestern Uganda. Employing a mixed-methods approach, quantitative data were collected through structured surveys, while qualitative insights were gathered through in-depth interviews and focus group discussions. Rigorous statistical analyses, including regression models and chi-square tests, were employed to elucidate patterns and associations.

**Results:** The research reveals compelling statistics: 35% of participants reported early marriages, with a staggering 45% lacking comprehensive knowledge of HIV prevention methods. Gender disparities were evident, with 60% of girls facing limited access to healthcare resources. Notably, older adolescents (16-18 years) exhibited a 25% higher vulnerability to HIV risk factors compared to their younger counterparts. These findings underscore the urgency for tailored interventions.

**Conclusions:** The statistically significant disparities underscore the urgency for targeted interventions. Age differentials highlight the need for age-specific strategies,

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

while gender disparities necessitate tailored healthcare and educational initiatives. The 35% prevalence of early marriages emphasizes the critical role of empowering adolescent girls to make informed decisions. The 45% knowledge gap in HIV prevention mandates a comprehensive and accessible education strategy. The 25% increased vulnerability among older adolescents underscores the need for transition-focused interventions. This research, with its high-level statistical insights, not only unveils the complexities of HIV risk among adolescent refugee girls but also provides a roadmap for evidence-based interventions and policy initiatives, setting a new standard for scientific inquiry in this critical field.

## OAD24 Climates' double burden: Tackling HIV most-affected regions

### OAD2402

Exploring the impact of climate-induced migration on HIV vulnerability in Africa

O. Ekerin<sup>1,2</sup>, D.O. Shomuyiwa<sup>3,4</sup>, O. Sonaike<sup>5</sup>, R. Mojeed<sup>6,7</sup>, I. Gbajumo<sup>5,8</sup>, A. Ahmed<sup>6,9</sup>, A. Ogunsanya<sup>6</sup>

<sup>1</sup>School of Public Health, University of Port Harcourt, Port Harcourt, Nigeria, <sup>2</sup>State AIDS and STIs Control Program, Department of Public Health, Kaduna State Ministry of Health, Kaduna, Nigeria, <sup>3</sup>Faculty of Pharmacy, University of Lagos, Lagos, Nigeria, <sup>4</sup>Global Health Focus, Lagos, Nigeria, <sup>5</sup>Lagos State University, Lagos, Nigeria, <sup>6</sup>University of Port Harcourt, Port Harcourt, Nigeria, <sup>7</sup>State AIDS and STIs Control Program, Department of Public Health, Ekiti State Ministry of Health, Ekiti, Nigeria, <sup>8</sup>Clafiya, Lagos, Nigeria, <sup>9</sup>State AIDS and STIs Control Program, Department of Public Health, Kwara State Ministry of Health, Kwara, Nigeria

**Background:** Rising global temperatures and environmental changes have prompted unprecedented migration patterns in Africa, with profound implications for public health. This study delves into the relationship between climate-induced migration and the heightened vulnerability of populations to HIV infection in Africa. As the number of environmental migrants continues to rise, understanding the intersectionality of climate-induced migration and HIV risk becomes imperative for targeted intervention strategies.

This research seeks to identify the specific factors linking climate-induced migration to increased susceptibility to HIV, considering the socio-economic, geographical, and demographic dimensions of affected populations.

**Methods:** A comprehensive literature review was conducted, synthesizing findings from epidemiological studies, migration reports, and public health databases. The analysis focused on identifying patterns and trends relat-

ed to climate-induced migration and HIV vulnerability in Africa. Peer-reviewed articles, reports from international organizations, and demographic health surveys were systematically reviewed to extract relevant data on the prevalence of HIV among climate-induced migrants and the specific factors contributing to heightened vulnerability.

The research also examined the impact of climate-induced migration on healthcare infrastructure, access to prevention programs, and the social determinants influencing HIV transmission dynamics.

**Results:** The review identified a limited number of studies specifically addressing the intersection of climate-induced migration and HIV vulnerability in Africa. Preliminary analysis of available data revealed that regions experiencing climate-related stressors, such as droughts and floods, often witness increased migration rates. However, the impact of these migrations on HIV prevalence and vulnerability is complex and varies across different contexts. Socio-economic factors, including access to healthcare and HIV prevention resources, play a crucial role in shaping the overall risk landscape for migrants.

**Conclusions:** The findings highlight the urgent need for more targeted research on the relationship between climate-induced migration and HIV vulnerability in Africa. Addressing this gap will require interdisciplinary collaborations between environmental scientists, healthcare professionals, and policymakers to develop comprehensive strategies that integrate HIV prevention and treatment services into climate-related migration policies. By understanding the nuanced dynamics at play, interventions can be tailored to mitigate HIV risk among migrant populations, contributing to both public health and climate adaptation efforts.

### OAD2403

Climate change-related factors and HIV vulnerabilities among very young adolescents in Kenya: multi-method qualitative findings

C. Logie<sup>1</sup>, J. Kagunda<sup>2</sup>, H. Evelia<sup>3</sup>, C. Gachoki<sup>2</sup>, B. Omondi<sup>3</sup>, L. Gittings<sup>4</sup>, A. Hasham<sup>1</sup>, I. Sternthal<sup>1</sup>, S. Van Borek<sup>1</sup>, L. Taing<sup>5</sup>, M. Narasimhan<sup>6</sup>

<sup>1</sup>University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, <sup>2</sup>Elim Trust, Nairobi, Kenya,

<sup>3</sup>Centre for Study of Adolescence, Nairobi, Kenya, <sup>4</sup>Western University, London, Canada, <sup>5</sup>United Nations University Institute for Water, Environment and Health, Hamilton, Canada, <sup>6</sup>World Health Organization, Geneva, Switzerland

**Background:** There is growing evidence of linkages between climate change-related factors, such as water insecurity, and HIV vulnerabilities. Yet knowledge gaps persist regarding climate change and HIV prevention needs, and climate experiences among very young adolescents (VYA) ages 10-14.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

We conducted a multi-method study to explore climate change-related factors and linkages with HIV vulnerabilities among VYA in climate-affected Kenyan regions.

**Methods:** This multi-method study in 6 sites (Nairobi, Nairobi, Kisumu, Isiolo, Kilifi, Kalobeyei refugee settlement) involved: n=12 focus groups (FG) with elders, n=60 VYA walk-along interviews, and n=12 two-day VYA participatory mapping workshops.

We conducted thematic analysis informed by the resource insecurity framework, and integration with a mixed-methods matrix.

**Results:** Participants (N=297) included: elders (n=119; mean age: 60.6 years, standard deviation [SD]: 7.9; men: 48.7%, women: 51.3%), youth walk-along interviewees (n=60; mean age: 13.4, SD: 1.5; boys: 51.4%, girls: 48.6%), and youth participatory mapping participants (n=118; mean age: 12.1, SD: 1.33; boys: 50.8%, girls: 49.2%).

Participant narratives revealed climate-related changes increased food insecurity, water insecurity, and sanitation insecurity. Each resource insecurity was linked with unique and overlapping HIV vulnerabilities.

Food insecurity was associated with youth running away, and transactional sex and exploitative relationships for food, which contributed to early pregnancy. Water insecurity was associated with: menstruation hygiene management challenges; sexual violence risks travelling far/at night for water; and transactional sex and exploitative relationships for water.

Sanitation insecurity was associated with: sexual violence risks accessing showers, toilets, and garbage disposal sites; and transactional sex for menstruation products, which elevated early pregnancy risks. Heavy rains and floods were raised as particularly dangerous for young women/girls due to infrastructure damage and subsequent sexual violence exposure.

While sanitation insecurity was common across sites, water and food insecurity were raised most frequently in Kalobeyei (refugee settlement) and Isiolo (nomadic and pastoralist community).

**Conclusions:** Together findings signal water, food, and sanitation insecurity are social drivers of HIV vulnerability among VYA in Kenya. Climate-informed interventions can consider seasonality influences, contextual differences, and target mechanistic pathways at interpersonal (e.g., transactional sex/exploitative relationships), community (e.g., gender inequitable norms), and structural (e.g., sanitation infrastructure, poverty) levels to advance HIV prevention with VYA in Kenya.

## OAD2404

### HIV and general health status of displaced populations receiving medical care at mobile clinics after severe flooding in Mulanje district, Malawi

J. Njala<sup>1</sup>, H. Chimbaka<sup>1</sup>, A. Makwaya<sup>1</sup>, T. Banda<sup>1</sup>, M. Mtulutsa<sup>1</sup>, D. Smith<sup>1</sup>, L. Njikhoo<sup>2</sup>, J. Chikonde<sup>3</sup>, B. Tauzie<sup>4</sup>, J. Songo<sup>1</sup>, M. Mphande<sup>1</sup>, K. Balakasi<sup>1</sup>, K. Phiri<sup>1</sup>, J.J. Van Oosterhout<sup>1</sup>, S. Phiri<sup>1</sup>

<sup>1</sup>Partners In Hope, Lilongwe, Malawi, <sup>2</sup>Ministry of Health, Mulanje, Malawi, <sup>3</sup>UNICEF, Blantyre, Malawi, <sup>4</sup>UNICEF, Lilongwe, Malawi

**Background:** Due to the rising impact of climate change, Malawi has experienced increased extreme weather events. These include devastating floods and mudslides that resulted in large-scale displacement of vulnerable populations.

In response, Ministry of Health and partners have conducted outreach clinics close to camps for displaced persons. However, little is known about health status and needs of the affected populations.

**Methods:** In November 2023, Partners in Hope (PIH) conducted a cross-sectional survey of individuals aged ≥18 years utilizing health services at mobile outreach clinics conducted at 7 campsites in Mulanje district, set up after flooding caused by Tropical Cyclone Freddy.

We describe demographic characteristics, prevalence of self-reported acute and chronic conditions, depression (PHQ score 1-6) and intimate partner violence (IPV) and health service satisfaction, stratified by residence status (displaced/non-displaced).

**Results:** Of 341 participants surveyed, median age was 32 years (IQR 23-47 years), and 80% were female. Fifty-eight percent (197/341) were displaced persons, the rest resided close to the camps (non-displaced). Displaced participants more frequently had: no formal education (32.5% vs. 15.3%; p<0.001), worse self-reported health (41.6% vs. 23.6%; p<0.001), respiratory illness (23.8% vs. 13.4%; p=0.02), COVID-19 symptoms (19.6% vs. 11.2%; p=0.04), HIV testing need (23.4% vs. 14.6%; p=0.04) and under-5 service need (14.7% vs. 7.6%; p=0.04). The displaced had similar chronic disease prevalence (42% vs. 38%; p=0.389) and unknown HIV status prevalence (1.0% vs. 4.2%; p=0.163) as residents. All PLHIV in both groups were engaged in HIV care (registered on ART 18.8% vs. 18.8%; p=0.300).

Rating of mobile services as good was near-universal in both groups (98%). Similar proportions in both groups screened positive for depression (53.5% vs. 56.3%, p=0.598; 91% was minimal/mild depression overall) and IPV (47.2% vs 54.6%, p=0.289). Overall prevalence of physical IPV was 16.3% and sexual IPV 15.3%, similar between groups.

**Conclusions:** After severe flooding, mobile outreach clinics were frequented by displaced persons in camps and nearby residents, unable to reach their regular health facility. Given high rates of acute illnesses, chronic con-

ditions (including HIV), depression and IPV, mobile clinics in these settings require multidisciplinary teams with diverse skills to meet the health needs of the attending client population.

## OAD2405

### Climate change vulnerability assessment (CCVA) for Orphaned and Vulnerable Children (OVC): results from FACT Zimbabwe and Pact. Manicaland and Masvingo provinces, Zimbabwe

D. Chimedza<sup>1</sup>, T. Mugoni<sup>1</sup>, M. Manditsera<sup>1</sup>, D. Bonnardeaux<sup>2</sup>, E. Olais<sup>2</sup>, T. Chimbizikai<sup>1</sup>, T. Takaidza<sup>1</sup>, G. Shumba<sup>1</sup>, J. Tavengerwei<sup>1</sup>, E. Nyakanda<sup>1</sup>, T. Nyatsanza<sup>1</sup>, V. Mubaiwa<sup>1</sup>, G. Nyahuma<sup>3</sup>, M. Mukuzunga<sup>4</sup>, T. Nyafesa<sup>5</sup>, B. Mukome<sup>1</sup>

<sup>1</sup>Family AIDS Caring Trust, Safeguarding and Sustainable Livelihoods, Mutare, Zimbabwe, <sup>2</sup>Pact, Environment, Climate, Energy, Washington DC, United States, <sup>3</sup>USAID Harare, USAID, Harare, Zimbabwe, <sup>4</sup>Ministry of Health and Child Care, PMD, Mutare, Zimbabwe, <sup>5</sup>Ministry of Health and Child Care, Maternal and Neonatal Child Health, Mutare, Zimbabwe

**Background:** FACT Zimbabwe is conducting its Orphans and Vulnerable Children (OVC) program in nine districts within the provinces of Manicaland and Masvingo, with funding from PERPFAR/USAID. The project aims to contribute to the HIV epidemic by providing support to children who are HIV-positive and their caregivers. Climate change (CC) is one of the cross-cutting components covered in the OVC for 0 -17 years. Zimbabwe has recently seen several natural disasters, such as cyclones and droughts and children's health, development, nutrition, education, and access to healthcare services are negatively impacted. FACT Zimbabwe from March-April 2023 conducted a CC vulnerability assessment to establish the extent at which OVC and their caregivers were affected by CC.

**Description:** Pact's Community-Based Adaptation Framework was used in Manicaland and Masvingo, selected through bio-climate clustering to represent all five agroecological zones and urban and rural contexts. Data was collected from daily clocks, vulnerability matrices, impact chains, adaptation pathways and historical timelines. A participatory and qualitative approach was used with primary data obtained from focus group discussions (n=585 and secondary data from Key Informant Interviews (n=51), targeting OVC and community leaders in March - April 2023.

**Lessons learned:** The thoughts of rainy seasons caused mental health disorders among caregivers, adolescents, and youths. Hunger due to crop/ livestock failure exposed OVC to malnutrition/delayed milestones. Adolescent girls/young women were pushed into transactional sex, teen pregnancy/ early marriages, especially those close to transport hubs and borders.

Floods affected access to clinics, hindering ART refill/adherence. Innovations included multi-month ART dispensing, scale-up of indigenous chicken, and planting small grains. With water scarcity, diminishing forests, and the destruction of schools, OVC walking longer distances to fetch water and firewood and to school exposed themselves to emotional, physical/sexual abuse. The use of solar-powered boreholes and stoves, improved transportation such as – bicycles for OVC and psychosocial support were sustainable strategies. Substance abuse was a challenge as youths tried to cope with stress, and OVC were not spared. Community-led OVC safety nets were said to be a necessity for stability.

**Conclusions/Next steps:** CC impacts OVC disproportionately because of their vulnerability/exposure to climate stresses/shocks. Exploration of adaptive capacity is required in communities at risk.

## OAD32 Unveiling layers: Exploring intersectionality and addressing HIV stigma and discrimination

### OAD3202

#### Major intersectional discrimination associated with increased HIV and bacterial STIs among gay, bisexual and other men who have sex with men in the U.S.

K. Atkins<sup>1</sup>, J.M. Wiginton<sup>2</sup>, T. Carpino<sup>3</sup>, A. Scheim<sup>4</sup>, S. Murray<sup>5</sup>, T. Sanchez<sup>6</sup>, S. Baral<sup>3</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, International Health, Baltimore, United States, <sup>2</sup>University of California, San Diego, San Diego, United States, <sup>3</sup>Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States, <sup>4</sup>Drexel University Dornsife School of Public Health, Epidemiology and Biostatistics, Philadelphia, United States, <sup>5</sup>Johns Hopkins Bloomberg School of Public Health, Mental Health, Baltimore, United States, <sup>6</sup>Emory University Rollins School of Public Health, Epidemiology, Atlanta, United States

**Background:** Intersectional discrimination is a critical determinant of health for marginalized communities. We sought to characterize intersectional discrimination as a potential driver of HIV and bacterial STIs among cisgender gay, bisexual, and other men who have sex with men (MSM).

**Methods:** A US nationwide online survey of MSM (October 2022-June 2023) assessed social systems exclusion and interpersonal violence, identified via factor analysis as two domains of the Intersectional Discrimination Index (Figure). We assessed prevalences of each form of discrimination and differences by race/ethnicity and HIV status, us-

ing modified Poisson regression with robust variance estimation to calculate prevalence ratios (PR) for associations between each form of discrimination and self-reported HIV status and past-year bacterial STI diagnoses.

**Results:** Of 4,348 MSM, 1,322 (27.8%) reported lifetime experiences of major discrimination, 679 in the last year. Past-year exclusion was twice as prevalent among MSM of color (i.e., non-white;  $p<0.001$ ) and 67% more prevalent among MSM with HIV ( $p=0.01$ ), and past-year violence was 30% more prevalent among MSM with HIV ( $p<0.01$ ). MSM reporting past-year exclusion had 51% higher HIV prevalence and 42% higher bacterial STI prevalence, including 55% and 72% higher prevalences of gonorrhea and syphilis, respectively, than MSM reporting no past-year exclusion (Figure).

Effects were stronger among MSM of color. Men reporting past-year violence exposure had 39% higher HIV prevalence, 23% higher bacterial STI prevalence, and over 30% higher prevalences of gonorrhea, chlamydia, and syphilis than those without past-year violence exposure; effects were more pronounced among MSM of color for HIV and chlamydia.

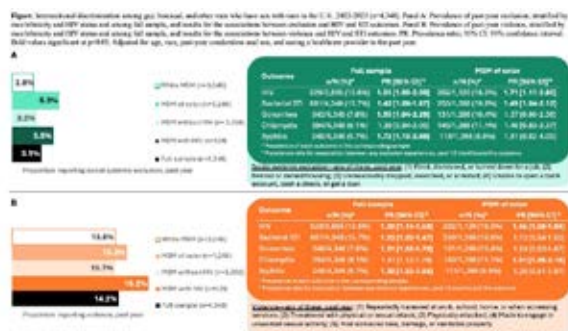

Figure.

**Conclusions:** Intersectional discrimination via social systems exclusion and violence disproportionately affects men living with HIV and is associated with elevated prevalence of HIV and bacterial STIs, disproportionately so among MSM of color. Structural interventions are critical to minimizing harms of systemic exclusion and mitigating the health effects of violence among MSM.

## OAD3203

### Relationship between discrimination, sexual decision-making and behaviours that increase the HIV/STI risk among trans and non-binary people in Germany, a cross-sectional study

M. Martín-Sánchez<sup>1,2</sup>, K. Pöge<sup>3</sup>, A. Hahne<sup>4</sup>, J. Hamm<sup>5</sup>, V. Bremer<sup>1</sup>, U. Koppe<sup>1</sup>, TASG-study group

<sup>1</sup>Robert Koch Institute, Department of Infectious Disease Epidemiology, Berlin, Germany, <sup>2</sup>ECDC Fellowship Programme, Field Epidemiology path (EPIET), European Centre for Disease Prevention and Control (ECDC), Stockholm, Sweden, <sup>3</sup>Robert Koch Institute, Department of Epidemiology and Health Monitoring, Berlin, Germany, <sup>4</sup>Freelance Sexual Health Counsellor and Bodyworker, Hamburg, Germany, <sup>5</sup>Deutsche Aidshilfe, Berlin, Germany

**Background:** Discrimination against trans and non-binary people has been linked to negative health outcomes, including sexual health. We explored the relationship between discrimination based on gender identity among trans and non-binary people in Germany and their perceived ability to make decisions to feel as protected as desired from HIV and sexually transmitted infections (STI).

We further assessed whether feeling unable of making decisions to feel protected from HIV/STI was associated with past 12-month behaviours that increase the HIV/STI risk.

**Methods:** We conducted a cross-sectional study using data from the TASG online survey, performed using a participatory approach during March-July 2022 among trans and/or non-binary people aged 18 years and older living in Germany. We described participants characteristics and the frequency of experiencing discrimination based on their gender identity. We calculated prevalence ratios (PR) with 95% confidence intervals (95%CI) for the associations between frequent discrimination and feeling unable of making decisions to feel protected from HIV/STIs, and between feeling unable of making these decisions and past 12-month sex while under drug influence and condomless penetrative sex with multiple partners without using PrEP.

**Results:** Among 3,077 participants, 22.0% identified as female, 21.8% as male, 12.4% as non-binary female, 12.7% as non-binary male, 27.0% as non-binary and 4.0% used other terms. Overall, 22.1% (505/2287) reported frequent discrimination based on their gender identity, and proportions varied across the gender spectrum, with 31.8% (190/597) in non-binary, 29.3% (76/259) in non-binary females, 22.0% (69/314) in non-binary males, 15.9% (79/497) in females and 11.2% (61/547) in males.

Participants experiencing frequent discrimination felt more often unable to make decisions to feel protected from HIV/STI (PR 1.4, 95%CI 1.1-1.8). Feeling unable of making decisions to feel protected from HIV/STI was associated with increased prevalence of past 12-month sex un-

der drug influence (PR 2.9, 95%CI 2.3-3.7) and condomless penetrative sex with multiple partners without PrEP (PR 2.1, 95%CI 1.5-3.0).

**Conclusions:** Feeling unable to make decisions to feel protected from HIV/STI among trans and non-binary people was associated with both frequent discrimination and behaviours that increase the HIV/STI risk. Strategies for empowering trans and non-binary people to assert their sexual decision-making needs should be explored.

## OAD3204

### HIV criminalization and enacted stigmas among people living with HIV in countries across Eastern Europe and Central Asia

M.A. Roach<sup>1</sup>, K. Atkins<sup>2</sup>, G. Turpin<sup>1</sup>, W. Gomez<sup>1</sup>, C. Lyons<sup>1</sup>, H. Moran<sup>1</sup>, A. Rao<sup>1</sup>, O. Syarif<sup>3</sup>, P. Looze<sup>3</sup>, K. Lalak<sup>3</sup>, J.d.D. Anoubissi<sup>3</sup>, F. Chiu<sup>3</sup>, S. Brion<sup>4</sup>, K. Dunaway<sup>4</sup>, L. Sprague<sup>5</sup>, C. Garcia De Leon Moreno<sup>5</sup>, D. Matyushina<sup>5</sup>, A. Leshanok<sup>6</sup>, S. Baral<sup>1</sup>, K. Rucinski<sup>2</sup>

<sup>1</sup>Johns Hopkins University, Department of Epidemiology, Baltimore, United States, <sup>2</sup>Johns Hopkins University, Department of International Health, Baltimore, United States, <sup>3</sup>Global Network of People Living with HIV, Amsterdam, Netherlands, the, <sup>4</sup>International Community of Women Living with HIV, Nairobi, Kenya, <sup>5</sup>UNAIDS, Geneva, Switzerland, <sup>6</sup>People PLUS, Svetlogorsk, Belarus

**Background:** HIV criminalization includes laws and policies that unjustly penalize people living with HIV (PLHIV). Convictions from HIV criminalization have increased in Eastern Europe and Central Asia (EECA), reinforcing discrimination towards PLHIV and threatening individual health and wellbeing. We examined the relationship between HIV-related conviction rates and individual experiences of stigma in the legal system, workplace, and healthcare across eight countries in EECA.

**Methods:** Country-level implementation of HIV-related conviction rates was approximated by the number of people convicted on HIV-related charges per capita through 2022 per the HIV Justice Network. We measured enacted stigma (Table) using Stigma Index 2.0 cross-sectional data, collected by networks of PLHIV in Belarus, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Russia, Tajikistan, and Ukraine (2020-2023). Multilevel logistic models, clustered at the country level, were used to estimate adjusted odds ratios (aOR) and 95% confidence intervals (CI) for the associations between country-level HIV-related conviction rates and enacted legal system, workplace, and healthcare stigma.

**Results:** Among 8,128 respondents, 50.4% (n=4121) had ever experienced enacted stigma. HIV-related conviction rates were lower in Kazakhstan, Ukraine, Georgia, and Kyrgyzstan; high in Russia and Moldova; and highest in Belarus and Tajikistan. Compared to PLHIV in countries with lower rates of HIV-related convictions, those in coun-

tries with the highest rates of HIV-related convictions had higher odds of experiencing enacted stigma in the legal system (aOR:4.88, 95%CI:2.18-10.95) and the workplace (aOR:2.12, 95%CI:1.57-2.86). While not associated with HIV criminalization, almost half of the participants (46.1%, n=3,772) reported enacted stigma in the healthcare setting.

**Conclusions:** The relationship between HIV criminalization and enacted stigma among PLHIV reinforces the potentially harmful impact of structural stigma. Changing the trajectory of HIV epidemics in Eastern Europe and Central Asia necessitates community-led and comprehensive policy and programmatic approaches including addressing punitive laws limiting the impact of HIV services.

## OAD3205

### Addressing self-stigma for young people living with HIV through football in Kampala, Uganda

K.S. Sekabira<sup>1</sup>, L. Brooks<sup>2</sup>, S.P. Nabude<sup>3</sup>, I. Kusemerirwe<sup>3</sup>

<sup>1</sup>Tackle, Programmes, Kampala, Uganda, <sup>2</sup>Tackle, Regional Programmes, Mombasa, Kenya, <sup>3</sup>Tackle, Projects, Kampala, Uganda

**Background:** 84.8% of PHIV surveyed showed signs of self-stigma (People Living with HIV Stigma Index Global Report 2023) affecting their lives negatively. We report the results of a youth-led, football-based intervention where learning happens through play, reducing self-stigma, increasing adherence to ART and improving overall health outcomes for YPLHIV.

**Description:** Over 18 months, 501 (m=174, f=327) participants engaged in self-stigma reduction sessions, delivered by 29 football coaches trained to deliver scenario-based football games designed to discussed stigma, both through play and during post-match debriefs. Topics covered during the sessions included identification of self-stigma, self-care techniques, U=U, where to find further support for adherence and mental wellbeing, and the importance of speaking about your status and your challenges.

Additionally, 2 football tournaments reached 608 participants where health services were offered alongside football. Sessions took place at ART clinics, health facilities, peer groups meets and community hubs. Focus was placed on qualitative data collection. Internalised stigma questions were based on ViiV's self-stigma index survey.

**Lessons learned:** The program's endline self-stigma index surveys (n=335) showed an increase from 54% to 62% willingness to disclose their positive status after the sessions. Those who felt guilty they are HIV positive reduced from 28% to 20%. Feelings of worthlessness due to positive status reduced from 30% to 20%. Those hiding their status reduced from 49% to 45%. Those uncomfortable disclosing their status reduced from 40% to 29%.

Qualitative data collection from 33 YPLHIV showed the camaraderie and sense of belonging from playing in a football team, coupled with the fun elements of sport allowed them to relax and open up about their lives to their peer group, seek further support where before they had not, and this led to reduced self-stigma.

**Conclusions/Next steps:** Tailored, football-based interventions are an effective mechanism to reduce self-stigma for YPLHIV, particularly for opening up necessary conversations around identifying self-stigma, self-care techniques to reduce it and ART adherence. However, data suggest more work is needed to shift societal attitudes even as internalized feelings improve.

## OAD37 Exploring the kaleidoscope of experiences among people living with HIV

**Empowering older adults living with HIV: a social support intervention boosts adherence and viral suppression**

P. Kakwera<sup>1</sup>, B. Kwagala<sup>1</sup>, F. Nakyeeyune<sup>1</sup>

<sup>1</sup>Wakiso District Network of People Living with HIV (WADNET), Kampala, Uganda

**Background:** As the population ages with HIV, older people living with HIV (OPLHIV) face a unique intersection of vulnerabilities. Age-related stigma, co-morbidities, and inadequate social support can compromise their health and HIV treatment outcomes. Existing research links stronger social networks to improved HIV control, highlighting the need for targeted interventions.

**Description:** Recognizing the dearth of social support among OPLHIV in Uganda, we implemented a 6-month social support program for 60 individuals with poor adherence. Our multi-pronged approach delivered emotional support through counseling and facilitated family disclosure, informational guidance for informed decision-making, and nutritional support via counseling, kitchen gardens, and food supplements.

**Lessons learned:** The intervention yielded significant improvements in treatment adherence and viral and other key vitals such as weight. Nearly half (46%) of initially unsuppressed individuals achieved viral suppression, while another 54% showed improved viral load control. Additionally, 67% reported enhanced treatment adherence, signifying the program's effectiveness in addressing critical challenges faced by OPLHIV.

Notably, 80% of participants also experienced weight gain, highlighting the program's impact on overall health and well-being.

**Conclusions/Next steps:** Our findings provide compelling evidence for the positive impact of comprehensive social support on OPLHIV outcomes. This model presents a promising, replicable approach for other communities and HIV/AIDS networks seeking to improve OPLHIV's well-being and treatment success. Future research should explore the long-term sustainability of such interventions and their broader applicability in diverse settings.

### OAD3703

**Primary outcomes of an intervention employing a hybrid online-offline approach to address HIV stigma among women living with HIV in Vietnam**

C. Lin<sup>1</sup>, B.D. Nguyen<sup>2</sup>, T.T. Nguyen<sup>2</sup>, H. Dang<sup>2</sup>, L. Li<sup>1</sup>, M.G. Le<sup>2</sup>

<sup>1</sup>University of California, Los Angeles, Los Angeles, United States, <sup>2</sup>Hanoi Medical University, Hanoi, Viet Nam

**Background:** There are approximately 80,000 women living with HIV/AIDS (WLHA) in Vietnam. In addition to HIV stigma and gender disparities in employment opportunities, financial power, and other social capital, WLHA faced unique challenges stemming from a patriarchal culture in Vietnam. In this context, women are often expected to embody traditional female virtues, maintain a subordinate role to males, and shoulder the primary responsibilities of family caregiving. These societal expectations add another layer of complexity to the stigma and delay in healthcare among WLHA in Vietnam.

**Methods:** The study team developed an online-offline hybrid approach to empower WLHA in Vietnam. This intervention incorporates evidence-based strategies to boost self-efficacy, foster positive coping with stigma, motivate service-seeking and treatment adherence, and engage peer and social support. To allow flexibility, the intervention is designed to be conducted in three modalities: in-person, Zoom, and Zalo (the most popular social media application in Vietnam). The efficacy of this intervention was evaluated through an intervention pilot with a single-arm design, comparing baseline and 4-month assessments among 91 WLHA participants recruited in Hanoi, Vietnam.

**Results:** The mean score of WLHA participants' perceived barrier to access care was significantly reduced from baseline (19.9 ± 0.5) to 4-month assessment (17.3 ± 0.6; p<0.0001). There was significant improvement demonstrated in active cognitive and behavioral coping with HIV (from 58.0 ± 1.0 at baseline to 61.5 ± 1.0 at 4-month; p<0.0001). We also observed a significant reduction in overall stigma score (consisting of awareness of stigma, agreement with stigma, and application of stigma subscales) (from 69.9 ± 1.5 at baseline to 65.2 ± 1.6 at 4-month; p<0.0001). This reduction was also observed in the HIV stigma attached to females, which declined from 70.9 ± 1.7 at baseline to 64.9 ± 1.7 at the 4-month assessment (p<0.0001).

**Conclusions:** These findings underscore the potential of tailored, flexible interventions that leverage both interpersonal support and social media platforms to empower WLHA and engage them in healthcare services. The study offers valuable insights for similar interventions to reduce the negative impacts of HIV stigma and gender disparities in other similar patriarchal contexts.

## OAD3704

### Cognitive trajectories of older adults with and without HIV: a longitudinal population-based study in rural South Africa

S. Gao<sup>1</sup>, D. Bassil<sup>1</sup>, C. Roberts-Toler<sup>1</sup>, J. Rohr<sup>1</sup>, R. Wagner<sup>2</sup>, L. Kobayashi<sup>3</sup>, M. Rosenberg<sup>4</sup>, T. Barninghausen<sup>5</sup>, K. Kahn<sup>2</sup>, J. Joska<sup>6</sup>, J. Manne-Goehler<sup>1,7</sup>

<sup>1</sup>Harvard T.H. Chan School of Public Health, Harvard Center for Population and Development Studies, Boston, United States, <sup>2</sup>University of the Witwatersrand, MRC/Wits Agincourt Research Unit, Johannesburg, South Africa, <sup>3</sup>University of Michigan School of Public Health, Department of Epidemiology, Ann Arbor, United States, <sup>4</sup>Indiana University School of Public Health, Department of Epidemiology and Biostatistics, Bloomington, United States, <sup>5</sup>Heidelberg Institute of Global Health, Heidelberg, Germany, <sup>6</sup>University of Cape Town, Cape Town, South Africa, <sup>7</sup>Brigham and Women's Hospital, Division of Infectious Diseases, Boston, United States

**Background:** Modern antiretroviral therapy has led to aging of people living with HIV (PLWH) and a growing prevalence of neurocognitive disorders associated with aging. However, the relationship between aging, HIV, and cognition remains unclear. We assessed cognitive trajectories among aging rural South African PLWH compared to people living without HIV (PWOH) overall and by viral suppression status.

**Methods:** We used data from the Health and Aging in Africa: Longitudinal Studies in South Africa (HAALSA), an ongoing population cohort of 5,059 adults aged ≥40 years living in rural South Africa.

We conducted linear mixed-effects models to determine the association between HIV serostatus at baseline and the outcomes of:

1. Z-standardized episodic memory score,
2. Activities of Daily Living (ADLs),
3. Instrumental Activities of Daily Living (IADLs), and
4. Trail-making among those with data at three time-points (n=1603).

The episodic memory models were adjusted for practice effects; the remaining models were adjusted for baseline cognition. All models included age, sex, education, wealth index, marital status, country of origin, and size of household, a random slope for time, random intercept for individual, and inverse probability weights for attrition and mortality over time.

**Results:** Suppressed PLWH had significantly better episodic memory over time compared to PWOH ( $b=0.002$ ,  $p\text{-value}=0.017$ ). This trend was still significant after adjusting for sociodemographic characteristics ( $b=0.002$ ,  $p\text{-value}=0.018$ ). There was no significant difference between unsuppressed PLWH and PWOH ( $b=0.00$ ,  $p\text{-value}=0.241$ ). These results were also consistent with the trail-making test after adjustment ( $b=0.03$ ,  $p\text{-value}=0.044$  and  $b=0.01$ ,  $p\text{-value}=0.634$ , respectively). There were no significant differences in ADL or IADL trend.

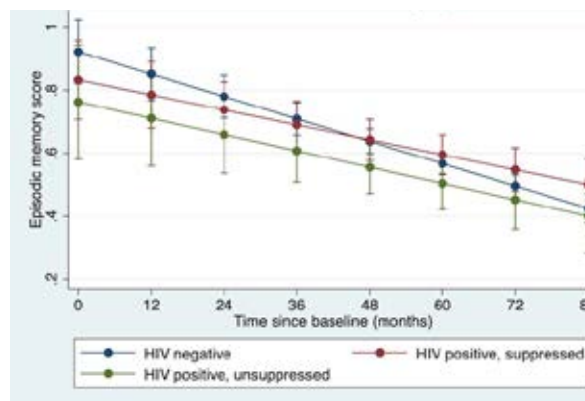

Figure. Effect of HIV serostatus on memory, adjusted.

**Conclusions:** Suppressed PLWH had better cognitive trajectories in episodic memory and executive function than PWOH, but there was no significant difference between unsuppressed PLWH and PWOH. These results offer further evidence of the importance of viral suppression for healthy cognitive aging in PLWH.

## OAD3705

### Experiences and acceptability of Long-acting Injectable antiretroviral therapy (ART) among adolescents enrolled in the Acceptability and Feasibility of long-acting Injectable ART in Adolescents and Young-Adults (AFINATy) study in South Africa

M. Atujuna<sup>1</sup>, L. Jennings<sup>1</sup>, E. Rousseau<sup>1</sup>, R. Panda<sup>1</sup>, N. Mashele<sup>1</sup>, N. Bongo<sup>1</sup>, L.-G. Bekker<sup>1</sup>, C. Orrell<sup>1</sup>

<sup>1</sup>Desmond Tutu HIV Centre, University of Cape Town, Department of Medicine, Cape Town, South Africa

**Background:** Adolescents living with HIV have struggled to adhere to antiretroviral treatment (ART), with only 10% achieving viral suppression. Long-acting injectable (LAI) antiretroviral therapy (ART) in the form of a cabotegravir (CAB) and rilpivirine (RPV) in combination may be a novel solution adolescents find this formulation acceptable.

**Methods:** Within the ongoing AFINATy study investigating the acceptability and feasibility of LAI among adolescents (12-24 years old), we conducted a series of longitudinal in-depth interviews with a sub-set of trial-participants across three cohorts: those with consistent viral suppres-

sion on ART; those with evidence of prior poor adherence; and ART-naïve. Participants had to achieve viral suppression on oral ART before starting LAI. The main areas of inquiry for the qualitative aim included: experience with ART, motivation to start LAI, prior experience with LAI, preference between LAI and oral ART. We analyzed data using a thematic and structured framework approach.

**Results:** Using data collected in the first round of interviews, four broad themes emerged:

1. *LAI simplifies life, while pills complicate life*, where the use of LAI reduces the burden of having to plan their lives around their daily pill-taking schedules;
  2. *Living life fully*, where with LAI, participants, for the first time, expressed feeling the freedom of living like individuals who were HIV-free, as they did not have to worry about anything, only to attend their next appointment;
  3. *LAI completely removed the fear of unplanned HIV disclosure* that often occurred among peers and family members caused by carrying or having pills around;
  4. *LAI removed adolescents' fear of missing pills due to pill fatigue and pill burden*, relieving anxieties and pressure of the consequences of not taking them, improving their general well-being and outlook on life.
- For these adolescents, the pain and minor side effects experienced with injections were inconsequential compared to the burden of taking pills daily.

**Conclusions:** Between oral and LAI ART, adolescents much preferred LAI ART. More research is needed to understand the long-term use of LAI and what new challenges might emerge, acknowledging that these adolescents had recently started using LAI.

### OAE0402

Improving advanced HIV disease identification among clients failing antiretroviral therapy: an implementation partner-led initiative in Uganda

A. Nuwagira<sup>1</sup>, R. Kirungi<sup>1</sup>, V. Nabitaka<sup>1</sup>, L. Kabunga<sup>1</sup>, J. Batusa<sup>1</sup>, W. Eigege<sup>2</sup>, I. Amamilo<sup>2</sup>, J. Conroy<sup>2</sup>, C. Amole<sup>2</sup>, P. M. Namuwenge<sup>3</sup>, V. Kasone<sup>4</sup>, J. Kyokushaba<sup>4</sup>

<sup>1</sup>Clinton Health Access Initiative, HIV Care and Treatment, Kampala, Uganda, <sup>2</sup>Clinton Health Access Initiative, Boston, United States, <sup>3</sup>Ministry of Health, AHD/TB Program, Kampala, Uganda, <sup>4</sup>National Health Laboratory and Diagnostic Services, Kampala, Uganda

**Background:** CD4 testing is the gateway to identifying Advanced HIV Disease (AHD) for both newly diagnosed clients with HIV and those failing treatment (non-suppressed people on antiretroviral therapy). While access

to baseline CD4+ testing for newly diagnosed people has improved over the years with the expansion of CD4+ testing to include VISITECT point-of-care testing, CD4+ testing among failing clients has remained unacceptably low.

**Description:** Between October 2022 and September 2023, the Uganda Ministry of Health (MOH) with support from partners implemented quality-improvement initiatives aimed at addressing gaps in the delivery of the AHD package of care implementation among failing clients. Key interventions implemented included healthcare workers (HCWs) training on the identification and treatment of AHD, data management and reporting, commodity inventory management, and formation of facility-level AHD focal teams. In addition to this, sub-national implementing partners integrated CD4+ testing into targeted community HIV services using a device-free CD4+ testing platform. The cascade was monitored on a bi-weekly basis to measure the impact on key indicators.

**Lessons learned:** Access to CD4+ testing among the failing clients increased from 42.8% before the intervention, to 60% by the end of the quality improvement initiative.

Figure. % Access to CD4+ Testing among NS People over the quarters.

**Conclusions/Next steps:** AHD screening services among failing people is critical to the reduction of AIDS-related deaths. However, more effort such as integration of AHD screening services into existing community outreach programs, HCW capacitation, improved commodity inventory management, and optimized reporting is needed to optimize CD4+ testing among failing people.

## OAE0403

### Cost-effectiveness simulation of implementing a point-of-care test package for opportunistic infections for people with advanced HIV in Mexico City's reference centers: preliminary analysis of the PREVALIO-CDMX study

A. Camiro-Zuñiga<sup>1</sup>, A. Martin Onraet<sup>1</sup>, V.H. Ahumada Topete<sup>2</sup>, Á. López Íñiguez<sup>3</sup>, E. Sienna Iracheta<sup>4</sup>, X.A. Flores Andrade<sup>2</sup>, A.P. Rodríguez Zulueta<sup>4</sup>, M. Aranda Audelo<sup>2</sup>, A.B. Peralta Prado<sup>2</sup>, C. Pérez Jiménez<sup>1</sup>, J.G. Sierra Madero<sup>3</sup>  
<sup>1</sup>Instituto Nacional de Cancerología, Infectious diseases, Mexico City, Mexico, <sup>2</sup>Instituto Nacional de Enfermedades Respiratorias, Infectious diseases, Mexico City, Mexico, <sup>3</sup>Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubirán, Infectious diseases, Mexico City, Mexico, <sup>4</sup>Hospital General Dr. Manuel Gea Gonzalez, Infectious diseases, Mexico City, Mexico

**Background:** Opportunistic infections (OIs) remain the main cause of death in people living with HIV in Latin America. Point of care tests (POC) represent an opportunity for timely diagnosis and reduce related costs.

**Methods:** Preliminary analysis of the retrospective data of the PREVALIO-CDMX study (NCT05685641), which is being conducted in 4 reference centers for HIV treatment in Mexico City. We included data of all individuals with advanced HIV disease (<200 CD4 or suspected AIDS-defining disease) that presented to care from September 2022 to September 2023, which underwent standard screening for tuberculosis (TB), disseminated histoplasmosis (DH), and cryptococcal disease (CD) during their routine care. We determined standard packages for related costs of care for the management of these OIs.

We calculated time until OI treatment initiation using day 0 as the moment in which the individual presented to the participating center, care provided during this time lapse was included in cost calculations. The simulated intervention was the center-wide implementation of first-day POC tests on new HIV diagnosis, specifically lateral flow tests for urinary lipoarabinomannan, urinary Histoplasma antigen, and serum Cryptococcus antigen.

We identified potential savings on spared hospitalization days and exempted further tests. We constructed Kaplan-Meier curves to assess differences in time to OI treatment initiation.

**Results:** We included 282 participants, with a CD4 count median of 35 (17-83.5) cells/ml. Median time to OI treatment initiation was 3 (1-4) days.

The simulation predicted a net reduction of costs of 320 USD/person, representing an average reduction of 12.49% and a median reduction in time to treatment initiation of 3 days ( $p=0.002$ ).

**Conclusions:** Optimal implementation of same-day POC tests has the potential to reduce attention costs of individuals with advanced HIV disease and reduce hospital

stays due to diagnostic delays. The potential impact of this intervention could be exponentiated if applied in the first level of care.

Figure 1.

## OAE0404

### Clinical impact and cost-effectiveness of improving access to cryptococcal meningitis diagnostics and treatment in Malawi

M. Feser<sup>1,2</sup>, T. Maphosa<sup>3</sup>, A. Shroufi<sup>4</sup>, A. Rangaraj<sup>5</sup>, V.R. Talbot<sup>2</sup>, Y. Qian<sup>2</sup>, E. Matiya<sup>3</sup>, N. Ford<sup>5</sup>, R. **Methods:** We used the CEPAC-I model to evaluate nine strategies singly and in combination: 1) *Status quo* (CM treatment if diagnosed with CM and pre-emptive fluconazole otherwise), 2) *LP for asymptomatic CrAg+*, 3) *Semi-quantitative CrAg (CrAgSQ) for asymptomatic CrAg+* to diagnose CM without LP, 4) *Increased 5FC*, and 5) *Liposomal amphotericin B (LAmB) use* (Table 1A). We simulated a cohort with mean (SD) CD4 27/mL (30/mL), age 37y (10y), 51% female; 15% had symptomatic CM, 48% asymptomatic CM, and 37% asymptomatic cryptococemia. Model outcomes included 1y survival, lifetime quality-adjusted life years (QALYs) and costs, and incremental cost-effectiveness ratios (ICER, \$/QALY); we considered \$640/QALY as the cost-effectiveness threshold. Sensitivity analyses of key parameters were performed.

**Results:** *Status quo* would result in 66% 1y-survival, 8.69 QALYs, and \$930/person (Table 1B). *LP for asymptomatic CrAg+* and *Increased 5FC* would be cost-effective: +10% 1y-survival, +0.89 QALYs, +\$130/person (ICER, \$310/QALY). *CrAgSQ for asymptomatic CrAg+* and *Increased 5FC* would increase QALYs but not be cost-effective (ICER \$780/QALY) due to more PLHIV without CM treated for CM given low test specificity. *LAmB use* could be cost-effective if it were substantially less costly than current prices. Results were sensitive to LP uptake, CrAgSQ specificity, efficacy of pre-emptive fluconazole and CM treatments, and proportion of asymptomatic PLHIV with CM.

A. Model input parameters									
Strategy	Type	Diagnosis	Cost	Treatment if diagnosed with CM	ICER	Cost	ICER	Cost	ICER
Status quo <sup>a</sup>		Uptake (%)	Sensitivity (%)	Access to 5FC (%)	Access to LAmB (%)	ICER (\$/QALY)	Cost (\$)	ICER (\$/QALY)	Cost (\$)
Symptomatic	LP and empTx	66 & 31	99/99	11	0	58	230	58	230
LP for asymptomatic CrAg+	LP and empTx	66 & 31	99/99	11	0	58	230	58	230
Asymptomatic	LP	66	99/99	11	0	58	230	58	230
CrAgSQ for asymptomatic CrAg+	LP and empTx	66 & 31	99/99	11	0	58	230	58	230
Symptomatic	CrAgSQ	66	99/99	11	0	58	230	58	230
Asymptomatic	CrAgSQ	66	99/99	11	0	58	230	58	230
Increased 5FC <sup>b</sup>	For people diagnosed with CM	Test+ or empTx	66 & 31	99/99	11	90	79	290	290
LAmB use <sup>c</sup>	For people diagnosed with CM	Test+ or empTx	66 & 31	99/99	11	90	90	440	440
B. Clinical and economic outcomes									
Strategy	1y survival (%)	QALYs	Cost (\$)	ICER (\$/QALY)	Cost (\$)	ICER (\$/QALY)	Cost (\$)	ICER (\$/QALY)	Cost (\$)
0. Status quo	65.8	8.69	930	-	930	-	930	-	930
1. Increased 5FC	69.8	9.21	1,060	130	1,060	130	1,060	130	1,060
2. LP for asymptomatic CrAg+	70.2	9.24	1,060	130	1,060	130	1,060	130	1,060
3. LAmB use	70.5	9.30	1,340	140	1,340	140	1,340	140	1,340
4. LP for asymptomatic CrAg+ and increased 5FC	72.5	9.57	1,000	110	1,000	110	1,000	110	1,000
5. CrAgSQ for asymptomatic CrAg+	71.2	9.42	1,070	120	1,070	120	1,070	120	1,070
6. CrAgSQ for asymptomatic CrAg+ and increased 5FC	73.3	9.88	1,150	130	1,150	130	1,150	130	1,150
7. LP for asymptomatic CrAg+ and LAmB use	72.9	9.83	1,150	130	1,150	130	1,150	130	1,150
8. CrAgSQ for asymptomatic CrAg+ and LAmB use	73.7	9.73	1,290	140	1,290	140	1,290	140	1,290

Table 1. Model input parameters (A) and clinical and economic outcomes (B) for CM management strategies among PLHIV.

**Conclusions:** Concurrently improving access to CM diagnostics and 5FC for symptomatic and asymptomatic PLHIV with CM would improve clinical outcomes and be cost-effective in Malawi and similar settings. Improving access to LAmB could further improve outcomes and be cost-effective at lower prices.

## OAE0405

### Link between poverty and HIV viral load non-suppression among people living with HIV

R.W. Mukondwa<sup>1</sup>, A. Ayer<sup>2</sup>, K. Takarinda<sup>1</sup>, T. Makoni<sup>3</sup>, C. Aviles-Guaman<sup>2</sup>, M. Hudson<sup>2</sup>, N. West<sup>2</sup>, K. Webb<sup>1</sup>, P. Shete<sup>2</sup>

<sup>1</sup>Organization for Public Health Interventions and Development (OPHID), Programs, Harare, Zimbabwe,

<sup>2</sup>Center for Tuberculosis, University of California San Francisco (UCSF), Division of Pulmonary and Critical Care Medicine, San Francisco, United States, <sup>3</sup>Zimbabwe National Network of People Living with HIV (ZNNP+), Programs, Harare, Zimbabwe

**Background:** HIV disproportionately impacts the impoverished. Social protection interventions (SPIs) including cash and food transfers may interrupt this cycle of poverty and disease. The objective of this study was to identify the relationship between poverty, social protection interventions and HIV viral load (VL) in 15 districts of Zimbabwe in a programmatic setting.

**Methods:** We conducted an exploratory, sequential mixed methods analysis. Quantitative analyses utilized retrospective cross-sectional data collected from January to July 2023 from client satisfaction surveys (CSS) among adults living with HIV (PLHIV) (> 18 years) on antiretroviral therapy (ART). We performed descriptive analyses and generalized estimated equations to evaluate relationships between multidimensional poverty, SPIs, and VL non-suppression (>=1000 copies/mL). Between August and September 2023, we conducted semi-structured in-depth interviews (IDIs) (n=25) with adults (>18 years) with a history of accessing SPIs. IDIs were audio recorded, transcribed, translated, and analyzed using the framework method.

**Results:** Among 13,722 PLHIV in ART care completing the CSS, 8,971 (65.4%) were female. Median age of the respondents was 44 years (Interquartile range [IQR]: 36-52 years). Nearly half (n=6,095; 44.4%) of respondents were multidimensionally poor. An additional 3,471 (25.3%) were vulnerable to multidimensional poverty, 5,894 (43%) lacked food, yet only 2,515 (18%) had ever received SPIs. The majority (1,283 (51.3%)) of SPI recipients received educational assistance. Poverty was associated with HIV VL non-suppression [relative risk (RR)= 1.55; (95% confidence interval (CI): 1.13, 2.13]. SPI receipt was also associated with HIV VL non-suppression [RR=1.67; (95% CI: 1.07, 2.62)]. Qualitative findings showed that despite significant need, PLHIV in ART care had limited information about types of SPIs available and how to apply to the programs.

Further, participants described their experiences of poverty, with SPI providing a fragile support system for access to food and basic needs.

**Conclusions:** SPI receipt is limited among PLHIV in Zimbabwe, despite frequently reported poverty and food insecurity. In this context, SPIs may serve as a surrogate

for socioeconomic vulnerability and appear insufficient to alleviate its effects. There may be a mismatch in SPIs (educational assistance) with individual needs (food insecurity) among this population of PLHIV, signaling importance of concordance in SP interventions with vulnerabilities experienced.

## OAE12 Welcome to the prevention choice agenda!

### OAE1202

Uptake of HIV post-exposure prophylaxis (PEP) in private retail pharmacies in Kenya: early findings from the Pharm PrEP study

P. Ong'wen<sup>1</sup>, S. Roche<sup>2</sup>, V. Omollo<sup>3</sup>, T. Kaireithi<sup>4</sup>, L. Juma<sup>3</sup>, C. Kiptinness<sup>4</sup>, P. Otieno<sup>3</sup>, G. Rota<sup>3</sup>, M. Anyona<sup>1</sup>, P. Banerjee<sup>2</sup>, M. Asewe<sup>3</sup>, B. Rono<sup>3</sup>, E. Gichuru<sup>4</sup>, K. Harkey<sup>2</sup>, R. C. Malen<sup>2</sup>, E. Irungu<sup>1</sup>, D. Were<sup>1</sup>, E. A. Bukusi<sup>3,5</sup>, K. Ngure<sup>4,5</sup>, K. F. Ortblad<sup>2</sup>, Pharm PrEP cRCT Team

<sup>1</sup>Jhpiego, Nairobi, Kenya, <sup>2</sup>Fred Hutchinson Cancer Center, Seattle, United States, <sup>3</sup>Kenya Medical Research Institute, Kisumu, Kenya, <sup>4</sup>Partners in Health and Research Development, Thika, Kenya, <sup>5</sup>University of Washington, Seattle, United States

**Background:** HIV post-exposure prophylaxis (PEP) is an effective strategy to reduce the risk of HIV acquisition after recent exposure, but has been underutilized in many HIV prevention programs. In Kenya, PEP is freely available in most public health clinics that offer HIV services; however, it is primarily used for occupational HIV exposure. We report early findings on PEP uptake at 45 intervention pharmacies delivering HIV services for the first time as part of the Pharm PrEP cluster-randomized control trial (cRCT).

**Methods:** As part of the Pharm PrEP cRCT, trained pharmacy providers at 45 private pharmacies in central and western Kenya are offering subsidized PEP and PrEP services to clients seeking sexual health products. Eligible PEP clients are ≥16 years and self-report: unknown/negative HIV status, a potential HIV exposure (e.g., condom break) in <72 hours, and no signs of acute HIV acquisition. Upon enrollment, participants undergo HIV testing and, if negative, are dispensed a 30-day PEP supply. Pharmacy providers record client demographics, HIV test results, and dispensing details in an electronic medical record.

**Results:** From July 2023 to mid-January 2024, 881 of 1534 clients (57%) seeking pharmacy-based HIV services initiated PEP (median: 7 PEP clients/pharmacy, IQR 3-13). The median age of PEP clients was 27 years (IQR: 23-32), with 59% (523/881) being male and 60% (531/881) unmarried. The majority (98%, 849/881) of clients identified as the general population and 61% (538/811) reported having casual sex

partners. The most common exposures leading to PEP use were condom break/condomless sex (85%, 747/811), sexual assault (3%, 23/881), and shared needles (2%, 20/881).

In addition, clients had ongoing HIV risk behaviors that would warrant PrEP use including, inconsistent condom use (64%, 561/881), sexual partners of unknown HIV status (51%, 449/881), and multiple sex partners (48%, 420/881).

**Conclusions:** Early data from the Pharm PrEP cRCT suggest that PEP services are in high demand at private pharmacies in Kenya and could be delivered in partnership with public support.

Additionally, our findings suggest that integrating PEP with PrEP services in HIV prevention programs might help better serve individuals with diverse HIV prevention needs, bringing us closer to ending the AIDS epidemic.

### OAE1203

Knowledge, awareness, feasibility, and acceptability of long-acting Cabotegravir for HIV prevention: results from the SEARCH Dynamic Choice HIV prevention trial

E. Kakande<sup>1</sup>, L. Balzer<sup>2</sup>, J. Kabami<sup>1</sup>, J. Ayieko<sup>3</sup>, G. Chamie<sup>4</sup>, N. Sutter<sup>4</sup>, H. Sunday<sup>1</sup>, M. Nyabuti<sup>3</sup>, J. Litunya<sup>3</sup>, C. Camlin<sup>4</sup>, J. Johnson-Peretz<sup>4</sup>, J. Temple<sup>2</sup>, G. Lavoy<sup>1</sup>, C. Koss<sup>4</sup>, M. Bacon<sup>5</sup>, M. Czarnogorski<sup>6</sup>, M. Petersen<sup>2</sup>, M. Kanya<sup>7,1</sup>, D. Havlir<sup>4</sup>, SEARCH collaboration

<sup>1</sup>Infectious Diseases Research Collaboration, Kampala, Uganda, <sup>2</sup>University of California, Berkeley, United States, <sup>3</sup>Kenya Medical Research Institute, Nairobi, Kenya, <sup>4</sup>University of California, San Francisco, United States, <sup>5</sup>National Institute of Health, Bethesda, United States, <sup>6</sup>Viiiv Healthcare, Washington, United States, <sup>7</sup>Makerere University, Kampala, Uganda

**Background:** Injectable Cabotegravir (CAB-LA) is highly effective for HIV prevention, but real-world implementation studies among men and women in Africa are lacking. We assessed knowledge, awareness, feasibility, and acceptability among participants who used CAB-LA for prevention in the ongoing SEARCH Dynamic Choice HIV prevention (DCP) randomized implementation study in rural Uganda and Kenya.

**Methods:** The SEARCH DCP study enrolled women and men aged ≥15 years with self-assessed risk for HIV acquisition. The intervention arm included structured product choice (oral PrEP, PEP, or injectable CAB-LA), with flexibility to switch between products based on changes in participant risk or preferences over 48 weeks of follow-up. CAB-LA injections were provided at Ministry of Health clinics. Quantitative surveys were completed by participants who chose and initiated CAB-LA at time of initiation and after 24-weeks of CAB-LA use.

**Results:** Of 487 intervention arm participants, 274 (56%) started CAB-LA during follow-up (183 women, 91 men; 79 youth aged 15-24 years); of these, 198 (72%) used CAB-LA

AIDS 2024

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

for  $\geq 24$  weeks. At initiation, 64% chose CAB-LA because it was easier to take an injection and 49% because of difficulty remembering to take oral pills. Among youth initiators, 42% chose CAB-LA because they did not want someone to see them taking pills and 22% because partners/friends would not let them take pills. At CAB-LA initiation, 99% of participants had basic to no knowledge of CAB-LA, consistent across gender and age groups. Awareness, acceptability, and feasibility were high at 24 weeks (Table).

	Question	Response	Overall	Women	Men	15-24 years	25+ years
Awareness of CAB-LA at Initiation vs. Week-24	"How many of your friends know about CAB-LA?"	None of my friends know about CAB-LA	91% vs. 25%	92% vs. 28%	89% vs. 19%	91% vs. 30%	91% vs. 23%
Acceptability at Week-24	"What is your level of satisfaction for using CAB-LA?"	Satisfied to Very Satisfied	97%	98%	96%	100%	96%
Acceptability at Week-24	"What is the likelihood of you recommending CAB-LA to a friend?"	Likely to Extremely Likely	95%	95%	94%	95%	95%
Feasibility at Week-24	"How easy was it to take CAB-LA?"	Easy to Very Easy	95%	95%	94%	98%	93%

Table: Awareness, Acceptability, and Feasibility of CAB-LA in SEARCH HIV Dynamic Choice Prevention

**Conclusions:** In rural Uganda and Kenya, over half of participants in the SEARCH DCP trial who were offered choice of oral PrEP/PEP or CAB-LA chose and started CAB-LA during the first 48 weeks. CAB-LA was a popular choice for men and women and was feasible to deliver with a high level of satisfaction.

## OAE1204

### Pharmacy-based delivery of long-acting injectable PrEP in Kenya: provider, client, and key stakeholder perspectives on potential challenges and opportunities

S.D. Roche<sup>1</sup>, K. Kamolloh<sup>2</sup>, N. Thuo<sup>3</sup>, M. Opiyo<sup>2</sup>, V. Ogello<sup>3</sup>, A. Odira<sup>2</sup>, E. Owidi<sup>3</sup>, P. Ochwal<sup>2</sup>, M. Hewa<sup>2</sup>, L. Adiema<sup>2</sup>, F. Mogaka<sup>2</sup>, V. Omollo<sup>2</sup>, R. Malen<sup>1</sup>, K. Harkey<sup>1</sup>, J. Stewart<sup>4</sup>, E.A. Bukusi<sup>2,5</sup>, K.F. Ortblad<sup>1</sup>, K. Ngunjiri<sup>3,6</sup>

<sup>1</sup>Fred Hutchinson Cancer Center, Public Health Sciences, Seattle, United States, <sup>2</sup>Kenya Medical Research Institute, Kisumu, Kenya, <sup>3</sup>Partners in Health and Research Development, Thika, Kenya, <sup>4</sup>University of Minnesota, Minneapolis, United States, <sup>5</sup>University of Washington, Seattle, United States, <sup>6</sup>Jomo Kenyatta University of Agriculture and Technology, Nairobi, Kenya

**Background:** Four sub-Saharan African countries have approved long-acting injectable PrEP for HIV prevention. As countries decide where to make injectable PrEP available for maximal impact, private pharmacies are one venue under consideration. To understand the potential barriers and facilitators to delivering injectable PrEP via

private pharmacies in Kenya, we conducted qualitative formative research with pharmacy providers, clients, and key stakeholders.

**Methods:** From July to September 2023, we interviewed pharmacy providers, pharmacy clients, and key stakeholders involved in HIV policymaking, regulation, and program implementation in Central and Western Kenya. We purposively sampled pharmacy providers and clients both with and without prior experience delivering or receiving, respectively, oral PrEP services at a pharmacy. Our semi-structured interview guide was informed by the Updated Consolidated Framework for Implementation Research (CFIR). We analyzed transcripts thematically.

**Results:** We interviewed 16 pharmacy providers, 25 pharmacy clients, and 9 key stakeholders. Each participant group was ~50% female, and median age was 25 (IQR 23-29) among clients and 37 (IQR 34-41) among providers and stakeholders.

Overall, participants supported the idea of pharmacy-based injectable PrEP delivery, with some recommending it first be rolled out at pharmacies with medical providers on staff. Providers and key stakeholders called for updated guidelines specifying the circumstances under which pharmacy providers can deliver injectable PrEP (CFIR: policy and law).

Across all groups, some participants expressed concern about unqualified providers, and many called for the development of an injectable PrEP certificate program—possibly modeled after existing courses on injectable contraception delivery—to ensure competency in maintaining the cold chain; counseling; administering injections; managing drug reactions; assessing side effects; and conducting pharmacovigilance (CFIR: access to knowledge and information).

To keep injectable PrEP affordable for clients and economically viable for pharmacies, a few recommended price controls or government subsidies (CFIR: innovation cost; financing). Some also noted the need for a shared health information system for client tracking (CFIR: information technology infrastructure) and reliable systems for safe disposal of used sharps (CFIR: compatibility).

**Conclusions:** Stakeholders of injectable PrEP are interested in pharmacy-based delivery. Additional implementation research is needed to identify and test specific capacity-building and integration strategies.

## OAE1205

### Preferences for services delivering pre-exposure prophylaxis among sexually active adolescent girls and young women: a discrete choice experiment in Zimbabwe

V. Cambiano<sup>1</sup>, P.P. Indravudh<sup>2</sup>, K. Chidhanguro<sup>3</sup>, W. Murenjekwa<sup>3</sup>, G. Ncube<sup>4</sup>, A. Copas<sup>5</sup>, F. Cowan<sup>6,3</sup>, J. Clinical Trials Unit, London, United Kingdom, <sup>6</sup>Liverpool

School of Tropical Medicine, Department of International

Public Health, Liverpool, United Kingdom, <sup>7</sup>National

AIDS Council (NAC), Harare, Zimbabwe, <sup>8</sup>UNAIDS UCO

Zimbabwe, Harare, Zimbabwe

**Background:** Adolescent girls and young women (AGYW) in Zimbabwe are disproportionately affected by HIV. As pre-exposure prophylaxis (PrEP) is rolled-out in Zimbabwe, we assessed preferences for services delivering PrEP among sexually active (SA-AGYW; self-reported sex in the last year) in Zimbabwe and identify key drivers of demand for services delivering PrEP.

**Methods:** We conducted a discrete choice experiment (DCE) among SA-AGYW (aged 15 to 24) recruited using a respondent driven sampling survey in six urban and peri-urban districts in May-July 2023. The DCE was designed based on a literature review and qualitative studies and administered face-to-face using pictorial illustrations. Data were analyzed using a conditional logit model.

**Results:** Nine hundred AGYW completed the DCE. There was a general preference for PrEP programmes over not receiving PrEP (see Figure).

Figure.

Participants had strong positive preferences for (in order of strength): a programme to support parents having a more positive attitude about sexual and reproductive health services (SRHS); a friendly attitude by dispensing health workers; collecting PrEP from a community health

worker (CHW) or the local public sector clinic compared with the pharmacy; and for injectable PrEP compared with oral PrEP. Participants reported negative preferences for: vaginal ring for PrEP (compared with oral PrEP), longer distance to the venue for PrEP collection; higher fees to access PrEP including the consultation; and longer time spent at the PrEP collection venue. There was no evidence of preference for the integration of the PrEP dispensing venue.

**Conclusions:** PrEP programmes can be optimised to reach sexually active AGYW, if PrEP is provided by friendly CHW or local public sector clinic at low-cost for the user, at venues within walking distance, with short waiting times, and with the choice of injectable PrEP. Programmes should be accompanied by activities for building parental support for SRHS.

## OAE20 A tale of two diseases: Novel strategies towards elimination of tuberculosis and viral hepatitis

### OAE2002

#### Promoting exploratory community monitoring of the incidence of tuberculosis and TB/ HIV comorbidities in health centers with the incorporation of Geographic Information Systems (GIS) in Caracas, Venezuela

A. Nieves<sup>1</sup>

<sup>1</sup>Acción Ciudadana Contra el SIDA (ACCSI), Dirección Ejecutiva, Caracas, Venezuela, Bolivarian Republic of

**Background:** The Venezuelan humanitarian crisis caused the collapse of the health system. There is an absence of official reports on the epidemiology of Tuberculosis and TB/HIV comorbidities in the COVID-19 context. Health authorities do not provide information on the situation of these diseases and do not authorize NGOs to monitor medical services that care for persons with TB and comorbidities. From 2019 to the present, the Global Fund pays for 100% of ARV and TB medications and supplies for persons with these diseases.

In response, Acción Ciudadana Contra el SIDA (ACCSI) implemented a project financed by The Global Fund with these OBJECTIVES:

1. Generate information through community monitoring with the participation of PLHIV in TB and comorbidity services in 5 hospitals in Caracas;
2. Incorporate GIS (ARCGIS Online software) and KoboToolbox to collect data (cell phone use) in health services, to community monitoring;
3. Carry out evidence-based advocacy to decision makers.

**Description:** Between November 2022 and April 2023, community monitoring was carried out in a difficult environment as it was affected by the aforementioned obstacles. However, PLHIV participated in stages of community monitoring (coordination, collection, documentation, systematization, analysis and dissemination) in health services of 5 hospitals, obtaining information on comorbidity in Caracas.

**Lessons learned:** The project findings are:

Indicator	Nov 2022	Dec 2022	Jan 2023	Feb 2023	March 2023	Apr 2023	TOTAL
Total number of TB cases	123	81	81	90	102	55	532
No. of report TB cases	85	44	40	46	34	15	264
No. new TB cases	38	37	41	44	68	40	286
Total number of TB/HIV comorbidity cases	14	11	13	15	24	17	94
No. HIV people notified of TB	1	7	7	7	1	0	23
No. people with HIV new TB cases	13	4	6	8	23	17	71

Two dashboards were produced that make visible the results of community monitoring, situation of the last 10 years of TB/HIV comorbidity and georeferencing of 49 TB consultations and pharmacies in 24 Venezuelan states, with public access to persons:

Dashboards 1: <https://ligma.maps.arcgis.com/apps/dashboards/59c1e0c604b54fa4850cacd83fb5f14b>

Dashboards 2: <https://www.arcgis.com/apps/dashboards/10d8877cd51a45ccb9e6b565fd988138>

GIS links health and geography to analyze people's access to health services and effective responses to the Venezuelan health emergency, among the lessons learned.

**Conclusions/Next steps:** The incorporation of GIS in community monitoring professionalized the work of NGOs, by improving the processes of collection, analysis and documentation and of quality data, whose evidence is useful for advocacy to decision makers and contribute to the improvement of international cooperation assistance for Venezuela.

## OAE2003

Community-led monitoring goes beyond evaluating essential health components, it also actively addresses issues of rights and social justice in Indonesia and Manipur, India

G. Khwairakpam<sup>1</sup>, C. Thomas<sup>2</sup>, E. Lankiewicz<sup>3</sup>, R. Nalinikanta<sup>4</sup>

<sup>1</sup>TREAT Asia/amfAR, Bangkok, Thailand, <sup>2</sup>Peduli Hati Bangsa, Jakarta, Indonesia, <sup>3</sup>Andelson Office of Public Policy/amfAR, Washington D.C., USA, United States, <sup>4</sup>Community Network for Empowerment, Manipur, India

**Background:** Community-led monitoring (CLM) is a routine, ongoing cycle of collecting data on community-designed indicators, identifying gaps, generating action-

able evidence, and advocating to improve essential components of healthcare services. It is gaining recognition among stakeholders and donors. Our project, CLM in Asia, is one of the first digitalized CLM projects, monitoring the essential components of HIV, hepatitis B (HBV) and hepatitis C (HCV) through care recipients.

**Description:** The project was initiated in 2021 by two community-based organizations, Peduli Hati in Jakarta, Indonesia and Community Network for Empowerment (CoNE) in Manipur, India, with amfAR's TREAT Asia program, monitoring 12 health facilities comprised of local district to referral hospitals in select provinces providing public HIV and viral hepatitis services. The indicators developed by the local partners were based on current national guidelines and address the essential components of the accessibility, acceptability, availability, affordability, and quality framework covering HIV, HBV and HCV. From April 2023, the project moved to a digitalized platform with publicly available information on the project details, tools, and a real-time data dashboard.

**Lessons learned:** Post digitalization from April to December 2023, we reached out to 1593 care recipients with 76% between 25 to 49 years of age; 71% male, 28% female, 0.56% transgender. Respondents were receiving care for HIV (62%), HBV, (3%), and HCV (34%). Besides monitoring essential care components and resolving bottlenecks, we assisted 174 people in HIV treatment monitoring, 19 linked to HBV treatment, 37 for HCV treatment. CLM team members resolved 7 episodes of medicine shortages or stock-outs. Interactions with care recipients resulted in successfully linking 20 children living with or affected by HIV to public education programs, restoring the right to education of a child living with HIV, home delivery of antiretrovirals for the visually challenged, addressing gender-based violence, and relocating 7 people to antiretroviral centers which were more convenient for them.

**Conclusions/Next steps:** CLM enables care recipients to have a say in improving the essential components of healthcare services they receive. It not only addresses care bottlenecks at facilities, but also serves as a mechanism to link people to social security schemes and bring about social justice.

Idemudia<sup>3</sup>, C. Nwadike<sup>3</sup>, K. Kakanfo<sup>3</sup>, B. Pius<sup>3</sup>, B. Onimode<sup>3</sup>, O. Asaolu<sup>3</sup>, A. Bashorun<sup>4</sup>, A. Gambo<sup>5</sup>, J. Pius<sup>3</sup>, O. Oyelaran<sup>3</sup>, R. Goldstein<sup>3</sup>, O. Onyediniachi<sup>1</sup>, A. Adegboye<sup>1</sup>, A. Eyo<sup>1</sup>  
<sup>1</sup>Excellence Community Education Welfare Scheme, HIV Prevention Care and Treatment, Uyo, Nigeria, <sup>2</sup>Family Health International (FHI 360), Abuja, Nigeria, <sup>3</sup>Office of HIV/AIDS and TB, United States Agency for International Development (USAID), Abuja, Nigeria, <sup>4</sup>National AIDS, Sexually Transmitted Infections Control and Hepatitis Programme (NASCP), Federal Ministry of Health, Abuja, Nigeria, <sup>5</sup>National Agency for the Control of AIDS (NACA), Abuja, Nigeria

**Background:** Diagnosis of Tuberculosis (TB) in children living with HIV (CLHIV) can be challenging using conventional diagnostics. Lateral Flow Urine Lipoarabinomannan (LF-LAM) assay is recommended for TB diagnosis among CLHIV with advanced HIV disease (AHD) in Nigeria, with simultaneous GeneXpert mycobacterium TB/rifampicin (MTB/RIF) tests when sputum or stool samples can be produced. The PEPFAR/USAID-funded ECEWS ACE-5 project implemented this recommendation using a quality implementation framework that included the development of a simplified algorithm for TB testing using LF-LAM, inventory optimisation for LF-LAM, and weekly data reviews. This study assessed the outcomes of this quality implementation approach on the uptake of TB tests using LF-LAM among children with AHD in Southern Nigeria.

**Methods:** This was a retrospective cohort analysis using electronic medical records of ART-naïve children (<15 years old) diagnosed with AHD using the WHO criteria, from October 2022 to March 2023 across 153 health facilities in Akwa Ibom and Cross River States, Nigeria. Results were disaggregated by age and sex. Uptake of LF-LAM tests (Proportion of children with AHD who were tested using LF-LAM) and proportion of LF-LAM tests that were positive, were compared before (October-December 2022 [Period-1]) and during (January-March 2023 [Period-2]) the intervention, using chi-square.

**Results:** In total, 215 children had AHD (M:111, F:104), with 60% (129/215) identified in Period-2. Median age was 2 years (IQR 1-3). Overall, 45.6% (98/215) of children with AHD were tested for TB using LF-LAM, with 18% (18/98) testing positive.

Of those who tested positive via LF-LAM, 88.9% [16/18] were in Period-2. Uptake of LF-LAM tests was significantly higher in Period-2 compared to Period-1 (69.0% [89/129] vs 10.5%

[9/86]  $p<0.01$ ), and the proportion of positive LF-LAM tests was lower in Period-2 than in Period-1 (18.0% [16/89] vs 22.2% [2/9]  $p=0.75$ ).

**Conclusions:** The uptake of TB testing using LF-LAM for children with AHD improved in our setting following a quality implementation approach. Further investigation of factors affecting the uptake of TB testing using LF-LAM in this subpopulation is recommended.

## OAE2005

### Integrating hepatitis C virus self-testing into HIV and harm reduction services as an approach towards HCV micro-elimination among key populations and people living with HIV in Vietnam

B. Vu<sup>1</sup>, K. Green<sup>1</sup>, M. Tran<sup>2</sup>, H. Nguyen<sup>1</sup>, K. Do<sup>1</sup>, L. Tran<sup>1</sup>, A. Tran<sup>1</sup>, G. Le<sup>2</sup>, C. Pham<sup>1</sup>, K. Granger<sup>3</sup>, H. Phan<sup>4</sup>, K. Nguyen<sup>5</sup>, L. Doan<sup>4</sup>, P. Cao<sup>5</sup>

<sup>1</sup>PATH, Hanoi, Viet Nam, <sup>2</sup>CCIHP, Hanoi, Viet Nam, <sup>3</sup>PATH, Washington DC, United States, <sup>4</sup>Vietnam Administration of HIV/AIDS Control (VAAC), Ministry of Health, Hanoi, Viet Nam, <sup>5</sup>Vietnam Administration of Medical Services (VAMS), Ministry of Health, Hanoi, Viet Nam

**Background:** Hepatitis C virus self-testing (HCVST) is an innovative approach to accelerate progress towards HCV elimination goals. We conducted a cross-sectional observational study to assess the acceptability and effectiveness of HCVST compared to routine HCV testing among key populations (KP) and people living with HIV (PLHIV) in Hanoi and Ho Chi Minh City, Vietnam.

**Methods:** From September 2023 to January 2024, we engaged eight community-based organizations (CBOs), six anti-retroviral therapy and methadone maintenance treatment (MMT) public clinics, and four KP-led private clinics in implementing community-based, facility-based, online, and secondary distribution. Clients were offered the choice of an oral fluid-based HCVST, or rapid HCV testing provided by CBOs and clinic staff (PL-HCVT). Individuals with a positive HCV test were referred or linked to designated public and private clinics for HCV confirmatory testing and treatment initiation. Acceptability of HCVST was defined as the proportion of first-time HCV testers utilizing the service, and effectiveness was measured by HCV positivity and treatment initiation rates.

**Results:** Of 2,882 individuals recruited, 1,834 opted for HCVST and 1,048 opted for PL-HCVT. The proportion of first-time testers was significantly higher in HCVST compared to PL-HCVT (67.6% vs. 59.1%), and particularly high in secondary distribution and community-based HCVST compared to online and facility-based HCVST (91.4% and 83.8% vs. 48.9% and 36.8%, respectively).

Overall, HCV sero-positivity rate was lower in HCVST than in PL-HCVT (11.2% vs. 18.4%), however, it was higher in community-based and facility-based HCVST compared to secondary distribution and online HCVST (18.1%

AIDS 2024

Author Index

and 16.8% vs. 3.6% and 1.5%, respectively). HCV positivity rate was highest among PLHIV (27.6%), followed by MMT clients (26.4%), people who inject drugs (17.9%), sex partners (3.9%), female sex workers (2.8%), and men who have sex with men (0.3%). Of 399 HCV sero-positive individuals detected, 206 were from HCVST, of which 92.7% received confirmatory testing, and 98.5% of those eligible initiated HCV treatment.

**Conclusions:** HCVST is an additional effective approach to increase uptake of HCV testing and treatment among KPs and PLHIV. HCVST is most effective in reaching unreached people and linkage to care through community-based model, followed by facility-based, secondary distribution and online.

### OAE2302

Impacts of community-led monitoring on HIV service improvements: implementation in three provinces in Thailand

S. Sittikarn<sup>1</sup>, N. Ketsuriyong<sup>2</sup>, P. Paaboonprung<sup>3</sup>, P. Rattakittvijun Na Nakorn<sup>4</sup>, A. Poonwanasatien<sup>5</sup>  
<sup>1</sup>Caremat Foundation, Chiang Mai, Thailand, <sup>2</sup>Stella Maris, Songkhla, Thailand, <sup>3</sup>Saichon Network, Chonburi, Thailand, <sup>4</sup>USAID, Bangkok, Thailand, <sup>5</sup>FHI 360, Bangkok, Thailand

**Background:** The implementation of community-led monitoring (CLM) by key populations and people living with HIV communities is still new in the Asia region and has few examples of successful implementation and improvements. We represent here CLM processes and impacts among stakeholders collaborating with the Thailand Ministry of Public Health and implemented in three provinces.

**Description:** Key-population-led health service providers involved in the CLM monitoring cycle engaged in data collection and analysis, stakeholder presentations, advocacy for service quality improvements, and outcome monitoring. Between October 2022 and September 2023, 3,248 responses were gathered online.

FINDINGS (% of responses)	IMPROVEMENT HIGHLIGHTS
Chiangmai 50% lacked information on undetectable=untransmissible (U=U)	Provincial Health Office (PHO) promoted U=U messages, reducing stigma toward PLHIV at provincial media outlets
91.84% indicated limited number of PrEP-offering facilities	PHO assisted all hospitals in Chiangmai to register as PrEP service facilities under National Health Security Office in 2024
Chonburi 12.23% mentioned ARV clinics lacked privacy	Extended ARV clinic area and separated counseling room
21.58% mentioned no client queuing system in place	Implemented a queuing system at ARV clinic
Chiangmai, Chonburi, and Songkhla 18.9% mentioned providers lacked understanding of gender sensitivity and stigma and discrimination	Conducted a series of gender sensitivity training and outcome monitoring for hospital staff

**Lessons learned:** Lessons learned from the provincial CLM implementations included:

- Sharing CLM success stories and challenges among provinces promoted knowledge exchange, problem-solving, and continuous improvement of health service provision.
- CLM working groups are best positioned to drive positive changes in HIV service delivery, policy reforms, stigma reduction, capacity enhancement, and access to accurate information within the HIV response.
- The launch of the CLM official Facebook page successfully promoted knowledge sharing and community engagement among implementers, thereby enhancing the program's effectiveness and impact.

**Conclusions/Next steps:** CLM led by KP and PLHIV communities can enhance the quality of health services. In 2024, CLM will be expanded to three additional provinces: Chiang Rai, Ubonratchathani, and Phitsanulok.

### OAE2303

Post-hospitalization community home visit intervention to decrease mortality among adults with advanced or unsuppressed HIV in urban Zambia: pilot evaluation

C. Claassen<sup>1,2,3</sup>, G. Muchanga<sup>2</sup>, M. Mujansi<sup>2</sup>, L. Mwango<sup>4</sup>, C. Bwalya<sup>2,5</sup>, K. Stoebe<sup>6</sup>, C. Baumhart<sup>1</sup>, D. Malama<sup>2</sup>, J. Mukuka<sup>2</sup>, T. Daka<sup>2</sup>, B. Lindsay<sup>1</sup>, M. Mwitumwa<sup>3</sup>, N. Mbewe<sup>3</sup>, W. Mutale<sup>6</sup>, M. Vinikoor<sup>7,3</sup>

<sup>1</sup>University of Maryland Baltimore, Institute of Human Virology, Center for International Health, Education, and Biosecurity (Ciheb), Baltimore, United States, <sup>2</sup>MGIC-Zambia, Lusaka, Zambia, <sup>3</sup>University Teaching Hospital, Lusaka, Zambia, <sup>4</sup>Ciheb Zambia, Lusaka, Zambia, <sup>5</sup>University of Maryland School of Public Health, Department of Behavioral and Community Health, College Park, United States, <sup>6</sup>University of Zambia, Lusaka, Zambia, <sup>7</sup>University of Alabama at Birmingham, Birmingham, United States

**Background:** HIV-related mortality remains high in Zambia. Hospitalization often precedes death; post-discharge mortality among people with HIV (PLWH) reaches 20-40%. We evaluated a community health worker (CHW) model to provide post-discharge support with the ultimate goal of mortality reduction.

**Methods:** We conducted a quasi-experimental feasibility and acceptability study at two tertiary hospitals in Lusaka, Zambia, using the PRISM implementation science framework. Hospitalized PLWH with either CD4 <200 (i.e., advanced HIV) and/or HIV RNA >60 copies/ml, regardless of treatment history, were enrolled and followed for six months post-discharge. Participants received a novel community intervention, based on formative qualitative work, consisting of a discharge summary card, CHW home visits within 7 days of discharge, and repeated every 2-4 weeks thereafter, and screening and referral for depres-

sion and unhealthy alcohol use. CHW visits were overseen by a physician-clinical liaison officer team based at the discharging hospital. During visits, CHWs provided psychosocial and medication counseling, checked vital signs, and made reminders for outpatient follow-up.

**Results:** From 18 August 2023 to 22 January 2024, 100 study participants (median age, 39 years; 47% women; median CD4, 118 cells/mm<sup>3</sup>) were enrolled. To date, 86 (86%) received at least one home visit (31 within 1 week of discharge); of these, 36 (42%) had two or more visits; 32 (37%) received a discharge summary card; and 86 (100%) were screened for behavioral health problems. At one month, 86 (86%) were alive, 14 (14%) had died; 20 (20%) were readmitted based on concerns found during CHW home visits. Acceptability of CHW home visits among participants and caregivers was high. When available, 6-month mortality data will be compared to a historical control group from the same hospitals.

**Conclusions:** A novel discharge model of care, involving enhanced discharge instructions, CHW home visits, and screening and referral for behavioral health problems, proved feasible and acceptable in urban Zambia. As post-hospital mortality is so high and minimal/no transition of care programs exist in African settings, CHW visits have potential to reduce post-discharge mortality among PLWH. Focusing on the peri-discharge period can strengthen health systems as countries move into HIV epidemic control.

## OAE2304

Improvement on quality of healthcare services offered to people living with HIV at health facility in Cameroon through the community-led monitoring mechanism

E. Sangong Rose<sup>1</sup>, M.N. Mireille<sup>1</sup>, L.H. Shey<sup>1</sup>,

A. Fabrice Yannick<sup>1</sup>, N. Gildas<sup>1</sup>, R.G. Bissai<sup>2</sup>, A. Ngong<sup>2</sup>,

Z.Z. Akiy<sup>2</sup>, A.D. Nzaddi<sup>2</sup>, L. Ebiam<sup>2</sup>, J. Tchofa<sup>2</sup>

<sup>1</sup>Reseau Camerounais des Associations des Personnes vivant avec le VIH (RECAP+), Yaounde, Cameroon, <sup>2</sup>USAID Cameroon, Yaounde, Cameroon

**Background:** Limited ownership of health policies by affected communities in Sub-Saharan Africa in general and Cameroon in particular remains a challenge in successful implementation of the health sector national strategic plan. With support from USAID, the Cameroon Network of Associations of PLHIV (RECAP+) is currently rolling out a CLM mechanism in Cameroon with the overall objective of improving access to free quality HIV/AIDS service offered at facility level while supporting the client-centered approach.

**Description:** The CLM is being rolled out nationwide, in 326 health facilities by 38-member organizations of RECAP+ and 169 rigorously trained site monitors who are mainly PLHIV. Activities include monthly data collection

using two main questionnaires at facility level to inform thirteen main indicators, community sensitization on HIV prevention and treatment access, psychosocial counseling, and evidence-based advocacy for change. The indicators monitored focus on treatment access barriers such as user fees elimination, stigma and discrimination, quality of psychosocial support, and other HIV care related variables.

**Lessons learned:** Contributions of the CLM led to the Ministry of public health developing an HIV CLM guide in 2023 for use by organizations. The CLM also helped in improving community engagement in healthcare; in fiscal year 2023, monitors were able to sensitize 14891 peers at facility-level and 45293 persons in the community on their rights, bringing back 41 LTFU peers to care.

Confidentiality issues were resolved in 8 health facilities and involved the creation of appropriate reception space for clients and serious warning to some health personnel, HIV commodities supplied in 16 facilities, 37 persons linked to the facility for HIV testing amongst which 8 new cases placed on treatment. Improvement in wait time in 10 facilities from two hours to 30 minutes and less involving actions such as the delocalization of viral load testing services and the use of customized tickets for ARV pickups. Thanks to the CLM some health facilities received equipment such as centrifuges, microscopes and fridges from mayors to improve quality of care.

**Conclusions/Next steps:** CLM remains one effective mechanism that governments can put in place to better engage the community and strengthen the health system.

## OAE2305

Bringing evidence to the table: community-led monitoring to reduce human rights violations and violence against sex workers

L. Gumpo<sup>1</sup>, L.S. Rajabo<sup>2</sup>, J. Vilanculos<sup>2</sup>, A. Zandamela<sup>3</sup>,

S.A. Balsamo<sup>4</sup>, S. Bouwmeester<sup>4</sup>, I. van Beekum<sup>4</sup>

<sup>1</sup>Southern African Sex Workers Alliance (SASWA), Lusaka, Zambia, <sup>2</sup>National Platform for Sex Workers' Rights, Maputo, Mozambique, <sup>3</sup>Pathfinder International, Maputo, Mozambique, <sup>4</sup>Aidsfonds-Soa Aids Netherlands, Amsterdam, Netherlands, the

**Background:** Since 2014, the Hands Off programme works to reduce violence against sex workers in Southern Africa, to support a decrease in HIV acquisition among this key population. When the programme began, little to no data regarding the prevalence of human rights violations against sex workers was available in the region, meaning previous interventions and advocacy efforts did not focus on the problems that the community itself prioritized.

**Description:** Sex worker-led organizations in Botswana, Mozambique, South Africa, and Zimbabwe were trained on the use of Ona, a secure, free, and open-source data

collection tool to capture human rights violations in real time. Organizations set up varied peer-monitoring systems by training additional sex workers in their communities to respond to human rights violations and capture data regarding demographics of the sex worker, the kind of violence that occurred, who perpetrated the violence, etc. The data is securely stored via Ona, owned by the sex worker-led organizations, and available for the organizations and the Hands Off team to access and use.

Since 2021, this data has formed the basis of an annual human rights violations report published by Hands Off partners.

**Lessons learned:** Since 2021, at least 1,500 human rights violations against sex workers have been recorded each year. When data collection is driven and owned by community organizations, we find these organizations take initiative to use the data in effective and innovative ways. In Mozambique, sex workers use the evidence collected in data-driven advocacy for stronger protections for sex workers on community, regional, and national levels.

They also use the data collection system as an accountability mechanism to follow up on cases of violence reported to law enforcement. Sex workers in Mozambique report stronger relationships with police and greater safety in their work as a result.

**Conclusions/Next steps:** Community-driven data collection for sex workers is vital for real-time understanding the nature and prevalence of violence in their communities. Their ownership over both the collection process and data itself has created a stronger understanding of high-risk hot spots and stakeholders to target for sensitization, and builds a strong evidence base for data-driven advocacy to support violence prevention.

## OAE25 Integrating social enterprise for sustainability of key population programmes

### OAE2502

Country HIV response sustainability roadmaps: where are key populations in the conversations?

R. Ochanda<sup>1</sup>, J. MacWilliam<sup>2</sup>, I. Tendolkar<sup>2</sup>, A. Gaudino<sup>2</sup>, K. Chapola<sup>3</sup>, M. Amalumilo<sup>4</sup>, S. Wambua<sup>5</sup>, A. Mitha<sup>6</sup>, F. Tingiba<sup>7</sup>, S. Malunga<sup>8</sup>, K. Mutale<sup>8</sup>, M. Mutongore<sup>9</sup>, C. Aviah<sup>9</sup>, O. Mussa<sup>10</sup>, A. Enema<sup>11</sup>

<sup>1</sup>AVAC, Policy Advocacy, Nairobi, Kenya, <sup>2</sup>AVAC, Policy Advocacy, New York, United States, <sup>3</sup>CHERA, Advocacy, Lilongwe, Malawi, <sup>4</sup>Nigeria Key Population Health and Rights Network, MSM and Transgender Network, Enugu, Nigeria, <sup>5</sup>Kenya Key Population Consortium, Leadership, Nairobi, Kenya, <sup>6</sup>Malawi Diversity Forum, Leadership, Lilongwe, Malawi, <sup>7</sup>South Sudan Key and Vulnerable Populations Forum, Leadership, Juba, South Sudan, <sup>8</sup>Key Population Trans National Collaboration/ Zambia Key Population Consortium, Secretariat, Lusaka, Zambia, <sup>9</sup>Tanzania Key and Vulnerable Populations Forum, Leadership, Dar es Salaam, Tanzania, the United Republic of, <sup>10</sup>Zanzibar Key and Vulnerable Populations Forum, Leadership, Pemba, Tanzania, the United Republic of, <sup>11</sup>Nigeria Key Population Health and Rights Network, KP Secretariat, Lagos, Nigeria

**Background:** The 2022 PEPFAR Strategic Plan encourages recipient governments to develop sustainability roadmaps. PEPFAR strategy further stipulates that a sustainable response must place people and communities at its center.

**Description:** A rapid, fact-finding study conducted by the Key Population Trans-National Collaboration (KP-TNC) in six countries (Kenya, Tanzania, Zambia, Nigeria, Malawi and South Sudan), reveals a notable absence of the KP community in the sustainability discussions.

The KP Community is not involved in the sustainability discussions yet some of these countries have created Multi-stakeholder Sustainability Technical Working Groups, KP Technical Working Groups and representative apex KP bodies (commonly known as KP-Consortia) that connect KPs to different HIV response platforms and stakeholders.

**Lessons learned:** According to the fact-finding study, key reasons for not including the KP community in the sustainability discussions include: cultural and religious beliefs that stigmatize KPs; push from some conservative policy makers for non-inclusive integration of KP programs; existence of punitive laws towards KPs; lack of frameworks providing guidelines on how the KP Community will be included in the sustainability framework; and lack of political will stemming from lack of understanding of KP needs in relation to HIV programming. This is a signal that some

or all KP HIV response needs within countries are likely not to be considered in the final sustainability roadmaps in case the KP Community will keep being left out of the on-going conversations.

**Conclusions/Next steps:** The lack of involvement of KP networks and representatives in the sustainability roadmap discussions is quite concerning and signals that countries are likely not to support KP programmes once they assume the full burden of the HIV response. This being the case, it would mean that the current gains that have been made in HIV response among KPs and general populations are likely to be reversed.

PEPFAR, Global Fund, UNAIDS and other stakeholders, therefore, need to assist countries to develop a framework for KP engagements in the sustainability roadmaps discussions.

## OAE2503

[Social contracting of NGOs/CBOs to reach the last mile key populations under National AIDS Control Programme \(NACP\) in India: learnings from the implementation of targeted interventions projects](#)

S. Purohit<sup>1</sup>, S. Rajan<sup>1</sup>, S. Bhavsar<sup>1</sup>, G. Pandey<sup>2</sup>, S. Kumar<sup>2</sup>

<sup>1</sup>National AIDS Control Organisation, New Delhi, India,

<sup>2</sup>PATH, New Delhi, India

**Background:** National AIDS Control Organisation (NACO) in India has partnered with Civil Society Organisations (CSOs) primarily Non-Governmental Organisations (NGOs) and Community-Based Organisations (CBOs) through State AIDS Control Societies (SACS) under the Social Contracting mechanism to expand the reach and provide prevention services to the key populations.

The social Contracting model not only includes grant-making by the Government of India but also ensures legislative, policy, and programmatic initiatives to strengthen the service delivery mechanisms.

**Description:** NACO implements the Targeted Intervention (TI) projects as a major prevention initiative through CSOs (NGOs /CBOs) to reach out to the key populations. Peer-led outreach model is adopted to provide a basic package of services tailored to the demands of key populations.

The services include counseling for behavior change, screening for HIV /STI, distribution of commodities (condoms, Needle/Syringes, lubes, etc.), linkages to treatment, as well as mobilization to reach the last mile.

The engagement of CSOs in the projects goes through a robust selection process followed by financing, recruitment of staff, monitoring, supportive supervision, capacity building, and evaluation of projects through third parties in a participatory process.

TI project coverage of the last six years (2017-18 to 2022-23) is analyzed and presented below to see the impact.

Year	Number of TI Projects	Total Coverage of Key Population (in lakh)	Total HIV test Conducted (in lakh)	% of Sero-HIV positive case detected	% linked to ART
2017-18	1450	60.67	21.74	0.25	81.5
2018-19	1443	66.62	23.45	0.25	83.0
2019-20	1426	86.61	27.41	0.23	86.7
2020-21	1472	64.77	23.24	0.20	85.0
2021-22	1512	90.56	30.62	0.20	80.4
2022-23	1543	100.88	34.57	0.25	82.7

The table above indicates that coverage of KP under TI has increased over the year with the increase in HIV testing and linkages to ART.

**Lessons learned:** Peer-led outreach combined with participatory evaluation, digital reporting, and capacity building of CSOs has resulted increase in coverage of KP under the projects.

**Conclusions/Next steps:** : India's social contracting model has contributed to expanding reach with services, increasing community ownership, improved governance, accountability, and partnership between the Government and CSOs. The social contracting model can be replicated in other disease prevention and control programs in the larger health system to fast-track results and achievements.

## OAE2504

[From outreach provider to primary health care clinic for key populations in Thailand: how a community-based organization expanded its mission and moved to sustainable financing](#)

P. Patpeerapong<sup>1</sup>, S. Santayakul<sup>2</sup>, S. Mills<sup>2</sup>, P. Rattakittvijun Na Nakorn<sup>3</sup>

<sup>1</sup>Mplus Foundation, Chiang Mai, Thailand, <sup>2</sup>Family Health International (FHI360), Bangkok, Thailand, <sup>3</sup>USAID, Bangkok, Thailand

**Background:** MPLUS Foundation is a community-based organization delivering comprehensive HIV, STI, and primary healthcare services through a key-population-led health service (KPLHS) approach. Over two decades, MPLUS evolved from conducting only HIV outreach to now serving as a government-certified clinic, extending its services to include HIV-adjacent areas like mental health, stigma and discrimination, and anti-bullying. This expansion is supported by diverse funding sources, including USAID, the Global Fund, domestic health financing, grants, and social enterprise incubation.

**Description:** Based on clients' needs, strategic planning, and its evolving mission, MPLUS expanded its services over time to offer increasingly comprehensive HIV/STI services and primary healthcare. This now includes HIV testing, PrEP, and referral to ART services, all recognized over time by the Thai government as reimbursable services by the Thailand National Health Security Office (NHSO). In 2019, MPLUS became the first KP-led organization certified as an HIV testing facility and gained ART provider certification in 2023. This certification led to increased domestic

Late-breaker  
abstracts

Author  
Index

financing, reducing MPLUS' dependence on international donors. These sources supported 18% of total operational costs in 2019, increasing to 56% in 2023.

Furthermore, a fee-based social enterprise service was added in 2023, accounting for 2% of total revenue in 2023.

**Lessons learned:** Challenges remain to full sustainability. In January 2023, the Thai government restricted HIV prevention services for non-universal coverage (UC) clients, challenging MPLUS's financial viability. As a certified health facility, MPLUS was more resilient than others in continuing core HIV services through a fee-based model for certain HIV services, utilizing this revenue as a revolving fund to sustain essential HIV services for key populations whose health benefits are not registered under the UC scheme and those with economic challenges.

MPLUS accessed the domestic health fund to explore government reimbursement for adjacent diseases like mental health and telemedicine for noncommunicable diseases to promote well-being of older key populations and other groups in need.

**Conclusions/Next steps:** With careful strategic planning and in environments with universal health coverage, KP-led organizations can transform into primary care facilities to sustainably serve their targeted populations through a one-stop shop model supported by diversified funding, including domestic health financing, grants, and social enterprises.

## OAE2505

### Key population community perspectives on sustainable HIV services

M. Ighodaro<sup>1</sup>, A. Mehrotra<sup>2</sup>, R. MacInnis<sup>3</sup>, A. Lambert<sup>2</sup>, D. Wendt<sup>2</sup>, M. Schiff<sup>3</sup>, C. Akolo<sup>2</sup>

<sup>1</sup>Global Black Gay Men Connect Corporation, New York, United States, <sup>2</sup>FHI 360, N/A, United States, <sup>3</sup>the Palladium Group, N/A, United States

**Background:** Global funding for HIV programming has decreased, and more funders are prioritizing "transition" or "sustainability" strategies. Continued HIV services for key population (KP) communities under alternative forms of financing require thoughtful consideration prior to transition and inclusion of KP perspectives to ensure continued service utilization and funding.

**Description:** The EpiC Project and Global Black Gay Men Connect (GBGMC) conducted five virtual focus group discussions between August-October 2023. Participants represented a diverse range of perspectives including 84 members of KP communities and organizations serving KP communities from 27 countries in Africa, Asia, and the Caribbean.

Participants shared viewpoints in a pre-consultation survey (n=75), a two-hour discussion (n=84), and a post-consultation survey (n=37). One consultation was held in French, and four in English. Anonymized pre-consultation

survey results were presented during focus groups. Focus groups were transcribed, excluding identifying details, and notes analyzed for prevalent themes.

**Lessons learned:** Consistently, participants highlighted the importance of meaningful involvement of KP communities, including engagement in design, delivery and evaluation of services paired with capacity strengthening support, to ensure communities are prepared to lead service delivery. Access to client-centered HIV services tailored to KP communities (preferably at KP-led facilities) free of stigma and discrimination was noted as critical. Adequate financing for services including access to innovative financing structures such as social contracting or social enterprise to meet needs not funded by governments or other donors was also a theme.

Regarding current services, participants said: "The involvement of key population groups in providing sustainable services is essential ... In [my country], the proportion of clients coming to key population-led facilities is 3-4 times higher than public facilities. And for the clients who come to public facilities ... they usually go with a key population supporter."

In the post-consultation survey, participants requested in-person consultations to have a more nuanced exploration of local financing options, and review models of effective engagement and capacity strengthening for KP communities.

**Conclusions/Next steps:** As sustainability related conversations with funders and governments move forward, further dialogue and engagement of key population communities is needed to ensure equitable access to services in the future and sustain current gains in service delivery.

## OAE30 The new vital sign: Evidence for action to improve mental health access for diverse populations

### OAE3002

#### Mental health outcomes of transgender women in Brazil: a narrative review and a call to action for public health policies

D.R. Araujo Coelho<sup>1</sup>, W. Fernando Vieira<sup>2</sup>, C. Coutinho<sup>3</sup>, S. L. Reisner<sup>1,4,5</sup>, V. G. Veloso<sup>3</sup>, B.G. Grinsztejn<sup>3</sup>

<sup>1</sup>Harvard T. H. Chan School of Public Health, Department of Epidemiology, Boston, United States, <sup>2</sup>Universidade de São Paulo, Instituto de Ciências Biomédicas, São Paulo, Brazil, <sup>3</sup>Instituto Nacional de Infectologia Evandro Chagas, Fundação Oswaldo Cruz (INI-Fiocruz), Rio de Janeiro, Brazil, <sup>4</sup>Fenway Health, The Fenway Institute, Boston, United States, <sup>5</sup>University of Michigan, Department of Epidemiology, Ann Arbor, United States

**Background:** In Brazil, transgender women (TGW) face several mental health challenges, often exacerbated by societal discrimination, physical and sexual violence, economic struggles, and HIV healthcare.

This study reviews these mental health challenges and suggests public health interventions for this vulnerable population.

**Methods:** A narrative review on PubMed was conducted in December 2023, using a combination of Mesh terms and title/abstract keywords: 'TGW', 'mental health outcomes', 'sociodemographic factors', and 'Brazil'. Observational studies on mental health outcomes of TGW in Brazil, regardless of HIV status, were included. Exclusions were made for studies not published in English or Portuguese, case reports, case series, and abstracts.

**Results:** The review revealed high rates of anxiety (26.5%-70.1%), depression (19.1%-69.6%), substance abuse (21.5%-56.6%), and suicidality (25%-47.25%) among TGW in Brazil. These issues are intensified by several societal factors, as illustrated in Table 1.

We propose an integrated policy framework, focusing on:

1. Expanding gender-affirming care in Brazil's Unified Health System (SUS), training health professionals in transgender health, and broadening access to mental health services;
  2. Promoting the Dandarah app, a tool for reporting harassment and violence;
  3. Enhancing job training and placement through non-governmental organizations (NGOs) like Transempregos;
  4. Implementing affirmative university policies for TGW;
  5. Improving access to HIV testing, PrEP, PEP, and HAART.
- Key stakeholders include SUS, the Ministry of Health, healthcare professionals, tech developers, law enforcement, legal aid organizations, employment agencies, private sector, educational institutions, schools, and NGOs.

Author	Year	Factor	Main findings	Impact
Luz <i>et al.</i>	2022	Discrimination	96% experienced discrimination	Increased risk for depression and psychological distress
Letier <i>et al.</i>	2021	Discrimination	Reduced likelihood of medical visits (OR 0.29) and HIV testing (OR 0.41)	Lower health-seeking behavior
Almeida <i>et al.</i>	2022	Violence	Sexual (OR 2.06) and physical violence (OR 2.09) associated with depression	Increased depressive symptoms
Luz <i>et al.</i>	2022	Physical violence	52% experienced physical violence	Higher rates of depressive symptoms
Rafael <i>et al.</i>	2021	Physical violence by family/partner	Increased suicidal ideation (aPR 1.37 and 1.92) and attempts (aPR 1.48 and 1.69)	Increased suicidal ideation and attempts
Reto <i>et al.</i>	2021	Sexual violence	Associated with suicidal ideation and attempts (OR 1.69)	Increased suicidal ideation and attempts
Luz <i>et al.</i>	2022	Sexual violence	42% experienced sexual violence	Increased depressive symptoms and trauma
Zucchi <i>et al.</i>	2019	Economic difficulties	42.3% were sex workers	Correlation with psychological distress
Ferreira <i>et al.</i>	2019	Economic difficulties	78.6% were sex workers and most earned below US\$ 10.00/day	High-risk survival strategies
Ferreira <i>et al.</i>	2019	HIV and health disparities	Only 18.8% of HIV-uninfected TGW used PrEP	Higher risk for HIV seroconversion
Wilson <i>et al.</i>	2019	HIV and health disparities	Discrimination reduced willingness to seek PrEP/healthcare	Barriers to accessing HIV-related healthcare services
Amante <i>et al.</i>	2023	HIV and health disparities	Reluctance to report new symptoms in HIV-positive TGW (aOR 7.62)	Barriers to accessing HIV-related healthcare services
Wilson <i>et al.</i>	2021	HIV and health disparities	Lower odds of PrEP knowledge (OR 0.5) and PrEP awareness (OR 0.5) in younger TGW (18-24 years old), as well as higher odds of unprotected sex (OR 1.8)	Increased vulnerability to HIV
Vera <i>et al.</i>	2021	HIV and health disparities	Higher prevalence of HIV among TGW aged 18-24 (rate ratio 3.85) and those engaged in sex work (rate ratio 5.96)	Elevated HIV risk
Letier <i>et al.</i>	2022	HIV and health disparities	Prevalence of HIV in TGW between 9.0% to 24.3%	Increased prevalence
Grinsztejn <i>et al.</i>	2017	HIV and health disparities	Newly diagnosed HIV infections associated with sex work history (OR 30.7)	Increased prevalence and association with sex work

PrEP: HIV Pre-exposure prophylaxis; PEP: HIV Post-exposure prophylaxis; TGW: transgender women

Table 1. Impact of societal factors on mental health and HIV outcomes of TGW in Brazil.

**Conclusions:** TGW in Brazil experience significant mental health issues, influenced by various factors. A holistic approach, encompassing healthcare, safety, employment, education, and HIV care, is essential. Effective public health policies must be inclusive, responsive, and tailored to TGW's needs, promoting their wellbeing and dignity.

### OAE3003

#### Role of psycho-social counselling in harm reduction program among people who inject drugs: Bangladesh experience

M.G. Rozario<sup>1</sup>, S. Islam<sup>2</sup>, M. Akhtaruzzaman<sup>3</sup>, M.-U. Rashid<sup>1</sup>, A. Chowdhury<sup>2</sup>, F. Afroz<sup>4</sup>

<sup>1</sup>CARE Bangladesh, Health and Nutrition Unit, Dhaka, Bangladesh, <sup>2</sup>Save the Children in Bangladesh, HIV/AIDS Program Health and Nutrition Sector, Dhaka, Bangladesh, <sup>3</sup>National AIDS/STD Control Program Bangladesh, DGHS, Dhaka, Bangladesh, <sup>4</sup>Counselor, CARE Bangladesh, Health and Nutrition Unit, Dhaka, Bangladesh

**Background:** Since 1995, Bangladesh has implemented the harm reduction program to address the needs of the People Who Inject Drugs (PWID). From 2021 to 2023, CARE Bangladesh as an implementer of the Global Fund grant is providing essential harm reduction services to 15,989 PWID of 13 districts. Bio-medical and psycho-social interventions were integrated into the program strategies to minimize the spread of HIV among PWID.

**Description:** Drug addiction's impact on the body, mind, and nervous system, with associated mental health issues, underscores the importance of psycho-social support in successfully integrating drug users into harm reduction services. 20% PWID in Bangladesh enrolled in harm reduction services have a history of over ten years of drug injection, often accompanied by mental illness.

The harm reduction package offered includes a range of services, from Needle-Syringe distribution to Condom promotion and treatment for various health issues, addressing the complex needs of this population.

25% PWID have received case management, brief intervention, motivational interviewing, cognitive behavior therapy, and social support group development which have decrease drop-out from 9.7% (2021) to 2.2% (2023) and adherence increased from 90% (2021) to more than 95% (2023) to Anti-retroviral Therapy (ART), opioid substitution therapy, management of HIV-HCV.

**Lessons learned:** Mental health support emerges as a cornerstone in addressing drug use disorders, teaching individuals coping mechanisms, replacing negative thoughts with positive ones, emphasizing treatment benefits, and involving family and social support systems.

Despite the challenges faced by counselors in conducting sessions with People Who Inject Drugs (PWID), varied methods, including case management, have been employed to ensure effective counseling sessions through different psycho-social interventions.

**Conclusions/Next steps:** Programmatic data for 2022 showcases retention rates on methadone therapy increase from 63% (2021) to 89% (2023), increase adherence to Anti-Retroviral Therapy ART more than 95% and management of HIV-HCV among 681 PLHIV client.

These positive outcomes underscore the critical impact of psycho-social interventions in maintaining the well-being and social integration of individual drug users.

## OAE3004

iTHRIVE 365 reduces the negative psychological impact of daily intersection stigma for black same gender loving men living with HIV

L. Scott-Walker<sup>1</sup>, J. Smith<sup>1</sup>, D. English<sup>2</sup>

<sup>1</sup>Rutgers University, Camden, United States, <sup>2</sup>Rutgers University, New Brunswick, United States

**Background:** While emerging evidence shows health inequities among Black gay, bisexual, other same gender loving men living with HIV (SGLMLWH) are driven by intersectional stigma, there is a lack of interventions designed to combat stigma and promote their mental health.

In light of this, our Black SGLM-led multisectoral team developed iTHRIVE 365, a multicomponent mHealth intervention designed to combat the negative effects of stigma by increasing access to health information and motivation, cultivating Black SGLM social support, and facilitating connections to culturally-affirming healthcare and economic resources.

This study examined whether this intervention moderated the daily effects of intersectional stigma on depressive symptoms, anxiety symptoms, and emotion dysregulation among a sample of Black SGLMliving with HIV.

**Methods:** We conducted a 14-day diary study with 32 Black SGLMLWH in Atlanta, GA. Daily surveys assessed intersectional stigma, depressive symptoms, anxiety symptoms, and emotion regulation difficulties. Participants spent 7 days without app access and 7 days with app access. Dynamic structural equation modelling assessed longitudinal associations from intersectional stigma to next-day psychological health. We tested for intervention moderation by comparing these associations between non-access and app-access days.

**Results:** Intersectional stigma was positively associated with next-day depressive symptoms( $\gamma=0.21$ , 95%CI=[.10,.34]), anxiety symptoms( $\gamma=0.26$ , 95%CI=[.13,.37]), and emotion dysregulation( $\gamma=0.09$ , 95%CI=[.01,.19]). iTHRIVE365 significantly moderated the associations with anxiety symptoms and emotion dysregulation, such that there were significant associations with stigma on non-access days, but not app-access days.

Group	Outcome	Parameter	Estimate	95% CI	Std. Effect
No T365 Access	Depressive Sx	Stigma, Fixed Effect	0.18*	[.02, .33]	0.23
	Anxiety Sx	Stigma, Fixed Effect	0.32*	[.16, .50]	0.37
	Emotion Dys	Stigma, Fixed Effect	0.15*	[.02, .28]	0.26
T365 Access	Depressive Sx	Stigma, Fixed Effect	0.19*	[.03, .41]	0.22
	Anxiety Sx	Stigma, Fixed Effect	0.19	[-.01, .40]	0.20
	Emotion Dys	Stigma, Fixed Effect	0.02	[-.10, .15]	0.03

Table 1. Grouped Dynamic Structural Equation Results  
Note: Sx= Symptoms, Dys= Dysregulation, T365= iTHRIVE365 intervention

Estimate = median of the posterior distribution, CI = Credible Interval using the highest posterior density method, Std.

Effect = Standardization using the average of within-person standardization method, \* indicates that 0 is not in the 95% credible interval of the parameter and is analogous to being statistically significant in a frequentist inference.

**Conclusions:** Findings suggest iTHRIVE365 may be an effective tool in reducing the negative mental health impacts of daily intersectional stigma for Black SGLMLWH.

## OAE3005

Evaluating the impact of Prime Time Sister Circles on select health outcomes for a diverse cohort of Black women with HIV in urban U.S.

H. Kwakwa<sup>1</sup>, A. Dongala<sup>1</sup>, M. Dorsainvil<sup>1</sup>, T. Stokes<sup>1</sup>

<sup>1</sup>Philadelphia Department of Public Health, Ambulatory Health Services, Philadelphia, United States

**Background:** Prime Time Sister Circles (PTSC) is a community-based, culturally-relevant intervention designed to help Black women improve cardiovascular health. With US Black women disproportionately impacted by cardiovascular risk, interventions to improve cardiovascular health in Black women with HIV are urgently needed. In one of

12 projects funded by HRSA, we implemented PTSC with 2 other interventions (Red Carpet Care and Trauma-informed Care) bundled for Black women with HIV. We report the clinical and access to care impact of PTSC plus the other 2 (base) interventions, compared with the base interventions only.

**Methods:** This study was conducted in community health centers in Philadelphia between May 2021 and December 2022. Eligibility criteria were: (1) Self-identification as a Black woman and (2) HIV diagnosis with (3a) Re-engagement in care or (3b) New diagnosis or (3c)  $\geq 2$  Emergency Department (ED) visits or  $\geq 1$  hospitalization within 12 months or (3d)  $\geq 2$  missed HIV care visits within 6 months. The base interventions were conducted over a 6-month period, and the PTSC intervention occurred over 12 weeks. A comprehensive survey and laboratory examination were conducted and access-to-care data collected at baseline, 6 months and 12 months. We present a descriptive analysis of data collected, comparing the PTSC group to the base intervention only cohort.

**Results:** 46 women enrolled the project, 19 of them opting into and 14 completing the PTSC intervention. Mean age was 51, 19 were born outside the US, 2 were transgender and participants reported a mean of 6 chronic co-morbidities. For both groups improvements were noted in HIV RNA, CD4 cell counts, hemoglobin A1c and LDL as well as in ED utilization and missed HIV primary care visits. These improvements were more pronounced at 6 months than 12 months. Additionally, PTSC participants showed an improvement in blood pressure at 6 months only.

**Conclusions:** Our base evidence-informed bundled interventions were collectively successful in improving HIV-related parameters as well as select cardiovascular risk parameters in this diverse cohort of aging Black women with HIV. The inclusion of PTSC provided added value in improving blood pressure at 6 months. The slight worsening from 6-12 months mandates further study of maintenance interventions.

## OAE39 New strategies for optimizing person-centred care

**Background:** Decreasing PrEP monitoring visits can reduce PrEP use burden. We examined STI testing behavior and STI positivity among PrEP users randomized to a less frequent 6-monthly versus 3-monthly STI screening (standard-of-care) within the EZI-PrEP study.

**Methods:** EZI-PrEP is a randomized controlled trial (September 2021-March 2024) on the non-inferiority of 6-monthly versus 3-monthly, and online versus in-clinic PrEP monitoring among men-who-have-sex-with-men in the Netherlands. Monitoring includes STI screening; additional free-of-charge STI testing in-between monitoring visits is optional.

This preliminary analysis includes data from participants with  $>1$  PrEP follow-up monitoring visit in Amsterdam, Rotterdam, The Hague and Nijmegen until September 2023. Using visit rate ratios and 95%CI, we compared (i) overall visit rates (i.e., number of PrEP visits and additional STI visits per person-year) and (ii) additional STI visit rates (i.e., number of additional STI visits per person-year) between 6- and 3-monthly monitoring arms.

Using  $\chi^2$  test, we compared (iii) the proportion of all visits with any positive chlamydia, gonorrhea, or infectious syphilis ('any STI') and (iv) the proportion of all additional STI visits without STI-related symptoms or partner notification between 6-monthly and 3-monthly monitoring arms.

**Results:** 428 participants (6-monthly arm: n=213; 3-monthly arm: n=215) contributed 512 person-years of follow-up. The overall visit rate in the 6-monthly arm was lower than the 3-monthly arm (visit rate ratio=0.70, 95%CI:0.64-0.77). The additional STI visit rate in the 6-monthly arm was higher than the 3-monthly arm (visit rate ratio=1.94, 95%CI:1.58-2.40).

We found no difference in STI positivity between arms (6-monthly arm: 22.3%; 3-monthly arm: 20.5%, p=0.35), nor in the proportion of additional STI visits without STI-related symptoms or a partner notification (6-monthly arm: 52.1%; 3-monthly arm: 42.8%, p=0.071).

**Conclusions:** Compared to PrEP users monitored every 3 months, PrEP users monitored every 6 months attended more additional STI visits, but had fewer visits overall. STI positivity was comparable between the arms.

These preliminary findings suggest that implementing 6-monthly PrEP monitoring as standard-of-care could reduce the total number of visits without resulting in increased STI positivity, leading to cost reductions of PrEP programs. Further research on the impact of 6-monthly monitoring on STI transmission is ongoing.

## OAE3903

Long-term health outcomes of people living with HIV who were enrolled in six-month dispensing of antiretroviral treatment for 12-18 months in four provinces of Mozambique

J. Chacha<sup>1</sup>, O. Canhang<sup>1</sup>, J. Moiane<sup>2</sup>, M. Prieto<sup>2</sup>

<sup>1</sup>Efficiencies for Clinical HIV Outcomes (ECHO) project, Mozambique/Abt Associates, Maputo, Mozambique,

<sup>2</sup>Efficiencies for Clinical HIV Outcomes (ECHO) project, Mozambique, Maputo, Mozambique

**Background:** Multi-month dispensing (MMD) of antiretroviral treatment (ART) reduces unnecessary clinic visits, contributes to improve health outcomes among people living with HIV (PLHIV), and improves the efficiency of health systems. 3MMD dispensing has become the standard of care in many clinical and community settings, and now, globally, the focus is to extend MMD up to a period of six-months (6MMD).

In 2020, Mozambique Ministry of Health adopted a phased approach to facilitate this transition towards 6MMD. US-AID-funded Efficiencies for Clinical HIV Outcomes (ECHO) project is supporting 6MMD implementation in 24 health facilities in four provinces. We analyzed long-term health outcomes of PLHIV who were enrolled in 6MMD for a period of 12-18 months.

**Methods:** This is a quantitative cross-sectional study of PLHIV enrolled in 6MMD from April to September 2022. Eligibility criteria included: age  $\geq 5$  years old, on ART for  $\geq 12$  months, with a viral load (VL)  $<1,000$  copies/ml, have no current illness, and not be on cotrimoxazole and/or tuberculosis prophylaxis (excluding pregnant/breastfeeding women). Data was collected from electronic medical records from 24 health facilities in four Mozambican provinces implementing 6MMD.

All individuals were followed through October 2023 to assess VL coverage, VL suppression (defined as VL $<1,000$  copies/ml) and retention in care after  $\geq 12$  months of enrollment in 6MMD. Descriptive statistics were used to characterize the study sample and determine long-term health outcomes.

**Results:** A total of 55,820 PLHIV enrolled in 6MMD were included in the analysis, of whom 65% were female (36,303/55,820). The median age was 39 years [interquartile range (IQR): 32-47 years]. VL coverage was 82% (45,644/55,820) across the cohort, and among those with a VL test result, 98% (44,580/45,644) were virally suppressed. 98% (54,954/55,820) of individuals were retained in HIV care after  $\geq 12$  months of enrollment in 6MMD.

**Conclusions:** PLHIV enrolled in 6MMD can achieve high rates of VL suppression and retention in care, which supports the case for the expansion of the model to other health facilities.

Further research will be needed to assess outcomes for individuals who have a shorter period on ART before enrollment, and for individuals with longer-term follow-up.

## OAE3904

Aligning key population HIV prevention service preferences and coverage in Vietnam: findings from a national private sector engagement assessment

K. Green<sup>1</sup>, H. Phan Thi Thu<sup>2</sup>, L. Tran Khanh<sup>1</sup>, A. Duong Thuy<sup>2</sup>, B. Vu Ngoc<sup>1</sup>, T. Tram Tri<sup>1</sup>, G. Nguyen Hoang<sup>3</sup>, D. Nguyen Anh<sup>4</sup>, T. Ngo Minh<sup>4</sup>, A. Doan Hong<sup>4</sup>, Y. Vu Ngoc<sup>1</sup>, G. Castillo<sup>1</sup>

<sup>1</sup>PATH, Hanoi, Viet Nam, <sup>2</sup>VAC/MOH, Hanoi, Viet Nam,

<sup>3</sup>HSPI, Hanoi, Viet Nam, <sup>4</sup>USAID, Hanoi, Viet Nam

**Background:** The HIV response in Vietnam has seen major successes in PrEP scale-up through a range of differentiated models. These include private sector services (PSSs) which are responsible for nearly half of PrEP enrollment nation-wide. While KP access to preferred PSSs is critical to sustainably achieving ending AIDS by 2030 goals, the delta between KP service preferences, willingness to pay (WTP) and actual coverage of desired services is unknown. Such information is critical to understand as donor funding for HIV prevention steadily declines.

**Methods:** We conducted a mixed-method assessment involving an HIV private-sector engagement (PSE) readiness and coverage benchmarking (58/63 provinces) and

a services use, preferences and WTP study in 11 highest HIV burden provinces among 3060 KP (1800 men who have sex with men, 420 transgender women; 420 people who inject drugs; 420 female sex workers) from May to October, 2023. PSSs were defined as general or KP-led clinics, hospitals or pharmacies, and the coverage assessment included provincial mapping of identified services, inventory of services offered, and maximum client load. We also scored provincial Department of Health readiness to engage with or increase coverage of PSSs.

**Results:** Only five of 58 provinces were identified as having high to very high HIV/PHC-related PSS coverage and 36% of provinces had no PSSs at all. Overall, two provinces were identified as representing combined strong PSE readiness and high coverage of PSS. Related to service preferences, 70.5% and 72.2% of KP preferred KP-led clinics for PrEP and PEP, respectively, followed by the public sector and then general private clinics or hospitals. 79.2% of KP reported WTP for PrEP and 68.2% for PEP. Of those, 51% of MSM reported being able to pay the average commercial price for PrEP (drugs, tests, exam), while only 6.9% of PWID, FSW and TGW were able to do the same.

**Conclusions:** There is a significant mis-alignment between KP service preferences, access to PSSs and WTP for preferred services. As donor funding declines, partial-subsidy models that offer reductions in HIV prevention pricing will be required as parallel efforts are undertaken to reduce cost and ultimate price passed onto clients for commercial services.

## OAE3905

Client experiences of and preferences for HIV care delivery during the first six months on antiretroviral therapy in South Africa

N. Mutanda<sup>1</sup>, A.J. Morgan<sup>2</sup>, L. Sande<sup>1</sup>, M. Maskew<sup>1</sup>, A. Kamanga<sup>3</sup>, V. Ntjikelane<sup>1</sup>, N. Scott<sup>2</sup>, M. Benade<sup>2</sup>, S. Rosen<sup>2,1</sup>

<sup>1</sup>University of Witwatersrand, Health Economics and Epidemiology Research Office, Johannesburg, South Africa, <sup>2</sup>Boston University, School of Public Health, Massachusetts, United States, <sup>3</sup>Clinton Health Access Initiative, Lusaka, Zambia

**Background:** Improving retention on antiretroviral therapy (ART) is essential to achieve global HIV goals. Disengagement from care is highest in the early treatment period (<6 months after initiation or re-initiation), but differentiated service delivery models designed to increase retention generally exclude clients with <6 months on ART. We assessed preferences for HIV service delivery in the early treatment period.

**Methods:** From 9/2022-6/2023, we surveyed adult (≥18) clients who were initiating, re-initiating, or on ART for ≤6 months at 18 primary health facilities in South Africa. The survey collected data on experiences with and prefer-

ences for HIV treatment delivery. A subset of respondents were re-contacted ≤12 months later for focus group discussions (FGD) to further explore preferences.

**Results:** We enrolled 1,098 adults (72% female, median age 33): 38% were initiating/re-initiating ART at study enrolment, 38% had been on ART ≤3 months, and 24% had been on ART 3-6 months. While 81% of clients reported actually receiving 1 month of medication at a time, 63% said they would prefer 3- or 6-month dispensing. 61% preferred 3- or 6-month visit scheduling, while only 13% preferred monthly visits. 79% overall would prefer to receive care from a nurse over a doctor (15%), counsellor (5%), or other provider (2%); men (20%) were more likely than women (12%) to prefer a doctor ( $p<0.05$ ). 65% said they would prefer receiving treatment in community settings (school, church, or pharmacy) instead of a clinic. A large majority of participants (93%) had not been offered any choices of service delivery locations or dispensing durations. 50% of participants desired more counselling; FGD participants expressed the need for frequent, intensive, and empathetic counselling during the early treatment period. Unlike the quantitative survey results, FGD participants expressed a preference for collecting medication from the clinic rather than at community pickup points to provide an opportunity to ask questions and receive counselling.

**Conclusions:** Even during the first six months after ART initiation, a substantial proportion of clients would prefer less frequent clinic visits and longer dispensing intervals, though they also value frequent and high-quality counselling. New care models for the early treatment period should reflect these preferences.

## OAF03 The law, human rights and access to medicines

### OAF0302

Challenging assumptions: rethinking the efficacy of voluntary licensing in medicine access, economic landscapes, and policy frameworks

O. Mellouk<sup>1</sup>, G. Krikorian<sup>2</sup>, S. Kondratuyk<sup>1</sup>

<sup>1</sup>ITPC, Johannesburg, South Africa, <sup>2</sup>Independent Consultant, Paris, France

**Background:** Voluntary licensing is a prevalent practice, particularly in sectors where patents are numerous like pharmaceuticals. During recent years, Voluntary Licenses (VLs) emerged as a predominant solution to ensure access to treatment in resource limited settings to the detriment of other compulsory strategies. The research delves into the multifaceted impacts of VLs on access to medicines, the economic dynamics of the pharmaceutical market, and the broader discourse surrounding access to health.

**Description:** Drawing insights from an extensive review of bibliographic resources, license agreements, and consultations with legal experts and stakeholders involved in HIV treatment and other medicine policies, this study conducted two analyses.

Firstly, an assessment of the provisions within license agreements was undertaken.

Secondly, the research documented the diverse effects and impacts that these agreements can exert on policies and stakeholders.

**Lessons learned:** The study uncovered a spectrum of potential effects stemming from voluntary licenses. It explores both positive impacts, such as enhanced access for specific populations in certain countries, and negative features within agreements related to target countries, transparency, knowledge transfer, active ingredient usage, pricing, grant-back of rights, and more.

The research examined how license deals influence the conduct and business practices of pharmaceutical companies, including partnerships between previously competitive entities, risk assessment for engaging in compulsory licensing, and potential repercussions for small generic manufacturers.

Moreover, it scrutinized their impact on the access to medicines movement, the utilization of TRIPS flexibilities, and their broader influence on access politics and policy debates.

The study concludes with a series of recommendations aimed at improving license agreements, enhancing their monitoring and regulation, and mitigating the inadvertent creation of new barriers to access to medicines.

**Conclusions/Next steps:** The findings contribute to a comprehensive understanding of industrial dynamics and relationships among various pharmaceutical entities on global markets. They highlight the indirect role that voluntary licensing plays in shaping policies and the access to medicines landscape. These insights are crucial for formulating informed policies to improve access to HIV medicines and guiding stakeholders in negotiations aligned with this overarching objective.

## OAF0303

Popularize the use of TRIPS flexibilities in MENA countries to improve access to ARVs

O. Marrakchi<sup>1</sup>

<sup>1</sup>International Treatment Preparedness Coalition for Middle East and North Africa, Marrakech, Morocco

**Background:** In the MENA region, the majority of countries encounter challenges in accessing high-quality antiretroviral drugs (ARVs). The latest generation treatments are often patented, and many countries in the region, classified as "developing countries," are increasingly excluded from voluntary licenses granted by pharmaceutical laboratories.

In response to this issue, a solution exists – using the TRIPS flexibilities provided by the WTO. However, these flexibilities are relatively unknown in the region, despite their potential to save millions of lives.

**Description:** The UNITAID Project, led by ITPC Global, is implemented across several countries worldwide. ITPC MENA, in its role as SSR, has been responsible for implementing the project in Morocco and the MENA region since 2018. The project aims to promote the use of flexibilities to enhance access to antiretroviral drugs (ARVs) as well as treatments for co-infections, such as TB, hepatitis, and even Covid-19.

**Lessons learned:** For over 6 years, ITPC MENA has undertaken extensive evidence collection efforts, conducting numerous studies to substantiate our advocacy and expose certain barriers hindering the use of these flexibilities. These barriers include international agreements and validation agreements signed by some countries in the region with the European Patent Office (EPO), demonstrating their impact on access to medicines. Subsequently, based on this evidence, extensive awareness campaigns were conducted targeting civil society, key populations, decision-makers, local generic manufacturers, and patent offices.

Finally, more tangible actions were taken, such as patent oppositions (e.g., TAF for HIV, Baricitinib for Covid-19). Following this approach (data collection, raising-awareness, and concrete actions), we successfully conducted a robust advocacy campaign grounded in evidence, convincing the majority of stakeholders who did not hesitate to express their support.

**Conclusions/Next steps:** Today, we can affirm that the program has borne fruit. For the first time, TRIPS flexibilities are being utilized in Morocco, thanks to successful advocacy and awareness efforts targeting decision-makers. The next step is to replicate the same journey for Morocco in other countries within the region, starting with Tunisia as early as this year.

## OAF0304

National Health insurance coverage of HIV benefits in 5 PEPFAR supported countries: a scoping review

A. Verani<sup>1</sup>, M. Ruffner<sup>1</sup>, F. Riako Anam<sup>2</sup>, N. Tavanxhi<sup>3</sup>, I. Semini<sup>4</sup>

<sup>1</sup>State Department, Bureau of Global Health Security and Diplomacy, U.S. President's Emergency Plan for AIDS Relief (PEPFAR), Washington DC, United States, <sup>2</sup>Global Network of People Living with HIV (GNP+), Amsterdam, Netherlands, <sup>3</sup>the, <sup>4</sup>Global Fund to Fight AIDS, Tuberculosis, and Malaria, Geneva, Switzerland, <sup>5</sup>UNAIDS, Geneva, Switzerland

**Background:** Integration of health benefits such as HIV testing and Anti-Retroviral Therapy (ART) into National Health Insurance (NHI), previously accomplished by Thai-

land and Vietnam with support from the U.S. President's Emergency Plan for AIDS Relief (PEPFAR), may help sustain the HIV response and improve the health of People Living with HIV (PLHIV). African nations have also established NHI benefits.

**Methods:** To discuss key findings from this body of literature and identify HIV related benefits in NHI, we purposively selected four PEPFAR partner countries with NHI (Ghana, Kenya, Nigeria, Rwanda) and one PEPFAR partner country planning to initiate NHI (South Africa), then searched peer reviewed literature in PubMed using terms "health insurance AND HIV AND country name" for each country selected and included 31 of 292 articles that:

- Addressed publicly financed health insurance and HIV,
- In the selected countries, and;
- Published between January 1, 2019 and December 31, 2023.

We identified which HIV benefits (testing, ART) and other benefits addressing PLHIV co-morbidities were included in NHI benefits, through review of the peer reviewed literature and official NHI websites.

**Results:** HIV and non-HIV benefits relevant to PLHIV are included in NHI packages of Ghana, Kenya, and Nigeria and planned for inclusion in South Africa's. Whether Rwanda's package covers these benefits is unclear, as benefits are stated generally ("drugs and medical services").

Our scoping review found:

- 1) *Having NHI is associated with:* higher rates of health seeking behavior, HIV testing, and antenatal screening; increased treatment of OIs in PLHIV; improved obstetric health among PLHIV; chemotherapy for PLHIV with Kaposi's sarcoma; higher cervical cancer survival rates; comprehensive knowledge about HIV/AIDS; and awareness of PrEP, and;
- 2) *Not having NHI is associated with:* HIV acquisition; catastrophic health expenditures for PLHIV; cardiovascular risk factors among PLHIV; and being on ART.

**Conclusions:** Most countries reviewed include (and South Africa plans to include) multiple HIV related benefits in their NHI. Having NHI is associated with greater awareness, access to, and use of health care by PLHIV (except ART). Integration of HIV services and other related health benefits into NHI is ongoing.

## OAF0305

### Community advocacy to reduce IP barriers to access to affordable medicine: lessons learned from the Bedaquiline Patent Opposition in Indonesia

B. Larasati<sup>1</sup>

<sup>1</sup>Indonesia AIDS Coalition, DKI Jakarta, Indonesia

**Background:** Trade Related Aspects on Intellectual Property Rights (TRIPS) poses a threat to public access to health commodities, especially in developing countries. TRIPS grants inventors monopoly rights, which results in high prices. However, there are cases when companies attempt to extend the protection period by registering new patents for minor modifications to existing products. To prevent such frivolous patents, the filing of Patent Opposition (PO) is needed.

**Description:** From November 2022 to November 2023, the Indonesia AIDS Coalition (IAC) filed a PO against Bedaquiline, part of the first-line treatment regimen for Drug-Resistant TB (DR-TB), dispersible tablet formulations. Overall, Indonesia ranked second in the world for TB cases, with a total of 969,000 cases, of which an estimated 28,000 are DR-TB. PLHIVs are especially vulnerable. In 2021, TB caused the deaths of 6,500 PLHIV, or 29.5% of the total TB-HIV cases.

The PO process lasted for ten rounds, from presenting written arguments to witness examinations. The arguments put forward are that CSOs are interested parties under the Patent Law and can file POs; the steps for creating dispersible tablets are already known; and patent applications for new uses of known substances without an increase in efficacy are not eligible for patents.

#### Lessons learned:

1. There are still differences in views between the judiciary panel and CSOs regarding CSOs' legal standing, which have roots in ambiguous sentences in the Patent Law. This highlights the importance of strengthening the arguments by referring to the organization's constitution and track record, as well as the need to advocate for more clarity;
2. Difficulty in finding local pharmaceutical expert witnesses. This highlights the importance of building rapport with academic circles and the role of international networks;
3. Difficulty finding law firms that possess a community perspective; and,
4. Difficulties in rallying support from TB groups due to the media ban during court proceedings.

**Conclusions/Next steps:** The Bedaquiline case marks the first time a CSO has conducted a PO in Indonesia. Not only for drugs but also for product patents. The lessons learned from this case will inform future PO efforts, specifically on strengthening the argument on CSOs' legal standing.

## OAF11 The HIV response in the context of political instability and emergencies

### OAF1102

A scoping review of factors associated with HIV acquisition in the context of humanitarian crises

D. Harsono<sup>1</sup>, S. Atre<sup>2</sup>, K. Nyhan<sup>3,4</sup>, D. Garmroudi<sup>5</sup>, J.L. Davis<sup>6,7</sup>, W. Ho<sup>8</sup>, K. Khoshnood<sup>6,1</sup>

<sup>1</sup>Center for Interdisciplinary Research on AIDS at Yale University, New Haven, United States, <sup>2</sup>Yale School of Public Health, Department of Chronic Disease Epidemiology, New Haven, United States, <sup>3</sup>Yale University, Harvey Cushing/John Hay Whitney Medical Library, New Haven, United States, <sup>4</sup>Yale School of Public Health, Department of Environmental Health Sciences, New Haven, United States, <sup>5</sup>Yale University, New Haven, United States, <sup>6</sup>Yale School of Public Health, Department of Epidemiology of Microbial Diseases, New Haven, United States, <sup>7</sup>Yale School of Medicine, Department of Pulmonary, Critical Care and Sleep Medicine, New Haven, United States, <sup>8</sup>Yale School of Public Health, Department of Social and Behavioral Sciences, New Haven, United States

**Background:** Humanitarian crises – natural or human-made events that can threaten communities' health, safety, security, and well-being – may affect the HIV epidemic dynamics and risk for HIV acquisition.

**Methods:** We conducted a scoping review of literature published in English between January 1990 and March 2022 to characterize the global evidence of modifiable and non-modifiable factors for HIV acquisition in the context of humanitarian crises. We systematically searched, screened, and synthesized literature from MEDLINE, Embase, Global Health (all accessed via Ovid), and Scopus, and sought out grey literature through websites of humanitarian agencies and relevant non-government organizations, the International AIDS Society's abstract databases, and Google Scholar.

We considered studies presenting empirical data on HIV acquisition in humanitarian crises-affected populations, including refugees, asylum seekers, and internally displaced persons.

**Results:** Forty-nine studies met the inclusion criteria. The majority of the studies were quantitative (n=43, 87.8%) and cross-sectional (n=30, 61.2%) in nature. Most of the research was a single-country study (n=43, 87.8%) and conducted in Sub-Saharan Africa (n=31, 63.3%).

We identified 5 non-modifiable factors associated with HIV acquisition (i.e., age, gender, location, place of birth or origin, and ethnicity) and 60 modifiable factors that we classified into five categories, namely, 18 policy and structural, 9 sociocultural, 11 health and mental health, 16 sexual practices, and 6 crisis-related traumatic event factors. Within these modifiable categories, factors that were most often investigated were education level, marital

status, sexually transmitted infection diagnosis, condom use, and experience of rape or sexual trauma, respectively. Informed by the findings, we applied the social ecological framework to map the multidimensional factors associated with HIV acquisition in humanitarian settings at the individual-, social and sexual networks-, community-, and public policy-levels.

**Conclusions:** The current review provides a comprehensive, global analysis of evidence on factors associated with HIV acquisition in humanitarian settings and implications for future programs and research. Future research should consider longitudinal and mixed methods designs to understand the potential causal linkages between non-modifiable and modifiable factors and HIV acquisition and explore the lived experiences of crises-affected populations. Such research will generate actionable evidence to inform ethical and culturally appropriate HIV prevention interventions in humanitarian settings.

### OAF1103

Assessing the disruption of HIV testing and treatment in Nepal during the COVID-19 pandemic: an interrupted time series analysis

K. Deuba<sup>1,2</sup>, S. Bhandari<sup>3</sup>, L.R. Pandey<sup>4</sup>, R.S. Kunwar<sup>3</sup>, M.B. Kc<sup>4</sup>

<sup>1</sup>Public Health and Environment Research Centre (PERC), Lalitpur, Nepal, <sup>2</sup>Karolinska Institutet, Department of Global Public Health, Stockholm, Sweden, <sup>3</sup>Save the Children, Kathmandu, Nepal, <sup>4</sup>National Centre for AIDS & STD Control, Ministry of Health and Population, Kathmandu, Nepal

**Background:** Nepal's response to COVID-19, involving public gathering bans and nationwide lockdowns, significantly impacted routine health services. This study evaluates the effect of these measures on HIV testing and treatment services.

**Methods:** We conducted an interrupted time series analysis using national routine health facility data from all HIV testing and treatment centers in Nepal, spanning January 2019 to December 2021. The study period includes the pre-pandemic phase (January 2019 to March 2020) and the pandemic period marked by three COVID-19 waves (December 2020 to December 2021). We analyzed monthly data on HIV testing, positive diagnoses, and new Antiretroviral Therapy (ART) enrollments. The Poisson regression model was applied to compare rates pre- and post-COVID-19 outbreak, yielding relative risk (RR) estimates with 95% confidence intervals (CI).

**Results:** Throughout the study period, 675,939 individuals were tested for HIV, 7,926 diagnosed with HIV, and 7,189 commenced ART. The pandemic correlated with a 34% reduction in HIV testing (RR: 0.657; 95% CI: 0.651-0.663; P < 0.001), a 47% decrease in positive diagnoses (RR: 0.529; 95% CI: 0.482-0.579; P < 0.001), and a 36% decline in new ART enrollments (RR: 0.641; 95% CI: 0.585-0.705; P < 0.001).

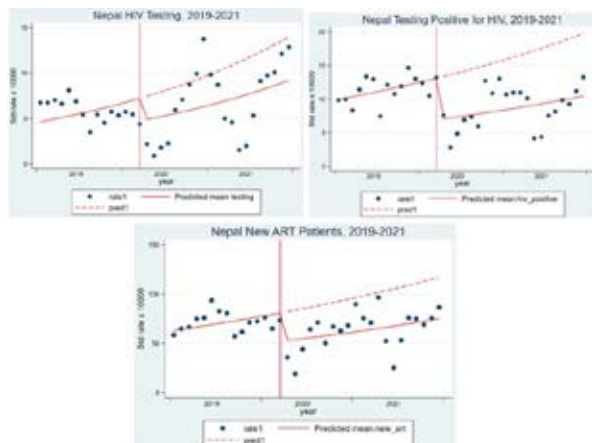

Figure 1. Interrupted time series with level of change model. Graph displays the pre and post COVID-19 trend of HIV testing, diagnosis, and new ART patients' monthly rates (continuous line), and the counterfactual scenario (dashed line).

**Conclusions:** The COVID-19 pandemic significantly disrupted HIV testing and treatment in Nepal. These findings highlight the urgent need for resilient health systems in low- and middle-income countries to sustain HIV control efforts amidst pandemic-related disruptions. Proactive measures are crucial to safeguard the gains made in HIV prevention and care against future health crises.

## OAF1104

Scaling up and drafting of risk mitigation strategies for key population programs in the context of complex and changing legal, social & political environment in Kenya

R.N. Josphine<sup>1,2</sup>, J. Kyana<sup>3</sup>, E. Amenya<sup>4</sup>

<sup>1</sup>Community Health Advocacy and Learning Initiative, Public Health Consultant, Kilifi, Kenya, <sup>2</sup>USAID Stawisha Pwani, LVCT Health, Prevention and Key Population Program, Kilifi, Kenya, <sup>3</sup>HAPA KENYA, Programs, Mombasa, Kenya, <sup>4</sup>WACHA Health, Programmes, Mombasa, Kenya

**Background:** In a concerning trend of violence against Kenya's LGBTQ community, activists Joash Mosoti, Sheila Lumumba, and Edwin Chiloba were brutally murdered between May 2021 and January 2023. This surge in hatred coincided with a growing regional anti-right movement in East Africa fueling an anti-LGBTIQ discourse.

The situation reached a tipping point when the Supreme court of Kenya delivered a landmark verdict on March 24th 2023, supporting legal registration of an LGBTIQ group.

This further convoked protests, violence incitement toward LGBTIQ individuals, organizations and allies and introduction of anti-LGBTIQ legislations in parliament.

**Description:** In March 2023, LGBTIQ and sex workers' leaders in Kenya's coast region addressed challenges amid the anti-LGBTIQ campaign. Topics included rhetoric, legal

gaps, evictions, violence, and mental health. Proposed solutions: engaging sensitized religious leaders, mapping legal advisors, safe spaces, community sensitization, and a crisis response framework. Strategies for mental health, evictions, and asylum information were outlined. Funding from UHAI, Hivos, The Global Fund, USAID-Stawisha Pwani, embassies, and NGLHRC, KELIN, and Defenders Coalition aims to protect LGBTQ rights amid a hostile environment.

Issue	Challenges/Context	Intervention/Solutions	Resources
Anti-LGBTIQ Rhetoric, Threats, Campaigns	Homophobic rhetoric and threats from religious and community leaders online and offline, attacks on supportive religious leaders	Engage sensitized religious leaders, community monitoring, strategic faith engagement, and sensitization/training programs	PCMA, Kenya training manual, UHAI, Hivos, GF, Stawisha, Embassies
Legal Resources and Frameworks	Lack of legal resources for emergency and post-emergency responses, insufficient cultural competence in legal representation	Enhance capacity of legal frameworks, create accessible legal databases, negotiate group deals with law firms, and work with sensitized law enforcement	Kenya Ministry of Law, National Legal Council, UHAI, Hivos, GF, UHAI, Hivos, PCMA, Defenders Coalition
Evictions	Business closures, community space closures, and lack of shelter or support during evictions	Identify safe spaces, strengthen communities and stakeholders, provide legal support, establish emergency support fund, and draft eviction policy	NGLHRC, GALIC, Defenders Coalition, UHAI, GF
Violence	Physical, sexual, emotional, verbal abuse, challenges with forced displacement, transitions	Community sensitization, safety/security training, review training manuals, mental health support, and dialogue with stakeholders	Kenya law enforcement, provincial, county, religious leaders, Hivos, GF, UHAI, GF, Stawisha
Crisis Response Strategy	Lack of a strong, functional, and coordinated crisis response strategy	Develop a coordinated risk mitigation framework with a hotline, documentation/data tracking, internal communication plan, and training more paragon	Kenya police, Kenya Coast Guard, UHAI, Hivos, GF, UHAI, Hivos, PCMA, Defenders Coalition
Mental Health	Stigma, violence, and anti-LGBTIQ campaigns leading to mental health risks, lack of culturally equipped mental health providers	Identify mental health practitioners, sensitive and engage them, provide referrals, therapy/counseling for community workers, activists, and volunteers	Kenya police, Kenya Coast Guard, UHAI, Hivos, GF, UHAI, Hivos, PCMA, Defenders Coalition
Asylum	Lack of understanding of asylum processes, eligibility, and gatekeepers	Proper documentation, provide information on accepting countries, and conduct seminars/workshops	Kenya police, Kenya Coast Guard, UHAI, Hivos, GF, UHAI, Hivos, PCMA, Defenders Coalition
Data Tracking	Insufficient data tracking on cases and incidents	Proper documentation of data/incidents/cases, provide information on accepting countries, conduct community/volunteer trainings	Kenya police, Kenya Coast Guard, UHAI, Hivos, GF, UHAI, Hivos, PCMA, Defenders Coalition

**Lessons learned:** Despite security risks, essential services like ARV and PrEP distribution persisted amid anti-LGBTIQ campaigns, utilizing COVID-19 care models like tele-consultation and online support. Community-led programs monitored campaigns online/offline. Limited donor support hindered organizations without a regional plan. Engagements with police, boda boda riders, religious leaders, and health officials provided sensitization opportunities. Challenges included funding shortages for emergencies and structural interventions. Nevertheless, improved relationships with law enforcement, boda boda riders, and health committees emerged through collaborative efforts amid adversity.

**Conclusions/Next steps:** Community leaders highlight inadequate understanding of key populations, escalating violence, and protests against supporting key population programs.

To ensure HIV response sustainability, crucial factors include supporting and funding community-led organizations for engaging stakeholders, challenging anti-rights narratives, and advocating for inclusion.

## OAF1105

Providing legal information through the chatbot "Legal Bot 100% LIFE" during full-scale war and martial law on the territory of Ukraine

M. Ignatushyna<sup>1</sup>, K. Rivera<sup>1</sup>

<sup>1</sup>CO "100 PERCENT LIFE", Kyiv, Ukraine

**Background:** With the beginning of a full-scale war on the territory of Ukraine, providing services for the prevention, testing, and treatment of HIV became complicated. 2,464 cases of AIDS were during 01.01.2023 - 01.10.2023 according to statistics by the Public Health Center of the MOH of Ukraine. The temporary loss of administrative control

over part of the territory makes it impossible to obtain complete information about the level of damage to the entire population right now.

Many people with HIV and tuberculosis and representatives of vulnerable groups (hereinafter the Clients) do not have access to services, medicines, and information due to hostilities.

**Methods:** A chatbot "Legal Bot 100% LIFE" (Chatbot) has been implemented by CO "100 PERCENT LIFE", so the Clients can get legal and information about the nearest legal offices and organizations providing social services. The Chatbot consists of 10 sections of answers now, including: HIV+, How to get HIV treatment; Pregnant women and women in labor; Social issues; Privacy; Replacement therapy; Tuberculosis; Discrimination; Viral hepatitis and Martial Law (the last two was supplemented in response to the challenges of war in 2022-2023).

The Legal Bot became a comfortable way to obtain legal advice and useful information which helped clients to reduce the negative impact of hostilities and martial law.

**Results:** Clients have gotten 1928 consultations through it in 2022-2023. The consultations provided by it concerning issues of violation of rights to access to medical care, services, military service, treatment of HIV, hepatitis, tuberculosis, etc. The Chatbot is popular because it shows its effectiveness during limited access to information and services of human rights defenders in wartime conditions for key groups.

**Conclusions:** The Chatbot provides sustainability of legal services and online information about the possibility of receiving other services for the Clients using modern digital technologies during military operations and martial law since the situation in Ukraine requires the introduction of new digital solutions to overcome new challenges.

duction of the proposed anti-LGBTQ+ bill by the Ghanaian parliament has further facilitated an environment where MSM constantly experience societal homophobia, fearmongering, and human-rights abuses which affect uptake and delivery of HIV services for MSM. Maintaining uninterrupted access to essential HIV services for MSM in the wake of the anti-LGBTQ+ debate requires using integrated and community-based strategies.

**Description:** Various community-based approaches to HIV service delivery for MSM were introduced during the wake of anti-LGBTQ+ debate in three districts.

Peer Educators halted conventional small and large group outreach and engaged peers with interpersonal one-on-one meetings to reduce public visibility. M-Friends/M-Watchers were deployed to facilitate access to needed legal and protective services; and address HIV-related stigma and human rights abuses directed at MSM.

Flexible community-based strategies and cross-cutting initiatives were implemented to preserve access to HIV services and promote safety of KP implementers and MSM during the period: (1) Social media platforms were used to engage peers for HTS and support PLHIVs through virtual case management; (2) HTS and treatment took place at homes and safe locations identified and agreed to by peers at their own convenience; (3) Condoms, lubricants and HIV self-test kits were made available at community-led DICs and outlets for easy access; (4) The program promoted multi-month dispensing of ART and PrEP to eliminate clinic visits.

**Lessons learned:** Introduction of community-based strategies reached out to more MSM and increased HIV+ yield across the 3 districts. During the period of anti-LGBTQ+ debate from September 2022-February 2023, 690 new MSM were reached and tested for HIV; 49 were diagnosed positive. After the introduction of community-based strategies, from March-August 2023, 834 new MSM were reached and tested; 141 were diagnosed positive.

**Conclusions/Next steps:** Community-based approaches to HIV service delivery proved to be effective within the period of the anti-LGBTQ+ debate. Nevertheless, the influence of the anti-LGBTQ+ bill on HIV&AIDS programming is enormous affecting MSM and organizations offering services to them. We therefore call for a high-level stakeholder advocacy on the effect of the anti-LGBTQ+ bill against sexual minorities in the fight against HIV&AIDS.

## OAF2703

### Strategies for HIV service continuity and risk mitigation for outlawed key populations in a restrictive legal environment

L. Oucul<sup>1</sup>, E. Kamakune<sup>2</sup>, M. Nakimuli<sup>3</sup>

<sup>1</sup>The AIDS Support Organization (TASO), Programs and Capacity Development Directorate, Kampala, Uganda,

<sup>2</sup>The AIDS Support Organization, Grants Management Unit, Kampala, Uganda, <sup>3</sup>Most At Risk Population Initiative (MARPI), Programs, Kampala, Uganda

**Background:** On 26th May 2023, the President of Uganda assented to the Anti- Homosexual Act, which subsequently came into force on 30<sup>th</sup> May 2023. Within 2 months of the enactment of the law, The AIDS Support Organization (TASO) sub-recipient, Human Rights Awareness and Promotion Forum (HRAPF) handled 141 cases involving LGBTIQ persons. 64.5% of these cases involved violence that targeted LGBTIQ person, 28 cases of evictions, and 15 cases of arrests (HRAPF report 23/June/2023). TASO is the second principle recipient of the Global Fund and we share strategies used for risk mitigation to ensure continuity of HIV services to the affected Key Populations (KPs).

**Description:** TASO and its Sub-Recipients (SR) partnered with Ministry of Health (MoH) and Uganda AIDS Commission to implement an adaptation plan to enable continuity of HIV services in the midst of the restrictive legal environment. This involved sensitization of the key stakeholders at 3 levels (National, sub-national and facility levels) on the impact of AHA on HIV services. At the National level, sensitization targeted parliament's HIV/AIDS committee. The sub national level targeted District and City leaders while facility level targeted health workers; KP peers, and local leaders. To assure health workers' safety, the Ministry of Health was engaged to issue a circular to guide health workers. Joint meetings to strengthen linkage between HIV service providers and legal support agencies were conducted. Safety and security training workshops for Civil Society Organizations and health workers were held. Standard Operating Procedures (SOPs) for client follow up and data collection were reviewed.

**Lessons learned:** HRAPF report shows 21% reduction of cases handled in October-December quarter compared to April-June quarter. The Director of Public Prosecutions issued a circular to guide all prosecutors on management of cases with charges preferred under the AHA. Strong linkage between HIV service providers and legal service providers greatly reduces the risk of arrests. The next steps will involve rolling out safe integrated key population information system managed by the key population consortium.

**Conclusions/Next steps:** It is possible to continue providing HIV services even in restrictive legal environment by mitigating security risks by engaging key stakeholders at all levels.

## OAF2704

### Ensuring the right to breastfeeding for women and pregnant people with undetectable HIV viral load in 13 Latin American countries

M. Iacono<sup>1</sup>, A. Luna<sup>2</sup>, K. Dunaway<sup>3</sup>

<sup>1</sup>National University of Lanus, Social Work (UNLA), Lanus, Argentina, <sup>2</sup>National Autonomous University of Mexico, Historia, Mexico, Argentina, <sup>3</sup>University of Buenos Aires, Social Studies, Buenos Aires, Argentina

**Background:** In 2010, the Pan American Health Organization, (PAHO) committed to eliminating mother-to-child transmission (EMTCT) of HIV and syphilis, establishing targets for 2015. This commitment persisted through the 2017 ETMI Plus initiative. Despite these efforts, breastfeeding for women with HIV remains forbidden and criminalized, needing guidance for decision-makers on reproductive rights, specifically regarding breastfeeding for those with undetectable viral loads.

**Methods:** Data was collected in 2023 across 13 Latin American countries eligible to the Global Fund grants including Bolivia, Colombia, Costa Rica, Cuba, Ecuador, El Salvador, Honduras, Guatemala, Nicaragua, Paraguay, Peru, Dominican Republic, and Venezuela, to understand the integration of national public policies on breastfeeding and HIV. Using stakeholder mapping, semi-structured interviews with National AIDS Programs and documentary reviews; the study identified actors, processes, and limitations within gender equality, reproductive rights, and HIV responses.

**Results:** Diverse breastfeeding approaches for women with undetectable viral loads across the 13 countries, emphasizing risks and promoting formula substitution. Despite regional ETMI Plus adherence, no documented breastfeeding cases exist, posing policy challenges. Issues include sustaining pregnancy attention, HIV test result delays, and control loss for HIV-positive pregnant adolescents due to stigma. Economic policies in Venezuela affecting formula underscore PAHO collaboration needs for guideline updates.

Recommendations stress enhancing care, addressing stigma, designing guidelines for indigenous women, and ensuring comprehensive care, with calls for UN and Global Fund modifications to promote inclusivity.

Regarding HIV criminalization laws, seven countries criminalize transmission, non-disclosure, or exposure to HIV, while four do not, relying on general criminal law. Cuba is an exception with no HIV criminal persecution, and one country lacks available data.

**Conclusions:** Ensuring reproductive rights, especially regarding breastfeeding, for women and pregnant individuals with HIV is imperative. The decision to substitute breastfeeding with formula milk, the only 0% HIV transmission risk option, should be stigma-free. Urgent actions include case registration, advocacy for expanded feeding choices, and updating guidelines for those with

undetectable viral loads. Prioritizing economic, technical, and political support, and placing the needs of women with HIV at the center of the response, is essential in Latin America.

## OAF2705

Advocacy for drug policy reforms at high political level in the EECA region

O. Kucheruk<sup>1</sup>

<sup>1</sup>Eastern and Central European and Central Asian Commission on Drug Policy, Mariestad, Sweden

**Background:** An enabling environment is critical for effective HIV response. Protective laws for people living with HIV and key populations contribute to better HIV outcomes, while criminalization of these populations and discriminatory laws undermine success. In the EECA region, drug legislation is primarily repressive and punitive, imposing severe criminal sanctions on people who use drugs. Massive criminalization prevent KPs from accessing health and social services.

**Description:** The Central and Eastern European and Central Asian Commission on Drug Policy (ECEACD) was initiated by Alexander Kwasniewski, former President of Poland and was created in 2021 gathering nine opinion leaders from the region in order to inspire better drug policy based on scientific evidence and human rights. The Commissioners are regional leaders from different professional arenas: former Heads of State, politicians, former members of Parliaments, diplomats, scientists, and philanthropists from the region. The core role of the Commission is advocacy for better drug policy at the high political level.

During last three years, Commissioners have conducted country missions to Kyrgyzstan, Moldova, Lithuania, Georgia. During these visits Commissioners have meetings with highest political leaders: Presidents of the states, Prime-Ministers, Ministers of Health, Ministers of Internal Affairs, Members of the Parliaments, other top level authorities. It helped to get political commitment for drug policy reforms.

Currently EU accession perspectives provide a great window of opportunities for the candidate countries: Moldova, Ukraine and Georgia. ECEACD provides expertise and support to governments to reform drug policies in compliance with EU requirements and standards.

**Lessons learned:** High political level advocacy resulted with political support to progressive reforms:

1. Seimas (Parliament of Lithuania) Committee on Legal Affairs approved amendments to the Administrative and Criminal Code that propose to decriminalize possession of small amounts of cannabis without intent to distribute it;
2. Committee on law enforcement of the Parliament of Kyrgyz Republic approved draft law that eliminate compulsory treatment for people who use drugs.

Top politicians from other countries committed to make drug policy reform in their countries.

**Conclusions/Next steps:** The ECEACD aims to inspire an open and honest debate, and promote evidence-based drug policy approaches across the region.

## OAF31 Transformative leadership and approaches for people living with HIV and criminalized populations

### OAF3102

Community activism to achieve access to housing, nutrition, and transportation assistance for all low-income people living with HIV

V. Shubert<sup>1</sup>, C. King<sup>2</sup>

<sup>1</sup>Housing Works, Advocacy, Brooklyn, United States,

<sup>2</sup>Housing Works, Brooklyn, United States

**Background:** Evidence shows that safe, stable housing is essential to support effective antiretroviral treatment (ART) that sustains optimal health for people with HIV and stops ongoing transmission. In New York City (NYC), unstable housing has been found to be the single strongest predictor of poor HIV health outcomes and health disparities. Yet, few jurisdictions invest in social supports as HIV healthcare.

As the result of persistent community activism over a 30-year period, in 2016 NYC became the first jurisdiction to provide housing, nutrition, and transportation assistance for every low-income person with HIV.

**Description:** In the mid-1980's New York State (NYS) put in place a government-funded rental assistance program for people with HIV-related illness, and New York City (NYC) supplemented this support with an HIV-specific nutrition and transportation enhancement to existing cash transfer programs for low-income New Yorkers. Initially viewed as palliative care, the supports were limited to people with an AIDS diagnosis.

With the advent of effective ART these social protection programs were recognized as critical enablers of HIV treatment.

Extensive community advocacy over a 30-year period beginning in 1988, including litigation, legislative lobbying, and civil disobedience, gradually expanded the reach of the NYS/NYC-funded social protection programs, and in 2016 these social supports were expanded to all low-income NYC residents with HIV experiencing homelessness and housing instability.

**Lessons learned:** At December 31, 2023, 27,472 New Yorkers with HIV (33% of all diagnosed) received public housing assistance. Among people with HIV in NYC in medical care, 88% were virally suppressed at the end of 2022, and

79% had sustained viral suppression from 2018 through 2022. Evidence-based community activism is key to addressing HIV health inequities and ending HIV epidemics.

**Conclusions/Next steps:** As the first jurisdiction to provide access to meaningful housing supports for all low-income persons with HIV, NYC has demonstrated the feasibility and effectiveness of addressing key social determinants of HIV health outcomes, and the vital role of community activism to achieve HIV health equity.

## OAF3103

### Navigating opposition: understanding and responding to coordinated resistance against Comprehensive Sexuality Education (CSE) and Sexual and Reproductive Health Rights (SRHR)

I. Zhukov<sup>1</sup>, E. Faur<sup>2</sup>, H. McEwen<sup>3</sup>

<sup>1</sup>UNFPA, Sexual and Reproductive Health Branch, New York, United States, <sup>2</sup>National University of San Martin (UNSAM), Full Professor, Argentina, <sup>3</sup>University of the Witwatersrand, Wits Centre for Diversity Studies, Johannesburg, South Africa

**Background:** Resistance against Comprehensive Sexuality Education (CSE) and Sexual and Reproductive Health Rights (SRHR) is a longstanding challenge, particularly fueled by conservative opposition intersecting with youth, sexuality, gender, and power dynamics. Recently, this opposition has gained traction, both within countries and at multilateral UN political levels. Despite global consensus on the positive impact of CSE, coordinated efforts aim to instigate doubt and distrust.

This research explores the politicization of CSE, identifying patterns and trends in opposition, with a focus on counter-movements describing themselves as 'pro-family' but labeled 'anti-gender' by concerned activists.

**Methods:** The research was conducted remotely in 2021-2022, engaging professionals working on CSE across the world. Semi-structured interviews with key informants provided insights into anti-CSE and anti-SRHR advocacy. Participants from diverse stakeholder groups were interviewed, offering a comprehensive view.

The study covered regions including Eastern and Southern Africa, Asia Pacific, Eastern Europe and Central Asia, Latin America and the Caribbean, Western and Central Africa, and the Arab States/Middle East and North Africa.

**Results:** The study identified 'activated opposition' against CSE. Eastern and Southern Africa provides an important case study for observing how a 'pro-family' organization from the global north has mobilized a highly coordinated anti-CSE regional advocacy campaign in the global south. West and Central Africa witnessed the politicization of CSE, with political leaders leveraging it for their agendas.

The Arab States exhibited institutionalized opposition rooted in strong religious views.

In Asia Pacific, governments opposed CSE, fearing it contradicted traditional family values. In Latin America, opposition stems from religious and cultural perspectives.

**Conclusions:** The research highlights the urgent need for additional evidence to support CSE, emphasizing the efficacy of its outcomes. Strategies include monitoring and responding to opposition, mapping allies, engaging media positively, mobilizing civil society, and understanding challenges in language and framing. Coordinated efforts between UN agencies, strategic partners, civil society, and governments are crucial. The findings emphasize the necessity for a proactive and comprehensive approach to address the evolving landscape of opposition against CSE and SRHR, ensuring the protection and advancement of sexual and reproductive rights globally.

## OAF3104

### A successful establishment of paralegals as human rights defenders towards ending HIV in Thailand

J. Siriphan<sup>1</sup>, P. Duangmala<sup>2</sup>, S. Thunprom<sup>3</sup>, S. Bootchadee<sup>3</sup>, W. Kopaibunsiri<sup>4</sup>

<sup>1</sup>Foundation for AIDS Rights, Director, Bangkok, Thailand,

<sup>2</sup>Foundation for AIDS Rights, Manager, Bangkok, Thailand,

<sup>3</sup>Foundation for AIDS Rights, Coordinator, Bangkok,

Thailand, <sup>4</sup>Foundation for AIDS Rights, Lawyer, Bangkok, Thailand

**Background:** The lack of legal and human rights knowledge among populations with higher risk of being discriminated, including people living with/affected by HIV, are common in Thailand. Legal and rights services provided by the government is limited, often complicated, and taking time. We aimed to:

- Establish a cadre of paralegals to actively promote, prevent and protect human rights and
- Document the burden of human rights violation and discriminatory actions.

**Description:** The Foundation for AIDS Rights (FAR) focused on paralegals establishment due to clear limitations of dedicated legal professionals and government mechanisms to promote and protect human rights. FAR together with communities with lived experiences, legal and human right experts, developed the "Paralegals as Human Rights Defenders" curriculum.

Key contents included

- Concept of respect in human dignity and diversity,
- Knowledge of human rights basics and justice system in Thailand, and;
- Skills on fact findings and case analysis.

Civil Society Organizations (CSOs) were invited to identify members with potentials to become a paralegal -trusted by communities, ability to access communities, and enthusiasm to empower their peers on human rights aspect.

## Lessons learned:

- *A cadre of paralegals can be successfully established.* During January 2021–May 2023, 64 paralegals were trained. FAR provided technical support to and accepted case referral from these paralegals.
- *Documentation of human rights violations and discriminatory incidents can be made through the country's Crisis Response System (CRS).* For HIV-related incidents, 192 reports—mainly compulsory HIV testing in workplace, involuntary HIV status disclosure, denial of health and social services, were filed through trained paralegals.
- *Data were used for policy advocacy and public communications.* Common incidents were used by Thailand's National AIDS Subcommittee on AIDS Rights Protection and Promotion for policy change and public communication design.

**Conclusions/Next steps:** Deprofessionalization of legal and human rights services is crucial to empower people to know their rights, voice their discriminatory experiences, and advocate for policy/law reforms. Paralegals can act as human right service providers to be integrated into community-led health services in Thailand. Curriculum will be expanded and tailored for paralegals serving migrants and people who use drugs.

## OAF3105

Bridging the divide and channelling support for parliamentarians to influence the repealing of "Bad" laws Africa, a case of the decriminalisation of HIV transmission in Zimbabwe 2022

R. Labode<sup>1</sup>

<sup>1</sup>Parliament of Zimbabwe, Parliamentary Portfolio Committee on Health and Child Care, Harare, Zimbabwe

**Background:** The criminalization of wilful transmission of HIV has been shown to perpetuate gender inequalities, increase stigma among people living with HIV, and not effectively decrease HIV infections. Zimbabwe, with one of the highest HIV prevalence rates globally, has been significantly affected by the epidemic. The objective was to implement the recommendations of an HIV legal environment assessment, specifically repealing section 79 of the Zimbabwe Constitution, which criminalizes wilful transmission of HIV, and advocating for the release of prisoners incarcerated under the same law.

**Methods:** Partnerships were formed with parliament, the National AIDS Council, civil society organizations, and development agencies such as UNDP and UNAIDS. Strategies included raising awareness through campaigns, conducting research for evidence-based policies, organizing dialogues, capacity building of parliamentary champions for sexual reproductive health rights, and holding public hearings in various provinces. Civil society organizations contributed their expertise and advocacy skills, while affected communities shared their lived experiences.

**Results:** The Minister of Justice successfully embedded the decriminalization of section 79 within a controversial Marriage Bill and presented it to Parliament for debate. Public hearings showed that 71% of attendees supported the motion to repeal the law. Legislators proposed advising the president to consider releasing all prisoners incarcerated under the same law.

**Conclusions:** Through policy advocacy and sustainable development initiatives, parliamentarians, together with development agencies, can collaborate to address HIV-related issues and drive progress towards inclusive laws that address HIV. Strong partnerships between civil society organizations, the executive, and legislators were key to achieving this change. This strategy can be replicated in efforts to change "bad" laws. Support for Zimbabwean parliamentarians in advocating for the release of prisoners incarcerated based on this repealed law is necessary.

## OAF41 Removing legal, policy and human rights barriers for children and young people

## OAF4102

Brazilian network of young people living with HIV/AIDS: we are the answer - what adolescents and young people living with HIV/AIDS think about the access to health services in Brazil

L. Moura da Silva<sup>1</sup>, M.K. Silva Rodrigues<sup>2</sup>,

A. Ribeiro Ferreira<sup>3</sup>, S. Bispo Amaral<sup>4</sup>

<sup>1</sup>Brazilian Network of Adolescents and Young People Living with HIV/AIDS, Brasília, Brazil, <sup>2</sup>Brazilian Network of Adolescents and Young People Living with HIV/AIDS, São Luís, Brazil, <sup>3</sup>The Joint United Nations Programme on HIV/AIDS, Brasília, Brazil, <sup>4</sup>United Nations International Children's Emergency Fund, Brasília, Brazil

**Background:** In Brazil, out of the 43,403 reported HIV cases in 2022, nearly half (41%) affected individuals between 15 and 29 years old, showing the need to prioritize actions to reach this age group. The Brazilian Network of Young People Living with HIV/AIDS (RNAJVHA) closely supported the mobilization and elaboration of the "We Are the Answer" study aiming to understand the obstacles to access healthcare through the experiences of young people living with HIV (YPLHIV) and develop strategies to enhance healthcare services aimed at this population.

**Methods:** The study, a collaboration between UNICEF, UNAIDS, civil society organizations, and the private sector, employed a unique approach by integrating both quantitative and qualitative methods for data collection and analysis. A representative sample of YPLHIV from 18 to 29

years old (n=710) participated in online interviews and the qualitative phase included interviews with RNAJVHA leaders (n=7) and round table discussions (n=70) in seven Brazilian capitals. These activities took place between March and April 2023, in which the participants were mobilized through websites and a peer-to-peer mobilization strategy. Round table discussions were facilitated by trained YPLHIV mobilizers.

**Results:** A fifth of respondents have experienced situations such as disrespect for privacy, discomfort during health care or feelings of guilt or shame for being a person with HIV/AIDS while using the Brazilian health system. Findings from the qualitative research align seamlessly with the quantitative findings, emphasizing stigma and discrimination among healthcare professionals as important barriers to treatment adherence. YPLHIV brought several recommendations for the improvement of services, such as: broaden access to information; provision psychological support; expanded and humanized health care; create and expand public campaigns to deconstruct the stigma of HIV/AIDS; include and expand the participation of YPLHIV in public policy decisions; and develop a protocol for communicating U=U.

**Conclusions:** The principle of GIPA and the policy of putting people at the centre of the response are some of the alternatives for strengthening public policies on HIV/AIDS. The community mobilization of YPLHIV for the preparation of this study strengthened the local and national leadership of RNAJVHA, which provided subsidies for the construction of public policies on HIV/AIDS in Brazil.

## OAF4103

**HIV is not gender neutral: how can we track whether the International AIDS Conference (IAC) represents the issues women and trans people living with HIV care about?**

J. Ouma<sup>1</sup>, C. Chung<sup>2</sup>, M. Tholanah<sup>3</sup>, K. Dunaway<sup>4</sup>, T. Otieno<sup>5</sup>, S. Petretti<sup>6</sup>, S. Strachan<sup>7</sup>, W. Thamm<sup>8,7</sup>, R. Mbewe<sup>9</sup>, B. Kasadha<sup>10</sup>, N. Policek<sup>11</sup>, L. Kwardem<sup>9</sup>, M. Rattue<sup>9</sup>, F. Murau<sup>9</sup>, L. Wanjiku Njenga<sup>12</sup>, O. Edwards<sup>13</sup>, S. Shahi<sup>14</sup>, M. Vazquez<sup>15</sup>, A. Welbourn<sup>16</sup>, E. Bell<sup>17</sup>, F. Hale<sup>17</sup>, The POWER Group

<sup>1</sup>Global Network of Young People living with HIV (Y+), Machakos, Kenya, <sup>2</sup>The Transgender Law Center, Oakland, United States, <sup>3</sup>Making Waves, Harare, United Kingdom, <sup>4</sup>International Community of Women living with HIV (ICW), Buenos Aires, Argentina, <sup>5</sup>Athena Network, Seattle, United States, <sup>6</sup>Positively UK, London, United Kingdom, <sup>7</sup>The Sophia Forum, London, United Kingdom, <sup>8</sup>Hillingdon AIDS Response Trust, Hillingdon, United Kingdom, <sup>9</sup>4M Mentor Mothers Network, London, United Kingdom, <sup>10</sup>University of Oxford, Oxford, United Kingdom, <sup>11</sup>European AIDS Treatment Group, Edinburgh, United Kingdom, <sup>12</sup>Positive Young Women Voices, Dandora, Kenya, <sup>13</sup>The Jamaican Community of Women living with HIV (JCW+), Kingston, Jamaica, <sup>14</sup>ICW Asia Pacific, Bangkok, Thailand, <sup>15</sup>Making Waves, Gijon, Spain, <sup>16</sup>Salamander Trust, London, United Kingdom, <sup>17</sup>Making Waves, London, United Kingdom

**Background:** IAC sets the global HIV agenda - so it is important to monitor whether priority issues of women and trans people living with HIV are covered at the IAC. We also track the use of stigmatising language, to support the work of community networks and uphold the *People First Charter*.

### Methods:

- Key terms were selected reflecting: gendered research on health and HIV treatment, meaningful engagement, psychosocial support, mental health, respectful and comprehensive services including SRH services, freedom from violence and discrimination, protective laws, freedom from criminalisation, and economic justice.
- We searched the AIDS2022 Abstract Book for key terms and compared numbers to previous abstract books from 2016.
- We searched the online portal for abstracts using the same key terms, and IAS+.
- Oral abstracts were read for gendered intention, disaggregation and reflections relevant to women, girls and trans people living with HIV.

### Results:

- Coverage of issues:
- There are very few mentions of IPV, GBV, VAWG, SRHR, GIPA, MIWA and (gender) transformative.
  - 85% of oral abstracts were either overwhelmingly gender neutral, or focused on prevention or men.

E-posters

Late-breaker abstracts

Author Index

- 18 (15%) oral abstracts had some intention to illuminate issues for women, girls and trans people living with HIV (through research aims or disaggregation) and gendered reflections.

Stigmatising language:

- The use of 'infect\*' remains extremely high. Use of 'infected' has reduced. Use of the acronym WLHIV has increased from 11 mentions in 2016 to 541 in 2022.

Challenges with tracking:

- The abstract book search does not give the number of abstracts using each term.
- The online portal search does not allow for multiple-word terms, and does not return more than 200 results.

- Abstract submission keywords are inadequate.

- Manual oral abstract search was time consuming, and lacked precision.

**Conclusions:**

- Tracking coverage of issues is problematic, undermining accountability of IAC to women, girls and trans people living with HIV. This should be addressed.
- Our issues are still inadequately covered. Research with clear gendered intentions, results and reflections is rare.
- Stigmatising language is widely used.
- The alert on abstract submissions for stigmatising language is a welcome response to our longstanding requests.
- IAS should continue to encourage and prioritise gendered research.

The database evaluates whether adolescents ( $\geq 12$  years) can access HIV testing and treatment services without parental consent, in alignment with the WHO recommended policy.

**Results:** In our preliminary analysis, we found relevant guidelines for 109 countries. Among them, only 25% (28/109) countries have adopted optimal AOA policies.

Testing policies: 18% (16/89) countries do not have specific AOA guidelines, 40% (35/89) require parental consent for individuals  $\leq 18$  years, 14% (13/89) countries require parental consent for those below 16 years and 14 years, respectively. 26 countries have created policy exceptions for HIV testing, including, demonstrated maturity, pregnancy, emancipated minors and sexual activity.

Treatment policies: 29.5% (21/71) countries lack AOA guidelines, 39.4% (28/71) countries have policies that require parental consent for adolescents  $\leq 18$  years, 21.1% (15/71) countries require consent for adolescents  $\leq 16$  years, and 7% (5/71) countries require consent for adolescents  $\leq 14$  years.

In sub-Saharan Africa, the region with the highest number of children and adolescents living with HIV (CALHIV), only 11 countries have adopted WHO AOA recommendations. Among 10 countries with the largest CALHIV population, only Mozambique and Lesotho have not adopted optimal AOA policies.

**Conclusions:** Many countries are out of step with WHO recommendations on AOA to HIV testing and treatment. Policy reform is needed in these countries to facilitate adolescent-centric HIV care and enable adolescents to make informed decisions about their health.

## OAF4104

Facilitating adolescent access to HIV interventions through age of access (AOA) policy reform

S. Lynch<sup>1</sup>, V. Srivatsan<sup>1</sup>, A. Banda<sup>1</sup>, A. Sharma<sup>1</sup>, M. Kavanagh<sup>1</sup>

<sup>1</sup>Center for Global Health Policy and Politics, O'Neill Institute for National and Global Health Law, Georgetown University, Washington DC, United States

**Background:** The science informing the fight against HIV/AIDS is the most advanced it has ever been, and yet adolescent populations continue to remain particularly affected. An enabling national policy environment should include alignment with WHO guidelines on the age of access (AOA) to HIV testing and treatment. WHO recommends eliminating parental consent requirements to access HIV services for adolescents aged 12 years and above. Here, we examine national AOA policies by evaluating if adolescents can access HIV testing and treatment without parental consent.

**Methods:** The HIV Policy Lab, a collaboration between Georgetown University, UNAIDS, and the Global Network of People Living with HIV (GNP+) tracks the adoption status of 33 globally recommended laws and policies for 194 countries.

## OAF4105

Supporting caregivers to care for children living with HIV in South Africa

N. Heath<sup>1</sup>, D. Heath<sup>2</sup>

<sup>1</sup>Zoe-Life, Training, Westville, South Africa, <sup>2</sup>Zoe-Life, Training, Durban, South Africa

**Background:** In 2016, 320,000 children aged 0-14 years were living with HIV in South Africa, the majority of whom acquired HIV through vertical transmission. However, 45% of these children were not enrolled in ART as a high number of children are lost to follow up after 12 months of age. HIV disclosure in South Africa is hindered by significant stigma and discrimination associated with HIV, leading to fear of rejection, isolation, and bullying for children and their families. Children and their caregivers often lack accurate knowledge about HIV, making effective disclosure challenging.

**Description:** KidzAlive@Home, implemented by Zoë-Life SA with support from Aidsfonds (2019-2022), enhances HIV identification, testing, treatment, and care retention for children in South Africa. Operating in eThekweni and uMgungundlovu districts, it collaborates with trusted com-

munity structures like faith based and community based organizations. The program offers caregivers resources like the KidzAdherence curriculum and Talk Tool, simplifying treatment literacy.

Healthcare workers utilize these tools for age-appropriate HIV education, disclosure support, and counseling. Child-friendly spaces within health facilities facilitate learning in a comfortable environment, contributing to improved care for children living with HIV.

**Lessons learned:** Knowledge must be translated into action. caregivers need support to translate knowledge into action which requires tools that are child -friendly and easy to understand. creating comfort in child-friendly spaces is critical to engaging caregivers and children themselves in their own care. child-friendly spaces and household visit create trust and comfort so that health-care workers can alleviate fears , support disclosure and help to translate knowledge. Kidzadherence clubs help children to understand their diagnosis and reduce fear through connection with other children living with HIV increasing agency in their own care.

**Conclusions/Next steps:** Zoë-Life's success with the KidzAlive@Home project has led to the government's endorsement of the approach as an intervention to improve children's health outcomes. Zoë-Life wants to continue to build capacity of community-based organisations within and outside of South Africa through quality assurance and quality improvement, strengthening the structures that support families so that care can be accessible and effective for the long term.

Probing the HIV-1 Gag-Pol self-association domains by using a Gag-Pol virus-like particle assembly system

C.-T. Wang<sup>1</sup>, S.-H. Hsieh<sup>1</sup>, K.-J. Huang<sup>2</sup>

<sup>1</sup>National Yang Ming Chiao Tung University, Taipei, Taiwan, Province of China, <sup>2</sup>Taipei Veterans General Hospital, Taipei, Taiwan, Province of China

**Background:** Activation of HIV-1 protease (PR) is triggered by Gag-Pol dimerization or multimerization. HIV-1 PR encoded by the pol gene, which is translated as a Gag-Pol fusion protein. Gag-Pol is unable to form virus-like particles (VLPs) because of lacking the p6gag budding domain. We previously found amino acid substitution mutations at reverse transcriptase (RT) led to p66/51RT heterodimer instability associated with impaired PR activation. In addition, *efavirenz* (EFV), an RT dimerization enhancer, could enhance PR activation. These data suggest an involvement of RT in PR activation. However, it remains to be corroborated that RT contributes to PR activation through promoting Gag-Pol dimerization.

Since we found p6gag-containing Gag-Pol could assemble and release from cells as VLPs, we assumed RT mutations disrupting Gag-Pol/Gag-Pol interactions would block Gagp6-Pol VLP assembly.

**Methods:** To test whether RT/RT interactions could affect Gag-Pol dimerization, the RT amino acid substitution mutations known to impair PR activation were cloned into the Gagp6-Pol. To map the domains involved in Gag-Pol/Gag-Pol interactions, the major Gag assembly domain combined with or without deletions of p6\*, PR or/and integrase (IN) were deleted from Gagp6-Pol. The resultant constructs were transiently expressed in HEK293T cells. Culture supernatants were collected, pelleted and subjected to western immunoblot analysis.

**Results:** Besides Gagp6-Pol, a p6gag-containing Pol expression vector designated p6-Pol was still capable of producing VLPs. Amino acid substitution mutations, which impaired RT stability and PR activation, could reduce Gagp6-Pol and p6-Pol VLP yields. Further, these RT mutations could also attenuate the EFV enhancement of Gagp6-Pol VLP assembly. Sucrose density gradient fractionation analyses suggest p6gag-containing RT molecules could form VLPs with a density slightly lower than that of wild-type particles.

**Conclusions:** Our results support the proposal that impaired RT stability or RT/RT interactions could disrupt Gag-Pol/Gag-Pol interaction, leading to insufficient PR

activation. This Gagp6-Pol VLP assembly system provides a convenient assay to probe the domains involved in Gag-Pol/Gag-Pol interactions.

#### TUPEA002

HIV-1 pre-integrative latency: dynamics and intracellular localization of stabilized unintegrated linear DNAs

M. Maisch<sup>1</sup>, S. Figueiredo-Morgado<sup>1</sup>,

B. Charmeteau-De Muylder<sup>1</sup>, A. Couëdel-Courteille<sup>1</sup>, R. Cheynier<sup>1</sup>, J. Dutrieux<sup>1</sup>

<sup>1</sup>Université Paris Cité, Institut Cochin, INSERM U1016, CNRS, UMR8104, Paris, France

**Background:** HIV pre-integrative latency is defined by the persistence of unintegrated linear DNA (ULD) delayed for integration. We have recently shown that this persistence depends on the cell type and its activation state. These ULDs can persist for up to 3 months in resting CD4 T-cells in vitro (Roux *et al*, 2023).

In the context of viral eradication strategies, this persistence could be an obstacle to the development of new therapies for the cure of either diagnosed or exposed individuals. With this in mind, we aim to determine the cellular and viral environment required for ULD stability.

**Methods:** The localisation of ULDs in activated T cells (MT4-R5), in macrophage-derived monocytes (MDM) and in resting CD4 T-cells, was determined by fluorescence microscopy using a virus containing a fluorescent integrase and the DNAscope technology. In parallel, cell fractionation was performed and ULDs were quantified by DUSQ (DNA Ultra-Sensitive quantification) using next generation sequencing.

**Results:** We observed that in early stages of infection, ULDs were located in the perinuclear zone in MDMs. On the other hand, at times longer than 3 days post-infection, ULDs remained exclusively located in the nuclear fraction. Interestingly, the co-localisation of integrase with ULDs remained stable over time, even after more than one week of infection.

**Conclusions:** In the cells studied, the pre-integrative latency seems to be located in the nucleus and we were able to observe the stability of integrase over time, co-localising with ULDs, suggesting that this integrase stability is at the origin of their future integration capacity and therefore of the pre-integrative latency phenomenon.

We now want to determine the protein environment of these stabilised ULDs and their ability to maintain their integrity over time. We think that the exploration of stabilized ULDs environment could lead to the identification of cellular and/or viral factors that could be targeted for cure.

### In vivo detection of HIV-1 antisense transcripts in persons living with HIV before and during ART

A. Capoferri<sup>1</sup>, T. Famuyiwa<sup>1</sup>, R. Sklutuis<sup>1</sup>, S. Pathak<sup>1</sup>, J. Groebner<sup>1</sup>, R. Li<sup>2</sup>, J. Rausch<sup>1</sup>, R. Hoh<sup>3</sup>, S. Deeks<sup>3</sup>, J. Mellors<sup>4</sup>, J. Coffin<sup>5</sup>, F. Romero<sup>2</sup>, M. Kearney<sup>1</sup>

<sup>1</sup>National Cancer Institute, Center for Cancer Research, HIV Dynamics and Replication Program, Frederick, United States, <sup>2</sup>The Johns Hopkins University School of Medicine, Department of Molecular and Comparative Pathobiology, United States, <sup>3</sup>University of California San Francisco, San Francisco, United States, <sup>4</sup>University of Pittsburgh, Department of Infectious Diseases, Pittsburgh, United States, <sup>5</sup>Tufts University, Department of Molecular Biology and Microbiology, Boston, United States

**Background:** Natural antisense transcripts (NATs) are expressed by viruses, prokaryotes, and eukaryotes and primarily function in regulating sense gene expression through multiple mechanisms. *In vitro* studies have shown that HIV-1 expresses antisense transcripts (AST) from a Tat-independent negative sense promoter in the 3' LTR. In cell line studies, AST was demonstrated to promote HIV latency through epigenetic modification of histones in the 5' LTR by the Polycomb Repressor Complex 2 (PRC2). Here, we asked whether HIV AST is expressed in peripheral blood mononuclear cells (PBMCs) that were donated from ART-naïve and ART-treated persons living with HIV (PLWH).

**Methods:** PBMCs were donated by 11 PLWH with varying levels of plasma viremia. PLWH were either ART-naïve or undergoing treatment interruption with HIV-RNA ranging from <50–200,000 copies/ml of plasma (n=8). PLWH on ART had <50 copies of HIV-RNA/ml of plasma for a median of 5.4-years (n=3). AST levels were measured by cell-associated antisense RNA single-genome sequencing (SGS) of a 1.7kb fragment in the opposite orientation of the *env* coding region.

An endpoint digital PCR approach with specific HIV primers for each individual was also used to quantify AST copies in the samples.

**Results:** We detected AST in 10/11 PLWH with a median of 11 copies/100 PBMCs with HIV-DNA. Antisense SGS revealed that about 5% of the PBMCs with HIV-DNA donated from PLWH on ART contained AST at any given time. Genetic diversity of AST was consistent with expression from a diverse population of proviruses. Proviral clonal populations were identified with matched AST from multiple aliquots of single PBMC with HIV-DNA. Digital PCR showed similar levels of AST expression in PLWH who were not on ART and had varying levels of HIV-RNA.

**Conclusions:** The low-level expression of HIV antisense RNA that was detected regardless of treatment status is consistent with defined NATs in other systems. The *in vivo* expression of HIV AST irrespective of ART status warrants further investigation into its potential role as an RNA ca-

pable of regulating HIV-1 sense gene expression and inducing HIV latency. Understanding the role of HIV AST *in vivo* may inform future strategies for controlling HIV replication without ART.

## TUPEA004

### The R2 switch: anti-retroviral therapy skews the latent reservoir towards latency-promoting viral strains in HIV-1C infection

D. Bhanage<sup>1</sup>, A. Panchapakesan<sup>2</sup>, S. Singh<sup>1</sup>, S. Mishra<sup>1</sup>, C. Saini<sup>1</sup>, M. Shanmugam<sup>2</sup>, H. Buch<sup>1</sup>, D. Parihar<sup>1</sup>, J. Kailapuri G<sup>2</sup>, U. Ranga<sup>1</sup>

<sup>1</sup>Jawaharlal Nehru Centre for Advanced Scientific Research, Molecular Biology and Genetics Unit, Bengaluru, India, <sup>2</sup>Y. R. Gaitonde Centre for AIDS Research and Education (YRG CARE), Molecular Biology, Chennai, India, <sup>3</sup>Jawaharlal Nehru Centre for Advanced Scientific Research, Flow Cytometry Facility, Bengaluru, India, <sup>4</sup>All India Institute of Medical Sciences, Department of Microbiology, New Delhi, India, <sup>5</sup>St. John's National Academy of Health Sciences, Division of Microbiology/ Infectious Diseases Unit, Bengaluru, India

**Background:** HIV-1C generates a plethora of novel promoter variant viral strains containing multiple copies of important Transcription Factor Binding Sites (TFBS). In a multi-centric longitudinal observational study, we previously reported the presence of nine different promoter variants circulating in India.

The present study examined how the TFBS profile variation of the LTR, especially the duplication of the RBEIII-binding motif, influences the latent reservoir characteristics in the natural infection of HIV-1C.

**Methods:** CD4+ cells were isolated from 25 patients before and after ART and activated. Genomic DNA and cell-associated RNA were amplified and sequenced using NGS, and the proportions of different LTR variant strains were quantified. Latency establishment and reversal kinetics were performed using panels of sub-genomic reporter viral strains. The TFBS occupancy was validated with the CUT&RUN assay. Integration Site Loop Amplification was performed to identify integration sites. The latent reservoir was quantified using U-TILDA, and ChIP-seq data was analysed from the ROADMAP database.

**Results:** We observed that the latent reservoirs in subjects were progressively enriched with variant viral strains containing two copies of the RBEIII binding motif. This phenomenon, which we call 'R2 switch', was absent in the early HIV infection, appeared spontaneously with time, and, importantly, was enhanced by ART administration. We show further that in a co-infection, the R2 viral strains demonstrated significant resistance to reactivation compared to the canonical virus when the enriched CD4

AIDS 2024

cells were subjected to diverse activation conditions. We constructed several reporter-virus-and-cell models using T cell lines and primary CD4 cells to substantiate this finding. We are presently characterizing the Transcription Factor Binding profile of the R2 viruses using the CUT&RUN assay and determining the influence of the epigenetic landscape and the integration site on the reactivation properties of the R2 viral strains.

**Conclusions:** We show, for the first time, that ART selects for LTR variant viral strains that resist latency reversal. We propose that by selectively eliminating the transcriptionally active viral strains in the reservoir, ART skews the reservoir toward the R2 switch. This phenomenon appears to be HIV-1C-specific. Our work is relevant to ART initiation, treatment duration, post-treatment control, and cure research.

Pre-treatment immune senescence is associated with immune reconstitution among PLWHIV after receiving anti-retroviral therapy

S. Chen<sup>1</sup>, Z. Qian<sup>2</sup>, H. Zhong<sup>1</sup>, G. Liao<sup>1</sup>, H. Chen<sup>1</sup>, X. Liao<sup>2</sup>, H. Long<sup>2</sup>, X. Wu<sup>3</sup>, H. Wu<sup>1</sup>, J. Wu<sup>2</sup>, J. Peng<sup>1</sup>, S. Cai<sup>1</sup>

<sup>1</sup>Southern Medical University Nanfang Hospital, Department of Infectious Diseases, Guangzhou City, China, <sup>2</sup>Guangdong Provincial People's Hospital, Guangzhou City, China, <sup>3</sup>Haizhu District Center for Disease Control and Prevention, Guangzhou City, China

**Background:** The potential for immune reconstitution failure (IR) looms over people living with HIV (PLWHIV) undergoing antiretroviral therapy (ART). This retrospective cohort study aimed to investigate risk factors impacting IR and to analyze the potential role of immune senescence in IR post ART.

**Methods:** PLWHIV were comprehensively assessed for demographic, clinical, and immunological data undergoing 48 weeks of ART. Univariate and multivariate logistic analyses identified factors influencing IR. Flow cytometry evaluated lymphocyte phenotype and immunological functionality.

**Results:** Enrollment comprised 510 PLWHIV, with 210 at acquired immunodeficiency syndrome (AIDS) stage and the rest at non-AIDS stage during diagnosis. Subsequent subdivision into IR and non-IR (NIR) groups at week 48 revealed a younger age in the IR group, both in AIDS ( $P=0.012$ ) and non-AIDS stage ( $P=0.029$ ) participants. Multivariate analysis established age as an independent risk factor for IR in both groups. Post ART, PLWHIV in the NIR group exhibited a more pronounced immuno-senescence phenotype,

characterized by a decline in naïve T cells and an increase in memory T cells. Nevertheless, ART failed to fully restore lymphocyte function. Comparable results were observed when exploring the immune function of CXCR5+ lymphocytes, indicating a stronger cytokine secretion function in CXCR5+ lymphocytes than CXCR5- lymphocytes in both non-AIDS and AIDS groups, irrespective of achieving IR.

**Conclusions:** Pre-ART immune senescence significantly influenced immune reconstitution in PLWHIV after ART. These findings underscore the importance of considering age and immune senescence in tailoring therapeutic strategies for individuals with HIV undergoing antiretroviral treatment.

### TUPEA006

Longitudinal evaluation of cerebrospinal fluid neurofilament light chain concentration during primary HIV infection

N. Kelentse<sup>1</sup>, J. Chiarella<sup>1</sup>, A. Grubman<sup>2</sup>, S. Farhadian<sup>2</sup>, R. Price<sup>3</sup>, S. Spudich<sup>1</sup>

<sup>1</sup>Yale University, Department of Neurology, New Haven, United States, <sup>2</sup>Yale University, Department of Medicine, New Haven, United States, <sup>3</sup>University of California San Francisco, Department of Neurology, San Francisco, United States

**Background:** HIV invasion of the central nervous system (CNS) during early stages is associated with neuronal injury prior to antiretroviral therapy (ART) initiation. We longitudinally evaluated cerebrospinal fluid (CSF) neurofilament light chain protein (NfL) concentration, a marker of neuronal injury, in ART-naïve participants and those who initiated ART during early stages of HIV.

**Methods:** In this retrospective cohort study, NfL concentration was measured using Single molecule array technology in CSF samples collected from men who have sex with men (MSM) enrolled in the Primary Infection CNS Events Study (PISCES) conducted in San Francisco, USA between 2005-2014. We compared  $\log_{10}$ -transformed CSF NfL concentration at baseline and at least 24 weeks follow-up in an untreated group ( $n=21$ ) and between the last sampling point prior to ART initiation and at a minimum of 24 weeks post ART initiation in a group that started ART ( $n=16$ ). A multivariable logistic regression model was used to determine predictors of baseline CSF NfL concentration while Pearson's correlation assessed correlation between baseline NfL concentration and a summed 11 test neuropsychological battery (NPZ).

**Results:** A total of 33 males, median age 40 (IQR: 32-46) years, were included in the study. At baseline, all participants except for one were ART-naïve. Age and CSF white blood cell count were significantly associated with increased baseline NfL concentration ( $\beta=0.02$ ; 95% CI: 0.01-0.03,  $p=0.01$ ) and ( $\beta=0.02$ ; 95% CI: 0.01, 0.04,  $p=0.01$ ), respectively. The median follow-up weeks for the untreated

group was 27.6 (IQR: 26.7-29.0) and NfL concentration did not vary significantly between this time point and baseline ( $p=0.81$ ). There was no significant difference ( $p=0.9$ ) in CSF NfL concentration between last sampling point prior to ART initiation and post initiation [median duration on ART was 32.2 (27.9-39.6) weeks].

Additionally, no significant correlation was found between NPZ scores and NfL concentration ( $r=0.24$ ,  $p=0.2$ ).

**Conclusions:** In the PISCES study of MSM, CSF NfL concentrations did not decline after >24 weeks of follow-up in the absence of therapy and after >24 weeks of ART treatment during early HIV infection.

Further studies are needed to understand whether neuronal injury sustained during untreated infection resolve with a longer duration of treatment.

## Host immune responses

Dysregulated immune checkpoints in the central nervous system in people living with HIV: biomarkers for HIV-associated neurocognitive disorder

A. Yu<sup>1</sup>

<sup>1</sup>Indiana University School of Medicine, Microbiology and Immunology, Indianapolis, United States

**Background:** Immune checkpoints (ICPs) consist of receptor-ligand pairs, exerting inhibitory or stimulatory effects on immune defense, surveillance, regulation, and self-tolerance. These ICPs exist in both membrane-bound and soluble forms *in vivo*. While the blockade of inhibitory membrane-bound ICPs (mICPs) such as CTLA-4, PD-1, and PD-L1 has emerged as a revolutionary therapy for advanced malignancies, soluble ICPs (sICPs) are found in the bloodstream and likely exhibit biological functions.

However, the origin, regulation, and biological significance of both mICPs and sICPs in the central nervous system (CNS) have not yet been systematically studied.

**Methods:** We used multiplex immunoassays to simultaneously quantify 16 sICPs and 65 inflammatory cytokines/chemokines/growth factors in cerebrospinal fluid (CSF) samples from 33 HIV-negative individuals and 105 people living with HIV (PLWH), including those with and without HIV-associated neurocognitive disorder (HAND). We also studied the expression of ICPs in neural cells in response to cytokine stimulation *in vitro*.

**Results:** 10 sICPs were consistently detected in all CSF samples, most of which were significantly elevated in PLWH. Notably, soluble HVEM (sHVEM) exhibited a marked increase in HAND compared to PLWH without HAND, suggesting its potential as a biomarker for HAND.

Analyzing the correlations between these inflammatory mediators and sICPs in the CSF samples using R programming, we found that 3 sICPs, including sHVEM, were most unambiguously correlated with inflammatory factors, suggesting functional connections between sICPs and inflammatory mediators in the CNS of HAND. The strong and positive correlation between CSF levels of sHVEM and IFN- $\gamma$ /IL-1 $\beta$ /TNF- $\alpha$  prompted us to investigate whether these inflammatory cytokines could induce the expression of HVEM in neural cells.

Our experiments revealed that HVEM expression in SK-N-BE, a human neuronal cell line, was induced by IFN- $\gamma$  stimulation and further enhanced by the addition of IL-1 $\beta$  + TNF- $\alpha$ . Thus, CNS ICPs can be induced by inflammatory cytokines.

**Conclusions:** Our findings unveil the dysregulation of CNS ICPs in PLWH, with CSF sHVEM emerging as a potential biomarker for HAND.

### TUPEA008

Innate/memory-like CD8<sup>+</sup>NKG2A<sup>+</sup>T cells with a regulatory phenotype and high effector capacity are expanded and correlate with markers of gut integrity and low inflammation in people living with HIV-2

Müller-Trutwin<sup>1</sup>, ANRS CO21 CODEX, CO6 PRIMO and CO5 HIV-1/2 Study Groups

<sup>1</sup>Institut Pasteur, Virology Department, Paris, France,

<sup>2</sup>Hôpital de la Pitié-Salpêtrière/INSERM, Département d'Immunologie, Paris, France, <sup>3</sup>Hôpital Bicêtre, Médecine Interne/Immunologie Clinique, Paris, France, <sup>4</sup>Hôpital Bicêtre/Université Paris Saclay/INSERM, Centre de Recherche en Épidémiologie et Santé des Populations, Paris, France, <sup>5</sup>Hôpital Bichat - Claude-Bernard, AP-HP Nord Université de Paris/INSERM, Paris, France

**Background:** Chronic inflammation is associated with an increased risk of non-AIDS co-morbidities. Our previous data in the African green monkey/SIVagm model suggest a regulatory role of CD8<sup>+</sup>NKG2A/C<sup>+</sup>T cells in the gut. People living with HIV-2 (PLWH-2) display no gut damage even in the presence of viral replication. We hypothesize that CD8<sup>+</sup>NKG2A/C<sup>+</sup>T cells have a regulatory role and are expanded in PLWH-2. Therefore, we aimed to study the phenotype and functional profile of CD8<sup>+</sup>NKG2A/C<sup>+</sup>T cells in PLWH-2 compared to PLWH-1.

**Methods:** We analyzed PBMCs of 38 PLWH-1, 17 PLWH-2 and 7 blood donors (BD) (16 viremic and 37 non-viremic, 27 women and 35 men). We performed a deep-phenotyping analysis using spectral flow cytometry. We investigated the functional profile through stimulation with IL-2+IL-15 and MHC-I-devoided target cells (innate activity), or with

Author Index

anti-CD3/CD28 (TCR activation). We quantified markers of systemic immune activation and gut-barrier integrity, and compared the data by sub-groups (i.e. controllers, under-ART and viremic PLWH).

**Results:** PLWH-2 displayed higher CD8<sup>+</sup>NKG2A/C<sup>+</sup>T cell frequencies than PLWH-1 and BD. CD8<sup>+</sup>NKG2A<sup>+</sup>T cells correlated positively (0.7242,  $P=0.001$ ) with the CD4<sup>+</sup>Th17/Treg ratio and negatively (-0.6132,  $P=0.0089$ ) with CD8<sup>+</sup>HLA-DR<sup>+</sup>CD38<sup>+</sup>T cells in PLWH-2 but not in PLWH-1. In BD, CD8<sup>+</sup>NKG2A<sup>+</sup>T cells expressed higher levels of chemokine/cytokine receptors (CXCR3, CXCR5, IL-21R, IL-23R, and GTR), integrin  $\beta$ 7 (adhesion), granzyme B, NKP80, CD39 (regulatory), and IL-22 as compared to other CD8<sup>+</sup>T cell subpopulations. There was an up-regulation of CD49d and CCR5 (homing), NKP80, CD226, granzyme B, and Ki-67 in CD8<sup>+</sup>NKG2A<sup>+</sup>T cells from PLWH-2 as compared to PLWH-1 and BD. The TCR-activation response of CD8<sup>+</sup>NKG2A<sup>+</sup>T cells was higher for PLWH-2 than for PLWH-1 and BD. No differences by gender or age were found.

**Conclusions:** CD8<sup>+</sup>NKG2A/C<sup>+</sup>T cell frequencies were highest in PLWH-2. These cells displayed a regulatory profile and correlated positively with Th17 CD4<sup>+</sup> cell levels, and negatively with immune activation in PLWH-2.

Our data are in favor of an anti-inflammatory role of CD8<sup>+</sup>NKG2A<sup>+</sup>T cells and of a positive association with gut integrity. This is important in the context of immunotherapies and the potential management of persistent chronic activation/inflammation in PLWH.

## TUPEA009

### Safety and immunogenicity of a subtype C ALVAC-HIV and bivalent subtype C gp120 vaccine regimen adjuvanted with MF59 or Alum in a phase 1/2a randomized clinical trial

**Background:** Adjuvants are widely used to enhance and/or direct vaccine-induced immune responses yet are rarely evaluated head-to-head. The HVTN 107 trial directly compared responses elicited by the ALVAC-HIV+gp120/MF59 regimen evaluated in the phase 2b/3 HVTN 702 trial that showed no vaccine efficacy to an alternative alum-adjuvanted regimen. This ALVAC-HIV+gp120/alum was a subtype C adapted version of the RV144 regimen that showed modest efficacy.

**Methods:** 132 healthy adults without HIV in South Africa, Zimbabwe, and Mozambique were randomized to receive intramuscularly:

1. Two priming doses of ALVAC-HIV (months 0, 1) followed by three booster doses of ALVAC-HIV+gp120/MF59 (months 3, 6, 12), n=36;
2. Two priming doses of ALVAC-HIV (months 0, 1) followed by three booster doses of ALVAC-HIV+gp120/alum (months 3, 6, 12), n=36;
3. Four doses of ALVAC-HIV+gp120/MF59 co-administered (months 0, 1, 6, 12), n=36; or,

abstractsAuthor  
Index

4. Two priming doses of ALVAC-HIV (months 0 and 1) followed by three booster doses of ALVAC-HIV+gp120/no adjuvant (months 3, 6, and 12), n=24.

Primary outcomes were safety and immunogenicity, including binding antibody and cellular responses at months 6.5, 12, 12.5, 18.

**Results:** Vaccinations were well-tolerated with mild to moderate systemic symptoms in 33.3% (44/132) of participants. Cellular and antibody responses did not differ substantially between adjuvants, with no differences at month 6.5, the primary time point of interest. At month 18, CD4+ T-cell response rates were higher for the alum- than MF59-adjuvanted group to the vaccine-matched protein inserts (1086 gp120: 68% vs. 38%, p=0.032; TV1 gp120: 75% vs. 46%, p-value=0.039) although magnitudes and polyfunctionality scores did not differ. Both adjuvants induced significantly higher binding antibody and cellular responses than the unadjuvanted group over time with 2- to 3-fold higher response rates at month 6.5 (p-values=0.006-0.049).

The prime-boost ALVAC+gp120/MF59 group generally had lower antibody but higher CD4+ T-cell responses than the co-administration group, however these differences were not consistently maintained across antigens or time points.

**Conclusions:** Although MF59 was expected to enhance immune responses, alum induced similar binding antibody and cellular responses to MF59, suggesting that the choice between these adjuvants may not be critical for the ALVAC+gp120 regimen for these immune responses.

## TUPEA010

Proteomic signatures reveal a subset of HIV controllers who resemble people without HIV, characterized by low reservoir sizes and IL-1beta levels

D. Maison<sup>1</sup>, T. Dalhuisen<sup>2</sup>, C. Jiang<sup>3</sup>, X. Lian<sup>3</sup>, C. Gao<sup>3</sup>, M.-G. Shin<sup>4</sup>, R. Thomas<sup>4</sup>, R. Hoh<sup>2</sup>, S. Deeks<sup>2</sup>, P. Hunt<sup>1</sup>, M. Lichtenfeld<sup>3</sup>, X. Yu<sup>3</sup>, T. Henrich<sup>1</sup>, M. Peluso<sup>2</sup>

<sup>1</sup>University of California, San Francisco, Division of Experimental Medicine, San Francisco, United States, <sup>2</sup>University of California, San Francisco, Division of HIV, Infectious Diseases, and Global Medicine, San Francisco, United States, <sup>3</sup>Ragon Institute, Boston, United States, <sup>4</sup>Gladstone Institutes, San Francisco, United States

**Background:** HIV controllers can suppress viral replication without ART. Recently, controllers with unique reservoirs – few intact proviruses and integration within inactive chromosomal regions – have been described ("exceptional controllers"), but their inflammatory state is unknown. Identification of immunologic pathways linked with control could reveal whether some PWH achieve a state resembling cure.

**Methods:** Among ART-naïve aviremic controllers (n=62), ART-suppressed non-controllers (n=37), and age/sex-matched people without HIV (n=50), we measured 374 plasma proteins using Olink proteomics. Using R, we constructed a dendrogram and visualized hierarchical clustering and assessed age/sex-adjusted relationships between each protein and group.

We compared controllers who resembled people without HIV with the remaining controllers using five machine learning algorithms.

**Results:** ART-suppressed non-controllers had higher levels of inflammation than ART-naïve controllers, including CCL11/21/23/24/25, CXCL12/17, IL17D, VEGFA, TNFRSF11B, and TNFSF11/13/13C. Controllers overall had higher levels of inflammation compared to people without HIV, including IL1B/16/18, GZMB, NCF2, JUN, CXCL1/6/8, and TGFβ1.

We identified a subset of controllers (n=8 total [n=7 adjusted for age, n=3 adjusted for age/sex]) whose protein expression resembled people without HIV. No such pattern was present among ART-suppressed non-controllers. Using proteomic signatures, CD4:CD8 ratio, and intact viral DNA as attributes, we classified this controller subset using various AI algorithms. The most robust algorithm, RandomTree, utilized proteins EIF4G1, NRTN, PRSS8, and MICB\_MICA. In this subset compared to all controllers, analysis of the top 10% of significant proteins by gene ontology revealed lack of activation of MAPK/ERK (FGF2, IL1B, SPRY2, TGFβ1, TIMP3, VEGFA) pathways. Between age-adjusted and age/sex-adjusted controllers resembling people without HIV, the single commonality was low IL-1beta levels. This subset tended to have smaller intact reservoirs by FLIP-seq than the other controllers (0.09/10<sup>6</sup>PBMCs vs. 0.25/10<sup>6</sup>PBMCs).

**Conclusions:** These data suggest that there is a unique clinical phenotype of a near-cure state characterized by low amounts of intact genomes and minimal persistent inflammation ("exceptional control"). IL-1beta, an inflammation marker associated with cardiovascular disease and other comorbidities, was particularly low in these individuals. Identifying the mechanisms of control resulting in fewer inflammatory consequences in these rare PWH could inform the development of novel curative interventions.

## TUPEA011

### Rectal mucosal injury and healing among HIV-negative men who have sex with men (MSM)

V. Van Doren<sup>1</sup>, S.A. Smith<sup>1</sup>, Y. Hu<sup>2</sup>, C. Ackerley<sup>1</sup>, P. Murray<sup>1</sup>, C. Kelley<sup>1</sup>

<sup>1</sup>Emory University School of Medicine, Internal Medicine; Division of Infectious Diseases, Atlanta, United States;

<sup>2</sup>Emory University Rollins School of Public Health, Biostatistics and Bioinformatics, Atlanta, United States

**Background:** MSM who engage in receptive anal intercourse (RAI) demonstrate a unique rectal mucosal immune environment compared to men who do not engage in RAI. We compared the immune and microbiome response to experimentally-induced rectal mucosal (RM) injury and mucosal healing between these groups of men without HIV.

**Methods:** HIV-negative MSM engaging in RAI (n=19) and men who never engaged in RAI (controls; n=6) aged 18-59 years underwent collection of RM secretions via anoscopy prior to experimentally-induced injury with biopsy forceps and subsequent digital imaging.

Participants then returned on days 2, 5, and 8 for repeated collection of mucosal secretions adjacent to the injury and imaging. Concentrations of 12 cytokines were measured by LegendPlex, and the microbiome was characterized by 16s rRNA sequencing.

Linear decomposition modeling (LDM) was utilized to examine cytokine concentrations, changes in the microbiome, and wound healing over time.

**Results:** RM levels of IL-1 $\beta$ , IL-17A, IP-10, IL-8, IFN- $\gamma$ , and a composite cytokine score were significantly higher among MSM engaging in RAI compared to controls at baseline and overall across study visits. Levels of IL-6 and IP-10 increased significantly after injury in both groups. Healing time after injury was faster among MSM engaging in RAI, although not statistically significant.

While the microbiome composition of MSM engaging in RAI was significantly different from controls, we did not detect any microbiome changes after injury. The overall microbiome composition and 26 individual taxa were significantly associated with the composite cytokine score.

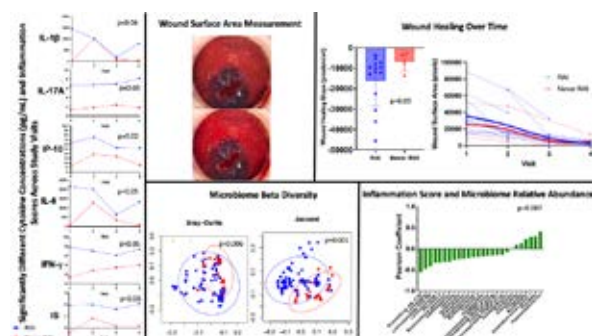

Figure.

**Conclusions:** MSM engaging in RAI demonstrated higher baseline RM inflammation, faster wound healing, and a distinct rectal microbiome compared with men who never engaged in RAI. IL-6 and IP-10 may be important mediators in the acute injury response, and specific bacterial taxa are associated with both high and low inflammation. Future research should explore how these factors facilitate or hinder mucosal HIV transmission.

## TUPEA012

### SAMD9 and SAMD9L innate immune host factors are conserved from prokaryotes to eucaryotes and display signatures of genetic conflicts including natural adaptations to lentivirus/HIV in hominids

A. Legrand<sup>1</sup>, A. Chantharath<sup>1</sup>, C. Rey<sup>1</sup>, J. L. Rocha<sup>2</sup>, N. Lou<sup>2</sup>, C. Gilchrist<sup>3</sup>, C. Loyer<sup>1</sup>, L. Picard<sup>1</sup>, M. Wcislo<sup>1</sup>, A. Cimorelli<sup>1</sup>, M. Steinegger<sup>3</sup>, P. H. Sudmant<sup>2</sup>, L. Etienne<sup>1</sup>

<sup>1</sup>Centre International de Recherche en Infectiologie (CIRI), Inserm U 1111, UCBL 1, CNRS UMR 5308, ENS de Lyon, Université de Lyon, Lyon, France, <sup>2</sup>University of California, Integrative Biology, Berkeley, United States, <sup>3</sup>School of Biological Sciences, Seoul National University, Seoul, Korea, the Republic of

**Background:** Human SAMD9 and SAMD9L are duplicated genes from the interferon innate immunity involved in the restriction of diverse viruses, including poxviruses. We previously showed that SAMD9L restricts HIV-1 and primate lentiviruses in the late phases of replication, while SAMD9 has a mild proviral effect. Now, we uncover the evolutionary and functional dynamics of the *SAMD9/9L* immune gene family from bacteria to primates, and their impact on antiviral defense mechanisms.

**Methods:** We used AlphaFold and FoldSeek structural homology AI tools to reconstruct SAMD9/9L functional and structural evolutionary history in very ancient times. We performed phylogenomic and population genetic analyses of the locus at the inter- and intra-species levels in mammals. We finally tested the functional impact of newly identified SAMD9L variants in HIV infected cells.

**Results:** We identified homologs of SAMD9/9L in bacterial organisms with some associated with the Avs anti-phage defense system, exhibiting conserved antiviral functions analogous to the human genes. The conservation of the nuclease active site of SAMD9/9L, as well as the multi-domain architecture, in bacterial homologs underscore their importance throughout domains of life.

We further trace the evolutionary origin of the ancient SAMD9/9L duplication in mammals. This gene family displays important genomic plasticity, with multiple copy number variations during mammalian evolution. Notably, primate SAMD9/9L have evolved under genetic conflicts, with independent gene losses and lineage-specific positive selection. Among hominids, bonobos stand out as the sole species that have lost SAMD9. We found that:

Oral  
abstracts

Author  
Index

i. SAMD9 loss is not fixed within the population and  
ii. SAMD9L harbors bonobo-specific polymorphisms (SNPs). Functionally, we found that these natural variants increased SAMD9L antiviral activity ("gain-of-function"), creating a more potent anti-HIV restrictor.

**Conclusions:** Interestingly, unlike humans and chimpanzees, bonobos do not host any lentivirus. We propose that the absence of the pro-lentiviral SAMD9 and the presence of a more potent anti-lentiviral SAMD9L in bonobos might contribute to their reduced susceptibility to lentiviruses. Furthermore, these SAMD9L "gain-of-function" polymorphisms may constitute a mechanism to compensate for SAMD9 loss to maintain cellular translation functions. Overall, these findings unveil natural adaptations in a major antiviral defense gene family with direct implications for understanding lentivirus-primate interactions and susceptibility.

The impact of stopping antiretroviral therapy on HIV-specific T-cell responses

T. Tipoe<sup>1</sup>, A. Ogbe<sup>2</sup>, M. Lee<sup>3</sup>, H. Brown<sup>1</sup>, N. Robinson<sup>1</sup>, R. Hall<sup>4</sup>, C. Petersen<sup>5</sup>, H. Lewis<sup>4</sup>, J. Thornhill<sup>6</sup>, F. Ryan<sup>7</sup>, J. Fox<sup>8</sup>, S. Fidler<sup>9</sup>, J. Frater<sup>1</sup>

<sup>1</sup>University of Oxford, Nuffield Department of Medicine, Oxford, United Kingdom, <sup>2</sup>Moderna, Oxford, United Kingdom, <sup>3</sup>Imperial College London, London, United Kingdom, <sup>4</sup>St. Mary's Hospital, HIV Medicine, London, United Kingdom, <sup>5</sup>St. Mary's Hospital, Imperial Biomedical Research Centre, London, United Kingdom, <sup>6</sup>Queen Mary, University of London, London, United Kingdom, <sup>7</sup>Guy's and St. Thomas' Hospital NHS Foundation Trust, London, United Kingdom, <sup>8</sup>King's College London, Department of Infection, London, United Kingdom, <sup>9</sup>Imperial College London, Department of HIV Medicine, London, United Kingdom

**Background:** Treatment interruption (TI) of antiretroviral therapy (ART) to explore viral rebound in studies of interventions to induce HIV remission may itself impact the quantity and quality of HIV-specific T cell responses, potentially inducing shifts in immunodominance and subsequent viral control. Understanding these responses could inform strategies to enhance immune-mediated viral control and help interpret interventional studies that include a TI.

**Methods:** HIV-specific T-cell immunity was analysed using gamma interferon enzyme linked immunospot in two clinical trials. The SPARTAC trial randomised individuals with primary HIV infection (PHI) to 48 weeks of ART (ART-48 group, n=24 studied here) or no immediate therapy (no ART group, n=37). HIV-specific T-cell immunity was analysed at Weeks 0, 24 and 60 in both groups. In the PITCH observational cohort (n=7), participants started ART in PHI for at least one year, followed by TI. HIV-specific T-cell immunity was analysed before, during and after TI.

**Results:** In SPARTAC, participants treated in PHI for 48 weeks made proportionately more Gag responses to novel epitopes at Week 60 (having been off ART for 12 weeks) compared to pre-ART baseline, compared to untreated participants at the same timepoint (p=0.02). New responses in untreated participants remaining off ART became less Gag (p=0.006) and more Nef-directed (p=0.03) between Weeks 24 and 60. In the more-intensively followed PITCH study, 6/7 participants showed dominant Gag and/or Pol-specific responses post-TI compared to pre-TI. One PITCH participant who remained virally suppressed for 170 days during TI showed stepwise increases in Gag-specific responses until viral rebound (>129 copies RNA/ml) and ART re-initiation.

**Conclusions:** Treatment interruption in PHI is associated with shifts in dominant responses towards Gag, during or post-TI that were not seen in people untreated in PHI. These findings may help inform vaccine immunogen design by harnessing HIV-specific T cell responses associated with viral control.

## Understanding and targeting persistent HIV reservoirs

### TUPEA014

Single-cell multi-omic sequencing of *in vitro* HIV-1 infection identifies integration-associated effector programs

H. Courtney<sup>1,2,3</sup>, A. Courtney<sup>1,4</sup>, Y. Qi<sup>1,5</sup>, T. Lu<sup>1,6</sup>, N. Apenes<sup>1,6</sup>, M. Gallagher<sup>1</sup>, G. John<sup>1</sup>, V. Wu<sup>2,6</sup>, M. Betts<sup>2,6</sup>, L. Vella<sup>1,2,6</sup>

<sup>1</sup>Children's Hospital of Philadelphia, Division of Infectious Diseases, Philadelphia, United States, <sup>2</sup>University of Pennsylvania, Center for AIDS Research, Philadelphia, United States, <sup>3</sup>University of Pennsylvania, Department of Chemistry, Philadelphia, United States, <sup>4</sup>Brown University, Department of Molecular Biology, Cell Biology, and Biochemistry, Providence, United States, <sup>5</sup>University of Pennsylvania, School of Engineering and Applied Science, Philadelphia, United States, <sup>6</sup>University of Pennsylvania, Perelman School of Medicine, Philadelphia, United States

**Background:** *In vitro* HIV-1 infection models have tremendous potential to advance the cure research agenda with iterative manipulations that can reveal targetable mechanisms of HIV-1 persistence. In combination with single-cell multi-omic approaches, it is possible to define the cellular mechanisms that support HIV-1 infection and reactivation. We therefore used trimodal sequencing to identify features of single HIV-1+ cells using an *in vitro* infection model.

**Methods:** Naïve CD4+ T cells were activated with anti-CD3/anti-CD28 in the presence of anti-IL-4, anti-IL-12, and TGF-β1 (Bosque/Planelles model) for 72 hours. After bead removal, cells were rested in IL-2-supplemented media for 96 hours before spinoculation with HIV-1 (SUMA molecular clone). Cells were then rested in IL-2-supplemented media for 6 days prior to single-cell multi-omic profiling. We applied single-cell, trimodal sequencing of surface proteins, transcripts (scRNAseq), and accessible chromatin (scATACseq). The scRNAseq and scATACseq outputs were aligned to both human and HIV-1 SUMA genomes, allowing paired information of infection status with cellular protein, transcriptional, and epigenetic features. Cells with a minimum of two HIV-1-RNA-aligning unique molecular identifiers (UMIs) were considered HIV-1 RNA+, and cells with a minimum of one HIV-1-DNA-aligning UMI were considered HIV-1 DNA+.

**Results:** 9,708 CD4+ T cells were profiled after quality-control filtering, of which 1,112 cells (11.5%) contained HIV-1 DNA and 5,888 cells (60.7%) with HIV-1 mRNA (9.2% HIV-1 DNA+ RNA+). We clustered and annotated cells using a 3-way weighted *k*-nearest neighbor analysis using protein, RNA, and ATAC data. HIV-1 DNA+ cells were enriched in effector T (T<sub>EFF</sub>) cells. Transcriptional effector programs enriched in HIV-1 DNA+ cells included cytotoxic (granzymes, *PRF1*), antiviral (*CCL5*, *IFNG*), and T follicular helper (*MAF*, *BCL6*)

phenotypes. In the ADT component, HIV-1 DNA+ cells were enriched for surface expression of CD161, and this enrichment was mirrored by *KLRB1* transcription.

**Conclusions:** These data suggest that early *in vitro* HIV-1 infection of activated cells is associated with transcriptional profiles related to cytotoxicity, antiviral responses, and T follicular helper cell programs. The role of the surface protein CD161 in early HIV-1 infection warrants continued study.

Ongoing analysis of early infection events using single-cell multi-omic modalities has the capacity to identify specific cellular phenotypes in cure-directed strategies.

### TUPEA015

HIV clonal expansion is driven by CD4+ T-cell proliferation in response to antigen during long-term viral suppression in cisgender males with HIV

J. Stern<sup>1</sup>, A. Person<sup>1</sup>, E.E. Giorgi<sup>1</sup>, R. Hoh<sup>2</sup>, R. Fromentin<sup>3</sup>, S.G. Deeks<sup>2</sup>, N. Chomont<sup>3</sup>, L.B. Cohn<sup>1</sup>

<sup>1</sup>Fred Hutchinson Cancer Center, Vaccine and Infectious Disease Division, Seattle, United States, <sup>2</sup>University of California San Francisco, School of Medicine, San Francisco, United States, <sup>3</sup>Centre Hospitalier de l'Université de Montréal, Microbiology, Infectious Diseases and Immunology, Montreal, Canada

**Background:** HIV-1 is incurable due to a reservoir of latently infected CD4+ T-cells harbouring replication-competent HIV-1 proviruses which persist partly due to antigen-driven proliferation. Using near-full length (NFL) proviral sequencing, we assessed how antigen-driven CD4+ T-cell activation and proliferation shape the defective and intact HIV reservoirs over time.

**Methods:** Peripheral blood mononuclear cells (PBMCs) were isolated from longitudinal leukaphereses of four virally suppressed cisgender male people living with HIV (PWH) over a median (range) 1.9 (1.1-4.7) years. CD8-depleted PBMCs were stimulated *ex vivo* for 18 hours or 7 days with overlapping peptide pools spanning antigen epitopes of cytomegalovirus (CMV) pp65, HIV Gag, and Epstein-Barr Virus (EBV) EBNA1 and BZLF1. Using an activation-induced markers (AIM) assay identifying early (18 hours) and late (7 days) cellular activation, antigen-responsive CD4+ T-cells were isolated by fluorescence-activated cell sorting. Proliferation was tracked using a celltrace dye. HIV DNA quantitation and single-genome NFL HIV-1 proviral sequencing were performed on sorted AIM+ cells.

**Results:** Early (18 hours) and late (7 days) antigen responses measured by AIM were positively correlated ( $R^2=0.72$ ) as well as antigen responses measured by AIM and cellular proliferation at 7 days ( $R^2=0.96$ ). AIM responses at 18 hours were highest amongst cells responsive to CMV pp65 (median [range] 1.77% [0.78-4.49%]) followed by HIV gag (0.29% [0.02-1.44%]), EBV EBNA1 (0.08% [0-0.27%]) and

BZLF1 (0.02% [0-0.09%]). However, AIM responses after 7 days were similar between CMV- and HIV-responsive cells driven by high cellular proliferation in response to HIV gag (8.22% [2.96-11.5%] proliferated cf. 6.46% [1.62-33.5%] for CMV). In one donor, expansion of a defective provirus with an 8.5kb deletion spanning *gag* – 3' long terminal repeat resulted in the proliferation of 29 clones. Importantly, *ex vivo* clonal expansion events of intact HIV-1 proviruses within HIV-responsive CD4+ T-cells were observed.

**Conclusions:** Despite ongoing immune exhaustion amongst PWH, CD4+ T-cells maintain high proliferative capacity upon antigen recognition, such that low frequencies of antigen-responsive cells can quickly undergo large expansions, including those harbouring intact proviruses. The extensive expansion of infected cells harbouring HIV integrants with large deletions akin to endogenised retroviruses may reflect preferential proliferation of translation-incompetent proviruses.

## TUPEA016

Phenotypic and virological characterization of the total and translation-competent HIV-1 reservoirs in blood and matched tissues from individuals on therapy

M. Pardons<sup>1</sup>, L. Lambrechts<sup>1</sup>, J. Vega<sup>2</sup>, E. Van Gulck<sup>3</sup>, S. Gerlo<sup>1</sup>, L. Vandekerckhove<sup>1</sup>

<sup>1</sup>Ghent University / HIV Cure Research Center, Ghent, Belgium, <sup>2</sup>Arcturus Therapeutics, San Diego, United States, <sup>3</sup>Janssen Infectious Diseases and Diagnostics, Beerse, Belgium

**Background:** Characterizing the HIV-1 reservoir in blood and lymphoid tissues is key to advance cure interventions. To date, no study has comprehensively evaluated both the viral composition and the immune phenotype of the total and inducible HIV reservoirs in blood, lymph nodes (LN), and gut simultaneously.

**Methods:** Matched blood, LN and gut biopsies were obtained from 5 HIV+ individuals undergoing antiretroviral therapy for an average time of 16.2y. Near-full length (NFL) sequencing was conducted using the HIV ProViral UMI-mediated Long-read Sequencing assay on blood, LN and gut. Following a 24h-stimulation with the Tat mRNA-containing lipid nanoparticle (Tat-LNP) and Panobinostat (PNB), phenotypic characterization of blood and LN p24+ cells was carried out on the same samples using the HIV-Flow assay (n = 128 and 55 p24+ cells from blood and LN, respectively).

**Results:** NFL sequencing indicated no compartmentalization, with the detection of identical defective and intact sequences across anatomical sites. Following Tat-LNP/PNB stimulation, the p24+ cells frequencies were similar between blood and LN (means = 11.5 and 9.0 p24+ cells/10<sup>6</sup> CD4 T cells, respectively). While the majority of blood p24+ cells shared a central/transitional and effector memory

phenotype (TCM/TTM: 69/128, TEM: 53/128), most of the LN p24+ cells showed a TCM/TTM phenotype (46/55). Similar proportions of p24+ cells expressed PD1 in blood and LN (44/128 and 13/55, respectively).

Only 11/128 blood p24+ cells expressed the follicular homing marker CXCR5, whereas 29/55 LN p24+ cells expressed CXCR5. However, in both compartments, few p24+ cells displayed a follicular helper T cell phenotype (Tfh CXCR5<sup>+</sup>PD1<sup>+</sup>: 0/128 in blood and 6/55 p24+ cells in LN).

Furthermore, none of the LN p24+ cells exhibited characteristics of germinal center Tfh cells (CXCR5<sup>high</sup>PD1<sup>high</sup>). Finally, while 22/128 blood p24+ cells expressed the cytotoxic molecule GZMA, only 1/55 p24+ cells was GZMA+ in the LN, suggesting that GZMA expression is not a distinctive feature of the LN inducible reservoir.

**Conclusions:** Our study reinforces the notion that HIV-infected cells can circulate across various anatomical compartments. Furthermore, the inducible reservoir has a distinct phenotype between blood and LN, and does not appear to be located within Tfh cells in long-term treated individuals.

Hannaman<sup>10</sup>, M.J. McElrath<sup>6</sup>, G.N. Pavlakis<sup>3</sup>, HVTN 119 Study Team

<sup>1</sup>Vanderbilt University Medical Center, Nashville, United States, <sup>2</sup>Vanderbilt University, Nashville, United States, <sup>3</sup>National Cancer Institute at Frederick, Frederick, United States, <sup>4</sup>University of Washington, Seattle, United States, <sup>5</sup>University of California at San Francisco, San Francisco, United States, <sup>6</sup>Fred Hutchinson Cancer Research Center, Seattle, United States, <sup>7</sup>Duke Center for Human Systems Immunology, Durham, United States, <sup>8</sup>National Institute of Allergy and Infectious Diseases, Rockville, United States, <sup>9</sup>Auro Vaccines LLC (formerly Profectus Biosciences, Inc.), Pearl River, United States, <sup>10</sup>Ichor Medical Systems, San Diego, United States

**Background:** In non-human primates, an HIV-1 DNA vaccine composed of 7 structurally important, highly conserved elements (termed CE) of p24<sup>Gag</sup> induced focused cytotoxic T cell responses to these regions. In a phase I clinical trial (HVTN 119, NCT03181789) amongst people without HIV, we compared T-cell responses between two DNA vaccine regimens - one with CE plus full-length p55<sup>Gag</sup> and the other with a full-length p55<sup>Gag</sup> alone.

**Methods:** Group1 (n=25) received two administrations of CE DNA followed by two administrations of CE+p55<sup>Gag</sup>. Group2 (n=25) received four administrations of p55<sup>Gag</sup> DNA.

All vaccines included IL-12 DNA as adjuvant. Group3 (n=6) received saline. The vaccines were injected intramuscularly in both deltoids, followed by electroporation (Ichor Tri-Grid™) at 0, 1, 3 and 6 months. Participants were followed for safety, tolerability and immunogenicity at month (M) 0, M1.5 and M6.5. T cell responses were assessed by intracellular cytokine staining for expression of IFN-gamma and/or IL-2 using peptide pools to each of the 7 CE, total CE, and p55<sup>Gag</sup>.

**Results:** Both regimens were safe and well-tolerated. The CE DNA vaccine was immunogenic at M1.5 (29% CD4, 4% CD8 responders) and responses against CE were significantly (p=0.037; 0.004) boosted by CE+p55<sup>Gag</sup> DNA (64% CD4+, 42% CD8+). Group1 developed CD4+ responses to 5 of 7 CE, reaching significance for CE5 (p=0.006) compared to Group2, which had responses to only 2 CE. Both groups had CD8+ T-cell responses (6 and 4 of 7 CE, respectively). The mean CD4+ CE Tcell breadth was higher in Group1 (0.68) compared to Group 2 (0.22) with a statistically significant difference of 0.464 (p=0.029) and showed a strong trend for overall (CD4+ plus CD8+) increased breadth (0.615, p=0.051). Both groups developed high p55<sup>Gag</sup> T-cell responses (91% vs 91%) as well as p24<sup>Gag</sup> antibody (91% vs 80%) responses. In Group1, vaccine-induced CD4+ CE T-cell responses correlated (p=0.007) with p24<sup>Gag</sup> antibody responses.

**Conclusions:** The CE+p55<sup>Gag</sup> DNA vaccine focused T-cell immune responses to conserved regions in p24<sup>Gag</sup>, resulting in a significant increase in breadth. Vaccines able to focus immune responses to highly conserved regions should be considered as part of a comprehensive HIV vaccine strategy.

## TUPEA018

### Targeting PTPN1/PTPN2 to improve HIV cure approaches

JN. Howard<sup>1</sup>, T. Zaikos<sup>2</sup>, C. Levinger<sup>1</sup>, E. Rivera<sup>1</sup>, E. McMahon<sup>3</sup>, C. Holmberg<sup>1</sup>, J. Terao<sup>1</sup>, C. Melo<sup>1</sup>, M. Sanz<sup>1</sup>, D. Copertino<sup>1</sup>, W. Wang<sup>1</sup>, N. Soriano-Sarabia<sup>1</sup>, R.B. Jones<sup>3</sup>, A. Bosque<sup>1</sup>

<sup>1</sup>The George Washington University, Washington, United States, <sup>2</sup>Johns Hopkins Hospital, Baltimore, United States, <sup>3</sup>Weill Cornell Medical College, New York, United States

**Background:** Nonreceptor tyrosine phosphatases (NTPs) play an important role regulating protein phosphorylation and have been proposed as attractive therapeutic targets for cancer and metabolic diseases. We have previously identified that 3-Hydroxy-1,2,3-benzotriazin-4(3H)-one (HODHBt) enhanced STAT activation upon cytokine stimulation leading to increased reactivation of latent HIV and effector functions of NK and CD8 T cells. We demonstrated that HODHBt interacts with and inhibits the NTPs PTPN1 and PTPN2. The small molecule AB-BV-CLS-484 (AC-484) is an active site inhibitor of PTPN1 and

PTPN2 currently in clinical trials for advanced solid tumors. In this study, we compared AC-484 and HODHBt for reactivation of latent HIV and ability to promote immune activation.

**Methods:** First, we evaluated the effects on STAT5 transcriptional activity using HEK-Blue-IL2/IL15 cells. Second, we performed a pSTAT5 time course experiment in primary total CD4 T cells. Next, we compared the effects of HODHBt and a dose response of AC-484 on immune activation, cytokine secretion, and increase NK effector functions. Finally, we measured the HIV latency reversal activity of AC-484 in a primary cell model of latency.

**Results:** AC-484 was 1,500-fold more potent activating STAT5 transcriptional activity than HODHBt in the HEK-Blue-IL2/IL15 cell line in the absence of toxicity (IC50 0.97μM vs 1,515μM).

However, in primary cells, AC-484 was not able to sustain STAT5 phosphorylation over time compared to HODHBt. Mechanistically, HODHBt treatment leads to the degradation of PTPN2 and PTPN1 while AC-484 fails to do so. Both HODHBt and AC-484 were sufficient to enhance immune activation of CD4T, CD8T and NK cells without induction of pro-inflammatory cytokines.

Finally, AC-484 increased IL-2 mediated viral reactivation in a primary cell model of latency albeit to a lesser extent than HODHBt.

**Conclusions:** Given our findings that AC-484 is sufficient to promote immune activation despite reduced latency reversal activity compared to HODHBt. Future directions include investigation of the effects of AC-484 on the anti-HIV activity of immune effector cells including CD8T cells and NK cells and its latency reversal properties in synergy with other LRAs.

Overall, our work highlights the possible therapeutic potential of PTPN1/PTPN2 inhibition in the search for globally applicable and efficient HIV cure strategies.

## TUPEA019

### Proteasome inhibition induces latency reversal and augments NK cell-mediated killing by downregulating HLA-E

T. Laeremans<sup>1</sup>, S. den Roover<sup>1</sup>, S. Nezcic<sup>1</sup>, S.D. Allard<sup>2</sup>, J.L. Aerts<sup>1</sup>

<sup>1</sup>Vrije Universiteit Brussel, Neuro-Aging and Viro-Immunotherapy Research Group, Brussels, Belgium, <sup>2</sup>Universitair Ziekenhuis Brussel, Internal Medicine and Infectious Diseases, Brussels, Belgium

**Background:** Employing the shock and kill strategy involves the use of latency reversal agents (LRAs) to reactivate the latent viral reservoir, rendering it visible for recognition and subsequent elimination by the host's immune system. Although this strategy has demonstrated high efficacy *in vitro* and *ex vivo*, so far, no significant delays in time to viral rebound have been observed *in*

vivo. This lack of delay is most likely attributed to the insufficient elimination of reactivated reservoir cells by the host's immune effector cells, including natural killer (NK) cells. Indeed, NK-cell functionality is diminished by the inhibitory interaction between NKG2A and HLA-E. Notably, inhibiting the proteasome has proven effective in reducing HLA-E expression on various tumor cell types, thereby enhancing NK-cell mediated killing. However, its impact on HIV-1 latency remains unexplored. Therefore, our study aimed to investigate the impact of blocking the inhibitory interaction between NKG2A receptor and HLA-E on NK cell-mediated killing of reactivated reservoir cells.

**Methods:** We examined the impact of bortezomib and other proteasome inhibitors on various latently infected cell lines including J-Lat8.4, J-Lat10.6, J-Lat15.4 and ACH-2 cells, as well as on primary NK cells utilizing flow cytometry. Subsequently, we assessed NK-cell mediated killing of reactivated cell lines by co-culturing primary NK cells from both healthy individuals and from people living with HIV (PLWH) through flow cytometry.

**Results:** Our findings reveal that the proteasome inhibitor bortezomib significantly reduced HLA-E expression on J-Lat cells, leading to a moderate increase in NK-cell cytotoxicity in healthy individuals and a significant increase in PLWH. Moreover, bortezomib induced latency reversal in J-Lat 10.6 cells but not in other variants of the J-Lat model. Additionally, treatment with bortezomib led to a reduced NKG2A expression on primary NK cells thereby improving NK-cell functionality.

**Conclusions:** Our results indicate that proteasome inhibition not only induces latency reversal but also enhances subsequent NK-cell mediated killing of latently infected cells *in vitro* by downregulating HLA-E. This implies that targeting the proteasome could serve as a novel therapeutic approach in the shock and kill strategy, with the potential to improve clinical outcomes. Nevertheless, further validation in primary latency models is still warranted.

**Background:** Hypermutated proviruses, which arise in a single replication cycle when host antiviral APOBEC proteins introduce G-to-A mutations throughout the HIV genome, persist during ART. But, their within-host origins and longevity are poorly understood because standard phylogenetic analyses, which assume that mutations gradually arise over many replication cycles, cannot accommodate them. We describe an approach for within-host phylogenetic analysis and molecular dating of hypermutated proviruses.

**Methods:** We analyzed longitudinal datasets from 6 women living with HIV, comprising >800 single-genome HIV RNA *env* sequences collected between seroconversion and ART initiation (median 8 years), along with >600 proviral *env* sequences sampled over a median 9 years on ART. APOBEC-induced mutations were identified using Hypermut. For each participant we inferred within-host maximum-likelihood phylogenies relating each participant's *env* pre-ART plasma sequences and *env*-intact on-

ART proviruses, with or without hypermutated proviruses. For the latter, APOBEC-mutated sites were either included unaltered, completely stripped from the alignment, or replaced with "R" (mixture of A/G). Proviral ages were inferred using an established root-to-tip regression approach.

**Results:** Phylogenies featured a median 286 (range:120-421) sequences per participant, including a median 19 (range:5-23) hypermutated proviruses. When directly incorporated into phylogenies, hypermutated proviruses displayed significantly longer branch lengths and higher evolutionary distinctiveness than *env*-intact proviruses (all  $p < 0.0001$ ), and clustered extensively. All these metrics normalized after stripping hypermutated sites from the alignment or replacing them with R.

The resulting trees produced age estimates of *env*-intact proviruses that were concordant to those from trees that excluded hypermutated sequences, though coefficients were generally slightly higher using the "R replacement" approach (0.90-0.99). Using the latter trees to molecularly date hypermutated proviruses revealed that these integrated throughout untreated infection, and persisted during ART. In 4 participants, the ages of hypermutated proviruses did not significantly differ from *env*-intact ones, in one participant they were on average slightly older than *env*-intact ones, and in another they were slightly younger.

**Conclusions:** Our approach allows hypermutated sequences to be incorporated into phylogenies for hypothesis testing. Our observations enrich our understanding of reservoir evolutionary dynamics by revealing that hypermutated proviruses, like other provirus types, are archived throughout untreated infection and can persist for years on ART.

## Novel treatment and prevention strategies, vaccines and immunotherapies

<sup>1</sup>Vir Biotechnology, Inc., San Francisco, United States,

<sup>2</sup>University of Washington, Seattle, United States, <sup>3</sup>Fred Hutchinson Cancer Center, Seattle, United States, <sup>4</sup>Oregon Health & Science University, Portland, United States

**Background:** Despite progress increasing antiretroviral treatment and PrEP utilization, HIV transmission persists globally. An effective HIV vaccine is needed to eliminate transmission and end the epidemic, but prior attempts had limited success or failed. Vir is developing a human cytomegalovirus (CMV) vaccine vector to leverage CMV's potential to elicit robust, sustained HIV-specific T cell responses, including effector memory T cells that traffic into tissue sites of viral entry and infection.

**Methods:** VIR-1111, a prototype CMV-HIV vaccine was evaluated in a randomized, double-blind, placebo-controlled first-in-human phase 1 study in healthy CMV-seropositive adults without HIV (NCT04725877). Participants were randomized to multiple dose-escalation of VIR-1111 ( $1 \times 10^3$  focus-forming units [ffu] ( $n = 4$ ),  $3 \times 10^4$  ffu ( $n = 5$ ),  $1 \times 10^6$  ffu ( $n = 11$ ) or placebo ( $n = 7$ ) subcutaneously administered at Day 1 and Week 8, and followed for 36 weeks for safety and immunogenicity.

**Results:** Twenty-seven participants were dosed; 20 received VIR-1111 (75% male). Mean age was 39.5 years (range: 23-51). 81.5% were White (37% Hispanic or Latino), 7.4% Black, 3.7% Pacific Islander, and 7.4% multiple races. Adverse event (AE) incidence was similar between VIR-1111 (55.0%) and placebo (57.1%) with no dose-dependent effect. 5/20 (25.0%) VIR-1111 and 2/7 (28.6%) placebo participants had AEs considered related to study intervention, all mild and transient. Local and systemic reactogenicity was reported mild by 6/20 (30%) VIR-1111 and 5/7 (71.4%) placebo participants, and moderate by 6/20 (30%) VIR-1111 participants. No clinically significant laboratory abnormalities were observed. VIR-1111 was not detected in blood, urine, or saliva. There were no sustained Gag-specific T cell nor antibody responses at any VIR-1111 dose. Peripheral blood RNAseq analysis revealed differential interferon and inflammatory pathway gene expression in 5/20 (25%) VIR-1111 participants, with maximal signal one week post-second dose.

**Conclusions:** VIR-1111 was generally safe and well-tolerated in healthy participants. While VIR-1111 did not elicit sustained Gag-specific immune responses, a gene sig-

nature associated with vaccine responses was identified in 5/20 participants. This study provides foundational safety data supporting further CMV-HIV vaccine development. VIR-1388, an optimized, next-generation CMV-HIV vaccine, is being evaluated in an ongoing Phase 1 study (NCT05854381).

### Suppression of HIV transcription via LNP-delivered mRNA-encoded CRISPR-Cas13: a novel latency promoting agent

P. Rawat<sup>1</sup>, S. Kan<sup>2,1</sup>, P. Ceva<sup>1,2</sup>, K. Tanaka<sup>2</sup>, J. Trapani<sup>1</sup>, S. Lewin<sup>2,3,4</sup>, M. Roche<sup>2,5</sup>, M. Fareh<sup>1</sup>

<sup>1</sup>Peter MacCallum Cancer Centre, University of Melbourne, Sir Peter MacCallum Department of Oncology, Melbourne, Australia, <sup>2</sup>Peter Doherty Institute for Infection and Immunity, University of Melbourne, Department of Infectious Diseases, Melbourne, Australia, <sup>3</sup>Alfred Hospital, Monash University, Department of Infectious Diseases, Melbourne, Australia, <sup>4</sup>Victorian Infectious Diseases Service, Royal Melbourne Hospital at the Peter Doherty Institute for Infection and Immunity, Melbourne, Australia, <sup>5</sup>STEM College, RMIT University, Melbourne, Australia

**Background:** Prolonged persistence of HIV latently infected cells on antiretroviral therapy (ART) in people with HIV (PWH) serves as a major roadblock towards a cure for HIV infections. CRISPR-Cas13 is a programmable RNA-nuclease that can effectively degrade viral transcripts and could be exploited to eliminate viral reactivation after cessation of ART. We hypothesised that the CRISPR-Cas13 system could knock down the essential HIV Tat protein, thus locking HIV into deep latency.

**Methods:** We used a proprietary T-cell tropic lipid nanoparticle (LNP) formulation to deliver a nucleoside-modified Cas13 mRNA and CRISPR guide RNA (crRNA) to HIV latently infected cell lines, JLat A2 and ACH2. We investigated two Cas13 orthologs, PspCas13b and RfxCas13d, that differ in their molecular mechanisms and are evolutionary distinct. Tat mRNA expression was measured by RT-qPCR, and viral reactivation via flow cytometry-based assessment of GFP reporter and viral p24 expression. Additionally, we assessed the ability of Tat-targeting Cas13 mRNA to suppress viral expression in human CD4+ T cells infected with a dual-reporter virus via flow cytometry.

**Results:** In the JLat A2 cell model, LNP-delivered Tat-targeting crRNA and RfxCas13d mRNA led to 80%±5% reduction in Tat mRNA expression ( $p<0.0001$ ) and 90%±9% reduction in GFP expression ( $p<0.0001$ ) indicative of viral reactivation. In the ACH2 cell model, Tat-targeting RfxCas13d mRNA resulted in reduction of 65%±10% in viral p24 expression ( $p<0.0001$ ). Similar findings were observed using the pspCas13b ortholog.

Additionally, we observed a significant reduction in cell viability ( $40\%\pm 8$ ,  $p<0.0001$ ) with both PspCas13b and RfxCas13d Tat-targeting mRNA relative to a non-targeting control.

Finally, in human CD4+ T cells infected with an HIV dual-reporter virus, Tat-specific crRNA and Cas13 mRNA delivered via LNP, resulted in 40% reduction in productive infection and an increase of 35% in latent population, consistent with enhancement of latent infection and suppression of HIV transcription/translation.

**Conclusions:** Our results demonstrate that a Tat-targeting Cas13 mRNA delivered via a T-cell tropic LNP effectively suppresses Tat expression in HIV latency cell lines and HIV-infected primary CD4+ T cells. Future work will determine the effect of this approach in cells from PWH on ART and whether the suppression persists with cell division.

### Anti-HIV-1 tier-2 neutralizing antibody induction by immunization with a Sendai virus vector expressing particles with modified HIV-1 Env trimers

H. Ishiji<sup>1</sup>, Y. Nomura<sup>1,2</sup>, T. Nomura<sup>1,3</sup>, M. Nishizawa<sup>1</sup>, M. Nakamura-Hoshi<sup>1</sup>, R. Kurokawa<sup>1,3</sup>, M. Okazaki<sup>1</sup>, Y. Suzuki<sup>4</sup>, Y. Ami<sup>4</sup>, T. Matano<sup>1,2,3</sup>

<sup>1</sup>AIDS Research Center, National Institute of Infectious Diseases, Tokyo, Japan, <sup>2</sup>Institute of Medical Science, University of Tokyo, Tokyo, Japan, <sup>3</sup>Joint Research Center for Human Retrovirus Infection, Kumamoto University, Kumamoto, Japan, <sup>4</sup>Management Department of Biosafety, Laboratory Animal, and Pathogen Bank, National Institute of Infectious Diseases, Tokyo, Japan

**Background:** Induction of broader anti-HIV-1 neutralizing antibody (NAb) responses is an important strategy for the development of an HIV vaccine. Env trimers can be a promising immunogen for boosting. We have recently developed a Sendai virus (SeV) vector expressing particles carrying chimeric HIV-1 Env trimers (EnvF consisting of HIV-1 Env extracellular domain and SeV transmembrane-cytoplasmic domain), confirmed NAb induction against an HIV-1 tier-1 strain by SeV-EnvF immunization in mice (Vaccine 40:2420-2431, 2022). In the present study, we investigated the potential of SeV-EnvF immunization to induce NAb against HIV-1 tier-2 strains in rabbits.

**Methods:** In the first experiment, twenty rabbits were intranasally immunized three times with SeVs expressing BG505-EnvF and/or AD8EO-EnvF. In the second experiment, eight rabbits were intranasally immunized three times with SeV expressing BG505-EnvF and/or AD8EO-EnvF followed by boosting six times with SeVs expressing modified BG505-EnvF and/or AD8EO-EnvF. Anti-gp120 binding antibodies and anti-HIV-1 NAb responses in serum obtained post-immunization were examined using several HIV-1 tier-1 and tier-2 strains.

**Results:** In the first experiment, SeV-BG505-EnvF immunization induced higher anti-HIV-1 tier-1 NAb responses than SeV-AD8EO-EnvF, but all the animals showed poor anti-HIV-1 tier-2 NAb induction. In the second experiment, NAb responses against HIV-1 tier-2 strains were induced after multiple boosting with SeV expressing modified EnvF.

**Conclusions:** The present study indicates the potential of SeV-EnvF boosting to induce NAb responses against HIV-1 tier-2 strains, implying that SeV-EnvF could be useful for boosting to induce broader anti-HIV-1 NAb responses.

<sup>1</sup>National Clinical Research Center for Infectious Diseases, HKU AIDS Institute Shenzhen Research Laboratory, The Third People's Hospital of Shenzhen, Shenzhen, China,

<sup>2</sup>Shenzhen Immuno Cure Biomedicine Co., Ltd., Shenzhen, China, <sup>3</sup>AIDS Institute, University of Hong Kong, Hong Kong Special Administrative Region, Microbiology, Li Ka Shing Faculty of Medicine, Hongkong, China, <sup>4</sup>Immuno Cure BioTech Ltd., Hongkong, China

**Background:** Combination antiretroviral therapy (cART) has successfully resulted in the saving of millions of lives. cART, However, cannot cure HIV-1. Here, we report a third-generation DNA vaccine namely ICVAX that incorporates a PD1-enhanced DC-targeting strategy and conserved HIV-1 mosaic Gag antigens. In preclinical non-human primate studies, such a vaccine conferred cART-free virologic control for over 6 years, whereas all control monkeys died within one and a half years after the pathogenic SHIV challenge.

**Methods:** We conducted a single-center, randomized, double-blind, placebo-controlled phase 1 clinical trial of ICVAX (CTR20223007) in persons living with HIV (PLWH) under effective cART. The primary objective was to assess the safety and tolerability of this vaccine.

The second exploratory objective was to determine the immunogenicity of ICVAX and its impact on peripheral virus reservoirs. ART-suppressed individuals were enrolled in a dose-escalation study of ICVAX in three different cohorts (1 mg, 2mg, and 4mg). 4 shots of ICVAX were administered intramuscularly (IM) with an interval of 4 weeks for the first 12 weeks; another boost shot was given, separated by 24 weeks.

**Results:** 45 cART-treated HIV-1 individuals who have achieved sustained viral load suppression were enrolled and randomized 4:1 to receive three different dosages of vaccine or the same volume of placebo control via intramuscular injection, followed by short-pulse electropora-

tion (EP) with a proprietary device at the same site (Table 1). Preliminary data indicate that this novel generation DNA vaccine with IM/EP is safe and well-tolerated, with no vaccine-related severe adverse events (SAE), potential immune-mediated diseases, or Grade 3 or higher adverse events (AEs).

The primary clinical AEs reported were mild injection site pain and rash (Table 1). No significant laboratory AEs attributable to ICVAX were observed. No clinically significant change in CD4 T cell count or VL occurred following the injection of ICVAX. In exploratory analyses, most vaccine recipients generated potent T-cell immune responses, as detected by the ELISPOT assay. More immunogenicity analyses by flow cytometry are ongoing.

**Conclusions:** These data suggest that ICVAX in ART-suppressed PLWH is safe and immunogenic and that larger clinical trials are needed to further investigate the effects of ICVAX on reservoirs.

## TUPEA025

**Covalent complexing of HIV1-C SOSIP.664 to 2dCD4<sup>S60C</sup> changes the conformational dynamics of CD4 and demonstrates exceptional immunogenicity in New Zealand white rabbits**

N. Meulenberg<sup>1</sup>, G. Owen<sup>1</sup>, P. Naicker<sup>2</sup>, M. Killick<sup>1</sup>, S. Stoychev<sup>2</sup>, M. Papathanasopoulos<sup>1</sup>

<sup>1</sup>University of the Witwatersrand, HIV Pathogenesis Research Unit, Faculty of Health Sciences, Johannesburg, South Africa, <sup>2</sup>Council for Scientific and Industrial Research, Biosciences, Pretoria, South Africa

**Background:** The human immunodeficiency virus type 1 (HIV-1) envelope glycoprotein (Env) mediates infection by targeting the host CD4 receptors. When bound to CD4, the HIV-1 Env undergoes conformational rearrangements that expose cryptic epitopes which could be exploited by vaccination. Our group has developed a CD4 mutant (2dCD4<sup>S60C</sup>) which stabilises the interaction between Env and CD4 through targeted inter-chain disulphide linkage. The resulting complexes elicit broadly neutralizing antibodies (bNAbs) in a preclinical setting, with preliminary mapping experiments suggesting the observed antibody response is predominantly CD4-specific.

This study further biochemically characterises the stabilised Env:CD4 interaction to aid in our understanding of the potent antibody responses elicited following small animal immunizations.

**Methods:** Purified HIV-1C SOSIP.664 trimeric Env was complexed to 2dCD4, covalently (Env:2dCD4<sup>S60C</sup>) and non-covalently (Env:2dCD4<sup>WT</sup>). Conformational dynamics of the complexes were compared using hydrogen-deuterium exchange mass spectrometry (HDX-MS). Antigenicity of the complexes was evaluated in ELISAs and immunogenicity of the covalent complex tested in New Zealand white rabbits.

**Results:** HDX-MS revealed the dynamics of key CD4 contact residues important for MHCII and Env binding located in CD4 domain 1 were maintained in the Env:2dCD4<sup>S60C</sup> complex, with greater variation observed throughout CD4 domain 2 when compared to Env:2dCD4<sup>WT</sup>. The covalent complex maintained the Env structural integrity as it was recognised by most anti-HIV antibodies targeting the V1V2 apex and the CD4 binding site.

Additionally, the covalent complex elicited bNAbs responses in rabbits, neutralising 76% of a global panel of clinically relevant HIV-1 pseudoviruses.

**Conclusions:** Combined these data suggest functionally significant residues in CD4 domain 1 remain anchored within each Env:CD4 complex, whilst the increased flexibility of CD4 domain 2 residues in the covalent complex may allow for the presentation of diverse antigenic targets on the host cell receptor relevant for HIV-1 neutralization. Fine mapping of the elicited antibody responses is required to confirm this hypothesis.

Overall, results reaffirm the continual development of Env:2dCD4<sup>S60C</sup> complex immunogens as promising HIV-1 vaccine candidates.

**Background:** In people living with HIV (PWH), immune dysfunction persists with elevated expression of the exhaustion marker programmed death (PD1) despite suppressive antiretroviral therapy (ART). Anti-PD1 therapy in people with cancer can enhance tumor-specific T-cell responses through the proliferative burst of exhausted effector T-cells (T<sub>EX</sub>). We aimed to determine the effects of anti-PD1 in vivo on the T-cell receptor (TCR) repertoire of HIV-specific CD8 T-cells.

**Methods:** As part of a prospective longitudinal clinical trial of PWH on ART with cancer (AIDS Malignancy Consortium-095 Study), participants received anti-PD1 (nivolumab) every 3 weeks. Blood was collected prior to and following the first, fourth and subsequent infusions. We sorted HIV-tetramer+ CD8 T-cells from six participants and performed single cell RNA sequencing and TCR repertoire computational analysis. We used a data-based frequency cut-off and considered a clonotype as expanded when a particular TCR sequence constituted > 2% of the overall TCR sequences.

**Results:** Out of 1828 TCR clonotypes, 55 expanded, totalling 913 cells, with 78.2% identified as T<sub>EM</sub> or T<sub>EX</sub> cells. All cells with expanded clonotypes showed differentially expressed genes upregulated for effector functions and

antigen recognition. Baseline TCR diversity positively correlated with expanded clonotypes after a single anti-PD1 dose ( $r=0.57$ ). In 3 participants, high diversity in HIV tetramer+ CD8 T-cells led to rapid expansion and subsequent contraction with additional doses. In the other 3 participants, lower diversity also resulted in clonotype expansion, but only after multiple anti-PD1 doses. Pair-wise TCR distance analysis demonstrated that expanded clones were biochemically diverse and therefore likely recognise a diverse range of HIV epitopes.

**Conclusions:** PWH on ART and cancer with a diverse HIV-specific TCR repertoire at baseline exhibit rapid clonotype expansion after a single anti-PD1 dose, while a less diverse TCR repertoire requires multiple doses of anti-PD1 for expansion. Whether these expanded clonotypes can control HIV replication once ART is stopped remains to be determined in future clinical trials of anti-PD1 in PWH on ART.

## TUPEA027

Delivery and long-term expression of CCR5-blocking monoclonal antibody Leronlimab with AAV for ART-free remission from SHIV viremia

G. Webb<sup>1,2</sup>, H. Wu<sup>1,2</sup>, C. Waytashek<sup>1,2</sup>, C. Boyle<sup>1,2</sup>, J. Hwang<sup>1,2</sup>, H. Fisher<sup>1,2</sup>, C. Pessoa<sup>1,2</sup>, M. Humkey<sup>1,2</sup>, A. McCullen<sup>1,2</sup>, M. Brown<sup>1,2</sup>, K. Kukula<sup>1,2</sup>, J. Smedley<sup>1</sup>, J. Zikos<sup>3</sup>, D. Magnani<sup>3</sup>, S. Fuchs<sup>4</sup>, R. Desrosiers<sup>4</sup>, J. Sacha<sup>1,2</sup>

<sup>1</sup>Oregon Health and Science University, Oregon National Primate Research Center, Beaverton, United States,

<sup>2</sup>Oregon Health and Science University, Vaccine and Gene Therapy Institute, Beaverton, United States, <sup>3</sup>University of Massachusetts Medical School, MassBiologics, Boston, United States, <sup>4</sup>University of Miami, Miller School of Medicine, Miami, United States

**Background:** CCR5 blockade represents a scalable non-transplantation approach for long-term ART-free HIV remission. Here, we tested if AAV vectors could induce long-term expression of CCR5-blocking monoclonal antibody Leronlimab in a SHIV-infected rhesus macaques (RMs).

**Methods:** Four SHIV-infected RMs received AAV9 encoding macaque Fc Leronlimab with stabilizing, silencing, and half-life extending mutations (AAV9-MacLSLeron). Animals were monitored longitudinally for CCR5 receptor occupancy (RO), plasma Leronlimab concentrations, antidrug antibodies (ADAs), and SHIV plasma viral loads.

**Results:** All four AAV9-MacLSLeron-treated RMs reached 100% CCR5 RO on blood CD4+ T cells within 1 week and plasma Leronlimab was detected ( $>1\mu\text{g/ml}$ ) within 2 weeks of AAV administration. In two of the RMs, SHIV viremia declined and reached undetectable levels between 10-40 weeks post-AAV, and those levels have remained undetectable through 70 weeks post-AAV. The remaining two RMs developed ADAs within 5-15 weeks post-AAV re-

sulting in complete clearance of Leronlimab from plasma as well as a rapid decline in CCR5 RO. Spontaneous reemergence of CCR5 RO by Leronlimab was observed approximately 1 year post-AAV. One of the two animals has had full and sustained CCR5 RO, detectable plasma Leronlimab, and undetectable SHIV RNA in plasma for over 1 year post-reexpression. The second re-expressing animal has achieved and maintained 100% CCR5 RO for about 10 weeks, has detectable plasma Leronlimab, and has declined plasma viremia.

**Conclusions:** While further investigation is needed to develop AAV vectors and/or regimens that reduce the incidence of ADAs, the transgene reexpression phenomenon we have observed highlights the need to further investigate the interplay between AAV establishment and the development of ADAs.

Overall, these data demonstrate the potential of AAV vectors for sustained antibody-based CCR5 blockade as a gene therapy approach for long-term ART-free HIV remission.

## TUPEA028

Evaluation of a supplement-containing enema on intestinal immunity, microbiome, and susceptibility to low dose intrarectal SIV

A. Ortiz O'Sick<sup>1</sup>, F. Castello Casta<sup>1</sup>, B. Keele<sup>2</sup>, J. Brechley<sup>1</sup>

<sup>1</sup>National Institutes of Health, Laboratory of Viral Diseases, Bethesda, United States, <sup>2</sup>Frederick National Laboratory for Cancer Research, AIDS and Cancer Virus Program, Frederick, United States

**Background:** In the Americas and Europe, men who have sex with men (MSM) are disproportionately affected by HIV. Rectal douching among MSM is proposed as a contributor to gastrointestinal damage and microbiome disruptions. We developed an epithelial-enhancing enema by supplementation with prebiotic fiber inulin and short-chain fatty acid sodium butyrate (Enema-BF).

We hypothesize that epithelial-enhancing enemas will mitigate colorectal epithelial damage and reduce intrarectal HIV acquisition.

**Methods:** We administered hypotonic enemas (Normosol-R) to rhesus macaques with or without inulin and sodium butyrate ( $n=6$  each Controls, Enema-alone, Enema-BF) thrice-weekly, prior to repeated low-dose intra-rectal SIVmac239X challenge.

Before and 28 days after treatment initiation ( $n=12$  enemas) we assessed the fecal microbiome by 16S Illumina sequencing and surveyed intestinal and systemic immunity by flow cytometry, transcriptional analysis (NanoString), and ELISA.

Fifty-six days after initiation ( $n=24$ ) we initiated challenges with 4 TCID<sub>50</sub> SIVmac239X. Susceptibility to acquisition was assessed by time to infection and acquired transmitter-founder (T/F) variants.

Oral  
abstracts

Poster  
exhibition

**Results:** Enema-alone animals exhibited significantly lower frequencies of rectal memory CD8<sup>+</sup> T-cells (CD8<sup>+</sup> TM), lower IL-2 expression by CD8<sup>+</sup> TM, and lower IL-22 production by both CD4<sup>+</sup> and CD8<sup>+</sup> TM, as compared to controls. Enema supplementation restored CD8<sup>+</sup> TM frequencies and IL-22 production. No differences were observed in plasma sCD14 or iFABP2 between groups. Irrespective of supplementation, enema treatment was associated with fecal bacterial dysbiosis. Whereas Enema-alone animals exhibited significantly increased frequencies of many *Prevotellaceae* species, these perturbations were blunted with supplementation. Of animals infected thus far, there are no differences in the number of challenges that resulted in infection; however, Enema-BF animals acquired a significantly higher number of T/F variants.

**Conclusions:** Our analyses assess the effect of repeated enema use on the intestinal microbiome and immunity, as well as the efficacy of a putatively epithelial-enhancing enema on these same measures.

Although our epithelial-enhancing enema limited a proinflammatory intestinal milieu and mitigated *Prevotellaceae* expansion, increased acquisition of T/F variants in Enema-BF animals suggests that our therapeutic may not reduce lentiviral acquisition. Insights gained from our study will inform the consequences of repeated enema usage in MSM and the design of improved bowel-clearing preparations for sexual and surgical use.

**Background:** Ainoovirine (ANV) is a new generation of non-nucleoside reverse transcriptase inhibitor for the treatment of human immunodeficiency virus (HIV) type 1 infection. This study aimed to evaluate the population pharmacokinetic (PopPK) profile and exposure-response relationship of ANV among people living with HIV.

**Methods:** Plasma concentration-time data from phase 1 and phase 3 clinical trials of ANV were pooled for developing the PopPK model. Exposure estimates obtained from the final model were used in exposure-response

analysis for virologic responses and safety responses. Trial registration with Chinese Clinical Trial Registry (ChiCTR1800018022 and ChiCTR1800019041).

**Results:** ANV exhibited a nonlinear pharmacokinetic profile, which was best described by a two-compartment model with first-order elimination. There were no significant covariates correlated to the pharmacokinetic parameters of ANV. The PopPK parameter estimate (relative standard error) for CL/F was 6.46 L/h (15.0), and the clearance of ANV increased after multiple doses. The exposure-response model revealed no significant correlation between the virologic response (HIV-RNA <50 copies/mL) at 48 weeks and the exposure, but the incidence of adverse events increased with the increasing exposure (P value of steady-state trough concentration and area under the steady-state curve were 0.0177 and 0.0141, respectively).

**Conclusions:** Our PopPK model supported ANV 150 mg once daily as the recommended dose for people living with HIV, requiring no dose adjustment for the studied factors. Optimization of ANV dose may be warranted in clinical practice due to an increasing trend in adverse reactions with increasing exposure.

uble, prefusion-stabilized, close-to-native, glycan-engineered clade C gp140 envelope (Env) trimers (sC23v4 KIKO and ConCv5 KIKO) for optimal display on the cell surface following homologous or heterologous vector delivery.

**Methods:** A combination of the following modifications scored best regarding the preservation of closed, native-like Env trimer conformation and antigenicity when using a panel of selected broadly neutralizing (bnAb) and non-neutralizing (nnAb) monoclonal antibodies for flow cytometry: i) replacing the natural cleavage site with a native flexible linker and introducing a single amino acid substitution to prevent CD4 binding (\*), ii) fusing a heterologous VSV-G-derived transmembrane moiety to the gp140 C-terminus, and iii) deleting six residues proximal to the membrane.

**Results:** When delivering membrane-tethered sC23v4 KIKO\* and ConCv5 KIKO\* via DNA, VSV-GP, and NYVAC vectors, the two native-like Env trimers provide differential antigenicity profiles. Whereas such patterns were largely consistent among the different vectors for either Env trimer, the membrane-tethered ConCv5 KIKO\* trimer adopted a more closed and native-like structure than sC23v4 KIKO\*. In immunized mice, VSV-GP and NYVAC vectors expressing the membrane-tethered ConCv5 KIKO\* administered in prime/boost combination were the most effective regimens for the priming of Env-specific CD4 T cells among all tested combinations. The subsequent booster administration of trimeric ConCv5 KIKO\* Env protein preserved the T cell activation levels between groups. The evaluation of the HIV-1-specific humoral responses induced in the different immunization groups after protein boosts showed that the various prime/boost protocols elicited broad and potent antibody responses, preferentially of a Th1-associated IgG2a subclass, and that the obtained antibody levels remained high at the memory phase.

**Conclusions:** In summary, we provide a feasible strategy to display multiple copies of native-like Env trimers on the cell surface, which translates into efficient priming of sustained CD4+ T cell responses after vector delivery as well as broad, potent, and sustained antibody responses following booster immunizations with the homologous, prefusion-stabilized, close-to-native ConCv5 KIKO\* gp140 Env trimer.

**Background:** Stabilization of the HIV-1 Envelope glycoprotein trimer (Env) in its native pre-fusion closed conformation is regarded as one requirement for the induction of neutralizing antibody (nAb) responses. Another essential requirement toward neutralization breadth is proper engagement of B cell receptors on naive B cells and subsequent guiding of B cell maturation by means of vaccination with sequential immunogens.

**Methods:** Here, we systematically analysed how the stepwise stabilization of a clade C consensus (ConC) Env immunogen impacts biochemical and biophysical protein traits such as antigenicity, thermal stability, structural integrity, and particle size distribution. Immunogenicity and neutralization profiles were assessed via mouse and rabbit studies. The most promising ConC candidate was modified with the goal to engage the germline gIVRC B cell receptor. CHO cell lines were developed, and a process was established to support GMP manufacturing of two Env trimer immunogens for sequential immunization.

Oral  
abstracts

**Results:** The increasing degree of prefusion Env trimer rigidification positively correlated with manufacturability, stability, and an overall favourable binding profile of structure-dependent broadly neutralizing antibodies (bnAbs) and non-neutralizing antibodies (non-nAbs). Increased structural integrity of the Env trimers improved the quality of binding antibodies and Tier2 neutralization capacity of sera obtained from rabbits following immunization with modified ConCv5 Env (ConCv5KIKO) in MPLA.

Further modifications enabled binding of the germ-line-targeting ConCv5 Env trimer (ConCv5-GT) to the germ-line VRC01 mAb and functional engagement with B cell lines displaying gIVRC01. Avidity gains achieved by ConCv5-GT multimerization on silica nanoparticles further improved activation of gIVRC01 B cell lines.

**Conclusions:** Based on these findings, two lots of Env trimers, ConCv5-GT and ConCv5-KIKO, for sequential immunization were manufactured and released as GMP-grade drug substance and product for clinical validation.

## HIV-associated viruses, co-infections and co-morbidities

### TUPEA032

Nef is the key pathogenic factor responsible for HIV-associated atherosclerosis

M. Bukrinsky<sup>1</sup>, Y. Wang<sup>2</sup>, D. Sviridov<sup>3</sup>

<sup>1</sup>The George Washington University, Microbiology, Immunology & Tropical Medicine, Washington, United States, <sup>2</sup>The George Washington University, Washington, United States, <sup>3</sup>Baker Heart and Diabetes Institute, Melbourne, Australia

**Background:** Anti-retroviral therapy (ART) can suppress HIV replication to undetectable levels and restore immune functions. Nevertheless, incidence of certain co-morbidities, in particular atherosclerosis, is significantly increased in ART-treated HIV-infected individuals. Pathogenic factors responsible for atherosclerosis in this population are not fully understood, limiting therapeutic approaches. In this study, we created a mouse model of HIV-associated atherosclerosis to test the hypothesis that Nef is the key pathogenic factor responsible for increased atherosclerosis associated with HIV infection.

**Methods:** The model we created is based on NSG immunodeficient mice. Newborn mice were sub-lethally irradiated and humanized by human cord blood CD34<sup>+</sup> cells. Humanized mice were injected with AAV-PCSK9, transferred to high-fat diet and infected with Nef-positive or Nef-deficient HIV-1 JR-CSF (or left uninfected). Each group had three mice (or male). Viral load and PCSK9 were an-

alyzed every 2 weeks, and after 14 weeks mice were sacrificed and analyzed for lipoproteins, inflammatory cytokines, and atherosclerotic plaques on aorta.

**Results:** Our analysis demonstrated that Nef-positive and Nef-negative HIV-1 strain used in this study (JR-CSF) replicated to the same level (5x10<sup>7</sup> copies/ml) in humanized NSG mice. Mice infected with Nef-positive virus developed significantly more atherosclerotic plaques (1.7% of aorta surface) than mice infected with Nef-negative HIV (1.3%) or uninfected mice (1.2%). HDL levels were significantly lower in HIV Nef<sup>+</sup> infected mice, but LDL levels were similar.

Ultrasound analysis demonstrated an over 2-fold decrease in LCCA and aortic root wall movement (diastole to systole) in mice infected with Nef-positive HIV-1 relative to uninfected mice or mice infected with Nef-deficient HIV-1. IL-6, TNF $\alpha$  and IL-1 $\beta$  were significantly increased in the plasma of mice infected with Nef-positive HIV-1 relative to mice in two other groups.

**Conclusions:** We describe the mouse model that reproduces HIV-associated atherosclerosis. Surprisingly, atherosclerosis in mice infected with Nef-deficient HIV-1 was not increased relative to uninfected mice, suggesting that Nef may be the only HIV-associated pro-atherogenic factor, at least in this model. Targeting Nef may be a promising therapeutic approach aimed at preventing this dangerous co-morbidity.

*Mycobacterium tuberculosis* (Mtb) isolates and evaluate the association of rifampicin-resistant-TB with HIV acquisition in Botswana.

**Methods:** A retrospective cohort study was conducted on 133 individuals diagnosed with rifampicin-resistant-TB from 2016-2021. Genomic DNA was extracted from isolates cultured on Löwenstein-Jensen media using the cetyltrimethylammonium bromide(CTAB) method. Library preparation was performed with the Illumina DNA prep kit and loaded on Illumina NextSeq 2000 platform. TBProfiler(v4.4.2) was used to identify and delineate *M.tb* lineages and drug resistance profiles according to WHO mutations catalogue. Logistic regression models were used to identify predictive factors of HIV in people with rifampicin-resistant-TB.

**Results:** In this cohort, 73/133(55%) were people living with HIV (PLWH). The median age of PLWH was 41 (Q1, Q3: 32, 48) years, which were older than people not living with HIV (PNLWH) (median age: 29 (Q1, Q3: 25, 47)(p=0.01). A total of 106/133 were successfully sequenced of which 64 were PLWH and 42 were PNLWH. Amongst 106 sequences, 61, 27, 16 and 2 belonged to lineage4, lineage1, lineage2 and lineage3(all from PLWH), respectively. For rifampicin, *rpoB*\_p.S450L(n=28) and *rpoB*\_p.H445L(n = 23) and were detected while for isoniazid, *katG*\_p.S315T was found in 50/106. Mutations associated with anti-TB drugs were stratified by HIV status in Table 1. Mutation *rpoB*\_c.1303\_1305delGAC was only observed among PLWH(n=3). Mono-rifampicin-resistant-TB was associated with living with HIV (unadjusted odd ratio:3.3, 95% confidence intervals:1.2-8.9(p=0.02)) when compared to those diagnosed with multidrug resistant-TB and pre-extensively drug resistant-TB.

Table 1. Mutations associated with anti TB drug stratified by HIV status.

Drug	Mutations	People not living with HIV (n=42)	People living with HIV (n=64)
Isoniazid	<i>inhA</i> _c.1030G>A	0/42	0/64
	<i>inhA</i> _c.1030G>C	0/42	0/64
	<i>inhA</i> _c.1030G>T	0/42	0/64

	<i>embB</i> _c.300G>C	0/42	0/64
	<i>embB</i> _c.300G>T	0/42	0/64
	<i>embB</i> _c.300G>A	0/42	0/64
Pyrazinamide	<i>pncA</i> _c.1030G>A	0/42	0/64
	<i>pncA</i> _c.1030G>C	0/42	0/64
	<i>pncA</i> _c.1030G>T	0/42	0/64
	<i>pncA</i> _c.1030G>A	0/42	0/64

**Conclusions:** Being elderly and diagnosed with Rifampicin-mono-resistant-TB were associated with living with HIV among people with rifampicin-resistant-TB in Botswana. WGS is useful in detecting drug resistance mutations missed in current diagnostic tools and can potentially guide more tailored treatment strategies.

## TUPEA034

### Genotypic characterization of drug-resistant *Mycobacterium tuberculosis* isolates from people living with HIV in Blantyre, Malawi

K. Mulungu<sup>1,2,3,4</sup>, C. Mkwangwanyo<sup>1,4</sup>, V. Ndhlovu<sup>4</sup>

<sup>1</sup>Malawi Liverpool Wellcome Programme, Infection and Immunity, Blantyre, Malawi, <sup>2</sup>African Forum for Research and Education in Health (AFREHealth), Kumasi, Ghana, <sup>3</sup>University of Glasgow, Infection and Immunity, Glasgow, United Kingdom, <sup>4</sup>Kamuzu University of Health Sciences, Infection and Immunity, Blantyre, Malawi

**Background:** Globally, about 0.167 million people died of HIV-associated TB in the year 2022 and around 10 million fall ill with TB every year. African region accounts for 23% of new cases. Malawi is among top 8 most HIV-TB co-infection burdened countries in Africa, the health condition is worsened by the country state of being one of the poorest countries in Africa with a fourth highest percentage of people living in extreme poverty in the world. A steady increase in the prevalence rate of HIV/AIDS makes the situation even more precarious. Malawi, with around 19 million inhabitants, shares geographical borders with Mozambique, Tanzania and Zambia where HIV-TB co-infection is also endemic. Molecular epidemiological studies have reported 7 main lineages (L1-L7) of *Mycobacterium tuberculosis* (Mtb) with each lineage adapting to populations of a specific geographical area. Certain Mtb lineages have been associated with evolution of unique properties such as increasing virulence and pathogenicity.

Specifically, the Beijing family of L2 has been associated with increasing drug resistance and HIV co-infection in some parts of the world including South Africa and Mozambique. Studies have expressed the diversity of *Mycobacterium tuberculosis* strains in some regions but few such studies have linked TB strains to multidrug resistance in people living with HIV.

**Methods:** A retrospective cross section study was conducted on the mycobacterium (Mtb) clinical isolates amongst TB drug resistant people living with HIV to establish and investigate any association with multidrug resistance. TB resistance was confirmed using GeneXpert followed by manual DNA extraction using C TAB method on 30 samples. Multiplex PCR and gel electrophoresis were used to cluster the mycobacterium (TB) strains present in the 30 isolates into 4 lineages (genotypes).

**Results:** There were 0/30 (0%) isolates belonging to Lineage 1, 0/30 (0%) isolates belonging to Lineage 2, 2/30 (7%) isolates belonging to Lineage 3 and 28/30 (93%) isolates belonging to Lineage 4.

**Conclusions:** The TB isolate belonging to Lineage 4 is predominant in HIV positive individuals who are resistant to TB treatment. Study of Lineage 4 isolates may play a key role in the design and formulation of an effective treatment for HIV-associated TB.

### IDO-driven Tryptophan catabolism and systemic inflammation in people with HIV under anti-retroviral therapy diagnosed with subclinical coronary artery disease: results of the Canadian HIV and Aging Cohort Study

K. Frias Boligan<sup>1</sup>, R.-S. Mboumba Bouassa<sup>1,2</sup>, M. Durand<sup>3</sup>, C. Tremblay<sup>3</sup>, C. Chartrand-Lefebvre<sup>3</sup>, M. El-Far<sup>3</sup>, M. Messier-Peet<sup>3</sup>, P. Ancuta<sup>3</sup>, I. Kema<sup>4</sup>, C.T. Costiniuk<sup>2</sup>, M.-A. Jenabian<sup>1</sup>

<sup>1</sup>Université du Québec à Montréal (UQAM), Department of Biological Sciences, Montreal, Canada, <sup>2</sup>Research Institute of the McGill University Health Centre, Medicine, Montreal, Canada, <sup>3</sup>Centre de Recherche du CHUM, Faculté de Médecine, Université de Montréal, Montreal, Canada, <sup>4</sup>University Medical Center, University of Groningen, Department of Laboratory Medicine, Groningen, Netherlands, the

**Background:** Despite the success of ART, people with HIV (PLWH) suffer from inflammatory comorbidities such as coronary artery disease (CAD). Tryptophan (Trp) catabolism via Kynurenine (Kyn) pathway by indolamine 2,3-dioxygenase (IDO), expressed by myeloid cells, is associated with HIV disease progression and atherosclerosis. Thus, we assessed the Trp metabolism and its interplay with peripheral markers of inflammation in PLWH with subclinical CAD.

**Methods:** Blood specimens from HIV+CAD+ (n=34), HIV+CAD- (n=32), HIV-CAD+ (n=17) and HIV-CAD- (n=23) participants were obtained from the Canadian HIV Aging Cohort Study. CAD was determined by cardiac computed tomography angiography. Plasma levels of Tryptophan metabolites were measured by solid-phase-extraction liquid chromatography-tandem mass spectrometry.

Soluble inflammatory mediators were measured by Luminescence or ELISA. Myeloid and lymphoid cell subsets were assessed by multi-color flow cytometry.

**Results:** Kyn/Trp and 3-hydroxykynurenine/Xanthurenic acid ratios as markers of IDO activity were significantly increased in HIV+CAD+ compared to HIV-CAD- and HIV-CAD+. Accordingly, plasma IFN $\gamma$  levels were highest in HIV+CAD+ individuals within study groups and correlated positively with Kyn/Trp ratio.

Positive correlation of Kyn/Trp ratio with plasma IP-10 levels in both HIV+ and HIV- groups were observed, while independent of the CAD status. Significant increases in the Trp metabolites kynurenic acid, anthranilic acid were observed in PLWH, while the levels of xanthurenic acid were decreased in PLWH independent of their CAD status. HIV+CAD+ individuals also exhibited the highest plasma levels of the markers of gut mucosal damage REG-3 $\alpha$  and IFABP within study groups, but only IFABP was associated with the CAD status. Increases in the levels of other inflammatory mediators sTNF- $\alpha$  and IL-6 were associated to the presence of HIV, but independent of CAD.

Non-classical CD16+ monocyte frequencies were decreased in CAD+ participants along with enriched frequencies of classical CD14+ in these individuals and regardless of their HIV status. mDC, CD73+ CD4 and Treg frequencies were all decreased in HIV+CAD+ group, while their levels were not associated with Trp metabolites.

**Conclusions:** IDO activity was increased in HIV+CAD+ individuals compared to both HIV negative groups, along with their higher levels of the markers of the gut mucosal damage, IFN $\gamma$  and altered monocyte subsets.

### Longitudinal SARS-CoV-2 antibody and cellular immune responses during the endemic phase in people living with and without HIV in Ethiopia

R. Kisch<sup>1</sup>, W. Adissu<sup>2</sup>, E. Girma<sup>2</sup>, K. Elsbernd<sup>1,3</sup>, S. Ali<sup>4</sup>, A. Wieser<sup>1,5,6</sup>, C. Geldmacher<sup>1</sup>, A. Kroidl<sup>1,6</sup>, E.K. Gudina<sup>2</sup>

<sup>1</sup>LMU University Hospital, Division of Infectious Diseases and Tropical Medicine, Munich, Germany, <sup>2</sup>Jimma University Institute of Health, Jimma University Clinical Trial Unit, Jimma, Ethiopia, <sup>3</sup>LMU Munich, Institute for Medical Information Processing, Biometry, and Epidemiology, Munich, Germany, <sup>4</sup>Saint Paul's Hospital Millennium Medical College, Addis Ababa, Ethiopia, <sup>5</sup>Fraunhofer Institute for Translational Medicine and Pharmacology ITMP, Immunology, Infection and Pandemic Research, Munich, Germany, <sup>6</sup>German Center for Infection Research (DZIF), Partner Site Munich, Germany

**Background:** During the COVID-19 pandemic, people living with HIV (PLWH) did not have significantly higher infection rates, but greater mortality rates, especially among severely immunosuppressed individuals, were observed. During the endemic phase of the COVID-19 pandemic, we compared the seroprevalence, reinfection rates, and clinical impact among PLWH and those without HIV.

**Methods:** We recruited health care workers and general population members from Jimma, Ethiopia in a longitudinal cohort study. Data was collected between Nov-2022 and Dec-2023, with 3-month study visit intervals. Blood samples for SARS-CoV-2 serology (Roche Elecsys®) and T cell analysis (Interferon gamma release assay, IGRA) were collected. Reinfection with SARS-CoV-2 was defined based on an anti-N antibody titer increase of greater than 2 standard deviations (SD) of the test variance.

We compared the distribution of binding anti-S antibodies and T cell IGRA responses using boxplots and Wilcoxon-test among PLWH and those without HIV in a 2:1 age-

sex-matched sample. Linear mixed models were used to analyze the serological course over time. Included factors were HIV status, reinfections, age, and sex.

**Results:** In total, 102 out of 500 participants (20.4%) were PLWH, 85.3% were female, with a mean age of 36.5 years (SD 9.0). All PLWH were on antiretroviral treatment and 11.8% thereof had a CD4 cell count <350 cells/ $\mu$ L (mean CD4: 651.6). No difference in the proportion of reinfections in PLWH and matched HIV-negative participants was observed (30.4% vs. 30.8%), and no cases of severe COVID-19 disease were reported. Anti-S antibody response increased over time on a population level (Beta 1.025, 95%-CI: 1.007; 1.043) but was lower for PLWH versus without HIV (Beta 0.849, 95%-CI: 0.743; 0.971).

There were no differences in anti-S antibody response over time between groups based on the presence or absence of reinfection (Beta 0.977, 95%-CI: 0.887; 1.085). The distribution of T cell responses was not statistically different between groups ( $p=0.928$ ).

**Conclusions:** During the endemic phase of COVID-19, we observed similar surrogate reinfection rates by HIV status in one third of the study population, without evidence for severe COVID-19 disease. However, binding anti-S antibody levels were lower in PLWH, indicating a potential impact on SARS-CoV-2-specific immune responses.

## TUPEA037

Chemokine receptors expression is altered during convalescent COVID-19 in people living with HIV on art

O. Briceño<sup>1</sup>, M.I. León Rodríguez<sup>1</sup>,

G. Salgado Montes de Oca<sup>1</sup>, E. de León-Lara<sup>1</sup>,

W.C. Lara Vázquez<sup>1</sup>, A. Juárez Díaz<sup>1</sup>, E. Canché Mucul<sup>1</sup>,

J.C. Rodríguez Hernández<sup>1</sup>, S. Avila Ríos<sup>1</sup>

<sup>1</sup>Instituto Nacional de Enfermedades Respiratorias, Centro de Investigación en Enfermedades Infecciosas, Mexico City, Mexico

**Background:** Several studies have demonstrated that people living with HIV (PLWHIV) on suppressive antiretroviral therapy (ART) do not exhibit higher susceptibility to COVID-19 infection and show similar clinical presentation and mortality as persons without HIV. Nevertheless, the effect of COVID-19 infection on the immune system of PLWHIV during the convalescent phase remains unknown.

The aim of this study is to describe the expression of chemokine receptors on T cells, B cells and monocytes during early convalescent COVID-19 in treated PLWHIV.

**Methods:** Enrollment of the participants occurred from April to November 2021. The study comprised 53 long-term treated (10 years) PLWHIV, of whom, 35 were diagnosed with COVID-19 in the past 5 months (HIV+COVID+) and 18 had never been infected by COVID-19 (HIV+COVID-). Freshly purified PBMCs were immunophenotyped using

flow cytometry. Statistical analyses were performed using GraphPad Prism9. U-Mann Whitney test was used to compare the study groups.

**Results:** We found that HIV+COVID+ individuals exhibited similar frequencies and activation levels of CD4+ and CD8+ T cells than HIV+COVID- individuals ( $p > 0.05$  in all cases). However, CCR1 expression was significantly decreased on CD8+ T cells ( $p = 0.0003$ ), B cells ( $p = 0.0046$ ), classical monocytes ( $p = 0.0005$ ) and non-classical monocytes ( $p = 0.0006$ ) in HIV+COVID+ compared to HIV+COVID- individuals. In the HIV+COVID+ group, CCR4 expression was increased in classical ( $p = 0.0001$ ) and non-classical monocytes ( $p = 0.0008$ ), while CCR5 was significantly reduced in classical monocytes ( $p = 0.0345$ ) compared to HIV+COVID- individuals. Moreover, the expression of the fractalkine receptor (CX3CR1) was significantly increased in the HIV+COVID+ group on CD4+ ( $p = 0.0007$ ) and CD8+ ( $p < 0.0001$ ) T cells, classical monocytes ( $p < 0.0001$ ), and B cells ( $p < 0.0001$ ) compared to HIV+COVID- individuals.

**Conclusions:** After complete COVID-19 recovery in the absence of any clinical symptoms, altered expression of chemokine receptors was observed in treated PLWHIV after 5 months of acute COVID-19 infection. The altered expression seems to perdure after months of active COVID-19 infection and may contribute to modification in the migration patterns of the immune cells and aberrant inflammatory responses in treated PLWHIV.

**Background:** Maternal-derived antibodies, transferred through the placenta or breast milk, represent a powerful tool to reduce the burden of neonatal infections. Maternal vaccination against Influenza and Tetanus, Diphtheria and acellular Pertussis (Tdap) has been well studied in terms of safety and efficacy for the protection of the newborn. We analyzed neonatal protection against severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) passively acquired after mother vaccination and/or infection (hybrid immunity).

**Methods:** Eighteen newborns of mothers vaccinated with three doses of BNT162b2 mRNA vaccine before pregnancy were enrolled in the study. Infants were stratified based

on the anamnestic lack/presence of COVID-19 maternal infection: 8 infants from SV (SARS-CoV-2 Vaccinated) mothers and 12 from SIV (SARS-CoV-2 Infected and Vaccinated) women. SARS-CoV-2-specific neutralizing antibody activity (NA) in plasma was assessed by virus neutralization assay (vNTA) against the SARS-CoV-2 Omicron (Omi, B.1.1.529) strain at delivery (T0) and 3 months after birth (T3).

**Results:** Average time from mother vaccination to delivery was similar in both groups (mean $\pm$ SD: SV=16 months $\pm$ 2.4; SIV=16 months $\pm$  6). In the SIV group, average time elapsed between the infection and delivery was 12 months (mean $\pm$ SD: 12 months $\pm$ 5). At birth, significantly lower NA was observed in infants of SV compared to SIV mothers ( $p < 0.05$ ). NA declined equally in both groups three months after delivery (mean $\pm$ SD: T3 vs T0 in SV=-39% $\pm$ 0.6; T3 vs T0 in SIV=-33% $\pm$ 0.5).

Finally, in non-breastfed infants NA was null at T3, whereas breastfed infants reported a minimal NA (mean $\pm$ SD: 18 $\pm$ 22), independently from previous maternal SARS-CoV-2 infection.

**Conclusions:** Results herein show that:

1. Maternal hybrid immunity confers greater protection at birth;
  2. Neutralization activity drops rapidly over time independently of previous maternal infection and;
  3. Neutralization activity is higher in breastfed newborns.
- Our findings suggest that, regardless of a previous SARS-CoV-2 infection, a booster vaccination should be recommended during pregnancy to confer a higher and long-lasting protection to the newborn.

## TUPEA039

Consecutive SARS-CoV-2 vaccine doses enhance immunity against variants in HIV-positive individuals, especially those with a compromised immune system

A. Vallejo<sup>1</sup>, A. Martin-Hondarza<sup>1</sup>, I. Izuzquiza<sup>1</sup>,

C. Fernandez-Chica<sup>1</sup>, A. Abad<sup>1</sup>, S. Martin-Colmenarejo<sup>1</sup>,

M.J. Pérez-Elías<sup>1</sup>, A. Moreno<sup>1</sup>, J.L. Casado<sup>1</sup>

<sup>1</sup>University Hospital Ramon y Cajal. Ramon y Cajal Institute for Health Research, Infectious Diseases, Madrid, Spain

**Background:** This study explored the impact of the humoral and cellular immune responses to SARS-CoV-2 variants in individuals living with HIV-1 (PLWH), especially those with compromised immune systems, following different COVID-19 vaccines and considered concurrent infections.

**Methods:** A prospective cohort study collected peripheral blood mononuclear cells (PBMCs) after multiple doses of COVID-19 vaccines, including both mRNA- and protein-based vaccines. Multiparametric flow cytometry analysis (IGRA) quantified CD4 and CD8 cell responses against the spike glycoprotein of the Wuhan, Delta and Omicron variants.

Additional assessments included changes in total and specific memory B cells (MBC) and quantification of S-specific IgG antibodies.

**Results:** A total of 151 PLWH under suppressive antiretroviral treatment received successive doses of either mRNA (N=118; Moderna or Comirnaty) or viral vector vaccines (N=33; Oxford-AstraZeneca or Janssen).

After the initial vaccination schedule, individuals with prior SARS-CoV-2 infection and those receiving mRNA-based vaccines showed higher spike IgG antibodies against Wuhan, Delta, and Omicron variants, along with specific MBCs, compared to uninfected individuals, those receiving other vaccines, and HIV-uninfected individuals. Wuhan-specific CD8 cell levels were higher in PLWH receiving mRNA vaccines but still lower than in HIV-uninfected individuals. Immunosuppressed PLWH (CD4 counts below 350 cells/mm<sup>3</sup>) exhibited lower Wuhan/Delta-specific IgG antibodies and specific MBCs.

Additionally, they had fewer Wuhan-specific CD4 cells and Delta-specific CD8 cells. Those with a CD4/CD8 ratio below 0.4 had reduced Delta-specific IgG antibodies, MBC, and Wuhan/Delta-specific CD8 cells. All PLWH received a third mRNA vaccine dose, resulting in significant improvements in all variables.

Intercurrent infections were more prevalent among uninfected PLWH compared to those with previous infection (30% vs. 7%,  $p=0.002$ ). Levels of antibodies and specific CD4/CD8 cells were comparable to healthy individuals. Immunosuppressed individuals exhibited similar levels of all variables, except for MBCs, which were lower compared to immunocompetent individuals ( $p < 0.001$ ). A fourth dose of mRNA vaccine further enhanced immune responses in a limited sample of 15 PLWH.

**Conclusions:** Despite initially lower immune responses in PLWH, particularly those with immunosuppression and a low CD4/CD8 ratio, successive vaccine doses significantly improved both humoral and cellular immune responses. Booster doses, especially for immunosuppressed PLWH, are strongly recommended to optimize immune responses against SARS-CoV-2 variants.

## Course of HIV disease

People presenting with advanced HIV disease are at high risk of dying: a mortality audit could help provide useful lessons

M. Bateganya<sup>1</sup>, C. Mbelwa<sup>1</sup>, C. Holtzman<sup>2</sup>, B. Christian<sup>3</sup>, A. Gelege<sup>3</sup>

<sup>1</sup>USAID, Health Office, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>USAID, Washington DC, United States, <sup>3</sup>Deloitte Consulting Limited, Dar es Salaam, Tanzania, the United Republic of

**Background:** In October 2022, Tanzania reported 4,666 (0.3%) deaths among the 1.6 million people living with HIV (PLHIV) on antiretroviral therapy (ART) that PEPFAR was supporting. Understanding the causes of death is critical to Tanzania achieving the UNAIDS 95-95-95 goals.

**Description:** A death audit was conducted at two health facilities in Lindi Region, one hospital (1,140 PLHIV) and a health center (725 PLHIV). Deaths occurring between October 1, 2022 to June 30, 2023 were assessed for likely causes of death. The virologic and immunological status, retention, and suspected or diagnosed opportunistic infections within the six months of death were reviewed to determine whether death was likely related to advanced HIV disease (AHD). Deaths were categorized as either HIV or non-HIV related.

**Lessons learned:** Overall 41 PLHIV died with a median age of 48 years, 56% were female and 17 (41%) had been on ART <6 months prior to death. Among deceased clients on ART >6 months, median duration on ART was 7-years. 91% had VL < 1000 copies/mL. Of 41 deaths, 19 (46%) were likely AHD related. HIV-related deaths (HRD) were more likely to occur within 6 months of ART initiation (63%) compared to non-HRD (23%). The most common conditions associated with HRD were tuberculosis (37%) and cryptococcal meningitis (26%), while non-communicable diseases (32%) and malaria (23%) were the most associated with non-HRD.

	HRD	Non-HRD
Deaths in FY23 Q1-Q3, n (%)	19	22
Median Age (years)	46	51
Female, n (%)	11 (58%)	12 (55%)
<6 months of ART prior to death, n (%)	12 (63%)	5 (23%)
>6 months of ART prior to death, n (%)	7 (37%)	17 (77%)
Median time on ART (years)	7.7	6.9
VL<1000, n (%)	7 (83%)	15 (94%)

Table 1. Characteristics of HRD and Non-HRD

**Conclusions/Next steps:** Deaths related to AHD or HIV are likely due to late diagnosis and simple mortality audits are a useful way to characterize them. Strategies to improve early diagnosis are critical in decreasing mortality. Among PLHIV on long term ART, screening, and management of NCDs could reduce deaths.

### TUPEB041

Outcomes of people with advanced HIV disease in the intensive care unit in Australia and New Zealand: a retrospective cohort study over three decades

B. Tan<sup>1</sup>, H. Webster<sup>1</sup>, S. Krisnaswamy<sup>1</sup>, D. Pilcher<sup>2,3,4</sup>, A. MacPhail<sup>1,5</sup>

<sup>1</sup>Monash Health, Monash Infectious Diseases, Melbourne, Australia, <sup>2</sup>Alfred Health, Department of Intensive Care, Melbourne, Australia, <sup>3</sup>Australian and New Zealand Intensive Care Society Centre for Outcome and Resource Evaluation, Melbourne, Australia, <sup>4</sup>Monash University, School of Public Health and Preventative Medicine, Melbourne, Australia, <sup>5</sup>Monash University, Faculty of Medicine, Nursing and Health Science, Melbourne, Australia

**Background:** A substantial proportion of people living with Human Immunodeficiency Virus (HIV) present or re-enter care with Advanced HIV disease (AHD). Admission to an Intensive Care Unit (ICU) for people with AHD was contentious in the 1980s and 1990s due to the poor prognosis of AHD at this time.

HIV and ICU management has since evolved, but limited data exist describing changes in survival for the subset of people with AHD and critical illness. We describe outcomes for people with AHD in Australia and New Zealand over three decades.

**Methods:** Retrospective cohort study of ICU admissions in Australia and New Zealand between 1993 and 2022, with a diagnosis of AHD. AHD was defined according to Acute Physiology and Chronic Health Assessment IIIJ, requiring a HIV diagnosis plus AHD-defining complication.

Data were extracted from the Australia and New Zealand Intensive Care Society Adult Patient Database, a binational clinical registry that receives data from over 200 ICUs. Descriptive longitudinal analysis of demographic, clinical, and outcome data was performed.

**Results:** We identified 1505 ICU admissions with comorbid AHD. Admission numbers increased over the study period (n=275 in 1993-2002; n=357 in 2003-2012; n=873 in 2013-2022).

Comparing 1993-2002 to 2013-2022, as demonstrated in Figure 1, we observed substantial reduction in both crude hospital mortality (36% vs 14% p <0.001) and ICU mortality (23% vs 9% p<0.001).

Median age increased (41 vs 53 years, p<0.001), illness se-

verity remained similar (mean APACHE-III score 70.0 vs 73.3,  $p=0.11$ ), and mechanical ventilation rates decreased (57% vs 39%,  $p<0.001$ ).

Figure 1. Crude hospital and ICU mortality.

**Conclusions:** Despite advances in HIV care, there remains a subset of people with AHD who require ICU admission. Mortality in this group has declined by more than 50%, but remains high. Mechanisms for improved survival likely relate to improvements in both ICU and HIV care and remains an important area for further research.

### Mortality rate and cause of death in people living with HIV in long term antiretroviral therapy at HIV-NAT, Bangkok, Thailand

T. Apornpong<sup>1</sup>, S.J. Kerr<sup>1,2,3</sup>, H.M.S. Lwin<sup>1</sup>, S. Gatechompol<sup>1</sup>, S. Thammapiwan<sup>1</sup>, P. Amornritvanich<sup>4,1</sup>, J. Sophonphan<sup>1</sup>, T. Nochaiwong<sup>1</sup>, S. Ubolyam<sup>1</sup>, A. Avihingasanon<sup>1,5</sup>, HIV-NAT 006

<sup>1</sup>HIV-NAT, Thai Red Cross AIDS Research Centre, Bangkok, Thailand, <sup>2</sup>The Kirby Institute, UNSW, Sydney, Australia, <sup>3</sup>Biostatistics Excellence Centre/Chulalongkorn University, Faculty of Medicine, Bangkok, Thailand, <sup>4</sup>Check-up & Wellness Center/Police General Hospital, Department of Family Medicine, Bangkok, Thailand, <sup>5</sup>Excellence Center in Tuberculosis/Chulalongkorn University, Faculty of Medicine, Bangkok, Thailand

**Background:** With increased access to effective antiretroviral therapy (ART), life expectancy of people with HIV (PWH) has significantly improved.

However, mortality rates remain higher than those without HIV. Several deaths can be averted if cause of death could be modified and treated.

We therefore investigated the causes and predictor of death among PWH on long term ART in Thailand.

**Methods:** We retrospectively analyzed data from a prospective long term adult PWH (aged  $\geq 18$  years) cohort at HIV-NAT, Thai Red Cross AIDS Research Centre, Thailand. This cohort was established in 1996. Participants were followed-up 6 monthly. Follow up time was calculated from

the first visit until death. Cumulative all-cause mortality incidence was calculated with losses and transfers considered competing events.

**Results:** A total of 3,156 PWH (70 % male, median age 32 years, median CD4 240 (IQR:111-376 cells/mm<sup>3</sup>) were enrolled. During median duration follow-up of 6.5 (2.5-14.8) years, 227 (7.2%) PWH died, 18/227 (7.9%) died within a year of ART initiation. Almost 56% of them died from non-AIDS related, following by AIDS-related (24%) and unknown cause (20%). The most common causes of death were TB (37: 16.3%), cardiovascular disease (26: 11.5%), hepatocellular carcinoma (12: 5%), and suicides (5%). At the time prior death, median age was 49 years, 68% had HIV RNA  $< 50$  copies/ml and 50 (22%) PWH had prior TB disease. For those with prior TB, 52% died from non AIDS.

In a multivariable model, older age (sub-hazard ratio [sHR]: 1.05, 95%CI: 1.04-1.07), heterosexual male (sHR: 1.72, 95%CI: 1.23-2.43), and ever having TB (sHR: 1.62, 95%CI: 1.13-2.32) were associated with higher mortality after adjusting for baseline CD4 count, and hepatitis B/ C co-infection (Figure1).

Figure 1. Cumulative incidence of mortality by gender.

**Conclusions:** Ever having TB infection was an independent and potentially modifiable risk factor for all-cause mortality. TB prevention in PWH should be aggressively pursued to reduce mortality risk.

The diagnostic performance of a urinary albumin and creatinine point of care test in screening for chronic kidney disease among young people living with HIV in Uganda

E. Nasuuna<sup>1,2</sup>, R. Kalyesubula<sup>3,2</sup>, C. Dziva Chikwari<sup>4,5</sup>, B. Castelnuovo<sup>1</sup>, E. Okello<sup>6</sup>, L.A. Tomlinson<sup>7</sup>, H.A. Weiss<sup>5</sup>

<sup>1</sup>Infectious Diseases Institute, Makerere University College of Health Sciences, Kampala, Uganda, <sup>2</sup>Medical Research Council/Uganda Virus Research Institute and London School of Hygiene and Tropical Medicine Uganda Research Unit, Non Communicable disease Program, Entebbe, Uganda, <sup>3</sup>Makerere University College of Health Sciences, Departments of Physiology and Medicine, Kampala, Uganda, <sup>4</sup>Biomedical Research and Training Institute, Harare, Zimbabwe, <sup>5</sup>MRC International Statistics and Epidemiology Group, London School of Hygiene & Tropical Medicine, London, United Kingdom, <sup>6</sup>Makerere University College of Health Sciences, Department of Medicine, Kampala, Uganda, <sup>7</sup>London School of Hygiene and Tropical Medicine, Department of non-Communicable Disease Epidemiology, London, United Kingdom

**Background:** Point of Care (POC) tests for albumin and creatinine are useful to screen for chronic kidney disease (CKD). They have mostly been used for people living with diabetes mellitus to rapidly identify those at risk of developing kidney disease. Their utility has not been assessed among young people living with HIV (YPLHIV). Our aim was to determine the diagnostic performance of a urinary albumin and creatinine POC for diagnosis of CKD among YPLHIV in Uganda.

**Methods:** We conducted a cross-sectional study comparing the diagnostic performance of MicroalbumPHAN® (Erba Lachema Czech Republic), a urinary albumin and creatinine POC test against the laboratory-measured albumin and creatinine as the reference standard. The participants were YPLHIV aged 10 to 24 years enrolled in seven public HIV clinics. They provided a spot mid-stream urine sample that was tested for albumin and creatinine using the POC and in the laboratory, and for proteinuria using urine dipstick. The albumin creatinine ratio (ACR) was calculated. Demographics and laboratory results were summarised in proportions, means and medians. The sensitivity, specificity, negative and positive predictive values of the POC vs the laboratory test, and factors associated with having a positive POC test using logistic regression were determined.

**Results:** A total of 497 participants were enrolled, 278 (56%) were females and 331 (67%) were aged 10-17 years. More participants had an ACR below 30mg/g on the laboratory measured ACR (88%) than the POC (64%). The POC showed a sensitivity of 74.5% (95% CI 70.6-78.4%) and a specificity

of 68.1% (95% CI 63.9-72.3%). The PPV was 21.5% (95% CI 17.8-25.1%) and the NPV was 95.8% (95% CI 94.0-97.6%) and an accuracy of 68.8%. Having a positive POC test was associated with having proteinuria (OR=2.82; 95% CI 1.89-4.22, p<0.001); a BMI <19.5 (OR=1.69 95% CI 1.17-2.45, p=0.005), and being male (OR=1.48; 95% CI 1.02-2.14, p=0.04).

**Conclusions:** The POC test had low sensitivity and specificity among YPLHIV in Uganda. However, it is still useful to rule out kidney disease given its high negative predictive value. It should be validated among people living with HIV against the 24-hour urinary excretion rate to further determine its diagnostic performance.

### TUPEB044

Clinical relevance of Next Generation Sequencing (NGS) of HIV intracellular DNA

S. Gudipati<sup>1</sup>, A. Golembieski<sup>1</sup>, J. Lee<sup>2</sup>, N. Markowitz<sup>1</sup>

<sup>1</sup>Henry Ford Health, Detroit, United States, <sup>2</sup>Gilead, Seattle, United States

**Background:** Intracellular DNA genotyping may be useful in people with HIV (PWH) with low or non-detectable HIV RNA, contemplating ART change. These assays may miss relevant drug resistance mutations (DRMs) and detect others present in defective virus. Thus, more data are needed to refine the clinical utility of DNA mutations for ART selection.

This study compares baseline HIV DNA and RNA genotypes in PWH initiating their first ART regimen.

**Methods:** In an ongoing study, paired DNA and RNA genotypes were collected on 27 ART-naïve PWH prior to ART initiation and on 3 after initiation. NGS was performed on DNA extracted from peripheral blood mononuclear cells and plasma RNA with the Ion Torrent PGM System. DRMs (threshold ≥1%) were interpreted by the HIV Stanford Database version 9.4. DRMs were categorized by target [protease, reverse transcriptase (RT), and integrase (IN)]; Stanford resistance score for unique codons (≥30 vs <30); variant frequency (≥5% vs <5%); and potential APOBEC activity (pAPOa).

**Results:** Overall, 29/30 PWH had DNA and 23/30 RNA DRMs. Among all DRMs scoring ≥30: 72% occurred in DNA (28% at ≥5%; 45% with pAPOa; 67% in combined RT and IN classes); and 28% occurred in RNA (21% at ≥5%; 18% with pAPOa; 76% in combined RT and IN classes). DNA sequencing detected 17 PWH with RT codon 184V/I mutations which were accompanied by IN DRMs in 13. RNA sequencing detected 2 PWH with codon 184V/I mutations, both with IN DRMs. Excluding pAPOa-specified DRMs, but including all DRMs with Stanford scores ≥0, 11/30 had DNA DRMs while 5/30 had RNA DRMs to 3 or 4 drug classes.

**Conclusions:** DNA genotyping on ART-naïve PWH yielded 2.5-fold more DRMs than RNA genotyping, particularly in RT and IN classes. RT codon 184 DRMs occurred in over half the population and were accompanied by IN DRMs in

76%. Thus, IN-based 2-drug regimens may be at particular risk. Nearly 3/4 of DNA DRMs occurred at low frequency and nearly half showed pAPOa. The predominance low frequency DRMs and pAPOa in DNA vs RNA suggests that some DNA DRMs may be due error or defective virus and cautious interpretation is warranted.

### Increased HIV viral testing output through mega polymerase chain reaction laboratories upgrade in Nigeria: a retrospective study

U.K. Omo-Emmanuel<sup>1</sup>, T.N. Yakubu<sup>2</sup>, O.R. Oyelaran<sup>3</sup>, P. Egena<sup>1</sup>, R. Goldstein<sup>3</sup>, J. Williams<sup>4</sup>, B.A. Pius<sup>3</sup>

<sup>1</sup>United States Agency for International Development (USAID), Integrated Service Delivery, Abuja, Nigeria,

<sup>2</sup>ICAP Global Health at Columbia University, Nigeria,

Laboratory, Abuja, Nigeria, <sup>3</sup>United States Agency for International Development (USAID), Abuja, Nigeria, <sup>4</sup>United States Agency for International Development (USAID), Washington, United States

**Background:** HIV viral load(HVL) monitoring plays a pivotal role in determining treatment success among individuals living with HIV. In Nigeria, as of 2016, inadequate testing capacities posed a significant challenge, only approximately 36% of 700,265 eligible clients receiving antiretroviral treatment had access to HVL testing. In alignment with Federal Ministry of Health's "test and treat" policy, addressing this issue required structural and equipment upgrades, as well as capacity building for personnel. We present a comprehensive analysis of HVL testing in three PCR laboratories in Nigeria both before and after their transformation into mega laboratories.

**Description:** PEPFAR supported substantial laboratory health systems strengthening interventions between 2017 and 2019. We rationalized laboratory services by reducing number of supported PCR laboratories from 27 to 17 based on historical data to improve efficiency and equitable workload distribution. The National Integrated Sample Referral Network was launched. Infrastructural and equipment upgrade for 6 selected high-throughput laboratories to mega laboratories in 2019.

USAID led the upgrade of 3 Laboratories situated at Nigeria Institute for Medical Research (NIMR) Lagos, University of Uyo Teaching Hospital (UUTH) Uyo, and Chukwemeka Odumegwu Ojukwu Teaching Hospital (COOUTH) Awka. Roche Cobas AmpliPrep/Cobas TaqMan 48 & 96 were replaced with Cobas 68/8800 in NIMR while additional Abbott m2000 sp/rt were placed in UUTH and COOUTH.

Additional staff were recruited, backup power supply was provided and allowances for extended working hours beyond the regular 8 hours of operation was introduced. Data on HVL samples received and tested before (January 2017 - December 2019) and after (January 2020 - December 2022) the intervention were collated from the

National Laboratory Information Management Systems and laboratory Registers and analyzed by Multivariate analysis of variance (MANOVA) on IBM SPSS 25.

**Lessons learned:** There was a significant difference in number of samples received & tested in the PCLs with a Wilks' Lambda value of 0.066, ( $p=0.001$ ). The Tests of between-subjects effects for samples received ( $F=18.2$ ,  $p=0.001$ ) & samples tested ( $F=11.1$ ,  $p=0.001$ ) were significant at 5 df. Samples received post-intervention (1,764,436) were greater than samples received pre-intervention (218,136) by 88% (1,546,300). Similarly, samples tested post-intervention (1,669,250) were greater than samples tested pre-intervention (219,587) by 87% (1,449,663).

**Conclusions/Next steps:** These data showed that mega PCL approach to HVL testing services contributed significantly to HVL testing uptake. The findings underscore importance of health system strengthening initiatives in expanding access to critical HIV services, leading to improved HIV treatment outcomes across Nigeria.

<sup>1</sup>Chantal Biya International Reference Center, Yaounde, Cameroon, <sup>2</sup>Chantal Biya International Reference Center, Virology Laboratory, Yaounde, Cameroon, <sup>3</sup>Data First Consulting, Sebastopol, United States, <sup>4</sup>R&D Team Lead - Hyrax Biosciences, Cape Town, South Africa, <sup>5</sup>WHO HIVDR Team, Geneva, Switzerland, <sup>6</sup>Chantal Biya International Reference Center, Medical Analysis Laboratory, Yaounde, Cameroon, <sup>7</sup>University of Rome "Tor Vergata", Experimental Medicine, Faculty of Medicine and Surgery, Rome, Italy, <sup>8</sup>Bambino Gesù Children's Hospital, Rome, Italy, <sup>9</sup>Africa Centres for Disease Control and Prevention (Africa CDC), Addis Ababa, Ethiopia, <sup>10</sup>University of Yaounde I, Faculty of Medicine and Biomedical Sciences, Yaounde, Cameroon

**Background:** Efficient monitoring of HIV drug resistance depends on the use of standardized bioinformatics tools that are reliable and best suited for the identification of drug resistance mutations (DRMs) by healthcare staff. In this frame, we aimed to compare the concordance of the HIV-1 genotypic profiles obtained from sequences analyzed using two editing algorithms.

E-posters

Late-breaker abstracts

Author Index

**Methods:** A comparative study was conducted on plasma samples from HIV-1-infected individuals received at the virology laboratory of the Chantal BIYA International Reference Centre (CIRCB) from April through August 2023 for genotypic resistance testing. Raw HIV-1 sequence data were analyzed simultaneously using RECall™ (semi-manual) versus Exatype™ (automated) algorithms. Statistical analyses were performed on Excel-2016; with  $p < 0.05$  considered statistically significant.

**Results:** A total of 221 HIV-1 sequences were included from patients with a mean age of  $32 \pm 15$  years, 52.5% female and 100% on antiretroviral therapy. According to the quality validation conditions, 70.1% (155/221) of the sequences were validated by RECall™ compared with 60.2% (133/221) by Exatype™,  $p < 0.0001$ .

Specifically, positive and negative concordances between the two algorithms were 85.8% (155/221) and 75% (66/221) respectively, with  $\kappa = 0.78$ . Among sequences edited by the two algorithms, the concordance in terms of identification of viral subtypes was 100% (133/133): CRF02\_AG (81/81), A1 (29/29), G (5/5), F2 (5/5) and others (D, CRF18\_cpx, CRF13\_cpx, CRF01\_AE, CRF37\_cpx: 13/13).

Regarding the detection of DRMs, the two algorithms gave a concordance of 99.0%, 98.0%, 98.6% and 100.0% for DRMs to protease inhibitors, nucleoside reverse transcriptase inhibitors, non-nucleoside reverse transcriptase inhibitors and integrase inhibitors, respectively. The semi-manual algorithm (RECall™) had a higher validation rate (70.1%) for sequence analysis with an average turn-around-time ( $5.5 \pm 1.7$  min) meanwhile the automated algorithm (Exatype™) was faster with only  $2.5 \pm 1.1$  min. Thus, the efficiency (validation rate/turn-around-time) of RECall™ versus Exatype™ was 12.7 (70.1/5.5) versus 24.1 (60.2/2.5).

**Conclusions:** Analysis of DRMs and HIV-1 clades using automated (Exatype™) and semi-manual (RECall™) bioinformatics tools shows a good agreement, supporting the interoperability of these tools in routine clinical practice. However, based on its higher efficiency, the use of the automated algorithm is preferable, while the semi-manual algorithm serves as an alternative in case of failure/inaccessibility to the preferred approach.

### HIV acquisition intra PrEP: do we need to change the existing diagnostic algorithms?

L. Cruces<sup>1,2</sup>, A. Osegueda<sup>1,2</sup>, L. Baquero<sup>1,3</sup>, L. Alfie<sup>1,2</sup>, Y. Longueira<sup>1,2</sup>, M. Pippo<sup>1,2</sup>, J. Barletta<sup>4</sup>, C. Monzani<sup>1,2</sup>, A. Czernikier<sup>1,2</sup>, Y. Ghiglione<sup>1,2</sup>, G. Turk<sup>1,3</sup>, N. Laufer<sup>1,3,4</sup>

<sup>1</sup>CONICET-Universidad de Buenos Aires, Instituto de Investigaciones Biomédicas en Retrovirus y SIDA (INBIRS), Buenos Aires, Argentina, <sup>2</sup>Universidad de Buenos Aires, Facultad de Medicina, Buenos Aires, Argentina, <sup>3</sup>Universidad de Buenos Aires, Facultad de Medicina, Departamento de Microbiología, Parasitología e Inmunología, Buenos Aires, Argentina, <sup>4</sup>Unidad de Enfermedades Infecciosas, Hospital Juan A. Fernández, Buenos Aires, Argentina

**Background:** Pre-exposure prophylaxis (PrEP) is a highly-effective HIV-prevention strategy. Initiating PrEP with a recent undiagnosed HIV-acquisition, or its occurrence during PrEP, could hinder the diagnosis due to a delay in anti-HIV antibodies and viral RNA/proteins detection.

**Methods:** We report the HIV-diagnosis difficulties in one individual that acquired HIV during PrEP, followed for 13-months. ELISA and Rapid-test serology-assays, Western Blot (WB), and viral load (VL) determination in whole and centrifuged (100,000xg 2h) plasma were performed. HIV proviral and total-DNA was evaluated by PCR in PBMC and isolated-CD4+ T-cells. HIV-specific T-cells were evaluated by flow cytometry after 14-day in vitro expansion with HIV-specific peptides.

**Results:** Results from a 36-year-old man who acquired HIV during PrEP (3TC/TDF, initiated 12/26/2022) are depicted in Table 1. On 03/16/2023, cART (3TC/TDF/DLG) was started with the first reactive ELISA (low OD); HIV rapid-test remained negative. WB was indeterminate (gp120 band) along the follow-up, until last visit. Low-range VL was detected from centrifuged-plasma; 0.33 HIV-DNA copies/1M CD4 T-cells were detected. Resistance-assay amplified the integrase HIV-proviral region, no resistance-associated mutations were found. Low magnitude of nef and p24-specific T-cells were found.

**Conclusions:** The standard algorithm might not be useful for HIV-diagnosis during PrEP. A cART-initiation delay could lead to the development of resistance-associated mutations and higher reservoir-size, underscoring the importance of early diagnosis. In this scenario, the use of rapid tests could render false negative results due to their limited number of antigens used in this type of assay. ELISA seems to play a better role for screening in this setting and WB positive criteria should be reconsidered, a single band could be sufficient in this context. RNA-detection techniques could be modified, using concentration techniques for detection of low levels of RNA. These considerations should be included in diagnostic algorithms of HIV-guidelines.

### Improving maternal HIV retesting in maternal newborn and child health clinics using paper-based health records in Zambia, 2022-2023: lessons from 4 provinces

W. Sichembe<sup>1</sup>, M. Selisho<sup>2</sup>, P. Hatimbula<sup>3</sup>, P. Banda<sup>4</sup>, C. Mulendele-Kazila<sup>5</sup>, L. Mbulo<sup>1</sup>, D. Zachary<sup>1</sup>, K. Mweebo<sup>1</sup>, L. Mwiinga<sup>1</sup>, C. Muleya<sup>1</sup>, B. Muyunda<sup>1</sup>, N. Kancheya<sup>1</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention, Lusaka, Zambia, <sup>2</sup>Lusaka Provincial Health Office, Lusaka, Zambia, <sup>3</sup>Western Provincial Health Office, Mongu, Zambia, <sup>4</sup>Eastern Provincial Health Office, Chipata, Zambia, <sup>5</sup>Southern Provincial Health Office, Choma, Zambia

**Background:** Incident maternal HIV acquisition is the leading cause of vertical HIV transmission, particularly during the lactating period. Regular HIV retesting for previously HIV negative pregnant and breastfeeding women (PBFW) can ensure early identification and rapid linkage to antiretroviral therapy (ART) of mother who acquire HIV. We describe maternal HIV retesting scale-up efforts in 4 of 10 Zambian provinces.

**Description:** Maternal Newborn Child Health (MNCH) clinics in Zambia routinely conduct HIV retesting every 3 months on previously HIV negative PBFW. Programmatic

challenges such as high numbers of PBFW in MNCH clinics, limited HIV testing kits, space, and staffing, and limited use of electronic health records (EHR), inhibit optimal retesting. MNCH teams in Eastern, Lusaka, Southern and Western provinces designed and implemented a model to scale-up maternal HIV retesting in all their MNCH clinics from October 2022 onwards. This model consisted of interventions to enhance integrated service-delivery, improve data management, dedicate HIV testing infrastructure, build capacity, task-shift to peer-mothers, and utilize continuous quality improvement approaches (Figure 1).

**Lessons learned:** After a year of implementation, maternal HIV retesting increased by more than 260% (from 116,265-303,142 tests) compared to the pre-implementation period (Figure 2). While the number of mothers diagnosed with HIV only slightly increased, retesting is still an impactful intervention to avert vertical transmission of HIV through interventions such as Pre-Exposure Prophylaxis. When utilizing a paper-based system, the tracking process can be challenging, and implementation of this model required substantial time spent reviewing registers.

Figure 1. The maternal HIV retesting model implemented by 4 provinces in Zambia.

Figure 2. Maternal HIV retesting trends before and during implementation of the model.

**Conclusions/Next steps:** Scaling-up maternal HIV retesting was successfully demonstrated using this model and would be beneficial for other Zambian provinces to adapt. For resource-constrained settings, that rely on paper-based systems, developing similar maternal HIV retesting models is useful for such scale-up efforts. Finally, scaling-up the use of EHR in MNCH clinics is a high priority in Zambia for a more robust maternal tracking system.

**Background:** We investigated the effect of the persistence of CXCR4-tropic virus on the occurrence of clinical events in persons living with 4-drug class resistant HIV (4DR-PWH).

**Methods:** We included PWH with a documented 4-class resistance (NRTIs, NNRTIs, PIs and INSTIs) and ≥2 HIV-tropism determinations during follow-up.

Follow-up accrued from the date of first 4DR evidence (baseline) until last visit (freezing time 31/Dec/2023/death/loss-to-follow-up).

HIV-co-receptor tropism (as determined by V3-loop sequencing) was defined as persistent if it remained unchanged during follow-up.

Clinical events were divided into HIV-related events (conditions included in the CDC classification categories B and C) and non-HIV-related events.

Incidence rates and 95% confidence intervals (IRs, 95%CI) of clinical events calculated with Poisson regression and compared with IR ratios (IRRs). Predictors of clinical events assessed by multivariable Poisson regression.

	Overall N=144	Other N=12	Persistent CXCR4 N=47	p-value
Sex at birth (male)	119 (76.4%)	11 (75.2%)	39 (83.0%)	0.277

HIV-related events <sup>a</sup>	10	16	4.22 (2.43-6.92)	11	14	1.22 (0.67-2.06)	3.46 (1.54-8.25)	0.001
Non-HIV-related events <sup>b</sup>	11	22	6.17 (3.62-9.74)	36	62	1.70 (1.10-2.62)	3.62 (1.91-6.92)	0.001
Major adverse cardiovascular events <sup>c</sup>	4	4	1.06 (0.29-3.88)	11	16	1.45 (0.58-3.62)	0.72 (0.21-2.46)	0.571
HIV-related events <sup>d</sup>	4	4	1.06 (0.29-3.88)	2	3	1.50 (0.38-5.82)	0.70 (0.19-2.64)	0.571
Non-HIV-related events <sup>e</sup>	4	4	1.06 (0.29-3.88)	6	7	1.16 (0.38-3.42)	0.91 (0.24-3.42)	0.878
ADH-defining events <sup>f</sup>	5	10	2.69 (1.44-5.01)	8	10	1.25 (0.47-3.20)	2.15 (0.87-5.30)	0.046
HIV-related clinical events <sup>g</sup>	10	20	5.25 (3.21-8.71)	10	20	2.52 (1.34-4.39)	2.08 (1.12-3.86)	0.042

Table 2. Incidence rates (IR) and incidence rate ratios (IRR) of different clinical events categories between persons with persistent CXCR4-tropism and other tropism (CCR5-tropism, or CXCR4-tropism switch during follow-up).

Abbreviations: IR, incidence rate; IRR, incidence rate ratio; PY, person-years.

a. HIV-related events: all events included in the CDC classification categories B and C.

b. Non-HIV-related events: all events not included in the CDC classification categories B and C.

c. Major adverse cardiovascular events: myocardial infarction, stroke, heart failure, peripheral vascular disease, aortic aneurysm/dissection.

d. HIV-related events: HIV-related events included in the CDC classification categories B and C.

e. Non-HIV-related events: non-HIV-related events included in the CDC classification categories B and C.

f. ADH-defining events: all events included in the CDC classification categories B and C.

g. HIV-related clinical events: HIV-related events included in the CDC classification categories B and C.

After adjusting for age, sex-at-birth and CD4+/CD8+ at baseline, standardized viremia copy-years [adjusted-IRR: 1.66 (95%CI=1.24-2.26), p<.001] and persistent CXCR4-tropism [adjusted-IRR: 2.01 (95%CI=1.04-3.91), p=0.037] were associated with the occurrence of HIV-related events.

**Conclusions:** Among 4DR-PWH, the persistence of CXCR4-tropic virus was associated with an increased risk of HIV-related clinical events.

## TUPEB050

### The role of HIV self-testing in crisis situations: a review of PEPFAR's HIV self-testing kit distribution data from 2019-2023

L. Manfredini<sup>1</sup>, D. Poindexter<sup>2</sup>, A. Ruesch<sup>3</sup>, D. Greensides<sup>4</sup>, J. Rose<sup>1</sup>, J. Grignon<sup>5</sup>

<sup>1</sup>GHTASC, Credence Management Solutions LLC, Supporting U.S. Agency for International Development, Office of HIV/AIDS, Washington, D.C., United States,

<sup>2</sup>STAR Project Implemented by Public Health Institute Supporting U.S. Agency for International Development, Office of HIV/AIDS, Washington, D.C., United States, <sup>3</sup>U.S. Agency for International Development, Bureau for Europe and Eurasia, Washington, D.C., United States, <sup>4</sup>GHTAMS Supporting U.S. Agency for International Development, Office of HIV/AIDS, Washington, D.C., United States, <sup>5</sup>U.S. Agency for International Development, Office of Health, Kyiv, Ukraine

**Background:** The world is experiencing increased crises that have impacted movement of individuals at unprecedented levels. These movement impacts create barriers and reduce access to facility-based HIV testing services (HTS).

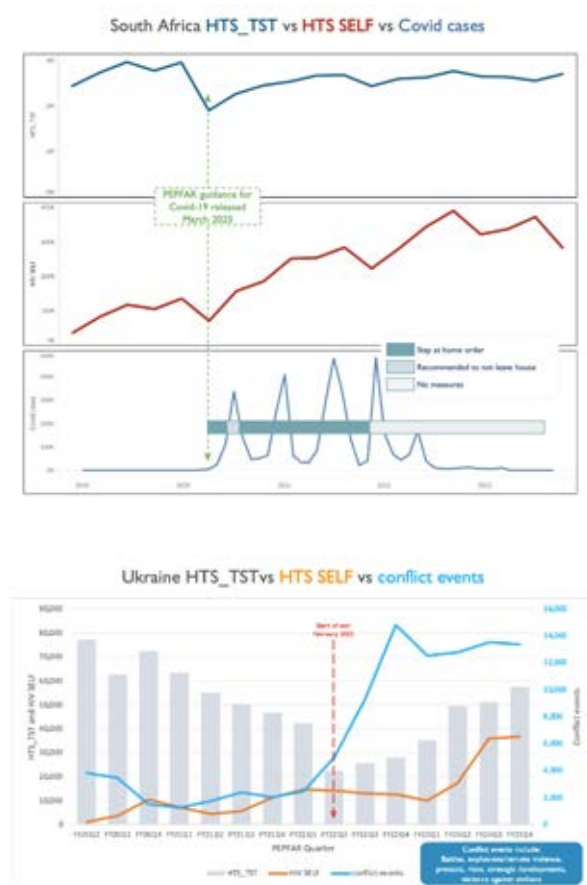

We assessed two instances of PEPFAR countries experiencing crisis situations, from pandemic to full-scale war, and analyzed how the distribution of HIV self-testing (HIVST) kits during this period potentially filled testing gaps.

South Africa accounted for 45% of the continent's COVID-19 cases. The nationwide lockdown, initiated on March 26, 2020, led to the closure of all non-essential services.

The first year of Russia's invasion of Ukraine resulted in significant damage to healthcare infrastructure: 218 hospitals/clinics damaged or destroyed; 181 attacks carried out on other health infrastructure; and 65 ambulances attacked. Access to healthcare was severely disrupted.

**Methods:** We reviewed PEPFAR Panorama Spotlight data from Ukraine and South Africa (FY19-FY23) to compare HIVST distribution and facility HTS. Additionally, we looked at conflict data from the Armed Conflict Location & Event Data Project and Our World in Data for COVID-19 (2020-2023).

**Results:** From March 2020 to 2023, South Africa reported over 4 million COVID-19 cases and 21 months of movement restriction. A 20% decrease in facility HTS coincided with a 430% increase in HIVST distribution. In Ukraine, over 106,000 conflict events from January 2020 - October 2023 coincide with a decrease in facility HTS, and a 572% (FY20-FY23) increase in HIVST distribution.

**Conclusions:** Expansion and utilization of HIVST is a critical tool for preserving access to HTS in countries facing crisis situations.

## TUPEB051

### Prevalence and trajectory of low-level viremia in PLHIV on treatment: a descriptive study in Vietnam, 2018-2023

N. Do<sup>1</sup>, H. Duong<sup>2</sup>, M. Tejan<sup>3</sup>, K. Sulzman<sup>3</sup>, C. Tran<sup>3</sup>, B. Nguyen<sup>4</sup>, C. Nguyen<sup>4</sup>, H. Luong<sup>4</sup>, T. <sup>1</sup>Vietnam Administration for HIV/AIDS Control, Hanoi, Viet Nam, <sup>2</sup>Ho Chi Minh City Center for Disease Control, Ho Chi Minh, Viet Nam, <sup>3</sup>US Centers for Disease Control and Prevention, USA, Division of Global HIV & Tuberculosis, Atlanta, United States, <sup>4</sup>US Centers for Disease Control and Prevention, Vietnam, Division of Global HIV & Tuberculosis, Hanoi, Viet Nam, <sup>5</sup>Ho Chi Minh City Department of Health, Ho Chi Minh, Viet Nam

**Background:** HIV low-level viremia (LLV) (50 to 1,000 copies/mL) is linked to higher risk of virologic failure. WHO guidance recommends adherence interventions for clients with viral load (VL) >50 copies/mL. We sought to investigate the prevalence of LLV among people living with HIV (PLHIV) in Vietnam.

**Methods:** Electronic Medical Records for PLHIV on antiretroviral therapy (ART) between January 1, 2018–July 31, 2023, were analyzed from five provinces and two cities. PLHIV with unique identifiers and ≥2 VL results had their first and last VL results categorized as: undetectable (<50 copies/mL); LLV-low (50-200 copies/mL); LLV-high (201-1,000 copies/mL); and non-suppressed (>1,000 copies/mL). Chi-square tests were used for statistical significance.

**Results:** Of 49,973 PLHIV who met inclusion criteria, 7,124 (14.3%) had ≥ 1 LLV result during the observation period. Within LLV thresholds, the median VL was 92 copies/mL (IQR: 65-170). Males (15.6%) had higher LLV occurrence than females (10.4%) ( $p < 0.001$ ). Partners of PLHIV had slightly higher LLV occurrence (16.8%) compared to men who have sex with men (16.1%), transgender PLHIV (15.8%), people who inject drugs (14.2%), and sex workers (13.6%). Of 2,473 PLHIV with first VL LLV-low, 2,129 (86.1%) had undetectable last VL. Of 656 PLHIV with first VL LLV-high, 499 (76.1%) were undetectable at their last VL. Viral load changes are illustrated in Figure 1. The median time between the first and last VL was 195 weeks (IQR: 107.3, 225.4).

**Conclusions:** In a 5-year period, about 14% of PLHIV on treatment in Vietnam had experienced LLV at least once. Most of those with LLV at first VL became undetectable by their final VL. The proportion of LLV for key populations with HIV were similar to the general PLHIV population. Further analyses to understand the impact of interventions for LLV, including enhanced adherence counseling and ART changes, are planned to inform program priorities.

Bissau, Guinea-Bissau, <sup>8</sup>National TB Program, Bissau,

Guinea-Bissau

**Background:** Over half of childhood tuberculosis (TB) remains undiagnosed yearly. TB culture is often unavailable. WHO recommends Xpert-Ultra as first test for diagnosis of paediatric TB, but microbiological confirmation remains low and often requires invasive procedures.

We aimed to determine the utility of Xpert-Ultra in stools and urine samples to diagnose TB in children living with HIV (CLWH) in two high-TB burden settings.

**Methods:** This cross-sectional multicentric study took place at Simão Mendes hospital, Guinea-Bissau, from July 2019 to April 2020, and in Malakal hospitals, South Sudan, from November 2019 to June 2023. Children 6 months to 15 years with presumptive TB underwent clinical and laboratory assessment, with one respiratory or extrapulmonary sample (gold standard (GS)), one stool and one urine specimens analysed with Xpert-Ultra.

**Results:** A total of 93 CLWH were enrolled from Bissau (n=57) and Malakal (n=36), with 49 (53%) females and median (IQR) age of 3.3 (1.5-10) years. Three-fourth of children had severe acute malnutrition (SAM). A total of 72 (77%) children were on ART at baseline and 26/77 (34%) had CD4 count <200cells/mm<sup>3</sup>.

Confirmation of TB was achieved in 10 (11%); 61 (66%) had unconfirmed TB, and 22 (24%) had unlikely TB. Of 93 children with GS diagnosis, the overall yield of positive TB results was 11% (10/93): 10% (9/90) in pulmonary samples and 20% (1/5) in extrapulmonary samples.

A total of 86 and 91 samples were used to evaluate Xpert-Ultra on stools and urine, respectively. Compared to GS, sensitivity and specificity on stool were 87.5%(95%CI:52.9-97.8) and 100%(95%CI: 95.3-100), whereas on urine were 30%(95%CI:10.8-60.3) and 100%(95%CI:95.5-100), respectively. No children were positive on stools or urine and negative with GS.

**Conclusions:** Xpert-Ultra in stools showed high sensitivity and specificity in children living with HIV when compared to gold standard. Test performance in urine was low but number of confirmed cases was low too, therefore more research could help determine its clinical indication in CLWH.

## Co-infections (including opportunistic infections)

### TUPEB053

Identification of multi-repeat sequences using genome mining approaches for developing highly sensitive molecular diagnostic assay for the detection of curable sexually transmitted infections in HIV burden countries

C. Likhovole<sup>1</sup>, B.N. Kanoi<sup>1</sup>, J. Gitaka<sup>1</sup>, S. Kamath<sup>2</sup>, H.M. Abkhallo<sup>3</sup>, N. Pamme<sup>4</sup>, C.M. Klapperich<sup>5</sup>, S. Raju Lolabattu<sup>2</sup>

<sup>1</sup>Mount Kenya University, Thika, Kenya, <sup>2</sup>Jigsaw Biosolutions,

Bangalore, India, <sup>3</sup>International Livestock Research

Institute, Nairobi, Kenya, <sup>4</sup>Stockholm University, Stockholm,

Sweden, <sup>5</sup>Boston University, Boston, United States

**Background:** Curable sexually transmitted infections (STIs) such as *Neisseria gonorrhoeae* (*N. gonorrhoeae*), *Chlamydia trachomatis* (*C. trachomatis*) and *Treponema pallidum* (*T. pallidum*) and *Trichomonas vaginalis* (*T. vaginalis*) are major causes of poor pregnancy outcome.

The World Health Organization (WHO) recommends STI screening as a component of comprehensive care for people with HIV in recognizing the impact of STI management on HIV incidence. Most STIs are asymptomatic in pregnant women and a syndrome-based approach of testing leads to missed diagnosis.

**Methods:** Here, we have identified new diagnostic target biomarker regions for *N. gonorrhoeae*, *C. trachomatis* *T. pallidum* and *T. vaginalis* using an algorithm for genome mining of identical multi repeat sequences (IMRS). These were then developed as DNA amplification primers to design better diagnostic assays.

To test the primer pair, genomic DNA was 10-fold serially diluted (100pg/μL to 1×10<sup>-3</sup>pg/μL) and used as DNA template for PCR reactions. The gold standard PCR using 16S rRNA for *N. gonorrhoeae*, *C. trachomatis* *T. pallidum* prim-

ers and 18S rRNA for *T. vaginalis* were also run as a comparative test, and both assay products resolved on 1% agarose gel.

**Results:** The *N. gonorrhoeae* and *C. trachomatis* IMRS-PCR assay had an analytical sensitivity of 6 fg/mL and 9.5 fg/μL, respectively representing better sensitivity compared to the 16S rRNA PCR assay with analytical sensitivity of 4.3096 pg/μL. The assays were also validated with clinical samples. Combining the iso-thermal IMRS with a low-cost Lateral Flow Assay, we were able to detect *N. gonorrhoeae* and *C. trachomatis* amplicons at a starting concentration of 100 pg/mL and 10 pg/μL, respectively.

Lower limit of detection analysis confirmed that the *T. pallidum* and *T. vaginalis* -IMRS primers both offered higher test sensitivity of 0.03 fg/μL starting PCR template concentration.

Using the *T. pallidum* and *T. vaginalis* -IMRS primers, we were able to observe Isothermal amplification of genomic DNA at concentration of 0.01 pg/μL and 100 pg/μL, respectively.

**Conclusions:** Our data demonstrate the successful development of cost effective and sensitive lateral flow and isothermal assays for detecting curable sexually transmitted infections with potential use in field settings mostly in HIV burden countries.

## TUPEB054

### High prevalence of hepatitis B virus drug resistance mutations to lamivudine among people with HIV and HBV in rural and peri-urban communities in Botswana

B. Phinius<sup>1,2</sup>, M. Anderson<sup>1</sup>, I. Gobe<sup>2</sup>, M. Mokomane<sup>2</sup>, W. Choga<sup>1,2</sup>, B. Phakedi<sup>1</sup>, T. Ratsoma<sup>1</sup>, G. Mpebe<sup>1</sup>, J. Makhema<sup>1,3</sup>, R. Shapiro<sup>1,3</sup>, S. Lockman<sup>1,3</sup>, R. Musonda<sup>1</sup>, S. Moyo<sup>1,2,3,4,5</sup>, S. Gaseitsiwe<sup>1,3</sup>

<sup>1</sup>Botswana Harvard Health Partnership, Research Laboratory, Gaborone, Botswana, <sup>2</sup>University of Botswana, School of Allied Health Professions, Gaborone, Botswana, <sup>3</sup>Harvard T. H. Chan School of Public Health, Department of Immunology and Infectious Diseases, Boston, United States, <sup>4</sup>Stellenbosch University, Division of Medical Virology, Cape Town, South Africa, <sup>5</sup>University of Pretoria, School of Health Systems and Public Health, Pretoria, South Africa

**Background:** Hepatitis B virus (HBV) remains a global health concern even in the era of potent vaccines and antiretroviral therapy (ART) that can greatly reduce morbidity and mortality. Prolonged antiviral use without adequate monitoring may lead to the selection of variants with resistance associated mutations (RAMs) that reduce ART susceptibility. We aimed to determine the prevalence of hepatitis B virus (HBV) resistance-associated mutations (RAMs) in people with HBV and human immunodeficiency virus (HIV/HBV) in Botswana.

**Methods:** Plasma samples from people with HIV (PWH) recruited in the Botswana Combination Prevention Project (BCPP) (2013 – 2018) were used in this study. We employed next generation sequencing to sequence HBV isolated from participants with HBV and HIV. FASTQ were uploaded into Genome Detective for reference assembly. Consensus sequences were analyzed for genotypic and mutational profiles using Geno2pheno and Stanford HBV database.

**Results:** Overall, 98 HBV sequences had evaluable reverse transcriptase (RT) region coverage. The median participant age was 43 years (IQR: 37, 49) and 66/98 (67.4%) were female. Most participants, 85/97 (87.6%) had suppressed HIV viral load (VL). HBV RAMs were identified in 61/98 (62.2%) participants in 7 HBV RT positions, mostly associated with lamivudine (3TC) resistance and none to tenofovir. There are positions rt204, rt180, rt173, rt250, rt80, rt169 and rt236. Most RAMs were in positions 204 (60.3%), 180 (50.5%) and 173 (33.3%). The triple and double amino acid substitutions, rtV173L/L180M/M204V and rtL180M/M204V were the most predominant (17/61 [27.9%] and 10/61 [16.4%] respectively).

Most participants (96.7%) with RAMs were on ART for a median duration of 7.5 years (IQR: 4.8, 10.5). Approximately 27.9% (17/61) of participants with RAMs had undetectable HBV VL, 50.8% (31/61) had VL <2000 IU/mL and 13/61 (21.3%) had VL ≥2000 IU/mL.

**Conclusions:** In ART-experienced people with HIV/HBV, the prevalence of HBV RAMs to 3TC was high. The high prevalence of 3TC RAMs in this population discourages the use of ART regimens with 3TC as the only HBV-active drug in people living with HIV/HBV. The presence of HBV RAMs hinders HBV elimination efforts hence the need to monitor HBV drug resistance mutations in Botswana and globally.

## TUPEB055

### Trends in and risk factors for drug resistance of *Mycobacterium tuberculosis* in people living with HIV

X. Le<sup>1</sup>, Y. Shen<sup>1</sup>, X. Qian<sup>1</sup>, L. Liu<sup>1</sup>, W. Song<sup>1</sup>, T. Qi<sup>1</sup>, Z. Wang<sup>1</sup>, Y. Tang<sup>1</sup>, S. Xu<sup>1</sup>, J. Wang<sup>1</sup>, J. Chen<sup>1</sup>, R. Zhang<sup>1</sup>, Z. Zhu<sup>1</sup>, J. Sun<sup>1</sup>, J. Yang<sup>1</sup>

<sup>1</sup>Shanghai Public Health and Clinical Center affiliated to Fudan University, Infection and Immunity, Shanghai, China

**Background:** To analyze trends in and risk factors for drug resistance of *Mycobacterium tuberculosis* in people living with HIV and active tuberculosis.

**Methods:** The clinical data of MTB and HIV co-acquired persons treated at the Shanghai Public Health Clinical Center between 2010 and 2022 were collected. The diagnosis of tuberculosis was confirmed by solid or liquid culture. The phenotype drug sensitivity test was carried out with proportional method, and the drug resistance

to first-line and second-line drugs was analyzed. Logistic regression analysis was performed to identify associated risk factors for MTB drug resistance.

**Results:** Of the 304 HIV-acquired people with MTB positive-culture and first-line drug sensitivity test results, 114(37.5%) were resistant to at least one first-line anti-tuberculosis drug. Of the 93 HIV-acquired people with first-line and second-line antituberculosis drug sensitivity test results, 40(43%) were resistant to at least one anti-tuberculosis drug and 20 (21.5%), 27(29.0%), 19 (20.4%), 16(17.2%), 14(15.1%) were resistant to rifampicin, streptomycin, ofloxacin, levofloxacin, moxifloxacin, respectively; seventeen persons (18.3%) had multidrug-resistant tuberculosis (MDR-TB). From 2010 to 2021, the resistance rates of streptomycin and rifampicin were from 14.3% to 40.0% and 8.0% to 26.3%, respectively, showing an increasing trend year by year. From 2016 to 2021, the resistance rate of quinolones was from 7.7% to 27.8%, showing an overall upward trend year by year. Logistic regression analysis showed that age<60 years old was a risk factor for streptomycin resistance, single drug resistance, total resistance (RR 4.139,  $P=0.023$ ; RR 7.734,  $P=0.047$ ; RR 3.733,  $P=0.009$ ). Retreatment was a risk factor for resistance to rifampicin, ofloxacin, levofloxacin (RR 2.984,  $P=0.047$ ; RR 4.517,  $P=0.038$ ; RR 6.277,  $P=0.014$ ).

**Conclusions:** The drug resistance rates of MTB to rifampicin and quinolones in people living with HIV/AIDS are high and increasing year by year. Age and retreatment are the main factors affecting drug resistance.

## TUPEB056

### Characterization of incident hepatitis C virus infection among people living with HIV in a HIV clinic in South Korea

B. Chin<sup>1</sup>, Y. Kim<sup>1</sup>, J. Jeon<sup>1</sup>, M.-K. Kim<sup>1</sup>, J.Y. Jeong<sup>2</sup>, H.C. Kwon<sup>2</sup>, S. Nam<sup>2</sup>

<sup>1</sup>National Medical Center, Division of Infectious Diseases, Department of Internal Medicine, Seoul, Korea, the Republic of, <sup>2</sup>National Medical Center, Division of Gastroenterology and Hepatology, Department of Internal Medicine, Seoul, Korea, the Republic of

**Background:** Coinfection with human immunodeficiency virus (HIV) and hepatitis C virus (HCV) can cause more rapid progression to cirrhosis than HCV-monoinfection. In this study, incident HCV case (IHCV)s were investigated in a HIV clinic in South Korea.

**Methods:** A retrospective HIV cohort was constructed who visited National Medical Center in Korea from 2013 to 2022 and performed  $\geq 1$  anti-HCV antibody tests (anti-HCV) during the study period. IHCV was defined as newly confirmed HCV infection by PCR with a prior negative anti-HCV and factors associated with IHCV were investigated among ALT>150 IU/mL sub-cohort without plausible reasons for ALT elevation.

**Results:** Overall, 2,567 HIV clinic visitors were recruited during the study period and 42 (1.63%) were confirmed as HIV/HCV co-infection. Fifteen IHCVs were identified during the study period. While no IHCV was observed in 2013-2015, incidence of 2016-2019 and 2020-2022 were 0.84 and 1.48 per 1000 person-year, respectively (Figure 1). Subtype 1a were more common among IHCVs in 2020-2022 (8/9) while Subtype 2 dominated in 2016-2019 (5/6,  $p=0.003$ ). Most IHCVs were identified during the evaluation of de novo liver enzyme elevation which was identified through the regularly performed blood tests (86.7%, 13/15).

Comparing twelve IHCVs with ALT>150 IU/mL with 58 HIV mono-infection comparators whose peak ALT exceeded 150 IU/mL during the study period, age, sex, HIV/HCV infection risk factor, CD4 cell count, and HIV-RNA viral load were not different between two groups. However, mean peak ALT of IHCVs was higher than comparators (776 vs. 237,  $p<0.001$ , Figure 2) and syphilis treatment within prior 24 months of ALT elevation was more common in IHCV group (41.7% vs. 12.7%,  $p=0.026$ ).

Figure 2: Peak ALT comparisons between incident HCV cases and HIV mono-infection comparators among ALT>150 cohort

**Conclusions:** Incidence rate of HCV among PLH revealed increasing trend between 2013 and 2022 among visitors at a HIV clinic in South Korea. Subtype 1a dominated among IHCVs after 2020 and recent syphilis treatment was associated with IHCVs.

## TUPEB057

Tuberculosis related mortality among people living with HIV- PEPFAR, [2022-2023]

I. Zabsonre<sup>1</sup>, C. D'auvergne<sup>1</sup>, R. Briceno Robaugh<sup>1</sup>, M. Peterson<sup>1</sup>, K. Kakanda<sup>1</sup>, S. Ahmedov<sup>1</sup>

<sup>1</sup>U.S. Agency for International Development, TB Division (USAID), Washington DC, United States

**Background:** TB remains the world's second leading cause of death from a single infectious agent in 2022, after COVID-19, and caused almost twice as many deaths as HIV/AIDS. The U.S. President's Emergency Plan for AIDS Relief (PEPFAR) monitors TB-related deaths among people living with HIV (PLHIV) in supported facilities in line with its 2023 United Nations High Level Meeting (UNHLM) commitment of finding 2 million PLHIV with TB and avoiding 500,000 TB-related deaths.

**Methods:** We analyzed data from 2022–2023 that were collected in supported facilities. Data were collected as a non-mandatory indicator on a quarterly basis as part of the PEPFAR reporting. The collected variables included TB-related deaths by country, age disaggregation, funding agency and sex.

**Results:** The number of TB-related deaths increased from 2,486 in FY22 (5.2%) to 3,213 in FY23 (6.2%). There were 727 more deaths from TB in FY23. In USAID supported facilities, 17,266 PLHIV died in FY23 vs 16,444 in FY22. There was a 5% increase in PLHIV deaths from FY22 to FY23 representing 33.2% and 34.1% of all reported deaths respectively. These represent 34.1% and 33.2% of the total deaths in FY22 and FY23 respectively. Whilst there was a 2.3% decline in the number of PLHIV deaths in children and adolescents from 2,246 to 2,194 during FY22–FY23, there was a 5.8% increase in TB-related deaths from 104 to 110 over the same period. In FY22, 1,118 females (45%) and 1,368 males (55%) living with HIV died from TB. In FY23, there were also more males who died from TB with 1,684 (52.4%) male and 1,529 female (47.6%) deaths in PEPFAR-supported facilities. Uganda and Kenya are the top countries reporting high numbers of TB related deaths among PLHIV with 517 and 1,096 in FY23 respectively.

**Conclusions:** These data showed an increased number of TB-related deaths among PLHIV and higher rates for children and adolescents living with HIV than adults. There are some data issues in terms of consistency, quality, and completeness at country level. Further investigations and assessments should be conducted in some countries to have a better sense of TB-related deaths among PLHIV.

**Background:** Few reports assess psychosocial effects and behavioral changes after the mpox outbreak. During 8/14/2023–12/04/2023, the Life After Mpox (LAMP) study assessed these among impacted groups.

**Methods:** Via online questionnaire, adult participants in New York City and Houston diagnosed with symptomatic, laboratory-confirmed mpox 10–14 months earlier (during 5/17/2022–1/15/2023) (post-mpox), and persons who did not have mpox and were either living with HIV and diagnosed with an STI within ≤12 months or PrEP-eligible (at-risk) self-reported psychosocial and behavioral changes (increased, decreased, no change) since mpox or the mpox outbreak. Post-mpox and at-risk group responses were compared (Chi-square test).

**Results:** 154 post-mpox and 201 at-risk participants (median ages 35 years) enrolled. Most self-identified, respectively, as: Black/African American (43%, 37%), White (37%, 38%), and/or Hispanic/Latino (49%, 54%); born male (96%, 85%) or female (3.2%, 15%); and currently a male (91%, 72%); [(84%, 62%) reporting male-to-male sex], female (3%, 15%) or transgender (2.6%, 7%) person.

Many in each group were living with HIV (64%, 41%), some reporting VL>200 copies/mL (17%, 12%). Post-mpox participants more often reported increased psychosocial changes.

Changes (since outbreak) differing between post-mpox and at-risk groups included: feeling down, depressed or hopeless ( $p=0.011$ ); unable to stop worrying ( $p=0.004$ ); anhedonia ( $p<0.001$ ); worry about appearance ( $p=0.042$ );

and attending school or work ( $p=0.006$ ) (Table). Changed frequency of hookup/dating app sex differed between groups ( $p=0.002$ ), often increased (16%, 33%). Both groups reported increases in number of sex partners (15%, 23%); group sex (30%, 32%); attending sex venues/sex parties/bathhouses (25%, 39%); and drug (37%, 37%) or alcohol (19%, 25%) use. Drug and alcohol use increased most among Hispanic/Latino participants (50%, 30%).

<sup>a</sup>  $\chi^2$ -value for difference between frequencies of post-ignition and at-risk responses of decreased, increased and no change since ignition outbreak; does not include responses of 'I don't know' or 'data not apply to me'. 'I did not do this' or 'data not apply to me' or missing responses between 0-9 missing responses for each query are not displayed.  
<sup>b</sup> Analysis denominator for frequency of decreased, increased or no change response.

**Conclusions:** Psychosocial effects and behavioral changes after the mpox outbreak occurred in both groups, some more frequent after mpox recovery, some with racial/ethnic variation. Sexual risk behaviors increased. Interventions are needed to reduce mpox psychosocial impact and future mpox/HIV/STI vulnerability.

## TUPEB059

# Testing for and treatment of latent tuberculosis infection (LTBI) in people with HIV at a university hospital in Taiwan

P.-Y. Wu<sup>1</sup>, H.-Y. Sun<sup>2</sup>, W.-H. Sheng<sup>2</sup>, S.-M. Hsieh<sup>2</sup>, Y.-C. Chuang<sup>2</sup>,  
Y.-S. Huang<sup>2</sup>, W.-D. Liu<sup>3</sup>, K.-Y. Lin<sup>2</sup>, S.-C. Pan<sup>2</sup>, H.-Y. Chang<sup>1</sup>,  
Y.-Z. Luo<sup>1</sup>, L.-Y. Chen<sup>1</sup>, Y.-T. Chen<sup>1</sup>, C.-C. Hung<sup>4,5,2</sup>

<sup>1</sup>National Taiwan University Hospital, Center of Infection Control, Taipei, Taiwan, Province of China, <sup>2</sup>National Taiwan University Hospital, Department of Internal Medicine, Taipei, Taiwan, Province of China, <sup>3</sup>National Taiwan University Cancer Center, Department of Medicine, Taipei, Taiwan, Province of China, <sup>4</sup>National Taiwan University Hospital Yunlin Branch, Department of Internal Medicine, Yunlin County, Taiwan, Province of China, <sup>5</sup>National Taiwan University College of Medicine, Department of Tropical Medicine and Parasitology, Taiwan, Taiwan, Province of China

**Background:** HIV infection increases the risk of developing TB among people with latent TB infection (LTBI) by more than 20 times compared with general population. The WHO guidelines therefore strongly recommend testing for and treatment of LTBI be accomplished among PWH. We aimed to investigate the care cascade of LTBI among PWH at a university hospital in Taiwan in 2019–2023.

**Methods:** PWH are provided with free-of-charge interferon-gamma release assay (IGRA) and treatments for LTBI since 2019. LTBI treatments include 1-month daily isoniazid (300 mg) plus rifapentine (600 mg) (1HP), 3-month

weekly isoniazid (900 mg) plus rifapentine (900 mg) (3HP), 4-month daily rifampin (4R), and 9-month daily isoniazid (9H). The patients testing IGRA-positive were advised to receive directly-observed therapy for LTBI after active TB was excluded by review of clinical symptomatology and chest radiography.

**Results:** From 2019 to 2023, 3482 PLWH without a previous history of TB or LTBI treatment underwent IGRA testing. The majority of the included PWH were male (96.6%) (mean age, 41.6 years). Overall, 136 (4.1%) tested IGRA-positive and 35 (1.1%) had indeterminate results. 126 (92.6%) and 1 (2.9%) PWH with positive IGRA and those with indeterminate IGRA result, respectively, initiated LTBI treatment. 1HP (89/121,73.6%) and 3HP (30/121,24.8%) were the most common regimens prescribed. The most frequent ART used were coformulated bictegravir/emtricitabine/tenofovir alafenamide (96/121,79.3%) and DTG-based regimens (21/121, 17.4%).

Overall, 111 (91.7%) PWH completed LTBI treatment and 9 failed to complete LTBI treatment. The most common reasons of treatment non-completion included skin rash, nausea and general malaise. Before LTBI treatment, plasma HIV-1 RNA <200 and <50 copies/ml was 98.3% (119/121) and 93.4% (113/121), respectively, for PWH who initiated LTBI treatment; at 3-6 months of LTBI treatment completion, the respective rate of <200 and <50 copies/ml was 96.4% (106/110) and 94.5% (104/110).

**Conclusions:** The screening rate for LTBI among PWH at the study site was 95.6% and the positive rate was 4.1%. About 92.6% of PWH testing positive for LTBI initiated treatment and only 8.3% failed to complete treatment due to adverse effects. Combination of 1HP or 3HP with integrase inhibitor-based antiretroviral therapy did not compromise the virologic control.

## TUPEB060

## Real-world vaccine effectiveness of mpox vaccination: a systematic review

L.M. Mason<sup>1</sup>, E. Betancur<sup>1</sup>, M. Riera<sup>1</sup>, F. Lienert<sup>2</sup>, R. Torgler<sup>3</sup>,  
S.S. Scheele<sup>4</sup>

<sup>1</sup>P95, Epidemiology and Pharmacovigilance Consulting and Services, Leuven, Belgium, <sup>2</sup>Bavarian Nordic AG, Zug, Switzerland, <sup>3</sup>Bavarian Nordic AG, Medical Strategy, Zug, Switzerland, <sup>4</sup>Bavarian Nordic, Inc. Morrisville, United States

**Background:** MVA-BN (Jynneos®/Imvanex®/Imvamune®), developed to prevent smallpox, was the primary vaccine used during the recent global mpox outbreak. Efficacy of the vaccine against mpox has not yet been demonstrated in clinical trials; however, since the outbreak start, a number of real-world effectiveness studies have been conducted. This systematic literature review aimed to summarize the current evidence on the vaccine's effectiveness, analyse the strengths and limitations of the studies, and review the quality of the available evidence.

**Description:** PubMed, Embase, and LILACS were searched as well as grey literature sources such as MedRxiv and publications' reference lists to identify observational studies published between January 2022 and November 2023 estimating vaccine effectiveness (VE) or the risk of infection among vaccinated compared to unvaccinated individuals.

Data was extracted from the selected articles, including study characteristics, methods, measures of association, and crude and adjusted VE estimates.

**Lessons learned:** Thirteen studies were identified that reported data on VE. VE estimates ranged from 35% to 89% for a single dose (reported by eleven studies) and from 66% to 90% for two doses (reported by six studies). Heterogeneity existed between studies in design and in how the 'at risk' population was defined and captured, which may contribute to the observed differences in VE estimates.

For instance, at risk populations used to capture controls or in which the underlying vaccine coverage was estimated varied from wide populations including all men who have sex with men to more select populations of those receiving HIV-PrEP or those with recent sexually transmitted infections only.

Despite this, the VE estimates were fairly similar across studies with the exception of one low outlier.

**Conclusions/Next steps:** Despite variations in study methods and how 'at-risk' populations were defined, the MVA-BN vaccine was consistently shown to be effective in preventing mpox when administered as either one or two doses.

**Background:** The high burden of tuberculosis (TB) in Africa (208 annual cases/100,000 population) has implications for clinical trial design, safety monitoring, and data interpretation. We describe baseline TB prevalence as well as TB incidence and mortality during the first six months of CoVPN 3008 (Ubuntu), a study of the mRNA-1273 Covid-19 vaccine in predominantly people living with HIV (PLWH) in East and Southern Africa.

**Methods:** We enrolled adults living with HIV or another comorbidity associated with severe Covid-19 at 47 sites in seven countries. Participants were asked about prior or current TB at enrolment to determine baseline prevalence. Serious adverse events (SAEs), including hospitalizations and deaths, were captured for all participants throughout the study duration. Incident TB was assessed when reported as an SAE. Odds ratios were derived using univariate logistic regression to associate TB outcomes with baseline characteristics.

**Results:** Among 14,237 participants enrolled from December 2021 to September 2022, 14,001 (83% PLWH) were analysed for a six-month post-enrolment period. For PLWH, median CD4 count was 635 cells/mm<sup>3</sup> (IQR 423-866) and 18.5% had a detectable HIV viral load. 142 participants (1%) had active TB at enrolment, of whom 121 (85%) were PLWH. 1,743 (12%) had baseline history of prior TB. 26 (0.19%) participants (including 25 PLWH) were identified with TB during follow-up, for an incidence of 394 per 100,000 person-years. Incidence was strongly associated with prior TB, low CD4 counts, and HIV viremia (Table 1). Among active cases at enrolment and incident cases, 12/168 (7%) died, for a TB mortality incidence of 179 deaths per 100,000 person-years.

Baseline characteristic	Participants without TB at baseline* N=13,859 N (%)	Participants with incident TB* N=26 N (%)	Odds Ratio (95% CI)	P value
Age ≥ 40 years	6434 (46%)	11 (42%)	0.85 (0.39, 1.84)	0.674
Male sex at birth	3826 (27%)	10 (38%)	1.54 (0.74, 3.62)	0.220
BMI ≤ 18.5	1229 (9%)	4 (15%)	1.87 (0.64, 5.44)	0.290
History of prior TB	1743 (12%)	9 (35%)	3.69 (1.64, 8.30)	0.002
Living with HIV	11,560 (83%)	25 (96%)	4.99 (0.67, 36.78)	0.119
CD4 count <200 cells/mm <sup>3</sup> **	730 (5%)	15 (58%)	22.70 (10.16, 50.71)	< 0.0001
CD4 count <500 cells/mm <sup>3</sup> **	3760 (27%)	21 (81%)	10.95 (3.75, 31.91)	< 0.0001
HIV viral load ≥50 copies/mL**	2639 (20%)	17 (65%)	6.86 (2.83, 15.22)	< 0.0001

\*142 participants with active TB at baseline were excluded from assessment of TB incidence and association with baseline characteristics. \*\*Among PLWH (N=11,560).

Table 1. Baseline characteristics and association with TB incidence.

**Conclusions:** This African cohort of largely PLWH experienced a high burden of TB disease and mortality, particularly those with uncontrolled HIV. Clinical trials involving PLWH in this region should include TB screening, robust safety surveillance, and engagement with local health experts for provision of comprehensive HIV/TB care.

## TUPEB063

### Tuberculous pericarditis with and without HIV in adults in Thailand's tertiary care center

R. Sirijatuphat<sup>1</sup>, T. Boonrubjiraroj<sup>1</sup>

<sup>1</sup>Mahidol University / Faculty of Medicine Siriraj Hospital, Medicine, Bangkok, Thailand

**Background:** The data on HIV-associated tuberculous (TB) pericarditis in Thailand is still sparse. This study aimed to determine the significant differences between TB pericarditis in HIV-positive and HIV-negative adults in Thailand.

**Methods:** A retrospective study was conducted in adults with TB pericarditis at Siriraj Hospital, Bangkok, Thailand, from January 2005 to December 2021.

**Results:** Of the 114 cases included, 25 (21.9%) had HIV-associated TB pericarditis, and 89 (78.1%) had non-HIV-associated TB pericarditis. Most HIV-positive individuals were male (56.0%) with a median (IQR) CD4 level of 84 (23-161) cells/mm<sup>3</sup> and did not receive antiretroviral therapy (92.0%). The HIV-positive cases were younger than HIV-negative cases (median (IQR) age: 33 (29-48) vs. 57 (45-74) years,  $p < 0.001$ ). Fever (83.3% vs. 61.4%,  $p = 0.044$ ),

hepatomegaly (66.7% vs. 35.6%,  $p = 0.006$ ), and cardiac tamponade (44.0% vs. 23.6%,  $p = 0.045$ ) were more common in HIV-positive adults than in HIV-negative adults. TB dissemination (87.5% vs. 42.5%,  $p < 0.001$ ) and positive mycobacterial blood culture (33.3% vs. 1.5%,  $p < 0.001$ ) were more significantly observed in HIV-positive individuals than those without HIV. Comparison between HIV-associated TB pericarditis and non-HIV-associated TB pericarditis resulted in a lower rate of obtained pericardial samples (52.0% vs. 82.0%,  $p = 0.002$ ), a higher rate of positive TB molecular testing (58.3% vs. 25.0%,  $p = 0.036$ ), and a positive TB culture (66.7% vs. 37.1%,  $p = 0.066$ ) in pericardial samples; however, the rate of positive AFB in pericardial samples was not significantly different in both groups (15.4% vs. 12.7%,  $p = 0.677$ ). Only one MDR-TB infection was found in the HIV-positive group. Anti-TB treatment and corticosteroid therapy were similar in both groups. Surgical treatment was performed in 48 adults without HIV (53.9%) but only in 2 adults with HIV (8.0%) ( $p < 0.001$ ). In-hospital mortality was not different in HIV-positive and HIV-negative groups; however, 1-year mortality was significantly higher in HIV-positive individuals than HIV-negative individuals (52.0% vs. 19.1%,  $p = 0.001$ ).

**Conclusions:** Compared to non-HIV-associated TB pericarditis, HIV-associated TB pericarditis appears to be a more aggressive disease with a higher mortality rate and a greater propensity for TB dissemination.

## TUPEB064

### Barriers and facilitators to Mpox vaccination among populations at high risk for exposure

A. Richterman<sup>1</sup>, C. O'Brien<sup>1</sup>, F. Ghadimi<sup>1</sup>, E. Sumners<sup>2</sup>,

A. Ford<sup>2</sup>, N. Houston<sup>3</sup>, S. Tate<sup>3</sup>, N. Aitchison<sup>1</sup>,

H. Nkwhihoreze<sup>1</sup>, J.B. Jemmott 3rd<sup>1</sup>, F. Momplaisir<sup>1</sup>

<sup>1</sup>University of Pennsylvania, Philadelphia, United States,

<sup>2</sup>The COLOURS Organization, Philadelphia, United States,

<sup>3</sup>Bebashi-Transition to Hope, Philadelphia, United States

**Background:** Little is known about beliefs, barriers, and facilitators to Mpox vaccination among sexual and gender minorities, people of color, and people living with HIV (PLWH) — populations at high-risk for exposure or adverse outcomes.

**Methods:** We conducted semi-structured interviews of individuals in Philadelphia recruited at University of Pennsylvania clinics and two community-based organizations serving LGBTQ-identifying persons of color who:

1. Were cisgender men who had sex with men, or transgender identity,
2. Had a sexually transmitted infection in the last 12 months, or sex with multiple partners within the last 2 weeks.

We used purposive selection to ensure inclusion of PLWH. We also interviewed health care workers at UPHS who were involved with the vaccine roll out.

We used an integrated analysis approach combining modified grounded theory and implementation science constructs.

**Results:** We interviewed 30 healthcare clients and community members 2/2023-9/2023 (median age 34 years [IQR 30-38.5]; 73% cisgender male; 13% Hispanic, 40% non-Hispanic White, 43% non-Hispanic Black, 3% non-Hispanic Asian; 33% PLWH; 43% Mpox vaccinated), and 10 health care workers (physicians, nurses, social workers, schedulers).

Healthcare client and community member participants varied in their perceptions of community- and self-risk for Mpox, depending on the perceived importance of sexual identity (e.g., "gay") versus specific sexual behaviors (e.g., "condomless sex"), but generally believed that at-risk individuals should be vaccinated. They reported trusting Mpox information from sources they trusted for other health information, such as health departments, community-based organizations, or knowledgeable members of social networks.

Commonly reported barriers to vaccination included inadequate awareness/knowledge, misinformation, burdensome registration processes, and vaccine availability. Facilitators included perceived self-risk, technological literacy, and having time and resources to find and register for vaccination. Health care workers identified barriers to vaccination at multiple levels including stigma associated with the physical mark at the vaccination site, logistical challenges coordinating with the city health department, and inadequate staffing to meet the sudden upsurge in demand.

**Conclusions:** Participants identified important structural and informational barriers to receiving Mpox vaccination during the public health emergency. Harmonizing vaccination efforts with preexisting trusted health-, community-, and social network-based resources may improve uptake and reduce disparities.

## TUPEB065

Integrating cervical cancer screening into routine HIV/AIDS care clinics: a strategic approach for increased uptake, early detection, and treatment of precancerous lesions among women living with HIV at Maanyi H.C.III

A. Mutegeki<sup>1</sup>, M. Julius<sup>1</sup>, B. Moses<sup>2</sup>, D. Mark<sup>3</sup>

<sup>1</sup>Maanyi Health Center III, ART, Kampala, Uganda, <sup>2</sup>Mildmay Uganda, CQI, Kampala, Uganda, <sup>3</sup>Mildmay Uganda, Health System Strengthening, Kampala, Uganda

**Background:** This project aimed at assessing the impact of an integrated cervical cancer screening initiative within routine HIV/AIDS care clinics at Maanyi H.C.III. The primary objective was to increase the percentage of women of reproductive age living with HIV screened for cervical cancer. The hypothesis tested is that integrating cervical

cancer screening into regular HIV care will lead to a significant improvement in screening rates among this population. The project addressed the critical need to enhance preventive measures and early detection for cervical cancer among women living with HIV.

**Methods:** The project was conducted at Maanyi H.C.III in Mityana, Uganda. The research employed a Continuous Quality Improvement (CQI) approach, integrating cervical cancer screening into ART clinic days. Women of reproductive age accessing HIV care were provided comprehensive health education, screened based on eligibility criteria, and those found positive received prompt treatment. Qualitative data were collected through interviews and focus group discussions with healthcare providers and women accessing HIV care. A longitudinal analysis of screening rates was performed.

**Results:** The percentage of HIV Positive women screened for cervical cancer increased from 20% (10/50) in April 2023, to 29% (14/48) in May 2023, to 31% (14/45) in June 2023, to 50% (25/50) in July 2023, to 82% (40/49) in August 2023, 91% (50/55) in September 2023, to 100% (49/49) in October 2023, to 100% (35/35) in November 2023. Qualitative findings revealed positive patient experiences and enhanced collaboration between HIV and cervical cancer screening health teams.

**Conclusions:** The study's significance lies in achieving the targeted 100% screening rate, showcasing the feasibility and success of integrating cervical cancer screening into routine HIV care. This integrated approach contributes to a patient-centered strategy, ensuring comprehensive healthcare for women living with HIV. The results emphasize the potential for sustainable, holistic healthcare initiatives that address multiple health concerns simultaneously.

Future implications include the scalability of this model to similar settings, reinforcing the importance of integrated services for improved HIV prevention, treatment, and overall healthcare support.

Comparison of serologic responses of early syphilis to treatment with single-dose ceftriaxone plus doxycycline versus single-dose benzathine penicillin G plus doxycycline among people with HIV: interim analysis

T.-Y. Wu<sup>1</sup>, K.-Y. Lin<sup>1</sup>, H.-Y. Sun<sup>1</sup>, Y.-S. Huang<sup>1</sup>, W.-D. Liu<sup>1</sup>, A. Cheng<sup>1</sup>, W.-H. Sheng<sup>1</sup>, W.-C. Liu<sup>1</sup>, K.-H. Chen<sup>1</sup>, S.-Y. Chang<sup>2</sup>, C.-C. Hung<sup>1,3</sup>

<sup>1</sup>National Taiwan University Hospital and National Taiwan University College of Medicine, Department of Internal Medicine, Taipei, Taiwan, Province of China, <sup>2</sup>National Taiwan University Hospital and National Taiwan University College of Medicine, Department of Laboratory Medicine, Taipei, Taiwan, Province of China, <sup>3</sup>National Taiwan University Hospital Yunlin Branch, Department of Internal Medicine, Yunlin, Taiwan, Province of China

**Background:** Co-infections of chlamydia and gonorrhea are common among people with HIV (PWH) experiencing early syphilis. Ceftriaxone and doxycycline, as alternative antibiotics for the treatment of early syphilis, may be effective not only for syphilis but also for chlamydia and gonorrhea.

The study aimed to evaluate the efficacy of a single-dose ceftriaxone combined with doxycycline for the treatment of early syphilis among PWH.

**Methods:** We conducted an open-label, randomized-controlled, non-inferiority trial to compare serologic responses to treatment with a 1-g single-dose ceftriaxone combined with 7-day doxycycline versus a 2.4-MU single-dose BPG combined with 7-day doxycycline in PWH who presented with early syphilis. Rapid plasma regain (RPR) titers were determined at baseline and weeks 4, 12, 24, 36 and 48. *T. pallidum* PCR (TP-PCR) and bacterial sexually transmitted infections (STIs) screening were performed at baseline on specimens collected from oral rinse, urethral and rectal sites, with follow-up tests performed weekly for 4 weeks and at week 4, respectively.

The primary outcome was the serologic response of syphilis at 24 weeks, which was defined as at least a 4-fold decline in RPR titers. The secondary outcomes were microbiologic responses of syphilis and bacterial STIs.

**Results:** From March to November 2023, 32 PWH with early syphilis received a single-dose ceftriaxone plus doxycycline (CTX/Doxy) and 22 received a single-dose BPG plus doxycycline (BPG/Doxy). All participants were men who have sex with men, with a baseline median CD4 count of 557 cells/mm<sup>3</sup> and 88.9% having plasma viral load <200 copies/mL. The baseline co-infection rates of chlamydia and gonorrhea were 38.9% and 14.8%, respectively. In the intention-to-treat analysis, PWH receiving CTX/Doxy had a numerically higher serologic response rate at 6 months of treatment than those receiving BPG/Doxy (71.4% vs 42.9%,  $P=0.346$ ). At week 4, the microbiologic responses for chlamydia were similar between the two study groups,

whereas more PWH receiving CTX/Doxy achieved microbiologic responses for syphilis and gonorrhea compared to those receiving BPG/Doxy (93.5% vs 75.0% and 100% vs 40.0%, respectively).

**Conclusions:** In this interim report, CTX/Doxy achieved numerically higher serologic and microbiologic responses in PWH with early syphilis than BPG/Doxy during a 6-month follow-up period.

## TUPEB067

Prioritizing advanced HIV disease screening for treatment interruption in PLHIV: early learnings from implementation of new guidelines in Zimbabwe

R. Dhliwayo<sup>1</sup>, L. Dziva<sup>1</sup>, T. Ngwenya<sup>1</sup>, C. Mupanguri<sup>2</sup>, B. Mushangwe<sup>1</sup>, G. Gonesse<sup>1</sup>, T. Apollo<sup>2</sup>, O. Mugurungi<sup>2</sup>, T. Maphosa<sup>3</sup>, H.J. Cham<sup>3</sup>, K. Thomson<sup>4</sup>, S. Wiktor<sup>4</sup>, B. Makunike-Chikwinya<sup>1</sup>

<sup>1</sup>Zimbabwe Technical Assistance, Training & Education Centre for Health (Zim-TTECH), Public Health, Harare, Zimbabwe, <sup>2</sup>Ministry of Health and Child Care, Medical, Harare, Zimbabwe, <sup>3</sup>Centre of Disease Control and Prevention, Public Health, Harare, Zimbabwe, <sup>4</sup>University of Washington, Public health, Seattle, United States

**Background:** People living with HIV (PLHIV) who experience treatment interruption are at high risk for mortality caused by advanced HIV disease (AHD), including tuberculosis (TB) and cryptococcal meningitis. In 2022 Zimbabwe introduced a new national guideline to facilitate immediate AHD screening of PLHIV reengaging in care.

**Description:** A total of 70 public sector facilities across five provinces implemented the new guideline for PLHIV returning to care. PLHIV returning to care were categorized based on time disengaged from care (<3 months or ≥3 months). PLHIV with treatment interruption ≥3 months are indicated for immediate AHD screening, starting with VISITECT CD4 point-of-care testing, and then further same-day screening with cryptococcal antigen lateral flow assay (CrAg LFA), and tuberculosis lipoarabinomannan antigen assays (TB-LAM) for those with CD4<200. Here we present data on PLHIV reengaging in HIV care in the first twelve months of implementation, from Oct 1, 2022, to Sept 30, 2023.

**Lessons learned:** A total of 1,821 PLHIV were reengaged in care between October 1, 2022, and September 30, 2023. Among these, 81.4% (1,484) were reengaging in care after ≥ 3 months treatment interruption. Of these 23.2% (345/1,484) received CD4 testing and 41.2% (142/345) had CD4 count <200 cells/μL. Of those tested, 12.4% (25/202) were positive for TB-LAM and 5.9% (11/187) were positive for CrAg. Of the total receiving CD4 testing 15.1% (52/345) were reached on subsequent visit. Health-care workers reported that guidelines specifying which laboratory test to prioritize for PLHIV returning to care was helpful, although

client flow and staff shortages were cited as additional challenges to implementation. Additionally, there is need to close the gap and ensure that recipients of care get AHD screening on point of re-engagement into care as it becomes difficult to offer the package on subsequent visits.

**Conclusions/Next steps:** Re-engaging in care guidelines have reinforced the importance and execution of pro-active clinical review and testing for clients at high risk of AHD. However, efforts to secure adequate staffing, establishing client flow, and consistent stocks of commodities are needed to improve comprehensive implementation of these guidelines at scale.

## TUPEB068

Is doxycycline post-exposure prophylaxis being utilised in Germany? Insights from an online survey among German men who have sex with men

L. Wagner<sup>1</sup>, C. Boesecke<sup>2</sup>, A. Baumgarten<sup>3</sup>, S. Scholten<sup>4</sup>, S. Schellberg<sup>5</sup>, C. Hoffmann<sup>6</sup>, F. Audebert<sup>7</sup>, S. Noe<sup>8</sup>, J. Erber<sup>1</sup>, M. Lee<sup>1</sup>, J. Triebelhorn<sup>1</sup>, J. Schneider<sup>1</sup>, C.D. Spinner<sup>1</sup>, F. Voit<sup>1</sup>

<sup>1</sup>TUM School of Medicine and Health, Munich, Germany,

<sup>2</sup>University Hospital Bonn, Bonn, Germany, <sup>3</sup>Center

for Infectiology, Berlin, Germany, <sup>4</sup>Private Practice

Hohenstaufenring, Cologne, Germany, <sup>5</sup>Novopraxis

Berlin GbR, Berlin, Germany, <sup>6</sup>ICH Study Center, Hamburg,

Germany, <sup>7</sup>Praxiszentrum Alte Mälzerei, Regensburg,

Germany, <sup>8</sup>MVZ München am Goetheplatz, Munich,

Germany

**Background:** Doxycycline post-exposure prophylaxis (Doxy-PEP) reduces the likelihood of bacterial sexually transmitted infections (STI) such as syphilis, gonorrhea, and chlamydia by approximately to two-thirds in a single study with men who have sex with men (MSM) in the United States of America. Currently, data on the frequency of Doxy-PEP use in German MSM are limited.

This study aimed to assess the estimates, knowledge, and frequency of Doxy-PEP use in the German MSM community.

**Methods:** We conducted a national online survey in Germany from summer to fall of 2023, recruiting MSM and transgender women aged  $\geq 18$  years. Participants were invited to complete the online survey through social media, online dating platforms, and print media advertisements, with active recruitment and poster advertising in private practices, tertiary outpatient clinics, and MSM community events in Munich.

**Results:** In total, 438 participants completed the online survey and were included in the study analysis. The majority of 433 participants identified themselves as male, 380 as homosexual, and 76 were living with the human immunodeficiency virus (HIV). In total, 209 participants reported HIV pre-exposure prophylaxis (PrEP) use. Overall, 170 participants have heard of Doxy-PEP, and 275 would

consider taking it, but only 32 reported having ever taken Doxy-PEP. In most cases, Doxy-PEP was prescribed by a medical practitioner (20 participants). The most common reasons for a negative attitude towards Doxy-PEP were apprehension about insufficient detailed information and concerns about antibiotic resistance. Most Doxy-PEP users described positive experiences with it and would be willing to retake it. Doxy-PEP users were more often on HIV PrEP, had a higher self-reported risk of bacterial STIs, and reported a history of bacterial STIs more frequently compared to participants who had no prior experiences with Doxy-PEP.

**Conclusions:** The study demonstrates high awareness and strong interest in Doxy-PEP among German MSM; however, the actual usage of Doxy-PEP remained low in the summer and fall of 2023.

## TUPEB069

Tuberculosis and HIV-coinfection in children at a tertiary hospital in Zambia: a 15-year retrospective review of TB notifications

S. Simwanza<sup>1</sup>, C. Chabala<sup>1,2</sup>

<sup>1</sup>University of Zambia, School of Medicine, Lusaka, Zambia,

<sup>2</sup>University Teaching Hospitals, Children's Hospital, Lusaka, Zambia

**Background:** HIV-positive children are disproportionately affected by TB. There have been many programmes targeting HIV and TB elimination. We aimed to explore the prevalence and trends in childhood TB-HIV coinfection from 2007 to 2021 at a tertiary hospital in Zambia.

**Methods:** We conducted a retrospective observational study at the University Teaching Hospitals - Children's Hospital in Lusaka, Zambia. All children aged 0 to 15 years diagnosed with TB between 2007 and 2021 recorded in hospital TB registers per national TB guidelines were included.

A complete enumeration of eligible children in the registers was conducted using a hospital-validated data-collection tool. We collected sociodemographic and TB/HIV data and fitted linear regression models to assess trends in subgroup-specific TB-HIV coinfection rates.

**Results:** Among 6075 children diagnosed with TB, 52% were male, 96% had a documented HIV status, and the overall prevalence of TB-HIV coinfection was 46.2%(95%CI: 45.0-47.5). The prevalence among females was 47.3%(95%CI: 45.5-49.1) and among males was 45.2%(95%CI: 43.5-47.0). The median age was 3 years(IQR: 1 - 8 years).

In the fitted models, the overall baseline prevalence of TB-HIV coinfection was 55% (95%CI; 47-63) reducing annually at -1.3%(95%CI; -2.3% to -0.37%,  $p=0.011$ ). Infants had the highest coinfection baseline(70%; 95%CI; 61-79) reducing at -2.5% per year. Coinfection in children aged 1-4 years and 5-15 years reduced at -1.3% per year (95%CI; -2.4% to -0.24%,  $p=0.020$ ) and -0.71% (95%CI; -1.8% to 0.33%,  $p=0.20$ )

respectively from a baseline of 50%(95%CI: 41-59) and 52%(95%CI: 43-60). Coinfection in males and females reduced at -1.4% per year(95%CI: -2.4% to -0.45%,  $p=0.008$ ) and -1.2% per year(95%CI: -2.2% to -0.22%,  $p=0.021$ ) from 54% and 55% respectively.

**Conclusions:** We observed a reduction over time in TB-HIV coinfection rates among children, suggesting the effectiveness of childhood TB/HIV-elimination activities and the need to sustain and expand them. Trends incorporating nationwide treatment outcomes and the efficacy of specific elimination programs should be assessed in the future.

## TUPEB070

### Evaluation of the performance of the NeuMoDx MPXV Test

M. Obermeier<sup>1</sup>, E. Ahmed<sup>1</sup>, R. Ehret<sup>1</sup>

<sup>1</sup>Medizinisches Infektiologiezentrum Berlin, Laboratory Medicine, Berlin, Germany

**Background:** Timely testing of m-pox virus (MPXV) is important for client care, contact tracing, and decreasing transmission. The objective of this study was to evaluate the accuracy of the new NeuMoDx MPXV Test in detecting m-pox virus (MPXV) from swabs compared with an in-house assay developed to begin of the global outbreak 2022.

**Methods:** We tested 247 MPXV-positive and 50 MPXV-negative archived (-20°C) residual samples in parallel on the NeuMoDx with the MPXV Test strips (Qiagen) and with an in-house PCR (LDT, primer and probes from TibMolbiol, cfx96 Biorad; extraction Nimbus, Seegene) to estimate the correlation between both tests. In a dilution series from a sample quantified by digital PCR, the detection limits (95% hit-rates) of the tests were determined by probit analysis.

**Results:** All client samples initially negative for MPXV were confirmed as negative with both tests. All 247 initial in-house PCR-positive results were reported positive with both tests. The correlation between results of both tests was very high ( $R^2: 0.95$ ) but with an intercept of about 4 Ct. The mean difference in Ct values determined by Bland-Altman analysis was 4.74 cycles, with the lower Ct values in the NeuMoDx MPXV Test strips. The probit analyses gave

95% hit-rates of 445cps/mL for the LDT and for the NeuMoDx MPXV Test a value below 32cps/mL, the last dilution step in our analysis.

**Conclusions:** In this comparative analysis the NeuMoDx MPXV Test assay showed a high specificity and very good sensitivity with a lower detection limit below 32 copies/mL. The random access capabilities of the NeuMoDx system allowed for improving turn-around-time of results in comparison to the batchprocedure-based LDT assay.

## Co-morbidities and clinical complications of HIV and antiretroviral therapy

### Weight gain prediction in naive treated people with HIV using a machine learning approach

C. Codde<sup>1</sup>, C. Benoist<sup>2</sup>, L. Hocqueloux<sup>3</sup>, C. Delpierre<sup>4</sup>, J.-F. Faucher<sup>1</sup>, J.-B. Woillard<sup>5</sup>, Dat'Aids Study Group  
<sup>1</sup>Dupuytren University Hospital Center, Infectious Diseases, Limoges, France, <sup>2</sup>Limoges University, INSERM U 1249 Pharmacology & Toxicology, Limoges, France, <sup>3</sup>Orleans Hospital Center, Infectious Diseases, Orléans, France, <sup>4</sup>Toulouse University, Toulouse, France, <sup>5</sup>Dupuytren University Hospital Center, Pharmacology & Toxicology, Limoges, France

**Background:** Excessive weight gain in naive treated people living with HIV is well known, especially with integrase inhibitor or tenofovir alafenamide but exhibits a high inter-individual variability. Many studies using linear statistical approaches have highlighted the effect of sex, ethnicity, and age at a population scale. Machine learning (ML) is increasingly used in medical field and allows for individual predictions using linear or non-linear relationships between weight gain and predictors.

We aimed to build an algorithm to predict body weight (BW) at different time points after antiretroviral therapy (ART) initiation using a ML approach.

**Methods:** Dat'Aids French database of naive diagnosed people between 2004 and 2021 was analyzed. Data cleaning with imputation of missing data and correction of continuous outliers to obtain a Gaussian distribution were performed. BW at 6, 12 and 24 months after ART initiation were predicted based on 112 covariates including baseline BW, socio-demographic and virological data, comedication, comorbidities and ART regimen. Extreme Gradient Boosting (XGBoost) models were fitted in R using the tidymodels framework. Data were split into a train (75%) and test (25%) set. For each timepoint, the XGBoost model with the lowest imprecision (RMSE) in a 10-fold cross validation experiment was evaluated in the test set.

**Results:** Available data from 6 739, 5 713 and 4 734 naive people respectively were analyzed for BW predictions at 6, 12 and 24 months. Cohorts were composed at 70% of Male and were from France for a half and from Central and West Africa for 20%. Less than 15% had AIDS. XGBoost results exhibited imprecisions (RMSE) of 4.60, 5.28 and 6.36 kg for the predictions of BW at 6, 12 and 24 months respectively.

**Conclusions:** The performances of the ML algorithm developed in order to predict BW after ART initiation, were not accurate enough to be used in clinical practice.

## TUPEB072

Switching to B/F/TAF in a real-world cohort of older people with HIV and a high burden of non-AIDS-related comorbidities

C. Miralles<sup>1</sup>, B. van Welzen<sup>2</sup>, S. McConkey<sup>3</sup>, B. Trottier<sup>4</sup>, D. Elbirt<sup>5</sup>, S. Scholten<sup>6</sup>, F. Bonnet<sup>7</sup>, A. Uriel<sup>8</sup>, R. Harrison<sup>9</sup>, A. Marongiu<sup>9</sup>, B. Gandhi-Patel<sup>10</sup>, L. Sarmati<sup>11</sup>

<sup>1</sup>Álvaro Cunqueiro Hospital, Department of Internal Medicine, Vigo, Spain, <sup>2</sup>University Medical Centre Utrecht, Department of Infectious Diseases, Utrecht, Netherlands, the, <sup>3</sup>RCSI University of Medicine and Health Sciences, Dublin, Ireland, <sup>4</sup>Clinique de Médecine Urbaine du Quartier Latin, Montreal, Canada, <sup>5</sup>Kaplan Medical Center and Faculty of Medicine, Hebrew University of Jerusalem, Jerusalem, Israel, <sup>6</sup>Praxis Hohenstaufenring, Cologne, Germany, <sup>7</sup>Centre Hospitalier Universitaire de Bordeaux, Bordeaux, France, <sup>8</sup>Department of Infectious Diseases and Tropical Medicine, North Manchester General Hospital, Manchester, United Kingdom, <sup>9</sup>Gilead Sciences, Stockley Park, United Kingdom, <sup>10</sup>Gilead Sciences, Medical Affairs, Foster City, United States, <sup>11</sup>Tor Vergata University, Clinical Infectious Diseases, Department of System Medicine, Rome, Italy

**Background:** Older people with HIV (PWH) have an increased prevalence of age-associated comorbidities. We assessed the effect of switching to bicitgravir/emtricitabine/tenofovir alafenamide (B/F/TAF) in PWH aged ≥50 years with a high burden of comorbidities and comediations.

**Methods:** BICSTaR is a large, multinational, prospective, observational cohort evaluating real-world effectiveness and safety of B/F/TAF in PWH. This analysis included treatment-experienced PWH aged ≥50 years with (or history of) ≥1 comorbidity at baseline. Assessments at 24 months (M) included effectiveness, safety, laboratory parameters, weight change, drug-drug interactions (DDIs; per Liverpool Interactions Checker) and persistence. HIV Treatment Satisfaction Questionnaire change (HIVTSQc) was assessed at 12M.

**Results:** 401 PWH aged ≥50 years who switched to B/F/TAF were included; median age 56 years; 86% male, 81% White; 18% aged ≥65 years. Overall, 65%/21%/14% switched from INSTI-/NNRTI-/boosted PI-based regimens, respectively. Baseline comorbidities included cardiovascular (48%), neuropsychiatric (34%) and musculoskeletal (28%); 22% reported taking ≥5 comediations. At 24M, 96% (315/328) had viral load <50 c/mL; viral suppression rates were similar by age, sex, race and those with ≥2 comorbidities/≥5 comediations at switch, with no treatment emergent resistance to B/F/TAF. Drug-related adverse events (DRAEs) occurred in 13% (54/401) and serious DRAEs in 0.2% (1/401). DRAEs leading to discontinuation occurred in 7% (27/401). Laboratory findings remained stable with no worsening in lipid, renal or liver parameters (table). Median (Q1, Q3) weight change was +1.0 kg (-1.3, 3.2) at 24M. No clinically significant DDIs were expected between B/F/TAF and comediations commonly prescribed in this cohort. At 24M, B/F/TAF treatment persistence was 90% (359/401). Treatment satisfaction was high at baseline and increased through 12M (median [Q1, Q3] HIVTSQc: +24.5 [13.0, 29.0]; n=290).

Laboratory Parameter, median (Q1, Q3)	Baseline	Change at 24M
eGFR, mL/min/1.73 m <sup>2</sup> [n=204]	84.7 (74.1, 102.3)	-5.0 (-13.7, 1.8)
ALT, U/L [n=263]	24.0 (19.0, 32.0)	+1.0 (-4.0, 7.4)
AST, U/L [n=220]	25.0 (20.9, 31.0)	+1.0 (-4.0, 5.0)
Total cholesterol, mg/dL [n=197]	181.7 (150.8, 214.3)	-1.9 (-26.3, 21.3)
Total cholesterol: HDL ratio [n=173]	4.1 (3.1, 4.7)	-0.1 (-0.6, 0.5)

**Conclusions:** In this cohort of PWH aged ≥50 years with a high prevalence of comorbidities, switching to B/F/TAF was highly effective and generally well tolerated. Cardiometabolic and renal parameters remained stable and high rates of persistence were maintained though 24M. These data support the safety of switching to B/F/TAF in older PWH.

## TUPEB073

Severe depression in people with HIV may be linked to increased neuroinflammation: a diffusion-weighted MRS study

A. Mudra Rakshasa-Loots<sup>1,2</sup>, N.G. Dowell<sup>3</sup>, I. Ronen<sup>3</sup>, J.H. Vera<sup>1</sup>

<sup>1</sup>University of Sussex, Department of Global Health and Infection, Brighton & Sussex Medical School, Brighton, United Kingdom, <sup>2</sup>University of Edinburgh, Edinburgh Neuroscience, School of Biomedical Sciences, Edinburgh, United Kingdom, <sup>3</sup>University of Sussex, Clinical Imaging Sciences Centre, Brighton & Sussex Medical School, Brighton, United Kingdom

**Background:** People with HIV exhibit neuroinflammation, which may contribute to depression. Neuroinflammation may be measured non-invasively using diffusion-weighted magnetic resonance spectroscopy (DW-MRS).

We investigated whether DW-MRS biomarkers were correlated with depressive symptom severity in people with HIV.

**Methods:** Adults with HIV completed the Patient Health Questionnaire (PHQ-9). Participants were split into high ("HD", PHQ-9  $\geq 15$ ) or low ("LD", PHQ-9  $\leq 7$ ) depressive symptom severity groups. DW-MRS data were acquired using a 3T Siemens Prisma scanner in a volume of interest in the anterior cingulate cortex (ACC), using which we quantified apparent diffusion coefficients (ADCs) for four metabolites. We then calculated Spearman's correlations between biomarker values and PHQ-9 score. All  $p$ -values were FDR-corrected for multiple comparisons to yield  $q$ -values.

**Results:** Participants were  $N = 16$  virally-suppressed people with HIV, with median age of 51 years, of whom 88% self-identified as men and 75% as White. Participants in the HD ( $n = 11$ , median PHQ-9 score = 21) and LD ( $n = 5$ , median PHQ-9 score = 4) groups had comparable socio-

demographic characteristics. ADCs for creatine ( $r = 0.72$ ,  $q = 0.008$ ) and choline ( $r = 0.58$ ,  $q = 0.045$ ) were strongly correlated with PHQ-9 score, but not for myo-inositol and NAA ( $q > 0.05$ ).

**Conclusions:** Intracellular diffusion of creatine and choline in the ACC were strongly correlated with depressive symptoms in people with HIV. Increased creatine and choline diffusion represent biomarkers of neuroinflammation as these have been reported in neuroinflammatory conditions (multiple sclerosis and neuropsychiatric lupus) and following experimentally-induced inflammation in humans (PMIDs 28394203, 26969685, 34673176). Therefore, our findings suggest that greater depressive symptom severity in people with HIV may be linked to increased neuroinflammation. With further validation, these biomarkers may help clarify the role of neuroinflammation in the pathogenesis of severe depression in people with HIV and enable targeted interventions.

## TUPEB074

Comprehensive lipidomic study revealed key lipid modules associated with depression in people with HIV

T. Chen<sup>1</sup>, H. Lin<sup>1,2</sup>, X. Chen<sup>1,2</sup>, T. Wang<sup>2</sup>, W. Shen<sup>2</sup>, S. Wang<sup>2</sup>, Y. Wang<sup>2</sup>, N. He<sup>1</sup>

<sup>1</sup>School of Public Health, Fudan University, Department of Epidemiology, Shanghai, China, <sup>2</sup>Taizhou City Center for Disease Control and Prevention, Department of AIDS/STD, Taizhou, China

**Background:** People with HIV (PWH) are at higher risk of depression than the general population. In the general population, lipid alterations are associated with depression; however, there is a lack of comprehensive lipidomics studies to investigate differential lipid changes associated with depression in people with versus without HIV.

**Methods:** A comprehensive lipidomics study was conducted among 712 PWH and 712 age- and sex-matched normal controls (NC) from the Comparative HIV and Aging Research in Taizhou (CHART) cohort, Eastern China. Depression was defined as a score of  $\geq 18$  on the validated 9-item revised Zung Self-rating Depression Scale. Differential lipids were screened using logistic regression, fold change, and Orthogonal Partial Least Squares Discriminant Analysis. Weighted Correlation Network Analysis identified highly correlated lipid modules.

**Results:** The prevalence of depression was 37.7% (195/712) for PWH and 8.0% (57/712) for NC, respectively. After adjusting for sociodemographic, HIV-related characteristics, 12 top lipid species, representing independent signals for 12 lipid classes, were identified to be associated with depression in PWH. For PWH with depression, carnitine (20:0) ( $P < 0.001$ ), lysophosphatidylcholine (O-22:1) ( $P = 0.006$ ), phosphatidylserine (20:4/20:4) ( $P = 0.046$ ) were upregulated, while tauroolithocholic acid-3-sulfate

( $P=0.022$ ), ceramide-AS(d18:1/21:0(2OH)) ( $P=0.005$ ), ceramide-NS(d18:1/25:1) ( $P<0.001$ ), N-acyl-lysophosphatidylethanolamine (16:1/N-16:0) ( $P=0.033$ ), lysophosphatidylethanolamine(16:1) ( $P=0.034$ ), monoglyceride (18:2) ( $P=0.002$ ), phosphatidylcholine(16:1/18:2) ( $P<0.001$ ), phosphatidylethanolamine(18:1/18:3) ( $P<0.001$ ), and phosphatidylglycerol(16:0/20:0) ( $P<0.001$ ) were downregulated (FIG.(a)).

The downregulation of ceramide-AS(d18:1/21:0(2OH)) was also found in NC with depression. Lipid network revealed depression in PWH was significantly associated with up-regulation of the lipid module composed of long-chain carnitine and the lipid module mainly composed of lysophosphatidylcholine and lysophosphatidylethanolamine with long and saturated acyl chains ( $P<0.001$ ), and was significantly associated with downregulation of the lipid module mainly composed of phosphatidylcholine and lysophosphatidylethanolamine with unsaturated acyl chains ( $P<0.001$ ) (FIG.(b)). No depression-related lipid modules were identified in NC.

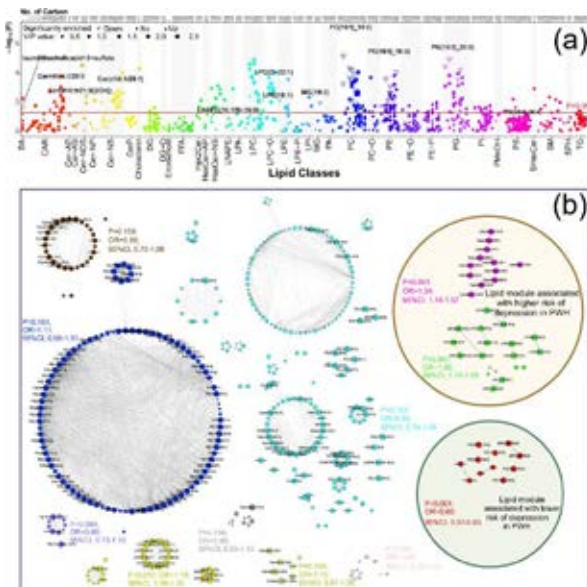

Figure. Lipid species and lipid modules associated with depression in PWH. (a) Manhattan plot of lipids associated with depression in PWH, top lipids labelled. VIP, variable importance in projection. (b) Lipid modules associated with depression in PWH. OR, odds ratio per standard deviation of module score.

**Conclusions:** The identification of lipid metabolic abnormalities in PWH with depression warrants further evaluation, and underscores the potential importance of lipid metabolic intervention for PWH with depression.

### Clinical implications of neurocognitive impairment in people living with HIV

I. Izuzquiza Avanzini<sup>1</sup>, M. Velez Diaz-Pallares<sup>2</sup>,

I. Gonzalez Cuello<sup>1</sup>, A. Marín<sup>1</sup>, MS. Retamar<sup>1</sup>, V. Iglesias<sup>1</sup>,

P. Vizcarra<sup>1</sup>, I. Corral<sup>1</sup>, J.L. Casado Osorio<sup>1</sup>

<sup>1</sup>Ramón y Cajal Institute for Health Research (IRYCIS),

Infectious Diseases, Madrid, Spain, <sup>2</sup>Ramón y Cajal Institute

for Health Research (IRYCIS), Pharmacy, Madrid, Spain

**Background:** The prevalence and clinical implications of HIV-associated neurocognitive disorders (HAND) remain debated. This study aimed to assess HAND diagnosis in a cohort of 270 people living with HIV (PLWH) and investigate its impact during follow up.

**Methods:** Cohort of PLWH from 2012 to 2016 enrolled for assessing HAND using Brief Neurocognitive Score (BNCS) and Grooved Pegboard test, in addition to psychological (HAD anxiety and depression) and functional (PAOFI; Patient's Assessment of Own Functioning Inventory) assessments. A normalized value for BNCS (NPZ3) and including Grooved pegboard (NPZ5) was obtained. Adherence to antiretroviral treatment was measured at enrolment and at 3- and 6-year intervals, according to pharmacy pickup data and patient's interview through a validate questionnaire.

**Results:** The descriptive variables are described in Table 1. According to NPZ3, HAND was observed in 13% of PLWH, correlated with a lower educational level ( $p=0.002$ ), higher depression score ( $p=0.01$ ), and lower CD4+ nadir ( $p=0.001$ ). NPZ3 and NPZ5 showed a significant correlation ( $r=0.62$ ), with NPZ5 being more sensitive in identifying HAND. Of note, both NPZ3 and NPZ5 were correlated with PAOFI score. In a linear regression analysis, HAND was associated with CD4+ nadir and education level. After adjusting by age, anxiety and depression, a lower NPZ3 value at inclusion was associated with a lower adherence level in the questionnaire (95% vs. 98%;  $p=0.01$ ) and in delay in the pickup of medication in pharmacy (69 vs. 26 days;  $p<0.001$ ) at 3 years of follow up. Moreover, initial NPZ5 predicted poor compliance and loss of follow up after 6 years of evaluation ( $p=0.003$ ).

Age (years)	44 (18-80)
Sex at birth male	211 (78%)
CD4 nadir (cels/mm <sup>3</sup> )	235 (121-365)
CD4 at inclusion	368 (232-523)
Undetectable viral load (VL)at baseline	268 (99%)

**Conclusions:** HAND diagnosis is associated with immunosuppression and lead to functional impairment. Notably, those PLWH with HAND demonstrated sustained poor adherence and compliance during long-term follow-up, emphasizing the need for targeted interventions to improve treatment outcomes in this population.

## TUPEB076

Effect of dolutegravir on weight changes and lipid profile compared with efavirenz in people living with HIV: a retrospective cohort study

R. Setpakdee<sup>1</sup>, S. Kiertiburanakul<sup>1</sup>

<sup>1</sup>Faculty of Medicine Ramathibodi Hospital, Mahidol University, Department of Medicine, Bangkok, Thailand

**Background:** Dolutegravir (DTG) has been recently introduced and widely used as the first-line antiretroviral therapy (ART) in Asian countries. There is limited data on DTG-associated weight gain among Asian treatment-naïve people living with HIV.

**Methods:** In Thailand, 81 and 100 adults initiating DTG-based and efavirenz (EFV)-based ART, respectively, were retrospective studies of weight changes and lipid profiles at 6 and 12 months after ART initiation. Multivariate with repeated measures using a multilevel mixed-effects linear regression was used to compare the primary outcome between groups.

**Results:** At baseline, the DTG group had a lower mean BW (60.7 kg vs. 64.3 kg,  $p=0.071$ ), a higher proportion of smoking (25.9% vs. 14.0%,  $p=0.043$ ), lower mean CD4 count (126 cells/mm<sup>3</sup> vs. 243 cells/mm<sup>3</sup>,  $p=0.002$ ), and lower mean cholesterol (172 mg/dL vs. 185 mg/dL,  $p=0.029$ ). At 6 months and 12 months, DTG groups had lower mean BW compared to those of the EFV group (58.2 kg vs. 66.0 kg, mean difference -7.8,  $p=0.005$  and 59.6 kg vs. 67.0 kg, mean difference -7.3,  $p=0.008$ , respectively). In comparison between baseline and 12 months, the DTG group had no statistically significant difference in BW, 60.7 kg vs. 59.6 kg,  $p=0.495$ ; in contrast, the EFV group had a statistically increased in BW, 64.3 kg vs. 66.9 kg,  $p=0.019$ . At 6 months and 12 months, DTG groups had lower mean cholesterol compared to those of the EFV group (174 mg/dL vs. 188 mg/dL, mean difference (MD) -14.2,  $p=0.022$  and 179 mg/dL vs 187 mg/dL, MD -8.1,  $p=0.183$ , respectively). In comparison between baseline and 12 months, neither the DTG nor EFV groups had a statistical increase in cholesterol levels.

Factors associated with BW at every point of time, after adjusting, were DTG [MD -6.24, 95% confidence interval (CI) -10.55, -1.93,  $p=0.005$ ], universal coverage health insurance (MD -5.50, 95% CI -10.46, -0.55,  $p=0.029$ ), opportunistic infections (MD -12.36, 95% CI -20.33, -4.40,  $p=0.002$ ), and height (MD 0.53, 95% CI 0.27, 0.79,  $p<0.001$ ).

**Conclusions:** DTG-based ART is not statistically associated with increased BW and cholesterol levels in naïve Thai PLHIV compared to EFV-based ART. The results support the National guidelines.

## TUPEB077

Reasons for emergency department use among people engaged in HIV care in the Southeastern US

D. Agil<sup>1</sup>, T. Davy-Mendez<sup>2</sup>, J. Zhu<sup>3</sup>, A. Durr<sup>2</sup>, L. Browne<sup>1</sup>, K.-P. Li<sup>2</sup>, H. Henderson<sup>2</sup>, S. Berry<sup>3</sup>, K. Gebo<sup>3</sup>, A. Tobian<sup>3</sup>, J. Eron<sup>2</sup>, C. Farel<sup>2</sup>, S. Napravnik<sup>2</sup>

<sup>1</sup>University of North Carolina at Chapel Hill, Department of Epidemiology, Chapel Hill, United States, <sup>2</sup>University of North Carolina at Chapel Hill, School of Medicine, Chapel Hill, United States, <sup>3</sup>Johns Hopkins University, School of Medicine, Baltimore, United States

**Background:** Characterizing emergency department (ED) use among people with HIV (PWH) could help identify unmet needs and inform outpatient prevention. We investigated reasons for ED visits in a clinical cohort of PWH in the state of North Carolina.

**Methods:** Among PWH in HIV care from 2016-2022, we examined ED visits that did not result in hospitalization. We categorized the first-listed ED visit diagnosis International Classification of Diseases, 10<sup>th</sup> revision code using the modified Clinical Classifications Software Refined (CCSR). We estimated ED visit incidence rates (IRs) using Poisson regression with GEE to account for repeated measures.

**Results:** The 2409 included PWH were 57% Black, 31% White, and 26% women. At the start of study follow-up, the median age was 47 years (IQR 35-55), the median CD4 count was 593 cells/mm<sup>3</sup> (IQR 372-826), and 71.3% had a viral load <40 copies/mL.

During the study period, there were 3016 ED visits over 12,445 person-years (IR 24.2 per 100 person-years [95% CI 23.4-25.1]). Of 738 (31%) PWH who had ≥1 ED visit during the study period, 40.7% had one ED visit, 17.2% two ED visits, 11.3% three ED visits, 6.8% four ED visits, and 34.0% had ≥5 ED visits. The five most frequent ED diagnosis categories were Symptoms Not Elsewhere Classified (19.1%), Musculoskeletal (13.5%), Injury/Poisoning (10.8%), Circulatory (8.1%), and Digestive (7.2%) (Table).

Disease Category	N (% of all visits)	Most Common Diagnosis (% of category)
Symptoms Not Classified	557 (19.1%)	Abdominal Symptoms (32.1%), Respiratory Symptoms (19.0%), Nausea/Vomiting (8.8%)
Musculoskeletal System	393 (13.5%)	Musculoskeletal Pain (49.1%)
Injury and Poisoning	314 (10.8%)	Initial Contusion (17.8%)
Circulatory System	237 (8.1%)	Nonspecific Chest Pain (70.5%)
Digestive System	211 (7.2%)	Disorders of Teeth (34.8%)
Respiratory System	184 (6.3%)	Upper Respiratory Infections (27.9%)
Genitourinary System	181 (6.2%)	Urinary Tract Infections (37.6%)
Nervous System	157 (5.4%)	Headache, Migraines (54.1%)

Table. Distribution of Disease Categories for the First-Listed ED Visit Diagnosis, with the Most Common Diagnosis in Each Category. Displayed are categories accounting for >5% of all ED visits.

**Conclusions:** Almost a third of PWH in this cohort sought care in the ED for conditions that did not require hospitalization. Reasons for ED visit were varied. Further work on drivers of ED use is needed to improve disease prevention and access to non-emergency outpatient care, particularly for PWH with a high number of ED visits.

## TUPEB078

### A new approach to preventing anal cancer in PLWHIV

R. Hillman<sup>1</sup>, I. Wong<sup>1</sup>, J. Roberts<sup>2</sup>, L. Heath<sup>3</sup>, H. Urquhart<sup>3</sup>  
<sup>1</sup>St Vincent's Hospital, Sydney, Dysplasia & Anal Cancer Services, Darlinghurst, Australia, <sup>2</sup>Douglass Hanly Moir, GynaePath, Macquarie Park, Australia, <sup>3</sup>St Vincent's Hospital, Colorectal Surgery, Darlinghurst, Australia

**Background:** Anal cancer is one of the most common cancers in PLWHIV, especially in MSM. Effective treatment of the precursor lesion, anal high grade squamous intraepithelial lesions (HSIL), markedly reduces the likelihood of progression to cancer. Current approaches to anal HSIL treatment (such as electrocautery) require the use of intra-procedure High Resolution Anoscopy (HRA), and are associated with frequent treatment failures. Radio Frequency Ablation (RFA) is highly effective in the treatment of esophageal HSIL. We assessed the efficacy of RFA in the treatment of intra-anal HSIL in PLWHIV and those without HIV.

**Methods:** Between August 2022 and March 2024, 30 high risk individuals were assessed by HRA for the presence of persisting intra-anal HSIL. Following informed consent, patients were given sedation anesthesia and a bilateral pudendal nerve block of 20ml 2% ropivacaine in an Endoscopy Suite. A single circumferential RFA treatment was then performed, using a catheter attached to a Barrx™ flex RFA energy generator (Medtronic, Minneapolis, MN, USA). Treatment response was assessed by HRA, three months following the RFA. Those with residual HSIL, after the circumferential RFA, were offered a subsequent, targeted, RFA.

**Results:** 23 (77%) of the patients were MSM or transgendered women and a total of 18 (60%) were LWHIV. Compared to HIV negative patients, PLWHIV were slightly older (mean age 62.5 v 60.8 years) and more likely to be past or current smokers (60.1% v 41.7%). The initial mean number of intra-anal octants affected by HSIL was 3.72 (range 1 to 7). PLWHIV had more extensive disease, but demonstrated a greater reduction in area affected by HSIL (68.3% v 56%) and were more likely to completely clear their HSIL (33% v 8.3%) and HPV (22.2% v 8.3%). Post-operative pain was reported at 53%, comparable to electrocautery. No participants developed stenosis.

**Conclusions:** RFA was easy to set up and did not require the use of intra-procedural HRA, thus potentially being available in settings with limited HRA capacity. RFA was at

least as effective as electrocautery in treating intra-anal HSIL in PLWHIV, and may be of particular value in those with extensive disease.

## TUPEB079

### Anal high-grade squamous intraepithelial lesion screening algorithms for Thai cisgender men and transgender women who have sex with men: baseline results of a multiphase optimization strategy study

S. Thitipatarakorn<sup>1</sup>, S. Suriwong<sup>1</sup>, T. Chaya-ananchot<sup>1</sup>, T. Sripathanasakul<sup>1</sup>, S. Tongmuang<sup>1</sup>, P. Hongchookiat<sup>1</sup>, S. Nonenoy<sup>1</sup>, N. Teeratakulpisarn<sup>1</sup>, R.A. Ramautarsing<sup>1</sup>, N. Phanuphak<sup>1,2</sup>  
<sup>1</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>2</sup>Chulalongkorn University, Center of Excellence in Transgender Health, Bangkok, Thailand

**Background:** Men who have sex with men, especially with HIV, face heightened risk of anal cancer. Treating its precursor, anal high-grade squamous intraepithelial lesion (HSIL), can reduce this risk. The current standard screening practice, anal cytology, has low sensitivity (19%). We aimed to identify an optimal anal HSIL screening algorithm using a Multiphase Optimization Strategy Trial (MOST).

**Methods:** The optimization phase enrolled participants aged ≥30 years old with HIV and ≥40 years old without HIV in Bangkok, Thailand, and followed them every six months for one year. Participants chose between self-sampling and physician sampling. Self-sampled participants were randomized into groups receiving combinations of anal cytology and high-risk human papillomavirus (HPV) DNA testing.

Physician-sampled participants were randomized into groups receiving combinations of digital anorectal examination, anal cytology, high-risk HPV DNA testing, and high-resolution anoscopy (HRA).

In groups without HRA, positive digital rectal examination, cytology, or high-risk HPV results were followed up with HRA.

**Results:** Between October 2022 and April 2023, 157 cisgender men and 23 transgender women were enrolled and conducted baseline visits. Of these, 132 (73.3%) had HIV. Median age was 43 years in those with HIV, and 46 years in those without HIV.

Four (2.22%) chose self-sampling, while 176 (97.8%) chose physician sampling. No HSIL diagnoses originated from self-sampled groups, while 20 were from physician-sampled groups (11.1% of 180, 95%CI 6.9%–16.6%).

Of all HSIL diagnoses, 16/20 (80.0%) originated from groups with HRA as standard screening method, while 4/20 (20.0%) were from a positive high-risk HPV DNA followed up with HRA.

Sampling method	Procedures	With HIV: HSIL n/N (%)	Without HIV: HSIL n/N (%)	Overall: n/N (%)
Self-sampling	Anal cytology, high-risk HPV; high-risk HPV only	0/2 (0%)	0/2 (0%)	0/4 (0%)
	Digital anorectal examination, anal cytology, high-risk HPV, high-resolution anoscopy	5/16 (31.3%)	0/6 (0%)	5/22 (22.7%)
	Digital anorectal examination, anal cytology, high-resolution anoscopy	2/15 (13.3%)	0/6 (0%)	2/21 (9.5%)
Physician sampling	Digital anorectal examination, high-risk HPV, high-resolution anoscopy	2/16 (12.5%)	1/6 (16.7%)	3/22 (13.6%)
	Digital anorectal examination, high-resolution anoscopy	5/16 (31.3%)	1/6 (16.7%)	6/22 (27.3%)
	Digital anorectal examination, anal cytology, high-risk HPV	3/16 (18.8%)	0/6 (0%)	3/22 (13.6%)
	Digital anorectal examination, anal cytology	0/16 (0%)	0/5 (0%)	0/21 (0%)
	Digital anorectal examination, high-risk HPV	1/17 (5.9%)	0/5 (0%)	1/22 (4.5%)
	Digital anorectal examination	0/16 (0%)	0/6 (0%)	0/22 (0%)

**Conclusions:** Most participants favored physician-sampled HSIL screening over self-sampling. HRA, with or without adjunctive testing, detected the most HSIL. While anal cytology did not contribute to HSIL diagnosis, using HRA as a follow-up test after a positive high-risk HPV result demonstrated potential as a screening approach.

## TUPEB080

Clinical efficacy of the HIV protease-inhibitor Indinavir alone or in combination with chemotherapy for the treatment of early and advanced classic Kaposi's sarcoma

C. Sgadari<sup>1</sup>, B. Scoppio<sup>2</sup>, O. Picconi<sup>1</sup>, A. Tripiciano<sup>1</sup>, F.M. Gaiani<sup>2</sup>, V. Francavilla<sup>1</sup>, A. Arancio<sup>1</sup>, M. Campagna<sup>1</sup>, C. Palladino<sup>1</sup>, S. Moretti<sup>1</sup>, P. Monini<sup>1</sup>, L. Brambilla<sup>2</sup>, B. Ensoli<sup>1</sup>

<sup>1</sup>Istituto Superiore di Sanità (ISS), National HIV/AIDS Research Center (CNAIDS), Rome, Italy, <sup>2</sup>Fondazione IRCCS Cà Granda - Ospedale Maggiore Policlinico, Unit of Dermatology, Milan, Italy

**Background:** Kaposi's sarcoma (KS) is a "rare" disease of angioproliferative nature presenting in different clinical-epidemiologic forms, all associated with human herpes virus-8 (HHV-8) infection and sharing the same histopathology. KS has gained notoriety with the advent of HIV/AIDS where it is frequent and aggressive, whereas classic KS (CKS) can be indolent and generally arises in elderly men.

Of note, no definitive cure has been established for KS, and all conventional therapies are only temporarily effective.

Previous data indicated that HIV protease inhibitors, as Indinavir, have anti-KS activity by exerting direct anti-angiogenic and anti-tumor effects, due to inhibition of ma-

trix-metalloproteases activation (Sgadari, NatMed 2002, LancetOncol, 2003; Monini, NatCancerRev 2004; Toschi, IntJCancer 2011; Qui, MolCancerTher 2020).

A proof-of-concept phase 2 trial indicated that Indinavir is safe and effective in participants with early CKS versus those with advanced disease, suggesting that these persons may achieve a response only after debulking chemotherapy (Monini, AIDS 2009).

**Methods:** Monocentric, open label, non-randomized phase 2 trial in elderly people with progressive advanced CKS aimed at determining the clinical response to Indinavir associated with debulking chemotherapy, followed by a maintenance phase with Indinavir alone. Secondary endpoints included safety and KS biomarkers.

**Results:** Twenty-eight persons with advanced CKS were screened and 25 started treatment. All evaluable participants (22) responded to debulking therapy. Out of these, 16 entered a maintenance phase with Indinavir alone. The overall response rate upon maintenance was 75%, with a better duration than previously reported in historical data from the same clinical center with chemotherapy alone or more recent experimental approaches. Moreover, most responders showed further clinical improvements (lesion number/nodularity) during maintenance and post-treatment follow-up. As compared to progressors, responders also showed an amelioration of the immune status with a consistent B cell increase, and positive changes of KS biomarkers (Sgadari C et al, submitted).

**Conclusions:** Our results indicate that Indinavir is safe and effective in early CKS, it boosts and maintains the clinical activity of conventional chemotherapy in advanced disease, and it could be rapidly adopted for the clinical management of persons with KS or other tumors associated or not with HIV infection.

## TUPEB081

144-week update: change in weight and BMI associated with switching to bictegrovir/emtricitabine/tenofovir alafenamide vs. a dolutegravir-based regimen among virologically suppressed adults living with HIV

C.-P. Rolle<sup>1,2</sup>, J. Garrett<sup>1</sup>, V. Nguyen<sup>1</sup>, B. Simons<sup>3</sup>, K. Patel<sup>4</sup>, F. Hineostroza<sup>1,3</sup>, E. DeJesus<sup>1,3</sup>

<sup>1</sup>Orlando Immunology Center, Orlando, United States, <sup>2</sup>Emory University Rollins School of Public Health, Global Health, Atlanta, United States, <sup>3</sup>University of Central Florida College of Medicine, Orlando, United States, <sup>4</sup>Gilead Sciences, Foster City, United States

**Background:** Previously, we demonstrated that switching to a bictegrovir (BIC) vs. dolutegravir (DTG)-based regimen (DBR) were both associated with lower annualized weight gain post-switch that was not significantly different at Week 96. Here, we report updated changes in weight and BMI through 144 weeks compared to 2 years prior to switch.

**Methods:** Data on demographics, clinical characteristics, weight, and BMI are collected from virologically suppressed adults switched to BIC/emtricitabine(F)/tenofovir alafenamide (TAF), DTG plus F/TAF, DTG/abacavir (ABC)/lamivudine (3TC), DTG/rilpivirine (RPV), and DTG/3TC 2 years prior to switch through 144 weeks post switch. Linear spline models were fit to estimate and compare the trajectories of weight and BMI changes observed pre-and-post-switch.

Adjusted piecewise linear mixed-effects models were fit to examine factors associated with weight and BMI change pre-and-post-switch.

**Results:** Baseline demographic and clinical characteristics have been previously reported. Six hundred and seventy-three switched to BIC/F/TAF, 148 switched to DTG plus F/TAF, 51 switched to DTG/ABC/3TC, 48 switched to DTG/RPV and 36 switched to DTG/3TC.

At Week 144, switching to BIC/F/TAF vs. a DBR (grouped) were both associated with lower annualized weight gain post-switch (-0.88 kg/year vs. -0.39 kg/year respectively,  $p=0.15$ ). DTG plus F/TAF switches had the highest annualized weight gain (0.68 kg/year, 95% confidence interval (CI): -0.32, 1.65) whereas, DTG/RPV switches had the lowest annualized weight gain (-2.22 kg/year, 95% CI: -3.69, -0.62) post-switch at Week 144. DTG/RPV and BIC/F/TAF switches were the only groups with significantly lower annualized weight gain post-switch at Week 144.

Similar trends were observed for BMI changes. Baseline BMI < 18.5 kg/m<sup>2</sup> was the only evaluated factor associated with significantly higher annualized weight gain post-switch whereas multiple factors were associated with significantly lower annualized weight gain, but among them baseline BMI ≥ 30 kg/m<sup>2</sup> and switching from a protease inhibitor were associated with the lowest annualized weight gain post-switch.

**Conclusions:** At Week 144, switching to a BIC vs. DBR were both associated with lower annualized weight gain post-switch that was not significantly different. Weight and BMI changes were largely stable for many groups at Week 144, however, switching to BIC/F/TAF and DTG/RPV were associated with significantly lower annualized weight gain post-switch.

**Background:** Although clinical trials reported a low and comparable rate of neuropsychiatric (NP) disturbances among people with HIV (PWH) receiving INSTI, higher rates of these disturbances have been reported in clinical practice.

**Methods:** Using data from the SCOLTA project, a multi-center observational study following PWH who start antiretrovirals to identify adverse events (AEs) in real-life, we performed a retrospective analysis (NEURO-INSTI) to assess incidence rates (IR) and 95% confidence intervals (95% CI) of NP AEs and related interruptions.

Observation was truncated at the first occurrence of any NP AEs, even if not causing treatment discontinuation. IRs were calculated as number of first occurrences/1000 person years follow-up (PYFU). When crude IR were significantly different according to selected baseline variables, they were included in the multivariate generalized linear model, to calculate the adjusted IRs (aIRs).

**Results:** We analyzed NP AEs occurring in 2922 PWH (mean age 47.2 years) on INSTI cohorts since 2007. Over a median observation time of 28 months (interquartile range 14-45), 126 NP AEs and 72 related discontinuations occurred; IRs were 15.9/1000 PYFU (95% CI, 13.4-19.0) and 9.1/1000 PYFU (95% CI 7.2-11.5), respectively.

Adjusted IRs are reported in the Table. PWH with a history of IDU and ART naïve individuals had higher aIRs and discontinued treatment more frequently. People with psychiatric disorders at baseline also had higher incidence rates of NP AEs but not of discontinuations. Regarding the role of antiretrovirals, PWH taking abacavir and DTG or RAL had higher aIRs of NP AEs: aIRs for DTG were >3-fold higher than with BIC, although with non-significant CI.

	N (%)	PWH N=70246	Any CNS AEs N=16	Adjusted CNS/NP AEs (95% CI)	CNS AEs leading to discontinuation N=12	Adjusted CNS/NP AEs leading to discontinuation (95% CI)

Polypill	119 (17.4)	1307.20	49	40.5 (26.1-60.8)	8	14.1 (6.6-31.1)

Table. Number of CNS AEs (any and leading to treatment discontinuation) and adjusted IRs (for CNS/NP AEs) in PWH starting a new INSTI-based treatment, stratified by characteristics at baseline.

**Conclusions:** Among PWH on INSTI treatment, IDU history and being on an initial ART regimen contributed to the occurrence of NP AEs and related discontinuations. PWH on DTG or RAL as INSTI showed higher aIRs of NP AEs, although not significant.

<sup>1</sup>Padua University Hospital, Padova, Italy; <sup>2</sup>Padua University, Padova, Italy

**Background:** Binge eating (BE) is a mental health disorder, possibly leading to weight gain (WG), whose prevalence and correlation with weight excess in people with HIV (PWH) have been scarcely investigated.

**Methods:** We included adult PWH during routine visits from October 2022 to February 2023. Participants underwent the validated Binge eating scale (BES) questionnaire (score <17 BE very unlikely, BE≥17 possible/very likely), with the support of a psychiatrist. Body mass index (BMI) was calculated as per WHO definitions (underweight <18, normal 18-24.9, overweighted 25-29.9, and obese ≥30 kg/m<sup>2</sup>). We performed a logistic regression for the binary outcome BES≥17 and being overweighted/obese as effect measure of risk association, and then adjusted for possible confounders (including exposure to integrase inhibi-

tors). We moreover performed a sensitivity analysis fitting the regression model both including and excluding people suffering from depression (which may drive BE).

**Results:** We included 1204 PWH, 68.7% males, median age 53 years (IQR:44-60), 85.5% Caucasian, 95.6% with HIV viral load <50 copies/ml (other characteristics Table 1).

As for BMI categories we had underweight in 17.4%, normal in 43.6%, overweight in 35.1%, and obese in 19.4% cases. Considering BES, 1089 (90.4%) PWH had a score <17, 115 (9.6%) ≥17.

Multivariable analysis showed that obesity (OR =6.20, p<0.0001), overweight (OR=2.21, p=0.006), and depression (OR=2.03, p=0.023) were significantly associated with high BES score.

At the sensitivity analysis, our results were confirmed and obesity and overweight remained significantly associated with BE behaviours (excluding depression, obesity OR = 6.49, p<0.0001, being overweighted OR = 2.15, p = 0.024, including depression obesity OR = 6.01, p = 0.018, being overweighted OR=3.47, p = 0.048).

Characteristic	Overall= 1204 n (%)	Characteristic	Overall= 1204 n (%)
Level of education, high, n (%)	828 (68.7)	Current CD4+ T cell count, cell/mm <sup>3</sup> , median (IQR)	643 (483-823)
Current smoker, n (%)	626 (52)	CD4+ T cell count at nadir, cell/mm <sup>3</sup> , median (IQR)	300 (163-450)
Regular physical exercise, n (%)	289 (24)	AIDS events in medical history, yes, n (%)	239 (19.8)
Alcohol use disorder, n (%)	103 (8.5)	Current integrase inhibitor exposure, yes, n (%)	734 (61)
Years living with HIV, median (IQR)	15 (8-24)	Multimorbidity, n (%)	816 (67.7)
Years on antiretrovirals, median (IQR)	14 (7-22)	Polypharmacy, n (%)	227 (18.8)

**Conclusions:** BE should be considered among other possible causes of WG in PWH. Our results push towards an in-depth study of this topic for a better understanding of the phenomenon in PWH, possibly identifying subgroups of this population who could benefit from a psychoeducational/psychological intervention to preventing WG.

## TUPEB084

### Evaluation of infectious diseases physicians' approach toward the treatment of dyslipidemia in PLWH

F.N. Ballı Turhan<sup>1,2</sup>, E. Kara<sup>2</sup>, O.A. Uyaroglu<sup>3</sup>, N. Çalık

Başaran<sup>3</sup>, A.Ç. İnkaya<sup>4</sup>, K. Demirkan<sup>2</sup>, S. Ünal<sup>4</sup>

<sup>1</sup>Gazi University Faculty of Pharmacy, Department of Clinical Pharmacy, Ankara, Türkiye, <sup>2</sup>Hacettepe University Faculty of Pharmacy, Department of Clinical Pharmacy, Ankara, Türkiye, <sup>3</sup>Hacettepe University Faculty of Medicine, Department of Internal Medicine, Ankara, Türkiye, <sup>4</sup>Hacettepe University Faculty of Medicine, Department of Infectious Diseases and Clinical Microbiology, Ankara, Türkiye

**Background:** Human Immunodeficiency Virus (HIV) infection is associated with risk factors for cardiovascular disease (CVD), including elevated serum lipids. Treatments of dyslipidemia decrease low-density lipoprotein cholesterol (LDL-C), and significantly reduce cardiovascular events.

This study aimed to evaluate the approach of physicians who are infectious diseases specialists or residents toward the treatment of dyslipidemia in people living with HIV (PLWH).

**Methods:** This study was conducted as an online survey to infectious disease specialists or residents attending the 7th International HIV/AIDS Congress on December 7-10, 2023. The survey collects data about the characteristics and experience of physicians. Also, the attitudes of physicians towards dyslipidemia management in PLWH were obtained. This study was approved by local Ethics Committee.

**Results:** Ninety-one participants were included in the study (60.4% specialists and 39.6% residents). Thirty-six percent (n=33) of physicians stated that they did not use any guidelines in their clinical practice. The specialists were more likely to use guidelines than the residents (72.7% vs 50.0, p = 0.047).

Most physicians (67.2%, n=39) preferred using the 2023 European Aids Clinical Society (EACS) Guidelines. Despite 25% (n=23) of the physicians did not use any calculator for CVD risk assessment, for those who use CVD risk assessment, Framingham was preferred by majority of them (75%, n=51).

The most frequently prescribed statins by physicians were atorvastatin (47.3%), pitavastatin (28.6%) and rosuvastatin (23.1%). Seventy-four percent (n=67) of physicians doubted the necessity of dyslipidemia treatment, and 77% (n=70) physicians were affected by the patient's reluctance.

Physicians' attitudes about dyslipidemia treatment are shown in Table 1. Physicians thought that dyslipidemia treatment targets for PLWH should be based on LDL-C (81.3%), total cholesterol/HDL ratio (12.1%) and non-HDL-C (6.6%).

	Strongly agree n (%)	Agree n (%)	Neutral n (%)	Disagree n (%)	Strongly disagree n (%)
Dyslipidemia guidelines contain sufficient information for PLWH.	11 (12.1)	28 (30.8)	29 (31.8)	21 (23.1)	2 (2.2)
Workload and time constraints hinder the implementation of dyslipidemia guideline recommendations.	18 (19.8)	40 (43.9)	19 (20.9)	10 (11.0)	4 (4.4)
Cardiovascular risk assessment is an integral part of clinical practice.	44 (48.3)	38 (41.8)	8 (8.8)	-	1 (1.1)

Table 1. Some survey questions and physicians' preferences and attitudes on treating dyslipidemia in PLWH.

**Conclusions:** Several physicians (specialists and residents) did not use guidelines and CVD risk calculators and doubted the necessity of dyslipidemia treatment. In addition, the patients' reluctance may affect the physicians' decisions. Continuing education programs regarding dyslipidemia management are vital for health professionals and PLWH.

## TUPEB085

### Non-small cell lung cancer survival, by tumor stage and histology, among people with and without HIV

M. Silverberg<sup>1,2</sup>, C. Hartman<sup>3,4</sup>, J. Kramer<sup>3,4</sup>, W. Leyden<sup>1</sup>, R. Hechter<sup>2,5</sup>, K. Pak<sup>5</sup>, A. Lea<sup>1</sup>, E. Chiao<sup>6</sup>

<sup>1</sup>Kaiser Permanente Northern California, Division of Research, Oakland, United States, <sup>2</sup>Kaiser Permanente Bernard J. Tyson School of Medicine, Department of Health Systems Science, Pasadena, United States, <sup>3</sup>Baylor College of Medicine, Department of Medicine, Houston, United States, <sup>4</sup>Michael E. DeBakey Veterans Affairs Medical Center, Center for Innovations in Quality, Effectiveness and Safety, Houston, United States, <sup>5</sup>Kaiser Permanente Southern California, Department of Research and Evaluation, Pasadena, United States, <sup>6</sup>University of Texas, MD Anderson Cancer Center Departments of Epidemiology and General Medical Oncology, Houston, United States, <sup>7</sup>Duke University School of Medicine, Department of Radiation Oncology, Durham, United States

**Background:** Among people with lung cancer, having HIV is associated with poorer survival. Few studies have evaluated the HIV survival gap by tumor histology and stage.

**Methods:** A retrospective cohort of people with HIV (PWH) and people without HIV (PWoH) with newly diagnosed non-small cell lung cancer (NSCLC), identified between 2008-2020 from the US Department of Veterans Affairs and Kaiser Permanente. Hazard ratios for HIV status associated with survival up to 5 years were estimated from Cox models stratified by histological subtype (adenocarcinoma, squamous) and TNM stage (I, II/III, IV), adjusting for baseline factors (see Table footnote). Separate models adjusted for time-dependent cancer treatment initiation within 6 months.

**Results:** There were 654 NSCLC cases diagnosed in PWH (53% adenocarcinoma, 33% squamous cell, 14% not specified; 97% men; 48% non-Hispanic Black, 48% non-Hispanic White). There were 91370 NSCLC cases diagnosed among PWoH (52% adenocarcinoma, 33% squamous cell, 15% not specified; 83% men; 14% non-Hispanic Black, 76% non-Hispanic White). For PWH, 22% were stage I, 13% stage II, 18% stage III, 40% stage IV, with median survival of 1.0 and 1.1 years for adenocarcinomas and squamous cell, respectively. For PWoH, 24% were stage I, 10% stage II, 20% stage III, 38% stage IV, with median survival of 1.5 and 1.3 years for adenocarcinomas and squamous cell, respectively. PWH had 30-50% higher mortality across most of the analyzed histologic and stage subgroups, except for adenocarcinoma stages II/III (Table). Finally, 77% of PWH and 78% of PWoH had cancer treatment within 6 months; adjustment for treatment did not change inferences (data not shown).

TNM Stage	All NSCLC <sup>2</sup>		Adenocarcinoma		Squamous cell	
	HR	(95% CI)	HR	(95% CI)	HR	(95% CI)
I	1.35	(1.06, 1.70)	1.44	(1.02, 2.02)	1.32	(0.82, 1.90)
II or III	1.27	(1.07, 1.49)	1.02	(0.79, 1.33)	1.46	(1.15, 1.86)
IV	1.31	(1.16, 1.49)	1.39	(1.18, 1.65)	1.25	(0.96, 1.63)

<sup>1</sup>From Cox regression models adjusted for baseline age, sex, race/ethnicity, diagnosis year, Deyo comorbidity index, smoking, substance use disorders, and organization

<sup>2</sup>Includes adenocarcinoma, squamous cell, and NSCLC histology not otherwise specified

**Table. Adjusted hazard ratios (95% confidence intervals)<sup>1</sup> for association of HIV status (reference: PWoH) with mortality risk up to 5 years after NSCLC diagnosis.**

**Conclusions:** The reduced survival for PWH with NSCLC was similar by stage and may not be due to treatment differences. The similar survival by HIV status for stage II or III adenocarcinomas, but not squamous cell cancers, requires further investigation.

**Background:** Some studies report weight gain on Dolutegravir(DTG) but data in children/adolescents living with HIV(CALWHIV) are limited.

**Methods:** CALWHIV on DTG aged 2-<18 years from 15 cohorts in the European Pregnancy and Paediatric Infections Cohort Collaboration were included. Mixed-models were used to describe changes in body mass index-for-age z-score(zBMI) by sex, age and treatment/viral load(VL) status at DTG start.

First cubic splines were used to describe non-linear zBMI trajectories 96-weeks before and after DTG start. Second, linear spline models estimated mean zBMI change in 48-weeks before and after DTG start to compare changes in short-term growth trajectories.

Third, CALWHIV aged 6-18 years at DTG start were compared to CALWHIV starting protease inhibitors (PI)-based regimens using propensity scores (PS) to balance differences in characteristics at regimen start.

Weighted mixed-models with linear splines were used to compare mean change in zBMI on DTG versus PIs from regimen start to 48 and 96-weeks.

**Results:** 907 CALWHIV with  $\geq 1$  zBMI measurement in the 96-weeks before and after DTG start were included. Median age at DTG start was 14[IQR 11-16] years, 451(50%) female, zBMI 0.38[-0.57-1.24], 68(8%) ART-naïve, 494(55%) ART-experienced/suppressed (VL<200c/ml), 116(13%) ART-experienced/unsuppressed (VL $\geq$ 200c/ml), 229(25%) ART-experienced/VL-unknown. Median time on DTG was 110[65-177] weeks.

CALWHIV of all age groups, treatment/VL status and sex experienced zBMI increase after DTG start (Figure). In linear spline models, there was no evidence that mean changes in zBMI differed in the 48-weeks before and after DTG start in any subgroup ( $p>0.1$ ).

In PS analysis, changes in zBMI in 455 CALWHIV on DTG were compared to 299 on PIs. There were no statistical differences in mean zBMI change over 48/96-weeks on DTG versus PI overall [change at 96-weeks: 0.23(95%CI 0.15,0.32) v 0.16(0.05,0.26),  $p=0.265$ ], or within treatment/VL subgroups( $p>0.1$ ).

Figure. Mixed-model using cubic splines to estimate non-linear growth trajectories of zBMI in the 96 weeks before and after DTG start.

**Conclusions:** CALWHIV experienced increases in zBMI after DTG start comparable to changes observed pre-DTG, and those observed on PI-based regimens.

## TUPEB087

Coronary artery calcium and abnormal arteries to predict death and cardiovascular diseases in older people living with HIV: a cohort study

P. Amornritvanich<sup>1,2</sup>, T. Apornpong<sup>2</sup>, H.M.S. Lwin<sup>2</sup>, A. Avihingsanon<sup>2</sup>

<sup>1</sup>Police General Hospital, Cardiovascular Unit, Department of Internal Medicine, Bangkok, Thailand, <sup>2</sup>HIV-NAT Research Collaboration Centre, Bangkok, Thailand

**Background:** Older PLWH bear a higher CVD burden due to traditional and HIV-specific factors. This study explored the use of non-invasive tools like ABI, CAVI, and CAC to improve CVD prediction and mortality assessment in this population.

**Methods:** This prospective study, part of the HIV-NAT aging cohort, examined 358 PLWH aged 50 and older from 2015-2023. Participants underwent assessments for peripheral arterial disease (PAD) and arterial stiffness, with CAC scores categorizing coronary artery disease risk. Data on CVD events (myocardial infarction, stroke, or revascularization) and deaths were extracted. Competing risks were considered for CVD events, with all-cause mortality assessed using Kaplan-Meier curves.

**Results:** In baseline characteristics, significant differences in age, sex, and underlying diseases (diabetes, hypertension) were observed among various CAC categories. Throughout the follow-up, 16 CVD events and 26 deaths occurred. Smoking posed a significant risk for CVD (SHR 8.78, 95% CI [7-45.41],  $p<0.05$ ) and death (HR:3.02, 95% CI [1.09-8.36],  $p=0.03$ ). Abnormal Triglyceride (HR 4.36, 95% CI [1.59-11.95],  $p<0.05$ ) and IL-6  $>6$  (HR 4.36, 95% CI [1.59-11.95],  $p=0.004$ ) were associated with death. Positive ABI and CAVI weren't significantly linked to CVD survival.

However, PAD participants had a higher death risk (HR 4.88, 95% CI [1.99-11.94],  $p=0.001$ ). While not statistically significant, a positive CAC score showed a potential trend for CVD risk.

Figure. Kaplan-Meier for all-cause mortality by:  
A. Degrees of coronary artery calcium (CAC) scores.  
B. Stratified CAC by positive or negative.

**Conclusions:** Our findings emphasize the significance of traditional CVD risk factors like smoking and hypertension in PLWH. While ABI and CAVI may not be ideal for stand-alone risk assessment, CAVI shows promise in predicting mortality.

However, the association between elevated CAC scores and event rates is uncertain due to limited events and wide confidence intervals. Larger studies are required to validate and explore CAC's predictive potential across the risk spectrum.

Additionally, inflammatory marker like IL-6 as alternative predictors is warranted.

## TUPEB088

Investigating lipid trends in DOR/RPV/DTG/BIC-including regimens using generalized additive mixed models

A. Castagna<sup>1,2</sup>, M. Bellomo<sup>1</sup>, N. Gianotti<sup>1</sup>, H. Hasson<sup>1</sup>, D. Canetti<sup>1</sup>, S. Nozza<sup>1,2</sup>, M. Guffanti<sup>1</sup>, E. Messina<sup>1</sup>, V. Spagnuolo<sup>1</sup>, R. Lolatto<sup>1</sup>, S. Diotallevi<sup>1</sup>, C. Muccini<sup>1</sup>

<sup>1</sup>San Raffaele Scientific Institute, Milan, Italy, <sup>2</sup>Vita-Salute San Raffaele University, Milan, Italy

**Background:** We compared the dynamics of total cholesterol (TC) and low-density lipoprotein (LDL) cholesterol in people living with HIV (PLWH) who switched to a regimen including doravirine (DOR), rilpivirine (RPV), dolutegravir (DTG) or bictegravir (BIC).

**Methods:** Observational cohort study of adult PLWH, antiretroviral therapy (ART)-experienced, who switched to a DOR/RPV/DTG/BIC-including regimen and were naïve to the studied drugs, with at least lipid determinations  $\geq 2$  before the switch and  $\geq 4$  after the switch.

Follow-up accrued from the first lipid determination within a 5-year interval before the switch, until the last available determination after the switch or the start of an ART-regimen not including DOR/RPV/DTG/BIC.

Generalized Additive Mixed Models were used to study the lipid dynamics. In addition to DOR/RPV/DTG/BIC-intake, variables considered were age, sex, BMI, TDF/TAF use, other antiretroviral drugs intake (grouped by class), statin use, diabetes, CVD events, CD4+ and viremia.

ART and statin covariates were coded as time-dependent variables, counting years of continuous use. Continuous risk variables were modeled nonparametrically, while covariates related to the drugs studied were modeled parametrically to facilitate comparisons.

Individual characteristics and temporal dynamics were modeled using random effects and an autoregressive structure on errors.

Slopes and 95% confidence intervals (CIs) were estimated distinguishing two intervals: the first 2 years of continuous use and longer periods.

**Results:** TC was evaluated in 2742 PLWH (60596 determinations); 2196/2742 were males (80%). At ART-switch, median age was 50.7 years (IQR:43.4-56.0), BMI 23.9 kg/m<sup>2</sup> (IQR:21.8-26.2), CD4+ 724 cells/ $\mu$ L (IQR:538-946), years of ART 12.7 (IQR:5.8-19.0), TC 190 mg/dL (IQR:165-217), LDL 120 mg/dL (IQR:97-143) and 2453 people (89%) had HIV-RNA  $< 50$  copies/mL.

2381/2742 PLWH were evaluated for LDL-cholesterol (54552 determinations).

The table shows the mean change/year in lipids associated with the studied drugs.

As the median follow-up under DOR was 1.2 years (IQR 0.64-1.69), no slope could be estimated for treatment longer than 2 years.

	Total Cholesterol mean change/year (95%CI) 0-2 years	Total Cholesterol mean change/year (95%CI) >2 years	LDL-Cholesterol mean change/year (95%CI) 0-2 years	LDL-Cholesterol mean change/year (95%CI) >2 years
doravirine	-4.16 (-8.37; 0.05), p=0.053	NA	-5.43 (-9.78; -1.08), p=0.014	NA
rilpivirine	-0.61 (-1.34; 0.13), p=0.105	2.09 (1.65; 2.54), p<0.001	1.01 (0.26; 1.76), p=0.008	0.69 (0.26; 1.12), p=0.002
dolutegravir	-0.54 (-1.20; 0.13), p=0.113	1.05 (0.59; 1.51), p<0.001	1.10 (0.43; 1.77), p=0.001	-0.31 (-0.76; 0.15), p=0.184
bictegravir	1.08 (-0.22; 2.38), p=0.102	-1.27 (-3.49; 0.94), p=0.261	-1.59 (-2.90; -0.27), p=0.018	1.11 (-1.15; 3.37), p=0.335

**Conclusions:** DOR showed the most favorable outcome on lipids over the first two years of use, especially on LDL-cholesterol.

## TUPEB089

Cystatin C as a marker of tubular and renal function in people living with HIV: the role of tenofovir disoproxil fumarate

I. Garcia Soriano<sup>1</sup>, S. Vidal García<sup>2</sup>, I. Izuzquiza<sup>3</sup>, A. Guillen<sup>1</sup>, M. Menacho<sup>4</sup>, S. Hernandez<sup>1</sup>, C. Santiuste<sup>4</sup>, I. Valdecabres<sup>1</sup>, A. Abad<sup>3</sup>, J.M. del Rey<sup>4</sup>, J.L. Casado<sup>3</sup>

<sup>1</sup>Hospital Universitario, Elda, Spain, <sup>2</sup>Hospital Rafael Mendez, Lorca, Spain, <sup>3</sup>Hospital Ramón y Cajal, Infectious Diseases, Madrid, Spain, <sup>4</sup>Hospital Ramón y Cajal, Biochemistry, Madrid, Spain

**Background:** The use of antiretrovirals such as tenofovir disoproxil fumarate (TDF) and an ageing population living with HIV (PLWH) make necessary to have reliable estimates of renal function.

The aim of this study was to compare the performance of serum cystatin C (cysC) and cysC-based glomerular filtration rate (GFR) to serum creatinine (scr)-based GFR equation in different clinical situations.

**Methods:** Cross sectional study of 280 PLWH, after excluding those receiving dolutegravir, bictegravir, rilpivirine, and cobicistat. Estimated GFR was derived using MDRD or CKD-epi equations (eGFR-scr) o cysC-based calculations (eGFR-cysC). Proximal tubular renal dysfunction was defined as  $\geq 2$  tubular parameters abnormalities (proteinuria, albuminuria, phosphaturia, uricosuria, glycosuria).

**Results:** Median age was 47 years (range, 23-74) and 80% were male. Nadir CD4 count was 255 cells/mm<sup>3</sup> (IQR, 146-364): After a median time of HIV of 164 months (IQR, 64-249), current CD4+ count was 581 cells/mm<sup>3</sup> (438-778) and HIV RNA level  $< 50$  cop/ml in 97% of cases.

Of note, 30% had hepatitis C virus (HCV) coinfection (35% with F3-F4). After a median time of 60 months of TDF use (80% remained in TDF), serum cystatin C level was 0.9 gr/L (IQR, 0.79-1.02), not related with nadir or current CD4+ count, neither with HIV RNA level pre- or on treatment.

However, HCV coinfection was associated with higher cysC and lower eGFR-cysC (p<0.01). After excluding PLWH with HCV, a moderate correlation between eGFR-scr and eGFR-cysC was observed (rho=0.521; p<0.01), and eGFR-cy-

sC ruled out the presence of CKD in 30% of cases identified by eGFR-scr. Of note, eGFR-cysC was not correlated with BMI, but it was directly correlated with age. Also, it was associated with time on TDF ( $\rho = -0.15$ ;  $p = 0.06$ ), and it was directly correlated with proximal tubular renal abnormalities.

**Conclusions:** Serum cystatin C and eGFR-cysC could be more sensitive than serum creatinine in the detection of tubular renal alterations in PLWH. Importantly, cystatin C is not affected by BMI, CD4+ or HIV RNA level in well-controlled PLWH without HCV coinfection.

Multimorbidity, polypharmacy, anticholinergic burden and frailty in HIV: disentangling the complex interactions through structural equation modeling

H. Michael<sup>1,2</sup>, M.-J. Brouillette<sup>3</sup>, R. Tamblyn<sup>1,4</sup>, L. Fellows<sup>5</sup>, N. Mayo<sup>1,2,6</sup>

<sup>1</sup>McGill University, Division of Experimental Medicine, Montreal, Canada, <sup>2</sup>Research Institute of the McGill University Health Center, Center for Outcomes Research and Evaluation (CORE), Montreal, Canada, <sup>3</sup>McGill University, Department of Psychiatry, Montreal, Canada, <sup>4</sup>McGill University, Department of Epidemiology, Biostatistics & Occupational Health, Montreal, Canada, <sup>5</sup>McGill University, Department of Neurology & Neurosurgery, Montreal Neurological Institute, Montreal, Canada, <sup>6</sup>McGill University, School of Physical and Occupational Therapy, Montreal, Canada

**Background:** Understanding the intricate dynamics among HIV, multimorbidity, polypharmacy, cognition, and frailty is crucial for advancing person-centered care. This study employs structural equation modelling (SEM) to estimate the extent to which sociodemographic characteristics, HIV-associated factors, multimorbidity, polypharmacy, and anticholinergic/sedative burden jointly affect cognitive ability, self-reported cognitive difficulties, and physical frailty in individuals living with HIV.

**Methods:** A cross-sectional analysis of 824 participants living with HIV from the Positive Brain Health Now cohort (85% male) was conducted. Multimorbidity (Charlson Comorbidity Index), polypharmacy (non-antiretroviral medication count), and anticholinergic burden (Anticholinergic and Sedative Burden Catalog) were assessed. Frailty and cognitive abilities were measured using the Modified Fried Frailty Criteria and the Brief Cognitive Ability Measure, respectively. The SEM, conducted using 'lavaan' in R, applied the Weighted Least Squares Mean and

Variance adjusted estimator, with model validation via Leave-One-Out Cross-Validation and z-score significance testing and bootstrapping for effect analysis.

**Results:** We observed a significant positive association between cognitive difficulties and physical frailty ( $\beta_{std} = 0.70$ ,  $p < 0.0001$ ), contrasting with the negligible association with cognitive ability. Anticholinergic burden was modestly correlated with physical frailty ( $\beta_{std} = 0.26$ ,  $p < 0.0001$ ) and cognitive difficulty ( $\beta_{std} = 0.22$ ,  $p < 0.0001$ ), yet unrelated to cognitive ability.

A significant mediation effect was observed between medication count and physical frailty ( $\beta_{std} = 0.18$ ,  $p < 0.0001$ ). Sex directly impacted cognitive ability and indirectly influenced physical frailty and cognitive difficulty via polypharmacy and anticholinergic burden.

Duration of HIV and nadir CD4 levels directly related to physical frailty and cognitive outcomes and indirectly through multimorbidity and polypharmacy. Education directly affected cognitive ability and frailty and indirectly through anticholinergic burden.

Age influences both frailty and cognitive function. Comorbidity and polypharmacy were indirectly linked to frailty and cognitive difficulties via anticholinergic burden. The model demonstrated a good fit (CFI: 0.978, TLI: 0.962, RMSEA: 0.048, SRMR: 0.038) and maintained robustness following cross-validation.

**Conclusions:** SEM revealed direct and indirect associations between important variables and physical frailty, cognitive ability, and difficulty. This comprehensive analysis underscores the necessity of considering a holistic approach in clinical care, especially in managing polypharmacy and anticholinergic burden, to improve health outcomes in people aging with HIV.

Fichtenbaum<sup>6</sup>, M. Zanni<sup>3</sup>, J. Aberg<sup>7</sup>, M. Rodriguez-Barradas<sup>8,9</sup>, K. Breaux<sup>8,9</sup>, R. Gomez Morones<sup>8,9</sup>, C. Malvestutto<sup>10</sup>, S. Grinspoon<sup>3</sup>, T. Brown<sup>11</sup>

<sup>1</sup>University of Colorado Anschutz Medical Campus, Medicine, Aurora, United States, <sup>2</sup>Harvard T.H. Chan School of Public Health, Boston, United States, <sup>3</sup>Massachusetts General Hospital, Boston, United States, <sup>4</sup>University of Freiburg, Freiburg, Germany, <sup>5</sup>Duke University, Durham, United States, <sup>6</sup>University of Cincinnati, Cincinnati, United States, <sup>7</sup>Mount Sinai, New York, United States, <sup>8</sup>Michael E. DeBakey VA Medical Center, Houston, United States, <sup>9</sup>Baylor College of Medicine, Houston, United States, <sup>10</sup>Ohio State University, Columbus, United States, <sup>11</sup>Johns Hopkins University, Baltimore, United States

**Background:** Skeletal muscle density (MD) and area (MA) are key components of physical function; both decline with increasing age. We have previously shown an increase in lean muscle mass with rosuvastatin among people with HIV (PWH), though rarely, statins have been associated with rapid muscle breakdown. We leveraged REPRIEVE to evaluate the impact of 2 years of pitavastatin on MD and MA.

**Methods:** REPRIEVE was a double-blind randomized trial evaluating pitavastatin for primary prevention of major adverse cardiovascular events in PWH. This analysis focuses on participants who underwent coronary CT in the Mechanistic Substudy. Thoracic paraspinal, pectoralis, and infraspinatus MD (Hounsfield units, HU) and MA (adjusted for height (HT), cm<sup>2</sup>/m) were assessed on non-contrast CT images. The difference in baseline-adjusted levels at month 24 between the two treatment groups was estimated using linear regression.

**Results:** Of 804 substudy participants, 692 remained on treatment at month 24; of those, 510 had imaging at baseline and month 24. Median age was 51 (IQR: 46-55) years; 17% female, 36% Black, and 27% Hispanic. There was minimal change in muscle measures within treatment groups, and the estimated treatment group differences were minimal (Table).

Table: Muscle Measure Distributions, Mean (SD)		Baseline		Month 24		Pitavastatin - Placebo Estimate [95% CI]	P-value
		Pitavastatin	Placebo	Pitavastatin	Placebo		
MD (HU)	Paraspinal	36.8 (16.1)	36.4 (16.7)	36.2 (16.7)	36.4 (16.1)	0.6 [-1.7, 2.9]	0.62
	Pectoral	41.4 (15.9)	40.9 (16.2)	41.5 (16.1)	41.8 (15.4)	-0.6 [-2.7, 1.4]	0.55
	Infraspinatus	44.3 (17.1)	42.6 (18.1)	44.2 (13.4)	44.0 (15.6)	-0.5 [-2.8, 1.8]	0.67
MA/HT (cm <sup>2</sup> /m)	Paraspinal	12.0 (4.8)	12.5 (5.1)	12.1 (4.8)	12.5 (4.9)	0.01 [-0.5, 0.5]	0.98
	Pectoral	8.3 (5.4)	8.6 (5.1)	8.2 (4.9)	8.7 (5.2)	-0.3 [-0.8, 0.3]	0.31
	Infraspinatus	6.3 (4.5)	6.3 (4.6)	6.5 (4.6)	6.2 (4.2)	0.4 [-0.2, 0.9]	0.21

Findings were generally consistent in prespecified subgroups including by sex, race, ART duration, nadir and baseline CD4, and baseline inflammatory and myokine biomarkers. A trend towards a protective pitavastatin ef-

fect on paraspinal MA/HT was observed among older individuals ( $\geq 55$  years; 0.96 [95% CI: -0.02, 1.94] cm<sup>2</sup>/m,  $p=0.10$  for interaction with treatment) and those with baseline muscle aches/weakness (0.87 [-0.28, 2.02] cm<sup>2</sup>/m;  $p=0.11$ ).

**Conclusions:** We found minimal change in muscle measures over 24 months overall, or difference between treatment arms. Trends towards a potentially protective effect of pitavastatin on MA/HT among older PWH and those with muscle aches/weakness warrant further study. These findings support the safety of statins among PWH.

## TUPEB092

### Multimorbidity by sex at birth among ageing (65 years and older) persons with HIV (PWH) in the Southern United States (US)

P. Menezes<sup>1</sup>, K. Enders<sup>2</sup>, T. Davy-Mendez<sup>1</sup>, J.J. Eron<sup>1</sup>

<sup>1</sup>University of North Carolina at Chapel Hill, Medicine/ Infectious Disease, Chapel Hill, United States, <sup>2</sup>University of North Carolina at Chapel Hill, Gillings School of Global Public Health, Chapel Hill, United States

**Background:** The Southern US has the highest prevalence of obesity (35.8%), encompasses the "stroke belt and diabetes belt" and includes 45% of PWH in the US. We characterize multimorbidity among ageing PWH in the Southern US to facilitate discussion around the unique health needs of this population.

**Methods:** Using the UNC CFAR HIV Clinical Cohort, we identified PWH  $\geq 65$ yo seen in the UNC Infectious Disease clinic who had  $\geq 1$  HIV RNA test performed between 1/1/22-12/31/23. We recorded sex at birth and defined multimorbidity as having  $\geq 2$  of the following: Hypertension classified by ICD9/10 codes; Hepatitis C if positive antibody or RNA; Hepatitis B if positive surface antigen, or core antibody, or DNA; Diabetes Mellitus (DM) Hemoglobin A1c  $\geq 6.5$ ; chronic kidney disease (CKD) (eGFR  $< 60$  ml/min calculated using CKD-EPI and most recent serum creatinine); and obesity BMI  $\geq 30$ kg/m<sup>2</sup>. Significance testing for continuous variables was performed using t-tests and for categorical variables using chi-square or Fisher's exact test.

**Results:** PWH (n=299) who fit entry criteria had median age 70.9 [IQR 67-73] years. Most were male (70.2%), African American (AA) (55.9%), had HIV RNA  $< 50$ copies/ml (95%) at last clinic encounter, and long duration of HIV acquisition median 25 years (IQR 18-30) and maximum 42 years. Nadir CD4 median 150 cells/mm<sup>3</sup> [IQR 52.5-306], current median CD4 574 cells/mm<sup>3</sup> [IQR 420-799]. Women, compared with men, were more likely ( $p<0.05$ ) to be AA (76.1 vs. 47.1%), obese (39.5 vs. 21.6%), have DM (59.1% vs. 35.7%) and have higher CD4 cells/mm<sup>3</sup> (median 667 vs. 545). More men ( $p<0.05$ ) were Hepatitis B positive (43.8 vs. 22.2%). We found no sex differences when comparing Hepatitis C, CKD and hypertension ( $p>0.05$ ). The overall prevalence of multimorbidity ( $\geq 2$  comorbidities) was high (75.2%), and significantly higher in women ( $p<0.05$ ) compared to men

abstracts

Author  
Index

(83% vs. 72%). Proportions of multimorbidity among study participants were: two (26.1%), three (28.8%), four (14.4%), five or more (6.0%) comorbidities.

**Conclusions:** Multimorbidity with non-communicable diseases is high among PWH  $\geq 65$  years. Management of ageing PWH may need to take into account sex, with women requiring more careful attention to weight and glycemic control, and men to liver function.

## TUPEB093

Comprehensive geriatric assessment for people living with HIV and frailty: a feasibility randomized controlled trial

N. St Clair-Sullivan<sup>1</sup>, K. Bristowe<sup>1</sup>, M. Maddocks<sup>1</sup>, R. Harding<sup>1</sup>, S. Bremner<sup>2</sup>, T. Levett<sup>2</sup>, J. Roberts<sup>3</sup>, Z. Adler<sup>3</sup>, J. Vera<sup>2</sup>

<sup>1</sup>King's College London, Cicely Saunders Institute of Palliative Care, Policy & Rehabilitation, London, United Kingdom, <sup>2</sup>Brighton and Sussex Medical School, Brighton, United Kingdom, <sup>3</sup>University Hospitals Sussex NHS Trust, Brighton, United Kingdom

**Background:** The population of people ageing with HIV is growing, and frailty is rising. Understanding the practicality and acceptability of frailty interventions for older people living with HIV (OPLWH) is crucial.

This study aimed to assess the feasibility and acceptability of delivering a novel comprehensive geriatric assessment (CGA) intervention for screening and management of frailty in OPLWH.

**Methods:** A mixed-methods single-centre feasibility RCT among OPLWH  $\geq 50$  years old, identified as frail using the FRAIL scale in Brighton, UK. Participants were randomized 1:1 to parallel groups: usual care or Silver Clinic intervention, consisting of a CGA delivered jointly by a geriatrician and HIV physician. Primary feasibility outcomes were rates of recruitment, retention and completion of outcome measures.

Patient-reported clinical outcome measures for frailty and quality of life were measured at baseline, 6 and 12 months. Acceptability was evaluated using in-depth qualitative interviews.

**Results:** 25 OPLWH were enrolled (15 intervention: 10 usual care). Most participants were male (99%) and white (88%), median (IQR) age 64 (54-79) years. The recruitment target of 84 participants was not achieved; retention (100% at 6 months) and outcome measure completion (n=97% 6 months) were high. Improvements in Timed and Up and Go tests and health-related quality of life were observed in the intervention group vs the control group at 12 months.

No changes in other frailty measures or clinical parameters were observed. Interviews revealed study processes and implemented outcome measures as acceptable and considered the intervention as a valuable addition to ageing HIV care.

	Intervention n=15	Usual care n=10
<b>Social-care related quality of life **</b>		
6 months	0.5 [0.4,0.9]	0.6 [0.4,0.7]
12 months	0.7 [0.4,0.9]	0.5 [0.4,0.8]
<b>EQ-5D-5L VAS **</b>		
6 months	50 [40,65]	65 [44,79]
12 months	57 [50,75]	50 [41,60]
<b>Timed up and go ** (seconds)</b>		
6 months	15 [12, 20]	12 [10,22]
12 months	12 [10, 16]	13 [10,23]
<b>HIV PROM *</b>		
6 months	28.7 (10.0)	24.8 (8.4)
12 months	28.3 (9.0)	25.5 (12.2)
<b>Montreal Cognitive Assessment**</b>		
6 months	25 [23,26]	24 [21,27]
12 months	26 [24,27]	25 [24,28]
<b>FRAX score **</b>		
6 months	6.0 [4.4,7.4]	7.0 [6.0,13.0]
12 months	6.0 [4.4,7.4]	5.7 [4.6,9.0]
<b>QRISK **</b>		
6 months	15 [12.1, 25]	27 [16,39]
12 months	15 [13.2,24]	24 [16,28]

\*Mean (SD) \*\*Median [IQR]

Table. Descriptive statistics of outcome measures by group.

**Conclusions:** CGA was acceptable and, compared to usual care, potentially improves health-related quality of life and Timed Up and Go scores over 12 months. Although the trial had high retention, recruiting frail individuals was challenging. A large RCT to determine the effectiveness of CGA in OPLWH is warranted using a multicentre design to improve recruitment.

Author Index

future LARs among PWH and investigate HCPs' willingness to discuss these options with PWH when they become available.

**Methods:** This study was conducted at Amsterdam UMC between July 2023 and December 2023. Six hypothetical descriptions of LARs in the form of vignettes, illustrating administration mode, frequency, site, and side effects were presented to all participants.

We asked participants if they were willing to consider a switch to each of these vignettes or preferred to continue their current oral regimen.

We asked HCPs if they would be likely to discuss each of the vignettes as potential treatment options with the participants. Both the percentage of participants that would be willing to switch to each of the options and the percentage that would be willing, but with whom the particular vignette would not be discussed by the HCP are reported.

**Results:** Of the 259 participants (median age 55 [20-84]; 79% males, 88% would be willing to switch to at least one vignette and 11% to all six options. The vast majority, i.e., 77% would consider switching to weekly tablets. Willingness to switch to intramuscular and subcutaneous injections, infusions and implants varied from 35% to 42%. HCPs' (n= 22; 64% working >10 years) intention to discuss each option with participants ranged from 58% to 90%. HCPs would discuss all LAR options in 40% of participants. In 37% to 40% of the participants that would be willing to switch to either intramuscular or intravenous regimens, the treatment options would not be discussed with them by the HCP.

**Conclusions:** Most participants would be willing to switch to weekly oral tablets. Among the other LARs, comparable levels of willingness are observed. Our findings suggest that HCPs may underestimate participants' willingness to switch to intramuscular injections and intravenous infusions.

Further research should explore the underlying reasons behind PWHs willingness and HCPs intentions to discuss various LAR options.

## TUPEB095

12-month outcomes of cabotegravir plus rilpivirine long-acting every 2 months in a real-world setting: effectiveness, adherence to injections, and patient-reported outcomes from people with HIV-1 in the German CARLOS cohort

C. Jonsson-Oldenbüttel<sup>1</sup>, S. Noe<sup>1</sup>, C. Wyen<sup>2</sup>, J. Borch<sup>3</sup>, K. Ummard-Berger<sup>4</sup>, N. Postel<sup>5</sup>, S. Scholten<sup>6</sup>, K.M. Dymek<sup>7</sup>, B. Westermayer<sup>8</sup>, P. de los Rios<sup>9</sup>, J. Scherzer<sup>7</sup>

<sup>1</sup>MVZ München am Goetheplatz, Munich, Germany, <sup>2</sup>Praxis am Ebertplatz, Cologne, Germany, <sup>3</sup>Praxis Goldstein, Berlin, Germany, <sup>4</sup>UBN/Praxis, Berlin, Germany, <sup>5</sup>Prinzmed, Practice for Infectious Diseases, Munich, Germany, <sup>6</sup>Praxis Hohenstaufenring, Cologne, Germany, <sup>7</sup>ViiV Healthcare, Munich, Germany, <sup>8</sup>GSK, Munich, Germany, <sup>9</sup>ViiV Healthcare, Montreal, Canada

**Background:** Injectable long-acting (LA) cabotegravir (CAB) plus rilpivirine (RPV) offers an alternative mode of drug administration with less frequent dosing than daily oral antiretroviral therapy (ART). CARLOS is a non-interventional, 3-year, multicenter cohort study including people living with HIV-1 (PWH) on suppressive daily oral ART who switched to CAB+RPV LA dosed every 2 months in routine clinical care in Germany. Here, we describe outcomes at Month (M) 12.

**Methods:** M12 effectiveness outcomes include virologic suppression (HIV-1 RNA <50 copies/mL), virologic non-response (HIV-1 RNA ≥50 copies/mL), and virologic failure (two consecutive HIV-1 RNA ≥200 copies/mL, or a single HIV-1 RNA ≥200 copies/mL followed by treatment discontinuation).

Additional outcomes include adherence to the injection window and change in HIV Treatment Satisfaction Questionnaire status version (HIVTSQs) score.

**Results:** In total, 351 PWH were included in the analysis at M12. Overall, 95.1% (n=1847/1943) of CAB+RPV LA injections were administered before or within the ±7-day injection window, and 4.9% (n=96/1943) occurred late. At M12, 85.8% (n=301/351) of participants maintained virologic suppression, and 9.4% (n=33/351) discontinued due to tolerability (n=13/351 [3.7%]; n=10 due to injection-related reasons) or non-virologic reasons (n=20/351 [5.7%]). There were five participants with virologic failure (n=5/351 [1.4%]). Full virologic outcomes are shown in Figure 1.

\*Virologic failure (two consecutive HIV-1 RNA ≥200 copies/mL, or a single HIV-1 RNA ≥200 copies/mL followed by treatment discontinuation). Participant 1: HIV-1 RNA <50 copies/mL; 2: HIV-1 RNA <50 copies/mL; 3: HIV-1 RNA <50 copies/mL; 4: HIV-1 RNA <50 copies/mL; 5: HIV-1 RNA <50 copies/mL; 6: HIV-1 RNA <50 copies/mL; 7: HIV-1 RNA <50 copies/mL; 8: HIV-1 RNA <50 copies/mL; 9: HIV-1 RNA <50 copies/mL; 10: HIV-1 RNA <50 copies/mL; 11: HIV-1 RNA <50 copies/mL; 12: HIV-1 RNA <50 copies/mL; 13: HIV-1 RNA <50 copies/mL; 14: HIV-1 RNA <50 copies/mL; 15: HIV-1 RNA <50 copies/mL; 16: HIV-1 RNA <50 copies/mL; 17: HIV-1 RNA <50 copies/mL; 18: HIV-1 RNA <50 copies/mL; 19: HIV-1 RNA <50 copies/mL; 20: HIV-1 RNA <50 copies/mL; 21: HIV-1 RNA <50 copies/mL; 22: HIV-1 RNA <50 copies/mL; 23: HIV-1 RNA <50 copies/mL; 24: HIV-1 RNA <50 copies/mL; 25: HIV-1 RNA <50 copies/mL; 26: HIV-1 RNA <50 copies/mL; 27: HIV-1 RNA <50 copies/mL; 28: HIV-1 RNA <50 copies/mL; 29: HIV-1 RNA <50 copies/mL; 30: HIV-1 RNA <50 copies/mL; 31: HIV-1 RNA <50 copies/mL; 32: HIV-1 RNA <50 copies/mL; 33: HIV-1 RNA <50 copies/mL; 34: HIV-1 RNA <50 copies/mL; 35: HIV-1 RNA <50 copies/mL; 36: HIV-1 RNA <50 copies/mL; 37: HIV-1 RNA <50 copies/mL; 38: HIV-1 RNA <50 copies/mL; 39: HIV-1 RNA <50 copies/mL; 40: HIV-1 RNA <50 copies/mL; 41: HIV-1 RNA <50 copies/mL; 42: HIV-1 RNA <50 copies/mL; 43: HIV-1 RNA <50 copies/mL; 44: HIV-1 RNA <50 copies/mL; 45: HIV-1 RNA <50 copies/mL; 46: HIV-1 RNA <50 copies/mL; 47: HIV-1 RNA <50 copies/mL; 48: HIV-1 RNA <50 copies/mL; 49: HIV-1 RNA <50 copies/mL; For participants (n=251/351) completing the HIVTSQs at both baseline (mean score, 54.6/66) and M12 (mean score, 61.0/66), a statistically significant improvement in treatment satisfaction was observed (mean change, +6.4;  $p < 0.001$ ).

**Conclusions:** In this real-world cohort, CAB+RPV LA maintained high rates of virologic suppression, with few treatment failures, in the first 12 months following switch. There was a low rate of discontinuation due to injection site reactions, and the majority of injections were administered within the  $\pm 7$ -day injection window or earlier. Despite high baseline scores on oral ART, treatment satisfaction scores increased significantly for participants remaining on CAB+RPV LA at M12.

Impact of different INSTIs on BMI among HIV treatment-naïve patients in Shenzhen, China: a real-world data analysis

L. Zhang<sup>1</sup>, X. Wu<sup>2</sup>, Y. He<sup>1</sup>, F. Zhao<sup>1</sup>, Q. Peng<sup>1</sup>, Q. Zhang<sup>1</sup>, Y. Song<sup>1</sup>, S. Wang<sup>1</sup>, M. Rao<sup>1</sup>, L. Sun<sup>1</sup>, X. Jia<sup>1</sup>, H. Wang<sup>1</sup>, H. Zou<sup>2</sup>  
<sup>1</sup>The Third People's Hospital of Shenzhen and The Second Affiliated Hospital of Southern University of Science and Technology, Shenzhen, China, <sup>2</sup>School of Public Health, Sun Yat-sen University, Shenzhen, China

**Background:** INSTIs-based ART might be associated with weight gain. The impact of different types of INSTIs has not been determined, particularly in combination with TDF or TAF. We compared BMI changes among HIV-infected treatment-naïve patients using data from electronic record in Shenzhen, China.

**Methods:** We conducted a descriptive analysis of 5102 PLHIV aged  $\geq 18$  years at ART initiation before and after ART between 2019 and May 2023. We used linear mixed models with interaction terms to assess whether BMI changes of PLHIV differed significantly over time between the treatment groups. We categorized the treatment group into three subgroups: NNRTI, INSTI, and PI. In order to examine the differential effects of these categories on BMI changes, we performed a subgroup analysis including the subjects who received INSTI to assess the effect of the four regimens (TDF+3TC/DTG, TAF/FTC/EVG/c, TAF/FTC/BIC, 3TC/DTG).

**Results:** The observed BMI trajectories and predicted BMI change by treatment regimen differed among treatment groups. Compared to people who contemporaneous used NNRTI, people who used INSTI 0-0.5 years after ART initiation gained 1.27 BMI (95% CI 1.14 to 1.50,  $p < 0.001$ ) more per year (Table 1), 0.5-1.5 years after ART initiation gained 0.18 BMI (95% CI 0.03 to 0.33,  $p = 0.016$ ) more per year. Compared to people who used TDF+3TC/DTG, TAF/FTC/EVG/c and TAF/FTC/BIC, people who used 3TC/DTG gained more BMI per year after ART initiation (Figure 1). There was no difference between the other three groups using.

	Coefficient	Lower 95% CI	Upper 95% CI	p-value
0-0.5 years & INSTI	1.27	1.04	1.5	0
0.5-1.5 years & INSTI	0.18	0.03	0.33	0.016
1.5-2.5 years & INSTI	0.16	0	0.32	0.052
0-0.5 years & PI	0.08	-0.23	0.38	0.622
0.5-1.5 years & PI	0.46	-0.08	1	0.098
1.5-2.5 years & PI	-0.01	-0.29	0.28	0.973

Table 1.

Figure 1.

**Conclusions:** Compared with NNRTIs, INSTIs can lead to an increase in BMI. Particularly, the increase in BMI caused by DTG is prominent. TDF may be associated with weight loss.

## TUPEB097

Effectiveness of bicitragravir/emtricitabine/tenofovir alafenamide fixed-dose combination in experienced people living with HIV with a history of virologic failure, M184V/I, and other resistance-associated mutations in clinical practice

C. Lamaizón<sup>1</sup>, D. Cecchini<sup>1</sup>, E. Bottaro<sup>1</sup>, M. Brizuela<sup>1</sup>, G. Copertari<sup>1</sup>, B. Bacelar<sup>1</sup>, R. Mauas<sup>1</sup>, I. Cassetti<sup>1</sup>  
<sup>1</sup>Helios Salud, Ciudad Autónoma de Buenos Aires, Ciudad Autónoma de Buenos Aires, Argentina

**Background:** Bicitragravir/emtricitabine/tenofovir alafenamide (B/F/TAF) fixed-dose combination showed high rates of efficacy in clinical trials and real-world cohorts. However, its effectiveness remains understudied in complex populations such as those with suspected or documented resistance-associated mutations (RAMs). We describe virologic outcomes in people living with HIV (PLWH) who were prescribed B/F/TAF and had a history of virologic failure (VF), any documented RAM, M184V/I mutation, and M184V/I + thymidine analog RAMs (TAMS). In addition, we present the findings based on the genotypic sensitivity score (GSS).

**Methods:** Sub-analysis of BICTARG study, an observational, retrospective, real-life cohort of PLWH exposed to B/F/TAF from 10/2019 to 12/2021. B/F/TAF GSS was classed as

1-1.75 (group 1), 2-2.75 (group 2) and 3 (group 3). Virological suppression (plasma HIV-1 RNA <50 copies/mL) rates (VSR) were assessed at 24 and 48 weeks.

**Results:** Of 2356 experienced PLWH included, 185 (7.8%) had a history of VF, of whom 28 had, also, an ongoing VF (OVF). Baseline characteristics: median age (IQR) was 48 (43-54) years; 69.6% were male; 100% were of Hispanic/Latin ethnicity; 57.6% had comorbidities. Overall VSR were 96 and 94% at 24 and 48-weeks. In those with OVF, the median viral load (copies/mL) was 2235 (130-35300). This group had 94% and 85% VSR at 24 and 48-weeks, respectively.

Considering PLWH with mutations ( $n = 174$ , 7.4%), predominant RAMS were for NNRTI (77%), NRTI (64%), and PI (25%). In PLWH with any RAM, VSR were 96 and 93% at 24 and 48 weeks. M184V/I and M184V/I + TAMS were present in 92 and 31 PLWH, respectively. VSR at 24/48 weeks were 94/97% and 96/95%, respectively. Considering GSS, 77 PLWH were in group 3; 84, in group 2, and 13 in group 1. Baseline VSR were: 75%, 82%, and 55%, respectively; at 24 weeks: 95%, 97%, and 82%; and at 48 weeks: 100%, 92%, and 100%, respectively. There was no emergence of new RAMs during follow-up.

**Conclusions:** In a real-life cohort, B/F/TAF provided high levels of VS at 48 weeks in PLWH with a history of VF, as well as those harboring M184V/I and other RAMS.

## TUPEB098

Metabolic complications after initiating B/F/TAF versus DTG/3TC in ART-naïve adults with HIV: a multicenter prospective cohort study

<sup>1</sup>Hospital Universitario Ramón y Cajal, Infectious Diseases, Madrid, Spain, <sup>2</sup>Universidad de Alcalá de Henares, Alcalá de Henares, Spain, <sup>3</sup>CIBER de Enfermedades Infecciosas (CIBERINFEC), Instituto de Salud Carlos III, Madrid, Spain, <sup>4</sup>Hospital General Universitario de Elche, Elche, Spain, <sup>5</sup>Instituto de Salud Carlos III, Centro Nacional de Epidemiología, Madrid, Spain, <sup>6</sup>Hospital Universitario de La Princesa, Sección de Infecciosas, Madrid, Spain, <sup>7</sup>Hospital Universitari de Bellvitge., Unidad VIH Servicio de Enfermedades Infecciosas, Bellvitge, Spain, <sup>8</sup>Institute of Biomedicine of Seville/Virgen del Rocio University Hospital/CSIC/University of Seville, Clinical Unit of Infectious Diseases, Clinical Microbiology and Parasitology, Sevilla, Spain, <sup>9</sup>Hospital Universitario Dr. Balmis de Alicante, Alicante, Spain

**Background:** Despite the widespread use of tenofovir alafenamide (TAF), more data are needed on metabolic outcomes of this therapy. We aimed to assess changes in

weight, laboratory markers, and clinical events in participants who started bictegravir/emtricitabine/TAF (B/F/TAF) vs. dolutegravir/lamivudine (DTG/3TC).

**Methods:** We used CoRIS, a Spanish multicenter prospective cohort. We included treatment-naïve adults with HIV who started B/F/TAF or DTG/3TC and had at least 96 weeks of follow-up. Participants were matched using propensity-score. We fitted generalized estimating equation (GEE) models to assess changes in weight, blood lipids, and hepatic steatosis index (HSI) and to compare the incidence of diabetes mellitus, hypertension, and lipid-lowering drug use at 96 weeks.

**Results:** In total, 340 participants were included in each group. Median age was 34 years, 95% were male, median CD4 count was 484 cell/ $\mu$ L, and median baseline weight was 71.1 kilograms. At 96 weeks, participants who started B/F/TAF had a mean weight increase of +1.37 kg (95% CI 0.93, 1.82), compared to +1.48 kg (95% CI 0.90, 2.07) in those who started DTG/3TC, with no differences between groups ( $p=0.774$ ). We found no significant differences in the occurrence of overweight or obesity. There were no between-group weight differences in subgroup analyses by sex, race, mode of HIV acquisition, education level, or CD4 count.

During follow-up, there was a modest increase in blood lipid levels (+10.6 mg/dL in total cholesterol, +3.6 mg/dL in HDL, + 5.9 mg/dL in LDL, + 5.7 mg/dL in triglycerides), but no in the total cholesterol/HDL ratio, with no differences between B/F/TAF and DTG/3TC. The table shows the incidence of clinical events at 96 weeks. No significant differences were observed between groups.

	B/F/TAF	DTG/3TC	OR (95% CI)	p-value
Overweight, n (%)	22 (6.47)	28 (8.24)	1.30 (0.73, 2.32)	0.378
Obesity, n (%)	3 (0.88)	6 (1.76)	2.02 (0.50, 8.14)	0.314
Diabetes Mellitus, n (%)	1 (0.29)	2 (0.59)	2.01 (0.18, 22.23)	0.571
Hypertension, n (%)	11 (3.24)	12 (3.53)	1.09 (0.48, 2.52)	0.832
Use of lipid-lowering therapy, n (%)	8 (2.35)	6 (1.76)	0.75 (0.26, 2.17)	0.590
NAFLD criteria (HSI $\geq 36$ ), n (%)	23 (6.76)	21 (6.18)	0.91 (0.49, 1.67)	0.755

**Conclusions:** Initiation of antiretroviral therapy with both B/F/TAF and DTG/3TC led to a modest increase in weight, total cholesterol, LDL, HDL, and triglycerides, with no differences between groups, in a prospective Spanish cohort. The incidence of overweight, obesity, and related clinical events was similar in both groups.

## TUPEB099

### D<sup>2</sup>EFT body composition sub-study week 96 results

D. Carey<sup>1</sup>, G. Musoro<sup>2</sup>, D. Boettiger<sup>1</sup>, E. Papot<sup>1</sup>, S. Wagner<sup>3</sup>, R. Kaplan<sup>4</sup>, B. Jones<sup>5</sup>, M. Law<sup>1</sup>, G. Matthews<sup>1</sup>, on behalf of the D<sup>2</sup>EFT Study Group

<sup>1</sup>University of New South Wales, Kirby Institute, Sydney, Australia, <sup>2</sup>University of Zimbabwe, Clinical Research

Centre, Harare, Zimbabwe, <sup>3</sup>INI, Rio de Janeiro, Brazil,

<sup>4</sup>Desmond Tutu Health Foundation, Cape Town, South Africa, <sup>5</sup>ViiV Healthcare, Brentford, United Kingdom

**Background:** Integrase inhibitors have been associated with greater weight increases than other anti-HIV agents. This study was conducted in a subset of adults with first line NNRTI treatment failure randomised to open-label dolutegravir (DTG) with fixed TDF and lamivudine or emtricitabine (TDF/XTC) versus DTG with darunavir/ritonavir (DRV/r) versus standard of care (DRV/r+2 NRTIs: SOC) as part of D<sup>2</sup>EFT. At 96 weeks rates of viral suppression in the DTG-containing regimens of D<sup>2</sup>EFT were superior to SOC.

**Methods:** D<sup>2</sup>EFT sites with access to whole-body dual energy x-ray absorptiometry (DXA) for body composition analysis could participate. Body habitus and body composition measures were assessed over 96 weeks. Changes from baseline were summarized by treatment arm and compared using linear regression. Models were adjusted for age, sex, baseline CD4 count and baseline outcome value.

**Results:** 149 participants from 6 sites in Africa and Asia were recruited between November 2020 and December 2021. Mean baseline variables were age 38.3 years, weight 61.9kg, BMI 23.1kg/m<sup>2</sup>, 50.3% were women and 81% black. At 96 weeks mean (SD) weight had increased 3.8kg (5.4) for SOC, 5.4kg (6.8) for DTG+TDF/XTC and 7.1kg (5.4) for DTG+DRV/r; mean (SD) BMI had increased 1.4kg/m<sup>2</sup> (2.0), 2.1kg/m<sup>2</sup> (2.6) and 2.7kg/m<sup>2</sup> (2.1), respectively.

Compared to SOC the mean changes in weight and BMI were higher at 96 weeks with DTG/DRV/r (3.4kg [95%CI 1.0,5.8]; p=0.006) and (1.3kg/m<sup>2</sup> [95%CI 0.4,2.2]; p=0.004), respectively but did not differ significantly with DTG+TDF/XTC. The change in waist-to-hip ratio did not differ significantly between arms.

Mean changes in weight and body composition measures are shown in the figure.

**Conclusions:** The greater increases in both fat and lean body mass relative to SOC may be due to an improved return to health effect. New strategies to counter the tendency to weight gain with these highly effective and robust regimens are required.

### Evaluation of the effect of Chinese medicine combined with ART in HIV immunological non-responders, a randomized, double-blind, placebo-controlled study

Z. Chen<sup>1</sup>, Y. Sun<sup>1</sup>, Z. Zhang<sup>1</sup>, X. Zhang<sup>1</sup>, M. Deng<sup>1</sup>, M. Feng<sup>1</sup>, Q. Li<sup>1</sup>

<sup>1</sup>The Sixth People's Hospital of Zhengzhou, Zhengzhou, China

**Background:** The treatment of immunological non-responders of acquired immune deficiency syndrome(AIDS) remains a challenge currently. Previous reports have indicated the potential efficacy of Chinese medicines (CM) combined with antiretroviral therapy (ART) in people living with human immunodeficiency virus (HIV).

**Methods:** This study evaluates the therapeutic effectiveness of Chinese medicines in immunological non-responders. A randomized, double-blind, placebo-controlled trial was conducted in people living with HIV who had been on ART for more than two years, had an HIV viral load below undetectable levels, and had CD4<sup>+</sup> T-lymphocyte counts below 250 cells/μL. The participants were randomly assigned to receive either CM+ART or Placebo+ART for 12 months. All study staffs and participants were masked. This study was registered on the Chinese Clinical Trial Register (CTR1900027695).

**Results:** A total of 116 participants were recruited between June 2019 and May 2021 and randomly assigned to receive either CM+ART (n=54) or Placebo+ART (n=62). There were no statistically significant differences in the demographic characteristics between the two groups ( $P>0.05$ ). In the CM+ART group, the median CD4 count was 164 cells/μL at baseline (IQR, 115, 214) and 232 cells/μL at outcome (IQR, 131, 394).

Statistical analysis indicated significant differences between baseline and outcome ( $Z=-4.851$ ,  $P<0.001$ ). The Placebo+ART group exhibited similar results ( $Z=-4.042$ ,  $P<0.001$ ). The mean change in CD4 count after 12 months was  $(112\pm142)$  cells/μL in the CM+ART and  $(56\pm98)$  cells/μL in the Placebo+ART.

The difference between the two groups was statistically significant ( $F=5.181$ ,  $P<0.05$ ) and the estimated mean difference was  $(52\pm23)$  cells/μL.

The success rate of immune reconstitution demonstrated a statistically significant distinction between the two groups ( $\chi^2=4.222$ ,  $P<0.05$ ). In the CM+ART, 24 participants on ART for 2-5 years showed the mean change in CD4 count of  $(35\pm84)$  cells/μL after treatment, and 26 on ART

for more than 5 years showed ( $183 \pm 148$ ) cells/ $\mu$ L, that was a statistically significant difference on different ART duration ( $F=17.987$ ,  $P<0.05$ ).

**Conclusions:** Combining Chinese medicine with antiretroviral therapy can elevate CD4 T-lymphocyte levels in immunological non-responders, which assists in people living with HIV with immune reconstitution, and the baseline ART duration is longer, and the combination of Chinese medicine with antiretroviral therapy resulted in greater efficacy.\*

## TUPEB101

Real-world effectiveness and tolerability of the 2-drug regimen dolutegravir and lamivudine (DTG/3TC) in people living with HIV: a systematic literature review and meta-analysis from clinical practice

J. Frayssse<sup>1</sup>, J. Priest<sup>2</sup>, M. Turner<sup>3</sup>, S. Hill<sup>3</sup>, B. Jones<sup>4</sup>, G. Verdier<sup>5</sup>, E. Letang<sup>6</sup>

<sup>1</sup>ViiV Healthcare, Amersfoort, Netherlands, the, <sup>2</sup>ViiV Healthcare, Durham, United States, <sup>3</sup>HEOR Ltd, Cardiff, United Kingdom, <sup>4</sup>ViiV Healthcare, Brentford, United Kingdom, <sup>5</sup>ViiV Healthcare, Montréal, Canada, <sup>6</sup>ViiV Healthcare, Madrid, Spain

**Background:** Clinical trials have demonstrated that dolutegravir (DTG) + lamivudine (3TC) is an efficacious, well-tolerated, and durable regimen for both treatment-naïve and -experienced people with HIV (PWH). This systematic literature review (SLR) and meta-analysis of real-world data aim to evaluate the effectiveness, durability, and tolerability of DTG+3TC in diverse populations of PWH in real-world clinical settings.

**Methods:** An SLR of PubMed, Embase, and 24 regional and international conferences conducted between January 2013 and March 2023 identified studies of DTG+3TC. Data were pooled using single-arm meta-analyses with random effects models. The estimated proportions of individuals achieving viral suppression (VS), experiencing viral failure (VF), and discontinuing treatment at weeks 48 or 96 were evaluated. Heterogeneity was assessed using  $I^2$  statistics, and publication bias was evaluated using funnel plots and Egger's tests.

**Results:** The SLR identified 187 publications reporting results from 146 studies across 67 cohorts, encompassing a total of 36,313 unique PWH. Thirty studies that reported consistently defined outcomes of interest at comparable time points (N: 7688; treatment-naïve: 1062; treatment-experienced: 6626) were included in the meta-analysis. Among treatment-naïve PWH, high proportions achieved VS at weeks 48 (0.975 [95% confidence interval (CI): 0.949-0.993]) and 96 (0.890 [CI: 0.654-1.000]).

Conversely, low proportions experienced VF at weeks 48 (0.000 [CI: 0.000-0.003]) and 96 (0.020 [CI: 0.000-0.114]). Discontinuations for any reason were low at weeks 48

(0.072 [CI: 0.031-0.124]) and 96 (0.144 [CI: 0.099-0.196]). For treatment-experienced PWH, high proportions achieved VS at weeks 48 (0.963 [CI: 0.941-0.981]) and 96 (0.977 [CI: 0.955-0.992]). Low proportions experienced VF at weeks 48 (0.007 [CI: 0.003-0.013]) and 96 (0.015 [CI: 0.005-0.029]). Discontinuations for any reason were low at weeks 48 (0.070 [CI: 0.048-0.095]) and 96 (0.123 [CI: 0.080-0.174]). Among 1062 treatment-naïve individuals, none reported treatment-emergent resistance at VF. In 6626 treatment-experienced individuals, on-treatment M184V/I mutations were reported in 2 PWH, and 1 individual had K103R+S147G mutations (treatment-emergence unknown).

**Conclusions:** This SLR and meta-analysis confirm that DTG+3TC is an effective, tolerable, and durable antiretroviral regimen through 96 weeks among diverse PWH in real-world clinical settings. On-treatment resistance development was not reported in treatment-naïve and was rarely reported in treatment-experienced PWH.

**Methods:** Observational multicenter SCOLTA (Surveillance Cohort Long-Term Toxicity Antiretrovirals) cohort. Reasons for LA discontinuation were prospectively collected. Probability of discontinuation for adverse events (AEs) was assessed through log-rank test.

**Results:** Of 231 people with HIV (PWH), who started CAB+RPV, and had at least one follow-up visit available, 53 (23%) were women, 220 were Caucasian (97%), most were men who have sex with men (115, 50%) and heterosexuals (75, 32%) PWH, mainly in CDC stage A (137, 60%). Mean age at enrolment was 48.5 ( $\pm 11.9$ ) years and median time on ART was 10 (IQR 5.4-16.1) years. Before LA, the ART contained an integrase inhibitor (INSTI) in 168 (73%) people, a non-nucleoside reverse transcriptase inhibitor (NNRTI) in 111 (48%), both INSTI+NNRTI in 61 (26%) and a protease inhibitor in 3 (1%). 129 participants (66%) had at least one treatment in addition to ART (86 were taking 1-2 other drugs; 43  $\geq 3$  other drugs). Twenty-one PWH (9%) discontinued LA treatment after a median of 2 months (range 0-6), of which 15 for AEs (Table). The probability of AE leading to discontinuation was not influenced by previous ART, sex, BMI, CDC stage, age, risk factor for HIV, concomitant treatments or by oral lead-in ( $p > 0.1$  for all). Other six persons discontinued treatment, due to lost to follow up (N=1), pregnancy (N=1), virologic failure (N=2), resistance to RPV (N=1) and inconvenience with injection schedule (N=1).

Table. Adverse events leading to discontinuation of long-acting therapy with cabotegravir/rilpivirine in SCOLTA cohort.

	Sex at birth, age	Previous regimen	Painful reaction	Fever	Other	Days since first injection	Oral lead-in	Causal correlation with therapy
1	M, 61	RPV-DTG	Grade 2	No	No	56	Yes	Certain
2	M, 55	RPV-DTG	Grade 2	No	No	1	No	Certain
3	F, 59	FTC-DTG	Grade 3	No	No	132	No	Certain
4	M, 40	RPV-DTG	Grade 2	No	No	1	No	Certain
5	M, 63	FTC-DTG	Grade 2	Grade 2	No	1	Yes	Both certain
6	M, 55	FTC-TAF-RPV	Grade 1	Grade NA	No	1	Yes	Certain
7	M, 55	FTC-TAF-BIC	No	Grade 1	No	29	Yes	Certain
8	M, 49	FTC-DTG	No	Grade 2	No	1	No	Likely
9	M, 44	RPV-DTG	No	Grade 2	Arthralgia, grade 2	87	No	Possible
10	F, 65	RPV-DTG	No	Grade 1	Gastrointestinal, grade NA	148	Yes	Possible
11	M, 66	FTC-TAF-RPV	No	No	Glycemic decompensation, grade 3	63	No	Possible
12	M, 54	FTC-TAF-RPV	No	No	Acute pancreatitis, grade 4	46	Yes	Likely
13	M, 51	RPV-DTG	No	No	Rash, grade 2	125	No	Possible
14	M, 51	FTC-TAF-BIC	No	No	Arthralgia, grade 4 Emile dysfunction, grade NA	55	Yes	Certain
15	F, 61	FTC-TAF-BIC	No	No	Headache, grade 2	During lead-in	Yes	Certain

FTC: lamivudine; BIC: bictegravir; DTG: dolutegravir; F: female sex at birth; FTC: emtricitabine; M: male sex at birth; NA: not available; RPV: rilpivirine; TAF: tenofovir alafenamide.

**Conclusions:** The frequency of LA CAB+RPV interruptions for AEs in SCOLTA was higher than in clinical trials. To explore PWH perspectives and continue the active surveillance of AEs in cohort studies will be critical to understanding the key to LA persistence and the actual impact of AE in clinical practice.

## TUPEB103

### Improved immunological recovery after ART intensification with Albuvirtide in immunological non-responders living with HIV

L. Fan<sup>1</sup>, Y. Hu<sup>2</sup>, R. Li<sup>3</sup>, J. Ding<sup>3</sup>, A. Yu<sup>2</sup>, Y. Liu<sup>4</sup>, S. Yu<sup>4</sup>, D. Xie<sup>4</sup>, M. Hu<sup>4</sup>, Y. Li<sup>2</sup>, R. Su<sup>2</sup>, P. Ma<sup>2</sup>

<sup>1</sup>Tianjin Second People's Hospital, Tianjin, Department of Infectious Diseases, Tianjin, China, <sup>2</sup>Tianjin Second People's Hospital, Tianjin, Tianjin, China, <sup>3</sup>Tianjin Medical University, Tianjin, China, <sup>4</sup>Frontier Biotechnologies Inc, Nanjing, China

**Background:** Incomplete immune recovery in people living with HIV/AIDS (PLWHA) during antiretroviral therapy (ART) remains an important clinical challenge. HIV-1 envelope glycoproteins and fusion are considered determining factors in thymocyte depletion and bystander cell death.

This study aimed to evaluate the effect of Albuvirtide (ABT), a long-acting HIV-1 fusion inhibitor, on immune recovery in immunological non-responders (INRs).

**Methods:** In this prospective, open-label, controlled study, 50 INRs received intensive treatment with ABT plus the original ART regimen (intensive ABT group) or only the original ART regimen (control group) at a ratio of 1:1. Immune response and safety were examined within 24 weeks.

Laboratory analysis was carried out to evaluate the effect of enhanced treatment with ABT on the functionality of immune cells by assessing thymus function, cell apoptosis, and autophagy.

**Results:**

Treatment efficacy parameter	Intensive group	Control group	P-value
<b>CD4<sup>+</sup> cells/<math>\mu</math>L</b>			
Baseline	287 (99)	280 (105)	0.813
Week 12	356 (133)	282 (110)	0.037
Week 24	350 (168)	259 (141)	0.213
Change in CD4 <sup>+</sup> cells at week 12 from baseline	45 (24, 122)	-5 (-23, 13)	<0.001
Change in CD4 <sup>+</sup> cells at week 24 from baseline	55 (25, 110)	-5 (-16, 11)	0.012
Change in CD4 <sup>+</sup> cells at week 24 from week 12	-16 (62)	-4 (21)	0.589

Totally 50 participants with comparable age, gender, and ART history were included, with 25 in each group. A significant increase in CD4<sup>+</sup> cell count was found in the intensive ABT group compared with control cases (45 vs. -5 cells/ $\mu$ L,  $p < 0.001$ ) at week 12. After ABT discontinuation, at week 24, CD4<sup>+</sup> cell counts remained significantly higher in the intensive ABT group than in the control group (55 vs. -5 cells/ $\mu$ L,  $p = 0.012$ ).

No serious adverse events associated with ABT were detected. In laboratory analysis, participants with unsatisfactory immune response (UIR) to ABT, naïve CD4<sup>+</sup> T cell amounts were lower compared with those of patients with satisfactory immune response (sIR) to ABT, im-

munological responders (IRs) and healthy donors (HDs) ( $p=0.001$ ). Meanwhile, elevated memory CD4 T cell content was also found in cases with UIR. The proportion of caspase 3<sup>+</sup>CD45RA<sup>+</sup>CD31<sup>+</sup>CD4<sup>+</sup> T cells was significantly lower in participants with sIR administered ABT ( $p<0.05$ ).

**Conclusions:** Significant CD4<sup>+</sup> cell count increase suggests ABT enhances immune function in INRs. Immune reconstitution achieved by ABT could be attributed to its antiviral properties as well as its ability to increase thymic cell output and decrease.

Willingness to pay for medical insurance antiretroviral drugs among people living with HIV in 18 Chinese cities: a mixed method study

J. Hu<sup>1</sup>, H. Tang<sup>1</sup>, W. Kang<sup>2</sup>, S. Wang<sup>1</sup>, J. Xu<sup>1</sup>, D. Zhao<sup>1</sup>, Y. Hao<sup>2</sup>, X. Wang<sup>2</sup>, F. Lyu<sup>3</sup>, G. Zhang<sup>1</sup>, P. Xu<sup>1</sup>

<sup>1</sup>Chinese Center for Disease Control and Prevention, National Center for STD/AIDS Control and Prevention, Beijing, China, <sup>2</sup>Chinese Association of STD&AIDS Prevention and Control, Beijing, China, <sup>3</sup>National Key Laboratory of Intelligent Tracking and Forecasting for Infectious Diseases, National Center for AIDS/STD Control and Prevention, Chinese Center for Disease Control and Prevention, Beijing, China

**Background:** Medical insurance antiretroviral drugs have been gradually used by some Chinese people living with human immunodeficiency virus (PLWH) in recent years. This study aimed to analyze the willingness to pay (WPT) for medical insurance antiretroviral drugs among PLWH.

**Methods:** A mixed method study design, involving a cross-sectional survey and qualitative in-depth interviews was conducted. A cross-sectional survey was used to collect the general characteristics, economic status, ART status, and WPT for medical insurance antiretroviral drugs among PLWH in 18 Chinese cities from August 2022 to February 2023.

Multivariable logistic regression was used to analyse the factors associated with the WPT. The representative PLWH was interviewed by qualitative in-depth interviews, and the data were thematically analyzed.

**Results:** According to the results of a cross-sectional survey, among 941 PLWH, 271 (28.80%) were willing to pay for medical insurance antiretroviral drugs. The senior high school or junior college degree ( $aOR=5.36$ ; 95%CI: 2.55-11.28), undergraduate or above ( $aOR=5.17$ ; 95%CI: 2.39-11.19); married ( $aOR=2.55$ ; 95%CI: 1.41-4.61); often work away from home ( $aOR=3.15$ ; 95%CI: 2.09-4.74); heterosexual transmission ( $aOR=2.79$ ; 95%CI: 1.79-4.36); personal annual income were 50,000-99,999 CNY ( $aOR=1.99$ ; 95%CI: 1.29-3.06),  $\geq 100,000$  CNY ( $aOR=2.69$ ; 95%CI: 1.57-4.61); occurred adverse drug reactions ( $aOR=1.89$ ; 95%CI: 1.30-2.77) were more willing to pay. According to the results of qualitative in-depth interviews,

The main reasons for PLWH's WPT for medical insurance antiretroviral drugs were that they had fewer adverse drug reactions and were easier to take. The main reasons for PLWH's unwillingness to pay for medical insurance antiretroviral drugs were financial difficulties and worrying about privacy disclosure.

**Conclusions:** Nearly a third PLWH are willing to pay for medical insurance antiretroviral drugs. In the future, PLWH with high WTP can be guided to use medical insurance antiretroviral drugs.

## TUPEB105

Initial ART choice among women and men living with HIV in Germany 2010-2018

U. Koppe<sup>1</sup>, A. Haberl<sup>2</sup>, C. Kollan<sup>1</sup>, A. Sailer<sup>1</sup>, V. Bremer<sup>1</sup>, B. Günsenheimer-Barmeyer<sup>1</sup>, ClinSurv-HIV Study Group  
<sup>1</sup>Robert Koch Institute, Infectious Disease Epidemiology, Berlin, Germany, <sup>2</sup>HIVCENTER, University Hospital of Frankfurt, Frankfurt, Germany

**Background:** HIV treatment guidelines in Germany do not include gender-specific recommendations for choice of first-line ART among men and women unless women are pregnant. Gender differences of first-line ART between men and women are insufficiently investigated.

**Methods:** We analysed data of first-line ART among therapy naïve men and women included in the ClinSurv-HIV cohort study in Germany between 2010 and 2018. ART prescription by gender was compared using  $\chi^2$ -tests.

**Results:** We included 1,062 women and 4,564 men in our analysis, who initiated ART between 2010 and 2018. Overall, 24.2% persons received an NNRTI with their first-line regimen (women: 18.6%, men: 25.5%,  $p<0.001$ ), 38.3% received a PI (women: 54.2%, men: 34.6%,  $p<0.001$ ), and 36.7% received an INSTI (women: 27.7%, men: 38.7%,  $p<0.001$ ). Among NNRTI-substances, women less likely received a therapy containing EFV (6.8% vs. 14.0%,  $p<0.001$ ) or RPV (6.0% vs. 8.2%,  $p=0.020$ ) and more likely received NVP (5.8% vs. 3.0%,  $p<0.001$ ) compared to men. Regarding PI, women more likely received a therapy containing ATV (20.7% vs. 7.4%,  $p<0.001$ ) or LPV (13.7% vs. 3.1%,  $p<0.001$ ) and less likely received DRV (19.4% vs. 23.8%,  $p=0.002$ ). Among INSTI, women less likely received a DTG-containing (10.8% vs. 17.8%,  $p<0.001$ ) or EVG-containing (4.8% vs. 10.0%,  $p<0.001$ ) regimen, but were comparably likely to receive a RAL-containing regimen (11.4% vs. 9.6%,  $p=0.086$ ).

We compared gender differences within transmission groups. Among: 836 women and 707 men with heterosexual HIV transmission or from high-prevalence countries the observed differences were similar (NNRTI: women: 19.0%, men: 24.0%,  $p=0.016$ , PI: women: 57.4%, men: 34.9%,  $p<0.001$ , INSTI: women: 24.4%, men: 41.2%,  $p<0.001$ ). Among 79 women and 193 men with intravenous drug use, NNRTI-prescription was comparable (women: 17.7%, men: 17.1%,  $p=0.902$ ) while PI were less often prescribed among

women (women: 38.0%, men: 56.5%,  $p=0.006$ ). INSTI were numerically more often prescribed (women: 41.8%, men: 30.6%,  $p=0.076$ ) although the numbers are small and the differences might be due to chance.

**Conclusions:** We detected differences among prescribed first-line regimens between men and women overall and within transmission groups. While some differences might be due to ART-prescription during planned or concurrent pregnancy, further reasons for differential prescribing need to be explored.

## TUPEB106

### Study of a randomised switch to DTG/RPV in subjects with HIV RNA <50c/ml and archived K103N (Wisard study): week 96 results

G. Moyle<sup>1</sup>, L. Assoumou<sup>2</sup>, J.M. Molina<sup>3</sup>, F. Post<sup>4</sup>, A. Curran<sup>5</sup>, S. Rusconi<sup>6</sup>, S. De Wit<sup>7</sup>, C. Stephan<sup>8</sup>, F. Pozniak<sup>15</sup>, Wisard Study Group

<sup>1</sup>Chelsea and Westminster NHS Foundation Trust, London, United Kingdom, <sup>2</sup>Sorbonne Université, INSERM, Institut Pierre Louis d'Epidémiologie et de Santé Publique, Paris, France, <sup>3</sup>Hospital Saint Louis, Paris, France, <sup>4</sup>Kings College NHS Foundation Trust, London, United Kingdom, <sup>5</sup>Hospital Universitario Vall d'Hebron, Barcelona, Spain, <sup>6</sup>University of Milan, Milan, Italy, <sup>7</sup>University Hospital of Saint-Pierre, Brussels, Belgium, <sup>8</sup>Goethe-Universität Frankfurt, Frankfurt, Germany, <sup>9</sup>University Hospital of Nantes, Nantes, France, <sup>10</sup>Royal Free London NHS Foundation Trust, London, United Kingdom, <sup>11</sup>General University Hospital of Elche, Elche, Spain, <sup>12</sup>Brighton and Sussex University Hospitals, Brighton, United Kingdom, <sup>13</sup>ViiV Healthcare, Brentford, United Kingdom, <sup>14</sup>Research Organisation (Kings Cross), London, United Kingdom, <sup>15</sup>Chelsea and Westminster Hospital, London, United Kingdom

**Background:** Two-drug regimen DTG/RPV has been studied in virologically suppressed patients with no prior treatment failure history or resistance. As viruses with NN-RTI resistance mutation K103N retain in-vitro RPV susceptibility, we investigated viral suppression maintenance potential of switching currently suppressed patients with documented K103N to DTG/RPV.

**Methods:** This 96-week European, open-label, multi-centre, exploratory study in treatment-experienced, HIV-1 participants with documented prior K103N mutation switched participants to DTG/RPV either immediately (DTG/RPV-I) or deferred switch until week 48 (DTG/RPV-D, previously referred to as CSR [continued suppressive regimen]) [randomised 2:1, DTG/RPV-I: DTG/RPV-D]. Prior PI and NRTI mutations were permitted.

**Results:** Week 48 primary endpoint confirmed virological failure (CVF) has previously been published for 140 randomised subjects. By week 96, in each arm, 2 further patients had CVF.

	DTG/RPV-I Immediate switch at Baseline N=95		CSR <sup>1</sup> : DTG/RPV-D <sup>2</sup> Deferred switch until Week 48 N=45	
	N	% (95% CI)	N	% (95% CI)
Week 0 to Week 48	3/95	3.2 (0.7-9.0)	1/45	2.2 (0.1-11.8)
Switch to DTG/RPV occurred at Week 48				
Week 0 to Week 96	5/95	5.3 (1.7-11.9)	3/45	6.7 (1.4-18.3)
Week 48 to Week 96	2/87	2.3 (0.3-8.1)	2/40	5.0 (0.6-16.9)
Confirmed Virological failure (CVF) = 2 consecutive viral loads >50 copies at least 2 weeks apart				

1 – known as continued suppressive regimen (CSR) from week 0 to week 48

2 – known as the DTG/RPV deferred switch (DTG/RPV-D) from week 48 to week 96

Table 1: Protocol defined confirmed virological failure (CVF) at week 48 and week 96.

Of the 8 CVFs through week 96, HIV-1 RNA was <200 copies/ml in 4; only 2 samples amplified, no DTG or RPV resistance mutations observed.

Week 96 treatment success proportion (HIV1 -RNA<50 copies/mL) by ITT FDA Snapshot DTG/RPV-I 84.2% vs DTG/RPV-D 73.3% (+10.9% 95% CI -4 to +25.8).

Figure 1. Proportion of participants with HIV-RNA <50 copies/mL at week 48 vs at week 96, with the ITT FDA Snapshot method.

DTG/RPV-I drug-related AE rate was 38 events in 22 participants (23.2%) (1 grade 3-4) between baseline/week 48; 2 events (0 grade 3-4) between week 48/96. There were 11 drug-related AEs in 5 (12.5%) DTG/RPV-D participants (0 grade 3-4) between week 48/96. No fatalities reported. Between week 48/96, 1 DTG/RPV-I (4 in first 48 weeks) and 1 DTG/RPV-D permanently discontinued due to AE/SAEs.

**Conclusions:** Week 96 data continues to show that switching to DTG/RPV maintains virological suppression in the majority of participants. No resistance emergence to DTG/RPV observed.

## TUPEB107

Efficacy of TLD regimen in viral suppression among HIV patients in Venezuela: the "Plan Maestro" initiative

M. Comegna<sup>1</sup>, E. El Hage<sup>1</sup>

<sup>1</sup>Once Trece Foundation, Caracas, Venezuela, Bolivarian Republic of

**Background:** With a critical shortage of antiretrovirals in Venezuela, reaching 99% in 2017, the "Plan Maestro" was initiated in June 2018. This collaborative strategy, led by UNAIDS, WHO, scientific societies, and civil society, aimed to ensure continuous access to comprehensive health-care for people living with HIV, tuberculosis, and malaria. The initiative, funded by the Global Fund, introduced the TLD (Tenofovir/Lamivudine/Dolutegravir) regimen. Proyecto Once Trece, recognizing the need for improved viral load testing, acquired GeneXpert equipment to assess the response to the TLD regimen provided through the Global Fund.

**Methods:** A prospective, cross-sectional, descriptive study was conducted from April 2022 to December 2023 at the Once Trece Foundation Medical Service laboratory. Using GeneXpert technology, HIV-1 viral load tests were performed on individuals living with HIV who had been on TLD treatment for over 3 months. These tests were conducted free of charge, with informed consent, maintaining confidentiality, on a voluntary basis and included a total of 2256 individuals (W:413, M:1878, TW:15).

**Results:** Viral suppression (<40 copies/ml) was observed in 1774 individuals (78.6%), and 2077 (92.1%) maintained viral loads <1000 copies/ml, meeting WHO criteria. A total of 179 individuals (7.9%) had viral loads >1000 copies/ml. The demographic breakdown showed that 79.49% were MSM (97.66% of males), 0.55% were transgender women, and 19.95% did not belong to any key population.

The TLD regimen demonstrated high efficacy, achieving viral suppression rates above 92.1%, suggesting its suitability as a treatment option. The average age of participants was 40 years.

**Conclusions:** The adoption of the "Plan Maestro" initiative, along with the TLD (Tenofovir/Lamivudine/Dolutegravir) regimen, significantly improved viral suppression rates among people living with HIV in Venezuela. The effectiveness of this strategy highlights its potential as a model for addressing HIV treatment challenges in similar contexts. Furthermore, the incorporation of GeneXpert technology by Proyecto Once Trece played a crucial role in verifying viral suppression among these individuals. The involvement of organized civil society is vital in ensuring the continuity of antiretroviral regimen supplies in complex environments like Venezuela.

## TUPEB108

Social Determinants of Health (SDoH) impact on Viral Suppression (VS) in a 48-week Low Barrier Care (LBC) study for rapid Antiretroviral Therapy (ART) reinitiation among persons with HIV (PWH) lost-to-care

K. Burke<sup>1</sup>, L. Roden<sup>1</sup>, K. Keckler<sup>1</sup>, C. DeMarco<sup>1</sup>,

P. Cortes Valadez<sup>1</sup>, D. Grennan<sup>1,2</sup>, G. Huhn<sup>1,2</sup>, R. Osborn, MD<sup>1</sup>

<sup>1</sup>Cook County Health, The Ruth M. Rothstein CORE Center, Chicago, United States, <sup>2</sup>Cook County Health, Infectious Diseases, Chicago, United States

**Background:** Effectively interrupting the source of transmission is a critical step in ending the HIV epidemic (EHE). COMEBACK (NCT04519970) is a 48-week single-center study in Chicago implemented in September 2020, with its main objectives to reengage lost-to-care PWH and rapidly reinitiate ART in an LBC model to promote VS and favorable Patient Reported Outcomes (PROs).

**Methods:** Adults off ART ≥2 weeks, without history of significant B/F/TAF resistance or renal impairment, were rapidly started on B/F/TAF upon reengagement after same day collection of baseline labs and PROs (N=100). A screening assessment was used to stratify participants into case management (CM) tiers with a dedicated retention specialist: minimal, moderate, or advanced.

An acuity assessment tool was adapted to determine whether participants needed additional support based on retention and VS. Baseline and 48-week endpoints were reported by intention-to-treat and observed analysis.

**Results:** At baseline median age was 37 years (range, 24–68), with 91.0% Black and 68.0% cisgender male. Median CD4+ was 310 cells/mm<sup>3</sup>, with median viral load 11,084 copies/mL (range, <40–2,000,000, 16% VS). Median time off ART was 5 months (range, 0.5–242). For CM, participants self-screened into minimal (70%), moderate (28%), and advanced (1%) tiers. By intention-to-treat 50% required tier escalation. The greatest proportion of transitions occurred from minimal at baseline to advanced (40%) by end of study. Among those who advanced (N=29) 24% reported housing insecurity, 35% had food insecurity, 48% demonstrated low health literacy, 35% expressed adherence concerns, and 21% reported active substance use. Sixty-four of 100 participants (64%) completed the study, with VS in 48% (N=48/100) by intention-to-treat and 75% (N=48/64) by observed analysis. No resistance to B/F/TAF was detected. Two participants stopped the study early to switch to long-acting ART for 78% VS (N=50/64) retained-in-care clinically observed at week 48.

**Conclusions:** VS was high for PWH with rapid ART reinitiation retained-in-care, however lapses in retention and shifts toward more intense CM were impacted by SDoH challenges. Achieving VS among high-risk populations disenfranchised from care will require not only individualized CM and specialized retention approaches but in-

tegrated sustainable strategies among multiple levels of SDoH interventions to capitalize on LBC models towards EHE.

### Sex-specific impacts of maternal dolutegravir-based ART on placental and embryonic metabolome in a mouse pregnancy model

H. Mohan<sup>1</sup>, I. Hsieh<sup>1</sup>, J. Jao<sup>2</sup>, R. Zash<sup>3</sup>, N. Greene<sup>4</sup>, A. Copp<sup>4</sup>, L. Serghides<sup>1</sup>

<sup>1</sup>University Health Network, Toronto, Canada,

<sup>2</sup>Northwestern University Feinberg School of Medicine, Departments of Pediatrics and Medicine, Chicago, United States, <sup>3</sup>Beth Israel Deaconess Medical Center, Boston, United States, <sup>4</sup>University College London, London, United Kingdom

**Background:** Metabolite shifts in pregnancy may play a role in perinatal origins of metabolic disease for offspring. Our study assessed the impact of DTG in pregnancy on the placental and embryonic metabolome.

**Methods:** Pregnant C57BL/6J mice were divided into control (water, N=10), and DTG (2.5 mg/kg, N=10, therapeutic dose), with DTG administered alongside 50mg/kg tenofovir disoproxil fumarate and 33.3mg/kg emtricitabine (TDF/FTC). From both control and DTG groups, metabolic profiles in male and female placenta (N=40, 20 males, 20 females) and embryos (N=40, 20 males, 20 females) were analyzed using liquid chromatography-mass spectrometry, with Welch's t-test identifying significant biochemical differences between groups.

**Results:** Compared to controls, DTG exposure was associated with differences in 72 metabolites (50 upregulated, 22 downregulated) in placentas of male fetuses, but only 29 metabolites (22 upregulated, 7 downregulated) in placentas of female fetuses. In male embryos DTG exposure was associated with differences in 77 metabolites (69 upregulated, 8 downregulated) compared to controls, and 73 metabolites (68 upregulated, 5 downregulated) in female embryos.

In placentas from male fetuses, most upregulated metabolites (24/50) belonged to the lipid pathway, whereas in placentas from female fetuses, they were primarily in the amino acid pathway (10/22).

In both male (39/69) and female (30/68) embryos, the lipid pathway had highest number of upregulated metabolites. In males 8 metabolites showed shared significant regulation between placenta and embryo (6 upregulated, 2 downregulated), while in the females only 3 metabolites showed shared regulation (2 upregulated, 1 downregulated).

Phenol sulfate, a microbial-dependent product, was significantly elevated in the placenta and embryos of both males and females exposed to DTG. Levels of 2-hydroxy-

butyrate, a marker of mitochondria dysfunction and oxidative stress, were higher in both the placenta and embryos of females exposed to DTG, but not in males.

**Conclusions:** Metabolites in amino acid pathway showed significant differences and sexual dimorphism in placentas and embryos of DTG+TDF/FTC-treated pregnant mice. Varied metabolite regulation was observed between placentas and embryos, except for phenol sulphate. Elevated 2-hydroxybutyrate in female embryos suggests sex-specific oxidative stress/mitochondrial dysfunction with DTG treatment.

Further research is needed to determine if these fetal metabolic changes affect later metabolic health in humans.

## TUPEB110

### A first-in-human phase 1 study of the novel nanoparticle-formulated TLC-ART 101, a single subcutaneous injection containing 3 HIV drugs, demonstrates long-acting pharmacokinetics and initial clinical safety

R.A. Bender Ignacio<sup>1,2</sup>, C. Jonsson<sup>1,3</sup>, M. Hartman<sup>3</sup>, S. Perazzolo<sup>3</sup>, P. Belaunzaran-Zamudio<sup>4</sup>, K.W. Crawford<sup>4</sup>, E. Acosta<sup>5</sup>, Z. Stephen<sup>3</sup>, B. Hanscom<sup>2</sup>, A.J. Melvin<sup>6</sup>, A.C. Collier<sup>1</sup>, R.J.Y. Ho<sup>3</sup>, for the TLC-ART Program

<sup>1</sup>University of Washington, Allergy and Infectious Diseases, Seattle, United States, <sup>2</sup>Fred Hutchinson Cancer Center, Vaccine and Infectious Diseases Division, Seattle, United States, <sup>3</sup>University of Washington, TLC-ART Program, Pharmaceuticals, Seattle, United States, <sup>4</sup>National Institute of Allergy and Infectious Diseases, National Institutes of Health, Division of AIDS, Rockville, United States, <sup>5</sup>University of Alabama Birmingham, Clinical Pharmacology, Birmingham, United States, <sup>6</sup>Seattle Childrens Hospital, Infectious Disease and Virology, Seattle, United States

**Background:** Long-acting injectable antiretroviral therapy (LAI-ART) is a significant step towards reducing HIV stigma and promoting ART adherence. The only current complete LAI regimen, LA-cabotegravir + LA-rilpivirine faces barriers to global implementation due to drug resistance, cost, distribution challenges, and clinic-required injections. The TLC-ART program has developed TLC-ART-101 composed of 3 HIV drugs - lopinavir (LPV), ritonavir (RTV), and tenofovir (TFV) - combined in drug combination nanoparticles (DcNP) and given subcutaneously. A phase 1 first-in-human study with pharmacologically guided adaptive dosing and study duration is enrolling 12-16 participants with up to two dose adjustments between cohorts (NCT06850728).

**Methods:** Cohort 1 comprised four adult participants without HIV or comorbidities. Each received a single 1.5mL subcutaneous injection of TLC-ART-101 (15.6mg LPV/ 4.1mg RTV/ 9.2mg TFV; <5% of daily oral dosing) in the abdomen. Participants were observed for clinical safety with blood

collection at multiple timepoints on days 0-1 and on days 2, 3, 7, 10, 14, 21, 28, 35, 49, and 57. Non-compartmental and non-parametric pharmacokinetic analysis were performed on plasma.

**Results:** All four participants (3M/1F, 24-58y) completed the 57-day study. TLC-101 was well-tolerated with only mild (Grade 1) injection-site reactions including redness, bruising, localized swelling, and/or itching that resolved completely in 1-7 days (mean 4.0). No gastrointestinal side effects or serious adverse events were reported. No changes in liver enzymes, kidney function, or blood cell lines were detected. LPV and TFV were detectable in plasma for 57 and 21 days respectively; RTV was detectable for 4 days. Each component demonstrated extended half-lives ( $T_{1/2}$ ) of 228 hours (LPV), 10h (RTV), and 84h (TFV).

**Conclusions:** With a fraction of daily LPV/RTV/TFV oral dosing, the three HIV-drug TLC-ART-101, enabled by DcNP technology, appeared safe and well-tolerated. In contrast to the short half-life of each drug when given orally, TLC-ART 101 demonstrated a 38-fold, 2-fold, and 11-fold half-life extension for LPV/RTV/TFV respectively in people versus oral dosing.

Cohort 2 is in process with a dose escalation to 2.7-fold the initial dose and a longer study duration. This proof-of-concept study will support global implementation of complete subcutaneously administered LA-ART regimens, including TLC-ART-301, which contains TFV/lamivudine/dolutegravir (LA-TLD) and is currently in pre-clinical studies.

**Background:** Studies have shown an increase in weight among people acquiring HIV (PAH) who have taken integrase strand-transfer inhibitor (INSTI) containing antiretroviral therapy (ART). However, limited data are available regarding analysis of risk factors of weight gain in Asia. The aim was to assess associated factors of weight gain after initiating or switching to bictegravir/emtricitabine/tenofovir alafenamide fumarate (BIC/FTC/TAF), lamivudine and dolutegravir (DTG/3TC) among PAH.

**Methods:** This was a retrospective, multiple-center, observational cohort study conducted at seven HIV-care-designated hospitals from October 2019 to October 2023. Information on body weight, clinical characteristics and HIV viral loads were collected and analyzed.

The first weight measure after the prescription of BIC/FTC/TAF or DTG/3TC, both pre- and 30 days post-index, was defined as baseline weight. The last measure at week 48 was defined as post-weight.

**Results:** A total of 2489 participants were included, and 21.7% were >50 years old, 92.4% were males and 13.8% were naïve patients at baseline. At week 48, 95.1% of patients in the DTG/3TC group and 94.5% in the BIC/FTC/TAF group achieved HIV RNA <50 copies/mL ( $p=0.15$ ).

Additionally, 192 participants (7.7%) exhibited ≥10% weight gain. Logistic regression analysis identified risk factors for ≥10% weight gain, including ART-naïve PAH (AOR 2.53, 95% CI 1.81-4.10), previous ART containing TDF, switch to BIC/FTC/TAF (AOR 2.05, 95% CI 1.40-2.98), TAF, switch to BIC/

FTC/TAF (AOR 2.18, 95% CI 1.33–3.57), previous ART containing efavirenz (EFV) (AOR 1.93, 95% CI 1.23–3.01) and boosted protease inhibitors (PIs) (AOR 3.24, 95% CI 1.64–6.39). (Table)

Logistic regression analysis	Crude odds ratio	95% CI	p	Adjusted odds ratio	95% CI	p
age	1.00	0.99 - 1.01	0.94	0.99	0.98 - 1.01	0.23
CD4 count > 500 cells/ $\mu$ L at baseline	0.58	0.44 - 0.77	<0.01	0.65	0.48 - 0.90	0.01
naïve people	2.04	1.47 - 2.84	<0.01	2.53	1.81 - 4.10	<0.01
TDF, switch to DTG/3TC	0.71	0.28 - 1.80	0.48	0.88	0.34 - 2.32	0.80
TDF, BIC/FTC/TAF	1.88	1.36 - 2.59	<0.01	2.05	1.40 - 2.98	<0.01
TAF, switch to DTG/3TC	0.30	0.07 - 1.25	0.10	0.45	0.11 - 1.87	0.27
TAF, switch to BIC/FTC/TAF	1.33	0.88 - 2.00	0.18	2.18	1.33 - 3.57	<0.01
previous ART containing EFV	1.36	0.96 - 1.94	0.09	1.93	1.23 - 3.01	<0.01
previous ART containing boosted PIs	2.24	1.23 - 4.10	0.01	3.24	1.64 - 6.39	<0.01

**Conclusions:** In a real-world setting, BIC/FTC/TAF is associated with greater weight gain compared to DTG/3TC. Furthermore, previous antiretroviral therapy containing EFV or boosted PIs may increase the likelihood of experiencing greater weight gain.

This study has the potential to provide valuable insights for healthcare providers when making decisions about HIV treatment choices.

### Dolutegravir vs efavirenz: comparison and factors associated with viral blips in an acute HIV infection cohort study

C. Sacdalan<sup>1,2</sup>, E. Kroon<sup>1</sup>, S. Pinyakorn<sup>3</sup>, P. Promsena<sup>1</sup>, F. Ocampo<sup>1</sup>, S. Sriplienchan<sup>1</sup>, N. Phanuphak<sup>4</sup>, T. Crowell<sup>5,3</sup>, S. Vasan<sup>5,3</sup>, L. Trautmann<sup>5,3</sup>, RV254/SEARCH010 Study Group  
<sup>1</sup>SEARCH Research Foundation, Bangkok, Thailand, <sup>2</sup>Chulalongkorn University, Research Affairs, Bangkok, Thailand, <sup>3</sup>Henry M. Jackson Foundation for the Advancement of Military Medicine, Inc., Bethesda, United States, <sup>4</sup>Institute of HIV Research and Innovation, Bangkok, Thailand, <sup>5</sup>U.S. Military HIV Research Program, Walter Reed Army Institute of Research, Silver Spring, United States

**Background:** Viral blips create uncertainty due to unclear pathophysiology and clinical impact. We compared blip incidence while on first-line dolutegravir vs efavirenz-based antiretroviral therapy (ART) started during acute HIV infection (AHI) and evaluated associated factors.

**Methods:** RV254/SEARCH010 participants with AHI achieving virologic suppression (<20 copies/ml) on either efavirenz or dolutegravir and maintained on their initial antiretroviral regimen  $\geq$  48 weeks were included. Parti-

cipants with HBV or HCV were excluded. HIV RNA was measured at weeks 0, 2, 4, 8, 12 and every 24 weeks thereafter. A blip was defined as transiently detectable RNA (20–999 copies/mL) after achieving suppression and categorized as "low" (20–200 copies/mL) or "high" (201–999 copies/mL). Univariate and multivariate models were used to assess factors associated with blips.

**Results:** 457 participants were analyzed, 283 starting efavirenz and 174 starting dolutegravir, predominantly MSM (93.9%) with a median age of 26 (IQR 23–32). The groups did not differ by gender, HIV risk, CD4, or HIV RNA at ART initiation (all  $p>0.05$ ).

84 blips were observed with an incidence of 8.37 (95%CI: 6.68–10.37) per 100 person-years. Most blips were low, except for one in the dolutegravir group (517 copies/mL). The median blip magnitude was higher with dolutegravir (34.5 [IQR:24–66]) than with efavirenz (27.5 [IQR:22–33],  $p=0.02$ ).

The median time to viral suppression was 8 weeks on dolutegravir (IQR 5–12) and 23 weeks on efavirenz (IQR 12–24;  $p<0.001$ ). The median time from antiretroviral initiation to the first blip was 65 and 38 weeks on dolutegravir and efavirenz, respectively ( $p=0.008$ ).

In the multivariate model, factors associated with a higher incidence rate of blips were longer time to suppression, baseline HIV RNA >6 log copies/mL, and age. Fiebig stage at ART initiation, CD4 count, and antiretroviral (efavirenz or dolutegravir) were not associated with blip incidence.

**Conclusions:** Early ART in AHI does not prevent viral blips in a highly adherent cohort. Blips are not uncommon. However, it is reassuring that most blips were less than the viral load threshold used by U=U-supporting studies. Earlier viral suppression was associated with fewer viral blips, further reinforcing early treatment, preferably with INSTI-based ART based on faster VL suppression and adherence

### Antiretroviral therapies and clinical issues in adults

M. Wolmarans<sup>1</sup>, E. Vosloo<sup>1</sup>, P. Rousseau<sup>1</sup>, C. Mulinder<sup>2</sup>, C. Githu<sup>2</sup>, S. Phakathi<sup>2</sup>

<sup>1</sup>Department of Health South Africa, Digital Health, Pretoria, South Africa, <sup>2</sup>Palladium, Data.FI, Pretoria, South Africa

**Background:** In South Africa, approximately 6.1 million of estimated 7.2 million HIV-positive clients are receiving antiretroviral therapy (ART). Progress has been made in linking HIV-positive clients to ART, but interruption in treatment (IIT) often results in permanent client attrition and could lead to sub-optimal viral load (VL) suppression. This paper offers an initial analysis of IIT using the national longitudinal client dataset.

**Methods:** Client-level electronic health record files are routinely collected into a national database from >4,000 non-networked public health facilities.

Oral abstracts

Author Index

We selected 2,043,037 records for clients that began ART between January 2018–December 2022 and used probabilistic record matching to match similar records between facilities. Matches with a positive predictive value (PPV) of 0.9 were confirmed as true matches.

Data on client encounters, including medication, treatment dates, and dates for the next ART refill, and VL values, were sequentially arranged for all clients to create a longitudinal record (in line with national definitions, IIT is defined as >90 days without HIV medication). Final analysis was conducted using Python and Postgres SQL.

**Results:** A total of 2,043,037 clients were enrolled on ART during the analysis period. Of these, 39.9% (814,642) had at least one interruption. While male and female clients were similarly likely to interrupt treatment (39.7% vs 40.1%, respectively), children and adolescents were less likely to interrupt treatment compared to adults 31.3% vs 40.0%. In all, 184,469 (9%) of clients interrupted more than once in this period, with most interruptions occurring in the first year on ART 31.2%. In total, 212,013 (26%) clients who experienced IIT had a VL recorded within one month of ART re-engagement. Of these clients, 72% had a VL value >50 copies/ml, above the national VL suppression threshold. Over time, nearly half of IIT instances (446,294, or 43%) do not return to care.

**Conclusions:** Our analysis shows that attrition from ART is most prevalent in the first year of treatment, and that many clients who experience IIT are lost either for a significant time or permanently. Efforts to strengthen messaging and psychological support post-treatment initiation are critical for reducing attrition and its effects on VL suppression and viral transmissibility.

**CHANGE-Rx: frailty, falls, polypharmacy, and inappropriate medication use in a Canadian cohort of people aged 65 and older living with HIV**

J. Hopwood-Raja<sup>1,2</sup>, A. Tseng<sup>1,3</sup>, N. Sheehan<sup>2,4</sup>, S. Walmsley<sup>1,5</sup>, J. Falutz<sup>2,6</sup>, A. Zhabokritsky<sup>1,5</sup>

<sup>1</sup>University Health Network, Immunodeficiency Clinic, Toronto, Canada, <sup>2</sup>McGill University Health Centre (Glen Site), Chronic Viral Illness Service, Montréal, Canada, <sup>3</sup>University of Toronto, Leslie Dan Faculty of Pharmacy and Pharmaceutical Sciences, Toronto, Canada, <sup>4</sup>Université de Montréal, Faculté de pharmacie, Montréal, Canada, <sup>5</sup>University of Toronto, Medicine, Division of Infectious Diseases, Toronto, Canada, <sup>6</sup>McGill University, Medicine, Division of Geriatric Medicine, Montréal, Canada

**Background:** Falls, frailty, and neurocognitive complications are negative outcomes in adults aging with HIV, often exacerbated by polypharmacy and potentially inappropriate medications (PIMs). Falls are associated with elevated anticholinergic (≥3) and sedative (moderate-high)

burden scores. In a cohort of older adults living with HIV, we examined the prevalence of PIMs, polypharmacy and anticholinergic and sedative burden.

**Methods:** CHANGE-Rx is a substudy of CHANGE-HIV, a Canadian cohort of people with HIV aged 65 years and older, established in 2019. Information on prescription, over-the-counter (OTC)/natural-health product (NHP) use, comorbidities, HIV-specific factors, Fried Frailty Phenotype and fall history were assessed. Proportion of people with polypharmacy (≥5 non-antiretroviral therapy (ART) drugs), severe polypharmacy (≥10 non-ART drugs), and PIMs (Beers and Screening Tool of Older People's Prescriptions criteria) were determined.

Anticholinergic burden was calculated using a combination of Anticholinergic Cognitive Burden scale and German Anticholinergic Burden Scale. Sedative burden was calculated using the Anticholinergic and Sedative Burden Catalog. Chi-square tests compared outcomes according to frailty status.

**Results:** 440 CHANGE-HIV participants were included: median age 69 years (range 65–89), 91% male, 76% white, 77% identified as men who have sex with men, 99.5% virally suppressed, median CD4 nadir 200 cells/mm<sup>3</sup>, median 26 years since HIV diagnosis, 15.5% were frail, 19.3% fell within the last six months.

Excluding ART, 93.6% were on prescribed comedications (median five, range 1–26), 53.2% had polypharmacy, 14.7% had severe polypharmacy, 46.5% had ≥1 PIM. Including self-reported OTC/NHPs, 97.5% were on comedications (median seven, range 1–28), 73.5% had polypharmacy, 30.2% had severe polypharmacy, 50.9% had ≥1 PIM. For prescribed comedications, 16.4% and 38.6% of participants had high anticholinergic and moderate-high sedative burden, respectively.

Frail participants, compared to non-frail, had more severe polypharmacy, sedative burden, and falls (p<0.05). Common PIMs included proton-pump inhibitors (19.8%), aspirin (9.8%), testosterone (9.8%) and benzodiazepines (9.1%).

Common anticholinergic drugs included metformin, lorazepam and metoprolol; most common moderate/severe sedative drugs were zopiclone, lorazepam and pregabalin.

**Conclusions:** Polypharmacy, PIMs and high anticholinergic/sedative burden are common among older adults living with HIV in Canada, particularly in those who are frail. It remains to be determined if addressing polypharmacy/PIMs would impact falls and frailty.

**TUPEB115****The perspective of health providers and people living with HIV on Darunavir use in second-line therapy: a prospective study in Nigeria**

O. Sowale<sup>1</sup>, O. Abudior<sup>1</sup>, W. Eigege<sup>1</sup>, N. Otubu<sup>1</sup>, F. Lufadeju<sup>1</sup>, O. Wiwa<sup>2</sup>, D. Rathakrishnan<sup>3</sup>, Z. Panos<sup>3</sup>, C. Amole<sup>3</sup>, K. Sani<sup>4</sup>, P. Nwaokenneya<sup>4</sup>, G. Ogbek<sup>4</sup>, U. Atu<sup>4</sup>, P. Mohammed<sup>4</sup>, A. Bashorun<sup>4</sup>, O. Agbaji<sup>5</sup>

<sup>1</sup>Clinton Health Access Initiative, Infectious Diseases, Abuja, Nigeria, <sup>2</sup>Clinton Health Access Initiative, Abuja, Nigeria,

<sup>3</sup>Clinton Health Access Initiative, Boston, United States,

<sup>4</sup>Federal Ministry of Health, National AIDS, Viral Hepatitis and STI Control Programme, Abuja, Nigeria, <sup>5</sup>Jos University Teaching Hospital, Jos, Nigeria

**Background:** Nigeria is an early adopter of the fixed-dose combination of generic ritonavir-boosted darunavir 400/50mg (DRV/r) for second-line (2L) antiretroviral therapy (ART). While the current national treatment guidelines recommend DRV/r-based regimens as alternative 2L ART, there is limited experience with its use.

This study assessed the perception of PLHIV newly initiated on DRV/r-based 2L regimen and their health providers. Findings from this study will inform the planned scale-up in-country.

**Methods:** This prospective study commenced in August 2022 in 12 ART sites across two states (Anambra and Benue). The study population included PLHIV eligible for DRV/r 400/50mg (aged  $\geq 12$  years and weighing  $\geq 40$ kg) who failed first-line ART or those on 2L with adverse reactions to ritonavir-boosted lopinavir transitioned to DRV/r, and health providers prescribing DRV/r. Separate structured questionnaires were administered to the PLHIV and health providers six months post-initiation to assess their experience with DRV/r. The questionnaires compared the DRV/r-based regimen with the previous regimen regarding side effects, pill burden, and ease of administration. Data was analyzed using MS Excel.

**Results:** A total of 48 PLHIV and 43 health providers responded to the survey. The mean age of PLHIV respondents was 41.9 years (SD 11.7), 68% were female, while that of the providers was 38.6 years (SD 7.1), and 51% were female. The commonest side effects reported among PLHIV respondents were headaches (12%), tiredness (10%), and skin rash (8%). Compared to their previous regimen, 54% reported better pill burden, 73% agreed/strongly agreed that DRV/r was easier to use, and 88% believed the DRV/r-based regimen was working better. 86% of interviewed health providers reported better side effect profiles in their clients, and 71% reported improved convenience compared to the previous regimen. All health providers agreed or strongly agreed that they would encourage others to prescribe DRV/r for 2L.

**Conclusions:** The study findings showed that DRV/r in 2L is highly acceptable among PLHIV and health providers. The improved side effect profile and reported ease of use are

enablers for the planned national scale-up. Further studies should be conducted to assess the effect of long-term use of DRV/r among PLHIV.

**TUPEB116****Perspectives of people with HIV (PWH) 12 months following a switch to cabotegravir and rilpivirine long-acting (CAB+RPV LA) in an observational real-world US study (BEYOND)**

W. Valenti<sup>1</sup>, D. Dandachi<sup>2</sup>, D. Cunningham<sup>3</sup>, R. Hsu<sup>4</sup>, K. Nguyen<sup>5</sup>, P. Teichner<sup>5</sup>, A. Jean-Louis<sup>6</sup>, M. Reynolds<sup>6</sup>, D. Richardson<sup>6</sup>, C. Garriss<sup>5</sup>

<sup>1</sup>Trillium Health/University of Rochester, Rochester, United States, <sup>2</sup>University of Missouri-Columbia, Division of Infectious Diseases, Department of Medicine, Columbia, United States, <sup>3</sup>Pueblo Family Physicians, Phoenix, United States, <sup>4</sup>AHF & NYU Langone Health, New York, United States, <sup>5</sup>ViiV Healthcare, Durham, United States, <sup>6</sup>RTI Health Solutions, Research Triangle Park, United States

**Background:** CAB+RPV LA is the only complete long-acting regimen administered by a healthcare provider for treatment of virologically suppressed PWH. CAB+RPV LA may alleviate challenges associated with daily oral antiretroviral therapy (ART).

This study reports the perspectives of PWH receiving CAB+RPV LA in real-world US healthcare settings.

**Methods:** This 2-year prospective, observational study enrolled PWH following the decision to switch to CAB+RPV LA (monthly or every 2 months) across 27 US sites. Participants completed surveys at baseline (BL) before the first injection and Month 12 (M12) identifying reasons for initiating CAB+RPV LA, challenges with daily oral ART, ART preference, HIV treatment satisfaction, and benefits of more frequent clinic visits.

**Results:** 308 PWH were enrolled and completed BL surveys. Median age was 45 years, 83% identified as male, 39% as Black. The most common primary reasons CAB+RPV LA was initiated were pill fatigue (27% of participants), convenient treatment option (21%), and adherence anxiety (17%).

At BL, 49% of participants reported sometimes, often, or always hiding their prior oral ART for fear of disclosing HIV status. At M12 (N=229), participants receiving CAB+RPV LA experienced a decrease in fear of disclosure, anxiety around adherence, daily reminder of HIV, and feeling stigmatized by HIV treatment (Figure 1).

At M12, most participants preferred CAB+RPV LA (97%), <1% preferred daily oral ART, and 2% expressed no preference. Treatment satisfaction increased from BL to M12. At M12, most participants (94%) reported  $\geq 1$  additional benefit of more frequent clinic visits (eg, feel HIV is better controlled, more opportunities to discuss HIV treatment and/or other issues, better relationship with HIV care provider).

Figure. Proportion of participants (A) Worried about disclosure of their HIV status, (B) Feeling reminded of their HIV status because of their treatment, (C) Feeling stigmatized by HIV treatment, and (D) Worried about forgetting to take ART/missing an injection at BL and M12.

**Conclusions:** Switching to CAB+RPV LA demonstrated improvements in the psychological challenges at M12. PWH reported a strong preference for CAB+RPV LA, increased treatment satisfaction, and more opportunities to engage with their HIV care.

## Antiretroviral therapies and clinical issues in adolescents and young adults

### TUPEB117

Mortality and virologic outcomes of antiretroviral therapy among HIV-positive children and adolescents: a prospective, multicenter, longitudinal, cohort study in China

H. Zhang<sup>1</sup>, X. Lao<sup>2</sup>, L. Yan<sup>2</sup>, F. Zhang<sup>2</sup>

<sup>1</sup>Beijing Ditan Hospital Capital Medical University, WHO Collaborating Centre for Comprehensive Management of HIV Treatment and Care, Beijing, China, <sup>2</sup>Beijing Ditan Hospital Capital Medical University, Beijing, China

**Background:** The national pediatric antiretroviral therapy (ART) program was launched in the 6 Chinese provinces with the highest HIV prevalence in 2005 and expanded to 28 provinces until 2010. The availability of ART drugs from the new classes was limited for children in developing countries.

This study began in 2008 when the recommended first-line treatment regimen was zidovudine (AZT) or stavudine (D4T) plus lamivudine (3TC) plus nevirapine (NVP) or efavirenz (EFV); second-line treatment regimen was included Lopinavir/ritonavir (LPV/r) -based regimens. So, this study aimed to evaluate the mortality and viral response in the long-term ART cohort among HIV-positive children and adolescents.

**Methods:** The prospective open-labeled multicenter cohort was conducted from January 2008 to July 2021. The participants were recruited from six representative sites in mainland China.

Participants with an HIV-positive serostatus and < 18 years old were recruited and each participant was informed consent at the time of enrollment. KM curve and Cox regression models were used for survival analysis. Virological failure (VF) was defined as failure to viral suppression or two consecutive viral load tests higher than 200 copies/mL after viral suppression. Follow-up visits were conducted for all patients every 3 months.

**Results:** There were 592 ART-naïve participants and 262 ART-experienced participants included. The median follow-up time of ART-naïve participants was 6.22 (2.07-8.99) person-years with the longest follow-up time being 13.43 person-years.

The mortality was 0.721 (0.443, 0.998) per hundred person-years, and the proportion of death was 4.39% (26/592). 173 of 592 children developed VF with an incidence of 4.83 per 100 person-years (4.11-5.56). The COX regression model showed that the baseline low CD4+T cell count and age >5 years old at HIV diagnosis were possible risk factors for death.

Among the 345 ART-naïve children vs. 113 ART-experienced children treated with LPV/r, the incidence of VF was 4.05 (3.25,4.85) and 4.98 (3.45,6.5) respectively. KM curve showed ART-experienced children were at higher risk of VF than ART-naïve children ( $P < 0.05$ ).

**Conclusions:** The longitudinal cohort study demonstrated the efficacy of China's ART program among HIV-positive children which was beneficial to countries with limited resources.

## TUPEB118

### Prevalence and associated factors of moderate-to-high suicidal risk among Thai adolescents and young adults living with HIV

Behavioral Studies, NY State Psychiatric Institute, New York

City, United States, <sup>8</sup>Columbia University, New York City,

United States

**Background:** Adolescents and young adults living with HIV (AYA-HIV) may be at increased risk for suicidality. However, this has not been well-investigated in resource-limited settings in Asia. We aimed to assess prevalence and factors associated with moderate-to-high suicidal risk among Thai AYA-HIV compared with HIV-negative AYA (AYA-HN).

**Methods:** During December 2022 to October 2023, a prospective cohort study was conducted with AYA-HIV (aged 15-24years) and age- and sex-matched AYA-HN across 3 sites in Thailand. Participants were assessed for suicidal risk using a cross-culturally validated Thai version of the Columbia-Suicide Severity Rating Scale.

Moderate-to-high suicidal risk was defined as having history of active suicidal ideations with specific method, intention, or plan (lifetime and/or within 1month) with/without history of suicide attempts (lifetime and/or within 3months).

Other psychosocial parameters (including depression, anxiety, alcohol use disorder, social support, self-esteem, resilience, HIV-related stigma) were assessed using validated Thai versions of standard questionnaires (Table).

Prevalence of moderate-to-high suicidal risk were compared using Chi-squared tests. Logistic regression analysis was performed to identify factors associated with moderate-to-high suicidal risk.

**Results:** A total of 200 AYA-HIV and 200 matched AYA-HN were enrolled (median age 22years, 59% male). Among AYA-HIV, 60% had perinatally-acquired HIV, 100% were on antiretroviral therapy (ART) (60% integrase inhibitor-based), 86% were virally suppressed, and 84% had ≥95% self-reported ART adherence. Almost all AYA-HN (98%) reported no/low self-perceived HIV-risk.

Overall, 12 (6%) AYA-HIV and 6 (3%) AYA-HN reported moderate-to-high suicidal risk ( $P=0.15$ ), of whom 1 AYA-HIV had high risk that needed emergency psychiatric referral.

On multivariable analysis, average/poor relationship with primary caregiver, documented history of depression, recent passive thoughts of death/self-harm, and low self-esteem were significantly associated with moderate-to-high suicidal risk (Table).

Parameters	Univariable analysis*		Multivariable analysis*	
	Odds ratio (95% CI)	P	Adjusted odds ratio (95% CI)	P

Moderate	2.31 (0.58-9.21)	0.24	4.78 (0.26-87.34)	0.29
High	8.57 (1.22-60.09)	0.03	0.15 (0.00-7.39)	0.34

Abbreviations: ART, antiretroviral therapy; Ref, reference group; 95% CI, 95% confidence interval.

\*Univariable logistic regression was conducted. Co-variables with  $P<0.20$  were included in the multivariable logistic regression model.

<sup>†</sup>Severity of depressive symptoms was evaluated by the Patient Health Questionnaire-9 tool. The scores of 0-4, 5-9, 10-14, and 15-19, and 20-27 indicate minimal, mild, moderate, moderately severe, and severe depressive symptoms, respectively.

<sup>‡</sup>Severity of anxiety symptoms was evaluated by the Generalized Anxiety Disorder-7 item tool. The scores of 0-4, 5-9, 10-14, and 15-21 indicate minimal, mild, moderate, and severe anxiety symptoms, respectively.

<sup>§</sup>Alcohol use disorder score was evaluated by the Alcohol Use Disorders Identification Test. A score ranges from 0-4 (low to high risk of alcohol use disorder).

<sup>||</sup>Level of social support was evaluated by the Oslo Social Support Scale-3. The scores of 3-8, 9-11, and 12-14 indicate low, moderate, and high levels of social support, respectively.

<sup>¶</sup>Self-esteem score was evaluated by the Rosenberg self-esteem scale. A score ranges from 0-10 (low to high self-esteem).

<sup>|||</sup>Resiliency score was evaluated by the Ego resiliency scale. A score ranges from 14-56 (low to high resiliency).

<sup>||||</sup>Level of HIV-related perceived stigma was evaluated by the Berger HIV Stigma Scale. The scores 40-60, 61-120, and 121-160 indicate low, moderate, and high HIV-related perceived stigma.

**Table.** Associated factors of moderate-to-high suicidal risk among Thai adolescents and young adults living with HIV.

**Conclusions:** Prevalence of moderate-to-high suicidal risk among Thai AYA-HIV was twice as high as AYA-HN with no statistical significance. Suicidality is a critical mental comorbidity among AYA-HIV, requiring multidisciplinary collaborative care.

### Virological response and antiretroviral drug resistance mutations in adolescents living with HIV in West Africa

D.L. Dahourou<sup>1,2</sup>, M.-S. N'Gbeche<sup>3</sup>, C. Yonaba<sup>4</sup>, K. Kouadio<sup>5</sup>, F. Eboua<sup>6</sup>, K. Malateste<sup>7</sup>, J.-C.A. Azani<sup>8</sup>, J. Jesson<sup>2</sup>, E. Kangah<sup>9</sup>, E. Thio<sup>9</sup>, T. Toni<sup>5</sup>, V. Leroy<sup>2</sup>

<sup>1</sup>Institut de Recherche en Sciences de la Santé (IRSS/ CNRST), Département Biomédical et de Santé Publique, Ouagadougou, Burkina Faso, <sup>2</sup>CERPOP, Inserm, Université de Toulouse, Université Paul Sabatier, Toulouse, Toulouse, France, <sup>3</sup>CePreF, Abidjan, Côte d'Ivoire, <sup>4</sup>Université Joseph Ki-Zerbo, Département de Pédiatrie, Ouagadougou, Côte d'Ivoire, <sup>5</sup>CIRBA, Abidjan, Côte d'Ivoire, <sup>6</sup>Centre de Traitement Ambulatoire Pédiatrique, CHU Yopougon, Abidjan, Côte d'Ivoire, <sup>7</sup>Inserm U1219, Bordeaux Population Health, Université de Bordeaux, Bordeaux, France, <sup>8</sup>Programme ANRS-PACCI, Abidjan, Côte d'Ivoire, <sup>9</sup>Centre de Recherche Internationale pour la Santé, Ouagadougou, Burkina Faso

**Background:** Sustained virological suppression (SVS) is crucial for controlling the HIV replication. Since 2018, antiretroviral treatment (ART) based on dolutegravir has been recommended as first-line treatment. However, few data exist on SVS in adolescents living with HIV (ALHIV). We measured the proportion of ALHIV with virological failure (VF), 12 months after their inclusion in the OPTIMISE-AO project, and described their drug resistance mutation (DRM) profiles to ART.

**Methods:** OPTIMISE-AO-ANRS-12390 is a stepped-wedge trial aimed to improve HIV-disclosure and ART adherence among ALHIV aged 10-17 years, in five pediatric clinics in Burkina Faso, Côte d'Ivoire, and Togo, and nested within the leDEA West Africa cohort. VF was defined as at least one viral load >50 copies/mL at six or 12 months. Factors associated to VF were identified using logistic regression.

**Results:** A total of 449 ALHIV were included: median age 14 years (interquartile range 12-16); 50% were girls; 75% were treated with dolutegravir-based regimen.

At inclusion, 39% were fully HIV-disclosed (names his/her illness as HIV/AIDS); 73% had a viral load <50copies/mL, 13% between 50 and 1000 copies/mL and 14% a viral load ≥1000copies/mL. Twelve months after inclusion, 38% (167/439) were in VF (95% confidence interval [95%CI]: 33%-43%).

Adjusted for site of care and age, a high viral load at inclusion (50-1000 copies/mL: adjusted odds ratio [aOR]: 2.00, 95%CI: 1.10-3.64; ≥1000copies/mL: aOR: 5.78, 95%CI: 3.03-11.06) and a non-dolutegravir-based regimen (aOR: 2.01, 95% CI: 1.21-3.34) increased the probability of VF.

Of the 37 ALHIV with confirmed VF with two viral loads ≥1000 copies/mL who had a resistance genotyping, 12 (32%) were currently available: 6/12 had DRM to nucleoside reverse transcriptase inhibitors and non-nucleoside reverse transcriptase inhibitors, 1/12 had potential resis-

tance to protease inhibitors and 6/12 had resistance to integrase inhibitors. Among those with DRM to integrase inhibitors, 3/6 were resistant to all integrase inhibitors.

**Conclusions:** Despite the transition to dolutegravir, SVS remains suboptimal in ALHIV, and DRM to integrase inhibitors are not uncommon. Monitoring of DRM and implementation of interventions to strengthen adherence are essential to preserve the sustainability of ART strategies, particularly among ALHIV in West Africa, where therapeutic options are limited.

## TUPEB120

### Quantitative results from a pilot study of an automated directly observed therapy intervention using artificial intelligence with conditional economic incentives among young adults with HIV

M.C. Stoner<sup>1</sup>, L. Smith<sup>2</sup>, K. Ming<sup>2</sup>, D. Wagner<sup>1</sup>, H. Patani<sup>3</sup>, A. Sukhija-Cohen<sup>4</sup>, N. Mancuso<sup>1</sup>, Y. Granados<sup>3</sup>, M.O. Johnson<sup>2</sup>, S. Napierala<sup>1</sup>, T.B. Neilands<sup>2</sup>, P. Saberi<sup>2</sup>  
<sup>1</sup>RTI International, Women's Global Health Imperative, Berkeley, United States, <sup>2</sup>University of California, Department of Medicine, San Francisco, United States, <sup>3</sup>AIDS Healthcare Foundation, Los Angeles, United States, <sup>4</sup>Sutter Health, Palo Alto Medical Foundation Research Institute, Sacramento, United States

**Background:** Suboptimal adherence is common among youth with HIV (YWH). It can increase poor clinical outcomes and is linked to barriers such as antiretroviral therapy (ART) forgetfulness, low engagement in health, and lack of daily routines. Addressing these barriers can enhance ART adherence.

We implemented an innovative mobile app-based intervention that included automated directly observed therapy (aDOT) using artificial intelligence, along with real-time dose tracking, medication reminders, and conditional economic incentives (CEIs). The intervention used facial recognition to record daily ART adherence, and CEIs were given based on the participant's confirmed daily adherence.

**Methods:** The pilot study of the aDOT-CEI intervention was informed by the operant framework of Key Principles in Contingency Management Implementation. We recruited virally unsuppressed YWH 18-29 years of age from AIDS Healthcare Foundation clinics in California and Florida, who received the aDOT-CEI intervention for 3 months. Study outcomes included feasibility and acceptability.

**Results:** Of 28 participants enrolled, 6 (21%) were lost to follow-up at 3 months. 91% of retained participants reported they were very or extremely satisfied with the app, and 82% said aDOT helped them take their medications. Comfort with the security and privacy of the app was moderate (55%). Approximately 81% of participants said the app helped them take their medications every day

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

and around 59% said the incentives were helpful. At study exit, the median self-reported adherence score was 82.7% (IQR: 74.4%, 91.7%).

**Conclusions:** Acceptability and feasibility of the aDOT-CEI intervention were high. Pilot results suggest refinements that may improve intervention outcomes including reassurances about app privacy and an increase in incentives. Even as long-acting injectables (LAIs) become increasingly available, many YWH will choose daily oral ART and will need adherence support.

Additionally, LAIs require viral suppression on oral ART before use. Therefore, adherence support to achieve viral suppression is an ongoing necessity, a gap that the aDOT-CEI intervention can fill. Additional research is recommended to test the efficacy of the aDOT-CEI intervention to improve viral suppression in a larger sample.

## TUPEB121

The spectrum of malignancies in adolescents and young adults living with HIV (AYALHIV) in Harare, Zimbabwe: a retrospective descriptive review of the cancer registry data

P. Gorejena-Chidawanyika<sup>1</sup>, M.Z. Borok<sup>1</sup>, L. Robertson<sup>1</sup>, V. Chikwasha<sup>1</sup>, R. Ferrand<sup>2</sup>, J. Bohlius<sup>3</sup>, M. Muchengeti<sup>4</sup>, N. Ndlovu<sup>5</sup>

<sup>1</sup>University of Zimbabwe, Internal Medicine, Harare, Zimbabwe, <sup>2</sup>London School of Hygiene and Tropical Medicine and Biomedical Research and Training Institute, Clinical Research, Harare, Zimbabwe, <sup>3</sup>Swiss Tropical and Public Health Institute, Education and Training, Basel, Switzerland, <sup>4</sup>National Cancer Registry; National Institute for Communicable Diseases, Division of National Health Laboratory Service, Sandringham, Johannesburg, South Africa, <sup>5</sup>University of Zimbabwe, Oncology, Harare, Zimbabwe

**Background:** The burden of cancer in adolescents and young adults living with HIV (AYALHIV) has been increasing in low-to-middle income countries. To improve the cancer outcomes of AYALHIV a study of the spectrum and prevalence of malignancies in this subgroup was performed. The factors associated with mortality were also described.

**Methods:** A retrospective cross-sectional analytic review of cancer registers was performed. AYALHIV between the ages of 10 to 24 years with a confirmed primary incident malignancy recorded from January 2009 to December 2018 were included from the Zimbabwe National Cancer Registry. Records were cross referenced with data from the following sources: the Parirenyatwa Hospital Radiotherapy Centre, the Parirenyatwa Hospital (AIDS Healthcare Foundation) AHF Centre of Excellence Adolescent Clinic, the Parirenyatwa Paediatric Oncology Ward, the Parirenyatwa Kaposi Sarcoma (KS) Clinic and from the Newlands Clinic.

This was performed in order to collect potential missing demographic, clinical and/or laboratory data. In the event of two different malignancies, they were considered as two individual records.

**Results:** A total of 470 records were reviewed. 46.4% were female. The median age at diagnosis was 19 years (range 15-22). More cancers were noted in the 20-24-year age group (49.6%). KS was the most common cancer (77.2%). The 2<sup>nd</sup> most prevalent cancer was non-Hodgkin Lymphoma (12.6%). The other common cancers were squamous cell carcinoma (2.8%) [eye – 1.0%; gastrointestinal – 0.2%; skin – 0.6%; vulva – 0.6%; cervix – 0.2%; unknown – 0.2%] and Hodgkin lymphoma (1.9%). The median time-of-diagnosis to cancer treatment was 11 days (range 3-60). The median duration of antiretroviral therapy at time-of-cancer-diagnosis was 0.7 years (range 0-4). 155 out of the 470 (33%) died over the 10-year period.

Sepsis was the major contributing factor to mortality (5.7%). Age at cancer diagnosis was the only significant factor associated with mortality [OR=0.91; 95%CI (0.83-0.99), p=0.035].

**Conclusions:** KS was the most common malignancy found in AYALHIV in Harare, Zimbabwe from 2009 to 2018. Targeted HIV testing of AYALHIV diagnosed with cancer and subsequent immediate antiretroviral therapy should be implemented. Despite timely therapeutic intervention in AYALHIV diagnosed with cancer, the cancer mortality remains high.

## TUPEB122

Fully integrated mental health management within routine HIV adolescent and young adult services using a collaborative care model in Thailand: lessons learned

W.N. Songtaweasin<sup>1,2,3</sup>, C. Saisaengjan<sup>2</sup>, Y. Thipakorn<sup>4</sup>, P. Wongharn<sup>2</sup>, T. Puthanakit<sup>2,3</sup>, P. Thisayakorn<sup>4</sup>

<sup>1</sup>Chulalongkorn University, School of Global Health, Faculty of Medicine, Bangkok, Thailand, <sup>2</sup>Chulalongkorn University, Center of Excellence for Pediatric Infectious Diseases and Vaccines, Bangkok, Thailand, <sup>3</sup>Chulalongkorn University, Department of Pediatrics, Faculty of Medicine, Bangkok, Thailand, <sup>4</sup>Chulalongkorn University, Department of Psychiatry, Faculty of Medicine, Bangkok, Thailand

**Background:** Approximately 20% of Thai adolescents and young adults living with HIV (ALHIV) have mental health disorders (MHDs). Thailand has only 0.94 psychiatrists per 100,000 population.

We aimed to provide a fully integrated collaborative care model (CCM) for mental healthcare in routine ALHIV clinic services to improve access.

**Description:** This program was conducted in a hospital-based clinic for ALHIV aged 15-24 years in Bangkok. Phase 1 (2018-2019): PHQ-9 screening was routinely conducted at clinic visits. If ALHIV had moderate depressive

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

symptoms (PHQ-9 score > 9) or pediatricians diagnosed major depressive disorder (MDD) using DSM-4, they were referred to the psychiatrist.

Phase 2 (2020-2023): The CCM was integrated into the clinic. Initial capacity building of HIV care providers (physicians, nurses, counsellors) on basic mental healthcare (counselling, psychiatric medication) and monthly meetings (case management guidance) by a supervising psychiatrist and protocol-driven care was conducted.

All initial mental healthcare assessment and management, including emergencies was done by clinic staff. Case managers accompanied ALHIV referred to psychiatric clinic and coordinated care delivery for moderate to severe conditions.

**Lessons learned:** Between 2018-2023, 312 ALHIV were served, 57% had acquired HIV during adolescence and 43% had perinatally acquired HIV. Median age was 18 years. Eighty (25.6%) were diagnosed with MHDs, mostly MDD (83.8%) and bipolar disorder (7.5%). Of these, 19/80 (23.8%) attempted suicide, commonly triggered by: HIV diagnosis, major life events and crystal methamphetamine intoxication.

Psychiatrist-delivered care reduced from 100% in phase 1 to 37% in phase 2. Half (52.5%) achieved remission of their MHD, 38.8% receive ongoing care and 8.7% refused care but remain in follow-up.

ALHIV accessibility was improved through existing provider trust, reduced stigma in accessing psychiatric services and reduced clinic visits. Monthly meetings empowered providers. The integrated CCM for mental healthcare was feasible, sustainable, and supports WHO's fourth 90 on optimizing quality of life for people living with HIV.

**Conclusions/Next steps:** Integrated mental healthcare using CCM enabled increased ALHIV mental healthcare accessibility and sustainable mental healthcare provision by HIV staff.

This model can be adapted to other youth-focused services in middle-income countries. Cost-utility analyses are underway to explore the cost-effectiveness of this model of care.

## TUPEB123

### Psychosocial challenges in the care of adolescents and young people living with perinatal HIV/AIDS in São Paulo state, Brazil

**Background:** Adolescents and young adults who acquired HIV perinatally (YLHAP) are at a greater risk of suffering from anxiety, depression, and suicidal ideation than their unaffected peers. Improving YLHAP care requires understanding current practices and their psychosocial situations.

**Methods:** Cross-sectional study using secondary data captured from medical records from 81 reference institutions during 2022/2023; we selected a probabilistic sample composed by YLHAP ≥ 18 years (N=336), proportional to the size of the number of inhabitants of the municipalities of São Paulo state, Brazil. We examined demographic data and psychosocial risk factors for detectable HIV viral load (HIV.VL), loss of follow-up, and mental health. We use descriptive analysis and Pearson's chi-square test to address associations, p<0.05 was considered statistically significant.

**Results:** 16.8% (95CI 13.1-21.4) YLHAP had experienced stigma, 41.8% (95CI 36.5-47.3) had reported depression or anxiety, 3.1% (95CI 1.7-5.7) had ideation or attempted suicide, 35.5% (95CI 30.5-40.8) had detectable HIV.VL and 33.4% (95CI 28.5-38.8) had a loss of follow-up. No significant associations were found between age, sexual orientation, or years of schooling. Being a woman was associated with depression or anxiety (p=0.04) and being black or having less schooling was associated with detectable HIV.VL, p=0.02 and p=0.05, respectively. Psychosocial factors were broadly associated with HIV.VL, loss of follow-up and mental health illnesses (Table 1).

Other	12943	76.36	12943	76.36	12943	76.36	12943	76.36

**Table 1. Case distribution according to psychosocial factors and HIV, VL, loss of follow-up, and mental health for youth who acquired HIV perinatally, Sao Paulo, Brazil.**

**Conclusions:** The experience of stigma, violence, and orphanhood are decisive factors both for YLHAP's mental health suffering and for lack of suppressing HIV replication. Being female and social vulnerabilities, such as being black or having less schooling, should be carefully considered for care. Society's collective efforts to minimize those factors can have a positive impact on harmful outcomes for YLHAP, such as suicide ideation/attempt, and loss of follow-up.

## TUPEB124

Virtual enhanced adherence counseling and viral re-suppression among children, adolescents, and young persons living with HIV at selected HIV care and treatment facilities in Nairobi, Kenya

A. Owino<sup>1</sup>, C. Odhiambo<sup>1</sup>, E. Kubo<sup>1</sup>, S. Arodi<sup>1</sup>, R. Marima<sup>1</sup>, J. Mecha<sup>1</sup>, C. Otieno<sup>1</sup>, D. Achwoka<sup>1</sup>, T. Simiyu<sup>1</sup>

<sup>1</sup>University of Nairobi School of Medicine-Fahari ya Jamii Program, Department of Clinical Medicine and Therapeutics, Nairobi, Kenya

**Background:** Viral Suppression of children, adolescents, and young persons living with HIV (CAYPLHIV) with high viral load (HVL) remained a challenge despite in-person increased adherence sessions or direct witness ingestion (DWI). *Fahari ya Jamii* (FYJ) USAID funded project' June 2023 data for CAYPLHIV indicated viral suppression ranging from 41% to 70%.

We implemented phone-based virtual enhanced adherence counseling (VEAC) and daily medication intake reminders for CAYPLHIV with HVL as an adaptation intervention to improve viral suppression.

**Description:** From July 2023, we implemented virtual EACs and daily medication reminders in 6 high volume FYJ-supported facilities. We developed standard operating procedures for conducting virtual EACs and medication reminders. Forty-eight healthcare personnel were trained on these, including a script for VEAC. Airtime for phones was provided. We defined VL suppression as <50 copies/ml.

We linked a case manager to each child with a detectable VL (≥51 copies/ml) after obtaining caregiver consent. Clients' and case managers' phone alarms were set to remind them the timing of medications. Case managers called clients and their caregivers daily to verify if they were taking their medications as prescribed.

We assessed clients' VL results after 3 months of successful VEAC sessions. We recorded the results in the High VL register and a live Google sheet designed for VEAC progress tracking.

**Lessons learned:** Between July and November 2023, 393 CAYPLHIV with HVL were reviewed. All 393 remained active, with 100% having VL results documented. Of those tested, 338 (86%) were re-suppressed without regimen change, showing improvement across age groups (59% for 1-4yrs, 86% for 5-9yrs, 91% for 10-14yrs, 81% for 15-19yrs, and 89% for 20-24yrs). Baseline suppression improved from 63% to a re-suppression of 86% (p<0.001). Challenges in the 1-4-years category included drug palatability, side effects, caregiver factors, stigma, forgetfulness, and medication administration difficulties.

**Conclusions/Next steps:** Daily phone-based reminders and VEAC may improve VL suppression among CALHIV. Programs experiencing similar challenges within comparable contexts may benefit from this approach.

## TUPEB125

Experience of care by adolescents with virologic failure on antiretroviral in a nomadic population in northeastern Uganda

R. Nekaka<sup>1</sup>, I.M. Neumbe<sup>1</sup>, M. Narika<sup>1</sup>, F. Kazibwe<sup>1</sup>, D. Tindyebwa<sup>1</sup>

<sup>1</sup>Africa Network for the Care of Children Affected by HIV/AIDS, Technical, Moroto, Uganda

**Background:** Adolescence is a complex developmental phase, made more complex by chronic disease. When dealing with treatment and the health impact of chronic diseases, adolescents need to learn to self-manage an array of challenges. Human immunodeficiency virus (HIV)-positive adolescents in a rural nomadic are followed-up according to the national guidelines for the treatment of HIV.

Blood monitoring revealed that adolescents on antiretroviral (ARV) treatment were persistently not virologically suppressed despite adherence and compliance being emphasized at every visit.

**Description:** During the implementation of a quality improvement initiative to improve viral suppression among adolescents, we explored the adolescents' experiences of care. We describe the perspectives of adolescents regarding the care and support in the Karamoja region, Uganda. In October 2023, individual interviews were conducted with twelve (12) adolescents with virologic failure on antiretroviral treatment across five districts.

**Lessons learned:** The adolescents reported good experiences especially regarding the support and counselling offered by the counsellors, easy access to care and good relationship with the clinic staff.

Additionally, the adolescents experienced feelings of sadness, low mood, fear, and guilt. Stigma and discrimination of adolescents living with HIV, was common at

school, home and from the neighbors in the community. They also experienced challenges at the health facilities including lack of privacy in the clinics, and long waiting time.

**Conclusions/Next steps:** The findings suggest practical recommendations to improve the quality of care offered to adolescents on ARVs: provision of HIV education to all adolescents and family members to help reduce stigma and offer social support; a community-based approach in service delivery to reduce the stigmatizing effects of consulting rooms for HIV services. The health workers are utilizing these findings to redesign the care offered to adolescents living with HIV in order to support them to stay in care and improve their quality of life.

## TUPEB126

Who is truly new among the KP typology "newly initiated" on antiretroviral therapy? Experiences from four HIV burdened districts of Zambia

K. Mwanda<sup>1</sup>, E. Chifwafwa<sup>2</sup>, J. Banda<sup>3</sup>, L. Chingumbe<sup>4</sup>, M. Chisashi<sup>4</sup>, J. Banda<sup>5</sup>, E. Chanda<sup>4</sup>, J. Chila<sup>4</sup>

<sup>1</sup>Diligent Health Initiatives, Technical, Lusaka, Zambia,

<sup>2</sup>USAID Zambia, Civil Society, Lusaka, Zambia, <sup>3</sup>USAID

CHEKUP II, Technical, Nakonde, Zambia, <sup>4</sup>USAID CHEKUP

II, Technical, Lusaka, Zambia, <sup>5</sup>USAID CHEKUP II, Technical, Kapiri Mposhi, Zambia

**Background:** Zambia is at the verge of HIV epidemic control standing at 87.7%/ 98%/96.3% against the 95/95/95 UNAIDS fast track goals (ZAMSTAT, 2021). This picture stipulates good progress, though achievement against the first 95 remains sub-optimal. While course corrective measures may be fairly attainable among the general population, the situation may be more difficult among key populations especially that there remains a paucity of information about how many KPs present as newly identified positives when they are potentially not.

**Methods:** Between October and December, 2023, we undertook to review the baseline viral load (BLV) counts for all key population groups that sought HIV testing services from 12 wellness centres and service delivery points as newly identified HIV positive clients in four of the high burdened districts of Zambia. BLV of less than 1000 viral copies were considered consistent with a silent transfer where someone has been on treatment, but has elected not to disclose that they are an old client that has just moved to the locality and are in need of ART. We labelled these as old clients at the study sites while those with BLV of over 1000 viral copies were labelled as newly diagnosed.

**Results:** 206 KP files were reviewed. With the youngest being 18 and the oldest being 60 years old. FSWs were the majority with 159 records accounting for 77.2%; while MSM and TGs accounted for 19.9% and 2.9% respectively. A total of 85 (41.2%) of all KP clients were silent transfers.

Among the FSWs, 71 (44.7%) were virally suppressed at time of presentation, while among MSMs and TGs, 31.7% and 16.7% were virally suppressed. The proportion of silent transfers was almost one and a half times higher among FSWs compared to MSMs and about three times higher than among TGs.

**Conclusions:** Non-disclosure of known HIV status among KPs seeking medication is not uncommon. Prudent counselling is needed to ensure a higher likelihood of disclosure which entails leads to better and efficient use of time and other resources, and provides for an opportunity to provide appropriate care to the client.

## Antiretroviral therapies and clinical issues in neonates, infants and children

Using audits of infants diagnosed with HIV to address missed opportunities to eliminate vertical transmission of HIV in Lusaka Province, Zambia, March 2021-June 2023

W. Sichemba<sup>1</sup>, M. Selisho<sup>2</sup>, J. Simpungwe<sup>1</sup>, K. Mwebo<sup>1</sup>, L. Mwiinga<sup>1</sup>, D. Zachary<sup>1</sup>, M. Montandon<sup>3</sup>, C. Chitambi<sup>4</sup>, M. Mubiana-Mbewe<sup>4</sup>, P. Lumano-Mulenga<sup>5</sup>, B. Muyunda<sup>1</sup>, N. Kancheya<sup>1</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention, Lusaka,

Zambia, <sup>2</sup>Lusaka Provincial Health Office, Lusaka, Zambia,

<sup>3</sup>U.S. Centers for Disease Control and Prevention, Atlanta,

United States, <sup>4</sup>Centre for Infectious Disease Research

in Zambia, Lusaka, Zambia, <sup>5</sup>Ministry of Health, Lusaka, Zambia

**Background:** Despite ongoing success of the Zambian prevention of mother-to-child transmission (PMTCT) program, many children still acquire HIV vertically. We explored the missed opportunities in the PMTCT program in Lusaka Province, Zambia using preliminary data from the ongoing Audit of infants diagnosed with HIV.

**Description:** Audits are conducted routinely, on all infants (0-24 months old) diagnosed with HIV in Lusaka Province, to ascertain programmatic gaps contributing to vertical HIV transmission. Trained staff abstract data from medical records of infants diagnosed with HIV using a standardized tool. We analyzed the Zambian Ministry of Health audit data for infants diagnosed with HIV in Lusaka Province from March 2021-June 2023 using R.

We describe the programmatic interventions implemented at facility, district and provincial-levels based on the gaps identified.

**Lessons learned:** Audits provided critical information regarding PMTCT missed opportunities in Lusaka Province. Of the 154 infants diagnosed with HIV, 110 (73.3%) were di-

agnosed before their first birthdays, and 147 (97.4%) were initiated on antiretroviral treatment (ART). Fifty-six (36.8%) had not received any postnatal prophylaxis (PNP). Thirty-eight (32.2%) mothers were aged below 25 years, 75 (54%) were newly diagnosed with HIV during pregnancy, delivery, or breastfeeding, and 43 (32.1%) were not on ART. Among mothers taking ART, 51 (53.1%) had reported poor adherence. Over 80% of mothers had no documented viral load (VL) result. Among the 38 mothers with a first VL result available, 24 (63%) were unsuppressed. Further, 48% of the mothers' sexual partners had unknown HIV status. Program-level interventions were instituted targeting identified gaps (Figure 1).

Figure 1.

**Conclusions/Next steps:** The audit identified missed opportunities that included inadequate infant PNP provision, new maternal HIV acquisition, suboptimal maternal ART adherence and viral suppression, and a high proportion of infants with HIV born to young mothers. Targeted program-level interventions were implemented, and ongoing monitoring will assess progress toward eliminating vertical transmission. This analysis would be beneficial to the whole Zambian PMTCT program.

<sup>1</sup>ViiV Healthcare, Durham, United States, <sup>2</sup>Syneos Health, Morrisville, United States, <sup>3</sup>University of Texas Southwestern Medical Center, Dallas, United States, <sup>4</sup>The Perelman School of Medicine, University of Pennsylvania, Philadelphia, United States, <sup>5</sup>University College London Great Ormond Street Institute of Child Health, London, United Kingdom, <sup>6</sup>Carl Icahn School of Medicine at Mt Sinai, BronxCare Health System, Bronx, United States, <sup>7</sup>Eunice Kennedy Shriver NICHD, National Institutes of Health, Bethesda, United States, <sup>8</sup>Elizabeth Glaser Pediatric AIDS Foundation, Silver Spring, United States

**Background:** The objective of this analysis is to assess pregnancy and neonatal outcomes among pregnancies with pre-natal exposure to specific dolutegravir-based regimens (DBRs) using data from the APR through 31 July 2023.

**Methods:** The APR is a prospective exposure-registration cohort study, monitoring for early warning signals of major teratogenic effects of antiretrovirals used during pregnancy. DBRs evaluated include dolutegravir+lamivudine (DTG+3TC), dolutegravir+lamivudine+abacavir (DTG+3TC+ABC), dolutegravir+tenofovir disoproxil fumarate+emtricitabine (DTG+TDF+FTC), and dolutegravir+tenofovir alafenamide+emtricitabine (DTG+TAF+FTC).

**Results:** Pregnancy and neonatal outcomes by drug exposure are presented in Table 1. There were 3 DBRs with enough pregnancies to show no increase in risk for major birth defects. There was no pattern to the defects overall or in any of the exposure groups.

	DTG+3TC	DTG+3TC+ABC	DTG+TDF+FTC	DTG+TAF+FTC
Total Pregnancy Outcomes	15*	316	328	203
Live Births	13 (86.7%)	299 (94.6%)	301 (91.8%)	187 (92.1%)
Stillbirths	0	2 (0.6%)	5 (1.5%)	4 (2.0%)
Spontaneous Abortions	1 (6.7%)	5 (1.6%)	11 (3.4%)	8 (3.9%)
Induced Abortions	1 (6.7%)	10 (3.2%)	11 (3.4%)	4 (2.0%)
Total Singleton, Live Births without Defects	13	279	273	167
Gestational Age ≥ 37 weeks	12 (92.3%)	249 (89.2%)	241 (88.3%)	144 (86.2%)
Gestational Age < 37 weeks (preterm)	1 (7.7%)	30 (10.8%)	32 (11.7%)	23 (13.8%)
Birth Weight ≥ 2500 grams	12 (92.3%)	243 (87.1%)	232 (85.0%)	136 (81.4%)
Birth Weight < 2500 grams (LBW)	1 (7.7%)	31 (11.1%)	35 (12.8%)	27 (16.2%)
Birth Weight < 1500 grams (very LBW)	0	8 (2.9%)	5 (1.8%)	3 (1.8%)
Missing	0	5 (1.8%)	6 (2.2%)	4 (2.4%)
Total Live Births	13	299	301	187
Birth Defect Cases	0	10 (3.3%, 1.62% - 6.06%)	12 (4.0%, 2.08% - 6.86%)	10 (5.3%, 2.59% - 9.61%)

\*N are mutually exclusive for each regimen

Table 1. Pregnancy and neonatal outcomes of participants exposed to DBRs using APR data through 31 July 2023.

**Conclusions:** APR data do not demonstrate an increased risk of overall birth defects with use of DTG+3TC+ABC, DTG+TDF+FTC or DTG+TAF+FTC above the population expected rate of defects (2.72-4.17 per 100 live births from

Metropolitan Atlanta Congenital Defects Program and Texas Birth Defects Registry respectively). While no definitive conclusions can be drawn on DTG+3TC use in pregnancy due to limited number of pregnancies on the regimen, the APR data on individual drugs demonstrate no increase in risk for defects.

## TUPEB129

A novel physiologically-based pharmacokinetic (PBPK) model to guide pediatric dosing for a long-acting triple-drug-in-one injectable product candidate TLC-ART-101 (lopinavir/tenofovir/ritonavir)

S. Perazzolo<sup>1</sup>, Z.R. Stephen<sup>1</sup>, R. Delle Fratte<sup>1</sup>, X. Xu<sup>1</sup>, L. Duan<sup>1</sup>, M. Eguchi<sup>1</sup>, M. Hartman<sup>1</sup>, C. Jonsson<sup>1</sup>, A.J. Melvin<sup>2</sup>, A.C. Collier<sup>3</sup>, R. Bender Ingacio<sup>3</sup>, R.J. Ho<sup>1</sup>

<sup>1</sup>University of Washington, Pharmaceuticals, Seattle, United States, <sup>2</sup>Seattle Children Hospital, Pediatrics, Seattle, United States, <sup>3</sup>University of Washington, Medicine, Seattle, United States

**Background:** Initial Phase 1 results of the long-acting injectable TLC-ART-101, a drug combination nanoparticle (DcNP) containing lopinavir (LPV), tenofovir (TFV), and ritonavir (RTV) injected subcutaneously, demonstrated safety and tolerability. TLC-ART-101 may be considered for global pediatric long-acting HIV treatment to increase ease of dosing and adherence in a population with challenges taking daily oral medications.

Determining safe entry doses for pediatric clinical trials from adult data is challenging. Physiological changes during maturation, which can affect drug distribution, disposition, and clearance/elimination must be considered.

**Methods:** We leveraged a suite of Physiologically-based Pharmacokinetic models (PBPK, mathematical representations of physiological, and developmental variations between adults and children) for more precision beyond weight-based (allometry) dosing. PBPK models were developed and validated by the TLC-ART team. Based on drug exposures (AUC), derived from a Phase 1 TLC-ART-101 study, the PBPK model was employed to estimate the pediatric dose needed to provide equivalent drug exposure for 1-18yrs. The PBPK-based dosing also accounts for potential drug-drug interactions between protease inhibitors and aims for detectability as observed in the Phase 1 study after subcutaneous LPV/TFV/RTV 16/9.2/4.1mg dose (60, 21, and 4 days for LPV, TFV, and RTV, respectively).

**Results:** Table 1 demonstrates the differences between PBPK- or weight-based scaling for TLC-ART-101. PBPK dosing for adolescents did not differ significantly from weight-based ones, but the model suggested that the youngest group (age 1-3 years), should receive only 20% of the weight-based recommendation (e.g., 0.65 vs 3 mg-lopinavir).

Age-weight band	lopinavir		ritonavir		tenofovir	
Adults	16 mg		4.1 mg		9.2 mg	
	BW	PBPK	BW	PBPK	BW	PBPK
10-18y, or >30kg	9.0 mg	10 mg	2.0 mg	2.0 mg	4.2 mg	4.5 mg
6-14y, or 20-30kg	7.0 mg	4.1 mg	1.9 mg	1.7 mg	3.5 mg	3.8 mg
3-6y, or 14-20kg	5.0 mg	3.5 mg	3.0 mg	2.5 mg	3.0 mg	2.0 mg
1-3 y, or 10-14kg	3.0 mg	0.65 mg	2.0 mg	0.65 mg	1.8 mg	0.8 mg

BW: body-weight dose proposals (allometry); PBPK: physiologically based PK dose projection.

Table 1. Pediatric TLC-ART-101 dose to provide equivalent AUC by PBPK modeling.

**Conclusions:** Integrating ontogeny and developmental changes in metabolic and physiological parameters, we developed a range of entry doses for equivalent exposure to TLC-ART-101 in children. The PBPK approach may serve as a starting point for advancing pediatric treatment studies to mitigate risks as we advance long-acting products for children living with HIV worldwide.

## TUPEB130

Pubertal onset in children with *in utero* HIV exposure in Botswana: results of the FLOURISH study

J. Jao<sup>1,2</sup>, C. Gochanour<sup>3</sup>, P.L. Williams<sup>4</sup>, S. Schenkel<sup>1,3</sup>, S. Kgole<sup>2</sup>, G. Masasa<sup>2</sup>, B. Phale<sup>2</sup>, M. Ngwaca<sup>2</sup>, C. Kgathi<sup>2</sup>, J. Makhema<sup>2</sup>, T. Ralegoreng<sup>2</sup>, G. Masheto<sup>5</sup>, N. Shaw<sup>6</sup>, L. Serghides<sup>7</sup>, R. Shapiro<sup>2,4</sup>, S. Lockman<sup>2,4,8</sup>, K. Powis<sup>2,4,3</sup>

<sup>1</sup>Northwestern University Feinberg School of Medicine, Chicago, United States, <sup>2</sup>Botswana Harvard Health Partnership, Gaborone, Botswana, <sup>3</sup>Massachusetts General Hospital, Boston, United States, <sup>4</sup>Harvard T.H. Chan School of Public Health, Boston, United States, <sup>5</sup>Botswana Ministry of Health and Wellness, Gaborone, Botswana, <sup>6</sup>National Institute of Environmental Health Sciences, Research Triangle Park, United States, <sup>7</sup>University Health Network, Toronto, Canada, <sup>8</sup>Brigham and Women's Hospital, Boston, United States

**Background:** Few studies have evaluated the association between *in utero* HIV/antiretroviral (ARV) exposure and pubertal onset.

**Methods:** We assessed Tanner stage (via visualization and orchidometer) in children with *in utero* HIV/ARV exposure who were uninfected (CHEU) and children HIV-unexposed and uninfected (CHUU) ages 9-11 enrolled in the FLOURISH study in Botswana. Pubertal onset was defined as reaching Tanner stage  $\geq 2$  for each puberty indicator separately for males (genitalia, pubic hair) and females (breasts, pubic hair).

Logistic regression models for each outcome were fit to assess the association of *in utero* HIV/ARV exposure with pubertal onset, adjusting for confounders. Subgroup analyses among CHEU were performed to assess the association of *in utero* ARV exposure [3-drug antiretroviral therapy (ART) vs ZDV monotherapy] with pubertal onset.

Sensitivity analyses were conducted additionally adjusting for body mass index (BMI) Z score at Tanner assessment.

**Results:** We evaluated 337 children (238 CHEU) at a median age of 10 years (Interquartile Range:9.5-10.6). Mothers of CHEU vs CHUU were older (31.5 vs 26 years) and reported lower monthly income (60% vs. 43%  $\leq$  75 US dollars). CHEU had lower mean birth weight Z scores (-0.21 vs 0.24) and BMI Z scores at Tanner assessment (-0.33 vs 0.19) than CHUU. Among mothers of CHEU, 65% had HIV-1 RNA <400 copies/mL at enrollment, and 74% received 3-drug ART. While CHEU had higher odds of pubertal onset according to female pubic hair, no differences in pubertal onset were observed between CHEU and CHUU for all other puberty indicators (Table). Among CHEU, no differences in pubertal onset by *in utero* ARV were observed. Findings were similar in sensitivity analyses.

Exposure	Model Outcome			
	Female Breast n=153	Female Pubic Hair n=153	Male Genitalia n=100	Male Pubic Hair n=100
CHEU vs. CHUU <sup>a</sup>	aOR (95% CI) 1.07 (0.47, 2.44)	2.66 (1.01, 6.81)	0.94 (0.46, 1.91)	0.79 (0.22, 2.75)
% with onset (CHEU/CHUU)	22.9%, 59.1%	40.7%, 20.0%	50.0%, 49.1%	7.9%, 9.1%
In utero exposure to 3-drug ART vs. ZDV monotherapy <sup>b</sup>	aOR (95% CI) 1.63 (0.54, 4.96)	0.73 (0.24, 2.19)	1.00 (0.34, 2.96)	— <sup>c</sup>
% with onset (CHEU/CHUU)	70.4%, 57.1%	36.0%, 42.9%	50.7%, 48.2%	10.7%, 0%

<sup>a</sup> Adjusted for age, household income, food insecurity; <sup>b</sup> Adjusted for age, household income, food insecurity, maternal CD4, maternal viral load; <sup>c</sup> No model convergence due to quasi-separation  
aOR=adjusted odds ratio, ART=antiretroviral therapy, CHEU=children with *in utero* HIV/ARV exposure who are uninfected, CHUU=children without *in utero* HIV/ARV exposure, CI=confidence interval

**Table.** Adjusted associations of *in utero* HIV and ARV exposures with pubertal onset (Tanner  $\geq$ 2) for each puberty indicator based on logistic regression models.

**Conclusions:** In this small cohort in Botswana, we did not observe differences in pubertal onset by *in utero* HIV/ARV exposure status, or among CHEU, by *in utero* ARV exposure. Longitudinal studies will be useful to confirm these findings.

## TUPEB131

Congenital and early post-natal cytomegalovirus acquisition decreases CD4+ T-cell counts among children who are HIV exposed and uninfected (CHEU)

J. Brochon<sup>1</sup>, K. Govender<sup>1</sup>, M.-S. Kang Dufour<sup>1</sup>, C. Renaud<sup>1</sup>, V. Lamarre<sup>1</sup>, S. Gantt<sup>1</sup>, I. Boucoiran<sup>1</sup>, H. Soudeyns<sup>1</sup>, F. Kakkar<sup>1</sup>

<sup>1</sup>University Hospital Sainte Justine, Montréal, Canada

**Background:** Immune dysregulation in children who are HIV exposed and uninfected (CHEU) is thought to contribute to their increased risk of morbidity and mortality from infectious diseases.

We therefore investigated the impact of cytomegalovirus (CMV) acquisition on lymphocyte populations among CHEU.

**Methods:** CHEU enrolled in the CMIS cohort (Montreal, Canada, 1997-2010) were retrospectively evaluated for evidence of CMV acquisition by CMV PCR in serum or plasma, and serology (CMV IgG and IgM) on serum from 18 months of age. Infants were classified as CMV-positive (CMV+) if

any test (PCR and/or IgG) was positive by 2 years of age, and as having acquired congenital CMV (cCMV, PCR positive before 3 weeks of age), or early postnatal CMV (PnC-MV, PCR positive by 2 months of age). For a subgroup of infants with available samples, lymphocyte subsets were assessed by flow cytometry at 2 and 24 months of age.

**Results:** Among 396 CHEU evaluated, 72(18.2%) were CMV+ by 2 years of age including 7 cCMV acquisition, 5 early PnC-MV acquisition, and 60 CMV acquisition after 2 months of age. At 2 months of age (n=330), while total CD3+ T-cell and CD19+ B-cell frequencies were similar between CMV+ and CMV- infants (61% vs 66%, p=0.82 and 29% vs 24%, p=0.51), CMV+ infants had significantly higher frequencies of CD8+ T-cells (25% vs 15%, p<0.01), lower frequencies of CD4+ T-cells (34% vs 49%, p<0.01), and lower CD4/CD8 ratios (1.72 vs 3.25, p<0.01).

At 2 years (n=99), significant differences in lymphocyte differentiation remained between CMV+ and CMV- children, with higher frequencies of CD8+ T-cells (25% vs 17.5%, p<0.01), lower frequencies of CD4+ T-cells (36% vs 41.5%, p<0.01), and lower CD4/CD8 ratios (1.38 vs 2.33, p<0.001). At both 2 months and 2 years of age, these differences remained statistically significant after adjustment for gestational age, maternal CD4 count and viral load at delivery.

**Conclusions:** CMV acquisition was common in this cohort of non-breastfed CHEU in a low seroprevalence setting, and significantly altered lymphocyte subpopulations at 2 months and 2 years of age.

Future research is needed to determine the potential clinical impact of these changes in high CMV and HIV seroprevalence settings.

## TUPEB132

The effect of viremia, immunosuppression, and dolutegravir on risk of virologic failure in children and adolescents living with HIV on antiretroviral therapy in sub-Saharan Africa (CLOVES), a multicenter cohort study

**Methods:** A retrospective chart review was performed on data collected from October 2004 to December 2022 from the Baylor College of Medicine Children's Foundation – Tanzania sites in Mbeya and Mwanza. CALHIV (0-19 years of age) on antiretroviral therapy (ART) for  $\geq 6$  months, with  $\geq 2$  total viral loads (VL), were included.

Multivariable logistic regression modeling was performed to evaluate the risk factors for virologic failure (VF) (defined as VL  $\geq 1000$  copies/mL); odds ratios (OR) with 95% confidence intervals (CI) are presented.

**Results:** A total of 2825 CALHIV were included in the analysis (median age 13.1, 52.5% female). A history of low-level viremia (LLV) (50-999 copies/mL) increased the risk of current VF (OR 2.07 [1.27, 3.38]), as did a history of VF (OR 4.38 [2.81, 6.81]). Other factors associated with increased VF risk included using an alternate 1<sup>st</sup> line ART regimen (OR 2.70 [1.64, 4.45]) or 2<sup>nd</sup> line (OR 2.25 [1.53, 3.31]) and immunosuppression with CD4 of 200-499 cells/mm<sup>3</sup> (OR 1.54 [1.01, 2.37]) or  $< 200$  cells/mm<sup>3</sup> (HR 1.96 [1.09, 3.65]). Adolescents aged 15-19 years were at higher risk of VF (OR 1.89 [1.15, 3.11]) and dolutegravir (DTG)-based ART regimens were protective (OR 0.40 [0.30, 0.54]). The incidence rates (IR) of current VF (per 1000 person-years) were 9.55 (6.55, 24.24), 16.82 (12.64, 22.39), and 30.26 (25.83, 35.43) for VL always  $< 50$ , history LLV (no VF), and VF respectively. The IR of current VF was 29.66 (18.68, 47.07) at  $< 1$  year and reached 10.75 (4.48, 25.83) by 2-3 years since last LLV. For time since VF, IR was 69.62 (56.29, 86.11) at  $< 1$  year and dropped to 8.06 (4.58, 14.20) by  $\geq 4$  years.

**Conclusions:** Risk of current VF increased with history of LLV or VF. Risk of VF returned to near-baseline in 2 years after LLV and 4 years after VF. Other factors associated with VF include non-standard or 2<sup>nd</sup> line ART regimen, being on a non-DTG regimen, immunosuppression, and age 15-19 years.

## TUPEB133

Transformation of 3 current short-acting HIV drugs, tenofovir-alafenamide, lamivudine and dolutegravir into a novel, all-in-one long-acting 3-drug-combination in a single injectable formulation that produces extended pharmacokinetics

Z. Stephen<sup>1</sup>, S. Perazzolo<sup>1</sup>, R. Delle Fratte<sup>1</sup>, L. Duan<sup>1</sup>, M. Eguchi<sup>1</sup>, M. Hartman<sup>1</sup>, C. Johnsson<sup>1</sup>, A. Collier<sup>2</sup>, A. Melvin<sup>3</sup>, R. Bender Ignacio<sup>2</sup>, R. Ho<sup>1</sup>

<sup>1</sup>University of Washington, Pharmaceuticals, Seattle, United States, <sup>2</sup>University of Washington, Medicine, Seattle, United States, <sup>3</sup>Seattle Children's Hospital, Pediatrics, Seattle, United States

**Background:** Long-acting injectable antiretroviral therapy is a significant step towards reducing HIV stigma and promoting ART adherence. The current option, LA-cabotegravir and LA-rilpivirine faces challenging global im-

plementation due to clinic-required injections, drug resistance, cost, and distribution. WHO has an ongoing initiative to distribute the oral single-tablet-regimen TLD (tenofovir disoproxil fumarate, lamivudine-L & dolutegravir-D). Dolutegravir has a higher barrier to resistance than cabotegravir, but oral TLD requires daily dosing; the pro-drug tenofovir-alafenamide (TAF) provides lower tenofovir blood levels which may be safer in pediatric populations than TDF.

The goal of this study is to develop a long-acting TAF-LD 3-drug all-in-one combination.

**Methods:** The TLC-ART program's drug combination nanoparticle platform (DcNP) enables transformation of current HIV drugs into a combined single suspension. The DcNP technology stabilizes multiple HIV drugs with disparate physical-chemical properties, including water-insoluble lopinavir, ritonavir, efavirenz, atazanavir, dolutegravir, and water soluble tenofovir and lamivudine) using biocompatible lipid-excipients.

TAF-LD-DcNP product was prepared by:

1. Dissolving TAF, lamivudine, and dolutegravir with lipid-excipients (distearoyl-phosphatidyl-choline (DSPC) and distearoyl-phosphatidyl-ethanolamine derivatized with polyethylene-glycol (mPEG<sub>2000</sub>-DSPE)) in hydrated-alcohol, followed by a controlled solvent-removal process to produce TAF-LD-DcNP powder;
2. The particle-size of TAF-LD-DcNP in saline suspension was reduced via high pressure homogenization.

*M. nemestrina* (~5-8 kg, n=2) were given a single subcutaneous injection of TAF-LD-DcNP (10.6/8.5/9.3 mg/kg) and a plasma time course was determined over 8 weeks.

**Results:** The TAF-LD-DcNP suspension had a mean diameter of ~60-80 nm and a pH of 6.8, appropriate for a stable, injectable TAF-LD product. Compared to the free form of TAF, L, and D, the subcutaneous DcNP formulation demonstrated a long-acting plasma time course for all 3 drugs in non-human primate (NHP) studies.

While NHP plasma TFV (active form of TAF)-LD profile for DcNP dosage-forms were different for each drug, at the dose tested all 3 drugs sustained concentrations for 4 weeks above EC<sub>50</sub>. No injection site reactions or notable laboratory safety or blood cell anomalies were observed.

**Conclusions:** We successfully transformed TAF-LD from short-acting to long-acting utilizing DcNP technology. The TLC-ART program anticipates clinical development of this single combination subcutaneous injection, especially focused on pediatric populations.

## TUPEB134

Implementation of Directly Observed Therapy (DOTS) in Haiti using geo-localization to improve viral suppression amongst children living with HIV

T. Lewis<sup>1</sup>, E. Carras-Terzian<sup>1</sup>, S. Charles<sup>1</sup>, D. Adrien<sup>1</sup>

<sup>1</sup>Caris Foundation International, Colleyville, United States

**Background:** As adherence to HIV Antiretroviral Therapy (ARVs) remains the most significant burden and common cause of unsuppressed viral load in children and adolescents living with HIV (CALHIV), community-based solutions targeting these populations combined with psycho-social support are needed. In lower-middle-income countries, like Haiti, with limited access to health centers due to long distances and socio-economic barriers, programs like DOTS which often involves in-person visits to an HIV-positive client to boost ARV adherence, should be considered.

**Description:** The USAID-funded Impact Youth project, led by Caris Foundation, collected data on the outcome of the DOTS strategy on viral suppression in CALHIV enrolled over 26 months. Viral load was used as a measurement tool. A mobile open-source smartphone app 'Commcare' was used, which enables GPS data to geo-localize the selected beneficiaries and records longitudinal data. This enabled rapid tracking of DOTS-eligible OVC when reviewing viral load results and for enrolled clients to be monitored in real-time by program managers to assess their progress.

We conducted a multicenter retrospective analysis on HIV positive children under 15 years old on ARVs with a viral load of over 1000 copies/ml in health centers in Haiti. Eligible clients were monitored via in-person visits or phone calls during three months. Virologic response was quantified and Kaplan-Meier curves were used to assess differences in viral suppression.

209 participants, mean age 6.1 years and median viral load 4.2 log<sub>10</sub> copies/ml were enrolled.

**Lessons learned:** Overall, 94% of the participants had achieved viral suppression with a mean turnaround time (TAT) of 4.4 months. After adjusting for other covariates, the factors significantly associated with shorter TAT were lower viral load at entry and being on DOTS-visits.

**Conclusions/Next steps:** This study indicates that DOTS-based adherence support is an effective way to improve suppression among pediatric clients on ARVs. The overall viral suppression rate among HIV positive children on DOTS (94%) almost meets the 95% target of UNAIDS.

Future studies could be conducted to include other aspects and community support such as psycho-social and nutritional assistance, to understand more reasons for the refusal of DOTS and/or non-adherence.

Sexualised substance use (chemsex) is associated with a high burden of syphilis and other sexually transmitted diseases: exploratory data from Checkpoint BLN, Berlin, Germany

C. Weber<sup>1</sup>, L. Rabbi<sup>1,2</sup>, B. Biomndo<sup>1</sup>, J. Kohl<sup>1</sup>

<sup>1</sup>Checkpoint BLN, Berlin, Germany, <sup>2</sup>Praxiszentrum Kaiserdamm, Berlin, Germany

**Background:** Many mostly young people come in large numbers from all over Europe to Berlin to attend so-called "sex-positive parties" (clubs, queer parties or sex-on-premises locations) during their stay. There has been an increase in sexually transmitted infections (STI) and an increase of psychoactive substances use for sexual purposes (including chemsex) in certain queer communities in Berlin. Checkpoint BLN (CP) is a community-based voluntary counselling (CBVCT) with testing and treatment of STIs for LGBTI communities and is highly frequented by the corresponding queer community.

**Methods:** We retrospectively analysed clinical data and evaluated questionnaires completed at each CP visit between 1.1.2022 and 31.12.2022. We collected the positive STI test results from all visits and compared prevalences of chlamydial (CT), gonococcal (NG) infections, syphilis (TP) and socioeconomic and behavioural data between those who reported chemsex substance use (CSU) and those who did not (NCSU). ChemSex was defined as the use of the following substances for sexual purposes: methamphetamine, ketamine, GBH/GBL, mephedrone and cocaine.

**Results:** Of 5045 visits for STI-check ups at Checkpoint BLN in 2022, 677/5054 (13%) reported CSU on their last sexual encounter. The overall prevalence for at least one STI was 15% (769/5045) with the highest burden (30.3%, 233/769) of positive results in the chemsex group (OR 2.90, CI95%: 2.47-3.4;  $p < 0.001$ ). No difference was found between the groups with regard to PrEP use.

**Characteristics of the CSU:** The average age was 30.2 years (range: 19-57), 431/671 (64 %) stated that they were cis-male and 430/677 (64 %) stated that they were gay/bisexual. Most patients were of European and German origin (38%; 24%). Among Europeans, the country of origin was mainly the United Kingdom (34%), Spain (21%) and Italy (10%). Of these, 173/677 (27%) did not have health insurance.

**Conclusions:** Chemsex use is associated with a high burden of syphilis and other sexually transmitted diseases. To ensure a link to care for CSU as a vulnerable group for STIs, it should become an international standard to regularly address sexual habits and substance use openly and without prejudice during medical visits, thus enabling a discussion to ensure a link to care.

Enhancing PrEP uptake and reducing HIV prevalence among people who inject drugs in Uganda: a community drug distribution point model

D. Katende<sup>1</sup>, G. Medina<sup>2</sup>

<sup>1</sup>Uganda Harm Reduction Network(UHRN), Research and Documentation, Kampala, Uganda, <sup>2</sup>Uganda Harm Reduction Network(UHRN), Access to Health and Justice, Kampala, Uganda

**Background:** In Uganda, the prevalence of HIV among people who inject drugs (PWID) stands at a concerning 17%. Contributing factors include needle sharing, risky sexual behaviors, and poor health-seeking behaviors. Pre-exposure prophylaxis (PrEP) has proven highly effective, reducing the risk of HIV transmission by up to 99% through sex and by 74% among PWID.

To address this issue, the Uganda Harm Reduction Network (UHRN) implemented a novel approach called the Community Drug Distribution Point (CDDP) model at our drop-in centers.

**Description:** Our community drop-in centers serve as CD-DPs, providing PrEP refills to HIV-negative PWID. Leveraging peers from the community to distribute PrEP refills ensures accessibility and adherence monitoring. Additional support, including monitoring and psychosocial assistance, is offered to a specified client group. Those clinically stable, without side effects, opportunistic infections, and with a stable weight (a 5% loss between the last three visits), are eligible for PrEP refills at the drop-in center.

**Lessons learned:** Implementation of the CDDP model has led to a reduction in stigma and discrimination against PWID taking PrEP within the community. The program addresses self-stigma among PWID on PrEP and minimizes clients' waiting time by serving a smaller group at designated times.

**Conclusions/Next steps:** PrEP refills through the CDDP model have strengthened the provider-client relationship, empowered PWID communities to take ownership of the program, and complemented HIV/AIDS prevention efforts through condom distribution, information dissemination, and community mobilization.

This innovative approach offers a promising avenue for scaling up PrEP services and reducing HIV prevalence among PWID in Uganda.

## TUPEB137

Vulnerability and psychological distress of female sex workers in Côte d'Ivoire

H. Youssoufa<sup>1</sup>, M. Nouaman<sup>2</sup>, C. Bernard<sup>1</sup>, V. Becquet<sup>3</sup>, P. Coffie<sup>2</sup>, A. Agoua<sup>4</sup>, S. Eholie<sup>2</sup>, J. Larmarange<sup>5</sup>, M. Plazy<sup>1</sup>

<sup>1</sup>University of Bordeaux, INSERM UMR 1219, IRD EMR 273, Bordeaux Population Health Research Center, Bordeaux, France, <sup>2</sup>PAC-CI, Université Félix Houphouët-Boigny, Abidjan, Côte d'Ivoire, <sup>3</sup>Ined, Aubervilliers, France, <sup>4</sup>ONG Aprosam, San Pedro, Côte d'Ivoire, <sup>5</sup>Ceped, Université Paris Cité, IRD, Inserm, Paris, France

**Background:** Despite the vulnerability of female sex workers (FSW), there is limited literature on the mental health conditions of this population.

This study aims to describe the prevalence of psychological distress among FSWs in Côte d'Ivoire and identify associated factors.

**Methods:** The ANRS 12381 PRINCESSE project (2019-2023) evaluated a community-based sexual and reproductive healthcare delivery through mobile clinics operating in prostitution sites in San Pedro and surrounding areas, Côte d'Ivoire, with a single-arm intervention cohort of FSW aged ≥18. FSWs were invited to complete a socio-behavioural questionnaire.

The Patient Health Questionnaire (PHQ-4) was used to categorise signs of psychological distress (none, mild, moderate, severe) based on four questions: 2 on anxiety symptoms ('feeling nervous/anxious'; 'unable to stop worrying') and 2 on depressive symptoms ('having little interest/pleasure in doing things'; 'feeling down/depressed/hopeless').

Multivariate logistic regression was used to identify factors associated with experiencing signs of psychological distress.

**Results:** Of the 489 FSWs included, 253 completed at least one questionnaire, and 32% reported mild signs of psychological distress (68% no sign). Focusing on the 230 FSWs with no missing data, factors associated with experiencing signs of psychological distress were: older age (8% psychological distress among those aged 19-24 vs 32% among those aged 25-30 (aOR=4.8 [95% CI=1.2-26.2]), 36% among those aged 31-40 (aOR=6.3 [1.7-33.8]), and 64% among those aged ≥41 (aOR=15.4 [3.3-94.7])), perceiving their financial situation as very difficult versus just getting by (43% vs 13%, aOR=4.4 [1.4-15.4]), being HIV-positive (63% vs 28%, aOR=5.5 [1.9-17.8]), engaging in sex work irregularly vs daily (62% vs 27%, aOR=3.9 [1.4-11.3]), reporting violence from a regular partner (62% vs 29%, aOR=5.1 [1.7-15.8]) or friends/family (49% vs 29%, aOR=2.9 [1.2-7.4]), poor vs good emotional support (73% vs 29%, aOR=3.7 [1.1-13.7]), very low vs moderate or higher self-esteem (65% vs 26%, aOR=6.9 [2.0-26.7]).

**Conclusions:** Although the PHQ-4 is not a diagnostic tool, the results highlight that 1/3 of FSWs experienced signs of psychological distress.

It underlines the need to integrate targeted mental health screening and intervention into health care programmes offered to FSWs, especially for those isolated, precarious, older, HIV-positive and/or experiencing violence.

## TUPEB138

### Sexual transmitted infections among female sex workers: differences among transgender and cisgender women

M.M. Sandoval<sup>1</sup>, V. Fink<sup>1</sup>, M. Loufty<sup>2</sup>, M. Romanelli<sup>1</sup>, A. Nava<sup>1</sup>, G. Mernies<sup>1</sup>, S. Vulcano<sup>3</sup>, H. Ludvik<sup>1</sup>, C. Pérez<sup>1</sup>, L. Spadaccini<sup>1</sup>, A. Gun<sup>1</sup>, N. Cardozo<sup>1,4</sup>, M. Romero<sup>4</sup>, G. Orellano<sup>5</sup>, I. Aristegui<sup>1</sup>, M.I. Figueroa<sup>1</sup>, Z. Ortiz<sup>1</sup>, A. Durán<sup>3</sup>, S. Walmsley<sup>6</sup>, P. Cahn<sup>1</sup>, MAS por Nosotras study group

<sup>1</sup>Fundación Huésped, Research Department, Buenos Aires, Argentina, <sup>2</sup>Women's College Hospital, University of Toronto, Toronto, Canada, <sup>3</sup>Coordination of Sexual Health, HIV and Sexually Transmitted Infections of the Ministry of Health of Buenos Aires, Buenos Aires, Argentina, <sup>4</sup>Asociación de Travestis, Transexuales y Transgénero de Argentina, Buenos Aires, Argentina, <sup>5</sup>Sindicato de Trabajadorxs Sexuales de Argentina, Buenos Aires, Argentina, <sup>6</sup>University Health Network, University of Toronto, Toronto, Canada

**Background:** Female sex workers (FSW) are at high risk of acquiring sexually transmitted infections (STI) due to work-related factors including multiple sexual partners, sex work initiation at early age and condomless sex. Gender-specific vulnerability, discrimination and marginalization limit access to health services.

We aimed to evaluate the prevalence and compare the differences of STI in a cohort of cisgender (CGW) and transgender (TGW) FSW.

**Methods:** "MAS por Nosotras" is an ongoing cohort aiming to evaluate the sexual and reproductive health of FSW, in Buenos Aires, Argentina. Each visit includes collection of medical and psychosocial information, including STI testing (HIV, HBV, HCV, syphilis, HPV, Neisseria gonorrhoeae -NG- and Chlamydia trachomatis -CT- infections). Data from the baseline visit is presented.

**Results:** Between June-December, 2023, 116 FSW were enrolled, 61 TGW (52.6%) and 55 CGW (47.4%). Median age was: TGW 29 [IQR 24-37], CGW 41 [IQR 33-50], ( $p<0.001$ ). Median age at sex work initiation was: TGW 18 [IQR 15-20], CGW 23 [IQR 20-30], ( $p<0.001$ ); overall median years on sex work: 12 [IQR 6-19].

In the previous month, 51.7% of TGW and 26% of CGW had >20 sexual partners ( $p=0.006$ ), while 55.7% of TGW and 47.3% of CGW reported having condomless anal or vaginal intercourse respectively. 26.8% of TGW and no CGW were on PrEP.

STI prevalence at baseline are in the table.

STI	All participants	TGW	CGW	p
Any	53.4%	70.5%	34.5%	<0.001
HIV	20.7%	37.7%	1.8%	<0.001
HBV	Chronic: 1.8%	3.4%	0%	0.5
	Resolved: 10.6%	13.6%	7.4%	0.3
Syphilis	16.1%	27.1%	3.8%	0.001
HPV	Anal: 31.3%	43.5%	14.8%	0.006
	Cervical: 16.3%	-	16.3%	-
NG	4.3%	5.0%	3.6%	>0.9
CT	1.1%	0%	2.4%	0.4

Three new HIV diagnoses but no HCV infection were detected. NG sites were: anal 3.2%, cervical 4.1%, urethral 1.9%, and oropharyngeal 0.9%. The only CT infection was anal.

**Conclusions:** We present a cross-sectional study on STI on FSW in Argentina. Use of Prep was limited and condomless sex high. TGW had a higher overall STI prevalence including HIV, syphilis and anal HPV, reflecting the need of expanding and tailoring prevention strategies with a gender-focused perspective.

## TUPEB139

### Prevalence and clinical and psychosocial factors related to use of liquid silicone injections among transgender women in the TransCITAR cohort in Argentina

I. Aristegui<sup>1</sup>, E. Panizoni<sup>1</sup>, P.D. Radusky<sup>1,2</sup>, N. Cardozo<sup>1,3,4</sup>, V. Zalazar<sup>1</sup>, M. Romanelli<sup>1</sup>, J.R. Garcia<sup>1</sup>, R. Caballero<sup>1,2</sup>, E. Frontini<sup>1</sup>, M. Duarte<sup>1,4</sup>, R. Acuña<sup>1</sup>, A. Gun<sup>1</sup>, N. Cabrera<sup>1</sup>, C. Perez<sup>1</sup>, V. Fink<sup>1</sup>, P. Cahn<sup>1</sup>, M.I. Figueroa<sup>1</sup>, TransCITAR Study Group

<sup>1</sup>Fundación Huésped, Research Department, Buenos Aires, Argentina, <sup>2</sup>Universidad de Buenos Aires, Facultad de Psicología, Buenos Aires, Argentina, <sup>3</sup>Asociación de Travestis, Transexuales y Transgeneros de Argentina, Buenos Aires, Argentina, <sup>4</sup>Casa Trans, Buenos Aires, Argentina

**Background:** The use of liquid silicone injections (LSI) has been widely reported by transgender women (TGW). Progress in injectable long-acting HIV prevention and treatment for key populations underline the need to better understand these practices. This work aimed at analyzing LSI prevalence and associated factors in TGW from TransCITAR in Buenos Aires, Argentina.

**Methods:** TransCITAR is a cohort designed to assess physical and mental health among transgender people in Argentina. TGW enrolled from September/2019-2022, completed a basal questionnaire on socio-demographics, substance use (AUDIT≥8; DAST-10≥3), depression (CES-D≥16), clinical variables (i.e., HIV, gender-affirming hormone therapy [GAHT]) and gender identity stigma. Bivariate analysis and a multivariate model were conducted to explore associations with LSI.

Oral abstracts

**Results:** The sample included 413 TGW; 50.8% (n=210) reported ever LSI. LSI users had a mean age of 34.97 years (SD 8.96) vs. 29.71 years (SD 8.73) for non-users. Socio-demographics characteristics were: 50.4% incomplete high school or lower education, 31.5% foreign-born, 68.7% internal migrants, 37.4% current sex work, 85.6% public healthcare.

Regarding clinical characteristics, 36.3% were receiving GAHT and 43.3% positive for HIV and syphilis. LSI was independently associated with being foreign-born, internal migration, incomplete high school, social and income assistance, public healthcare, currently engaging in sex work, discrimination from security forces, hazardous drinking, lifetime cocaine use, and living with HIV.

LSI was negatively associated with lifetime GATH. In the multivariable model, sex work (aOR=4.609, 95%CI=1.846-11.505); internal migration (aOR=4.199, 95%CI=1.604-10.966); and age (aOR=1.121, 95%CI=1.054-1.191) remained associated with LSI.

**Conclusions:** TGW from TransCITAR presented a high prevalence of LSI. These TGW also showed significantly high psychosocial vulnerability, thus contributing to increased risk of HIV acquisition. Since this population could especially benefit from long-acting injectables for prevention or treatment it is crucial to promote educational tools about the impact of LSI use on the efficacy and effectiveness of such interventions.

## TUPEB140

Retention in care and access to preventive strategies in foreign versus Italian-born people living with HIV in an Italian public healthcare unit

L. Gazzola<sup>1</sup>, R. Nardo<sup>1</sup>, A. Tavelli<sup>2</sup>, A. Maschi<sup>2</sup>, T. Bini<sup>1</sup>, G.C. Marchetti<sup>1</sup>

<sup>1</sup>University of Milan, Infectious Disease Unit, Milan, Italy,

<sup>2</sup>University of Milan, Milan, Italy

**Background:** This study aims to assess the disparities in retention in care and access to prevention strategies, specifically the vaccination program, among foreigners and Italians living with HIV.

**Methods:** Retrospective observational study conducted at the Infectious Diseases Unit of S.Paolo Hospital, Milan, Italy, from Jan-2016 to Jun-2021, including all the people with HIV (PWH) who attended at least one visit/blood test. Endpoints:

1. Incidence rate (IR) of Lost to HIV care (LC): not having a visit or lab examination for at least 12 months, excluding transfers to other centers/institutions;
  2. Probability of being re-engaged in care;
  3. Probability of accessing the unit's vaccination program.
- Unadjusted and adjusted Poisson regression models to investigate differences in incidence rate of LC and Cox regression models for compare access to vaccination program in foreigners versus Italians.

**Results:** 1600 PWH included, 416 being foreigners (26%). 346 PWH had at least one LC (21.6%) for a total of 378 events in 6292 person-years-follow-up(PYFU). The LC incidence was 98x1000PYFU for foreigners and 49x1000PYFU for Italians.

Adjusting for age, sex, AIDS, and transmission mode, foreigners exhibited twice the LC incidence compared to Italians (aIRR=1.88,95%CI 1.49-2.36).

Stratifying for area of origin, people from sub-Saharan Africa, Latin America and Eastern Europe showed a higher aIRR of LC (2.36, 2.15 and 1.63, respectively).

After a median of 1.3 years, 130/378 (34.4%) PWH were re-engaged in care, with no significant difference in re-engagement probability in the two groups (p=0.202). Upon re-engagement: 25.7% of foreigners decreased CD4 levels<350cell/mm<sup>3</sup>, as compared to 10.9% of Italians (p=0.056), HIV-RNA increased above 200cp/mL in 29.4% and 16.9%, respectively (p=0.140), overall only 5 clinical events were observed.

672 PWH (47.3%) attended the vaccination program (50.2% of the Italians and 38.6% of the foreigners,p<0.001). After adjusting for age, sex, AIDS, HIV epidemiology, the Cox regression model indicated a non-statistically significant reduced probability of entering in the vaccination program among foreigners (aHR=0.86;95%CI 0.70-1.05;p=0.131).

**Conclusions:** Foreigners with HIV face increased vulnerability, showing higher risks of loss to follow-up and lower adherence to health programs. This emphasizes the need for targeted efforts to mitigate these disparities and improve outcomes in this fragile population.

## TUPEB141

New stressors can precipitate or exacerbate post-traumatic stress disorder in persons living with HIV

S. Walmsley<sup>1</sup>, M. Nabipoor<sup>2</sup>, V. Martel-Laferrriere<sup>3</sup>, M. Loutfy<sup>4</sup>, C. Cooper<sup>5</sup>, M.-L. Vachon<sup>6</sup>, B. Boyachuk<sup>1</sup>, P. Aldebes<sup>7</sup>, M. Klein<sup>7</sup>, CTN-COVID Substudy Group

<sup>1</sup>University Health Network, Infectious Diseases, Toronto, Canada,

<sup>2</sup>University Health Network, The Biostatistics Research Unit (BRU), Toronto, Canada,

<sup>3</sup>CHUM - Centre hospitalier de l'Université de Montréal, Montreal, Canada,

<sup>4</sup>Women's College Hospital Research Institute, Toronto, Canada,

<sup>5</sup>The Ottawa Hospital, Ottawa, Canada,

<sup>6</sup>CHU de Québec, Quebec, Canada,

<sup>7</sup>Research Institute of the MUHC, Montreal, Canada

**Background:** With the onset of the COVID pandemic, many persons living with HIV were reporting symptoms suggestive of post-traumatic stress disorder (PTSD). They felt the restrictions and stigma of the COVID pandemic caused them to reflect back to stress at the time of their HIV diagnosis. The extent to which this was a concern was uncertain.

**Methods:** Participants of the two cohorts were invited to participate in a COVID sub-study at their cohort visit. As part of the sub-study they completed the PCL (PTSD checklist) - a 17-item self-report checklist of PTSD symptoms based closely on the DSM-5 criteria.

Respondents rate each item from 0 ("not at all") to 4 ("extremely") to indicate the degree to which they have been bothered by that particular symptom over the past 6 months. They were instructed to answer the questions as it related to their HIV diagnosis. For example: "how often have you felt as if a stressful experience related to your HIV were happening again or you were reliving it." The numbers are summed to indicate the degree of PTSD.

**Results:** 454 participants completed the questionnaire at the baseline visit for the COVID sub-study between February 2021 and March 2023 including 133 from CTN 314 and 321 from CTN 222.

PTSD score	CTN222= Canadian HCV Co-Infection participants	CTN314=CHANGE HIV (Aging with HIV Study) participants
None (0-17)	23 (7.2%)	17 (12.8%)
Minimum (18-20)	38 (11.8%)	28 (21.1%)
Mild (21-29)	102 (31.8%)	55 (41.4%)
Moderate (30-49)	122 (38.0%)	26 (19.5%)
Severe (50-86)	36 (11.2%)	7 (5.3%)

**Conclusions:** During the COVID pandemic the majority of persons living with HIV in our cohorts experienced symptoms of PTSD related to their previous HIV diagnosis, a substantial number in whom it was moderate-to-severe. We found PTSD symptoms to be higher in those with underlying HCV infection than those who were aging with HIV.

## Other strategies and therapies

### TUPEB142

Mental health ratings before, during and after analytical treatment interruptions in HIV cure trials

J. Saucedo<sup>1</sup>, N. Lisha<sup>1</sup>, E. Nguyen<sup>1</sup>, L. Rodriguez-Garcia<sup>1</sup>, F. Wan<sup>2</sup>, M. Williams<sup>1</sup>, R. Hoh<sup>1</sup>, S. Deeks<sup>1</sup>, M. Peluso<sup>1</sup>, L. Dee<sup>3</sup>, J. Taylor<sup>4</sup>, J. Sugarman<sup>5</sup>, K. Dubé<sup>2</sup>

<sup>1</sup>University of California, San Francisco, Medicine, San Francisco, United States, <sup>2</sup>University of California, San Diego, San Diego, United States, <sup>3</sup>AIDS Action Baltimore, Baltimore, United States, <sup>4</sup>HIV+ Aging Research Project, Palm Springs, United States, <sup>5</sup>Johns Hopkins University, Baltimore, United States

**Background:** Limited data suggest that analytical treatment interruptions (ATIs) in HIV cure trials raise psychological concerns (e.g., worry of high viral loads and their

consequences, risk of forward transmission when U=U is broken). To overcome this informational gap, we elicited participants mental health ratings before, during, and after such ATIs.

**Methods:** Between 2020 and 2023 in San Francisco, CA, we surveyed 10 adult participants in the UCSF-amfAR Combinatorial Therapy Trial (NCT04357821), an experimental interventional study to induce sustained HIV control without antiretroviral therapy (ART); and 15 adult participants in the SCOPE-ATI Study (NCT04359186), a prospective observational study to identify biomarkers of viral rebound. ATIs lasted 4 to 52 weeks.

We planned *a priori* to pool data with an identical longitudinal survey schedule:

1. Baseline;
2. Prior to the ATI;
3. During the ATI; and,
4. At ART re-start.

We used the 7-item generalized anxiety disorder measure (past 2-week symptom measure) at baseline and the 6-item State-Trait Anxiety Inventory (a measure of present anxiety, rather than past) at subsequent visits. Depression was measured with an 8-item Patient Health Questionnaire (PHQ-9, deleting suicide ideation measurement).

**Results:** Participants (N=25) were mostly White (95%), non-Latino (70%) with at least some college or higher (78.2%) and male (96%). Baseline depression (M=7.76, SD=5.30) and anxiety (M=6.76, SD=4.98) were mild. Prior to the ATI, depression (M=7.04, SD=4.8) and anxiety (M=6.88, SD=3.17) remained mild.

During the ATI, depression (M=4.9, SD=5.18) fell just below the mild severity threshold while anxiety (M=7.71, SD=2.92) increased within this category. At ART restart, depression increased within the mild category (M=8.23, SD=4.10) and anxiety remained constant (M=7.05, SD=2.16).

Study differences were present. SCOPE-ATI ratings were higher than UCSF-amfAR ratings; however, in both studies, anxiety increased during the ATI. Sample variability and the fact that one study was observational while one was interventional may explain mean differences between them.

**Conclusions:** Overall, participants experienced mild anxiety and depression during HIV cure trials with ATIs. Whether ATIs induced mental health symptoms is yet to be determined.

However, monitoring and addressing mental health symptoms are necessary to mitigate associated ATI risks and support study retention and completion of ATI HIV cure trials.

## ART resistance

### TUPEB144

Discordance of proviral DNA and plasma RNA genotyping for detection of drug resistance mutations (DRM) more important in persistent low-level viremia (PLLV)

T. Xavier de Jesus<sup>1</sup>, A. Coelho Sichi<sup>1</sup>, V. Oliveira Silva<sup>1</sup>, C. Mayumi Ahagon<sup>1</sup>, M. Alves dos Santos<sup>1</sup>, G. Ilette Silva López-Lopes<sup>1</sup>, L.F. Macedo Brigido<sup>1</sup>  
<sup>1</sup>Adolfo Lutz Institute, Virology, São Paulo, Brazil

**Background:** PLLV is not uncommon among individuals receiving antiretroviral therapy (ART) and may be associated to inflammation, immune activation, and increased rates of virological failure. Antiretroviral (ARV) susceptibility may be detected by genotyping but RNA sequencing may be difficult in this setting where proviral DNA may provide an alternative source of genetic information.

**Methods:** Paired RNA/DNA sequences from samples from (i) ART naïve patients, (ii) virological failure or (iii) PLLV (two or more VL 50-1000 copies/mL) were obtained after independent RNA/DNA extractions (Qiagen), followed by retrotranscription with Superscript II (for RNA), nested PCR amplification, Big dye termination and Sanger sequencing. The sequences were edited at REcall and analyzed at Stanford HIV db for DRMs. Genetic distance were evaluated at Bioedit.

**Results:** RNA/DNA paired sequences from 72 samples were collected from 2017-2022 (Table 1)

	TOTAL 72	VL <1K N=36	VL >1K N=36	p
Age (IQR)	42 (30 – 50)	49 (40 – 54)	33 (26 – 43)	0.0001
Male (%)	46 (64%)	24 (67%)	22 (61%)	0.62
On ART	53 (74%)	35 (97%)	18 (50%)	<0.0001
Time (years) on ART	6.0 (0 – 8)	7.8 (4.1-12.6)	7.0 (1.0- 8.1)	0.06
VL*	848 (200 – 34679)	200 (112 – 339)	34679 (11582 – 247772)	<0.0001
Last CD4+** (IQR)	385 (195 – 651)	349 (242 – 778)	373 (158 – 574)	0.20
Subtype non-B***	25 (35%)	11 (31%)	14 (39%)	0.45

Results as median (IQR) or percentage; ART, antiretroviral therapy; VL, viral load \*VL results were obtained via RT-PCR (Abbott); \*\*Last CD4+ count was obtained via BD FACSCalibur; Person chi and Mann-Whitney tests were executed by Stata software; \*\*\*Subtype non-B (7C and 8F) includes recombinants (1BC and 9BF).

Table 1. Demographic information.

The genetic distance of sequences among those with VL<1K was 0.0084 (0.006-0.02) and 0.003 (0.001-0.01) for VL>1K (P=0.01). Discordance pol DRM was documented in 55% of paired sequences, 11% with more DRMs at proviral DNA, and 43% with more DRMs at plasma RNA sequences. Samples from naïve patients had a lower distance, 0.002 (0-0.007, p=0.0008) than treated cases. Discordance tends to increase with time on treatment (P=0.003). DRMs to

NRTI, used in all regimens, were discordant in 40% (1-6 discordant DRM to NRTI), of 35 samples with VL<1K and 11% of 18 with VL>1K (1-2 discordant DRMs, p=0.001). Discordance in DRM for NNRTI or PI was also higher among samples with VL <1K.

**Conclusions:** Although proviral DNA genotyping is practical and informative, discordance between plasma RNA and proviral DNA DRM identification is common and more pronounced in low-level viremia where its use could provide an alternative to RNA genotyping.

### TUPEB145

HIV drug resistance trends among 294 treatment experienced children and young adults (0-24) in the first decade of a national pediatric HIVDR program

S. Perry<sup>1,2</sup>, M. Abadie<sup>3,2</sup>, M. Beneus<sup>4</sup>, L. Mpango<sup>5</sup>, C. Nyapokoto<sup>6</sup>, N. Mthethwa<sup>6</sup>

<sup>1</sup>Baylor College of Medicine, Pediatrics/Texas Children's Global Health, Houston, United States, <sup>2</sup>Baylor Children's Foundation Eswatini, Mbabane, Eswatini, <sup>3</sup>Baylor College of Medicine, Pediatrics/Global TB, Houston, United States, <sup>4</sup>Center for Global Health Practice and Impact (CGHPI), Georgetown University, Mbabane, Eswatini, <sup>5</sup>USAID: The ASPIRE Project, Elizabeth Glaser Pediatric AIDS Foundation (EGPAF), Mbabane, Eswatini, <sup>6</sup>Eswatini National AIDS Program (SNAP), Mbabane, Eswatini

**Background:** Treatment-experienced clients are failing antiretroviral therapy (ART) throughout Sub-Saharan Africa. The resulting HIV Drug resistance mutations (DRMs) present an urgent need for access to genotyping, and robust treatment options, to provide successful individualized lifelong treatment in our most vulnerable clients living with HIV.

This abstract looks at early resistance trends in our treatment experienced pediatric and young adult clients in Eswatini (0-24 years).

**Methods:** This is a retrospective review of electronic medical records and genotype results from Baylor Children's Foundation-Eswatini and referrals from other facilities in Eswatini. All genotypes are from treatment-experienced clients, 0-24 years old, with at least two detectable viral loads on Protease Inhibitor (PI) or Dolutegravir (DTG)-based ART. Genotypes were done through the National Reference Laboratory in South Africa using dried blood spot (DBS) specimens in alignment with National Treatment Guidelines. Stanford HIVdb Program was used to calculate predicted activity of ART.

**Results:** Genotypes were performed in 294 clients between January 2014 and January 2024 (44% (128/294) female; 56% (166/294) male). Fifteen percent (44/285) showed intermediate level or higher resistance to LPV/r; 9% (4/44) of those also showed intermediate or higher resistance to DRV/r.

Most common PI mutations were I54V (33), V82A (32), M46I (31). Integrase Strand Transfer Inhibitor (INSTI) resistance testing was performed on 33 samples. Six percent (2/33) had intermediate or high level DTG resistance due to the following mutations: E138AK(2), G140A(1), Q148R(1), R263K(1). Intermediate or high resistance to Rilpivirine (RPV) was observed in 30% of genotypes (85/285) despite no clients being on non-nucleotide reverse transcriptase inhibitors (NNRTI) at the time of sample collection. Most common nucleotide reverse transcriptase inhibitor (NRTI) mutations were M184V (130), M41L (28), D67N (25), T215Y (24).

**Conclusions:** Trends in DRMs in Eswatini give insight into future effective ART for treatment-experienced clients and may inform national policies regarding sequencing of ART moving forward.

Pediatric surveillance resistance testing is needed in Eswatini and the region to inform national ART optimization guidelines and advocacy for access to novel treatment options for our most vulnerable clients.

Chan School of Public Health, research lab, Boston, United States

**Background:** The recommended first-line antiretroviral therapy for people living with HIV (PLWH) in Botswana has involved the use of Dolutegravir(DTG), an Integrase strand transfer inhibitor (INSTI), in combination with nucleoside reverse transcriptase inhibitors (NRTIs), since June 2016. The transition to DTG-based regimens necessitated an assessment of prevalence of baseline INSTI drug resistance mutations (DRMs) before wide rollout of DTG based antiretroviral therapy.

**Methods:** We analyzed HIV-1 proviral sequences to identify the presence of INSTI DRMs from INSTI-naïve people living with HIV-1 in the Botswana Combination Prevention

Project (BCPP) during the years 2013 to 2018. INSTI DRMs were defined according to the Stanford University HIV drug resistance database.

**Results:** A total of 5144 HIV-1 sequences were included into our analysis, (n = 1281 ART-naïve and n = 3863 NNRTI ART-experienced participants). The overall prevalence of major resistance mutations to INSTIs was 1.1% (57/5144). We identified participants exhibiting high-level drug resistance to cabotegravir (0.72%, 37/5144), Elvitegravir (0.16%, 8/5144), and Raltegravir (0.08%, 4/5144), while no high level resistance to DTG and Bictegravir was observed. Seventeen individuals (0.33%, 17/5144) additionally exhibited mutations in the reverse transcriptase (RT) gene, with 13 in the non-nucleoside reverse transcriptase inhibitor (NRTI), 3 in the nucleoside reverse transcriptase inhibitor (NRTI) and 1 in the Protease Inhibitor gene.

The prevalence of INSTI mutations in ART-naïve was 1.64% (21/1281), while in ART-experienced participants, was 0.93% (36/3863). Among the ART-naïve participants the following major DRMs were detected, E138K (2/1281; 0.16%), G140R (8/1281;0.62%) , E92G (2/1281; 0.16%) , E92Q (2/1281; 0.16%) , R263K (5/1281; 0.4%) , N155H (1/1281; 0.08%) , P145S (1/1281; 0.08%). Additionally, accessory mutations G163R and A128T were found in 0.08% (1/1281, each).

Among the ART-experienced individuals, major INSTI DRMs were detected were as follows: E138K (4/3863; 0.10%), G140R (25/3863;0.65%), G118R (2/3863;0.05%), R263K (4/3863, 0.10%), T66I (1/3863; 0.03), E138K+G140R (1/3863, 0.03%), G140R +R263K (1/3863, 0.03%). In addition, 6/3863 (0.16%) participants had G163R accessory mutation.

**Conclusions:** The overall prevalence of INSTI DRMs in Botswana is low. Our findings support the widespread adoption of dolutegravir-based regimes, although surveillance of INSTI DRMs is encouraged.

## TUPEB147

Acquired HIV drug resistance among adults receiving dolutegravir-based ART in Haiti: findings from a nationally representative survey 2019-2020

K. Francois<sup>1</sup>, M. Jordan<sup>2</sup>, S. Inzaule<sup>3</sup>, I. Journe<sup>4</sup>, G. Dos Santos<sup>5</sup>  
<sup>1</sup>National Aids Program of Ministry of Health, Ouest, Petionville, Haiti, <sup>2</sup>Tufts University/ School of Medicine, Boston, United States, <sup>3</sup>amsterdam University, Amsterdam, Netherlands, the, <sup>4</sup>National Laboratory Services of MOH, Ouest, Petionville, Haiti, <sup>5</sup>Service de Virologie, CHU Martinique, Fort-de-France, Martinique

**Background:** Despite the potency of dolutegravir-based antiretroviral therapy (ART), some clients will fail treatment and select for HIV drug resistance (HIVDR). We estimated the prevalence of drug resistance among virally non-suppressed (viral load of <sup>3</sup>1000 copies/ml) people living with HIV (PLWH) receiving dolutegravir-based ART in Haiti.

**Methods:** Following WHO survey guidance, we conducted a viral load laboratory-based acquired HIVDR survey, which leveraged remnant viral load specimens obtained for clinical purposes from adults (age >15 years) receiving dolutegravir-containing regimens for at least 6 months and having a routine viral load  $\geq 1000$  copies/ml.

The HIV-1 *pol* gene was genotyped using Sanger-based sequencing methods at CHU Martinique, a WHO-designated laboratory; sequences were quality-assured following WHO recommendations.

Sequences classified as having predicted low-level, intermediate, or high-level resistance (Stanford HIVdb Version 9.09) were classified as drug-resistant.

**Results:** During the national survey period 1 October 2019 – 30 September 2020, 696 adults had viral load test results  $\geq 1000$  copies/ml, and 657 remnant specimens were sent for HIVDR testing. 457 of 657 HIV-1 PR- PRT and 451 of 657 IN sequences were established, passed quality assurance, and analyzed. 96% of the participants were receiving tenofovir+lamivudine+dolutegravir (TLD). 53.5% of those on DTG had any predicted drug resistance, primarily driven by resistance to the non-nucleoside reverse transcriptase inhibitors (NNRTIs), 49.1% (95%CI 44.5-53.7%).

The prevalence of nucleoside reverse transcriptase inhibitors (NRTI) resistance was 11.4% (95%CI 8.4-14.3%) with 9.4%, 95%CI 6.7-12.1% of sequences exhibiting lamivudine/emtricitabine resistance. The prevalence of tenofovir and zidovudine resistance was 3.5% (95%CI 1.8-5.2) and 3.3% (95% 1.6-4.9), respectively. The prevalence of protease inhibitor resistance was 0.88% (95%CI 0.18-1.7%), and resistance to DTG was 1.1% (95%CI 0.0-2.4%).

**Conclusions:** Resistance to DTG and to NRTIs was low, suggesting non-adherence as the most likely cause of treatment failure. This finding highlights the need to greatly strengthen adherence in people with viral-non-suppression to prevent unnecessary switches and ensure maximum durability of potent DTG-based regimens.

#### Longitudinal impact of the COVID-19 pandemic on perinatally-acquired youth living with HIV in Kenya

M. Singh<sup>1</sup>, W. Nyandiko<sup>2</sup>, A. DeLong<sup>3</sup>, C. Ashimosi<sup>4</sup>, D. Munyoro<sup>4</sup>, J. Lidweye<sup>4</sup>, J. Nyagaya<sup>4</sup>, W. Biegon<sup>4</sup>, J. Aluoch<sup>4</sup>, A. Chory<sup>5</sup>, E. Sang<sup>4</sup>, E. Jekemboi<sup>4</sup>, M. Orido<sup>4</sup>, V. Novitsky<sup>1</sup>, R. Vreeman<sup>5</sup>, T. Liu<sup>3</sup>, R. Kantor<sup>1</sup>

<sup>1</sup>Warren Alpert Medical School of Brown University, Providence, United States, <sup>2</sup>Moi Teaching and Referral Hospital, Eldoret, Kenya, <sup>3</sup>Brown University Center for Statistical Sciences, Providence, United States, <sup>4</sup>Academic Model Providing Access to Healthcare (AMPATH), Eldoret, Kenya, <sup>5</sup>Icahn School of Medicine at Mount Sinai, New York City, United States

**Background:** Understanding challenges experienced by youth living with HIV (YLWH) over time during COVID-19 and their impact on clinical outcomes could guide HIV care during public health crises as well as ongoing management, particularly in resource-limited settings.

**Methods:** From 2021-2023, surveys utilizing validated self-reported measures were administered bi-monthly for one year to assess intra-personal temporal trends in psychological (e.g., depression, anxiety), physical (e.g., illnesses, hospitalizations), and socioeconomic (e.g., education, food, housing instability) challenges among perinatally-acquired YLWH at the Academic Model Providing Access to Healthcare in western Kenya.

Parallely, COVID-19-related cases/deaths and Oxford Stringency Index (OSI), an estimate of stringency of restrictions, were followed. Blood was collected bi-annually for HIV-1 viral load (VL).

Associations among COVID-19 events, participant challenges, antiretroviral nonadherence, and treatment failure transitions (to/from VL>1000 copies/mL) were evaluated using regression models, fit using generalized estimating equations with AR(1)-correlation structure, accounting for subject-level repeated measures.

Effects of within-subject exposure changes on outcomes were assessed by including both prior visit measure and between-visit changes. Models were adjusted for age, gender, clinic, between-visit days, caseloads, and OSI.

**Results:** Among 441 participants (mean age 16.9 years, 59% female, 98% one-year follow-up rate), 89% experienced any challenge at baseline (48% psychological, 66% physical, 61% socioeconomic). Intra-personal challenges fluctuated throughout, as did caseload and OSI.

During highly stringent periods, intra-personal physical challenges worsened (OR=1.02 per 1-higher OSI, 95%CI=1.01-1.03, p=0.002) but socioeconomic and psychological challenges did not. Likewise, during case surges, intra-personal physical challenges worsened (OR=1.04

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

per 100-higher cases/day, 95%CI=1.00-1.08,  $p=0.028$ ) but socioeconomic challenges only worsened during larger upticks in caseloads (OR=2.08 per 100 case/day change, 95%CI=1.14-3.81,  $p=0.017$ ) and psychological challenges did not.

Worse enrollment challenges were associated with worsening subsequent-visit challenges ( $p<0.001$ ). Incomplete adherence was reported by 74% and worsening adherence was associated with worsening of all three challenges ( $p<0.001$ ).

Suppression-to-failure transition was associated with worsening adherence (OR=1.26 per 1-higher nonadherence score, 95%CI=1.00-1.58,  $p=0.047$ ), but failure-to-suppression transition was not associated with improving adherence.

**Conclusions:** Kenyan YLWH experienced significant wellness challenges throughout COVID-19, possibly prompting poor adherence and viral outcomes. While stability of non-physical challenges suggests adaptation to COVID-19, targeted interventions are warranted to support this vulnerable population during pandemics.

## TUPEB149

BIC/FTC/TAF benefits for people with HIV after Omicron breakthrough acquired by shortening the duration of symptoms, enhancing specific immune response and increasing total CD4 cells

N. Wang<sup>1</sup>, N. Wang<sup>1</sup>, D. Zhang<sup>1</sup>

<sup>1</sup>The Second Affiliated Hospital of Chongqing Medical University, Department of Infectious Diseases, Key Laboratory of Molecular Biology for Infectious Diseases (Ministry of Education), Institute for Viral Hepatitis, Chongqing, China

**Background:** The clinical manifestations of variability in PLWH with SARS-CoV-2 acquired may be attributed to the use of ART drugs. However, it remains unknown whether BIC/FTC/TAF surpasses TDF-based ART regimens in improving COVID-19 symptoms and immune responses after breakthrough acquires. Our study assess efficacy of B/F/TAF and TDF+3TC+EFV in protecting against SARS-CoV-2, potentially offering enhanced protection for high-risk populations amid COVID-19 normalization.

**Methods:** We conducted a retrospective, single-center study in Southwest China from January 2023 to March 2023. The primary endpoints were the level of BA.5 specific IgG after Omicron breakthrough acquired, the duration of COVID-19 symptoms and CD4+T cells increase in PLWH after Omicron acquired.

**Results:** Enrolled were 78 PLWH aged 18-75 (79% male), with 27 on BIC/FTC/TAF and 51 on TDF+3TC+EFV (Table 1). The duration of symptoms of COVID-19 of BIC/FTC/TAF-treated was shorter. BIC/FTC/TAF-treated individuals exhibited significantly higher BA.5 IgG levels than TDF+3TC+EFV-treated ( $p<0.05$ ). The CD4+T cell count in-

crease post-Omicron acquired was significantly greater in BIC/FTC/TAF group ( $p<0.05$ ), with higher BA.5-specific CD4+T cells ( $p<0.05$ ). Breakthrough acquired symptoms were mostly mild, with no severe cases; long COVID occurred in 2 TDF+3TC+EFV users, none in BIC/FTC/TAF users.

	Bikarvy (BIC/FTC/TAF, n=27)	TDF/3TC/EFV, n=51	p value

>500, n (%)	8(29.63%)	24(47.06%)	
Unknown, n (%)	0	3(5.88%)	

Table 1. Baseline characteristics.

Figure 1. CD4 changes before and after breakthrough infection of PLWH using Bikarvy and TDF/3TC/EFV. A: The diagram shows the CD4 changes before and after breakthrough infection of PLWH using Bikarvy and TDF/3TC/EFV. B: The diagram shows the CD4 changes before and after breakthrough infection of PLWH using Bikarvy and TDF/3TC/EFV. C: The diagram shows the CD4 count changes before and after breakthrough infection of PLWH using Bikarvy and TDF/3TC/EFV. D: The diagram shows BA.5 specific CD4+T cells after Omicron infection of PLWH using Bikarvy and TDF/3TC/EFV.

**Conclusions:** BIC/FTC/TAF can enhance SARS-CoV-2 specific humoral and cellular immune responses and help PLWH shorten the duration of COVID-19 symptoms.

Moreover, CD4+T cells increase in PLWH after Omicron acquired, and BIC/FTC/TAF can help to expand the increase. Therefore, in the context of COVID-19 normalization, the use of BIC/FTC/TAF may be more beneficial for PLWH with high risk of SARS-CoV-2 acquired.

### Reported uptake and perceived safety of COVID-19 vaccination among adults living with HIV in Tanzania: results from Tanzania HIV Impact Survey 2022-2023

D. Damian<sup>1</sup>, A. Kihame<sup>1</sup>, G. Mgomella<sup>1</sup>, A. Malero<sup>1</sup>, K. Mukurasi<sup>2</sup>, M. Dahoma<sup>3</sup>, P. Njau<sup>4</sup>, A. Khatibu<sup>5</sup>, A. Kailembo<sup>1</sup>, J. Kamwela<sup>6</sup>, R. Laws<sup>7</sup>, S. Birhanu<sup>7</sup>, S. Porter<sup>1</sup>, N. Schaad<sup>1</sup>, M. Swaminathan<sup>1</sup>

<sup>1</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB (DGHT), Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Centers for Disease Control and Prevention, Division of Global Health Protection (DGHP), Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>Zanzibar Integrated HIV, Hepatitis, TB and Leprosy Program, Zanzibar, Tanzania, the United Republic of, <sup>4</sup>National AIDS, STIs and Hepatitis Control Program, Dodoma, Tanzania, the United Republic of, <sup>5</sup>Zanzibar AIDS Commission, Zanzibar, Tanzania, the United Republic of, <sup>6</sup>Tanzania Commission for AIDS, Dodoma, Tanzania, the United Republic of, <sup>7</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB (DGHT), Atlanta, United States

**Background:** People with underlying and chronic medical conditions are at greater risk for severe Coronavirus disease 2019 (COVID-19) and its sequelae. COVID-19 vaccination is an effective intervention to reduce morbidity and mortality, including among people living with HIV (PLHIV). Despite being proven to be safe and effective, COVID-19 vaccine hesitancy has been reported to be high among vulnerable populations, including PLHIV. Reasons for vaccine hesitancy include skepticism about vaccine safety and efficacy. We analyzed uptake and perceived safety of COVID-19 vaccination among PLHIV in Tanzania using data from the Tanzania HIV Impact Survey (THIS) 2022-2023, conducted from November 2022-March 2023.

**Methods:** THIS 2022-2023 was a nationally representative, cross-sectional household survey with a stratified two-stage cluster design including 33,663 participants. Participants were considered to have completed a primary COVID-19 vaccine series if they self-reported receiving one dose of a single-dose vaccine or two doses on different days (regardless of time interval) of an mRNA or protein-based vaccine. Descriptive analyses were conducted to determine the proportion of PLHIV who reported receiving COVID-19 vaccine and completed the primary vaccine series and to assess perceptions of vaccine safety. Sampling weights and Jackknife variance estimation were used to generate 95% confidence intervals (95% CI).

**Results:** Of 1,850 PLHIV aged ≥15 years confirmed as HIV-positive, 48.5% (95%CI: 45.9%-51.0%) reported receiving a COVID-19 vaccination. Of these, 84.7% (95%CI: 81.8%-87.2%) completed a primary vaccine series. Proportion of PLHIV who reported being vaccinated increased with age (from 23.1% among 15-24 years to 67.7% among ≥65

years) and duration on antiretroviral therapy (ART) (from 45.4% among <1 year to 63.8% among ≥10 years). Among all PLHIV, 74.6% (95%CI: 72.1%-77.0%) thought COVID-19 vaccination was safe: 51.5% very safe, 14.1% moderately safe, and 9.1% a little safe. Among PLHIV who perceived COVID-19 vaccination as not being safe, 92.5% reported not having been vaccinated.

**Conclusions:** Approximately one-quarter of PLHIV did not believe the COVID-19 vaccine was safe; most of these did not get vaccinated. Vaccine utilization educational interventions and collaborative and cooperative efforts to increase trust around COVID-19 vaccine, reduce hesitancy among unvaccinated PLHIV, and increase vaccine uptake are needed.

## TUPEB151

### Longitudinal changes in mental health among HIV-negative Chinese men who have sex with men during the COVID-19 pandemic: a prospective cohort study

H. Lin<sup>1</sup>, M. Liu<sup>2</sup>, Y. Gu<sup>3</sup>, J. Li<sup>2</sup>, W. Cao<sup>1</sup>

<sup>1</sup>Peking University, School of Public Health, Beijing, China, <sup>2</sup>Sun Yat-sen University, School of Public Health, Guangzhou, China, <sup>3</sup>Hohhot Rainbow House Health Consulting Service Center, Hohhot, China

**Background:** Men who have sex with men (MSM) face complex mental health challenges, which increase their vulnerability to HIV acquisition, particularly during the COVID-19 pandemic.

This study aims to investigate the longitudinal changes in mental health indicators during the COVID-19 pandemic explore factors influencing mental well-being among Chinese MSM.

**Methods:** This prospective cohort study was conducted in Hohhot, China, from June 2022 to July 2023. HIV-negative MSM participants were recruited and followed up at 0, 6, and 12 months, representing three distinct periods in China's epidemic control measures: the most stringent control phase, the phase of gradual relaxation, and the phase of complete lifting of control measures.

Validated scales were used to assess mental health, including depression, mental pain, anxiety, and suicidal ideation. Participants also provided information on sexual behaviors and HIV Acquisition status.

Analysis of Variance was used to examine differences between time points, and Generalized Estimating Equations was used to analyze the longitudinal changes in mental health.

**Results:** The study included a baseline sample of 280 participants with an average age of 35.5±9.8 years. The follow-up rates for the two rounds were 91.8% and 93.6%, respectively. During the follow-up period, a total of 10 individuals (3.6%) tested positive for HIV. At baseline, more than one in ten (11.1%) participants reported experiencing

moderate to severe depressive symptoms, and the prevalence of moderate to severe anxiety symptoms and suicidal ideation was 3.9% and 6.1%, respectively. Our findings revealed a gradual reduction in depressive symptoms ( $\beta = -0.12$ ,  $SE = 0.04$ ,  $p < 0.05$ ) and anxiety symptoms ( $\beta = -0.10$ ,  $SE = 0.03$ ,  $p < 0.05$ ) as the pandemic subsided after adjusting for age, education level and sexual behavioral factors.

**Conclusions:** This study highlights the importance of prioritizing mental health support for Chinese MSM during the COVID-19 pandemic, particularly during similar emergency situations. Policy makers should address depression and anxiety symptoms and provide targeted support to ensure effective mental health interventions.

## TUPEB152

### COVID-19 Pandemic effects on HIV viral load monitoring and viral load suppression among adolescents and young people living with HIV in South Africa

S. Zhou<sup>1</sup>, O. Edun<sup>2</sup>, Z. Leon<sup>1</sup>, G. Sherman<sup>3</sup>, E. Toska<sup>1</sup>

<sup>1</sup>University of Cape Town, Centre for Social Science Research, Cape Town, South Africa, <sup>2</sup>Imperial College London, MRC Centre for Global Infectious Disease Analysis, London, United Kingdom, <sup>3</sup>University of the Witwatersrand, Department of Paediatrics and Child Health, Johannesburg, South Africa

**Background:** The impact of COVID-19 on healthcare access has been widely documented, with mostly qualitative data on adolescents living with HIV (ALHIV). This study sought to assess the impact of COVID-19 on viral load frequency of monitoring and viral load suppression among ALHIV in South Africa.

**Methods:** We linked data from a social science cohort of ALHIV (N=1107) in the Eastern Cape of South Africa to the South African National Health Laboratory Service (NHLS) to obtain all available routine viral load records since 2004. We assessed differences in virologic monitoring and viral suppression by sex using four 18-months periods: two periods pre-COVID-19, COVID-19 and 18 months since, using 26 March 2020 as the first COVID-19 pandemic related lock-down start date in South Africa. All models were adjusted for duration on ART and mode of acquisition of HIV.

**Results:** 829 (75.2%) ALHIV were linked to the NHLS data warehouse: the proportion of participants with at least one VL record for each period decreased over time, indicating a decrease in access to VL testing (Period 1 70.4%, Period 2 64.1%, Period 3 58.9%, Period 4 48.8%). In total, there were 3328 VL records during the study period, with decreasing rates over time. The proportion of ALHIV with VLS among those tested was similar over time: Period 1 71.7%, Period 2 73.2%, Period 3 74.5%, and Period 4 77.8%. The odds of having a VL measurement during the COVID-19 period were lower (aOR 0.42, 95%CI 0.32-0.55) compared to pre-pre-COVID, and female ALHIV were

more likely to have VL data compared to their males (aOR 1.81, 95%CI 1.06-3.10). Older adolescents were also less likely to have VL measurements (aOR 0.86, 95%CI 0.80-0.93) during the COVID-19 period. There were no differences in viral suppression rates by age, sex, or mode of HIV acquisition.

**Conclusions:** ALHIV were less likely to have a viral load test during the COVID-19 pandemic, however, there was no difference in rates of VLS pre-COVID and during COVID among those with VL monitoring. Identifying ways to improve and minimize disruptions to virologic monitoring among ALHIV, including pandemic-responsive models of care is critical to improving VLS.

Progress towards UNAIDS's 95-95-95 targets among People Who Inject Drugs (PWID) and Men Who Have Sex with Men (MSM) in six Kyrgyz Republic sites, 2021

N. Usmanova<sup>1</sup>, B. Kalmyrzaev<sup>1</sup>, D. Biibosunova<sup>1</sup>, A. Mereke<sup>2</sup>, J. Neal<sup>2</sup>, D. Selenic<sup>2</sup>, D. Kanny<sup>2</sup>, B. Sheralieva<sup>3</sup>, C. Zhumalieva<sup>3</sup>, A. Solpueva<sup>3</sup>, L. Yanbuchtina<sup>3</sup>, A. Bekbolotov<sup>3</sup>, U. Chokmorova<sup>3</sup>, M. Tursunbekov<sup>4</sup>, G. Esenkeldieva<sup>4</sup>, V. Ivakin<sup>5</sup>, A. Deryabina<sup>5</sup>, P. Nado<sup>1</sup>  
<sup>1</sup>CDC, DGHT, Bishkek, Kyrgyzstan, <sup>2</sup>CDC, DGHT, Atlanta, United States, <sup>3</sup>RCBVHHC, Bishkek, Kyrgyzstan, <sup>4</sup>ICAP, KG Office, Bishkek, Kyrgyzstan, <sup>5</sup>ICAP, CAR Regional Office, Almaty, Kazakhstan

**Background:** The Joint United Nations Programme on HIV/AIDS (UNAIDS) '95-95-95' targets provide a useful framework to assess the health system effectiveness for diagnosis, treatment, and viral suppression among people with HIV (PWHIV). As of 2022, achievement towards the '95-95-95' targets were 82%-66%-89% in the Kyrgyz Republic. Similar data for key populations (KP) are critical to inform the HIV response in the country.

**Methods:** In 2021, we conducted a biobehavioral survey using respondent-driven sampling (RDS) in the six largest sites among adult PWID (Bishkek, Tokmok, Kara-Balta, Sokuluk, Osh, and Karasu), and among MSM in two sites (Bishkek and Osh). After obtaining informed consent, interviewers collected information on demographics, risk behaviors, knowledge of HIV status, and self-reported anti-retroviral therapy (ART) uptake. Blood specimens were tested for HIV, HCV, and syphilis using rapid tests. All participants with reactive HIV or HCV tests were referred to healthcare facility and further tested for HIV viral load and HCV RNA (GeneXpert platform). Viral load suppression (VLS) was defined as less than 1000 copies/ml. Weighted, population-level estimates were generated using the "Giles SS" estimator in RDS-Analyst software.

**Results:** Among PWID with HIV, knowledge of HIV status ranged from 56.5% (Kara-Balta) to 91.8% (Bishkek). ART coverage among PWID who knew their HIV status was more than 90% in all sites; VLS among those on ART varied by site from 53.3% (Tokmok) to 91.3% (Karasuu). Among MSM with HIV in Bishkek, the largest city in the Kyrgyz Republic, 41.0% knew their status, whereas ART coverage among PWHIV aware of their status was 92.7% and VLS among those on ART was 85.2%.

**Conclusions:** This survey provides new, KP-based data on HIV service coverage and uptake that can be used

to improve HIV services by population and location. HIV case-finding among MSM is sub-optimal although treatment coverage and effectiveness was high. Variation, by location, in testing coverage and VLS among PWID indicates the need for localized focus in testing uptake and ART adherence.

#### TUPEC154

Decline in HIV-related deaths in Australia: a 24-year national cohort study

S. McGregor<sup>1</sup>, H. McManus<sup>1</sup>, R. Guy<sup>1</sup>, on behalf of the Australian National HIV Data Linkage Study  
<sup>1</sup>UNSW Sydney, The Kirby Institute, Sydney, Australia

**Background:** Global targets to end AIDS as a public health threat include a 90% reduction in HIV/AIDS-related deaths by 2030. Understanding patterns of mortality is crucial to understand the impact of HIV treatment and care interventions. We used integrated national data sources to determine changes in HIV-related death over time, in the Australian population of people with HIV.

**Methods:** Using data linkage, a national cohort of people diagnosed with HIV in Australia between 1 January 1997 and 31 December 2020 was created, from the National HIV Registry (NHR) and National Death Index (NDI). Cause of death was determined from ICD-10 codes recorded in the NDI and cause of death in the NHR and described over time. The Kaplan-Meier method with log-rank test was used to compare the probability of HIV-related and non-HIV-related death by time-period of diagnosis.

**Results:** The study included 24,270 persons aged  $\geq 20$  years; most were male (88%), and aged 30-39 (35%) at diagnosis, with half born in Australia. The number of recorded deaths after data linkage increased by 235% from 746 to 1750. Between 2010 and 2020, the number of HIV-related deaths declined by 90%. Over the study, 61% of all deaths were attributed to HIV-related causes, declining from 64% for people diagnosed in 1997-2002 to 57% in 2015-2020.

Figure 1: Kaplan-Meier curve for probability of HIV-related and non-HIV-related death, by time-period of HIV diagnosis.

The Kaplan-Meier analysis (Figure 1) demonstrated that those diagnosed earlier (1997-2002) had a higher probability of HIV-related death (1174.2 per 100,000), than those in later time-periods. There was no difference in probability of non-HIV-related deaths by time-period.

**Conclusions:** HIV-related deaths were responsible for the highest proportion of deaths but the probability declined over time. Australia should be aiming for zero HIV-related deaths, which will require enhanced and equitable access to HIV prevention, testing, treatment, and care.

## TUPEC155

### Willingness of joining online support groups among men who have sex with men living with HIV in Shandong Province of China: a mixed methods study

K. Jiao<sup>1</sup>, J. Ma<sup>1</sup>, Y. Lin<sup>1</sup>, C. Wang<sup>2</sup>, M. Liao<sup>3</sup>, X. Cheng<sup>4</sup>, M. Song<sup>5</sup>, D. Liu<sup>5</sup>, D. Kang<sup>3</sup>, W. Ma<sup>1</sup>

<sup>1</sup>Shandong University, Jinan, China, <sup>2</sup>Shandong Public Health Clinical Center, Jinan, China, <sup>3</sup>Shandong Center for Disease Control and Prevention, Jinan, China, <sup>4</sup>Yantai Center for Disease Control and Prevention, Yantai, China, <sup>5</sup>Weifang Municipal Center for Disease Control and Prevention, Weifang, China

**Background:** Online support groups afford new opportunities to help individuals affected by HIV/AIDS to seek social support from peers. The study aimed to understand the willingness and associated factors of joining online support groups among men who have sex with men (MSM) living with HIV in Shandong Province, China.

**Methods:** The study followed a mixed method approach, with qualitative in-depth interviews followed by a quantitative cross-sectional survey in three cities of Shandong Province from 2019 to 2020. The in-depth interviews were audio-taped, transcribed verbatim and analyzed using thematic approach.

In the quantitative analysis, explanatory variables included sociodemographic, behavioral, clinical, psychological, and demand factors. Univariate and multivariable logistic regressions were conducted to examine the associated factors of willing to join online support groups.

**Results:** A total of 576 and 20 participants were included in the quantitative survey and qualitative interviews, respectively. Only 24.7% (142/576) of participants in the quantitative study were willing to join the online support group.

Multivariable analysis showed that participants whose monthly income >3,000 CNY (AOR=2.37, 95%CI: 1.26-4.46) were more likely to join the online support group. Elder participants (AOR=0.97, 95%CI: 0.95-0.99) and those who perceived higher availability of the information that they need (AOR=0.79, 95%CI: 0.65-0.97) were less likely to join the online support group. Compared with gay men, heterosexual participants (AOR=1.89, 95%CI: 1.07-3.32) had high-

er willingness to join the online support group. Qualitative interviews showed that the barriers to joining online support groups included privacy disclosure concern and psychological pressure exposed to HIV-related information. Facilitators included information acquisition, mutual medication reminding, and emotional support.

**Conclusions:** MSM living with HIV in China had relatively low willingness to join the online support groups.

This study highlighted the importance of safeguarding privacy, involving professional mental health providers, and providing high-quality information when establishing online support groups for people living with HIV.

## TUPEC156

### Trends in advanced HIV disease, mortality and lost to follow-up among adults living with HIV in rural Tanzania

F. Héritier<sup>1</sup>, E. Luoga<sup>2</sup>, J. Okuma<sup>1</sup>, Y. Haridas<sup>2</sup>, A. Katende<sup>2</sup>, M. Rohacek<sup>1,2</sup>, M. Battegay<sup>3</sup>, D.H. Paris<sup>1</sup>, M. Weisser<sup>3,1,2</sup>, T.R. Glass<sup>1</sup>, F. Vanobberghen<sup>1</sup>, KIULARCO study group

<sup>1</sup>University of Basel, Swiss Tropical and Public Health Institute, Allschwil, Switzerland, <sup>2</sup>Ifakara Health Institute, Chronic Diseases Clinic Ifakara, Ifakara, Tanzania, the United Republic of, <sup>3</sup>University of Basel, Division of Infectious Diseases and Hospital Epidemiology, University Hospital Basel, Allschwil, Switzerland

**Background:** Data regarding improved antiretroviral treatment strategies in sub-Saharan Africa remain scarce. We determined trends of advanced HIV disease (AHD), mortality and lost to follow-up (LTFU) among PLHIV in rural Tanzania.

**Methods:** PLHIV ≥ 15 years in the Kilombero and Ulanga Antiretroviral Cohort (KIULARCO) were enrolled from 2005 - 2022. AHD was defined as CD4 count <200 cells/μL and/or WHO stage III/IV; severe AHD as CD4 count <100 cells/μL; and LTFU as being ≥60 days late for visit.

Calendar time was categorised by changes in Tanzanian guidelines in 2013 and 2017. Time to death/LTFU or death alone was estimated using Kaplan-Meier and cumulative incidence methods, associated factors were assessed using Cox regression.

**Results:** Of 9,535 PLHIV assessed, at enrollment 4,931 (52%) had AHD with range 41%-66% by calendar year although no clear trends over time were detectable. However, classification in recent years was based less frequently on CD4 only. 1,846 (25%) participants had severe AHD.

After median follow-up of 2.9 years (IQR 0.8-7.6), there were 1,109 confirmed deaths (12%) and 3,728 (39%) LTFU. One-year, 5-year and 10-year risk of death/LTFU were 26% (95%CI 25-27), 46% (95%CI 44-47) and 58% (95%CI 57-59), respectively. AHD at enrolment was associated with higher risk of death/LTFU (adjusted hazard ratio (aHR) 1.29, 95%CI 1.17-1.41, figure 1a), and death (2.20, 95%CI 1.73-2.79; those LTFU were censored, figure 1b).

There was no evidence of a difference in the association between AHD at baseline and death/LTFU by calendar year (interaction  $p=0.07$ , figure 1c), while the risk of death was greatest among those with AHD in the earliest calendar time period ( $p<0.001$ , figure 1d).

**Conclusions:** The prevalence of PLHIV presenting with AHD and severe AHD remains consistently high over time and is associated with higher mortality. These findings re-emphasize the need for early diagnosis and treatment to reduce HIV-associated mortality and LTFU.

## TUPEC157

### Incidence and risk factors for treatment-emergent metabolic syndrome among Zambian adults receiving antiretroviral therapy: a cohort study

B.M. Hamooya<sup>1,2,3</sup>, S.K. Masenga<sup>1</sup>, C. Cheelo<sup>1</sup>, L. Siame<sup>1</sup>, T. Mwakyoma<sup>4</sup>, J. Mudenda<sup>5</sup>, W. Mutale<sup>6</sup>, H. Halwiindi<sup>6</sup>, R. Bedimo<sup>7</sup>, L. Lipworth<sup>8,9</sup>, D.C. Heimbürger<sup>5,8,9</sup>, S. Shrestha<sup>2</sup>, S. Bosomprah<sup>3</sup>

<sup>1</sup>Mulungushi University School of Medicine and Health Sciences, Livingstone, Zambia, <sup>2</sup>University of Alabama at Birmingham, School of Public Health, Birmingham, United States, <sup>3</sup>Centre for Infectious Disease Research in Zambia, Lusaka, Zambia, <sup>4</sup>Livingstone University Teaching Hospital, Livingstone, Zambia, <sup>5</sup>University of Zambia School of Medicine, Lusaka, Zambia, <sup>6</sup>University of Zambia School of Public Health, Lusaka, Zambia, <sup>7</sup>Office of Global Health, UT Southwestern Medical Center, Dallas, United States, <sup>8</sup>Vanderbilt Institute for Global Health, Nashville, United States, <sup>9</sup>Vanderbilt University Medical Center, Nashville, United States

**Background:** There is limited longitudinal epidemiological data on metabolic changes among people with HIV (PWH) receiving ART in sub-Saharan Africa. We estimated the incidence of treatment-emergent metabolic syndrome (tMetS) and identified associated risk factors among adult PWH at a tertiary health facility in Zambia.

**Methods:** We enrolled PWH initiating care ( $n=12$ ) and those on ART for  $\geq 6$  months ( $n=313$ ), without prevalent MetS, at Livingstone University Teaching Hospital be-

tween April 2019 and April 2020. Participants returned for a follow-up visit between December 2022 and June 2023. Demographic, clinical and laboratory data were collected by structured questionnaire and medical chart abstraction.

The primary outcome was incident tMetS, defined as having  $\geq 3$  of the following: low high-density lipoprotein cholesterol (HDL-c,  $<1.0$  mmol/L for men,  $<1.3$  for women), elevated waist circumference (WC,  $\geq 94$  cm for men,  $\geq 80$  cm for women), elevated triglycerides (TG,  $\geq 1.7$  mmol/L), elevated fasting blood glucose (FBG,  $\geq 5.6$  mmol/L), and elevated blood pressure (BP) (systolic BP  $\geq 130$  or diastolic BP  $\geq 85$  mm Hg). Multivariable robust Poisson logistic regression was used to examine risk factors for tMetS.

**Results:** The median age was 43 years at baseline, and 61.9% were female. The prevalences of abnormal FBG (12.8% vs. 25.9%), HDL-c (31.7% vs. 71.35%), WC (29.9% vs. 44.8%) and TG (8.9% vs. 45.2%) increased significantly between baseline and follow-up ( $p<0.001$  for all comparisons).

Over a median follow-up of 43 months, the cumulative incidence of tMetS was 38.8% (126/325; 95% confidence interval (CI) 33.4, 44.3).

In multivariable analysis, factors positively associated with MetS were older age (incidence rate ratio (IRR) 1.02; 95%CI 1.01, 1.04), female sex (IRR 1.58; 95%CI 1.11, 2.24), dolutegravir (DTG)-based regimen use (IRR 1.50; 95%CI 1.01, 2.23) and higher body mass index (BMI) (IRR 1.14; 95%CI 1.10, 1.18); while larger hip circumference (HC) was inversely associated (IRR 0.98; 95%CI 0.97, 0.99).

**Conclusions:** The incidence of MetS was high among PWH and was significantly influenced by demographic and clinical factors.

The results suggest a need for targeted screening, particularly among older persons, women, those using DTG and those with higher BMI. Longitudinal studies focusing on the mechanism through which DTG induces metabolic dysregulation are warranted.

Hoelscher<sup>1,2,6,7</sup>

<sup>1</sup>LMU University Hospital, Division of Infectious Diseases and Tropical Medicine, Munich, Germany, <sup>2</sup>German Center for Infection Research, Partner Site Munich, Munich, Germany, <sup>3</sup>NIMR-Mbeya Medical Research Center, HIV, Mbeya, Tanzania, the United Republic of, <sup>4</sup>NIMR-Mbeya Medical Research Center, Immunology, Mbeya, Tanzania, the United Republic of, <sup>5</sup>University of Dar es Salaam, Mbeya College of Health and Allied Sciences, Dar es Salaam, Tanzania, the United Republic of, <sup>6</sup>Fraunhofer Institute ITMP, Immunology, Infection and Pandemic Research, Munich, Germany, <sup>7</sup>German Research Center for Environmental Health, Unit Global Health of Helmholtz Center, Munich, Germany

**Background:** Prior to the introduction of antihelminthic treatment programs in southwestern Tanzania, our group described a 2.3-fold increase in HIV susceptibility among individuals 14 to 65 years testing positive for the *Wuchereria bancrofti* (WB) compared to WB-negative villagers. The impact of helminth elimination on HIV incidence is currently being investigated over a further eight years of surveillance.

**Methods:** Study participants in a prospective cohort study of the general population were tested annually for HIV and circulating filarial antigen, an indicator of WB burden from 2007 to 2011 and additionally in 2019. Due to the high prevalence of WB in the region in 2007, ivermectin and albendazole was distributed annually to all villagers as part of government programs annually from 2009 to 2015, virtually eliminating filarial transmission. We measured new HIV acquisitions among all villagers and compared two subgroup of individuals (WB-positive and negative) during the high and low endemicity period.

**Results:** Of the 1,299 villagers who were rescreened in 2019, 1,139 had tested HIV-negative at the end of previous surveillance in 2011. This included 848 persons who had never tested positive for WB, 272 participants who were previously – but no longer – WB-positive, and 19 individuals who were still or again WB-positive.

During the first surveillance period from 2007 to 2011, 15 HIV seroconversions occurred among WB positive individuals during 871 PYs (1.72 per 100 PY). In the second period from 2011 to 2019, the HIV incidence decreased significantly to 0.73 cases per 100 PY (17 in 2,344 PY,  $p=0.019$ ) in this group. In all-time-WB-negative individuals we documented 9 HIV seroconversions in 1,298 PY (0.69 per 100 PY) between 2007 to 2011, 39 in 5,724 PY (0.68 per 100 PY), between 2011 and 2019  $p=0.963$ ).

**Conclusions:** There was a significant decline in the incidence of HIV in the group of villagers who were previously filarial- positive but were now cured of WB. This reduction in HIV incidence was not observed among those who had never been touched WB. These results show that the elimination of unrelated pathogens, for example with filarial worms, can help to reduce the spread of HIV.

## TUPEC159

### Defining risk strata and associated HIV prevalence among men who have sex with men in nine sub-Saharan African countries: a latent class analysis

<sup>2</sup>Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States, <sup>3</sup>Dalla Lana School of Public Health, University of Toronto, Toronto, Canada, <sup>4</sup>Programme d'Appui au Monde Associatif et Communautaire (PAMAC), Ouagadougou, Burkina Faso, <sup>5</sup>Johns Hopkins University, Yaoundé, Cameroon, <sup>6</sup>Metabiota, Yaoundé, Cameroon, <sup>7</sup>Ministère de la Santé Publique, Comité National de Lutte contre le Sida, Yaoundé, Cameroon, <sup>8</sup>ActionAid, Banjul, Gambia, the, <sup>9</sup>ENDA Santé Guinée Bissau, Bissau, Guinea-Bissau, <sup>10</sup>ENDA Santé, Dakar, Senegal, <sup>11</sup>Arc-en-ciel, Lome, Togo, <sup>12</sup>Global Fund, Geneva, Switzerland

**Background:** Gay, bisexual, and other men who have sex with men (MSM) are disproportionately affected by HIV across sub-Saharan Africa. However, HIV risks among MSM are heterogeneous given diverse sexual networks, behaviors, and legal environments. To inform delivery of differentiated HIV services for MSM, we sought to define risk strata among MSM in sub-Saharan Africa and quantify HIV burden within each stratum.

**Methods:** Using data from 17 biobehavioural surveys with MSM in 9 countries (2009-2023), we used latent class analysis (LCA) to identify clustering of potential drivers of HIV risk (inconsistent condom use (ICU) with main and casual male partners, and cisgender female partners; condom-compatible lubricant (CCL) use; injection drug use; alcohol use; transactional sex; and physical and sexual violence victimization). We used mixture models to estimate associations between LCA-identified risk strata and HIV and syphilis test results.

**Results:** We identified five risk strata among 4,409 MSM with distinct patterns of risk (Figure): 1—transactional sex, substance use, and violence ( $n=315$ ); 2—ICU with casual partners and binge drinking ( $n=1,962$ ); 3—sexual vio-

lence( $n=681$ ); 4—ICU with main partners and binge drinking( $n=1,043$ ); and 5—ICU with main partners and rare CCL use( $n=408$ ). In multivariable mixture models relative to the fifth class, substance use and violence (PR 8.51, 95% CI 8.04–8.98); binge drinking and ICU with causal partners (PR 3.18, 95% CI 2.72–3.64); sexual violence (PR 5.73, 95% CI 4.67–5.60); and binge drinking and ICU with main partners (PR 5.13, 95% CI 4.67–5.59) were associated with increased HIV prevalence.

Figure. Results from latent class analysis and multivariable mixture model to identify clustering of potential drivers of HIV risk among men who have sex with men in nine sub-Saharan African countries, 2009 - 2023 ( $n=4,409$ ).

**Conclusions:** These analyses suggest HIV vulnerability among MSM in sub-Saharan Africa may be driven by concomitant transactional sex and substance use, along with clustering physical and sexual violence. LCA approaches are scalable with routinely collected data and can support differentiated service delivery by identifying clustering vulnerabilities that drive HIV prevalence and other outcomes among MSM and other marginalized populations.

## TUPEC160

### Stalled progress in addressing HIV among trans women in San Francisco, USA

E.C. Wilson<sup>1</sup>, E. Palafox<sup>1</sup>, C. O'Neal<sup>1</sup>, R. Ruiz<sup>1</sup>, B. Suprasert<sup>1</sup>, M. Tate<sup>1</sup>, G. Baguso<sup>1</sup>, W. McFarland<sup>1</sup>

<sup>1</sup>San Francisco Department of Public Health, Trans Research Unit for Equity, San Francisco, United States

**Background:** Trans women in San Francisco have experienced the most severe burden of HIV of any group, similar to the situation worldwide. Efforts to prioritize care and prevention for trans women in San Francisco were showing several years of success, particularly in closing gaps in HIV testing, use of antiretrovirals (ART), viral suppression, and uptake of PrEP. To assess the current trajectory for getting to zero HIV among trans women, we analyzed trends in HIV prevention and care indicators from 2019/20 to 2023.

**Methods:** Population-based data were collected for adult trans women in 2019/2020 and 2023 in San Francisco using respondent-driven sampling (RDS). HIV prevention and care engagement, risk indicators, and HIV test results were compared. Further analysis was done to identify risk correlates with homelessness and methamphetamine use among HIV-negative trans women in 2023.

**Results:** Between 2019/20 and 2023, most epidemic indicators showed no improvement or worsened, including HIV prevalence (41% vs. 36%,  $p=0.497$ ), new HIV infections (3% vs. 4%,  $p=0.208$ ), HIV testing (91% vs. 81%,  $p=0.015$ ), PrEP use (43% vs. 40%,  $p=0.613$ ), and viral suppression (82% vs. 89%,  $p=0.280$ ).

Improvements were seen in ART use (90% vs 99%,  $p=0.026$ ), methamphetamine use (32% vs. 22%,  $p=0.027$ ), and homelessness in the last year (60% vs. 40%,  $p<0.001$ ), although current homelessness did not improve (27% vs. 29%,  $p=0.719$ ).

Among HIV-negative trans women, current homelessness was associated with sex work (OR=2.04, 95%CI=1.02–4.10), condomless receptive anal intercourse (CRAI) (OR=2.05, 95%CI=1.01–4.16), and injecting drugs (OR=7.72, 95%CI=2.57–23.25); methamphetamine use was associated with sex work (OR=2.43, 95%CI=1.14–5.18) and CRAI (OR=3.26, 95%CI=1.45–7.34).

**Conclusions:** Progress has stalled in addressing HIV and its causative factors among trans women in San Francisco. Effective prevention measures have hit a plateau, including uptake of testing, use of PrEP, and sustaining viral suppression. While homelessness and methamphetamine use have declined, HIV risk behaviors remained high among trans women in these groups.

Efforts focused on those most at risk by addressing upstream factors, such as housing insecurity and substance use, are needed to end the HIV epidemic among trans women in San Francisco.

## TUPEC161

### Classifying women at high risk of HIV in sub-Saharan Africa: a pooled latent class analysis

K. Rucinski<sup>1</sup>, K. Atkins<sup>1</sup>, H. Moran<sup>2</sup>, G. Turpin<sup>2</sup>, M.A. Roache<sup>2</sup>, K. Willis<sup>2</sup>, N. Tahmo<sup>3</sup>, O. Ky- Zerbo<sup>4</sup>, I. Mfochive Njindam<sup>5</sup>, U. Tamoufe<sup>6</sup>, S. Billong<sup>7</sup>, B. Cham<sup>8</sup>, M. Ndowsise<sup>8</sup>, M. Aliu Djaló<sup>9</sup>, R. Phaswana-Mafuya<sup>10</sup>, M. Mcingana<sup>11</sup>, I. Ba<sup>12</sup>, N. Turpin<sup>12</sup>, D. Diouf<sup>12</sup>, S. Anato<sup>13</sup>, J. Zhao<sup>14</sup>, S. Schwartz<sup>2</sup>, S. Baral<sup>2</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, International Health, Baltimore, United States, <sup>2</sup>Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States, <sup>3</sup>University of Toronto, Toronto, Canada, <sup>4</sup>Programme d'Appui au Monde Associatif et Communautaire (PAMAC), Ouagadougou, Burkina Faso, <sup>5</sup>Johns Hopkins University, Yaoundé, Cameroon, <sup>6</sup>Metabiota, Yaoundé, Cameroon, <sup>7</sup>Ministère de la Santé Publique, Comité National de Lutte contre le Sida, Yaoundé, Cameroon, <sup>8</sup>ActionAid, Banjul, Gambia, the, <sup>9</sup>ENDA Santé Guinée Bissau, Bissau, Guinea-Bissau, <sup>10</sup>Faculty of Health Sciences, University of Johannesburg, Environmental Health, Johannesburg, South Africa, <sup>11</sup>TB HIV Care, Cape Town, South Africa, <sup>12</sup>ENDA Santé, Dakar, Senegal, <sup>13</sup>Arc-en-ciel, Lome, Togo, <sup>14</sup>The Global Fund, Geneva, Switzerland

**Background:** Community-led HIV programs have been successful in reaching female sex workers (FSW) with comprehensive sexual and reproductive health services across sub-Saharan Africa. However, intensified efforts are needed to identify and reach FSW that remain marginalized from existing programs.

**Methods:** We conducted a pooled multi-country analysis to characterize discrete HIV risk strata among FSW completing bio-behavioral surveys in 9 countries: Burkina Faso, Cameroon, Côte d'Ivoire, Gambia, Guinea-Bissau, Lesotho, South Africa, Senegal and Togo (2013-2017). Latent class analysis was used to classify FSW into discrete groups defined by underlying constructs of sexual and socio-structural risk including sexual frequency, client type, condomless sex, alcohol use and physical/sexual violence. Individual-level characteristics, including known determinants of HIV risk, were profiled across classes. Mixture models were used to estimate adjusted prevalence ratios (aPR) and 95% confidence intervals (CI) for the association of class membership with prior HIV testing experience and biologically-confirmed HIV status.

**Results:** Among 5548 FSW reporting ≥1 client in the last 30 days (median age:27, IQR 23-34), four risk profiles (classes) were identified by latent modeling, defined most predominantly within a class through experiences of: (Class-1) Violence and alcohol use (17% prevalence), (Class-2) High client turnover (38% prevalence), (Class-3) Lower client volume (32% prevalence), and, (Class-4) Limited use of condoms/lubricant (13% prevalence).

In mixture modeling, prior HIV testing was significantly lower among the limited condom/lubricant use class relative to the remaining classes: violence and alcohol use (aPR 0.65, 95%CI 0.58-0.72), high client turnover (aPR 0.54, 95%CI 0.48-0.61), and lower client volume (aPR 0.69, 95%CI 0.62-0.76) (Figure).

Figure.

**Conclusions:** Pooled analyses demonstrated heterogeneity in both individual and structural barriers to HIV prevention among FSW. This represents a scalable approach using commonly collected data to describe risk strata among FSW to inform differentiated service delivery strategies to optimize impact in the context of decreasing resources for HIV prevention and treatment.

## TUPEC162

### Underestimation of HIV epidemic among men who have sex with men: challenges in "Know your epidemic" in the WHO European Region

M. Otani<sup>1</sup>, G. Kuchukhidze<sup>1</sup>, V. Grankov<sup>1</sup>, S. Bivo<sup>1</sup>

<sup>1</sup>WHO Regional Office for Europe, Copenhagen, Denmark

**Background:** In Eastern Europe and Central Asia, key populations (KPs) and their sexual partners comprised 94% of new HIV infections in 2022. Even though data on KPs is vital to inform optimised HIV responses, many member states in the WHO European region continue to face challenges in generating accurate data.

In particular, HIV epidemic among men who have sex with men (MSM) is underestimated, especially in countries where homosexuality is highly stigmatised. Core epidemiological data among MSM in the selected countries was assessed to identify gaps in data on MSM in the region.

**Methods:** The data from seven countries in the WHO European region: Albania, Azerbaijan, Belarus, Republic of Moldova, Ukraine, Uzbekistan, and Tajikistan, in which WHO conducted HIV programme reviews in 2022-2023, was assessed. We calculated the estimated number of MSM living with HIV in each country by using the latest estimated MSM population size and HIV prevalence among MSM, which was compared to the cumulative reported HIV diagnoses in MSM until the end of 2022.

**Results:** The prevalence of HIV among MSM was the lowest in Albania (2.0%) and the highest in Moldova (11.4%). The estimated proportion of MSM in the adult male population used by national programmes ranged from 0.03% (Uzbekistan) to 2.0% (Moldova), with only three countries

having a proportion above the lower limit of 1.0% recommended by WHO and UNAIDS. While six out of seven countries had a significantly lower number of reported HIV diagnoses among MSM than the estimated infections, Albania was the only country where the reported number exceeded the estimate.

**Conclusions:** The necessity of strengthening the population size estimation method was indicated for better programme planning for MSM. At the same time, considering that a significant number of HIV infections in MSM might have been misclassified in countries across the region, improvement in the ascertainment of modes of HIV transmission is urgent. Accelerated efforts are needed to acquire an accurate picture of HIV epidemics and key populations to move forward towards ending AIDS by 2030.

## TUPEC163

The profiles and treatment outcomes of people diagnosed with HIV 50 years and above at Newlands Clinic in Zimbabwe: a descriptive analysis

C. Taderera<sup>1</sup>, S. Lowe<sup>12</sup>

<sup>1</sup>Newlands Clinic, Medicine, Harare, Zimbabwe, <sup>2</sup>University of Zimbabwe, Department of Medicine, Harare, Zimbabwe

**Background:** According to 2021 UNAIDS estimates, 7% of new HIV diagnoses in Eastern and Southern Africa occurred in individuals  $\geq 50$  years. Poor outcomes are common in older people with delayed diagnosis leading to presentation with advanced HIV disease (AHD) resulting in increased likelihood of mortality within a year of antiretroviral therapy (ART) initiation.

We assessed the burden of AHD and the treatment outcomes of those diagnosed of HIV from  $\geq 50$  years at a Zimbabwean facility.

**Methods:** Electronic medical records were extracted of all clients with a documented HIV diagnosis made at  $\geq 50$  years at an HIV outpatient department in Harare, Zimbabwe. Descriptive statistics and Stata BE17 were used to analyze clinical characteristics and treatment outcomes.

**Results:** A total of 883 clients (53% female) were diagnosed between 1988 and 2023. Median age at diagnosis was 54 years (IQR 51-59), the oldest at 83. At diagnosis, more men were married than women (83% versus 22%) while more women were widowed (53% versus 8.7%). CD4 count at diagnosis was documented for 470 (53%) clients, the median was 153 cells/mm<sup>3</sup> (IQR 76-265), (comparable in both sexes; women:155, men:145).

Most clients had initial CD4 counts  $< 200$  cells/mm<sup>3</sup> (303/470, 64%). 54% of clients had documented WHO stage at diagnosis: 32% with stage 1, 25% stage 2, 30% stage 3, 13% stage 4. In 2023, 544/883 (62%) clients remain in care, 213 (24%) deceased, 28 (3%) lost to follow up and 47 (5%) transferred out. For those in care, median age is 67 years (IQR 61-70) with median ART duration of 10 years

(IQR 5.6-14.4). Median CD4 count 430 cells/mm<sup>3</sup> (IQR 288-598, women:504, men:350), and mean CD4 recovery was 307 cells/mm<sup>3</sup> (95% CI 222-270). 95% have an undetectable viral load ( $\leq 50$  copies/ml).

Treatment failure was uncommon (7.9%). 114 deceased clients had baseline CD4 counts, 74% were  $< 200$  cells/mm<sup>3</sup>. 2/213 died before ART initiation, 54/213 (25%) died within a year of ART initiation.

**Conclusions:** Older people often present with AHD leading to high mortality within the first year of treatment. Of those who survive, treatment outcomes are good. Targeting earlier diagnosis in older adults should be prioritized by HIV programmes.

## Surveillance: Measuring the HIV pandemic

### TUPEC165

Estimating HIV prevalence and recent transmissions in a U.S. national cohort of sexual and gender minorities, with an emphasis on over-enrolling people who use methamphetamine

C. Grov<sup>1</sup>, A. D'Angelo<sup>2</sup>, C. Mirzayi<sup>2</sup>, M. Dearolf<sup>2</sup>, E. Hoepfner<sup>2</sup>, Y. Guo<sup>2</sup>, N. Richards<sup>2</sup>, R. Ehsan<sup>2</sup>, S. Kulkarni<sup>2</sup>, D. Nash<sup>2</sup>, V. Patel<sup>3</sup>, D. Duncan<sup>4</sup>, M. Ray<sup>5</sup>, T. Bartholomew<sup>6</sup>, J. Manuzak<sup>7</sup>, J. Manuel<sup>8</sup>, K. McCollister<sup>6</sup>, D. Westmoreland<sup>9</sup>, A. Carrico<sup>10</sup>

<sup>1</sup>CUNY Graduate School of Public Health and Health Policy, Community Health and Social Sciences, New York, United States, <sup>2</sup>CUNY Graduate School of Public Health and Health Policy, New York, United States, <sup>3</sup>Albert Einstein College of Medicine, New York, United States, <sup>4</sup>Columbia University, New York, United States, <sup>5</sup>University of Memphis, Memphis, United States, <sup>6</sup>University of Miami, Miami, United States, <sup>7</sup>Tulane University, New Orleans, United States, <sup>8</sup>University of California, San Francisco, San Francisco, United States, <sup>9</sup>University of Florida, Gainesville, United States, <sup>10</sup>Florida International University, Miami, United States

**Background:** Sexual and gender minorities (SGM) represent 2-5% of the US population, yet continue to account for more than two-thirds of new HIV diagnoses. Cohort studies offer a robust methodology for examining behaviors that occur naturally, and capture longitudinal changes and relations.

**Methods:** In 2022-2023, using advertising on geosocial sexual networking apps, we enrolled a geographically and racially diverse cohort of 5,404 sexual and gender minorities (aged 16 to 49) and oversampling persons who use methamphetamine (52.2%). To be eligible, participants had to report meeting objective criteria for PrEP care, but not be taking PrEP. All participants completed

abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

an online survey and were mailed an oral fluid specimen collection kit for HIV testing (returned via mail and analyses conducted by a lab).

**Results:** Nearly all participants (84.7%) were cisgender male, 3.8% (203/5404) were transgender women, and 1.1% (61/5404) were transgender men who have sex with men. There were also  $n = 564$  (10.4%) individuals who self-identified outside of the gender binary—all reported being assigned male sex at birth. In total, 56.5% (3052/5404) were persons of color, and 31.8% (1717/5404) were younger individuals aged 16 to 29 years. In total, 4,201 HIV test kits were returned (96.6% had valid results), including  $n = 372$  HIV-reactive samples—3.5% were HIV-positive among those who did not report methamphetamine use, and 15.3% were HIV-positive among those reporting methamphetamine use.

Based on participant's HIV results as well as self-reporting when their most recent HIV-negative test was, we estimated the incidence rate in this cohort in the 12-month period leading up to study enrollment was 8.01 per 100 person-years among those reporting methamphetamine use compared with 1.83 among those not reporting methamphetamine use per 100 person-years.

**Conclusions:** A large, national, and racially diverse online cohort of SGM at high risk for HIV have been successfully enrolled and will be followed through 2027. Persons who use methamphetamine have been oversampled and demonstrated exceptionally greater risk for HIV.

## TUPEC166

Sample composition and HIV prevention indicator differences using physical vs. virtual venue recruitment of men who have sex with men in San Francisco

I. Chiu<sup>1,2</sup>, M. Tate<sup>1</sup>, D. Trujillo<sup>3</sup>, B. Suprasert<sup>1</sup>, A. Marr<sup>4</sup>, S. Arayasirikul<sup>5</sup>, E.C. Wilson<sup>1,4</sup>, H.F. Raymond<sup>6</sup>, W. McFarland<sup>1,4</sup>

<sup>1</sup>San Francisco Department of Public Health, Center for Public Health Research, San Francisco, United States,

<sup>2</sup>University of California Los Angeles, Fielding School of Public Health Department of Epidemiology, Los Angeles, United States, <sup>3</sup>University of California Los Angeles, Fielding School of Public Health Department of Community Health Sciences, Los Angeles, United States, <sup>4</sup>University of California San Francisco, Department of Epidemiology and Biostatistics, San Francisco, United States, <sup>5</sup>University of California, Irvine, Department of Health, Society, and Behavior, Program in Public Health, Irvine, United States,

<sup>6</sup>Rutgers School of Public Health, Piscataway, United States

**Background:** During the COVID-19 pandemic, the sampling method for the National HIV Behavioral Surveillance (NHBS) in San Francisco (i.e., "integrated bio-behavioral surveillance") changed from physical venue time-location sampling (TLS) to online or virtual venue TLS for men who have sex with men (MSM).

We present differences in the samples of MSM recruited using physical venue TLS in 2017 vs. virtual venue TLS in 2021.

**Methods:** Physical venue TLS in 2017 was conducted using formative research to create a sampling frame of venues, days, and times (VDTs) where MSM congregate throughout the city and randomly selecting 4-hour VDTs to recruit through outreach. Virtual venue TLS in 2021 was conducted by creating a sampling frame of online venues where MSM socialize (e.g., dating apps), and randomly selecting 4-hour app-day-times (ADTs) to recruit through messaging profiles, and through targeted ads.

We assess changes in preventive and risk behaviors from 2017 to 2021 after controlling for differences in the sample compositions using logistic regression.

**Results:** Both methods exceeded their targeted sample size of 500 (physical venue TLS  $N=502$ , virtual venue TLS  $N=505$ ). Compared to the physical venue TLS sample, the virtual venue TLS sample had significantly fewer persons experiencing homelessness and incarceration, and more persons with health insurance and post-graduate degrees.

After adjusting for these differences and age, race, and employment status, PrEP use significantly increased from 2017 to 2021. The use of several non-injection drugs also increased, namely marijuana, poppers, ketamine, psilocybin, and LSD.

**Conclusions:** Changing recruitment of MSM from physical venues in 2017 to online venues in 2021 achieved target sample sizes with identifiable demographic differences between samples. Adjustment for sample differences suggest that we were able to track an increase in PrEP use consistent with programmatic data and in non-injection drug use consistent with the legalization of marijuana and other data.

We found virtual venue recruitment of MSM to be a viable approach for tracking trends in HIV-related behaviors, with notable appeal given possible future pandemic lockdowns of physical venues, changing socialization patterns, and for parts of the world where physical venues for MSM are few, non-existent, or vulnerable to exposure.

### High HIV and HSV-2 incidence among young women who sell sex (YWSS) and young men who buy sex (YMBS) in Rural South Africa: a population-based study

F. Magut<sup>1</sup>, N. Chimbindi<sup>1,2</sup>, L. Mazibuko<sup>1</sup>, N. Mthiyane<sup>1</sup>, G. Harling<sup>1,2,3</sup>, K. Baisley<sup>1,4</sup>, T. Zuma<sup>1,2,5</sup>, J. Dreyer<sup>1</sup>, N. Okesola<sup>1</sup>, O. Behuhuma<sup>1</sup>, C. Herbst<sup>1</sup>, T. Smit<sup>1</sup>, J. Seeley<sup>1,4</sup>, S. Floyd<sup>4</sup>,

I. Birdthistle<sup>4</sup>, F. Cowan<sup>6</sup>, J. Hargreaves<sup>4</sup>, M. Shahmanesh<sup>1,5,2</sup>

<sup>1</sup>Africa Health Research Institute(AHRI), Mtubatuba, South Africa, <sup>2</sup>Institute for Global Health, University College London, London, United Kingdom, <sup>3</sup>University of KwaZulu-Natal, KwaZulu-Natal, South Africa, Durban, South Africa, <sup>4</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>5</sup>University of KwaZulu-Natal, Durban, South Africa, <sup>6</sup>Centre for Sexual Health and HIV/AIDS Research (CeSHHAR), Harare, Zimbabwe

**Background:** In South Africa sex workers and adolescent girls and young women (AGYW) are at high risk of sexually acquiring HIV.

We aimed to understand the risk of acquiring HIV and herpes simplex virus (HSV-2) amongst Young Women Who Sell Sex (YWSS) and Young Men who Buy Sex (YMBS) to inform HIV prevention targeting in a rural setting in uMkhanyakude District in KwaZulu-Natal.

**Methods:** Between 2017-2019 we interviewed a population representative sample of AGYW and adolescent boys and young men (ABYM) aged 13-30 years annually in KwaZulu-Natal and collected dried blood spot samples for HIV and HSV-2 serology. We estimated the incidence of HIV and HSV-2 cases per 100 person-years (py).

We used Cox proportional hazards regression to estimate relative hazards of HIV and HSV-2 incidence for selling and buying sex, adjusting for various factors including age, education and employment, location and food insecurity.

**Results:** n=2761 (96.2%) of eligible AGYW and n=2487(81.6%) of eligible ABYM participated and 2463 (89.2%) AGYW and 1945(78.2%) ABYM provided data for at least one follow-up. Prevalence of selling sex (14%) and buying sex (6%).

Overall HIV incidence was 3.36/100py (95%CI:2.68-4.15) among AGYW and 0.66/100py (95%CI:0.28-1.30) among ABYM. HIV incidence was higher among YWSS compared to females who didn't sell sex (8.21 (95%CI:5.36-12.02) vs 2.66 (95%CI:2.03-3.44)/100py); adjusted Hazard Ratio (aHR)=2.35; 95%CI: 1.76-3.14. HIV incidence was higher among YMBS compared to males who didn't buy sex 2.31 (95%CI:0.48-6.76) vs 0.46 (95%CI:0.15-1.08) /100 py; aHR=5.01; 95% CI:1.03-20.4.

HSV-2 incidence among AGYW was 18.43/100py (95%CI:16.50-20.53) and 30.27/100py (95%CI:26.06-34.31) among ABYM. HSV-2 incidence was higher among young women who sold sex compared to those who didn't (29.32 (95%CI:22.09-38.16) vs 17.17 (95%CI:16.50-20.53)/100py; aHR=1.28; 95%CI:1.06-1.53. HSV-2 incidence was lower

among YMBS compared to males who didn't buy sex (26.97 (95% CI:15.69-43.13) vs 30.27 (95% CI:26.15-34.86)/100py), with no evidence of a difference after adjustment.

**Conclusions:** Buying and selling sex contributes to high incidence of HIV, suggesting young women and men who sell and buy sex are priority groups for HIV prevention, including HIV Pre-Exposure Prophylaxis. The discrepancy between similarly high incidence of HSV-2 in females and males, but lower HIV incidence among males may reflect HIV treatment amongst their female partners and VMMC.

## TUPEC168

### Estimating HIV incidence among key populations in Unguja, Zanzibar, 2023

J. Ndayongeje Joel<sup>1</sup>, M. Dahoma<sup>2</sup>, M. Mtoro<sup>1</sup>, A. Kailembo<sup>3</sup>, C. Said<sup>4</sup>, S. Welty<sup>4</sup>, S.E. Porter<sup>3</sup>, A. Ussi<sup>5</sup>, A. Khatib<sup>6</sup>, F. Faki<sup>2</sup>, H. Solomon<sup>7</sup>, W. McFarland<sup>8</sup>

<sup>1</sup>Global Programs, Dar es Salaam, Tanzania, Dar Es Salaam, Tanzania, the United Republic of, <sup>2</sup>Zanzibar Integrated HIV, Hepatitis, TB, and Leprosy Programme, Unguja, Zanzibar, Zanzibar, Tanzania, the United Republic of, <sup>3</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Dar es Salaam, Tanzania, Dar Es Salaam, Tanzania, the United Republic of, <sup>4</sup>University of California, San Francisco, San Francisco, CA, United States, <sup>5</sup>Ministry of Health, Unguja, Zanzibar, Zanzibar, Tanzania, the United Republic of, <sup>6</sup>Zanzibar AIDS Commission, Unguja, Zanzibar, Zanzibar, Tanzania, the United Republic of, <sup>7</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, GA, USA, Atlanta, United States, <sup>8</sup>San Francisco Department of Public Health, CA, USA, San Francisco, United States

**Background:** No estimates of HIV incidence exist among female sex workers (≥18)/sexually exploited children (girls <18 who are given money or products for sex) (FSW/SEC), people who inject drugs (PWID), and men who have sex with men (MSM) in Unguja, Zanzibar. Information on HIV incidence is crucial to track the epidemic and assess preventive measures. An integrated bio-behavioral survey was conducted to estimate HIV incidence among these populations in 2023.

**Methods:** Using respondent-driven sampling (RDS), we recruited individuals aged ≥15 years who reported living in Unguja for ≥3 months and were FSW/SEC (exchanged sexual intercourse for money in the prior month), MSM (had sex with men in the past 3 months) or PWID (injected drugs in the past 3 months). We used Osmond's method to estimate HIV incidence. Person-years at risk were calculated from the onset of risk behavior (first selling or exploitation for sex for FSW/SEC, first sex with men for MSM, and first injecting drugs for PWID) for HIV-negative individuals and halfway from the onset of risk behavior for HIV-positive individuals. We produced crude estimates, reported as percentages with 95% confidence intervals

(95%CI). Population size estimates (PSE) were calculated using the Anchored Multiplier method based on 3-source capture-recapture and sequential sampling (SS) PSE estimates generated in RDS-Analyst. New acquisition of HIV estimates were computed using HIV prevalence, incidence, and PSE.

**Results:** HIV incidence was 3.2% (95%CI: 2.7-3.8) among FSW/SEC, 1.2% (95%CI: 0.9-1.5) among MSM, and 0.7% (95%CI: 0.5-1.0) among PWID. PSEs were 5,800 (95%CI: 3490-8700) for FSW/SEC, 3,250 (95%CI: 1550-5630) for MSM, and 2,350 (95%CI: 1610-3240) for PWID, which indicates an estimated 146, 35, and 15 new HIV infections, respectively, in the next 12 months.

**Conclusions:** The findings highlight an increasing number of HIV infections in these populations. KP-targeted HIV prevention interventions including pre-exposure prophylaxis will be important to stop HIV transmission and achieve the UNAIDS 95-95-95 targets in these populations

## TUPEC169

Progress towards 95-95-95 and challenges with HIV diagnosis among men who have sex with men in Unguja, Zanzibar, 2023

A. Khatib<sup>1,2</sup>, C. Said<sup>3</sup>, M. Dahoma<sup>3</sup>, J. Ndayongeje<sup>4</sup>, M. Mtoro<sup>4</sup>, F. Khalid<sup>5</sup>, A. Ussi<sup>5</sup>, A. Jahzumi<sup>3</sup>, S. Porter<sup>6</sup>, H. Solomon<sup>7</sup>, A. Kailembo<sup>6</sup>

<sup>1</sup>Zanzibar AIDS Commission, Zanzibar, Tanzania, the United Republic of, <sup>2</sup>University of California San Francisco, San Francisco, United States, <sup>3</sup>Zanzibar Integrated HIV, Hepatitis, TB and Leprosy Programme, Zanzibar, Tanzania, the United Republic of, <sup>4</sup>Global Program, Dar es Salaam, Tanzania, the United Republic of, <sup>5</sup>Ministry of Health, Zanzibar, Tanzania, the United Republic of, <sup>6</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Dar es Salaam, Tanzania, the United Republic of, <sup>7</sup>Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, Georgia, United States

**Background:** Zanzibar has a concentrated HIV epidemic among key populations, including men who have sex with men (MSM). We conducted a biobehavioral survey in Unguja Island, Zanzibar to assess progress towards UNAIDS' 95-95-95 clinical cascade among MSM.

**Methods:** We recruited MSM aged ≥15 years who lived in Unguja for ≥3 months using respondent-driven sampling. We assessed HIV testing and treatment history through an interviewer-administered questionnaire and offered point-of-care HIV testing per the national testing algorithm. For those who tested HIV-positive, we measured HIV viral load (VL).

We defined viral suppression as <1,000 HIV RNA copies/mL and an undetectable VL as <50 copies/mL. MSM who disclosed a positive HIV status or were virally suppressed were categorized as knowing their status. MSM who

self-reported anti-retroviral therapy (ART) use or were virally suppressed were classified as on ART. We produced weighted estimates, presented as percentages with 95% confidence intervals (95%CI).

**Results:** We enrolled 455 MSM with a median age of 30 (inter-quartile range [IQR]: 24-39) years. HIV prevalence was 11.4% (95%CI: 8.4-14.5). Of all MSM, 87.9% (95%CI: 84.3-91.6) ever tested for HIV.

Among those, 7.2% (95%CI: 4.2-10.1) reported testing for HIV monthly, 11.5% (95%CI: 8.3-14.4) testing quarterly, 3.5% (95%CI: 1.7-5.3) testing biannually, 13.9% (95%CI: 10.2-17.9) testing annually, 61.9% (95%CI: 57.0-66.7) no pattern of HIV testing, and the remainder did not respond.

Of MSM who tested HIV-positive, 69.4% (95%CI: 57.8-82.0) knew their status, of whom 97.6% (95%CI: 80.7-100.0) were on ART, and of whom 91.7% (95%CI: 77.2-100.0) were virally suppressed. Of those who were virally suppressed, 89.8% (95%CI: 81.0-98.9) had an undetectable VL.

**Conclusions:** Our findings highlight a substantial gap in HIV diagnosis and challenges in viral suppression. Prioritizing diagnosis of MSM living with HIV through evidence-based strategies including self-testing, social network testing, and integration of frequent HIV testing into routine medical care, offered by MSM-competent providers and venues, will be critical to addressing the diagnostic gap.

## TUPEC170

Formative assessment of HIV, and reproductive health status among adolescent girls and young women in Zambia

M. Musukuma<sup>1,1</sup>, H. Phiri<sup>2</sup>, P. Musonda<sup>3</sup>, H. Halwindi<sup>3</sup>, A. Hazemba<sup>3</sup>, C. Malizgani<sup>3</sup>, M. Mweemba<sup>2</sup>, M. Simpungwe<sup>3</sup>, C. Zyambo<sup>3</sup>, M. Munakampe<sup>3</sup>, J. Chisoso<sup>3</sup>, P. Kaonga<sup>3</sup>, J. Mwewa<sup>2</sup>, O. Ngalamika<sup>3</sup>, P. Choonga<sup>2</sup>

<sup>1</sup>University of Zambia, Epidemiology and Biostatistics, Lusaka, Zambia, <sup>2</sup>Ministry of Health, Lusaka, Zambia, <sup>3</sup>University of Zambia, Lusaka, Zambia

**Background:** Like many Sub-Saharan countries, Adolescent girls and young women (AGYW) in Zambia are disproportionately affected by poor sexual reproductive health outcomes. Despite the recognition of the rights of young people to SRH information and services, AGYW still face challenges in accessing and utilizing SHR services. The overall objective of the study was to collect baseline HIV, SRH and GBV data at district level to inform the design of interventions targeting AGYW aged 10-24 years in Zambia.

**Methods:** Using a mixed-methods approach, a cross-sectional study was conducted in 20 districts of Zambia among 12,813 AGYW participants from October to November 2022. The quantitative data analysis summarized the characteristics of study participants and differences

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

in HIV and syphilis prevalence rates by district, age-group, and schooling status. Mixed effects logistic regression was used to model possible associations between factors.

**Results:** Of the total 12,813 study participants, 12.6% were aged 10-14 years, 35.4% were aged 15-19 years, and 52.0% were aged 20-24 years. Forty-seven percent were in-school while 53.3% were out-of-school. Approximately 32% of the participants had low comprehensive HIV knowledge and knowledge rates were lower among the in-school participants. Thirty percent of the respondents had their first sexual intercourse before or at age 15 years and 45.7% of all sexually active respondents reported having never used a condom. Overall, 58% of the participants had previously tested for HIV while only 11.7% had tested in the last 12 months.

The overall HIV prevalence was 3.7%, with a higher prevalence among out-of-school adolescents (5.5%) vs 2.0% (in-school adolescents). The prevalence of syphilis was also higher among the out-of-school than the in-school participants (4.1% vs 1.5%). An HIV prevalence of as high as 6.7% was estimated in 2 of the 20 districts while a syphilis prevalence rate of 7.3% was estimated in one district.

**Conclusions:** The study found that HIV and syphilis are still significant public health problems among AGYW in Zambia, emphasizing the need for increased efforts to prevent and manage these infections. It's important to note that in some of the behavioral aspects reported in this study, the out-of-school AGYW are much more disadvantaged than their counterparts.

## TUPEC171

Correlates of population-based HIV viremia among women selling sex and living with HIV in Uganda - respondent-driven sampling surveys, 2021-2023

G. Aluzimb<sup>1</sup>, J. Ssempiira<sup>1</sup>, H.S Kiyingi<sup>1</sup>, P. Kyambadde<sup>2</sup>, S. Alamo<sup>1</sup>, C. Ajulong<sup>1</sup>, M. Ogwal<sup>3</sup>, E. Nazziwa<sup>1</sup>, T. Nsibambi<sup>1</sup>, W. Kafeero Bikokye<sup>4</sup>, S. Kyobutungi<sup>4</sup>, P.N Muniina<sup>1</sup>, A.G Fitzmaurice<sup>1</sup>, G. Musinguzi<sup>3</sup>, R.K Wanyenze<sup>3</sup>, W. Hladik<sup>5</sup>  
<sup>1</sup>US Centers for Disease Control and Prevention, Kampala, Uganda, <sup>2</sup>Ministry of Health, Kampala, Uganda, <sup>3</sup>Makerere School of Public Health, Kampala, Uganda, <sup>4</sup>United States Agency for International Development, Kampala, Uganda, <sup>5</sup>US Centers for Disease Control and Prevention, Atlanta, United States

**Background:** Reduction of HIV viremia (HV) among female sex workers (FSW) is still suboptimal. We examined correlates of HV (defined as  $\geq 1000$  copies/ml) among FSW living with HIV (FSWLHIV) in Uganda using population-based survey data.

**Methods:** We enrolled 2,674 FSWLHIV using respondent-driven sampling surveys in Kampala and 11 up-country sites during April 2021–September 2023. Blood was tested for HIV, viral load, and active syphilis (Chembio Di-

agnostics, Medford, NY, USA); cervicovaginal swabs were tested for high-risk strains of human papilloma virus (hr-HPV); interview data were collected through audio-computer assisted self-interviews. Data were weighted for the complex sampling design, accounting for varying local population size estimates and aggregated data for analysis. We fitted logistic regression models to any variable that had a P-value  $\leq 0.2$  to examine associations between select explanatory variables and HV.

The final model was adjusted for age, syphilis status, education level, marital status, alcohol misuse, drug use, HIV status knowledge, and self-reported antiretroviral therapy (ART).

**Results:** The mean (standard error) age was 28.9 (0.1) years; almost a quarter (667/2,674, 22.6%) had HV. Statistically significant correlates of HV (Table) included age 35-49 years [adjusted odds ratio (aOR)=0.53, vs. 18-24 years], disclosure of sex work behaviour to health workers (aOR=1.48), hr-HPV (aOR=1.47), positive syphilis test (aOR=0.56), HIV status knowledge (aOR=1.43) and self-reported ART use (aOR=0.39).

Table. Correlates of HIV viremia among female sex workers living with HIV in Uganda, 2021-23.

**Conclusions:** The study findings reveal factors linked to HV among FSWLHIV in Uganda. Follow-up initiatives to combat HV and onward transmission might focus on under 30-year-olds, those diagnosed with hr-HPV, and those who do not self-report ART use.

## TUPEC172

### Spatial patterns of HIV seropositivity in the transboundary areas of Senegal

C.T. Koulibaly<sup>1</sup>, S. Thiam<sup>2</sup>, C.B. Dieye<sup>1</sup>, A. Sagna<sup>1</sup>, D. Niang<sup>1</sup>, C.T. Ndour<sup>3</sup>

<sup>1</sup>National AIDS Fighting Council of Senegal, Monitoring and Evaluation, Dakar, Senegal, <sup>2</sup>National AIDS Fighting Council of Senegal, Dakar, Senegal, <sup>3</sup>Ministry of Health, AIDS Fighting Division of Senegal, Dakar, Senegal

**Background:** In the West African region, borders have been since long classified as areas at high risk of HIV transmission due to the mobility of the population. In Senegal, the spread of the virus has always been associated with internal and external movement of persons within corridors and borders even if the geographical dynamic of HIV in those areas is poorly documented. This study proposes a spatial patterns' analysis of HIV seropositivity in the Trans boundary regions of Senegal from 2019 to 2022.

**Methods:** Our study targeted 8 regions (Fatick, Kaolack, Kaffrine, Tambacounda, Kedougou, Kolda, Sedhiou and Ziguinchor) sharing boundaries with neighborhood countries as Mali, Gambia, Guinea Bissau and Guinea Republic. The HIV Testing Services (HTS) were used as the main source of data to determine the seropositivity of selected areas at districts level.

The spatiotemporal pattern of HIV seropositivity was determined through ArcGIS 10.1 software using Index Distance Weighting (IDW) and Trend tools. Finally, the Getis-Ord Gi\* statistic tool was utilized to identify statistically significant hot spots and cold spots of HIV seropositivity in the selected areas.

**Results:** The major hotspots have been identified within 5 major transboundary regions namely Kolda (3%), Ziguinchor (3.5%), Sedhiou (1.8%), Tambacounda (1.1%) and Kedougou (1%). From 2019-2020, 10 hotspot districts have been located within the regions of Kolda, Sedhiou and Ziguinchor, all sharing boundaries with Gambia and Guinea Bissau. From 2021 to 2022, 11 hotspots have been detected from Kolda, Sedhiou and Ziguinchor and 2 hotspots in Tambacounda and Kedougou sharing boundaries with Mali and Guinea Republic.

Moreover, at the local level, the trend analysis showed that the districts close to the boundaries present the highest rate of seropositivity.

**Conclusions:** Our study showed evidence of serious concentration of the HIV seropositivity in the transboundary areas of Senegal. From 2019 to 2020, the major hotspots were generally localized in 3 regions (Ziguinchor, Kolda, Sedhiou). However, from 2021-2022, new emerging hotspots have been identified in Tambacounda and Kedougou. HIV/AIDS is therefore a trans-boundary health threat that cannot be contained or addressed solely within one country and thus requires action across governance levels.

## TUPEC173

### Not getting to zero HIV among men who have sex with men in San Francisco despite high care continuum and prevention targets

B. Suprasert<sup>1</sup>, M. Tate<sup>1</sup>, R. Williams<sup>1</sup>, D. Reagan<sup>1</sup>, J. Francisco<sup>1</sup>, K. McNaughton<sup>1</sup>, J. Anakwenze<sup>1</sup>, E.C. Wilson<sup>1,2</sup>, W. McFarland<sup>1,2</sup>

<sup>1</sup>Center for Public Health Research, San Francisco Department of Public Health, San Francisco, United States, <sup>2</sup>University of California San Francisco, Department of Epidemiology and Biostatistics, San Francisco, United States

**Background:** New HIV diagnoses among men who have sex with men (MSM) in San Francisco decreased by 77% over the decade from 2012 to 2021, presenting an encouraging trajectory toward zero infections by 2030. Unfortunately, the trajectory has slowed in recent years, with an uptick in new diagnoses from 2021 to 2022. Using data from National HIV Behavioral Surveillance (NHBS), we assessed the current HIV epidemic status and progress towards achieving UNAIDS 95-95-95 targets among MSM in San Francisco.

**Methods:** NHBS comprises serial cross-sectional surveys of populations at risk for HIV in 23 cities in the USA. Time-location sampling (TLS) was used to recruit MSM, intercepting them at physical and online venues at randomly chosen venue-day-time periods between June and November 2023. HIV status was obtained by rapid testing; HIV care and prevention engagement were self-reported.

**Results:** Among 545 MSM, HIV prevalence was 24.4%. Prevalence was highest at 48.8% among Black/African American MSM. Three of 132 MSM living with HIV had not been previously diagnosed, yielding 97.7% aware of their status. Of those previously diagnosed, 96.1% were on ART. Of those on ART, 91.9% reported being virally suppressed on their last viral load test. MSM in the 30-39 age group were the least likely to report viral suppression (77.3% vs. >92%, p=0.017). Among MSM not known to have HIV, 80.1% had an HIV test, 56.5% used PrEP, 27.9% consistently used condoms, and 9.2% used PEP in the past 12 months.

**Conclusions:** MSM has high levels of HIV care engagement in San Francisco in 2023, exceeding the first (status awareness) and second (ART use) of the 95-95-95 UNAIDS targets and greater than 90% for the third (viral suppression). The slowing reduction and possible increase in new HIV cases are discouraging, given our sustained high levels of ART and PrEP use among MSM in San Francisco over many years.

Our data suggest we are entering a new era of the HIV epidemic in which our current prevention tools are hitting diminishing returns. If we are to get to zero HIV, we need to re-strategize how to best deploy our current effective interventions.

Annual temporal trends in recent HIV infections among FSWs in Ethiopia; a guide to prioritization of HIV resources

M. Alene<sup>1</sup>, E. Bahru<sup>2</sup>, S. Abdela<sup>3</sup>, G. Eyasu<sup>4</sup>, K. Belete<sup>4</sup>, P. Ndase<sup>1</sup>

<sup>1</sup>Population Services International, HIV/TB/NCD, Addis Ababa, Ethiopia, <sup>2</sup>Population Services International, Monitoring and Evaluation, Addis Ababa, Ethiopia,

<sup>3</sup>Ethiopian Public Health Institute, HIV/TB, Addis Ababa, Ethiopia, <sup>4</sup>USAID, HIV/TB, Addis Ababa, Ethiopia

**Background:** HIV recency surveillance although not beneficial at an individual level, guides resource prioritization at a geo-spatial level towards highest transmission zones. The recency assay in Ethiopia (*Asanté*® HIV-1 Rapid Recency) differentiates recently acquired HIV infection (within a year prior), from infections acquired more than a year. We examine trends in recent HIV infections among female sex workers (FSWs) in a community led HIV program. FSWs who newly test HIV positive through conventional national algorithm also undergo HIV recency testing.

**Methods:** We reviewed HIV Testing data for PEPFAR fiscal years of 2022 and 2023 to determine trends in probable recent HIV infection among FSWs in a comprehensive community HIV prevention, care, and treatment program. Additionally, we compared HIV case yield from indexing FSWs with recent infections, against yield from indexing FSWs infected more than a year prior.

**Results:** In 2022, 8% of FSWs in 12 sub-national units (SNUs) of Addis Ababa had probable recent infection. FSWs in two SNUs (Riche and Kasanchis) had a two - to - three-fold higher rate of recent HIV infection (RRs=2.2 and 2.8, respectively) compared to FSWs in other SNUs. In 2023 recency surveillance was expanded to regions outside of Addis Ababa.

FSWs living outside of Addis Ababa had significantly higher rates of HIV recency averaging 31%. FSWs in four SNUs in the South of Ethiopia (Robe, Nekmte, Hawassa, Arba-minch) and Humera in the North of Ethiopia, were seven times more likely to have recent infection compared to FSW living in Addis Ababa which had recency rate of 5.1% (RR =7.1).

Acceptance to Index Testing and partner elicitation ratios were similar across FSWs, regardless of the recency of their HIV infection. HIV case yield from indexing FSWs with recent infection, was however consistently 20% higher (OR =0.79) over the two years, when compared to indexing among FSWs who were infected for more than a year.

**Conclusions:** HIV recency surveillance remains critical to national-level planning and resource prioritization. Index testing is the most efficient HIV testing modality in mitigating further risk of HIV transmission within active sexual networks.

Onimode<sup>3</sup>, B. Oyawola<sup>3</sup>, A. Bashorun<sup>4</sup>, A. Gambo<sup>5</sup>, J. Pius<sup>3</sup>, O. Oyelaran<sup>3</sup>, R. Goldstein<sup>3</sup>

<sup>1</sup>Data.FI Palladium, Abuja, Nigeria, <sup>2</sup>Data.FI Palladium, Washington, United States, <sup>3</sup>Office of HIV/AIDS and TB, United States Agency for International Development, Nigeria, Abuja, Nigeria, <sup>4</sup>National AIDS, Sexually Transmitted Infections Control and Hepatitis Programme (NASCP), Federal Ministry of Health, Nigeria, Abuja, Nigeria, <sup>5</sup>National Agency for the Control of AIDS (NACA), Abuja, Nigeria

**Background:** According to UNAIDS' 2019 report, Nigeria accounts for 41% of vertically transmitted HIV among children in the West and Central African region This study delves into the evolving trends in transmission rates among infants exposed to HIV.

**Methods:** A retrospective study was conducted using aggregate data from 539 primary, secondary, and tertiary healthcare facilities across 17 states in Nigeria between July 2017 to September 2022. The analysis focused on the infants exposed to HIV (IEH) (IEH load) and the proportion of those infants with a documented HIV status (transmission rate). The transmission rate was assessed across both urban and rural population settings. Inferential statistics (Kendall's Tau correlation and Kruskal-Wallis H Test) were employed to determine the correlation between the transmission rate, the service level (primary, secondary, and tertiary), and IEH load.

**Results:** Among the 53,318 IEH, 2,300 were diagnosed with HIV, yielding a transmission rate of 4.3%. In urban health facilities, comprising 68.4% (1,573 infants) of the IEH, the transmission rate was 4.5% (1,573 out of 34,764), while rural health facilities showed a lower rate of 3.9% (727 out of 18,554). Secondary health facilities accounted for 51% (1,178 infants) of HIV cases but had the lowest transmission rate at 3.7% (1,178 out of 31,498). Tertiary facilities exhibited the highest transmission rate at 6.5% (495 out of 7,626), and primary health facilities recorded a rate of 4.4% (627 out of 14,194). Significant differences were observed across service levels (H = 16.8, p = 0.0002246).

The transmission rate peaked in 2021 at 6.0% (660 out of 11,004 infants) and decreased to 1.9% (240 out of 12,735 infants) in 2022. A moderate negative correlation was found between IEH load and transmission rate (tau = -0.3405849, p = 8.3e-17).

**Conclusions:** Urban settings and secondary facilities had the highest number of IEH, but the tertiary facilities had the highest transmission rate. The service level had an impact on the transmission rate. The facilities with lower IEH loads recorded higher transmission rates and this may

suggest the need for more resources to care for these infants. To curb vertical transmission of HIV, strategic and focused interventions are essential.

**Background:** The field of HIV molecular epidemiology has gained considerable popularity. However, HIV sequences are often analyzed without the involvement of communities most affected by HIV. Guidelines and procedures to engage affected communities are noticeably absent from the HIV molecular epidemiology literature.

Our program aims at building connections between how scientific knowledge is shared with communities through co-designing a pilot HIV molecular surveillance and improving the affected communities' understanding of biomedical research on them.

**Description:** The CIPHR project engaged a working group, including community health activists representing community-based organizations led by gay, bisexual, and other men who have sex with men, and female sex workers in Nairobi, Kenya, to meaningfully and collaboratively develop the methods for a community-led molecular HIV pilot project.

Through a series of in-person and virtual discussions beginning in June 2022, the CIPHR working group of community health activists and basic and social scientists, which includes experts working in the field of molecular HIV research:

1. Learned about and interrogated phylogenetic research terminologies, methods, and past research findings;
2. Co-explored the possibilities and limitations of HIV molecular epidemiology for key population programs; and
3. Co-developed a protocol for a pilot community-based HIV molecular study.

**Lessons learned:** Placing communities at the center of scientific research and personalizing the research process has enabled us to move from an unknown scientific concept (phylogenetics) to a deep community understanding of HIV molecular surveillance.

Bringing scientists and communities together to break down the terminology and build scientific literacy, while interrogating how and whether community-based programs can integrate phylogenetic data into their organizational planning and outreach shows great promise in ensuring that communities can reclaim spaces in the scientific space in the spirit of 'nothing about us without us'.

Traditional methods of communicating scientific information do not adequately serve communities, there's a need to purposefully involve communities in co-developing awareness materials for their communities.

**Conclusions/Next steps:** Following the implementation of the community-developed pilot study that combines molecular network data with community knowledge, we'll critically assess emergent ethical issues, advantages, and disadvantages of HIV molecular research to develop a policy framework to guide its benefit in the global HIV response.

## TUPEC177

Recent HIV infection surveillance in Uganda, 2020-2022

E. Muramuzi<sup>1,2</sup>, E. Kansiime<sup>3</sup>, A.M. Mubiru<sup>4</sup>, G. Taasi<sup>1</sup>, L. Buback<sup>2</sup>, S. Stephens<sup>2</sup>, H. Kiyingi<sup>4</sup>, R. King<sup>2</sup>, A. Namale<sup>3</sup>

<sup>1</sup>Ministry of Health, AIDS Control Program, Kampala, Uganda, <sup>2</sup>University of California, San Francisco, United States, <sup>3</sup>Makerere University School of Public Health, METS Program, Kampala, Uganda, <sup>4</sup>Division of Global Health HIV & TB, Centers for Disease Control and Prevention, Kampala, Uganda

**Background:** The Uganda Ministry of Health and stakeholders launched recent HIV infection surveillance in October 2019. Surveillance data monitors and describes trends in recent infections among those newly diagnosed to detect signals of potential elevated HIV acquisition among geographical areas and sub-populations. Recent infection refers to the acquisition of HIV infection within the last 12 months as determined by Recent Infection Testing Algorithm (RITA), confirmed by a recent result on rapid test for recent infection (RTRI) and a viral load (VL) of  $\geq 1000$  copies/ml.

**Methods:** We analysed national surveillance data from 2020-2022. Consenting persons aged 15 years and above with no reported history of antiretroviral therapy are tested for RITA. We conducted descriptive analyses and logistic regression to determine factors associated with RITA-recent. RITA data merged with the HIV testing electronic medical records was used in analysis. We summarized results as proportions and adjusted odds ratios with 95% confidence intervals.

**Results:** Among the 4,803 persons living with HIV tested by RTIR, 700 (14.6%) tested positive for recent infection and 473 (9.8%) met criteria for recent infection by RITA. Majorities of RITA recent infections were female (329; 69.6%) and 15-34 years (338; 71.5%). and were from Kampala (23.7%), Ankole in South West (15.6%) and South Central (15.0%) regions. Being 15-24 year-old (aOR=1.88, CI 1.30-2.71), testing HIV positive using community HTS delivery models (aOR=1.40, CI 1.01-1.94), and residing in Ankole (aOR=1.6, CI 1.09-2.70), and Kigezi (aOR=1.7, CI: 1.12-2.62) in the Southwest, (compared to Kampala) were associated with RITA recent results. Although not significant, among 15-24-year-olds, males had a higher proportion (18.0%) of RITA recent infections than females (13.2%).

Characteristic	Total	RITA Recent %	cOR	95%CI	aOR	95%CI
15-24	1218	13.7	1.96	1.38-2.78	1.88	1.32-2.71
25-34	1873	9.1	1.24	0.88-1.74	1.23	0.87-1.76
35-44	1050	9.3	1.17	0.80-1.70	1.17	0.80-1.71
45+	586	7.5	Ref		Ref	
Male	1675	8.6	Ref		Ref	
Female	3052	10.8	1.29	1.05-1.58	1.15	0.92-1.43
Facility	4309	9.6	Ref		Ref	
Community	418	14.6	1.62	1.21-2.11	1.40	1.01-1.95

**Conclusions:** RITA results potentially signal HIV acquisition among adolescents and young men and women and may warrant further data triangulation to better understand and programmatically address gaps in HIV prevention and treatment programs.

## Modelling the HIV pandemic

### TUPEC178

Effects of reducing consultations for Pre-Exposure Prophylaxis Program on HIV and gonorrhea among MSM in the Netherlands: a modelling study

M. Reitsema<sup>1,2</sup>, J. Wallinga<sup>1,2</sup>, A. van Sighem<sup>3</sup>, D. Bezemer<sup>3</sup>, M. van der Valk<sup>3,4</sup>, F. van Aar<sup>5</sup>, J. Heijne<sup>6</sup>, E. Hoornenborg<sup>6</sup>, G. Rozhnova<sup>7,8,9</sup>, B. van Benthem<sup>10</sup>, M. Xiridou<sup>1</sup>

<sup>1</sup>National Institute for Public Health and the Environment, EPI-MOD, Bilthoven, Netherlands, the, <sup>2</sup>Leiden University Medical Center, Department of Medical Statistics and Bioinformatics, Leiden, Netherlands, the, <sup>3</sup>Stichting HIV Monitoring, Amsterdam, Netherlands, the, <sup>4</sup>Amsterdam University Medical Center, Department of Infectious Diseases, Amsterdam, Netherlands, the, <sup>5</sup>National Institute for Public Health and the Environment, Bilthoven, Netherlands, the, <sup>6</sup>Public Health Service Amsterdam, Amsterdam, Netherlands, the, <sup>7</sup>University Medical Center Utrecht, Julius Center for Health Sciences and Primary Care, Utrecht, Netherlands, the, <sup>8</sup>Universidade de Lisboa, Biosystems & Integrative Sciences, Lisboa, Portugal, <sup>9</sup>Utrecht University, Center for Complex Systems Study, Utrecht, Netherlands, the, <sup>10</sup>National Institute for Public Health and the Environment, EPI-SOA, Bilthoven, Netherlands, the

**Background:** Pre-exposure prophylaxis (PrEP) is highly effective in reducing HIV acquisition. In 2019, a five-year PrEP pilot program started in the Netherlands that provides PrEP medication and care in the form of 3-monthly consultations including HIV and STI tests to a maximum of 8,500 individuals.

We investigated the impact on HIV and *N. gonorrhoeae* (NG) transmission among men who have sex with men (MSM) of possible variations in PrEP program capacity and PrEP consultation frequency after 2024.

**Methods:** We extended an earlier developed agent-based model that describes the transmission of HIV and NG via sexual partnerships among MSM.

In four scenarios, we assumed a maximum capacity after 2024 of either continuing of 8,500 individuals or increasing to 16,000 individuals, and simultaneously either continuing consultation frequency at 3-monthly; or changing to 6-monthly. The numbers of new HIV and NG acquisitions and PrEP consultations over 2024-2034 in the four scenarios were compared relative to the baseline scenario where the PrEP program was discontinued in 2024.

**Results:** For a maximum capacity of 8,500 individuals with 3-monthly consultations, the cumulative number of averted acquisitions over the years 2024-2034 could be 3,140 (95%CrI: 2,710 – 3,660) and 27,930 (95%CrI: 23,700 – 33,730) for HIV and NG respectively, while resulting in 316,050 (95%CrI: 315,440 – 346,530) consultations.

Increasing the maximum capacity to 16,000 individuals with 3-monthly consultations could result in 3,940 (95%CrI: 3460 – 4420) and 29,970 (95%CrI: 25,390 – 36,420) acquisitions averted for HIV and NG respectively, while resulting in 589,330 (95%CrI: 588,350 – 589,910) consultations.

Decreasing the consultation frequency to 6-monthly with a capacity of 16,000 could result in 3,900 (95%CrI: 3,400 – 4,450) and 29,960 (95%CrI: 24,790 – 36,490) acquisitions averted for HIV and NG respectively, while resulting in 272,590 (95%CrI: 272,330 – 272,810) consultations.

**Conclusions:** Increasing the capacity of the PrEP program and decreasing the frequency of PrEP consultations could be an effective and efficient extension of the current PrEP program, since it enhances the impact of PrEP in reducing HIV transmission with a rather moderate increase in consultations and no effect on NG. However, a health-economic evaluation will be needed to further assess the cost-effectiveness of these scenarios.

## TUPEC179

**Closing the gender gap in primary health care: did the only dedicated male clinic in Mozambique increase the uptake of health services for HIV by men?**

C. Amade<sup>1</sup>, L. Macaringue<sup>1</sup>, L. Macache<sup>1</sup>, H. Muquingue<sup>1</sup>, Z. Mwand<sup>2</sup>

<sup>1</sup>Jhpiego Mozambique, Maputo, Mozambique, <sup>2</sup>Jhpiego Kenya, Nairobi, Kenya

**Background:** Men engage less in healthcare services, and delay seeking care, leading to notable gender disparities in health outcomes. UNAIDS 95-95-95 achievements are lower in men than women in Mozambique (e.g., first 95: 73.3% of women and 68.5% of men). To address the need of male-friendly healthcare, the MoH and Jhpiego established the first Integrated Men's Clinic (MC) at Dondo Health Center (DHC) in Mozambique, in March 2022, providing a comprehensive package of male services (including sexual and reproductive health and reduction of HIV risk behaviors). The MC was announced in TV and radio broadcasts. We assessed how the MC affected men's utilization of health services, focusing on HIV testing, care and treatment.

**Methods:** Two facilities near DHC, with similar catchment areas and not offering the package were included for comparison: Mafambisse (MaHC, 10 Km away) and Mutua (MuHC) (25 Km away). Facility annual data were from the National Health Information System, before (April 2021-March 2022 or Y0) and after establishing DHCMC (April 2022-March 2023 or Y1). Data elements were related to HIV service delivery.

**Results:** At DHC, indicators that increased from Y0 to Y1 were "men tested for HIV" (3,092 to 5,695; +84%); "newly diagnosed HIV positive men" (480 to 784; +63%); "new enrollments in HIV care" (460 to 515; +12%); "total men in HIV

care" (24,433 to 32,116; +31%); and "men on PrEP" (31 to 198; +539%). From Y0 to Y1, the mean monthly number of men attended increased from 2,094 to 2,710 at DHC, 2,327 to 2,597 at MaHC and 412 to 486 at MuHC, corresponding to increases of 27%, 12% and 18%, respectively.

**Conclusions:** Establishing a MC resulted in notable improvements in several key HIV-related indicators at DHC. Integrated male clinics can lead to increased HIV testing, earlier diagnoses, and better male access to HIV care and prevention services. Continued analysis and monitoring are recommended to fully assess the effectiveness and sustainability of this MC strategy.

## TUPEC180

**Cost-effectiveness of pretreatment HIV drug resistance testing in people living with HIV in Iran**

H. Sharifi<sup>1,2</sup>, H. Mirzaei<sup>1</sup>, M. Barouni<sup>3</sup>, A. Mirzazadeh<sup>1,4</sup>, A. Iranpour<sup>1</sup>, F. Esmailzadeh<sup>5</sup>, F. Mehrabi<sup>1</sup>, E. Ranjbar<sup>6</sup>  
<sup>1</sup>HIV/STI Surveillance Research Center, and WHO Collaborating Center for HIV Surveillance, Institute for Futures Studies in Health, Kerman University of Medical Sciences, Kerman, Iran, Islamic Republic of, <sup>2</sup>Institute for Global Health Sciences, University of California, San Francisco, San Francisco, United States, <sup>3</sup>Health Service Management Research Center, Institute for Futures Studies in Health, Kerman University of Medical Sciences, Kerman, Iran, Islamic Republic of, <sup>4</sup>University of California, Department of Epidemiology and Biostatistics, San Francisco, United States, <sup>5</sup>Maragheh University of Medical Sciences, Department of Public Health, School of Public Health, Maragheh, Iran, Islamic Republic of, <sup>6</sup>Kerman Counseling Center for Behavioral Disorders, Kerman University of Medical Sciences, Kerman, Iran, Islamic Republic of

**Background:** HIV drug resistance (HIVDR) is an important challenge in the fight against HIV/AIDS and can threaten progress toward achieving the target of HIV elimination by 2030. Genotyping pretreatment HIVDR testing (DRT) has been proposed as a potential solution. However, the cost-effectiveness of this intervention needs to be evaluated to determine its feasibility and potential impact on healthcare systems. This study aimed to assess the cost-effectiveness of DRT among people living with HIV (PLHIV) in Iran.

**Methods:** 1000 hypothetical PLHIV were simulated in terms of cost and effectiveness based on quality-adjusted life Years (QALY). The Markov Model was developed to calculate incremental cost-effectiveness ratio (ICER) using TreeAge Pro 2020. Deterministic and probabilistic analyses were performed for sensitivity analyses.

**Results:** Results showed that compared to not performing pretreatment HIVDR testing this intervention gained 0.035999 QALY with an incremental cost of 1,695.32 USD. The ICER was calculated as 47,093.53 USD, indicating that

pretreatment DRT was not cost-effective. The probability of opportunistic infection in people with viral failure, the effectiveness of Dolutegravir in people without drug resistance, and the quality of life of people in the AIDS stage were found to be the most important variables affecting ICER. With an increasing willingness to pay more than 53,000 USD, pretreatment DRT testing will become cost-effective.

**Conclusions:** Based on our findings, pretreatment HIVDR testing is not currently cost-effective in Iran as it imposes high costs on healthcare systems with few benefits for PLHIV. However, if resources are available, drug resistance testing can be a valuable tool in generating HIV molecular data and molecular surveillance of HIV.

## TUPEC181

**On the compounding manifestations of racism shaping the US HIV/AIDS epidemic: why ending the HIV epidemic must address these factors for success**

X. Zang<sup>1</sup>, Y. Sui<sup>2</sup>, S. Bessey<sup>3</sup>, B. Enns<sup>2</sup>, B. Marshall<sup>3</sup>, B. Nosyk<sup>4</sup>,  
Localized Economic Modeling Group

<sup>1</sup>University of Minnesota, Division of Health Policy and Management, Minneapolis, United States, <sup>2</sup>Centre for Advancing Health Outcomes, Vancouver, Canada, <sup>3</sup>Brown University, Department of Epidemiology, Providence, United States, <sup>4</sup>Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada

**Background:** Growing racial/ethnic inequities in healthcare access as well as racially segregated sexual mixing both contribute to disparities in HIV incidence, posing a major barrier to the efforts to end the HIV epidemic in the US. We demonstrate the compounding effects of these two manifestations of racism on the trajectories of HIV incidence and racial/ethnic disparities with two simulation models, using Atlanta Georgia as a case study.

**Methods:** We used two independently developed HIV transmission models (LEM and TITAN) to estimate the annual number and rate of HIV new infections and incidence rate ratios between racial/ethnic groups among men who have sex with men (MSM) between 2020 to 2030. Compared to a status quo scenario of maintaining current disparities in health services access and assortative sexual mixing by race/ethnicity, we assessed three alternative scenarios: equalizing health service access across racial/ethnic groups with observed assortative sexual mixing; equalizing health service access with sexual mixing at random; and equalizing health service access with fully assortative sexual mixing. We standardized both models regarding setting, population, and calibration to enhance model comparability.

**Results:** Under the status quo, the LEM and TITAN models projected annual HIV new infections among MSM would decrease by 5.0% and 6.9% from 2020 to 2030, respective-

ly; however, the racial/ethnic disparities in HIV incidence rate would persist. Compared to the status quo, equalizing health service access only resulted in a moderate reduction in incidence rate ratios in 2030. Equalizing health service access when sexual mixing was at random yielded the greatest reduction in both the annual new HIV infections (23.6% and 54.3% in LEM and TITAN, respectively) and the incidence rate ratios (LEM: 33.3% [Black/White], 24.3% [Hispanic/White]; TITAN: 58.2% [Black/White], 32.1% [Hispanic/White]) in 2030.

**Conclusions:** The enduring racial/ethnic disparities in HIV incidence indicate that our current approaches are inadequate. While differences in the HIV incidence trajectories can be attributable to variations in target populations, model design and parameters, this study reaffirms the importance of addressing inequitable HIV service access and sexual racism in our efforts to improve equity and move toward ending the HIV epidemic.

### TUPEC182

**HIV-PrEP use and care in Germany - data from HIV specialty care centers within the national PrEP-Surveillance**

D. Schmidt<sup>1</sup>, Z. Ates<sup>1</sup>, M. Friebe<sup>1</sup>, C. Kollan<sup>1</sup>, V. Bremer<sup>1</sup>,  
B. Bartmeyer<sup>1</sup>, N. Hanhoff<sup>2</sup>, K. Schewe<sup>2</sup>,  
PrEP-Surv dagnä Study Group

<sup>1</sup>Robert Koch Institute, Department of Infectious Disease Epidemiology, Berlin, Germany, <sup>2</sup>German Association of Outpatient Physicians for Infectious Diseases and HIV Medicine e.V. (dagnä), Berlin, Germany

**Background:** HIV pre-exposure prophylaxis (PrEP) has been funded by statutory health insurance in Germany for people at risk of acquiring HIV since 09/2019. As part of the national PrEP-Surveillance, surveys on PrEP use and care were conducted.

**Methods:** Between 01/2022-12/2023, semi-annual retrospective, anonymous online surveys were conducted among PrEP providers in 29 HIV specialty care centers reflecting Germany's various geographical regions and health care settings. Aggregated data and assessments of the centers were collected.

**Results:** At the end of 2022, n=12,525 PrEP users received care at 29 centers. 99% of PrEP users were male, 98% were men who have sex with men (MSM) and 88% had statutory health insurance.

In 2022, 11 HIV infections were reported after PrEP initiation (0.09%). A similar proportion was observed across various surveys of German cohorts. The suspected reasons were almost exclusively low adherence, often in combination

with event-driven use and PrEP interruption. The proportion of daily PrEP users was 67%; PrEP breaks and PrEP discontinuations were reported for 19% and 7% respectively. 31 HIV-infections were newly diagnosed during screening before PrEP initiation in 2022.

Fear of side effects was one of the most common reasons for not starting PrEP. However, only 2% of PrEP users interrupted/discontinued PrEP due to adverse reactions.

The majority of centers stated that the incidences of chlamydia/gonococci (72% of centers, 74% of prep users) and syphilis (69% of centers, 67% of prep users) among PrEP users had increased in 2021-2022.

**Conclusions:** PrEP continues to be highly effective in the prevention of HIV infection in everyday clinical practice. Maintenance of adherence, PrEP interruptions and event-driven PrEP use remain challenging for optimal prevention. PrEP counseling and guidance should take this into account, especially considering that one-third did not use PrEP daily.

Screening at PrEP initiation or re-initiation led to earlier detection of unknown HIV infections. Statutory health insurance plays an important role in PrEP provision. PrEP is almost exclusively used by MSM in Germany. Specific education and information should address side effects and target other key groups at risk for HIV. STI incidences should be further monitored and analyzed.

## TUPEC183

### A scoping review of PEP (under-) use among health care workers

J.D. Auerbach<sup>1</sup>, A.D. Forsyth<sup>2</sup>, S. Malone<sup>3</sup>

<sup>1</sup>University of California San Francisco, Medicine, San Francisco, United States, <sup>2</sup>Andrew Forsyth Consulting, Berkeley, United States, <sup>3</sup>Bill & Melinda Gates Foundation, Seattle, United States

**Background:** Post-exposure prophylaxis (PEP) is a highly efficacious prevention method following HIV exposure. Yet PEP has been underutilized, even among health care workers (HCWs) with occupational exposure in sites with PEP policies and procedures and access to PEP medications.

It is important to understand the dynamics of uneven use of PEP in what appears to be an optimal context to better protect the health and well-being of HCWs.

**Methods:** We conducted a scoping review, using Arksey & O'Malley's (2005) guidelines, to elucidate the values and preferences influencing HCWs use of PEP after occupational exposure. We searched PubMed, PsychInfo, and Google Scholar for peer reviewed literature published in English from 2014 to 2022 using the terms *HIV, postexposure/post-exposure prophylaxis, acceptability, health care workers, and values and preferences*. This yielded 63 articles of relevance of which we undertook a narrative review.

**Results:** All studies occurred in Africa and Asia, involved various HCWs and settings, and used a range of methodologies. Emergent themes arrayed along the trajectory of the PEP use experience: awareness/knowledge; acceptability; availability/access; uptake/use; adherence/completion.

On average across studies, although awareness of PEP for HIV prevention was high (81%), knowledge about drug regimens and healthcare facility policies was moderate to low (58%).

Acceptability of PEP was moderate to high (77%). PEP's perceived accessibility/availability was inconsistent and varied by geographic location and setting. HCWs' uptake of PEP was low (40%), affected by not knowing how to report an exposure and being unaware of PEP availability. Adherence/completion of PEP regimens was moderate to low (58%), impeded by side effects and a belief that completing regimens was unnecessary to avert infection. HCWs consistently expressed concern about HIV stigma. Findings are limited by the inconsistent use of constructs across studies and a lack of clarity about the reporting of exposure events.

**Conclusions:** A multi-level approach is needed to address the interplay of individual, social, and structural barriers that diminish HCWs' PEP use after occupational exposure. Improved training, incident reporting, 24-hour access to non-stigmatizing PEP services, and monitoring of adherence and completion are essential to optimizing HCWs' PEP use.

<sup>6</sup>Johns Hopkins University School of Medicine, Department of Pathology, Baltimore, United States, <sup>7</sup>University of California San Francisco, San Francisco, United States, <sup>8</sup>ViiV Healthcare, Research Triangle Park, United States, <sup>9</sup>Gilead Sciences, Inc., Foster City, United States, <sup>10</sup>U.S Centers for Disease Control and Prevention, Atlanta, United States,

<sup>11</sup>FHI 360, Washington DC, United States, <sup>12</sup>FHI 360, Durham, United States, <sup>13</sup>University of North Carolina Chapel Hill, Infectious Diseases, Chapel Hill, United States, <sup>14</sup>Instituto Nacional de Infectologia Evandro Chagas-Fiocruz, Rio de Janeiro, Brazil, <sup>15</sup>University of California Los Angeles, Los Angeles, United States

**Background:** The HPTN 083 study demonstrated superiority of long-acting injectable cabotegravir (CAB-LA) compared to daily oral tenofovir disoproxil fumarate-emtricitabine (TDF/FTC) for HIV pre-exposure prophylaxis (PrEP) in cisgender men and transgender women who have sex with men. In the study's open-label extension (OLE), participants were offered choice of CAB-LA or to complete study participation with TDF/FTC.

We report on OLE product choice for all participants by region to investigate presence of any regional or cultural differences in product preference.

**Methods:** We provide a breakdown of product choice among participants overall and within four regions globally and describe participants' reported reasons for regimen choice. Participants' reasons for declining OLE participation and for study termination are also reported.

**Results:** Among 4566 participants enrolled, 533 (11.7%) were ineligible for the OLE, 547 (12.0%) were lost-to-follow-up, and 431 (9.4%) were terminated.

Additionally, 337 (7.4%) declined participation in the OLE and 126 (2.8%) remain OLE-eligible. Of the remaining 2592 participants entering the OLE, 2488 (96.0%) chose CAB-LA and 104 (4.0%) chose TDF/FTC.

Among regions, the proportion choosing CAB-LA was similar: 1142/1193 (95.7%) in Latin America, 501/515 (97.3%) in Asia, 75/81 (92.6%) in Africa, and 770/803 (95.9%) in the United States. Reported reasons for product choice are listed in the Table.

The most common reason for terminating prior to the OLE or declining participation in the OLE was lack of continued study interest (186/431 [43.2%] and 168/337 [49.9%], respectively).

	Overall (n=2592)	US* (n=803)	Latin America (n=1193)	Asia (n=515)	Africa (n=81)
Reason for choosing CAB-LA	n=2488 (%)	n=770 (%)	n=1142 (%)	n=501 (%)	n=75 (%)
Prefer injection and/or don't like pills	1774 (71.3)	541 (70.3)	784 (68.7)	405 (80.8)	44 (58.7)
CAB-LA shown to be superior to TDF/FTC for HIV prevention	431 (17.3)	112 (14.5)	237 (20.8)	78 (15.6)	4 (5.3)
CAB more convenient, discreet, or easier to adhere to	115 (4.6)	37 (4.8)	52 (4.6)	8 (1.6)	18 (24.0)
Other	168 (6.8)	52 (6.6)	89 (8.0)	10 (2.0)	9 (12.0)
Reason for choosing TDF/FTC	n=104 (%)	n=33 (%)	n=51 (%)	n=14 (%)	n=6 (%)
Don't like injections and/or prefer pills	63 (60.6)	17 (51.5)	30 (58.8)	12 (86.7)	4 (66.7)
The potential side effects of TDF/FTC are better understood or preferable to those of CAB-LA	19 (18.6)	4 (12.1)	4 (7.8)	1 (7.1)	1 (17.7)
Concerned about resistance if injectable PrEP fails	8 (7.7)	4 (12.1)	4 (7.8)	1 (7.1)	1 (17.7)
Other	23 (22.1)	8 (24.2)	13 (25.5)	0 (0.0)	0 (0.0)

Table. Reported reasons for choosing an HIV PrEP regimen at the time of HPTN 083 open label extension entry.

**Conclusions:** In the OLE phase of HPTN 083, nearly all participants globally chose CAB-LA over TDF/FTC. Participants' choice of regimen was largely driven by a general preference for injections or pills. Study visit fatigue was a large contributor to declined OLE participation and to study termination. These results should be interpreted with the lens that individuals preferring an oral PrEP regimen may have opted not to participate in HPTN 083.

## TUPEC185

### Healthcare worker's attitudes towards PrEP and the implications towards PrEP rollout

V.C. Bailey<sup>1</sup>, M.M. Mokgatle<sup>2</sup>

<sup>1</sup>Hutchinson Centre Research Institute of South Africa (HCRISA), Johannesburg, South Africa, <sup>2</sup>Sefako Makgatho Health Sciences University, Department of Public Health, Pretoria, South Africa

**Background:** HIV pre-exposure prophylaxis (PrEP) is an essential prevention strategy. Healthcare workers are key to informing both the healthcare clients and for healthcare provision. Successful implementation of PrEP depends on healthcare workers attitudes and views that significantly impact on the public perceptions, acceptability, and uptake.

**Methods:** A cross-sectional survey was conducted amongst healthcare workers from ten primary health care facilities in Tshwane, Pretoria, to assess the attitudes towards the program. Convenience sampling technique was employed to recruit 114 healthcare workers, who consented to participate. Data was collected over three months from September to November 2019. Univariate, bivariate and logistic regressions estimated the association between the attitudes and the demographic characteristics of the healthcare workers.

**Results:** Largely, PrEP was viewed negatively by 84.3% of respondents. Healthcare workers reported negative attitudes regarding PrEP use for the following reasons: PrEP could lead to increased sexual risk-taking behaviour (53.7%), promotes HIV resistance (45.4%), and that potential ARV resistance (64.8%), and medication side effects

Oral  
abstracts

abstracts

Author  
Index

(56.5%) would be potential barriers to PrEP use. Additionally, majority (66.7%) of the respondents believed that behavioural interventions were more effective (66.7%). Although the overall attitude towards PrEP was negative, majority (90.7%) of the respondents believed that PrEP education for HIV prevention is essential, 88.9% reported willingness to counsel potential users about HIV-PrEP for prevention, and 91.7 % reported willingness to recommend PrEP to potential users.

The odds of a positive attitude towards PrEP as an HIV preventive measure were 1.92 times higher among males versus females (OR = 1.92; 95% CI 0.54–6.83;  $p = 0.311$ ) and 1.24 times higher among those with a bachelor's degree versus respondents with a diploma (OR = 1.24; 95% CI 0.51–3.01;  $p = 0.636$ ).

**Conclusions:** Success and feasibility of PrEP implementation requires positive attitudes by healthcare workers as they will likely promote the programs to their healthcare clients. Addressing educational and training needs of healthcare workers on PREP guidelines and benefits are imperative for successful implementation of PrEP. Healthcare workers' perceptions and positive attitudes could influence the willingness to provide PrEP as part of the HIV prevention strategies.

**Background:** TechStep was a technology-based trial, with a stepped care approach, to reduce cumulative condomless encounters (CCEs) and increase PrEP uptake among

transgender and gender expansive youth and young adults (TGE-YYA) in the US.

**Methods:** From October 2019 to September 2021, 254 TGE-YYA (16–24 years) were randomized into:

- 1) *Text* (n=82), or
- 2) *Webapp* (n=87), or
- 3) *Control* (n=85).

At month 3, those randomized to *Text* and *Webapp* who did not demonstrate improvement on the primary outcomes were re-randomized to receive virtual eCoaching (grounded in Motivational Interviewing/CBT; referred to as *Text+* or *Webapp+* conditions) or remain in their initial condition without eCoaching. Participants were followed for 9 months. The efficacy of the *Text+* and *Webapp+* stepped care interventions at improving outcomes compared to the *Control* intervention was assessed by estimating the additive effect of the interventions on each of the primary outcomes of interest.

**Results:** Participant follow-up rates for all conditions were 89.8% (3-month), 80.7% (6-month), and 83.1% (9-month). Most (66.5%) participants were 21–24 years old and White (57.9%; 10.2% Black; 7.1% Latinx). Nonbinary and assigned female at birth (44.5%) and trans man/masculine (34.6%) were the most common gender identities. At baseline, 55% of participants engaged in condomless sex in the past 3 months, but only 7% were prescribed PrEP. At month 6, the *Text+* and *Webapp+* interventions had lower estimated average CCEs compared to the *Control* (see Table), however differences were not statistically significant for any of the primary outcomes. In secondary analyses, participants who received *Text* only (with no eCoaching) had statistically fewer CCEs than those in the *Control* (2.05 vs. 2.54,  $p < .05$ ), however a lower percentage of *Text* only participants discussed PrEP with their provider compared to all other study conditions.

Primary Outcomes	Comparison Groups	Estimated 6 Month Difference (95% CI)	p-value
Cumulative Condomless Encounters (CCEs; possible range = 1–6 CCEs)	<i>Text+</i> vs. <i>Control</i> (2.27 vs. 2.54)	-0.27 (-0.68, 0.13)	0.181
	<i>Webapp+</i> vs. <i>Control</i> (2.21 vs. 2.54)	-0.33 (-0.67, 0.01)	0.057
CCEs while High on Drugs or Alcohol (possible range = 1–6 CCEs)	<i>Text+</i> vs. <i>Control</i> (0.67 vs. 0.73)	-0.06 (-0.24, 0.12)	0.531
	<i>Webapp+</i> vs. <i>Control</i> (0.76 vs. 0.73)	0.04 (-0.16, 0.24)	0.714
PrEP Uptake	<i>Text+</i> vs. <i>Control</i> (11% vs. 10%)	0.00 (-0.08, 0.09)	0.913
	<i>Webapp+</i> vs. <i>Control</i> (4% vs. 10%)	-0.06 (-0.13, 0.01)	0.083

**Conclusions:** Although CCEs were reduced, findings suggest that these approaches may not be sufficient to increase PrEP uptake. However, different combinations of technology-based interventions may have differential impact on HIV prevention outcomes for TGE-YYA.

### Key informant preferences for characteristics of a long-acting HIV pre-exposure prophylaxis (PrEP) implant

N. Mancuso<sup>1</sup>, I. Hawley<sup>2</sup>, C.-D. Alleyne<sup>3</sup>, S. Dougherty<sup>4</sup>, E. Luecke<sup>2</sup>, J. Vinson<sup>3</sup>, N. Walker<sup>3</sup>, B. Johnson<sup>4</sup>, O. Van Gerwen<sup>4</sup>, L. Johnson<sup>5</sup>, A. Liu<sup>3,6</sup>, E.T. Montgomery<sup>2,6</sup>  
<sup>1</sup>RTI International, Women's Global Health Imperative, Atlanta, United States, <sup>2</sup>RTI International, Women's Global Health Imperative, Berkeley, United States, <sup>3</sup>San Francisco Department of Public Health, Bridge HIV, San Francisco, United States, <sup>4</sup>University of Alabama at Birmingham, Birmingham, United States, <sup>5</sup>RTI International, Biomedical Technologies, Research Triangle Park, United States, <sup>6</sup>University of California, San Francisco, School of Medicine, San Francisco, United States

**Background:** A long-acting PrEP implant that delivers sustained, extended-release drug is under development and could address challenges with daily and on-demand prevention options. To inform design of an implant acceptable to intended users, we explored implant characteristic preferences from key informants (KIs) of HIV services, including potential end-users, PrEP providers/counselors, and public-health-workers, early in the product development stage.

**Methods:** Using a quota sampling frame targeting men-who-have-sex-with-men (MSM), transgender women (TGW) and cisgender women (CGW), KIs were purposively recruited in California and Alabama between 09/2021 and 04/2022. Qualitative interviews used a semi-structured guide and included implant prototypes and an interactive importance ranking activity for implant characteristics. After each interview, a report summarized key findings, which were extracted into an analysis matrix organized by participant type and implant characteristic. Results were analyzed thematically and synthesized into summary reports to describe preferences. Quantitative data from the ranking activity were analyzed overall and by participant type.

**Results:** Twenty-eight KIs were interviewed (11 CGW, 10 MSM, 7 TGW), of which 11 had prior PrEP experience. Most KIs (n=24) ranked removability of an implant before drugs are fully delivered as important. They highlighted the importance of removing the implant early if experiencing side effects. Acceptable locations for implant insertion included the arm and thigh for all KIs, with CGW and TGW also suggesting insertion under the breast. KIs preferred a small, flexible, single rod implant because these characteristics were perceived as more comfortable and less visible after insertion. KIs highlighted the importance of discretion given concerns about potential implant stigma. However, several KIs thought a larger implant with multiple rods would be acceptable if it provided longer duration of protection. Most KIs (n=24) ranked duration of protection as important, citing 1-3 years as acceptable.

**Conclusions:** Preferences for implant characteristics raised by KIs provide important considerations for design of future implants. KIs raised questions about the acceptability of a larger implant or multiple rods to achieve longer duration of protection, which is being explored in further research among intended users. Ultimately, integrating insights from HIV prevention stakeholders early in new HIV prevention product development could help improve design and implant acceptability.

## TUPEC188

### Mozambique's voluntary medical male circumcision program for HIV prevention: progress towards sustainability

M. Peck<sup>1</sup>, M. Canda<sup>2</sup>, J. Come<sup>3</sup>, D. Chicavel<sup>3</sup>, I. Malimane<sup>2</sup>, R. Bhatia<sup>1</sup>, C. Toledo<sup>1</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV & TB, Atlanta, United States,

<sup>2</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV & TB, Maputo, Mozambique,

<sup>3</sup>Mozambique Ministry of Health, Maputo, Mozambique

**Background:** Since 2010, the Mozambique Ministry of Health (MoH) with support from the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) through the Centers for Disease Control and Prevention (CDC) has implemented voluntary medical male circumcision (VMMC) for HIV prevention.

Sustainable VMMC services has been a priority of WHO and PEPFAR who define sustainability as a health system that can provide six building blocks ranging from financing to integration with other health services.

We describe Mozambique MoH's approach to integrating VMMC services into the public health system.

**Description:** In 2021, six VMMC sites transitioned from CDC financial support to MoH. Sites were selected in both rural and urban areas with high male circumcision coverage. Roles were established for a transition team and included MoH to lead, ongoing technical assistance from CDC, regular communication between all partners, and site compliance with quality and safety standards.

**Lessons learned:** At the beginning of the transition, VMMC administrative, workforce, and infrastructure systems were integrated into MoH services.

Active technical support from CDC and MoH were essential to ensure provincial and site level ownership and effective community engagement. Commodities have not yet been integrated. VMMC volume and performance against targets dropped across all transitioned sites.

Actions were taken to address challenges based on community feedback with technical support from CDC. As the transition team adjusted their approach, including enhancing community outreach, volume of circumcisions increased after the first year.

**Conclusions/Next steps:** The pilot phase of the transition is ongoing, however, it informed the development of the "Key Strategic Vision 2024–2026" providing a roadmap to transition the entire VMMC portfolio, over 100 sites, to the MoH by 2029. Lessons learned from the pilot emphasized in the roadmap include strong community engagement, adjusting service delivery approaches as needed, and ongoing technical support from partners. Mozambique has made important progress towards sustainability and demonstrated application of the WHO framework for sustaining VMMC, however additional work is needed to define a sustainable package of VMMC services.

## TUPEC189

### Genital inflammation and microflora in Kenyan female sex workers who have undergone female genital mutilation/cutting (FGM/C)

J. Pollock<sup>1</sup>, R. Liu<sup>2</sup>, C. Rwenji<sup>3</sup>, E. Ombunga<sup>3</sup>, S. Udayakumar<sup>2</sup>, S. Huibner<sup>2</sup>, M. Kung'u<sup>3</sup>, R. Kabuti<sup>3</sup>, H. Babu<sup>3</sup>, E. Irungu<sup>3</sup>, P. Ngurukiri<sup>3</sup>, P. Muthoga<sup>3</sup>, W. Adhiambo<sup>3</sup>, H. Weiss<sup>4</sup>, J. Seeley<sup>5</sup>, T. Abramsky<sup>5</sup>, J. Kimani<sup>3</sup>, T. Beattie<sup>5</sup>, R. Kaul<sup>1,2</sup>, Maisha Fiti Study Champions

<sup>1</sup>University of Toronto, Immunology, Toronto, Canada,

<sup>2</sup>University of Toronto, Medicine, Toronto, Canada,

<sup>3</sup>Partners for Health and Development in Africa, Nairobi, Kenya, <sup>4</sup>London School of Hygiene and Tropical Medicine, Infectious Disease Epidemiology, London, United Kingdom,

<sup>5</sup>London School of Hygiene and Tropical Medicine, Global Health and Development, Toronto, Canada

**Background:** Female genital mutilation/cutting (FGM/C) is harmful to physical, mental, and reproductive health, though the effect of this practice on a woman's HIV susceptibility is poorly understood. Despite the known associations of FGM/C with short-term vaginal epithelial damage, neither genital inflammation nor the genital microbiome have been explored in women who have undergone FGM/C.

Here we hypothesize that these biological factors are dysregulated in women who have undergone FGM/C, heightening their risk of HIV acquisition.

**Methods:** Levels of proinflammatory cytokines and soluble E-cadherin (sE-cad), a biomarker of epithelial barrier disruption, were measured in cervicovaginal secretion samples from a cohort of 746 HIV-negative female sex workers (FSWs) in Nairobi, Kenya in 2019 by multiplex immunoassay. Sociodemographic factors were compared between participants who reported undergoing FGM/C and those who did not. Genital inflammation was defined using a composite score of inflammatory cytokines previously associated with HIV acquisition.

The presence of inflammation was compared cross-sectionally between groups using logistic regression models to control for potential confounders including age, bacterial vaginosis (BV) status, and others.

**Results:** 27 of 746 (4%) HIV-negative Maisha Fiti participants self-reported FGM/C exposure. 24 participants reported Type I FGM/C (clitoridectomy) and 3 participants reported Type II FGM/C (excision of the labia).

These participants tended to be in early adolescence when they underwent FGM/C (median age = 14, range: 5–25) and were older than women that had not undergone FGM/C (median age 35 vs. 30,  $p = 0.03$ ). Genital inflammation was not associated with FGM/C status after controlling for potential confounders ( $aOR = 0.83$ ; 95% CI: 0.36 – 1.87;  $p = 0.66$ ).

In adjusted analyses, we also found no difference in BV status, as defined by Nugent score, between participants who have and have not undergone FGM/C ( $aOR = 0.71$ ; 95% CI: 0.32 – 1.57;  $p = 0.40$ ).

**Conclusions:** FGM/C was not associated with genital inflammation or microbial dysregulation in the long-term among this cohort of HIV-negative FSWs. This may be due to the length of time that elapsed since FGM/C occurred or the lowered mucosal immune activation previously observed in FSWs. Future studies should confirm these findings in a cohort of non-FSWs.

## TUPEC190

### Condom use among sexually active men who know their HIV status: findings from the 2022 cross-sectional Kenya Demographic and Health Survey (KDHS)

O. Leukou Nzoutchoum<sup>1,2</sup>, E. Akom<sup>1,2</sup>, T. Kupamupindi<sup>3</sup>, S. Konopka<sup>4</sup>

<sup>1</sup>U.S. Military HIV Research Program, CIDR, Walter Reed Army Institute of Research, Silver Spring, United States,

<sup>2</sup>Henry M. Jackson Foundation for the Advancement of Military Medicine Inc., Bethesda, United States, <sup>3</sup>ICAP, New York, United States, <sup>4</sup>MSH, Arlington, United States

**Background:** Condoms remain an integral part of a comprehensive prevention package, offering triple protection: against HIV, other sexually transmitted infections, and unintended pregnancy. As Kenya nears epidemic control, it is important to understand condom use determinants among people aware of their HIV status to inform targeted prevention strategies, and thereby reducing disparities in HIV transmission risk and promoting health equity. We explored sociodemographic and behavioral factors associated with higher odds of condom use.

**Methods:** We analyzed data from the 2022 Kenya Demographic and Health Survey to identify factors associated with self-reported condom use during the most recent sexual intercourse. Descriptive analysis using frequencies and percentages was generated, and to determine association with condom use, we performed logistic regression at 95% confidence level and 5% statistical significance. All analyses were weighted and generated using SAS statistical software.

**Results:** Among 6,738 sexually active men who knew their HIV status, mean age was 32 years, 48% were married, 56% lived in rural areas, and 63% were circumcised. Only 35% reported condom use, 1.10% tested HIV-positive, 46% reported  $\geq 1$  non-spousal sexual partners, 33% completed primary education and 26% attained higher education. Logistic regression results showed condom use being positively correlated with being married (aOR: 1.625, 95% CI: 1.254-2.106, p-value:  $<0.0002$ ), and recent sexual activity (aOR: 1.358, 95% CI: 1.088-1.696, p-value: 0.0069). Primary education (aOR: 0.394, 95% CI: 0.222-0.699, p-value: 0.0015), higher education (aOR: 0.210, 95% CI: 0.116-0.378, p-value:  $<0.0001$ ), HIV-positivity (aOR: 0.233, 95% CI: 0.120-0.452, p-value:  $<0.0001$ ), and having one (aOR: 0.065, 95% CI: 0.053-0.081, p-value:  $<0.0001$ ) or more non-spousal sexual partners (aOR: 0.039, 95% CI: 0.029-0.053, p-value:  $<0.0001$ ) were all negatively correlated with condom use. No significant association was observed between condom use and age or urban/rural residence.

**Conclusions:** Higher education, HIV-positive results, and increased number of sexual partners were unexpectedly associated with lower condom use. These findings underscore the need for enhanced HIV prevention education to promote safer sexual practices. As countries strive for epidemic control, effective investment in condom programs with person-centered demand creation and differentiated delivery systems aligned with Total Market Approach is essential for a national combined prevention strategy.

## TUPEC191

Correlates of oral PrEP uptake among young men who have sex with men in Nigeria: findings from the iCARE Nigeria-testing study

T. Badru<sup>1</sup>, E. Aniekan<sup>2</sup>, H. Smart<sup>3</sup>, G. Goji<sup>4</sup>, E. Herbertson<sup>5</sup>, J. Adekeye<sup>6</sup>, A. Olaleye<sup>7</sup>, O. Adeshina<sup>2</sup>, O. Akinpelu<sup>3</sup>, R. Jibarang<sup>4</sup>, B. Opaleke<sup>5</sup>, A. Adediji<sup>6</sup>, S. Abu<sup>7</sup>, M. Cevantes<sup>8</sup>, B. Berzins<sup>1</sup>, R. Garofalo<sup>8,1</sup>, B. Taiwo<sup>1</sup>, L.M. Kuhns<sup>8,1</sup>

<sup>1</sup>Northwestern University, Feinberg School of Medicine, Chicago, United States, <sup>2</sup>Lagos University Teaching Hospital, Lagos, Nigeria, <sup>3</sup>Lagos State University Teaching Hospital, Lagos, Nigeria, <sup>4</sup>Jos University Teaching Hospital, Jos, Nigeria, <sup>5</sup>Nigerian Institute for Medical Research, Lagos, Nigeria, <sup>6</sup>Olabisi Onabanjo University Teaching Hospital, Sagamu, Nigeria, <sup>7</sup>Infectious Disease Institute, College of Medicine, University of Ibadan, Ibadan, Nigeria, <sup>8</sup>Ann and Robert H Lurie Children's Hospital of Chicago, Chicago, United States

**Background:** In Nigeria, men who have sex with men (MSM) are disproportionately affected by HIV and are a priority population for oral pre-exposure prophylaxis (PrEP) implementation. Despite the efficacy and availability of PrEP, uptake remains low among young MSM (YMSM) in Nigeria. We examined factors associated with PrEP uptake among YMSM in the HIV testing arm of the iCARE

Nigeria study, which used the combination of social media and peer navigation to promote HIV testing, linkage to care, and awareness and uptake of oral PrEP among YMSM aged 15-24 years.

**Methods:** The multi-phased stepped-wedge trial was conducted in six sites across Nigeria. Trained peer navigators (PNs) leveraged social media platforms including Facebook, Grindr, and WhatsApp to engage peers on sexual health-related topics and navigated them to HIV counselling and rapid testing in clinical, community, or home settings based on personal preferences. YMSM with non-reactive results were informed about PrEP and referred for PrEP services if desired.

Individuals who completed HIV testing consented to an anonymous questionnaire reporting demographic characteristics, HIV testing behaviour (first vs. repeat testers), testing location, and awareness, uptake, and history of PrEP. We examined factors associated with PrEP uptake (defined as completing a PrEP initiation visit) using logistic regression.

**Results:** From April 2021 to March 2023, 2,479 YMSM were tested for HIV; of these, 2,076 (83.7%) tested HIV negative and had never taken PrEP or were not currently on PrEP. Among this group, 80.6% (1,674) were aged 20-24 years, 19.7% (409) identified as bisexual, and 56.2% (1,167) were first-time testers. The location of HIV testing was 2.9%, 30.6%, 66.5% in clinical, community-based, and home-based settings respectively. The majority were aware of PrEP (81.8%), and only 6.7% had ever taken PrEP. PrEP uptake was 6.6% (136). Factors associated with PrEP uptake were ever taken PrEP (aOR 0.31, 95% C.I (0.12-0.82)), testing in either a clinical (aOR 14.40, 95% C.I (7.43-27.94)) or community-based (aOR 3.45, 95% C.I (2.26-5.27)) settings compared to home-based settings.

**Conclusions:** We found high awareness, but low uptake of PrEP among YMSM. Our findings underscore the need for tailored interventions to promote PrEP uptake among YMSM in Nigeria.

## TUPEC192

Acceptability of a dual prevention pill versus PrEP and oral contraceptives taken separately: women's baseline preferences in Johannesburg, South Africa

J.B. Burnett-Zieman<sup>1</sup>, T. Palanee-Philips<sup>2</sup>, M. Plagianos<sup>1</sup>, S. Mathur<sup>3</sup>, S. Zulu<sup>2</sup>, K. Reddy<sup>2</sup>, I. Bruce<sup>1</sup>, N. Ndlovu<sup>2</sup>, L. Haddad<sup>1</sup>, B. Friedland<sup>1</sup>

<sup>1</sup>Population Council, Center for Biomedical Research, New York, United States, <sup>2</sup>University of the Witwatersrand, Johannesburg, South Africa, <sup>3</sup>Population Council, Social and Behavioral Research, Washington, United States

**Background:** Oral pre-exposure prophylaxis (PrEP) use has been sub-optimal among sub-Saharan African women. A dual prevention pill (DPP) combining PrEP and an

oral contraceptive (OC) may be preferable, acceptable and increase adherence vs PrEP alone. Accordingly we are assessing the acceptability of, preferences about, and adherence to the DPP compared to PrEP and OCs taken separately among women in South Africa.

**Methods:** We recruited HIV-negative, non-pregnant females aged 16-40 years old who had used OCs for ≥3 months before screening. In a 6-month crossover design, participants used both regimens (DPP or separate PrEP and OC) for 3 28-day cycles; the regimen order was randomized. As part of a baseline computer-assisted self-interview (CASI), participants were asked which regimen they anticipated preferring.

We used chi-squared and Fisher's exact tests to explore associations between anticipated regimen preference and self-reported demographics, sexual behaviors, and worry about HIV. Variables associated with regimen preference at  $p < 0.1$  were included in a logistic regression model controlling for age.

**Results:** We enrolled 96 participants (September 2022-June 2023); 9 were excluded from this analysis (no preference [ $n=4$ ], missing data [ $n=5$ ]). Mean age was 27.5 years (range 18-40); 18% completed secondary school, 76% had ≥1 child. Median number of sex partners in the last 3 months was 2 (range 1-30). 69% and 31% anticipated preferring the DPP and 2 separate pills, respectively.

Only potential recent HIV exposure was significantly associated with regimen preference in bivariate analysis; it remained significant after adjusting for age.

Participants who didn't know or who thought they were somewhat/very likely to have been exposed to HIV had 2.7 times the odds of expecting to prefer the DPP versus those who thought recent HIV exposure was unlikely [95% CI: 1.05-6.84;  $p=0.04$ ].

**Conclusions:** This analysis suggests that recent HIV exposure concern may predict initial preference for the DPP. Our results may highlight a particularly vulnerable population who may be interested in using a multipurpose prevention technology for HIV risk reduction-and may be an optimal cohort of early DPP adopters.

This study is poised to provide important data on the potential for the DPP to improve PrEP uptake, adherence, and persistence.

## TUPEC193

### Impact of HIV prevention interventions on the triple burden of HIV, teenage pregnancy and intimate partner violence among adolescent girls and young women in Uganda

J.K. Matovu<sup>1</sup>, J.B. Bwanika<sup>1</sup>, J.B. Ddamulira<sup>1</sup>, D. Kasozi<sup>1</sup>, I. Murungi<sup>2</sup>, J. Katesi<sup>2</sup>, B. Etukoit<sup>2</sup>, R.K. Wanyenze<sup>1</sup>

<sup>1</sup>Makerere University School of Public Health, Disease Control and Environmental Health, Kampala, Uganda,

<sup>2</sup>The AIDS Support Organization, Kampala, Uganda

**Background:** Implementation of targeted socio-structural, educational and behavioral interventions can reduce the risk of HIV, teenage pregnancy and intimate partner violence (IPV) among adolescent girls and young women (AGYW). We assessed the effect of HIV prevention interventions on the triple burdens among AGYW aged 10-24 years in Uganda.

**Methods:** We conducted serial cross-sectional analyses to assess the impact of AGYW interventions (skills-based training; enterprise development assistance, or educational subsidies; reinforced by social and behavior change communication messages) on HIV, teenage pregnancy, and IPV. We used data from eight intervention and six comparison districts, collected in July 2018 ( $n=8,236$ ) and July 2023 ( $n=5,449$ ). Blood samples were collected for HIV and syphilis testing. Exposure to the interventions was defined as participation in or receipt of at least one intervention. Impact was measured using a difference in difference approach to determine the net effect of the interventions. Data analysis was performed using STATA (version 16.0).

**Results:** Half of the AGYW were in school; 60-70% were aged 18-24 years. Between 2019 and 2023, intervention coverage increased from 31 to 60% of targeted sub-counties in the intervention districts; however, intervention exposure was moderate (48%,  $n=2,639$ ). Exposure to the interventions improved teenage pregnancy and intimate partner violence (in the expected direction) but weighted HIV prevalence was higher among exposed (1.56% [95%CI: 0.73, 3.34]) than unexposed AGYW (0.94% [95%CI: 0.49, 1.78]). Teenage pregnancy reduced from 16.5% to 10.9% in the intervention districts but increased from 11.9% to 13.1% in the comparison districts (net effect: -6.8%). Sexual IPV reduced from 6.2% to 3.7% in the intervention and 9.8% to 4.5% in the comparison districts (net effect: 2.8%) while physical IPV reduced from 14.9% to 4.0% in the intervention and 18.2% to 4.1% in the comparison districts (net effect: 3.2%). At district level, weighted HIV prevalence increased from 1.0% to 1.4% in the intervention and 1.1% to 1.3% in the non-intervention districts (net effect: 0.2%).

**Conclusions:** AGYW interventions had a small net effect on teenage pregnancy and intimate partner violence but did not impact on HIV prevalence, suggesting a need for increased exposure and coverage of interventions targeting AGYW in Uganda.

PrEPing to end the HIV epidemic: describing PrEP need and missed opportunities for HIV prevention using five population-based surveys from Southern Africa, 2019-2021

S. Wallach<sup>1</sup>, M.R. Lamb<sup>1,2</sup>, S. Wiant<sup>3</sup>, C.J. Heck<sup>1,3</sup>, S.M. Farley<sup>2</sup>, J. Zucker<sup>3</sup>, A. Low<sup>1,2</sup>, J. Justman<sup>1,2,3</sup>, D. Quigee<sup>3</sup>, N.M. Philip<sup>2</sup>, H. Nuwagaba-Biribonwoha<sup>1,2</sup>, S. Matse<sup>4</sup>, D. Castor<sup>1,3</sup>

<sup>1</sup>Columbia University, Mailman School of Public Health, Department of Epidemiology, New York, United States,

<sup>2</sup>ICAP at Columbia University, New York, United States,

<sup>3</sup>Columbia University Irving Medical Center, Division of Infectious Disease, Department of Medicine, New York, United States, <sup>4</sup>Ministry of Health, Eswatini National AIDS Program, Mbabane, Eswatini

**Background:** To end the HIV epidemic, UNAIDS estimates that 95% of those needing HIV prevention, including pre-exposure prophylaxis (PrEP), should receive it by 2030. However, operationalizing "need" is challenging. Using nationally representative survey data, we assessed existing PrEP-need definitions and described missed opportunities for HIV prevention in five Sub-Saharan African countries.

**Methods:** We used 2019-2021 population-based HIV impact assessment data from Eswatini, Lesotho, Malawi, Mozambique, and Zimbabwe. We compared the accuracy of World Health Organization (WHO) 2016 and 2021 guidelines for predicting PrEP need via area-under-the-curve measurement (AUC) for those recently HIV-infected (RHI) (LAg-avidity). We assessed the association between those meeting the more accurate 2021 PrEP-need criteria, RHI, and newly diagnosed (self-report negative/unknown status, HIV-serology-positive) (ND) and PrEP knowledge, use, and willingness. Analyses were weighted.

Figure 1. PrEP indicators for individuals without HIV, those identified by the WHO 2021 criteria, those recently infected, and those newly diagnosed with 95% confidence intervals, 2019 - 2021 (weighted).

**Results:** Among individuals with complete data (N=83,233), 14,049 (18%) had HIV, 96 (0.11%) were RHI (range 16-22 per country), and 1,734 (3%) were ND. WHO 2016 and 2021 criteria estimated 33% and 47% of PrEP need, respectively, and had AUCs of 0.61 and 0.66 for identifying those RHI, respectively. Of individuals meeting 2021 criteria, 10% had heard of PrEP, 16% of those who heard of PrEP had taken it, and 70% said they would take PrEP to prevent HIV.

Of individuals RHI or ND, respectively, 20% and 10% had heard of PrEP, none and 19% of those who heard of it had taken it, and 77% and 69% reported they would take PrEP (Figure 1).

**Conclusions:** WHO 2021 criteria were superior to 2016's at predicting individuals RHI. Although confidence intervals overlapped, more individuals RHI said they would take PrEP compared to those ND or meeting WHO 2021 criteria, suggesting increased PrEP knowledge would lead to increased use by those who would otherwise acquire HIV. We recommend expanding PrEP knowledge and increasing the accuracy of PrEP criteria.

## TUPEC195

PrEP modalities and implementation preferences among Black cisgender emerging and older adult women in Baltimore, Maryland

D. Knight<sup>1</sup>, H. Saleem<sup>1</sup>, S. Baral<sup>2</sup>, D. German<sup>3</sup>, T. Willie<sup>4</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, International Health Department, Baltimore, United States,

<sup>2</sup>Johns Hopkins Bloomberg School of Public Health, Epidemiology Department, Baltimore, United States,

<sup>3</sup>Johns Hopkins Bloomberg School of Public Health, Health Behavior and Society Department, Baltimore, United States,

<sup>4</sup>Johns Hopkins Bloomberg School of Public Health, Mental Health Department, Baltimore, United States

**Background:** Black cisgender women are disproportionately affected by HIV in the United States (US). Moreover, emerging Americans continue to be significantly affected compared to women in other age groups. Yet in 2024, Black cisgender women and emerging adult women comprise a small fraction of pre-exposure prophylaxis (PrEP) users in the United States (US). This study sought to examine PrEP modality and implementation preferences by age among Black cisgender women in Baltimore, Maryland.

**Methods:** Between December 2021 and April 2023, Black cisgender PrEP-inexperienced emerging (18 to 29 years) and older (30 to 44 years) adult women were purposively recruited to participate in a one-time, in-depth interview. Interview topics included questions regarding PrEP modality and implementation preferences among the two currently approved methods (e.g., pill and long-acting injectable) and the two currently in development (e.g., ring and implant). Interviews were audio-recorded, transcribed verbatim, and analyzed using a grounded theory approach. Six follow-up, member-checking interviews were also conducted.

**Results:** Our sample included 12 emerging and 14 older adult Black women, with an average age of 29. Whereas emerging adult women preferred the pill, older adult women preferred the long-acting injectable. The pill was preferred because it was considered the most common medication modality for other medications, whereas the

Oral  
abstracts

Poster  
exhibition

E-posters

abstracts

Author  
Index

injectable was preferred because of its longevity (i.e., no daily administration). Emerging adult women reported challenges with adhering to the routine PrEP three-month follow-up period for all four methods, such as transportation, scheduling appointments, conflicts with school engagements, and being in a period of transition into adulthood where they experience structural changes (e.g., health insurance). Transportation was the only reported challenge for older adult women for follow-up. Both age groups preferred longer follow-up time periods to refill their PrEP prescriptions and to obtain PrEP by a trusted physician (e.g., primary care doctor or OBGYN). Women expressed a preference for PrEP to be advertised through social media campaigns and sexual health forums, on college campuses, and by including Black women in PrEP commercials.

**Conclusions:** It is critical to better integrate lived realities and also improve representation as central strategies to improve PrEP equity among existing and emerging PrEP modalities.

## TUPEC196

Factors affecting prevention-effective adherence to HIV Pre-Exposure Prophylaxis (PrEP) among Australian gay and bisexual men: results from the PrEPARE Project 2023

Heath-Paynter<sup>4,5</sup>, S. Clackett<sup>6</sup>, T. Gordon<sup>6</sup>, J. Ellard<sup>3</sup>, A. Heslop<sup>7</sup>, A. Molyneux<sup>8</sup>, J. de Wit<sup>1,9</sup>, B.R. Bavinton<sup>4</sup>

<sup>1</sup>UNSW Sydney, Centre for Social Research in Health, Sydney, Australia, <sup>2</sup>George Washington University, Department of Psychological & Brain Sciences, Washington DC, United States, <sup>3</sup>La Trobe University, Australian Research Centre in Sex, Health & Society, Melbourne, Australia, <sup>4</sup>UNSW Sydney, Kirby Institute, Sydney, Australia, <sup>5</sup>Health Equity Matters, Sydney, Australia, <sup>6</sup>New South Wales Ministry of Health, Sydney, Australia, <sup>7</sup>Positive Life NSW, Sydney, Australia, <sup>8</sup>ACON, Sydney, Australia, <sup>9</sup>Utrecht University, Department of Interdisciplinary Social Science, Utrecht, Netherlands, the

**Background:** Oral HIV pre-exposure prophylaxis (PrEP) is highly effective when taken appropriately at times of HIV risk, termed "prevention-effective adherence". To understand suboptimal adherence, we assessed characteristics of PrEP users who reported condomless anal intercourse with casual partners (CLAIC) that was not protected by their own PrEP use ("PrEP-unprotected CLAIC").

**Methods:** A national online survey of gay and bisexual men (GBM) was conducted in June–July 2023. PrEP users were asked how many times they had PrEP-unprotected CLAIC (i.e., they missed >1 required dose). We examined characteristics associated with PrEP-unprotected CLAIC using logistic regression.

**Results:** Of 2,046 total respondents, 771 cisgender male, current PrEP users who had any CLAIC in the past 6 months were included (81.4% of 947 current users). Median age was 37, 88.1% identified as gay, 79.6% were full-time employed, 73.9% were Australian-born, and 94% had access to government-subsidised healthcare. 65.5% used daily PrEP, 31.3% on demand, and 3.2% periodic PrEP.

193 PrEP users reported PrEP-unprotected CLAIC in the last six months (20.4% of all PrEP users, 25% of those reporting any CLAIC), of whom, 68.4% reported 1–2 episodes, 19.2% reported 3–5 episodes, 3.6% reported 6–10 episodes, and 8.8% reported >10 episodes. Among the same group, 11.4% reported PrEP-unprotected CLAIC limited to PrEP users or people with undetectable viral loads, while 88.6% reported ≥1 PrEP-unprotected CLAIC episode with an assumed HIV-negative or unknown-status partner.

Participants who reported PrEP-unprotected CLAIC were more likely to: be <30 years old ( $aOR=1.78$ , 95%CI=1.16–2.72), be born overseas ( $aOR=1.94$ , 95%CI=1.25–3.01), use on-demand ( $aOR=2.78$ , 95%CI=1.90–4.08) or periodic PrEP ( $aOR=4.19$ , 95%CI=1.74–10.11) compared to daily pills, find it difficult to get PrEP ( $aOR=1.70$ , 95%CI=1.09–2.64), experience side effects from PrEP ( $aOR=1.81$ , 95%CI=1.00–3.28), and report any sexualised drug use in the past 6 months ( $aOR=1.95$ , 95%CI=1.28–2.97).

**Conclusions:** This first national estimate of prevention-effective adherence found that 20.4% of PrEP users had PrEP-unprotected CLAIC. Targeted interventions in subgroups with more frequent PrEP-unprotected episodes must address side effects and other adherence barriers. Long-acting PrEP presents a potential solution to improve prevention-effective adherence with careful attention to user preferences while also addressing difficulties accessing PrEP.

Hillier<sup>4,9</sup>

<sup>1</sup>Wits RHI, Maternal and Child, Johannesburg, South Africa, <sup>2</sup>FHCRC - SCHARP, Seattle, United States, <sup>3</sup>FHI 360, Durham, United States, <sup>4</sup>Magee-Womens Hospital of UPMC, Pittsburgh, United States, <sup>5</sup>University of Zimbabwe Clinical Trials Research Centre (UZ-CTRC) Clinical Trials Unit (CTU) - Zengeza CRS, Harare, Zimbabwe, <sup>6</sup>DAIDS/NIAID/NIH/HHS, Rockville, United States, <sup>7</sup>Johns Hopkins Research Project-Kamuzu University of Health Sciences, Blantyre, Malawi, <sup>8</sup>Makerere University - Johns Hopkins University (MU-JHU) Research Collaboration CRS, Kampala, Uganda, <sup>9</sup>Microbicide Trials Network, Pittsburgh, United States

**Background:** Dapivirine vaginal ring (DVR) is registered for HIV prevention in 11 African countries and available for use in six. MTN-042/DELIVER, conducted in Malawi, South Africa, Uganda and Zimbabwe, is the first study of DVR use during pregnancy and provides data on daily oral tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) pre-exposure prophylaxis (oral PrEP). We report infant birth and safety outcomes following in-utero exposure to these products.

**Methods:** Pregnant individuals were enrolled at 36-37 weeks' gestation (cohort 1), 30-35 weeks (cohort 2) and 12-29 weeks (cohort 3). In cohorts 1 and 2, women were randomised 2:1, in cohort 3, 4:1, to receive DVR or TDF/FTC. Infant visits were conducted at <2 weeks, 6-weeks, 6- and 12-months after delivery. Birth outcomes, Serious Adverse Events (SAEs), ≥Grade 3 AEs, growth parameters and infant development (assessed using Ages and Stages questionnaire) up to 12-months for cohorts 1 and 2 and 6-months for cohort 3 are included.

	Cohort 1		Cohort 2		Cohort 3	
	DVR	Oral PrEP	DVR	Oral PrEP	DVR	Oral PrEP
Preterm births	1/99 (1%)	2/49 (4%)	6/103 (6%)	4/51 (8%)	8/200 (4%)	3/48 (6%)
Low birthweight	2/94 (2%)	3/47 (6%)	6/101 (6%)	3/50 (6%)	12/193 (6%)	3/48 (6%)
SAEs or ≥ Grade 3 AEs	23/99 (23%)	15/48 (31%)	30/103 (29%)	10/51 (20%)	41/197 (21%)	6/48 (13%)
Infant deaths	0/99 (0%)	1/48 (2%)	4/103 (4%)	0/51 (0%)	4/197 (2%)	0/48 (0%)
6-week WFL z-score (median, IQR)	1.04 (-0.27 - 1.87)	0.53 (-0.38 - 2.23)	0.62 (-0.63 - 1.43)	0.65 (-0.06 - 1.63)	0.80 (-0.08 - 1.68)	0.97 (-0.30 - 1.96)

Table 1. Birth outcomes, adverse events, infant deaths and early growth on the MTN study by cohort and product.

**Results:** In total 546 infants enrolled (cohort 1=147, cohort 2=154, cohort 3=245), median intrauterine exposure 3.4, 9.1 and 16.0 weeks respectively. Across all 3 cohorts, 99% of deliveries were live births, and there were no ≥grade 3 AEs/

SAEs related to either product. Low birth weight (<2500g) was recorded in 5% of infants. Congenital anomalies occurred in 25 children (12 umbilical hernias), none considered related to product. SAEs were reported in 61/399 (15%) infants exposed to DVR and 14/147 (9.5%) to TDF/FTC, including 9 infant deaths, none considered related to product use. Development was in the "typical development" range for almost all children in all cohorts, across both products.

**Conclusions:** Through 6 and 12-month follow-up of infants, no safety concerns were observed following maternal use of DVR or oral TDF/FTC. Combined with previously reported maternal safety findings, this analysis supports use of DVR and oral TDF/FTC by pregnant individuals to prevent HIV.

## TUPEC198

Interest and intention to use long-acting injectable PrEP for HIV (LA-PrEP) among MSM and trans people in the Netherlands – results from the PROTECT survey

J. Kolstee<sup>1</sup>, H. Wang<sup>1</sup>, H. Zimmermann<sup>1</sup>, A. Adriaque Lozano<sup>1</sup>, M. Schroeder<sup>2</sup>, A. Appiah<sup>2</sup>, C. Brown<sup>3</sup>, K. Jonas<sup>1</sup>

<sup>1</sup>Maastricht University, Maastricht, Netherlands, the, <sup>2</sup>ViiV Healthcare Ltd, Brentford, United Kingdom, <sup>3</sup>ViiV Healthcare Ltd, Durham, United States

**Background:** Long-acting injectable PrEP for HIV (LA-PrEP), Cabotegravir, has been approved for use in Europe. Understanding who demonstrates interest and intent to use LA-PrEP is critical to help end HIV. In the Netherlands men-who-have-sex-with-men (MSM) and trans\* people are key populations for whom continued engagement with new HIV prevention options is important.

**Methods:** The Understanding Pre-exposure pRophylaxis mOdalities for HIV preventiOn in the European Communities (PROTECT) Survey is a cross sectional online survey that collected data in 20 European countries. Data collection occurred in the Netherlands from October to December 2023 among MSM and trans\* people greater than 18 years old. Data from participants residing in the Netherlands were analysed to produce descriptive data and to undertake multivariate regression analyses to determine factors associated with intention to use LA-PrEP.

**Results:** 1195 participants were included in this analysis, most were MSM (97.4%), with others identifying as trans\* or non-binary. Most participants were interested in using LA-PrEP (78.1%) and intended to use it (75.4%).

Higher interest in taking LA-PrEP was reported in participants who had between 11 and 50 (aOR 3.00; 1.31-6.88) or more than 150 sex partners (aOR 3.93; 1.60-9.68) in the past six months, and in participants reporting a belief that they are likely to acquire HIV (aOR 1.24; 1.04-1.48) and frequent worry that they will acquire HIV (aOR 1.45; 1.18-

1.80). Higher intention was also reported in participants with less concern about injection pain (aOR 0.67; 0.60-0.75) and less concern about side effects from LA-PrEP use (aOR 0.83; 0.73-0.95).

Compared with current and former PrEP users, participants who were PrEP naive were significantly less likely to intend to use LA-PrEP (aOR 0.61; 0.44-0.85).

For current oral PrEP users, neither the type of regimen they use (daily or on-demand), nor their level of adherence, predicted higher intention to use LA-PrEP.

**Conclusions:** High interest and intent to use LA-PrEP exists among MSM and trans\* people in the Netherlands. People who are concerned about HIV, who have many sexual partners and who are currently taking oral PrEP could be engaged with this new PrEP modality.

## TUPEC199

Community peer-led approach to improve access to pre-exposure prophylaxis among HIV high-risk populations in Bunyoro region, mid-western Uganda

S. Engulu<sup>1</sup>, B. Nsangi<sup>1</sup>, J. Makiika<sup>1</sup>, A.G. Fitzmaurice<sup>2</sup>, R. N. Ssebunya<sup>1</sup>, A. Maganda<sup>1</sup>, D. Kiragga<sup>1</sup>

<sup>1</sup>Baylor Uganda College of Medicine Children's foundation, Prevention, Hoima, Uganda, <sup>2</sup>US Centers for Disease Control and Prevention, Prevention, Global Health Center, Division of Global HIV & TB, Kampala, Uganda

**Background:** In June 2011, Uganda adopted the HIV combination prevention strategy that includes the use of pre-exposure prophylaxis (PrEP) to reduce the acquisition of HIV and eradicate AIDS by 2030. Bunyoro region in mid-western Uganda started PrEP implementation in 2017 at selected health facilities. By 2021, PrEP uptake in the Bunyoro region was poor at 14% of the eligible clients.

A Root cause analysis conducted revealed that; pill burden, poor access to facilities offering PrEP, unfriendly health workers and support structures, and fear of being seen taking antiretroviral drugs (ARVs) are key barriers to PrEP access.

We describe lessons learned from a community-based approach to improve PrEP uptake among HIV high-risk populations in Bunyoro, mid-western Uganda.

**Description:** The Baylor Uganda Project supports community peer educators (PEs) and health care workers (HCWs) to offer PrEP services to HIV at-risk populations. During October 2021 to September 2023, we identified and trained 54 community Peer Educators (PEs) on PrEP mobilization skills and 48 HCWs across accredited 43 health facilities on PrEP as HIV prevention for key and priority populations; attached peers to mapped hotspots for routine mobilization, education, and PrEP pre-screening; and provided PEs with bags to carry information, education, and communication materials focused on engaging individuals at the community, including HIV self-tests for

distribution, and access to a toll-free telephone number for PrEP enrollment, while HCWs supervised PEs with quarterly mentorship.

**Lessons learned:** The increases in PrEP New enrolments and clients returning for refills are attributed to; the recruitment of PEs, and Integration of peer-led PrEP services into community activities.

**Conclusions/Next steps:** The use of committed, trained, and mentored community PEs with knowledge and skills in mobilization and PrEP service delivery working with HCWs can improve PrEP access and use among high-risk populations, especially key populations despite low uptake for MSM.

## TUPEC200

Pre-Exposure Prophylaxis for HIV in Brazil's Unified Health System: current stage and assessment of pharmacist prescription initiatives

F.A. Paula de Franca<sup>1</sup>, T.H. de Sousa Nascimento<sup>1</sup>, M.C. Madeira de Moura<sup>1</sup>, T.M. Dantas de Alencar<sup>1</sup>

<sup>1</sup>Ministry of Health, Department of HIV/AIDS, Tuberculosis, Viral Hepatitis, and Sexually Transmitted Infections, Brasília, Brazil

**Background:** Oral Pre-Exposure Prophylaxis (PrEP) is a combination of antiretroviral drugs taken either daily or using an "on-demand" regimen. It has been provided free of charge by the Brazilian Unified Health System (SUS) since 2018, targeting individuals at higher risk of acquiring the HIV virus. Pharmacists can play a strategic role in monitoring pharmacotherapy and promoting the well-being, recovery, and care of users to achieve positive outcomes.

Therefore, the objective of this study was to characterize and describe PrEP users and the initial interventions conducted by pharmacists in Brazil.

**Methods:** This is an exploratory and descriptive study based on secondary data, covering the period from January 2018 to December 2023, using the PrEP dashboard provided by the Ministry of Health, (<https://www.gov.br/aids/pt-br/assuntos/prevencao-combinada/prep-profilaxia-pre-exposicao/painel-prep>). The dashboard presents aggregated data, without any user identification.

**Results:** Desde janeiro de 2018, 149.023 indivíduos iniciaram a PrEP. Até dezembro de 2023, 110.429 (74,1%) receberam pelo menos uma dispensa nos últimos 12 meses.

A maioria dos usuários da PrEP eram homens que fazem sexo com homens (82,0%), autoidentificados como brancos (55,5%), com 12 anos ou mais de estudo (71,4%), atendidos no sistema público de saúde (90%), e com idade entre 30 e 39 anos (42%). No Brasil, os farmacêuticos começaram a prescrever a PrEP em março de 2023, com exceção da cidade de São Paulo, onde começou em 2020. Assim, de março a dezembro de 2023, foram realizadas 6.282 dispensações de PrEP por farmacêuticos para 3.540 usuários em 183 farmácias em 126 municípios brasileiros.

**Conclusions:** Despite the relatively small number, pharmacist-led PrEP prescription in Brazil is promising. It is expected that pharmacists may improve access to PrEP beyond white, educated individuals in large cities. Additionally, it may serve as an example for broadening the prescription of other medications under the clinical protocols of SUS.

## TUPEC201

Demographic and behavioral characteristics of sexually active, HIV-negative transgender and gender-diverse adults in the United States interested in HIV pre-exposure prophylaxis initiation

D. Watson<sup>1</sup>, L. Listerud<sup>2</sup>, R. Drab<sup>2</sup>, W. Lin<sup>2</sup>, F. Momplaisir<sup>1</sup>, J. Bauermeister<sup>2</sup>

<sup>1</sup>University of Pennsylvania Perelman School of Medicine, Medicine/Infectious Diseases, Philadelphia, United States,

<sup>2</sup>University of Pennsylvania School of Nursing, Department of Family and Community Health, Philadelphia, United States

**Background:** PrEP implementation in the United States (US) is not equitable for transgender and gender-diverse (TGD) people and is seldom explicitly inclusive of transmasculine and nonbinary people. We examined factors associated with interest in PrEP initiation among TGD adults in the US.

**Methods:** We conducted a national online survey between April 2022 and June 2022 with 304 HIV-negative TGD adults in the US. Self-administered surveys assessed participants' sexual behaviors and PrEP preferences and experiences. Logistic regression was used to estimate associations between participant characteristics and interest in taking PrEP in the next six months.

**Results:** Overall, 233 (77%) participants were aware of and not taking PrEP: median age was 23 years [range 18-51, SD: 5.4]; 133 (57%) were transmasculine or trans men; 73 (31%) were nonbinary; 27 (12%) were transfeminine or trans women; 144 (62%) were white; 32 (14%) were Latine; 19 (8%) were Black; and 38 (16%) were non-Latine another race. Interest in taking PrEP was associated with degree of concern about contracting HIV (adjusted odds ratio, aOR: 2.09 [95% CI 1.54, 2.83]); prior STI diagnosis (aOR: 2.89 [95% CI 1.11, 7.54]; transmasculine or trans man gender identity

(aOR: 3.30 [95% CI 1.04, 10.4]); and known partner with HIV in past 6 months (aOR: 4.66 [95% CI 1.02, 21.4]; all p-values < 0.05. Age, race/ethnicity, condomless anal and/or vaginal sex and a partner with unknown HIV status in past 6 months were not associated with interest in taking PrEP.

Characteristic	Unadjusted Odds Ratio [95% confidence interval]	p-value	Adjusted Odds Ratio [95% confidence interval]	p-value
Age (years)	1.03 [0.98, 1.08]	0.31	0.98 [0.93, 1.05]	0.62
Gender identity (Reference: Transfeminine or trans woman)				
Transmasculine or trans man	1.37 [0.57, 3.27]	0.48	3.30 [1.04, 10.4]	<0.05
Nonbinary, genderqueer, or another gender identity	1.24 [0.49, 3.15]	0.64	3.10 [0.95, 10.1]	0.06
Race and ethnicity (Reference: Non-Latine white)				
Non-Latine Black	1.97 [0.75, 5.15]	0.17	0.87 [0.27, 2.80]	0.81
Non-Latine Another race	0.82 [0.38, 1.75]	0.60	0.74 [0.32, 1.68]	0.47
Latine, Any race	2.01 [0.93, 4.34]	0.08	1.59 [0.65, 3.91]	0.31
Prior lifetime Chlamydia trachomatis, Neisseria gonorrhoeae, or Treponema pallidum diagnosis	2.31 [1.04, 5.15]	0.04	2.89 [1.11, 7.54]	<0.05
Condomless anal and/or vaginal sex in past 6 months	1.66 [0.92, 2.97]	0.09	1.49 [0.77, 2.87]	0.24
Known HIV-positive sexual partner in past 6 months	5.09 [1.34, 19.3]	0.02	4.66 [1.02, 21.4]	<0.05
Sexual partner with unknown HIV status in past 6 months	1.36 [0.76, 2.44]	0.31	0.93 [0.47, 1.83]	0.84
Degree of concern about contracting with HIV <sup>‡</sup>	1.92 [1.48, 2.51]	<0.001	2.09 [1.54, 2.83]	<0.001

<sup>‡</sup> Likert scale: 1-5; not at all concerned, slightly concerned, somewhat concerned, moderately concerned, extremely concerned.

**Table 1. Multivariable logistic regression analysis of factors associated with interest in taking PrEP among a national online sample of sexually-active, HIV-negative transgender and gender-diverse adults in the United States (n = 233).**

**Dichotomized outcome:** "How likely would you be to take PrEP in the next 6 months?"; Interested = Somewhat likely or very likely; Not interested = Not at all likely or unsure.

**Conclusions:** Despite high PrEP awareness, current PrEP use was low among this cohort. Future research should prioritize the development of implementation strategies that strengthen trans-inclusive low-barrier PrEP services for TGD people with known partners with HIV, transmasculine people, and trans men interested in taking PrEP. Future research should examine ways to equitably integrate comprehensive gender-affirming care into PrEP service delivery for TGD people.

## TUPEC202

Factors influencing timely antenatal care booking among pregnant women living with HIV: a study at Kinoni Health Center IV in Rwampara District, Uganda

M. Abdal Rashid<sup>1</sup>

<sup>1</sup>Mbarara University of Science and Technology, Public Health, Mbarara, Uganda

**Background:** In many developing countries, including Uganda, delayed initiation of antenatal care (ANC) among pregnant women, particularly those living with HIV, remains a concern. The World Health Organization

recommends starting ANC within the first trimester, yet adherence to this guideline is often suboptimal. Understanding the factors influencing the timing of ANC initiation is crucial for improving maternal and child health outcomes.

**Methods:** A cross-sectional study was conducted at Kinoni Health Center IV in Rwampara District, Uganda, from October 1st to December 30th, 2022. The study included 217 pregnant women living with HIV attending the Antenatal clinic. Consecutive sampling was employed, and both qualitative and quantitative data were collected through structured questionnaires and focus group discussions. Quantitative data were analyzed using Stata Version 14, employing bivariate and multivariate logistic regression analyses. Focus group discussions provided additional insights into barriers faced by pregnant women.

**Results:** Out of the 217 participants, only 22.58% attended ANC within the first trimester. Factors associated with delayed ANC initiation included unplanned pregnancies (aOR=0.27, 95% CI 0.12-0.43, p=0.003), residing 1-2km (aOR=0.06, 95% CI 0.009-0.43, p=0.005) or ≥5km away (aOR=0.08, 95% CI 0.009-0.81, p=0.033) from the health facility, and the misconception that ANC should start between 4 and 6 months of pregnancy (aOR=0.17, 95% CI 0.04-0.66, p=0.011). Focus group discussions identified financial challenges, long distances, delayed pregnancy diagnosis, multiparity, unfavorable healthcare worker attitudes, and inadequate knowledge as barriers to first-trimester ANC visits.

**Conclusions:** Pregnant women living 1-2km or >5km away, those with unplanned pregnancies, and those with misconceptions about the ideal timing for ANC were less likely to initiate ANC within the first trimester. Barriers identified include inadequate knowledge, financial constraints, and geographical distances. To address these challenges, the study recommends implementing community ANC outreach programs, emphasizing health education during antenatal talks, and strengthening family planning services to reduce unplanned pregnancies. These interventions aim to enhance ANC utilization, improve maternal and child health outcomes, and mitigate the risk of mother-to-child transmission of HIV.

## TUPEC203

### Persistence in Pre-Exposure Prophylaxis (PrEP) receipt post-prescription among people who inject drugs

A. Khati<sup>1</sup>, J. Wickersham<sup>2</sup>, M. Copenhaver<sup>1</sup>, R. Xu<sup>1</sup>, K. Gautam<sup>1</sup>, K. Paudel<sup>1</sup>, L. JadKarim<sup>2</sup>, S. Sujani<sup>1</sup>, R. Shrestha<sup>1</sup>

<sup>1</sup>University of Connecticut, Allied Health Sciences, Storrs, United States, <sup>2</sup>Yale University, Department of Internal Medicine, Section of Infectious Diseases, New Haven, United States

**Background:** The opioid crisis in the United States has led to not only increasing overdose rates but also HIV outbreaks among people who inject drugs (PWID). One aspect of the pre-exposure prophylaxis (PrEP) cascade that has received little attention includes the post-prescription phase of PrEP, where PWID obtain PrEP from pharmacies or other PrEP-dispensing facilities.

To address this gap, this study investigated persistence in PrEP receipt after prescription and associated factors among PWID.

**Methods:** Between December 2020 and July 2022, 100 opioid-dependent PWID were enrolled in the biobehavioral HIV prevention study, titled "Expanding PrEP Implementation in Communities of PWID". Eligibility criteria included age ≥18, HIV-negative, injection drug use (past 6 months), and meeting DSM-V criteria for opioid dependence. Participants meeting clinical criteria received a 90-day supply of PrEP from a community-based syringe services program. Participants were followed up quarterly for 9 months. Sociodemographic characteristics, prior PrEP use, and sex- and drug-related behaviors were assessed. PrEP receipt was measured ordinally by the number of times PWID picked up PrEP medication.

**Results:** On average, participants were in their early 40s, male (63.0%), non-Hispanic White (52.0%), heterosexual (79.0%), and unemployed (89.0%). Participants reported injecting drugs at least once per week (64.0%) in the past month. Most participants (79.0%) reported never using PrEP before. Overall, 60 participants picked up PrEP medication at least once, with 42 of them (70.0%) retrieving it only once, 16 (26.7%) twice, and only 2 participants (3.3%) doing so three times. In the multivariable model, unemployed participants (aOR=7.819; 95% CI: 1.538-39.751) and those who had previously used PrEP (aOR=3.381; 95% CI: 1.210-9.443) had higher persistence in PrEP receipt, whereas those who engaged in IDU once a week or less (aOR=0.039; 95% CI: 0.008-0.182) or more than once a week in the past month (aOR=0.098; 95% CI: 0.029-0.329) were less likely to retrieve PrEP consistently.

**Conclusions:** Despite a strong willingness to use PrEP, its adoption was notably low among opioid-dependent PWID, a marginalized group facing significant HIV risk. These results underscore the need for comprehensive strategies to enhance the PrEP continuum of care, particularly in high-priority populations such as PWID.

## TUPEC204

### Persistence of transgender women in oral PrEP in Buenos Aires, Argentina: survival analysis of the first 2 years of the program

C. Cesar<sup>1</sup>, G. Mernies<sup>1</sup>, D.D. Salusso<sup>1</sup>, F. Bilbao<sup>1</sup>, J. Garcia<sup>1</sup>, P. Patterson<sup>1</sup>, A. Nava<sup>1</sup>, I. Aristegui<sup>1</sup>, V. Zalazar<sup>1</sup>, P.D. Radusky<sup>1</sup>, F. Luna<sup>1</sup>, D. Parera<sup>1</sup>, A. Duran<sup>2</sup>, M.I. Figueroa<sup>1</sup>, Z. Ortiz<sup>1</sup>, P. Cahn<sup>1</sup>

<sup>1</sup>Fundacion Huesped, Research Department, Ciudad Autonoma de Buenos Aires, Argentina, <sup>2</sup>Ministry of Health, Coordinación Salud Sexual, VIH e Infecciones de Transmisión Sexual, Ciudad Autonoma de Buenos Aires, Argentina

**Background:** In 2021, oral PrEP with TDF/FTC was implemented in a non-governmental organization in Buenos Aires with access to key populations including TGW, according to national guidelines. We aimed to analyze PrEP program persistence (PPP) for TGW and explore its correlates in a real-world setting.

**Methods:** PPP was defined as time to first PrEP discontinuation (TFD): medical or client decision. In those clients without a definite date of complete discontinuation, we calculated the end date as the date the prescribed supply of pills would be depleted if taken daily. TFD was assessed using survival analysis. Cox proportional hazard models examined associations between PrEP discontinuation and baseline demographics, sex practices, and substance use.

**Results:** From September 2021-December 2023 191 TGW started PrEP: median age 28 years (IQR:24-34); 87(47%) had incomplete high school or lower; 50(33%) reported cocaine use in the last month and 163 (86%) were currently engaged in sex work. After a median follow-up time of 9 months (3-17), 86 (45%) discontinued. PPP at months 1, 6, 12, 18 and 24 was 87.7%, 74.4%, 62.6%, 47.3% and 36.9%, respectively. Use of gender-affirming hormone therapy (GAHT) in the same facility was significantly associated with higher persistence (79.9% vs 67.6% by month 6; 71.1% vs 47.4% by month 12;  $p=0.005$ ) (Figure A).

In a Cox regression model controlling for age, education level, and GAHT, probability of discontinuation decreased with age [4% per year (0.4%-7%)] and GAHT [51% (23%-69%)] (Figure B).

There were 4 HIV seroconversions, all after PrEP discontinuation.

Figure A. Persistence on PrEP among TGW according to gender affirming hormone therapy (GAHT)

Figure B: Cox regression model

Variable	N	Hazard ratio	95% CI	p
age	176	0.96 (0.93, 0.99)		0.008
edu				
Incomplete secondary school or less	80	Reference		
Secondary School (completed or more)	97	1.54 (0.67, 3.53)		0.383
sexw	85	Reference		
No	107	0.45 (0.31, 0.67)		0.000

**Conclusions:** Maximizing efforts to support younger TGW is needed to expand PrEP benefits and retention. Future qualitative studies should dig deeper into aspects leading to PrEP discontinuation to design comprehensive and tailored implementation strategies.

## TUPEC205

### Implementation of the first biomedical HIV prevention protocol in Romania: towards national PrEP rollout

C. Lelutiu-Weinberger<sup>1</sup>, A.M. Zavodszky<sup>1</sup>, M.L. Filimon<sup>1</sup>, M. Lixandru<sup>2</sup>, L. Hanu<sup>2</sup>, C. Fierbințeanu<sup>2</sup>, R. Pătrașcu<sup>3</sup>, M. Bora<sup>4</sup>, I. Filipescu<sup>4</sup>, S. Luculescu<sup>5</sup>, L.B. Hightow-Weidman<sup>6</sup>, A. Rochelle<sup>6</sup>, B. Yi<sup>7</sup>, N. Buckner<sup>7</sup>, S.A. Golub<sup>8</sup>, A. Streinu-Cercel<sup>3</sup>, C. Jianu<sup>4</sup>, J. Burger<sup>9</sup>, J.E. Pachankis<sup>9</sup>

<sup>1</sup>Columbia University, New York, United States, <sup>2</sup>Romanian Association Against AIDS, Bucharest, Romania, <sup>3</sup>National Institute of Infectious Diseases "Prof. Dr. Matei Balș", Bucharest, Romania, <sup>4</sup>Clinical Hospital of Infectious Diseases, Cluj-Napoca, Romania, <sup>5</sup>Romanian Association Against AIDS, Cluj-Napoca, Romania, <sup>6</sup>Florida State University, Tallahassee, United States, <sup>7</sup>One Cow Standing, Durham, United States, <sup>8</sup>Hunter College of the City University of New York, New York, United States, <sup>9</sup>Yale University, New Haven, United States

**Background:** HIV pre-exposure prophylaxis (PrEP) is nearing formal rollout in Romania, a country with increasing HIV incidence among gay and bisexual men (GBM), high structural anti-LGBTQ stigma, and normative lack of sexual and mental health supports. This study presents interim results from a trial evaluating the introduction of PrEP in Romania.

**Methods:** *Prepare Romania*, an evidence-based PrEP counseling and adherence protocol adapted to local needs, is being implemented in Bucharest and Cluj-Napoca, where 120 GBM have been enrolled to receive a PrEP prescription and randomized to either a PrEP education control or an affirming PrEP counseling condition accompanied by an adherence support app. While the trial is ongoing, interim analyses conducted across both conditions examined participants' PrEP knowledge, stigma, and mental health from baseline to 3-months post-PrEP initiation. Self-reported PrEP adherence was measured via a weekly diary post-PrEP initiation. One-sample *t*-tests and chi-square tests were used to assess differences between baseline and 3-month data. Correlational analyses explored the relationship between mental health and PrEP adherence.

**Results:** Participants ( $N=99$ ,  $M$  age=29.83,  $SD=9.42$ ) reported an average of 6.67 ( $SD=0.71$ ) days of PrEP use per week across 3-months. PrEP knowledge was high at baseline and increased marginally at 3-months (89% vs. 98% of

sample). PrEP stigma, although low at baseline, also decreased marginally at 3-months ( $M=1.82$  vs.  $M=1.72$ ). Both depression ( $M=4.58$  vs.  $M=3.40$ ,  $p<0.01$ ) and anxiety ( $M=3.72$  vs.  $M=2.59$ ,  $p<0.01$ ) scores decreased significantly, while lower levels of anxiety were associated with higher levels of PrEP adherence at 3-months ( $r=-0.29$ ,  $p<0.01$ ).

**Conclusions:** Results indicate high PrEP adherence and knowledge, as well as low levels of PrEP stigma. Findings corroborate research in other settings indicating that PrEP use, in addition to providing protection against HIV, may have mental health benefits for stigmatized GBM, which may, in turn, be related to improved adherence. Pending efficacy analyses upon trial completion in July 2024, including dried blood spot testing to measure PrEP adherence, *Prepare Romania* may offer an effective tool to support PrEP rollout in countries with similar contextual features and a high need for biopsychosocial HIV prevention.

## TUPEC206

Safety and acceptability of Shang Ring device for VMMC in younger adolescents in Zimbabwe

N. Nhando<sup>1</sup>, B. Maponga<sup>1</sup>, H. Chigijii<sup>1</sup>, N. Tarubekera<sup>1</sup>, O. Mugurungi<sup>2</sup>, S. Xaba<sup>2</sup>, K. Hatzhold<sup>3</sup>

<sup>1</sup>Population Solutions for Health, INTEGRATE, Harare, Zimbabwe, <sup>2</sup>Ministry of Health and Child Care, Zimbabwe, AIDS and TB Unit, Harare, Zimbabwe, <sup>3</sup>Population Services International, HIV/ AIDS and TB, Cape Town, South Africa

**Background:** Voluntary medical male circumcision decreases the risk of HIV acquisition through heterosexual transition among males by 60%. We conducted a clinical observational study to evaluate the safety, acceptability, and technical efficiency of the Shang Ring (SR) male circumcision device among younger (13 – 14 years) and older (15 – 16 years) adolescent males in Zimbabwe

**Methods:** Between June 2022 and May 2023, 5,878 adolescent boys at 93 sites across 9 rural districts were recruited into two age group cohorts 13 –14 years (offered SR only) and 15-16 years (offered either SR or surgical dorsal slit (DS) procedure). Participants were followed up on days 2, 14, and 42 (DS) and days 7, 14, and 49 for SR post-procedure to assess adverse events and the wound healing process. An interviewer-administered questionnaire was used to collect data on client satisfaction and acceptability on days 14 and 49 post-procedure. We collected data on mild, moderate, and severe adverse events (AEs) in both cohorts and analyzed data using SPSS. Interim analysis to assess adverse events rates in the two groups was conducted.

**Results:** 5,878 adolescents, 4,076 and 1802 from the age groups 13-14 and 15-16 years respectively were recruited. Among the older age group, 1,089/1802 (60.4 %) had been circumcised with the SR device. Six moderate/severe AEs were observed, translating to an overall AE rate of 1.36 per

1,000 among both groups. Four AEs occurred in the 13-14 age cohort (1.47 per 1,000 circumcisions (95% CI 0.54; 3.20)) and 2 AEs in the 15-16 years age cohort (incidence of 1.11 per 1,000 MCs (95% CI 0.13; 4.01)). All AEs were resolved successfully. 97.6% (3756/3845) of clients interviewed were satisfied/ very satisfied with the procedure; 89.1% (3426/3845) were likely to recommend the procedure to their peers.

**Conclusions:** SR was highly acceptable among younger adolescents. Moderate/severe AE rates were low in both age groups, and not different between age groups. This was the largest study to evaluate the safety and acceptability of SR among <15-year-old adolescents in Africa. The data may inform evidence for WHO and countries' guidance on SR device use as an option for circumcision for younger adolescents.

## TUPEC207

Early experiences with usage of injectable cabotegravir (CAB-LA) among Kenyan and Ugandan adults participating in the SEARCH Dynamic Choice HIV Prevention trial: a qualitative study

C.S. Camlin<sup>1</sup>, C. Akatukwasa<sup>2</sup>, J. Johnson-Peretz<sup>1</sup>, T. Arunga<sup>3</sup>, F. Atwine<sup>2</sup>, A. Onyango<sup>3</sup>, L. Owino<sup>3</sup>, G. Chamie<sup>4</sup>, L.B. Balzer<sup>5</sup>, M. Czarowski<sup>6</sup>, E. Kakande<sup>2</sup>, H. Sunday<sup>2</sup>, N. Sutter<sup>4</sup>, M.R. Kamya<sup>2,7</sup>, J. Ayieko<sup>3</sup>, M.L. Petersen<sup>5</sup>, D.V. Havlir<sup>4</sup>, J. Kabami<sup>2</sup>

<sup>1</sup>University of California, San Francisco, Obstetrics, Gynecology & Reproductive Sciences, San Francisco, United States, <sup>2</sup>Infectious Diseases Research Collaboration, Kampala, Uganda, <sup>3</sup>Kenya Medical Research Institute, Kisumu, Kenya, <sup>4</sup>University of California, San Francisco, Medicine, San Francisco, United States, <sup>5</sup>University of California, Berkeley, Biostatistics, Epidemiology, and Computational Precision Health, Berkeley, United States, <sup>6</sup>ViiV Healthcare, Durham, United States, <sup>7</sup>Makerere University College of Health Sciences, Medicine, Kampala, Uganda

**Background:** The ongoing SEARCH study in Kenya and Uganda evaluated HIV prevention uptake through a structured, person-centered HIV 'dynamic choice prevention model' (DCP). Men and women were offered choice of oral PrEP(TDF/XTC), PEP(TLD) and injectable cabotegravir(CA-LA), with option to stop or switch. This qualitative study explored early experiences with CAB-LA.

**Methods:** In-depth interviews were conducted July-October 2023 with a purposively-selected sample of 48 participants who initiated CAB-LA. Interviews explored experiences with counseling, reasons for CAB-LA preference, and factors in decision-making, including perceived HIV risk, partner/family support, stigma/disclosure, prior experiences with PrEP, expectations of/experiences with CAB-LA, quality of care, and barriers/facilitators to persistence. We analyzed data using inductive coding and memoing.

Late-breaker abstracts

Author Index

**Results:** Participants were enthusiastic about initiating CAB-LA, which was perceived as novel, efficacious, and advantageous relative to oral daily PrEP. Two major themes emerged regarding advantages of CAB-LA over oral PrEP: improved protection from HIV stigma and from HIV acquisition due to easier adherence. CAB-LA was seen as clearly distinguishable from ART, and not a product that could mark an individual (mistakenly) as HIV-positive ("...when they see the pill bottle, they conclude that I have HIV.")

Among women, clandestine use to guard against stigma from partners or in-laws was important, and more achievable compared to PrEP. ("I was getting issues with my husband after seeing the pills.")

Appointments for injections were rare enough that they could be kept, especially with reminders from providers. For some, prior use of oral PrEP was hindered by stigma, side effects, pill size/smell, and interruptions due to work and travel ("I had to travel and would forget to take my pills with me. The injection is much easier— when I take it, I become free.")

Some participants reported pain and swelling at injection site, but hoped to continue usage if side effects could be managed.

**Conclusions:** In a context of continued HIV-related stigma, CAB-LA met some clients' preferences for a product that permitted prevention to be visibly distinguishable from treatment, enabling prevention uptake to feel safer. Adherence was more easily achieved with CAB-LA compared to PrEP, boosting clients' confidence in prevention efficacy.

## TUPEC208

High incidence of syphilis among PrEP users under Thailand's Universal Health Coverage (UHC) scheme provided by key population-led and hospital-based services at baseline compared during follow-up; What's next?

K. Intawong<sup>1</sup>, S. Chariyalertsak<sup>1</sup>, P. Namahoot<sup>2</sup>, P. Wareechai<sup>2</sup>, S. Chautrakarn<sup>1</sup>, A. Thongprachum<sup>1</sup>

<sup>1</sup>Chiang Mai University, Faculty of Public Health, Muang Chiang Mai, Thailand, <sup>2</sup>National Health Security Office, Bangkok, Thailand

**Background:** UHC scheme had initiated to pilot free of charge for HIV pre-exposure prophylaxis (PrEP) services for high-risk population in Thailand since 2020. In 2022, there were several Key Population-Led Health Services (KPLHS) run by Community Based Organizations (CBOs) and hospital-based facilities distributed throughout the country to provide PrEP services for KPs.

**Methods:** PrEP services under UHC were recorded under National AIDS Program (NAP) through online system. We used the data from NAP for newly registered PrEP users in 2022 then followed up to December 2023.

We used linked de-identified PrEP users and Syphilis screening results who newly registered under NAP and initiated PrEP in 2022 and follow up them till December 2023.

**Results:** There were 10,938 people who initiated PrEP under UHC which 9,237(84.45%) were newly PrEP users and 1,701(15.55%) who ever used PrEP and restarted to use PrEP again. From 10,938 users, 8,295(75.84%) received PrEP services by KPLHS and 2,643(24.16%) by hospitals. Most common key-population were MSM (78.13%) and TGW(9.54%) by KPLHS and MSM(72.34%) and partner of PLHIV(14.30%) by hospital-based services. From KPLHS, there were 5.39% found positive for Syphilis at baseline and those who were negative at baseline became to be positive for Syphilis 14.59% during follow up visit for PrEP while for hospital-based PrEP services, there were 11.80% found positive for Syphilis at baseline and those who were negative became to be positive for Syphilis 6.44% during follow up for PrEP. For newly Syphilis cases occurred during follow up visit by KPLHS, 51.53% were aged 21-30 years, 41.66% were aged 31-45 years, 80.52% were MSM and 9.96% were TGW. For newly Syphilis cases occurred during follow up visit by hospitals, 50.0% were aged 21-30 years, 31.33% were aged 31-45 years, 66.67% were MSM and 27.73% were general population.

**Conclusions:** PrEP implementation under UHC had demonstrated the increasing number of newly Syphilis cases during follow-up visit for PrEP services especially by KPLHS. Multiple effective interventions must be considered to stem the rising rates of STIs among KPs who engaged in high-risk behaviours during PrEP included behavioural modification and other clinical strategies such as more frequent STI testing and antibacterial prophylaxis.

## TUPEC209

Exploring interest in long-acting antiretroviral injections: perspectives of people living with HIV in Egypt

S.M.A. Mansour<sup>1</sup>, A. Cordie<sup>2</sup>, A.A. Salem<sup>3</sup>, H. Fahmy<sup>2</sup>, R. Mohamed<sup>2</sup>, I.A. Kabbash<sup>4</sup>

<sup>1</sup>Egyptian Patent Office, Academy of Scientific Research and Technology (ASRT), Cairo, Egypt, <sup>2</sup>Cairo University, Cairo University Hospitals HIV Clinic, Endemic Medicine Department, Cairo, Egypt, <sup>3</sup>Faculty of Medicine, Cairo University, Public Health Department, Cairo, Egypt, <sup>4</sup>Faculty of Medicine, Tanta University, Public Health and Community Medicine Department, Tanta, Egypt

**Background:** People living with HIV (PLHIV) have to receive a daily oral dosage of antiretroviral treatment (ART) that could be challenging in several cases.

**Objective:** this study was carried to identify willingness of PLHIV to use the long-acting antiretroviral injections (LAI), and explore the factors associated with interest in trying a LAI among PLHIV.

**Methods:** A cross sectional study was conducted using a validated survey questionnaire after customization to fit PLHIV in Egypt. An overview of the LAI was provided, consent form was taken, and data was gathered from 135 PLHIV between October–December 2023 at Cairo University Hospitals HIV Clinic, Egypt.

**Results:** Of the enrolled PLHIV, 77% (104) were males, and 61.5% were in the age group of 18 to 39 years. All participants were on ART; most of them using Dolutegravir-based therapy (124, 93.2%). Among participants, 76.3% (103) expressed a high interest in the LAI.

The majority of study participants had confidentiality concerns about their condition and negative feelings towards ART; as 116 (85.9%) of PLHIV informed only limited persons in their very close circle of contacts about their condition, and 13 (9.6%) expressed their fear of self-disclosure. Moreover, 45 (33.6%) reported negative feelings towards ART, and 72 (53.7%) were neutral. Therefore, PLHIV with confidentiality concerns were significantly interested in receiving LAI ( $X^2 = 17.736, p = 0.00$ ).

More than 90% of the PLHIV were anxious about swallowing pills every day. Therefore, there was a significant interest in LAI among PLHIV who cannot take HIV pills every day, those suffering of other medical conditions ( $X^2 = 5.567, p = 0.018$ ) and those who suffer from emotional burden associated with taking pills every day ( $X^2 = 9.573, p = 0.002$ ).

Figure 1. Top 5 perceived benefits and constraints to using a LAI, PLHIV's perspective.

**Conclusions:** Our findings indicated that LAI may help address PLHIV unmet needs and may be more convenient for many of them.

## TUPEC210

Centering community leadership with PURPOSE: inclusion of adolescents, ciswomen, and pregnant and lactating individuals in a Phase 3 clinical trial evaluating lenacapavir (LEN) and emtricitabine/tenofovir alafenamide (F/TAF) for PrEP

D. M. Campbell<sup>1,2,3</sup>, Y. Raphael<sup>4</sup>, S. Mkhabela<sup>4</sup>, S. Brown<sup>5</sup>, N. Sikwana<sup>6</sup>, N. Cynthia Mpongo<sup>7</sup>, S. Mugamba<sup>8</sup>, A. Kintu<sup>9</sup>, M. Das<sup>9</sup>, L. Mworeko<sup>10</sup>, D. Dixon Diallo<sup>11</sup>, N. Yola<sup>7</sup>, PURPOSE 1 G-CAG

<sup>1</sup>Division of Infectious Diseases and Global Public Health, Department of Medicine, School of Medicine, University of California, San Diego, United States, <sup>2</sup>School of Public Health, San Diego State University, San Diego, United States, <sup>3</sup>Division of Preventive and Social Medicine, School of Medicine, Charles R. Drew University of Medicine and Science, Los Angeles, United States, <sup>4</sup>Advocacy for Prevention of HIV and AIDS (APHA), Johannesburg, South Africa, <sup>5</sup>Global Network of Young People Living with HIV (Y+), Mmabatho, South Africa, <sup>6</sup>AIDS Vaccine Advocacy Coalition (AVAC), Johannesburg, South Africa, <sup>7</sup>The Desmond Tutu HIV Centre, University of Cape Town, Cape Town, South Africa, <sup>8</sup>Makerere University Walter Reed Project (MUWRP), Uganda, Kampala, Uganda, <sup>9</sup>Gilead Sciences, Inc., Foster City, United States, <sup>10</sup>International Community of Women Living with HIV Eastern Africa (ICWEA), Kampala, Uganda, <sup>11</sup>SisterLove, Inc., Atlanta, United States

**Background:** Adolescent girls and young women (AGYW) and pregnant and lactating individuals (PLI) are disproportionately vulnerable to HIV-1 acquisition due to complex biological, social, and structural circumstances; both groups have been historically excluded from participation in clinical trials, limiting their human right to benefit from scientific advances of research. Global advocacy, largely led by AGYW and PLI (e.g., the PHASES Working Group, African Women Prevention Community Accountability Board's HIV Prevention Choice Manifesto, and the APHA Policy Statement on Support for Women's Inclusion in HIV-Related Clinical Research), developed evidence-based recommendations for protecting AGYW and PLI through meaningful inclusion in HIV-1 research, rather than exclusion.

**Description:** PURPOSE-1 (NCT04994509) is an ongoing Phase 3 study evaluating twice-yearly subcutaneous LEN and daily oral F/TAF for PrEP in cisgender AGYW ages 16–25 in South Africa and Uganda.

The study's Global Community Accountability Group (GCAG) includes people who may benefit from PrEP (PWPB), AGYW and PLI, and the advocates who represent them. The GCAG, guided by clear terms of reference and workplans, ensured community representation from the trial conceptualization, including reviewing, and advising on study design and protocol development, through supporting trial implementation.

**Lessons learned:** Intentionality is necessary to reconceptualize research paradigms that center communities of AGYW and PLI and advance evidentiary gaps. Informed by the robust GCAG consultation, PURPOSE-1 supports:

1. Inclusion of adolescents with tailored informed assent and consent process;
  2. Reproductive choice of participants with no requirement for contraception (and provided free of cost for those who do not desire pregnancy);
  3. Continued participation of those who become pregnant and lactating while on study; and,
  4. Assessment, support, and referral for intimate partner violence and/or social harm from study participation.
- GCAG members championed the importance of understanding LEN drug exposure during pregnancy, postpartum, in infants, and breastmilk, or among those on contraception.

**Conclusions/Next steps:** By centering the voices of AGYW and PLI in the GCAG, we can intentionally and meaningfully include the most disproportionately affected and vulnerable to HIV acquisition in Phase 3 PrEP trials. Bidirectional engagement is essential to the meaningful inclusion of AGYW and PLI in HIV-1 prevention research.

## TUPEC211

PrEP uptake in pregnant and postpartum women in two districts in KwaZulu-Natal, South Africa

V. Ramokolo<sup>1</sup>, O.B. Mhlongo<sup>2</sup>, N. Abdelatif<sup>3</sup>, S. Swanevelder<sup>3</sup>, V. Magasana<sup>4</sup>, D. Nsibande<sup>4</sup>, T. Ramraj<sup>4</sup>, S. Mzimela<sup>4</sup>, K. Mohlabi<sup>5</sup>, N. Titus<sup>6</sup>, G. Titus<sup>1</sup>, C. Lombard<sup>3</sup>, T. Chetty<sup>4</sup>

<sup>1</sup>South African Medical Research Council, HIV and Other Infectious Disease Research Unit, Cape Town, South Africa,

<sup>2</sup>KwaZulu-Natal, Department of Health, Pietermaritzburg, South Africa, <sup>3</sup>South African Medical Research Council,

Biostatistics Unit, Cape Town, South Africa, <sup>4</sup>South African Medical Research Council, HIV and Other Infectious

Disease Research Unit, Durban, South Africa, <sup>5</sup>South African Medical Research Council, HIV and Other Infectious

Disease Research Unit, Pretoria, South Africa, <sup>6</sup>South African Medical Research Council, Information Technology

Services, Cape Town, South Africa

**Background:** KwaZulu-Natal, South Africa, faces a persistent high prevalence of HIV, particularly among pregnant and postpartum women. Pre-exposure prophylaxis (PrEP) is a critical tool in vertical transmission prevention (VTP) and protecting maternal health. Understanding PrEP uptake in this population is crucial for optimizing HIV prevention efforts.

This study aimed to measure PrEP uptake among pregnant and postpartum women in two districts in KwaZulu-Natal, South Africa.

**Methods:** Quantitative data were collected using a cross-sectional survey conducted among pregnant and postpartum women attending antenatal and postnatal

clinics in 40 primary healthcare facilities in two districts (eThekweni and Ilembe) in KwaZulu-Natal, South Africa. We conducted univariate and multivariable logistic regression to determine behavioral and demographic factors associated with PrEP uptake.

**Results:** 2039 pregnant and postpartum women underwent structured interviews (November 2022 and July 2023). Although majority (93.67%) had perceived high HIV acquisition risk, only 40.46% reported to have initiated PrEP. Married women living with their partners (adjusted odd ratio (AOR) 0.36; 95% CI 0.23-0.55), women aged 25-34 years (0.78; 95% CI 0.62-0.98), having other illnesses (AOR 0.46; 95% CI 0.25-0.84) and those with a shared flush toilet (AOR 0.69; 95% CI 0.55-0.87) were less likely to be take PrEP. Having a planned pregnancy (AOR 1.26; 95% CI 1.01 - 1.55), consuming alcohol (AOR 2.77; 95% CI 1.26- 6.07), being self-employed (AOR 1.97; 95% 1.23-3.16), and having condomless sex with an unknown partner (AOR 1.97; 95% CI 1.59-2.44) increased the odds of taking PrEP. For every additional live birth, the odds of taking PrEP increased by 18% (AOR 1.18; 95% CI 1.04-1.33).

**Conclusions:** PrEP uptake among pregnant and postpartum women in KwaZulu-Natal is influenced by a complex interplay of individual, social, and structural factors. Addressing these barriers and enhancing awareness, education, and accessibility to PrEP services is essential to improving uptake and, ultimately, reducing HIV transmission in this vulnerable population.

## TUPEC212

HIV-1 subtype C long terminal repeat sequence exhibiting single-nucleotide polymorphism in Sp1 site III may impact transcription activity and binding affinity of Sp1 transcription factor

N. Mtshali<sup>1,2</sup>, R. Khan<sup>1</sup>, T. Ndung'u<sup>1,2,3,4,5,6,7</sup>, P. Madlala<sup>1,2</sup>

<sup>1</sup>University of KwaZulu-Natal, School of Laboratory Medicine and Medical Science, College of Health Science, Durban, South Africa, <sup>2</sup>University of KwaZulu-Natal, The Doris Duke Medical Research Institute, Nelson R. Mandela School of Medicine, Durban, South Africa, <sup>3</sup>University of KwaZulu-Natal, African Health Research Institute (AHRI), Durban, Kenya, <sup>4</sup>University College London, Division of Infection and Immunity, London, United Kingdom, <sup>5</sup>Ragon Institute of Mass General, MIT, and Harvard, Boston, United States, <sup>6</sup>Massachusetts General Hospital, Infectious Disease Division, Boston, United States, <sup>7</sup>Harvard Medical School, Boston, Boston, United States

**Background:** There is higher viral load in the CSF than plasma of ART-naïve people living with HIV and tuberculous meningitis (TBM). However, the mechanisms that govern high viral load in the CSF compared to plasma of ART-naïve individuals with HIV and TBM remain to be determined. The HIV-1 LTR exhibits numerous transcription factor binding sites and is the viral promoter that drives

viral gene transcription. Genetic variation within the LTR translates to functional differences. Preliminary data from this project show that CSF-derived LTR exhibits a single polymorphism, Thymine to Adenine at position five of the Sp1III bind site (Sp1III5A). Therefore, the major aim of this study was to investigate the effect of Sp1III5A mutation alone or in combination with other mutations on LTR transcription activity.

**Methods:** The gene block containing Adenine (A) instead of Thymine (A) at position five of Sp1 site III (Sp1III5A) was cloned into the pGL3 vector to produce the LTR-Sp1III5A-pGL3 recombinant, which was then sequenced to confirm the mutation. The mutant LTR-Sp1III5A-pGL3 and wild-type LTR-Sp1III5T-pGL3 recombinants were independently transfected into central nervous system (CNS) derived astrocytes and lymphocyte T-derived Jurkat cell lines to access the transcription activity. Lastly, expression levels of the Sp1 transcription factor in astrocytes and Jurkat cells were measured by the Western blot.

**Results:** The mutant LTR-Sp1III5A showed a significantly increased basal and Tat-mediated LTR transcription activity compared to the consensus LTR-Sp1III5T in both astrocytes and Jurkat cell lines. Although mutant LTR-Sp1III5A exhibited higher transcription activity compared to LTR-Sp1III5T in both cell lines, it showed a more pronounced effect in Astrocytes. Consistently, our data show that Sp1 expression levels were higher in astrocytes compared to Jurkat cell lines.

**Conclusions:** Mutant LTR-Sp1III5A exhibits higher transcription activity in Astrocytes compared to Jurkat cells. Astrocytes were also associated with higher Sp1 Transcription factor expression levels compared to Jurkat cells. These could explain the higher transcription activity in astrocytes. Future studies should assess the effect of mutant Sp1III5A on the binding affinity of Sp1 binding affinity.

## TUPEC213

Assessment of longitudinal changes in renal function of HIV-1 oral pre-exposure prophylaxis (PrEP) users using real-world data in the United States

X. Huang<sup>1</sup>, V. Shvachko<sup>1</sup>, B. Shannon<sup>1</sup>, C. Nguyen<sup>1</sup>, J. Gruber<sup>1</sup>, L. Tao<sup>1</sup>

<sup>1</sup>Gilead Sciences, Inc., Foster City, United States

**Background:** In the DISCOVER trial, F/TAF for HIV-1 oral PrEP demonstrated an improved renal safety profile versus F/TDF through Week 96. We evaluated real-world renal safety of F/TAF versus F/TDF.

**Methods:** Individuals without HIV-1 who initiated F/TAF or F/TDF (2015–2023) and had  $\geq 1$  glomerular filtration rate (eGFR) measurements within 1 year pre- and post-PrEP initiation were identified using HealthVerity Marketplace. For individuals who switched regimens (4% F/TDF users, 2% F/TAF users), eGFR measurements taken after

switching were excluded. eGFR changes were calculated by subtracting post-PrEP initiation measurements from the pre-initiation 1-year average eGFR and analyzed using mixed-effects modeling. Odds ratios of eGFR  $<60$  mL/min/1.73 m<sup>2</sup> over 96 weeks post-PrEP initiation were compared for F/TAF versus F/TDF using logistic regression, overall and by individual characteristics. Both mixed and logistic models were adjusted for potential confounders: age, baseline eGFR, comorbidities, and medications.

**Results:** At baseline, F/TAF (n=2,323) and F/TDF (n=9,860) users had an average eGFR of 101.2 and 103.6 mL/min/1.73 m<sup>2</sup>, respectively, with 593 (25.5%) and 2,088 (21.2%) within the 60–90 mL/min/1.73 m<sup>2</sup> range. There was a 40% reduced risk of eGFR falling  $<60$  mL/min/1.73 m<sup>2</sup> in F/TAF versus F/TDF users (Figure 1). The trajectories of eGFR for users of F/TAF and F/TDF are illustrated in Figure 2.

Figure 1. Odds ratios (95% CI) of eGFR  $<60$  mL/min/1.73 m<sup>2</sup> for F/TAF users versus F/TDF users through 96 weeks after PrEP initiation\*

Figure 2. Least-squares mean eGFR change\* from baseline over time for F/TAF or F/TDF for HIV-1 oral PrEP users.

**Conclusions:** This is the first real-world study validating DISCOVER findings that F/TAF for HIV-1 PrEP has an improved renal safety profile versus F/TDF; however, real-world data limitations hinder complete bias control.

## TUPEC214

### High syphilis incidence among PrEP-adherent men who have sex with men and trans women PrEP users

S. Vargas<sup>1</sup>, K. Konda<sup>1</sup>, R. Moreira<sup>2</sup>, I. Leite<sup>2</sup>, M. Cunha<sup>2</sup>, B. Hoagland<sup>2</sup>, J.V. Guanira<sup>1</sup>, C. Pimenta<sup>2</sup>, B. Grinztajn<sup>2</sup>, V. Veloso<sup>2</sup>, C.F. Caceres<sup>1</sup>

<sup>1</sup>Universidad Peruana Cayetano Heredia, Centro de Investigación Interdisciplinaria en Sexualidad, SIDA y Sociedad, Lima, Peru, <sup>2</sup>Oswaldo Cruz Foundation/Fiocruz, Evandro Chagas National Institute of Infectious Diseases, Rio de Janeiro, Brazil

**Background:** Syphilis remains as a public health concern. PrEP implementation programs in Latin America need to assess, along testing their feasibility, the impact on STIs. We evaluated the relationship between PrEP adherence and Syphilis incidence among men who have sex with men (MSM) and Trans women (TW) enrolled in ImPrEP, a multi-country PrEP demonstration project

**Methods:** From April 2018 to June 2021, 2,293 MSM/TW attending STI clinics from Peru were enrolled in ImPrEP. Participants were  $\geq 18$  yo, HIV-negative, and reported recent (previous 6 months): condomless anal sex, sex with HIV positive/unknown status partner, STI history (diagnosis or signs/symptoms) or transactional sex.

Follow-up visits and PrEP dispensation were quarterly, included syphilis testing (rapid treponemal test and RPR, if syphilis-negative at enrolment, RPR only if rapid treponemal test was reactive at baseline), and behavioral assessment. PrEP adherence assessment included medication possession ratio (MPR: number of pills prescribed/number of days between visits) for each visit. GEE Poisson regression models were used to evaluate factors related to syphilis incidence, and changes in syphilis incidence due to lockdown for COVID-19 emergency (declared on March 15, 2020)

**Results:** Overall syphilis incidence was 9.1 (95%CI: 7.9-10.4)/100 person-years (p.y.) (205 syphilis cases over 185 participants); 10.0 (8.3-12.1)/100 p.y. and 8.1 (6.6-10.0)/100 p.y. before and during/after lockdown, respectively.

Syphilis incidence was 14.7 (10.5 - 20.1)/100 p.y. for TW and 8.3 (7.1 - 9.7)/100 p.y. for cisgender-MSM. Syphilis incidence was higher among PrEP-adherent participants (MPR $\geq 0.6$ ) (IRR: 1.5 [IC: 1.1 - 2.0]), among TW (IRR: 1.6 [1.1 - 2.5]) and for participants reporting condomless anal sex (IRR: 1.5 [1.1 - 2.1]). Syphilis incidence was related to condomless anal sex (IRR: 2.4 [1.4 - 3.9]) before lockdown, but was related with syphilis diagnosis at enrolment (IRR: 2.7 [1.7 - 4.4]) during/after lockdown.

**Conclusions:** Syphilis incidence was high among Prep-adherent MSM/TW, was strongly related to condomless sex and being trans.

Health systems incorporating PrEP should reinforce the importance of periodical check-ups for those on PrEP, especially TW, who had a higher syphilis incidence com-

pared to cis-gender MSM; Interventions to prevent STIs among TW using PrEP are needed to sustain trans-focused services.

## TUPEC215

### Optimizing PrEP service delivery amongst AGYW in Tebelopele Wellness Centers to accelerate access and retention

T. Lekhane<sup>1</sup>, K. Jaba<sup>2</sup>, G. Makwinja<sup>2</sup>, B. Matswiri<sup>2</sup>

<sup>1</sup>Tebelopele Wellness Centers, Monitoring and Evaluation, Gaborone, Botswana, <sup>2</sup>Tebelopele Wellness Centers, Programs, Gaborone, Botswana

**Background:** The Fifth Botswana AIDS Impact Survey 2021 (BAIS V) report indicates that Botswana is well on its way to reaching epidemic control having surpassed the UN-AIDS 95-95-95 target at 95-98-98. The survey depicts a gap among people living with HIV 15-24 years, 84.5% were aware of their status, 98.5% of those aware were on Anti-Retroviral Therapy, and 91.6% of those on Anti-Retroviral Therapy achieved Viral Suppression.

To sustain epidemic control, Tebelopele Wellness Centers (TWC) as a community-based facilities and DREAMS clinical partner continues to be challenged with reaching AGYW with HIV prevention services and reduce their susceptibility to contract HIV due to variety of factors including low PrEP awareness and poor perception of HIV exposure.

**Description:** To accelerate PrEP uptake, TWC adopted facility- and community-based service provision models targeting 2 groups with different susceptibility profiles: the in-school and out-of-school. TWC collaborated with tertiary schools including vocational training institution (in-school) to raise awareness through DREAMS screening to provide comprehensive prevention package: HTS, PrEP, contraceptive methods, condom education and distribution, STI screening and treatment, post GBV care, and referrals for DREAMS primary package. In collaboration with TWC, community-based organizations actively mobilize out-of-school AGYW to access services during community outreaches at AGYW area of foci as well as DREAMS safe spaces.

**Lessons learned:** From October 1<sup>st</sup>, 2021, to 30<sup>th</sup> September 2023, a total of 3320 AGYW were initiated on PrEP. 2253 (68%) were initiated in the community while 1067 (32%) were initiated in the facility. Of the 1279 clients who were reviewed during this period, 882 (69%) and 397 (31%) were reviewed in the community and facility respectively. Through decentralizing PrEP services, TWC achieved 110% (3320/3017) AGYW initiation on PrEP against the target.

**Conclusions/Next steps:** 1. Successful PrEP scale up for AGYW requires PrEP integration into the young women's daily lives.

2. Scale up PrEP decentralization to improve access and continuity.

Significant Strides are made to access PrEP from community-based initiation and reviews, this may be attributed to effective community health promotion, quick access to care and lack of stigmatization experienced. Improvement of HIV education from lower age levels would increase uptake of PrEP for AGYM.

## TUPEC216

### VMMC scale-up in SA: key lessons

M. Phohole<sup>1</sup>, N. Igaba<sup>1</sup>, C. Wose Kinge<sup>1</sup>, K. Moyo<sup>1</sup>

<sup>1</sup>Right to Care, Voluntary Medical Male Circumcision, Pretoria, South Africa

**Background:** South Africa (SA) is among fifteen Sub-Saharan African nations intensifying efforts to expand Voluntary Medical Male Circumcision (VMMC) due to the high HIV burden and inadequate circumcision coverage. Scientific evidence supports VMMC as a measure to reduce HIV transmission by 60%. Despite circumcising around 5.5 million males, SA's national circumcision saturation stands at 49.9%, falling short of the 80% target.

This study examines the outcomes of a major VMMC initiative in SA's selected districts, supported by Right to Care (RTC) through the CDC-funded VMMC program.

**Methods:** A retrospective data analysis utilized de-identified program data collected between April 2018 and September 2023 from 15 CDC-supported districts across six provinces. Focused on males aged 10 and above, a semi-structured questionnaire explored reasons for seeking VMMC and information sources. Standard tools from RTC and the National Department of Health (NDoH) facilitated data collection and were stored securely in a cloud-based Monitoring and Evaluation (M&E) system. Descriptive analysis, Pearson's chi-square, and Fischer's exact test were applied to the dataset.

**Results:** Over six years, 465,188 clients received HIV prevention services at program sites. Whilst 113 females (0.02%) received HIV testing services, among 465,075 male consultees, an impressive 99% (459,367) underwent successful circumcision. Tradition/Customary Male Initiation provinces, namely Eastern Cape and Mpumalanga, contributed significantly (28% and 33%). FY2 and FY5 saw peak circumcision rates at 22% and 25%. Most circumcisions were among individuals aged 15 to 34. HIV uptake was 85%, with a 7% refusal rate and a 1% yield.

The 87% follow-up rate aided early identification and management of adverse events (0.19%), with Gauteng province contributing the most severe cases. Swelling, bleeding and infection were the commonly identified AEs at 28%, 26% and 23% respectively.

**Conclusions:** Despite facing challenges, the six-year VMMC program in SA demonstrated adaptability, with the number of circumcised men ranging from 38,393 to 116,012. Investments in Traditional Male Initiation were beneficial but would require further strengthening over

time for more coverage. Collaborative efforts in client recruitment, counselling, and surgical processes could enhance the follow-up rate, improving the early identification and management of adverse events.

## TUPEC217

### Time to Diagnosis of notifiable adverse events resulting from Voluntary Medical Male Circumcision in select countries, 2012-2021

K. Ong<sup>1</sup>, M. Peck<sup>1</sup>, A. Thomas<sup>2</sup>, S. Nabukera<sup>3</sup>, V. Kiggundu<sup>4</sup>, L. Martindale<sup>5</sup>, R. Bhatia<sup>1</sup>, T. Lucas<sup>1</sup>

<sup>1</sup>Centers for Disease Control and Prevention, Division of HIV and TB, Atlanta, United States, <sup>2</sup>HIV/AIDS Prevention Program U.S. Department of Defense, Washington DC, United States, <sup>3</sup>Bureau of Global Health Security and Diplomacy (GHSD), Washington DC, United States, <sup>4</sup>United States Agency for International Development (USAID, Washington DC, United States, <sup>5</sup>United States Agency for International Development, Washington DC, United States

**Background:** Voluntary medical male circumcision (VMMC) has been a primary strategy for HIV prevention in high HIV burden countries in Southern and Eastern Africa since 2008. Monitoring of adverse events (AE) is essential for VMMC program safety. VMMC sites supported by the United States President's Emergency Plan for AIDS Relief (PEPFAR) require follow-up of VMMC clients within 14 days post-surgery for AE assessment.

Notifiable AEs (NAEs) are monitored using PEPFAR's Notifiable Adverse Events Reporting System (NAERS). Circumcision procedure to NAE diagnosis time (i.e., time to diagnosis or TTD) for different types of NAEs in NAERS has not been studied and may occur outside the recommended 14-day period.

**Methods:** We analyzed NAEs reported in NAERS between fiscal year (FY)2012 and FY2021 across the 15 Southern and Eastern African countries with PEPFAR-funded VMMC programs. Frequency of different types of NAEs were assessed. Key variables included in the analysis were date of circumcision, date of NAE diagnosis, NAE type, and client age. Range and median TTD for the various types of AEs were compared.

**Results:** From 2012-2021, 472 NAE cases were reported from 14 of the 15 countries. Fifty-three percent (n = 248) of NAEs were diagnosed within 7 days of circumcision, 21.8%(n=103) between 8 and 14 days, 23.1%(n=109) more than 14 days after VMMC and 2.5% (n=12) had missing information.

Overall median TTD was 7 days but variable by NAE type: hospital admissions 7.0 (0-339), anatomic deformity 22.5(0-347), permanent disability 23.0(0-114), amputation of the glans or shaft of penis 0.0(0-366), death 5.0(0-19), device displacement 0.0(0-1), tetanus 11.0(3-22). Median TTD for clients <15 years old was 8.0(0-366) and 6.0(0-105) for clients ≥ 15 years old (Mann-Whitney U=21093, p=.004).

**Conclusions:** Although most NAEs are diagnosed within 14 days, some take longer to develop and may present outside the standard 14-day follow-up window. It is essential to ensure mechanisms are in place for timely AE diagnosis and management beyond scheduled follow up period. Understanding reasons for extended TTDs and identifying clients who may be at risk for AEs beyond the traditional follow-up period is important for AE prevention and optimal management.

## Integration of HIV services with other services, including sexual and reproductive health

### TUPEC218

Child sexual assault: a public health threat.  
Review of program data at UTH One-Stop Centre, Lusaka Zambia

R. Ginwalla<sup>1</sup>, K. Sampa<sup>1</sup>, C. Mtine<sup>1</sup>, O. Tembo<sup>1</sup>, M. Phiri<sup>1</sup>, M. Mweemba<sup>1</sup>, F. Mulenga<sup>1</sup>, C. Kankasa<sup>1</sup>

<sup>1</sup>University Teaching Hospital, Pediatrics, Lusaka, Zambia

**Background:** The impact of sexual violence against children goes far beyond the initial incident, both severe short to long-term health and social consequences. In Zambia Child Sexual Abuse is very common but largely under-reported due to social stigma and access to services.

**Methods:** Reviewed program data of reported cases of suspected child defilement at the University Teaching Hospital from January to June 2021 in children below the age of 16 years. Reviewed all the cases in this period by age and sex, alleged perpetrators, where offence took place and medical services offered.

Results of tests including HIV, RPR, Hep B, swabs for sperm analysis and pregnancies, eligibility and access to Post Exposure Prophylaxis (PEP) and Emergency Contraception (EC).

**Results:** Total 467 cases were reported over 6 months. Majority cases were female (404) and 72 % were adolescents. Age ranges included the following: 0 to 4yrs - 46 (11%); 6 to 10yrs - 70 (17%) and 11 to 15 - 297 (72%).

Perpetrators were known to the survivor 371 (89%) the commonest being a boyfriend 27% or a neighbor 11%. Location of the abuse known in 309 cases. Majority of abuse took place in the abusers home (43 %) or in the survivors' home (24%). Nine children tested positive for HIV (2%); 2 (0.5%) for syphilis and 4 (1%) for Hep B. Of the 256 adolescent girls who were sexually mature, 15% (39) tested positive for pregnancy.

Genital swabs for spermatozoa were collected from 233 girls 107 (46%) tested positive. 100% of the clients received PEP for HIV prophylaxis if they were eligible, however many

(45%) presented late (after 72 hours) missed the opportunity to get PEP. Missed opportunity for Emergency Contraception was 44% (after 120 hours).

**Conclusions:** Child Sexual Abuse remains a public health threat with many young children and adolescents, vulnerable within their "protected environment" close to home. Late presentation to the One-Stop Centre resulted in missed opportunity to prevent pregnancies HIV and other STI's. The high rates of positive smears for spermatozoa from vaginal swabs, presents an opportunity to work closely with the newly established DNA laboratory in Zambia.

### TUPEC219

Integrating mental health support in HIV treatment programs: the ICARE model's impact on vulnerable populations in Uganda

G. Kasula Ntale<sup>1</sup>

<sup>1</sup>MUCOBADI, Programs, Kampala, Uganda

**Background:** Uganda faces a dual burden of mental health challenges and HIV prevalence, with 35% of the population experiencing mental health issues and a 5.8% HIV prevalence rate. Vulnerable populations, including adolescents living with HIV (ALHIV) and survivors of sexual violence against children (SVAC), experience disproportionate mental health struggles that negatively impact HIV outcomes.

This study sought to address this interplay by integrating mental health interventions into HIV treatment programs through the ICARE model.

Project Goals and Objectives were to expand the implementation of interpersonal group therapy for adolescents affected by HIV in the districts of Kamuli, Bugiri, Namayingo, Jinja, Buikwe, and Kayunga, ensuring broader reach and impact.

**Description:** The ICARE Mental Health integration into the HIV pilot took place in the Districts of Bugiri, Kamuli, Namayingo, Buikwe, and Mukono in East Central Uganda, targeting vulnerable HIV+. A phased approach involving: **Awareness Raising of Stakeholders** from clinical, education, and community sectors; **Depression Screening by using** the PHQ9 tool; **Group Therapy by community social workers**; **Sports Integration** to promote well-being and social engagement; **Community Conversations to enhance** Open dialogues with caregivers and local leaders for sustaining mental health services.

**Lessons learned: Findings:** Better disclosure: MH status @94% & HIV status @100%; Better coping skills; reduced stigma, functional limitations & suicidal thoughts; Reduced IIT: 97% PLHIV (12-24 years) treatment adherence; Improved VLS: 86% PLHIV (12-24 years) attributing VLS partly to MH integration. The ICARE model demonstrates a promising approach for integrating mental health support into HIV treatment programs in low-resource set-

tings, with potential for replication in other countries. Further research is needed to evaluate its long-term impact on HIV outcomes and overall well-being.

Integration of mental health services into HIV care has the potential to significantly improve treatment adherence, viral load suppression, and quality of life for PLWHA.

**Conclusions/Next steps:** The pilot successfully reached a large number of vulnerable AYP with mental health services, highlighting the effectiveness of the integrated approach and its potential for long-term sustainability. The ICARE model highlights an innovative approach to addressing the complex interplay between mental health and HIV, contributing to the fight against the HIV/AIDS epidemic in Uganda and beyond.

## TUPEC220

Retrospective analysis of cervical cancer screening rates among women living with HIV enrolled in differentiated service delivery models in Nigeria

O. Ibitham<sup>1</sup>, C. Nwangeneh<sup>1</sup>, I. Elechi<sup>2</sup>, E. Nwanja<sup>3</sup>, U. Akpan<sup>3</sup>, M. Unimuke<sup>3</sup>, O. Onwah<sup>3</sup>, C. Okolo<sup>3</sup>, O. Toyo<sup>3</sup>, D. Carpenter<sup>4</sup>, G. Etheredge<sup>4</sup>, N. Persaud<sup>4</sup>, B. Oyawola<sup>5</sup>, D. Ogundehin<sup>5</sup>, E. James<sup>5</sup>, O. Onyedini<sup>3</sup>, A. Adegboye<sup>3</sup>, V. Ogbodo<sup>1</sup>, A. Eyo<sup>3</sup>

<sup>1</sup>FHI 360, Abuja, Nigeria, <sup>2</sup>Achieving Health Nigeria Initiative, Abuja, Nigeria, <sup>3</sup>Excellence Community Education Welfare Scheme (ECEWS), Uyo, Nigeria, <sup>4</sup>FHI 360, Washington, DC, United States, <sup>5</sup>Office of HIV/AIDS and TB, United States Agency for International Development, Abuja, Nigeria

**Background:** Women living with HIV (WLHIV) have a higher risk of developing cervical cancer. To improve early detection and treatment, the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) through the United States Agency for International Development (USAID)-funded Meeting Targets and Maintaining Epidemic Control (EpiC) and Accelerating Control of HIV Epidemic (ACE 5) projects, integrated cervical cancer screening and treatment in HIV programs across the differentiated service delivery models (DSD) in 2020.

This study assessed the uptake of cervical cancer (CC) screening among WLHIV enrolled on DSD models in Cross River State, Nigeria.

**Methods:** This was a retrospective cross-sectional analysis of the electronic medical records at 53 health facilities in Cross River State between April 2020 and March 2023. WLHIV ages 25–49 years were categorized by eligibility for CC screening.

We abstracted their CC screening status, categorized as screened and not screened, and DSD status, categorized based on location of antiretroviral therapy (ART) refill pickup into facility-based (FBM) and community-based (CBM) DSD models. All women in DSD were offered screening. Those in FBM who accepted were screened during the

same clinic visit at the health facility, and those in CBM who accepted were referred to the nearest health facility with the capacity to conduct CC screening. The proportion of women screened for CC was compared between the FBM and the CBM using chi-square with a significance level set at 0.05.

**Results:** A total of 16,441 WLHIV were eligible for CC screening, with a median age of 37±7.4; 60.0% (9,862) were enrolled on DSD (FBM = 56.3%, 5,548/9,862; CBM = 43.7%, 4,314/9,862). Overall, 41.4% (6,806/16,441) received CC screening, with a positivity rate of 0.7% (48/6,806). Of the 6,806 women screened for cervical cancer, 59.2% (4,026) were enrolled in a DSD model. The proportion of women screened was higher in the FBM at 57.3% (2,307/4,026) compared to the CBM at 42.7% (1,719/4,026) ( $p < 0.05$ ).

**Conclusions:** Though cervical cancer screening rates were suboptimal, WLHIV enrolled in FBM had better screening rates than those in CBM. Interventions that identify and address the reasons for the suboptimal screening rates in both models are recommended.

## TUPEC221

Sexually transmitted infections and seeking care behaviour among sexually active adolescent girls and young women (AGYW) in Zimbabwe: a respondent driven sampling survey

K. Chidhanguro<sup>1</sup>, W. Murenjekwa<sup>1</sup>, G. Ncube<sup>2</sup>, A. Copas<sup>3</sup>, F. Cowan<sup>1,4</sup>, J. Dirawo<sup>1</sup>, E. Matsikire<sup>1</sup>, A. Mpofu<sup>5</sup>, O. Mugurungi<sup>2</sup>, A. Phillips<sup>6</sup>, I. Taramusi<sup>7</sup>, E. Sibanda<sup>1,4</sup>, V. Cambiano<sup>6</sup>

<sup>1</sup>Centre for Sexual Health, HIV & AIDS Research (CeSHHAR), Zimbabwe, Sexual & Reproductive Health, Harare, Zimbabwe, <sup>2</sup>Ministry of Health and Child Care, AIDS and TB Unit, Harare, Zimbabwe, <sup>3</sup>University College London, Institute for Global Health and the MRC Clinical Trials Unit, London, United Kingdom, <sup>4</sup>Liverpool School of Tropical Medicine, International Public Health, Liverpool, United Kingdom, <sup>5</sup>National AIDS Council (NAC), Monitoring and Evaluation, Harare, Zimbabwe, <sup>6</sup>University College London, Institute for Global Health, London, United Kingdom, <sup>7</sup>UNAIDS UCO, Harare, Zimbabwe

**Background:** Uptake of sexual and reproductive health services (SRH) among adolescent girls and young women (AGYW) is poor. We aimed to estimate the prevalence of sexually transmitted infections (STIs) and describe uptake of STI treatment amongst sexually active AGYW (SA-AGYW).

**Methods:** A cross-sectional respondent driven sampling survey of SA-AGYW, aged 15–24 years was conducted in May–July 2023 in six urban and peri-urban districts in Zimbabwe. Participants self-completed an audio computer-assisted questionnaire focusing on sexual behaviour, STI symptoms and uptake of SRH services. A random third self-collected vaginal swabs that were tested for Chla-

mydia (CT), Gonorrhoea (NG), and *Trichomonas vaginalis* (TV) using a multiplex polymerase chain reaction test. Individuals with positive results were notified by phone call (up to six attempts) and offered free treatment at their clinic of choice.

**Results:** Of 900 SA-AGYW, 68% (614/900), reported having condomless sex in the last three months, with 17% (157/900) reporting having genital sores, genital warts, or an unusual vaginal discharge in the last 12 months; 41% (64/157) reported not doing anything about these symptoms. During the survey 8% (72/900) reported current symptoms. Among the 300 that collected vaginal swabs 31% (93/300) tested positive to at least one of CT, NG, or TV; however, 89% (82/92) reported no current symptoms. Of note 9% (26/294) reported current symptoms and among these 38% (10/26) tested positive to at least one STI compared to 31% (82/268) in those who did not. Of those with a positive result 76% (71/93) were successfully notified. However, 51% (36/71) came forward to receive treatment (Figure).

Figure 1. STI cascade of care among sexually active AGYW in Zimbabwe.

**Conclusions:** High STI prevalence continues to be seen amongst SA-AGYW. Despite offering free treatment at local clinics only half of them accessed it. Better provision for screening and treatment of STIs is required coupled with education to raise awareness of STIs and the fact that they are often asymptomatic.

## TUPEC222

**Background:** Cervical cancer is the fourth most common cancer in women globally with an estimated 604 000 new cases and 342 000 deaths in 2020. Women living with HIV are 6 times more likely to develop cervical cancer compared to women without HIV.

This study assessed awareness and knowledge of cervical cancer and uptake of cervical cancer screening and prevention services among women of reproductive age living with HIV and AIDS in Nigeria.

**Methods:** A cross sectional study was conducted among women living with HIV accessing care and treatment services in two states of North Central Region of Nigeria (N

= 1,030) with average age of 36.5. years. Multistage sampling technique was used for selection of study zones, local government areas and facilities. Purposive sampling was adopted to select women age 24 – 49 years who met other inclusion criteria. Quantitative data collection was done using validated questionnaire with Cronbach's Alpha coefficient of 0.8. Data were analysed with SPSS version 16.0 and data were presented in frequency and percentages.

**Results:** Only 279 (36.5%) of the 765 have ever been screened for cervical cancer, while 486 (63.5%) have never been screened and 222 (79.6%) of the 279 have only been screened once. Unfortunately, 737 (96.3%) of the 765 had never been vaccinated for cervical cancer. More than 60% of the participants have good knowledge of cervical cancer as 62.3% know that having multiple sexual partners and early sexual activities are risk factors.

Also, 57.6% knows that Human Papilloma Virus is a causative agent of cervical cancer and 67.6% also know that cervical cancer is preventable and that pre-cancerous lesion can be treated. However, only 34.2% have heard that pap smear test can help in early detection.

**Conclusions:** Awareness, screening and vaccination against cervical cancer are not optimal among women of reproductive age living with HIV in North Central, Nigeria. Although knowledge among those who are aware is above average, responsibilities are placed on all Public Health Experts to develop interventions that will increase awareness and uptake of screening and vaccination against cervical cancer among women of reproductive age living with HIV in North Central Nigeria.

## TUPEC223

**An evaluation of the impact of HIV/Syphilis combo test kit on equity of access to syphilis screening of pregnant women presenting for ANC in Enugu State, Nigeria**

S. Ilechukwu<sup>1</sup>, I. Ezieme<sup>2</sup>, P. Eze<sup>3</sup>, U. Egwim<sup>1</sup>, A. Ogueji<sup>4</sup>, U. Okenwa<sup>5</sup>

<sup>1</sup>South Saharan Social Development Organisation, Enugu, Nigeria, <sup>2</sup>Georgetown Global Health Nigeria, Bauchi,

Nigeria, <sup>3</sup>Penn State University, Department of Health Policy and Administration, Pennsylvania, United States,

<sup>4</sup>Enugu State Ministry of Health, Planning Research and Statistics, Enugu, Nigeria, <sup>5</sup>Enugu State Ministry of Health, Public Health, Enugu, Nigeria

**Background:** Pregnant women are screened for syphilis when they present at Antenatal Clinics (ANC), failure of which risks the health of the unborn children. We sought to understand if there was inequity in access to syphilis screening across different populations and if the introduction of an HIV Combo test kit (a rapid test kit that screens for both HIV and syphilis) in January 2023 led to improvement in equity.

**Methods:** We analyzed the aggregate data reported by health facilities on syphilis and HIV screening among pregnant women who presented for ANC on the DHIS2 platform between January 2021 and December 2023 to determine coverage rates in urban, semi-urban, and rural populations in Enugu state, Nigeria. After that, we calculated the absolute and relative inequity in screening coverage for both diseases between the urban and rural populations.

**Results:** Pregnant women presenting for ANC in urban areas were eleven times more likely to be screened for syphilis than their rural counterparts in 2021, five times more likely in 2022, and two times more likely in 2023. The HIV screening rate was similar across populations for 2021, 2022, and 2023.

Year	Coverage				Absolute inequity = (Urban - Rural)		Relative inequity = (Urban/Rural)	
	Rural		Urban					
	Syphilis	HIV	Syphilis	HIV	Syphilis	HIV	Syphilis	HIV
2021	7%	100%	79%	100%	72%	0%	11	1
2022	18%	100%	84%	100%	66%	0%	5	1
2023	49%	100%	100%	100%	51%	0%	2	1

Table. Syphilis and HIV screening rates among pregnant women presenting for ANC in Enugu State.

**Conclusions:** Inequity exists in access to syphilis screening but not in HIV screening. However, inequity in syphilis screening has reduced over the last three years, with the introduction of the HIV-Syphilis Combo test kit contributing to this. This suggests that integrating other disease intervention programs into the HIV/AIDS program could lead to a greater increase in access as the HIV/AIDS program is disproportionately well-funded in the country, enabling its saturation across populations within the state. Further research should investigate other factors that contribute to a decrease in inequity in access to syphilis screening.

Center IV, Sexual and Reproductive Health, Nakasongola,

Uganda, <sup>7</sup>PATH-Seattle, Primary Health Care, Seattle,

United States

**Background:** In Uganda, 1 in 4 adolescent girls (aged 15-19) is pregnant or has a child, and 29% of new HIV infections occur among AGYW (aged 15-24). Although PrEP is a highly-effective prevention method, awareness, access, and adherence among AGYW in Uganda remain low.

With the Ministry of Health, PATH and AGYW peer researchers applied human-centered design to co-create integrated PrEP and FP service delivery models tailored to AGYW preferences and needs in Uganda.

**Methods:** Ugandan AGYW researchers and PATH collected 128 in-depth interviews (IDIs) from 60 AGYW (aged 15-24), 24 public and 24 private health care providers, 10 policymakers, and 10 community leaders plus 4 focus group discussions with AGYW and FP and PrEP Providers from Nakasongola and Masaka districts from May to September 2023 to identify access barriers and preferences for integrated PrEP-FP service models.

**Results:** Participants across all categories strongly favored integrating PrEP within existing FP services through a range of integration models; reasons given included possible reduced transport costs, reduced waiting time at facilities, improved privacy, and improved PrEP awareness and understanding among AGYW who use FP and may also have a need for PrEP.

*"If I can come to hospital and I receive my PrEP and injection (for contraception) then I can save on transport." (Young Woman from Masaka).*

PrEP-FP models recommended by participants were: midwives at public facilities (most preferred model); community health workers; and pharmacy-based PrEP/FP services.

Potential challenges for suggested models to be addressed include PrEP availability outside of government facilities, end-user costs at pharmacies, human resource shortages, stockouts of PrEP and FP products, and fears and misconceptions related to PrEP and FP. To mitigate potential challenges, participants recommended policy and workflow changes to enable PrEP delivery by addi-

tional cadres, provider training, supportive supervision, supply chains strengthening, and communication campaigns.

**Conclusions:** Ugandan AGYW and health workers call upon policymakers and donors to integrate PrEP and FP services, with three models identified as acceptable and feasible. If potential challenges are addressed, differentiated PrEP-FP models could lead to increased dual uptake and cost efficiencies, sustainably contributing to improved choice, agency, and health.

## TUPEC225

Integrated service delivery for people who inject drugs: a program implementation study from India

S.S. Vohra<sup>1</sup>, R. Rana<sup>1</sup>, A. Rawat<sup>1</sup>, K. Biswas<sup>1</sup>, M. Asif<sup>1</sup>

<sup>1</sup>Plan International (India Chapter), New Delhi, India

**Background:** The 2021 Programmatic Mapping and Population Size Estimation (p-MPSE) conducted by the National AIDS Control Organisation revealed an estimated 280,000 People Who Inject Drugs (PWIDs) in India. These individuals face heightened risks of diseases like Tuberculosis, HIV, Hepatitis, and sexually transmitted infections due to unsafe practices and poor quality of life. The absence of a formal institutional mechanism for cross-referrals necessitated a shift from fragmented, provider-centred models of care to integrated, person-centred approaches.

**Description:** One Stop Centres (OSCs), a novel initiative with inter-ministerial coordination involving the Ministry of Social Justice & Empowerment, emerged as a solution. These OSCs aimed to provide comprehensive services to PWIDs through a community-based, single-window approach. Services, both health and non-health related, were offered directly or through accompanied referrals. Staff recruitment from within the community enhanced effectiveness in client outreach and service delivery. Drop-in centres were established, offering a safe space for clients to engage in recreational activities and peer-led motivational discussions. Flexi-timings were adopted to reach clients at more convenient times, and intensive counselling along with family engagement was sought to improve treatment adherence.

**Lessons learned:** Within months, 9244 clients were enrolled, with over 90% undergoing HIV screening (4.7% positivity). Unprecedentedly high HIV positivity was noted in states like Haryana, Delhi, Assam, Tripura, and Mizoram. A 9.3% positivity for Hepatitis C was observed, with identification of tuberculosis and syphilis cases. Over 3000 clients were screened for non-communicable diseases, and 146 were linked with social protection and welfare schemes. The pan-India implementation of OSCs unveiled varying risk profiles among PWIDs in different states. For example, in North-Eastern states, a majority of clients were aged 19-27, while in Delhi and Haryana, entire families were in-

volved in drug use. Contrasts also emerged in drug injection practices, with undiluted heroin use prevalent in the North-East, while in the North, dilution with pharmaceutical substances and high needle-sharing behaviour were noted.

**Conclusions/Next steps:** Integrated service delivery centres like OSCs have underscored the significance of person-centric, single-window service delivery models for HIV elimination. The successful outcomes showcased immense potential for scaling up such initiatives nationwide.

### Integrating mobile SMS PrEP navigation services into a nationwide home HIV/STI self-testing program in the US

A. Liu<sup>1,2</sup>, C.-D. Alleyne<sup>1</sup>, J. Moss<sup>1</sup>, J. Vinson<sup>1</sup>, K. Lafferty<sup>3</sup>, S. Quintana<sup>3</sup>, N. Duenez<sup>3</sup>, K. Lopez<sup>4</sup>, D. Johannessen<sup>5</sup>, A. Fraide<sup>5</sup>, S. Buchbinder<sup>1,2</sup>, H. Scott<sup>1,2</sup>, T. Torres<sup>6</sup>, J. Hecht<sup>7</sup>  
<sup>1</sup>San Francisco Department of Public Health, Bridge HIV, San Francisco, United States, <sup>2</sup>University of California, San Francisco, San Francisco, United States, <sup>3</sup>Sacramento County Public Health, Sacramento, United States, <sup>4</sup>Tarrant County HIV Administrative Agency, Fort Worth, United States, <sup>5</sup>HELP Center for LGBT Health and Wellness, Fort Worth, United States, <sup>6</sup>Instituto Nacional de Infectologia Evandro Chagas, Fundação Oswaldo Cruz, Rio de Janeiro, Brazil, <sup>7</sup>Springboard HealthLab, Richmond, United States

**Background:** TakeMeHome.org is an online program enabling state/local health departments to offer free HIV/STI self-testing. Since its inception in March-2020, >42,000 kits have been ordered, with 31% testers reporting never testing. As <5% of TakeMeHome users have used PrEP, there is an opportunity of linking TakeMeHome users to PrEP information and services.

**Description:** PrEPmate, a CDC-endorsed bi-directional texting platform, demonstrated increased PrEP retention/adherence. We developed a novel program of linking TakeMeHome testers to mobile SMS PrEP navigation via PrEPmate. We conducted focus groups (FGs) among TakeMeHome.org users to elicit preferences for linkage from TakeMeHome to PrEPmate. Through these FGs and input from local health departments and community advisory groups, we revised content and functionality for this linkage. In October-2023, we launched a pilot in two US Ending the HIV Epidemic (EHE) jurisdictions: Sacramento, California and Tarrant, Texas.

**Lessons learned:** 13 TakeMeHome users participated in four FGs (mean age 31.5; 31% Latinx, 15% Black; 69% never used PrEP). When shown wireframes of TakeMeHome/PrEPmate linkage, most thought they were easy to navigate and user-friendly. They liked the privacy of connecting with a PrEP navigator using SMS. Participants recommended providing a clear description of PrEP and

PrEPmate's services and indicating PrEP is low/no-cost. On PrEPmate landing page, they recommended adding language on confidentiality and the partnership with TakeMeHome to show both services are connected. Once enrolled, they recommended weekly/bi-weekly check-ins to assist with PrEP navigation.

Overall, 92% of FG participants were likely to use PrEPmate to learn more about PrEP and/or link to PrEP services. From October-December-2023, among 252 individuals who ordered test kits, 62 were linked to PrEPmate page, and 29 enrolled in PrEPmate. PrEP navigation has been provided via SMS/phone, with several new PrEP starts at local clinics. Navigators suggested adding PrEP information to onboarding messages, using open-ended questions to address broader client needs, and including clinic website links to facilitate appointment scheduling.

**Conclusions/Next steps:** Through local public health and community input, we successfully developed a program to link TakeMeHome testers to PrEP navigation via PrEPmate. Next steps will be to evaluate pilot outcomes and if successful, expand PrEPmate navigation to all EHE jurisdictions using TakeMeHome.

## TUPEC227

### Co-creating an integrated gonorrhea and chlamydia testing program at community-based HIV testing centers for men who have sex with men in China

K.T. Li<sup>1</sup>, G. Marley<sup>2</sup>, L. Zhang<sup>3</sup>, Z. Zhu<sup>2</sup>, Y. Liu<sup>2</sup>, R.K. Tan<sup>3</sup>, W. Tang<sup>4</sup>, J.D. Tucker<sup>4</sup>

<sup>1</sup>University of California Los Angeles, Division of Infectious Diseases, Los Angeles, United States, <sup>2</sup>UNC Project China, Guangzhou, China, <sup>3</sup>National University of Singapore, School of Public Health, Singapore, Singapore, <sup>4</sup>University of North Carolina - Chapel Hill, Division of Infectious Diseases, Chapel Hill, United States

**Background:** Many Chinese men who have sex with men (MSM) rarely access care through traditional healthcare channels due to social stigma. Community-based organizations (CBOs) have emerged as an important provider of HIV testing services for MSM. However, few CBOs offer integrated testing for *Neisseria gonorrhea* (NG) or *Chlamydia trachomatis* (CT). We co-created and implemented a CT/NG testing program in partnership with six CBOs in Guangdong Province that normally provide rapid HIV, syphilis, and HCV testing for MSM as part of the PIONEER RCT (NCT05723263).

**Description:** From February to November 2023, we co-created a program for CT/NG testing along with 12 community MSM and 4 CBO staff members. The program was implemented from July to December 2023. CBO staff approached MSM presenting for routine HIV testing 18 years old who had not tested for CT/NG in the past year. At baseline, sociodemographic information and prior STI

testing history were collected. Participants were offered pooled urethral, pharyngeal, and rectal CT/NG nucleic acid amplification testing. CBO implementors collected and pooled all samples and shipped samples to an external lab weekly. They also provided results notification for participants through WeChat and referred positive testers for treatment at local hospitals.

**Lessons learned:** 393 MSM were approached from July to December 2023. The mean age was 32.9 years (SD 10.2). At baseline, 374 (95%) reported ever testing for HIV, 372 (95%) for syphilis, and 349 (89%) for hepatitis C. Only 216 (54%) reported ever testing for NG and 211 (54%) for CT. Across all sites, 291 (74%) participants received CT/NG testing. 10 (3.4%) tested positive for NG and 60 (20.6%) for CT, including 5 CT/NG co-infections.

With support from the research team, CBO staff successfully integrated CT/NG testing procedures, including counseling for results and referrals for further care, with routine workflows for HIV rapid testing. CBO leadership was critical for reaching and maintaining the trust of community MSM.

**Conclusions/Next steps:** Through an integrated CT/NG testing program, CBOs reached new CT/NG testers and diagnosed high rates of CT/NG in MSM at risk for HIV. Next steps include optimizing follow-up and treatment and analyzing costs so that these programs can be sustained.

## TUPEC228

**Acceptability and feasibility of a one-stop home-based genital self-sampling for female genital schistosomiasis, human papilloma virus and trichomonas and HIV self-testing: baseline data from a longitudinal cohort study in Zambia**

R. Ndubani<sup>1</sup>, K. Shanaube<sup>1</sup>, O. Lamberti<sup>2</sup>, N. Kasese<sup>1</sup>, J. Fitzpatrick<sup>1</sup>, M. Cheeba<sup>1</sup>, B. Nyondo<sup>1</sup>, B. Neufeld<sup>2</sup>, B. Kosloff<sup>3</sup>, B. Webster<sup>4</sup>, H. Kelly<sup>2</sup>, A.L. Bustinduy<sup>2</sup>

<sup>1</sup>Zambart, Lusaka, Zambia, <sup>2</sup>London School of Hygiene and Tropical Medicine, Clinical Research, London, United Kingdom, <sup>3</sup>Longhorn Vaccines and Diagnostics LLC, Bethesda, United States, <sup>4</sup>Natural History Museum, London, United Kingdom

**Background:** Female genital schistosomiasis (FGS) is a neglected gynecological disorder that affects 56 million girls and women in Sub-Saharan Africa, caused by the waterborne parasite *Schistosoma (S.) haematobium*. FGS is associated with infertility, dyspareunia and symptoms mimicking sexually transmitted infections (STIs), is a risk factor for HIV transmission and is associated with human papillomavirus (HPV) and cervical cancer. Diagnosis is bottlenecked, but studies have shown acceptability of genital self-sampling, for STI, FGS and HPV.

We aim to determine the acceptability and feasibility of a multi-genital self-sampling method in a large cohort in Zambia.

**Methods:** The Zipime Weka Schista study is a longitudinal cohort (April 2021- January 2025) which is integrating a one-stop home-based genital self-sampling for *S. haematobium* and HPV DNA and self-testing for HIV and *Trichomonas vaginalis* (Tv) in three communities in Zambia. Sexually active women aged 15-50 years were randomly selected by community health workers and during a home visit two cervicovaginal self-swabs, a urine sample were obtained and HIV and Tv self-test were provided. Information was collected on acceptability and feasibility of the multi-pathogen genital self-sampling. We present baseline data collected at home between January 2022 – March 2023.

**Results:** A total of 2,701 women were approached by community health workers and 2,531 (93.7%) were enrolled. All women enrolled provided two cervicovaginal I self-swab and a urine sample. Approximately 2,389 (94.3%) and 1,404 (55.4%) women had self-swabs for Tv and HIV test respectively. There was high acceptability of the home multi-genital self-sampling (2,208/2531; 87.2%). Participants preferred to be seen at home than clinic.

Some reasons stated were that it is more convenient 1585 (71.8%); there was more privacy at home 1215 (55.0%); going to the clinic was not convenient 264 (12.0%); lack of transport to go to the clinic 208 (9.4%); unavailability due to work 118 (5.3%) and lack of childcare, 69 (3.1%).

**Conclusions:** A home-based multi-pathogen self-sampling and testing is highly acceptable and feasible in three communities in Zambia. This represents an evidence-based novel direction for national policy to increase access to diagnosis, treatment and care for HIV and other genital infections co-existing in women of childbearing age.

## TUPEC229

**Assessing comorbid conditions in people with HIV/AIDS: insights from the CHAO (Comorbidities of HIV/AIDS Outpatients) study in Meru County, Kenya and their role in shaping integrated health care approaches**

F. Ciccacci<sup>1</sup>, B. Welu<sup>2</sup>, H. Ndoi<sup>2</sup>, C. Mosconi<sup>3</sup>, C. De Santo<sup>3</sup>, M. Carestia<sup>3</sup>, M. Cicala<sup>3</sup>, J. Murungi<sup>4</sup>, K. Muthuri<sup>4</sup>, M. Thurani<sup>4</sup>, L. Karoki<sup>4</sup>, G. Guidotti<sup>5</sup>, S. Orlando<sup>3</sup>

<sup>1</sup>Unicamillus, Saint Camillus International University of Health Sciences, Rome, Italy, <sup>2</sup>Community of Sant'Egidio, DREAM programme, Meru, Kenya, <sup>3</sup>Università degli Studi di Roma Tor Vergata, Biomedicine and Prevention, Rome, Italy, <sup>4</sup>County Government of Meru, Department of Health, Meru, Kenya, <sup>5</sup>Azienda Sanitaria Locale Roma 1, Rome, Italy

**Background:** Co-morbidities among people living with HIV (PLWH) pose a public health challenge, impacting clinical management and quality of life. Understanding their prevalence is crucial for tailored healthcare strategies.

The Comorbidities in HIV/AIDS Outpatients (CHAO) project, in Meru County, Kenya, is a cross-sectional epidemiological study aimed to ascertain the prevalence of comorbid conditions in PLWH, with a particular focus on non-communicable diseases (NCDs).

**Methods:** Comprehensive screenings for non-communicable and infectious diseases were conducted in 25 HIV clinics. Participants underwent comprehensive clinical and laboratory evaluations. Data on demographics, clinical history, and lifestyle factors were collected. The primary outcome was the prevalence of comorbidities, including hypertension, diabetes, dyslipidemias, obesity, syphilis, and hepatitis.

**Results:** Data analysis included 1,051 PLWH, 75% female and a median age of 47 years (IQR 38,54); 96% of the participants were on antiretroviral treatment for more than 12 months. The majority of individuals (n=582, 55.4%) were affected by one or more comorbidity, 352 individuals (33.5%) were affected by one or more NCD, 157 individuals (14.9%) by one or more communicable, and 73 individuals (6.9%) by both NCDs and communicable diseases. Hypertension affected 20.17% of the individuals, and dyslipidemia 21.22%. Among infectious diseases, the prevalence of presumptive TB was 0.9%, HbsAg positivity was 2.2%, HCV-ag positivity was 0.3%, and syphilis was 5.3%. Furthermore, 16% of PLWH were underweight, 54% had a normal weight, 21% were overweight, and 9.2% were obese. Hypertension prevalence increased from 19.9% in under-40s to 33.1% in over-60s. Overweight rates halved from 16.0% in younger adults to 8.3% in seniors. Underweight was more common in younger individuals (27.6%) than in the elderly (15.9%). Diabetes prevalence grew from 0.6% in the youngest group to 5.5% in those over 60.

**Conclusions:** Burden of co-morbidities, in particular NCDs, among PLWH is high. Tailored healthcare strategies integrating routine screenings, health promotion, and surveillance are essential.

## TUPEC230

### Evaluating a self-care intervention to promote uptake of HIV and contraception services among tertiary education students: a pilot study

L.N. Mancitshana<sup>1</sup>, M.K. Tumushime<sup>2</sup>, C. Manganah<sup>1,3</sup>, N. Ruhode<sup>1</sup>, E. Matsikire<sup>1</sup>, J. Kalweo<sup>4</sup>, F. Terris-Prestholt<sup>5</sup>, F.M. Cowan<sup>1,3</sup>, E.L. Sibanda<sup>1,3</sup>

<sup>1</sup>The Centre for Sexual Health and HIV/AIDS Research (CeSHHAR), Sexual and Reproductive Health, Harare, Zimbabwe, <sup>2</sup>London School of Hygiene and Tropical Medicine, Department of Global Health and Development, London, United Kingdom, <sup>3</sup>Liverpool School of Tropical Medicine, Department of International Public Health, Liverpool, United Kingdom, <sup>4</sup>UNAIDS Zimbabwe, Harare, Zimbabwe, <sup>5</sup>UNAIDS, Geneva, Switzerland

**Background:** Self-care is critical for achieving universal health coverage, however there is limited knowledge to inform optimal implementation. We piloted a co-developed self-care intervention for HIV self-tests (HIVST), HIV Post-exposure prophylaxis (PEP), emergency contraception (EC), and condoms among students – a group with suboptimal uptake/access but high literacy and self-efficacy suggesting optimal conditions for self-care.

**Methods:** In two workshops with students and relevant stakeholders and bi-weekly meetings with other key stakeholders over three months, we developed an intervention for peer-led promotion/distribution of HIVST, PEP, EC and condoms.

The agreed intervention was piloted in three Zimbabwean colleges/universities in Dec/2023-Jan/2024. Student peers distributed HIVST and condoms directly, and vouchers for PEP and EC that were redeemed at college/nearby clinics. Vouchers were additionally placed in public access points for self-collection.

During co-development students strongly preferred peer distribution of all commodities but this was restricted by regulatory requirements for PEP and EC. Peer distributors (n=15) kept daily audio diaries of their experiences; these data were analysed thematically.

**Results:** Co-development workshops and audio diaries showed hunger and unmet need for pregnancy and HIV prevention (...“this intervention is overdue!”). There was no easy access to condoms before the study and students had no prior knowledge of PEP or PrEP.

During the first two weeks of intervention implementation, 299/2,896 (10.3%) students collected HIVST kits; with 79/2,896 (2.7%) of all students and 101/1,049 (9.6%) of female students collecting PEP and EC vouchers respectively. At college/nearby clinics, 17/79 (17.9%) and 38/101 (37.6%) PEP and EC vouchers were redeemed, respectively.

There was 100% redemption of vouchers collected from public access points (n=3). 1,071 male condoms were collected by 221 students; 77 students collected 309 female condoms. Audio diaries showed that many students felt too shy to redeem vouchers at clinics – some female stu-

dents asked their boyfriends to redeem EC for them (this was confirmed by health workers). Students also requested PrEP to be added to the package.

**Conclusions:** We found that peer-led distribution of HIVST, PEP, EC, and condoms is feasible and acceptable; the model can be optimised by making it fully peer-led/community-based. This work informs an upcoming large trial of the intervention.

## TUPEC231

**Sexually transmitted infection screening rates did not recover following COVID-19 shelter in place in a multi-site cohort of U.S. HIV primary care clinics**

K.D. Sassaman<sup>1</sup>, M.J. Heise<sup>1</sup>, N.E. Lisha<sup>1</sup>, C.V. Moreira<sup>1</sup>, D.V. Glidden<sup>1</sup>, G.A. Burkholder<sup>2</sup>, H.M. Crane<sup>3</sup>, J.M. Gandhi<sup>1</sup>, M.A. Spinelli<sup>1</sup>

<sup>1</sup>University of California San Francisco, Department of HIV, ID, and Global Medicine, San Francisco, United States, <sup>2</sup>University of Alabama at Birmingham, Medicine/ Infectious Diseases, Birmingham, United States, <sup>3</sup>University of Washington, Medicine, Seattle, United States, <sup>4</sup>Case Western Reserve University, Medicine, Cleveland, United States, <sup>5</sup>University of California San Diego, Medicine, San Diego, United States, <sup>6</sup>The Fenway Institute, Boston, United States, <sup>7</sup>University of North Carolina at Chapel Hill, Epidemiology, Chapel Hill, United States, <sup>8</sup>Johns Hopkins University, Medicine, Baltimore, United States

**Background:** Following COVID-19 shelter-in-place orders, access to non-essential services, including asymptomatic STI screening, decreased, potentially contributing to the worsening STI epidemic.

**Methods:** We assessed the incidence of bacterial STIs (*Chlamydia trachomatis* [CT], *Neisseria gonorrhoeae* [NG], and syphilis) and STI testing. Syphilis reinfections were defined as a fourfold increase in titer. Using interrupted time series approaches, we compared changes in testing rates between March 2018 and March 2022.

Data were collected from 11,030 PWH with a clinical visit both before and after COVID-19 from the Center for AIDS Research Network of Integrated Clinical Systems (CNICS) cohort, a multi-site cohort of 8 HIV clinics across the U.S.

**Results:** 11,030 participants contributed data from 135,862 assessments. After COVID-19, there were fewer tests conducted for CT ( $p<.001$ ) and NG ( $p<.001$ ) compared to pre COVID-19 (Figure 1).

Similarly, when examining incident infections, there was a decrease in positive tests ( $p=.026$ ; Figure 2). There was a decrease in the proportion of positive tests for syphilis ( $p<.001$ ), but no change for CT and NG

In a subset of the sample ( $n=2,673$ ), 31% reported having the same amount of sex as before COVID-19 and 53% reported no changes to sexual health behaviors.

Figure 1. Total number of STI tests between March 2018 and March 2022.

Figure 2. Positive STI incidence between March 2018 and March 2022.

**Conclusions:** Despite a worsening STI epidemic, STI screening decreased in the 2-years following COVID-19 and has yet to resume previous levels. Although the rate of incident STIs decreased post-COVID-19, this is likely driven by underscreening.

This study underscores the need for reinvestment in STI services and consideration of novel STI prevention approaches in addressing the STI epidemic.

## TUPEC232

### Retention of people who inject drugs enrolled in a 'Medications for opioid use disorder' (MOUD) treatment programme in Uganda

P. Mudiopel<sup>1</sup>, B. Byamah Mutamba<sup>2</sup>, L. Komuhangi<sup>2</sup>, J. Nangendo<sup>3</sup>, S. Alamo<sup>4</sup>, B. Mathers<sup>5</sup>, F. Makumbi<sup>6</sup>, R. Wanyenze<sup>6</sup>

<sup>1</sup>Ministry of Health, Kampala, AIDS/STI Control Program, Kampala, Uganda, <sup>2</sup>Butabika National Referral Mental Hospital, Kampala, Uganda, <sup>3</sup>Makerere University College of Health Sciences, Kampala, Uganda, <sup>4</sup>United States of America Centers for Diseases Control and Prevention, Uganda Country Office, Kampala, Uganda, <sup>5</sup>Global HIV, Hepatitis and Sexually Transmitted Infections Programmes, World Health Organization, Geneva, Switzerland, <sup>6</sup>Makerere University School of Public Health, Kampala, Uganda

**Background:** Injection Drug use is associated with increased HIV risk behaviour that may result in the transmission of HIV, and poor access to HIV prevention and treatment. In 2020, Uganda, with PEPFAR support, introduced the 'medication for opioid use disorder treatment' (MOUDT) for People who inject drugs (PWID).

We analysed the 12-month retention and associated factors among PWID enrolled on MOUD treatment in Kampala, Uganda.

**Methods:** We conducted a retrospective analysis of 343 PWID enrolled in the MOUDT programme between September 2020 and July 2022. Retention was defined as the number of individuals still in the programme divided by the total number enrolled, computed at 3-, 6-, 9- and 12 months using lifetable and Kaplan-Meier survival analyses. Cox proportional regression analyses were conducted to assess factors associated with retention in the programme in the first 12 months

**Results:** Overall, 243 (71%) of 343 participants took a high methadone dose (60mg or more). The majority of participants were males (n=284, 82.8%), and the median (interquartile range, IQR) age was 31 (26-38) years. Most participants (n=276, 80.5%) were living 5km or more away from the MOUDT clinic. Thirty (8.8%) were HIV-positive, 52 (15.7%) had a major mental illness and 96 (27.9%) had a history of taking alcohol three months prior to enrollment.

The cumulative retention significantly declined from 83.4% (95%CI=79.0 - 87.0) at 3 months to 71.9% (95%CI=67.2-76.6) at 6months, 64% 95%CI=58.7-68.9) at 9 months, and 55.2%; 95% CI (49.8- 60.3% at 12 months. The 12-month retention was significantly higher for clients on methadone doses of 60mg or more (adj.HR=2.1, 95%CI=1.41-3.22), while patients resident within 5km of the MOUDT clinic were 4.9 times more likely to be retained at 12 months compared

to those residing 5km or more, (adj. HR=4.81, 95%CI=1.54-15). Other factors, including predisposing, need, and enabling factors, were not associated with retention.

**Conclusions:** Our study demonstrates acceptable 12-month retention rates comparable to studies performed elsewhere in developing and developed countries. Sustaining and improving retention may require enhanced scaling up of MOUDT dose to optimal level in the first 3months and reducing the distance between client locale and MOUDT clinics.

## TUPEC233

### Brief alcohol E-intervention reduces hazardous alcohol use and improves PrEP adherence among men who have sex with men: results from a pilot randomized controlled trial

P.A. Shuper<sup>1,2,3,4,5</sup>, N. Joharchi<sup>1</sup>, M. Loutfy<sup>6,7,8,3</sup>, I.I. Bogoch<sup>9</sup>, J.A. Cunningham<sup>10,12</sup>, C. Fehr<sup>1</sup>, G. Da Silva<sup>1</sup>, M. Acsai<sup>6</sup>, P. El-Helou<sup>11</sup>, G.H. Smith<sup>6</sup>, J. Rehm<sup>1,3,12,213,14,15</sup>

<sup>1</sup>Centre for Addiction and Mental Health, Institute for Mental Health Policy Research and Campbell Family Mental Health Research Institute, Toronto, Canada, <sup>2</sup>University of Toronto, Department of Psychiatry, Toronto, Canada, <sup>3</sup>University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, <sup>4</sup>University of Connecticut, Institute for Collaboration on Health, Intervention, and Policy (InCHIP), Storrs, United States, <sup>5</sup>South African Medical Research Council, Mental Health, Alcohol, Substance Use and Tobacco Research Unit, Cape Town, South Africa, <sup>6</sup>Maple Leaf Medical Clinic, Toronto, Canada, <sup>7</sup>Women's College Hospital, Toronto, Canada, <sup>8</sup>University of Toronto, Department of Medicine, Toronto, Canada, <sup>9</sup>Toronto General Hospital, University Health Network, Division of Infectious Diseases, Toronto, Canada, <sup>10</sup>King's College London, National Addictions Center, London, United Kingdom, <sup>11</sup>McMaster University, Hamilton, Canada, <sup>12</sup>University of Toronto, Institute of Health Policy, Management and Evaluation, Toronto, Canada, <sup>13</sup>PAHO/WHO Collaborating Centre at CAMH, Toronto, Canada, <sup>14</sup>WHO European Region Collaborating Centre at Public Health Institute of Catalonia, Barcelona, Spain, <sup>15</sup>Universitätsklinikum Hamburg-Eppendorf, Zentrum für Interdisziplinäre Suchtforschung der Universität Hamburg (ZIS), Hamburg, Germany

**Background:** Although oral HIV Pre-Exposure Prophylaxis (PrEP) is highly effective at preventing HIV acquisition, its effectiveness is contingent upon regimen adherence. Recognizing that alcohol-related issues may hinder one's ability and/or motivation to take PrEP as prescribed, the present investigation entailed an NIH/NIAAA-funded pilot randomized controlled trial (RCT) to explore whether the delivery of a brief, alcohol-focused e-intervention could reduce hazardous alcohol consumption and in turn improve PrEP adherence among a sample of PrEP-prescribed men-who-have-sex-with-men (MSM).

**Methods:** From Oct-2021 to May-2022, MSM (age $\geq$ 18; pre-scribed daily oral PrEP  $\geq$ 3 months; hazardous drinking (AUDIT-C score $\geq$ 4)) were recruited from two PrEP-delivery sites in Toronto, Canada. Following their baseline assessment, participants were randomly assigned to receive either "Check-Your-Drinking," a brief, single-session, alcohol-focused, normative feedback e-intervention; or standard-of-care (control). Self-report and biomarker outcomes pertaining to alcohol consumption (i.e., AUDIT-C hazardous drinking; weekly consumption; binge drinking; phosphatidylethanol  $\geq$ 35 ng/ml) and PrEP nonadherence (i.e., any missed doses,  $\geq$ 4 missed doses – past 7 days;  $<$ 100% adherence,  $<$ 60% adherence – past month; Tenofovir  $<$ 1250,  $<$ 700 fmol/punch) were administered at baseline, 3-months, and 6-months post-baseline. Intervention efficacy was assessed through general linear modelling that compared changes in outcomes over time.

**Results:** A total of 122 PrEP-prescribed MSM (Mean age=33.6, White=55.7%) participated in the RCT. Retention was very high, with 95.1% and 97.5% completing 3-month and 6-month assessments, respectively.

In support of the hypotheses, at the 3-month follow-up, hazardous drinking (intervention=77.8% vs. control=92.7%;  $F=4.33$ ,  $p=.040$ ); missing any PrEP doses over the past seven days (intervention=18.5% vs. control=43.9%;  $F=7.45$ ,  $p=.007$ ); and suboptimal (i.e.,  $<$ 60%) PrEP adherence over the past month (intervention=2.5% vs. control=14.6%;  $F=9.41$ ,  $p=.003$ ) were all significantly lower for intervention vs. control participants.

These intervention effects were not sustained at the 6-month follow-up, and effects involving the other alcohol- and adherence-related outcomes were not significant.

**Conclusions:** Findings from this novel pilot RCT suggest that a brief, stand-alone e-intervention can reduce hazardous drinking and improve PrEP adherence among MSM.

However, as such intervention effects were only short-lived, further trials are needed to evaluate whether the provision of "booster" intervention sessions, delivered at set intervals or on-demand, could lead to sustained alcohol- and PrEP adherence-related improvements.

## TUPEC234

### Innovative approaches in HIV outreach for transgender populations: a case study of the GLAM project at Amos Tara Community Center

J. Abenoja<sup>1</sup>, L.B. Norella<sup>1</sup>, R. Angluben<sup>2</sup>

<sup>1</sup>PSFI, Manila, Philippines, the, <sup>2</sup>Pilipinas Shell Foundation Inc., PROTECTS UPSCALE, Manila, Philippines, the

**Background:** Despite global advances in HIV prevention and treatment, transgender women remain disproportionately affected by HIV, facing systemic barriers to healthcare access and enduring social stigma. The Amos Tara Community Center recognized the urgent need for tailored interventions and launched the GLAM (Glamorous Livelihood, Advocacy and Mental Health) project aimed at transgender women.

**Description:** The GLAM project is an innovative initiative designed to engage transgender women in HIV prevention and care while simultaneously providing opportunities for personal and professional development. The project integrates HIV screening with referral services and combines it with livelihood workshops. These workshops not only equip participants with practical skills for economic empowerment but also create a supportive community for advocacy and mental health support.

The program utilizes a peer-led model, leveraging the power of shared experiences and trust within the transgender community to encourage participation and HIV screening.

**Lessons learned:** The GLAM project has demonstrated that integrating HIV services with livelihood training and mental health support resonates well with transgender women. The peer-led approach fosters a sense of belonging and empowerment, which is crucial in overcoming the fear and discrimination that often deter transgender individuals from seeking HIV-related services.

A key lesson is the importance of providing comprehensive, culturally competent, and stigma-free services to effectively reach and engage this key population in HIV prevention and care.

**Conclusions/Next steps:** The success of the GLAM project illustrates the potential of innovative, community-led, and integrated approaches to address the HIV epidemic among transgender women. As a next step, the Amos Tara Community Center plans to scale up the project to reach a broader segment of the transgender community.

Additionally, the project serves as a replicable model that can be adapted by other organizations seeking to reduce HIV disparities among transgender populations. Evaluation of long-term outcomes and sustainability of the project will be critical in informing future initiatives and policy directions.

## TUPEC235

### Drug use and needle sharing among adolescents and young adults in Nigeria: secondary analysis of data from a multi-site HIV self-testing clinical trial

S. Agunbiade<sup>1</sup>, T. Gbaja-Biamila<sup>2,3</sup>, D. Oladele<sup>3</sup>, C. Obiezu-Umeh<sup>2</sup>, A.Z. Musa<sup>3</sup>, L.A. Blessing<sup>3</sup>, K. Tahlil<sup>4</sup>, F.T. Akinsolu<sup>5</sup>, D.F. Conserve<sup>6</sup>, E. Adeoti<sup>2</sup>, H. Xian<sup>2</sup>, K. Kuriakose<sup>7</sup>, J. Iwelunmor<sup>8</sup>, O. Ezechi<sup>3</sup>, J. Tucker<sup>1,4</sup>

<sup>1</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>2</sup>Saint Louis University, St. Louis, United States, <sup>3</sup>Nigerian Institute of Medical Research, Lagos, Nigeria, <sup>4</sup>University of North Carolina at Chapel Hill, Chapel Hill, United States, <sup>5</sup>Lead City University, Ibadan, Nigeria, <sup>6</sup>Milken Institute School of Public Health, George Washington University, Washington, United States, <sup>7</sup>The University of Manchester, Manchester, United Kingdom, <sup>8</sup>Washington University in St. Louis, St. Louis, United States

**Background:** Adolescents and young adults (AYA, 14-24 years old) have the highest rates of drug use in most low and middle-income countries. Little is known about the drivers of drug use among AYA in Nigeria.

The purpose of this secondary analysis was to examine drug use and needle sharing among AYA enrolled in a multi-site clinical trial in Nigeria.

**Methods:** Our stepped-wedge, cluster RCT (NCT04710784) enrolled AYA in thirty-two local government areas across four geopolitical zones of Nigeria. The primary purpose of the RCT was to enhance uptake of HIV self-testing. This secondary analysis focused on drug use and needle sharing.

Drug use was defined as having ever used drugs. Needle sharing was defined as having shared needles or other injection equipment. Socio-demographic characteristics, including age, sex, ethnicity, education and geopolitical zone were exposures.

Univariate and multivariate logistic regression analyses were performed to obtain odds ratios for the correlations between exposure and outcome variables. Likelihood ratio tests were performed to calculate p-values.

**Results:** 1,500 AYA were recruited. AYA were mostly unemployed students living in southern Nigeria. Drug use was reported by 301/1500 (20.3%) AYA. Among these, 213/301 (71.5%) reported needle sharing.

Rates of drug use did not vary by age (OR:0.94, 95%CI:0.73-1.22), sex (OR:1.00 95%CI:0.77-1.28) or ethnicity (Yoruba OR:0.94 95%CI:0.68-1.30), (Other OR:1.17 95%CI:0.87-1.58). AYA in the North-Central zone had higher odds of drug use compared to AYA in the South-West (OR:1.86 95%CI:1.28-2.69).

AYA aged 14-19 had higher odds of needle sharing compared to those aged 20-24 (OR:3.49, 95%CI:1.94-6.26). Female AYA had higher odds of needle sharing compared to males (OR:5.05, 95%CI:2.85-8.95).

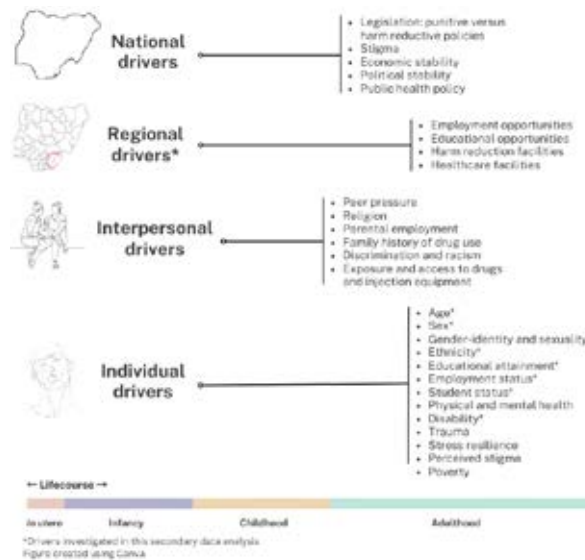

Figure. Proposed drivers of drug use among adolescents and young adults in Nigeria.

**Conclusions:** Drug use and needle sharing are common among AYA in Nigeria, potentially contributing to the growing population of AYA in Nigeria living with HIV. Harm reduction services, informed by AYA who use drugs, should be expanded in Nigeria.

## TUPEC236

### Factors associated with PTSD symptom severity among pregnant persons at risk for HIV acquisition in Cape Town, South Africa

M.J. Bustamante<sup>1</sup>, A. Downs<sup>1</sup>, L. Gulbicki<sup>2</sup>, S. Moldovanu<sup>1</sup>, K. Kabel<sup>1</sup>, L. Gwangqa<sup>3</sup>, J.N. Githaiga<sup>3</sup>, C. O'Cleirigh<sup>2</sup>, C. Psaros<sup>2</sup>, A.M. Stanton<sup>1</sup>

<sup>1</sup>Boston University, Psychological & Brain Sciences, Boston, United States, <sup>2</sup>Massachusetts General Hospital, Department of Psychiatry, Boston, United States,

<sup>3</sup>University of Cape Town, School of Public Health and Family Medicine, Division of Social and Behavioral Sciences, Cape Town, South Africa

**Background:** In South Africa (SA), pregnant persons are disproportionately affected by HIV. Mental health symptoms, including those specific to post-traumatic stress disorder (PTSD), are associated with decreased engagement in HIV prevention behaviors. This is particularly relevant to women of reproductive age because HIV acquisition risk increases during the pregnancy period. Multi-level factors at the individual, dyadic, and community levels associated with PTSD symptom severity during pregnancy are poorly understood in this context.

**Methods:** HIV-negative pregnant persons were recruited for a study investigating mental health barriers to PrEP uptake during pregnancy. Participants completed the PTSD Checklist for DSM-5 (PCL-5) among other validated measures. Using hierarchical regression, we examined individual- (alcohol use, shame/blame, perceived risk of

HIV), dyadic- (reproductive autonomy, relationship power, dyadic trust), and community-level (enacted stigma, social support, shame/blame) factors as predictors of PTSD symptom severity (controlling for age, gestational age, education, number of previous pregnancies).

**Results:** The sample included 110 participants with a mean age of 25 (IQR 18-39) and a mean gestational age of 29 weeks (SD = 0.83). Overall, 13.6% (n=15) had PCL-5 scores above the clinical cutoff ( $\geq 32$ ), indicative of likely PTSD. At dyadic-level, age and decreased relationship power were associated with increased PTSD symptoms. In the final model, which included community-level variables, decreased relationship power ( $\mu = -6.39$ , CI= -11.99 - -0.79,  $p=0.02$ ), enacted stigma ( $\mu = 1.60$ , CI= 0.62 - 2.58,  $p<0.01$ ) and decreased social support ( $\mu = -0.52$ , CI= -0.99 - -0.05,  $p=0.02$ ) were associated with increased PTSD symptoms, accounting for a significant proportion of the variance ( $R^2 = 0.4257$ ,  $F(15, 88) = 4.35$ ,  $p < 0.01$ ). Decreased reproductive autonomy ( $p=0.06$ ) and community blame ( $p=0.06$ ) were marginally significant.

**Conclusions:** These findings offer preliminary insights on factors that may contribute to meaningful targeted transdiagnostic prevention programs for pregnant persons in the context of HIV prevention. Dyadic and community factors like relationship power and social support are not often addressed in antenatal care and may have important implications for HIV prevention. Further studies are needed to develop or adapt interventions that address these elements in culturally meaningful ways.

## TUPEC237

**Lesson learned: Tanzania's resilient journey to expand Needle and Syringe programs as effective HIV prevention**

M. Kagashe<sup>1</sup>, C. Nyandindi<sup>2</sup>, D. Thobias<sup>3</sup>, J. Kamwela<sup>4</sup>, O. Machangu<sup>5</sup>, N. Makyao<sup>6</sup>

<sup>1</sup>Tanzania Commission for AIDS, Dodoma, Tanzania, the United Republic of, <sup>2</sup>Drug Control and Enforcement Authority, Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>MUKIKUTE, Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>Tanzania Commission for AIDS, Dodoma, Tanzania, the United Republic of, <sup>5</sup>Ministry of Health, Dodoma, Tanzania, the United Republic of, <sup>6</sup>AMREF Health Africa, Dar es Salaam, Tanzania, the United Republic of

**Background:** In 2014 Tanzania drug use become widespread, with estimated 300,00 people who use drug (PWUD) and 30,000 people who inject drugs (PWID) correlating with a surge in HIV prevalence among PWIDs reaching 36%. Needle and Syringe program (NSP) has been growing as an effective harm reduction program to reduce blood borne infections to PWID.

**Description:** November 2010, Tanzania marked a groundbreaking milestone in sub-Saharan Africa by launching a Needle and Syringe Program (NSP) in a small scale, initially

covering only two districts in Dar es Salaam. These initiatives, were guided by the Drug Control and Enforcement Authority (DCEA) and international organisation Mdm under the National strategic framework for HIV prevention efforts among PWID. The program underwent a significant transition in 2018 when its implementation was handed over to local civil society organisation, signalling a shift towards community-led initiatives.

Subsequently, the NSP's reach expanded to cover five districts in Dar es Salaam. In 2022 and 2023, we scaled up NSP to Arusha, Pwani and Tanga respectively. The program integrated a continuum of services aligning NSP with broader HIV prevention, care, and treatment initiatives.

**Lessons learned:** From June 2018 to December 2023, Tanzania's NSP reached 46,600 PWIDs, distributing 47,393,036 needles and syringes. In average each person used 3-5 needles a day. Of the enrolled persons, 20,182 stopped or dropped from follow up to services, 5,182 opted treatment services such as MAT and 312 opted for rehabilitation homes. Condom programming as preventive measures for those in need was distributed and a total of 98,394,859 condoms were distributed for HIV prevention. HIV testing services showed a decline in positivity rates from 35% in 2010 to 12% in 2018 and less than 9% in 2023. Negative clients were linked to preventive measures like PrEP, and positive cases were linked to care and treatment.

**Conclusions/Next steps:** Tanzania's NSP stands as a noteworthy model for HIV/AIDS harm reduction, emphasizing the transformative impact of community-led initiatives. The program's success is attributed to the contextualization of NSP, proving paramount in achieving effective HIV prevention. Effort to expand NSP to 26 regions is ongoing, further solidifying its dedication to widespread harm reduction strategies.

## TUPEC238

**A transgender clinic in Yangon, Myanmar, with tailored services for transgender women**

N.N. Tun<sup>1,2</sup>, M.M. Hlaing<sup>1</sup>, T. Win<sup>1</sup>, H.H. Aung<sup>1</sup>, F. Smithuis<sup>1,2</sup>

<sup>1</sup>Medical Action Myanmar, Yangon, Myanmar, <sup>2</sup>Myanmar Oxford Clinical Research Unit, Yangon, Myanmar

**Background:** In Yangon, Myanmar's largest city, MSM and TGW have an HIV prevalence of 26.6%, the highest prevalence in a specific location in the Asia-Pacific region. Transgender women (TGW) were 49 times more likely to have HIV than other adults of reproductive age, according to a global 2012 study that included six countries from Asia and the Pacific region. In 2018, Medical Action Myanmar (MAM), a medical aid organization, started HIV prevention and treatment services for MSM and TGW in Yangon. Subsequently, in March 2022, MAM started a clinic ("Daisy") specifically designed to target TGW with the aim to enhance the uptake of HIV prevention and treatment services among this community.

**Description:** The "Daisy" clinic provides routine HIV services, including prevention and treatment of HIV, sexually transmitted diseases, viral hepatitis B and C and, pre-exposure prophylaxis of HIV transmission and provides condoms. In addition, specific services for diagnosis and treatment of gender dysphoria and gender-affirming hormone therapy. To reduce the threshold of accessing the clinic, we established a transgender-oriented medical team including a medical doctor and TGW-peer counselors.

**Lessons learned:** The average number of monthly TGW consultations increased from 36 (January 2021 - February 2022) to 216 per month following the opening of the TGW clinic (March - December 2022). The percentage of TGW tested for HIV before and after the clinic opening was 79.3% and 90.4% respectively, and the percentage of HIV-positive TGW who started on ART rose from 44.9% to 86.7%. In addition, the number of TGW on PrEP increased from 72 to 211.

**Conclusions/Next steps:** TGW individuals have unique needs and concerns when interacting with the health care system. In our setting, offering TGW-specific care to improve communication and establish a more supporting environment for transgender people improved the uptake of HIV prevention and treatment services. PrEP and ART initiation increased substantially after the introduction of TGW-specific care. It is now crucial to ensure longer-term retention and monitoring HIV viral load suppression will be essential.

## TUPEC239

### Role of mentor mothers in the elimination of mother-to-child transmission of HIV in military health units in Mozambique

C. Santos<sup>1</sup>, L. Macaringue<sup>1</sup>, L. Nhambi<sup>2</sup>, O. Tuzine<sup>3</sup>, C. Machalela<sup>1</sup>, L. Juenta<sup>1</sup>, L. Joaquim<sup>3</sup>, A. Viegas<sup>2</sup>, S. Massangaie<sup>4</sup>, M. Strachan<sup>1</sup>, S. Kelbert<sup>1</sup>

<sup>1</sup>Jhpiego, DOD Project, Maputo, Mozambique, <sup>2</sup>Jhpiego, M&E, Maputo, Mozambique, <sup>3</sup>FADM, Direcção de Saúde Militar, Maputo, Mozambique, <sup>4</sup>FADM, Departamento de Saúde Militar, Maputo, Mozambique

**Background:** Despite national efforts to prevent mother-to-child transmission (PMTCT) of HIV and a reduction in vertical transmission rates from 14% in 2019 to 10% in 2023, challenges remain. Associated factors include poor treatment continuation among pregnant women living with HIV, as well as cultural, economic, social and structural factors. Jhpiego and the FADM (Armed Forces of Mozambique) introduced the Mentor Mothers (MM) strategy in 2019 in 10 medium or high-volume FADM-supported health facilities (HFs).

**Methods:** This is a retrospective analysis of the role of MM in reducing MTCT of HIV. The PMTCT cascade was assessed using data from 10 military HFs with MM and 12 HFs with-

out mentor mothers, between the period of 2021 to 2023. Data included 3,116 HIV-exposed infants from HFs with the MM strategy, 190 HIV exposed infants in HFs without the MM strategy. MM are trained HIV-positive women in care who provide support and share experiences and healthy practices with other HIV-positive pregnant or breastfeeding women (PBFW) with HIV-exposed children.

**Results:** Of 3,116 children exposed to HIV in HFs with MM, 84% (2,626/3,116) of children had PCR tests administered at 4-8 weeks of age. Of these children, 3.1% (99/2626) had a positive PCR result for HIV and of these, 92.9% (93/99) started ART. In comparison, at the HFs without MM, of the 190 HIV exposed children, 67% (128/190) had PCR tests at 4-8 weeks of age. Of these children, 2.6% (5/128) had a positive PCR result for HIV and of these, 60% (3/5) started ART. In HFs with MM, 58% (18,200/30,081) of the partners of PBFW came in for HIV testing, compared to 45% (1,136/2,527) among HFs without MM.

**Conclusions:** These preliminary findings show an increased coverage of testing for HIV exposed infants, ART initiation for children who tested HIV-positive, and increased coverage of partner testing in HFs using the MM approach. Additional follow-up time and research in more HFs are needed to assess long-term impact and scale up of the intervention.

## TUPEC240

### Trends in PEPFAR-supported HIV self-testing and PrEP among key populations

A. Jones<sup>1</sup>, M. Yang<sup>1</sup>, B. White<sup>1</sup>, W. Miller<sup>1</sup>

<sup>1</sup>U.S. Department of State, Bureau of Global Health Security and Diplomacy, Washington, United States

**Background:** PEPFAR programs have prioritized scale-up of HIV Self-Testing (HIVST) and PrEP as key interventions for key populations (KPs). New guidance for PEPFAR's KP prevention service indicator (KP\_PREV) further promotes access to these interventions. We must understand the current reach and progress of these interventions to guide future expansion.

**Methods:** PEPFAR Monitoring, Evaluation, and Reporting (MER) indicators for HIVST distribution (HTS\_SELF) and new initiations on PrEP (PrEP\_NEW) for fiscal years 2020 through 2023 were downloaded and limited to key populations disaggregates. Totals for each key population group per year and PEPFAR Operating Unit (OU) per year were calculated and trends across time were assessed. Analysis excluded the final two quarters of FY2023 data for Nigeria (implementing a data review) and Uganda (paused KP data collection after passage of the Anti-Homosexuality Act).

**Results:** HTS\_SELF for KPs increased from 265,252 in FY2020 to 963,597 in FY2023, while PrEP\_NEW for KPs increased from 126,371 in FY2020 to 552,841 in FY2023. Female sex workers (FSW) received the largest numbers of each inter-

vention. HTS\_SELF for KPs was greatest in FY2023 in Tanzania at 274,172, up from 38,639 in FY2020. PrEP\_NEW for KPs was greatest in FY2022 in Nigeria at 151,670, up from 24,829 in FY2020.

Figure 1. HTS\_SELF and PrEP\_NEW, by KP group.

**Conclusions:** Both interventions have been scaled quickly for key populations, with especially notable progress in Tanzania and Nigeria. In 2023, WHO recommended offering HIVST for PrEP initiation, re-initiation and continuation, building on previously issued simplified PrEP service delivery guidance. Gaps remain in access to these services, with HIV incidence among KPs continually exceeding other populations. As new PEPFAR guidance on linking key populations to HIVST and PrEP is implemented, countries should update national guidelines and train providers on how to create demand for these services to further increase access.

<sup>2</sup>USAID CHEKUP II, Management, Lusaka, Zambia, <sup>3</sup>USAID

CHEKUP II, Key Population, Lusaka, Zambia, <sup>4</sup>USAID CHEKUP II, Strategic Information, Lusaka, Zambia

**Background:** In Zambia, adolescent boys and young men (ABYM) are less likely to access HIV and sexual violence interventions than adolescent girls and young women (AGYW). Results from ZAMPHIA, (ZAMSTAT 2021) survey provided data-driven strategies on how to bridge health gaps and address unmet needs among ABYM. To foster access to HIV and sexual violence prevention among ABYM, the USAID Controlling HIV Epidemic for Key and Underserved Populations (CHEKUP II) Activity, implemented by John Snow Health, designed 12-week interactive sessions, evidence-based curriculum, aimed at educating ABYM on HIV and sexual violence prevention.

**Methods:** From June to September 2023, we trained 24 master trainers in HIV and sexual violence prevention using 12-week interactive sessions in four districts of Zam-

bia. The master trainers further recruited and trained 160 teachers and community members, as coaches in HIV and sexual violence prevention, using the 12-week interactive sessions. Using the snowball approach, each coach was assigned to reach 25 ABYM. Through the 160 coaches, 4,000 ABYM were provided with 12-week interactive sessions. A register was used to monitor the attendance of ABYM.

**Results:** A total of 4,000 ABYM were enrolled and provided with 12-week interactive sessions, from which 3,464 completed the interactive sessions. Out of the 3,464 ABYM, 3,228 were provided with HIV counseling and testing, of which 89(2.7%) tested positive for HIV and were linked to ART. Of the ABYM who tested negative, 3,139 were offered PrEP, and 2,411 (77%) were eligible and were initiated on PrEP. The remaining 728(23%) were not eligible for PrEP, however, condoms were provided and other HIV prevention measures. 206 ABYM were discovered to have experienced sexual violence, and immediate mental health and psychosocial support services were provided. Out of the 206 ABYM, 19 showed signs of fear because of post-violence experience and comprehensive post-violence care was provided by healthcare providers. According to the the post-coach survey conducted, the ABYM's confidence and communication skills improved, ready to navigate adolescence healthily.

**Conclusions:** The 12-week interactive sessions approach is an effective intervention in fostering access to HIV and sexual violence prevention among ABYM and ultimately addressing the gaps and unmet needs among ABYM.

Behavioral and Community Health, College Park, United

States, <sup>8</sup>University of California San Francisco, Division

of HIV, Infectious Diseases, and Global Medicine, San

Francisco, United States

**Background:** For justice-involved people, the times during and immediately after incarceration can be high-risk periods for HIV acquisition since these periods afford limited

access to effective HIV prevention. In 2019, Zambia began offering HIV pre-exposure prophylaxis (PrEP) in correctional facilities. We report initial results from one of the first longitudinal studies to characterize PrEP use among justice-involved people in sub-Saharan Africa.

**Methods:** In August 2023, we launched a cohort study of PrEP users and non-users in three correctional facilities in Lusaka, Zambia. Following HIV testing, HIV-negative incarcerated persons were offered oral tenofovir (TFV)-based PrEP by the corrections health system, and then approached by study staff for participation. Consenting participants were followed from incarceration through community release for PrEP outcomes, including uptake, persistence, and adherence. A randomly selected sub-cohort of participants on PrEP underwent urine tenofovir (TFV) screening for adherence at each visit.

**Results:** From August 2023–January 2024, we screened 421 incarcerated persons; 396 (94%) were eligible, consented, and enrolled. Participants were 27 years old, on average (range:18–56 years), a majority 370 (93%) male, less than half (115, 29%) completed secondary education, and 26 (7%) indicated previous incarceration. Of the 258 eligible to start PrEP, 205 (79%) initiated PrEP at enrollment. As of January 2024, 341 were eligible for one-month study follow-up and 55% (186/341) had completed a visit, including 176 (95%) who were still incarcerated and 10 (5%) who had been released. Of the 122 who initiated PrEP at enrollment and had a one-month visit, 97/122 (80%) were still on PrEP, and all were HIV-negative; 16 (13%) who had initiated PrEP at enrollment chose to discontinue at follow-up. 11 of 64 (17%) who had not initiated PrEP at enrollment chose to initiate at follow-up. Of the 122 who initiated PrEP at enrollment and had ≥1 follow-up visit, 70 (61%) were in the sub-cohort with urine TFV testing. Of these, 47% (33/70) demonstrated TFV assay results consistent with adherence.

**Conclusions:** Initial results suggest high demand for, and uptake of, PrEP among incarcerated persons in Zambia, but sub-optimal persistence and adherence (measured objectively). Although preliminary, our findings suggest a need for interventions to support prevention-effective PrEP use in this population.

## TUPEC243

### Including pregnant and breast-feeding mothers in HIV prevention trials - ethical and equitable engagement of communities

S. Chatrath<sup>1</sup>, M. Nagrath<sup>1</sup>, J. Mukherjee<sup>2</sup>, V. Muturi-Kioi<sup>3</sup>  
<sup>1</sup>IAVI, Clinical Development, Gurugram, India, <sup>2</sup>IAVI, Access, Gurugram, India, <sup>3</sup>IAVI, Clinical Development, Nairobi, Kenya

**Background:** Mother-to-child transmission rate of HIV continues to be high globally and it is critical to advance HIV prevention options for Pregnant and Breast-feeding Mothers (PBFMs). Historically this population has been underrepresented in clinical trials to protect them and their fetuses from research-related risks.

The recent guidance by the World Health Organization and U.S Food and Drug Administration highlight the need and considerations to ensure equity and protect PBFMs through research.

**Description:** A virtual co-learning workshop was conducted in Dec 2023, engaging 16 domain-experts including bioethicists, regulators, clinical researchers, and policy-makers from India, Africa and globally, to discuss considerations for adopting global guidance in the local context. Data from the workshop were explored through thematic analysis.

**Lessons learned:** While key ethical considerations in the global guidance may be applicable in the local context, including balancing risk to benefit ratio for the mother and fetus, elaborating study procedures and related risks during consenting and rigorous follow-up for adverse effects in mother and fetus, additional considerations may include:

- *Relevance of inclusion* – Relevance of including this population in trials must be well-understood by key stakeholders, including communities, participants, ethics/regulatory bodies, media to prevent any misconceptions and enhance participant engagement.
- *Equity and ethics in conducting trials*– In the context of global trials, Standard of Care used must be ethically acceptable and scientifically beneficial to the local population to ensure equity in trial designs.
- *Deeper understanding of communities* – It is imperative to understand in-country power relations in a family (e.g. in India, partners and elders in the family may be the key decision makers and in Africa, in addition to family members, traditional health care providers also play a key role) and conduct informed consent process in presence of relevant family members to ensure buy-in. Additionally, formative research to understand baseline pregnancy outcomes in the trial community is essential.
- *Post-trial access* – It is important to ensure mechanisms of post-trial access to trial participants and focus on strengthening health-system capacities for timely introduction.

**Conclusions/Next steps:** There is a need for shifting from whether this population can be included in future trials to how to ethically, and effectively conduct trials in this population.

## TUPEC244

Leaving no adolescent behind: lessons learned from PrEP provision for adolescent girls and boys, aged 10-14 in Mozambique

J.T.A. De Seleme<sup>1</sup>, I. Sathane<sup>1</sup>, M. Boothe<sup>2</sup>, O. Tiberi<sup>1</sup>, V. Mega<sup>1</sup>, M. Da cunha<sup>1</sup>, K. Tibana<sup>1</sup>, N. Eliseu<sup>1</sup>, M. Pereira<sup>3</sup>, A. Couto<sup>1</sup>

<sup>1</sup>Ministry of Health of Mozambique, Department of Public Health, Maputo, Mozambique, <sup>2</sup>UNAIDS, data for impact, Maputo, Mozambique, <sup>3</sup>Maputo City Health services, Public Health department, Maputo, Mozambique

**Background:** Little is known about the HIV epidemic among young adolescents aged 10-14 in Mozambique. Estimates of HIV acquisition among young adolescents are not available because Spectrum/EPP modeling tools, used to estimate the acquisition of HIV, do not permit sexual transmission for those under the age of 15.

However, 14% of women report having been married or in a union before the age of 15, and more than 15,000 births in 2023 were to mothers aged 10-14.

**Description:** In July 2021, Mozambique rolled out pre-exposure prophylaxis (PrEP) nationally. Young adolescents were eligible for PrEP if they were at substantial risk for HIV acquisition, defined as being a member of a key population group (men who have sex with men, sex worker, people who inject drugs, and/or transgender people), in a serodiscordant relationship, pregnant or lactating young adolescent girl with unknown HIV status of sexual partner, and/or reported transactional or intergenerational sex.

**Lessons learned:** National roll-out demonstrated the feasibility of PrEP provision in this young population. From 2022-2023, 745 young adolescents initiated PrEP (of which 89% were girls); there was a 109% increase in PrEP initiations from 2022 to 2023. The vast majority of PrEP uptake occurred at co-located ANC and youth-friendly services, where 34,111 young adolescent girls received antenatal care (ANC) services during the same period. PrEP provision largely followed the geographic distribution of child marriage and early pregnancy, highlighting that cultural beliefs and practices potentially influence the screening practices of service providers.

**Conclusions/Next steps:** PrEP uptake by this subpopulation highlights the importance of increasing screening at all entry points serving adolescents, not simply at ANC services. The low number of young adolescent girls initiating PrEP, compared to the large numbers of those receiving antenatal services, represents a missed opportunity that requires more focused PrEP screening and demand creation efforts to reduce the risk for HIV acquisition and

subsequent vertical transmission to their children. Finally, young adolescent boys at risk are potentially being left behind when PrEP screening and provision largely occurs at ANC youth-friendly services.

## TUPEC245

Prevalence of HIV and sexually transmitted infections among female sex workers in a rural setting in KwaZulu-Natal, South Africa

L. Mazibuko<sup>1</sup>, N. Chimbindi<sup>1,2,3</sup>, T. Zuma<sup>1</sup>, D. Gumede<sup>1</sup>, J. Dreyer<sup>1</sup>, T. Smit<sup>1</sup>, C. Herbst<sup>1</sup>, N. Okesola<sup>1</sup>, A. Sanni<sup>4</sup>, J. Hargreaves<sup>4</sup>, F. Cowan<sup>5,6</sup>, G. Harling<sup>1,2,3,7</sup>, M. Shahmanesh<sup>1,2,3</sup>

<sup>1</sup>Africa Health Research Institute, Mtubatuba, South Africa, <sup>2</sup>University of KwaZulu-Natal, Durban, South Africa, <sup>3</sup>University College London, London, United Kingdom, <sup>4</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>5</sup>Centre for Sexual Health and HIV AIDS Research, Harare, Zimbabwe, <sup>6</sup>Liverpool School of Tropical Medicine, Liverpool, United Kingdom, <sup>7</sup>University of the Witwatersrand, Johannesburg, South Africa

**Background:** In South Africa, high HIV prevalence among female sex workers (FSWs) is well-documented in major cities, but less well-studied elsewhere. We therefore estimated the prevalence of transmissible and acquirable HIV, and of sexually transmitted infections (STI) among FSWs in a South African rural and small town setting where over 14% of young women are selling sex.

**Methods:** We conducted a respondent-driven sampling (RDS) bio-behavioural survey among FSWs in the uMkhanyakude district in northern KwaZulu-Natal (KZN) between November 2021 and June 2022. We recruited 193 participants from eight seeds, measuring sociodemographic, psychosocial, sex work, and sexual behaviours. We evaluated HIV serostatus from dry blood spots and bacterial STIs from self-taken vaginal swabs.

We present the RDS-weighted prevalence of chlamydia trachomatis, Neisseria gonorrhoea, trichomonas vaginalis, transmissible HIV (HIV viral load > 50 copies per ml) and acquirable HIV (HIV negative, any condomless sex in the past 12 months and not on HIV Pre-Exposure Prophylaxis).

**Results:** The 201 FSWs had a median age of 31 and 32% had initiated sex work in the last three years. HIV prevention behaviours were limited, with 21% and 53% reporting condomless sex with clients and intimate partners respectively, and only 8% ever using PrEP.

One-quarter (25%) consumed alcohol four or more times a week. Over half (55%) experienced STI symptoms in the past 12 months, with 43% of these completing treatment. Weighted prevalence of any STI, excluding HIV, was 29% (95% CI: 23-36%) in the past 12 months. Specific bacterial STI prevalences ranged from 7% to 17%. HIV prevalence was substantial at 59% (95% CI: 52% - 67%), but 61% (95%

CI: 52% - 69%) were virally suppressed. Transmissible HIV was 12% (95% CI: 4% - 27%) and acquirable HIV among the HIV-negative FSWs was 80% (95% CI: 70% - 89%).

**Conclusions:** HIV prevalence amongst FSWs in this rural setting was just as high as in urban South Africa. However, in the absence of effective sex worker programming, rural FSWs have an alarmingly high prevalence of STIs and risk of acquiring HIV. There is an urgent need for comprehensive FSW programmes that extend into rural communities in South Africa.

## TUPEC246

### A program to empower women who use drugs in South Africa

A.E. Manyuchi<sup>1</sup>, L. Li<sup>2</sup>, N. Zuma<sup>3</sup>, J. Daniels<sup>4</sup>, M. Mbambo<sup>3</sup>, M. Mabitsi<sup>3</sup>, J.A. McIntyre<sup>5</sup>, H. Struthers<sup>6</sup>

<sup>1</sup>University of the Witwatersrand, Global Change Institute, University Corner, Johannesburg, South Africa, <sup>2</sup>University of California, Los Angeles, Department of Psychiatry and Biobehavioral Sciences, Semel Institute for Neuroscience and Human Behavior, David Geffen School of Medicine, Los Angeles, United States, <sup>3</sup>Anova Health Institute, Programs, Johannesburg, South Africa, <sup>4</sup>Arizona State University, Edson College of Nursing and Health Innovation, Phoenix, United States, <sup>5</sup>University of Cape Town, School of Public Health & Family Medicine, Cape Town, South Africa, <sup>6</sup>University of Cape Town, Division of Infectious Diseases & HIV Medicine, Department of Medicine, Cape Town, South Africa

**Background:** Women who use drugs (WWUDs) are at higher risk of HIV and hepatitis C infection, facing discrimination, homelessness, and serious violation of their human rights. In South Africa, the number of people who use drugs (PWUDs) is rapidly increasing. According to the Johannesburg Health District program data, approximately 10% of PWUDs are women. Among them, about 15% of WWUDs have infants to look after.

However, existing interventions only partially acknowledge gender differences in service delivery. To address this gap, we have piloted an empowerment program specifically targeting the needs and challenges of WWUDs.

**Description:** The program was piloted in the Johannesburg Health District in 2023. Working with Social Workers, we recorded individuals' case history, noted capabilities, explored aspirations and needs, and ranked support needs for WWUD with infants, living with HIV and on Opioid Substitution Therapy.

A support group of 18 women was created. Group members received six capacity-building sessions of 60 minutes each encompassing health literacy, human rights, managing stress, coping skills, activities of daily living, and resiliency over seven weeks. Women selected vocational courses they were interested in pursuing. The 18 women received motivational counselling and were enrolled into

vocational courses (6 sewing; 4 manicure and pedicure; 8 makeup and beauty therapy). Social workers engaged with support structures to look after the infants of women attending classes. All women completed their vocational courses and received business start-up kits enabling them to venture into business.

**Lessons learned:** An integrated capacity-building approach including communication, interpersonal interactions, listening, and vocational skills is imperative. Training on entrepreneurship is essential for successful creation of WWUDs-led viable enterprises. Empowerment actions are important in addressing intersectional stigma amongst WWUDs. Empowering WWUDs helps with assertiveness, resiliency, self-sufficiency and generating income. Integrating harm reduction services with capacity building is vital in ending the HIV epidemic amongst WWUDs.

**Conclusions/Next steps:** This piloted program provides practical insights for future intervention development and implementation for the key population of women who use drugs (WWUDs). Building on these insights, we plan to incorporate business management training into the current women's vocational program. Additionally, we will continue exploring other empowerment avenues.

## TUPEC247

### Research on drug use and barriers to opioid substitution therapy in Tajikistan

A. Kaspirova<sup>1</sup>, N. Malikov<sup>2</sup>, S. Orbelyan<sup>3</sup>, M. Trofymenko<sup>3</sup>  
<sup>1</sup>Aktobe AIDS Center, Aktobe, Kazakhstan, <sup>2</sup>Republican Clinical Narcology Center, Dushanbe, Tajikistan, <sup>3</sup>UNDP Tajikistan, Dushanbe, Tajikistan

**Background:** According to the 2022 IBBS the estimated number of people who inject drugs (PWID) in Tajikistan is 18200. Despite the network of 15 opioid substitution therapy (OST) sites operating in all regions of the country the OST program coverage remains low - around 660 people. To explore the reasons behind suboptimal coverage of PWID with OST services UNDP Tajikistan in February-April 2023 undertook a study on drug use and barriers to opioid substitution therapy in Tajikistan.

**Methods:** The research was based on focus group discussions with PWID aimed at establishing a) changes in drug use that could have potentially led to decrease in demand for OST and b) level of correspondence of existing OST program to PWID needs.

Participants who are 18 years or older and who either injected drugs or received OST within the past 3 months were selected via purposive sampling method taking into account their gender, enrollment to OST program and coverage with other harm reduction services.

In total 16 focus group discussions were held in 8 cities that covered 65 people both receiving (30 people) and not receiving OST (35 people) living in all regions of Tajikistan (except remote GBAO region).

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Results:** A moderate reduction in injection drug use was confirmed by the respondents due to decrease in access to opioids and emergence of new psychoactive substances. The most common reasons mentioned by PWID that negatively impact enrollment and adherence to the OST may be grouped into 3 categories:

1. Lack of appeal of the OST program, e.g. need for everyday visits to the OST site, registration at narcology as a pre-condition for enrollment to OST, etc. (55 respondents),
2. Lack of the capacity of OST sites staff (25 respondents),
3. Misinformation circulated among PWID on OST (15 respondents).

**Conclusions:** The research suggests that despite a certain decrease in total number of PWID, the demand for quality OST services among PWID remains high in Tajikistan. Introduction of take-home OST options, development of OST sites staff capacity and raising awareness of PWID and healthcare professionals on OST should lead to increase in OST program coverage.

## TUPEC248

**SPrEP – Online PrEP and PEP: breaking down access barriers to HIV prophylaxes in the city of São Paulo**

M.C. Abbate<sup>1</sup>, A.Q. Silva<sup>1</sup>, C.M. Matos<sup>1</sup>, S.F.M. Rodrigues<sup>1</sup>, L. Pinheiro<sup>1</sup>, M.A. Barbosa<sup>1</sup>, R.F. Camargo<sup>1</sup>, G.M. Rodrigues<sup>1</sup>, M.d.L.F. Camargo<sup>1</sup>, B.L. Macedo<sup>1</sup>

<sup>1</sup>Municipal Health Secretariat of São Paulo, STI/Aids Coordination, São Paulo, Brazil

**Background:** The city of São Paulo has an HIV epidemic specific to some populations, with a higher incidence among men and young people aged 15 to 29. São Paulo has the largest distribution hub in Brazil and the STI/Aids Coordination has several ways of accessing pre- (PrEP) and post-exposure (PEP) HIV prophylaxes.

**Description:** SPrEP – Online PrEP and PEP is the first online service in Brazil for HIV prophylaxes. SPrEP is hosted in the e-saúdeSP application, from the Municipal Health Department, which allows PrEP and PEP services every day from 6pm to 10pm, including on weekends and holidays, via online appointment. The user signs up or logs in the application and, in the case of PrEP, uploads the image or PDF file of a negative HIV test result within 7 consecutive days. An appointment is generated for the medical professionals and the user is video-called that same day, within a few minutes. Upon medical advice, the medication is prescribed, which can be picked up at 17 24-hour units or at 28 municipal health units specialized in STIs/Aids.

**Lessons learned:** From June to December 2023, SPrEP had 187,000 accesses, with 970 services requested, 148 prescriptions for PrEP, 210 for PEP, 126 follow-up appointments and 486 appointments for other benefits. Out of the total number of appointments, 41% were for people aged between 15 and 29; 78.3% were born male; 54.7%

white people, 36.1% black people and 2.4% yellow people. Regarding the medication pick up, 48% did so in 24-hour units; 28% in units with regular hours and 25% in a unit that operates with an alternative schedule and opens on Saturdays.

**Conclusions/Next steps:** The city of São Paulo registered more than 36,000 people on PrEP from 2018 to 2023. SPrEP is another option for the population to have access to prophylaxes at alternative hours and at various medication pick-up points at any time of the day in the capital São Paulo, via online appointment, which offers access to a medical prescription and to online medical examination requests.

## TUPEC249

**Opioid substitution therapy (OST): a harm reduction strategy among people who inject drug (PWIDs) under National AIDS and STD Control Programme (NACP) in India**

S. Verma<sup>1</sup>, S. Rajan<sup>2</sup>, S. Bhavsar<sup>3</sup>, S. Purohit<sup>1</sup>, G. Mung<sup>1</sup>  
<sup>1</sup>National AIDS Control Organization, Health & Family Welfare, Govt of India, Delhi, India, <sup>2</sup>National AIDS Control Organization, Health & Family Welfare, Delhi, India, <sup>3</sup>National AIDS Control Organization, Health & Family Welfare, Delhi, India

**Background:** The National AIDS and STD Control Programme (NACP) has adopted Opioid Substitution Therapy (OST) as key harm-reduction strategy to prevent HIV and other blood-borne infections among IDUs since 2007. Amongst all key populations, positivity of IDUs is highest at 9.83% (HSS, 2021), hence the need OST. OST program involves treatment of patients with opioid dependence with long-acting opioid-agonist medication for certain duration of time through sublingual route, in dose which effectively minimizes craving and withdrawals, thereby enabling patient to stop injecting drugs. Combined with extensive psycho-social intervention, OST program has proved to be relatively successful in reducing drug-related harms including transmission of HIV, HCV and opioid overdose.

**Description:** OST as a key harm-reduction strategy is demonstrated as successful intervention in reducing drug-related harms including transmission of HIV, HBV and HCV. NACP provides OST as a "Directly Observed Treatment" in clinic-based setting known as OST Centre under supervision of Medical Officer. There is also provision for take-home dosage for clinically-stable clients satisfying all criteria provided. OST program is provided through three models: Collaborative model at public-health facilities, NGO-based model provided at Targeted Intervention (TI) and Satellite Model which includes provision of OST at Prison and other-closed settings. Progress under OST Programme has been analyzed since 2018-19 to 2022-23 as in table below:

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

Year	OST Centres	Clients on-OST (in Thousand)	% of PWIDs on OST
2018-19	215	29.1	19
2019-20	226	36.4	22
2020-21	232	42.2	25
2021-22	238	42.6	24
2022-23	244	44.6	23

**Lessons learned:** OST as part of NACP is a highly successful strategy with (52000 number of clients covered). It assists IDUs in mainstreaming to regular life and society. It also leads to strengthening their economic situation by providing opportunities for employment. The program has also made efforts to scale up the service through different models ensuring access to the community wherever they are.

**Conclusions/Next steps:** The scale up of OST Centres and increased coverage of IDUs on OST will lead to minimising HIV and viral hepatitis transmission as well as motivate IDUs to adopt a healthy life with dignity free of stigma and discrimination.

## TUPEC250

Comparison of new HIV diagnosis, adolescent pregnancy, and gender-based violence in DREAMS and non-DREAMS districts in two regions in Tanzania, 2018–2023

P. Haun<sup>1</sup>, A. Katale<sup>1</sup>, A. Wang<sup>1</sup>, R. Gongo<sup>1</sup>, J. Kitalile<sup>1</sup>, P. Kuya<sup>2</sup>, H. Nasrallah<sup>1</sup>

<sup>1</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV and Tuberculosis, Dar Es Salaam, Tanzania, the United Republic of, <sup>2</sup>Ministry of Health, Tanzania, National AIDS, STIs, and Hepatitis Control Programme, Dar Es Salaam, Tanzania, the United Republic of

**Background:** HIV incidence among adolescent girls and young women (AGYW) remains high compared to male peers. The DREAMS program provides a combination of interventions to reduce HIV incidence in AGYW. In Tanzania, DREAMS was introduced in Muleba district, Kagera region, in 2018 and Nyamagana district, Mwanza region, in 2021.

We compared the association of DREAMS on HIV and related outcomes among AGYW in two regions over 5 years of implementation.

**Methods:** Using PEPFAR MER data and Tanzania's District Health Information System data, we conducted a two-sample test of proportions on positive HIV tests, reported GBV, and adolescent pregnancy for DREAMS districts (Muleba, Nyamagana) compared to non-DREAMS (6 Kagera districts, 7 Mwanza districts) to determine if proportions between timepoints (2018 to 2023) or populations (DREAMS and non-DREAMS) changed.

Results were stratified by age (15-19 years, 20-24 years) and region (Kagera, Mwanza).

**Results:** Among AGYW aged 15-19 in Muleba, the proportion of positive HIV tests decreased from 1.50% at baseline to 0.80%, a change of 46.6% ( $p<0.05$ ); among those aged 20-24, there was a decrease of 55.6% ( $p<0.05$ ), from 2.52% to 1.12%. Among AGYW in Kagera non-DREAMS districts, there was no significant difference between timepoints. In AGYW aged 15-19 in Nyamagana, positive HIV tests decreased by 49.8% ( $p<0.05$ ) from 2.58% to 1.29%; among those aged 20-24, there was a decrease of 50.1% ( $p<0.05$ ) from 4.08% to 2.03%. AGYW in non-DREAMS Mwanza districts saw a significant decrease between timepoints: for ages 15-19, 57.4% (1.96% to 0.84%,  $p<0.05$ ) and for ages 20-24, 51.3% (3.37% to 1.64%,  $p<0.05$ ).

GBV reports significantly declined among AGYW aged 20-24 in all Kagera districts (68.4% decline in non-DREAMS districts and 77.8% decline in Muleba). However, GBV reports among other age bands and in Mwanza districts increased. Adolescent pregnancy rates in Muleba did not significantly change and decreased in non-DREAMS Kagera districts by 8.1%. Adolescent pregnancy significantly increased in all Mwanza districts ( $p<0.05$ ).

**Conclusions:** Overall the proportion of positive HIV tests declined. Trends were mixed for adolescent pregnancy and GBV, indicating challenges remain in tackling these issues. Continued monitoring is needed to improve non-HIV outcomes and substantiate DREAMS intervention effects on all objectives.

Rethinking HIV prevention among refugees: a case study from West Africa's largest settlement

I. Ogunkola<sup>1</sup>, M. Ogbodum<sup>1</sup>, J. Adole<sup>1</sup>, H. Jonah<sup>1</sup>, T. Bepeh<sup>2</sup>, M. Ironbar<sup>1</sup>, C. Agi<sup>1</sup>, Y. Adebayo<sup>3</sup>, M. Wang<sup>4</sup>, M. Plymoth<sup>5</sup>  
<sup>1</sup>University of Calabar, Department of Public Health, Calabar, Nigeria, <sup>2</sup>The Excellence Community Education Welfare Scheme, Ogoja, Nigeria, <sup>3</sup>University of Glasgow, Population Health, Glasgow, United Kingdom, <sup>4</sup>University of Sydney, Sydney, Australia, <sup>5</sup>Westmead Hospital, Sydney, Australia

**Background:** Amidst the global crisis of 70.8 million forcibly displaced individuals, of whom 25.9 million are refugees as of 2019, the need for accessible HIV prevention services in humanitarian settings has become increasingly urgent, particularly among young refugees. Leveraging funding from the International AIDS Society Seed Grant, we established a comprehensive HIV prevention and harm reduction service hub within the Adagom refugee settlement in Nigeria, catering specifically to the needs of young Cameroonian refugees.

**Description:** In collaboration with a local NGO (Today For Tomorrow Foundation) and settlement authorities, a walk-in center was constructed in the heart of the refugee settlement, comprising 41 communities. One young person from each community was selected based on pre-

Index

defined criteria and trained as an HIV peer educator. The training encompassed comprehensive sexuality education, HIV testing methodologies, harm reduction service provision, and other related services. These certified peer educators subsequently returned to their communities to educate peers and gather data using the Kobo Collect app.

**Lessons learned:** During the initial six-month implementation phase ending in December, the hub serviced 1,500 young refugees, with a notable 63% female attendance. Strikingly, 90% of these individuals had never undergone HIV testing prior. The hub recorded a low HIV-positive rate of 0.45%, with about 31% of the female being teenage mothers. Although quantitatively challenging to measure, the hub witnessed an overwhelming demand post-public sensitization, exhausting supplies intended for a 2,500-population size twice within six months.

**Conclusions/Next steps:** The peer-to-peer model has proven remarkably effective in HIV prevention efforts among young refugees in the Adagom settlement. It not only facilitated increased awareness and service uptake but also demonstrated a sustainable, community-driven approach to health education.

Building on this success, the next phase aims to scale up the project to other refugee settlements and Internally Displaced Persons camps across Nigeria, potentially amplifying the model's impact on a national scale.

## TUPEC252

### Factors associated with non-use of sexual and reproductive health services by sex workers in DRC

I.N.B. Hilo<sup>1</sup>, M.-M. Marie-Agnes<sup>1</sup>, M.N. Aimé<sup>1</sup>, L.L. Guy<sup>1</sup>, L.M. Aimée<sup>2</sup>, E. François<sup>3</sup>

<sup>1</sup>Ministry of Public Health, Hygiene and Prevention, National Program of HIV, Kinshasa, Congo, the Democratic Republic of the, <sup>2</sup>University of Kinshasa, Kinshasa School of Public Health, School of Medicine, Kinshasa, Congo, the Democratic Republic of the, <sup>3</sup>Global funds, Monitoring, Evaluation and Epidemiology, Geneva, Switzerland

**Background:** Using reproductive health services during pregnancy, childbirth and postpartum constitutes an important opportunity for the prevention of mother-to-child transmission of HIV. However, there is low use of these Services by sex workers. Key populations and their sexual partners are at higher risk of HIV infection. In the DRC, the HIV epidemic remains more concentrated in key populations with a prevalence in 2019 of 7.7% among SWs. This study was conducted to determine the factors associated with the non-use of reproductive health services by FSWs.

**Methods:** The study was conducted in ten provinces of the DRC. A mixed approach was used, the quantitative part focused on an analytical cross-sectional study and the qualitative part on in-depth interviews with key infor-

nants who were SPs responsible for the associations. The study population consisted of SWs who had given birth in the last two years preceding the survey; they were selected by snowball sampling. The Chi-square and Student's t tests were used to compare proportions and means, respectively. Logistic regression was used to identify factors independently associated with low use of reproductive health services by FSWs. The statistical significance threshold was set at 0.05.

**Results:** Of 1263 SWs surveyed, only 24% had used the recommended reproductive health service. The factors associated with this non-use were: drug consumption ORA 1.64 (95% CI: 1.13-2.36); non-knowledge of the transmission of syphilis from mother to child ORA (95% CI: 2.9(1.1-7.7); having suffered sexual violence in the last 12 months ORA 0.71 (95% CI: 0.53-0.95); non-carrying a desired pregnancy ORA 1.55(95% CI: 1.16-2.06); recruiting clients on the street ORA 1.49 (IC95% : 1.11-2.00); the fact of not recruiting clients by telephone ORA 1.92 (IC95% : 1.44-2.56); the fact of non - having been tested for HIV at the CPN ORA 1.94(IC95% : 1.45-2.60)..

**Conclusions:** In terms of use of reproductive health services, there is a delay to start of the prenatal consultation by sex workers which results in a lower proportion of prenatal consultation. The sex workers are very vulnerable people and this vulnerability is associated with the use of maternal health services. It is therefore important to consider interventions that include factors of vulnerability.

## TUPEC253

### Subnational certification of HIV vertical transmission elimination in Brazil in the years 2022 and 2023: toward elimination

C. Francisco da Silva<sup>1</sup>, P. Cristina Gaspar<sup>1</sup>, F. Moherdau<sup>1</sup>, A. Tiago Bernardes de Matos<sup>1</sup>, N. Maria da Silva Machado<sup>1</sup>, L. Henriette de Lannoy<sup>1</sup>, A.P. Betaressi da Silva<sup>1</sup>, M. Gonçalves Aragón<sup>1</sup>, A. Morais Lima<sup>1</sup>, S. Ferreira Junior<sup>1</sup>, R. Bugarin Steenhout<sup>1</sup>, L.F. Ayres Junior<sup>1</sup>, M. Colombo<sup>1</sup>, L.S. Araujo Barreto<sup>1</sup>, I.M. Cleide Diana de Souza<sup>1</sup>, M.d.G. Oliveira<sup>1</sup>, D. Barreira Cravo Neto<sup>1</sup>, A. Espinosa Miranda<sup>1</sup>

<sup>1</sup>Ministry of Health of Brazil, Department of HIV/AIDS, Tuberculosis, Viral Hepatitis, and Sexually Transmitted Infections, Brasília, Brazil

**Background:** The scientific community and health assessment organizations have committed to eliminating vertical transmission (VT) of HIV, syphilis, hepatitis B, and Chagas disease as public health problems. In Brazil, this commitment has led to the subnational certification process for VT elimination in municipalities with ≥100,000 inhabitants. This process recognizes, strengthens, and promotes local efforts to reduce HIV vertical transmission (HIV-VT) and syphilis cases, fostering healthy births.

This study presents results obtained from the certification process of VT-Elimination in 2022 and 2023 through analyses of impact and process indicators from the Global Guidance on criteria and processes for validation: Elimination of mother-to-child transmission of HIV, syphilis, and hepatitis B virus, adapted to the Brazilian context in the National Guide.

**Methods:** Descriptive study based on the analysis of municipal reports applying for HIV-VT certification in the years 2022 and 2023. The stages involve the preparation of a municipal report by the Municipal Validation Committee, followed by the evaluation of the State Validation Committee, and the analysis and approval of the Ministry of Health (MH). The MH organizes on-site technical visits to the applying municipality by the National Validation Team (NVT).

Following this, the National Validation Committee analyzes and validates the reports and the certification process.

Finally, the MH officially certifies the municipalities. Minimum criteria for national certification: achieving impact and process indicators outlined in the National Guide; having a surveillance system for monitoring HIV-VT cases; implementing an HIV-VT Municipal Investigation Committee; and demonstrating all HIV-VT preventive measures for elimination while safeguarding human rights.

**Results:** A total of 28 municipalities were awarded HIV-VT elimination certificates in 2022 and 37 in 2023. Additionally, 10 good practices certificates were awarded in 2022 and 33 in 2023. Overall, 108 municipalities were certified, with an approximate population of 53.546.759 inhabitants.

**Conclusions:** The awarded certificates reflect the outcomes of improved processes, restructuring its flows, and population access to health services for promotion and prevention, surveillance, and care, enhancing the quality of life for women and children.

Successfully achieving the goals of eliminating VT-related diseases requires shared responsibility among the Ministry of Health, states, and municipalities.

## TUPEC254

### Mapping key populations in Nigeria: hotspots for targeted interventions

J.E. Egwu<sup>1</sup>, A.E. Andrew<sup>1</sup>, O. Oshagbami<sup>1</sup>, U. Sylvester Avom<sup>1</sup>, R. Aguolu<sup>1</sup>, F. Agbo<sup>1</sup>

<sup>1</sup>National Agency for the Control of AIDS, Research, Monitoring and Evaluation, Abuja, Nigeria

**Background:** Nigeria has the fourth-highest HIV burden in the world and is known for having a mixed HIV epidemic with high HIV prevalence among key populations (UNAIDS 2020).

Mapping locations with evidence of high HIV prevalence gives access to greater knowledge and evidence-based KP data.

To strategically place services and allocate scarce resources for focused interventions, in response to HIV/AIDS, reliable and accurate mapping of key population hotspots is required.

**Methods:** Secondary data analysis of programmatic mapping and size estimation of KP groups across 20 states in Nigeria. The study was conducted using mapping methodology based on a geographic approach that identified the key locations including virtual locations where key population members are found. The mapping methodology was in two sequential steps: Level 1 – Systematic information-gathering from secondary informants and Level 2 – Site validation and in-depth profiling of sites identified from Level 1.

**Results:** The mapping exercise validated 55,418 active hotspots for all KP typologies across the 20 states. Hotspots validated by typologies were FSW 18,711(34%), PWID 18,419(33%), MSM 10,192(18%) and TG 8,096(15%) with FSW 254,613 being the highest TG 64,182 lowest in population. Katsina state 5,672 is the highest in active hotspots while Plateau 1,299 is the lowest. A total of 629,741 KPs were estimated with FSW 254,613 highest and TG 64,182 lowest. Generally, Fridays, Sundays, and Saturdays stand out as the days with the most activity and the peak is evening and nighttime.

**Conclusions:** The findings of this study show a sizeable number of key population hotspots which underscores the need for targeted interventions and deeper-dives into KPSE data. Nationwide coverage of KPSE (across 36+1 states) is necessary for the next round to facilitate the harvest of national-level estimates.

A study on social network engagement of other sexual partners at spots other than physical will be useful for developing innovative virtual platform intervention programs.

## TUPEC255

### Substance use patterns among PrEP users at the University Medical Center Hamburg-Eppendorf: implications for sexual health

men (MSM) and transgender individuals. This study investigates sexualized drug use among PrEP users at the University Medical Center Hamburg-Eppendorf, examining associated social parameters and the risk of sexually transmitted diseases (STDs).

**Methods:** Our ongoing prospective observational study, the PrEP-Cohort, initiated in October 2020, employs recurring online questionnaires (RedCap), standard blood tests, and STD screenings to assess sexualized drug and alcohol consumption among PrEP users. Data include sexual orientation, behavior, socio-economic information, and a sexual transmitted diseases history up to January 2024.

**Results:** Among 345 individuals completing the principal questionnaire, 40 (11.5%) reported frequent substance use, while 179 (52%) reported occasional use. Overall, 219 (63%) PrEP users acknowledged using one or more substances during sexual encounters, including alcohol, impotence medication, poppers, GBL/GHB, ecstasy/MDMA, cocaine, amphetamines, cannabis, methadone, benzodiazepines, mephedrone, and others.

The majority of our cohort consumed alcohol ( $n=196$ , 57%, mean age  $37 \pm 9.3$ ), followed by poppers ( $n=110$ , 32%, mean age  $38 \pm 9.0$ ). Higher age correlates with impotence medication use ( $n=37$ , 11%, mean age  $43 \pm 10.7$ ). Cannabis is used by 49 participants (14%, mean age  $36 \pm 10$ ). Hard drugs (GBL/GHB, ecstasy/MDMA, cocaine, amphetamines, methadone, benzodiazepines, mephedrone, opioids, and others) are used by 53 participants (15%, mean age  $37 \pm 9$ ), and this subgroup exhibits higher rates of STD ( $p=0.0015$ ) and more frequently involved in group sex ( $p<0.0001$ ).

**Conclusions:** A notable percentage of our participants, irrespective of job qualification and age, engage in alcohol and soft drug use in sexual contexts. However, hard drug use is more prevalent among younger PrEP users, correlating with significantly higher rates of STDs. These findings underscore the importance of targeted prevention programs to address sexual health within the PrEP user population

## TUPEC703

Female Sex Workers' (FSWs') knowledge, attitude and self-efficacy on Pre-Exposure Prophylaxis (PrEP) in Yangon Region, Myanmar

H.H. Yu<sup>1</sup>

<sup>1</sup>High School, Program, Yangon, Myanmar

**Background:** This study investigates the factors influencing FSWs' utilization of PrEP services which is essential to effectively use PrEP and keep adherence.

**Methods:** This study is a community-based cross-sectional survey targeting the FSWs with random proportionate sampling. The survey was conducted in 2023, among 373 FSWs and a focus group discussion was conducted with 20 FSWs from Insein and South Okkalapa Townships.

The questionnaires included socio-demographics, HIV and PrEP knowledge, sources of PrEP information, attitude, and self-efficacy on PrEP utilization.

The study employs descriptive and inferential statistics using JASP software for quantitative analysis and NVivo 10 for qualitative analysis.

**Results:** The mean age of the respondents was 34 years ( $SD=8.991$ ) and the majority were street-based FSWs ( $n=308$ , 82.6%) with low education ( $n=289$ , 77.5% below secondary education) and low-income levels ( $n=241$ , 64.6% earned below 200,000 MMK, approximately 100 USD, monthly). Most of them regularly used condoms ( $n=309$ , 82.8%), but had experiences of unprotected sex in the last 12 months ( $n=238$ , 63.8%).

The respondents had moderate knowledge of HIV and low knowledge levels about PrEP (an average of 61% and 30%, respectively, correctly answered the knowledge assessment). The main sources of PrEP information were friends, relatives, and acquaintances ( $n=161$ , 40.7%), while 41.4% ( $n=164$ ) reported no source of information. The respondents expressed positive attitudes toward PrEP, with 276 (74%) expressing willingness to use PrEP with more information, and 278 (74.5%) expressing willingness if it were free, respectively. However, they also reported concerns about the cost, accessibility, and stigma.

The respondents' self-efficacy to utilize PrEP varied according to their type of sex work (35.4% street-based and 18.5% venue-based sex workers had high self-efficacy). The main challenges they faced were seeking the right information, talking with their owners, finding a way to pay, and adhering to their daily regimen.

**Conclusions:** There are significant gaps in PrEP knowledge among FSWs in the Yangon Region. Despite a positive attitude towards PrEP, FSWs, especially venue-based FSWs, had a lot of challenges in accessing PrEP. To address these issues, targeted awareness sessions, coordination efforts with venue owners, and partnerships with health-care professionals are recommended.

## TUPEC256

HIV retesting uptake and incidence during pregnancy and postpartum period among women in sub-Saharan Africa: a systematic review and meta-analysis

M.S. Mbwana<sup>1</sup>, Z.M. Ally<sup>2</sup>, H.M. Bakari<sup>3</sup>, S.S. Mustafa<sup>4</sup>, T. Lascko<sup>5,6</sup>, H.O. Ramadhani<sup>6</sup>

<sup>1</sup>Primary Health Care Institute, Iringa, Tanzania, the United Republic of, <sup>2</sup>District Hospital, Tanga, Tanzania, the United Republic of, <sup>3</sup>University of Dar es Salaam, Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>Canada Youth Group, Dar es Salaam, Tanzania, the United Republic of, <sup>5</sup>Center for International Health, Education, and Biosecurity, University of Maryland School of Medicine, Baltimore, United States, <sup>6</sup>Institute of Human Virology, University of Maryland School of Medicine, Baltimore, United States

**Background:** To reduce mother-to-child transmission of HIV and maternal morbidity and mortality, most HIV programs recommend retesting for HIV every three months during pregnancy and postpartum periods. Data on HIV retesting uptake is limited; therefore, we aimed to estimate the pooled prevalence of HIV retesting uptake and HIV incidence among women during pregnancy and the postpartum period in sub-Saharan Africa (SSA).

**Methods:** We conducted a systematic review and meta-analysis of women attending antenatal and postnatal clinics in SSA. PubMed, Cochrane Library, Embase, and Google Scholar were searched for articles published between January 2002 and December 2023. Retesting uptake was defined as the number of women who retested for HIV following an initial HIV-negative test during the antenatal and/or postnatal periods.

Using random effects models, we computed the pooled prevalence of HIV retesting uptake, incidence rates (IR) and 95% confidence intervals (CI).

**Results:** A total of 31 studies (19-cohorts, 10-cross-sectional, and 2-mixed methods) with 411,130 women were included in the final analysis. Overall, the pooled prevalence of HIV retesting uptake was 72.6% (95%CI:72.4-72.8%). Retesting uptake was significantly higher during postpartum compared to during pregnancy (89.3% vs 70.8%;  $p<0.001$ ), higher before the rollout of test and treat compared to after test and treat (79.4% vs 70.9%;  $p<0.001$ ), and higher in Eastern compared to Southern Africa (78.2% vs 70.5%;  $p<0.001$ ). A total of 2,392 (0.6%) women acquired HIV. Twenty-one studies reported an IR, and the overall pooled IR was 4.3/100 person-year (PY; 95%CI:4.0-4.6/100PY). The HIV incidence rate was significantly higher during pregnancy compared to postpartum periods (6.0/100 vs 3.5/100PY;  $p<0.001$ ), higher after test and treat compared to before test and treat (7.3/100 vs 4.0/100PY;  $p<0.001$ ), and higher in Southern compared to Eastern Africa (5.5/100 vs 3.5/100PY;  $p<0.001$ ).

**Conclusions:** Nearly three in ten women in SSA do not retest for HIV during pregnancy or postpartum periods. The risk of HIV acquisition was significantly higher during pregnancy compared to postpartum periods. Emphasizing HIV retesting during these periods is critical to eliminate pediatric HIV given that the overall IR is beyond the World Health Organization threshold (3.0/100 PY) for substantial risk of HIV transmission

## TUPEC257

Lessons learned from retesting of pregnant and breastfeeding women

C. Shava<sup>1</sup>, E. Mwiinga<sup>1</sup>, J. Chansa<sup>1</sup>, E. Kaemba<sup>1</sup>, F. Lipita<sup>1</sup>, F. Kunda<sup>1</sup>, A. Mumba<sup>1</sup>, M. Chitambo<sup>1</sup>, M. Mukumba<sup>1</sup>, O. Luneta<sup>1</sup>, D. Mwansa-Zulu<sup>1</sup>, X. Bean<sup>2</sup>, P. Juarez<sup>2</sup>, S. Chirwa<sup>2</sup>, P. Matthews-Juarez<sup>2</sup>

<sup>1</sup>Meharry Medical College Global Health and HIV Clinical Services, Clinical, Lusaka, Zambia, <sup>2</sup>Meharry Medical College, Nashville, United States

**Background:** Incident HIV infection in pregnant and breastfeeding women (PBFW) is contributing to pediatric HIV infection. Re-testing of PBFW after the first antenatal visit is key in early diagnosis, treatment and prevention of Mother-To-Child-transmission of HIV.

The PEPFAR-supported program: Leveraging Health Service Equity through supporting the health care needs of mothers and their HIV-exposed infants has successfully incorporated retesting of PBFW in its "One-Stop" Differentiated Service Delivery model.

**Description:** This initiative is being conducted in Maternal and Child Health Units (MCH) of four high volume, Level-one Hospitals in Lusaka from October 2022 to date. A person-centered team embedded in MCH provides care for PBFW living with HIV and their children under 2-years-old. They provide health education and screen all PBFW to identify those due for retesting (3-monthly according to Zambia Ministry of Health Guidelines) at all service points in MCH: antenatal, postnatal, immunization, family planning and cervical cancer screening.

Those identified are tested and results and next test date are documented in the client's booklet, the paper register and the electronic health record, SmartCare. Eligible clients are offered Pre-exposure prophylaxis. Retesting data from October 2022 to September 2023 were reviewed.

**Lessons learned:** Out of an expected 46,930 retests, 36,202 were performed (77%). The retesting rates were 86% and 75% for pregnant and breastfeeding women respectively. The positivity yield was 0.4% (146 clients, 94 breastfeeding). 62 breastfeeding women (67%) received a positive test result within the first month postpartum (Range 1 to 180 days), while for pregnant women 42 (81%) were diagnosed in the third trimester (Range 14 to 39 weeks). 98% of clients who tested positive were linked to treatment and paired with mentor mothers for psychosocial sup-

port. Having dedicated staff screening PBFW for retesting eligibility at all service points and health education contributed to increased retesting rates while clients silently electing to be retested at other health facilities and incomplete data entry into paper records lowered them.

**Conclusions/Next steps:** Strengthening of retesting through deliberate screening and health education particularly in the third trimester to 6 months postpartum is recommended in detecting the majority of incident HIV infections.

## TUPEC258

Prevalence of sexual violence and HIV screening services for survivors in selected tertiary in Ogun State, Nigeria

C. Onyemelukwe<sup>1</sup>, O. Olamide<sup>1</sup>

<sup>1</sup>Center for Health Ethics Law and Development, Lagos, Nigeria

**Background:** Sexual exploitation and abuse within higher education institutions in Nigeria is a pressing issue that demands immediate attention and comprehensive action. It is also an issue which is prevalent in tertiary institutions in Ogun State, Nigeria. Rape has often emerged as a predominant form of sexual violence among female students. The health repercussions of such incidents are profound. Survivors of rape in Nigerian tertiary institutions must have prompt access to HIV screening and counselling to prevent negative health outcomes.

**Methods:** A cross-sectional mixed survey, combining qualitative and quantitative approaches was employed for this study. A total of 300 students were randomly recruited from four tertiary institutions for the quantitative aspect of the study while 14 key informant interviews were conducted. The quantitative data was collected through kobo and analyzed using SPSS v 25.

Results were presented as frequencies, percentages and means, while inferential statistical analysis such as chi-square and binary logistic regression was also employed. For the qualitative aspect, audio recording was transcribed verbatim and thematic analyses were conducted to identify patterns and recurring themes.

**Results:** The mean age of participants was 21 years and the majority (56.7%) were between 20-25 years. A greater number (75.7%) were in their 2<sup>nd</sup> year (33%) of tertiary education. The study found a 5% prevalence of sexual violence with (28.5%) rape and (35.7%) sexual harassment being the most prevalent.

Furthermore, all forms of sexual violence perpetuated were significantly higher among females ( $p < 0.05$ ).

In terms of access to HIV screening services, results found that the majority of survivors (83%) failed to report cases of sexual violence which was a major factor hindering prompt HIV screening and other medical services to survivors.

**Conclusions:** This study found that sexual violence exists in institutions assessed. Furthermore, the prevalent form of sexual abuse was rape and it was mostly perpetuated against women. Under-reporting of cases associated with fear, stigma and victim blaming was also a major issue which continues to limit the understanding of the issue at hand within the institutions. This also prevent timely access to care for survivors most especially in the area of timely HIV screening and counselling.

## TUPEC260

Promotion of primary HIV testing amidst internal migration challenges

Y. Chechotkina<sup>1</sup>, M. Rovinsky<sup>2</sup>, K. Rivera<sup>2</sup>, N. Smolianets<sup>2</sup>, A. Kryvoruchko<sup>3</sup>

<sup>1</sup>CO "100% LIFE", Communication Department, Kyiv, Ukraine, <sup>2</sup>CO "100% LIFE", Communication Department, Kyiv, Ukraine, <sup>3</sup>CO "100% LIFE", Innovation Department, Kyiv, Ukraine

**Background:** Russia's war in Ukraine resulted in 4 million IDPs. The East and South of Ukraine, being a combat zone or partially occupied, have been historically the most affected by HIV. The war caused the population to move to safer Central and Western regions. The Lviv region has become one of resettlement hubs, hosting 700,000 IDPs. The health system had to respond quickly to new challenges posed by the influx of healthcare clients, to prevent the possible spread of the epidemic to the west by expanding HIV screening programs.

**Description:** Family doctors, as the entry point into the health system, became the target population for the intervention. A unique 5-hour training for family doctors on rapid HIV testing and counseling was developed. The goal was to increase the number of tests performed in polyclinics. In January-July 2023, 28 training workshops were held for 500+ doctors. Upon completion, participants were awarded continuing education credits that doctors earn annually for certification.

**Lessons learned:** In 6 months of 2023, Lviv family doctors exceeded last year's testing rates by testing 20,288 people for HIV. 88 people living with HIV were identified. The six-month detection rate in 2023 was three times higher than in 2022. The intervention also created an active "Your Family Doctor" community, whose ambassadors develop a culture of HIV testing and anti-stigma. The interactive workshop combined with visual and promotional communications, involving the media and government officials, increased doctors' motivation, as evidenced by community feedback. Combining the HealthLink project's expertise in HIV testing with the practice of the medical community created a demand for training that reached all 500+ family doctors in Lviv. For many, communicating with a person living with HIV was their first such experience contributing to an understanding of people living with HIV needs.

**Conclusions/Next steps:** WHO recommends testing as many people as possible. The intervention demonstrated the feasibility of new prevention and support programs in western Ukraine. Currently, "100% Life" and the association "Your Family Doctor" expand the training program for family doctors throughout Ukraine.

## TUPEC261

### Successes and challenges in expanding access to HIV treatment for key populations in Uzbekistan

S. Uchayev<sup>1</sup>, E. Korokova<sup>1</sup>

<sup>1</sup>NGO ISHONCH VA HAYOT, Tashkent, Uzbekistan

**Background:** The goal of the project is to ensure effective access of key populations (KP) to HIV testing and treatment as part of achieving global 95-95-95 targets through community-led efforts. Project implemented in Tashkent, Uzbekistan from May 2021 to April 2023, focusing on people who use drugs (PUD), sex workers (SW) and men who have sex with men (MSM).

**Description:** Project was implemented by the community of people living with HIV "ISHONCH VA HAYOT" and included assisted HIV self-testing (OraQuick), psychosocial and legal assistance (support groups, consultations of psychologists and lawyers), support for adherence to ART, training of outreach workers and creating a project monitoring system.

**Lessons learned:** Over 24 months, 8409 people (12.28% MSM, 25.94% SW, 61.78% PWUD) were tested for HIV. Of them, HIV was detected for the first time in 825 people (9.8%): 12.4% in the KP of PUD, SW - 4.7%, MSM - 7.7%. 445 clients were D-registered and initiated ART.

However, 380 people were lost from the program's radar. Being tied to the place of residential registration significantly complicated the process of D-registration for internal migrants living in Tashkent. Fear of disclosing HIV status and identity is a prominent barrier among MSM (HIV transmission and homosexual relations are criminalized in Uzbekistan).

The project team also worked with PLHIV who had previously dropped out of the HIV treatment, and managed to return 702 PLHIV to ART. To solve the problems of D-registering people living without registration in Tashkent, the project team carried out advocacy activities.

As a result, the Republican AIDS Center took responsibility for registering HIV-positive internal migrants located in Tashkent. This decision played an important role in simplifying the D-registration process, significantly reducing barriers to treatment initiation.

**Conclusions/Next steps:** The project has been continued in 2024 and the team focuses on increasing the number of people who test positive for HIV, become D-registered and receive ART. The project showed that to improve access to HIV treatment, it is necessary to address HIV stigmatization, criminalization and provide comprehensive

psychosocial support to key populations after a positive HIV test, as well as eliminating structural barriers for internal migrants.

## TUPEC262

### Linkage to care and prevention after HIV self-testing: a systematic review and meta-analysis

Y. Zhang<sup>1,2</sup>, J. Tapa<sup>1,2</sup>, S.M. Goh<sup>3</sup>, C.C. Johnson<sup>4</sup>, E.P. Chow<sup>1,2,5</sup>, C.K. Fairley<sup>1,2,6</sup>, J.J. Ong<sup>1,2,7</sup>

<sup>1</sup>Central Clinical School, Faculty of Medicine, Nursing and Health Sciences, Monash University, Melbourne, Australia, <sup>2</sup>Melbourne Sexual Health Centre, Alfred Health, Melbourne, Australia, <sup>3</sup>Chelsea and Westminster Trust, London, United Kingdom, <sup>4</sup>Global HIV, Hepatitis and STI Programmes, World Health Organization, Geneva, Switzerland, <sup>5</sup>Centre for Epidemiology and Biostatistics, Melbourne School of Population and Global Health, The University of Melbourne, Melbourne, Australia, <sup>6</sup>University of Melbourne, Melbourne, Australia, <sup>7</sup>Faculty of Infectious and Tropical Diseases, London School of Hygiene and Tropical Medicine, London, United Kingdom

**Background:** Effective linkage to prevention and care is a crucial step following HIV testing services. This systematic review aimed to determine the proportion of individuals who are linked to prevention and care after HIV self-testing (HIVST) and describe factors associated with linkage.

**Methods:** An initial search was conducted across eight databases, including conference abstracts, up to October 2023. Linkage to care after HIVST was defined as getting a confirmatory test or antiretroviral therapy (ART) if the self-test was reactive, and/or pre-exposure prophylaxis (PrEP) if the self-test was non-reactive. A random-effects meta-analysis was performed to summarize the linkage to prevention and care.

**Results:** A total of 10,071 studies were screened, of which, 174 were included in this meta-analysis. Most studies examining linkage to confirmatory testing or ART initiation were conducted in the African region among key populations who used oral fluid-based HIVST kits.

Overall, 92% (95% confidence interval (CI): 89-96) of those whose HIVST was reactive were linked to confirmatory testing, and 89% (95% CI: 84-93) of those newly diagnosed with HIV initiated ART. Eighty-four percent (95% CI: 74-93) of those tested were linked to care.

Of the individuals whose HIVST was non-reactive, 9% (95% CI: 2-19) were linked to PrEP. Studies utilising assisted HIVST demonstrated a higher linkage to confirmatory testing 98% (95% CI: 88-100), ART initiation (91% (95% CI: 84-96)) and engagement in HIV care (100% (95% CI: 100-100)) compared to studies using unassisted self-testing (91% (95% CI: 86-95), 89% (95% CI: 83-95), 83% (95% CI: 71-93), respectively).

Our meta-regression analysis found that the type of delivery model for the HIVST kits influenced linkage and that individuals who obtained their HIVST kits through a social network-based approach (SNA) were more likely to be linked to confirmatory testing (adjusted odds ratio (aOR) = 1.28 (95% CI: 1.10-1.50),  $p = 0.001$ ) compared to non-SNA service delivery model.

**Conclusions:** In the context of expanding HIVST services globally, we found that linkage to confirmatory testing and ART initiation after HIVST is generally high, particularly with assisted HIVST and when SNA was used to obtain the HIVST kits.

## TUPEC263

Improving early HIV diagnosis in Taiwan: uptake and challenges of HIV-self-testing among people living with HIV

C.-Y. Lee<sup>1,2</sup>, Y.-P. Lin<sup>1,2</sup>, C.-Y. Tsai<sup>1,2</sup>, P.-L. Lu<sup>1,2</sup>

<sup>1</sup>Kaohsiung Medical University, Kaohsiung City, Taiwan, Province of China, <sup>2</sup>Kaohsiung Medical University Hospital, Division of Infectious Diseases, Department of Internal Medicine, Kaohsiung City, Taiwan, Province of China

**Background:** The uptake and attrition of an HIV self-testing (HIV-ST) cascade among people living with HIV (PLWH) in Taiwan and the factors influencing self-testing uptake remain unclear. Besides, the proportion of individuals undergoing confirmatory tests after positive HIV-ST results and the degree of delay between positive self-testing and confirmatory testing remain unclear.

**Methods:** This multicenter cross-sectional survey was conducted among 443 participants (53.27% aged  $\leq 30$  years; 99.1% men; 92.33% MSM) in Taiwan.

We designed a 5-tier continuum—named the HIV-ST cascade—based on the participants' levels of engagement with the HIV-ST continuum: starting with HIV-positive participants (Tier 1), advancing to those who ever heard of HIV-ST pre-diagnosis (Tier 2), those contemplating HIV-ST (Tier 3), those who ever used HIV-ST before diagnosis (Tier 4), and finally those who self-tested annually (Tier 5). Exploratory factor analysis identified five domains hindering progress in the HIV-ST continuum: indifference or apathy towards HIV risk (domain 1), fear of HIV diagnosis (domain 2), fear of discrimination with a positive result (domain 3), fear of stigmatization with a positive result (domain 4), and structural barriers to HIV-ST (domain 5).

**Results:** Our findings indicated a consistent annual increase in the rate of HIV-ST acceptance among HIV-positive individuals from 2017 to 2023 (11.9% to 30.4%,  $P$  for trend  $< .001$ ). A marginal decline was observed in the proportion of people who had never heard of HIV-ST; however, this remained the most significant loss in the HIV-ST continuum from 2017 to 2023 (39.1% to 59.6%). The fear of negative consequences of a positive HIV test result is not only a major impediment to progressing along the

HIV-ST continuum but also a primary reason for the delay in seeking diagnostic confirmation after a positive test result. Multivariate analysis indicated that older age (vs. age  $\leq 30$  years), employment, and year of diagnosis (2021, 2023 vs. 2017) were significantly correlated with higher acceptance of HIV-ST.

**Conclusions:** The increasing trend in the acceptance of HIV-ST indicates progress in Taiwan; however, a lack of awareness and fear of adverse outcomes remain considerable barriers that necessitate strategies to promote regular HIV-ST and timely follow-up after a positive result.

## TUPEC264

Enhancing HIV prevention among young key populations through digital distribution of self-testing kits: a SWING foundation initiative

S. Sumalu<sup>1</sup>, S. Sukthongsa<sup>1</sup>, P. Leksiri<sup>1</sup>, K.H. Thy<sup>1</sup>, S. Janyam<sup>1</sup>, C. Phaengnongyang<sup>1</sup>

<sup>1</sup>Service Workers In Group Foundation, Bangkok, Thailand

**Background:** Recognizing the heightened HIV risk and barriers to testing services among young key populations, particularly those using dating apps or engaged in online sexual services, the Service Worker In Group Foundation (SWING) initiated an innovative approach. This approach involved the distribution of HIV self-testing kits (HIVST) via online platforms, aimed at facilitating easier access to testing and encouraging the maintenance of HIV-negative status.

**Description:** From October 2022 to September 2023, SWING's program distributed 478 HIVST kits, both blood-based and oral fluid-based, targeting various key populations, with a focus on different age groups. The intervention began with a risk assessment questionnaire, followed by kit distribution through the 'Testmenow' booking system. Follow-up processes, conducted via phone and the Line app, allowed users to self-report their results. The follow-up protocol varied from providing prevention information and emotional support to guiding users towards confirmatory testing and treatment initiation for reactive results.

**Lessons learned:** Of the 478 kits distributed, 95% were blood-based, with the 15-24 age group receiving 40% of these kits and showing the highest utilization rate (41%). The high rate of reactive results, especially in this age group, where 11 of 15 reactive cases were confirmed HIV positive, underscores the effectiveness of this outreach method. Key lessons include the efficacy of digital platforms in reaching and engaging young high-risk populations and the critical role of tailored follow-up support in facilitating immediate care and treatment.

**Conclusions/Next steps:** The success of this program in engaging young key populations and identifying new HIV cases demonstrates the potential of HIV self-testing as a cornerstone in HIV prevention strategies. Moving for-

ward, it is essential to expand the reach of self-testing to a broader range of demographics within key populations. Strengthening the integration of these community-led initiatives with the larger healthcare system will ensure comprehensive care and support for those diagnosed with HIV. This approach, if replicated and scaled, could significantly contribute to global efforts in HIV prevention and treatment.

## TUPEC265

Improving HIV case identification in adolescents and young people (AYP) through index case testing: a quantitative study on tracing partners of HIV - positive adolescents in Kabwe District, Central Zambia

K. Kazilimani<sup>1</sup>, A. Chasaya<sup>2</sup>, J. Chila<sup>3</sup>, L. Chingumbe<sup>4</sup>

<sup>1</sup>USAID CHEKUP II, Strategic Information, Kabwe, Zambia,

<sup>2</sup>USAID CHEKUP II, Knowledge Management and Communications, Lusaka, Zambia, <sup>3</sup>USAID CHEKUP II, Key Populations - DEpiCC Manager, Kabwe, Zambia, <sup>4</sup>USAID CHEKUP II, Key Populations - Senior Management, Lusaka, Zambia

**Background:** Over twice as many AYP, in comparison to the general population, do not know their HIV status in Zambia which has derailed progress on the 95-95-95 goals for this age cohort (Zamstat, 2021).

Furthermore, the incidence of HIV acquisition AYP stood at 14,000 per year. We sought to investigate the feasibility of index case testing as a model of identifying partners of HIV-positive adolescents in Kabwe District, Central Zambia.

**Methods:** A quantitative study was conducted using secondary data from DataSync, a database established by the USAID CHEKUP II Activity, between April and December, 2023. During that period, we reached out and offered index case testing services to AYP aged 15 – 24 years, within the Activity's facilities in the district, using the client advisor model.

Thereafter, a detailed analysis of the contribution of index case identification was conducted. The indicators utilized to establish the effectiveness of index case testing were the number of contacts elicited and offered HIV testing services, and the number of HIV-positive AYP who were linked to antiretroviral therapy (ART).

**Results:** 208 AYP accepted indexing and from those 388 contacts aged 15-24 were elicited using the index case identification model representing an elicitation ratio of 1: 2. Of these, 342 AYP were tested through the index case testing. This represented 88.1% of the total number of AYP elicited between April and December, 2023. A total of 61 HIV-positive AYP were identified, and 59 of these were linked to ART. This represented a 17.8 % positivity yield (61/342) among AYP, with a 96.7% linkage rate (59/61). The positivity yield was the highest amongst females than

males at 21% and 9.5% respectively. The linkage rate was higher amongst males than females at 100% and 96.2% respectively. Those that tested negative and were eligible were offered PrEP, condoms, sexual reproductive health talks and lubricants among other interventions.

**Conclusions:** Index case identification has proven to be a very effective strategy for identifying, testing and linking to treatment AYP at increased risk of HIV infection. It is also one of the surest strategies for increasing adolescents' access to HIV testing services.

## TUPEC266

Navigating the final mile to epidemic control, a case study of strategic weekend approach to HIV testing, North Central Nigeria

I. Onyejiaka<sup>1</sup>, A. Etsetowaghan<sup>2</sup>, E.N. Atuma<sup>3</sup>, I. Saliu<sup>2</sup>, F. Eluke<sup>4</sup>, N. Kehinde<sup>4</sup>, D. Olutola<sup>2</sup>, P. Gado<sup>5</sup>, P. Igweike<sup>6</sup>, N. Afolabi<sup>4</sup>, O. Adeoye<sup>4</sup>, O.S. Afonsike<sup>4</sup>, A. Agweye<sup>5</sup>, T. Idaboh<sup>5</sup>, C. Obiora-Okafo<sup>5</sup>, K. Kakanfo<sup>5</sup>, A. Gambo<sup>9</sup>, W. Okafor<sup>10</sup>, D. Abu Sambe<sup>3</sup>

<sup>1</sup>Johns Hopkins Program for International Education in Gynecology and Obstetrics (JHPIEGO), Prevention, Kwara, Nigeria, <sup>2</sup>Center for Clinical Care and Clinical Research Nigeria, Abuja, Nigeria, <sup>3</sup>Johns Hopkins Program for International Education in Gynecology and Obstetrics (JHPIEGO), Program, Abuja, Nigeria, <sup>4</sup>Center for Clinical Care and Clinical Research Nigeria, Kwara, Nigeria, <sup>5</sup>Office of HIV/AIDS and TB, United States Agency for International Development (USAID), Abuja, Nigeria, <sup>6</sup>Center for Clinical Care and Clinical Research Nigeria, Technical, Minna, Nigeria, <sup>7</sup>Office of HIV/AIDS and TB, United States Agency for International Development (USAID), Washington DC, Nigeria, <sup>8</sup>National HIV/AIDS and STI Control Program, Abuja, Nigeria, <sup>9</sup>National Agency for the Control of AIDS, Abuja, Nigeria, <sup>10</sup>Johns Hopkins Program for International Education in Gynecology and Obstetrics (JHPIEGO), Abuja, Nigeria

**Background:** There are appreciable efforts towards achieving HIV epidemic control in Nigeria and globally, but we are short of achieving epidemic control. More concerted efforts and innovative strategies are required to achieve it. Strategic Weekend Approach to HIV Testing (SWEAT) is an innovative, targeted, and efficient community HIV testing and case finding strategy.

The purpose of the study is to evaluate the impact of SWEAT in HIV epidemic control, North Central Nigeria.

**Methods:** We conducted a retrospective review of the HIV testing records from SWEAT conducted by 20 testers over the weekends (Saturdays and Sundays) from December 2022 to January 2023 across 8 randomly selected local government areas (LGAs) and compared the achievements with the community testing conducted on week-

days (Mondays-Fridays) within the same period across the same LGAs by another set of 20 testers to evaluate the impact of SWEAT on achieving HIV epidemic control.

**Results:** From our results, a total of 10,393 people were tested for HIV, 249 (3.0%) tested positive from SWEAT (Saturdays & Sundays) and initiated on ART in comparison to 19,388 people tested, with 208 (1%) identified positives and initiated on ART from community weekday (Mondays-Fridays) testing. The peak case finding efficiency recorded across the same LGAs were 5.1%, 4.6% and 4.3% for SWEAT and 2.0%, 1.5% and 1.3% for community weekday testing.

**Conclusions:** SWEAT is a more targeted and efficient HIV case finding strategy, with improved case finding and linkage on ART. It is an innovative strategy for accelerating case finding and linkage on ART to achieve epidemic control. We recommend the SWEAT strategy. Future research is needed to compare weekend and weekday testing in health facilities, across urban and rural areas, the insight will be useful in strengthening facility HIV services.

## TUPEC267

Comparative analysis of people living with HIV identified by community-based organizations and health care facilities in Bishkek and Osh, Kyrgyzstan

A. Kubatova<sup>1</sup>, K. Stankevitz<sup>2</sup>, A. Gottlieb<sup>3</sup>, T. Mambetov<sup>1</sup>, O. Samoilova<sup>1</sup>, D. Saliev<sup>1</sup>

<sup>1</sup>FHI 360 EpiC, Bishkek, Kyrgyzstan, <sup>2</sup>FHI 360, Durham, NC, United States, <sup>3</sup>FHI 360, Washington, DC, United States

**Background:** Community-based organizations (CBOs) have been essential to the HIV response, but as countries near epidemic control, CBO support is diminishing. Launched in 2019 and funded by the U.S. President's Emergency Plan for AIDS Relief, EpiC Kyrgyzstan aims to maintain epidemic control by focusing on innovative testing approaches.

The study examined the characteristics of people living with HIV (PLHIV) receiving care from health care facilities (HCFs) and CBOs in Bishkek and Osh cities, Kyrgyzstan. The analysis aimed to uncover the contribution of CBOs to HIV case identification, explore differences in age distribution, identification of high-risk populations, and demographic factors between CBOs and HCFs.

**Methods:** Using the electronic databases of EpiC and the Republican AIDS Center (RAC), we generated a dataset with sociodemographic and risk characteristics of all clients diagnosed between October 1, 2020, and September 31, 2023, in Bishkek and Osh. We divided the sample into two groups: those identified by HCFs and by CBOs. Using descriptive statistics and logistic regression, we explored client characteristics and organizational settings.

**Results:** CBOs contributed to the identification of 18.8% of PLHIV in Bishkek and Osh. The average age of PLHIV identified in CBOs was significantly lower than in HCFs (34.5 vs. 37.9,  $p < 0.001$ ). CBOs also reached a higher proportion of

men (76% vs 60%,  $p < 0.001$ ), homeless people (6.7% vs 2.7%,  $p = 0.001$ ), single individuals (71.8% vs 54.6%,  $p < 0.001$ ), and drug users (9.0% vs 4.3%,  $p = 0.002$ ). CBOs covered more people with previous HIV tests (51.4% vs 42.8%,  $p = 0.02$ ), and those identified in CBOs were more likely to be initiated on ART within 30 days (97.0 vs 95.1,  $p = 0.06$ ).

In the multivariate model, CBOs showed a specific identification profile with significantly more homeless people (OR=2.9, CI=1.3-6.4), individuals from key populations (OR=4.3, CI=3.0-6.0), and PLHIV in earlier stages of infection (OR=0.5, CI=0.3-0.8).

**Conclusions:** This analysis highlights the significant contribution of CBOs in identifying PLHIV from high-risk groups, especially homeless people, and key populations. The findings underscore the need for collaborative strategies between CBOs and HCFs that emphasize an individualized approach to addressing risk factors among PLHIV and expand coverage of testing and treatment services among women.

## TUPEC268

Different post-COVID-19 recovery in HIV testing according to PrEP use among gay and bisexual men attending clinics in a surveillance network in Australia

S. Vaccher<sup>1</sup>, M. Traeger<sup>1</sup>, J. Asselin<sup>1</sup>, H.L. Aung<sup>2</sup>, A. Carter<sup>2,3,4</sup>, N. Ryder<sup>2</sup>, P. Keen<sup>2</sup>, C. Fairley<sup>5,6</sup>, E. Guy<sup>2</sup>, M. Stoové<sup>11,14</sup>

<sup>1</sup>Burnet Institute, Melbourne, Australia, <sup>2</sup>Kirby Institute, UNSW Sydney, Sydney, Australia, <sup>3</sup>Australian Human Rights Institute, UNSW Sydney, Sydney, Australia, <sup>4</sup>Simon Fraser University, Faculty of Health Sciences, Vancouver, Canada, <sup>5</sup>Melbourne Sexual Health Centre, Alfred Health, Melbourne, Australia, <sup>6</sup>Central Clinical School, Monash University, Melbourne, Australia, <sup>7</sup>Melbourne School of Population and Global Health, University of Melbourne, Centre for Epidemiology and Biostatistics, Melbourne, Australia, <sup>8</sup>Sydney Sexual Health Centre, Sydney, Australia, <sup>9</sup>Taylor Square Private Clinic, Sydney, Australia, <sup>10</sup>East Sydney Doctors, Sydney, Australia, <sup>11</sup>Health Equity Matters, Sydney, Australia, <sup>12</sup>Central Clinical School, Monash University, Department of Infectious Diseases, Alfred Health, Melbourne, Australia, <sup>13</sup>Peter Doherty Institute, Melbourne, Australia, <sup>14</sup>School of Public Health and Preventive Medicine, Monash University, Melbourne, Australia

**Background:** Quarterly HIV/STI testing is recommended for all gay and bisexual men (GBM) in Australia, and typically required for GBM accessing PrEP. Interruptions to service delivery and regular HIV testing during COVID-19 may have ongoing impacts on community-level testing rates. We examine recovery in HIV testing among Australian GBM stratified by PrEP use.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Methods:** Data on HIV testing and PrEP prescription among GBM  $\geq 16$  years were extracted from 22 Victorian and New South Wales clinics in the ACCESS network for the period 01/01/2019 to 30/06/2023. Quarterly numbers of HIV tests were stratified by PrEP status (PrEP-linked testing defined as PrEP prescription within 28 days of HIV test). We used Poisson regression to compute rate ratios comparing mean quarterly tests in each year from 2020–2023 with 2019. We also calculated the median time between tests and proportion of people tested in 2019 who did not return for a subsequent test.

**Results:** In total, 176,297 HIV tests were performed among 49,480 GBM during the study period. The quarterly number of HIV tests declined from 18,688 in Q1 2019 to 9,951 in Q2 2020 (first COVID-19 lockdowns), increasing to 13,656 by Q2 2023.

The reduction in HIV testing in Q1 2019 relative to Q2 2020 was greater for non-PrEP-linked HIV tests (52%, 11,253–5,387) than PrEP-linked tests (39%, 7,435–4,564). In 2023, mean quarterly HIV testing remained 20% lower compared to 2019 (RR=0.80, CI:0.79–0.81); the relative reduction was greater for HIV tests not linked to PrEP (RR=0.72, CI:0.71–0.73) than PrEP-linked tests (RR=0.91, 95%CI:0.89–0.93). Median days since last HIV test was 99 (range 91–114) for PrEP-linked tests, compared to 147 (range 127–181) for non-PrEP-linked tests.

Of the 33,646 people tested in 2019, 9,393 (28%) did not return for testing by 30/06/2023; 8,664 (92%) of which were not linked to PrEP at their last test in 2019.

**Conclusions:** Sustained drops in HIV testing since COVID-19 restrictions eased are being driven by a lack of recovery in HIV testing not associated with PrEP prescriptions among GBM. Re-engaging non-PrEP users in HIV testing and care will be crucial to achieving targets for eliminating HIV transmission.

## TUPEC269

A peer-led outreach approach is effective in finding and linking to treatment internally displaced populations living with HIV in Mali

M.M.S. Tall<sup>1</sup>, C. Casalini<sup>2</sup>, N. Dougnon<sup>1</sup>, I. Daou<sup>1</sup>, K. Coulibaly<sup>1</sup>, V. Ranebennur<sup>3</sup>, A. Lambert<sup>4</sup>, E. Cooper<sup>5</sup>, D. Boré<sup>6</sup>, N. Diarra<sup>6</sup>, A. Diallo<sup>7</sup>, M. Ruberintwari<sup>1</sup>

<sup>1</sup>FHI360, EpiC project, Bamako, Mali, <sup>2</sup>FHI360, HIV Department, Amsterdam, Netherlands, the, <sup>3</sup>FHI360, HIV Programs, New Delhi, India, <sup>4</sup>FHI360, HIV Programs, Cape Town, South Africa, <sup>5</sup>FHI360, HIV Department, Washington, United States, <sup>6</sup>USAID, HIV, Bamako, Mali, <sup>7</sup>IMADEL, EpiC Project, Bamako, Mali

**Background:** Internally displaced people (IDP) are vulnerable to HIV due to conflict, displacement, poverty; lack of access to care, all resulting in low HIV testing and treatment access. The security crisis in Mali resulted in over 400,000 IDP and although the HIV prevalence

and incidence is 0.9% and 0.28 per 1,000 among general population, there are no data among IDP. Though, we know that HIV case finding among IDP in Africa, ranges between 1.5% in Nigeria and 6% in Cameroon. U.S. President's Emergency Plan for AIDS Relief (PEPFAR) through U.S. Agency for International Development (USAID)-funded Meeting Targets and Maintaining Epidemic Control (EpiC) project offers HIV prevention, care, and treatment to IDP in Mali.

**Description:** EpiC Mali, through a community-based organization, offered community-based peer-led HIV services to IDP in 4 districts. Peer outreach workers provided HIV education; offered HIV rapid test; navigated clients to HIV prevention and treatment services, as per "status neutral" approach.

We analyzed aggregated IDP data by sex and by age from an individual level database (DHIS2) from October 2022 to September 2023 to assess HIV testing coverage and case finding and to assess HIV prevention needs.

**Lessons learned:** EpiC project reached 4,705 IDP with HIV education and tested 2,454 (52%) at 4% case finding and 97% treatment initiation. The highest case finding was in the age group 45–49 years (7%). The IDP who tested HIV negative, were offered condoms, lubricants, and linkage to voluntary medical male circumcision, while pre-exposure prophylaxis (PrEP) was not available to IDP in the geographic areas of the project.

**Conclusions/Next steps:** An outreach approach effectively identified IDP living with HIV and ensured linkage to treatment. HIV case finding was within the range reported by other African countries, and higher than the national prevalence in Mali. These findings suggest a high degree of vulnerability among IDP.

Furthermore, the low testing coverage and the highest case finding in older ages, calls for consultations with IDP to understand barriers and enablers to increase HIV testing coverage and to design strategies to effectively reach higher-risk age groups. PrEP should be made available as additional prevention choice for IDP in EpiC project areas.

## TUPEC270

The impact of distributing HIV self-test kits in achieving the first 95

S. Fogue Tiozang<sup>1</sup>, C.E. Metuge<sup>1</sup>, S. Mabouna<sup>1</sup>, G. Fako<sup>1</sup>, I. Nna Banga<sup>1</sup>, A. Zeh Meka<sup>1</sup>, M. Tokam<sup>1</sup>, A. Boupda<sup>1</sup>

<sup>1</sup>Care and Health Program, Yaounde, Cameroon

**Background:** Conventional HIV testing faces resistance from a considerable proportion of high-risk individuals. HIV self-testing, recommended as an additional approach by the WHO in 2019, has proven effective in reducing missed HIV testing opportunities and promoting the diagnosis of PLHIV among affected Key Populations (KPs) in the CHILL project.

Oral  
abstracts

**Methods:** This cross-sectional, descriptive study utilized program data from community distribution of HIV self-test kits between June and September 2023 under the PEPFAR-funded CHILL project. The study population comprised Men who have Sex with Men (MSM), Female Sex Workers (SW), Injecting Drug Users (IDU), and Transgender individuals (TG). OraQuick HIV self-test kits, involving a non-invasive oral swab, were distributed to clients who declined conventional HIV tests for personal use. KPs received in-person demonstrations from peer educators trained to PEPFAR standards, supplemented by manufacturer-provided instructions.

A follow-up call two days after distribution ensured kit usage and collection of test results. Those with a reactive test were directed for confirmation per national guidelines to a project drop-in-center or health facility.

**Results:** Risk assessment of 40,390 KPs revealed 76% (30,739) at elevated HIV risk, eligible for HIV testing. Among the eligible, 72% (22,043) accepted conventional health-care professional-led testing, while 28% (8,696) declined. Refusal demographics included 53% (4,593) FSW, 42% (3,613) MSM, 4% IDU, and 2% TG.

Self-test kits were systematically offered to all KPs who declined conventional HIV testing, with an overall acceptance rate of 86% (7,486) [100% for FSW, 74% for MSM, 56% for IDU, and 31% for TG].

Of the 7,486 who accepted self-tests, 94% (7,034) used the kits, with utilization rates of 99% for FSW, 85% for MSM, and 100% for IDU and TG. Among the 7,034 tests, 83 were reactive, of which 60 (72%) were confirmed positive.

**Conclusions:** HIV self-testing emerges as a pivotal innovation, empowering people and significantly contributing to awareness of serological status among KPs. In our study, it acted as the catalyst for knowing serological status in a stigma free, convenient and confidential way; particularly for clients who declined conventional finger prick HIV testing.

## TUPEC271

**Sustainable supply of HIV, HBV, HCV viral load, molecular detection of chlamydia/gonorrhea and CD4+ count tests in Brazil: an innovative and effective service contracting model**

A. A. C. Morais<sup>1</sup>, F. L. Conte<sup>1</sup>, P. Pezzuto<sup>1</sup>, J.A. V. Morais<sup>1</sup>, N. O. de O. Guedes<sup>1</sup>, R. Diquique<sup>1</sup>, Á. Bigolin<sup>1</sup>, D. Barreira<sup>1</sup>

<sup>1</sup>Ministry of Health of Brazil, Department of HIV/AIDS, Tuberculosis, Viral Hepatitis and Sexually Transmitted Infections, Brasília, Brazil

**Background:** The Brazilian MoH provides universal coverage, comprehensive care, and free access to healthcare through the Brazilian Unified Health System. Since 1997, the MoH has maintained, in partnership with the Federative Units and municipalities, the National Network of Laboratories for HIV-VL and CD4+ T-Lymphocyte Count.

In 2011 and 2012, the HBV and HCV VL were incorporated into the network, followed by the inclusion of the CT/NG molecular detection test in 2023.

**Description:** The MoH implemented an innovative contract model for continuous service maintenance, integrating four tests (HIV/HBV/HCV-VL and detection of CT/NG) on a single automated platform in 82 laboratories, and the CD4+ test also on an automated platform in 72 laboratories (standard-of-care) and 53 health facilities (point-of-care). The company is responsible for supplying necessary inputs for exams. Monthly payment is based on the number of tests released by laboratories in the MoH information systems. Figure 1 presents some specifications of the service contracting modality.

Figure 1. Specifications of the Brazilian service contracting modality.

**Lessons learned:** With this model, there is shared responsibility for the maintenance and quality of exams among the laboratory/health facilities, governmental managers, and the contracted supplier.

Furthermore, in this type of contracting, the supplier manages the validity and resupply of inputs, in addition, there is no need to purchase equipment and it allows you to always have platforms with up-to-date technologies. Finally, the aim is to integrate the largest number of tests for different health issues on these platforms, ensuring the possibility of obtaining timely test results, maximum productivity and the decentralization of access to tests.

**Conclusions/Next steps:** The laboratory services contract model has proven to be effective and advantageous for users by ensuring continuous care, prompt, and high-quality feedback. It is strongly recommended that other countries adopt a similar contractual model to ensure collective responsibility among all involved parties, promoting integrated service and user-focused actions within the health system.

## TUPEC272

### Revolutionizing HIV testing: Maritime Life Precious Foundation's success with index testing in reaching high-risk clients

M.K.A. Owusu<sup>1</sup>, S. Wosornu<sup>1</sup>, H. Aikins<sup>1</sup>, J. Sanful<sup>1</sup>, R. Osei<sup>1</sup>, P. Kumi<sup>1</sup>, H. Nagai<sup>2</sup>, Y. Ahmed<sup>2</sup>

<sup>1</sup>Maritime Life Precious Foundation, Takoradi, Ghana, <sup>2</sup>JSI Research & Training Institute, Inc. (JSI), Takoradi, Ghana

**Background:** In the past, Maritime Life Precious Foundation (MLPF) has implemented various testing strategies to identify individuals living with HIV (PLHIV), but these strategies have yielded a low number of positive cases among men who have sex with men (MSM). MLPF introduced community-based index testing as an effective strategy in the Western region of Ghana.

**Description:** Community-based Index testing is a testing strategy where people living with HIV are encouraged to voluntarily refer their sexual partners for HIV testing. MLPF started two variations of index testing known as the group index testing and individualized index testing under the USAID Strengthening the Care Continuum Project. Group index testing involved inviting one or two sexual partners of a maximum of 10 PLHIV clients to participate in group activities. Individualized index testing focused on testing partners in comfortable locations, facilitated by nurses.

To increase case finding, MLPF introduced two additional variants of index testing known as the Viral Load Result-Based Index Testing and ART Defaulted index testing. These approaches utilized clients with a high viral load or those who had discontinued HIV medication for over a year as index cases to encourage testing among their partners. MLPF analyzed viral load results for high viral loads as well as client's defaulter records to identify treatment interrupted clients as index cases, as they pose a higher risk to their partners.

This approach was implemented from October 2019 to June 2023 across selected MLPF sites. MLPF adopted the four types of referrals for index testing implementation: contract referral, client referral, provider referral, and dual referral.

**Lessons learned:** Between April 2017 and June 2023, MLPF conducted 2,275 index testing sessions, revealing 693 HIV-positive cases (30.4% yield). In contrast, other testing strategies, with 15,930 tests, identified 589 positives. Obviously, index testing alone accounted for 54% of the total positive cases (1,282) during this period.

**Conclusions/Next steps:** This approach showcases the strategy's effectiveness in case finding. MLPF recommends the adoption and implementation of index testing by all HIV prevention projects, as it contributes significantly to achieving the UNAIDS objective of the first 95.

## TUPEC273

### Reasons for re-taking the HIV test after a previously positive result: findings from a rapid test program in Latin America

N. Delgadillo<sup>1</sup>, M. Pedrola<sup>1</sup>, B. De Jesus<sup>1</sup>, C. Becerra<sup>1</sup>, D. Galvis<sup>1</sup>, M. Ruiz<sup>1</sup>, X. Torres<sup>1</sup>, S. Paau<sup>1</sup>, K. Duverger<sup>1</sup>, K. Harvey<sup>1</sup>, G. Bustamante<sup>1</sup>, N. Dormoi<sup>1</sup>, J.L. Sebastian<sup>1</sup>, A. Schwartz Benzaken<sup>1</sup>

<sup>1</sup>AIDS Healthcare Foundation, Los Angeles, United States

**Background:** Aids Healthcare Foundation's rapid test program aims to promote universal access to HIV diagnosis, focusing on key populations who still do not know their HIV status.

However, clients may occasionally seek testing despite having a prior reactive HIV serology. Motivations for recurrent test seeking are poorly understood.

**Methods:** The rapid test program was carried out by trained lay personnel from 01/01/2023 to 12/31/2023 in facilities and community centers in Argentina, Brazil, Chile, Colombia, Dominican Republic, El Salvador, Guatemala, Haiti, Jamaica, Mexico, Panama, and Peru. Prior to sample collection for HIV rapid tests, the program included group counselling and a self-administered risk survey addressing age, sex at birth, gender, possible mode of HIV transmission, reason for taking the test, condom use, previous tests and results, and reason for recurrent testing among participants with a previously positive HIV test result. The rapid test result was informed with individual counselling and linkage to the HIV care when applicable.

**Results:** Of 337,148 HIV rapid tests performed, 13,526 (4.1%) yielded positive results. There were 186,338 people who had previously been tested for HIV, of whom 8,045 (4.3%) were positive; 3,251 of them (40.4%) already knew their HIV diagnosis. Of those, 2,455 (75.5%) provided reasons for repeating the HIV test despite knowing their diagnosis.

We identified five response categories:

1. Need for referral to treatment and care (80.3%);
2. Difficulty in accepting the HIV diagnosis (denial, 7.8%);
3. Curiosity about the rapid test results relative to the previous test (5.5%);
4. Distrust about the test carried out previously (3.9%); and,
5. Other reasons, including social pressure from friends, sexual partner, or job application (2.4%).

**Conclusions:** We found a significant number of people who, despite knowing their HIV diagnosis, are still not on treatment and seek to repeat their HIV test. This underscores that existing programs for HIV diagnosis, counselling and linkage to care have important gaps, failing to provide sufficient support for patients following diagnosis. Studies are needed to explore potential solutions for this concerning issue.

### Transition to 3-test HIV testing algorithm saves 371 individuals from potential misdiagnosis: lessons from Malawi's HIV testing program

T. Chimpandule<sup>1,2</sup>, K. Namachapa<sup>1</sup>, S. Mbiriawanda<sup>1</sup>,  
T. Masina<sup>1</sup>, W. Wu<sup>3</sup>, L. Goeke<sup>3</sup>, D. Bilicki<sup>3</sup>, A. Jahn<sup>1,4</sup>,  
W. Nyaungulu<sup>3</sup>, P. Wiszniewski<sup>3</sup>, A. Kapachika<sup>1</sup>

<sup>1</sup>Directorate of HIV, STI and Viral Hepatitis, Lilongwe, Malawi, <sup>2</sup>International Training and Education Center for Health, Lilongwe, Malawi, <sup>3</sup>Quantitative Engineering Design (QED.ai), Sheridan, United States, <sup>4</sup>Department of Global Health and I-TECH, University of Washington, Seattle, United States

**Background:** Following WHO recommendations, Malawi revised its guidelines in 2023 and became the first country to adopt and transition to a new HIV 3-test diagnostic algorithm to reduce the risk of false positive diagnoses, due to declining positivity rates. The national HIV Testing Services (HTS) program in Malawi rolled out three sequential rapid diagnostic tests – Determine HIV1/2, Uni-Gold HIV1/2, and SD Bioline HIV1/2 – and concurrently introduced advanced monitoring & evaluation (M&E) tools to capture essential protocol decisions and HTS outcomes. These paper registers are scannable with ScanForm technology, which uses artificial intelligence to automatically transcribe handwriting into digital data with a smartphone picture.

**Description:** The ongoing transition from the 2-test HIV testing algorithm in Malawi is coordinated by the Ministry of Health as a phased nationwide initiative which started in November 2022. As of January 23, 2024, the program successfully activated 545 facilities across all 28 districts, representing 78% of access points. National quarterly supervision and ScanForm's daily automated data quality assessment reports are pivotal in ensuring data accuracy, 3-test algorithm concordance and driving continuous quality improvement at each site.

**Lessons learned:** Data from November 1, 2022 to January 23, 2024 shows that 3,082,406 HTS records have been collected. Of the total tested, the 3-test algorithm concordance rate was 99.96% (2,605,324 / 2,606,280).

Of these, 371 individuals (239 females and 132 males) received inconclusive results after test 3, with initial reactive test 1 and test 2 tests. Under the previous 2-test algorithm, these individuals would have likely been misdiagnosed as HIV positive and started on antiretroviral therapy immediately.

An additional 448 individuals (281 females and 167 males) were diagnosed as HIV negative, instead of requiring re-testing after two weeks under the previous 2-test algorithm.

**Conclusions/Next steps:** With declining HIV positivity rates globally, adopting the WHO-recommended 3-test algorithm is crucial for reducing misdiagnoses. Malawi's experience demonstrates that through effective provider

training and robust M&E tools such as ScanForm, accurate implementation of this algorithm can be achieved swiftly. The full transition is expected by June 2024 with ongoing site support to ensure sustained success.

## TUPEC275

### Walking the last mile towards achieving the first 95: an analysis of HIV Self Testing scale up in Uganda

G. Taasi<sup>1</sup>, D. Adoo<sup>1</sup>, C. Katusiime<sup>1</sup>, R. Kizito<sup>2</sup>, M. Lyazi<sup>1</sup>,  
L. Kabunga<sup>2</sup>, J. Batusa<sup>2</sup>, M. Lubega<sup>2</sup>

<sup>1</sup>Ministry of Health, Kampala, Uganda, <sup>2</sup>Clinton Health Access Initiative, Kampala, Uganda

**Background:** HIV Testing Services (HTS) programs are operating within increasingly complex environments with more limited resources and declining number of people living with HIV identified. Identifying and linking the remaining people living with HIV (PLHIV) remains the major limiting factor to the achievement of the 95-95-95 targets in Uganda. The World Health Organization recommends HIV Self Testing (HIVST) as an additional HTS approach. HIVST has been proven to increase testing coverage among populations that are not being reached with conventional HTS. The Uganda HTS program is prioritizing integration and scale up of HIVST as part of case finding efforts.

**Methods:** Following initial pilot implementation, the Ministry of Health in Uganda opened up for large scale deployment of HIVST as part of the national PLHIV identification efforts. Between January 2022 to December 2023, HIVST was scaled up from the initial 21 priority districts to all the 145 districts across the country covering more than 3,500 public health facilities. Priority distribution channels included both facility-based and community-based models.

Clients were reached with both primary and secondary HIVST distribution modalities. HIVST was also integrated into other HTS approaches such as assisted partner notification and social network testing strategy.

**Results:** A total of 1,432,464 HIVST kits were distributed to the clients with 926,900 (64.7%) clients doing directly assisted HIVST and 505,564 (35.3%) doing unassisted HIVST. Majority of the kits were distributed to females (55.9%). Of those that used the HIVST kits, 16,884 report a positive HIVST result and 9,803 (58%) were confirmed with the national algorithm as HIV positive.

**Conclusions:** Scale up and integration of HIVST as part of the HTS program can lead to efficiencies in case identification. Opportunities exist for further optimization of HIVST distribution.

### TUPEC276

Characteristics and associations of adverse pediatric outcomes in the prevention of Mother-to-Child HIV Transmission program, selected regions of Tanzania, 2018–2023

V.J. Hicks<sup>1</sup>, A. Rugarabamu<sup>2</sup>, A. Wang<sup>1</sup>, A. Ismail<sup>1</sup>, P. Rwehumbiza<sup>1</sup>, C. Mahende<sup>1</sup>, A.E. Kimonge<sup>2</sup>, B. Simba<sup>2</sup>, W. Mauka<sup>2</sup>, D. Sando<sup>2</sup>, G.W. Lyatuu<sup>2</sup>, L.C. Machumi<sup>2</sup>, M.J. Mahande<sup>2</sup>, N.D. Schaad<sup>1</sup>, L. Fidelis<sup>1</sup>, S.E. Porter<sup>1</sup>, W.E. Maokola<sup>3</sup>, P.F. Njau<sup>3</sup>

<sup>1</sup>United States Centers for Disease Control and Prevention, Dar es Salaam, Tanzania, the United Republic of,

<sup>2</sup>Management and Development for Health, Dar es Salaam, Tanzania, the United Republic of, <sup>3</sup>National AIDS Control Programme of Tanzania, Dar es Salaam, Tanzania, the United Republic of

**Background:** Prevention of mother-to-child transmission programs aim to eliminate HIV transmission from pregnant and/or breastfeeding mothers living with HIV to their infants. Infants are clinically monitored, routinely tested for HIV, and given preventive medications.

We analyzed program data from Tanzania to identify programmatic gaps and assess risks of adverse pediatric outcomes.

**Methods:** Using de-identified client-level data from a national HIV clinical database, we created a retrospective cohort of mother-infant pairs in the Dar es Salaam, Geita, Tabora, and Kagera regions, where adult HIV prevalence is 4.2%–5.7%. We followed infants born between 2018–2021 from birth to 24 months or until their last documented clinical interaction.

We excluded infants without documentation of services during and after birth. We documented compliance with HIV testing guidelines and program delivery. We categorized death and HIV positivity as adverse outcomes.

We grouped mothers into high and low programmatic vertical transmission risk categories based on HIV diagnosis timing, antiretroviral therapy regimen, and viral load.

We reported proportions and relative risks (RR) with 95% confidence intervals for bivariate analyses assessing the association of risk factors with adverse outcomes.

**Results:** Of 57,385 infants, we excluded 1,415 (2.5%) as lost to follow-up. Among 55,970 infants in the analysis, 1,183 (2.1%) died and 939 (1.7%) were diagnosed with HIV. Median (IQR) infant follow-up time was 9 (4–14) months. Among 1,700 (3.0%) infants who completed the full HIV testing cascade according to the national algorithm, all remained HIV-negative.

Risk of adverse outcome was higher for infants not prescribed the recommended antiretroviral prophylaxis (RR=2.1, 1.8–2.2), not exclusively breastfed (RR=3.1, 2.7–3.5),

not prescribed cotrimoxazole preventive therapy (CPT) (RR=1.7, 1.6–1.9), and born to high-risk mothers (RR=4.9, 4.4–5.3) compared to infants receiving antiretroviral prophylaxis, exclusive breastfeeding, and CPT, and born to low-risk mothers, respectively.

**Conclusions:** Infant HIV positivity was lower than UNAIDS' 2022 estimated national vertical transmission rate (7%). Programmatic follow-up time and full adherence to testing and prophylaxis guidelines for most infants were not followed and adverse outcome risks were higher among infants who did not receive program interventions. Improved programmatic tracking and targeted support for mother-infant pairs with risk factors might reduce adverse pediatric outcomes in Tanzania.

### TUPEC277

Sustained viral suppression among Australian people living with HIV in the era of U=U

H.L. Aung<sup>1</sup>, R. Gray<sup>1</sup>, E. Chow<sup>2,3,4</sup>, B. Quinn<sup>5</sup>, D. Russell<sup>6</sup>, R. Varma<sup>7,1</sup>, J. Rule<sup>8</sup>, J. Asselin<sup>9</sup>, A. Carter<sup>1</sup>, M. Stoope<sup>9</sup>, B. Donovan<sup>1</sup>, M. Hellard<sup>9</sup>, R. Guy<sup>1</sup>

<sup>1</sup>University of New South Wales, Kirby Institute, Sydney, Australia, <sup>2</sup>Melbourne Sexual Health Centre, Melbourne, Australia, <sup>3</sup>Monash University, Central Clinical School, Melbourne, Australia, <sup>4</sup>The University of Melbourne, Centre for Epidemiology and Biostatistics, Melbourne, Australia, <sup>5</sup>Victorian Department of Health, Health Protection Branch, Melbourne, Australia, <sup>6</sup>Cairns Sexual Health Service, Cairns, Australia, <sup>7</sup>Sydney Sexual Health Centre, Sydney, Australia, <sup>8</sup>National Association of People With HIV Australia (NAPWHA), Sydney, Australia, <sup>9</sup>Burnet Institute, Melbourne, Australia

**Background:** In Australia, people living with HIV (PLHIV) have a reported viral suppression rate of >95%. However, this reflects the latest viral load (VL) test within a reporting period and does not account for earlier tests. Sustained suppression is critical for overall health of PLHIV and reducing transmission risk.

This study identified the level of sustained viral suppression (SVS) (i.e., VL<1000 in all the tests within the last three years) among Australian PLHIV and factors contributing to inconsistent suppression.

**Methods:** Data were from a national sentinel surveillance system, ACCESS. A total of 6,444 PLHIV (95% male, >16 years) who attended one of the 60 health services within the ACCESS network in 2022, and had consistently taken anti-retroviral therapy (ART) and had undertaken at least two VL tests over the last three years were included in this study. Multivariable logistic regression determined the effects of demographics and medical history on SVS.

**Results:** Out of 6,444 PLHIV (mean age=51.04), 6,090 (95.5%) had SVS, whereas 98.4% achieved viral suppression based on the last VL alone. Multivariable logistic regression showed that lower odd of SVS is associated with

living in an inner/outer regional area (OR-0.61,CI-0.44,0.84) or remote/very remote area (OR-0.16,CI-0.04,0.63) (versus major cities), young age (<30years) (OR-0.45,CI-0.44,0.84), receiving care at a publicly-funded sexual health clinic or hospital-based clinic (OR-0.52,CI-0.39,0.69) (versus general practices), higher number of gonorrhea diagnoses during the last three years (OR-0.87,CI-0.76,0.99), co-infection with hepatitis-C in the last three years (OR-0.44,CI-0.29,0.65), and ever co-infected with hepatitis-B (OR-0.74,CI-0.56,0.98) while being from a culturally and linguistically-diverse background (OR-2.00,CI-1.43,2.81) and higher first CD4 count (OR-1.0009,CI-1.0004,1.001) are associated with a higher odd of SVS ( $p<0.05$ ).

**Conclusions:** SVS is higher than 95% among Australian PLHIV taking ART and not largely different from viral suppression rate based on the last VL test. Targeted supports to improve ART adherence may help to achieve SVS among those who are young, who are likely to engage in unprotected sex or share injecting equipment (i.e., those with a higher number of gonorrhea infections or with a history of hepatitis B or C infection), those living in non-metropolitan areas, and those receiving care at publicly-funded health services.

## TUPEC278

Real-world utilization and effectiveness of long-acting Ccbotegravir + rilpivirine in virologically suppressed treatment experienced individuals in Europe: data from COMBINE-2 cohort study

A. Pozniak<sup>1</sup>, G. Sridhar<sup>2</sup>, L. Assoumou<sup>1,3</sup>, L. Piroth<sup>4</sup>, D. Braun<sup>5</sup>, C. Fletcher<sup>6</sup>, A. Duffy<sup>6</sup>, L. Ragone<sup>2</sup>, A. Shah<sup>7</sup>, J. van Wyk<sup>8</sup>, V. Vannappagari<sup>2</sup>

<sup>1</sup>The European Treatment Network for HIV, Hepatitis and Global Infectious Diseases (NEAT-ID), London, United Kingdom, <sup>2</sup>ViiV Healthcare, Durham, United States, <sup>3</sup>Sorbonne Université, INSERM, Institut Pierre Louis d'Épidémiologie et de Santé Publique, Paris, France, <sup>4</sup>CHU Dijon-Bourgogne, Dijon Cedex, France, <sup>5</sup>Department of Infectious Diseases and Hospital Epidemiology, University Hospital Zurich, University of Zurich, Zurich, Switzerland, <sup>6</sup>Research Organization (KC) Ltd., London, United Kingdom, <sup>7</sup>GlaxoSmithKline, Brentford, Middlesex, United Kingdom, <sup>8</sup>ViiV Healthcare, London, England, United Kingdom

**Background:** Cabotegravir (CAB) + rilpivirine (RPV) is the first complete long-acting (LA) regimen for treatment experienced virologically suppressed (HIV-1 RNA <50 copies/mL) people with HIV (PWH) without present or past evidence of viral resistance to, and no prior virological failure with NNRTI and INI class agents.

This study assessed the utilization and virologic effectiveness among individuals initiating CAB+RPV LA regimen in real-world setting in Europe.

**Methods:** Adult PWH who were treatment experienced, virologically suppressed and received CAB+RPV between December 2020 and September 2023 were enrolled at NEAT ID Network sites across seven European countries. Viral loads (VLs) were assessed from first injection until CAB+RPV discontinuation or at analysis.

**Results:** A total of 477 individuals initiating CAB+RPV are included in the analysis. All were treatment experienced, had VL <50 copies/mL at initiation, had no previous virologic failure and five individuals had history of either NN-RTI or INSTI mutations but were sensitive to these classes. The median age was 44 years (IQR: 37-53), 89% were males and median BMI at initiation was 24.7 kg/m<sup>2</sup> (IQR: 22.7-27.4). Adherence to CAB+RPV LA regimen was high, 2% individuals having delayed doses with a median delay of 7 days (IQR: 7-8) and one individual with missed doses. 96% of individuals remained on CAB+RPV LA regimen with a median follow-up of 3.0 months (IQR: 2.8, 7.1). Of 378 individuals with follow-up VLs, 98% had last VL measured <50 copies/mL. Three individuals had confirmed virologic failure (CVF) after initiation of CAB+RPV LA regimen. One individual had low-level resistance to rilpivirine and no resistance to the INSTI class at failure.

		Treatment experienced Undetectable VL (<50 copies/mL) at initiation (N=477)
Duration of follow-up	Median months (IQR)	3.0 (2.8, 7.1)
On CAB+RPV LA at end of follow-up	n (%)	458 (96)
≥1 VL after first injection	n (%)	378 (79)
	Last VL <50 copies/mL, n (%)	369/378 (98)
Confirmed virologic failure*	n (%)	3/378 (0.8)

\*Two consecutive VLs ≥200 copies/mL, or one VL ≥200 copies/mL, followed by discontinuation

Table 1. Virologic outcomes among individuals initiating CAB+RPV LA regimen.

**Conclusions:** The real-world data of PWH who received CAB+RPV LA in Europe, suggest that the regimen is effective among individuals virologically suppressed at initiation. High levels of virologic control were observed with low CVF (<1%), consistent with clinical trial data.

## TUPEC279

Detecting potential barriers in health units to prevent interruptions in HIV treatment: a self-report measure of care engagement in three Brazilian cities - Campo Grande, Curitiba, and Florianópolis

V. Cota<sup>1</sup>, M. Cruz<sup>1</sup>, C. Santamarina<sup>1</sup>, R. Miranda<sup>2</sup>, G. Pessanha<sup>3</sup>, A.P. Cunha<sup>1</sup>, F. Aguiar<sup>4</sup>, C. Schweitzer<sup>5</sup>, G. Faccin<sup>6</sup>, J. Santos<sup>7</sup>

<sup>1</sup>Oswaldo Cruz Foundation (Fiocruz), Sergio Arouca National School of Public Health (ENSP), Rio de Janeiro, Brazil, <sup>2</sup>University of Brasília, Department of Public Health FS, Brasília, Brazil, <sup>3</sup>Rio de Janeiro State Health Department, Rio de Janeiro, Brazil, <sup>4</sup>Federal University of Rio de Janeiro, Rio de Janeiro, Brazil, <sup>5</sup>Florianópolis Municipal Health Department, Florianópolis, Brazil, <sup>6</sup>Campo Grande Municipal Health Department, Campo Grande, Brazil, <sup>7</sup>Curitiba Municipal Health Department, Curitiba, Brazil

**Background:** Antiretroviral treatment (ART) has many benefits, but one of the main issues associated with it is a lack of adherence, which can lead to interruptions. Non-adherence to ART in Brazil varies from 18% to 74.3%, stressing the need for an adaptable approach. This study is part of "A Hora é Agora" project, which aims to identify client engagement and barriers to treatment interruption.

**Methods:** We conducted a self-report questionnaire adapted from Johnson MO et al., 2019 using Google Forms in six AHA-supported healthcare facilities across three cities - Campo Grande, Curitiba, and Florianópolis. The survey was conducted between November 2022 and March 2023, with 571 participants.

Additionally, data was collected from REDCap to assess reasons for treatment interruption. Health professionals contacted 2005 clients (28% Campo Grande, 10% Curitiba, 62% Florianópolis) who were without treatment between Oct 2022 and Sep 2023.

**Results:** The survey showed that most respondents (26.8%) were between 25 and 29 years old, 78% were cis-gender men, 70.7% were homosexual, 61% were white, and 53.7% had completed higher education. 43.6% of the responses came from Campo Grande, 42.2% from Florianópolis, and 14.2% from Curitiba. Most clients expressed confidence in health professionals and services, as indicated in Table 1.

Reasons for discontinuing HIV treatment: Campo Grande - Non-acceptance of HIV/negative beliefs (19%); Curitiba - Mental health issues (16.3%); Florianópolis - Difficulty in personal organization for treatment (45.8%) (Table 2).

	Total (n)	Not at all	A little	A moderate	A lot	A great deal
How much do you trust your HIV care provider?	572	0.3%	1.0%	8.2%	27.6%	62.9%
How much does your HIV care provider respect what you say?	571	0.2%	0.2%	1.4%	26.1%	72.2%
How much do you think your healthcare professionals understand what you say and feel?	572	0.2%	1.2%	8.7%	39.8%	50.1%
How satisfied are you with the level of healthcare provided by your health unit to meet your health needs?	572	0.4%	1.8%	7.7%	56.8%	33.3%
How open do you feel you can be with your HIV care provider?	570	0.4%	2.8%	10.4%	51.2%	35.1%
How much can you comprehend the information provided by your healthcare provider?	572	0.2%	0.9%	4.2%	33.1%	60.8%
		Not at all	Slightly	Moderately	Very	Extremely
How important is it to set goals for health?	572	0.2%	0.9%	4.3%	26.5%	67.7%
How much do you believe it is to stay up-to-date on the latest research about HIV?	564	0.3%	0.9%	0.9%	14.8%	83.1%
		Never	Sometimes	Most of the time	Always	
How comfortable do you feel asking questions during appointments?	568	0.2%	1.4%	1.8%	38.8%	57.8%
In different phases of your life, how well were you able to adhere to the prescribed treatment and medication?	571	0.3%	1.2%	3.0%	31.5%	63.7%
How important is your involvement in decisions making processes regarding your HIV prevention or treatments?	565	0.3%	1.1%	1.9%	17.4%	79.3%
How often do you leave your HIV care appointments feeling like you got really good care?	564	0.3%	0.3%	0.3%	15.9%	82.4%
Do you refill HIV medications on time?	564	1.3%	0.0%	0.5%	10.7%	87.5%

Table 1. Client relationship/satisfaction with services and professionals\*, in Campo Grande, Curitiba and Florianópolis, Brazil, November 22 to March 23.

Causes for discontinuing the treatment	Campo Grande	Curitiba	Florianópolis
Financial difficulty	2.8%	3.4%	1.3%
Difficulty moving around	5.7%	2.4%	2.8%
Didn't see the need for treatment	1.3%	1.0%	2.0%
"Healing" (religious beliefs)	0.9%	1.0%	0.1%
Alcohol and drug abuse	12.3%	12.0%	2.6%
Homeless person	1.8%	3.4%	1.2%
Adverse effects of medication	1.4%	7.2%	2.9%
Complexity of ART (not understanding dosage)	0.7%	2.9%	0.8%
Difficulty in personal organization for treatment	16.7%	11.1%	45.8%
Non-acceptance of HIV/negative beliefs - stigma and discrimination	19.6%	4.2%	2.6%
Mental health issues	1.1%	16.3%	2.4%
Dissatisfaction with professionals/services	1.1%	3.4%	0.6%
Couldn't access/didn't know how to access the network	1.1%	6.7%	2.1%
Travel	8.4%	1.0%	4.5%
Lack of time to withdraw the medication	4.1%	18.2%	4.5%
Moving to another city, state or country	1.8%	18.6%	1.9%
Others	10.5%	0.0%	0.0%

Table 2. Causes for discontinuing the treatment in Campo Grande, Curitiba and Florianópolis, Brazil - October 22 to September 23.

**Conclusions:** The study's results can help local managers improve services and enhance customer-centered care, thereby contributing to stronger treatment adherence.

## TUPEC280

Enhancing retention in ART care: the impact of flexible people first approaches

K.P. Viswanath<sup>1</sup>, S. Prasad<sup>1</sup>, E. Michael<sup>1</sup>, M. Kumar<sup>1</sup>, S. Dwivedi<sup>1</sup>, L.H. Mojica<sup>1</sup>

<sup>1</sup>AHF India Cares, New Delhi, India

**Background:** AIDS Healthcare Foundation - India implements the Centre of Excellence ART Clinics - The People's Clinic in Delhi and Mumbai. Client retention in Antiretroviral Therapy (ART) care remains a formidable challenge, necessitating a departure from conventional, one-size-fits-all methodologies.

This study, conducted in Delhi with 2200 clients and Mumbai with 1100 clients, delves into the efficacy of innovative and flexible approaches to address client needs. The research focuses on personalized strategies, aiming to re-define the landscape of ART care and improve long-term client retention.

**Description:** The research advocates for tailored solutions by introducing multi-month dispensation of medicines, allowing clients to receive up to six months' supply at once. Leveraging modern conveniences, medications are dispatched via courier, Proxy medicine collection by friends or relatives offers an additional layer of flexibility. Walk-in services without prior appointments reduce barriers to access, catering to the diverse needs of the clientele.

For outstation clients, telephonic consultations and decentralized blood workups were done. This empowers clients to receive medical advice remotely and receive necessary medication refills via courier, minimizing burden of frequent travels.

Mental health aspects were addressed comprehensively, with a qualified Psychiatrist providing treatment for mental illnesses and substance use disorders. Collaboration with specialty doctors ensures seamless integration of services for clients availing multiple medical treatments.

**Lessons learned:** The research underscores the significance of flexibility in healthcare delivery. Multi-month dispensation, courier services, proxy collections, and telephonic consultations emerge as effective tools in this pursuit. In a span of 2 years from the end of 2021 to 2023, the retention rates in Delhi have improved from 87% to 99%, in Mumbai from 49% to 97%.

**Conclusions/Next steps:** The study concludes by emphasizing the pivotal role of extended clinic hours (9 am - 10 pm, Monday to Friday, and 12 pm to 10 pm on Saturdays) in accommodating the needs of working clients and marginalized communities.

The findings suggest that adopting flexible approaches in healthcare settings significantly improves client retention, offering a blueprint for the future design of ART care programs.

The research contributes valuable insights for global efforts in enhancing effectiveness of ART care programs, emphasizing the importance of adaptable, client-centric approaches.

### Adolescent mothers' engagement in HIV testing and prevention of vertical transmission services in the Eastern Cape Province, South Africa: insights from dyadic data linkage

J. Tolmay<sup>1</sup>, L. Cluver<sup>1,2</sup>, S. Zhou<sup>3</sup>, O. Edun<sup>4</sup>, J. Jochim<sup>1</sup>, N. Langwenya<sup>1</sup>, G. Sherman<sup>5,6</sup>, E. Toska<sup>7</sup>

<sup>1</sup>University of Oxford, Social Policy and Intervention, Oxford, United Kingdom, <sup>2</sup>University of Cape Town, Cape Town, South Africa, <sup>3</sup>University of Cape Town, Public Health, Cape Town, South Africa, <sup>4</sup>Imperial College London, MRC Centre for Global Infectious Disease Analysis, London, United Kingdom, <sup>5</sup>University of Witwatersrand, Department of Paediatrics and Child Health, Johannesburg, South Africa, <sup>6</sup>National Institute for Communicable Diseases, Johannesburg, South Africa, <sup>7</sup>University of Cape Town, Centre for Social Science Research, Cape Town, South Africa

**Background:** Adolescent mothers have a higher risk of HIV acquisition, poorer access to HIV testing services and increased vertical transmission, compared to adult mothers. However, few studies have linked adolescents' self-report and clinical data to better understand engagement in HIV testing and subsequent retention in care.

We examine engagement in prevention of vertical transmission services and socio-economic predictors of HIV-test timing among adolescent mothers, through linkage with national laboratory test results in South Africa.

**Methods:** We analysed data from 1,044 adolescent mothers from the UPLIFT cohort and their first-born children in a peri-urban, high HIV prevalence setting in the Eastern Cape Province, South Africa, all of whom had their first child before age 20. HIV test results were retrieved from the National Health Laboratory Service database and linked to mother-child dyads.

Self-report data were collected (2017-2019) through researcher-administered questionnaires, covering pregnancy experiences, HIV services, healthcare engagement, and children's health. Chi-squared test explored associations between maternal socio-economic factors and HIV-test timing.

**Results:** 30% (313/1,044) of mothers were living with HIV. Nearly all (98%) attended at least one antenatal care appointment, and 89% the recommended 8 appointments. While all mothers had been tested for HIV, among those living with HIV only 29% reported first testing before their first pregnancy, 65% during the pregnancy, and 6% during or after delivery.

Younger mothers ( $\leq 16$ ) had lower rates of pre-pregnancy testing (18%vs33%, $p=0.002$ ), and higher rates of first testing at/after delivery (11%vs4%, $p=0.002$ ). Having an undisclosed HIV status was associated with only testing during/after delivery (21%vs5%, $p=0.002$ ).

Education, residence (urban/rural), grant receipt, and risky sex showed no association. Eighty percent of moth-

ers living with HIV and 57% of their children were linked to HIV-related laboratory records. Of those HIV-exposed, 15 (5%) children were living with HIV, 3-times the 2017 national vertical acquisition rate.

**Conclusions:** The prevention of vertical HIV transmission is critical to reaching the global goal of ending the HIV/AIDS epidemic by 2030.

To strengthen engagement in future care, young women need focused interventions for HIV testing and disclosure support, even before their first pregnancy. Linked dyadic data can provide a unique, robust evidence base for such programmatic refinement.

## TUPEC282

### Trend in time to antiretroviral therapy initiation after HIV diagnosis in Shandong province, China (2008-2021): a longitudinal cohort study

J. Ma<sup>1</sup>, N. Zhang<sup>2</sup>, X. Liu<sup>3</sup>, L. Hao<sup>2</sup>, X. Zhu<sup>2</sup>, L. Li<sup>2</sup>, L. Wang<sup>2</sup>, D. Kang<sup>2</sup>, W. Ma<sup>1</sup>, G. Wang<sup>2</sup>

<sup>1</sup>School of Public Health, Cheeloo College of Medicine, Shandong University, Department of Epidemiology, Jinan, China, <sup>2</sup>Institute for AIDS Control and Prevention, Shandong Center for Disease Control and Prevention, Jinan, China, <sup>3</sup>University of Tennessee Health Science Center, Memphis, United States

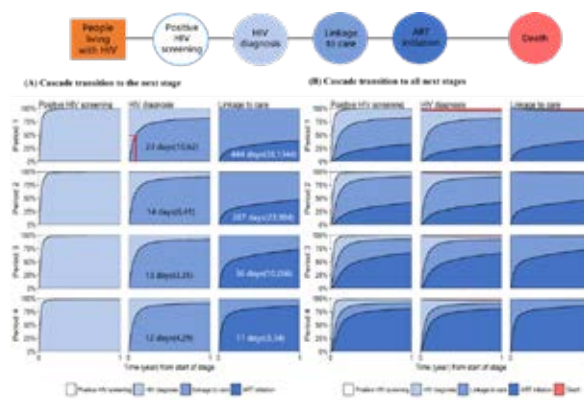

**Background:** Although clinical trials demonstrated that expanding antiretroviral therapy (ART) eligibility has broad clinical benefits, the improvement and barriers of prior updated guideline on HIV care cascade under real-world conditions is still unknown.

**Methods:** We conducted a longitudinal cohort study and included HIV-positive individuals diagnosed during 2008-2018 in Shandong Province, China. Participants were divided into four ART eligibility periods (CD4≤200, ≤350, ≤500, treat all). We estimated HIV cascade from positive HIV screening to ART initiation for each period and median time of stage transition.

Then we used logistic regression to explored factors associated with rapid linkage to care (from HIV diagnosis to linkage within 6 days) and rapid ART initiation (from linkage to ART initiation within 1 day) in treat all era.

**Results:** We included 16 025 individuals, among whom 15 052 were linked to care, 13 932 initiated ART. Over four ART guidelines periods, we observed prominent improvement in cascade transition from diagnosis to linkage (median time decreased from 23 days to 14, 13, 12), and in transition from linkage to ART initiation (median time decreased from 444 days to 287, 36, 11).

We found that female, older, individuals diagnosed at AIDS-stage and screened at CDC prone to linkage rapidly. Besides, those who are older, transmitted through non-MSM sex, screened at hospital were likely to start ART rapidly, while those who started ART in hospital and district/county level units were likely to delay ART.

**Conclusions:** The time to ART initiation reduced greatly, attention needs to be paid to the institutional level factors.

## TUPEC283

### History of antiretroviral therapy interruption prior to antenatal care is associated with delivery viremia and disengagement from care postpartum among women in Gugulethu, South Africa: a retrospective cohort

B. Leonard<sup>1</sup>, P. Mogoba<sup>1</sup>, Y. Gomba<sup>1</sup>, L. Hlatshwayo<sup>1</sup>, L. Myer<sup>1</sup>, E.J. Abrams<sup>2</sup>, T.K. Phillips<sup>1</sup>

<sup>1</sup>University of Cape Town, Cape Town, South Africa,

<sup>2</sup>Columbia University, New York, United States

**Background:** Disengagement from antiretroviral therapy (ART) during and after pregnancy is common. With the rapid scale-up of universal treatment there are increasing numbers of women conceiving on ART but little is known about ART history before pregnancy and associations with treatment outcomes.

**Methods:** We used existing data from a prospective cohort that enrolled women living with HIV (WLHIV) attending ANC in Gugulethu, South Africa (March 2021-April 2022) to describe ART history before ANC and associations with delivery viral load (VL) and disengagement from HIV care postpartum. Enrolment interviews collected self-reported ART history, grouping women into:

1. Initiating ART in pregnancy,
2. ART-experienced without any interruptions,
3. ART-experienced with ≥1 interruption.

Delivery VL and postpartum engagement in care were abstracted from electronic medical records. Log-bino-mial models were used to assess associations between ART history and i) VL at delivery (>50 copies/ml) and ii) dis-engagement from HIV care at 12 weeks postpartum (≥30 days late for ART refill at 12 weeks postpartum).

**Results:** Among 321 women (median age 32.3 years, interquartile range [IQR] 28.1–35.9; 61.4% in their first pregnancy), 15.3% reported initiating ART in pregnancy, 52% reported being ART-experienced with no interruptions (median years on ART 6.1, IQR 3.3–10.1), and 32.7% reported being ART-experienced with ≥1 interruption (median years on ART 6.9, IQR 4.4–9.4; 94.3% reported one interruption). In adjusted models, ART-experienced women with ≥1 interruption were more likely to have VL >50 copies/mL at delivery (adjusted risk ratio [aRR] 2.39 95% CI 1.39–4.35) and to be disengaged from care at 12 weeks postpartum (aRR 1.96 95% CI 1.23–3.13) compared to ART-experienced women without interruption. ART-experienced women with ≥1 interruption were also more likely to have disengaged at 12 weeks compared to women newly starting ART in pregnancy (aRR 6.20 95% CI 2.05–18.77).

**Conclusions:** These findings highlight that ART history, and history of treatment interruption, is an important consideration for maternal ART outcomes in this critical period for vertical transmission. Further research is needed to explore mechanisms driving these associations and examine interventions to support sustained engagement in HIV care before, during and after pregnancy.

## TUPEC284

The Community Pop-up Clinic (CPC):  
HIV treatment in vulnerable population  
of people who use drugs (PWUD)

S. Beitari<sup>1</sup>, B. Conway<sup>1,2</sup>, S. Yi<sup>1</sup>, S. Sharma<sup>1</sup>

<sup>1</sup>Vancouver Infectious Diseases Centre, Vancouver, Canada,

<sup>2</sup>Simon Fraser University, Vancouver, Canada

**Background:** To address the HIV pandemic, a concerted effort is needed to include vulnerable inner-city residents, many of whom are actively using drugs, disengaged from care, and facing issues such as housing insecurity and active untreated addiction. We have evaluated a new model of HIV care using our community pop-up clinic (CPC) as a strategy to identify people living with HIV, to engage them in care and successfully engage and maintain them on antiretroviral therapy.

**Methods:** Weekly events are conducted at places of residence in Vancouver's inner city. Point-of-care testing for HCV and HIV are completed (with phlebotomy performed on site), along with ascertainment of prior HCV or HIV infection status.

All individuals in whom this is indicated are then offered access to antiretroviral therapy delivered within a multi-disciplinary program with adherence support.

**Results:** From 01/21 to 11/23, we conducted 125 CPCs (3.5 events/month) evaluating 2111 individuals, 68 (3.2%) of whom tested positive for HIV antibodies, all previously diagnosed with HIV infection and lost to follow up. Of the 68, 45 (66.2%) showed active HCV co-infection. Among clients living with HIV, we note median age 50 (25–66) years, 24 (35.3%) female, 11 (16.2%) indigenous, and 26 (38.3%) with unstable housing, 28 (41.2%) experiencing recent incarceration, and 26 (38.2%) were active drug users, 25 of whom had a significant opioid overdose in the previous 6 months. Of 68, 45 (66.2%) engaged in long-term care at our center and continued with antiretroviral therapy.

**Conclusions:** Although we have made significant progress in the control of the HIV pandemic in British Columbia and across Canada, many inner-city residents have disengaged from care and discontinued antiretroviral therapy. To control disease progression and transmission in this priority population, there is an urgent need to develop and evaluate interventions such as our CPC program to optimize our approach to the diagnosis and treatment of HIV acquisition in Canada.

## TUPEC285

Closing the final gap of elimination of  
vertical transmission of HIV through scale up  
of community interventions for early infant  
diagnosis (EID) in Botswana

R. Ngwako Balisi<sup>1</sup>

<sup>1</sup>USAID, Gaborone, Botswana

**Background:** Botswana is the first high HIV burden country globally to attain the World Health Organization (WHO) "Silver Tier" status certification for path to elimination of vertical transmission of HIV (EMTCT). Despite this, Botswana lags behind in testing coverage for Early Infant Diagnosis (EID). USAID, through Implementing Partners, supported the Ministry of Health to track and link mother-baby pairs who missed their appointments for early infant diagnosis and final outcomes through engagement of Community Health Workers (CHWs). We aim to demonstrate the success of community health worker tracking interventions.

**Description:** We conducted a retrospective review of routine programme data reported in PEPFAR's Data for Accountability, Transparency and Impact Monitoring system (DATIM) over a 30-month period from January 2021 to July 2023 in 17 USAID supported districts. We compared this to the national DHIS system data to establish the number of infants eligible for EID. We triangulated this with data from the national HIV-positive infant audit conducted for 2018 - 2023.

**Lessons learned:** Between January 2021 to July 2023, 1479, HIV exposed infants were referred for tracking and re-linking; of these, 34% (496 of 1479) missed the early infant diagnosis (EID) appointment at <12 months of age, and 66%

(983 of 1479) missed the final outcomes (FID) appointment. Community tracking resulted in 76% (1130 of 1479) being successfully reached. Of those reached, 65% (740 of 1130) were re-linked to care and 26% (299 of 1130) were found to have been already tested - representing 91% confirmation of outcomes. 0.5% (4 of 740) children tested HIV positive. The national HIV infected infant audit showed 16% (36 of 212) of mothers of positive infants identified only initiated treatment during the breastfeeding period; and subsequently 7% (13 of 182) of infected infants identified after 12-months of age.

**Conclusions/Next steps:** Data showed that community tracking interventions were successful in closing the EID coverage gap, which remains critical to mitigate for vertical transmissions, as national data showed a correlation between late incident maternal acquisitions and vertical transmissions. Sufficient scale of CHW involvement will ensure optimal EID coverage and enhanced program monitoring to move Botswana towards EMTCT.

## TUPEC286

Reaching HIV epidemic control by 2030 will require focused attention on the PMTCT cascade: a comparison of PEPFAR versus non-PEPFAR supported sites in Tanzania

S.J. Kimambo<sup>1</sup>, R. Van de Ven<sup>1</sup>, C. Nnko<sup>1</sup>, F. Lyimo<sup>1</sup>, F. Haraka<sup>1</sup>, H. Magige<sup>1</sup>, M. Nyamhagotta<sup>2</sup>, M. Msangi<sup>2</sup>, F. Tsiouris<sup>3</sup>, M. Rosenthal<sup>4</sup>, M. Bateganya<sup>4</sup>, V. Sampathkumar<sup>3</sup>

<sup>1</sup>Elizabeth Glaser Paediatric AIDS Foundation, Dar es Salaam, Tanzania, the United Republic of, <sup>2</sup>Ministry of Health, Dodoma, Tanzania, the United Republic of,

<sup>3</sup>Elizabeth Glaser Paediatric AIDS Foundation, Washington D.C., United States, <sup>4</sup>United States Agency for International Development, Dar es Salaam, Tanzania, the United Republic of

**Background:** The Tanzania HIV response is mainly funded by donors; however, decreasing donor funding poses a risk for sustaining gains and ending AIDS in children by 2030. Tanzania endorsed the global goal of eliminating mother-to-child transmission (MTCT) of HIV, but progress has fallen short with a current MTCT rate of 7% in 2022. We reviewed national MTCT data to describe current performance of prevention of MTCT (PMTCT) at sites supported by PEPFAR versus non-PEPFAR supported sites.

**Description:** A cross-sectional retrospective analysis was conducted on the PMTCT program for the year 2022, using the national DHIS2 database. Annual routine PMTCT data were abstracted from the monthly site-level DHIS2 reports and aggregated by PEPFAR and non-PEPFAR supported sites. The standard PMTCT cascade indicators were calculated using Excel, and numbers and proportions presented to compare the PMTCT program performance between supported and non-supported sites.

**Lessons learned:** In 2022, 7,501 health facilities offered PMTCT services, of which 61% (4,560/7,501) were non-PEPFAR supported sites. A total of 2,365,940 pregnant women (99%) attending antenatal care (ANC) were tested for HIV at their first ANC visit. Of those tested, 0.8% (18,646) were newly diagnosed HIV positive during the current pregnancy; 74% (13,766) of them were seen at PEPFAR-supported sites, compared to 26% (4,880) at non-PEPFAR sites. ART initiation was 108% at PEPFAR-supported sites vs 43% non-PEPFAR supported sites, and testing of HIV-exposed infants (HEI) in the first two months after birth was 75% at supported sites vs 28% at non-supported sites. Other notable differences are shown in the table.

PMTCT variables	PEPFAR N (%)	Non PEPFAR N (%)
Number and % of new ANC women tested for HIV	1,522,552 (99%)	843,388 (98%)
Number and % of new ANC women tested positive	13,766 (0.9%)	4,880 (0.6%)
Number and % of women known positive at ANC of all ANC positive	43,355 (76%)	7,058 (59%)
Number and % of new HIV positive women at ANC Initiated on ART	14,844 (108%)	2,108 (43%)
Number and % of all HIV positive women on ART (New pregnancy, known, and breastfeeding)	59,647 (99%)	9,508 (72%)
Number and % of HEIs tested with dried blood spot testing (DBS) <2mo	42,582 (75%)	3,402 (28%)
Number and % of HEIs tested with DBS <12mo	50,675 (85%)	4,320 (45%)
Number and % of HEI tested positive through DBS	1,501 (3.0%)	196 (4.5%)

Table: National PMTCT cascade data disaggregated by PEPFAR vs non-PEPFAR supported sites

**Conclusions/Next steps:** The PMTCT performance is low in non-PEPFAR supported facilities; however, these sites serve 26% of newly identified pregnant women each year. This calls for adaptation of the current program and resource prioritization to address the gaps and support Tanzania on the path to elimination of MTCT

## Predictors of disengagement during the early treatment period in South Africa

M. Maskew<sup>1</sup>, M. Benade<sup>2,1</sup>, N. Mutanda<sup>1</sup>, L. Sande<sup>1</sup>,  
V. Ntjikelane<sup>1</sup>, L. Malala<sup>3</sup>, S. Rosen<sup>2,1</sup>

<sup>1</sup>Faculty of Health Sciences, University of the Witwatersrand, Health Economics and Epidemiology Research Office, Johannesburg, South Africa, <sup>2</sup>Boston University School of Public Health, Department of Global Health, Boston, United States, <sup>3</sup>National Department of Health, HIV/AIDS Care and Treatment, Pretoria, South Africa

**Background:** Disengagement from HIV care in the early treatment period is a critical obstacle to achieving UNAIDS's second 95 target. Underlying drivers of disengagement from care in the early treatment period are not clear. While South Africa's Service Delivery Guideline on Fast Track Initiation and Counseling (FTIC) define normative procedures, the effect of guideline implementation and underlying drivers of disengagement remain unclear.

**Methods:** From 8/2022-6/2023, PREFER surveyed adult ART clients initiating, re-initiating, or on ART for  $\geq 1$  post-initiation visit but  $\leq 6$  months at 18 facilities across three provinces in South Africa. We collected data on demographics, HIV testing, treatment history, and service delivery preferences. Participants were followed using routinely-collected EMR data up to 7 months after initiation. We defined disengagement from care at 6 months as no clinic visit 5-7 months after ART initiation.

**Results:** 301 participants (median age=32, 80% female, median CD4 count=316 cells/mm<sup>3</sup>) had sufficient follow-up time. At study enrollment, 19% self-reported newly initiating ART, 7% re-initiated after a period of disengagement, and 74% were on ART for ≥1 post-initiation visit. By 6-months, 58 (19%) had disengaged from HIV care. Figure 1 summarizes drivers.

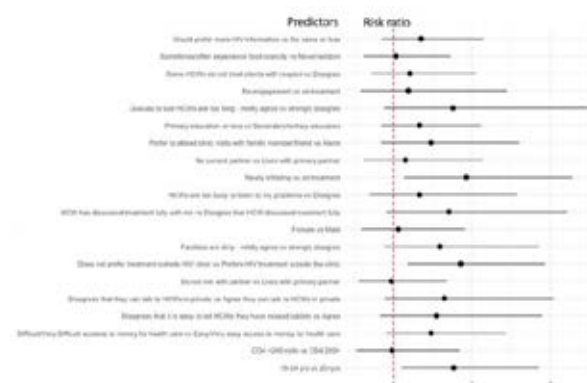

Figure 1. Potential drivers of disengagement from HIV care during the first 6 months on treatment.

Those newly initiating ART at study enrollment were nearly twice as likely to have disengaged by 6 months (crude relative risk (cRR)=1.93; 95% CI:1.13-3.29) as those who had remained in care for  $\geq 1$  visit. Disengagement was also

more likely among younger (18–24 years) participants, those saying that queues were too long, those preferring care within the facility rather than in the community, and those who felt they needed more treatment information. Disengagement did not differ by gender, relationship status, or CD4 count.

**Conclusions:** Among adults initiating or re-initiating ART in South Africa, risk of disengagement is highest immediately after initiation. Strengthening implementation of SA's Service Delivery Guidelines may improve retention during the early treatment period.

## TUPEC288

Early initiation of peer support is acceptable to people newly diagnosed with HIV through opt-out testing in the emergency department

O. Davies<sup>1</sup>, L. Stewart<sup>1</sup>

<sup>1</sup>Epsom & St Helier University Hospitals NHS Trust, Sexual health & HIV, Rosehill clinic, London, United Kingdom

**Background:** Peer support interventions have been shown to increase self-management, reduce stigma and increase adherence to antiretroviral therapy (ART). We reviewed the offer and acceptability of peer support to people who were newly diagnosed with HIV through opt-out testing in the emergency department (ED).

**Description:** Following the availability of National Health Service England funding for HIV testing in EDs of high prevalence areas in April 2022, opt out testing was expanded in the EDs of Epsom & St Helier Hospitals (ESTH). People aged over 16 having blood tests in both EDs were tested for HIV.

At the start of the project there was no in-house peer support and referrals were made to voluntary sector organisations. In-house peer support became available in July 2023.

Between April 2022 and December 2023, 17 people were newly diagnosed with HIV. The median (IQR) age of diagnosis was 39 (31-52) years. One person died during admission and 1 was transferred to another hospital. Of the 15 remaining, 10 were offered peer support and 9 accepted the offer (90%). Of these, seven were male and two were female. Three were white British, three were from other white backgrounds and two of mixed ethnicity. Other ethnic backgrounds represented included Black African and Asian. Of the 17 newly diagnosed, 16 remain in care. 100% of those who accepted the offer of peer support remain in care. One person who did not receive an early offer of peer support has not engaged with care.

**Lessons learned:** The early offer of peer support was well received by people of various ages, gender identities, sexuality and ethnic backgrounds who were newly diagnosed with HIV. High rates of linkage and retention in care were observed; however one person who did not receive an early offer of peer support did not remain in care.

**Conclusions/Next steps:** Opt out testing in the ED has achieved high rates of new diagnoses, however retention in care is important. We found that the early offer of peer support was acceptable and may be an important tool in improving retention. With the availability of an in-house peer mentor we now offer early peer support.

## TUPEC289

Patterns of retention in care during clients' first 12 months after HIV treatment initiation in Zambia: a retrospective cohort analysis using routinely collected data

M. Benade<sup>1,2,3</sup>, M. Maskew<sup>2</sup>, P. Chilembo<sup>4</sup>, M. Mwanza<sup>5</sup>, S. Rosen<sup>1,2</sup>

<sup>1</sup>Boston University School of Public Health, Department of Global Health, Boston, United States, <sup>2</sup>University of Witwatersrand, Health Economics and Epidemiology Research Office, Johannesburg, South Africa, <sup>3</sup>Amsterdam University Medical Center, Department of Medical Microbiology, Amsterdam, Netherlands, the, <sup>4</sup>Centre for Infectious Disease Research in Zambia, Lusaka, Zambia, <sup>5</sup>Centre for Infectious Disease Research in Zambia, Clinical Care Services, Lusaka, Zambia

**Background:** The first year after HIV treatment initiation or re-initiation remains the time of the highest risk of treatment interruption, yet little is known about the timing or patterns of early interruptions. We used routinely collected medical record data to define and describe patterns of engagement in Zambia during clients' first year after initiation.

**Methods:** Using leDEA's electronic medical record data from the 566 Zambian facilities supported by CIDRZ, we described patterns of engagement among those presenting for initiation of ART in 2018 to 2021. We merged clinical visits and other interactions to create service events, categorized events based on whether they were attended on time or  $\leq 28$  days or late  $> 28$  days and used these visit categories to define engagement patterns for months 0-6 and months 7-12 after initiation. Clients who remained engaged without treatment interruption were defined as continuous; those who attended  $\geq 1$  visit late  $> 28$  days but returned to care were labeled cyclical. Disengagement was defined as missing a scheduled visit by  $> 28$  days and without evidence of return.

**Results:** 159,429 individual client records were included (61% female, median age 33). In months 0-6, 51% clients were continuously engaged, 12% cyclically engaged, and 33% disengaged by 6 months (Figure 1). During months 7-12, most clients who had been continuously engaged in months 0-6 (54%) remained so, while 18% moved to cyclical engagement. Among those in a cyclical pattern in months 0-6, nearly half (47%) moved to being continuously engaged by month 12. Only 34% of the study population were engaged continuously for the full 12 months period.

**Conclusions:** Fewer than 60% of clients initiating ART between 2018 and 2021 at Zambian facilities remained continuously engaged at month 6 and  $< 40\%$  remained continuously engaged at month 12. Cyclical engagement is common and may call for a new model of service delivery.

## TUPEC290

Telehealth disparities in HIV care during the COVID-19 pandemic at a large academic medical center: study findings from North Carolina

V. Yelverton<sup>1</sup>, J. Ostermann<sup>2,3,4</sup>, M.E. Yarrington<sup>1</sup>, A.K. Weinhold<sup>5,4</sup>, N. Natafji<sup>2</sup>, B. Olatosi<sup>2,3</sup>, S. Weissman<sup>6,3,7</sup>, N.M. Thielman<sup>1,4</sup>

<sup>1</sup>Duke University, Division of Infectious Diseases, Durham, United States, <sup>2</sup>University of South Carolina, Health Services Policy and Management, Columbia, United States, <sup>3</sup>University of South Carolina, South Carolina SmartState Center for Healthcare Quality (CHQ), Columbia, United States, <sup>4</sup>Duke University, Duke Global Health Institute, Durham, United States, <sup>5</sup>Duke University, Center for Health Policy and Inequalities Research, Durham, United States, <sup>6</sup>University of South Carolina, Department of Internal Medicine, Columbia, United States, <sup>7</sup>Prisma Health, Columbia, United States

**Background:** Telehealth was used to maintain HIV care continuity during the COVID-19 pandemic in the United States. We examined variation in the utilization of telehealth HIV visits during the COVID-19 pandemic among people living with HIV (PLWH) by sociodemographic characteristics.

**Methods:** Aggregated electronic health record (EHR) data from the Duke University Infectious Disease clinic in NC were analyzed graphically to assess variation in telehealth use by (1) race and ethnicity, (2) age, (3) sex, and (4) residence. Monthly rates of HIV care engagement among

Author Index

PWH (henceforth: monthly visit rates) were calculated as the proportion of PWH with at least one in-person and/or telehealth visit that month.

**Results:** EHR data from 2,623 PWH receiving care between January 2019 and March 2023 were extracted. Telehealth use increased sharply in the early phase of the COVID-19 pandemic but reverted to predominantly in-person care within 1 year (<3% of PWH receiving telehealth per month). The proportion of PWH who received at least one telehealth visit was higher among those identifying as non-Hispanic White, ≥50 years old, female, and not residing in the county in which the HIV clinic is located, as compared to people of color, 18-49-year-olds, males, and persons living in the clinic county (Figure 1).

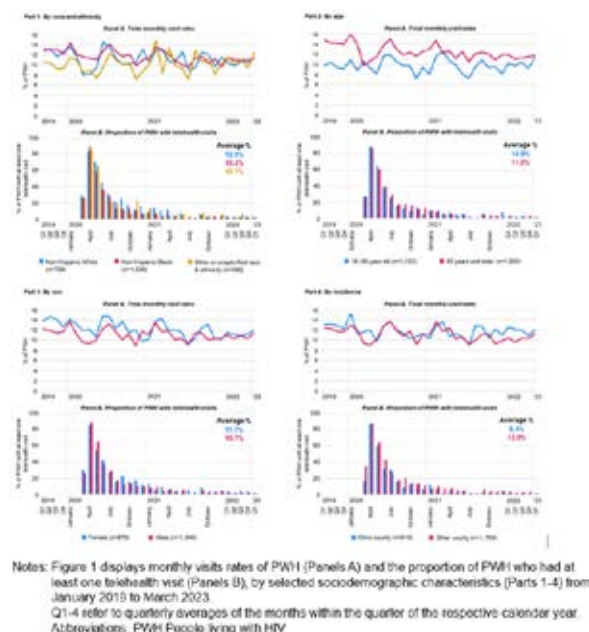

Figure 1. Engagement in HIV care relative to the COVID-19 pandemic, by sociodemographic characteristics.

**Conclusions:** While telehealth bridged the initial COVID-19 pandemic phase with reduced in-person visit availability, it was unequally utilized. People of color utilized telehealth less than non-Hispanic White PWH indicating telehealth disparities in HIV care. To guide the optimal integration of telehealth in HIV care and promote equitable HIV care, strategies designed to promote access for people of color are needed.

## TUPEC291

### Father engagement and caregiver relationship dynamics impact early child neurodevelopment

M.A. Bulterys<sup>1</sup>, M. King<sup>2</sup>, I. Njuguna<sup>1,3</sup>, D. Chebet<sup>2</sup>, A. Onyango<sup>2</sup>, A. Wagner<sup>1</sup>, K.M. Powis<sup>4,5,6</sup>, A.R. Cassidy<sup>7</sup>, S. Benki-Nugent<sup>1</sup>, D. Wamalwa<sup>2</sup>, G. John-Stewart<sup>1,8,9</sup>  
<sup>1</sup>University of Washington, Global Health, Seattle, United States, <sup>2</sup>University of Nairobi, Department of Pediatrics and Child Health, Nairobi, Kenya, <sup>3</sup>Kenyatta National Hospital, Nairobi, Kenya, <sup>4</sup>Harvard Medical School, Boston, United States, <sup>5</sup>Harvard T.H. Chan School of Public Health, Immunology and Infectious Diseases, Boston, United States, <sup>6</sup>Massachusetts General Hospital, Internal Medicine and Pediatrics, Boston, United States, <sup>7</sup>Mayo Clinic, of Psychiatry & Psychology, and Pediatric & Adolescent Medicine, Rochester, United States, <sup>8</sup>University of Washington, Pediatrics, Seattle, United States, <sup>9</sup>University of Washington, Medicine, Seattle, United States

**Background:** The role of caregiver relationship dynamics and father engagement factors in child neurodevelopment remain poorly understood. We assessed differences in caregiver factors between children who are HIV-exposed uninfected (CHEU) and children who are HIV-unexposed uninfected (CHUU) and determined associations between caregiver factors and child neurodevelopment among two-year-old children.

**Methods:** CHEU and CHUU and their mothers were enrolled during 6-week routine postnatal care visits across six sites in Kenya between March-October 2021. Univariable descriptive analyses compared caregiver relationship and father engagement factors between CHEU and CHUU at two years. Neurodevelopment was assessed using the Malawi Developmental Assessment Tool that examines social, language, fine motor, and gross motor skills. Multivariable linear mixed effects models explored associations and clustered by site.

**Results:** Compared to mothers of CHUU (N=733), mothers of CHEU (N=503) were significantly more likely to be older, have ≤7 years of education, report moderate to severe household food insecurity, and less likely to still be in a relationship with the child's biological father by 2 years postpartum (72% among CHEU and 80% among CHUU). Among mothers still together with the child's biological father, mothers of CHEU were more likely to be in polygamous marriages, have significantly older partners, report lower satisfaction and stability in their relationships, and have less financially supportive partners. Among all children with neurodevelopment assessments at Year 2, regardless of maternal relationship status, CHEU (N=335) exhibited lower (worse) gross motor scores compared to CHUU (N=456) (adjusted coeff: -0.52, 95% CI: -0.95, -0.08), but comparable social, language and fine motor, after adjusting for maternal age, marital status and education, and child age and sex. Among all children adjusting for CHEU status, lower social, language and fine

motor scores (but not gross motor scores) were associated with male child sex, shorter duration of parental relationship, poorer maternal relationship satisfaction, lower frequency of father-child interactions, and father living separately (all  $p < 0.01$ ).

**Conclusions:** Gross motor scores were lower among CHEU than CHUU, and relationship satisfaction and father engagement were associated with multiple neuro-developmental domains among both CHEU and CHUU. Caregiver-based interventions may be useful to support families impacted by HIV and relationship instability.

## TUPEC292

Factors associated with rapid antiretroviral therapy (ART) initiation following HIV diagnosis in British Columbia

R. McKerchar<sup>1</sup>, S. Guillemi<sup>2</sup>, V. Dias Lima<sup>2,3</sup>, L. Wang<sup>3</sup>, W. Zhang<sup>3</sup>, R. Barrios<sup>2</sup>, J. Montaner<sup>2,3</sup>, M. Hull<sup>2,3</sup>

<sup>1</sup>Memorial University of Newfoundland, St John's, Canada, <sup>2</sup>BC Centre for Excellence in HIV/AIDS, Vancouver, Canada, <sup>3</sup>University of British Columbia, Vancouver, Canada

**Background:** Early initiation of antiretroviral therapy (ART) following HIV diagnosis is standard of care. Treatment as Prevention strategies in British Columbia (BC) have improved linkage to care and time to overall ART initiation. Rapid (within seven days or less) starts have been shown to be feasible in many high-income settings. We evaluated the proportion of individuals undergoing rapid ART initiation in BC.

**Methods:** We evaluated time to ART initiation from 01/2008 - 03/2020 in newly HIV diagnosed adults (>19 years) captured in a retrospective cohort (STOP HIV/AIDS), linking the provincial ART Drug Treatment Program and different administrative datasets. Rapid ART starts were analysed over three periods from 01/2008 - 30/2012, 04/2012 - 03/2016 and 04/2016 - 03/2020.

Factors associated with rapid ART start were analysed using multivariable logistic regression adjusted for age, gender, geographic setting, ethnicity, and HIV risk status (men who have sex with men, heterosexual transmission or history of injection drug use [PWID]).

**Results:** Overall, 1529 individuals initiated ART following confirmed HIV diagnosis. The median time to ART start fell from 451 days (25th-75th percentiles 78 - 1222) in the first time period to 28 days (25th-75th percentiles 14 - 50) in the most recent time period ( $p < 0.001$ ). Rapid initiations increased from 0% in the first time period to 14.3% in period 3 ( $p < 0.001$ ).

In multivariable analysis, factors associated with rapid ART were younger age (adjusted odds ratio (aOR) 1.03 per year, 95% CI 1.01 - 10.4), MSM risk (aOR 2.86, 95% CI 1.29 - 6.35) and place of residence in Vancouver (aOR 2.64, 95% CI 1.76 - 3.97).

**Conclusions:** Rapid starts make up a minority of new starts but have increased in frequency over time.

Younger individuals, those with MSM risk and those living in a large urban city were more likely to start rapid therapy.

Early ART initiation needs to be encouraged, and supported in key populations and varied geographic settings.

## Monitoring the spread, impact and prevention of new or resurgent pathogens

Self-reporting adverse events after MVA-BN immunization against the Mpox epidemic in Taiwan, 2023

P.-H. Lee<sup>1</sup>, C.-S. Yen<sup>1</sup>, H.-J. Su<sup>1</sup>, K.-C. Chen<sup>1</sup>, Y.-C. Lai<sup>1</sup>, C.-M. Chiu<sup>1</sup>, P.-C. Chan<sup>1</sup>, C.-C. Lee<sup>1</sup>

<sup>1</sup>Taiwan Centers for Disease Control, Taipei, Thailand

**Background:** The emergence of Mpox, an orthopox virus responsible for over 87,000 global cases in 2022, persisted into 2023, spreading across the Western Pacific regions, including Taiwan. WHO recommends MVA-BN vaccination for at-risk populations to control the epidemic. However, the MVA-BN vaccine has not been approved in Taiwan, and it was administered intradermally (ID) due to vaccine shortages.

This study aimed to investigate the vaccine safety through self-reporting by vaccinees.

**Methods:** Participants were enrolled through QR code snapshots on vaccination day (D0) and completed voluntary, anonymous online questionnaires on day 7 (D7). Data included birth year, gender, vaccination dates, administration routes (subcutaneous, SC; or intradermal, ID), and percentages reporting local or systematic adverse events (AEs), AEs leading to medical visits, or missed daily activities post-vaccination. Chi-square tests and logistic regression models analyzed AE differences and associated risk factors.

**Results:** From March 25 to Oct 3, 2023, 6110 vaccinees completed D0 surveys, with 2180 (35.7%) completing D7 questionnaires. After data cleaning, 2141 respondents were analyzed (92.9% men, median age 40, IQR: 31-42 years). Local AEs within D7 of the 1st dose with SC and ID, and 2nd dose with SC and ID were 48.9%, 23.6%, 52.0%, and 29.6%, respectively. Systematic events within D7 were 4.3%, 2.9%, 3.2%, and 3.5%, respectively.

Among those 2063 participants with complete information for D0 and D7 survey, analysis of associated factors showed that a history of allergy increased AE risk (aOR=1.57, 95% CI: 1.14-2.15), while the 2nd dose, regardless of SC or ID,

Table 1. Associated factors with having local or systemic adverse events on day 7 (or less) after MVA-BN immunization among those voluntary self-reporting participants (n=2063).

**Conclusions:** MVA-BN immunization demonstrated safety in this study. Individuals receiving the second dose, regardless of administration route, experienced significantly fewer local or systematic AEs within or on D7 after immunization.

## TUPEC294

Time to COVID-19 clinical deterioration and factors associated with COVID-19 severe disease among patients living with HIV in KwaZulu Natal, South Africa: a retrospective cohort analysis of COVID-19 surveillance data

R.N. Phaswana-Mafuya<sup>1,2</sup>, C.P. Sosibo<sup>1,2</sup>, E. Phalane<sup>1,2</sup>, L. Olifant<sup>1,2</sup>

<sup>1</sup>University of Johannesburg, Faculty of Health Sciences, South African Medical Research Council/ University of Johannesburg (SAMRC/UJ) Pan African Centre for Epidemics Research (PACER) Extramural Unit, Johannesburg, South Africa, <sup>2</sup>University of Johannesburg, Faculty of Health Sciences, Department of Environmental Health, Johannesburg, South Africa

**Background:** We sought to determine whether time to COVID-19 clinical deterioration is shortened by HIV infection and whether factors that influence SARS-CoV-2 infected patients' progress to severe disease and mortality

risk differ between patients living with HIV and those who are HIV-negative. Some socio-demographic characteristics, behavioral factors and co-morbidities may likely affect time-to-disease severity amongst COVID-19 patients living with HIV than those who are HIV-negative.

**Methods:** A total of 5399 COVID-19 patients aged 18+ years enrolled in the daily COVID-19 database one of the highly burdened districts in KwaZulu Natal Province of South Africa and the COVID-19 hospital admission database surveillance system were retrospectively followed between 8 March 2020 and 25 April 2022. Analysis was performed via STATA version 17. A logistic regression model was fitted to assess whether HIV infection had any influence on COVID-19 severity. Kaplan-Meier survival curves were used to estimate time-to-event among those who developed the outcome of interest (COVID-19 severity) and the log-rank test to test whether there were statistically significant differences in time to COVID-19 severity. Lastly, a parametric proportional hazard model with a Weibull distribution was used to test how age, gender, and long-term health conditions affected the time to COVID-19 disease severity in the HIV-positive and HIV-negative groups after a COVID-19 diagnosis.

**Results:** Of the 5399 COVID-19 patients, 4209 (78.0%) were HIV-negative, and 1190 (22.0%) were living with HIV. In the adjusted model, although COVID-19 patients living with HIV were 20% more likely to experience COVID-19 disease severity, the association was not significant (Adjusted Hazards Ratio (AHR):1.2;95%CI: 0.9-1.5). Further, older age, being male, having hypertension, current active TB, and chronic kidney disease were associated with COVID-19 severity. Men experienced events at a 10% (AHR:1.1;95%-CI:1.0-1.2) higher rate than women. Hypertension, as well as previous and current active TB, were significantly associated with 50% (AHR:1.5;95%CI:1.2-1.9), 80% (AHR:1.8;95%-CI:1.4-2.5) and 60% (AHR:1.6;95%CI:1.2-2.2) increased risk of COVID-19 disease severity.

**Conclusions:** Notably co-morbidities, older age, and being male affected on time to disease severity amongst COVID-19 patients living with HIV compared to those who are HIV negative. This necessitates integrated care to prevent COVID-19 adverse clinical outcomes.

## TUPEC295

Mpox virus seroprevalence among men who have sex with men, transgender, non-binary, and gender diverse individuals in NYC in 2023

J. Platt<sup>1</sup>, A. Greenleaf<sup>1</sup>, M. Reyes<sup>1</sup>, C. Wright<sup>1</sup>, C. Chang<sup>1</sup>, M. Rivas<sup>1</sup>, D. Liu<sup>1</sup>, M. Mihaley<sup>1</sup>, S. Kaur<sup>1</sup>, W.M. El-Sadr<sup>1</sup>, J. Justman<sup>1</sup>

<sup>1</sup>ICAP at Columbia University, New York, United States

**Background:** New York City (NYC) was the US epicenter of the 2022 global mpox outbreak among gay, bisexual, and other men who have sex with men (MSM). However, due to

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

stigma and limited testing the burden of mpox remains unclear. We assessed the prevalence of orthopoxvirus antibodies (Ab) by history of mpox diagnosis and vaccination for mpox and smallpox among a cohort in NYC.

**Methods:** We conducted a cross-sectional survey (June-December 2023) among a purposive sample of MSM, transgender, non-binary, and gender diverse individuals who have sex with men, recruited primarily from outdoor venues in neighborhoods with large LGBTQ+ populations. Descriptive analyses were conducted using data from questionnaires and ELISA results for anti-orthopoxvirus IgG Ab.

**Results:** Results for 231 participants of 570 persons screened were available for preliminary analysis. Median age was 36 years, 73% male, 55% gay, 36% White, 25% Black, 23% Latinx, 9% multi-racial, and 7% Asian. Prevalence of self-reported HIV and prior mpox diagnosis was 19% (n=43) and 5% (n=11), respectively; among the latter, 8/11 reported HIV diagnosis and 7/11 reported STI diagnosis in the past year. Prior smallpox vaccination and 1- and 2-dose mpox vaccination was reported by 43%, 15% and 40%, respectively, with 54% reporting last mpox vaccination 6-12 months previously. Overall orthopoxvirus seroprevalence was 61%, with highest seroprevalence among those reporting prior mpox diagnosis (100%), followed by those reporting mpox and smallpox vaccinations (85%), two mpox vaccine doses (83%), prior mpox diagnosis and smallpox vaccination or mpox vaccination (67%), one mpox vaccine dose (47%), or prior smallpox vaccination only (42%). Among those reporting no prior mpox diagnosis or smallpox or mpox vaccinations, seroprevalence was 31%, or 18% after excluding individuals >45 years old who may have received childhood smallpox vaccination.

**Conclusions:** In this NYC community sample, orthopoxvirus seroprevalence was high, even among those with no prior mpox diagnosis or mpox/smallpox vaccination, suggesting that undiagnosed mpox infections may be more common than previously appreciated. Two-dose mpox vaccination was associated with high short-term seroprevalence. Evidence also suggests long-lasting seroprevalence among those reporting smallpox (likely during childhood) vaccinations. Distinguishing Ab from infection versus vaccination is needed to better understand mpox epidemiology.

## Monitoring and population-level interventions for non-HIV outcomes

### TUPEC296

#### Role of familial stigma in depression among cisgender GBMSM

T. Carpino<sup>1</sup>, K. Atkins<sup>1</sup>, I.L. Lucas<sup>2</sup>, M. Valentine-Graves<sup>2</sup>, M. Smith<sup>2</sup>, J.M. Wiginton<sup>3</sup>, A. Rao<sup>1</sup>, S. Murray<sup>1</sup>, S. Baral<sup>1</sup>, T. Sanchez<sup>2</sup>

<sup>1</sup>Johns Hopkins University School of Public Health, Baltimore, United States, <sup>2</sup>Emory University Rollins School of Public Health, Atlanta, United States, <sup>3</sup>University of California San Diego, San Diego, United States

**Background:** Cisgender gay, bisexual, and other men who have sex with men (GBMSM) face a disproportionate burden of mental health challenges, including depression. Sexual activity stigma and lack of family support can exacerbate poor mental health, which may be complicated by HIV-related stigma. However, the role of lifetime familial stigma in current depression outcomes has not been extensively studied. In response, we explored relationships between sexual activity stigma from family and current depressive symptoms among GBMSM.

**Methods:** Data were collected using the 2021 American Men's Internet Survey, a web-based survey of US cisgender GBMSM. The survey included modules on HIV, demographics, substance use, sexual history, and familial stigma (exclusion and/or discriminatory remarks). Depressive symptoms within the past two weeks were assessed using the Patient Health Questionnaire-9 (PHQ-9), with a score of  $\geq 10$  indicating moderate to severe depression. Modified Poisson regression with robust variance was employed to examine associations between familial stigma and current moderate to severe depression symptoms while adjusting for outness, sexual orientation, age, income, and race/ethnicity.

	Moderate-Severe Depression row % (n)	chi <sup>2</sup> p value
Overall (n=7754)	21.1% (1636)	
Familial Stigma		<0.001
Lifetime or recent (n=3637)	28.1% (1021)	
Recent only (n=1447)	34.9% (506)	
Never (n=3518)	13.6% (479)	
HIV Status		0.058
Living with HIV (n=1040)	22.9% (238)	
Not living with HIV (n=5817)	20.4% (1189)	
Life Stage		<0.001
15-19 (n=134)	38.1% (51)	
20-30 (n=1412)	30.0% (424)	
31-64 (n=5544)	19.6% (1089)	
65+ (n=664)	10.8% (72)	
Race/ethnicity		0.002
White (n=5096)	20.6% (1048)	
Hispanic (n=938)	19.3% (181)	
Black (n=942)	23.7% (223)	
Asian (n=284)	18.3% (52)	
Outness		0.007
Out to someone (n=7282)	21.5% (1562)	
Not out to anyone (n=416)	15.9% (66)	

Figure. Prevalence of current depression by potential factors in cisgender GBMSM in the US.

**Results:** Of the 9061 GBMSM who completed the survey, we retained 7754 participants who completed the PHQ-9. Among the respondents, prevalence of lifetime sexual activity stigma from family was 46.9% (n=3637) and recent

Oral  
abstracts

Poster  
exhibition

E-posters

abstracts

Author  
Index

moderate-severe depression was 21.1% (n=1636). Several factors were associated ( $p<0.01$ ) with depression including age, race/ethnicity, and experiences of stigma. In adjusted models, lifetime familial stigma was associated with a 75% greater prevalence of depression (aPR: 1.76; 95% CI: 1.60, 1.95).

**Conclusions:** The relationship between stigma and mental health suggests that addressing stigma should be part of an effective mental health response. Specifically, in addition to addressing familial stigma, there is a clear need to address the disproportionate burden of depression among cisgender GBMSM and develop effective intervention strategies for depression and other mental health outcomes.

## TUPEC297

Depression among people with tuberculosis and tuberculosis/HIV in Ukraine: a cross-sectional study

A. Salnikova<sup>1</sup>, O. Makarenko<sup>1</sup>, Y. Sereda<sup>1</sup>, T. Kiriazova<sup>1</sup>, K. Lunze<sup>2</sup>, J. DeHovitz<sup>3</sup>, D.C. Ompad<sup>4,5</sup>

<sup>1</sup>Ukrainian Institute on Public Health Policy, Kyiv, Ukraine,

<sup>2</sup>Department of Medicine, Boston Medical Center, Boston University Chobanian & Avedisian School of Medicine, Boston, MA, United States, <sup>3</sup>SUNY Downstate Health Sciences University, Department of Medicine, Brooklyn, United States, <sup>4</sup>New York University, School of Global Public Health, Department of Epidemiology, New York, United States, <sup>5</sup>Center for Drug Use and HIV/HCV Research, New York, United States

**Background:** TB/HIV coinfection accounted for 22% of TB cases in 2019, and TB remains the leading cause of death among people living with HIV (PLWH) in Ukraine. Depressive disorders are associated with poor treatment outcomes, poor physical health and quality of life among people living with TB and TB/HIV. Data on depression and associated factors among this population is limited in Ukraine.

The present study aimed to examine the prevalence of depression risk and its correlates and describe willingness to be in depression treatment among people living with TB and TB/HIV in Ukraine.

**Methods:** This cross-sectional analysis included adult healthcare clients who initiated TB treatment within 30 days (n=100 with TB; n=109 with TB/HIV) in two tertiary hospitals in Kyiv and Odesa. We conducted a survey from February 2021 to October 2022 and reviewed clients' health records.

We used the Center for Epidemiological Studies-Depression Scale (CES-D), with a cut-off score of  $\geq 16$  points to indicate risk for clinical depression. TB stigma was measured with Van Rie TB stigma scale. Factors associated with risk for clinical depression were identified using logistic regression.

**Results:** The mean age of participants was 43 (SD = 11) years and 66% identified as male. The prevalence of risk for clinical depression was 28%. Among those with risk for depression, 66% were willing to seek either therapeutic or medical help for it. HIV coinfection (2.95, 95% CI: 1.46, 6.20), illicit drug use in a past 30 days (3.57, 95% CI: 1.18–11.60), TB stigma (moderate stigma - 7.40, 95% CI: 2.22, 34.1; high stigma - 15.5, 95% CI: 4.52, 73.2), and unemployment status (2.25, 95% CI: 1.12, 4.60) were significantly associated with risk for depression among people living with TB and TB/HIV.

**Conclusions:** Findings support integration of a clinical depression screening tool into routine clinical care of people living with TB and HIV, and highlight the importance of linking clinical care for TB/HIV with mental health services. HIV coinfection, illicit drug use in a past 30 days, TB stigma, unemployment status were associated with risk for depression, highlighting the need for comprehensive services for this healthcare client population.

## TUPEC298

Exclusive breastfeeding and associated factors for mothers living with and without HIV in Botswana

<sup>1</sup>Harvard Medical School, Boston, United States,

<sup>2</sup>Botswana-Harvard Health Partnership, Gaborone, Botswana, <sup>3</sup>Massachusetts General Hospital, Department of Pediatric Global Health, Boston, United States, <sup>4</sup>Massachusetts General Hospital, Department of Psychiatry, Boston, United States, <sup>5</sup>University of Washington, Department of Global Health, Seattle, United States, <sup>6</sup>University of Washington, Department of Epidemiology, Seattle, United States, <sup>7</sup>Ministry of Health Botswana, Gaborone, Botswana, <sup>8</sup>Harvard T.H. Chan School of Public Health, Department of Immunology and Infectious Diseases, Boston, United States, <sup>9</sup>Northwestern University Feinberg School of Medicine, Department of Pediatrics, Chicago, United States, <sup>10</sup>Massachusetts General Hospital, Department of Internal Medicine, Boston, United States

**Background:** Exclusive breastfeeding (EBF) through 6 months is associated with lower morbidity and mortality for infants born to mothers living with HIV (MLHIV) on antiretroviral therapy. Botswana's national guidelines for MLHIV adopted EBF in 2016, after global recommendations in 2013. Since then, no studies have longitudinally estimated EBF in Botswana. We evaluated infant feeding practices through 6 months for mothers living with and without HIV in Botswana.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

**Methods:** The FLOURISH study prospectively enrolls Botswana citizens with singleton pregnancies, age  $\geq 18$  years, and breastfeeding intent. From July 2022–December 2023, participants answered a questionnaire at 6 months post-partum on factors influencing infant feeding choices. Participants reported feeding practices quarterly, enabling 6-month EBF quantification. Factors associated with EBF were evaluated overall and for MLHIV only using multivariable logistic regressions.

**Results:** Of 198 participants, 47.5% were living with HIV. Median age was 28 years (IQR 24–33). Participants were 65.2% multiparous, 22.2% single, and 40.4% unemployed. Overall 6-month EBF prevalence was 29.8%, without significant difference by HIV status (30.8% HIV-seronegative and 28.7% MLHIV).

Median duration of any breastfeeding was 6.1 months (IQR 2.9–9.5). 27.3% received ante/peripartum counselling on feeding methods. 19.2% were influenced by returning to work/school. Among MLHIV, 85.9% correctly understood EBF guidelines, and 8.5% were advised against breastfeeding due to viral load.

Overall, mothers were less likely to EBF if influenced by returning to work/school (aOR 0.14 [95%CI: 0.03–0.45],  $p < 0.01$ ) or single (aOR 0.41 [95%CI: 0.20–0.83],  $p = 0.01$ ), and more likely if multiparous (aOR 3.65 [95%CI: 1.68–8.48],  $p < 0.01$ ). MLHIV were more likely to EBF if influenced by the infant's father (aOR 9.71 [95%CI: 2.11–58.03],  $p < 0.01$ ) and less likely if single (aOR 0.20 [95%CI: 0.06–0.60],  $p < 0.01$ ).

Figure 1. Final multivariable models of factors associated with exclusive breastfeeding among all mothers and among mothers living with HIV (MLHIV) only.

**Conclusions:** Sustained EBF in Botswana remains low irrespective of maternal HIV status. Structural interventions targeting breastfeeding feasibility at work/school, engagement of infants' fathers, and support for single mothers may increase EBF.

## TUPEC299

HCV incidence among MSM using HIV PrEP and MSM with HIV in a New York City Health Care System over 2 decades

R. Silvera<sup>1</sup>, A. Urbina<sup>1</sup>, K. Sigel<sup>1</sup>, D. Fierer<sup>1</sup>

<sup>1</sup>Icahn School of Medicine at Mount Sinai, Medicine, New York, United States

**Background:** Despite HCV elimination efforts, transmission among MSM with HIV remains high. MSM on PrEP have emerged as a risk group, expanding those at risk for

sexual acquisition of HCV. New York City (NYC) has been an epicenter of this HCV epidemic, but there are no data quantifying the extent of this epidemic.

**Methods:** We performed a retrospective analysis of the electronic health records in the Mount Sinai Health System for incident HCV among MSM with HIV and MSM on PrEP from 2000–2022. Incident HCV was defined as a positive HCV Ab test after a negative test. Incidence rates were calculated using the time between the initial negative Ab test and either a positive Ab test or the last negative Ab test. Kaplan-Meier (KM) analysis was used to compare cumulative probability of incident HCV infection.

**Results:** We identified 10,862 MSM who had a negative Ab test and at least one follow-up Ab test  $>90$  days later between June 15, 2012 through December 31, 2022, of whom 8,273 were MSM with HIV and 1,890 were MSM on PrEP. Among MSM with HIV, there were 94 incident HCV infections over 38,889 (mean 4.7) years of follow up. Among MSM on PrEP there were 8 incident HCV infections over 5,208 (mean 2.8) years of follow up.

There was no difference between the HCV incidence rates for these groups [0.24/100 PY (95% CI 0.20–0.30)/100 PY; 0.15/100 PY (95% CI 0.07–0.30)/100 PY, respectively,  $p = 0.21$ ]. The HCV incidence rate for MSM with HIV over the entire study period (2000–2022) was 0.26/100 PY (95% CI 0.06–0.22)/100 PY.

**Conclusions:** The incidence rate of HCV infection among MSM on PrEP in NYC is equivalent to that of MSM with HIV over the last 20 years. CDC PrEP guidelines should be updated to reflect the need for active HCV surveillance as well as targeted education about the risk of HCV.

## TUPEC300

Impacts of COVID-19 on supervised consumption service utilization in Canada using interrupted time series analysis

P. McDougall<sup>1</sup>, C. Benny<sup>2</sup>, E. Hyshka<sup>3</sup>

<sup>1</sup>Dr Peter Centre, Vancouver, Canada, <sup>2</sup>Public Health Ontario, Toronto, Canada, <sup>3</sup>University of Alberta, Edmonton, Canada

**Background:** Drug poisoning morbidity and mortality increased markedly in Canada during the COVID-19 pandemic. However, it is unknown whether reduced supervised consumption service (SCS) utilization contributed to these trends. We aimed to determine if the onset of COVID-19 was associated with changes in the number of total visits to SCS in Canada, number of unique visitors, and the frequency of drug poisoning events occurring in SCS.

**Methods:** We analyzed administrative data from 28 SCSs across British Columbia, Alberta, Saskatchewan, and Ontario using interrupted time series techniques to examine changes following the onset of the COVID-19 pandemic. Multi-level segmented Poisson analyses were employed

Index

to account for variation within SCSs. Outcomes included the total number of visits, number of unique visitors, total number of overdose events, and number of overdose events requiring medical intervention between March, 2019 and February, 2021.

**Results:** Following the onset of COVID-19, we observed immediate increases in both poisonings (level  $\Delta$ : 12.00; 95% CI -18.71, 13.70) and poisonings requiring naloxone (level: 23.39, 95% CI 17.44, 29.34). These trends persisted throughout the study period, with marked increases in overdoses (slope: 3.76; 95% CI 2.65, 4.87) and overdoses requiring naloxone and oxygen, respectively [slope: 5.10 (95% CI 3.33, 6.87); slope: 6.34 (95% CI 5.67, 7.61)].

We also observed immediate decreases in average unique visitors per month (level: -34.55; 95% CI -35.57, -33.53), which also persisted throughout the study period (slope: -4.77, 95% CI -5.07, -4.47).

**Conclusions:** Increases in poisonings and decreases in unique visitors indicate reduced access to SCS in Canada during COVID-19, when poisoning risk was elevated. Efforts are needed to support to promote and protect access to SCS in future emergencies.

## Methodology to support epidemiological studies

### TUPEC301

#### Longitudinal HIV care engagement and viral suppression trajectories among persons with HIV diagnosed during 2017–2019 – United States

S. Johnson Lyons<sup>1</sup>, N. Crepaz<sup>1</sup>, R. Song<sup>1</sup>, A. Satcher Johnson<sup>1</sup>  
<sup>1</sup>Centers for Disease Control and Prevention, NCHHSTP/  
Division of HIV Prevention, Atlanta, United States

**Background:** Consistent HIV care engagement with viral suppression is associated with optimal health outcomes and decreased community transmission. Monitoring HIV care and viral suppression outcomes is important to assess progress towards the Ending HIV Epidemic in the U.S. initiative goals and inform resource allocation and program planning. These outcomes are often evaluated cross-sectionally, and long-term patterns are not well understood.

**Methods:** Using data from the CDC's National HIV Surveillance System from 41 jurisdictions with complete laboratory reporting, we conducted group-based trajectory models (SAS PROC TRAJ) to identify longitudinal (4-year) patterns of care engagement and viral suppression among 98,755 persons with HIV diagnosed during 2017–2019. HIV care and viral suppression were defined at 6-month intervals after diagnosis using CD4 and/or viral load markers as proxies.

**Results:** We identified two 4-class model trajectories for care (58.1% consistently high, 22.6% constant decline, 6.0% progressive increase, 13.3% persistently low) and viral suppression (42.8% consistently high, 24.5% constant decline, 10.0% progressive increase, 22.7% persistently low) during the first 4 years after HIV diagnosis. Models for care engagement and viral suppression demonstrated an overall 72% concordance; 12% and 15% of the population were either classified "persistently low" or in "constant decline" for both care and viral suppression (Table).

Care Engagement Class	Viral Suppression Class				Total
	1 Consistently high	2 Constant decline	3 Progressive increase	4 Persistently low	
1 Consistently high	41,206 (71.8) (41.7)	8,449 (14.7) (8.6)	4,458 (7.8) (4.5)	3,244 (5.7) (3.3)	57,357 (58.1)
2 Constant decline	742 (3.3) (1.8) (0.8)	14,418 (64.6) (59.7) (14.6)	1,955 (8.8) (19.7) (2.0)	5,207 (23.3) (23.2) (5.3)	22,322 (22.6)
3 Progressive increase	329 (5.6) (0.8) (0.3)	265 (4.5) (1.1) (0.3)	3,506 (59.4) (35.3) (3.6)	1,803 (30.5) (8.0) (1.8)	5,903 (6.0)
4 Persistently low	0	1,014 (7.7) (4.2) (1.0)	0	12,159 (92.3) (54.2) (12.3)	13,173 (13.3)
Total	42,277 (42.8)	24,146 (24.5)	9,919 (10.0)	22,413 (22.7)	98,755 (100)

Table.

**Conclusions:** Among persons with HIV diagnosed during 2017–2019, approximately 1 in 9 persons were persistently low and 1 in 7 persons were in constant decline for both care and viral suppression during the 4-years after diagnosis. These findings, highlight the urgent need for interventions to help engage and retain people with HIV in care to have viral suppression.

Our findings contribute to existing research with findings of varied national care outcome patterns after diagnosis. These insights are crucial for informing the development of focused interventions throughout the HIV care cycle to optimize outcomes, address gaps in the care continuum, and to make progress towards ending the HIV epidemic in the U.S.

## TUPEC302

### Patterns of platform use by men seeking male sexual partners as indicator of HIV risk to differentiate interventions: results from a Latent Class Analysis

I. Tavitian-Exley<sup>1</sup>, Y. Hao<sup>1</sup>, M.I.-C. Chen<sup>1</sup>, C.S. Wong<sup>2</sup>, C. Kwok<sup>3</sup>, M. Toh<sup>1</sup>

<sup>1</sup>National Centre for Infectious Diseases, National Public Health Epidemiology Unit, Singapore, Singapore,

<sup>2</sup>National Centre for Infectious Diseases, National HIV Programme, Singapore, Singapore, <sup>3</sup>Action for AIDS Singapore (AfA), MSM Programme and ATS, Singapore, Singapore

**Background:** Low-level HIV epidemic settings like Singapore face the challenge of effectively reaching men at-risk who have less contact with prevention programmes. We hypothesized that the use of multiple networking platforms by men seeking male sexual partners could serve as potential marker of risk to differentiate sub-groups for targeted interventions.

**Methods:** Latent class modelling was used to identify homogeneous sub-groups with similar patterns of meeting platforms use and demographic profiles. The best-fit latent class model was factored in multivariable regression to identify associations with key risk behaviours.

**Results:** Five distinct patterns emerged, reflecting salient platform use characteristics: *Sauna-centric (SC; n=413)*, *App-centric (AC; n=276)*, *Multiple-Platforms (MP; 123)*, *Platform-inactive (PI; 257)* and *"Do not hook up" (DNH; n=72)* classes. Men in the SC and MP classes had high probabilities of using saunas to meet partners; SC were significantly older and less likely to have disclosed their sexual orientation. The MP class had high probabilities of connecting via internet, smartphone apps and *all* other platforms in addition to saunas – and more likely to have disclosed their sexual orientation.

Men in SC and MP classes had twice the odds of reporting multiple sex partners ( $aOR^{SC}=2.1$ ; 95%CI: 1.3-3.2;  $aOR^{MP}=2.2$ ; 95%CI: 1.1-4.6, respectively). Single/non-partnered MSM and those using alcohol/drugs during sex had 1.7 (95%CI: 1.2-2.5) and 3.2 (95%CI: 2.0-5.1) times the odds respectively, of reporting multiple sex partners.

The SC and MP class had higher odds of engaging in group sex ( $aOR^{SC}=1.6$ ; 95%CI: 1.1-2.3 and  $aOR^{MP}=1.7$ ; 95%CI: 1.1-2.8, respectively). Participants using alcohol/drugs during sex had twice the odds of reporting group sex ( $aOR=2.2$ ; 95%CI: 1.6-3.0).

There were no between-class difference in unprotected sex, however, MSM using alcohol/drugs during sex or reporting group sex had twice the odds of reporting condom-less sex. Lower education was positively associated with unprotected sex. Group sex, alcohol/drug use during sex, disclosure of sexual orientation or being Singaporean/permanent resident were positively associated with recent testing for HIV.

**Conclusions:** Our analysis identified five distinct platform use patterns associated with different risk profiles which, combined with field knowledge, can be used by programmes to tailor interventions including HIV self-testing and Pre-Exposure Prophylaxis to sub-groups at risk.

## TUPEC303

### Opportunities and challenges of using smartphone GPS technology to understand linkages between mobility patterns and HIV risk among young adults in rural South Africa

T. Mathenjwa<sup>1</sup>, E. Okango<sup>1</sup>, K. Tram<sup>2</sup>, A. Dobra<sup>3</sup>, F. Tanser<sup>1,4</sup>

<sup>1</sup>Africa Health Research Institute, Durban South, South Africa, <sup>2</sup>University of Washington, Department of Medicine, Washington, United States, <sup>3</sup>University of Washington, Department of Statistics, Washington, United States, <sup>4</sup>Stellenbosch University, Centre for Epidemic Response and Innovation, School for Data Science and Computational Thinking, Cape Town, South Africa

**Background:** Despite widespread HIV prevention and treatment programs, mobile individuals still face a heightened risk of HIV acquisition and poor treatment outcomes. This study in rural KwaZulu-Natal, South Africa, explores the feasibility and acceptability of gathering location data of young adults using a smartphone-based GPS app to investigate the association between movement patterns and the risk of HIV transmission or interruptions in HIV care.

**Methods:** Between June 2021 and November 2022, we enrolled 205 randomly selected young adults (20-30 years old) from the 2019 Africa Health Research Institute HIV surveillance program in two phases. In Phase 1, participants were given study smartphones, while in Phase 2, participants used their own personal smartphones. A customized version of the commercially available Ethica app was installed to record the device's location at regular intervals. Participants were followed up for six months; participants whose smartphones failed to transmit positional data as per the study protocol were contacted via phone or home visits for troubleshooting.

**Results:** We received over 29 million location points, with common issues for not receiving data traced to lack of internet connection, inadvertent app terminations linked to its background functionality and participants changing app settings. Some participants opted to use their personal phones to avoid carrying an extra device. Various phone-related challenges were reported with the study phone, such as breakages, losses, and network signal issues. In Phase 2, 44 participants were enrolled, with two personal devices that were unable to support the app. To address sub-optimal data uploads, an incentive-based game was introduced to boost user engagement, resulting in greater than 50% increase in the average number of location data points uploaded.

**Conclusions:** Use of smartphone GPS technology to record mobility in a rural setting is feasible and acceptable. This type of mobility data holds the potential to not only identify location-based risk factors but also to help inform tailored intervention strategies. We were able to demonstrate that the challenges of sub-optimal data upload can be overcome by including consistent troubleshooting and motivating app engagement.

## Characterizing intersectional stigma and its association with mental health outcomes among cisgender men and gender diverse minority youth in the United States

J. Tran<sup>1</sup>, S.K. Choi<sup>1</sup>, K. Muessig<sup>2</sup>, L. Hightow-Weidman<sup>2</sup>, J. Bauermeister<sup>1</sup>

<sup>1</sup>University of Pennsylvania, Philadelphia, United States,

<sup>2</sup>Florida State University, Tallahassee, United States

**Background:** Sexual and gender minorities experience disproportionately higher rates of depression and anxiety. Experiences of intersectional stigma related to HIV status, sexuality, gender, and race/ethnicity likely contribute to these disparities. Accurate characterization of intersectional stigma (IS) among these populations is a critical first step to enhancing HIV programming that also meets mental health needs.

**Methods:** A sample of men and gender diverse participants (N=750) were enrolled in a national randomized controlled trial (RCT) testing HealthMpowerment (HMP) 2.0, a mobile health intervention to improve HIV prevention and care continuum outcomes. We conducted latent profile analysis (LPA) to categorize participants' experiences of IS, including five indicators: internalized sexuality stigma, gender identity stigma, gender prejudice, enacted stigma, and everyday discrimination. Recognizing the distinct experiences of gender minority individuals relative to their cisgender counterparts, we estimated the LPA separately for these groups and associations with mental health outcomes.

**Results:** We identified a high IS profile and a low IS profile for cisgender men (n=666) and gender minority participants (n=84), respectively. A one-way ANOVA yielded significant differences between IS profiles and symptoms of anxiety, depression, and social isolation (Table 1).

Measures	Intersectional Stigma Profile Means (SD)				F	p-value	Effect size (η2)
	Cisgender Men		Gender Diverse Minority				
	Low IS	High IS	Low IS	High IS			
Anxiety	1.90 (1.75)	2.93 (1.76)	1.99 (1.76)	3.22 (1.78)	10.90	<.001 <sup>a,b,c,d</sup>	.04
Depression	1.91 (1.78)	3.06 (1.94)	2.08 (1.81)	3.37 (1.61)	12.79	<.001 <sup>a,b,c,d</sup>	.05
Social Isolation	7.08 (4.21)	9.79 (4.38)	8.00 (4.22)	12.05 (3.10)	17.79	<.001 <sup>a,b,d</sup>	.07

<sup>a</sup> significant difference between cisgender men low IS and cisgender men high IS

<sup>b</sup> significant difference between cisgender men low IS and gender diverse minority high IS

<sup>c</sup> significant difference between cisgender men high IS and gender diverse minority low IS

<sup>d</sup> significant difference between gender diverse minority low IS and gender minority high IS

Table 1. Pairwise comparisons of differences in mental health outcomes by intersectional stigma profiles.

A post hoc Tukey test found cisgender men and gender minority participants with high IS had significantly higher anxiety, depression, and social isolation compared to cisgender men with low IS, respectively. Among gender minority participants, those with high IS had significantly higher anxiety, depression, and social isolation compared to those with low IS. Gender minority participants with low IS also had significantly higher anxiety and depression compared to cisgender men with low IS.

**Conclusions:** High IS profiles are associated with higher levels of anxiety, depression, and social isolation among cisgender men and gender diverse participants. We highlight the utility of an LPA to characterize distinct IS profiles, which is needed to develop and tailor interventions to measure and address IS impacting the mental health of vulnerable, often marginalized population.

## "Empowerment" for Us By Us: developing a model of empowerment using feminist participatory methods with and among lesbian, bisexual, queer, and transgender (LBQT) women/persons in Western Kenya

R.O. Odhiambo<sup>1</sup>, A. Mbanda<sup>1</sup>, H. Tucker<sup>2</sup>, L. Jadwin-Cakmak<sup>2</sup>, S. Porter<sup>3</sup>, A. Lacombe-Duncan<sup>4</sup>, G. Harper<sup>2</sup>

<sup>1</sup>Western Kenya LBQT Feminist Forum (Lets Be Tested

Queens CBO), Kisumu, Kenya, <sup>2</sup>University of Michigan, School of Public Health, Ann Arbor, United States,

<sup>3</sup>University of Michigan, College of Literature, Science, and the Arts, Ann Arbor, United States, <sup>4</sup>University of Michigan, School of Social Work, Ann Arbor, United States

**Background:** Many LGBTQ people in Kenya experience human rights violations (e.g., healthcare barriers) driven by anti-LBQT and intersecting stigmas, and associated with physical and mental health inequities, including HIV. Studies also suggest strengths-based factors, such as empowerment, may mitigate the negative impact of intersectional stigma on HIV vulnerability of LGBTQ people. Little research has focused specifically on LBQT women/persons, focusing almost exclusively on cisgender men. We sought to explore Kenyan LBQT women/persons' conceptualizations of empowerment and to understand how empowerment influences their health.

**Methods:** A community-based participatory study "Empowerment For Us By Us" (E4UBU) was conducted in collaboration between the University of Michigan and Western Kenya LBQT Feminist Forum WKLFF (Lets Be Tested Queens CBO) and Homa Bay LBQ Women and Feminist Network (HBL) 2021-2023. Semi-structured qualitative interviews were conducted with 40 LBQT women/persons in two counties (Homa Bay, Kisumu). Data were analyzed using a participatory approach to develop an initial draft of a conceptual model of empowerment. Findings were presented in 2 focus groups as a form of member checking.

**Results:** Participants (ages 19-35) identified as lesbian 51.2 %, queer 26.8%, bisexual 17.1 %, and other 4.9%. All participants were assigned female at birth, with over half cis-gender women, 19.5% nonbinary, 12% transgender men, and 2.4% intersex. Participant narratives revealed there is no one central measurable construct of empowerment. Empowerment was viewed as a process that led to healthy growth (See Figure). The process was dependent on context, issue, and population, and could be impeded at any point because of internal or external barriers. Intersectional identities that determined one's relationship with power included ethnicity, sexuality, gender expression/identity, partner status, sexual/reproductive health, employment, and more. The model demonstrated points where interventions were needed at multiple socioecological levels, including individual (e.g., knowledge), interpersonal (e.g., social support), community (e.g., LGBTQ visibility), and policy (e.g., employment protection). The model also identified manifestations of powerlessness, including poor mental and physical health.

**Conclusions:** This model of empowerment, grounded in the lived experiences of LBQT women/persons in Western Kenya, can be used to inform the development of participatory, community-led interventions to address multiple outcomes that influence HIV vulnerability.

## TUPED306

### Adherence through the prism of long-acting injectable therapy: qualitative findings from the ILANA implementation study

S. Paparini<sup>1</sup>, R. Hayes<sup>1</sup>, C. Mwendera<sup>2</sup>, C.M. Orkin<sup>3,4</sup>

<sup>1</sup>Queen Mary University of London, SHARE Collaborative, Wolfson Institute for Population Health, London, United Kingdom, <sup>2</sup>University of Liverpool, Clinical Infection, Microbiology & Immunology, Liverpool, United Kingdom, <sup>3</sup>Queen Mary University of London, SHARE Collaborative, Blizard Institute, London, United Kingdom, <sup>4</sup>Barts Health NHS Trust, Department of Infection and Immunity, London, United Kingdom

**Background:** Adherence to ART is one of the most studied topics in HIV research. Many disciplinary, methodological, and theoretical approaches have been applied to understanding adherence as a complexity of life with HIV. The advent of long-acting injectable therapy is the most significant paradigmatic disruption since the introduction of combination treatment. ILANA is the first UK-based mixed methods study examining the acceptability and feasibility of long-acting injectable Cabotegravir + Rilpivirine (CAB+RPV) among healthcare providers and people living with HIV. We describe the experience of patient participants.

**Methods:** A longitudinal qualitative study design was used. Fourteen semi-structured repeat interviews were conducted with patient participants at baseline (Aug-

Nov '22) and at study end (Sept-Nov '23). Participants were recruited from six HIV clinics across the UK. Interview topics included questions regarding adherence before switching to injectables, perceptions around switching and experiences of being on injectable therapy after 12 months. Interviews were transcribed in full then analysed using thematic analysis of individual narrative summaries.

**Results:** The interviews generated data about new, key dimensions of a framework to understand adherence in the context of injectable therapy:

1. The relief experienced by the majority participants when moving to CAB+RPV reveals the ongoing treatment burden on patients otherwise considered to be taking therapy 'successfully' based on undetectable VL;
2. Such relief from previous anxieties is accompanied by the birth of new anxieties among a minority of participants about the effectiveness of CAB+RPV and the rigid exigencies of regular injections;
3. The welcome shift in responsibility for managing treatment from the patient to the clinical team also engenders a loss of control for some;
4. The transitional and dynamic nature of the adherence experience with injectable therapy carries yet under-researched implications for scale-up and sustainability.

**Conclusions:** ILANA participants constitute a diverse and pioneering group characterised by enthusiasm for injectable therapy.

The study identifies new areas of research to maximise opportunities afforded by injectable therapy whilst understanding new arising concerns in the context of injectables for a wider population, outside of study conditions, and in different geographical contexts.

## TUPED307

### Australian consensus statements of the HIV response to approaching and moving beyond the elimination of HIV transmission

T. Phillips<sup>1,2</sup>, H. Taouk<sup>3</sup>, R. Kiggundu<sup>1,2</sup>, D. O'Donnell<sup>3</sup>, P. Lau<sup>4</sup>, J. Ong<sup>1,2</sup>

<sup>1</sup>Monash University, Central Clinical School, Melbourne, Australia, <sup>2</sup>Melbourne Sexual Health Centre, Melbourne, Australia, <sup>3</sup>Health Equity Matters, Sydney, Australia, <sup>4</sup>Western Sydney University, School of Medicine, Sydney, Australia

**Background:** In 2023, Sydney, Australia, reported an 88% decline in new HIV infections, signalling the near elimination of HIV transmission (indicated by a 90% decline from a 2010 baseline). As the rest of Australia approaches the elimination of HIV transmission, a longer-term strategy is critical to ensure that a sustained effort continues to work towards minimal transmission rates of HIV across all affected communities in Australia. We aimed to establish consensus statements to articulate these strategies.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

**Methods:** Co-creation and Delphi techniques were used. Two focus groups, using an exploratory approach with a series of open-ended questions, were conducted with 11 community representatives, researchers and clinicians to co-create draft statements that would guide Australia's future HIV response. One hundred and sixty-four experts in the Australian HIV response were then invited to participate in two rounds of an online Delphi survey to rate their agreement with the draft statements in achieving and moving beyond the elimination of HIV transmission. Each statement required 80% agreement to reach consensus.

**Results:** Thirty-five draft statements were co-created following the focus group discussions and grouped under six themes: 1) Prevention; 2) Treatment, Management and Care; 3) Testing; 4) Reducing stigma and discrimination; 5) Research; and 6) Community-led responses. In round 1 of the survey, 106 participants rated the 35 draft statements, of which 30 (85.7%) reached consensus. In round 2, 89 participants re-rated the five draft statements that did not reach consensus, of which none reached consensus. Participants were also asked to rate six new statements suggested by participants in round 1, of which all six reached consensus.

**Conclusions:** Australia is one of the first countries in the world to actively plan for strategies post-elimination of HIV transmission. The rigorous and collaborative approach, involving diverse experts from the community, research and clinical sectors, has ensured that the identified strategies reflect a multifaceted understanding of the challenges and opportunities ahead after eliminating HIV transmission. The resulting consensus statements provide a valuable roadmap for guiding future policy and program development as Australia strives to maintain and solidify hard-won gains against HIV and ensure that affected communities are not left behind.

## TUPED308

A psycho-social weather report in the Netherlands: mapping the internalised homonegativity "storms" and the sexual self-efficacy "sunshine" among MSM and their ecological associations with HIV care cascade

H. Wang<sup>1</sup>, H.M. Zimmermann<sup>1</sup>, J. Kolstee<sup>1</sup>, A. van Sighem<sup>2</sup>, K.J. Jonas<sup>1</sup>

<sup>1</sup>Maastricht University, Department of Work and Social Psychology, Maastricht, Netherlands, the, <sup>2</sup>Stichting HIV Monitoring, Amsterdam, Netherlands, the

**Background:** Internalised homonegativity (IH) is associated negatively on all steps of the HIV care cascade (testing, treatment and viral suppression), while sexual self-efficacy (SSE, e.g. confidence to say no to sex) may lead to better outcomes. This study mapped the nationwide IH and SSE among MSM and their ecological associations with HIV cascade in the Netherlands.

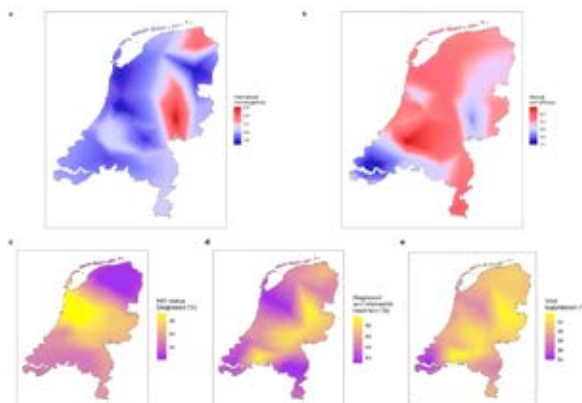

**Methods:** Data from the Dutch MSM subsample (n=1,102) of PROTECT, a cross-sectional survey, obtained from October-December 2023, were included. IH and SSE (measured on 1-5 Likert scale) were aggregated on regional level using postcode data. Regional HIV cascades were obtained from the Dutch HIV Monitoring Foundation.

We first mapped the IH, SSE, and the HIV cascade using a stochastic partial differential equation approach. We then used ecological regressions to explore associations between geostatistical IH/SSE and each HIV cascade.

**Results:** The estimated geostatistical IH (range 1.7-2.6), SSE (3.4-4.4) and HIV cascades in the Netherlands are shown in Figure below. Ecologically, a negative association between IH and SSE were estimated ( $B=-0.11$ ), where the highest (lowest) concentrated IH "storm" (SSE "sunshine") were found around more rural regions. Highest %HIV diagnoses were observed in areas around Amsterdam, declining with distance.

Upon diagnosis, the %retained in treatment and %virally suppressed were, however, higher in more rural areas. Our ecological models affirmed these observations: higher geostatistical IH was associated with lower %HIV diagnosed ( $B=-0.58$ ), higher %linked to treatment ( $B=0.39$ ), and higher %Virally suppressed ( $B=0.23$ ).

Conversely, geostatistical SSE exhibited opposite associations with these cascades ( $B=0.44$ ,  $B=-0.02$ ,  $B=0.21$ ).

**Conclusions:** Higher IH "storm" may bar achieving the first "95" but could facilitate reaching the second and third "95" goals in HIV care cascades.

Conversely, SSE "sunshine" works oppositely, emphasizing the importance of local psycho-social "climate".

Tailored interventions/actions may be proven to enhance the nuanced approach needed for optimal HIV care outcomes, especially in diverse geographic settings.

## TUPED310

Explaining the condom use of sex workers with casual partners in Switzerland using an extended Information-Motivation-Behavioral Skills (IMB) model

S. Nideröst<sup>1</sup>, P. Weber<sup>1</sup>, B. Hassler<sup>1</sup>

<sup>1</sup>University of Applied Sciences and Arts, Northwestern Switzerland, School of Social Work, Institute for Integration and Participation, Olten, Switzerland

**Background:** HIV prevention messages are often based on risk behavior taking place in the professional setting of sex work. However, sex workers also have sex with private casual partners.

The aim of the study was to identify predictors of condom use with private casual partners. For this purpose, we used an extended IMB model, which also considers personal, social, and economic conditions, as well as critical life events.

**Methods:** The study was a nationwide cross-sectional survey which took place from March to October 2022. We used a self-administered online questionnaire with validated instruments to measure the IMB construct variables. The dependent variable was the frequency of condom use during vaginal or anal intercourse with casual partners within the past 12 months.

Sex workers completed questionnaire at local sex worker drop-in-centers. Informed consent was obtained. Participation was voluntary. To test the extended IMB model, we performed a structural equation modeling using AMOS.

**Results:** Among the 386 sex workers were 265 women, 82 men and 39 transgender persons. Mean age was 35.5 years (SD=10.85). Fifty-six percent were heterosexual, 16.3% homosexual, and 14.8% bisexual. Approximately 31% were migrants from HIV high-prevalence countries. Fifty-seven percent always used condoms when having sex with private casual partners.

Predictors of condom use were intention to use condoms ( $\beta=0.28$ ,  $p<0.001$ ), attitude toward condoms ( $\beta=0.22$ ,  $p<0.001$ ), subjective norm ( $\beta=0.12$ ,  $p<0.01$ ), higher age ( $\beta=0.11$ ,  $p<0.05$ ), heterosexual orientation ( $\beta=0.11$ ,  $p<0.05$ ), and drug use before sex ( $\beta=-0.14$ ,  $p<0.01$ ). Intention was predicted by age ( $\beta=0.21$ ,  $p<0.001$ ) and heterosexual orientation ( $\beta=0.10$ ,  $p<0.05$ ).

Attitude toward condoms was predicted by female gender ( $\beta=0.13$ ,  $p<0.05$ ), heterosexual orientation ( $\beta=0.20$ ,  $p<0.001$ ), education ( $\beta=0.15$ ,  $p<0.01$ ), and perceived discrimination ( $\beta=-0.13$ ,  $p<0.01$ ). Subjective norm was predicted by being in a committed relationship ( $\beta=0.11$ ,  $p<0.05$ ).

The extended IMB model showed an acceptable model fit:  $\chi^2=53.2$ ,  $df=33$ ,  $RMSEA=0.034$ . The explained variance for condom use was 30%.

**Conclusions:** The results show that the extended IMB model is a suitable model for explaining condom use among sex workers. However, neither information nor self-efficacy had any influence on the frequency of con-

dom use with private casual sex partners. Prevention should take into account both drug use and discrimination against sex workers.

## TUPED311

Enhanced HIV science literacy and improved motivation towards participation in biomedical research among key communities in India – the role of gamification and experiential-learning based interventions

P. Saha<sup>1</sup>, J. Mukherjee<sup>1</sup>, D.L. Bose<sup>1</sup>, K. Goyal<sup>2</sup>, S. ul Hadi<sup>1</sup>, S.P. Shewale<sup>3</sup>, A. Jadhav<sup>3</sup>, S. Sahay<sup>4</sup>

<sup>1</sup>IAVI, Gurugram, India, <sup>2</sup>DCT Mindlinks, New Delhi, India,

<sup>3</sup>Krishna Institute of Medical Science Deemed to be University, Karad, India, <sup>4</sup>ICMR-National AIDS Research Institute, Pune, India

**Background:** The fundamental right to health is predicated by the right to science, including the right to be a part of scientific progress. Therefore, access to core scientific rationale in a comprehensible way is critical for informed and voluntary community participation in biomedical research (BMR). Gamification and experiential learning (GEL) use indigenous knowledge and culturally-rooted metaphors to expedite scientific learning.

We employed GEL-based interventions to enhance HIV science literacy and motivation to engage in HIV BMR. The intervention included interactive games and participatory theatre to explain HIV viral diversity, latency, drug resistance and broadly neutralizing antibodies.

**Methods:** The mixed-method study employed quasi-experimental treatment-controlled design and qualitative enquiry on participant experience for evaluating utility of GEL intervention.

Baseline survey engaging 600 participants representing Female Sex Workers, Men who have Sex with Men and Transgender Women from rural Maharashtra, India, captured community perspectives about HIV science and their willingness to participate in research. 300 of baseline participants were exposed to the GEL intervention.

These 300 participants, and another 300 intervention-naïve participants were subjected to end-line survey for assessing change in HIV science knowledge and attitude towards HIV BMR. Data was thematically structured base on COM-B behaviour change framework and analysed using 2-sample parametric statistics.

### Results:

- **HIV science literacy:** Irrespective of existing baseline knowledge, exposure to GEL intervention yielded higher level of correct response (39% increase in viral diversity and latency, 29% increase in drug resistance) around scientific concepts;
- **Motivation for research participation:** Enhanced level of motivation to engage in HIV research was represented by 61% reduction in hesitancy towards re-

search participation in intervention exposed group than control group;

- **Altruism:** Participants exposed to interventions showed positive shift in altruistic reasons boosting research participation;
- **Participant feedback:** Post-intervention feedback revealed high level of likability and participant satisfaction. Participants shared a greater appreciation for complexity of science and value of community participation in research.

**Conclusions:** GEL intervention provided a jargon-free interactive way to make complex science accessible and relevant to the community. GEL-based strategies seem promising in effectively communicating science and strengthening motivation, and hence might be considered for broader adoption in upcoming next generation HIV trials.

## Social and behavioural aspects and approaches to HIV and living with HIV

### TUPED312

Understanding HIV and drug use related stigma among people living with HIV who use drugs in Vietnam: a latent class analysis

L. Wang<sup>1,2</sup>, L. Li<sup>2</sup>, T.A. Nguyen<sup>3</sup>

<sup>1</sup>University of Washington, Department of Psychology, Seattle, United States, <sup>2</sup>University of California, Los Angeles, Semel Institute for Neuroscience and Human Behavior, Los Angeles, United States, <sup>3</sup>National Institute of Hygiene and Epidemiology, Hanoi, Viet Nam

**Background:** HIV- and drug-related stigma, encompassing internalized, perceived, and enacted subtypes, significantly impairs medication adherence and mental health among people living with HIV who use drugs (PLHWUD). Disentangling the impact of intersectional stigma and subtypes of stigma could add nuances to intervention development.

**Methods:** This study analyzed baseline data from a randomized control trial (N = 241) conducted among PLHWUD in Vietnam. Latent class analysis was conducted to identify patterns in self-reported intersectional stigma and subtypes of stigma. Multivariable regression was conducted to examine the association between class membership and depression, ART adherence self-efficacy, social support, HIV disclosure, and drug avoidance self-efficacy.

**Results:** A five-class model of stigma was identified:

- Class 1. High on perceived stigma;
- Class 2. High on internalized stigma;
- Class 3. Low on all stigma;
- Class 4. High on all stigma;

Class 5. High on drug-related stigma & low on HIV-related stigma.

Compared to people with high perceived stigma (Class 1), people with high internalized stigma reported lower ART adherence self-efficacy ( $\beta = -2.72$ , 95% CI [-5.10 – -0.35]), lower drug avoidance self-efficacy ( $\beta = -4.22$ , 95% CI [-8.26 – -0.18]), and higher depression ( $\beta = 4.23$ , 95% CI [1.18 – 7.27]). Compared to people with high perceived stigma (Class 1), people with high drug-related stigma and low HIV-related stigma (Class 5) reported lower tangible support ( $\beta = -1.55$ , 95% CI [-3.04 – -0.06]), lower drug-avoidance self-efficacy ( $\beta = -4.37$ , 95% CI [-8.65 – -0.09]), and higher disclosure ( $\beta = 1.96$ , 95% CI [0.49 – 3.42]).

**Conclusions:** This study enriches stigma literature by unpacking stigma patterns among PLHWUD, linking high internalized stigma to increased depression and reduced ART adherence, and associating high drug-related stigma with decreased tangible support.

This study underscored the imperative of examining the intersectionality of HIV and drug stigma and the distinct impacts of stigma subtypes.

### TUPED313

Perceptions about mpox-related stigma manifestations and key elements to prevent this stigma: a qualitative research in Lima, Peru

J. Ruiz<sup>1</sup>, E. Soldevilla-Huanca<sup>1</sup>, C. Jara<sup>1</sup>, F. Samalvides<sup>2</sup>, A. Miranda Cardenas<sup>3</sup>, C.D. Mitnick<sup>4</sup>, M.F. Franke<sup>4</sup>, J.T. Galea<sup>5</sup>, A. Mendoza-Ticona<sup>6</sup>, R.A. Errea<sup>1</sup>

<sup>1</sup>Socios En Salud Sucursal Peru, HIV Program, Lima, Peru, <sup>2</sup>Hospital Nacional Cayetano Heredia, Department of Infectious, Tropical and Dermatological Diseases, Lima, Peru, <sup>3</sup>Hospital de Emergencias de Villa El Salvador, Infectious Diseases and Tropical Medicine Service, Lima, Peru, <sup>4</sup>Harvard Medical School, Department of Global Health and Social Medicine, Boston, United States, <sup>5</sup>University of South Florida, Department of Mental Health Law and Policy, Tampa, United States, <sup>6</sup>Socios En Salud Sucursal Peru, Lima, Peru

**Background:** The mpox outbreak in 2022 in Peru affected primarily men who have sex with men, transgender women and people living with HIV, communities that historically face high levels of stigma. Due to reported stigma, there was concern that stigma against persons diagnosed with mpox could impact individual health behavior and public health efforts to control the epidemic. We sought to explore mpox-related stigma manifestations and to identify key elements of a public health response to prevent and combat mpox-related stigma in Peru.

**Methods:** Four focus groups with individuals who had mpox (three comprising persons living with HIV diagnosed with mpox) and four in-depth interviews with healthcare personnel were conducted between September 2023

and January 2024 in Lima. Semi-structured guides were used to explore client experiences with stigma (how and by whom they were stigmatized), healthcare personnel perceptions of persons diagnosed with mpox and their care, and recommendations for reducing mpox-related stigma.

Audio recordings were transcribed verbatim. A three-stage content analysis was conducted using QDA Miner Lite.

**Results:** Three themes emerged regarding stigma manifestations against persons diagnosed with mpox:

A. people's assumptions about their sexual orientation (i.e. homosexual, bisexual) and sexual behavior (i.e., promiscuity),

B. healthcare personnel's assumptions about their HIV-positive status, and;

C. inequitable (i.e., delays while in the healthcare facility compared to people with other conditions) and unempathetic (i.e., use of isolation measures without proper explanation) health care.

Many persons diagnosed with mpox perceived that this suboptimal care arose from health care personnel's insufficient knowledge about mpox.

Indeed, healthcare personnel reported insufficient knowledge of mpox management (i.e., isolation procedures, infection control precautions, and use of personal protective equipment).

Elements that could reduce mpox-related stigma mentioned by the participants included the development of communication material shared especially through social media to educate about mpox, and prompt training of healthcare personnel on mpox management.

**Conclusions:** Mpox-related stigma was present in the form of stigmatizing assumptions and inequitable health care. Timely training of healthcare personnel on mpox management, and mass communication material with educational content could help to reduce these experiences in a future mpox outbreak.

## TUPED314

[Strengthening meaningful engagement of youth-led organisations to monitor and advocate for improved HIV responses for young key populations](#)

V. Monley<sup>1</sup>

<sup>1</sup>Youth LEAD, Programmes, Bangkok, Thailand

**Background:** This programme is multifaceted approach to address the challenges faced by young key populations (YKPs) in accessing HIV services in the Asia Pacific region. The strategic objectives include capacity-building initiatives for healthcare workers, ensuring the design and delivery of YKP-friendly services within a stigma-free environment, bolstering leadership skills among YKPs to actively contribute to national HIV responses, and fortifying partnerships between communities, civil society, health-

care facilities, UN agencies, and government entities to create a unified and comprehensive approach to combat HIV/AIDS.

**Description:** The program involves comprehensive activities based off of Youth LEAD's "Reginal Healthcare Worker Sensitisation Training Manual" aimed at advancing HIV/AIDS advocacy and healthcare for YKPs across four countries: Papua New Guinea, Indonesia, the Philippines and Cambodia. Engaging with national YKP-led networks as implementing partners, the initiative focused on sensitizing healthcare workers in areas with high numbers of YKPs on improving friendlier services and environments in increasing the uptake of vital HIV, prevention and treatment services.

**Lessons learned:** The programme surpassed expectations with 120 healthcare workers trained across the four countries, demonstrating a successful achievement of the set indicator. All districts submitted action plans, with over 90% of participants achieving their commitments, reflecting adaptability within constraints like limited funding and existing work plans.

Evaluation reports on sensitization training in seven districts demonstrated practicality and effectiveness, with all districts providing valuable qualitative feedback for improvements in the training manual.

Overall, the project successfully achieved short-term and long-term objectives by capacitating healthcare workers, fostering YKP-friendly environments, and strengthening partnerships, emphasizing the essential leadership capacity of YKP national networks.

**Conclusions/Next steps:** Key partnerships and collaborations involved various entities, including UNAIDS, national health departments, youth-led networks, and local NGOs, showcasing a multi-stakeholder approach. Implementation constraints, such as limited funding for action plans and evaluation periods, were identified, providing valuable lessons for future initiatives, emphasizing the importance of securing funding for action plans and adjusting evaluation periods based on country context.

Overall, the project demonstrated the effectiveness of capacitating healthcare workers, fostering leadership among YKPs, and strengthening partnerships for more inclusive and supportive healthcare services.

## TUPED316

Fostering resilience: a holistic approach to empowering HIV-positive teens and children (aged 8-14) through foster care, and community collaboration in Nakivale Refugee Settlement

C. Kamwiine<sup>1</sup>, J. Ssemanda<sup>2</sup>, N. Nabulumba<sup>1</sup>

<sup>1</sup>Alight International, General Protection, Kampala, Uganda, <sup>2</sup>Makerere University, Public Health, Kampala, Uganda

**Background:** Nakivale Refugee Settlement in Southwestern Uganda hosts over 171,000 refugees, with 15% comprising HIV-positive children aged 8 to 14. Alight's multi-faceted approach encompasses mental health support, legal aid, livelihood programs, and child protection. In 2019, recognizing the challenges faced by HIV-positive youth, Alight initiated a groundbreaking strategy, introducing foster care and community collaboration. This innovative approach aims to ensure adequate support and supervision for children between 8 to 14 years struggling with adherence to ARVs, empowering foster parents to play a pivotal role in promoting HIV awareness and fostering a supportive environment.

Through engaging foster parents as key influencers within the community, Alight seeks to create a ripple effect of positive change, addressing both the immediate health needs of PLHIV and contributing to a broader societal shift.

This intervention, conducted in collaboration with Village Health Teams (VHTs), aims to address the immediate needs of HIV-positive teens and children while enhancing their economic well-being.

The objectives include successful integration into supportive families, improved overall health through increasing ARV's adherence and well-being.

**Description:** The initiative strategically placed 80% of identified HIV-positive children into foster care, creating clusters of 20 homes linked to Village Health Teams (VHTs). VHTs played a pivotal role in achieving health-related objectives, providing medical care, adherence support, and counseling. Alight's supervisors monitored ARV adherence, while the livelihood training program saw 70% of foster families engage in income-generating activities, contributing to financial stability. Greenhouses at Isanja, Rubondo, and Basecamp exemplify the success of this comprehensive approach.

**Lessons learned:** Key insights include the effectiveness of tailored interventions, emphasizing community engagement's significance, and the importance of clear communication channels for health monitoring. Consistent oversight in medical interventions and the success of the livelihood program underscore the value of holistic approaches integrating health and economic empowerment.

**Conclusions/Next steps:** Alight aims to refine strategies for ARV adherence, continuously adapting to evolving needs. The initiative serves as a reference for interven-

tions in diverse refugee settings, emphasizing collaboration with local partners. This holistic empowerment model, extending to other settlements, calls for advocacy for policy change and knowledge sharing within the humanitarian community, contributing to the discourse on supporting vulnerable populations.

## TUPED317

Analysis of vulnerability to co-infections and co-morbidity of opportunistic infections from indoor air pollution amongst positive elderly persons in rural households in Kisumu County

N. Samba Omumbo Otieno<sup>1</sup>

<sup>1</sup>Youths for Sustainable Development, Head Office, Kisumu, Kenya

**Background:** The level of exposure to Bio-Mass Fuel (BMF) pollutants in rural poor households in developing Countries is 100 times greater than the UN recommended maximums. A normal healthy Elderly Persons aged above 60years in Kisumu County is twice more likely to contract ALRI while those above 75years are 4x more likely to suffer from COPD since majority spend a lot of time indoors. However, Elderly persons living with HIV are 5 to 10times more exposed to health effects of BMF-Household Air Pollution (BMF-HAP). The health effects of BMF-HAP may arise after just a single exposure and/or long or repeated exposure.

The short-term effects are treatable; however, the long term effects can be severely debilitating and/or fatal. BMF-HAP pollutants are involved in altering macro-phage function thus increasing vulnerability to active Pulmonary TB.

**Description:** We conducted a study over a period of 60months to investigate the general health effects of BMF-HAP on elderly persons aged above 60years living with HIV in poor rural households in Kisumu County when switching from the traditional BMF sources to simple low cost modern alternative energy Solutions. Special consideration was given to the households with persons aged above 75years. Analysis was done on all diseases but special emphasis was given to TB, ALRI, COPD and eye infections.

**Lessons learned:** Over 85% of the elderly persons aged 60 to 74years and 66% of those aged over 75years recorded reduced incidences of respiratory Tract infections within 30days. There was a 60% deceleration in the development of ALRI and 80% decelerated development of COPD within 6months. Over 95% experienced over 90% reduction in the short-term effects of BMF-HAP. There was 30% reduction in Pulmonary TB infection.

**Conclusions/Next steps:** Over 98% of rural poor households in developing countries use BMF daily thereby increasing the vulnerability to co-infection and co-morbidities. HIV infection and exposure to BMF-HAP is a dou-

ble tragedy to elderly persons in rural poor households. BMF-HAP kills over 1.5million people globally, 40% being Elderly persons. Reducing BMF-HAP is a new frontier and a viable HCBCS strategy that requires targeted funding to strengthen Community Leadership and Behaviour Change in the fight against HIV/AIDS & TB.

## TUPED318

Knowledge, attitudes, beliefs, and practices towards HIV/AIDS among adolescents and young adults in Western Kenya. Baseline results in the context of a drone-based differentiated service delivery initiative

P. Kremer<sup>1</sup>, C. Burton<sup>2</sup>, O. Lebed<sup>1</sup>, L.F. Garcia Espinal<sup>3</sup>, L. Hayden<sup>3</sup>, C. Wanjala<sup>4</sup>

<sup>1</sup>Zipline International, Global Health Impact Evaluation, South San Francisco, United States, <sup>2</sup>Zipline International, Global Health Partnerships, South San Francisco, United States, <sup>3</sup>Elton John AIDS Foundation, Grants, New York, United States, <sup>4</sup>Zipline International, Global Health Partnerships, Nairobi, Kenya

**Background:** HIV is a significant public health issue in Kenya, affecting around 4% of its population. Adolescents and young adults (AYA's) are particularly vulnerable, due to misinformation and lower ARVs adherence and retention, among other reasons. A Differentiated Service Delivery (DSD) of HIV commodities could enhance PrEP, PEP, and ARV adherence by addressing the needs of vulnerable groups, while reducing stigma associated with visiting health facilities.

This study, conducted in Kisumu County, Kenya, aimed to evaluate AYAs baseline Knowledge, Attitudes, Beliefs, and Practices (KABPs) towards HIV/AIDS, before the implementation of a DSD intervention that will use drones to deliver HIV commodities outside from the traditional health system.

**Methods:** The study employed quantitative surveys, qualitative interviews, and focus groups. A total of 1,415 individuals were surveyed (56% female, 43.5% male, 0.42% intersex), focusing on HIV-related KABPs. In-depth interviews and focus groups involved AYAs, healthcare workers, and community leaders. Thematic analysis was used for qualitative data, while quantitative data were analyzed using descriptive and inferential statistics.

**Results:** Results showed a high awareness of HIV, its transmission, and prevention. However, misconceptions persisted, such as belief in transmission through saliva. Only 26.7% of respondents understood the efficacy of ARVs in reducing transmission, indicating a need for education on the "treatment as prevention" model.

Condom use was limited (45.6 %) due to logistical issues, shortages, and costs. Anticipated stigma, including from neighbors, religious, and medical communities, was found to be a significant concern.

Many participants feared breach of confidentiality by medical staff, and shared stories of religious and cultural leaders viewing HIV as a curse or punishment. These factors potentially deter people from seeking HIV testing and affect ARV adherence and retention. Access to healthcare was also hindered by logistical challenges, transportation issues, drug shortages, and high costs.

**Conclusions:** The study highlights the potential of the DSD model in enhancing HIV/AIDS prevention and treatment in Kisumu County. It revealed multiple barriers to accessing HIV healthcare, such as stigma, mistrust in medical staff, logistical and financial constraints, and shortages of condoms and medication.

These findings are vital to understand HIV/AIDS dynamics in high-prevalence areas and could guide future intervention strategies.

## TUPED319

Examining trends and demographic variations in discriminatory attitudes towards people living with HIV: insights from 22 Sub-Saharan African countries

Y.A. Adebisi<sup>1,2</sup>, N.D. Jimoh<sup>1</sup>, I. Ogunkola<sup>1</sup>

<sup>1</sup>Global Health Focus Africa, Research Department, Abuja, Nigeria, <sup>2</sup>University of Glasgow, College of Social Science, Glasgow, United Kingdom

**Background:** Discriminatory attitudes towards people living with HIV can exacerbate the epidemic by hindering efforts in prevention and treatment. The aim of this study is to examine the patterns and demographic variations in these attitudes across Sub-Saharan Africa.

**Methods:** This study utilized a dataset from UNICEF's Multiple Indicator Cluster Surveys and other household surveys, conducted between 2014 and 2022, and published in July 2023, examining discriminatory attitudes towards people living with HIV. The indicator for discriminatory attitude measures the percentage of individuals aware of HIV who exhibit prejudice against HIV-positive people, determined through their responses to questions about interactions with such individuals.

The dataset spans 22 Sub-Saharan African countries, offering detailed demographic data (gender, age, residence, wealth, education) and uses descriptive statistics and inferential statistics (t-tests, Chi-square, ANOVA) to identify attitudinal differences across regions and demographics.

**Results:** In our analysis of individuals aged 15 to 49 years in Sub-Saharan Africa, we observed fluctuations in discriminatory attitudes towards people living with HIV over time. Notable differences were evident across countries, with Mauritania reporting the highest average levels of discriminatory attitudes at 85.2%, followed by Guinea at 81.8%, and Gambia at 79.4%. Significant variations were found in terms of residence, with rural areas reporting

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

higher average levels of discriminatory attitudes at 64.8% compared to urban areas at 52.7%, and the lowest in nomadic areas at 48.4% ( $p = 0.002$ ).

Additionally, significant differences were observed across wealth quintiles ( $p < 0.05$ ), where the highest average levels of discriminatory attitudes were noted in the poorest quintile at 69.5%.

Gender-based analysis showed no significant difference in levels of discriminatory attitudes between females (59.9%) and males (59.85%) ( $p = 0.993$ ). Regionally, higher average levels of discriminatory attitudes were found in West and Central Africa at 64.7%.

Furthermore, our analysis indicated that younger age groups and those with lower education levels generally reported higher levels of discriminatory attitudes ( $p < 0.05$ ).

**Conclusions:** These findings underscore the urgent need for continued initiatives to reduce discriminatory attitudes towards people living with HIV in Sub-Saharan Africa. Targeted interventions are needed in regions and demographic groups with particularly high levels of such attitudes.

## TUPED320

Unveiling complexities: a socio-ecological exploration of access and acceptability of HIV/AIDS treatment and care services for key populations - a qualitative case study in Pakistan

A. Naeem ul Haq<sup>1</sup>, A. Ali<sup>1</sup>, A. Hussain<sup>2</sup>, S. Azariah<sup>3</sup>,  
M. Sarfraz<sup>1</sup>

<sup>1</sup>Health Services Academy, Global Health, Islamabad, Pakistan, <sup>2</sup>Punjab AIDS Control Program, PACP, Lahore, Pakistan, <sup>3</sup>Progressive Development Institute, Barnet, United Kingdom

**Background:** Pakistan contends with a concentrated HIV epidemic; Key populations (KPs) such as men having sex with men (MSM), people who inject drugs (PWIDs), transgender populations (TG), and female sex workers (FSW) bear a disproportionate HIV burden. Round 6 of the Integrated Biological and Behavioural Surveillance (IBBS) recently covered 31 districts, to provide an improved understanding of the HIV landscape and allowing a comprehensive evaluation of HIV/AIDS prevalence and intervention effectiveness. This study employed formative research methods within the IBBS framework to explore socio-ecological factors influencing access to and acceptability of HIV/AIDS treatment and care services (HACTS).

**Methods:** This qualitative study within the socio-ecological framework explored HIV service utilization in Pakistan. In-depth interviews with key populations at HATCS aimed to reveal lived experiences, barriers, and challenges for a nuanced understanding of healthcare access dynamics among People Living with HIV. Data analysis employed the Framework analysis method.

**Results:** A total of 111 interviews were conducted with PLHIVs from key populations at public sector HATCS. The distribution included 33% transgender individuals, 13% FSWs, 36% MSM, and 18% PWIDs.

Factors influencing access and acceptability of HACTS were categorized across four socio-ecological units: individual (awareness, experiences, expectations, income, employment, family, HIV disclosure, and side effects of medicines), interpersonal (care and support, stigma, discrimination, and side effects of treatment), organizational (interactions with care providers, availability, confidentiality, quality, distance, affordability, logistics, follow-up, and service administration), and systemic (treatment and welfare support/financing, service standards, and regulations). Gendered discrimination emerged within interpersonal factors, affecting access and acceptability, notably for transgender individuals and FSWs.

**Conclusions:** The socio-ecological perspective provides a valuable framework to assess multilevel factors influencing access and acceptability of HIV/AIDS treatment and care services.

Findings indicate the necessity for enhanced client-provider interactions, staff training, logistics supply, and community education. Access to HATCS is closely tied to social support and financial resources, requiring short and long-term plans for individuals from low socioeconomic strata.

The study emphasizes importance of integrating the socio-ecological framework into program planning, targeting clients, communities, health systems, and policy levels to improve access and acceptability of HIV/AIDS treatment and care services.

## TUPED321

Low bone mineral density in PLHIV and its correlation with bone health quality of life, an observational study conducted by treatment adherence advocacy and literacy, TAAL+ community pharmacy, peer-led intervention

M. Pardeshi<sup>1</sup>

<sup>1</sup>TAAL+ Community Pharmacy, Management, Pune, India

**Background:** In India, the Antiretroviral Therapy (ART) Program was launched in 2004, with over 14.6 lakhs People Living with HIV (PLHIV) on treatment. TAAL is a community-based pharmacy serving PLHIV participants for ART from both the private and government sectors ( $n=1859$  on ART till Feb 22).

HIV treatment is lifelong, and research has shown that HIV infection may accelerate the aging process, leading to complications typically associated with aging occurring at younger ages in PLHIV.

Integrating bone health and noncommunicable disease management into the care of PLHIV can lead to improved treatment outcomes.

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

**Description:** TAAL Pharmacy initiated a small study involving DEXA scans to assess the Bone Mineral Density in a total of 160 participants, with 80 (50%) being PLHIVs and 80 (50%) non-PLHIVs.

**Lessons learned:** In the general population, out of 80 participants, 44 (55%) were found to be osteopenic, while among PLHIVs, out of 80 participants, 58 (72%) were found to be osteopenic. In the general population, 56 (70%) participants were found to be either osteopenic or osteoporotic, compared to PLHIVs, where 71 (88%) participants fell into these categories.

Among participants aged 20-40 years, 25 (31%) in the general population were osteopenic, whereas among PLHIVs, 31 (38%) were osteopenic. This indicates that PLHIVs are more susceptible to osteopenia.

**Conclusions/Next steps:** PLHIVs are at a higher risk of developing osteopenia and osteoporosis, indicating the need for additional supplementation.

**Conclusion:** In addition to ART, the inclusion of calcium and vitamin D3 supplementation should be considered as part of the treatment regimen to prevent osteopenia and osteoporosis in PLHIVs.

## TUPED322

The influence and impact of creativity in the Wakakosha (Your'e Worth It) intervention for self-stigma among young people with HIV in Harare, Zimbabwe

L. Heniff<sup>1</sup>, N. Ferris France<sup>2</sup>, W. Mavhu<sup>3</sup>, M. Ramadan<sup>4</sup>, O. Nyamwanza<sup>3</sup>, M. Chinembiri<sup>5</sup>, E. Crehan<sup>6</sup>, N. Willis<sup>7</sup>, D. Ní Cheallaigh<sup>2</sup>, E. Gwenz<sup>7</sup>, A. Nolan<sup>4</sup>, E. Byrne<sup>8</sup>

<sup>1</sup>Trinity College Dublin, Dublin, Ireland, <sup>2</sup>Beyond Stigma, Dublin, Ireland, <sup>3</sup>CeSHHAR, Harare, Zimbabwe, <sup>4</sup>Trinity College Dublin, Centre for Global Health, Dublin, Ireland, <sup>5</sup>Beyond Stigma, Harare, Zimbabwe, <sup>6</sup>Speak Up Sing Out, Meath, Ireland, <sup>7</sup>Zvandiri, Harare, Zimbabwe, <sup>8</sup>Royal College of Surgeons in Ireland, Dublin, Ireland

**Background:** The integration of creativity into interventions directed at health and well-being is growing with increasing evidence on how the arts can elicit stigma reduction. Many research projects evaluate arts-based approaches, but few specifically examine creativity.

This study focuses on the influence and impact of creativity in an intervention to move young people living with HIV from positions of self-stigma to self-worth.

**Methods:** The Wakakosha self-stigma intervention - a 16 session group therapy intervention using inquiry-based stress reduction integrated with creative activities - was conducted among 60 (n=30 female) young people (ages 18-24) living with HIV in Zimbabwe in 2022. The impact of the programme is published elsewhere.

This study involved the examination of that same data but looking specifically at creativity and its influence and impact on the participants. The anonymised transcripts

of three focus groups and twelve interviews, the creative products and outcomes were inductively thematically analysed using NVivo.

**Results:** Wakakosha's integration of creative expression created several opportunities where participants were able to express and release emotions within the process of shifting negative personal beliefs.

Overall, the intervention transferred a set of practical skills on self-inquiry, mindfulness, meditation and creativity that continued to be used in participants' daily lives. Creativity saturated the Wakakosha intervention through modalities such as music, dance, letters to the body, drawing, colouring, poetry and body mapping. The creativity in the programme engaged participants and gave them a space in which to shift their self-stigmatising beliefs.

Four major themes on the influence and impact of creativity in the intervention emerged: Acceptance and Forgiveness, Emotional Regulation, Self-Empowerment and Self-Worth, and Reminder of Messaging or New Skills.

Our findings align with the literature on creativity and the arts aligns with our findings that creative activities can enhance the therapeutic environment and associated participant experience.

**Conclusions:** Creativity contributed to the self-stigma reduction process and improved overall participant experience. The creativity in the programme gave participants new skills with which to remind themselves of the lessons of the programme as well as regulating distress when it arose. This project provided promising insight into the potential of creativity in counteracting self-stigma.

## TUPED323

WILLOW: enhancing self-efficacy, health literacy and resiliency among HIV-positive African Caribbean and Black women through peer-led support groups in Toronto, Canada

I. Wanyoto<sup>1</sup>, M. Bagaya<sup>1</sup>

<sup>1</sup>Women's Health in Women's Hands Community Health Centre, Research, Toronto, Canada

**Background:** African, Caribbean and Black women (ACB) have a 60-fold higher risk of HIV than women of other racial and ethnic identities despite making up only 3% of the female population in Canada. Addition to the physical effects of the disease, ACB HIV positive women also face multiple layers of oppression and marginalization.

Peer-led approaches are effective in increasing HIV prevention uptake among hard-to-reach and vulnerable populations with high HIV prevalence.

**Description:** In response to these concerns, the WILLOW project was developed to enhance self-efficacy, health literacy, and resiliency among HIV-positive ACB womxn through peer-led support groups. This is a community-based program that aims to empower womxn living

with HIV by providing a safe and supportive space for them to share their experiences, learn from one another, and build a sense of community. The program is grounded in the understanding that peer support can be a powerful tool in promoting health and well-being.

Through the WILLOW program, womxn living with HIV are able to develop self-efficacy, or the belief in their ability to manage their health and make positive changes in their lives. This is achieved through a series of workshops and activities focused on topics such as medication adherence, self-care, and healthy coping strategies.

**Lessons learned:** Through the support groups, participants have been able to access reliable information and learn how to critically evaluate health information, thus empowering them to take control of their health and make informed decisions. The WILLOW program has been built resiliency among HIV-positive African Caribbean and Black womxn. By fostering a sense of community and providing a safe and non-judgmental space, the WILLOW program has helped participants build resilience and develop coping strategies to overcome these challenges.

**Conclusions/Next steps:** WILLOW project is a crucial step towards addressing the unique needs of HIV-positive ACB womxn. By enhancing self-efficacy, health literacy, and resiliency through peer-led support groups, this program aims to improve the overall well-being of womxn living with HIV and ultimately contribute to reducing health disparities within these communities.

This program has the potential to make a significant impact and create a more supportive and empowered community for HIV-positive racialised womxn.

## TUPED324

Drama and psycho-educational support intervention reduced HIV stigma among sexual and gender minority migrants affected by HIV

E. Kanon<sup>1</sup>, E. Olsson<sup>1</sup>, A. Campastro<sup>1</sup>, K. Westerlund<sup>1</sup>  
<sup>1</sup>Noaks Ark Stockholm (NGO), Stockholm, Sweden

**Background:** During 2023 the project Be You! explored the use of drama and creativity for stigma reductive group interventions among sexual and gender minority migrants affected by HIV. This group is disproportionately affected by HIV, bearing a high burden of intersectional stigma and structural inequality.

**Description:** The Be You! project was created from ideas and feedback from the target group (sexual and gender minority migrants affected by HIV). The participants were active through the whole process together with three leaders (one in drama and two in psychology and social work).

The project involved 12 participants and reached more than 700 people. A multilingual work process was adapted combining Swedish, English and Spanish. The activities within Be You! were structured in a process-based ap-

proach through peer- and professional support (CBT and ACT approach). Creative activities with photography, storytelling, embodiment, drama and singing were altered with therapeutic and psycho-educative sessions around self-worth, stigma, triggers, identity and empowerment, with additional individual support for those needed.

**Lessons learned:** The interventions were evaluated through different tools such as open group evaluations, CSQ-8 (Client Satisfactory Questionnaire) and the 12-item HIV stigma scale. The results from the CSQ-8 showed a positive result in all questions asked.

For example, all the respondents thought that the interventions responded to their needs, would recommend the intervention to a friend, and that the intervention has helped them to better cope with their problem.

Results from the 12-item stigma scale concluded a reduction in HIV stigma by 3,5 points (scoring 26 out of 48 in entry of intervention and 22,5 points of 48 at the end of intervention). This quote from one participant marks its effect; "Being part of this project makes me feel that I can celebrate my existence".

**Conclusions/Next steps:** The success of this project is an important reminder of how vital it is to combine professional and peer lead support with creativity to make way for individual and collective empowerment and stigma reduction. The dual function of presenting, or exposing, the participants stories to their community was expressed as a somewhat scary but empowering process in terms of de-attaching stigma and improving self-worth.

## TUPED325

Life mapping through citizen journalism: exploring and documenting the lived experience of recipients of care with treatment literacy gaps

R. Zolowere<sup>1</sup>, K. Zokwana<sup>1</sup>, J. Harries<sup>2</sup>, L. Donald<sup>1</sup>, J. Bozinovski<sup>1</sup>, K. Lauer<sup>1</sup>, S. Baptise<sup>1</sup>

<sup>1</sup>International Treatment Preparedness Coalition ITPC, Watch What Matter Pillar, Johannesburg, South Africa,

<sup>2</sup>University of Cape Town, Center for Social Science Research, Cape Town, South Africa

**Background:** "Life Mapping" is a form of citizen journalism that aims to document the lived experiences and perspectives of people affected by HIV. "Life Maps" is a collaborative and participatory research methodology utilizing digital storytelling to document peoples' daily lives within the context of HIV. It aims to empower, advocate, and improve healthcare outcomes by moving from models of "data extraction" to "data democracy".

A key area that impedes access to HIV services is treatment literacy and this research project intends to highlight this barrier.

**Methods:** Citizen Science Life Maps is a qualitative longitudinal research study that uses digital smart phones to collect data on (among other topics) gaps in treatment

literacy. This project has 39 participants; 19 in South Africa and 20 Malawi that were recruited from 2022 to 2024. Data is collected in form of written text messages, voice notes, photographs and videos. The data collection process is informed by a qualitative guide and analyzed using thematic analysis approach.

This abstract reports on themes of treatment literacy and present data on Undetectable = Untransmissible (U=U) and sources of HIV information.

**Results:** Many participants reported obtaining their HIV information through social media, radio, and less from their health workers. Half the South African participants especially young people had little knowledge of U=U. Almost all participants had never seen a U=U poster in a public or private health facility.

The majority of participants had heard of Pre-exposure prophylaxis (PrEP); most reported learning about PrEP through non-governmental organizations, rather than from health care workers in their health facilities.

The data collection process itself was an educational opportunity for participants, as identifying gaps in knowledge about U=U and PrEP led to curiosity and research about the science and evidence of HIV treatment.

**Conclusions:** This project highlights the gap in treatment literacy among people affected by HIV, the key demographic that should be most knowledgeable about HIV prevention, treatment and care. Much investment is needed in these communities regarding treatment education. Citizen journalists and other community monitors provide a logical entry point for peer education about HIV prevention, treatment and care modalities and innovations moving forward.

## TUPED326

Dialogue and joint actions between religious leaders and people living with HIV to eradicate stigma and discrimination. The case of Uganda and Nigeria

G.V. Ross Quiroga<sup>1</sup>, B. Ajonye<sup>2</sup>, F. Merico<sup>3</sup>, T. Adeleye<sup>4</sup>

<sup>1</sup>World Council of Churches, HIV, Reproductive Health & Other Pandemics, Geneva, Switzerland, <sup>2</sup>International Community of Women Living with HIV, ICW East Africa, Kampala, Uganda, <sup>3</sup>UNAIDS-PEPFAR Faith Initiative, HIV, Geneva, Switzerland, <sup>4</sup>AIDS Health Care Foundation (AHF), Prevention, Abuja, Nigeria

**Background:** Stigma and discrimination are major barriers to HIV prevention, testing, treatment and adherence. The 2021 Stigma Index Survey reported HIV related stigma at 20% and 22% in Nigeria and Uganda respectively. AYPs and Key-populations are disproportionately affected, heightened by existing laws and policies.

In response, the UNAIDS – PEPFAR Faith Initiative, in collaboration with the World Council of Churches (WCC), the Global Network of People Living with HIV (GNP+), and the

International Network of Religious Leaders Living with or Personally Affected by HIV (INERELA+) implemented the Framework for Dialogue (FfD). FfD seeks to foster sustained partnerships between religious leaders and networks of PLHIV to eradicate stigma and discrimination.

**Description:** In 2023, FfD was implemented in Uganda and Nigeria, engaging diverse participants, including communities living with HIV, civil society groups, government representatives, key populations, and religious leaders from Christian and Muslim communities. Facilitated by WCC and UNAIDS, FfD emphasized principles such as country ownership, evidence-based strategies, people-centered approaches, equal and meaningful participation, innovation, action orientation, safe spaces, and doing no harm. The FfD engaged and re-engaged communities and faith leaders.

### Lessons learned:

- In Uganda, where an Anti Homosexuality Act had recently passed, the FfD provided a safe space for healing, allowing community organizations to voice their concerns and address threats to supporting LGBTQ+ causes.
- In Nigeria, joint actions emerged from the dialogue, galvanizing the implementation of two scalable activities addressing HIV self-stigma among young people and building capacity of young women living with HIV.
- In both Uganda and Nigeria, stigma related policies exist; however, design, planning, implementation, monitoring, and evaluation of context-specific stigma reduction programs need to be strengthened.
- The FfD facilitated the creation of shared understanding, collaborative approaches to overcome HIV stigma and discrimination, follow-up and sustained dialogue particularly among women and young people living with HIV.

**Conclusions/Next steps:** The FfD proved effective in analyzing evidence, fostering dialogue, and promoting joint actions against HIV stigma and discrimination. Ongoing dialogue is crucial for sustaining these efforts.

Global and local actors should continue to provide platforms for evidence-based discussions, encouraging and funding joint actions between religious leaders and communities affected by HIV in order to influence policy change.

## TUPED327

### Prioritising issues for intervention to improve the health-related quality of life of people with HIV: a network analysis

M.J. Fuster-Ruiz de Apodaca<sup>1</sup>, R. Izquierdo<sup>2</sup>, C. Iniesta<sup>1</sup>,

T.M. White<sup>3</sup>, C. Prats-Silvestre<sup>1</sup>, J.V. Lazarus<sup>3</sup>, I. Jarrín<sup>2</sup>

<sup>1</sup>SEISIDA, Madrid, Spain, <sup>2</sup>National Center of Epidemiology,

Instituto de Salud Carlos III, Madrid, Spain, <sup>3</sup>ISGlobal,

Barcelona, Spain

**Background:** Signs impacting the health-related quality of life (HRQoL) in people with HIV (PHIV) are often overlooked. To address this, our team created the clinic screening tool CST-HIV, assessing eight key HRQoL issues: anticipated stigma, psychological distress, sexuality, social support, material deprivation, sleep and fatigue, cognitive problems, and physical symptoms.

We aimed to analyze the associations between the dimensions of CST-HIV through network analysis, identifying central aspects to prioritize interventions, addressing the underdiagnosis of critical symptoms by healthcare professionals.

**Methods:** Between 2021 and 2023, we carried out a cross-sectional study within the Spanish CoRIS cohort. We designed a mobile app to collect information on sociodemographic and health data, the CST-HIV and the WHOQOL-HIV-BREF to measure HRQoL. We conducted a weighted and undirected network analysis using the EBICGlasso estimator with the JASP program.

**Results:** Of 347 PHIV from 17 centres included in the study, 92.4% were men, 72.6% homosexual men and the mean age was 43.4 (SD:10.6) years. CST-HIV dimension with higher scores was stigma, then by sleep and fatigue. Sexuality and psychological distress also exceeded the mean range of responses. The dimensions that had the most connections (strength centrality) in the network were psychological distress, then sleep and fatigue, then the cognitive dimension. When considering closeness centrality, psychological distress, cognitive problems, sleep and fatigue, and social support were the closest dimensions. Regarding betweenness centrality, psychological distress, cognitive problems, and social support were found to be the most interrelated (Figure 1).

Figure 1. Network analysis of the eight dimensions of the CST-HIV.

**Conclusions:** Focusing on central nodes, especially psychological distress, enhances the likelihood of addressing issues measured by CST-HIV dimensions, thereby improving HRQoL.

However, for effective clinical use, analyzing interrelationships among problems in HIV cohorts is recommended to tailor interventions based on diverse contexts and profiles of PHIV.

## TUPED328

### "A tool to be okay": experiences of and attitudes towards starting antiretroviral therapy amongst people with recently acquired HIV in Greece, Spain and the UK

<sup>11</sup>Mortimer Market Centre, Central and North West London

NHS Foundation Trust, London, United Kingdom

**Background:** The twelve months following HIV acquisition (henceforth termed recent acquisition) is a time when people may experience debilitating symptoms and are potentially at heightened risk of HIV transmission. Most national guidelines recommend rapid initiation of antiretroviral therapy (ART) for those with recently acquired HIV. However, little is known about attitudes to and experiences of rapid initiation of ART among those with recently acquired HIV.

**Methods:** We conducted 23 semi-structured interviews (SSIs) with individuals from Greece, Spain and UK who had recently acquired HIV (HIV-negative to HIV-positive  $\leq 1$  year or other laboratory evidence of seroconversion) as part of CASCADE, an international longitudinal mixed-methods study of recently acquired HIV. Interview data were summarised and synthesised across countries using Rapid Assessment Procedures and analysed thematically.

**Results:** Of 23 participants, 21 were cis-gender men and 2 cis-gender women. Most initiated ART soon after diagnosis, describing themselves as ready or excited about starting treatment. Key motivations were restoration of health, becoming virally suppressed, returning to normalcy and regaining control over one's health. Some participants expressed concerns, primarily about long-term side-effects (particularly hepatic and renal toxicity),

the lifelong nature of treatment and adherence; a small number were uncertain about efficacy. However, despite these concerns, the majority reported good adherence with some seeking out aids such as dosette boxes and reminders.

Support was integral to feeling ready to start ART and maintaining adherence, with participants describing their HIV clinical team, friends and peer mentors as key.

**Conclusions:** Our data show that people with recently acquired HIV who are linked to care are highly motivated to start ART, with concerns largely outweighed by the desire to return to health and to achieve virological suppression. Commonly reported concerns included long-term side-effects and efficacy.

Healthcare providers and others supporting people with recently acquired HIV should proactively address such concerns when initiating ART in order to reduce medication-related anxiety and to maximise adherence.

## TUPED329

HIV and gender identity stigma, health-related quality of life, mental health and substance use in transgender women (TGW) with HIV: two years follow up analysis in the TransCITAR cohort

E. Frontini<sup>1</sup>, R. Caballero<sup>1,2</sup>, E. Panizoni<sup>1</sup>, M.C. Trejo<sup>1</sup>, C. Serrao<sup>1</sup>, A.C. Zeltman<sup>1</sup>, R. Acuña<sup>1</sup>, N. Doudchitsky<sup>1</sup>, P.D. Radusky<sup>1,2</sup>, N. Cardozo<sup>1,3,4</sup>, M. Duarte<sup>1,4</sup>, S. Fabian<sup>1,5</sup>, A. Exner<sup>1</sup>, B. Brunori<sup>1</sup>, C. Pérez<sup>1</sup>, V. Zalazar<sup>1</sup>, M.I. Figueroa<sup>1</sup>, I. Aristegui<sup>1</sup>, TransCITAR Study Group

<sup>1</sup>Fundacion Huesped, Research Department, Ciudad Autonoma de Buenos Aires, Argentina, <sup>2</sup>Universidad de Buenos Aires, Ciudad Autonoma de Buenos Aires, Argentina, <sup>3</sup>REDLACTRANS, Ciudad Autónoma de Buenos Aires, Argentina, <sup>4</sup>Asociación de Travestis, Transexuales y Transgéneros de Argentina (A.T.T.A.), Ciudad Autonoma de Buenos Aires, Argentina, <sup>5</sup>Asociación Civil Gondolin, Ciudad Autonoma de Buenos Aires, Argentina

**Background:** TransCITAR is a prospective cohort study of 500 transgender and non-binary individuals from Buenos Aires, Argentina. This work examined changes from baseline to follow-up (12-months and 24-months) in HIV-related stigma, gender identity stigma, health-related quality of life, mental health and substance use in a subsample of transgender women (TGW) with HIV.

**Methods:** From September/2019 to December/2023, 175 TGW with HIV attended a gender-affirming healthcare service and completed questionnaires at baseline, 12 and 24 months follow-up to assess HIV status, HIV-related stigma (Berger's Scale, 4 dimensions: personalized stigma [PS], disclosure concerns [DC], negative self-image [NSI], and concern with public attitudes toward people with HIV [CPA]); gender identity stigma (GIS); health-related quality of life (HRQoL, SF-36, 2 component summaries:

mental and physical), depression (CES-D); alcohol use (AUDIT); and substance use and possible dependence (DAST-10). Repeated measures ANOVA was used.

**Results:** The median age was 31 years (IQR=27-38). Across the three timepoints, a significant reduction in total HIV-related stigma ( $F=420.84(1.78)$ ,  $p=.000$ ,  $n2=.88$ ), and in GIS ( $F=37.11(1.90)$ ,  $p=.000$ ,  $n2=.38$ ) was observed. All dimensions of HIV-related stigma significantly decreased.

Global HRQoL ( $F=22.12(2)$ ,  $p=.000$ ,  $n2=.22$ ) increased significantly between months 12 and 24 compared to baseline. Particularly, the Physical component summary ( $F=3.80(2)$ ,  $p=.025$ ,  $n2=.06$ ) significantly increased from baseline to month 24. No significant differences were found in the mental component summary of HRQoL, depression, alcohol use and substance use.

**Conclusions:** Access to HIV care in a gender-affirming service, supported by a peer navigator team, may have enhanced self-acceptance concerning HIV status and gender identity, leading to improved personal resources to cope with stigmatizing situations. Such support by peers and enhanced access to healthcare could have contributed to a general improvement in HRQoL, particularly in physical health. It is crucial to implement comprehensive strategies to address substance use and mental health indicators in this group.

## TUPED330

Detectable HIV-RNA and curable STI prevalence among Ugandan men living with HIV who are planning to have a child

L.T. Matthews<sup>1</sup>, M. Owembabazi<sup>2</sup>, T. Wood<sup>1</sup>, P. Chitneni<sup>3</sup>, M.C. Pratt<sup>1</sup>, P.M. Smith<sup>1</sup>, D.M. Long<sup>4</sup>, A. Kaida<sup>5</sup>, J.M. Turan<sup>1</sup>, E.C. Atukunda<sup>2</sup>

<sup>1</sup>University of Alabama at Birmingham, Birmingham, United States, <sup>2</sup>Mbarara University of Science and Technology, Mbarara, Uganda, <sup>3</sup>Brigham and Women's Hospital, Boston, United States, <sup>4</sup>Wake Forest University, Wake Forest, United States, <sup>5</sup>Simon Fraser University, Burnaby, Canada

**Background:** Many men with HIV (MWH) want to have children. We hypothesized that unmet reproductive goals contribute to men prioritizing behaviors favoring conception (e.g., additional sexual partners, condomless sex) over HIV and STI prevention. We evaluated whether men with unmet versus met reproductive goals were more likely to have detectable HIV-RNA or prevalent STI.

**Methods:** We recruited MWH from an HIV clinic in southwestern Uganda. Half had "met" reproductive goals, defined as fathering a child in the last two years. Half had "unmet" reproductive goals, defined as not fathering a child in the last two years.

All reported ongoing condomless sex with intent to conceive a child. Men completed a questionnaire to assess demographics, sexual, and health behaviors. HIV-RNA

Late-breaker  
abstracts

Author  
Index

(blood) and *Neisseria gonorrhea*, *Chlamydia trachomatis* (urine) were measured via GeneXpert. Syphilis was assessed via rapid immunochromatographic testing, confirmed by RPR.

We conducted multivariable logistic regression to assess whether unmet reproductive goals were associated with detectable HIV-RNA or curable STI.

**Results:** 100 MWH enrolled, 50 with and 50 without unmet reproductive goals. Median age was 41 (range 24-68) years. Twenty-two (22%) reported 2 or more sexual partners in the last month and most 62% reported no condom use. Most (88%) knew their pregnancy partner's HIV-serostatus; 35% reported a partner without HIV.

Among all men, 17% had detectable HIV-RNA and 30% had a curable STI. In models adjusted for age and education having unmet reproductive goals was not associated with detected HIV-RNA (aOR 0.79, 95% CI 0.14-4.57) or STI (aOR 1.02, 95% CI 0.39-2.65).

	Overall, N=100	Unmet Reproductive Goals, N=50	Fulfilled Reproductive Goals, N=50
Age, years (Median, range)	41 (24-68)	44 (28-68)	37.5 (24-61)
Education, primary or less (N,%)	43 (43%)	22 (44%)	21 (42%)
Partner serostatus, (N,%)			
With HIV	56 (56%)	30 (60%)	26 (52%)
Without HIV	30 (30%)	14 (28%)	16 (32%)
Unknown	11 (11%)	5 (10%)	6 (12%)
Curable STI, (N,%)	30 (30%)	14 (28%)	16 (32%)
Ng	8 (8%)	6 (12%)	2 (4%)
CT	5 (5%)	2 (4%)	3 (6%)
Syphilis	20 (20%)	8 (16%)	12 (24%)
HIV-RNA detected, (N,%)	17 (17%)	8 (16%)	9 (18%)
HIV-RNA > 200 copies/mL	7 (7%)	3 (6%)	4 (8%)

Table. Characteristics, HIV-RNA, and STI prevalence among men with & without unmet reproductive goals, living w/HIV, and planning for partner pregnancy in Uganda.

**Conclusions:** Our hypothesis that men with unmet reproductive goals may have greater odds of viremia or STIs was rejected. MWH continue to have detectable HIV-RNA and high STI prevalence, compromising their own health and creating risk for sexual partners. Engaging MWH who want children in STI care and adherence support is important to promote their health and address HIV incidence among women of reproductive age.

## TUPED331

### Factors influencing HIV treatment preferences for pills, injectables, and future 6-month modalities in people with HIV in the United States

B. Uhrig Castonguay<sup>1</sup>, C. Ruiz<sup>2</sup>, C. Barrington<sup>2</sup>, D. Wohl<sup>3</sup>, D. Kerrigan<sup>1</sup>

<sup>1</sup>Milken Institute School of Public Health, George Washington University, Prevention and Community Health, Washington, United States, <sup>2</sup>Gillings School of Global Public Health at The University of North Carolina, Chapel Hill, Health Behavior, Chapel Hill, United States, <sup>3</sup>University of North Carolina at Chapel Hill, School of Medicine, Chapel Hill, United States

**Background:** As long-acting injectable antiretroviral therapies (LA-ART) offer people with HIV (PWH) treatment options beyond daily pill regimens, there is a need to understand preferences for distinct treatment modalities. We assessed factors associated with HIV treatment preferences among PWH.

**Methods:** We surveyed 798 PWH at 3 clinics in the United States (Chapel Hill, NC; Boston, MA; San Diego, CA) from June 2022 to March 2023.

Our primary outcome was HIV treatment preference for pills (daily, weekly, or monthly), LA-ART (injected therapy every 1 or 2 months), or a future 6-month injected modality. Using multinomial regression, we examined the association between socio-demographic, psychosocial (fear of needles and perceived HIV pill burden) and logistical aspects of HIV treatment (appointment frequency) on treatment preferences.

**Results:** 81% of participants identified as cisgender male with 43% White, 33% Black, and 16% Hispanic. Mean age was 52 years. 81% did not feel burdened by their HIV pill regimen; 62% did not fear needles, and 49% attended HIV care appointments  $\geq 3$  times/year. Using pills as the reference category, participants replying "yes" to HIV pill burden were over twice as likely (RRR= 2.26,  $p < 0.01$ ) to prefer LA-ART and over 2.5 times as likely (RRR= 2.65,  $p < 0.01$ ) to prefer the 6-month LA-ART option. As fear of needles increased, preference for LA-ART and 6-month options decreased (RRR= 0.16,  $p < 0.01$  and RRR= 0.30,  $p < 0.01$ , respectively).

Participants with  $\geq 3$  clinic visits/year were 3 times more likely than those with 0-1 visits/year to prefer LA-ART (RRR=3.66,  $p < 0.05$ ) and twice as likely to prefer the 6-month option (RRR=2.11,  $p < 0.10$ ).

Participants in the oldest tercile ( $\geq 58$ ) were half as likely as the youngest (19-47) to prefer LA-ART (RRR=0.43,  $p \leq 0.01$ ) and less likely to prefer the 6-month option (RRR=0.34,  $p < 0.001$ ). Black respondents were less likely vs white respondents to prefer 6-month option (RRR=.55,  $p < 0.01$ ).

**Conclusions:** Socio-demographic, psychosocial, and logistical factors influence HIV treatment decisions. Respondents who were older, Black, or expressed needle fear preferred pills, whereas younger respondents, those

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

who reported HIV pill burden, and more clinic visits preferred LA-ART modalities. Findings highlight the need to consider multiple factors to support shared therapeutic decision-making between PWH and their providers.

## TUPED332

HIV-related stigma and social isolation among people living with HIV in China: the mediating role of family adaptability and cohesion

H. Chen<sup>1</sup>

<sup>1</sup>Sichuan University, West China Hospital, School of Nursing, Chengdu, China

**Background:** People living with HIV are prone to mental health problems, especially, social isolation. However, evidence indicates that HIV-related stigma is a significant risk factor. On the other hand, family adaptability and cohesion play important supportive roles in the response to physiological and psychological stress, among people living with HIV, and has a significant impact on their social isolation.

Therefore, this study explored potential mechanisms between HIV-related stigma and social isolation, specifically whether family adaptability and cohesion moderate the relationship.

**Methods:** A cross-sectional descriptive correlational exploratory research design was used to conduct the study. Data were collected from 294 people living with HIV recruited from two HIV-designated hospital or Disease Control Centers in Sichuan, China using three instruments, namely, the HIV Stigma Scale, General Alienation Scale, and Family Adaptability and Cohesion Scale.

We used descriptive statistics, inferential statistics as well as structured equation modeling (SEM).

Figure. Final model with standardized coefficients \* $p < 0.001$

**Results:** The participants' average scores were  $41.46 \pm 7.52$  on social isolation,  $34.55 \pm 6.74$  on HIV-related stigma, and  $102.11 \pm 20.26$  on family adaptability and cohesion. The findings demonstrated a significant positive association between HIV-related stigma and social isolation ( $\beta = 0.36$ ,  $t = -4.99$ ,  $p < 0.001$ ).

Moreover, there was a negative and significant correlation between HIV-related stigma and family adaptability and cohesion ( $\beta = -0.34$ ,  $t = -5.04$ ,  $p < 0.001$ ). Path analysis revealed a significant negative effect between family adaptability and cohesion and social isolation ( $\beta = -0.52$ ,

$t = -7.78$ ,  $p < 0.001$ ). The results of mediation revealed that the indirect effect of HIV-related stigma on social isolation through family adaptability and cohesion was statistically significant; suggesting that family adaptability and cohesion partially mediated this relationship.

**Conclusions:** Family adaptability and cohesion mediated the association between HIV-related stigma and social isolation.

Thus, we should strive to reduce stigma faced by people living with HIV and strengthen the connection between people living with HIV and their families, thereby promoting their social integration, and reducing social isolation.

## TUPED333

Exploring health provider knowledge of the Undetectable equals Untransmissible (U=U) concept in Central America

M.I. Castañeda Aragón<sup>1</sup>, F. Castillo<sup>2</sup>, C. Guzmán<sup>2</sup>, D. Nelson<sup>3</sup>, E. Tumbaré<sup>3</sup>, A. Fitzgerald<sup>3</sup>, D. Dobrowolski<sup>3</sup>, G. Meléndez<sup>4</sup>, D. Muralles<sup>4</sup>

<sup>1</sup>IntraHealth International, Guatemala, Guatemala City, Guatemala, <sup>2</sup>IntraHealth International, Guatemala de la Asunción, Guatemala, <sup>3</sup>IntraHealth, North Carolina, United States, <sup>4</sup>USAID-Guatemala, Guatemala City, Guatemala

**Background:** The USAID HIV Care and Treatment Project, led by IntraHealth International, provides technical assistance to 36 HIV clinics in Central America to achieve the 95-95-95 goals. Regarding the third 95, in Q3FY23 project-supported clinics in the region reached 94.72% viral load suppression.

The region is therefore at a key moment to reinforce the Undetectable = Untransmittable (U=U) concept. Knowing that suppressed is not the same as undetectable, the project wanted to evaluate knowledge about this concept.

**Description:** In 2023, the project carried out an exploratory survey on U=U among project-supported health workers at HIV clinics, to identify gaps in their knowledge, attitudes, and perceptions. A multidisciplinary team designed the survey based on WHO guidelines and literature on U=U.

It included open-ended questions about the meaning of U=U and participants' opinions on it, and closed questions about key definitions like untransmittable, undetectable, and use of barrier methods according to viral load values. 123 participants from different professional backgrounds (medical doctors, nurses, psychologists, social workers) answered the online survey. The team analyzed responses to identify recurring themes.

**Lessons learned:** Findings showed around 30% of participants mentioned U=U as an important message that benefits adherence and clients' quality of life and leads to reduction in HIV transmission. However, there is confusion between the definitions of viral load suppression,

undetectable, and untransmittable. For instance, 49% of participants answered that only people with an undetectable viral load do not transmit HIV.

**Conclusions/Next steps:** The survey showed the importance of training and sensitizing all health personnel in the timely and correct dissemination of the U=U concept.

Literature shows that clients with viral load values between 1,000 and 50 copies/ml do not transmit HIV; however, these values represent the risk to develop future virological failures, stressing the importance of reinforcing adherence and aiming towards an undetectable viral load. It is crucial that providers use simple language and visual materials when explaining these concepts.

Providers should also keep transmitting STIs prevention messages, such as the use of barrier methods, regardless of the client's viral load value.

## TUPED334

**"A photo is not enough": Limitations of telemedicine based on qualitative analysis of interviews with people living with HIV using this strategy in the public health system of Buenos Aires**

T. Kierszenowicz<sup>1</sup>, M. Bullo<sup>2</sup>, M.C. Acosta<sup>3</sup>, M.J. Rolon<sup>3</sup>, G. Oshiro<sup>3</sup>, D. Cecchini<sup>4</sup>, C.G. Rodriguez<sup>4</sup>, P.G. Scapellato<sup>5</sup>, E. Bottaro<sup>5</sup>, M. Losso<sup>2</sup>, M. Kundro<sup>2</sup>

<sup>1</sup>The National Scientific and Technical Research Council, Buenos Aires, Argentina, <sup>2</sup>Hospital J.M. Ramos Mejía, Buenos Aires, Argentina, <sup>3</sup>Hospital Dr. Juan A. Fernández, Buenos Aires, Argentina, <sup>4</sup>Hospital Dr. Cosme Argerich, Buenos Aires, Argentina, <sup>5</sup>Hospital Donación F. Santojanni, Buenos Aires, Argentina

**Background:** From October-2020 to September-2022, we conducted an implementation study to offer telemedicine(TM) across four HIV units of public hospitals in Buenos Aires. We implemented TM to provide a continuum of care to people living with HIV(PLHIV) while exploring their perceptions of factors that promote or prevent the utilization of telemedicine. TM visits were conducted through phone or video calls.

The study started during the COVID-19 outbreak and continued until complete flexibilization came through.

**Methods:** This work analyzes PLHIV's perceptions to understand the limitations of TM for HIV care. We prospectively collected qualitative data through virtual open-ended interviews with PLHIV users of telemedicine. Interviewees were identified considering their gender, age, hospital unit, and years from diagnosis.

Sample size was determined by theoretical saturation according to the baseline analytical axis: care trajectories, hospital unit valuation, and difficulties for telemedicine. Interviews were conducted through Zoom® and manually recorded.

Rather than a statistical analysis, we favored an approach focused on both the diversity and the common experiences. Analysis was done using Atlas.ti®.

**Results:** 39 PLHIV were invited to interviews. 100% agreed to participate. 41%(16) were cisgender women, 2.5%(1) were transgender women, and 56.5%(22) were cisgender men. 51%(20) had up to 10 years since diagnosis.

Telemedicine was positively valued by 100% of interviewees, highlighting benefits such as avoiding commuting to hospitals and reducing consultation time.

However, face-to-face consultations were considered irreplaceable in the future due to the willingness to receive physical examinations. Even in PLHIV with suppressed viral loads, the fear of medical underestimation of problems was pointed out.

For example, when consulting for cutaneous rash and being assessed only by photography, they feared a diagnosis of an AIDS related event or long-term treatment adverse event could be overlooked. From their perspective, TM remains limited to routine purposes such as demanding prescriptions and clinical study assessments.

**Conclusions:** In a setting with accessible ART and acceptable rates of viral load suppression, PLHIV still underline the daily uncertainties of living with the virus. Limitations of TM for HIV-care shed light on how certain concerns remain unreachable by strategies focused exclusively on delivering ART and the replacement of in-person consultations.

## TUPED335

**Community services support children and adolescents living with HIV enrolled in an orphans and vulnerable children project achieve viral suppression in South Sudan**

P. Mawora<sup>1</sup>, F. Eriga<sup>2</sup>

<sup>1</sup>Midlands State University, Development Studies, Gweru, Zimbabwe, <sup>2</sup>Clarke International University, Public Health, Kampala, Uganda

**Background:** In South Sudan, viral suppression (VLS) for children and adolescents living with HIV (CALHIV) 0-17 years is 63%. Factors contributing to low VLS include missed appointments, non-adherence to treatment, lack of psychosocial support and other community services, and stigma and discrimination. Adolescents and Children, HIV Incidence-reduction, Empowerment, and Virus Elimination (ACHIEVE), a USAID/PEPFAR funded project, is implemented in South Sudan by Jhpiego in collaboration with Ministry of Health (MOH) offering services to CALHIV in Juba County through community-based case management.

**Description:** ACHIEVE collaborates with health facilities where CALHIV are identified and offered enrolment into the orphans and vulnerable children (OVC) projects. Services are provided by case care workers and community

adolescent treatment supporters (CATS). CATS update clinical records and work with clinical partners to ensure that non-suppressed CLHIV are identified and case conferred, and action plans are designed and monitored until VLS is achieved. Families of CALHIV receive other services including HIV treatment literacy provided twice a quarter through home visits, disclosure counselling, reminders for clinical appointments, including for viral load testing and MMD, as well as economic strengthening services through savings groups for caregivers, income generating activities, positive parenting training, and education support for children.

**Lessons learned:** Between April 1, 2020, and December 2023, 542 CALHIV were enrolled in the OVC program (316F/226M). Viral load suppression (VLs 1000 copies/ml) among the CLHIV increased from 63.4 to 90 percent in this period. CALHIV who stayed longer in the OVC program achieved better viral suppression: 87 percent for 18 to 24 months compared to 70 percent for <6 months.

These findings suggest length of time in the OVC program may be a predictor of improved VLS rates among CLHIV. The main barrier to viral suppression for CALHIV was interrupted adherence as a result of limited access to food.

**Conclusions/Next steps:** Community-based services through the OVC platform offer an opportunity to provide family-centered services, bridging the treatment cascade gap and contributing towards sustained viral load suppression.

ACHIEVE will build on these findings and best practices to strengthen coordination with MOH and clinical partners to enroll and offer OVC and other comprehensive services towards 95% VLS.

## TUPED336

Typologies of stigma and discrimination management in healthcare settings among people living with HIV in Australia

D. Murphy<sup>1</sup>, T. Norman<sup>1</sup>, J. Power<sup>1</sup>, A. Bourne<sup>1</sup>, A. Smith<sup>2</sup>, T. Broady<sup>2</sup>, G. Meléndez-Torres<sup>3</sup>

<sup>1</sup>La Trobe University, Australian Research Centre in Sex, Health and Society, Melbourne, Australia, <sup>2</sup>University of New South Wales, Centre for Social Research in Health, Sydney, Australia, <sup>3</sup>University of Exeter, Faculty of Health and Life Sciences, Exeter, United Kingdom

**Background:** The existing literature provides clear evidence that anticipated and experienced stigma and discrimination within health care settings have detrimental effects on people living with HIV (PLHIV), particularly in relation to physician trust, use of health services, treatment adherence, and overall health and well-being.

The aim of this study was to understand the different ways PLHIV manage stigma or discrimination in healthcare settings using latent class analysis (LCA).

**Methods:** Data were collected from 739 PLHIV in Australia between May 2021 and July 2022 via a cross-sectional survey. Participants were asked how often they did any of the following in order to avoid stigma or discrimination in health settings: "delayed accessing care", "not told health workers about your HIV", "looked for alternative services", and "not attended a follow-up appointment". Response options were measured on a five-point Likert scale (0-4; never, rarely, sometimes, often, always).

**Results:** LCA suggested four distinct classes of stigma and discrimination management. Class 1 ("No avoidance/deferment or non-disclosure") was the most common (41.8% of participants were in this group); and these participants were more likely than other participants to be: male; gay; an English speaker; diagnosed >5 years ago; and not living in a rural area. One in six participants (15.3%) were in Class 2 ("Both avoidance/deferment and non-disclosure") – the group using the most strategies to avoid stigma in healthcare settings. These participants were more likely to be: female or a different gender (compared to male); and heterosexual, queer, or a different sexuality (compared to gay). The remaining participants were in Class 3 ("Non-disclosure but no avoidance/deferment"), comprising 15.2% of the sample; and Class 4 ("Situational avoidance/deferment and non-disclosure"), which comprised 27.7% of participants.

**Conclusions:** These findings suggest that PLHIV in Australia who are recently diagnosed, and who are not gay men, are more likely to anticipate stigma and discrimination related to accessing healthcare services. Health services and systems need to meaningfully engage people recently diagnosed with HIV in order to reduce anticipated stigma and discrimination, and give greater attention to informing PLHIV about their rights in relation to healthcare provision.

## TUPED337

Contextualizing factors that impact access to HIV care among women aged 30-49 years in Gauteng and Limpopo, South Africa

A. Moolla<sup>1</sup>, C. Mongwenyana<sup>1</sup>, R. Greener<sup>1</sup>, J. Miot<sup>1</sup>, W. Magolego<sup>1</sup>, P. Leshabana<sup>1</sup>, N. Ngcobo<sup>1</sup>, N. Naidoo<sup>1</sup>, L. Coetzee<sup>1</sup>

<sup>1</sup>Health Economics and Epidemiology Research Office, Johannesburg, South Africa

**Background:** South Africa carries the largest share of the global HIV burden, with women bearing the brunt of the epidemic. This study explored factors impacting access to HIV care among 30-49-year-old women accessing HIV services.

**Methods:** Employing convenience sampling, we recruited and consented 291 women aged 30-49 at 15 clinics and various public spaces in Gauteng and Limpopo, which constituted urban and rural respectively. The sample

consisted of three cohorts: HIV positive missing from care (HPM, n=44), HIV Unknown status (HU, n=121), and HIV positive linked to care (HPL, n=126). Descriptive analysis was conducted using Stata17.

**Results:** Most participants were Black/African (99%), citizens/permanent residents (82%) and currently in a relationship (78%). Among HPL and HU participants, highest level of education was secondary/university school (50% and 64%), whereas it was primary school (59%) for HPM. Most participants listed extended waiting and queues as primary barriers to accessing health care (HPL 60%, HU 50% and HPM 80%). HPM also viewed poor attitude among healthcare workers (HCWs) as a barrier (70%). Most participants that did not access healthcare in the last 12 months, listed primary barriers as not feeling sick (HPL 17%, HU 17%, HPM 27%), not trusting HCWs (HU 2%, HPM 14%) and previous negative clinic experiences (HU 1%, HPM 11%). Most women missing from care (93%) reported that they had started antiretroviral therapy previously, although most of their last ARV collection was between 7 and 12 months (36%) or more than a year ago (41%) (Table 1).

Barriers to accessing health care *Multiple Response	HPL n(%)	HPM n(%)	HU n(%)
Poor attitude of HCW	30 (23.8)	31 (70.4)	21 (17.4)
Lack of confidentiality	14 (11.1)	16 (36.4)	4 (3.3)
Inappropriate language or behaviour such as racism or xenophobia	8 (6.4)	5 (11.4)	5 (4.1)
Refusal to provide me with testing or treatment	2 (1.6)	5 (11.4)	1 (0.8)
Refusal to see/treat me without ID documents	5 (3.9)	1 (0.8)	
Long queues and waiting times	75 (59.5)	35 (79.6)	61 (50.4)
Did not have the medication I needed	8 (6.4)	1 (2.3)	13 (10.7)
They were unable to communicate with me in my language	3 (2.4)	4 (9.1)	3 (2.5)

**Conclusions:** Since 93% of missing women have been on antiretroviral therapy previously and many highlighted negative clinic experiences as barriers, offering these women safe and supported spaces as options for them to return is a potentially viable solution. Additionally, targeted HCW interventions focusing on protocols for women returning to care after multiple missed visits can be explored.

## TUPED338

### Building MindSKILLZ of young people in Zambia: lessons learned from a printed mental health magazine in Lusaka and Eastern Province

C. Mubanga<sup>1</sup>, C. Manyele<sup>2</sup>, R. Banda<sup>2</sup>, K. Bhauti<sup>3</sup>, D. Lee<sup>4</sup>, B. Mkandawire<sup>2</sup>

<sup>1</sup>Grassroot Soccer, Inc., Lusaka, Zambia, <sup>2</sup>Grassroot Soccer Zambia, Lusaka, Zambia, <sup>3</sup>Grassroot Soccer, Inc., Wolverhampton, United Kingdom, <sup>4</sup>Grassroot Soccer, Inc., Cape Town, South Africa

**Background:** Adolescents and young people (AYP) in Zambia face numerous mental health challenges, especially youth living with HIV (YLHIV), but services are scarce. Under two phases of the USAID-funded Youth Excel project from 2022-2023, Grassroot Soccer Zambia (GRSZ) developed the MindSKILLZ Magazine, a comic book-style, take-home resource to promote positive mental health and build coping skills and promote social support for AYP.

**Description:** In phase 1, GRSZ near-peer 'Coaches' distributed the magazine to YLHIV who participated in a GRSZ group ART adherence support program. In phase 2, teachers and volunteer ART caregivers also distributed magazines, additionally reaching AGYW participants in a GRSZ SRHR and life skills program and some adolescents who had not previously engaged with GRSZ. Magazines were distributed through home visits or school-based group distribution, and virtual or in-person follow-up visits were conducted.

A mixed methods evaluation was conducted across both phases, including a brief pre-post tests for participants (n=500), in-depth interviews with AYP (n=34) and parents (n=12), focus group discussions with Coaches (n=5) and AYP (n=10) and key informant interviews with teachers (n=6) and caregivers (n=19).

#### Lessons learned:

- Across both project phases, 4,796 AYP received the magazine, including 3,295 YLHIV.
- Participants found the magazine content relevant and useful, and enjoyed the youth-friendly design, games, and engaging activities in the magazine, including space for writing and drawing.
- YLHIV and AGYW who participated in GRSZ programs had higher baseline levels of mental health knowledge than those who had not (79% vs. 83%, respectively), indicating reinforcement of content covered in in-person programming.
- Participants reported referring to the magazine at stressful times to help them calm down. They also shared it with friends and used the 'conversation starter' prompts to begin discussions with family.
- Teachers and caregivers worked together with GRSZ Coaches in phase 2 magazine distribution, but faced time constraints due to other job duties. They also requested additional training to build their capacity in mental health.

**Conclusions/Next steps:** The MindSKILLZ magazine is an acceptable resource for promoting positive mental health among AYP, including YLHIV. Its distribution is being further scaled and evaluated when coupled with in-person program sessions.

## TUPED339

### Mental health of key population groups and PLHIV during war

I. Danylyshyna<sup>1</sup>

<sup>1</sup>CO «Light Of Hope», Public Health Department, Poltava, Ukraine

**Background:** War has a destructive impact on the mental health and psychosocial well-being of all Ukrainians, especially affecting the health of key population groups. Representatives of key groups and people living with HIV (PLHIV) become particularly vulnerable to mental health issues due to high levels of social stigma and discrimination, unique experiences of traumatic events and stress (often involving substance abuse), accompanying barriers related to access to essential treatment services (infrastructure destruction, medical facility damage, disruptions in drug supplies).

Denial of mental health problems and interpreting them as another stigmatizing factor hinder key groups from seeking specialized services. A low level of mental health care culture often leads representatives of key groups to not consider mental health issues as illnesses, attempting to ignore psychological disturbances that arise or worsen under the influence of war-related stressors, resorting to self-treatment, and so on.

**Description:** The main goal of the NGO "Light of Hope" program was the implementation of screening tools to identify mental disorders in representatives of key groups and PLHIV, followed by guiding them to specialized services for assistance.

Additionally, the program aimed to cultivate a culture of caring for mental health and reduce the stigma associated with mental disorders.

#### Lessons learned:

- Early detection of mental disorders significantly facilitates their treatment and minimizes their impact on adherence to HIV and other disease treatments.
- Navigating participants to relevant support services demonstrated the importance of easy and quick access to qualified assistance, thereby reinforcing the state's efforts in the field of mental disorder treatment at the primary healthcare level.

#### Conclusions/Next steps:

- It is necessary to expand screening and navigation programs not only at the NGO level but also to involve middle-level medical personnel to fully cover representatives of key groups with services.

- Support and training for medical professionals in managing cases of mental disorders at the primary healthcare level should be ensured.
- Conduct regular evaluation and monitoring of program results to adapt and improve it for more effective assistance.
- It is crucial to engage both civil and governmental organizations to support and develop programs focused on mental health support, especially in crisis conditions.

## TUPED340

### Doblemente tachada: a mixed methods assessment of how intersectional stigma affects HIV prevention among Indigenous gay and bisexual men in Guatemala

D.A. Davis<sup>1</sup>, J. Yac<sup>2</sup>, B. Saucedo Merida<sup>3</sup>, L. Weyer Johnson<sup>1</sup>, C. Purnell<sup>1</sup>, D.M. Elias Rodas<sup>4</sup>, E.R. Orellana<sup>5</sup>

<sup>1</sup>Duke University, Duke Global Health Institute, Durham, United States, <sup>2</sup>Asociación para la Investigación, Desarrollo, y Educación Integral (Asociación IDEI), Quetzaltenango, Guatemala, <sup>3</sup>Trabajando Unidos, Huehuetenango, Guatemala, <sup>4</sup>Universidad del Valle de Guatemala, Guatemala City, Guatemala, <sup>5</sup>University of Washington, Seattle, United States

**Background:** Indigenous Guatemalans comprise half the country's population and are more likely to live in extreme poverty, have lower rates of educational attainment, and experience poorer health outcomes. Indigenous gay and bisexual men (GBM) likely experience intersectional stigma, when various forms of oppression overlap to negatively affect those with multiple marginalized identities. We sought to assess how intersectional stigma impacts HIV prevention for Indigenous GBM in Guatemala.

**Methods:** Between April 2022 and December 2023, we conducted an exploratory sequential mixed methods study and integrated data from in-depth qualitative interviews with Indigenous GBM (n=23) and an ongoing cross-sectional survey with Indigenous GBM (n=324) in Western Guatemala.

For qualitative data, we coded thematically and conducted narrative analysis to identify the most salient themes. For quantitative data, we conducted descriptive statistics to report the frequency and proportion of stigma and HIV prevention outcomes.

**Results:** In qualitative interviews, we found that Indigenous GBM experience intersectional stigma based primarily on their Indigenous and sexual identities, but also based on gender expression, level of education, and if they were from a rural setting. Indigenous GBM perceived that intersectional stigma had a direct impact on their mental and physical health, and also impacted access to education, employment, and quality healthcare, including HIV

services. Quantitative findings further highlight the high burden of sexual orientation (SO) stigma and Indigenous identity stigma experienced by this population. 80.5% of participants reported hearing that their SO was not normal; over half (52.8%) reported losing a relationship with a family member because of their SO; and 29.3% suffered physical violence for being gay/bisexual. The majority of Indigenous GBM (76.0%) also reported high levels of interpersonal racism based on their Indigenous identity.

Although less than half (48.8%) of participants reported always using a condom during sex, only 50.2% believed PrEP was an acceptable prevention strategy and only 20.7% had initiated PrEP.

**Conclusions:** To increase Indigenous GBM engagement in HIV prevention services, including PrEP uptake, multicomponent interventions are needed to mitigate the effects of intersectional stigma, including on structural determinants of health, while also identifying innovative strategies for addressing the root causes of homophobia and racism in Guatemala.

## TUPED341

The impact of multilevel interventions on alcohol consumption, depression, stigma, and ART adherence among men living with HIV in India: results from a 27-month longitudinal study

T. Ha<sup>1</sup>, S. Schensul<sup>2</sup>, R. Singh<sup>3</sup>, L. Frank<sup>1</sup>

<sup>1</sup>University of Pittsburgh School of Public Health, Infectious Diseases and Microbiology, Pittsburgh, United States,

<sup>2</sup>University of Connecticut School of Medicine, Public Health Sciences, Farmington, United States, <sup>3</sup>Population Council, New Dehli, India

**Background:** Individuals living with HIV frequently encounter additional challenges such as stigma and mental health disorders, along with issues including alcohol use and suboptimal ART adherence. Interventions are needed to address multiple factors to comprehensively improve their overall health and well-being.

This study assessed the effectiveness of multilevel interventions designed to decrease alcohol consumption, alleviate depression, stigma, and improve ART adherence among men living with HIV in India.

**Methods:** This study utilized data from the research project titled *Alcohol and ART Adherence: Assessment, Intervention, and Modeling in India*. The investigation implemented multilevel interventions, including individual counseling (IC), group intervention (GI), and collective advocacy (CA) across three cycles at three ART centers. Participants in the control center only received standard care and treatment.

Participants completed surveys assessing demographic characteristics, alcohol use, HIV stigma, and depressive symptoms at baseline, 9 months, 18 months, and 27 months. The two-way mixed ANOVA was employed to as-

sess differences between intervention and control groups over 27 months, controlling for covariates including age, education, marital status, migration, and time since ART treatment.

**Results:** A total of 940 participants initially enrolled in the study at baseline. Analysis focused on 726 participants who responded to both the baseline and the 27-month follow-up surveys. The intervention group exhibited significantly lower alcohol use compared to the control group ( $F(1, 577) = 18.6, p = 0.000$ ).

Moreover, the intervention demonstrated a significant impact on reducing depression and stigma compared to the control group, with significant differences observed in depression ( $F(1, 577) = 125.5, p = 0.000$ ) and internal stigma ( $F(1, 577) = 61.6, p = 0.000$ ) across time points.

In contrast, 4-day ART adherence did not show a significant difference between the intervention and control groups over time. This lack of significance may be attributed to the already high adherence levels present in both groups.

**Conclusions:** These findings demonstrated the effectiveness of the multilevel interventions in addressing the various challenges experienced by men living with HIV in India. Similar interventions could be replicated in countries with comparable contexts.

## TUPED342

Psychosocial distress of persons living with HIV in the workplace in Trinidad and Tobago

H. Rodney<sup>1</sup>, Y. Simon<sup>1</sup>, J. Edwards<sup>2</sup>, B. Andrews<sup>3</sup>

<sup>1</sup>Ministry of Labour, HIV Workplace Advocacy Unit, Port of Spain, Trinidad and Tobago, <sup>2</sup>Medical Research Foundation of Trinidad and Tobago, Port of Spain, Trinidad and Tobago, <sup>3</sup>National AIDS Coordinating Committee Secretariat, Port of Spain, Trinidad and Tobago

**Background:** As the HIV and AIDS pandemic enters its sixth decade, despite advancements in treatment, HIV-related stigma continues to impact the workplace experiences of people living with HIV (PLHIV), particularly under the added strain of the COVID-19 pandemic.

This study explores the psychosocial distress among employed PLHIV, examining the effects on mental health and well-being, considering the compounded challenges posed by the COVID-19 pandemic.

The objectives of the study were to:

Investigate the interplay between HIV, COVID-19, and psychosocial well-being in the workplace.

Inform policies and interventions for improving workplace equity for PLHIV.

**Methods:** The data for this survey is from a cross-sectional study conducted from October 2022 to November 2023. Using a stratified convenience sampling methodology, data were collected from 300 adult, employed PLHIV aged 18 years and over who were clients of the largest

treatment clinic (Medical Research Foundation) in TNT. The survey instrument collected information on demographic characteristics, sexual identity, mental Health, effects of COVID-19 and workplace experience of participants.

**Results:** The provision of free antiretroviral therapy (ART) positively impacted PLHIV, though a significant need for enhanced psychosocial and mental health support was identified. Notably, 24% of respondents reported thoughts of self-harm. The government's response to COVID-19 helped mitigate additional impacts on PLHIV, with 43.7% getting vaccinated primarily to retain employment.

Workplace experiences varied; 24.4% of PLHIV who disclosed their status experienced confidentiality breaches, and 33.8% faced discrimination, underscoring the need for stronger workplace support systems.

**Conclusions:** Advocacy efforts should aim to strengthen Social Protection Networks to enhance the quality of life for PLHIV.

Development of protocols to protect livelihoods during future pandemics is imperative.

Implementing workplace programs to manage HIV is crucial for creating a supportive environment for PLHIV

## TUPED343

**Lack of access to viral load testing and results is demotivating as people with HIV cannot celebrate the benefits of U=U: expressions from PLHIV in South Africa**

M. Dukashe<sup>1,2</sup>, B. Richman<sup>3</sup>, M. Ighodaro<sup>3</sup>, D. Cannistraci<sup>3</sup>, P. Nkambule<sup>2</sup>, J. Malesa<sup>2</sup>, S. Moqobelo<sup>2</sup>

<sup>1</sup>South African National Aids Council, National Strategic Plan, Pretoria, South Africa, <sup>2</sup>HIV Survivors and Partners Network, Advocacy and Community Engagement, Centurion, South Africa, <sup>3</sup>Prevention Access Campaign, Programs and Advocacy, New York, United States

**Background:** We conducted a series of advocacy workshops for people living with HIV (PLHIV) across three provinces in South Africa between October and December 2023 to sensitize them about the importance of viral load testing (VLT) and access to viral load results as a determinant of an undetectable status.

**Description:** We recruited 75 adult PLHIV across different provinces across South Africa with assistance from the PLHIV sector provincial representatives and each session had 22- 25 people. Discussions were facilitated to establish participants expressions about VLT and results sharing practises in their provinces.

Participant also completed a questionnaire to assess their level of understanding about the Undetectable equals Untransmittable (U=U) concept, and the benefits of VLT and results to themselves and in preventing transmissions.

**Lessons learned:** We have learned that many participants who tested more than 5 years ago had at least one VLT once a year, but more than half of them did not know their viral load results. Some were told at the clinics that their VLT results were ok, but the meaning of ok was not explained.

From those who tested for HIV a year or less ago, some indicated that they had blood tests done, but were never told what it was and results were never shared. Four clients indicated that they never had a blood test, and didn't know there is a test that monitors treatment effectiveness.

Some participants expressed that they lost hope in dating and in having children of their own. But they later reported that their hope in finding love and having children was restored because of U=U. It is clear that PLHIV must have control of their VLT schedules, demand the test when due, and demand that results must be shared and explained to them.

**Conclusions/Next steps:** A reward for PLHIV for adhering and being motivated to remain on treatment is a proof that they achieved a U=U status, and that proof is VLT results. Improving VLT access, and results sharing and documenting has multiple benefits : improves the quality of life, continuity in care and attainment of the 95 95 95 targets.

## TUPED344

**Barriers and facilitators to daily oral PrEP uptake and adherence among youth in a clinical trial to evaluate community-based biosocial HIV prevention and sexual reproductive health in rural South Africa**

M. Luthuli<sup>1</sup>, T. Zuma<sup>1</sup>, J. Busang<sup>1</sup>, D. Gumede<sup>1</sup>, P. Khanyile<sup>1</sup>, D. Mthethwa<sup>1</sup>, Z. Xulu<sup>1</sup>, L. Sibiyi<sup>1</sup>, N. Chimbidi<sup>1,2,3</sup>, S. Hlongwane<sup>1</sup>, N. Okesola<sup>1</sup>, J. Dreyer<sup>1</sup>, C. Herbst<sup>1</sup>, J. Seeley<sup>1,4,3</sup>, M. Shahmanesh<sup>1,2,3</sup>

<sup>1</sup>Africa Health Research Institute, Social Science, Mtubatuba, South Africa, <sup>2</sup>University College London, Institute for Global Health, London, United Kingdom, <sup>3</sup>University of KwaZulu-Natal, Public Health, Durban, South Africa, <sup>4</sup>London School of Tropical Hygiene, London, United Kingdom

**Background:** Freely available anti-retroviral based prevention, including HIV Pre-Exposure Prophylaxis (PrEP) has not translated into population effect due to suboptimal coverage amongst adolescents and young adults (AYA). We hypothesized that a stepped-wedge trial whereby trained and peer navigators conducting tailored psychosocial assessments, mentorship and referring AYA to mobile sexual and reproductive health (SRH) clinics for differentiated HIV prevention, and ongoing peer adherence support, would improve AYA's uptake and adherence to oral PrEP. As part of the trial's process evaluation between

July and December 2023, we explored acceptability and uptake of daily oral PrEP among males and females aged 16-30 years old participating in the trial.

**Methods:** Using a mixed methods approach, we triangulated intervention delivery process data collected electronically during psychosocial assessments by peer navigators and clinic data with semi-structured in-depth interviews conducted with a purposive sample of  $n = 30$  AYA. Qualitative data was transcribed, translated from IsiZulu into English, and analysed thematically.

**Results:**  $N = 10188$  AYA underwent psychosocial assessment and  $n = 4515$  (44.3%) were referred to the mobile clinics.  $N = 1243$  participants were eligible for PrEP, of which 864 (69.5%) initiated. Of those initiated, 334 (38.7%) returned for the first PrEP refill, while 150 (17.3%) discontinued PrEP use after 30 days. Factors facilitating uptake and retention included health promotion from peer navigators as part of individual psychosocial needs assessment and tailored health promotion, significant risk perception of HIV transmission due to multiple partners or not knowing a sexual partner's HIV status, experiencing minimal to no side effects, adherence support, and a desire to be in control of own health. Those who discontinued PrEP cited barriers including migration, forgetting to recollect, stigma associated with using PrEP, pill burden, and side effects. Those who refused to be initiated cited a perceived pill burden, stigma associated with HIV treatment, lack of knowledge, not wanting to test for HIV, and fear of PrEP's side effects.

**Conclusions:** Peer delivered psychosocial needs assessment to tailor health promotion and support can facilitate the uptake and acceptability of daily oral PrEP among young people. However, barriers including usability, palatability and context discourage uptake and retention.

## TUPED345

Empowering choices for health and beyond: a status-neutral demand generation campaign to proactively combat HIV transmission in the Philippines

R. Brines<sup>1</sup>, J.D. Rosadiño<sup>2</sup>, L.-A. Lomarda<sup>2</sup>, D. Cruz<sup>2</sup>, A. Revalde<sup>3</sup>, R. Domingo<sup>1</sup>, K. Tangcalagan<sup>3</sup>, C. Gray<sup>3</sup>, R. Pagtakhan<sup>4</sup>, J.A. Cabio<sup>1</sup>

<sup>1</sup>LoveYourself Inc., Communications and Digital Marketing, Mandaluyong, Philippines, the, <sup>2</sup>LoveYourself Inc., Programs & Innovations, Mandaluyong, Philippines, the, <sup>3</sup>LoveYourself Inc., Volunteer, Mandaluyong, Philippines, the, <sup>4</sup>LoveYourself Inc., Executive Director/CEO, Mandaluyong, Philippines, the

**Background:** According to the latest data, the Philippines is far from its 95-95-95 targets, registering at 64-66-97. Diagnosed cases are increasing, with 50 Filipinos diagnosed with HIV per day. Current approaches in HIV-related demand generation strategies include sero-sorting, risk-

based, and messages involving behavior change for key populations. Here, we present #WhatWorksForU: a status-neutral demand generation campaign developed by key communities in the Philippines.

**Description:** A crowdsourcing inviting key populations were conducted to facilitate discussions in creating the framework of the demand generation campaign. In the discussions, the following were considered: demographics (such as age, occupation, activities during the day, etc.) and technographics (social media accounts they use, how they interact, etc.).

The campaign made sure to use a range of sub-campaigns targeted at specific age groups and relationship dynamics, emphasizing self-empowerment and inspiring others to do the same. The campaign also highlighted the integration of the status-neutral approach, recognizing that HIV prevention and care is everyone's responsibility, regardless of their HIV status.

**Lessons learned:** The developed campaign, #WhatWorksForU, is a demand generation campaign that aims to promote HIV testing and combination prevention among individuals regardless of their HIV status and gender. The campaign's status-neutral approach recognizes that HIV care is everyone's responsibility, regardless of their HIV status and demographics.

Also, the different sub-campaigns will cater to the different needs of individuals, encouraging them to access free and/or subsidized sexual health packages and services.

The sub-campaigns will also educate individuals on how to protect themselves and their partners from HIV and other STIs, depending on their specific relationship dynamics.

**Conclusions/Next steps:** In conclusion, the #WhatWorksForU campaign is a comprehensive approach to HIV prevention and care that aims to increase HIV awareness and combination prevention among individuals of all HIV statuses and genders.

Through a series of sub-campaigns targeting different relationship dynamics and sexual experiences, the campaign empowers people to take charge of their sexual health.

With the help of key people and the entire community, and the power of social media, the #WhatWorksForU campaign seeks to create a lasting impact and a world where everyone can take proactive steps to protect themselves and others.

Exploring differences in the association between mental health, viral suppression, and adherence by age and transmission risk among people living with HIV: results from the DC Cohort

J. Malone<sup>1</sup>, L. O'Connor<sup>2</sup>, A. Monroe<sup>2</sup>, S. Barth<sup>2</sup>,

R. Denyer<sup>3</sup>, M. Horberg<sup>4</sup>, A. Castel<sup>2</sup>,

DC Cohort Executive Committee

<sup>1</sup>Whitman Walker Institute, Washington, United States,

<sup>2</sup>George Washington University Milken Institute School of Public Health, Epidemiology, Washington, United States,

<sup>3</sup>Washington District of Columbia Veterans Affairs Medical Center, Washington, United States, <sup>4</sup>Kaiser Permanente Mid-Atlantic Permanente Medical Group, Rockville, United States

**Background:** One in five people with HIV (PWH) in the US are older than 55 years and are men who have sex with men (MSM). Adverse mental health disproportionately impacts sexual minorities and can result in suboptimal HIV outcomes. This may have a greater impact among older adults.

Stratifying by age and HIV transmission risk, we examined the influence of mental health on adherence to antiretrovirals (ARV) and viral suppression (VS) among PWH.

**Methods:** The DC Cohort is a longitudinal study on PWH across 14 clinics in Washington, D.C. This analysis includes participants who completed a patient reported outcomes survey (PROs) between 10/1/2022 and 01/01/2024 linked to electronic health records.

We classified whether or not participants had a mental health diagnosis (MHD) of either anxiety, depression, or post-traumatic stress disorder (PTSD) using ICD codes at least 6 months prior to completing the PROs.

We used Poisson regression with robust variance to calculate adjusted risk ratios (RR) between MHD and self-reported ARV adherence and VS (HIV RNA < 200 copies/mL measured within 6 months of the PROs), stratifying by age ( $\geq$  vs. < 50 years) and HIV transmission risk factor (MSM vs. non-MSM). Models were adjusted for race/ethnicity, time since HIV diagnosis, and employment.

**Results:** Among the 1324 participants, having a MHD was associated with lower VS (Adjusted RR [95% CI]: 0.96 [0.93, 0.99]). This association was constant across age groups and transmission risk groups.

Having an MHD was associated with a lower likelihood of adherence (7 Days RR: 0.89 [0.83, 0.96]; 30 Days RR: 0.86 [0.78, 0.95]; 90 Days RR: 0.85 [0.76, 0.96]) and this was true across all age and transmission risk strata.

We did not find evidence of interaction by age or transmission risk for any of the associations when evaluating p-values of interaction terms, Breslow-Day tests, or likelihood ratio tests.

**Conclusions:** MHD was associated with lower VS and lower adherence. These associations were the same across age and HIV transmission risk strata.

Future analyses should further investigate how mental health impacts adherence and VS among aging MSM living with HIV to inform future HIV care interventions in this population.

## TUPED347

Navigating HIV challenges through interfaith collaboration through the UNAIDS-PEPFAR Faith Initiative

A. Muhereza<sup>1</sup>, R. Gemi<sup>1</sup>, N. Njeru<sup>2</sup>

<sup>1</sup>Africa Christian Health Associations Platform, Programs, Kampala, Uganda, <sup>2</sup>Africa Christian Health Associations Platform, Nairobi, Kenya

**Background:** The UNAIDS-PEPFAR Faith Initiative 2022-2023 addresses the global challenge of an off-track response to end the AIDS pandemic. Despite great progress in HIV response, new HIV infections persist, mostly among Children, Adolescent Girls and Young Women, and older men, with late diagnosis contributing to poor treatment outcomes. Sexual and Gender-based Violence (SGBV) is a significant risk factor fueling HIV spread.

The faith initiative aims to create interfaith advocacy and collaboration among faith community and public health agencies to address gender and social inequalities.

**Description:** The interfaith approach involved identification of 20 national Christian Health Associations and religious leaders, establishing connections with the Interfaith Health Platform to facilitate coordinated activities. Additionally, 15 targeted HIV prevention messages were designed and disseminated during sensitization sessions by faith leaders. In Zambia, 50 faith leaders were trained on SGBV as a key driver of HIV spread. Subsequently, collaborative stakeholder dialogues on SGBV prevention and response were held, fostering a unified front among faith leaders, NGOs, and government departments.

As a result, faith leaders endorsed a call to action and developed action plans, established a robust referral network with other SGBV stakeholders, and initiated media campaigns against SGBV.

**Lessons learned:** Acknowledging faith leaders as influential advocates, necessitate comprehensive tools for delivering effective HIV prevention messages. The intricate diversity in values and traditions inherent in each religion mandates utmost respect throughout the phases of engagement. Active involvement of faith leaders emphasizes integrating religious teachings in health programs. Working with religious scholars create opportunities for aligning counseling practices with scriptural teachings. Furthermore, the lessons highlight the critical need for capacity building to enhance knowledge on HIV prevention and control.

**Conclusions/Next steps:** The faith Initiative embodies the essence of global collaboration in addressing the persistent challenges of HIV/AIDS. The achievements under-

score the significance of faith leaders in steering efforts towards achieving the Global AIDS Strategy 2021-2026. Navigating the complexities of the HIV pandemic requires sustained efforts to ensure an inclusive, and impactful response, leaving no one behind.

## TUPED348

### Towards a stigma-free healthcare experience among people living with HIV in Pennsylvania: recommendations from a Statewide Intersectional Stigma Project

S. Krier<sup>1</sup>, T. O'Malley<sup>1</sup>, H. Roth<sup>1</sup>, M.R. Friedman<sup>2</sup>, R. Pompa<sup>3</sup>

<sup>1</sup>University of Pittsburgh, Department of Infectious Diseases and Microbiology, Pittsburgh, United States, <sup>2</sup>Rutgers, the State University of New Jersey, Urban-Global Public Health, Newark, United States, <sup>3</sup>Pennsylvania HIV Planning Group, Jim Thorpe, United States

**Background:** Intersectional stigma (IS) significantly impacts the healthcare experiences and health outcomes of people with HIV (PLWH) including being predictive of healthcare avoidance and poor adherence to HIV medical care. Despite its critical importance, no evidence-based IS reduction interventions exist that work dually to reduce stigmatizing behaviors among clinical staff and perceptions of IS among clients.

**Description:** Through a community-government-academic partnership committed to reducing IS in healthcare settings among PLWH in Pennsylvania (PA), United States, this project used statewide stakeholder-engaged approaches to: document the prevalence and impact of IS in healthcare settings among PLWH (2021); determine healthcare provider readiness for IS reduction efforts (2022); and develop IS reduction interventions for HIV care clinics (2023).

**Lessons learned:** A statewide, online anonymous survey heard from 1,421 clients of PA's AIDS Drug Assistance program from all seven Ryan White Coalition regions of PA (2021). Participants reported experiences and anticipation of stigma from health care professionals (33% from non-HIV doctors, 26% front desk staff, 25% medical care team). Higher levels of IS in healthcare settings were significantly associated with lower odds of both self-reported retention in HIV care ( $p<0.001$ ) and self-reported viral suppression ( $p=0.02$ ).

Survey findings underscore the urgent need to develop interventions to reduce IS and improve HIV care outcomes. We then designed a series of stakeholder activities using Human-Centered Design to prioritize experts with lived experiences in the creation of IS reduction interventions (2022-2023).

Forty-one stakeholders including PLWH, healthcare workers, and government officials participated in an iterative and inclusive process of sharing, prioritizing, generating, and refining intervention concepts for reducing IS expe-

riences for PLWH in HIV care settings. Eight IS reduction interventions were co-designed across three levels: clinic culture and environment, capacity-building, and institutional/structural.

**Conclusions/Next steps:** This project quantified the scale of IS experienced by PLWH in healthcare settings, underscoring the significant role that stigma plays in negative health outcomes and points to the need for healthcare-based stigma reduction interventions.

Our systematic meaningful co-creation approach allowed PLWH and healthcare providers to imagine a stigma-free healthcare experience for PLWH.

We will discuss feasibility, acceptability, and context of initial deployment of these interventions, planned to occur in Spring 2024.

## TUPED349

### Peer-facilitated disclosure support for adolescents and young people living with HIV in rural Limpopo, South Africa

V. Trivella<sup>1</sup>, I. Engelbrecht<sup>1</sup>, P. Matyanga<sup>2</sup>, B. Matlou<sup>1</sup>, V. Mpongoma<sup>1</sup>, J. Moruri<sup>1</sup>, D. McCarthy<sup>1</sup>, C. Sikhakhana<sup>1</sup>, O. Rammutla<sup>1</sup>, C. Chasela<sup>1</sup>, A. Plowright<sup>3</sup>, S. Tenza<sup>4</sup>

<sup>1</sup>Right to Care, Centurion, South Africa, <sup>2</sup>Zvandiri, Harare, Zimbabwe, <sup>3</sup>Anglo American, London, United Kingdom, <sup>4</sup>Anglo American, Johannesburg, South Africa

**Background:** Adolescents and young people living with HIV (AYPLHIV), aged 0-24, encounter intricate challenges encompassing health, relationships, and societal stigma. Our programme in rural Limpopo, South Africa, focuses on supporting AYPLHIV, emphasizing the crucial aspect of HIV status disclosure.

**Description:** Anchored in the Zvandiri model, our programme employs AYPLHIV as peer educators to aid their peers in the community. With lived experiences and unique disclosure journeys, these educators are well-equipped to navigate the fears and implications of both receiving and delivering disclosures. Rooted in the community, they possess an in-depth understanding of cultural norms, local practices, and prevailing stigma, making them effective advocates.

Peer educators undergo comprehensive training to assist in vertical disclosure (caregiver to child) and peer-to-peer disclosure (AYP disclosing to friends and/or intimate partners). Since the programme's inception in September 2023, 11 educators have supported 64 disclosures, with 52 (83%) being vertical and 11 (17%) peer-to-peer.

**Lessons learned:** The disclosure support initiative yielded valuable insights, particularly in the case of peer-to-peer disclosure.

Those who underwent this process experienced a greater sense of comfort attributed to having a peer of similar age and disease experience guide them through the disclosure journey.

The presence of a peer further made the disclosing party more receptive to the process due to the relatable way in which it was facilitated, fostering easy and open communication.

The establishment of a safe space, conducive to questions and accurate knowledge sharing, played an important role in eliciting supportive responses from peers. Notably, 100% of peer-to-peer disclosures ended in a commitment of ongoing support which was reportedly sustained during the following month when follow-ups were conducted. Peer-facilitated vertical disclosure support also proved to be beneficial as peer educators, drawing from their own experiences, could establish connections with the child/adolescent and offer insights and advice that individuals without lived experience might find challenging.

**Conclusions/Next steps:** This initiative highlights the impact peer-facilitated disclosure support has on fostering acceptance and positive outcomes among AYPLHIV.

Future efforts will focus on refining training methodologies, strengthening community partnerships, and assessing the long-term impact on client wellbeing, with a commitment to addressing the ongoing challenges associated with AYPLHIV disclosure.

## TUPED350

**CHAMPS in action: cultivating a skilled workforce for effective HIV prevention in West Virginia**

H. Arnold<sup>1</sup>, L. Storrow<sup>1</sup>, A.T. Young<sup>1</sup>, J. Lucas<sup>1</sup>, M. Reynolds<sup>2</sup>

<sup>1</sup>Community Education Group, Lost River, United States,

<sup>2</sup>West Virginia University, Morgantown, United States

**Background:** The opioid crisis has increased risks for HIV outbreaks associated with injection drug use in West Virginia, where common barriers to testing, treatment, and transportation are exacerbated by social and geographical isolation.

To address these challenges, the Community Education Group (CEG) adapted its highly effective CHAMPS program to serve vulnerable communities in the state.

**Description:** CHAMPS was first established in Washington, D.C. in 2004 to address the health needs of communities of color.

The program was highly successful, training over 150 Community Health Workers (CHWs), screening over 10,000 for HIV and 5000 for HCV annually, and achieving a 90% linkage to/retention in care rate.

CEG adapted this program to better suit West Virginia's unique needs, resulting in a six-week, 147-hour training program that has successfully trained 185 CHWs across 25 counties, while prioritizing recruitment from rural areas, BIPOC communities, and populations with a history of substance use.

## CHAMPS Outcomes (2023)

Participants graduated:	185
% Participants graduated:	89%
% Grads w/ history of substance use:	53%
% Grads identifying as female:	69%
% Grads identifying as BIPOC:	35%
% Grads w/ history of incarceration:	41%

CHAMPS equips participants with core CHW skills, but also includes 22+ hours of HIV education, making CHAMPS graduates well-suited to fill gaps in the HIV care continuum, mitigate increases in HIV incidence, increase HIV testing and linkage to care, disseminate HIV education, and reduce HIV stigma.

These workers can be particularly effective, as they are already positioned in many of the communities most vulnerable to HIV in West Virginia.

**Lessons learned:** CHAMPS has successfully served two distinct populations, demonstrating the effectiveness of training CHWs from rural and at-risk communities to address specific health needs.

CHAMPS graduates represent a trained workforce, already positioned to leverage existing trust relationships and local knowledge to deliver effective interventions and address local health concerns.

### Conclusions/Next steps:

- Expand CHAMPS across Appalachia, reaching more rural and high-risk communities.
- Leverage the CHAMPS workforce for future HIV-related interventions, including rapid deployment for outbreaks or new initiatives.
- Conduct further research to evaluate the long-term impact of CHAMPS on HIV prevention and care outcomes throughout Appalachia.

## TUPED351

**Building trust: a qualitative investigation of peer navigation experiences among transgender women (TGW) living with HIV in São Paulo, Brazil**

P. Galdino Cardin de Carvalho<sup>1</sup>, G. Santa Roza Saggese<sup>1</sup>, S. A. Lippman<sup>2</sup>, J. Sevelius<sup>3</sup>, M. Amélia Veras<sup>1</sup>

<sup>1</sup>Faculdade de Ciências Médicas da Santa Casa de São Paulo, Collective Health, Sao Paulo, Brazil, <sup>2</sup>University of California, San Francisco, United States, <sup>3</sup>Columbia University, New York, United States

**Background:** Transgender women (TGW) face an elevated risk of HIV infection, encountering barriers to health-care access and antiretroviral therapy (ART) adherence. Grounded in the Gender Affirmation Model, 'Trans Amigas,' a peer-led intervention, was designed to improve retention in HIV care for TGW Living with HIV (LWH) in São Paulo, Brazil. We utilize in-depth interviews (IDI) with peer

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

navigators (PN) post-study completion to explore PN's trust-building experiences and obstacles confronted by participants.

**Methods:** Conducted between May 2018 and September 2019, the Trans Amigas project provided peer navigation services to 75 TGWLWH. PNs were TGWLWH and adherent to treatment themselves, PNs guided participants in seeking healthcare and social assistance and fostering strategies for increased ART adherence. Collaboratively, participants and PNs addressed self-care and personal goals. Following the navigation phase, we conducted in-depth interviews (IDIs) with seven PNs. These interviews utilized a semi-structured script designed to explore the PN's perception of participant challenges and interactions during the navigation. Thematic analysis was applied to transcribed and coded IDIs.

**Results:** PNs discussed their participant's receiving and disclosing HIV serostatus. The support of PNs emerged as crucial, often serving as the initial confidante for participants to express fears and expectations. PNs were viewed as exemplary figures, given their adherence to treatment. Despite PN efforts, some participants were lost to follow-up, primarily due to extreme social vulnerability. Nevertheless, actively engaged participants remained adherent to treatment, achieving milestones such as completing educational or occupational courses and re-entering the job market.

ART adherence significantly impacted the quality of life for TGWLWH, influencing subjective organization and access to essential resources like stable housing and treatment for other health conditions, notably evident in participants with substance abuse issues.

**Conclusions:** Trans Amigas, a pioneering study in Brazil, illuminated the benefits and challenges of peer navigation for promoting ART adherence among TGWLWH.

Continuous assessment of structural issues faced by TGWLWH is essential for tailored support and addressing persistent obstacles. Peer navigation demonstrates positive impacts and holds potential for integration into broader public health programs.

## TUPED352

### Caregiver trauma and abuse among adolescents living with HIV in India: a dyadic analysis

A. Gill<sup>1</sup>, A. Bhome<sup>1,2</sup>, M. Pardeshi<sup>2</sup>, N. Suryavanshi<sup>3</sup>, R. Oberhelman<sup>1</sup>, K.P. Theall<sup>1</sup>

<sup>1</sup>Tulane University School of Public Health and Tropical Medicine, New Orleans, United States, <sup>2</sup>Network of Maharashtra People with HIV, Pune, India, <sup>3</sup>Byramjee Jeejeebhoy Government Medical College - Johns Hopkins University Clinical Trials Unit, Pune, India

**Background:** Trauma and post-traumatic stress disorder (PTSD) are associated with poor parenting practices that increase abuse potential among adolescents. Abuse po-

tential might be further elevated among adolescents living with HIV. However, no studies have examined the relationship between caregiver trauma and abuse among adolescents living with HIV in India.

The objective of this research was to examine the pathways between caregiver trauma, PTSD, and adolescent abuse.

**Methods:** An exploratory sequential mixed methods study was conducted in three phases among adolescents living with HIV (10-19 years) and caregiver dyads. Dyads were recruited purposively from a community-led clinic in India. In Phase I, in-depth interviews were conducted with 25 dyads, transcribed, and analyzed following a grounded theory approach.

Findings were utilized to develop a survey in Phase II implemented among 88 dyads in Phase III. Survey data was utilized to implement a path analysis to examine the association between caregiver adverse childhood experiences (ACES), adult traumatic experiences, PTSD, and adolescent verbal and physical abuse (caregiver and adolescent self-report).

**Results:** Between September 2021 and December 2023, 113 adolescents living with HIV (51 Females and 62 Males) and their caregivers (84 Females and 29 Males) were recruited. 83% of the caregivers were living with HIV. The themes of caregiver PTSD and intergenerational trauma emerged from the in-depth interviews.

The subthemes of caregiver PTSD were alcohol use, cognitive distortions like lack of trust, self-blame, detachment, and social withdrawal. Narratives suggest that PTSD may contribute to parental hypervigilance and intergenerational transmission of trauma through punitive parenting practices with implications for adolescent mental health. Path analysis reveals that both caregiver ACES ( $\beta=0.34$ ,  $=0.02$ ) and adult traumatic experiences ( $\beta=0.90$ ,  $p<0.01$ ) were associated with caregiver PTSD.

Caregiver PTSD was associated with caregiver reports of adolescent verbal abuse ( $\beta=1.24$ ,  $p=0.01$ ) but not with physical abuse ( $\beta=-0.07$ ,  $p=0.91$ ). Caregiver PTSD was not associated with adolescent reports of abuse. ACES and adult traumatic experiences were not associated with caregiver or adolescent reports of abuse.

**Conclusions:** Findings indicate the need for trauma-informed care for adolescents living with HIV and their caregivers. Screening of caregivers for ACES, trauma, PTSD, and timely care might prevent intergenerational transmission of violence.

### TUPED353

Mapping the future: leveraging lasso regression and GWR to guide HIV testing and prevention strategies in Tanzania

A. Onovo<sup>1,2</sup>, J.d. Nondi<sup>3</sup>, R.I. Majengo<sup>3</sup>, E. Mtui<sup>4</sup>, R. Mrina<sup>1,2</sup>, P. Agaba<sup>1,2</sup>, E. Akom<sup>1,2</sup>

<sup>1</sup>The Henry M. Jackson Foundation for the Advancement of Military Medicine Inc., International HIV Prevention and Treatment, Bethesda, United States, <sup>2</sup>U.S Military HIV Research Program, Walter Reed Army Institute of Research, International HIV Prevention and Treatment, Silver Spring, United States, <sup>3</sup>U.S Military HIV Research Program, Walter Reed Army Institute of Research, U.S Army Medical Research Directorate-Africa/Tanzania, Dar es Salaam, Tanzania, the United Republic of, <sup>4</sup>The Henry M. Jackson Foundation, Medical Research International, Tanzania, Dar es Salaam, Tanzania, the United Republic of

**Background:** Identifying prevalent HIV infections and preventing new infections in Tanzania requires understanding the interplay of sociodemographic, biological, and behavioral factors.

This study identifies key determinants of HIV infection, using advanced statistical methods to reveal the dynamics of these variables, thereby informing targeted public health interventions.

**Methods:** A nuanced dual analytical approach was employed across Tanzania's thirty-one regions. Lasso Regression, implemented in three distinct models—Cross-Validation (CV) for optimal regularization, Minimum Bayesian Information Criterion (minBIC) for balanced model complexity, and Adaptive Lasso for refined variable weighting—guided the selection of key variables. Concurrently, Geographical Weighted Regression (GWR) examined the spatial dynamics in these variables' relationship with HIV infection. This robust approach leverages comprehensive data of persons above 15 years from the 2022-2023 Tanzania HIV Impact Survey and the 2022 Tanzania Demographic and Health Survey. The dataset, comprising 49 explanatory variables, was divided into training and testing groups for lasso model selection and validation, respectively.

**Results:** In the analysis of 49 explanatory variables, both CV and minBIC Lasso models consistently selected 4 key variables as most influential in determining HIV infection. These were, in order of ranking: men's alcohol consumption (14.8%, IQR: 9.7%-24.5%), women's primary education completion (44.9%, IQR: 38.3%-48.7%), age at first sexual intercourse among women (16.9%, IQR: 16.6%-18.1%), and women tested for HIV and informed of their results (35.5%, IQR: 30.4%-40.4%). The GWR model demonstrated

strong fit, with an adjusted R-squared of 0.784, indicating its reliability in explaining spatial trends in HIV infections. Spatial analysis revealed distinct regional patterns: men's alcohol consumption was significantly related to HIV infection in the northeast, women's completion of primary education in the southeast, and the awareness of HIV test results among women in the southwest region. Multicollinearity led to the exclusion of age at first sexual intercourse from the GWR model.

Our findings reveal a significant spatial variance in HIV infections, with specific sociodemographic factors displaying a pronounced impact in certain regions.

**Conclusions:** This study's insights into spatial dynamics of HIV infections provide a strategic foundation for implementing targeted, data-driven HIV prevention and management programs, particularly in high-impact areas identified through our analysis.

### TUPED354

How COVID-19 increased AGWY's vulnerability: a qualitative analysis of the pandemic's effects on the implementation and outcomes of the DREAMS HIV prevention program in Kenya

R. Kamazima<sup>1,2,3</sup>, V. Kamire<sup>4</sup>, J. Osindo<sup>5</sup>, E. Kemigisha<sup>5</sup>, S. Floyd<sup>3</sup>, A. Ziraba<sup>5</sup>, D. Kwaro<sup>4</sup>, I. Birdthistle<sup>3</sup>, A. Gourlay<sup>3</sup>

<sup>1</sup>Office of Global Health and HIV, Peace Corps, Washington DC, United States, <sup>2</sup>Office of the U.S. Global AIDS Coordinator and Health Diplomacy, Department of State, Washington DC, United States, <sup>3</sup>Faculty of Epidemiology & Population Health, London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>4</sup>Kenya Medical Research Institute, Kisumu, Kenya, <sup>5</sup>African Population and Health Research Center, Nairobi, Kenya

**Background:** The COVID-19 pandemic disrupted global health programs, including the DREAMS (Determined, Resilient, Empowered, AIDS-free, Mentored and Safe) initiative – a combination HIV prevention program aimed at reducing adolescent girls and young women's (AGYW) risk of HIV acquisition.

This study explores the pandemic's influence on DREAMS implementation and assesses program recipients' perceptions on its impact on their empowerment and sexual reproductive health (SRH) outcomes.

**Methods:** This secondary analysis utilizes qualitative data from the DREAMS II Evaluation, collected in Nairobi and in rural Western Kenya (Gem) between October, 2022 and February, 2023. 3 key informant interviews with implementing partners, 8 focus group discussions with 74 DREAMS mentors, and 43 in-depth interviews with AGYW DREAMS recipients were analyzed using thematic analysis. NVivo 12 for Windows was used to organize the data and conduct analysis using coding methods. Themes were structured using the Medical Research Council (MRC) framework for process evaluation.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

**Results:** COVID-19-related challenges affected DREAMS service delivery, limited AGYW's access to health services, reduced attendance rates and limited psychosocial support like peer-to-peer interaction in safe spaces. Adaptations included virtual communication and intervention delivery via WhatsApp, smaller group sizes, and vocational training for in-school AGYW.

While positive outcomes emerged from adjustments and innovations, disparities in technology access widened inequalities and affected parents' trust of program staff. AGYW perceived COVID-related restrictions, heightened economic hardships, and limited psychosocial support as barriers to their empowerment and sexual health. Qualitative evidence from AGYW indicated increase in unintended pregnancies, in part due to disrupted education. While AGYW reported increased perceived susceptibility to engagement in risky behaviors as a result of idleness caused by school closures, they also demonstrated resilience and self-efficacy during the pandemic.

**Conclusions:** Despite challenges posed by COVID-19, the DREAMS program continued through the implementation of program adjustments and innovative adaptations. The study findings highlight the importance of resilience-building and economic strengthening activities for AGYW empowerment, and consistent school attendance in reducing AGYW's vulnerability to HIV acquisition, mitigating sexual risk behaviors, and avoiding unintended teenage pregnancies. Sustained efforts are needed to ensure safe and accessible program implementation, and for equitable support during national and international emergency situations.

## TUPED355

We fear the day this bill is passed:  
the criminalization of LGBTQ+ and its effect  
on public health efforts in Ghana

N.A. Acheampong<sup>1</sup>, E.O. Ankrah<sup>1</sup>, R. Afriyie<sup>1</sup>  
<sup>1</sup>Ghana AIDS Commission, Accra, Ghana

**Background:** The criminalization of lesbians, gay, bisexual, transgender, and queer (LGBTQ+) individuals remains a global issue with discriminatory laws, stigma and violence affecting their well-being.

Health and human rights. Ghana is currently in the process of criminalizing LGBTQ+. A bill proscribing LGBTQ+-related activities was proposed to the parliament of Ghana in 2021. The bill proposes to promote proper human sexual rights and family values while proscribing all LGBTQ+-related activities. The bill as it stands now prohibits all forms of advocacy for LGBTQ+. Thus making it illegal to provide HIV prevention services to LGBTQ+. The prevalence of HIV in Ghana is 1.3%, compared to 18.1% among men who have sex with men (MSM).

We sought to investigate the effects of LGBTQ+ criminalization on HIV prevention and treatment efforts in Ghana.

**Methods:** We elicited respondents' perceptions of the effect the bill will have on MSM and HIV-related activities in January 2023. We conducted 23 semi-structured in-depth qualitative interviews with peer social networks of MSM within Greater Accra Region. A thematic analytical framework was used to analyze audio recordings.

**Results:** The major findings indicated that MSM will be less willing to access HIV prevention services from drop-in centers due to fear of being arrested. It was indicated that stigma and discrimination currently discourage the majority of MSM from accessing HIV prevention services. Further criminalization of LGBTQ+-related activities will worsen the situation.

Respondents also reported that the majority of MSM have gone underground out of fear of penalization due to their sexual behavior. This poses a challenge for public health organizations to implement targeted intervention and outreach programmes for MSM.

**Conclusions:** Laws criminalizing all forms of LGBTQ+ advocacy can fuel the HIV epidemic as they dissuade MSM from seeking treatment. Penalization of same-sex intercourse also contributes to a cycle of stigma and discrimination. Such a hostile legal and social environment will exacerbate mental health issues among LGBTQ+ individuals, leading to higher rates of stress, anxiety and depression. The criminalization of LGBTQ+ in Ghana will significantly impact the country's HIV response.

## TUPED356

A holistic approach to accessible HIV prevention  
and care for women with disabilities in the  
Dominican Republic

M. Jaar Guérin<sup>1</sup>, A. Martín Ortiz<sup>1</sup>, C. Francisco<sup>2</sup>

<sup>1</sup>Centro de Orientación e Investigación Integral (COIN), Programs Department, Santo Domingo, Dominican Republic, the, <sup>2</sup>Círculo de Mujeres con Discapacidad, Santo Domingo, Dominican Republic, the

**Background:** The LISS project focuses on enhancing access to HIV prevention and care services for women with disabilities (WWD) in the Dominican Republic. Despite WWD constituting around 7% of the population, and 43% of them having their first child at 20 or younger, misconceptions about their sexual activity place them at risk. WWD are often excluded from HIV programs and policies and no prevalence data is collected. Also, 55.6% of people with disabilities report facing challenges in healthcare access.

**Description:** The project comprises three components:

1. Empowering WWD to reduce HIV risk factors, through workshops on sexual and reproductive health (SSR) and gender-based violence (GBV);
2. Enhancing combined HIV services and care through infrastructure reforms, the creation of a guide on care for WWD, and training for health providers; and,

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

3. Advocacy to increase representation of WWD in decision-making mechanisms.

**Lessons learned:** We conducted multiple studies that reveal that obstacles to service provision stem from attitudinal barriers, infrastructure issues, and non-compliance with inclusivity/accessibility laws for people with disabilities, and not from the disability itself as a social driver.

WWD Group pre- and post-test scores on SSR knowledge increased by an average of 14%, emphasizing the demand for enhanced access to sexual education.

Assessments on health center accessibility show a need for interventions at both infrastructure and attitudinal levels, with health centers obtaining an accessibility score of 60% or lower, and 48% of WWD indicating a lack of empathy during service provision.

Feasibility studies on a digital platform to increase access to services for WWD indicate high internet access (76.5%) and emphasize the usefulness of such a platform (94.1%). Legal frameworks exist but lack enforcement at the national level and do not include sanctions for non-compliance.

**Conclusions/Next steps:** By understanding the multifaceted challenges, the LISS project aims to implement comprehensive strategies for inclusivity, leveraging technology, infrastructure improvements, and educational adaptations to increase equal access to healthcare services for WWD in the Dominican Republic.

The project has been:

- Developing a digital platform for increased accessibility.
- Collaborating with the Ministry of Health for infrastructure changes.
- Adapting education content and training healthcare workers to overcome attitudinal barriers.

## TUPED357

**Social drivers associated with HIV prevention efficacy and HIV vulnerabilities among urban refugee youth in Kampala, Uganda**

C. Logie<sup>1</sup>, Z. Admassu<sup>1</sup>, M. Okumu<sup>2</sup>, F. MacKenzie<sup>1</sup>,

R. Hakiza<sup>3</sup>, D. Kibuuka Musoke<sup>4</sup>, A. Nakitende<sup>4</sup>, B. Katisi<sup>3</sup>,

P. Kyambadde<sup>5</sup>

<sup>1</sup>University of Toronto, Factor-Inwentash Faculty of Social

Work, Toronto, Canada, <sup>2</sup>University of Illinois at Urbana-

Champaign, Urbana, United States, <sup>3</sup>Young African

Refugees for Integral Development (YARID), Kampala,

Uganda, <sup>4</sup>International Research Consortium (Uganda),

Kampala, Uganda, <sup>5</sup>Uganda Ministry of Health, Kampala,

Uganda

**Background:** Social drivers of HIV vulnerability—inequitable social arrangements that shape HIV prevention engagement—are understudied in urban humanitarian settings. We examined associations between multi-level social drivers of HIV (*structural*: water insecurity [WI], food insecurity [FI]; *relational*: intimate partner violence [IPV],

transactional sex, multiple sex partners; *intrapersonal*: alcohol misuse) and HIV prevention efficacy (sexual relationship power [SRP], condom use self-efficacy [CUSE]) among urban refugee youth in Kampala, Uganda.

**Methods:** This longitudinal study collected data at two time-points over 12-months to characterize patterns of social drivers of HIV among a peer-driven sample of urban refugee youth (ages 16-25) in informal settlements in Kampala. We conducted latent class analysis (LCA) to identify sub-groups of co-occurring social drivers.

We then (a) explored the extent to which sub-groups were associated with Time 1 (T1) HIV prevention efficacy outcomes (SRP, CUSE), and (b) tested whether class membership differences persisted over time (Time 2 [T2]) on predicted HIV vulnerabilities (T2: IPV, transactional sex) using logistic and linear regression.

**Results:** Among participants (n=282, mean age: 20.1, standard deviation: 2.5, cisgender women: 51.8%, cisgender men: 46.1%, transgender women: 2.1%), LCA identified three social driver subgroups with differing HIV risk levels: 1) "lower risk" (n=69; 24.5%); 2) "medium risk" (n=185; 65.6%) (co-occurring: FI, WI, alcohol misuse); and 3) "high risk" (n=28; 9.9%) (co-occurring: FI, WI, alcohol misuse, IPV, multiple sex partners, transactional sex).

In multivariable analysis, "high risk" (adjusted beta coefficient [ $\alpha\beta$ ]; -9.09; 95% confidence interval [CI]: -15.12, -3.06); p=0.003) and "medium risk" ( $\alpha\beta$ = -3.21, 95% CI: -5.40, -1.03; p=0.004) groups had lower T1 SRP, and the "medium risk" group ( $\alpha\beta$ = -2.01, 95% CI: -3.27, -0.75; p=0.002) had lower baseline CUSE, compared with the "lower risk" group. Subgroup differences persisted; in T2 multivariable analyses the "high risk" group had higher odds of IPV (aOR: 6.24, 95% CI: 1.39, 27.99; p=0.017) and transactional sex (aOR=33.78, 95% CI: 3.80, 300.54; p=0.002) compared with the "low-risk" group.

**Conclusions:** Social inequities were associated with reduced HIV prevention efficacy and increased HIV vulnerabilities among urban refugee youth in Kampala. Multi-level strategies can address co-occurring resource insecurities, IPV, and alcohol misuse to advance HIV prevention with urban refugee youth.

## TUPED358

**Intersecting realities: exploring the nexus of mental health, drug use, and HIV prevention among adolescents and young adults (AYA) in Zimbabwe**

M. Dhodho<sup>1</sup>, M. Munjoma<sup>1</sup>, J. Mavudze<sup>1</sup>, B. Mutede<sup>1</sup>, N. Tarubekera<sup>1</sup>

<sup>1</sup>Population Solutions for Health, Harare, Zimbabwe

**Background:** There is lack of clear understanding of the surge in drug and substance use among Adolescents and Young adults (AYA) in Zimbabwe. To better understand drug and substance use among young people, Popula-

tion Solutions for Health with support from the Sweden Embassy, conducted a study to investigate the intricate relationships between mental health, drug use, and HIV prevention, examining risks, factors, and interventions for a comprehensive public health strategy.

**Methods:** A cross-sectional study was conducted between May 2023 and June 2023. Data derived from the above stated survey was used, and included variables like substance use history, HIV transmission knowledge, engagement in risky sexual behaviours, and awareness of drug effects on mental health. We divided previously identified causes of drug use into mental health-related and non-mental health-related factors.

Mental health-related causes were prolonged or traumatic parental absence, harsh discipline, communication breakdown, family members using drugs, unemployment, and stress-related problems.

Non-mental health causes included easy access to drugs, lack of awareness, availability of financial resources, peer pressure, experimentation, and weak law enforcement. Data were analysed using Stata 17.

**Results:** Of the 770 participants examined, 46.5% were females, 53.2% males, and 0.26% transgender individuals. Median ages were 24 (IQR 19-29) for males and 23 (IQR 19-26) for females. Drug use was prevalent among males (50%) compared to females (36%), with a median age of onset at 18 (IQR 16-20).

Among the 269 with a history of drug use, 73% attributed it to mental health reasons, while 27% cited non-mental health reasons. We observed universal HIV knowledge (97%) among drug users and non-users, no statistical difference. During drug use, 27% reported mental health issues, 6% engaged in risky sexual behaviours, 23% reported testing for HIV and 24% reported pregnancies.

**Conclusions:** The result emphasizes the complex relationship between drug use, mental health, and their impact on HIV prevention/transmission, including unwanted pregnancies.

The intricate interplay underscores the importance of addressing mental health, a key contributor to risky behaviours such as substance abuse, heightening HIV transmission risks. Integrated interventions considering mental health alongside HIV prevention and drug use can enhance overall well-being and reduce transmission risks.

## TUPED359

### Housing instability impacts all-cause and substance-involved mortality among people with HIV in British Columbia, Canada

M. Marziali<sup>1</sup>, K. Kooij<sup>2</sup>, M. Budu<sup>3</sup>, M. Ye<sup>3</sup>, C. Tam<sup>3</sup>, S. Hansen<sup>3</sup>, T. McLinden<sup>2</sup>, S. Emerson<sup>3</sup>, J. Montaner<sup>3</sup>, R. Hogg<sup>2</sup>, C. Cardinal<sup>3</sup>

<sup>1</sup>Columbia University, Epidemiology, New York City, United States, <sup>2</sup>Simon Fraser University, Health Sciences, Burnaby, Canada, <sup>3</sup>British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada

**Background:** British Columbia (BC), Canada, is experiencing a housing crisis marked by a shortage of accessible, safe, and affordable housing. BC is also the epicenter of the overdose crisis in Canada. We explore the impact of housing instability on all-cause and substance-involved mortality among a cohort of people with HIV in BC.

**Methods:** Data are from the Longitudinal Investigation into Supportive and Ancillary Health Services (LISA) study, a cross-sectional survey (2007-2010) (n=998). Survey data are linked with prospective administrative health data from the BC Centre for Excellence in HIV/AIDS Drug Treatment Program (DTP) and Population Data BC until March 31, 2020. This linkage includes information on mortality via ICD-10-CA codes, allowing us to investigate the relationship between housing instability, all-cause mortality, and substance-involved mortality. Selection bias into LISA was potentially introduced through oversampling PWH marginalized by sociostructural inequities. We used inverse probability of participation weighting (IPPW) to address this bias. We constructed participation weights using information from the entire DTP database, which includes all known people with HIV in BC accessing antiretrovirals via the DTP (including respondents and non-respondents to the LISA survey). Leveraging time-to-event data, we estimated hazards of all-cause and substance-involved mortality associated with housing instability using an adjusted, IPPW-weighted Cox proportional hazards model.

**Results:** In this sample, 317 (32%) people reported housing instability. Overall, 302 people (30%) died from any cause between the completion of the LISA survey and March 31, 2020; of those people, 111 (37%) died due to substance-involved mortality, and 86 (29%) experienced housing instability. We found experiences of housing instability were associated with both increased hazards of all-cause and substance-involved mortality (Table 1).

	All-cause mortality		Substance-involved mortality	
	aHR	95% CI	aHR	95% CI
Housing instability				
No	1.00		1.00	
Yes	1.52	1.13 – 2.04	1.80	1.01 – 3.19

Table 1. Association between housing instability and mortality, estimated via Cox proportional hazards model, weighted via IPPW.

Models are adjusted for: gender, race, employment, mental health disorder, current drug use, and history of incarceration.

**Conclusions:** People with HIV experiencing housing instability may have a greater risk of both all-cause and substance-involved mortality. Our findings add to the literature supporting a need to expand access to safe and affordable housing.

## TUPED360

**Social and structural marginalization associated with increased odds of sub-optimal viral load suppression among women living with HIV: implications for HIV law reform in Canada and globally**

A. Krüsi<sup>1,2</sup>, K. Shannon<sup>1,2</sup>, D. King<sup>2,1</sup>, H. Zhou<sup>1,2</sup>, W. Bartels<sup>1,2</sup>, S. Baral<sup>3</sup>, M. Ohtsuka<sup>1,2</sup>, K. Deering<sup>1,2</sup>

<sup>1</sup>University of British Columbia, Medicine, Vancouver, Canada, <sup>2</sup>University of British Columbia, Centre for Gender and Sexual Health Equity, Vancouver, Canada, <sup>3</sup>Johns Hopkins University, Bloomberg School of Public Health, Baltimore, United States

**Background:** Despite recommendation globally as well as by the federal Canadian government to limit prosecution of HIV non-disclosure cases, Canada stands out in its assertive approach to criminalizing HIV non-disclosure during sex.

This study investigated key social and structural determinants of sub-optimal viral load suppression among women living with HIV (WLWH) under Canada's current approach to HIV criminalization.

**Methods:** Data were drawn from the Sexual Health and HIV/AIDS: Women's Longitudinal Needs Assessment (SHAWNA) Project, a longitudinal community-based research project with WLWH in Metro Vancouver (2014-present).

We used bivariate and multivariable logistic regression with generalized estimating equations to account for repeated measures over time to examine the relationship between social and structural factors and sub-optimal viral load suppression ( $\geq 200$  copies/mL at least once in the last six months); adjusted odds ratios (AOR) and 95% confidence intervals are reported.

**Results:** Among 355 women with 2312 observations (September/14-August/20), the prevalence of sub-optimal viral load suppression at baseline was 24.2% (n=86) and 44.5% (n=158) over the study period.

In multivariable analysis, longer duration since first diagnosed with HIV was inversely associated with sub-optimal viral load suppression (AOR:0.94 [0.92-0.97], for each increase of one year).

Participants who, in the last six months: experienced sexual violence (AOR: 1.77 [1.11-2.83], who experienced housing insecurity (AOR: 1.64 [1.22-2.19]), who reported daily crimi-

nalized non-injection drug use (AOR: 1.59 [1.09-2.34], versus none), who had been incarcerated (AOR: 2.11 [1.09-4.06]), who experienced food insecurity (AOR: 1.32 [0.95-1.82]) had higher odds of sub-optimal viral load suppression.

**Conclusions:** Our study results highlight that women living with HIV who experience multiple forms of social and structural marginalization are at the highest risk of sub-optimal viral load suppression and prosecution for HIV non-disclosure under Canada's current approach to HIV criminalization.

There is an urgent need for HIV law reform and it remains critical to address the over-criminalization of women living with HIV alongside core needs relating to improved options for violence prevention and supports, housing, food security, substance use treatment and better supports during and post-incarceration among women living with HIV. All approaches should be gender-responsive, harm reduction-focused, trauma-informed, culturally safe and culturally appropriate.

## TUPED361

**Multi-level factors associated with HIV late presentation with advanced disease and delay time of diagnosis in Southern United States, 2005-2019**

F. Shi<sup>1</sup>, J. Zhang<sup>2</sup>, S. Chen<sup>2</sup>, X. Yang<sup>1</sup>, Z. Li<sup>2</sup>, S. Weissman<sup>2</sup>, B. Olatosi<sup>2</sup>, X. Li<sup>1</sup>

<sup>1</sup>University of South Carolina, Health Promotion, Education and Behavior, Columbia, United States, <sup>2</sup>University of South Carolina, Columbia, United States

**Background:** Despite highly effective antiretroviral therapy (ART), HIV late presentation with advanced disease (LPWA) remains a major contributor to the mortality of people with HIV (PWH).

We aimed to identify individual- and county-level risk factors of LPWA among PWH and longer delay time of diagnosis among PWH showing LPWA.

**Methods:** This retrospective cohort study derived HIV data from South Carolina (SC) statewide Enhanced HIV/AIDS Reporting System (eHARS). LPWA was defined as having an AIDS diagnosis within three months of initial HIV diagnosis.

According to the CD4 depletion model, we used the initial CD4 test result to calculate the delay time of diagnosis (interval from HIV infection to diagnosis) among PWH with LPWA.

Generalized linear mixed effects models were employed to explore the associations of multi-level characteristics with LPWA and the delay time of diagnosis.

**Results:** A total of 3,733 (41.88%) out of 8,913 adult PWH diagnosed from 2005 to 2019 in SC were LPWA, and the median delay time of diagnosis was 13.04 years. PWH who were male (adjusted odds ratio [aOR]: 1.61, 95% CI: 1.32 ~ 1.95), aged  $\geq 55$  vs 18-34 years old (aOR: 2.94, 95% CI: 2.45 ~

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author

3.53), were Black (aOR: 1.21, 95% CI: 1.09 ~ 1.35) or Hispanic (aOR: 2.27, 95% CI: 1.66 ~ 3.11), and live in counties with a larger proportion of unemployment individuals (aOR: 1.02, 95% CI: 1.00 ~ 1.04) were more likely to be LPWA. Among PWH who were LPWA, Hispanic (adjusted beta: 1.17, 95% CI: 0.49 ~ 1.84) instead of Black (adjusted beta: 0.14, 95% CI: -0.27 ~ 0.55) individuals had significant longer delay time of diagnosis compared to White individuals.

**Conclusions:** Targeted and sustained interventions are needed for older, male, Hispanic or Black individuals and those living in counties with a higher percentage of unemployment because of their higher risk of LPWA.

Additionally, specific attention should be paid to Hispanic individuals due to their longer delay caring. Promoting HIV testing among people in communities at socioeconomic disadvantages with tailored interventions is warranted to decrease HIV late diagnosis as part of the effort to end the HIV epidemic.

## TUPED362

Survival of people living with HIV in displaced sites in three provinces of the Democratic Republic of Congo

D. Menayame N'tangu<sup>1</sup>, A. Mavula Ndeke<sup>2</sup>,  
M. Felo Tuendimbandi<sup>3</sup>, J.C. Mukendi Tshishimbi<sup>4</sup>,  
R. Ramazani Mpale<sup>5</sup>

<sup>1</sup>Trois fois sain Ongd, Kinshasa, Congo, the Democratic Republic of the, <sup>2</sup>Congolese Union of Organizations of People Living with HIV, Kinshasa, Kinshasa, Congo, the Democratic Republic of the, <sup>3</sup>Congolese Union of Organizations of People Living with HIV, Kinshasa, Kinshasa, Congo, the Democratic Republic of the, <sup>4</sup>Congolese Union of Organizations of People Living with HIV, Kinshasa, Kinshasa, Congo, the Democratic Republic of the, <sup>5</sup>National Multisectoral Program to Fight AIDS, Capacity Building, Kinshasa, Congo, the Democratic Republic of the

**Background:** To contribute to improving the living conditions of PLHIV in the displaced persons camps in the provinces of Ituri, North Kivu and South Kivu, identify them and describe their socio-demographic characteristics as well as their means of survival in the different camps.

**Methods:** This is an exploratory descriptive study carried out in the DRC. It was conducted among people living with HIV in 143 sites via non-probability sampling using the snowball technique.

To do this, each camp was considered a study area and, in each area, a household where PLHIV lives was identified.

To collect the data for this survey, we used the interview technique carried out face to face between the investigator and his respondent.

Data was collected in January 2024 using a pre-tested and structured interview questionnaire via KoboCollect.

**Results:** In total, 1,337 PLHIV were reached in 97 war displaced persons camps out of the 143 planned in the DRC provinces during the study. 80% of identified PLHIV are female compared to 20% of men.

Around two thirds of PLHIV living in IDP camps do not have regular access to treatment due to lack of access to their care centers. The absence of HIV care centers in the camps means that they lack medication.

Almost all PLHIV living in the camps are economically inactive and only survive on food support from the WFP and other agencies working in the humanitarian field. PLHIV are unable to create income-generating activities following the recurring clashes between the armed forces and the rebels. Note also the absence of HIV activities in the camps for displaced people for fear of stigma and discrimination.

**Conclusions:** The survival of PLHIV in camps for war displaced persons remains a factor favoring the increase in new HIV infections following the double vulnerability of the latter due to the fact that they are PLHIV and displaced by war but without means of survival. The frequent sex trade in the camps remains an intense activity for their survival. The use of condoms as a means of prevention is not respected following the absence of HIV activities and pharmacies in the camps.

## TUPED363

HIV behavioural and social risks among female, male and transgender female sex workers in Thailand – a national cross-sectional study

S. Janyam<sup>1</sup>, C. Phaennongyang<sup>1</sup>, S. Sumalu<sup>1</sup>,  
S. Sukthongsa<sup>1</sup>, A. Somwaeng<sup>1</sup>, C. Manopaiaboon<sup>2</sup>,  
D. Clarke<sup>2</sup>, P. Girault<sup>2</sup>, R. Vannakit<sup>2</sup>

<sup>1</sup>SWING (Service Workers In Group Foundation), Bangrak, Thailand, <sup>2</sup>BIRD (Bangkok Interdisciplinary Research and Development), Phayathai, Thailand

**Background:** HIV prevention in Thailand has been a success story, particularly among female sex workers (FSW) with 0.7% HIV prevalence in 2018 (Thailand Ministry of Public Health, 2023). However, other SW sub-populations display higher prevalence rates: males (MSW: 3.8%, 2018) with no available data on transgender females (TGSW). Investigation of HIV risk behaviors was included in a cross-sectional study of pre-exposure prophylaxis (PrEP) among Thai SW populations.

**Methods:** This study was conducted from April-December 2023 by SWING and BIRD (Bangkok Interdisciplinary Research and Development) in seven provinces in Thailand. This study investigated associated factors with PrEP uptake using a questionnaire including questions on HIV risk behaviors.

The study enrolled a total of 1,511 MSW, FSW and TGSW, aged ≥18 years old, HIV-negative, and engaged in sex work in the past three months. 621 FSW, 452 MSW and 438

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

TGSW were interviewed face-to-face by trained outreach workers. A descriptive analysis of HIV risk behaviors was conducted.

**Results:** Out of the total, 702 respondents (46%) perceived high and medium HIV risks; 172 (11.4%) had never been tested; 493 (32.6%) not tested in the past 12 months; and 324 (21.4%) reported participating in group sex in the past 3 months with the highest rates among MSW (25.6%) and TGSW (29.6%). Of these, 95% reported any unprotected sex during group sex: TGSW 99.0%; FSW 96.1% and MSW 91.0%. Furthermore, recreational drug use in the past 12 months was reported by 11.8% of SW (MSW: 17.3%; TGSW: 15.1%; and FSW 5.5%); and 51.6% had ever been screened for a sexually transmitted infection (STI). Any form of gender-based violence in the past 12 months, was reported by one third (35.8%) of SW, perpetrated largely by clients.

**Conclusions:** Thailand HIV testing and prevention strategies for SW need to be revisited. Significant HIV risks and vulnerability were reported by SW underscoring their need for PrEP. HIV programming for SW needs to be reprioritized using a people-centred approach covering the full spectrum of SW behavioural and social risks. PrEP programming for SW must be rapidly intensified.

## TUPED364

Making a case for social and structural support to improve outcomes of children living with HIV in Baringo and Samburu Counties, Kenya

L. Matu<sup>1,2</sup>, S. Ajuoga<sup>2</sup>, R. Osoti<sup>2</sup>, M. Kitheka<sup>2</sup>

<sup>1</sup>Gold Star Kenya, Nairobi, Kenya, <sup>2</sup>USAID Tujenge Jamii, Nairobi, Kenya

**Background:** USAID Tujenge Jamii (UTJ) is implementing an integrated HIV program in Baringo, Laikipia, Nakuru and Samburu Counties serving 4535 children and adolescents aged below 19 years living with HIV (CLHIV) on ART. Of the CLHIV, 91% are virally suppressed. Despite this good viral load suppression, there are about 400 children who have persistent high viral load (HVL).

The project team engaged with the children and their care givers to understand the reasons for not achieving viral load suppression to inform interventions. The main barriers leading to the persistent HVL were social (neglect, poor relationships with caregivers) and structural (poverty, food insecurity) in nature.

The hypothesis postulated by the UTJ team was that addressing these barriers would improve outcomes (viral load suppression, adherence to treatment, good health) for these children.

**Description:** UTJ identified partners providing social and structural support for vulnerable children in Baringo and Samburu counties. Meetings were held between the UTJ team, these social/structural support implementing partners and the families of children with high viral load and poor adherence to clinic appointments.

Consent was received from the families to link their children with the services provided by the partners to help improve care for the children. 25 children were provided with food, a loving and caring environment, school fees and other basic needs by the partners and monitored for outcomes over a six months' period between October 2022 and March 2023.

**Lessons learned:** At baseline in October 2022, only 42% and 25% children in Baringo had adherence to clinic appointments and viral load suppression respectively. This improved to 86% and 91% respectively by March 2023. In Samburu, at baseline, only 56% of the children had adherence to clinic appointments and viral load suppression. This improved to 100% and 89% respectively after the intervention in March 2023.

**Conclusions/Next steps:** For countries to achieve the UN-AIDS 3<sup>rd</sup> 95, there is need to address social and structural barriers identified at family level. Providing socio-structural interventions through meaningful partnerships improves outcomes for children living with HIV.

Funders supporting HIV interventions for children should include resources to respond to social and structural needs.

## TUPED365

Understanding the HIV continuum of care in rural people living with HIV in Nepal: a qualitative study

A. Timilsina<sup>1</sup>, P. Neupane<sup>2</sup>, A. Shrestha<sup>3</sup>

<sup>1</sup>University of Southern Denmark, Esbjerg, Denmark, <sup>2</sup>Tribhuvan University, Department of Gender Studies, Kathmandu, Nepal, <sup>3</sup>Tribhuvan University, Central Department of Public Health, Kathmandu, Nepal

**Background:** Individuals engaging in risky sexual behavior, injecting drug usage, sex work, and those identifying as transgender face an elevated susceptibility to HIV diagnosed, often accompanied by societal discrimination. The impact of HIV extends beyond physical health, significantly affecting the social and psychological aspects of individuals' lives. Continuity of care connect distinct elements throughout a client's care trajectory, incorporating various episodes, interventions from different providers, and adaptations to the client's health status.

This study delves into the experiences of People Living with HIV in rural Nepal understanding the need for continuum of care to enhance overall quality of life.

**Methods:** A qualitative thematic study was conducted where 43 People Living with HIV living in rural areas of Nepal and four key-informants were interviewed from rural Nepal. In-depth interview and key-informant interview was conducted using semi-structured interview guidelines. Inductive coding was conducted to develop codes and codes were grouped to form sub-theme and theme. Manifest analysis was conducted to analyze the data and presented in the form of excerpts.

**Results:** A total of 72 codes, comprising five sub-themes and two overarching themes (HIV care seeking pathways and Continuum of HIV Care), were derived from the data to effectively communicate the study's findings. Participants stressed the importance of accessible medication, advocating for decentralization of ART centers to the local level to alleviate challenges related to distance, economic hardships, and daily living costs.

Participants also underscored the need for expanded services, including periodic viral load and CD4 cell count examinations, access to nutritious food, and self-care practices. Particularly those without employment, expressed the need for vocational education, skill development, and financial support to initiate livelihoods and businesses, inclusion of HIV-positive populations in social security schemes, and extended health insurance packages.

**Conclusions:** The continuum of care for People Living with HIV can be significantly enhanced through a multifaceted approach that not only involves medical interventions but also addresses the broader spectrum of educational, social, and community-based needs. This emphasizes the importance of not only treating the physical aspects of the condition but also fostering an environment that promotes understanding, support, and overall well-being for those affected by HIV.

## TUPED366

Care pathways and barriers to HIV treatment among migrant people living with HIV in Quebec, Canada

T. Hedrich<sup>1,2</sup>, P. Bisimwa<sup>1</sup>, K. Monteith<sup>1</sup>, F. Nininahazwe<sup>1</sup>, C. Zarowsky<sup>3</sup>, S. Tiné<sup>3</sup>

<sup>1</sup>Coalition des Organismes Communautaires Québécois de Lutte contre le Sida (COCQ-SIDA), Montreal, Canada,

<sup>2</sup>Université du Québec à Montréal (UQAM), École de Travail Social, Montreal, Canada, <sup>3</sup>Université de Montreal, École de Santé Publique, Montreal, Canada

**Background:** In Quebec, Canada, migrant people living with HIV (mPLWH) who hold a temporary study or work visa or have no legal status are unable to access public health insurance. Therefore, they are unable to obtain antiretroviral treatment at low cost. This study examines the care pathway of mPLWH from their arrival in Canada until they receive treatment.

**Methods:** Semi-structured qualitative individual interviews were conducted to mPLWH who received assistance of *Cercle Orange*, a Montreal-based organisation that facilitates access to care and treatment to mPLWH. The interviews took place between August 2022 and September 2023.

The aim of these interviews was to document their experiences in Canada, identify barriers and facilitators to accessing antiretroviral treatment, and inquire about their concerns and requests regarding access to care in Can-

ada. The interviews were conducted via the Zoom platform by three peer research associates in English, Spanish or French. The audio part was recorded, transcribed and translated into French if needed. Thematic content analysis was conducted by two researchers.

**Results:** Sixteen people living with HIV were interviewed, with four interviews conducted in English, seven in Spanish, and five in French. The respondents' ages ranged from 24 to 48. Six held a study permit and ten a temporary work permit.

The main barriers to accessing healthcare were identified as a lack of information on how to access the system and the cost of consultations, despite having private insurance. While community organisations and some specialised clinics offered solutions for accessing care, they were not easily visible.

The interviewees expressed anxiety and frustration due to uncertainty about access to medication upon arrival in Canada. The main demand was for clearer and easier access to HIV care for migrant people with temporary status.

**Conclusions:** The interviews revealed the challenges that mPLWH faced to access care and treatment, even though Canada's immigration service is often aware of their HIV status before their arrival. Solutions for mPLWH are available through community organizations or specialized clinics, but navigating them can be difficult.

These experiences highlight the care journey of mPLWH and emphasize the importance of easy, free and universal access to HIV care.

## TUPED367

The association between HIV infection status and mothers' experience measures among post-partum women in Mbeya, Tanzania

B. Mbwele<sup>1</sup>, P. Franklin<sup>2</sup>, C. Hawkins<sup>3</sup>

<sup>1</sup>University of Dar es Salaam - Mbeya College of Health and Allied Sciences (UDSM-MCHAS), Mbeya, Tanzania, the United Republic of, <sup>2</sup>Northwestern University Feinberg School of Medicine, Medical Social Sciences, Medicine (Rheumatology) and Orthopaedic Surgery, Chicago, United States, <sup>3</sup>Northwestern University Feinberg School of Medicine, Institute for Global Health, Chicago, United States

**Background:** Most of the challenges in attaining Sustainable Development Goal number 3.1 aiming to reduce the global maternal mortality ratio to less than 70 per 100,000 live births by 2023 have their roots in the event of birth. Understating mothers' satisfaction with care after birth, "Confidence in healthcare providers" "Birth experience" "Quality of care provision", "Women's personal attributes", "Stigma" and "Stress experienced during labour". We aimed to describe the mother's experiences and differences between women with and without HIV.

**Methods:** The cross-sectional study was conducted in the four (4) Reproductive and Child Health (RCH) Clinics (2 referral hospitals and 2 district hospitals) in Mbeya, Tanzania from June 2022 to August 2022.

Mothers who gave birth were immediately recruited within 1 week after birth and interviewed on their experience using the Child Birth Experience (CEQ); Birth Satisfaction Scale-Revised (BSS-R). STATA was used to describe the items and domain scores. The bivariate Chi-square and t-tests and multivariate linear regression models were used to test the effect of the demographic on the relationship between HIV and scores.

**Results:** A total of 626 mothers with a mean age of 31.9  $\pm$  7.8 ranging from 18.1 to 49.2 years were studied in the 4 hospitals. The scores from 288 mothers with HIV (46.0%) were worse compared to 338 mothers (54.0%) without HIV. When adjusted for the 6 demographic covariates of age, education, socio-economic status, marital status, residence and the level of the hospital facility, the coefficient of scores in CEQ was "Own capacity" (0.73, 95%CI 0.45, 1.01),  $p < 0.001$ , "Professional support" 0.94 (0.68, 1.2),  $p < 0.001$ , "Perceived safety" -0.07 95% CI (-0.24, 0.09),  $p = 0.41$ , and "Participation" 0.33 (0.15, 0.51),  $p < 0.001$ . In the BSS-R, the coefficient of scores was "Quality of care provision" 0.87 95% CI (0.74, 1.01),  $p < 0.001$ , "Women's attributes 0.27 95% CI (0.1, 0.45),  $p = 0.002$ , and "Stress experienced" 0.1 95% CI (-0.02, 0.23),  $p = 0.1$ .

**Conclusions:** Mothers with HIV in the postpartum period reported poor scores of CEQ and BSS-R compared to mothers without HIV urging a special package of respective maternal care among mothers with HIV at birth.

Risks and rewards of AI-generated HIV prevention and treatment information across four ai platforms

J. Brown<sup>1</sup>, S. Beegle<sup>1</sup>, L. Gomez<sup>1</sup>, J. Blackard<sup>2</sup>, B. Yan<sup>3</sup>, J. Robertson<sup>2</sup>, K. Fedders<sup>2</sup>, L. Dinh<sup>3</sup>, A. Crusey<sup>2</sup>, S. Horner<sup>2</sup>, H. Meeds<sup>2</sup>, W. Liu<sup>3</sup>

<sup>1</sup>Purdue University, Psychological Sciences, West Lafayette, United States, <sup>2</sup>University of Cincinnati, Department of Internal Medicine, Cincinnati, United States, <sup>3</sup>University of Cincinnati, James L. Winkle College of Pharmacy, Cincinnati, United States

**Background:** Despite increasing use of artificial intelligence (AI), there are scant empirical data regarding the strengths and limitations of AI-delivered HIV health information.

The aim of this study was to examine:

- The health information related to pre-exposure prophylaxis (PrEP) and treatment as prevention (TasP) and substance use (alcohol, opioid/fentanyl use) across four AI platforms,
- Core themes present in AI-generated responses, and
- Differentiation of responses across platforms.

**Methods:** Four AI platforms – ChatGPT Plus (ChatGPT-4), ChatGPT-3.5, HIV.gov chatbot, and Google Bard – were queried on four consecutive weeks during July-August, 2023. Queries ( $n=34$  unique questions) were assessed across four domains related to PrEP and TasP regarding:

- Safety, efficacy, and side effects;
- Effects of substance use (broadly);
- Effects of alcohol; and
- Effects of opioids including fentanyl.

Platform-specific responses to each query were recorded verbatim. Qualitative analyses using a conventional content analysis coding approach examined key themes in AI responses both within and across AI platforms, and response comprehensiveness was rated via the number of themes represented in a response.

**Results:** The HIV.gov chatbot frequently, and to a lesser extent, Google Bard were unable to provide responses to some queries. While AI-generated responses typically provided correct information, comprehensiveness differed significantly across platforms, with ChatGPT-3.5 and ChatGPT-4 providing the most comprehensive responses. Core themes included:

- General medication information;
- Medication purposes and recommended uses;
- Recommendations to consult a healthcare provider;
- Side effect information;
- Potential medication interactions with substances and other medications; and
- Information from regulatory and other public health agencies (e.g., FDA-approved indications).

**Conclusions:** Except for instances where the AI platform did not provide a response, AI-generated responses provided correct, factual information related to PrEP, TasP, and the potential effects of substance use.

Responses differed across AI platforms, with Google Bard and the HIV.gov chatbot providing less comprehensive responses relative to ChatGPT. Core themes included medication information, interactions, and side effects with recommendations to seek consultation from healthcare professionals.

## TUPED369

Programmatic mapping and size estimation of key population in Niger state: for an inclusive and evidence based HIV intervention, towards ending AIDS by 2030

C.R. Nwagbo<sup>1</sup>, K. Green<sup>2</sup>, C. Ejeckam<sup>2</sup>

<sup>1</sup>International Centre for Total Health and Rights Advocacy Empowerment (ICTHARAE), Programmes, Abuja, Nigeria,

<sup>2</sup>West African Centre for Public Health Development (WACPHD)/University of Manitoba, Epidemiology, Abuja, Nigeria

**Background:** Key Population (KP) communities representing less than 2% of the population, they contribute to approximately 11% of HIV incidence. In Niger state, HIV prevalence of key population is 10 to 17 times more than the general population.

To provide effective and efficient HIV intervention towards vision 2030, there is need for population size estimates of Men who have Sex with Men (MSM), Female Sex Workers (FSW), Person Who Inject Drugs (PWID) and Transgenders (TG) as none exist in Niger State, Nigeria.

**Methods:** We deployed programmatic mapping and size estimation in 23 LGA of Niger state between October 2022 to March 2023; using ESRI ArcGIS software, we identified and mapped key geographical locations/areas, identified and mapped all web-based spots/apps used by MSM to look for sexual partnerships in Niger state. Interviewed 3750 secondary and 2490 primary key informants using Survey CTO, validated and estimated the size of key populations in their hotspots on usual day and peak day, described the characteristics of identified spots and data analysis was completed using Excel and STATA.

**Results:** The analysis of the data collected and validated from secondary key informants and primary key informants showed that, in the active 3897 KP hotspots mapped in Niger state, it was estimated that, there are minimum of 12605 and maximum of 12605 KPs on a usual day and 14901 and 24323 respectively on a peak day. By typology, for the community of FSW, there are average of 11489 (95% CI 6074 to 10790) in 1415 hotspots, community of MSM are average of 5140 (95% CI 4319 to 5961) in 1000 hotspots, community of TG are 2621 (95% CI 2380 to 2861) in 559 hotspots and community of PWID are 5575 (95% CI 3490 to 7661) in 923 hotspots. For MSM virtual sites, 728 (95% CI 683 to 779 ) from 17 virtual sites.

**Conclusions:** These estimates will be useful to advocate for and in planning, implementation and evaluation of HIV prevention and care interventions for MSM, FSW, PWID and TG as investments are made towards ending AIDS by 2030. Periodic state surveillance activities may consider integrating key population size estimation in their protocols.

## TUPED370

Self-perceived HIV risk and objective behaviors of young students: implications for HIV prevention

J. Xu<sup>1</sup>, J. Lv<sup>2</sup>, C. Yan<sup>3</sup>, H. Dong<sup>1</sup>, X. Zhang<sup>4</sup>

<sup>1</sup>Zhejiang University, School of Public Health, Hangzhou, China, <sup>2</sup>School of Public Health, Second Affiliated Hospital, Zhejiang University School of Medicine, Hangzhou, China, <sup>3</sup>Linping Campus, Second Affiliated Hospital, Zhejiang University School of Medicine, Hangzhou, China, <sup>4</sup>Hangzhou Center for Disease Control and Prevention, Hangzhou, China

**Background:** With the increasing number of young students living with HIV, HIV related prevention is very important but might be hampered by inaccurate self-perceived risk.

Therefore, we aim to evaluate discordance between self-perceived and objectively measured HIV risk among young students and to determine the predictors of young students who underestimated their risk and have higher probability to acquire HIV.

**Methods:** We used an institutional based cross-sectional study design to collect data from 21,962 young students from colleges between November 2022 and May 2023. Self-perceived and objectively measured HIV infection risk were evaluated. Participants were categorized into three groups, i.e., congruent, subjectively underestimating risk and subjectively overestimating risk.

Logistic regression method was used to identify the factors influencing the subjectively underestimating HIV risk of young students.

**Results:** Most young students (94.5%) were objectively evaluated as low risk. Similarly, majority (95.1%) of young students self-perceived themselves no risk for HIV infection subjectively. In total, 4.5% of young students subjectively underestimating HIV risk and 4.3% subjectively overestimating the risk. 91.2% of young students were congruent between objective and self-perceived HIV risk. However, 89.38% of individuals who were objectively evaluated as moderate risk perceived themselves as without any risky sexual behaviors subjectively. 61.90% of individuals who were objectively evaluated as high risk perceived themselves as without any risky sexual behaviors subjectively. In total, 4.51% of young students perceived they had risky sexual behaviors but without objective risky behaviors.

The logistic regression results showed that female compared to male ( $P=0.020$ ), having 2-5 partners compared to more than 5 partners ( $P<0.001$ ), sometimes using condom compared to never using ( $P<0.001$ ), seek PrEP compared without ( $P=0.039$ ) tended to underestimate their risk of HIV infection.

**Conclusions:** Discordance between self-perceived and objectively measured HIV risk among young students does occur, which indicated under/over estimation of one's HIV acquisition risk.

Much efforts need to be made to decrease the vulnerability of young students especially those who have inaccurate HIV risk perception, such as warning education for those underestimating risk subjectively and improving literacy to reduce risk imagination for those overestimating risk subjectively.

## TUPED371

**A cautionary tale of online research procedures for couples-based HIV prevention intervention studies with transgender women and their partners in the United States**

K. Gamarel<sup>1</sup>, E. Stein<sup>2</sup>, W. King<sup>1</sup>, B. McCree<sup>2</sup>, J. Johnson<sup>2</sup>, L. Pollack<sup>2</sup>, T. Neilands<sup>2</sup>, M. Johnson<sup>2</sup>, D. Operario<sup>3</sup>, J. Sevelius<sup>4</sup>

<sup>1</sup>University of Michigan School of Public Health, Department of Health Behavior and Health Education, Ann Arbor, United States, <sup>2</sup>University of California, San Francisco, Department of Medicine, San Francisco, United States, <sup>3</sup>Emory University Rollins School of Public Health, Department of Behavioral, Social, and Health Education Sciences, Atlanta, United States, <sup>4</sup>Columbia University, Department of Psychiatry, New York, United States

**Background:** It Takes Two (T2) is a couples-based HIV prevention intervention designed for transgender women and their partners. At the onset of the COVID-19 pandemic, the T2 clinical trial shifted to online methods for research continuity.

This analysis explores differences in socio-demographics, relationship dynamics, mental health, and HIV outcomes at baseline between participants enrolled in-person and those enrolled online.

**Methods:** In-person enrollment occurred between November 2019 and March 2020 where all study procedures occurred at a field site in the Tenderloin District of San Francisco, California. Study activities restarted completely online in January 2021 and enrollment ended in January 2023. We conducted bivariate analyses to examine differences between participants enrolled in-person and those enrolled online.

**Results:** We enrolled 52 couples (N=104 individuals, 40% in-person and 60% online during the COVID-19 pandemic). Those enrolled in-person were more likely to be African America (31.0% vs. 1.6%,  $p<0.001$ ) and partners were more likely to be cisgender men compared to those enrolled online (71.4% vs. 16.1%,  $p=0.003$ ).

Couples enrolled in-person were more likely to be serodiscordant (47.6% vs. 3.2%,  $p<0.001$ ), have less than a college degree (64.3% vs. 42%,  $p=0.002$ ), be unemployed (58.5% vs. 33.9%,  $p=0.033$ ), and have a history of arrests (72.5% vs. 17.7%,  $p<0.001$ ).

Additionally, those enrolled online had higher relationship satisfaction ( $M=4.2$  vs.  $M=3.9$ ,  $p=0.035$ ), communication ( $M=3.9$  vs.  $M=3.6$ ,  $p=0.021$ ), and goal congruence ( $M=4.5$

vs.  $M=3.6$ ,  $p<0.001$ ), and partners reported lower relationship stigma scores ( $M=1.3$  vs.  $M=1.7$ ,  $p=0.024$ ) than those enrolled in-person. There were no significant differences in relationship length, sexual agreements, PrEP use, viral load, sexual behaviors, or mental health.

**Conclusions:** Despite community-engaged efforts to develop online procedures that would recruit a participant cohort that reflects the current HIV epidemic, findings demonstrate that online recruitment resulted in fewer African American transgender women being enrolled. In-person procedures reached participants who were more structurally vulnerable than those recruited online. Findings also corroborate previous studies suggesting that online methods inadequately engage cisgender male partners of transgender women. In this era of online HIV prevention intervention proliferation, we caution researchers and funders to thoughtfully consider who will be left behind if in-person options are not provided.

## TUPED372

**A community-academic partnership to empower Black MSM for economic development, advocacy, and HIV prevention research: HPTN 096**

I. Haddock<sup>1</sup>, D. Davidson<sup>2</sup>, J. Edwards<sup>1</sup>, J. Espeut<sup>1</sup>, W. Jeffries IV<sup>3</sup>, E. Greene<sup>4</sup>, C. Beyrer<sup>5</sup>, S. Moore-Edwards<sup>6</sup>, D. Vlahov<sup>7</sup>, L. Nelson<sup>7</sup>

<sup>1</sup>The Normal Anomaly Initiative, Houston, United States,

<sup>2</sup>Center for Interdisciplinary Research on AIDS at Yale,

New Haven, United States, <sup>3</sup>Centers for Disease Control

and Prevention, Atlanta, United States, <sup>4</sup>FHI 360, Durham,

United States, <sup>5</sup>Duke University, Durham, United States,

<sup>6</sup>Yale University, New Haven, United States, <sup>7</sup>Yale School of

Nursing, New Haven, United States

**Background:** Despite the effectiveness of HIV biomedical interventions, HIV incidence remains high among Black men who have sex with men (BMSM) in the Southern USA. BMSM must be meaningfully engaged in local HIV responses while prioritizing their needs. Enhancing local community capacity requires more than recruitment to time-limited research advisory boards. The Center for Interdisciplinary Research on AIDS (CIRA) and HIV Prevention Trials Network (HPTN) 096 commissioned a program to build leadership, scientific literacy, and social entrepreneurship capacity among BMSM to promote individual and community economic development while increasing HIV research engagement.

**Description:** CIRA identified two complimentary programs aimed at developing Black queer people: The Investigaytors, developed by Vancouver-based Community Based Research Centre as a method to increase scientific literacy, and Project Liberate, an economic development program, developed by the Normal Anomaly Initiative (TNAI), a Black-led, grassroots Houston, TX organization. Investigaytors has run across Canada building research

capacity in numerous cohorts of young queer people. Two cohorts have completed TNAI's year-long program, and outcomes included developing 48 Black, queer-led businesses.

TNAI, CIRA, and HPTN 096 are developing a program to integrate these two initiatives to train BMSM to create sustainable projects that advance economic justice and promote equity in HIV prevention responses and outcomes in Atlanta, Dallas, Memphis, Montgomery, and Ft. Lauderdale/Miami. Program development began with a TNAI-led retreat that engaged scientists and community leaders.

Activities included a community engagement dinner, development of a theory of change using the Art of Hosting, a collaborative, solution-generating modality, and a review of community capacity building interventions delivered with BMSM.

**Lessons learned:** The community dinner was a feasible approach that attracted 13 BMSM without previous health equity involvement. Participants questioned and contributed ideas regarding the intent and direction of the program, endorsing and providing face validity to the idea that developing qualities common to leadership and entrepreneurship would also prepare BMSM to collaborate in designing local solutions to HIV, while reinforcing the sustainability of grassroots organizations.

**Conclusions/Next steps:** Project Liberate and The Investigators program are both undergoing adaptation, integration, and expansion to build local capacity in community leadership to mobilize and advocate for ending the HIV epidemic.

## TUPED373

Factors associated with oral daily Pre-Exposure Prophylaxis (PrEP) discontinuation among clients at coptic hospitals in Kenya

B. Muthiani<sup>1</sup>

<sup>1</sup>Coptic Hospitals, Clinic, Nairobi, Kenya

**Background:** PrEP has revolutionized HIV prevention for clients who are at risk. Understanding the factors contributing to PrEP-discontinuation remains essential for enhancing its long-term effectiveness.

**Methods:** We conducted a retrospective cohort-analysis for clients who had initiated PrEP between January 2020-December 2023 at eleven Coptic hospital facilities in Kenya. Demographics (gender, age, marital-status, occupation) and HIV-risk-factors (HIV testing-point, client-type, sexual-partner's HIV status, sexual-partner on ART, sex with multiple-partners, recurrent Post-Exposure-Prophylaxis (PEP) use, sex under-the-influence of alcohol, inconsistent-condom-use, PrEP adherence-counselling and signs-of-acute HIV-disease) were explored as predictors. Reasons for PrEP-discontinuation were categorized as: client-related (self-discontinued,

transferred-out, PrEP-non-adherence, Intimate-Partner-Violence (IPV), partner-refusal, numerous HIV-tests); clinical (HIV sero-conversion, renal dysfunction and adverse-drug-reaction).

Multivariable logistic regression with robust standard-errors was used to assess selected predictors of the outcome. Statistical-analyses were done using Stata-17.0.

**Results:** In total, 1350 clients were initiated on PrEP with a median follow-up time of 3months (IQR: 0-11 months); 741 (54.9%) female, mean-age 32.2 (SD=9.9) years.

Overall, 295 (21.9%) had client-related (CR) reasons for PrEP-discontinuation, of whom 184 (62.4%) self-discontinued, 59 (20.0%) had non-adherence, 19 (6.4%) transferred-out, 30 (10.2%) other CR-reasons; while IPV, partner-refusal and numerous HIV-tests, each, contributed only 1 (0.4%) to CR-discontinuation. Eight (0.6%) had clinical-reasons for discontinuation.

In multivariate analysis, clients who were more likely to discontinue PrEP were those in informal-work or without-employment (vs formal-employment, adjusted OR: 5.29; 95% CI: 2.00, 13.98 and adjusted OR: 4.69; 95% CI: 1.69, 13.06 respectively); those whose sexual-partner/s had a negative-HIV-status (vs whose partner/s were living-with-HIV, adjusted OR: 4.88; 95% CI: 1.53, 15.64), those engaging-in-sex while under-the-influence of alcohol (adjusted OR: 6.13; 95% CI: 1.61, 23.27); and those with inconsistent-condom-use (adjusted OR: 2.15; 95% CI: 1.16, 3.99). Conversely, clients who were less likely to discontinue PrEP were those with multiple-sexual-partners (adjusted OR: 0.32; 95% CI: 0.14, 0.72) and those counselled-on-PrEP-adherence (adjusted OR: 0.12; 95% CI: 0.05, 0.30). Recurrent PEP-use, testing-strategy, whether sexual-partner was on ART, client's gender and age were not associated with CR-PrEP-discontinuation.

**Conclusions:** Prioritizing CR-interventions (intensive adherence-counseling during HIV-testing, encouraging partner-disclosure, offering-counseling on substance/alcohol-abuse) and targeted-strategies designed to enhance-communication and prevent PrEP-discontinuation for those at high-risk of HIV maybe essential to address PrEP-discontinuation.

## TUPED374

Innovative model: prisoners' involvement as peer counselors in HIV prevention services provision in prisons under the martial law

S. Bolsheva<sup>1</sup>, O. Zagrebelnyi<sup>1</sup>, O. Mosorin<sup>2</sup>

<sup>1</sup>Charitable Organization Free Zone, Kyiv, Ukraine,

<sup>2</sup>Charitable Organization Free Zone, Peer Counselor from among Prisoners, Kyiv, Ukraine

**Background:** In Ukraine, there are more than 39,000 prisoners in correctional facilities, where the HIV prevalence is several times higher than outside, reaching 7.7%. NGOs were involved in HIV/TB/HCV service provision to prison-

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

ers. However, the provision of services to prisoners has almost stopped due to the prison regime restrictions on visits, and other COVID-19-related quarantine measures, location remoteness, etc. The situation worsened significantly in 2022 with the war outbreak - shelling, air raids, evacuation of prisons, disrupted logistics, and occupation of territories.

**Description:** FREE ZONE has been implementing a unique practice involving prisoners as peer preventive service providers since 2017. Such peer social workers encourage prisoners to undergo HIV testing, distribute needles and syringes, prevent overdoses, assist in early TB detection, form adherence to HIV/TB/HCV treatment, and provide primary legal support.

To train prisoners as peer consultants, paralegals, case finders, and syringe exchange program peer outreach workers comprehensive methodological manuals were developed. Learning webinars were based on these manuals covering ethical standards, basic peer counseling skills, HIV/TB/HCV prevention and treatment services provision, ART adherence formation, harm reduction services, and legal support basics.

The aforementioned practice allows us to introduce peer-to-peer service provision in every prison, solving several problems: - sustainability of service provision and a high percentage of coverage of target groups in prisons; - services are provided at a convenient time for prisoners, almost 27/7; - continuous provision of HIV prevention services amidst the pandemic and war.

**Lessons learned:** During 2020-2023, more than 1330 prisoners underwent training as peer social workers. Following the training, NGOs officially employed 43 prisoners, 98 prisoners as volunteers, and 15 as paralegals.

Continuity of involving prisoners in HIV/TB-related activities was ensured due to systematic approaches to service provision by the peer consultants, especially during the extremely difficult COVID-19 quarantine restrictions and current war hostilities.

**Conclusions/Next steps:** In 2024-2026, we continue training prisoners across all Ukrainian correctional facilities. It enables them to provide peer counseling on HIV in prisons reducing the spread of HIV, TB, and HCV, and to promote adherence to ART and syringe exchange programs, etc.

## TUPED375

"Not every queer woman is informed": multi-level erasure of lesbian, bisexual, queer, and other sexuality and gender diverse women's experiences of HIV in Western Kenya

H. Tucker<sup>1</sup>, R. Odhiambo<sup>2</sup>, A. Mbanda<sup>2</sup>, S. Porter<sup>3</sup>, L. Jadwin-Chadwick<sup>3</sup>, A. Lacombe-Duncan<sup>4</sup>, G. Harper<sup>3</sup>  
<sup>1</sup>University of Michigan, Center for Global Health Equity, School of Medicine, Ann Arbor, United States, <sup>2</sup>Western Kenya LBQT Feminist Forum, Kisumu, Kenya, <sup>3</sup>University of Michigan, School of Public Health, Health Behavior and Health Education, Ann Arbor, United States, <sup>4</sup>University of Michigan, School of Social Work, Ann Arbor, United States

**Background:** There is a dearth of data on HIV risk perceptions and HIV prevention/care needs among lesbian, bisexual, queer (LBQ) and other sexuality and gender diverse women (heretofore referred to as LBQ women), globally, and more so in Sub-Saharan Africa. What little research has been done in Kenya among LBQ women suggests increased risk of negative sexual health outcomes, including HIV, driven by intersectional stigma. Meanwhile, LBQ women are invisible in HIV policy and programming in Kenya. We sought to illuminate HIV risk and perceptions among this population to inform HIV prevention, care, and policy.

**Methods:** We conducted a community-based participatory mixed methods study from 2021-2023: "Empowerment for Us by Us" (E4UBU), a collaboration between the University of Michigan, Western Kenya LBQT Feminist Forum (Let's Be Tested Queens CBO), and Homa Bay LBQ Women and Feminist Network. Semi-structured qualitative interviews were conducted with 40 LBQ women in two counties in Western Kenya (Homa Bay, Kisumu), and surveys were collected from 227 LBQ women in Kisumu County. Quantitative data were analyzed descriptively (e.g., means, standard deviations, proportions) and qualitative data were analyzed using a thematic analysis.

**Results:** Although most participants had engaged in condomless vaginal sexual activity with men, over two-thirds (69%) reported a small or zero chance of acquiring HIV, 13% were already living with HIV, and 37% reported experiencing forced vaginal sex with men. Participants described how assumptions of low HIV risk among LBQ women fuels a lack of funding for LBQ women-specific HIV research and exclusion of LBQ women from LGBTQ+ HIV studies. Participants described negative experiences in healthcare settings, such as accessing testing with same gender partners, including assumptions of heterosexuality, to denial of care. Participants recognized a lack of knowledge about HIV/STIs in their community, and knowledge was a powerful driver of HIV prevention and testing for those who had access.

**Conclusions:** The self-reported HIV prevalence rate among LBQ women was double the Kenyan national seroprevalence rates for women.

Understanding the intersectional stigmatization of LBQ women in Kenya, dispelling myths, creating awareness of risks, and producing evidence for policymakers is crucial to create positive health outcomes among this population.

## TUPED376

"I am not sick, why should I swallow daily pills?": non-uptake of, and adherence to daily oral pre-exposure prophylaxis among adults at high-risk of HIV in Masaka, Uganda

R. Kawuma<sup>1</sup>, S. Nakamanya<sup>1</sup>, G. Nabaggala<sup>1</sup>, S. Kusemererwa<sup>2</sup>, E. Ruzagira<sup>2,3</sup>, J. Seeley<sup>1,4</sup>, PrEPVACC Study Group

<sup>1</sup>MRC/UVRI & LSHTM, Uganda Research Unit, Social Science, Entebbe, Uganda, <sup>2</sup>MRC/UVRI & LSHTM, Uganda Research Unit, Viral Pathogens and Epidemiology Interventions, Entebbe, Uganda, <sup>3</sup>London School of Hygiene and Tropical Medicine, Faculty of Epidemiology and Population Health, London, United Kingdom, <sup>4</sup>London School of Hygiene and Tropical Medicine, Faculty of Public Health and Policy, London, United Kingdom

**Background:** In sub-Saharan African countries, oral pre-exposure prophylaxis (PrEP) has mainly been provided through daily regimens, yet uptake and adherence to oral PrEP in the region are sub-optimal.

We explored non-uptake and adherence to daily oral PrEP among men and women at high risk of acquiring HIV who took part in a PrEP and HIV vaccine trial (PrEPVacc) in Masaka, Uganda. PrEP was promoted and provided to all trial participants.

**Methods:** Between October 2021 and August 2023, we conducted three repeat in-depth interviews with 14 male and 16 female PrEP users, a single interview with 10 participants PrEP refusers (6 females, 4 males) and six focus group discussions (4 with PrEP users and 2 with PrEP refusers of both gender).

We explored attitudes and experiences of using PrEP, and preference of using either daily or event driven PrEP regimen. Thematic content analysis was used to generate themes across the data.

**Results:** Participants' reluctance to take daily PrEP was based on the belief that one was not sick and did not require medication. Many of those who refused to start on PrEP confessed a dislike for oral medication and preferred injections; in the context of the trial, the injection was the HIV vaccine.

Others feared to be seen taking daily pills by their partners, family members and employers because they associated pill taking with being on antiretroviral therapy while some faced resistance from their partners who suspected them of being promiscuous or living with HIV. In many instances, side effects such as nausea and headaches were a 'put off' and often disrupted their daily

routine. However, we noticed that some made efforts to take PrEP during periods they perceived to be at risk of acquiring HIV. There were no gendered differences, rather we noted that both males and females reported these experiences.

**Conclusions:** Participants' interpretation that medicine is for people who are not well and perceived social stigma around HIV affected PrEP uptake. Supporting them to manage stigmatizing situations could improve uptake. Promoting alternative PrEP regimens such as oral event-driven PrEP, and delivering methods such as injectables should be expedited to meet user preferences.

## TUPED377

Co-create innovative PrEP service approaches with the community: experiences from PrEP users in China

Z. Yin<sup>1</sup>, C. Li<sup>2</sup>, Y. Dai<sup>1</sup>, C. Fan<sup>1</sup>, Q. Li<sup>3</sup>, S. Wu<sup>4</sup>, H. Huang<sup>5</sup>, A. Hazra<sup>6</sup>, J. Lio<sup>6</sup>, K. Liang<sup>4</sup>, L. Li<sup>3</sup>, R. Sherer<sup>6</sup>, W. Tang<sup>7,1</sup>, J.D. Tucker<sup>8,7,1</sup>

<sup>1</sup>UNC-Project China, Guangzhou, China, <sup>2</sup>The University of Tokyo, Tokyo College, Tokyo, Japan, <sup>3</sup>Guangzhou Eighth People's Hospital, Guangzhou, China, <sup>4</sup>Zhongnan Hospital of Wuhan University, Wuhan, China, <sup>5</sup>Wuhan Tongxing LGBT Center, Wuhan, China, <sup>6</sup>University of Chicago, Chicago, United States, <sup>7</sup>University of North Carolina at Chapel Hill, Institute for Global Health and infectious diseases, Chapel Hill, United States, <sup>8</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom

**Background:** Co-creation is an iterative, bidirectional strategy that includes researchers and relevant to create knowledge, that may help inform the development of innovative HIV prevention and sexual health services.

This study used co-creation groups to develop posters, videos, and texts promoting PrEP adherence and then assessed their efficacy and potential barriers.

**Description:** Three rounds of co-creation groups were held between 2021 and 2023 in China to develop mobile phone-based PrEP adherence enhancement materials. Six researchers and 19 Chinese adult MSM PrEP users enrolled in the PrEP demonstration trial (NCT04754139) joined the groups. For each co-creation session, we adopted a three-step approach informed by Hawkins and Leask's framework of co-creation activities, which includes participants' consultation, co-production, and evaluation (on the advantages, deficiencies, and suggestions of the co-creation group).

**Lessons learned:** After extensive discussion on the adherence intervention content themes and visual designs during the co-creation sessions, a total of 25 products (19 posters, 3 videos, and 3 text messages) were generated, iterated, and finalized. Among those, 17 products were sent to 910 PrEP users in the demonstration trial via WeChat messages (a popular Chinese chat app).

These products received average scores of 8.25/10, 7.86/10, and 7.25/10 on relevance to the topic, feasibility of utilization, and elaboration, respectively. The most common barriers to PrEP adherence identified during the co-creation sessions include concerns about side effects, perceived PrEP stigma, and difficulties in integrating PrEP into daily life routines.

Participants underscored the effectiveness of product generating, localized community engagement, and self-empowerment during the participation while pointing out the need to:

1. Thoroughly synchronize the activity aims, include diverse users to enrich solicited foci during the consultation;
2. Overcome the subjective and objective barriers that hindered proactiveness building, and balance the engagement and producing avoiding productivism when co-production;
3. Actual intervention effects and follow up activities disclose were needed for evaluation.

**Conclusions/Next steps:** Co-creation can generate culturally appropriate PrEP adherence enhancement materials for Chinese MSM PrEP users, demonstrating high acceptability and feasibility. Trials are needed to understand effectiveness. approaches.

## TUPED378

### Understanding parental motivations and decision-making for adolescent girls' participation in the long-acting cabotegravir (CAB-LA) trial – Insights from HPTN 084-1

M.N. Ndumande-Khoza<sup>1</sup>, H. Chauke<sup>1</sup>, M. Chitukuta<sup>2</sup>, J. Etima<sup>3</sup>, E. Hamilton<sup>4</sup>, K. Matambanadzo<sup>2</sup>, B. Siziba<sup>2</sup>, L. Stranix-Chibanda<sup>2</sup>, N.N. Mgodi<sup>2</sup>, S. Hosek<sup>5</sup>, S. Delany-Moretlwe<sup>1</sup>

<sup>1</sup>Wits RHI, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, <sup>2</sup>University of Zimbabwe, Clinical Trials Research Centre (UZ-CTRC), Harare, Zimbabwe, <sup>3</sup>Makarere-Johns Hopkins University Clinical Research Site, Kampala, Uganda, <sup>4</sup>FHI 360, Durham, United States, <sup>5</sup>University of Illinois Chicago, Chicago, United States

**Background:** HIV disproportionately impacts adolescent girls, yet they are underrepresented in HIV prevention trials in part due to parental consent barriers. In HPTN 084-1, adolescents and their parents provided consent/assent to trial participation.

We aimed to understand parents/guardians' motivations and decision-making process regarding adolescents participating in a long-acting cabotegravir (CAB-LA) trial for HIV prevention.

**Methods:** This study was conducted from October 2021 to July 2022 as part of HPTN 084-1, an open-label study assessing the safety, tolerability, and acceptability of CAB-LA for HIV prevention among adolescent girls aged

under 18 in South Africa, Uganda, and Zimbabwe. Enrolled girls were offered CAB-LA. We conducted interviews with purposively selected parents/guardians (n=15) across all three sites to explore their motivations for allowing their adolescent girls to join the study. We coded transcripts in NVivo 12, created memos, and followed a thematic analysis approach.

**Results:** Parents/guardians' motivations emanated from concerns about HIV and unplanned teenage pregnancy caused by apprehensions about their adolescent daughters' behaviors, including going out at night, not sleeping at home, and difficulties in discussing sexual health. One parent stated:

*"There are a lot of diseases, children have sex anyhow, they don't use condoms. Sometimes, they are just playing, and the next thing they are naked. Children date older people; ...it's good for her to be safe."*

Parents valued the trial's medical benefits, like HIV testing and contraceptives, viewing it as an opportunity to access prevention and sexual and reproductive health (SRH) information. This was perceived as a means of alleviating risks and communication challenges.

Other parents hoped their daughters would be empowered through counseling and trial activities. Reimbursement also served as a motivation. Parents reported positive changes in adolescents' attitudes and behavior, encouraging them to keep their daughters in the trial. Decision-making involved parents and adolescents and sometimes trusted friends and family members.

**Conclusions:** Parents/guardians recognize the risks of HIV and unplanned pregnancies facing their adolescent daughters and value their participation in HIV prevention trials.

Our findings highlight the importance of emphasizing the trial's medical and educational to parents and addressing any concerns they may have about their daughters' participation.

## TUPED379

### Intention to use different long-acting pre-exposure prophylaxis formulations for HIV prevention in transgender and gender expansive Texans: associations with social vulnerability and medical mistrust

P.W. Schnarrs<sup>1,2</sup>, J. Zuniga<sup>3,2</sup>, G. Benitez<sup>1,2</sup>, P. Fliedner<sup>1,2</sup>, A. Norwood<sup>1,4,5,2</sup>, M. Croll<sup>6,7</sup>, J. Buchorn<sup>8</sup>, L.D. Serrano Oviedo<sup>9,2</sup>, J. Oeffinger<sup>10</sup>, R. Lane<sup>11</sup>, E. Schelling<sup>11</sup>, G. Pham<sup>11</sup>, T. Pate<sup>11</sup>, E.M. Arnold<sup>12</sup>

<sup>1</sup>The University of Texas at Austin Dell Medical School, Population Health, Austin, United States, <sup>2</sup>The University of Texas at Austin, Texas Institute for Sexual and Gender Minority Health Research, Austin, United States, <sup>3</sup>The University of Texas at Austin, School of Nursing, Austin, United States, <sup>4</sup>The University of Texas at Austin Dell Medical School, Internal Medicine, Austin, United States, <sup>5</sup>Vivent Health, Austin, United States, <sup>6</sup>The University of Texas Rio Grand Valley, Sociology, Edinburg, United States, <sup>7</sup>GenTex, Edinburg, United States, <sup>8</sup>New York University, Sociology, New York City, United States, <sup>9</sup>The University of Texas at Austin, School of Human Ecology, Austin, United States, <sup>10</sup>Texas Health Institute, Austin, United States, <sup>11</sup>Transgender Education Network of Texas, Austin, United States, <sup>12</sup>The University of Kentucky College of Medicine, Psychiatry, Lexington, United States

**Background:** Transgender and gender expansive (TGE) populations carry a disproportionate HIV burden. Daily oral pre-exposure prophylaxis (PrEP) for HIV prevention in adults was approved by the United States Federal Drug Administration in 2012. Less than a third of PrEP-eligible transgender women have used PrEP. Less is known about PrEP use among transgender men and gender expansive individuals. Longer acting injectable PrEP (LA PrEP) has been approved for use and other formulations are in development. Identifying and examining factors that influence intention to use different formulations is warranted. TGE individuals face barriers related to PrEP use. For example, this population has exposure to more social vulnerabilities and there is also a history of mistreatment that contributes to medical mistrust. Both of these factors need to be considered in relation to intention to use different LA PrEP formulations.

**Methods:** *PrEP for ALL* is a community-based participatory research project that engaged TGE Texans and community-based organizations as collaborators in the research. In total, 482 TGE individuals were recruited and responded to all relevant questions in an online survey. Intention to use three different formulations were assessed: a monthly oral pill, a bimonthly intramuscular injection, and an annual subdermal implant.

After controlling for relevant demographic factors, the association between social vulnerability and medical mistrust with intention to use different LA PrEP formulations was assessed using multiple regression.

**Results:** TGE individuals with higher levels of social vulnerability had greater intentions to use the monthly oral pill ( $\beta = 0.12$ ,  $p = .009$ ), the bimonthly intramuscular injection ( $\beta = 0.18$ ,  $p < .001$ ) and annual subdermal implant ( $\beta = 0.17$ ,  $p < .001$ ). Medical mistrust reduced intentions to use the bimonthly intramuscular injection ( $\beta = -0.18$ ,  $p < .001$ ) and the annual subdermal implant ( $\beta = -0.11$ ,  $p = .021$ ).

**Conclusions:** Social vulnerability and medical mistrust should be considered in the design of new LA PrEP formulations. For example, formulations that increase clinical contact may not be preferable for priority populations with high levels of medical mistrust.

If LA PrEP is going to have a meaningful impact then perspectives of the most marginalized priority populations, like TGE individuals need to be included in the drug development and rollout processes.

## TUPED380

### Training socially-connected fishermen in western Kenya to distribute HIV self-test kits and health facility referral vouchers

J.O. Okore<sup>1</sup>, C.S. Camlin<sup>2,3</sup>, J. Lewis-Kulzer<sup>2</sup>, S.A. Gutin<sup>4</sup>, E. Charlebois<sup>3</sup>, B. Ayieko<sup>1</sup>, Z.A. Kwen<sup>5</sup>, K. Agot<sup>1</sup>

<sup>1</sup>Impact Research and Development Organization, Research, Kisumu, Kenya, <sup>2</sup>University of California San Francisco, Department of Obstetrics, Gynecology and Reproductive Sciences, San Francisco, United States, <sup>3</sup>University of California San Francisco, Department of Medicine, Division of Prevention Sciences, San Francisco, United States, <sup>4</sup>University of California San Francisco, Department of Community Health Systems, School of Nursing, San Francisco, United States, <sup>5</sup>Kenya Medical Research Institute, Centre for Microbiology Research, Kisumu, Kenya

**Background:** Despite significant progress on the HIV response in Kenya, HIV prevalence around Lake Victoria remains high. A key challenge is low HIV testing among men, particularly highly mobile fishermen. The Owete Study (NCT#04772469) employed a social network-based approach to promote testing and linkage to HIV services among fishermen in Siaya County, Kenya. Social networks of fishermen in three beach communities were mapped to identify highly influential and socially-connected men ('Promoters') and close social networks, who were then randomized to intervention or control arms.

We describe Owete's training approach and Promoters' training experiences to offer implementation insights.

**Methods:** Experienced trainers employed interactive methodologies to enhance comprehension among Promoter trainees with diverse educational backgrounds. Training lasted two days: day 1 included both arms, involving: study overview, Promoter-roles, HIV literacy, HIV testing including self-testing, and prevention and treatment information. Intervention Promoters participated in

day 2 which focused on: HIV self-testing demonstrations and peer communication role-plays. After training, control Promoters received non-monetary referral vouchers for peer distribution for local health facility linkage for HIV testing.

Intervention Promoters received HIV self-testing kits for peer distribution, with incentive vouchers (~USD \$3.50) for local health facility linkage following self-testing.

**Results:** There were 146 Promoter trainees (balanced across arms). Promoters were highly engaged, eager to learn, and supportive of targeted health talks and trainings for men, whom they felt had been left out of the HIV response. Promoters felt the knowledge gained improved their understanding of health matters and elevated their social status. Trainer demonstrations and HIV self-testing role plays elicited participant excitement. Promoters felt empowered knowing how to interpret self-testing results. Promoters were pleased that the training provided an opportunity to answer questions about PrEP use and correct misconceptions.

**Conclusions:** Training and engaging social network-central Promoters as lay health workers to spearhead campaigns on health issues affecting fishermen, can leverage established relationships and may prompt increased participation of highly mobile men in health seeking practices. Capacity building through training and providing Promoters with tools to deliver health information and HIV self-testing kits may expand knowledge, trust, and help overcome limited health service access among fishermen.

## TUPED381

Acceptability of HIV Pre-Exposure Prophylaxis (PrEP) among individuals being tested for HIV and healthcare workers in Nyeri County, Kenya

M.J. Wang'ombe<sup>1</sup>, D. Wanjala<sup>2</sup>, P.B. Auko<sup>2</sup>, C. Tarus<sup>2</sup>, S. Mutungi<sup>2</sup>, S. Onyango<sup>1</sup>, F. Ongecha<sup>3</sup>, T. Kahiga<sup>3</sup>  
<sup>1</sup>Kenyatta University, Pharmacy, Kiambu, Kenya, <sup>2</sup>Kenyatta University, Medicine, Kiambu, Kenya, <sup>3</sup>Kenyatta University, Kiambu, Kenya

**Background:** Pre-exposure prophylaxis (PrEP) is highly effective in HIV prevention. However, its uptake remains suboptimal in Kenya tied to differing levels of awareness and acceptability. In 2022, Kenya reported an increase in the number of new HIV acquisition in 10 years, with over 2000 cases.

This study sought to determine the acceptability of PrEP among individuals tested for HIV and healthcare workers (HCWs). The specific objectives were investigating the socio-demographic, socio-cultural, and health system factors associated with PrEP acceptability.

**Methods:** A cross-sectional survey was conducted to assess PrEP acceptability in March 2023 among individuals tested for HIV in Karatina SubCounty Hospital and HCWs

in Nyeri County, Kenya. Participants were administered pre-tested questionnaires and two key informant interviews were conducted. Approval of the study was granted by the Kenyatta University Ethical Review Committee. Statistical analysis was done using MS Excel and SPSS. The confidence level was set at 95%. Chi-square was used to test the association between variables while thematic analysis was used to analyze qualitative data.

**Results:** 60.7% of individuals tested for HIV during the study period were aware of PrEP and 63.6% were willing to use PrEP. Acceptability among HCWs was high as 94.1% were willing to prescribe PrEP. 92.2% of HCWs felt that PrEP preventing HIV acquisition was the main motivation for prescription. There was no statistically significant association between key socio-demographic factors and acceptability of PrEP.

A statistically significant relationship between HIV risk perception and acceptability of PrEP was noted. Stigma ( $P=0.008$ ), a sociocultural factor, and long waiting times at the pharmacy ( $P=0.038$ ), a health system factor, were significantly associated with a reduction in acceptability of PrEP.

**Conclusions:** Findings indicate moderate PrEP acceptability among individuals at risk of HIV acquisition while acceptability among HCWs is high. HIV risk perception, stigma, and long waiting times at the pharmacy significantly affect PrEP acceptability. Strategies should be implemented to address barriers to PrEP acceptability among individuals at risk of acquisition.

The study recommends community engagement in the advocacy for PrEP usage and similar studies be done in different settings to enable a global overview and hence globally accepted strategies in campaigns for PrEP usage.

## TUPED382

Aging concerns and relations with HIV prevention strategies among individuals aged 50 or older in the United States

R. Watson<sup>1</sup>, N. Albright<sup>2</sup>, L. Eaton<sup>1</sup>, E. Morgan<sup>2</sup>  
<sup>1</sup>University of Connecticut, Storrs, United States, <sup>2</sup>Ohio State University, Columbus, United States

**Background:** While most research focuses on HIV prevention and implementation of Pre-Exposure Prophylaxis (PrEP) among young men aged 18-29, a substantial portion of adults who lived through the HIV/AIDS crisis of the 1980s and 90s still age with concerns related to their sexual/gender identities and sexual health.

Concerns about aging in a time with new biotechnological tools to prevent and treat HIV are important to explore given generational differences in attitudes and experiences with the HIV epidemic.

**Methods:** To better understand aging concerns related to HIV prevention among sexual and gender minority adults, a sample of 794 adults both living with and with-

out HIV over 50 years old (mean = 59) residing in the US were asked about their aging concerns related to three domains: general aging concerns (e.g., becoming isolated and lonely), sexual orientation (e.g., lack of support/care due to sexual identity), and gender identity specific-concerns (e.g., lack of support/care due to sexual identity).

The relations of three HIV-related experiences (i.e., HIV serostatus, lifetime use of PrEP, and recent use of PrEP) were investigated among all three aging concerns.

**Results:** Findings revealed that participants living with HIV reported significantly higher aging concerns related to sexual orientation, but not general or gender identity-specific aging concerns.

Additionally, both lifetime and recent PrEP use were associated with significantly higher general aging concerns only.

Last, among heterosexual, older participants, general aging concerns was significantly lower, yet the opposite was true among sexual minority participants—as age increased, aging concerns related to one's sexual orientation also increased.

**Conclusions:** Findings related to sexual orientation-specific aging concerns among participants living with HIV may be related to receiving care related to HIV from health care professionals who are not fluent in the needs of sexual and gender diverse clients.

For participants who used PrEP who also lived through the HIV/AIDS crisis, concerns may shift toward general aging as opposed to specific challenges of aging as a sexual or gender diverse individual.

These findings have implications for strategies healthcare professionals may employ to ensure that their clients are able to engage appropriate support systems and tools while aging.

## TUPED383

[Distribution of SRH products and HIV self-tests to adolescent girls and young women enrolled in a girl-friendly loyalty club: midline results from the AmbassADDors for Health cluster randomized controlled trial](#)

L.A. Sheira<sup>1</sup>, A. Mnyippembe<sup>2</sup>, A. Sabasaba<sup>2</sup>, J. Msasa<sup>2</sup>, L. Packel<sup>3</sup>, J. Allen<sup>2</sup>, E. Katabaro<sup>2</sup>, S. McCoy<sup>1</sup>, E. Anderson<sup>1</sup>, C. Solorzano-Barrera<sup>3</sup>, C. Chiu<sup>3</sup>, P. Njau<sup>4</sup>, J. Liu<sup>3</sup>

<sup>1</sup>University of California, Berkeley, Division of Epidemiology, Berkeley, United States, <sup>2</sup>Health for a Prosperous Nation, Shinyanga, Tanzania, the United Republic of, <sup>3</sup>University of California, San Francisco, School of Nursing, San Francisco, United States, <sup>4</sup>Ministry of Health, Dar es Salaam, Tanzania, the United Republic of

**Background:** With obstructed access to youth-friendly preventive healthcare, adolescent girls and young women (AGYW) in East Africa remain disproportionately

burdened by HIV and unplanned pregnancy. Small drug shops are a promising venue for differentiated service delivery of sexual and reproductive health (SRH) and HIV prevention products to AGYW given their ubiquity in rural communities.

**Methods:** Our *AmbassADDors for Health* cluster randomized controlled trial enrolled 158 drug shops ('ADDOS') in 41 wards within Lake Zone, Tanzania. Shops in intervention areas implemented a girl-friendly loyalty program providing free opt-out HIV self-test (HIVST) kits and SRH products (over-the-counter contraceptives, pregnancy tests) with a shop purchase; shops in 20 control areas offered only free HIVST kits to AGYW. Using electronic sales data, we estimate zero-inflated models controlling for study region with clustered standard errors by ward to estimate the rate of distribution of SRH products between arms at midline (12 of 24 months).

**Results:** From July 2022 – November 2023, 158 shops distributed a cumulative 20,939 HIVST kits, 10,362 units of condoms, 9,962 units of daily oral contraceptive pills (OCP), 5,339 emergency contraceptives (EC), and 9,697 pregnancy tests (UPT).

The rate of HIVST distributions were not meaningfully different by arms (adjusted rate ratio[aRR]=0.94; 95% CI: 0.92, 0.97), but was higher in the intervention arm compared to control for condoms (aOR=15.59; 95% CI: 14.19, 17.13), OCPs (aRR=18.54; 95% CI: 16.0, 21.6), EC (aRR=20.8; 95% CI: 16.2, 26.6), and UPTs (aRR=3.9; 95% CI: 3.7, 4.1). Intervention shops distributed a mean of 9.2, 8.3, 4.8, and 7.3 more units of condoms, OCP, EC, and UPT, respectively, per month compared to control shops (all  $p < 0.01$ ), and 1.17 fewer HIVST kits compared to control shops ( $p = 0.143$ ).

**Conclusions:** Higher distribution of SRH products from intervention shops at midline suggests the intervention facilitates distribution of subsidized contraceptives and UPTs, which will be confirmed in an ongoing validation study, but not necessarily HIVST kits which were free in both arms.

Nonetheless, overall high distribution of HIVST kits affirms both high demand among AGYW for obtaining HIVST kits from drug shops and potentially demonstrates high willingness of shopkeepers to facilitate access to HIVST.

Pediatrics, Chicago, United States

**Background:** Lived experience is a vital form of expertise that contributes to socially valid and impactful research by incorporating the priorities of community members historically excluded from the research process. While Community Advisory Boards are common in HIV research, logistical challenges and a lack of committed resources can prevent community members from being truly engaged in decisions about research in which they participate.

There is a need for a widely adoptable infrastructure that meaningfully integrates community members throughout all stages of the research process.

**Description:** Within the US-based, NIH-funded Pediatric HIV/AIDS Cohort Study (PHACS) Network, we established the Health Education and Community Core (HECC) in 2020 with a team of 13 multidisciplinary staff (including 2 full-time staff) and multiple community groups, including a group of study participants paid as consultants.

The HECC's primary aim is to advance and formalize bi-directional partnership between researchers and community members throughout the research process.

**Lessons learned:** Dedicated resources and staff experienced in plain language communication, community engagement, and graphic design are critical to build the foundation for community partnership in research. Through a committed process of authentic relationship-building, promotion of community leadership, and creation of a flexible and adaptable infrastructure (wherein community members can choose when and how they share input - via email, phone/video call, text, etc.), the HECC has offered myriad services that support

the PHACS research agenda. HECC members participate in setting PHACS' overall research priorities, shaping network policies, crafting research questions and specific aims, reviewing research proposals, determining study procedures, troubleshooting issues with data collection, and interpreting study results.

Because of members' multidisciplinary expertise and skills, the HECC is also able to respond nimbly to ad hoc requests from research teams, such as creating participant resources, study logos, and disseminating results to participants and the public. The HECC's work - whether creative or research-based - centers community voices and lived experiences.

**Conclusions/Next steps:** Purposeful inclusion of lived experience and community priorities across HIV-focused research networks can support more socially valid research that ultimately benefits people living with HIV. The HECC model provides a practical roadmap for other research networks looking to expand their community engagement.

## TUPED385

A qualitative analysis of knowledge, attitudes, and  
practices of sexually transmitted infections among  
youth: perspectives from the Isisekelo Sempilo  
Clinical Trial in rural KwaZulu-Natal, South Africa

Z. Xulu<sup>1</sup>, N. Okesola<sup>1</sup>, C. Herbst<sup>1</sup>, J. Dreyer<sup>1</sup>, J. Seeley<sup>1,4,5</sup>,  
M. Shahmanesh<sup>1,4,6</sup>, T. Zuma<sup>1,4,7</sup>

<sup>1</sup>Africa Health Research Institute, KwaZulu-Natal, South  
Africa, Mtubatuba, South Africa, <sup>2</sup>Africa Health Research  
Institute, KwaZulu-Natal, South Africa, Mtubatuba, South  
Africa, Mtubatuba, South Africa, <sup>3</sup>Africa Health Research  
Institute, Mtubatuba, South Africa, <sup>4</sup>University of KwaZulu-  
Natal, Durban, South Africa, Durban, South Africa, <sup>5</sup>London  
School of Hygiene and Tropical Medicine, London, UK,  
London, United Kingdom, <sup>6</sup>University College London,  
Institute for Global Health, London, UK, London, United  
Kingdom, <sup>7</sup>University College London, Division of Infection  
and Immunity, London, UK, London, United Kingdom

**Background:** Adolescents and young adults (AYAs) in low-income settings face a high burden of sexually transmitted infections (STIs), including an increased risk of a significant risk for HIV. We explored knowledge, attitudes, and practices among AYAs participating in an intervention trial that offered home-based STI self-sampling and integration of HIV and sexual and reproductive health services in rural KwaZulu-Natal, South Africa.

**Methods:** We conducted seventy in-depth interviews in June-December 2020 (telephonically), and September-November 2021 (face-to-face). Male and female trial participants (n=52) and intervention delivery teams (n=18 peer navigators) were purposively sampled. Study and research procedures were explained to participants

and parents/guardians (to gain consent for AYA under 18 years) during recruitment. Interviews were conducted using a semi-structured interview guide. Data were transcribed, translated from IsiZulu into English, and analysed thematically.

**Results:** We found a significant gap in AYA's knowledge about STIs, with the exception of HIV. AYA and the delivery team attributed this disparity to the focus of health promotion on HIV. Young women were more concerned about unintended pregnancy than contracting STIs. AYAs were reluctant to engage in open discussions with parents, peers, and healthcare providers about sex and STIs. They described the negative attitudes to adolescent sexuality perpetuating misinformation about STI prevention and treatment.

Confidentiality and privacy were major concerns. Despite some AYA mentioning they had experienced STI-related symptoms, they did not seek timely medical care, and some, particularly males, opted for traditional healers or home remedies, because they perceived less stigma and greater privacy and confidentiality with these methods.

AYA described the home-based STI sampling and mobile SRH service delivered to young men and women through the trial as meeting their needs. They appreciated the privacy, convenience, and individualised sexual health promotion and care.

**Conclusions:** In a setting with a high burden of HIV, we demonstrated ambivalent attitudes and practices toward STI services among AYAs. There is a need for integrated, private and decentralised services to address a wider spectrum of STIs alongside HIV to reduce HIV and improve sexual health among AYAs.

## TUPED386

Ubomi Bethu! It is our life, let us own it and live it: community leadership by young women working together to prevent HIV in rural Ngqushwa, Eastern Cape, South Africa

K. Pepper<sup>1,2</sup>, B. Ganca<sup>2</sup>, L. Nkanyana<sup>2</sup>, S. Kama<sup>2</sup>

<sup>1</sup>Rhodes University, Community Engagement, Makhanda, South Africa, <sup>2</sup>Ubunye Foundation, Community-led Non Government Organisation, Makhanda, South Africa

**Background:** In South Africa, a third of young women experience sexual abuse before 18 years. This abuse contributed to the 13,000 teenage pregnancies recorded in the Eastern Cape in 2022 and an associated spike in them acquiring HIV.

With funding from Viiv HealthCare, the Ubunye Foundation, a community-led organisation, worked with young women to create their own programme of change.

**Description:** With training and mentoring from Ubunye staff, volunteer learners from nine schools set themselves up as HIV Ambassadors in a project they named Ubomi Bethu: It's Our Life. These Ambassadors talk to their

friends and colleagues, passing on information on HIV prevention and linking young women in need of immediate professional help to a dedicated team of counsellors, teachers, police, legal aid representatives, nurses - all local public sector employees trained and pledged to help young people.

The Ambassadors also refer those in abusive relationships (providing sex for food and luxury goods) to Life Skills groups. Here, they are coached in creating alternative life plans, with each step supported by financial, training, psycho-social, and study assistance.

A targeted mobile app gives the community (men included) access to Ubomi Bethu resources, access to feedback on the project, local resources and an interactive platform where young people can chat anonymously and get support.

**Lessons learned:** Since August 2023, there have been daily personal conversations between Ambassadors and their colleagues, widespread community access to the Ubomi Bethu app, 200 referrals to the Support Team and 80 young women joining Life Skills groups.

Feedback from the Community Led Monitoring in the app indicates a decline in abusive relationships and an increase in uptake of HIV prevention methods, but significantly, through the Participatory Action Research method: photovoice, Ambassadors, learners, and young people speak of their growing confidence and ability to address abuse.

**Conclusions/Next steps:** Young women can effectively design, implement, monitor and evaluate a programme to prevent young women from acquiring HIV, especially when it is caused by their sexual exploitation and abuse. With a community-based support network: a community-led organisation, concerned and informed professionals, and a community-led app, young people lead in making a difference in their lives.

## TUPED387

Effectiveness of digital health interventions on HIV knowledge, testing, and behavioral change among young women and girls in sub-Saharan Africa: a narrative review

Z.R. Sibeko<sup>1</sup>

<sup>1</sup>The Aurum Institute, Implementation Research Division, Parktown, South Africa

**Background:** Robust intervention to ease HIV burden among young women and girls in Sub-Saharan countries is paramount. There is a growing evidence that digital health interventions can successfully influence significant changes in HIV related behaviour among young women and girls. Given the widespread uptake and use of digital media among young people, it is critical to investigate the ever-changing landscape of digital health interventions and their impact on HIV-related outcomes among

Oral abstracts

Late-breaker abstracts

Author Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

young people. Furthermore, the intersection of digital media into healthcare may present new chances to leverage innovative approaches to promote HIV health related interventions to this demographic.

Therefore, this review aims to explore and synthesize existing literature on the effectiveness of digital health interventions on HIV knowledge, Testing, and behavioral change among adolescents in SSA.

**Methods:** A narrative scope review was adopted, following the comprehensive nine-step approach outlined by Juntunen and Lehenkari. English-written articles from 2014 to 2024 were electronically searched from Google Scholar, Science Direct, PubMed, and Medline.

The inclusion criteria consisted of studies that specifically addressed digital health interventions for health promotion among young women and girls in Sub-Saharan Africa, excluded non-English written articles and those with a focus derailing from young women and girls.

**Results:** Studies highlighted evidence supporting the effectiveness of digital health interventions in influencing significant changes in HIV-related behaviour among adolescents in Sub-Saharan Africa. Digital platforms may enhance HIV knowledge dissemination, increasing testing rates, and facilitating positive behavioural changes.

Although digital media has the capacity to expand efficiencies and have positive health interventions, it does not guarantee success. Challenges observed were demographic and socio-economic aspect, culture and education level.

**Conclusions:** Studies reviewed showed that digital health interventions hold promise in addressing the burden of HIV among adolescents in Sub-Saharan Africa. These interventions have the capacity to contribute positively to HIV knowledge, testing, and behavioral outcomes among young women and girls. Digital healthcare intervention may have shortfalls due to challenges of socio-economic and cultural aspect. Innovations to ensure that digital health interventions are culturally sensitive and could be accessible to a larger scale of young women and girls is paramount

## TUPED388

### Community-led research for enhancing pre-exposure prophylaxis (PrEP) uptake among sex workers in Thailand – a national level cross-sectional study

S. Sumalu<sup>1</sup>, S. Sukthongsa<sup>1</sup>, A. Somwaeng<sup>1</sup>, C. Phaennongyang<sup>1</sup>, S. Janyam<sup>1</sup>, C. Manopaiboon<sup>2</sup>, D. Clarke<sup>2</sup>, P. Girault<sup>2</sup>, R. Vannakit<sup>2</sup>

<sup>1</sup>SWING (Service Workers In Group Foundation), Bangrak, Thailand, <sup>2</sup>BIRD (Bangkok Interdisciplinary Research and Development), Phayathai, Thailand

**Background:** SWING Foundation, a sex worker-led community-based organization (CBO), led a national cross-sectional study in collaboration with BIRD (Bangkok Interdisciplinary Research and Development) to investigate low levels of PrEP uptake (8%: MoPH, 2023) among sex workers (SW) – female (FSW), male (MSW) and transgender female (TGSW) despite government policy of free PrEP for anyone who wants it.

**Description:** From April-December 2023, SWING conducted the largest cross-sectional study of SW in Thailand to assess demand for PrEP and decision-making factors in PrEP engagement. We enrolled 621 FSW, 452 MSW and 438 TGSW (n=1,511) in 7 provinces – Bangkok, Pattaya, Chiang Mai, Kanchanaburi, Phuket, Sakaew and Udonthani. SWING engaged in protocol development and defense with the Ethics Committee. We collaborated with provincial public health offices to obtain permission. National government and other key stakeholders served in the study advisory group. We used our connections and our database to promote the study and facilitate SW participation in face-to-face data collection. We identified hotspots for sex work and recruited SW populations. We contributed to questionnaire development and implementation ensuring sensitivity to SW cultures.

**Lessons learned:** The study reveals important findings that can be used to inform advocacy activities, improve SWING interventions for SW and influence Thailand policy on PrEP in line with our strategic plan, 2023-2027. We found evidence of high-risk behaviors, including group sex (21% of respondents) with 95% of these reporting no use of condoms, low levels of HIV testing with 43% not having been tested in the past 12 months, low levels of PrEP knowledge, but relatively high level of interest in PrEP use. Gender-based violence was found to be pervasive among all sub-populations, particularly from clients but also from the society.

**Conclusions/Next steps:** Community leadership in policy-relevant research is not only feasible, but also essential to engage successfully with the different and hard to reach SW populations. We will use the findings to drive the expansion of HIV prevention particularly PrEP services to cover the needs of SW populations and geographical areas. We will advocate for the inclusion of community-led research in the national strategic plan to end AIDS.

## TUPED389

## Mental models reflect continued demand and unique value of vaccines for HIV prevention: insights from an end-user study in India, Uganda and South Africa

J. Mukherjee<sup>1</sup>, P. Saha<sup>1</sup>, V. Loganathan<sup>2</sup>, B. Mohan<sup>3</sup>, J. Chaudhary<sup>3</sup>, U. Gopinath<sup>4</sup>, S. Mohapatra<sup>4</sup>, M. Atujuna<sup>5</sup>, M. Wallace<sup>5</sup>, H. Makkan<sup>6</sup>, R. Kawuma<sup>7</sup>, V. Chakrapani<sup>2</sup>, S. Rawat<sup>3</sup>, A. Dange<sup>3</sup>, A.K. Srikrishnan<sup>4</sup>, K. Ondeng'e<sup>8</sup>, Y.W. Machira<sup>8</sup>, S. ul Hadi<sup>1</sup>

<sup>1</sup>IAVI, Gurugram, India, <sup>2</sup>Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, <sup>3</sup>The Humsafar Trust, Mumbai, India, <sup>4</sup>YR Gaitonde Centre for AIDS Research and Education, Chennai, India, <sup>5</sup>The Desmond Tutu Health Foundation, Cape Town, South Africa, <sup>6</sup>The Aurum Institute, Rustenburg Research Centre, Rustenburg, South Africa, <sup>7</sup>MRC/UVRI & LSHTM, Uganda Research Unit, Entebbe, Uganda, <sup>8</sup>IAVI, Nairobi, Kenya

**Background:** With newer advances in HIV biomedical research, the prevention toolbox is expanding with the inclusion of vaginal rings, long-acting anti-retrovirals and broadly neutralizing antibodies. Numerous global efforts are also being directed towards developing effective HIV vaccines. Thus, it becomes pertinent to understand the continued demand and value proposition of HIV vaccines among key and vulnerable communities in light of other prevention products.

Real-world lived experiences, diverse interactions and deep-seated beliefs around vaccines among potential end-users give rise to mental models which are pivotal in shaping their perceptions and eventual decision-making with regard to HIV vaccines.

**Methods:** Between October 2022 and April 2023, a qualitative study with descriptive-interpretive exploratory design was conducted in 6 sites across 3 countries (India, South Africa and Uganda) among men who have sex with men, transgender women, female sex workers, fishing communities, long-haul truck drivers, adolescent girls and young women and adolescent boys and young men. Using maximum variation purposive sampling, 106 focus-groups (n=848) were conducted. Data were thematically analysed with a focus on mental models of HIV vaccines.

**Results:** Data revealed that end-users perceived vaccines to have distinct values despite the availability of newer prevention options. The following deeply ingrained mental models dominated perceptions around continued need for HIV vaccines:

- Since vaccines train the human body to fight for itself, they provide more durable, efficacious and longer-term protection and are the only tool that can lead to disease elimination;
- Vaccines are well-tolerated even among children and have fewer side-effects than drugs due to lesser frequency and volume of dose;

c. Vaccines are accessed through generalized, routine non-discriminatory immunization systems meant for all, hence will avoid the stigma of being associated with high-risk behaviours;

d. Vaccines are non-habit-forming and not associated with drug resistance.

**Conclusions:** As newer HIV prevention options continue to be made available across regions, ongoing HIV vaccine development efforts will need to articulate the persisting need and distinctive value of HIV vaccines in this continuously evolving context. This messaging can be informed by mental models of vaccines that highlight the continued relevance to community and policy stakeholders.

## TUPED390

## Evolving HIV risk networks among female sex workers in India and need for strengthening linkages to prevention services

B. Mohan<sup>1</sup>, A. Dange<sup>1</sup>, V.R. Anand<sup>1</sup>, A.K. Srikrishnan<sup>2</sup>, P. Saha<sup>3</sup>, S.U. Hadi<sup>3</sup>, S. Rawat<sup>1</sup>, J. Chaudary<sup>1</sup>, Z. Baghel<sup>1</sup>, N. Mutyal<sup>1</sup>, K. Ondeng'e<sup>4</sup>, Y. Machira<sup>4</sup>, V. Chakrapani<sup>5</sup>, J. Mukherjee<sup>3</sup>

<sup>1</sup>The Humsafar Trust, Mumbai, India, <sup>2</sup>YRG CARE, Chennai, India, <sup>3</sup>IAVI, Gurugram, India, <sup>4</sup>IAVI, Nairobi, Kenya, <sup>5</sup>Center for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India

**Background:** High HIV prevalence among Indian female sex workers (1.56% vs. national average 0.22%) underscores the urgent need to address gaps in HIV prevention, notably in the context of evolving digital networks.

In response, a study was launched to understand these evolving HIV risk networks and this abstract focuses on the gaps/needs in engaging FSWs with existing HIV prevention services.

**Methods:** From October 2022 to June 2023, a qualitative study included FSWs aged 18-45 in Chennai, Mumbai, and Delhi, covering physical and digital spaces. Inclusion criteria followed NACO's guidelines for sex work or transactional sex in the past month. 12 focus group discussions (4/site, n=76) and 12 in-depth interviews (4/site, n=12), were conducted. Data analysis employed ATLAS.ti (Version.23.2.1), using a blend of framework analysis and grounded theory to derive key themes.

**Results:** The study included 88 participants with a mean age of 33 years. Among them, 58% operated in physical spaces, 33% in both physical and digital spaces, and 9% exclusively in digital spaces. 37.5% had at least a secondary level of education and the majority (80.7%) considered sex work as their primary occupation. Nearly equal percentages were either married (44.3%) or separated/widowed/divorced (43.2%).

The study revealed that digital spaces benefited FSWs with client screening, autonomy, privacy, and violence protection. Despite challenges like digital illiteracy, many preferred digital platforms. Some FSW groups, like those

on streets or hidden brothels and young girls were hard to reach with interventions. Outreach workers faced difficulties in reaching these unaffiliated groups, and FSWs encountered obstacles accessing services due to awareness gaps, distance, inconvenient operational hours, stigma, and clients' resistance to condom use. Limited access to education materials was also a challenge, attributed to literacy and technological barriers.

**Conclusions:** Findings emphasize the need for nuanced strategies in HIV prevention, especially amid the evolving landscape of digital sexual networks, creating barriers for FSWs to access existing programs.

The study advocates for innovative outreach, urging prevention programs to leverage virtual platforms for knowledge dissemination and health access including testing and treatment linkages.

## TUPED391

Barriers and facilitators of pay-it-forward interventions for HIV/STI research: a systematic review and qualitative evidence synthesis

D. Ho<sup>1</sup>, Y. Liu<sup>2</sup>, J.D. Tucker<sup>3,4</sup>

<sup>1</sup>University of North Carolina at Chapel Hill, Department of Health Policy and Management, Gillings School of Global Public Health, Chapel Hill, United States, <sup>2</sup>University of North Carolina Project-China, Guangzhou, China, <sup>3</sup>University of North Carolina at Chapel Hill, School of Medicine, Chapel Hill, United States, <sup>4</sup>London School of Hygiene and Tropical Medicine, Clinical Research Department, London, United Kingdom

**Background:** Pay-it-forward interventions involve an individual receiving a free health service, then making a monetary or non-monetary donation to support another individual's health service. Pay-it-forward interventions have been used to distribute HIV self-test kits, increase STI test uptake, and distribute sterile needles.

The purpose of this systematic review and qualitative evidence synthesis was to examine barriers, facilitators, and implementation of pay-it-forward approaches in HIV/STI research.

**Methods:** We used the Cochrane Handbook and registered the review in PROSPERO (CRD42024499448). Five databases (PubMed, CINAHL, Embase, PsycInfo, ProQuest) were searched for qualitative studies on pay-it-forward interventions related to HIV/STI research. Thematic synthesis was used to summarize findings. CASP was used to assess the quality of individual studies; GRADE-CERQual was used to assess confidence in the review findings.

**Results:** Twenty-one studies examined pay-it-forward interventions. Fifteen studies concerned secondary distribution of HIV self-tests; five concerned secondary syringe exchange; and one concerned a pay-it-forward approach for STI tests. Studies included heterosexual partners (nine

studies), people who inject drugs (seven studies), pregnant women (six studies), female sex workers (five studies), and men who have sex with men (four studies). Study settings included high- (six studies), middle- (nine studies), and low-income countries (nine studies).

Pay-it-forward interventions increased participant agency and empowered participants to make informed sexual or injection decisions (11 studies, high confidence). Distribution was often motivated by an altruistic concern for the health of partners, friends, and clients, sometimes with moral obligations (nine studies, moderate confidence).

In established marital, sexual, and peer relationships, distribution was mediated by mutual trust and responsibility, aligning with an ethic of care (13 studies, moderate confidence). Distribution to more distant peers was rare but facilitated by shared community identity and social cohesion (seven studies, low confidence). For female partners and sex workers, the key barrier to distribution was anticipated negative recipient reactions, including violence or abandonment (11 studies, high confidence).

**Conclusions:** Pay-it-forward interventions leverage agency, altruism, and relationality to increase HIV/STI testing and sterile needle use among key populations. Social network distribution can empower participants as health agents and draw on a natural propensity for care to enhance HIV/STI services.

## TUPED392

Volunteers' motivation to participate in an experimental medicine trial and experiences with non-conventional invasive sampling techniques

K. Ondeng'e<sup>1</sup>, Y. Wangüi Machira<sup>1</sup>, J. Mdluli<sup>2</sup>, H. Makkan<sup>2</sup>, J. Nyombayire<sup>3</sup>, A. Naidoo<sup>4</sup>, S. Malhotra<sup>5</sup>

<sup>1</sup>International AIDS Vaccine Initiative, Nairobi, Kenya, <sup>2</sup>The Aurum Institute, Rustenburg Research Centre, Rustenburg, South Africa, <sup>3</sup>Center for Family Health Research (CFHR), Kigali, Rwanda, <sup>4</sup>International AIDS Vaccine Initiative, Durban, South Africa, <sup>5</sup>International AIDS Vaccine Initiative, New York, United States

**Background:** Experimental medicine trials (EMT) do not confer immediate benefits to study volunteers and often require unique safety considerations. Non-conventional sampling techniques (NCST) are not typical in clinical care or trials in Africa. We sought to;

1. Understand the volunteers' motivation to participate in EMT and,
2. Elucidate their experiences with NCST including, large blood draws (LBD), leukaphereses and fine needle aspirates (FNA).

**Methods:** We employed a qualitative evaluation among HIV-1 uninfected healthy adults enrolled in IAVI G003, a Phase 1 clinical trial to assess the safety, tolerability, and immunogenicity of an mRNA vaccine immunogen in

Rwanda and South Africa. Semi-structured in-depth interviews were conducted with all 18 volunteers at three time points between June 2022 and June 2023. Audio recordings were transcribed verbatim and meaning-based translations were performed.

We applied a thematic data analysis approach to summarise the results through an iterative coding process. Data was organised using NVivo version 14, a QSR International Software.

**Results:** The volunteers' considerations to participate in the trial involved a complex interplay of intrinsic and extrinsic drivers. Altruistic inspirations such as 'saving humanity', 'finding a cure for HIV', 'saving family and peers' and 'contributing to vaccine development' manifested as important drivers to participation.

These noble ideals were coupled with expectations of benefit to 'protect self from HIV', access to 'health insurance' for self and family, 'HIV testing', 'monitoring of one's health', compensation, 'free treatment' and perceived superior quality care.

Prospective perceptions of the NCST were characterized by fear and anxiety due to anticipated pain, the complexity of the machines and procedures, and the quantity of the blood draw.

Retrospective experiences were characterised by ambivalent reactions including concerns regarding immediate side effects and perceived long-term effects and safety post-trial, a sense of déjà vu and 'feeling fine', to 'not understanding why' the NCST procedures.

**Conclusions:** Our findings demonstrate the feasibility of conducting EMT involving NCST while highlighting literacy gaps including the scientific rationale for trial procedures. This work calls for reimagining the notions of standard of care, adequate compensation, and quality of informed consent in the context of collaborative transnational clinical research.

## TUPED393

### Effective strategies to expand PrEP use among transgender women in Brazil

V.F. Da Silva<sup>1</sup>, P.A. De Souza<sup>1</sup>, C.A.P. Alves<sup>1</sup>, F.D.L.S. Da Rocha<sup>1</sup>, J.R.C. Da Silva<sup>1</sup>, J.V.R. Madruga<sup>2</sup>, A.C.C. Iglessias<sup>2</sup>, L.R. Ramos<sup>2</sup>, P. De Lima e Menezes<sup>2</sup>, R.S. Nogueira<sup>2</sup>

<sup>1</sup>Centro de Referência e Treinamento DST/AIDS, Research Unit /Community Education, São Paulo, Brazil, <sup>2</sup>Centro de Referência e Treinamento DST/AIDS, Research Unit, São Paulo, Brazil

**Background:** Pre-Exposure Prophylaxis for HIV (PrEP) was introduced as a Public Policy in Brazil in 2017. According to data from the Ministry of Health's 2022 monitoring report, PrEP users are predominantly gay men and other cisgender men who have sex with men (84%), with transgender women representing only 4%, concentrated in the age group of 30 to 39. It is crucial to emphasize that while PrEP

is effective, it cannot be considered in isolation, detached from the educational process and sociological and psychological approaches.

**Methods:** From February 2020 to July 2023, the Community Education Program of Casa da Pesquisa/CRT/AIDS developed behavioral and social methodologies to reach the transgender women population not using PrEP.

We implemented the peer education methodology to access social spaces and reach the transgender population, complementing this strategy with social actions and vulnerability reduction initiatives.

**Results:** To implement the peer education methodology, transgender women were intentionally hired for the team. Addressing comprehensive health, we implemented the hormone therapy protocol and a specialized team, providing psychiatric and oral health care.

For vulnerability reduction, we initiated community education for all PrEP users, established social vulnerability criteria for providing food baskets, and launched seasonal campaigns for clothing donations. Additionally, with a focus on a humanized and individualized approach, we introduced birthday presents, birthday cards, and cultural activities.

Evaluating the period from 2020 (pre-implementation of the Community Education Program), we identified a total of 319 PrEP users at Casa da Pesquisa, with 5.3% being transgender women. In July 2023, the total number of PrEP users is 248, with transgender women constituting 22.9%, a significant increase in this population.

This surpasses the data for the state of São Paulo and Brazil, where this population represents 4% of PrEP users, according to the Ministry of Health's report.

**Conclusions:** We conclude that the effectiveness of HIV prevention goes beyond the availability of biomedical technologies and requires a comprehensive approach that includes education, awareness, and behavioral and social strategies.

Our methodology, based on peer education, has proven to be effective in attracting and retaining a substantial group of transgender women and transvestites in our HIV prevention clinical studies.

## TUPED394

Empowering young people through digital innovation

M. Katekwe<sup>1</sup>, J. Ouma<sup>2</sup>, F. Thiye<sup>3</sup>, A. Sanmabo<sup>4</sup>

<sup>1</sup>Global Network of Young People Living with HIV, MEAL, Harare, Zimbabwe, <sup>2</sup>Global Network of Young People Living with HIV, Programmes, Nairobi, Kenya, <sup>3</sup>Global Network of Young People Living with HIV, Programmes, Gaborone, Botswana, <sup>4</sup>Global Network of Young People Living with HIV, MEAL, Abuja, Nigeria

**Background:** The Global Network of Young People has identified a significant gap in opportunities for young people affected or living with HIV to share their stories and advocate for change. The primary objective of READYCast is to provide a platform for young people to raise their voices on policy reforms and create a conducive environment for all of them.

By empowering young people to share their experiences and advocate for change, READYCast is working towards improving the lives of communities affected by HIV and promoting policy reforms that support them.

**Description:** The organization has implemented the READY+ program in seven countries, introducing a series of podcasts called READYCast. The podcast is an open platform and safe space for youth advocates to host discussions with key influencers on various topics such as HIV, SRHR, and human rights. It is edited before being uploaded to Anchor and Spotify and targets adolescents, young people, caregivers, and donors.

**Lessons learned:** The READYCast, an innovative educational content, has covered several topics, including the significance of self-care for mental health, the meaningful engagement of young people living with HIV, and Digital Health Rights.

The program has proved to be highly effective in creating a diverse range of content aimed at reaching out to a wide range of young people. According to the analytics, the number of plays has seen an increase from 2021 to 2022, as shown in the graph.

**Conclusions/Next steps:** The implementation of an innovation aimed at providing young people with consistent and high-quality information, while concurrently amplifying their voices, has yielded significant results. The sub-

stantial increase in the number of listeners serves as a testament to the effectiveness of this intervention, which has evidently filled a gap in HIV response.

## TUPED395

The caregivers' participatory approach to understanding the extent to which OVC services are delivered, their value and the current gaps within OVC services

V. Skiti<sup>1</sup>, L. Hobane<sup>2</sup>, I. Hobane, A. Mokoto, C. Hoffmann

<sup>1</sup>NACOSA, Strategic Information Manager, Cape Town, South Africa, <sup>2</sup>NACOSA, Strategic Information, Cape Town, South Africa

**Background:** Funded by USAID, NACOSA implements HIV/AIDS Prevention interventions in vulnerable populations focusing on orphans and vulnerable children and youth (OVCY) in the Western Cape. The program delivers services to OVCY aligned to the four OVC family-centered objectives of Healthy, Stable, Safe and Schooled.

**Methods:** A qualitative study evaluated the extent to which the services of the program are impacting on eligible OVCY. 90 OVCY caregivers that have been in the program for a year or more were randomly selected from 4 sub-districts in Cape Town, South Africa.

Data were gathered through focus group discussions using an interview guide and content analysis was used to analyze the results.

**Results:** The objectives of the OVCY program were achieved, even though the degrees of achievement differed for each beneficiary and by sub-district. OVCY services were delivered to almost all beneficiaries. Significant successes were achieved in the provision of educational support and school re-enrolments.

The support provided by care workers to children living with HIV and recalling those who were defaulting on ART was viewed as a great benefit. Improved relationships and the ability to have healthy conversations between adolescent girls and their caregivers was highlighted as a value-add of the program.

Strengthened relationships between government departments and the implementing partners facilitated quick turnaround times for beneficiaries to acquire birth certificates and identity documents, enabling them to receive social grants. Caregivers spoke highly about the levels of skill and commitment of care workers but voiced disappointment in retrenchments due to reduced funding opportunities. Participants suggested to increase the number of boys in the program as they are vulnerable to gangsterism, violence and drug misuse.

The need for meaningful income-generating activities and food security was great. Although SRH and HIV prevention interventions were part of the program, these needed to be intensified as teenage pregnancy and early sexual debut was very prevalent.

**Conclusions:** The magnitude of the problem requires co-ordinated efforts to scale up existing interventions and adapting interventions to increase funding for care workers, More support for caregivers. Intensify SRH and HIV prevention interventions/awareness to prevent unwanted pregnancy and early sexual debut. to meet the community-identified needs.

## TUPED396

What attracts young men for VMMC services?  
Finding from a large scale VMMC program in South Africa

N. Igaba<sup>1</sup>, C. Wose Kinge<sup>2</sup>, K. Moyo<sup>1</sup>, M. Phohole<sup>1</sup>, S. Hlongwane<sup>1</sup>, S. Grove<sup>1</sup>

<sup>1</sup>Right to Care, VMMC, Pretoria, South Africa, <sup>2</sup>University of the Witwatersrand, Health Science, Johannesburg, South Africa

**Background:** Voluntary Medical Male Circumcision (VMMC) remains one of the most cost-effective and cost-saving HIV prevention modalities especially when targeted to males 15-29 years in communities with high HIV prevalence and low circumcision saturation. Innovative, targeted demand creation activities are key in reaching this age group. Over a six-year period, Right to Care (RTC) under the Centres for Disease Prevention and Control (CDC) funded VMMC program supported selected districts in South Africa (SA) with VMMC services for HIV prevention. We reviewed data on clients' sources of information about VMMC and reasons for circumcision.

**Methods:** This was retrospective data analysis using routinely collected de-identified program data collected from 15 CDC-supported districts across six provinces between April 2018 and September 2023. Consenting males aged 10 years and above eligible for comprehensive package of VMMC services completed a semi-structured questionnaire on reasons for assessing VMMC and source of information about VMMC. Standard RTC and National Department of Health (NDoH) tools were used for data collection and the data was captured into a cloud-based M&E system with restricted access. Descriptive analysis, and tests of association were done using Pearson's chi-square or Fischer's exact test on extracted dataset.

**Results:** A total of 465,188 clients visited our facilities, with 38% (n=178 622) of males in the age group 15-19 years. Among the males, 98.77% (459,367) successfully had a VMMC procedure performed. When asked why they wanted to be circumcised, most (n=202,705;43.47%) indicated hygiene and cleanliness as the reason for circumcision, followed up by reducing risk of HIV (25,17%, n=117,369), tradition (8.75%; n=40,803), and reduced risk of STI (7.61%; n=35,484;). Friends & relatives (45.64%; n=202,705) and social mobilizers (37.56%; n=175,127) were the major sources of information on VMMC.

**Conclusions:** To reach the target age group of males 15-29 years for VMMC services, peer interventions like use of friend/relatives for VMMC mobilization should be up-scaled. Use and capacitation of social of social mobilisers may increase VMMC uptake. Equally, hygiene and reduction of risk of HIV&STI need to be incorporated in educational materials for VMMC.

## TUPED397

Almost half a century later...are we REALLY HIV aware?: knowledge about female genital schistosomiasis (FGS), family planning, mental health and HIV in Zimbabwe

K. Choga<sup>1</sup>, P. Charashika<sup>1</sup>, K. Takarinda<sup>1</sup>, K. Masiye<sup>1</sup>, I. Nhiringi<sup>1</sup>, L. Gale<sup>2</sup>, S. Moore<sup>2</sup>, K. Webb<sup>1</sup>

<sup>1</sup>Organisation of Public Health Interventions and Development, Harare, Zimbabwe, <sup>2</sup>Avert, London, United Kingdom

**Background:** Risk perception and awareness about HIV pathogenesis is critical to HIV prevention, diagnosis and treatment. Community health-workers (CHWs) form the backbone of HIV information and services in high burden countries.

Our objective was to explore the knowledge and awareness of CHWs around evidence-based risk factors for HIV acquisition including access to family planning methods prevention and treatment of FGS and mental health disorders.

**Methods:** From April to May 2023, we conducted a mixed-method evaluation with 465 CHWs in 9 districts of Zimbabwe about HIV transmission, awareness of family planning methods, FGS and mental health disorders. We collected quantitative data from 465 CHWs using Open Data Kit. Focus group discussions were conducted in April to May 2023 and analyzed thematically.

**Results:** There were high levels of awareness among CHWs (100%; n=465) regarding the importance of HIV testing for personal health awareness. The importance of lifelong adherence to antiretroviral medications among HIV-positive individuals was well recognized in both CHW survey and FGDs. Knowledge of family planning methods was evident, with condoms being the most frequently mentioned (77%; n=357).

However, awareness of Female Genital Schistosomiasis (FGS) was limited (56%; n=260) with varying understanding of its transmission and treatment locations. While participants suggested diverse sources for seeking treatment for MHDs including church-based support, awareness about clinical MHDs was limited.

**Conclusions:** We find that while HIV-awareness in affected communities is high, critical gaps remain. These findings underscore the need for targeted education on FGS and mental health interventions in the community.

## TUPED398

Enhancing HIV/mental health care through  
community-based SACCO Health & Wellness  
Models in Uganda

E. Oboi<sup>1</sup>, S. Mukirane<sup>1</sup>, C. Adoyo<sup>2</sup>, N. Upadhaya<sup>2</sup>, P. Navario<sup>3,2</sup>

<sup>1</sup>HealthRight Uganda, Lira City, Uganda, <sup>2</sup>HealthRight International, New York, United States, <sup>3</sup>New York University, School of Global Public Health, New York, United States

**Background:** In Uganda, men are less likely to know their HIV status in comparison to women. Moreover, recent studies in Uganda show higher HIV prevalence among boda-boda (motorcycle taxi) drivers, prompting National AIDS plans to prioritize prevention and treatment in this sector. The project utilizes a community-based approach to screen men for HIV and common mental health (MH) issues.

**Description:** The project collaborates with existing Community-Based Organizations (CBOs), local health departments, and SACCOs in Africa's transport sector, focusing on men vulnerable to HIV due to high-risk behaviors. Implemented from February 2022 to July 2023, the project trains champions, health staff, and volunteers, conducts sensitization events, HIV testing, and MH screenings. The aim is to link HIV-positive individuals or those with depression to appropriate care.

### Lessons learned:

1. The SACCO Health and Wellness model has proven its effectiveness, with over 4,000 men voluntarily undergoing HIV tests, along with some members of their families. The model is tailored to the mobile nature of men in the transport sector, establishing service centers with flexible hours for easy access to services.
2. Integrating MH care with HIV prevention has shown significant positive outcomes for men living with HIV. The intervention effectively addressed challenges related to medication adherence and MH issues. Providing MH and psychosocial support allowed men living with HIV to tackle underlying challenges affecting their well-being.
3. The approach successfully addressed the mental health gap and increased access to mental health services among men. A total of 3,021 individuals were screened for mental health, with over 4,500 tested for HIV and more than 300,000 community members sensitized about MH and HIV care. The predominant mental health conditions identified were depression (76%), PTSD (55%), and substance use disorders (SUDs) (56%), with a notable symptom reduction rate of 72%.

**Conclusions/Next steps:** The SACCO Health and Wellness Model showcases innovation in integrating mental health services. As SACCO models continue to expand across various communities, there is potential for replication beyond the transport sector.

## TUPED399

Perceived norms and misperceptions about  
PrEP-related behavior and personal willingness  
to take PrEP among all adults across eight villages  
in rural Uganda

J. Perkins<sup>1</sup>, A. Sophus<sup>2</sup>, B. Kakuhikire<sup>3</sup>, C. Baguma<sup>3</sup>, R. Dongre<sup>1</sup>, I. Simmons<sup>1</sup>, P. Gumisiriza<sup>3</sup>, M. Matte<sup>3</sup>, E. Satinsky<sup>4</sup>, C. Audet<sup>5</sup>, A. Pettit<sup>5</sup>, S. Ashaba<sup>3</sup>, A. Tsai<sup>6</sup>

<sup>1</sup>Vanderbilt University, Nashville, United States, <sup>2</sup>Florida International University, Miami, United States, <sup>3</sup>Mbarara University of Science and Technology, Mbarara, Uganda, <sup>4</sup>University of Southern California, Los Angeles, United States, <sup>5</sup>Vanderbilt University Medical Center, Nashville, United States, <sup>6</sup>Harvard Medical School, Boston, United States

**Background:** Perceived norms drive health-promoting attitudes and behaviors, but their relevance to PrEP in an HIV-endemic setting is unknown.

**Methods:** We conducted a study of adults across eight villages in Uganda. Survey questions elicited whether a participant would personally be willing to take PrEP daily (yes/no), talk to a friend/spouse/provider about PrEP (yes/no for each), and react violently to partner PrEP use (yes/no). Participants also reported their own perceptions about how many men and women in their villages would engage in those behaviors.

Participants could choose a response from a 4-point Likert-type scale ranging from 'all or almost all' to 'very few or no one' for these questions. Perceptions were compared with village-rates of personal behaviors to identify the prevalence of men and women misperceiving health-risk PrEP-related behaviors as local norms. Modified Poisson regression models estimated associations between perceived norms (i.e., what majority would do) and personal willingness to take PrEP among adults not living with HIV and adjusting for other factors.

**Results:** Among 1566 participants, 14% reported medium/high personal HIV risk; 11% reported having condomless, non-spousal sex; 44% said that they would be willing to take PrEP.

Overall, 64% of participants would not personally react violently to partner PrEP use and 70%-78% would personally talk to a friend/spouse/provider about PrEP. However, 39-61% thought that most men would react violently and not talk about PrEP, and 14% thought that few to no men would be willing to take PrEP.

Misperceived norms about women were similar. Perceived norms about men and women were associated with personal PrEP uptake willingness.

Oral  
abstractsPoster  
exhibition

E-posters

Late-breaker  
abstractsAuthor  
Index

Perceived Norms [REF = did not think most would engage in that behavior]	Personal willingness to take PrEP daily if free and accessible					
	Model 1*			Model 2*		
	aRR	(95% CI)	p-value	aRR	(95% CI)	p-value
Most men would react violently to partner PrEP use	0.79	(0.71-0.86)	<0.001	-	-	-
Most men would talk with a healthcare provider about PrEP	1.37	(1.08-1.74)	0.008	-	-	-
Most single men would be willing to take PrEP daily	1.27	(1.09-1.48)	0.002	-	-	-
Most women would react violently to partner PrEP use	-	-	-	0.81	(0.72- 0.91)	<0.001
Most women would talk with a healthcare provider about PrEP	-	-	-	1.44	(1.21- 1.72)	<0.001
Most single women would be willing to take PrEP daily	-	-	-	1.32	(1.18- 1.47)	<0.001

\*Adjusted for sex, age, marital status, education, household wealth, alcohol consumption, recent HIV testing, condomless sex, personal HIV risk, & thinking less of others on PrEP.

**Conclusions:** Although most adults would engage in health-promoting PrEP-related behavior, many incorrectly thought peers would not.

Adults who perceived health-promoting PrEP-related behavior as common were more willing to take PrEP themselves.

Strategies to change misperceived norms about PrEP-related behavior use may help increase PrEP uptake.

## Key populations and other vulnerable populations: Behavioural, social and cultural issues and contexts

### TUPED400

Saving souls, healing bodies: faith-based HIV outreach to Black communities in New Orleans

T. Washington<sup>1</sup>, L. Simon<sup>1</sup>, S. Pogroszewski<sup>1</sup>, M. Stevens<sup>2</sup>, M. Broussard<sup>3</sup>, D. Beals<sup>1</sup>, T. Moore<sup>3</sup>

<sup>1</sup>DKBmed, New York, United States, <sup>2</sup>Pilgrim Baptist Church, New Orleans, United States, <sup>3</sup>Ochsner Health, New Orleans, United States

**Background:** Black individuals, particularly those in the southern United States, are disproportionately affected by HIV. Black faith-based organizations (FBOs) have long been recognized as important partners for delivering health-related behavior change interventions. New Orleans, Louisiana, has one of the highest rates of HIV in the United States.

Saving Souls, Healing Bodies: Faith-Based HIV Outreach to Black Communities in New Orleans was designed to tackle this issue by educating clergy, congregants, and clinicians in New Orleans and offering HIV screening at local church-based health fairs.

**Description:** We partnered with a community-based organization, an established local healthcare system, and a network of Black churches in the New Orleans area (Louisiana Freedmen Missionary Baptist Association) to develop and deploy this initiative.

This initiative included engaging local clergy (n = 432) by educating them about HIV transmission and the importance of testing so that they could educate their congregants and encourage testing, hosting health fairs at four local Black churches to screen congregants for HIV, establishing a referral network, and educating clinicians (n = 260) serving those communities so that congregants are referred to providers knowledgeable about preventing and treating HIV. To reduce potential aversion by congregants, screening was also conducted for other conditions (eg, hypertension, diabetes, hyperlipidemia).

In total, 309 people attended the health fairs, 132 were educated on HIV prevention and treatment, 465 were screened for hypertension, diabetes, or other conditions, and 61 were screened for HIV.

**Lessons learned:** While pastors recognized the critical need for this program, some expressed concern about providing HIV education to some of their conservative congregants, who may be uncomfortable given HIV's association with the LGBTQIA+ community.

Nonetheless, the pastors fully supported the education as vital to overcoming the impact HIV has on the community.

**Conclusions/Next steps:** By collaborating with FBOs, expert faculty, and an established local health care system, we provided a comprehensive curriculum for clergy, clinicians, and the communities they serve. Because the congregants were educated about HIV by a trusted source (clergy), stigma some individuals feel about HIV testing may be ameliorated.

### Association between criminal legal system involvement and HIV prevention and care behaviors among transgender women of color: the TURNNT cohort study

A. Furuya<sup>1</sup>, A. Whalen<sup>1</sup>, S.H. Park<sup>2</sup>, A. Radix<sup>3</sup>, G. Torrats-Espinosa<sup>4</sup>, J. Contreras<sup>5</sup>, R. Scheinmann<sup>1</sup>, C. Herrera<sup>6</sup>, K. Watson<sup>7</sup>, D. Callander<sup>1</sup>, J. Schneider<sup>8</sup>, M. Khan<sup>9</sup>, S. Lim<sup>9</sup>, C. Trinh-Shevrin<sup>9</sup>, D. Duncan<sup>1</sup>

<sup>1</sup>Columbia University Mailman School of Public Health, Epidemiology, New York, United States, <sup>2</sup>National University of Singapore, Singapore, Singapore, <sup>3</sup>Callen-Lorde Community Health Center, New York City, United States, <sup>4</sup>Columbia University Mailman School of Public Health, Sociology, New York, United States, <sup>5</sup>Columbia University Mailman School of Public Health, New York, United States, <sup>6</sup>Translatinx Network, Epidemiology, New York, United States, <sup>7</sup>Community Kinship Life, New York, United States, <sup>8</sup>University of Chicago School of Medicine, Public Health Sciences, Chicago, United States, <sup>9</sup>New York University School of Medicine, Population Health, New York City, United States

**Background:** It is estimated that 62% of Black transgender women and 35% of Latina transgender women are living with HIV. Transgender women of color are also targets of over policing; Black transgender women are incarcerated 10 times the rate of the general population.

**Methods:** We conducted a cross sectional analysis using the first-wave data from The Trying to Understand Neighborhoods and Networks Among Transgender Women of Color (TURNNT) Cohort Study. 314 transgender women of color were included in this analysis. 28.7% identified as Black and 46.2% identified as Latina. 49% had previously been arrested and 27.7% had previously been incarcerated. Half of the participants were living with HIV.

We estimated the association of criminal legal system involvement with HIV status as well as HIV testing, condom use, PrEP use, and HIV viral load suppression among transgender women of color living in metropolitan areas. Effect measure modification by race and ethnicity was also analyzed.

**Results:** History of incarceration was positively associated with being HIV positive (ARR: 1.41; 95% CI: 1.15, 1.74). Among those living with HIV, history of incarceration was associated with increased risk of having a detectable HIV viral load (ARR: 4.01; 95% CI: 1.56, 10.4).

Among seronegative individuals, history of arrest decreased the probability of PrEP use, though results were not significant (ARR: 0.70; 95% CI: 0.46, 1.06).

Effect measure modification by race was observed. The effect size for the association between history of arrest and HIV seropositivity was positive among non-Black and non-Latina women, but null for Black women. Among Black individuals, history of arrest was positively associat-

ed with consistent condom use, while there was a negative association among those who identified as non-Black and non-Latina.

**Conclusions:** Within a cohort of transgender women of color, criminal legal system involvement was positively associated with HIV seropositivity and detectable viral load, and it was negatively associated with PrEP use. Race and ethnicity acted as effect measure modifiers. Criminal legal system involvement negatively affects the health of transgender women of color through complex mechanisms; more intersectional research is needed to identify specific pathways and strategies to eliminate or mitigate this effect.

### Assessing population-level outcomes for HIV programmes among female sex workers and men who have sex with men in Nairobi, Kenya

A. Kinyua<sup>1</sup>, R. Kabuti<sup>1</sup>, L. McClarty<sup>2</sup>, S. Isac<sup>1</sup>, H. Musyoki<sup>1</sup>, A. Kiplagat<sup>1</sup>, M. Wanjiru<sup>1</sup>, I. Wanjiru<sup>1</sup>, M. Mbuthia<sup>1</sup>, P. Ong'ayo<sup>1</sup>, P. Arimi<sup>1</sup>, S. Shaw<sup>2</sup>, F. Emmanuel<sup>2</sup>, M. Becker<sup>2</sup>, J. Blanchard<sup>2</sup>, J. Kimani<sup>1</sup>, P. Bhattacharjee<sup>2</sup>

<sup>1</sup>University of Nairobi, Nairobi, Kenya, <sup>2</sup>University of Manitoba, Manitoba, Canada

**Background:** Nairobi has the highest proportion of estimated Female Sex Workers (FSW) and Men who have Sex with Men (MSM). Understanding the gaps and strengths in HIV prevention program designed for FSW and MSM is key to improving programming for these populations and achieving population-level HIV impact.

**Methods:** Mixed-method study was conducted in April-July 2023. Quantitative methods included

- Polling booth surveys and
- Face-to-face interviews with biological sample collection among 759 FSW and 368 MSM.

The qualitative component included 20 focus group discussions. A descriptive analysis of the quantitative data by appropriate stratifications to assess the behavioral, biomedical and structural outcomes. Thematic analysis was done.

**Results:** In the PBS, 81% of FSW reported using a condom at last sex with a client and 73% of MSM used a condom at last sex with a non-regular partner. However, only 62% of FSW and 44% of MSM reported consistently using condoms in the last 3 months. Two-fifths (40%) of FSW and 50% of MSM reported condom non-availability in the last month.

Among HIV-negative participants, only 16% of FSW and 13% of MSM were taking PrEP. 26% of FSW and 11% of MSM reported experiencing police violence in the last 12 months and 12% of FSW and 13% of MSM reported experiencing stigma and discrimination at health care in the last 12 months. 73% FSW and MSM 53% reported experiencing loneliness and sadness continuously for 2 weeks in

the last 3 months. 69% of FSW and 66% MSM were met by a peer educator in the last 3 months and 68% of FSW and 62% of MSM visited a clinic in the last 3 months. HIV prevalence of 14% FSW and 18.6% MSM participants. 87% FSW and 88% MSM were currently on ART. HIV incidence for FSW and MSM was 1.9 and 3.4 per 100 person-years.

**Conclusions:** Study shows a gap in availability and utilization of HIV prevention services. High violence, stigma and discrimination are barriers to utilization of prevention services. High linkage to treatment reported by participants. Study highlights key areas government and partners focus on to improve coverage and quality of services.

## TUPED403

### Preferences for PrEP delivery and PrEP modalities among adolescent girls and young women who are mothers and at risk of HIV in South Africa

J. Chen-Charles<sup>1,2</sup>, L.-G. Bekker<sup>3</sup>, J. Jochim<sup>2</sup>, N. Langwenya<sup>2</sup>, W. Saal<sup>4</sup>, L. Cluver<sup>2,5</sup>, E. Toska<sup>2,6,7</sup>, HEY BABY Research Team

<sup>1</sup>University of Cape Town, Department of Medicine, Cape Town, South Africa, <sup>2</sup>University of Oxford, Department of Social Policy and Intervention, Oxford, United Kingdom,

<sup>3</sup>Desmond Tutu Health Foundation, Cape Town, South Africa, <sup>4</sup>Sol Plaatje University, Kimberley, South Africa,

<sup>5</sup>University of Cape Town, Department of Psychiatry and Mental Health, Cape Town, South Africa, <sup>6</sup>University of Cape Town, Centre for Social Science Research, Cape Town, South Africa, <sup>7</sup>University of Cape Town, Department of Sociology, Cape Town, South Africa

**Background:** HIV continues to be a significant public health challenge, especially among adolescent girls and young women (AGYW) in sub-Saharan Africa. Pre-exposure prophylaxis (PrEP) is an efficacious HIV prevention tool, but real-world uptake of oral PrEP remains extremely low. More nuanced understanding of AGYW preferences regarding PrEP delivery models and modalities is needed to improve PrEP rollout, uptake, and use.

The aim of this study was to understand the preferences for PrEP delivery and modalities of AGYW mothers in an observational cohort.

**Methods:** This study used cross-sectional data from the follow-up survey of a cohort study (HEY BABY) of AGYW mothers in the Eastern Cape, South Africa in 2020-2023. 96% of participants were aged 16-24, 96% had their first child aged <20.

Quantitative descriptive analysis was conducted on self-reported preferences for PrEP delivery and modalities. Associations with current use of family planning services and accessing HIV testing in recent years were evaluated using bivariate and multivariate logistic regression, adjusting for sociodemographic factors.

**Results:** The study included n=582 AGYW mothers who were HIV-negative. 78% had previously heard of PrEP and 11% reported previous PrEP use. 55% said they would

prefer to receive PrEP integrated with family planning services, and 23% preferred other primary health clinics. 90% of participants favoured long-acting PrEP modalities over daily oral pills – of which most preferred long-acting injectables (48%). In multivariate analysis, preference for PrEP delivery integrated with family planning services was significantly associated with current use of family planning methods (OR 1.69, 95%CI 1.00-2.85, p<0.05) and accessing HIV testing in recent years (aOR 1.78, 95%CI 1.05-3.03, p<0.05).

However, participants were less likely to prefer delivery through primary health clinics if they accessed HIV testing in recent years (aOR 0.53, 95%CI 0.30-0.94, p<0.05).

**Conclusions:** Tailoring PrEP delivery to align with AGYW preferences and needs can lead to more effective PrEP uptake and use. Integrating PrEP delivery into other services already accessed by AGYW would be beneficial, such as family planning and SRH services. AGYW prefer long-acting PrEP modalities, which highlights the need for long-acting PrEP to be available and accessible. Increasing awareness and knowledge of PrEP options is essential during rollout.

## TUPED404

### Acceptability of oral HIV self-testing among female sex workers: a qualitative study from Accra, Ghana

T. Nyasulu<sup>1</sup>, E. Asampong<sup>1</sup>

<sup>1</sup>University of Ghana, School of Public Health, Accra, Ghana

**Background:** HIV testing is a key entry point to prevention and treatment measures. Key populations mostly have a lower uptake of HIV testing services because of several factors. In Ghana, HIV prevalence among Female Sex Workers (FSWs) is 11.1% which is disproportionately higher in comparison to the national general population prevalence at 2.1%. This study was conducted to investigate acceptability of oral HIV Self-Testing (HIVST) among FSWs in Accra Ghana.

The aim of the study was to explore awareness of oral HIVST, perceived self-efficacy and perceived effectiveness of the oral HIVST.

**Methods:** A Qualitative study with a phenomenological study design was employed to explore FSWs' acceptability of oral HIVST. Non-probability convenience sampling was used. 5 FGDs (n=30) and 13 IDIs were conducted in Accra, Ghana in Ashaiman, East Legon and Adabraka. Data was collected between May 2023 and September 2023. The data was recorded digitally and transcribed verbatim. Thematic analysis was adopted in the analysis of the data using NVivo 14.

**Results:** The study generally showed a low level of awareness of oral HIVST. Despite this, several advantages were attributed to using oral HIVST including confidentiality, convenience, and ease of use.

Late-breaker abstracts

Author Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

The study further showed a preference to oral HIVST as compared to the standard HIV testing as it is painless and does not involve blood. However, concerns arose about accuracy of the test at diagnosing HIV mostly because of the use of saliva as a sample specimen. Even though many participants (38/43, 88%) expressed confidence in performing the test, all of them could not correctly outline the procedure and only (2/38, 5%) could correctly interpret the results.

**Conclusions:** Acceptability of oral HIV self-testing was high among FSWs with many of them willing to use the oral HIVST attributing it to the benefits of the test. The results suggest that implementation of oral HIVST among FSWs can have a high uptake and help increase HIV testing coverage. There is a need for health education to improve awareness, testing technique and address individual's concerns of the test kit.

## TUPED405

PrEPared for change: injectable PrEP interest among women engaged in sex work in Zambia, a rapid qualitative study

R. Kumar<sup>1,2</sup>, C. Mwale<sup>3,1</sup>, J. Phiri<sup>1</sup>, A. Sharma<sup>1</sup>, K. Mugwanya<sup>2</sup>, D. Rao<sup>2</sup>, W. Barrington<sup>2</sup>, R. Zyambo<sup>4</sup>, M. Zimba<sup>5</sup>, M. Herce<sup>6,1</sup>, M. Musheke<sup>1</sup>

<sup>1</sup>Centre for Infectious Disease Research Zambia (CIDRZ), Lusaka, Zambia, <sup>2</sup>University of Washington School of Public Health, Seattle, United States, <sup>3</sup>Emory University Laney Graduate School, Atlanta, United States, <sup>4</sup>Tithandizeni Umoyo Network, Lusaka, Zambia, <sup>5</sup>Zambia Sex Workers Alliance (ZASWA), Lusaka, Zambia, <sup>6</sup>University of North Carolina, Institute for Global Health and Infectious Diseases, Chapel Hill, United States

**Background:** Women in sex work (WESW) face a 21-fold higher risk for HIV acquisition than the general adult population. Structural barriers including stigma hinder adherence to oral HIV pre-exposure prophylaxis (PrEP). Long-acting injectable (LAI-PrEP), may offer a less stigmatizing and convenient option for this priority population.

With Zambia planning to introduce LAI-PrEP in 2024, the WiSSPr study qualitatively investigated its potential acceptance among WESW in Lusaka, exploring barriers to oral PrEP and prospects for LAI-PrEP.

**Methods:** Utilizing a community-based participatory approach, the WiSSPr study collaborated with key population civil society organizations (CSOs) and Zambia's Ministry of Health. From July-October 2023, we conducted in-depth interviews with 18 WESW and 6 peer health navigators in Lusaka.

Rapid qualitative analysis involved interview memos and an analysis matrix to distill themes, confirmed through team consensus.

**Results:** Participants' average age was 28 years, with 5.8 years in sex work. They showed a strong preference for LAI-PrEP, facilitated by CSO-supported peer networks and service delivery platforms. Preference for LAI over oral PrEP was due to anonymity ("nobody can know that you are on PrEP" [age:21]), potentially reducing anticipated stigma and the ease of adherence ("I wouldn't be forgetting" [age:23]).

Challenges to oral PrEP adherence included missing doses due to alcohol use, anxiety of missing doses when "a client gets you and keeps you" [age:31] for several days, and fear of clients "even beating you [age:31]" if they find pills that could be mistaken for antiretrovirals (ART).

However, some concerns about LAI-PrEP included potential side effects such as weight gain, and prolonged menstrual periods, as well as the loss of solidarity ("sometimes we share tablets but if in jab form, then no sharing" [age:33]).

Misconceptions exist among peer promoters who believe if someone seroconverts after inconsistent PrEP use, "ART will never work in your body [age:29]."

**Conclusions:** LAI-PrEP offers a viable alternative to oral PrEP, addressing adherence challenges and potentially other barriers to HIV prevention for WESW. Peer-led education that explains adverse event risks and supports informed decision-making may enable WESW to choose the HIV prevention method that best suits them.

## TUPED406

Understanding sexual risk during sex work transitions amongst female sex workers in Blantyre, Malawi: a longitudinal life-course narrative study

W.S. Lora<sup>1,2</sup>, D. Sakala<sup>1,2</sup>, E. Sanudi<sup>1</sup>, W. Nyapigoti<sup>1</sup>, A. Saidi<sup>1</sup>, M. Shahmenesh<sup>3,4</sup>, F. Cowan<sup>5,2</sup>, J. Busza<sup>6,7</sup>, N. Desmond<sup>2</sup>

<sup>1</sup>Malawi Liverpool Wellcome Programme, Public Health, Blantyre, Malawi, <sup>2</sup>Liverpool School of Tropical Medicine, International Public Health, Liverpool, United Kingdom, <sup>3</sup>Africa Health Research Institute, Durban, South Africa, <sup>4</sup>University College London, London, United Kingdom, <sup>5</sup>Center for Sexual Reproductive Health, Harare, Zimbabwe, <sup>6</sup>Medical Research Council The Gambia, Serrekunda, Gambia, the, <sup>7</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom

**Background:** Globally, female sex workers (FSW) are estimated to be 30 times more likely to be living with HIV than other women of reproductive age. In Malawi, HIV prevalence amongst FSW is 49.9%.

Sexual risk amongst FSW varies across their life-course, influenced by socio-economic and interpersonal factors which impact behavioural choices and engagement in HIV/STI care. Evidence of FSW's experiences and risks during these transitions remains inadequately investigated.

We explored transitions in the life-course of FSW to understand the shifting dynamics of sexual risk in Blantyre, Malawi.

**Methods:** We conducted a nested longitudinal qualitative study (February 2022 to January 2023) as part of the AMETHIST Consortium, a three-country study designed to reduce the risk of HIV transmission in sex work. We conducted three serial narrative interviews with 30 purposively sampled FSW (22-55 years old) at three-time points (0, 3, 6 months) to explore retrospective factors influencing their life course and document prospectively changes over one year. We compared individual narratives to understand sex work transitions, risk and engagement with HIV services.

**Results:** Transition into sex work was a process shaped distally by financial hardships and disrupted family structures. Proximate influences included social networks and peer interactions.

Once engaged in sex work, women's experiences were characterised by a mix of opportunities, uncertainties, and inevitabilities. While sex work provided a means of livelihood improvement for many, it was marred with uncertain income, normalisation of HIV risk, and exposure to violence. Despite HIV/STI service availability, alcohol and substance abuse hindered consistent engagement with HIV services.

The study highlights cyclical transitions marked by temporary breaks and fluctuating sexual risk. Temporary transitions were primarily influenced by financial stability and relationship status. Sex work breaks may have temporarily reduced exposure to some sexual risks (reduced number of sexual partners) but increased disengagement with PrEP/ART, especially in stable partnerships.

**Conclusions:** Both social and physical drivers shaped sexual risk behaviours. Risk fluctuated along the life course of FSW, influenced by shifting social dynamics tied to broader lifestyle changes within the sex work trajectory. Interventions should consider the changing life-course of FSW and acknowledge the increased risk inherent in transitions.

## TUPED407

Empowering men's health: Mina/Coach Impilo(life) program's innovative approach to addressing HIV-related challenges in South Africa

B.J. Morure<sup>1</sup>

<sup>1</sup>Fola Wellness Services, Clinical Advisor, Boksburg, South Africa

**Background:** The Mina/Coachh Impilo Men's Program is a groundbreaking initiative aimed at addressing HIV-related health challenges faced by men in South Africa. The program, rooted in the concept of "Mina," encourages individuals to take charge of their health, while "Coachh Impilo" involves peer-led support for men openly living

with HIV. Regardless of factors such as sexuality, age, race, tribe, or religion, the program extends its reach to newly diagnosed males, fostering a supportive community.

**Description:** Operational for the past five years, Mina/Coach Impilo operates across diverse urban and rural settings in South Africa, improving the uptake of Men in our health facility and health community campaigns.

The program adopts a unique approach, employing simple and culturally sensitive language encompassing all 11 official languages. Focused on reaching men unable to access clinics due to work commitments, the program delivers medication and establishes treatment partnerships. These treatment buddies accompany individuals until they achieve viral suppression, empowering them to independently manage their health.

Beyond HIV/TB concerns, the program addresses critical issues like gender-based violence, recognizing the broader health implications of societal challenges.

**Lessons learned:** The program's outcomes highlight significant successes. Peer-led support has proven effective in fostering a sense of community, essential for individuals navigating their HIV journey.

The decentralized approach and language inclusivity have bridged communication gaps, making healthcare more accessible. The personalized treatment buddy system ensures adherence and support, contributing to improved health outcomes.

Lessons learned emphasize the importance of culturally competent and community-centric interventions in addressing the complex landscape of men's health, especially in the context of HIV.

**Conclusions/Next steps:** The Mina/Coach Impilo Men's Program signifies a paradigm shift in HIV health interventions for men in South Africa. Its success in reaching marginalized populations and addressing broader health issues beyond HIV/TB underscores its significance.

The program's approach offers a blueprint for future initiatives, emphasizing the need for cultural sensitivity, peer support, and community engagement.

Moving forward, the program's impact extends beyond individual health, contributing to a more resilient and empowered community, resilient against the multifaceted challenges of HIV and related health issues.

## TUPED408

The missing measurement; understanding gaps in uptake of PrEP by MSM

D. Murigo<sup>1</sup>

<sup>1</sup>GALZ, Monitoring and Evaluation, Harare, Zimbabwe

**Background:** The Global Fund Cycle 6 introduced 2 new performance indicators which focused on the number of MSM accessing HIV testing and PrEP. At the beginning of the cycle in Quarter 1 in 2021, only 16 MSM accessed PrEP from the 5 MSM targeted sites.

Oral  
abstracts

Poster  
exhibition

E-posters

Late-breaker  
abstracts

Author  
Index

Oral abstracts

Poster exhibition

E-posters

Late-breaker abstracts

Author Index

The Global Fund Programme is numbers-driven which in the case of MSM who are criminalised should be the secondary not primary focus. GALZ through the monitoring and evaluation department developed client satisfaction surveys for specific public health facilities and worked with mystery clients as a way of investigating ways of improving both demand for and service provision of PrEP in facilities.

**Description:** In Quarter 2 of 2021, GALZ developed a supplementary performance framework that combined qualitative and quantitative indicators which were at both process and results level. The indicators focused on variables such as level of satisfaction with the quality of PrEP services, enablers and barriers of access to services such as distance, user fees, and service provider behaviour, as well as the state of support systems.

**Lessons learned:** MSM reported accessing PrEP improved from 10 in Q1 of 2021 to 34 in Q1 of 2022, 120 in Q1 of 2023, and 167 in Q4 of 2023. Although this only represents 20% of the 822 target, the increase from 10 is very commendable and attributable to the focus on the missing measurement which is Process indicators that edify program implementation.

A holistic understanding of the factors affecting the uptake of PrEP by MSM required more than just a prudent adherence to the Detailed Implementation Plan activities for the 3 years but also a further investigation into why the MSM community did not want to get PrEP services.

**Conclusions/Next steps:** Developing process indicators as part of broader performance frameworks that focus on other crucial elements of programs targeting MSM should be considered not as an option for the partners implementing MSM programs but as a mandate for the Principal Recipient of Global Fund.

The attention should not only be on the health facility itself but broadly on the environment and how enabling it can be for improved access to PrEP

## TUPED409

HIV and syphilis self-testing to support implementation of patient-delivered partner therapy for bacterial STI partner treatment among men who have sex with men

S.A. John<sup>1</sup>, V. Baier<sup>2</sup>, A.M. O'Neil<sup>1</sup>, D. Wheeler<sup>2</sup>, R.D. Hubach<sup>3</sup>

<sup>1</sup>Medical College of Wisconsin, Center for AIDS Intervention Research, Milwaukee, United States, <sup>2</sup>Oklahoma State University, Tulsa, United States, <sup>3</sup>Purdue University, West Lafayette, United States

**Background:** Bacterial sexually transmitted infections (STIs) are rising among men who have sex with men (MSM) in the U.S., with nearly two-thirds of syphilis cases occurring among MSM and roughly 10% of HIV incidence attributable to untreated active chlamydia and gonorrhea infections. Patient-delivered partner therapy (PDPT) is a

presumptive treatment mechanism for sexual partners, wherein people diagnosed with gonorrhea and chlamydia deliver medications to their partners without the need for diagnostic partner testing.

The Centers for Disease Control and Prevention endorsed the use of PDPT for MSM in July 2021, but concerns about missed opportunities for HIV and syphilis testing impede successful implementation.

We explored barriers and facilitators of including a dual HIV and syphilis self-testing device with PDPT among MSM residing in Oklahoma—a priority rural state of the U.S. Ending the HIV Epidemic initiative.

**Methods:** In 2023, HIV-negative or unknown status MSM ( $n=20$ ;  $M_{age}=33.4$ ; 90% cisgender; 55% white, 25% multiracial, and 20% Black or Latino; 50% gay, 35% bisexual, and 15% queer) were recruited for in-depth interviews eliciting responses about access to care, at-home HIV/STI testing, and PDPT. Data were analyzed using inductive and deductive thematic analysis. Recruitment occurred until data saturation.

**Results:** MSM reported inadequate access to culturally competent providers. Despite mixed perceptions, altruism led most participants to indicate the importance of notifying a partner of a bacterial STI diagnosis.

Delivering PDPT with an HIV and syphilis self-testing kit was perceived to increase confidentiality, improve access to appropriate care, decrease time to partner treatment, reduce exposure to anti-gay and HIV/STI stigmas, and avoid insurance and cost challenges.

Participant intervention requests included the need for multimodal educational materials, a letter from a healthcare provider with contact information, medication and safety information, discrete packaging, and a communication guide.

**Conclusions:** PDPT with an HIV and syphilis self-testing kit could help reduce HIV/STI transmission by reducing barriers to partner treatment and testing, but further efforts are needed to reduce remaining barriers to support use. Intervention requests by MSM will be important for maximizing successful uptake. Additional research with providers is needed to identify potential implementation strategies to support prescribing behaviors.

## TUPED410

Intersecting barriers to Pre-exposure Prophylaxis (PrEP) uptake among migrants in Belgium

C. Nöstlinger<sup>1</sup>, E. Van Landeghem<sup>1</sup>, J. Vanhamel<sup>1</sup>, G. Scheerder<sup>1</sup>

<sup>1</sup>Institute of Tropical Medicine, Public Health, Antwerp, Belgium

**Background:** In Belgium, 63% of newly reported HIV cases in 2022 ( $N=595$ ; 51 diagnoses/million inhabitants) were reported among people with foreign nationalities (51% among men having sex with men; among heterosexuals,

54% were of sub-Saharan African (SSA) origin). Yet, migrants were underrepresented among PrEP users: 71% of PrEP-starters were Belgian, 99% were men, 1% had a SSA nationality.

This study aimed at assessing multi-level barriers to PrEP uptake to inform strategies to better reach migrant groups with unmet PrEP need.

**Methods:** This qualitative community-based study collected data from n=8 key informant-interviews (community members/service providers), n=23 in-depth interviews (men having sex with men), and n=7 group discussions (GD) with SSA participants (n=51; women: n=26) in community settings in Antwerp.

Verbatim transcripts of audio recordings were coded in NVivo-12, analyzed inductively using a reflexive thematic approach, and triangulated to assess intersecting barriers.

**Results:** Socio-economic precariousness and undocumented status created barriers to PrEP uptake. HIV stigma and restrictive sexual norms limited participants' PrEP knowledge, especially among SSA participants who perceived their HIV risk to be low.

Several participants had experienced of multiple stigmata: racism and stigma against immigrants intersecting with HIV stigma. Harsh post-migration conditions and potential trauma during migration trajectories resulted in mental health problems for some, especially among LGBTQ+ refugees seeking asylum because of sexual or gender identity.

Huge PrEP information deficits became apparent in the GD, with younger participants feeling both racially targeted and overlooked in HIV prevention.

For some men, access to gay networks and dating apps created new social support systems and a sense of community belonging, which needed to be balanced against increased sexual health risks.

The national PrEP delivery/reimbursement system through specialized HIV clinics using risk-based eligibility criteria was perceived as having a high threshold.

**Conclusions:** Intersecting structural, health systems, community and individual level barriers lead to inequitable access to PrEP in a public health system reimbursing PrEP.

Barriers were particularly high for those most at risk of HIV acquisition due to their socio-economic and legal precariousness. Clinic-CBO partnerships could increase PrEP uptake. PrEP should be made available as a sexual health promotion tool independent of users' legal status.

## TUPED411

### Factors associated with HIV infection among contacts of newly diagnosed PLHIV in Thailand, 2019 – 2023

J. Danyuttapolchai<sup>1</sup>, S. Jiamsiri<sup>2</sup>, P. Prommal<sup>2</sup>, Y. Srikhamjean<sup>2</sup>, C. Lertpiriyasuwat<sup>2</sup>, S. Ongwandee<sup>3</sup>, J. Favaloro<sup>4</sup>, N. Tepmongkol<sup>2</sup>, A. Kanphukiew<sup>1</sup>, S. Northbrook<sup>1</sup>

<sup>1</sup>Centers for Disease Control and Prevention, Nonthaburi, Thailand, <sup>2</sup>Division of AIDS and STIs, Department of Disease Control, Ministry of Public Health, Nonthaburi, Thailand, <sup>3</sup>Department of Disease Control, Ministry of Public Health, Nonthaburi, Thailand, <sup>4</sup>Centers for Disease Control and Prevention, G.A., United States

**Background:** In 2019, the Ministry of Public Health implemented index partner testing (IPT) to strengthen case finding. We investigated factors associated with HIV diagnosis among contacts of index cases in Thailand.

**Description:** All newly diagnosed PLHIV ≥ 1 years of age seeking health services at 107 sites during October 2019 through September 2023 were enrolled in IPT after providing informed consent. Exposed contacts of index clients (i.e., sexual partners and drug injecting partners within the past year, biological children, or biological parents if child was the index client) were elicited, offered HIV testing, and linked to appropriate HIV services. We reported contact's demographic and clinical data using an online system and performed multiple logistic regression to determine factors associated with HIV infection using R.

**Lessons learned:** Of 3,741 contacts elicited, 3,113 (83.2%) were tested for HIV, 583 (15.6%) did not test, and 45 (1.2%) were known HIV-positive. Of those tested, the median age was 30 years (IQR: 24–41), 92.1% (2,868/3,113) had sex with index case, 85.4% (2,658/3,113) were Thai, 65.6% (2,042/3,113) were male, 42.0% (1,309/3,113) lived in the northeastern region, and 30.3% (942/3,113) self-reported as a member of key populations (KP). Of 966/3,113 (31.0%) contacts testing HIV-positive, 926 (95.9%) were sex partners of index cases. Of 433/3,113 (13.9%) contacts with a baseline CD4 result, the median was 328 cells/mm<sup>3</sup> (IQR: 207–449 cells/mm<sup>3</sup>) with 29.4% (128/435) with a CD4 200–350 cells/mm<sup>3</sup>, and 27.1% (118/435) with a CD4 351–500 cells/mm<sup>3</sup>, and 19.8% (86/435) with a CD4 >500 cells/mm<sup>3</sup>. Contacts who did not self-report as KP vs. those who did (Adjusted odds ratio [AOR] 0.78, 95%CI 0.63–0.95), had sex with the index case vs. those who had a biologic relationship (AOR 5.4, 95%CI 1.3–22.9), and reported living in the northern region (AOR 2.5, 95%CI 1.6–3.9) vs. those who live in Bangkok or nearby provinces were more likely to be diagnosed with HIV.

**Conclusions/Next steps:** HIV diagnosis was strongly associated with non-KP, sexual partners, and living in northern provinces. Integrating HIV self-test into index testing services as an option for contacts to test for HIV could potentially increase HIV testing uptake and strengthen case finding.

Implementation of AI navigator for HIV prevention with AIDS healthcare foundation: reducing medical mistrust in LGBT and communities of Color

M. Blasingame<sup>1</sup>, R. Bastani<sup>1</sup>, G. Palmeri<sup>1</sup>, S. Warmuth<sup>1</sup>, H. Patani<sup>2</sup>, W. Engeran<sup>2</sup>

<sup>1</sup>Healthvana, Los Angeles, United States, <sup>2</sup>AIDS Healthcare Foundation, Los Angeles, United States

**Background:** Medical mistrust is high in communities of color and lesbian, gay, bisexual, and transgender (LGBT) communities, given the history of on-going systemic discrimination (Williamson et al, 2018; Martos et al, 2019). Emerging artificial intelligence (AI) healthcare tools have the power to reverse some mistrust, but care must be taken to avoid further division, especially in marginalized communities (Bautista et al, 2023; Bragazzi et al, 2023).

**Methods:** Healthvana, a healthcare client engagement platform, in collaboration with AIDS Healthcare Foundation, an HIV prevention provider, asked 20,000 clients during their routine clinic visit registration if they were interested in early access to an AI Navigator to assist with scheduling and access to Pre-Exposure Prophylaxis (PrEP), an HIV prevention drug.

This registration process also collected demographic information including race and sexual orientation, amongst other demographic markers.

We compared non-white and LGBT client responses to their white and heterosexual/straight responses, respectively, in order to gauge interest in marginalized communities using an AI tool.

**Results:** High interest was indicated by 49.8% of respondents (9,953/20,000) saying 'Yes' to early access. Overall participation of non-white clients was also high, with 71% (6,579/9,264) of all 'yes' responses coming from non-white clients.

Furthermore, non-white clients were the most interested demographic, with 54% 6,579/12,434 of non-white clients responding 'Yes'. 52% (4,536/8,673) of LGBT clients also responded 'yes' at a higher rate compared to 48% (5,139/10,716) of heterosexual/straight clients.

**Conclusions:** These results are promising for AI tools that may assist healthcare providers in reaching out to clients who have apprehension in participating in a system that has historically disregarded their needs, given the high enthusiasm that both of these communities have demonstrated.

AI may then be a way to bring more marginalized communities who may benefit the most from HIV prevention into healthcare clinics to receive the care they need.

## TUPED413

Defining the economic impact of Climate Change on Health in high HIV-burden countries in Africa

M. Reid<sup>1</sup>, S. Silva<sup>2</sup>, V. Whittaker<sup>1</sup>

<sup>1</sup>University of California, San Francisco, Institute for Global Health Sciences, San Francisco, United States, <sup>2</sup>Harvard University, Boston, United States

**Background:** By 2100 global temperatures are projected to rise by > 4 degrees in the 'Business-As-Usual' (BAU) climate scenario and by as much as 2 degrees in the 'Best-Case' (BC) scenario relative to 2019 temperatures, according to the Intergovernmental Panel on Climate Change. Unfortunately, the economic impact of climate on health in high HIV-burden countries has not been well described.

We sought to estimate the economic losses resulting from climate-related mortality in high HIV burden, PEPFAR-supported countries in sub-Saharan Africa (SSA) between now and 2050.

**Methods:** We used the excess mortality risk due to a 1°C increase in temperatures estimated by others to calculate excess deaths due to global warming at ten-year increments between now and 2050. We then calculated expectancy losses and estimated the impact on national income growth in 20 PEPFAR countries in SSA.

In estimating full income, 'Value of Statistical Lives' (VSLs) were estimated using benefits transfer, with a US VSL of US\$11,77 9611 at an annual per capita income of \$13,416 and an income elasticity of 1.0.

We compared full income losses resulting under the 'BAU' climate trajectory and the 'BC' scenario.

**Results:** Across 20 PEPFAR-supported countries in SSA, full income losses from climate-related deaths will be in excess of US\$54.1 billion per year in 2030, >US\$80 billion per year in 2040, and >US\$117.0 in 2050 in the BAU scenario.

The BC climate scenario will lead to full income losses from climate-related deaths of \$49 billion per year in 2030, \$69.5 billion in 2040 and \$89.3 billion in 2050 in the same 20 countries.

The economic impact will be greatest in Nigeria, where annual full income losses resulting from climate deaths will be \$61.3 billion in 2050 in the BAU scenario and \$46 billion in the BC scenario.

**Conclusions:** Climate-related deaths will increase substantially between now and 2050, regardless of the climate scenario across SSA.

However, in the BAU, full income losses from climate-related deaths will have a much more marked economic impact.

As PEPFAR-supported countries plan for HIV sustainability, there is a pressing need to also adopt climate-responsive health policies to both maintain HIV gains and mitigate climate-related threats.

## TUPED414

### Innovative approaches to HIV prevention and stigma reduction among vulnerable populations: a case study of the 'Blind Chat' and 'I-atm' Initiatives

M. Gideon<sup>1</sup>, Y. Thomas<sup>1</sup>, S. Ndowah<sup>2</sup>, A. Amamata<sup>3</sup>, N. Aminatu<sup>4</sup>, E. Gubha Sama<sup>4</sup>, K. Suleman<sup>1</sup>

<sup>1</sup>ICAD Center of Excellence, Computer Science, Dschang, Cameroon, <sup>2</sup>ICAD Center of Excellence, Advocacy, Dschang, Cameroon, <sup>3</sup>ICAD Center of Excellence, Marketing and Outreach, Dschang, Cameroon, <sup>4</sup>ICAD Center of Excellence, Training and Capacity Building, Dschang, Cameroon

**Background:** Vulnerable populations, including men who have sex with men (MSM), sex workers, transgender individuals, and people who inject drugs, face heightened risks of HIV infection and pervasive stigma.

Traditional HIV-related interventions often fall short in addressing their unique needs and concerns. "Blind Chat" and "I-atm" were conceived to bridge this gap.

**Description:** The "Blind Chat" project leverages an innovative mobile application to provide counseling, prescriptions, and support for individuals living with HIV/AIDS. Its unique feature is anonymity, allowing users to access services discreetly, reducing the fear of discrimination. The "I-atm" initiative takes this concept further by deploying automated machines that dispense ARTs and distribute free condoms, ensuring accessibility and privacy.

**Lessons learned:** The case study illustrates the effectiveness of technology-driven, community-led interventions in addressing behavioral, social, and cultural barriers to HIV prevention.

Key lessons include the power of community ownership, tailored interventions, and data-driven adaptations to ensure impact.

**Conclusions/Next steps:** "Blind Chat" and "I-atm" represent groundbreaking approaches that have transformed the landscape of HIV prevention and stigma reduction.

These initiatives offer a blueprint for addressing behavioral, social, and cultural issues among key populations and other vulnerable groups.

The integration of innovative technology with community engagement has the potential to create a more inclusive and supportive environment for HIV prevention and care.

**Next steps:** The success of these projects underscores the need for broader adoption of similar interventions worldwide. Scaling up technology-driven, community-led initiatives can significantly contribute to reducing the burden of HIV/AIDS among key populations and other vulnerable communities. Collaboration, knowledge exchange, and policy advocacy are essential for advancing these approaches on a global scale.

## TUPED415

### Exploration of the co-delivery of long-acting injectable antiretroviral therapy (iART) and long-acting injectable medication for addiction treatment (iMAT) for people with HIV and comorbid substance use disorder

J. Montoya<sup>1,2,3</sup>, J. Delgado<sup>1</sup>, J. Narez<sup>1</sup>, J. Westcott<sup>4</sup>, C. Mueller<sup>2</sup>, P. Highfill<sup>4</sup>, G. Aarons<sup>1,3</sup>, D. Grelotti<sup>1,2</sup>

<sup>1</sup>University of California San Diego, Psychiatry, San Diego, United States, <sup>2</sup>University of California San Diego Health, Owen Clinic, San Diego, United States, <sup>3</sup>University of California San Diego, ACTRI Dissemination and Implementation Science Center, San Diego, United States, <sup>4</sup>Stepping Stone of San Diego, San Diego, United States

**Background:** Long-acting injectable antiretroviral therapy (iART) paired with long-acting injectable medication for addiction treatment (iMAT) has the potential to improve the health of people with HIV and comorbid substance use disorder (PWH and comorbid SUD).

The objective of this mixed methods study is to assess perceptions of the co-delivery of iART and iMAT and to explore implementation determinants of the co-delivery of iART and iMAT.

**Methods:** PWH and comorbid SUD (n=23) and providers (n=14) participated in a mixed methods study involving a quantitative survey and focus group. Participants were recruited from an HIV clinic and SUD treatment program. A total of four focus groups with PWH and comorbid SUD and two focus groups with providers were conducted between April and July 2022. The quantitative survey included measures of acceptability, appropriateness, and feasibility of the co-delivery of iART and iMAT (total scores for each measure range from 1 to 5, with 5 indicating more favorable ratings).

A semi-structured guide, informed by the Exploration, Preparation, Implementation, Sustainment (EPIS) framework, was used to guide focus group discussions. Qualitative data generated from the focus groups were examined using a rapid qualitative analysis and triangulated with quantitative data.

**Results:** Overall quantitative ratings [median (IQR)] of acceptability [4.0 (3.7-5.0)], appropriateness [4.0 (3.9-5.0)], and feasibility [4.0 (3.8-4.8)] of co-delivering iART and iMAT were highly favorable. However, providers reported hesitation in prescribing iART to PWH and comorbid SUD due to concerns of the lower barrier of resistance with iART and high prevalence of commodities (e.g., Hepatitis B) that may be contraindicated for iART. PWH and comorbid SUD reported low awareness of iART and iMAT and described how various social determinants of health (SDOH; e.g., housing stability) might negatively interfere with adherence to iART and iMAT clinic visits.

**Conclusions:** Co-delivery of iART and iMAT is perceived as highly acceptable, appropriate, and feasible for PWH and comorbid SUD. Several implementation barriers

Oral abstracts

were identified, highlighting the need for implementation strategies focused on mitigating provider concerns, increasing PWH awareness of these regimens, and addressing SDOH related to the co-delivery of iART and iMAT.

## TUPED416

**A comprehensive analysis of sexual health, behaviors, and prevalence of HIV, syphilis, and HCV among transgender women in Bangladesh: findings from the Integrated Bio-Behavioural Survey (IBBS) 2020**

M.M. Rahman<sup>1</sup>, S. Islam<sup>1</sup>, M.R. Sarker<sup>1</sup>, F. Haseen<sup>2</sup>, S. Alam<sup>3</sup>, M. Hasan<sup>2</sup>, S.U. Munshi<sup>3</sup>

<sup>1</sup>AIDS/ STD Programme, Dhaka, Bangladesh,

<sup>2</sup>Bangabandhu Sheikh Mujib Medical University, Department of Public Health and Informatics, Dhaka, Bangladesh, <sup>3</sup>Bangabandhu Sheikh Mujib Medical University, Virology, Dhaka, Bangladesh

**Background:** The 2020 Integrated Bio-Behavioural Survey (IBBS) assessed HIV, syphilis, and hepatitis C prevalence among TGW (self-identifying as part of the traditional Hijra sub-culture). The survey explored risk behaviors, access to prevention/treatment, experiences of stigma, discrimination, violence, and TWG's knowledge about HIV/sexually transmitted infections (STIs) in Bangladesh.

**Methods:** The IBBS survey, aligning with WHO and UNAIDS guidelines, sampled TGW populations (n= 1172) in seven districts between October and December 2021, through face-to-face interviews and testing for HIV, syphilis, and HCV.

**Results:** The TGW Participants were recruited from seven intervention districts, with 35% falling within the 18-24 age group and 50% having education up to the primary level. Over the past six months, TGW reported a median of seven partners for anal sex, with 74% acknowledging having ever sold sex and 57% engaging in sex work for money during the same period. Among TGW who had anal sex with casual male partners, only 38% reported using condoms during the last encounter. While 90% of respondents had experience using condoms, consistent use during anal sex in the past six months was relatively low at 38.5%. Reasons for non-use included client objections, personal choice, and, significantly, the unavailability of condoms reported by over 40% of TGWs. Despite 93% being aware of STIs, only 36% and 48% were knowledgeable about three or more STI symptoms in males and females, respectively. A mere 20% could accurately answer all five questions related to HIV prevention.

Concerning HIV testing, 67% of TGW had ever been tested, varying from 50% to 91% across districts. The overall prevalence of HIV was 1%, with the highest rate recorded in Rajshahi at 2.6%. The prevalence of active syphilis was notably high at 11.9%, with a potential outbreak indicated in Chattogram (24.7%).

Conversely, the prevalence of HCV was low at 0.3%. Among the TGW, only 3% of participants reported being arrested in the last six months.

**Conclusions:** The findings underscore the complexities surrounding sexual health knowledge, practices, and prevalence of infections within the TGW community, emphasizing the need for targeted interventions and education programs to address these issues comprehensively.

## TUPED417

**Barriers and facilitators in targeted interventions service uptake among Transgenders in Puducherry, India: a sequential explanatory mixed method study**

K.M. Abdul Basith<sup>1</sup>, Z.R. Ismail<sup>1</sup>, A. Arthi<sup>1</sup>, S. Amirdhavarshini<sup>1</sup>, C. Palanivel<sup>1</sup>

<sup>1</sup>Jawaharlal Institute of Medical Education & Research (JIPMER), Preventive & Social Medicine, Puducherry, India

**Background:** This study assessed targeted interventions (TI) service utilization among transgender individuals in Puducherry, India, a high-risk group under the National AIDS Control Programme. Despite comprehensive services available, gap exists in service uptake and the study also explored barriers and facilitators impacting this vulnerable population's service uptake.

**Methods:** The study (sequential explanatory mixed-method design) was conducted at community-based organization drop-in center after Institutional Ethics and Research Review Committees' approval. Ninety-nine transgender individuals were surveyed using a structured questionnaire, and qualitative component had FGDs (among TGs), IDIs (among TGs) & KIs (with programme manager, outreach worker, peer-educators, ICTC counsellor, TI coordinator and dermatologist). Qualitative data underwent thematic content analysis.

**Results:** The mean age of the participants was 29±8 years and majority of them had completed their school education with were graduates. Most of them were unemployed (41.4%) and resorting to alms. Majority of them were living with their family (60.6%). Most of them were getting HIV/ AIDS testing as per TI norms. Despite high testing rates, barriers like stigma, discrimination, and cumbersome registration processes were prevalent. Facilitators and barriers of service uptake at different levels highlighted by various stakeholders in service uptake and delivery is highlighted using socioecological framework. (Figure 1)

**Conclusions:** Transgender individuals in Puducherry face challenges in accessing health services, primarily due to systemic barriers and stigma. To enhance service uptake and delivery, we recommend sensitizing stakeholders via regular training and adopting a transgender clinic model with evening hours for accessibility. Services, especially condoms and lubricants, should be tailored to meet community needs. A shift towards quality-focused service

delivery, coupled with revised human resource norms, will ensure more effective care. Strengthening community-based screening and engaging unaffiliated transgender groups are also crucial for comprehensive coverage.

Figure 1. Facilitators and barriers of service uptake among transgenders (socioecological model).

## TUPED418

Increase of synthetic opioid use: two evidence-based and low threshold interventions to prevent drug-related deaths

D. Schaeffer<sup>1</sup>, M. Kuban<sup>1</sup>, S. Fleißner<sup>2</sup>, H. Stöver<sup>2</sup>

<sup>1</sup>Deutsche Aidshilfe - German Aids Federation, Drugs and Prison, Berlin, Germany, <sup>2</sup>University of Applied Sciences, Frankfurt, Germany

**Background:** Synthetic opioids are a major contributor to drug-related deaths in different countries (2020, USA 75% of 91.799 drug-related deaths; 2021, Canada 81% of 7.560 opioid-related deaths). Also in Europe (e.g. Ireland, England, Estonia) synthetic opioids are responsible for a sharp increase in the number of drug overdoses. Germany saw 2022 a renewed increase in drug-related deaths for the sixth year in a row (1.990 cases). Synthetic opioids was registered in 86 cases. Two german studies (Take Home Naloxone and Rapid fentanyl testing) have proven measures for preventing opioid-related drug emergencies and drug deaths.

**Description:** RaFT (Rapid fentanyl Testing): The multi-centred study was carried out in 17 drug consumption rooms. With easy-to-use rapid tests, 2.736 heroin samples were tested. Users receive the result quickly, anonymously and have no loss of heroin. If the test is positive, fentanyl-related counselling is provided. The main goal was to raise awareness for fentanyl and support fact-based consumption decisions.

NALtrain (Take Home Naloxone): It is a nationwide program that trains opioid users and employees in the use of naloxone and provides them with the medication in case of an emergency.

**Lessons learned:** RaFT: Within 6 months, 3% of the samples tested positive for fentanyl. After fentanyl-related counselling, one in five users took advantage of harm reduction measures such as dose splitting.

NALtrain: Around 700 people were trained as multipliers in 72 training sessions by the end of 2023. Around 1,000 participants were provided with THN. 90 uses of naloxone were documented. No deaths were recorded.

Both projects shows that there is a great interest and willingness among employees and users to implement new, low-threshold and effective harm reduction measures.

**Both interventions are highly effective in preventing drug emergencies and drug-related deaths.**

**Conclusions/Next steps:** In view of the fact that drug checking cannot be implemented politically in many countries, fentanyl rapid tests is one effective way of reducing harm. Take-home naloxone is an inexpensive life-saving drug that every user should be equipped with. **Both projects are building blocks of effective and evidence based strategies that can be applied regardless of the economic status of the countries.**

## TUPED419

"Go Back to Your Country": trials and tribulations of accessing healthcare in South Africa for cross-border Lesotho-South Africa male and female migrant workers

J.E. Mantell<sup>1</sup>, A.A. Howard<sup>2</sup>, A. Low<sup>3</sup>, F. Ndagije<sup>4</sup>, M. Lethoko<sup>4</sup>, M. McCarthy<sup>5</sup>, G. George<sup>6</sup>, M. Strauss<sup>6</sup>, Y. Hirsch-Moverman<sup>2</sup>

<sup>1</sup>Columbia University, Psychiatry, New York, United States,

<sup>2</sup>Mailman School of Public Health, Columbia University, ICAP & Epidemiology Department, New York, United States,

<sup>3</sup>Mailman School of Public Health, Columbia University, Epidemiology Department, New York, United States,

<sup>4</sup>Columbia University/Lesotho, ICAP, Maseru, Lesotho,

<sup>5</sup>Mailman School of Public Health, Columbia University, Population and Family Health Department, New York, United States,

<sup>6</sup>University of KwaZulu-Natal, HEARD, Durban, South Africa

**Background:** Migrant workers face greater risk of suboptimal health status, including increased vulnerability to HIV. We explored perceived challenges and recommendations regarding access to healthcare services in South Africa (SA) among Lesotho migrants.

**Methods:** We used purposive sampling to recruit Lesotho migrant workers working in SA from community organizations serving migrant workers and at border crossings for 10 same-sex focus group discussions (FGDs) divided equally by sex. Data were analyzed using template methods.

**Results:** We enrolled 84 migrant workers (40 men, 44 women), with median age 40.5 (IQR, 32.8-53.0); 42.9% completed primary school and 38.1% secondary school. Length of time as migrant worker varied: 27.3% ≤1 year, 28.6% 1-4 years, 15.5% 5-10 years, 28.6% >10 years. Domestic work (32.1%), mining (17.9%) and construction (13.1%) were the dominant employment sectors.

Author Index

Only 27.4% possessed a work permit; all but two were men. While services in SA were seen as professional and efficient, discrimination (*"go back to [your] country to collect medication"*), lack of legal status and proper documentation (*"I will go there without my passport or any form of identification, they just will not show me where to have my [HIV] test"*), unfriendly and disrespectful treatment by healthcare providers (*"I never went to a clinic while I was there...I already knew how they will talk to me... they'll be rude..."*), lack of access to medications (*"South African medication is for South Africans only"*), reported in nearly all FGDs, discouraged migrant workers from seeking healthcare services in SA.

Transportation costs, non-alignment of clinic and worker hours, and language differences were other impediments to receiving health services.

There was consensus that providing a 6-12-month antiretrovirals supply would help ensure treatment adherence and enable their stay in SA for extended periods. Participants suggested that mobile clinics and doctors posted at border crossings would facilitate HIV testing and enable treatment if needed.

**Conclusions:** Increased collaboration between the SA and Lesotho governments, such as implementing health passports, is needed to address complex challenges to healthcare access faced by migrant workers in SA and provide services without discrimination based on nationality.

## TUPED420

HIV testing behaviors among cisgender women: exploring the interplay between HIV-related stigma and trust in healthcare providers

S.H. Kim<sup>1,2</sup>, L. Starbird<sup>1,2</sup>, A. Bittenheim<sup>1,2</sup>

<sup>1</sup>University of Pennsylvania, School of Nursing, Philadelphia, United States, <sup>2</sup>Leonard Davis Institute of Health Economics, University of Pennsylvania, Philadelphia, United States

**Background:** Stigma and discrimination surrounding HIV discourage individuals from seeking testing and act as critical barriers to HIV interventions.

Public initiatives often focus on gender minorities, leaving cisgender women underserved with disproportionately low access to HIV prevention and education opportunities.

This study explored the dynamics behind HIV-related stigma and testing behavior in cisgender women, with a specific focus on the moderating effects of trust in healthcare providers.

**Methods:** Data from 453 cisgender women were drawn from the 2022 General Social Survey conducted in the United States. HIV-related stigma was evaluated across three domains: two forms of personal stigma, including

the fear of transmission and moral judgement, and the perceived social climate against people living with HIV. We employed hierarchical and stratified logistic regression for data analyses.

**Results:** Despite the moderately low levels of personal stigma, most participants acknowledged the existence of discrimination against people living with HIV in society. Among the three domains of stigma, fear of transmission was the only significant predictor for lower levels of HIV testing (OR=0.615, 95% CI=0.451-0.825).

The manifestation of HIV-related risk behaviors, such as engaging in transactional or unprotected sex, drug injection, and binge drinking, was not associated with HIV testing. Individuals who identified as Black had 3.86 times greater odds of undergoing HIV testing compared to their White counterparts (95% CI=2.003-7.676).

In the subgroup expressing low levels of trust towards healthcare providers, stigma concerning the fear of transmission was associated with a 50.8% reduction in the odds of receiving testing (95% CI= 0.296-0.786).

However, this association was not observed among those with high levels of trust in healthcare providers, and no other forms of HIV-related stigma emerged as significant factors influencing HIV testing in either the low or high trust subgroups.

**Conclusions:** The interaction between HIV-related stigma and trust in healthcare providers led to different patterns of HIV testing among cisgender women, with trust mitigating the adverse consequences of stigma.

The findings underscore the importance of collective actions to foster trust in the healthcare system, which should simultaneously address common misconceptions about HIV transmission and enhance awareness of risk behaviors for this population.

## TUPED421

Measuring diversity to promote inclusion and equity: diversity indicators through an HIVSTI-focused behavioural surveillance type survey among Asian GBQ+ men who have sex with men in Australia

L. Mao<sup>1</sup>, H.T. Wong<sup>2</sup>, S.K. Prankumar<sup>3</sup>, H. Sarasola<sup>4</sup>, T. Kaewnukul<sup>4</sup>, L. Nguyen<sup>5</sup>

<sup>1</sup>UNSW, Centre for Social Research in Health, Sydney, Australia, <sup>2</sup>University of Sydney, Susan Wakil School of Nursing and Midwifery, Sydney, Australia, <sup>3</sup>UNSW, The Kirby Institute, Sydney, Australia, <sup>4</sup>ACON, Peer Education, Sydney, Australia, <sup>5</sup>ACON, Multicultural Engagement & Greater Western Sydney, Sydney, Australia

**Background:** Limited and oversimplified understandings of the nuanced and intersectional nature of cultures and languages, which largely shape beliefs, norms and practices, severely hinder inclusive and equitable HIVSTI service access targeting immigrants.

**Methods:** In the biennial Australian Asian GBQ+ Men, cross-sectional online survey, a range of sociodemographic measures assessed cultural and linguistic diversities through an intersectional lens. The basic set contains non-modifiable, individual-level characteristics (Yellow circle in the Venn diagram below). The second relates to immigration trajectory (Green circle). The final set is structure-level service access (Blue circle).

**Results:** The sample of the latest 2023 (Oct-Dec) survey round consists of predominantly first-generation immigrants – 80% being overseas-born and 91.5% both parents also born overseas. Together, 78.6% had access to government-subsidised universal healthcare (Medicare). Close to half (n=555, 49%) identified as Chinese and a further 42.5% (n=481) of a Southeast Asian ethnic background (most commonly: Filipino, Thai, Vietnamese and Malay). Of the 615 non-native English speakers, 60.5% (n=372) perceived their English near or at native proficiency.

Of the remaining non-native English speakers, 186 (76.5%) men felt limited by English proficiency at least sometimes in Australia. Among this subgroup, only 22.6% (n=42) accessed any formal interpreter services within previous 12 months.

A much lower rate of lifetime Mpox vaccine uptake (27.8%) was reported in this subgroup, compared to the 372 men (42.2%, p=0.001).

Notably, no differences in HIV and STI screening rates within the previous 12 months were observed within the 615 non-native speakers (HIV: 63.4%; STI: 46.8%). This is likely due to high levels of HIVSTI free screening coverage in Australia through public funded sexual health clinics, private general practices and peer-led (including Asian GBQ+ peer) community services.

**Conclusions:** These findings underline the need to recognise and utilise cultural and linguistic indicators to improve inclusion and equity in HIVSTI service provision for queer immigrant communities.

## TUPED422

**"In a community that is strict about contraceptives, I have been able to access them because of DREAMS". An analysis of facilitators and barriers of contraception use amongst adolescent girls**

C. Maambo<sup>1</sup>, K. Stoebe<sup>2</sup>, M. Mwale<sup>1</sup>, G. Muchanga<sup>1</sup>, M. Mwamba<sup>3</sup>, S. Toussaint<sup>2</sup>, A. Kumar<sup>2</sup>, C. Bwalya<sup>2</sup>, C. Baumhart<sup>2,4</sup>, C. Muleya<sup>5</sup>, A. Mwila<sup>5</sup>, C.W. Claassen<sup>1,6,4</sup>, L.K. Mwangi<sup>7</sup>

<sup>1</sup>Maryland Global Initiatives Corporation, Research, Lusaka, Zambia, <sup>2</sup>University of Maryland College Park, Maryland, United States, <sup>3</sup>Ciheb Zambia, Research, Lusaka, Zambia, <sup>4</sup>Institute of Human Virology, University of Maryland School of Medicine, Baltimore, United States, <sup>5</sup>U.S. Centers for Disease Control and Prevention, Division of Global HIV and TB, Lusaka, Zambia, <sup>6</sup>Center for International Health, Education and Biosecurity, University of Maryland School of Medicine, Baltimore, United States, <sup>7</sup>Ciheb Zambia, Technical, Lusaka, Zambia

**Background:** Adolescent girls and young women (AGYW) in sub-Saharan Africa are at a high risk of teenage and unplanned pregnancies. DREAMS (Determined, Resilient, Empowered, Aids-Free, Mentored, and Safe) is a multilayered HIV prevention program that empowers AGYW to make informed decisions about their bodies, including by offering contraceptives.

Through physical centers, DREAMS offers an alternative source of contraception. We explored the facilitators and ongoing barriers to this approach.

**Methods:** A qualitative evaluation was conducted in three districts in Zambia (one rural district and 2 urban districts). Data were collected from audio-recorded in-depth interviews (IDIs) and focus groups with DREAMS beneficiaries aged 16-21 (n=55), and program implementers (n=51). During IDIs, a romantic life history calendar gained insight into the participants' romantic and sexual relationships over time.

To analyze these data, we used thematic and narrative analysis. For thematic analysis, we coded data, and categorized results from data coded on reproductive health. For narrative analysis, we wrote, reviewed and compared narratives of beneficiaries' contraceptive use in romantic relationships. Data were analyzed using Atlas.ti (V23).

**Results:** Beneficiaries appreciated that they had a DREAMS center where they were comfortable accessing contraceptives in their local area. In the rural site, the DREAMS program served as the only local provider of these services.

Beneficiaries described the value of the information and accessibility of these services through DREAMS. They highlighted their understanding that early pregnancy can result in school drop-out, and noted contraceptives helped avoid unwanted pregnancies and allowed them to stay in school as well.

Despite improved education efforts and increased accessibility, some beneficiaries reported ongoing misconceptions, namely the belief that contraceptives were only safe for a woman who had already given birth.

Further, continued accessibility challenges were reported – in the rural sites there were limited contraceptive method options. Some reported not using contraceptives because the methods they preferred were unavailable. Additionally, others complained of side-effects.

**Conclusions:** The inclusion of contraception in the DREAMS program has provided many AGYW with added resources and choices to meet their reproductive health needs. However, there is still need to further improve accessibility and choice of family planning methods, particularly in rural sites.

Understanding sexualised drug use engagement among Asian Gay, Bisexual+ and Queer Men in Australia: a cross sectional study

T. Kaewnukul<sup>1</sup>, TC. Witzel<sup>2,3</sup>, H. Wong<sup>4</sup>, S. Kumar<sup>5</sup>, J. Xiao<sup>6</sup>, H. Sarasola<sup>1</sup>, L. Nguyen<sup>7</sup>, L. Mao<sup>8</sup>  
<sup>1</sup>ACON, Peer Education, Sydney, Australia, <sup>2</sup>University College London, Institute for Global Health, London, United Kingdom, <sup>3</sup>Mahidol University, Bangkok, Thailand, <sup>4</sup>University of Sydney, Susan Wakil School of Nursing and Midwifery, Sydney, Australia, <sup>5</sup>University of New South Wales, The Kirby Institute, Sydney, Australia, <sup>6</sup>ACON, Gay Men's Sexual Health Program, Sydney, Australia, <sup>7</sup>ACON, Multicultural Engagement and Greater Western Sydney, Sydney, Australia, <sup>8</sup>University of New South Wales, Centre for Social Research in Health, Sydney, Australia

**Background:** Asian Gay, Bi+, Queer Men (GBQMSM) in Australia face health challenges not experienced by other groups, including a potential syndemic of sexual/mental health challenges with links to sexualised drug use (SDU).

Understanding which groups of Asian GBQMSM are most likely to engage in SDU can facilitate targeted support for wellbeing, including harm reduction and peer support. To inform service development, we aim to explore which drugs are most frequently used in sexual settings and which groups of Asian GBMSM in Australia are most likely to engage in SDU.

**Methods:** Using data obtained through GAMS 2023- a bi-annual, cross-sectional survey recruiting Asian GBQMSM, aged 18+ residing in New South Wales (NSW)/ broader Australia, online/through community outreach (Oct/December 2023)- we tabulated drugs used during SDU to identify which are most taken during sex.

Univariate and multivariate regression models explored SDU prevalence (methamphetamine, MDMA, GHB/GBL, cocaine, ketamine) in prior 6-months by region of birth,

age, sexual orientation, HIV status, Medicare card (indicative of permanent residence or citizenship), and educational qualification.

**Results:** GAM recruited 1,132 Asian GBQMSM, 46.5% (n=527) residing in NSW. Overall 12.3% (n=139) reported SDU in the preceding 6-months using: methamphetamine 5.4% (n=61); MDMA 5.0% (n=57); GHB/GBL 4.2% (n=48); cocaine 3.8% (n=43) and ketamine 3.8% (n=43).

In univariate analysis (table 1) GBQMSM born in East Asia, and without Medicare coverage were least likely to engage in SDU. Queer men, those taking, PrEP, living with HIV (PLHIV) and with Medicare coverage were more likely to engage. In multivariate analysis those taking PrEP, PLWHIV and with Medicare coverage remained more likely to report SDU.

Characteristic	% (n)	Unadjusted OR (95%CI)	Adjusted OR
<b>Region of birth</b>			
Australia / NZ	20.7 (234)	Ref	Ref
East Asia	27.4 (310)	0.56 (0.33 – 0.95)*	0.68 (0.38 – 1.21)
Southeast Asia	41.7 (472)	0.88 (0.56 – 1.37)	1.11 (0.67 – 1.86)
South Asia	5.4 (61)	0.74 (0.31 – 1.75)	0.81 (0.31 – 2.14)
Other	4.9 (55)	0.18 (0.28 – 1.75)	0.74 (0.26 – 2.09)
<b>Age</b>			
<19	2.1 (24)	0.79 (0.18 – 3.53)	0.42 (0.05 – 3.70)
20-29	27.5 (311)	Ref	Ref
30-39	42.2 (478)	1.42 (0.91 – 2.22)	1.22 (0.74 – 2.01)
40-49	17.0 (192)	1.55 (0.91 – 2.66)	1.25 (0.68 – 2.28)
50-59	8.6 (97)	0.57 (0.23 – 1.42)	0.37 (0.13 – 2.95)
60+	2.7 (30)	0.97 (0.28 – 3.37)	0.61 (0.13 – 2.94)
<b>Sexual Orientation</b>			
Gay	87.4 (988)	Ref	Ref
Bisexual	7.3 (82)	0.47 (0.19 – 1.20)	0.50 (0.17 – 1.42)
Queer	2.9 (33)	2.74 (1.24 – 6.03)*	2.36 (0.98 – 5.68)
In another way / straight	2.5 (28)	1.59 (0.59 – 4.25)	1.64 (0.45 – 5.93)
<b>HIV status</b>			
Negative	56.7 (608)	Ref	Ref
Negative taking PrEP	38.3 (411)	2.96 (1.99 – 4.38)*	2.78 (1.86 – 4.17)*
Positive	5.0 (54)	3.28 (1.58 – 6.80)*	2.90 (1.37 – 6.16)*
<b>Medicare card</b>			
Yes	78.4 (887)	Ref	Ref
No	21.6 (244)	0.37 (0.21 – 0.66)*	0.37 (0.20 – 0.70)*
<b>Highest education</b>			
High	77.9 (882)	Ref	Ref
Medium & low	22.1 (250)	1.22 (0.81 – 1.84)	1.37 (0.86 – 2.18)

\*Statistically significant

Table 1. GAMS baseline, univariate and multivariate regression.

**Conclusions:** Asian GBQMSM who have Medicare coverage, those taking PrEP and PLWHIV had higher odds of SDU engagement. SDU support can be targeted towards Asian GBQMSM taking PrEP and LWHIV, however support should remain inclusive as this group may face pronounced service accessibility barriers.

Lessons learnt from the art-based HIV prevention programme for and by adolescent boys and young men in Kenya: a case study from Meru County

V. Kailemia<sup>1</sup>

<sup>1</sup>IMPACT, Health, Meru, Kenya

**Background:** This program delved into the lessons and experiences harvested from an innovative art-based HIV prevention programme tailored for and by adolescent boys and young men (ABYM) in Meru County, Kenya.

This initiative addresses the unique challenges faced by ABYM, acknowledging the cultural, religious, and social barriers hindering access to HIV health services due to issues around age limitations in the current programs.

**Description:** The programme engages young visual artists, activities are majorly online based, and interventions are incorporated into the cultural landscape of the Meru community, ensuring relevance and effectiveness in addressing HIV health issues among adolescent boys and young men.

Snippets and pieces of art are shared and polled on social media that contains educational content on SRHR and HIV.

**Lessons learned:** Artistic interventions emerged as great catalysts for removing social barriers, promoting education, and fostering positive behavioral changes among adolescents and young men. The main lesson learnt was especially - transformative potential of creative art and content creation in addressing health disparities among young people.

Figure: Visual Artists showcasing their pieces of art.

**Conclusions/Next steps:** Engaging young people builds their agency in shaping interventions, this program contributed to the development of age-appropriate and sustainable strategies for HIV prevention with adolescents and young people.

## TUPED425

The effect of the Russian war against Ukraine – Critically low enrollment of OAT healthcare clients in the National Program!

Z. Islam<sup>1</sup>, Y. Zakrevska<sup>1</sup>, K. Savchenko<sup>1</sup>

<sup>1</sup>Alliance for Public Health, Treatment and Procurement, Kyiv, Ukraine

**Background:** Before the full-scale aggression by the Russian Federation, in February 2022, 17,431 healthcare clients received opioid agonist therapies (OAT) in 218 OAT sites. Since the beginning of the war, 18 OAT sites in Ukraine

have closed due to active hostilities and temporary occupation. 94.6% of healthcare clients received OAT at the expense of the state budget.

**Methods:** This was a retrospective cohort study using data from the national OAT patient register managed by the Alliance for Public Health (the Alliance). We compared the increase in the number of healthcare clients, percent of retention in the program, adherence to ART, and percent of healthcare clients in the state budget.

**Results:** The increase in the number of healthcare clients during the 21 months of the war was 20.6% while before the war this number was 31.4% for the same period. The state budget funded 94.6% of OAT medication procurement before the war and now it is only able to support 16.2%. From the onset of the war, the Alliance's OAT activities were reprogrammed to the most essential needs of healthcare clients including humanitarian assistance, evacuation from frontline areas, transportation services for OAT healthcare clients to receive medications, and financial support to OAT sites that were overloaded with healthcare client.

Due to this, retention in the OAT program for 6 months or more from the start of treatment remains high (before the war - 83.1%, now - 83.3%). There is also an increase in adherence to ART (before - 92.4%, now - 97.2%).

**Conclusions:** Despite the fast response of the Alliance and partners to the impact of the war on the OAT program in Ukraine, the enrollment of OAT healthcare clients into the program remains critically low. Only 6.6% of the estimated PWID are receiving OAT while WHO recommends 35%. Therefore, it is necessary to make targeted efforts to increase the coverage of OAT among PWIDs including the expansion of services through mobile vans, and integrated psychological and social support to OAT healthcare clients.
